According to Y.V. Truntsevsky, «in the case of CII, serious consequences should not be limited to material damage, that is, the gravity of the consequences should be determined taking into account the causing (or reality of the created threat) of serious harm to human health or death, material damage, serious disruption of the activities of enterprises, accidents and disasters, destruction, blocking, modification or copying of privileged information of special value» [17].

A.N. Popov proposes to recognize under serious consequence «the fact of termination of operation of the facility of critical information infrastructure of the Russian Federation, the telecommunication network used for organization of interaction of facilities of critical information infrastructure of the Russian Federation, and (or) violation of security of information processed by such facility» [18].

The methodological recommendations of STEP LODGIK, the system integrator of the National Computer Corporation, dated 05.07.2019 «Categorization of Critical Information Infrastructure Facilities 187-FL «On the Security of the Critical Information Infrastructure of the Russian Federation» contain criteria for assessing possible consequences as a result of computer incidents at CII facilities [19]:

- Social importance: damage to life and health of people, termination or disruption of functioning of facilities of life support of the population, termination or disruption of functioning of transport infrastructure facilities, termination or disruption of functioning of communication network, lack of access to public service;

- Political significance: termination or disruption of the functioning of the state body in terms of non-fulfillment of its assigned function, violation of the terms of the international treaty of the Russian Federation, breakdown of negotiations or signing of the planned international treaty of the Russian Federation;

- Economic significance: occurrence of damage to the subject of CII, which is the state corporation of State Joint Stock Company, State Company, Strategic Joint Stock Company, Strategic Enterprise, occurrence of damage to the budgets of the Russian Federation, termination or disruption of functioning of transactions by clients on bank accounts and (or) without opening a bank account or operations performed by a subject of a critical information infrastructure, which is in accordance with the legislation of the Russian Federation a systemically important credit institution;

- Environmental importance: harmful effects on the environment;

- Importance for security: termination or disruption of the functioning of the control point (situation center), reduction of the indicators of the state defense order performed by the subject of the CII, termination or disruption of the functioning of the information system in the field of national defense, state security and law and order.

These criteria should be considered as serious consequences provided for in Part 5 of article 274.1 of the Criminal Code of the Russian Federation.

Turning to the question of the legitimate definition of serious consequences, two steps should be highlighted in addressing the current dilemma:

1. Specifying the list of consequences relating to serious in the law itself: for example, «caused the termination or disruption of the activities of human life support facilities or other serious consequences». The formulation of one of the most serious consequences will serve as a guide for the law enforcement agency. However, this will not allow to offset the possibility of considering certain consequences as serious.

2. Judicial interpretation of the evaluation feature being analysed is considered most appropriate. There is an objective need for a qualified explanation by the Plenary of the Supreme Court of the Russian Federation not only of the list of consequences relating to serious, but also of other issues related to the qualification of crimes provided for in chapter 28 of the Criminal Code of the Russian Federation.

Of particular importance in the analysis of socially dangerous consequences is their division into real damage and the threat or danger of causing them. Chapter 28 of the Criminal Code of the Russian Federation provides as a particularly aggravating circumstance the occurrence of «serious consequences or the threat of their occurrence». In the analysis of the offence, the well-established phrase «if it has serious consequences or has threatened to occur» is not used by the legislator. In this regard, according to A.A. Chavgun and S.D. Brezhnik, «it is quite reasonable for the legislator to use this design" creating danger "in the compositions of Article 272-274 of the Criminal Code, while when protecting a more significant object, the legislator simply ignores it [20]. In this regard, we propose:
«In part 5 of article 274.1, the phrase «grave consequences» should be replaced by the phrase «grave consequences or threatened to occur».

The need to improve criminal law requires the expansion of the scope of the Administrative Code of the Russian Federation. In this regard, it is necessary to draw attention to the initiative of the legislator in establishing administrative liability for non-compliance of the subjects of the CII with the requirements in the field of security of significant objects of the CII in order to differentiate the punishment depending on the severity of the consequences of violation of the requirements of the law in the field under consideration. Administrative offences provided for in the draft law of 18.02.2020 № 02/04/10-19/00096058: art.1.12.1 Violation of requirements in the field of security of critical information infrastructure of the Russian Federation, art.19.7.15. Failure to provide information provided for by the legislation in the field of security of the critical information infrastructure of the Russian Federation.

Conclusion № 4250-AH/D26i of 14.02.2020 on the assessment of the regulatory impact of the bill states that «at present the balance of violations and measures of liability for them has been observed, and the additional establishment of a wide range of administrative liability measures should be synchronized with the simultaneous reduction of criminal liability measures» [21]. In addition, the risk of assigning additional costs to the relevant budgets of the budget system of the Russian Federation is considered to be a negative impact of the adoption of the bill.

However, the analysis of the above-mentioned bill allows to state that the norms provided for in it do not duplicate the norms of article 274.1 of the Criminal Code of the Russian Federation in terms of ensuring the functioning of the CII, but are aimed at regulating the procedure for categorizing the objects of the CII of the Russian Federation; Violation of the procedure for informing about computer incidents, violation of the procedure for exchanging information about computer incidents between subjects of the Criminal Code of the Russian Federation, etc.

Allocating as one of the important directions of improvement of the criminal legislation decriminalization of a number of the acts provided in Chapter 28 of the Criminal Code of the Russian Federation in case these acts did not entail causing damage/harm S.D. Brazhnik notes that legal

relationship in the sphere of computer information, information resources, information systems and technologies need regulation by norms of administrative law [22].

In conclusion, we note that in the absence of a well-established law enforcement practice of bringing persons to criminal responsibility for committing an illegal act that consists in unlawfully influencing the CII of Russia, it is proposed to apply the following recommendations and proposals aimed at improving criminal legislation on criminal liability in the field of critical information infrastructure:

1. Due to the absence of an indication of the scope and significance of the harm caused by criminal attacks on the facilities of the CII, it is necessary to

- replace in part 2 and part 3 of article 274.1 the word «harm» with the word «major harm»;

-note to article 274.1 to read as follows:

«Note. The acts provided for in this article are considered to have been committed on a large scale if the amount of costs for ensuring the safety and sustainable and uninterrupted functioning of the critical information infrastructure exceeds two million two hundred and fifty thousand rubles»;
paragraph 2 of the notes to article 272 shall read as follows:

«2. Major damage in the articles of this chapter, with the exception of article 274.1, shall be considered damage the amount of which exceeds one million rubles»

2. To consider the list of heavy consequences according to part 5 of article 274.1 of the Criminal Code of the Russian Federation to identical criteria for evaluation of possible consequences as a result of emergence of computer incidents on objects CII, the provided methodical recommendations of STEP LODZHIK, system integrator of National computer corporation, of 05.07.2019 «Categorization of objects of critical information infrastructure 187-FL «About safety of critical information infrastructure of the Russian Federation».

3. We propose to establish the scope of serious consequences either in the criminal law itself («caused the termination or violation of the activities of human life support facilities or other serious consequences»), which will serve as a guide for the law enforcement officer, or to state the updating of the qualified explanation of the Plenum of the Supreme Court of the Russian Federation on issues related to the qualification of crimes provided for in chapter 28 of the Criminal Code.

4. Based on the fact that the design of part 5 does not provide for the possibility of bringing to criminal responsibility the person who committed the wrongful act provided for in the article in case of threat of serious consequences: replace in paragraph 5 of article 274.1 the phrase «serious consequences» with the phrase «serious consequences or created threat of their occurrence».

Abstract

The task of ensuring the security of facilities and staff of the penal correction system with regard to the reliable protection and isolation of convicted persons and persons detained in accordance with the requirements of law and order remains one of the relevant tasks in the activities of the staff of the penal correction system. In this regard, the article analyses the effectiveness of measures to introduce new technologies in the security system of facilities and staff of the penal correction system in terms of the economic component of this process. Special attention is paid to the economic efficiency of the implementation of engineering and technical means of protection and supervision. Proposed method is to evaluate efficiency of engineering and technical means of protection and supervision on the basis of certain indicators and methods of calculating integral indicator of efficiency of the system as a whole.

Keywords: Engineering and Technical Means of Supervision, Criminal Enforcement System, Control and Supervision, Efficiency of Application, Security, Correctional Institutions, Economic Component of Security.

Introduction

One of the directions of improvement of the penal correction system of the Russian Federation according to the concept of development of the penal correction system of the Russian Federation until 2020 is the development of engineering and technical means of protection and supervision (hereinafter - ITSON). In order to implement this direction, it is envisaged to establish a system to counter the unlawful behaviour of convicted persons on the basis of the use of modern ITSON, state-of-the-art technologies and approaches to the organization of security of facilities of the penal correction system.

ITSON should be understood as the means used to ensure the security of facilities of the penal correction system, the isolation and supervision of convicted persons and persons in custody, as well as to carry out other tasks of operational and performance activities of staff of the penal correction system.

It is undeniable that one of the most effective methods of improving the effectiveness of supervision in correctional institutions of the penal correction system is the introduction of ITSON into their activities. The use of ITSON at security facilities allows to minimize the impact of the «human factor»» and to

ensure prompt adoption of the necessary decisions and their documentation. It is undeniable that one of the most effective methods of improving the effectiveness of supervision in correctional institutions of the penal correction system is the introduction of ITSON into their activities. The use of ITSON at security facilities allows to minimize the impact of the "human factor" and to ensure prompt adoption of the necessary decisions and their documentation.

At present, the Federal Penal Correction Service is taking a number of consistent measures to improve the engineering and technical equipment of the facilities and to ensure the necessary level of their technical safety. Equally important in this area is the formation of a unified technical policy in equipping the facilities of the penal correction system with ITSON complexes and the introduction of new technologies, and the active improvement of the legal and regulatory framework governing the organization of the use of ITSON in correctional institutions and remand centres.

At present, there is a need to further improve the supervision system in order to improve the efficiency of correctional institutions of the territorial bodies of the penal correction system. The tasks are primarily related to the elaboration of measures ensuring the achievement of the main goal of supervision - the isolation of convicted persons, the prevention of crimes and offences, while at the same time bringing the procedure and conditions for the serving and execution of sentences in the form of deprivation of liberty into line with generally accepted international standards and rules for the treatment of convicted persons.

Results

The activities of the penal correction system in the present period can be described as transitional in the context of the administrative reform of the Federal Penal Correction Service of the Russian Federation in general and the re-equipping of institutions and bodies of the penal correction system with modern technical means and new information technologies, in particular. According to E.A. Scherbakov, «there is a clear lack of funding, much needed right now, a shortage of specialists in the use of engineering and technical means of protection and supervision, sometimes their weak preparation for new tasks, problems of organizational nature, as well as the entrenched in recent years approach of the management of many institutions and bodies of different levels to problems of technical re-equipment as secondary ones» [1].

ITSON, as the basis for equipping the facilities of the penal correction system with security equipment, has a direct influence on the organization of the activities of the staff of the operational units and bodies of the penitentiary system. As A.A. Babkin rightly notes, «without a well-developed, equipped with new modern technical means of the ITSON complex, the implementation of the regime of serving sentences in correctional institutions of the Federal Penal Correction Service of the Russian Federation becomes not only ineffective, but also inadequate to the main goals and objectives of the penal correction system, economically unprofitable» [2]. The authors of the manual "Use of technical means in the mode, Ensuring isolation, safety and supervision of convicted persons, "only with reliable and effective protection of facilities by technical means of supervision and control, Their timely, complete and competent operation, continuous improvement of engineering and technical support for the activities of institutions and bodies of the penal correction system are possible due organization of the regime of execution of punishment in the form of deprivation of liberty, progressive and sustainable development of the penal correction system of Russia [3].

One of the proposals made by the authors is the creation of a single integrated ITSON complex of the institution consisting of safety and security subsystems, implemented in a modular version with a single software, will significantly improve the efficiency of the system of regime and protection of the UIS institutions. In our opinion, this approach in the equipment of ITSON UIS facilities will allow not to involve third-party organizations in the installation works, to operate within the existing number of engineering and technical support specialists, thus reducing the spending of budgetary funds of the state for the implementation of the creation of a single integrated complex of ITSON institutions and bodies of the penal correction system. However, upgrading and adding video surveillance systems and

access controls to existing ITSON systems will not require additional costs for the acquisition of peripherals and cable products.

The creation of this system implies that on the basis of the achieved potential and further development in the field of detection, video surveillance, access control and communication, it is planned to organize in the unit - territorial body - federal district - central apparatus automated telemetry data control and video surveillance stations. The creation of this infrastructure will allow to respond quickly to changes in the situation in the institutions and bodies of the Federal Penal Correction Service of the Russian Federation, to make timely management decisions.

Using a system-wide approach to modelling the application of ITSON, P. M. Nikolayev, in his study shows that "the effectiveness of protection and supervision in the institutions of PIS will be significantly influenced by the following factors: the technical characteristics of ITSON; Methods and tactics for the use of ITSON; Types and number of ITSON used. For example, incorrect tactics of use or insufficient quantity of ITSON reduces the effectiveness of supervision and protection, as well as creates prerequisites for the commission of escape or violation of the regime. On the other hand, the excess of ITSON leads to the over expenditure of funds for their purchase, installation and operation, while the effectiveness of supervision and protection remains unchanged» [4]. This presents a complex and complex technical challenge of calculating the needs of prison institutions in ITSON and how they can be applied to ensure an adequate level of security at such facilities. Such a task is carried out through in-kind experiments involving equipment and personnel, which requires significant financial costs.

Exploring the methodological basis of increasing the efficiency of protection of UIS institutions by means of security units against external threats A.S. Bondarchuk and V.G. Zarubsky show that «the synthesis of simple, reliable, highly efficient, universal security systems, taking into account the justification of their rational structure and parameters ensuring the maximum probability of protection of objects under the calculated conditions of external threats (attackers), is an urgent necessity today»[5].

It should be noted that equipping the institutions of the penal correction system with automated equipment requires careful assessments, as the costs of robotics, maintenance of equipment and training of specialists in its operation are high, which will require significant material and financial costs. In addition, it should be considered that in the process of using ITSON, they may suffer damage, the subsequent elimination of which requires certain costs.

According to M. Y. Popov and A.E. Kostromtsov, «when equipping the correctional institution with automated security and fire systems, it is mandatory to consider the configuration of the facilities, as a large enough number of correctional institutions are located in the urban area, the fire capacity of such systems, their rate of fire and striking factor, as well as the probability of physical damage to civilians» [6].

An important part of the assessment of the effectiveness of security systems is economic efficiency, under which the effectiveness of the funds invested in the security activities of the institution should be considered, the criterion of which is the maximum economic result obtained at the minimum cost and rational use of resources. Of course, the cost-effectiveness of the implementation of ITSON in institutions and bodies implementing punishment should be assessed not from the point of view of the operation of the security system, but by the amount of damage prevented. In this regard, E.G. Tsarkova, «noting the importance of the economic component of ITSON, proposes to understand efficiency of safety systems of UIS facilities, and efficiency in the sense of economy to allocate to the group of complex indicators of the type "efficiency - cost» [7].

Measuring the effectiveness of ITSON is a procedure aimed at determining qualitative and/or quantitative performance indicators and calculating the integral performance indicator of the system as a whole. Based on the system approach of safety system development, it follows that the results of safety efficiency assessment serve as initial data for the stage of detailed system design, comparative

analysis of technical solutions and proposals for equipment of institutions of the penal correction system with technical means, including at the stage of study of projects on equipment of the facility with the ITSON complex.

A comprehensive assessment of the effectiveness of the security system provided by ITSON is important, consisting of a system analytical study, which should provide a synthesis assessment of its effectiveness, which is a basis for comparing with the effectiveness of possible options for security systems, as well as ranking institutions by degree of security.

The evaluation of the effectiveness of ITSON shall be carried out on the basis of certain indicators and methods of calculating the integral performance indicator of the system as a whole. It should be noted that there is no unified methodological approach to the construction of a system of indicators that together reflect the effectiveness of the security system of the protected facility of the penal correction system. It should be noted that the lack of a unified approach to assessing the effectiveness of the ITSON penal correction system introduced into bodies and institutions leads to a decrease in the level of safety of facilities.

In order to obtain a comprehensive assessment, the security indicators of the institution should be considered as much as possible, which should then be consolidated into a single integral indicator, which allows to measure the difference between the analysed security system and others and plan its modernization by analysing each individual indicator included in the common system. An indicator of the effectiveness of any of the subsystems of the security system is the extent to which it has achieved any of its objectives. The value of a private performance indicator in which the system meets its requirements is a private performance criterion. For example, a particular criterion for the effectiveness of a security system may be to meet the conditions of the GOST from the point of view of the reliability of the system. So, GOST P 53704-2009 establishes requirements to the size of availability quotient of a security system: ≥ 0,93 Kг [8].

Performance indicators can be divided into groups:

1. Single (private) - reflecting any of the significant aspects of ITSON operation (for example, Pobn - probability of detection of the intruder by technical means, Pneitr - probability of neutralization of the intruder by security forces, cost indicators, design costs, etc.);

2. Complex (generalized) - are a combination of private indicators (for example, Pper = Pob. Pzad - probability of detention of the offender by the security forces acting on signals of actuation of the security equipment).

As private indicators, the alarm reliability of the perimeter of the protected facility of the penal correction system should be considered, Engineering preparation of terrain and perimeter, characteristics and parameters of the information collection and processing system, Characteristics and parameters of the access control system, characteristics and parameters of the video surveillance system, The characteristic of the alarm lighting system, the characteristic of the operational communication system, the persistence in case of industrial network outages and in other abnormal situations, Measures to counter technical intelligence of organized criminal groups and illegal armed groups.

Security performance measures include one-time and long-term costs. Single cost represents the cost of costs of initial purchase, installation, installation and debugging of ITSON. The long-term cost consists of the cost of maintenance, repair, replacement of ITSON per month.

In order to obtain an integral indicator of efficiency, a convolution of private indicators into one general integral indicator must be used, taking into account the specified "weights" of criteria (private, value, special efficiency indicators taking into account their weights), each of the indicators is separately aimed at: Substantiation of conclusions on quality of created or modernized safety system, verification

of performance criteria compliance, formulation of requirements to characteristics of technical means ensuring compliance with these criteria.

Obtaining an integral indicator of efficiency in numerical value makes it possible to optimize according to the main criteria when implementing ITSON in bodies and institutions implementing criminal penalties, among which the maximum level of protection at the specified costs and the specified level of protection at the minimum costs can be allocated.

At present, there is a need for a systematic assessment of the effectiveness of security systems for protected facilities of the penal correction system. Accordingly, it is necessary to specify and approve a single list of safety system performance indicators, and to determine for each of them the method of calculation, as well as the method of obtaining a comprehensive performance indicator. The evaluation process should be based, inter alia, on the use of GOST, guidance documents, as well as real statistics, making maximum use of the opportunities provided by the existing information infrastructure of the agency.

Modernization in this area, first of all, should be based on the definition of a uniform policy for the introduction of ITSON into the bodies and institutions implementing penalties, which should provide for:

- Development of a list of ITSON, as well as standards for such facilities and requirements for equipping facilities of the penal correction system;

- unification of ITSON;

- Acceptance of ITSON from manufacturers whose products meet the technical requirements and standards stipulated by departmental acts of bodies and institutions of the penal correction system;

- Increasing the level of utilization of the productive capacity of the authorities and institutions of the penal correction system in the context of the development and establishment of ITSON.

The introduction of new engineering and technical means developed on the basis of modern technologies is economically profitable and useful, as it allows to carry out protection and supervision in institutions in more progressive ways, to redistribute and find funds for further rearmament of PIS.

The use of all available methods and means of ensuring the safety of facilities and personnel of PIS can certainly have a significant result, but will also prove to be as costly as possible in material and physical aspects, as well as in complexity of implementation. Therefore, it is advisable to use only methods and means that have high efficiency and low average costs of material and labor resources for their implementation and operation. The effectiveness of the results of the use of modern ITSON is largely determined by the professional and moral qualities of the staff of the UIS, whose activities constantly involve attacks on their safety, various threats against them, as well as their loved ones. It is therefore necessary to modernize in a timely manner the system of economic, political, institutional and other measures adequate to threats to their vital interests within the framework of a unified State security policy.

Abstract

The implementation of development policies in the field of transmigration as an integral part in accelerating economic equality and development in Indonesia has actually been implemented since the era of Dutch colonialism in Indonesia, and is known as "colonization" which was later adopted by the Government of the Republic of Indonesia as "transmigration". This research was conducted to implement technology in the field of territorial analysis in a series of geographic information systems (GIS) as part of knowing the condition of the ecological footprint in developing transmigration settlement locations synchronized with forest conservation policies. Data collection methods used in this study are by conducting literature reviews on documents from the results of transmigration development and implementation of placement with enrichment of literature related to the implementation of transmigration programs in the form of thematic geospatial information (IGT) / thematic maps, forest management, utilization of information system technology geographical and related scientific works. The steps of data analysis are carried out by making spatial analysis by overlaying the thematic geospatial information data from the distribution of transmigration sites as well as forest and water areas. The results showed that there was an implementation of transmigration settlement development policy that was not in accordance with the rules because it was inside a forest area, thus triggering an opportunity to increase the ecological footprint of the Transmigrant community from the aspect of exploitation of the forestry sector.

Keywords: Transmigration, Deforestation, Forest Area, Geographic Information System.

Introduction

Forest is one of the natural resource that is important for human life. Trees provide many benefits in human life, especially for producing oxygen and absorbing carbon, thus makes human beings can breathe well and remain comfortable living environment. Besides that, if properly managed, forest will provide economic benefits through job creation while maintaining environmental advantages (Kandari *et al.*, 2015). Major changes began to occur in the forested landscapes of Indonesia in the 1970s with the introduction of powerful tractors for timber harvesting. The introduction of these machines paved the way for large-scale harvesting of the tropical lowland forests, which continues today in many parts of Indonesia (Suyanto *et al.*, 2004). The deforestation and degradation in several location of Indonesia are caused by the illegal logging, commercial agriculture, farming, mining, the big scale of plantation, and aquaculture (Angi and Wiati, 2017). The construction of the transmigration settlements location is seen as a part of the several sectors which cause the deforestation in Indonesia, because the implementation of land provider and service scheme in the transmigration which come from the state's land and with the status of forest area. Whereas in Indonesia, forest is the main natural vegetation and the most important natural resources (Manik, 2018).

Between 1950 and 1997, 59.0 Mha of forest was deforested, while 7.1 Mha of arable land, 10.2 Mha of permanent crop, and 41.7 Mha of "other" land category were increased. Between 1997 and 2015, 5.6 Mha of arable land and 11.3 Mha of land for permanent crop were increased, while 9.0 Mha of forest and 7.9 Mha of the "other" category decreased. Prior to 1970, no trend of severe forest loss was apparent. Between 1970 and the mid-1990s, export-oriented log production and global demand were the primary pressures underlying deforestation. Cultivation of rice and other crops was also found to be associated with a growing population and transmigration policy (Tsujino *et al.*, 2016). In the other side, Indonesia with huge population, unequal spread, and unbalance between the natural carrying and environment capacity, if not handled properly, it can cause social insecurity or environmental damage (Iskandar, 2010).

In the scope of transmigration field related to forestry problems, the forms of disturbance that considered serious and needed to be handled are the practice of illegal logging and theft of forest products, encroachment of forest areas, shifting cultivation, forest fires, poaching and disturbance of wildlife resulting in material losses and decreasing environmental quality. The transmigration development basically is the regional development through new rural development. The use of forest areas for the construction of transmigration settlements cause the agro-climate change and environmental damage (Husodo, 2003). The rules for the utilization of forest areas in the scheme of land provision and services in the field of transmigration, are actually quite clearly stipulated, that the transmigration land from the State land and the forest area includes Production Forest (HP), Permanent Production Forest (HPT), Protected Forest (HL) dan Nature Reserve and Tourism Forest (HSAW) are forbidden (Departement of Manpower and Transmigration Republic of Indonesia, 2006).

Nothing hides the fact that environmental problems such as global warming, large-scale deforestation, desertification, loss of biodiversity, have disturbed our ecological balance in our world (Sonu, Binod and Sonika, 2011). Utilization of the forestry sector is one aspect that forms a pattern of community ecological footprint (EF) in an area. Ecological footprint is a theoretical category of the use of bioproductive areas in meeting human needs. But keep in mind that nature has a maximum carrying capacity to meet the needs of human life (Muta'ali, 2012). Analysis of the ecological footprint of the forestry sector is one aspect that is integrated with other aspects with functions as an important part of the ecological sustainability chain of the region as well as the main source of timber producers that are used in a sustainable manner (Haberl, Erb and Krausmann, 2001). As part of regional management based on the ecological footprint, this study also aims to identify populations and cultivation areas through regional management, infrastructure development, and the implementation of good environmental management (Ministry of Public Works of Republic of Indonesia, 2010). Simply put, the description of the relationship between the ecological footprint analysis framework, the use of GIS technology and the efforts to achieve sustainable transmigration development can be seen in *Figure 1*.

The issue of implementing the transmigration program is considered as one of the causes of deforestation in forest areas and environmental degradation (Sunderlin and Resosudarmo, 1999; Gatto, Wollni and Qaim, 2015; Darmawan, Klasen and Nuryantono, 2015; Bellfield *et al.*, 2016; Mulyani and Jepson, 2017), in Indonesia. Through this research it is expected to provide a technical review of the implementation of the use of GIS technology in the management of transmigration development and reveal the background to the increasing value of the EF forestry sector in transmigration sites that were built to achieve more sustainable transmigration development.

Figure 1: Relationship framework of ecological footprint analysis by utilizing GIS technology for the management of sustainable transmigration development (reprocessed from Borucke *et al.*, 2013).

Methods

The study was conducted on the transmigration locations with the status of under coaching by the Ministry of Village, Development of Disadvantaged Area and Transmigration Republic of Indonesia and included in the action plan for One Map Policy programe at the level of map accuracy 1: 50.000 in 2015-2018 or as many as 222 locations of transmigration locations. The description of the method used can be seen in *Figure 2*.

Figure 2: Diagram of Research Flow

Data Availability

Database can be interpreted as a collection of data about an object or event that are interconnected with each other. While data is a fact that represents an object such as humans, events, concepts and others. Data is recorded in the form of numbers, letters, symbols, images and sounds, or the

combination of them (Kresnanto, 2010). Based on the results of data collection using a literature review method consisting of documents from the implementation of development and transmigration placement result, not all of them were supported by geospatial location information data. From 222 transmigration location targets, there were 204 locations (92%) supported by information geospatial (IG) data, while 18 locations (8%) were not supported by IG data. It could be seen on the *Table 1*.

Table 1: Data availability of IGT Transmigration Location Distribution

MAP SOURCE	AMOUNT	UNIT
As Built Drawing Image (ABD)	28	Locations

Result and Discussion

Validation of Geospatial Information Data

The requirement for a data be used for an analysis which results could be accounted is if the data quality standards were fulfilled. One of the criteria for quality data is having a high level of validity. Therefore, every data used as a reference for analysis must be tested first. This testing process can be done with several approaches (Susilo and Harini, 2018). Analysis using geographic information systems is often used as spatial analysis, unlike the other information systems, by adding dimensions of 'space' or geography. Spatial analysis was made by overlaying two maps which then produce new maps as a result of analysis (Ningsih, Soelistijadi and Sunardi, 2005).

The method of map superimposed had proven to be very good if it is used to conduct impact studies on projects which the distribution area had a very wide range of integrated project activities, area projects and regional projects. In its development, the method of map superimposed is combined by scoring and statistical calculations so that it could be used to determine land use (Fandeli, 2017). This process can be understood as adding together the spatial frontiers of the data in the case of polygonal entities, in which a set of polygons is obtained with the same homogeneous attributes as those of the factors from the previously established layers. After overlaying the spatial data, the decision rule is applied to the simple objective and multiple criteria problem in order to obtain the alternatives map according to suitability (Quinta-Nova, Fernandez and Pedro, 2017).

The results of the validation of geospatial data on research objects were 222 transmigration locations, only 92 locations (41%) supported by the availability of geospatial information data that met the validity standard. While another 112 locations (50%) were not supported by the availability of geospatial information data that met the validity standard because it was sourced from the map of transmigration settlement development plans which were often very different from the existing conditions of transmigration settlement development and the rest 18 locations (9%) were not supported by the availability of information data geospatial.

Field Survey

Field check activities included the checking of geometry accuracy and verification of land cover, which both were part of the field completeness survey. Geometry accuracy checking is a comparison between the coordinates on the manuscript map and the coordinates of the Global Positioning System

(GPS) in the same location, while the land cover verification is a land cover comparison between the results of the stereoplotting stage and the land cover which was checked directly on the field (Susetyo and Perdana, 2014). Field surveys or field checks were conducted at 130 transmigration location consisted of 112 transmigration locations with information geospatial (IG) data sources in the form of development plan maps and 18 transmigration locations with no supporting IG data.

Spatial Analysis Results

The result towards the spatial analysis on 222 transmigration location, seen from the distribution location perspective, could be explained that 55 (25%) location were under the territory of Sumatera region 47 (21%) location were under territory of Kalimantan/Borneo, 71 (32%) location were under the territory of Sulawesi/ Celebes region, 19 (9%) location were under the territory of Maluku/ Moluccas region, 21 (9%) location were under the territory of Papua, 9 (4%) location were under the territory of Nusa Tenggara. Generally, the result from the spatial analysis of transmigration location on the forest area which was synchronized with the land provider and service in the field of transmigration showed that the wide of development in 222 transmigration location were 14.9654,96 ha, where 139 (63%) transmigration location were built outside of forest area (APL) and 83 (37%) transmigration location were built on the forest area. The detail can be seen on the *Table 2*, *Table 3* and *Figure 3*.

Table 2: Wide Recap of Transmigration Locations on Forest Area

CATEGORY	AMOUNT (ha)
Other Usage Areas/ Non-Forest Area (APL)	135.497,64
Convertible Production Forest (HPK)	8.025,31
Production Forest (HP)	1.909,50
Permanent Production Forest (HPT)	2.298,62
Protected Forest (HL)	1.540,97
Nature Reserve and Tourism Forest (HSAW)	382,92
TOTAL	**14.9654,96**

Table 3: Recap of Total Transmigration Location on Forest Area

CATEGORY	AMOUNT	UNITS
Other Usage Areas/ Non-Forest Area (APL)	139	Locations
Convertible Production Forest (HPK)	29	
Production Forest (HP)	10	
Permanent Production Forest (HPT)	12	
Protected Forest (HL)	13	
Nature Reserve and Tourism Forest (HSAW)	6	
Multi Zone Forest	13	
TOTAL	**222**	

Figure 3: Diagram of Suitability of Transmigration Location Towards Forest Area

The detail of spatial analysis with the regional base showed that from 55 transmigration location which was built in the Sumatera region 40 (73%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 3 (5%) transmigration locations were under the function of Convertible Production Forest (HPK), 11 (20%) locations were under the production forest area (HP) and 1 (2%) transmigration location were multiregional area. In the Kalimantan/ Borneo, from 47 transmigration locations which was built, 32 (68%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 6 (13%) transmigration locations were under the function of Convertible Production Forest (HPK), 7 (15%) locations were under the forest area and 2 (4%) transmigration location were multiregional area.

From 71 transmigration locations which were built in the Sulawesi/ Celebes region 39 (55%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 6 (8%) transmigration locations were under the function of Convertible Production Forest (HPK), 7 (10%) locations were under the forest area and 2 (4%) transmigration location were multiregional area. While from 19 transmigration locations which were built in the Maluku/ Moluccas region 8 (42%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 9 (47%) transmigration locations were under the function of Convertible Production Forest (HPK), 2 (11%) locations were multiregional area.

In Papua region, from 21 transmigration locations which were built in the Papua region 16 (76%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 4 (19%) transmigration locations were forest area, 1 (5%) locations were multiregional area. And from 9 transmigration locations which were built in the Nusa Tenggara region 4 (44%) transmigration locations were Other Usage Areas/ Non-Forest Area (APL), 5 (56%) transmigration locations were under the function of Convertible Production Forest (HPK). Example of analysis spatial map can be seen on *Figure 4*.

Figure 4: Map analysis of transmigration locations for forest areas (Lengoro Pantai transmigration site)

Conclusion

Based on this research, it shows that not all transmigration sites are built following regulations on the use of forest areas for transmigration development. In total, 83 (37%) transmigration sites entered the forest area. With details as many as 29 locations (13%) transmigration settlements are in the area of the Conversion Production Forest (HPK). There are 13 (6%) locations of transmigration settlements located in more than one function of a multi-area forest area which is prohibited for development. The total area of transmigration settlement location in the function of forest area which is prohibited for the accumulative development of transmigration settlement is 6.132 ha.

Basically, the implementation of GIS technology for spatial analysis in the planning and evaluation stages of development in various fields is a very effective regional analysis scheme. In the context of being part of the implementation of transmigration development in Indonesia, GIS plays a major role in implementing sustainable development policy directions that are integrated with forest area conservation efforts.

Based on these facts, it shows that the proportion of the use of forest areas to build transmigration sites is still very large. This is very likely to trigger the soaring value of the ecological footprint of the Transmigrant community in the context of utilizing forest resources to meet their daily needs. Departing from this point of views, the hypothesis regarding the transmigration sector as one of the drivers of deforestation in Indonesia still occurs. If examined deeper, then the inconsistency of the implementation of the rules becomes the main cause of this phenomenon.

Application of Modern Digital ERP Systems in Company Management Accounting and Reporting

Ludmila KORCHAGINA

Plekhanov Russian University of Economics, Moscow, Russian Federation
lmk-puzzle@inbox.ru

Abstract

In the conditions of competition existing in the world market, the role of forms and methods of management for the enterprise based on identification and transformation, as well as forms of convergence of accounting, control and analytical systems of all levels and directions is increasing. In this regard, the importance of creating a generalized concept, methodology, as well as used tools and methods to improve management accounting is increasing. At the same time, management accounting is a management function; its tasks are to collect, register, generalize and provide reliable information about the organization's activities, which is necessary for making competent management decisions. Consequently, the identified problems of the conducted research are to a greater extent aimed at identifying strategically important aspects of the enterprise, regardless of ownership forms, the most important of which are: lack of clear understanding of the users of management reporting, underestimation of the role and importance of creating the financial structure of the company, as well as the lack of appropriate level of regulatory regulation of the formation of internal reporting of the organization.

Keywords: Economics, Management Accounting, Information Support, Reporting Users

Introduction

At the heart of modern financial and economic activity of the company effective accounting systems, in particular software products existing on the market of information services are used. At the same time, the current world practice over the past decades has developed a wide application of ERP (Enterprise Resource Planning) system, which allows to centrally manage the company and coordinate the relationship between its structural units. At the same time, ERP are automated or modular programs based on the management and structuring of Bajwa (2004) information. In this regard, the specifics of management accounting are most closely related:

(a) Operative presentation of more complete analytical information to company management (Parr, 2000);

(b) More information users (Bradford, 2014);

(c) Multiple reporting forms for obtaining information (Haines, 2003).

The digital economy is currently undergoing intensive development and is characterized by its distinctive features:

- the existence of a digital environment and information infrastructure;
- the use of modern information technologies;
- a direct relationship between producers and consumers, for example, through Internet commerce;
- customer orientation;

- application of artificial intelligence for processing large volumes of information.

Proceeding from the fact that the leading function of management accounting is to provide internal users with information for making management decisions, in conditions of digital economy the scope of application of management accounting is significantly increased. In this connection, not only the formation of costs and identification of reserves for their reduction, but also the analysis of the impact of internal and external factors on the development of the company using modern digital ERP systems become relevant issues.

Literature Review

Scientists-economists notice that in the conditions of existence of a market competition for granting to interested users of the accounting and analytical information to the companies it is necessary to have the developed technological platform allowing to carry out planning and forecasting of directions of activity of the organisation and to promote acceptance of administrative decisions (Abu-Shanab, 2015). Thus, in conditions of digitalization of economy the administrative account becomes an information basis and an analytical subsystem of enterprise management. In particular, in researches of economist Drury C. (2005) management accounting is defined as the process of identification, measurement, accumulation, analysis, preparation, interpretation and presentation of financial information, which is used by management in planning, evaluation and management of the organization to ensure the optimal use of resources of the enterprise, as well as the completeness of their accounting Fiss (2007).

In turn, in economic research Garefalakis, (2017) under management accounting means an integrated system of cost and income accounting, rationing, planning, control and analysis, systematizing information for operational management solutions and coordination of problems of future development of the enterprise. Thus, it is possible to distinguish the following principles of realization of the tasks of management accounting (Fig. 1).

Fig. 1: Main aspects of implementation of practical tasks of management accounting at an enterprise

At the same time, it may be noted that the way to implement the principles of accessibility and information completeness is to form managerial and financial statements. The provision of relevant information, as well as analysis of the impact of various factors on the importance of the company is carried out through operational accounting. At the same time, the principle of trust is based on the budgeting process. In its turn, according to Aloini (2007), the means of implementing the principles of accessibility and information completeness is the budget of revenues and expenses. Provision of relevant information and analysis of the impact of various factors on the significance of the company is implemented through the cash flow budget (Petrova, 2019). The principle of trust is implemented by means of a forecast balance, which means the necessity to organize an internal control system and a management accounting reporting system.

Theoretical Background

The internal control system is one of the elements of management accounting. On the one hand, such system can perform a separate management function in the company, and on the other hand, it can be combined with the management accounting system. This will help the management accounting system to obtain additional information and use new methods of control by the internal control system. At the same time, the existing internal control system should contribute:

- efficient conduct of financial and economic activities of the company;
- detection, correction and prevention of errors and distortions of information on the state of the company;
- ensuring compliance with established norms and rules;
- ensuring the safety of the company's assets.

At the same time, an effective internal control system contributes to a significant increase in the efficiency of the company's management system and guarantees its sustainable development. While studying the works of economists engaged in research in the field of management accounting and reporting, it should be noted that to date no mechanisms of management reporting have been disclosed. Since the purpose of management reporting is to provide interested users with the necessary information for making competent management decisions, such reporting should meet the following requirements:

a) promptness (to be provided in due time);
b) utility (to be necessary and necessary);
c) neutrality (not affecting the interests of a certain group of users);
d) targeting (intended for a particular group of users);
e) cost-effectiveness (expenses for preparation of management reports should not be higher than the economic result obtained from their use).

Consequently, management reporting contains structured internal information that reflects the conditions and results of the company and its divisions' activities and contributes to making effective management decisions (Lehoux, 2019). It should be noted that in practical terms, economists highlight the following generalized features of classification of management reports by:

- the period of periodicity of preparation (short, medium and long term);
- structure of information content (complex, thematic, analytical);
- characteristics of information users (owners, shareholders, managers, employees, etc.);
- presented information objectives as well as management levels (operational, current, consolidated);
- volume of information (summary, summary, total);
- responsibility centers (cost center (expense center), profit center, investment center, income center);
- forms of information presentation (tabular, text, graphic, paper, electronic);
- peculiarities of the activity (segments of activity, taxation systems applied, etc.).
- areas of activity (operating, investment, financial).

Also, management reporting can be classified depending on the stage at which it is in the digital economy, namely, on:

a) the stage of formation;

b) the stage of use (using digital technologies);

c) the stage of impact (when there is a possibility that the digital transformation may affect the company's activity).

At the same time, the information contained in management reports influences the company's activity through analysis, observation, verification, forecasting, as well as planning of the work of individual structural divisions of the organization. The content and essence of all types of management reporting affect the activities of the organization by assessing, monitoring, forecasting and planning the activities of its individual structural units or areas. Among the main problems connected with the fact that many companies present information in the management reporting not in full, it is possible to allocate the following:

(a) Insufficient understanding by the management of the company of the meaning and role of management reporting; in order to solve this problem, it is necessary to develop and implement standards and rules of management reporting, which will allow quicker and more accurate formation of management reporting, corresponding to the requests of the company management. This can be achieved by assessing the direction of the company's development, determining the goal, as well as the available resources;

b) underestimating the role and importance of establishing the financial structure of the company; in order to solve this problem, it is necessary to analyze the financial structure of the company, as well as to consider the relationships within the divisions of the organization and to ensure consistency of goals of the responsibility centers;

(c) The absence of a regulatory framework for internal reporting of the organization that allows for correct and clear structuring of the information received, which would guarantee that users receive truthful and accurate data.

(d) A choice of the optimum software of automation of the management accounting and the reporting; the given problem can be solved by simultaneous performance of actions in the following directions: first, to check up coordination of administrative plans and budgets of divisions; secondly, to provide uniform structure and the maintenance of analytical directories of the accounting; thirdly, to provide reliability of the management reporting by the organization of a uniform database of the primary data used for drawing up of the accounting and management report; thirdly, to provide a uniform database of the primary data used for drawing up of the management report. At the same time, when developing a management accounting system, a company should use the Methodological Recommendations on Management Accounting approved by the Expert and Consulting Council on Management Accounting under the Ministry of Economic Development and Trade of Russia, as well as international financial reporting standards; all this will improve the quality of information provided, resulting in more informative and structured company reports. At the same time, the distinctive features of the organization's management reporting are as follows expediency and suitability of the information on the basis of which the level of competitiveness of the company is determined, the forecast of its development is made. In this regard, the efficiency and quality of management decisions depend on the following conditions:

a) availability of developed forms of management reporting in the company;
b) degree of automation of management accounting;
c) coordination of the relationship between users and the information system.

Research Question and Discussion

Individual management accounting researchers point to the relationship between the management and financial accounting system. For example, the Hassab (2012) study emphasizes that the subject of financial and accounting management accounting is the same capital of an organization. In this connection, it is possible to agree on the unity of financial and management accounting systems. Thus, according to Keil (2006) any information required for the management of the company, including the preparation of reports, can be obtained in the management accounting system. In turn, the integration of accounting (financial) and management accounting can be observed. Thus, when providing information on segments, there is a need to use internal information of management accounting when

making an explanation of the annual financial statements. At the same time, Liang and Xue (2004) singled out components of information and analytical support of management for solving modern management tasks and summarized them in the following directions, which, in our opinion, is sufficiently justified:

a) bookkeeping and control and analysis of economic activity (Avvakumova, 2020);
b) the account of uncertainty and risk;
c) generation of information data and database creation.

All the above components contain elements of management accounting. However, the implementation of software based on the ERP strategy is necessary in the following cases:

- separation of accounting types (Akhmadeev, 2019);
- lack of a single source of reference and regulatory information (Chang, 2013);
- stockpiling and lack of centralized planning, sales accounting;
- lack of in-demand product at points of sale;
- lack of control over the calculation of production costs;
- long formation and submission of management reporting (Daoud, 2013).

In the practical aspect of the company's activity, according to Boehm (1991), ERP programs perform the following functions:

- financial planning and modeling and business planning and modeling;
- marketing planning and management (Morozova. 2020);
- planning and sales management, sales planning and management (Petrov, 2019);
- supply management, resource management and demand modeling (Korableva, 2019);
- production management and simulation (Riemenschneider, 2000).

With the help of the program it is possible to set up differentiated access to the database, and also to form variable security policies at one enterprise. All working documentation is concentrated in the database, which allows to provide control over it and protect it from unauthorized access by unauthorized persons (Morabito, 2005). Features If necessary, the automated system can be limited or expanded depending on production volumes, business needs. At the same time, ERP systems imply integration with software products of third-party companies, suppliers, customers (Lehoux, 2019). Platforms for workflow organization, planning and control today are as convenient as possible, easy to use and open wide opportunities for business development.

Conclusion

Implementation of ERP components allows not only to establish control over business processes, synchronize interaction between departments, but also to minimize costs by eliminating duplication of working documentation. Moreover, the automated system allows to optimize personnel and warehouse accounting and to minimize costs that arise due to inconsistency of functional blocks. The main advantages and distinctive features of the ERP-system are as follows:

a) simplicity and efficiency of obtaining necessary data and consistency of work processes at all levels;
b) standardization of reporting documentation and reliability of information protection against unauthorized hacking;
c) automation of typical, standard operations of departments - in warehouses, accounting and human resources;
d) increased transparency of business operations and possibility to organize own corporate mechanism of personnel training.

Despite the big list of advantages of introduction of programs on the basis of ERP, they have a number of features. The use of such a system is possible only if the business processes in the organization are fully established. At the same time, it is necessary to carry out consulting expertise, involving independent specialists. It will help to reveal errors operatively and correctly to correct firm activity. Thus, before starting to start a software product, it is necessary to analyse thoroughly functional areas, features of manufacture which should be automated. If you try to install all program components simultaneously, it can lead to unpleasant consequences. The stage-by-stage technique of introduction of ERP-system works at the enterprises with simple structure and uncomplicated industrial activity. Consequently, the use of information technologies has a great influence on further development of management accounting.

Abstract

The correct study of stocks in modern distribution firms is a key concept to the management teams, since they are essential for the correct functioning the organization, with the objective of a future sale, its application or transformation. The existence of stock, as well as stock control analysis systems, can facilitate the analysis of firm stock levels, which allows for a better delineation and allows for better demand response. To analyze and optimize the stock levels of the modern distribution firm store several performance indicators were analyzed during this study. It was found that breaks in stocks were very high and far from the objectives outlined for the store. The origin of the ruptures in the two analyzed time-spaces, came from the universe of fast-moving consumer goods. Forecasting models were studied to determine which could be more appropriate to adopt by the firm. Given the retail sector characteristics, in which there was a strong seasonal component, for the sweet grocery category the additive Holt-Winters model was shown to be the most effective. However, it was not the most effective in all categories, so the model should be adopted according to the category in question.
The results show that the grocery markets have a continuous breakage levels reduction between Monday and Saturday, which demonstrated that the first days of the week are the most impactful, thus more. The results also show that the causes of ruptures are mainly due to the lack of replacement.

Keywords: Stocks, Modern Distribution, Breaks, Forecast.

Introduction

The modern distribution industry is characterized by a high change in demand due to several factors such as promotions, increased demand during weekends and at the ends of the months. Such factors must be considered in the stock management process. Products stocks management has numerous difficulties, namely due to the variation in demand levels and the impossibility of accurately forecasting it (Barlas and Gunduz (2011), Carvalho (2010).

Stocks may be defined as the physical articles or resources that are essential for an organization operation, that will be used in a future sale, in an application or used to be transformed, thus managing to meet customer demand. It's a crucial item to be managed with a high level of accuracy since stocks can represent a large percentage of firm fixed capital. It is through the existence of stocks that it is

possible to support a business from constant changes in demand levels, react to several needs during the production phase and carry out promotions campaigns.

An effective stock system incurs several policies and analyzes of inventory levels, in order to determine the correct level of stock, time to place the order, as well as the quantity, always aiming to satisfy the searching for a more economical way (Chase and Nicholas, 1995).

The creation of stocks also intends to respond to certain events such as delivery failures, production problems, loss of orders, as well as meeting variations in demand for a particular product (Carvalho, 2010). For Sanders (2012), the time between the creation of the order and the merchandise reception is called Lead Time or provisioning time. The longer the lead time, the greater the need to order larger quantities, because their failure represents longer periods without offering them. Correct stock management needs to look at different lead times each product may have and model all of its stocks decision around this key analyses.

A low rate of disruption should be an essential goal for any customer-centric organization and the basis of any quality process. In retail, this process is even more important. In fact, for the customer it is an unsatisfactory shopping experience not to find the item highlighted by its implantation and markings, being even more disgusting, if the customer goes to the store because of unavailable items.

Based on any item sought by the customer, there is an unmet need. If the product is broken, it is possibly possible that the customer will be able to satisfy it by another who responds to the same need, resulting in a minor disappointment. If the customer does not satisfy this need, and especially if it is not the first time, the company risks losing that customer.

There is a purpose to reduce this dissatisfaction, by offering a wide variety of products to meet the most frequent needs and a more restricted choice for more specific needs. High-speed products generally cover more frequent needs and are therefore more easily replaceable. In the total of the store, the products of high rotation represent only 20% to 30% of the products of the active range.

In addition to the monetary loss obtained by multiplying the price of the product with the estimated value of its average daily sale, there is also a real loss from the customer. Companies in the retail sector should, therefore, consider that disruption is a source of dissatisfaction for the customer and should try to keep it to a minimum.

The rest of the paper is organized as follows: First, in chapter 2, we briefly present an overview of the relevant literature in the topic. The methodology is presented in chapter 3. In chapter 4 we present the main results of our study, and the conclusions are exposed in chapter 5.

Literature Review

According to Cencal (2004), the existence of stock can have two opposite origins, from one hand, a "voluntary" origin, that is, its creation is planned, on the other hand, an "involuntary" origin, resulting from a lower demand than expected at the time of purchase. The main reasons for creating stocks can be due to changing of the pace of entry and exit of the organization's raw materials and final products; demand forecast errors; suppliers with extended Lead Times and non-compliance; pre-orders and with greater volume to reduce the probability of rupture; take care of changes in the demand levels, because given the fact that they are not stable; speculative purpose; and to avoid frequent purchases and in small quantities due to the impossibility of the supplier making them available.

The existence of stock, as well as stock control analysis systems, can facilitate the analysis of firm stock levels, which allows for the delineation of these and allows responding to demand (Chase and Nicholas, 1995). On the other hand, the existence of high-level stocks, represents negative impacts on the firm, namely, at financial and competitive sides, since they represent 25% to 35% of the capital invested annually (Courtois, 2006). In this way, they must be constantly analyzed and subject to

strategies that make it possible to determine them at the optimum level, thus being related to the quantity to be ordered and its timing (Chase, 1995). If their management occurs in a controlled and effective way, this leads to a reduction in functional costs, increasing in profits (Samal and Pratihar, 2014).

Although the forecasts may help in determining the stock needed within the store, they are uncertain, and may, therefore, be insufficient or exaggerated concerning real demand. If expected consumption is lower than the actual one, this will result in disruption and customer dissatisfaction. On the other hand, if the forecasts are too optimistic, they will translate into an increase in stock. Studies claim that the existence of ruptures is more harmful to companies than excess stocks, which is why they choose to establish conservative minimum stocks (Carvalho, 2010).

Security Stock

To be able to respond to fluctuations in demand and delivery uncertainty, factors that generate some uncertainty, a firm should have a safety stock for each article, reducing the probability of the article breaking down.

The greater the safety stock, the greater the likelihood that it will be able to respond to variations in demand. In this context of safety stock, an important factor is the level of service, being a factor of enormous importance in the constitution of the size of the stock. The option of having security stock entails a higher cost of ownership, which can be offset by sales opportunities that would not have occurred without it.

The determination of the safety stock, also, depends on the inconsistency of the demand concerning the average values, because given its great variability to respond to a higher level of service, it is necessary to increase the level of stock. On the other hand, if there is a greater demand constancy, the smaller the necessary safety stock will be (Carvalho, 2010).

In a study by Bhunia et al (2019), the optimal order quantity for single item price break inventory models and multi-item purchasing model with different constraints like investment, average inventory and space constraints are analyzed and related to the importance to firms of a good management of shortages, lead time and the implications of several kinds of inventory cost. They develop a single item purchasing and business inventory models with and without shortages.

Stocks at the Store Level

The point of sale (POS) represents the place where products and/or services sales happens to the consumer. At the retail level in the modern distribution industry, hypermarkets, supermarkets, and convenience stores are examples of points of sale (Blessa, 2008).

According to Blessa (2008), at the point of sale, the exhibition of products must be effective, facilitate the act of purchase and present a harmonious environment to its customers to attract them. Products sold at the must respect some fundamental bases for their efficiency and effectiveness, such has presence, that is, that the item at the time of its search is available for sale since 70% of purchase decisions occur at the place of sale and most of these are influenced by impulses; visibility, to highlight the article and boost its sale. The quantity sold is directly linked to its exposure, and the doubling of the sales space for an article leads to an increase of 50% in sales; and stock, as there is no use in high product exposure if the stock is unable to meet your demand, to this extent, the exposure and stock levels must have sufficient stock for consumption.

In the modern distribution industry context, the stock allows sales to occur in a given period by offering the products at the point of sale, and this must be insufficient quantities to meet demand in a certain period so that its replacement does not have to occur more times.

Stock Control Systems

According to Ballou (2003), there are two distinct philosophies responsible for stock management, which are the push and pull philosophy. The push system is based on accurate forecasting methods to meet customer needs. Organizations that work through this system must be able to predict the intensity of demand for articles closely. In this philosophy, products are "pushed" to the consumer. This supply method has some limitations, namely, because the forecasts are imprecise, derived from the variation of the levels of demand over time and require a greater quantity in stock, which presents great costs.

In contrast, in the pull philosophy, in-store stock levels result from a response to customer demand, that is, based on actual consumption. Ballou (2003), states that this philosophy main disadvantage is the fact that the supply chain is more susceptible to problems external to the organization. But it has the advantage of reducing stock levels in stores, consequently leading to a reduction in costs. This stock management system makes it possible to create stock levels within the store that are closest to the demand since their replacement occurs to respond to the particular needs of each store.

The operationalization adopted for the products vary according to their characteristics, the supplier and the associated lead times. Usually, products with a presence in the logistics center can be operated in two different ways: picking by line (PBL) and picking by store (PBS). The operationalized items, according to the picking by store method, a traditional method of the distribution chain, are stored in stock at the distribution center until their dispatch, upon their order. On the other hand, articles belonging to the PBL method, are subject to the principle of cross-docking, that is, a stock level is not created in the logistics center, and they are dispatched directly to the respective stores.

The segmentation of articles in PBS and PBL is based on several factors such as the rate of rotation, the quality of the supplier's service, as well as the validity of the articles.

Lean System

Among the various methodologies for continuous process improvement, within the organizations, the six sigma models and the Lean Manufacturing philosophy stand out. According to Endler et al. (2016), adoptions of these methodologies have positive impacts for organizations, as well as an increase in financial gains.

This model was adapted for supermarkets, through the perception that the application of these standards could present advantages for companies in this sector (Ohno, 1997), since an efficient availability of materials would result in a high reduction in waiting times between orders, delivery of the goods, resulting in greater operational efficiency, as there was not so much interruption. According to Ohno (1997), customers go to supermarkets to acquire goods immediately and in the quantity they need. The supermarket replenishes the shelves after the products are removed by the customers, and the necessary material is made available immediately to the worker without wasting time, through easy access to it.

Demand forecast

In retail, sales forecasts represent speculation about demand and/or sales volume, being an essential activity for business planning, these same forecasts are the basis on which organizations plans are outlined, a focal point for companies' competitive capacity (Guo and Li, 2013).

Forecasting future demand levels are the foundation for all strategic and planning decisions throughout the supply chain, and without them, operations would only respond in a retroactive manner that would result in insufficient production, customer dissatisfaction, and inefficiency in the use of resources (Wong and Guo 2010).

Predictions, to facilitate decision making in a more rational way, can follow two different paths, whether quantitative or qualitative. Forecasts allow companies to analyze the paths that are being taken,

adjusting them if necessary to the current forecast, aiming to determine predicted values as close as possible to reality, to act more effectively (Enders, 1995).

According to Johnson (1994), the uncertainty associated with purchase forecasts is characterized as one of the main obstacles inherent to the management and control of stock levels, that companies use forecasting models that assist in making the most appropriate decision.

The problems related to the uncertainty of demand are evident in the most varied areas of business, which has led to the development of several forecasting methods, such as linear regression and exponential smoothing which are methods that have been used for decades to make predictions (Bartezzaghi et al., 1999).

Prak and Teunter (2019) propose a framework with estimation uncertainty applied to any inventory model, demand distribution, and parameter estimator. They show that the relative savings are among 10% and 30% for mean demand and in the presence of a trend, savings are among 50% and 80% for several scenarios. The savings are bigger when the estimates are based on fewer observations, if backorders are costlier, or when the lead time is longer.

The forecasting of demand levels, associated with forecasting methods, facilitates the determination of the necessary inputs for the management and control of stock levels, being an aid tool in determining stock within the organization. The management of an organization needs to have the data at the right time to be able to make predictions more effectively. Given this, it is necessary to develop a simple method, with high precision and low associated costs.

Exponential smoothing is one of the most successive forecasting methods used by companies that use inventories (stocks), considering that an exponential decrease in weights as they become more distant, with the most recent data showing greater weight. Referring to Hyndman et al. (2008), in exponential smoothing models, the first component under analysis is the trend, in which the term level is combined with the term growth. Simple exponential smoothing is the simplest and most appropriate method when analyzing time-series forecasts with no trend pattern and no seasonality. Holt (1957) created an amplified model of simple exponential smoothing in which the trend component would be applied, but without seasonal movements, being an alternative to the double exponential smoothing method to estimate the level and slope of the series trend. This model, in contrast to the simple exponential smoothing, uses two smoothing constants, namely α and β, with values between 0 and 1. The Holt double exponential smoothing prediction model, expanded in 1960 by Winters adding the seasonality component to the level and trend component, that is, this model has three smoothing constants, as well as different equations for its calculation (Caiado, 2011).

The Holt-Winters methods present two models for modeling seasonality, which may present an additive or multiplicative form in relation to the seasonality component, and in both methods the trend component has an additive form. According to Caiado (2011), the multiplicative model of Holt-Winters is the appropriate model for series that present a linear trend and seasonal movement. This model is based on the fact that the amplitude of seasonality varies over time, and this occurs, generally in an increasing way. The Holt-Winters additive model should be used for time series with a tendency and additive seasonality. This method is the most suitable for series where the seasonal effect does not occur due to the average level of the series and can be added or subtracted from a forecast that depends only on the level and the trend.

Methodology

Several quantitative analyzes techniques are used to present and analyze key indicators related to the stock management of a store of a major firm of modern distribution operating in the Portuguese market. A store rupture analysis, a key indicator of operational efficiency is the first indicator shown, to verify its origins. Stochastic methods to determine the target stock are also applied to some specific products and categories.

In the analysis of ruptures to discover their origins to reduce them, it will be evaluated in several components, such as the markets with the most impact, the days of the week, the activities with the highest level of rupture and the causes of it.

Concerning stochastic models, the application of the periodic review model will focus on the products with the highest breakage index and excess stock in the store understudy, to verify the impact that this model would have on the application of these articles with a mismatched stock.

All data collected refer to the grocery store categories, with the selected article based on the breakage index and the efficiency process.

Within the scope of this investigation, one of the questions to be answered is: What is the best forecasting method for store sales? The techniques used to answer the question will be presented, namely through the description of the data analysis that provided the necessary information to determine which is the best forecasting model taking into account the past values of the time series.

Exploratory analyzes will be approached to characterize the data and assist the performance measures of the various models analyzed. To determine which models are most suitable to be analyzed, historical observations will be established identifying the most suitable model for each time series. To determine the model, there are aspects to consider: i. identify the models that fit the time series; ii. estimate the parameters estimated in the previous phase; iii. diagnosis: check if the proposed model is adequate by analyzing its performance; iv. make future predictions.

The determination of the most adjusted model for making predictions depends on the behavior of the series and its components, such as seasonality and trend. Thus, exploratory data analysis provides fundamental information in the application and determination of forecasting models. The objective of the study is to determine the forecast model that presents values closer to reality, for that, certain statistical measures are used to find the model with the least forecast error.

Within the different forecasting models, it’s important to adopt the one that provides data as close as possible to reality. To determine the model, the data must be analyzed constantly over time to understand whether the observed data is in line with the predicted. Simultaneously analyzes of several models, to compare the forecast errors obtained must be held. Forecasting errors are dependent on the scale of the data and cannot be used in other series at different scales. The most used measures to measure forecasting errors are the Mean square error (MSE), the Mean absolute error (MAE) and the Mean absolute percentage error (MAPE).

Store Stock Management Analysis

Activity Description

The company's policy is based on lean philosophy, seeking to reduce waste in all its processes. Among the various methodologies for continuous process improvement, within the organizations, the six sigma models and the Lean Manufacturing philosophy stand out. The firm supply chain practices its operation almost exclusively through a pull strategy, that is, the operations respond to store orders. This process begins with a request for the necessary goods in the store, through the creation of an order, this can come from the automatic calculation carried out by the system or through manual orders. The store understudy has articles with PBL and PBS operations. The articles with PBS operation, with stock in the logistics, allow the creation of the order every working day, and its delivery occurs on the following day, except for the order received on Monday, which must be done on the previous Friday (Table 1). PBS activity in the Fast-moving consumer goods (FMCG) universe is controlled almost exclusively by activity 004-PGC (AZ Stock).

Table 1: Activity 004 - FMCG (AZ Stock) (Own Elaboration)

Order Creation Day	Order receipt day	*Lead Time* (in days)
Monday	Tuesday	1
Tuesday	Wednesday	1
Wednesday	Thursday	1
Thursday	Friday	1
Friday	Saturday	1
Friday	Monday	3

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday

On the other hand, and representative of a large part of the articles, PBL activities have higher lead times, with several activities associated with it. Most of these activities feature three deliveries to the store per week. Table 2 shows the activity 043-3x Week (Inf. PBL), in which delivery occurs three times a week and the average lead time is approximately 3 days. As shown in the table below, orders are delivered on Mondays, Thursdays, and Saturdays.

Table 2: Activity 043- 3x week (Inf. PBL) (Own Elaboration)

Order Creation Day	Order receipt day	*Lead Time* (in days)
Tuesday	Thursday	2
Wednesday	Saturday	3
Friday	Monday	3

Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday

Stock Breaks

Disruptions represent a deficit of items in stores, that is, they are not made available to the customer at the time of their search, presenting several consequences for the organization, such as loss of sales, devaluation of the brand, and even a factor with a high impact on satisfaction. of the customer. In this way, it is essential to act on disruptions when it is intended to manage stock.

Table 3 shows the average number of disruptions per universe in the entire year 2018 and the first half of 2019. As shown in the year 2018, no universe managed to achieve the proposed objective, with the store remaining 38% of it. In the 1st semester of 2019, with the implementation of the new rupture counting rules, the goal was changed, reducing from 575 to 400 ruptured units. Besides, it is still possible to see through table 3 that the number of ruptures has decreased compared to the previous year.

Given the objective, it appears that the universes toys and stationery and home and decoration (universes with little impact in total) managed to overcome the proposed objectives. Although overall there is a 10% reduction concerning the target, the numbers of global disruptions are still far from the target.

Another fact that must be taken into account is the fact that the ruptures come mostly from the FMCG universe.

Table 3: Breaks by universe (own elaboration)

	Break Avg (2018)	Objetive (2018)	Diference (%)	Break Avg (2019, 1st Semester)	Objetive (2019, 1st Semester)	Diference (%)
FMCG	464	353	31%	271	198	37%
Fresh produce	85	55	54%	60	43	40%
Toys and stationery	31	18	72%	12	15	+20%
Nutrition, health and well-being	35	22	59%	45	33	36%
Technological equipment	13	9	44%	10	9	11%
Exterior leisure	106	70	51%	67	57	18%
Home and interior decoration	40	34	18%	30	34	+12%
Textile	22	14	57%	15	11	36%
Total	**796**	**575**	**38%**	**510**	**400**	**28%**

Given the fact that the FMCG universe is responsible for more than 50% of disruptions, table 4 aims to determine which markets are responsible for this very significant impact. Concerning the markets under study, that is, the grocery store, it appears that these together accounted for more than 15% of total disruptions.

Table 4: Comparison of ruptures in the FMCG (own elaboration)

	Break Avg (2018)	Objetive (2018)	Diference (%)	Break Avg (2019, 1st Semester)	Objetive (2019, 1st Semester)	Diference (%)
Sweet grocery	79	58	36%	45	35	29%

TOTAL	**464**	**353**	**32%**	**275**	**198**	**39%**

About the markets under study, that is, the grocery store, it appears that these together accounted for more than 15% of total disruptions.

Through figure 1 it is possible to verify that there was a reduction in the number of ruptures, in the first half of 2019 in relation to 2018, but despite the changes suffered, these are still very high considering the objective. Through it, it is possible to see an overrun of objectives in the first months of 2019, but after changing the lifting rules, contrary to what is expected, disruptions increased.

Figure 1: Breakdowns from 2018 to June 2019 (own elaboration).

Figure 2 shows the variation in breakdown levels throughout the week in the FMCG universe and in particular in the sum of the grocery markets, this component being analyzed to verify whether or not oscillations occur over the days of the week.

Through the analysis of the figure it can be said that the FMCG universe presents a greater number of ruptures on Tuesday, and Thursday as the day with the least ruptures, with a decrease of these exceeding 100 units in the space of two days. Concerning the grocery markets, there is a gradual reduction over the week, with the worst day being Monday, when only PBS items are delivered to the store.

Figure 2: Variation of breaks in relation to the day of the week (own elaboration)

Addressing the grocery markets, in particular, there is an increase in the cause "lack of replacement", accounting for 72% of total disruptions. Given this discrepancy, the market leader must act to solve this specific cause.

Figure 3: Cause of breakage as a percentage (own elaboration)

Through figure 4 it is possible to verify that the highest percentage of rupture of the articles is centered on the PBL activity. The main cause may be associated with operationalization with superior lead times.

Figure 4: Percentage of breakages due to the operation of items in the grocery store (own elaboration)

Forecasting Methods

This investigation aims to determine the most effective forecasting method for the observed time series, to combat budgets that are very out of touch with reality.

Due to the high quantity of items in the store, and the impossibility of accessing other markets, this investigation will focus on the Sweet grocery market, in its entirety and categories that constitute it. This combination of products into categories is because there is a very high number of articles and that a detailed analysis of each article would be impossible to carry out. Given the fact that articles belonging to the same category present similar responses to customer needs and to reduce the impact of the promotions inherent in them, the values by category will be analyzed.

Through figure 5, in which the total sales of Sweet grocery between January 2010 and December 2018 are shown, it was found that it had a high seasonal character, being able to determine that the seasonal component needs to be associated with the model adopted, that is, the methods in which this component is not included in its resolution, should be excluded from the analysis.

Figure 5: Time series of the grocery store (own elaboration)

Through the analysis of the previous figure, it was not possible to determine which model to adopt, thus, an empirical analysis was carried out to determine which of the methods have better predictive values.

Table 5 describes the data obtained with the application of the additive Holt-Winters model in the time series of the sweet grocery under study.

Table 5: Data from the additive Holt-Winters model in the sweet grocery time series (own elaboration)

Smoothing parameters			α **0,044856**	β **0,70233**	γ **0,02098**		
Initial states			**a0**		**b0**		
			186616,6		86,27597		
			s1	**s2**	**s3**	**s4**	**s5**	**s6**
			-21293,8	-27713,7	60326,93	14355,97	-34730,6	-48776,9
			s7	**s8**	**s9**	**s10**	**s11**	**s12**
			-37358,9	-43254,8	-35087,3	-4027,54	19496,41	168753

Table 6 shows the values of the measurement measures for forecasting errors, with an average absolute percentage error of 7.71%, thus being a relatively low percentage error.

Table 6. Measures for the evaluation of forecasting errors (own elaboration)

MSE	MAE	MAPE
910254392,4	30170,4224	7,71%

After analyzing the time series using the additive Holt-Winters model, the same study was performed for the additive model, with the data inherent to it in table 7.

Table 7: Data from the multiplicative Holt-Winters model in the time series of the grocery store (own elaboration)

Smoothing parameters							
			0,075961	0,000628	0,193981		
Initial states			**a0**		**b0**		
			186616,6		86,27597		
			s1	**s2**	**s3**	**s4**	**s5**	**s6**
			0,885896	0,851494	1,323267	1,076928	0,813893	0,738625
			s7	**s8**	**s9**	**s10**	**s11**	**s12**
			0,799809	0,768216	0,811982	0,978418	1,104473	1,904276

Table 8 shows the assessment measures studied using the multiplicative model. Noting that the forecast errors presented by this model are higher than those shown by the additive model. Thus, the most appropriate additive Holt-Winters model, that is, with forecasts closer to reality.

Table 8: Measures for the evaluation of forecasting errors (own elaboration)

MSE	MAE	MAPE
1242224416	35245,20416	8,01%

Through the exploratory analysis of the two models, it was found that they do not present very high forecasting errors, but the additive method presents better values in the measurement measures of forecasting errors.

Through the use of different formulas to calculate future forecasts, a high approximation was found between the values obtained in the two models with the real value (shown in figure 6). It can be said that the use of Holt-Winters models are good predictors of sales, except March and April, in which forecasts were very different from reality, justified by the fact that Easter, the second season with more sales in the year, not having a fixed day and month.

Figure 6: Comparison of actual sales with those predicted by the Holt-Winters forecast methods (own elaboration)

After the application of Holt-Winters models to the sweet grocery market, in general, the same study was carried out for the needs that contemplate the same. The data concerning the mean absolute percentage error (MAPE), shown in table 9, justify that the adopted model varies according to the need, because for some the additive model presented better results, in contrast, for the others, the application model was the most appropriate. Despite this fact, in general, the values presented by the two models are similar. Also, it was found that these models are not good predictors for the "seasonal sweet" need, since they presented high forecasting errors, a fact justified by the Easter day to vary annually.

Table 9: Comparison of the MAPE in the Holt-Winters models in the sweet grocery different categories (own elaboration)

	Multiplicative Holt-Winters	Additive Holt-Winters
Capsules	13,30%	12,79%
Dairy products	7,05%	7,10%
Sugar	11,13%	9,43%
Fruits	10,89%	10,45%
Industrial Pastry	6,23%	6,36%
Industrial bakery	4,58%	4,30%
Coffees and filters	6,03%	6,02%
Teas	8,42%	8,99%
Breakfast cereals	5,86%	5,75%
Cookies	5,44%	5,13%
***Drops* and candy**	7,28%	6,80%
Chocolate	9,67%	10,48%
Milk	9,40%	9,42%
Cakes	8,92%	9,5%
Deserts	9,95%	10,25%
Cocoa	6,76%	6,56%
Fine bakery	6,41%	6,57%
Chewing-gum	5,55%	5,56%
Seasonal sweet	270,60%	510,44%
Sweet Grocery	**8,01%**	**7,76%**

Conclusions

To analyze and optimize the stock levels of the modern distribution firm store several performance indicators were analyzed. One of the indicators evaluated was ruptures. It was found that they were with very high values and far from the objectives outlined for the store. Since, in 2018, no universe managed to reach or even approach the pre-established goal. Overall, the store had 38% more disruptions than intended. Concerning the first half of 2019, there was a general reduction of 56% compared to the previous year. This decrease can be justified, in part, by the change in the rules for lifting breaches. The origin of the ruptures, in large part and in the two analyzed time-spaces, came from the universe of products of the fast-moving consumer goods. Accordingly, the categories inherent to the same market were evaluated to discover the markets with the greatest impact, with the sweet grocery category being one understudy, since it was one of the most impactful in terms of disruptions. Regarding breakage levels during the week, it was found that the grocery markets showed a continuous reduction between Monday and Saturday, reducing, on average, almost 40 units of break between these days, which demonstrated that the first days of the week they are the most impactful, thus acting more efficiently and corresponding to the needs of consumers.

About the causes of ruptures, in the markets under analysis, it was observed that more than 70% of the ruptures are due to the lack of replacement, as verified in the description of the company's activities, this cause is assumed whenever an article is in rupture and the theoretical stock is greater than zero. This leads to the fact that this is associated with non-real causes, such as when there is a delivery failure, if the stock is greater than zero, as the theoretical stock is not correct, the system states as a cause of rupture lack of replacement, and this cause is generally not analyzed by those responsible, as theoretically the article is in storage and just needs to be replaced. The causes of the disruptions presented by the software are not the real causes, which means that its treatment is not the most effective and correct.

Finally, the forecasting models were studied to determine which one had the least associated forecasting errors, to select the most appropriate model. Given the characteristics of the retail sector, in which there was a seasonal component, for the sweet grocery the additive Holt-Winters model was shown to be the most effective. However, this was not the most effective in all categories, so the model should be adopted according to the category in question.

This work was financially supported by the research unit on Governance, Competitiveness and Public Policy (UIDB/04058/2020), funded by national funds through FCT - Fundação para a Ciência e a Tecnologia.

Abstract

Synergy effects start to be more important in strategy management of current cooperative organizational forms. Synergy represents stronger cooperation relations in business environment, which participates in formation of synergy effect. Cooperation strategy of those collaborations achieves innovative and sustainable solutions of many problems. The purpose of this article is to point out emerging importance of synergy effect in formation of successful cooperation strategy. Creation of recommendations for praxis towards successful cooperation is an important step in the following analysis. The coexistence of cooperation and competitiveness is a common solution that will support the creation of added value (synergy effects) of the cooperative relationship of several environmental elements. This research confirms the versatility of synergy within different conditions and environments, achieving it as a result of being managed. Mapping the synergy in a current environment within the chosen cooperation relations shows that each one contributor of such a relationship builds stronger relation if all cooperation´s actors build stronger competitiveness. In general the main consensus from single conceptions is that proposal of measurement and management of synergy effects in business environment through cooperation relations is the fundamental competitive strategy in current dynamic environment.

Keywords: Cooperation; Cooperation Strategy; International Companies; Strategy Management; Synergy; Synergy Effect

JEL classification: Q13, M14, O31

Introduction

Prerequisite for investigation of synergy in business environment thus cooperative organizational forms is complex content analysis of investigated phenomenon. Because of this it is important to strengthen the knowledge about synergy in business environment where it is possible not only to find the synergy but also to apply it as a method which supports cooperative organizational forms and it is necessary to identify the right elements for strategy management of cooperation – cooperation strategy.

The obstacle of current business environment is an incessant searching for new, more effective ways of getting competitiveness and business aims.

The aim of the whole research included in this article is to identify the emerging synergic effects in real cooperation environment and to propose the recommendations for effective cooperation strategy.

Synergy in the current interconnected market has to represent a new contribution in the concept of strategy management itself within cooperation and competition. The basis of focusing on synergy is in the issue of solving the failing strategy management of cooperative organizational forms as strategy alliances (Ireland, et al., 2002; Kubina, et al., 2015; Varmus, et al., 2015, b) the most of which ends in failure in opposition with the given aims and cooperation itself. The starting prerequisite for successful cooperation strategy based on synergy effect is the investigation of theoretical and practical knowledge from this article within the qualitative research for strategy management of cooperative organizational forms oriented on maintenance and formation of synergy effects.

The current business environment consists of companies trying to make such a business policy and strategy that enforce their policy for policy of competitive company in a specific environment with specific aims and conditions. Collins (Collins, et al., 2008) explained the point of strategy policy of each enterprise within the various fights, competitive or cooperation such as: "The basic distinguishing feature of the most lasting and the most successful corporations is that they preserve the basic ideology while simultaneously stimulating the development and change in everything which is not the part of the basic ideology." The strategy of individual cooperative relations in business environment shows us closely the strategy management within cooperation and it is also possible to identify closely the motives of individual relations from the perspective of outstanding synergy effects.

The problem is the need to conceptualise and measure the performance of effective cooperation. This way the participants in cooperation can not only document the conditions for benefits of cooperation, but they can also determine if their activities and affords are on the right track (Lasker, et al., 2001; Zrakova, et al., 2017; Varmus, et al., 2016, c). In a dynamic market demonstrates that previous cooperation bolsters contractual adaptability, which in turn nurtures current cooperation between the same partners (Luo, et al., 2002; Jankal, et al., 2018, a). Contract and cooperation differ in the contribution of contract completeness to performance declines as completeness increase contribution of cooperation. Cooperation is a paradoxical relationship between two or more subjects. It doesn't matter if the relationship between the subjects is horizontal or vertical, they are still engaged in cooperative and competitive interactions (Bengtsson, et al., 2014; Varmus, et al., 2018, a). Effective management is crucial for maintaining the cooperation (Mazzarol, et al., 2013; Jankal, et al., 2016, b). Authors (Ireland, et al., 2002) offer obvious fact: The effectiveness of alliance management should come from its accomplishable benefits. According to (Wallenburg and Schäffler, 2016), the use of cooperation in performance measurement reduces the overall conflict in horizontal cooperation. This fact can be seen for example in:

- The success of agricultural cooperatives. Set of rules and directives is crucial for this success. This set of cooperative rules should help create a detailed business plan and future success of the cooperation (Altman, 2015). Cooperatives represent an alternative to large-scale corporate farms as well as to independent unaffiliated small private farms.

- The success of Cheese Board Collective helped by 3 aspects: small size, the right selection and firm customer base. Gupta (2014) confirms the internal trust and reciprocity in Ostrom´s principle and expands its use to different areas.

- The analysis conducted by Carini (2014) empirically proves the endurance of cooperation during the economic crisis, the growing number of employees working in cooperation and the positive reaction of Italian cooperation to the financial crisis.

The modern enterprise should integrate the external design forces and make a good job of design cooperation management. According to Yao & Guo (2009) this is a way as good products be

designed and the enterprise strategy be carried out. Kafi & Ghomi (2014) conclude that under intuitive conditions coopetition strategy is superior to the pure competitive relationship between the suppliers in terms of profitability.

Materials and Methods

In the background of the cooperation issue, cooperation management, strategy management and synergy is the research which we have been dealing with for a longer time. Methodologically it is about the deep content analysis of secondary data about synergy, their induction into the seven basic admissions. The second analytical part includes closer analysing of the eleven chosen successful cooperation connections which have been analysed from the available secondary sources about the given real cooperation. The form of case studies which represents qualitative access in analysing of business environment is used for gaining information about the aims, accesses and results of cooperative organizational forms. After that there is the synthesis of theoretical and practical knowledge about the given issue used in the article and there are formulated the concrete solutions for practice in the field of cooperation management for the purpose of creation of synergy effects. Logical order of the article is preserved within the switching from the general to the concrete information which is pulled together in the final discussion.

The content analysis at the beginning highlighted some branches of science in which synergy picked by watching and confirmed (biology, chemistry, physics, economics, management, sociology and others). Wide field of the influence of synergy and synergy effects consequences from this fact and it can influence the duration time of research and it is important to concretize the borders of research. The environment made by knowledge about synergy, strategy, strategy management, methods of strategy management, cooperation and cooperation management create the basic theoretical and practical level for research of the chosen topic.

Identified Approaches to Synergy

By induction of individual acts of famous authors and with the help of synthesis the following definitions and accesses to the synergy are created. Those accesses refer to generalized accesses of synergy and synergy effects (concentrating on reality of the inspected phenomenon and closer characteristics of synergy with its forms). It is possible to identify the result of the mentioned research which is that synergy exists in common conditions and it also has an impact on the inspected issue – the origin and creation of synergy and synergy effect within the cooperative organizational forms in order to use suitable strategic management. During the next research being interested in their connection with strategy management by the help of identified features of strategy management in concrete conditions will be needed.

Synergy is a connection, interconnection, engagement in the cooperation in concrete environment which is changing, evolving and reacting. This connection results from combination of features of two and more elements between which mutual reversible interactions (one of the basic elements of the synergy basis) are under way. Controlled interaction connections do not secure only gained synergies within expected and unexpected, thus synergy effects (value added cooperation). Synergy effect is a value, expected and unexpected result, condition which emerges within the certain environment. It does not present only the value but also input-output substance of many processes and changes in the evolution. For instance for the corporation itself it means its evolution towards the future. In terms of the condition it stands for cooperation, connecting the corporations together in a specific environment. Synergy remains the main issue of the research and consideration. From the theoretical point of view of synergy issue it is possible to make the partial conclusion that synergy creating can be conditioned or unconditioned. On the other hand it is important to show the fact that synergies depend on the resources (tangible, impalpable), processes, features and characteristics of interacted elements through which the potential synergy effects can be realized.

On the basis of the following accesses of synergy it is necessary to point out on its complexity and connectivity within the whole researched world. The following "Seven basic accesses to synergy" present the induction of complex synergy research and they present the unification of individual researched synergy fields and occurrence of synergy effects.

(1) The access to synergy within naturalness (the basic nature of things, animals and human beings)

According to Corning (2006, a) synergy in biology formulates associated effects which are made by two or more parts, elements or organisms. They are effects which are not possible to gain in other way. Closely connected synergy definition from the sociology field shows us: Team, society is the place for synergy individuals where gaining the common aim is the possibility of gaining the individual aims (Hewstone, et al., 2001, a; b). From the point of medicine synergy is the process in which two muscles, organs, substances or parts work contemporarily together and cooperate with each other for improving the function of the unit and increase of its impact, performance (Morasso, et al., 2010).

The elements in grouping, individuals in groups, corporations in branch are based on certain basic functioning attributes and they show certain behaviour in an environment they live in. synergy is in interaction of those systems as its basal form of creating certain features, abilities or position.

(2) Synergy as an evolution approach

Synergy causal role depends on success of survival and evolution. As writes Corning (1995, b) synergy is everywhere around us and inside us, it is inevitable. However, trajectory of evolution shifted the causal dynamics away from autocatalytic (Chemical reaction accelerated by catalyst which is created as its product.) phenomenon to purposeful and function phenomena. In accordance with it, the future lies in self-determination which means it is based on information and purposeful innovations. We can safely predict that new synergy forms will play the key role in creating our future development.

Synergy causal role does not depend only on random and unpredictable phenomena any more, but with evolution it is forced to purposeful reactions and interactions within the elements between individuals, business subjects and so on. Those new phenomena carry out the future of the evolution itself.

(3) Synergy as something new, newly appeared

According to Ivanička (1997) synergy reflects also newly appeared features such as: bearing no relation structures, dividing into more parts and developing states of the system. Those features are interconnected for certain behaviour of systems. Authors Shannon (1998) and Taylor-Power (1998) and col. picked out that synergy is not only the cooperation and information change but by combination of individual perspectives (attitudes), sources and skills of partners, the group creates something new and valuable.

Dynamics of current environment provides us combination of various elements, individuals, corporations which are characteristic by various features, abilities and sources – within so diverse environment synergy is able to create something new.

(4) Synergy within the cooperation

From the point of lexicology the term synergy is derived from Greek word "synergin" which means "to work together" – "cooperate". According to Ivanička (1997): "Evolution and progress of social

system have their own structure of worldwide behaviour which is after passing the synergetics theory better to identify and use in constructive attitude and in conflict situations".

Synergy is based on cooperation of two or more elements, people or corporations and that is why it is needed to look at synergy as from the point of view of cooperation strategy as state: If the corporation managers want to create cooperation strategy it is important to analyse cooperation potential of corporation, create common vision with partners and depict the cooperation orientation. By this it is important to deal with constructing cooperation management tasks such as: the transition to cooperation conception (requirements, activities), the change of point of view on cooperation (change to mutual relations within the cooperation on a long-term basis oriented), changes of thinking in all participating sides (the advantages of cooperation), measurement of achieved level of processes of creating cooperation management in corporations, usage of modern technologies.

Common work of elements, individuals, corporations, in various conditions, accesses and situations with the help of knowing the synergy sense and meaning can realize evolutionary movement of cooperation within the individual and worldwide behaviour.

(5) Access to the synergy within the interaction influence

Synergy, according to Eye and col. (1998) is in situations including the activity of two or more subjects making certain output, result. Corning (1995, b) confirmed that synergy is in the same way with two different types, such as integration (aggregation, fusion, alliance of various kinds) and the internal differentiation. Authors Goold M. and Campbell A. (1998) have the similar theoretical specification and they understand the synergy as a result of interaction connection and cooperation affects between partial entrepreneurial groups which lead into the creating of additional value. Authors Vodáček and Vodáčková (2009) dealt with interaction affects and they defined synergy as a change of system´s behaviour and features by the influence of creating interactive impact on its partial subsystems.

Causal interactions between elements, individuals, corporations show additional results which the individuals would not get themselves – this is the output of mutual interaction impact in synergy and evolution relations.

(6) Approach to the synergy as a higher value

Author Knoll (2008) states that synergy is an effect which combines profitability of the whole, which is bigger than the total of profit of individual parts. This thought is supported by authors Bartol and Martin (1991) with the handbook of management in which they state: synergy is the ability of system to be more performing as a total of performances of its individual parts. That means organization would be able to gain its aims as more efficiently as it is possible if its individual parts worked separately.

Synergy does not affect only higher profit but according to Sirower (2007) there is bigger competitiveness and final cash flow opposite of both corporations predicted to gain separately.

Synergy in individual and common performance can make opportunities for added value in environment of higher profit, performance, faster growing, competitiveness and others.

(7) Approach to the synergy in business environment

In present world the aims based on gaining some benefits cannot be gained by one person, corporation or sector. They are based on cooperation, synergy which forms the system. System which is overpowered by economic and technology changes and it is getting more and more competitive and specific (Lasker, et al., 2001). Authors in field of management define synergy as a value made by two

cooperating divisions (corporations) which is bigger than value which would both divisions make if they worked separately (Jones, et al., 2000). This solution is needed to be filled by author Griffin (1990) who thinks synergy is an important management concept based on coordinated cooperation. Synergy occurs when cooperating subsystems are able to create bigger effect as if they tried themselves separately. Convincing evidence of existence of synergy performance (dissynergy) provides support for existence of common value, common effects. The existence of common effect depicts that common strategy plays an important role in the whole corporation performance. The performance of common grouping is not caused only by extraordinary industrial structure or total of individual performances of business features (Martin and Eisenhardt, 2002).

Interactions in business environment are within various management attitudes, coordination, cooperation, common strategy, tuning of subsystems, competitiveness represent the mechanism for gaining the benefits which would not be gained without the value made within the synergy.

Case study – locate synergies within selected cooperative strategies

The previous approaches to synergy present its basic learned types of repeated patterns in so far explored issue. They spread the point of view on synergy, on something with bigger sizes (more elements) and wider impacts (more results from common reactions). On the basis of those synergy approaches it is inevitable to show its complexity and connectivity within the whole inspected world in which the life exists, reactions on changes, development towards the future and mutual influencing of organic or inorganic objects in intentional or unintentional actions by which intentional and unintentional results (values) are created. One of the approaches is the synergy in business environment which confirms the actuality and importance of chosen topic. On the basis of approaches we can conclude the dynamic character of synergy which can function as stimuli to new acts, values and results.

If the corporation wants to gain synergy throughout its cooperation groups the critical meaning in this case has the perception of results which they can gain together. We can put between them some synergy effects which can bring to the cooperation new added value. From the point of view of management it is important to learn by which conditions of cooperation environment and by which way of management (concretized elements of management) those synergy effects occur and are maintained.

If the managers want to create cooperation strategy it is needed to analyse cooperation potential of corporation, create the common vision with partners and determine cooperation orientation. Identified findings out in the article are worthy solutions of creating and realisation of cooperation strategy in corporation within creation of synergy effects and strengthen the competitiveness.

Achievement of each corporation in cooperation organization forms is based on its strategy. We can assume that corporation which does not have effective and purposeful working strategy and strategy management it cannot survive in this competition world. Each corporation strategy is a unique piece of work. From this point of view synergy comes from the working of individual strategies of cooperation corporations itself together in cooperation environment and it only harmonizes its influence for creating synergy effects.

Chosen Cooperative Relations

From the exploration of cooperation strategy in chosen connections it is possible to relatively exactly identify synergies and synergy effect which is in a relation with mentioned successful management – strategies of cooperation organization forms. Common cooperation environment depicts many cooperation connections however strategy steps which stand firmly behind the success or failure it is important to analyse constantly. The following context presents the main findings out in theoretical research of secondary resources of investigated issue.

The first part is the introduction of chosen cooperation connections. The selection was taking place on the basis of those criteria: gained success rate of cooperation strategy, international environment, interesting and unusual environment of cooperation and conditions of its creation.

Tata Starbucks Identification of cooperation relation: Joint venture Tata Starbucks represents cooperation connection between Indian corporation Tata Global Beverages and American corporation Starbucks Coffee Corporation. Tata Global Beverages is the representative of non-alcoholic beverages and Starbucks is a famous coffee seller. In this cooperation connection was the main point to establish in an Indian market which is famous for its population and fast growing branch of commerce (to increase market share). It is important to pick up that Starbucks first try to get on the Indian market failed. Delimitation of cooperation relation: the aim of cooperation was to closer and built more powerful customers base. Of Starbucks in which the strong emphasis was on customers, employees and local coffee provider. Starbucks should be treated as foreign brand in the role of marketing participant by the connection with Tata Global Beverages as home and famous provider.

One World. Identification of cooperation relation: Joint venture of flying companies American Airlines, British Airways, Ibera and Finnair are the partners of worldwide alliance OneWorld. The aim of it is to cooperate on transatlantic flights which have to empower global competitiveness on transatlantic ways and empower position on the market and create better conditions for customers, employees, shareholders and community. Delimitation of cooperation relation: the content of this cooperation is to delimit common creation of prices, transportation capacities, coordination of flight prices and partnership on profit shares.

Comité Colbert. Identification of cooperation relation: Association Comité Colbert, which is oriented on cooperation of right competitors of various kinds of luxury goods depicting the French lifestyle. Delimitation of cooperation relation: cooperation is based on empowering of awareness and strengthening of home and foreign competitiveness in items: export of home luxury goods around the world (development on new markets), identity of trademark (to protect from plagiarism, lift up sector of luxury goods), quality and etiquette.

Aerospace Valley. Identification of cooperation relation: Aerospace Valley is a French cluster of flying engineering which joins together many various subjects. Delimitation of cooperation relation: Cluster has a non-profit character its primary aim is to share knowledge, technology and know-how (contributes to support of competitiveness of participants with development in the field of science and research, production and education in form of transferring knowledge between corporations, institutions together with meeting the flying and astronautics market). In the current time it belongs to the European and worldwide leaders in employment in the field of aviation and astronautics. The main participants are small, middle and big corporations, state and region power bodies, high schools, educational and research institutes.

Disney a Pixar. Identification of cooperation relation: Fusion between two film corporations Disney and Pixar. Delimitation of cooperation relation: Cooperation delimited Disney as a corporation with many distribution networks (propaganda), financial sources and status while Pixar in this cooperation field represents corporation with modern technologies and know-how for creation of 3D films. At the beginning there was identified problem in the hope of mutual relation. Later this mistrust led to strong cooperation connection based on strong brands and reputation which form films for the whole families, for all age categories.

Danish Food Cluster. Identification of cooperation relation: Cluster which is placed in Denmark under the name Danish Food Cluster. Delimitation of cooperation relation: Danish Food Cluster is a membership non-profit organization for corporations, research institutions and public bodies working in food processing and agriculture industry sector in Denmark. Maximizing of potential of this sector for global growth, strengthening the innovations in the field, support of sharing knowledge and cooperation. Cluster is focused on organization of events, creation of contacts and broadening of cooperation in this sector. To the aims of cluster belong: support of innovations, strengthening of

competitiveness and attracting new corporations and investments. Growing turnover and growing production of this cluster has a big importance in food processing and agriculture industry sector in Denmark.

The California Wine Cluster. Identification of cooperation relation: cooperation connection The California Wine Cluster. Delimitation of cooperation relation: The California Wine Cluster spreads the production and quality of wines and connects winemakers, restaurants and tourism into one part in the purpose of propaganda and distribution of Californian wine around the whole world.

IT Valley Košice. Identification of cooperation relation: IT Valley Košice is a cluster from the Slovak Republic. Delimitation of cooperation relation: IT Valley Košice represents cluster, association of IT firms, educational institutes and parts of self-government. The signification of existence of this association is creation of prerequisites and ideal conditions for creation of the centre of information and communication technologies in eastern Slovakia and to make its social-economic environment more attractive. It is also about creation of prosperous region, qualified education and attractive job opportunities.

Global Brands Group a Li&Fung. Identification of cooperation relation: cooperation of the form in which Li&Fung made spin-off called Global Brands Group. Delimitation of cooperation relation: the result for making it was to broaden its relations with existing and new retail customers. Li&Fung can be interested in gaining the resources and logistics and Global Brands Group is interested in abilities to design and make brands, marketing abilities and licensing.

One Nucleus. Identification of cooperation relation: British cluster One Nucleus. Delimitation of cooperation relation: One Nucleus is international membership organisation which deals with: biotechnology, diagnostics, medical mechanisms and pharmaceutics. It also provides and creates specialised services, consulting, trainings and conferences.

Chery Jaguar Land Rover Automotive Company. Identification of cooperation relation: British-Chinese joint venture with the name Chery Jaguar Land Rover Automotive Company. Delimitation of cooperation relation: cooperation connections of cars manufacturer Chery Automotive Company and automobile company Jaguar Land Rover provides the creation of automobiles and motors, also the research centre and centre for design of new models. The intention of it is to grow selling abroad in the way of creating distributive network in China. Cooperation connections of cars manufacturer Chery Automotive Company and automobile company Jaguar Land Rover provides the creation of automobiles and motors, also the research centre and centre for design of new models. The intention of it is to grow selling abroad in the way of creating distributive network in China. JLR tries to find responsible partner in Chinese market who will provide production capacities for those brands by what it will reduce the costs for production and it will improve the availability of automobiles JLR on Chinese market.

Identification of key aspects of cooperation strategy and synergy effects

On the basis of learned situation within the current business environment one of the main tasks, the meaning of business strategy is to be able to compete, cooperate and innovate in ahead of time of competitors or to choose strategy of following or filling the gap on the market. In the total global environment it is obvious that the attitude of synergy has a big potential in the present in the field of strategical management of cooperation relations of corporations. Synergy, synergy effects create competitive benefit by creating of common value if we speak about conditioned (aims) or unconditioned (added effects) of expectation which depend on concrete case. From the complex qualitative analysis of individual cases of cooperation it is important to point out on its important output.

- Delimitation of cooperation relation – The aim of cooperation (Mission. Aims. Common strategy.)

- Provision of cooperation in mutually created environment – Provision of environment (Development and growing of members. Creating the attractiveness of members. Gaining the information. Spreading the knowledge.)

- Support of mutual cooperation – Creating the relations (Following the contacts. Categorization. Long-term partnerships.)

- Cooperation relation built on assimilations (to a certain extent) – Acceptation of culture (Outward environment. Internal environment. Mutuality and unification of cultures. Effective and creative environment.)

- Cooperation relation built on common values – Sharing the same values in partnership (Trust. Reciprocity. Loyalty. Mutual reversible cooperation.)

- Cooperation based on development of ĽP and reversible interaction – Effective cooperation (work) with human potential. (Mutual interaction. Experience. Education. Motivation.)

- Cooperation relation based on individual rights for all participants on a certain place – Observance of legislation (Restriction and possibilities on a certain place)

- Common cooperation of various subjects on delimited places – Creation of common mutual resolution (Combination and sharing the resources. Reconciliation. Creation of background. Connectivity. Dividing tasks. Common organization. Flexibility. Integration.)

Identified elements have a big impact on widening the partnership relationships in cooperation organization forms. Strategy management of cooperation organization forms needs to gain full potential of cooperation. The full potential is not only fulfilling the expectations and aims but it is also opening the new possibilities – synergy in cooperation relations or creating the synergy effect (expected or unexpected added value). Strategy management of corporation is a tool which can provide filling the long term aims and intentions. Groups of corporations nowadays, such as various cooperation groups (networks, clusters, alliances, fusions and others) show us the need of stability of cooperation relations not only on a long-term cooperation but also with the intention of creating synergy which creates conditioned or unconditioned synergy effects. Identified common synergy effects introduce areas in which it is possible to reach common synergy effects however throughout previously delimited elements of cooperation strategy.

Higher competitiveness which is characteristic by stronger position within the place in which subjects cooperate and compete for example: in the form of bargaining power, wider product portfolio,

- Gaining higher level of expertise in abilities, knowledge and skills of individual subjects of cooperation relation.

- Creating new partnerships, which bring reversible advantageous common results and synergy effects.

- Creating new solutions in many fields and common creations (new added value) for example: products, services, innovations, various departments and centres (controlling, training), distribution opportunities and job vacancies,

- Growing performances in economic factors, for instance: employment, market share, takings, sale support, growth of customers, income, energy saving and costs, growth of production,
- Gaining of positive acceptance and change of culture of participate subjects.
- Combination of resources within cooperating subjects and their interacting place.
- Growing loyalty of customers by which help sustainability of common business is gained for example, by increasing awareness.
- Development and growth of individual subjects of cooperation.

Mentioned synergy fields show where it is possible to find synergy and synergy effects. On one hand in given examples we can see how synergies were created, on the other hand there were some certain barriers created. Synergy in individual areas did not have only positive effect and positive results, but it also depicted on possible parasitizing, disadvantage of second side or bad results. In the research it is learned that synergies depend on characteristic interactive elements, processes, features and resources (tangible and impalpable) through which they can be realized. On the basis of results it is important to add that creating synergy can have conditioned or unconditioned effects. Thanks to it corporations can use shared environment (advantages) but mutually compete and prosper. Second area are partnerships or strategy alliances which have the purpose to activate synergy effects in the combination of resources, lowering takings, filling in individual activities, growing performances and other effects. New trend of cooperation is looking for the fact how to maximize effectivity and profits. On the one hand the corporations create cooperation connections, on the other hand they compete – create competitive alliances.

Proposal Model of New cooperation strategy based on synergy effect

Discovering and learning elements of cooperation strategy in front of sustainable cooperation and emerge synergy effect as base for successful and strong cooperation has strongly importance of these days.

We can certainly show on many successful and failure cooperation connections. The question is: what is standing in the background of this cooperation? Within the chosen successful cases we can depict many common elements which were by the strategic management of created cooperation important for gaining the final wanted effect. Each cooperation act is created on the basis of some certain stimuli. It can be internal or external stimuli. The stimuli of cooperation can be also the intention, the answer for the question: Why do we need to cooperate? The most common stimuli come from:

- Absenting area in which its members could create solutions, mutually help each other and involved their effect (to go forward). Solving the problem.
- Creating new one

Interacting area on the picture emphasizes the connection of two elements, home and foreign market. Globalization enlarges opportunities of cooperation. It is not only about internal relations of corporations but it is about more intervening of external, foreign environment. The importance of interacted environment is needed to be seen in the:

- Less delimited conditions for creating common business relations in two ways:

1 Creating of culture of shared values and mutual acceptance of various cultural features.

2 Newly created conditions of cooperation areas show 6 important elements which relate to: legal and legislative conditions on a certain area, interconnection of cultures of participants, sharing the values of participants, creating the relations, work with human potential and provision of environment in which they will be working together.

All the above mentioned solutions create new dynamic environment. Creating the common strategy solution is based on unity of cooperation participants in those solutions and mutual reversible interaction.

Fig. 1: Proposal Model of New cooperation strategy within the key aspects of cooperation strategy

Identified elements (see Figure 1) have a big impact on creating the synergy effects throughout the common cooperation strategy and so common strategy solution (management). In order to cooperation strategy gained its full potential by creating synergy effects it is important to join the formation of common strategy and later create synergy in expected and unexpected areas. By this step new common solution will be created which will support the added value of cooperation relation of many elements of environment.

Cooperation environment which is about application of strategy management is influenced by internal and external environment and vice versa. The changes held in the present influence all the market environments. Information about strategy depicted the importance of chosen basic elements of strategy management which are important within the gaining the aims and so management of

corporations or group of corporations. Each management is based on certain solutions which are presented by the grade of cooperation, measure of sharing information, experience, knowledge, know-how and others. Management also results from the analysis of history, current environment and prediction of future. Strategy management is the mean by the help of which we can provide long term management of interaction relations within cooperation environment. The important element by the help of which strategy management is able to adapt during the change of external or internal area of corporation and it also can use the opportunities which lowers the risk of threats. It is important to see the strategy access as a wide part of possibilities for solving certain problems and aims, creating new solutions, provision of competitiveness and impact on the market.

Model of simplified strategy management which is needed to be kept for gaining the creation and holding the synergy and synergy effect makes its main components in the meaning of:

- External environment, its changes influence not only cooperation environment but also strategy management, observing and creation of synergy effects.
- Cooperation environment in which are main researched objects, it is internal environment which is important to be managed appropriately in order to gain synergy effect.
- Chosen steps of strategy management represent the sequence of activities which are needed for application of certain management framework in cooperation environment for observing and gaining synergy effect.
- Creation and observance of the synergy and synergy effect is secured by applying the right (effective) strategy management –cooperation strategy, choosing the right components of management. Those components can differ depending on internal and external cooperation environment. It is inevitable to come from the condition of uniqueness of each subject, its relations, current environment and changes affecting the creation and implementation of chosen strategy.

Conclusion

Corporation is needed to be prepared for the future time which is characteristic by being unrecognizable future but from the point of view of current changes in business it is inevitable to predict the future development, potential areas of growth and direction of corporation needs. One of those ways how to prepare for the future is not only to react on the occurrence of changes but also to sign cooperation relations which have synergy potential and can create synergy effects – it is the cooperation strategy.

In this point there is very important optimization of cooperation relations and it is shown in the field of cooperation strategy – strategy management of cooperation organization forms. Strategy management is needed to be seen as a specific strategy processes aimed on activities which come from corporation intentions. Strategy thinking of managers is needed to be lead in intentions of a current global environment which is characterized by dynamics of changes and increasing number of mutually influencing interactions on the market and in the internal area of corporation. Newly created conditions of cooperation areas show 6 important elements which relate to: legal and legislative conditions on a certain area, interconnection of cultures of participants, sharing the values of participants, creating the relations, work with human potential and provision of environment in which they will be working together.

Identified elements of strategy management of cooperation organization forms: The aim of cooperation, Provision of environment, Acceptation of culture, Sharing the same values in partnership, Effective cooperation (work) with human potential, Observance of legislation, Creation of common mutual resolution have a big impact on creating the synergy effects throughout the common cooperation strategy and so common strategy solution (management). In order to

cooperation strategy gained its full potential by creating synergy effects it is important to join the formation of common strategy and later create synergy in expected and unexpected areas. By this step new common solution will be created which will support the added value of cooperation relation of many elements of environment.

Groups of corporations nowadays, such as various cooperation groups (networks, clusters, alliances, fusions and others) show us the need of stability of cooperation relations not only on a long-term cooperation but also with the intention of creating synergy which creates conditioned or unconditioned synergy effects. Identified common synergy effects introduce areas in which it is possible to reach common synergy effects however throughout previously delimited elements of cooperation strategy. The most important area is the area of coexistence of competitiveness and cooperation.

Many connections of corporations are spreading nowadays because of the globalization phenomena. That is why it is more difficult to lead and it is important to find correct cooperation connections with the correct corporations in the right time for creating the synergy from which synergy effects are created. This innovation of managers thinking is important for right understanding and setting the strategy thinking of cooperation organization forms.

Abstract

Tourism is a multifaceted and geographically complex activity, with tourism increasingly creating new (and different) market segments with different individual interests. These segments are characterized by the motivations that make them travel and, in turn, by the differentiation of the existing offer. On the other hand, and in a recent tourist segment, geotourism, geotourists seek to enjoy contact with nature, perform sports activities and acquire authentic experiences. The present study aims to explore how this niche has developed, so it will be presented a contextualization of the concepts that are related to geotourism. Therefore, initially an approach to geodiversity and Geoconservation will be made (essential elements of this type of tourism) that will help to better understand the concept of geotourism, followed by a trip to the geosites that will end in the geoparks. Like companies, tourist destinations can also develop their own brands, becoming increasingly different and competitive destinations. Thus, this study aims to better understand the role of marketing applied to places and territories as a contribution to the tourist segmentation. In particular, a conceptual model is proposed to be tested empirically in geotourism contexts. In the end, some limitations and lines of investigation for the future will be

presented. In an interdisciplinary perspective, this study presents inputs from the perspective of tourism and marketing (segmentation and consumer behavior of geotourism).

Keywords: Geoconservation, Geopark, Geosite, Geotourism, Niche Tourism

Introduction

Niche tourism has been asserting itself in recent decades and is strongly associated with the theory of niche marketing (Sousa, 2014). In this sense, and as an example, geotourism has recently been considered a leisure activity. Geodiversity is the variety of elements and processes related to the abiotic elements of nature. Landscapes, rocks, minerals, fossils and soils are some examples that form the basis of life on Earth. According to Gray (2004), it began to be used by geologists and geomorphologists in the 90s, serving to describe the variety of the abiotic environment, as it is a recent term. This form of natural tourism that focuses on landscape and geology (Newsome and Dowling, 2010) is spread across the world. Honduras was the first country to make Geotourism its national tourism strategy. According to López and Salazar (2008), Geotourism aims to promote and develop sustainable communities with economic deficits through the use and protection of their Geological Heritage as a high quality tourist resource. For this niche to reach a greater number of tourists and be successful, it is necessary, according to Pforr and Megerle (2006), the establishment of communication networks alongside the appropriate exchange of information.

In parallel, and according to Sousa, Malheiro and Veloso (2019), management and territorial identity is the vital element on which a city or region is defined, and thus intends to measure, manage and to develop a distinct image of the place in order to satisfy its interests by creating a positive international reputation (Blair, Kung, Shieh, & Chen, 2014; Ferreira et al., 2019). Territorial marketing managers should increasingly focus on establishing places as brands and promoting them to their different target audiences, through a good territorial branding strategy (Rola, Malheiro & Sousa, 2018). In terms of strategic planning and brand management, it is important to define the nature of a destination in all its aspects so that the conditions necessary for the success of the marketing strategy defined for geotourism and positioning of geoparks can be pre-conceived. Thus, and in an interdisciplinary perspective (i.e. marketing and tourism), the present study intends to bring an exploratory contribution to geotourism and geoparks. In particular, it will be in the interest of the research to empirically test the conceptual model proposed here by the authors (e.g. in specific geotourism and geoparks contexts).

Geodiversity and Geotourism

The concern with the environment mobilizes the global market, which affects organizations that want to continue in the current business market, however, it is essential to add social responsibility, the economic situation and sustainability to provide services and products required by consumers and the green marketing and geotourism appears as a tool that can facilitate and inform the issues that are decisive for conscious consumption (Peneda de Oliveira & Sousa, 2020). The term Green Marketing came up in the year 1970, when AMA discussed the impacts of marketing on the environment. At that time, the term was defined as the "study of the positive and negative aspects of marketing activities in relation to pollution, energy depletion and non-renewable resources."

Tourism is an example, assuming itself as a multifaceted and geographically complex activity, with tourism increasingly creating new (and different) market segments with different individual interests (Sousa & Simões, 2010). In this sense, the term niche, from a marketing perspective, refers to two interrelated key ideas: that there is a place in the market for the product, and that there is an audience for that same product. This refers to a specific product capable of keeping up with the needs of a specific market segment (Sousa et al., 2019). Therefore, one should not look at the market in a simplistic and homogeneous way, since it represents a set of individuals with specific characteristics and needs.

geodiversity is the variety of elements and processes related to the abiotic elements of nature. Landscapes, rocks, minerals, fossils and soils are some examples that form the basis of life on Earth.

According to Gray (2004), it began to be used by geologists and geomorphologists in the 90s, serving to describe the variety of the abiotic environment, as it is a recent term. Stanley (2000) describes "The variety of geological environments, phenomena and active processes that give rise to landscapes, rocks, minerals, fossils, soils and other deposits that are the support for life on Earth", that is, this is the " stage "where we talk about biodiversity, later called geodiversity. Examples that mark geodiversity over biodiversity are the nesting of certain birds, such as eagles, and several birds from coastal regions, occurring on cliffs. Experienced geologists use the vegetation cover as a whole to identify the soil and the source rock, so this knowledge can be used for geological interpretation with intrinsic, cultural, aesthetic, economic, functional and scientific values.

Geoconservation is the enjoyment, conscious use and protection of geodiversity resources. Leopold (1993), in the middle of the 20th century, considers that "Conservation is a state of harmony between men and the land. By "earth" I mean all things about, above, or within the Earth. " Sharples (2002), on a case of geoconservation explains that "geoconservation aims to preserve the natural diversity (or geodiversity) of significant aspects and geological (substrate), geomorphological (landscape forms) and soil aspects, by maintaining natural evolution those aspects and processes ". To understand geoconservation it is necessary to apply common sense with the use of natural resources, therefore, humanity defines itself in one word: "to live", otherwise, to promote the conservation of specific places. For this reason, conservation requires investment and intends to evaluate, select, prioritize and measure the geoconservation initiatives themselves. Thus, the component is subjective, allowing to decrease the degree of subjectivity of the decision.

Heritage protection takes place through conservation or preservation, that is, preservation considers that for effective protection, heritage must be intact. For Barretto (1999), preservation is a form of protection, leading to the destruction of heritage, due to the lack of financial conditions for restoration and / or maintenance works. On the other hand, conservation understands that the heritage results from changes and shows the testimony of a specific time and adapts over time. For Pellegrini (2000), conservation is "Giving natural and cultural goods a convenient function, with appropriate solutions implying the appropriate use of nature and cultural attractions, however, avoiding or minimizing the damage to them or their loss. ", that is, the geological heritage is classified as a natural heritage, being subject to natural dynamics, leading to incessant modification. The concept of conservation for Thomas (1988), in relation to the 18th century, considers that "human civilization" refers to the conquest of nature. For example, England is characterized by a high dependence on natural resources, such as work, food, clothing or transportation. Sharples (2002) attributes the following main geoconservation objectives: to conserve and ensure the maintenance of geodiversity; protect and maintain the integrity of sites with relevance in terms of geoconservation; minimize the adverse impacts of important sites in terms of geoconservation; interpret geodiversity for visitors to protected areas and contribute to the maintenance of biodiversity and ecological processes dependent on geodiversity. On the other hand, the conservation of geodiversity is divided into three categories of values, being intrinsic or existence values; ecological values; and equity values (Sharples, 2002). The intrinsic value means that the geological heritage justifies the conservation and maintenance of its integrity; ecological value, according to Pereira (2004), is related to the importance of geodiversity for maintaining biological processes; the patrimonial value associates the need to conserve any type of heritage, encompassing the geological for the benefit of humanity.

Geotourism and Geosites

Planet Earth stands out from the rest of the planets in the solar system, not only because it allows for the existence of human life, but because it is also full of unique landscapes and unparalleled places of authentic nature. In the 19th century, tourists began to gain interest in visiting landscapes linked to geology, however, it was only in the late eighties of the past century that the approach to Geotourism began to be developed, in the United Kingdom. The problems of loss of mines and quarries for insensitive purposes and recovery plans, as well as the natural geological exposures that were being lost due to the lack of development and construction of infrastructure, were the main factors that led to the development of this niche (Hose, 2011). In Europe, the same concern led to the creation of the European Association for the Conservation of Geological Heritage (ProGEO), in 1993, whose main

objective is to promote geoconservation, as well as the protection of sites and landscapes of geological interest (Geotopes).

Just as geodiversity has developed as an abiotic equivalent to biodiversity, in recent years Geotourism has become a very popular segment alongside Ecotourism (Gray, 2008). Although some authors consider Geotourism to be an aspect of ecotourism, some argue that the former is an expanding segment of its own (Jorge and Guerra, 2016). Ecotourism is essentially based on aspects related to the biodiversity of tourist destinations, while Geotourism has some advantages over "traditional" ecotourism. According to Brilha (2005), Geotourism represents an active attraction throughout the year (it is not seasonal) and does not depend on the habits of the fauna. It is an alternative for those who want to escape overcrowded places, ending up complementing the offer in tourist areas and promoting local geodiversity crafts. Some authors like Robinson and Roots (2008) claim that Geotourism is more "eco-friendly" than ecotourism.

There is no concrete definition of Geotourism, however, several authors try to explain this term. Thomas Hose (1995) presented as the first explanation of Geotourism, the "provision of interpretive and service facilities that allow tourists to acquire knowledge and understanding of the geology and geomorphology of a place (including its contribution to the development of Earth sciences)), in addition to the level of aesthetic appreciation '. Subsequently, Hose (2011) reformulated this definition, then including the terms «geosites and geomorphosites, as well as their comprehensive topography, together with their associated in situ and ex situ artifacts, for the construction of components for conservation, generating appreciation , learning and searching for and for present and future generations ». It was then intended that access to geosites and geomorphological spaces be opened and maintained, through the development of sustainable products and services. Hose's original definition (1995) and the approach around it were accepted by UNESCO in its initial documentation on geoparks (Patzack and Eder, 1998; UNESCO, 2000), which should support the development of modern geoparks. Also Dowling and Newsome (2010) updated a definition that they had already exposed in 2006, stating that this tourism niche "promotes geosites, the conservation of geodiversity and a knowledge of earth sciences through appreciation and learning. This is achieved through independent visits to geological features, the use of geo-trails and points of view, guided tours, geo-activities and sponsorship of geo-site visitor centers».

A successful geotourism strategy is only possible with the knowledge of the target audience, so knowing the habits and motivations of geotourists becomes essential. According to Hose (2000), geotourists can be considered dedicated, when they choose to visit a place of geological and geomorphological interest, or exhibitions, for profit or for pleasure; casual, when visiting places of geological and geomorphological interest only for pleasure and intellectual stimulation. After carrying out some studies in the United Kingdom, Hose characterizes the "average geotourist" as an individual who visits, most of the time, a geosite casually, who has no experience of working in the field and therefore cannot "read the maps". He is usually over 30 years old, travels in small groups of friends or family and his "reading ability" is average. This tourist is not always familiar with the topic of geoconservation, nor well prepared in terms of footwear and prefers to keep a distance close to the vehicle. As for behavior, geotourists tend to observe the interpretive panels for a short period of time, and some may ignore them. The attention paid to interpretive panels on Geology is low, however, the interpretation activities in which there may be direct interaction and visits and field trips with expert guides captivate geotourists more. The knowledge of these characteristics helps to create a strategy to disseminate and understand the Geological Heritage, and it is necessary to recognize the existence of different profiles of geotourists.

One of the advantages of this type of tourism is the fact that it encourages knowledge of the environment from a geological education, causing an awareness in the population in relation to the Geological Heritage. However, Geotourism can cause some negative impacts, such as damage to geological sites (resulting from their excessive or incorrect use), modification of environmental conditions (Carcavilla et al. (2007)), vandalism and illegal removal of articles such as fossils and minerals. However, as it is a growing niche, the impacts are not yet fully understood or calculated (Dowling and Newsome, 2006). With regard to the term of Geosite, this applies to elements of the Geological Heritage that constitute an occurrence of recognized scientific value, in view of the rest of

the environment, however, it may present more than one type of importance, namely didactic, cultural or aesthetics. The geological heritage comprises the natural occurrences of elements of geodiversity - the geosites - which have exceptional scientific value. These are places where minerals, rocks, fossils, soils or geoforms have their own characteristics that allow us to know the geological history of our planet. Geosites, in addition to having a scientific value, can also have an educational and tourist value, whose sustained use must be promoted for the benefit of society.

UNESCO Geoparks and Geoparks Network

We can understand how Geopark is a territorial area with clearly defined limits, which includes a notable heritage known for its richness and geological interest, usually associated with a sustainable development strategy. Associated with this concept, a Geopark should have a defined set of sites of international, national and / or regional importance, which make it possible to tell and learn about the geological history of the region. The geosites that are also inserted in the geoparks are points of geological interest with scientific, aesthetic, educational or economic value.

A geopark should also highlight the protection and dissemination of the archaeological, ecological, historical and cultural values of the region and always look for their sustainability. According to this panorama, geoparks started at a meeting held in June 2000 in Greece, organized by representatives of four initiatives that promoted the conservation of geological heritage and sustainable development in Europe. This meeting gave rise to the creation of the European Geoparks Network (REG), with the first geoparks in Europe (MC Keever; Zouros, 2005). This sustainable development strategy that must focus on geoparks is based on three main elements, geoconservation, education and geotourism. Geotourism tends to stimulate the creation of economic activities based on the geodiversity of the region, involving the local community and making known to those who visit us the best that the geopark and the region where it may be inserted contains.

When talking about geotourism or geoparks, it is necessary to approach the World Geoparks Network, which today is known as a pioneer and investor in this theme (Liberato, Bernardo & Liberato, 2019). This was established in 2004 through a partnership between UNESCO and the International Union of Geological Sciences. It aims to distinguish natural areas with high geological value, in which a sustainable development strategy based on geology and other natural or human values is being executed.

UNESCO also defined its own concept of Geoparks, according to which they are: “Unified geographical areas where sites and landscapes of international geological relevance are managed based on a holistic concept of protection, education and sustainable development. Its approach combines conservation with sustainable development that at the same time involves local communities and visitors. ” According to UNESCO, the list of geoparks worldwide already has 127 geoparks in 35 different countries, and in Portugal there are 4 (Geopark Terras de Cavaleiros, Geopark Arouca, Geopark Naturtejo and Geopark of the Azores). These should show the geological heritage of international relevance. Despite this, its purpose is to explore, develop and celebrate the relationship between this geological heritage and all other natural, cultural and immaterial heritage aspects of the area. The European Geoparks Network (REG) created in the year 2000, and which currently has 69 Geoparks, has as main objective the sharing between Geoparks of strategies and common good practices for environmental preservation and tourism development. In 2006, Portugal constituted the lists of the European and Global Geoparks Networks, with the Geopark Naturtejo da Meseta Meridional, followed by the entry of Geopark Arouca in 2009 and Geopark Azores in 2013, as mentioned above and lastly the Geopark of Knight's Lands. There are currently 120 geoparks that are part of the Global and European Geoparks Networks.

Conceptual Model Proposed

Preliminary research was conducted in order to develop the research instrument. Details of the preliminary research are given below. After the collection of the preliminary data, empirical data would be collected through fieldwork. This study discusses the increasing phenomena of geotourism and the relationship marketing perspective associated to specific tourism contexts. Based in the literature

review, we propose a model that connects the relationship marketing dimensions (i.e. commitment, trust and cooperation) with the consequent satisfaction with geotourism and the behavioural intention of repeating the experience or reinforcing the experience with a niche marketing and niche tourism perspective. Several studies in marketing and tourism contexts have discussed the association relationship marketing to the site and consumer purchasing behaviour, including the study of satisfaction, loyalty or quality of service (Sousa & Alves, 2019). An extensive review of the current literature reveals that no integrated theoretical framework for the holistic study of the niche tourism industry exists. The proposed research model not only has implications for future research, but also provides useful information for practitioners in the geotourism. Several studies have shown that more brand commitment and brand trust leads to more positive satisfaction behaviour. According to Sousa and Alves, 2019 commitment is the necessary condition of loyalty. The investigations into the brand's engagement relationship have found that commitment plays a central role in predicting brand loyalty. Other studies postulate that more commitment leads to positive loyalty behavior (Amine, 1998). The correlation between trust, commitment, cooperation and satisfaction is also a well-studied area, being supported by the literature (Lin & Wang, 2006). The credibility and integrity components of brand trust appear to be predictors of brand loyalty. To reclaim loyalty and achieve success, companies should pay more attention to consumer relationships and, in that way, gain trust. The literature highlights that satisfaction tends to favour the development of behavioural loyalty. These results are particularly evident in tourism contexts, as the example of the importance of satisfaction in revisiting or recommendation family or friends (Bigné et al., 2005; Prayag, 2008). This aspect was corroborated in our empirical study. Based on this discussion, we propose that, in a context of geotourism, the increase in trust, cooperation and commitment facilitates the development of behavioural satisfaction and loyalty. The proposed model is presented in figure 1. Hence we propose that: P1: cooperation has a positive effect on satisfaction of geotourism; P2: commitment has a positive effect on satisfaction of geotourism; P3: trust has a positive effect on satisfaction of geotourism; P4: Satisfaction has a positive effect on the geotourist.

Final Considerations and Future Research

Geotourism is an area still growing. It is essential to relate this niche with the concepts of Geoconservation and Geodiversity, since they correspond, respectively, to the actions implemented with the purpose of preserving geodiversity and geological heritage and to the variety of geological environments or landscape formation processes through rocks, minerals , fossils, among others.

Geotourism aims to provide tourists with the opportunity to get involved with the environment, in order to acquire geological and geomorphological knowledge and experience activities.

To complement this segment, points of specific geological interest have emerged, that is, Geosites, which have great value at various levels and require an assessment to receive this title. These Geosites are generally inserted in Geoparks - places whose geological heritage is recognized and where sustainable development strategies generally exist. Although there are four geoparks in Portugal, the Terras de Cavaleiros Geopark, which is part of the Global Network and European Network of Geoparks, was approached. After a brief exploration of this place, it is concluded that foreign tourists are the ones who visit it most, so a bigger promotion must be made at national level to make the Portuguese known, what the country has to offer. Now, in an exploratory logic, the present manuscript seeks to present some insights so that in the future it will be possible to establish causal relationships between the study variables presented here. In our understanding, it is an instrument to assist all those who directly or indirectly work in territorial management and marketing, namely in specific segments of geotourism and geosites. In an interdisciplinary perspective, this study presents contributions to tourism, marketing and local development. Future studies should, however, allow the empirical testing of the conceptual model presented here (administration of surveys by questionnaire to geotourists and subsequent treatment of data using the structural equation models with the AMOS software), also using the focus group methodology in a attempt to analyze and understand the point of view of different stakeholders in the territory (ie residents, businessmen, politicians, tourism agents).

Abstract

This study investigates the influence of external factors environment, such as government regulations, access to finance, and access to infrastructure on the performance of Small and Medium Enterprises (SMEs). The sample used for this study comprises 152 SMEs, and they were given a three-section survey questionnaire. Normality tests, correlation, and regression analysis were employed for data analysis. The findings indicate that access to finance and infrastructure has a significant positive influence. Meanwhile, government regulation and policy have no significant influence on SMEs' performance. These findings may add to the literature about the importance of some external factors in influencing the SMEs' performance, especially for developing countries. The results may also assist the government, policymakers, and SME agencies in searching for a progressive and inclusive approach from the explicit factors environment to strengthen the performance of SMEs. Additionally, this study also discusses several recommendations and limitations for consideration in future research.

Keywords: Access to finance, government policy, infrastructure, performance, small and medium enterprises.

Introduction

Among all types of business entities, the roles of Small and Medium Enterprises (SMEs) in contributing to the economy of most nations, including Malaysia, have grown through resources optimisation, reduction in the number of unemployment, entrepreneurship activities promotion, wealth creation (Umar & Hashim, 2017), and also the initiation of multinational and big corporations development (Madanchian, Hussein, Noordin, & Taherdoost, 2015; Mat Dangi, Ismail, Johari, & Md. Noor, 2017). SMEs can be established in any form of business activities, and usually operated by owners or co-owners with a small market share (Chin & Lim, 2018). Technically, SMEs in Malaysia are governed by SME Corporation Malaysia (SME Corp.), one of the government agencies responsible for formulating policies and strategies for SMEs, as well as coordinating various programmes for SME development. There are two main sectors of SMEs in Malaysia, which are 1) manufacturing and 2) services and other sectors, including construction, agriculture, mining, and quarrying, which are categorised into three business types—micro, small, or medium enterprise. The categorisation takes into account the number of employee and sales turnover, as the determinants. For instance, a business entity with a sales turnover of less than RM300,000 and the number of employees of less than five is categorised under micro businesses, which is applicable to both manufacturing and services and other sectors. Meanwhile, the small business category is grounded by sales turnover of more than RM300,000 up to RM15 million, and with employees of five to seventy-five for a manufacturing company. The services and other sectors company can be categorised as a small business if it has a sales turnover of RM300,000 to RM3 million, and the number of employees is from five to thirty persons. On the other hand, a company is categorised as a medium company if its sales turnover is in

the range of RM15 million to RM50 million, or with employees of seventy-five to two hundred for the manufacturing sector, while for services and other sectors, the sales turnover is RM3 million up to RM20 million, or with thirty to seventy-five number of employees.

It is interesting to note that SMEs contributed up to 99.2% of the overall business establishment in Malaysia across all sizes and sectors (Bhuiyan, Said, Ismail, Mohd Jani, & Fie, 2016). According to the Department of Statistic Malaysia (2018), SMEs contribution to the country's GDP increased to 38.3% in 2018 compared to 37.8% in 2017, which amounts to the total GDP of RM1,174.3 billion. This increment of GDP contribution implies that SMEs made a crucial contribution to the nation's economy; in fact, SMEs account for 98.5% of the total business establishment in Malaysia. In addition, SMEs existence facilitates the development of the economy through creativity, innovation, technology advancement, and competitiveness (Abdul Razak, Abdullah, & Ersoy, 2018). With this prominent role, the government of Malaysia has planned numerous programmes that include the access to financing, access to market, technology and innovation, development of human capital, infrastructure, and the legal and regulatory improvement (National Entrepreneur and SME Development Council, 2019). The government has also launched the National Entrepreneurship Policy 2030, which highlights important strategies to upsurge the number of resilient and competitive entrepreneurs as well as to expand the capabilities of SMEs.

With the exceptional role of SMEs in the economy, scholars and practitioners placed a high interest in studying the factors that could influence SMEs' performance in various aspects. This paper focuses on the impact of external factors, particularly government regulation and policies, access to finance, and infrastructure on the performance of SMEs. Although various aspects of the external environment could be taken into account, the external environment is regarded as a critical aspect by some scholars, as it can influence entrepreneurs' motivation and business performance (Machmud & Sidharta, 2016). Besides, some studies suggest that for SMEs to compete effectively in the market, it is imperative to use the external environment as a source of support, in terms of strategic advice and for business growth (Appiah, Possumah, Ahmat, & Sanusi, 2018). Thus, SMEs need to be sensitive to the external environment where they ventured their business as it may influence their decision-making and determine their success. In line with the notion, it is expected that the findings of this study would be invaluable for SMEs and practitioners in identifying the external environment approach that could augment their performance in order to attain success, domestically and internationally.

Literature Review

Generally, the external environment in the business context includes factors that either positively or negatively affect business activities happening outside the company; hence, making it difficult to control (Appiah et al., 2018). Researchers have outlined the numerous factors of external environments, such as government policies, sociocultural, and economic aspects (Munizu, 2010), technological advances, regulatory changes, customer expectations, supplier requirements, increased competition (Banham, 2010), market turbulence, competitive intensity (Wan Mohd Nasir, Al Mamun, & Breen, 2017), and perceived customer benefit and perceived competitive value (Kartiwi, Hussin, Suhaimi, Mohamed Jalaldeen, & Amin, 2018). Mole, North, and Baldock (2017) asserted that for SMEs to compete effectively in their businesses, they need to seek external support and assistance for efficient operational and strategic direction. Among all of these factors, the information about government regulations and tax policies, access to finance, resources, and infrastructure are the crucial determinants that could influence SMEs' performance (Mole et al., 2017; Appiah et al., 2018; lwidiko, Esther, & Baisi, 2019).

Performance of SMEs

Performance can be described as the strategic outcomes that an organisation uses to realise its goals, whether it is attainable or vice versa (Eniola & Entebang, 2015). Performance is repeatedly measured based on the conventional method; for example, sales growth, market share, liquidity return on investment (ROI), and cash flow (Nastasiea & Mironeasa, 2019). However, in the case of SMEs, the performance measurement is more difficult compared to large companies because only a few objective

data can be used to support the relationship between the companies' activities and corporate performance. For instance, when ROI is used to measure performance, it can be easily manipulated (Gáti, 2015). In another view, there is a growing trend of researchers paying great attention on exploring the non-financial aspect, including capital, infrastructure, business network, production and operation, competitiveness, and even market and distribution, as the key performance indicators to gauge SMEs performance (Nastasiea & Mironeasa, 2019), besides the quantitative and financial measurement that has been used extensively (Mat Dangi, Ismail, Saad, & Johari, 2018). Nastasiea and Mironeasa (2019) concluded that the traditional performance measurement that based on financial management had hit its limits; thus, many scholars have shifted to non-traditional indicators, which is based on non-financial strategic and qualitative indicators, methods, and models. Therefore, it is justifiable for this study to include government regulation and policies, access to finance, and access to infrastructure, as the external factors and determinants for measuring the performance of SMEs. Furthermore, the three factors are some of the identified driving forces of Malaysian SME performance, as stated in the SME Masterplan (Chin & Lim, 2018). In this study, monetary measurement using profit will be used to indicate the performance. The following section discusses these variables further and its application in the performance measurement.

Government Regulation & Policies and SMEs Performance

Government regulation and policies associated with SMEs can be described as external policies, which contain the plan of actions, approved and chosen by a group of people, organisation, or political party that fosters the startup and sustainability of entrepreneurship activities (Akinyemi & Adejumo, 2018). From a global perspective, governments worldwide have taken initiatives to encourage entrepreneurship and new firms, including SMEs growth in particular (Pickernell, Atkinson, & Miller, 2015). For instance, the government of the United Kingdom has a policy supporting SMEs' access to resources, such as financial aid (Pickernell et al., 2015), while the government of South Africa is focusing on reducing the gap between the rural SMEs and high-end SMEs by creating an environment where both can succeed (Gopaul & Manley, 2015). Similarly, the Malaysian government also put concerted efforts to nurture the entrepreneurial culture ever since the inception of New Economic Policy (NEP) in 1971, followed by the Industrial Master Plan (IMP) and the establishment of the National SME Development Council, as the policy-making authorities with a strategic function that include all SME of every sector in Malaysia (Wan Mohd Nasir et al., 2017). Studies have documented that government policies, such as financial assistance (Peter et al., 2018), facilitation of infrastructure, nurturing innovativeness and technology (Sharom, Cheng, & Yahya, 2016; Simiyu, Namusonge, & Sakwa, 2016; Nguyen, Van, Bartolacci, & Tran, 2018), registration process, credit policies and tax system (Ndiaye, Abdul Razak, Nagayev, & Ng, 2018; Nyarku & Oduro, 2018) have a significant impact on firm performance. However, several studies also argued that certain government regulations and bureaucratic procedures had become a burden that could hinder SMEs growth, as well as one of the challenges faced by SMEs while doing their business activities and it could affect their viability in the long run (Eniola & Entebang, 2015; Kitching, Hart, & Wilson, 2015; Simiyu et al., 2016; Peck, Jackson, & Mulvey, 2018). Nevertheless, Kitching et al. (2015) asserted that although there are mixed perceptions of government regulations and policies, they are actually a dynamic force; they could be enabling or constraining the performance of SMEs, depending on how they were designed, enforced, implemented, and whether SMEs can exploit those regulations and policies to support their business environment.

Access to Finance and SMEs Performance

Many studies claimed that access to finance is vital for the business since it is functioned as a capital for starting up and running a business (Onyiego, Namusonge, & Waiganjo, 2017). Fanta et al. (2017) explain that access to finance can be viewed from two perspectives, namely the macro-level (access is based on the legal and business environment, and the efficiency of a banking system) and firm-level (factors such as life cycle profile of the firm, age, gender, and educational level of the business owner), which are essential aspects for accessing external financial aid. However, access to finance is also one of the biggest challenges for SMEs because they are facing many problems in obtaining financial assistance (Ullah, Bilal, Hamza, & Iqbal, 2018), and it is ranked as the most significant obstacle to

growth (Onyiego et al., 2017). This scenario is also supported by the World Bank in 2018, who reported that almost 70% of SMEs worldwide are not using external financing from financial institutions, while the rest were underfinanced (Ramalho et al., 2018). Among the reasons for this circumstance are insufficient collateral and high-interest rate (Yoshino & Taghizadeh-Hesary, 2018), macroeconomic instability and competition (Ramalho et al., 2018), and also the character of the owner and the capacity of the finance required (Mohd Ali, Haron, Nik Abdullah, & Abdull Hamid, 2019). Generally, most SMEs financed their operation by internally generated funds, for example, from personal savings, financial assistance from family or friends, and microfinance institution, whereas the amount might be insufficient for the firm to grow and expand (Mohd Ali et al., 2019). Many studies (see Abdullahi, Ghazali, Awang, Mohd Tahir, & Mat Ali @ Salim, 2015; Ibrahim & Mohd Shariff, 2016; Effendi & Yasmin, 2017; Nyanzu & Quaidoo, 2017; Andries, Marcu, Oprea, & Tofan, 2018) acknowledged that the financial aspect has positive and significant impact on the performance of SMEs. This is also recognised by the Organisation for Economic Co-operation and Development (OECD) during their SME ministerial conference 2018, which stated that access to finance is the key to the creation, growth, and productivity of SMEs since it is imperative at all stages of a business life cycle (OECD, 2018).

Access to Infrastructure and SMEs performance

Chin and Lim (2018) stated that infrastructure is essential to support SMEs and entrepreneurs as it provides a conducive environment for business activities. It is the facilities and services needed for the economy to function, which includes the technical structures, such as electricity, water supply, roads, bridges, telecommunications, sewers and other products or services that are crucial in enabling, sustaining, and improving a society living condition (Abdullahi et al., 2015). Generally, the government is the main provider for the infrastructural facilities because of the massive cost of acquiring them (Akinson, 2018). In Malaysia, one of the programmes under the government initiatives for SMEs developed by the National Entrepreneur and SME Development Council (NESDC) is to provide and enhance the infrastructure, which amounts to RM69.2 million in 2018, and RM44.0 million in 2019. The quality of these physical infrastructures is vital in emerging economies, as it is one of the crucial factors for SMEs growth and global opportunities (Organisation for Economic Co-operation Development, 2017). Previous studies (see Abdullahi et al., 2015; Akinyele, Akinyele, & Ajagunna, 2016; Akinson, 2018) confirmed that infrastructures have a significant positive impact on the performance of SMEs in Nigeria due to its major role in ensuring the businesses' operations and activities. In another view, a study by Mohd Khan, Md. Noor, and Anuar (2016) on SMEs in Malaysia found that the sales performance is influenced by the infrastructure facilities, such as electricity, water, and information technology facility. Conversely, poor infrastructure and inadequate facilities would result in the firms bearing the cost of obtaining such services instead of using it to expand their business (Ndiaye et al., 2018). Thus, reflecting the view, this study strongly believed that infrastructure facilities play a vital role in supporting the business operation of SMEs.

Mohd Khan et al. (2016) explain that SMEs' profit within three years of business operation is likely to be influenced by government regulations and policies (such as tax information, market information, rules and regulation), infrastructure facility (such as electricity, water, and information technology) and business support (such as entrepreneurship programme, management expertise, and financial support). Therefore, with the mixed criticisms, different findings of past research, and the importance of the three external elements mentioned in other studies, this research attempts to analyse the significant influence of those factors on SMEs' performance in Malaysia. The findings would be useful for the related parties in determining whether government intermediation through the regulations, finance, and infrastructure enhanced SMEs' performance, which then motivates the firms to excel in the global arena and assists in achieving the socio-economy and welfare aspirations. Thus, based on the view and relevant literature discussion, the following Table 1 presents this study proposed hypotheses:

Table 1: Hypotheses Development

Hypothesis 1 (H1)	There is a significant influence of government regulations and policies on SME performance.
Hypothesis 2 (H2)	There is a significant influence of access to finance on SME performance.
Hypothesis 3 (H3)	There is a significant influence of access to infrastructure on SME performance.

Based on the hypotheses, Figure 1 below reflects the relationship between independent variables and the outcome variable, in which this study believes that SME performance is influenced by government regulations and policies, access to finance, and access to infrastructure.

Figure 1: The framework of association between independent variables and the outcome variable.

Research Methodology

This study intends to investigate the influence of the external factors on SMEs' performance. The random sampling method was used to collect primary data on the performance of firm-year observation. A total of 152 (76%) survey questionnaires were returned and usable from the 200 samples distributed to various states in Malaysia. The structure of the research model used in this study comprised the three independent variables, namely government regulations and policies, access to finance, and access to infrastructure, with SMEs' performance as the dependent variable. The survey questionnaire using the five-point Likert scale is adapted from a combination of instruments by Abdullahi et al. (2015) and Mag (2015) with some modifications to fit the context of this study. The questionnaire is divided into two main sections; Section A contains eight items related to the respondents' demographic profile, while Section B comprises 27 items related to the three external factors and SMEs' performance. Data collected were analysed using Statistical Package for Social Science (SPSS) software to get the descriptive statistical analysis, correlational test, and multivariate analysis as well as normality tests in order to achieve the study's hypotheses and validate the findings.

Additionally, this study also employed the assumption testing to ensure that the model yield from the sample can be accurately applied to the population of interest. Accordingly, the model used to represent the SMEs performance in this study is projected as follows:

Model:

$$\textit{PERFORMANCE} = ß0 + ß1\ (Ext_GRP) + ß2\ (Ext_AF) + ß3\ (Ext_AI) + \varepsilon it$$

Where PERFORMANCE = Performance is measured by monetary performance
(Notes: Ext_GRP = Government Regulations & Policies; Ext_AF = Access to Finance; Ext_AI = Access to Infrastructure)

Results and Findings

This study performed the Kolmogorov-Smirnov (K-S) and Shapiro-Wilk on all items to test the normality in order to meet the regression assumptions, and the result indicated that they are significant ($P<0.05$). On the other hand, the results for the test conducted for homogeneity of variance for all variables show an unequal variance with $p<0.05$. Meanwhile, the multicollinearity and the Variance Inflation Factor (VIF) values were below 10 with the tolerance values of above 0.2; hence, the results implied that there is no collinearity within the data. Next, to certify the reliability and internal consistency of the survey questionnaire used in this study, the reliability analysis was also performed, and the result demonstrated a score of more than 0.85, which means the scale used is good, reliable, and sufficient to gather data for this study.

Demographic Analysis

Most of the respondents in this study (33.1%) have been operating their business within six and ten years, and the majority of them are involved in consumer goods production. For the demographic profile of the respondents, 72 (47.4%) of them aged between 31 and 35 years old, while the gender profile showed male respondents as the majority (65.8%) compared to females (24.2%), and 10% skipped the question. The ethnic group profile indicated that the Chinese have the highest number, with a total of 84 (55.6%) respondents, compared to the Malays, Indian, and other ethnicities. Meanwhile, in terms of educational background, 109 (71.7%) respondents stated bachelor degrees as their highest level of education. Other than that, this study also asked the respondents about their business operation location, where the majority of them (64.2%) claimed the township as the strategic location compared to the city centre, and the district or suburban area. For business operations, on average, most of the SMEs had about 16,000 customers per year, and to fulfil the demands, the number of employees is more than 15 staff with the production of at least 2,000 units per month. In terms of strategies, the result shows that about 55.3% of SMEs in this study introduced at least one new product per year to boost up their sales and maintain business sustainability.

Pearson Correlation Analysis

The result in Table 2 presents the Pearson correlation matrix analysis conducted between variables. The rule of thumb for this analysis can be referred to Sekaran and Bougie (2010), who stated that the result of $0 < /r/ < 0.3$ indicates a weak correlation; $0.3 < /r/ < 0.7$ implies a moderate correlation, while $/r/ > 0.7$ signifies a strong correlation. The results of this study show that Ext_GRP, Ext_AF, and Ext_AI are positively correlated with PERF at 0.379^{**}, 0.749^{**}, and 0.759^{**}, respectively. Likewise, the correlation results among the independent variables of this study were also positive (Ext_GRP and Ext_AF: 0.441^{**}; Ext_GRP and Ext_AI: 0.426^{**}; and Ext_AF and Ext_AI: 0.776^{**}). Therefore, there are no multicollinearity issues, as the values for all variables of this study recorded <0.9, which is within the acceptable range.

Table 2: Pearson Correlation Matrix

		PERF	Ext_GRP	Ext_AF	Ext_AI
PERF	Pearson Correlation	1	$.379^{**}$	$.749^{**}$	$.759^{**}$
	Sig. (2-tailed)		.000	.000	.000
Ext_GRP	Pearson Correlation		1	$.441^{**}$	$.426^{**}$
	Sig. (2-tailed)			.000	.000
Ext_AF	Pearson Correlation			1	$.776^{**}$
	Sig. (2-tailed)				.000
Ext_AI	Pearson Correlation				1
	Sig. (2-tailed)				

Notes: PERF = Performance; Ext_GRP = Government Regulations and Policies; Ext_AF = Access to Finance; Ext_AI = Access to Infrastructure

** Correlation is significant at 0.01 level (2-tailed).

* Correlation is significant at 0.05 level (2-tailed).

Multivariate analysis

This study proceeds with the multiple regression analysis to examine if the external factors, namely government regulations and policies; access to finance; and access to infrastructure, have a significant influence on SMEs' performance. The result is displayed in Table 3 with most of the variables employed are positively significant with the performance of SMEs, as the *p*-value is recorded at 0.000 ($p<.005$), which means that the model of this study is sufficiently developed to determine the influence of external variables on SMEs performance. The resulting yield of the F ratio value is high (87.927), which is also highly significant ($p<.001$); thus, it is safe to say that the model can predict the outcome that the external factors could influence SMEs performance. In order to certify the multicollinearity of this study, the value of VIF was observed, and all variables signify the value below 10 (VIF<10) with a tolerance value of more than 0.1. Therefore, no collinearity within the data used. The coefficient result shows that, Ext_AF (β=0.484, $p<.005$) and Ext_AI (β=0.540, $p<.005$) are significantly associated with SMEs' performance; thus, H2 and H3 are supported. In essence, the variables used in this study can predict 63.3% of the relationship of the outcome variable. The outcome for H2 is parallel with Almansour, Almansour, and Almansour (2019), who claimed that there is a positive and significant association of the financial factors as better access to finance would improve the performance of SMEs. This is also consistent with Nyanzu and Quaidoo (2017) and Fanta et al. (2017), who asserted the importance of financial access in boosting the SMEs' performance since it is required for the growth, expansion, and function of their business. Access to finance is not only imperative for SMEs to operate their business activities but also serves as an enabler for the transition in the economic systems, where economic and environmental performance are reconciled to create value and transact financial assets towards a more sustainable economy (Andries et al., 2018). On the other hand, the significant association between access to infrastructure with SMEs performance, as suggested in H3, is parallel to the findings of Akinson (2018) that infrastructures are vital for SMEs because it provides an enabling environment for the business operations to grow, hence, improving its performance. Furthermore, infrastructures, such as electricity, road, water supply, and the telecommunication system are basic essential services, and SMEs cannot afford most of the infrastructures on their own (Akinyele et al., 2016). Thus, access to these infrastructures provided by the authorities could create a conducive business environment and encourage business activities.

However, for Hypothesis 1, which represents factors of government regulations and policies (Ext_GRP) in SME, it is found that they do not significantly influence the performance of SMEs. This finding is also mentioned in Simiyu et al. (2016), as they discovered that government policy and regulation had no significant influence on the growth or SMEs' performance. Simiyu et al. (2016) explained that this could happen when a bureaucratic regulatory regime exists, which may hinder the growth of business operations and activities. Nevertheless, it also depends on how SMEs accept the regulations or policies, either favourably or unfavourably, and it does not impact all phases of SMEs' decisions and actions (Akinyemi & Adejumo, 2018). In addition, regulations and policies influence SMEs not only by prohibiting or mandating some actions but also stimulating other forms of adaptation issues. For example, regulations and policies could discourage the process of innovation in producing products or services, which could also influence stakeholders' behaviour (Kitching et al., 2015). Consequently, from the analysis, the regression framework can be outlined by switching the β coefficient in Equation 1 as follows:

$$\text{PERFORMANCE} = 3.261 + 0.020\ (\text{Ext_GRP}) + 0.484\ (\text{Ext_AF}) + 0.540\ (\text{Ext_AI}) + \epsilon it$$

Table 3: Regression Results

Variables	Beta Coefficient	Std. Error	t-value	Prob.	Tolerance	VIF
Constant	3.261	.328	9.936	.000		
Ext_GRP	.020	.075	.266	.790	.788	1.269
Ext_AF	.484	.097	4.988	.000**	.383	2.611
Ext_AI	.540	.096	5.631	.000**	.389	2.568
F-statistic	87.927					
p-value	.001					
Adjusted R^2	.633					
Notes: PERF = Performance; Ext_GRP = Government Regulations and Policies; Ext_AF = Access to Finance; Ext_AI = Access to Infrastructure						
** Represent the significant at the 1% level. * Represent the significant at the 5% level.						

Conclusion and Recommendation

This study examined the external factors of an environment, namely government regulations and policies, access to finance, and access to infrastructure, whether they have a significant influence on SMEs' performance. The results indicate that two hypotheses are accepted; access to finance and access to infrastructure are positively significant and could influence SMEs' performance. These findings imply that there is a dire need to maintain financial assistance and infrastructures to support the economic growth of SMEs in Malaysia, as the findings suggest a significant influence of the two variables on SMEs' performance. Conversely, the variable of government regulations and policies have no significant influence on the performance of SMEs. This might be because this factor can be a dynamic force as it could simultaneously act as an enabler and restrictor to performance. These effects may have a different consequence on a different level of SMEs and how it is perceived by the owner of SMEs, suppliers, customers, and other stakeholders. Therefore, it is suggested that future research should explore this issue more in particular to determine the impact of government regulations and policies on SMEs' performance or acceptance from different perspectives and the reason behind these findings as well. Such an effort is imperative to identify whether the current policies and regulations should be revamped or revised to cater to the specific needs of the SMEs and to enhance their overall performance.

This study also identified some limitations; firstly, it pertains to the sample size, which is limited in terms of the total population. Future studies may include a larger and broader range of samples to acquire more information and robust findings between regions. Secondly, the external factors used in this study only covers three variables. Alternatively, research in the future could explore other factors, such as competition, technological changes, customers, country's economy trend, market conditions, and labour market, to get a better understanding of the various external factors that could influence SMEs' performance.

Based on the findings of this study, policymakers should take into account any initiative that could create an environment that allows for continuous access to finance and conducive infrastructure to boosts up the economic growth among SMEs to a larger scale. Nevertheless, this study contributes greatly to the literature. It also hopes to assist government institutions and SME agencies in looking for a progressive and inclusive approach for the improvement of SMEs' development.

Agile-Methods as A Managerial Instrument in Education

Alexander OBYDENOV

Financial University under the Government of the Russian Federation, Moscow, Russia,
alexander.obydenov@gmail.com

Abstract

The scope of Agile-methods application is growing substantially . And educational sector is not being left out. We can establish at least two aspects of applying Agile-methods in education – (1) in the students' educational process itself and (2) in the management system of educational institutions. When we are applying Agile-methods as a managerial instrument in education, we can use Agile transformation framework. In that case not only we are able to diagnose the problematic areas (bottlenecks) in the educational institution's management, but discover possible ways of solving these issues.

Keywords: Agile, Management, Education Organization

Introduction

For the most part, appliance of Agile-methods in education has started due to their successful usage in team management in the software development field, which has been followed by the willingness of many researchers to adapt these methods to the educational sector (Dewi, Muniandy, 2014). However, that adaptation is mostly happening within the context of improvement of the schooling methods (Salza, Musmarra, Ferrucci, 2019). Thus, an adaptation of one of the most demanded, in terms of practical use, framework of the Agile – Scrum (Schwaber, Sutherland, 2011) to the educational sector, has led to an invention of a new method - "eduScrum" (Delhij, van Solingenm Wijnands, 2015). Yet still, Agile-methods are, first of all, managerial instruments, which is why we have made an attempt to apply them precisely to the management system of one of the educational institutions.

Main Part

One of the most interesting approaches to the analysis and development of the organization administration systems is Agile transformation framework (Spayd, Madore, 2020). Let us recall, that this framework suggests a reviewal of the four levels of corporate management development within four quadrants: I (leadership and mindset), IT (behavior and intention), ITS (organization design) and WE (organization culture); where each level has a color appointed to it – amber, orange, green or teal, in a manner similar to that of the spiral dynamics (Beck, Cowan, 2005).

After conducting an analysis of one of the russian higher education establishments, we have arrived to the following conclusions.

Within the I (leadership and mindset) quadrant, the organizational leader is an "achiever" (orange level), as he is constantly striving to improve the employees' performance indicators, by applying a system of financial rewards. A good method for an upward transition in that case is Sahota's bubble model (Sahota, 2012), where certain employees are able to utilize a "catalyst" approach (green level), or even a "co-creator" approach (teal level). In which case, employees must set up certain connectors – external behavioral features, that imitate fulfillment of the organization's "rules of the game"[1] and

[1] For more information on the implication of the "rules of the game" in management see (Obydenov, 2016; 2018).

are performance level oriented, consciously investing their time and cognitive resources to set these connectors up.

Within the IT (behavior and intention) quadrant, the organization is on the "goals" (orange) level and is marketing oriented, stimulating potential students to enroll in that particular higher education establishment. However, certain departments are demonstrating a higher level – "organization" or even "vision" (teal level), where one of the main goals of the education is consistently forming new thinking skills in students. Consequently, we'd recommend giving more freedom and responsibility in decision-making to these departments in that case.

Within the ITS (organization design) quadrant the organization is more or less on the "hierarchy" (amber) level, mostly focused on the bureaucratic side of the organization, exercising the maintenance function of the core business (education and scientific research). Although, it is fair to say that the scientist-employees are on the "team" (green) level, because that organization design allows them to fulfill their duties. Recommendations – to define more exactly and set up the value chain and transform the organization design of that higher education establishment accordingly.

And finally, within the WE (organization culture) quadrant, the "conformistic" (amber) level is being implemented in the organization, where most employees are forced to follow the "achiever" rules based on their performance levels, and not actually incorporating this culture within themselves or feeling strongly about it. At the same time they are applying such strategies, that would maximize their performance indicators. Our recommendation is that the scientist-employees set up a pool of trans-organizational agencies akin to labor unions, that could determine the new set of "rules of the game" in the future, correspondent with the "pluralistic" (green level) or even "evolutional" (teal level) organization culture.

It is worth noting that in certain departments of this educational institution such management methods are being implemented, that are relevant to the complex systems, where the truth criterion and the department buildup are dictated by exploratory experiment, which is consistent with scientific tradition and is in complete accordance with the David Snowden's complexity concept (Kurtz, Snowden 2003).

Conclusion

We were the first to apply Agile transformation framework to an educational institution. Our research allowed us to structurize characteristic aspects and determine main problematic areas in one particular educational institution's management. On top of that, we were able to formulate a set of recommendations for the transformation of the management system in that institution: application of the Sahota's bubble model; delegating more freedom and responsibility in the decision-making to the departments; organization design optimization based on a more defined value chain; creation of trans-organizational agencies by the scientist-employees akin to labor unions.

Bogna KONODYBA-RORAT

Czestochowa University of Technology, Czestochowa, Poland, b.konodyba-rorat@pcz.pl

Abstract

The subject of this paper is time management in a group of students. The paper explained the meaning of the concept of time management and presented techniques and methods for effective time management. It pointed to various traps that lead to making mistakes, resulting in the waste of precious time. The paper described the authors' own research on the level of knowledge about time management and the knowledge of and ability to apply time management methods within a study group. The research tool was a survey questionnaire composed of 21 questions. The research was conducted among random 132 working and non-working students. The analysis of the survey results showed that the students surveyed were not familiar with the concept or techniques of time management, but employed such techniques unconsciously. Detailed data analysis did not reveal significant differences between working and non-working students in terms of the knowledge about time management and effective use of time management methods for implementation of a specified goal.

Keywords: Time Management, Time Management Principles and Techniques, Time Wasters

Introduction

Most students today have a tight schedule. Each of them has to deal with every-day stress connected with duties in such areas as work, family, hobby or other tasks they would like to complete. We live ever faster, we have more and more things to do, we race against time. According to scientists, after homo erectus and homo sapiens, homo insomnis, i.e. man who undersleeps, appeared on the Earth (Szeląg, 2010). We live in a constant stress due to shortage of time and forgetting about important issues that should have been done. We would like to know how to manage time effectively in order to organise every day well. We often feel that others are better-organised than we are. By constantly comparing ourselves with others and expecting more self-discipline and self-control we may become even more frustrated. We should ask ourselves whether having too little time is the real problem. Perhaps, we are unable to manage it properly. According to P.F. Druckers, "time is one of the scarcest resources and unless it is managed, nothing else can be managed" (Drucker, 2009). P. Zimbardo and J. Boyd (2009) disagree with B. Franklin's statement that time is money. They claim that time, our most limited asset, is in fact much more precious than money.

This paper addresses the issue of time management in a group of working and non-working students.

Meaning of the concept of time management

According to Stephen R. Covey (2013), what is important is not managing time, but "managing oneself in time." Technique and technology is helpful in execution of certain tasks. A human equipped with a computer, tablet or smartphone is more efficient and effective in what they do.
In order to manage time properly, one has to practice self-discipline and concentrate on oneself. According to K. Płuska (2019), managing oneself in time is a game of choices, knowledge about how to cope given the disposable time.

Time management, according to J. Kardas (2008), is "conscious planning and controlling one's own life so that a chaotic working style can be transformed into planned, systematic execution of tasks aimed at achieving a success."

D. Fontana (1999) notes that the benefits of skilful time management are obvious and the most important of them include:

- increased effectiveness,
- increased productivity,
- more time for oneself (for entertainment, hobby, etc.),
- more job satisfaction (everyone likes working until they are overwhelmed by work), less stress,
- more time to "tune out" after work (after completing all the work, our mind relaxes more easily at night),
- easier planning of long-term tasks (in advance) (without tormenting emotions, a human is more free to think ahead),
- increased creativity (a human is most creative when they can daydream in free time).

Time management refers to the way we organise and plan how much time we will spend on specified activities. Good time management allows you to work smarter, not harder, so that you can do more in less time even if there is not much time and the pressure is high. Failure to manage time decreases effectiveness and increases stress (Web-1).
Time management is a practical aspect of managing oneself. It involves taking decisions about the role we will take on next, time horizons, how we will use the time and what tasks we will engage in (Hutter, 2008).

L.J. Seiwert (1998) defines the concept of time management as a consistent and goal-oriented practical application of tried and tested work techniques so that managing oneself and one's environment is effortless, and the time available is used meaningfully and optimally.

Selected time management methods and techniques

In pursuing one's goals, one should avoid perfection and perfectionism. Allowing for some imperfection eliminates rush, unnecessary stress and demotivation due to failure to complete the task at hand in 100%. There is a variety of methods to improve the effectiveness of time management. They include the following:

- The 60:40 principle: This method is mainly based on the fact that not everything can be planned, and so we should be realistic and only plan 60% of the time available for fulfilling our duties. 40% should be time buffer for unplanned situations and actions. According to this rule, planning 100% of the time for accomplishing a task is pointless, because there are always unpredicted situations and chance events that should be taken into consideration in order to avoid overestimation in task planning (Płuska, 2019, Seiwert 1996).
- Golden hour in time management: According to this rule, we should determine the best moment for starting or finishing the day. We can decide to get up an hour earlier than the other household members. By doing so, we will have "time for us." This additional hour should be spent on activities that are most important to us or on things that we never can find time to do during the day. Similarly, we can choose a time in the evening when everybody at home goes to sleep (Płuska, 2019);
- The 20/80 rule (the Pareto Principle): It is a popular principle developed by Italian economist Vilfredo Federico Damaso Pareto, who noted, while analysing statistical data during his research, that 80% of the country's wealth was owned by 20% of the population. Soon afterwards, it turned out that similar distribution applied to other areas of life as well. Thus, it can be pointed out that only 20% of the time we spend on specific activities produces 80% of the final result. The remaining 80% of the time is translated to only 20% of the result. This

suggests that when trying to get things done we should concentrate on the most important issues, because they will guarantee us a success (Haughey, 2009).

- Parkinson's law: The main assumption of Parkinson's law described by English historian Cyril Northcote Parkinson in 1955 is the following thesis: "Time is wasted in proportion to the overall time available to us." According to this principle, the more time we have to complete a task, the more time it takes us to complete it. This means that the completion of a task will take the exact amount of time we scheduled for it. If a given person has a specified amount of time to execute a task, it will eventually be executed at the last moment (Grzyb, Kryzhanivska, 2019, Parkinson, 1955);
- The Pomodoro Method: The aim of this method is to ensure maximum focus and creative freshness to the user so that they can complete tasks faster and with less psychological fatigue. In its original form, it involves taking short 5-minute breaks after working for 25 minutes. Each 25-minute work period is called "pomodoro" after the Italian word for "tomato." Francesco Cirillo (2013) used a tomato-shaped kitchen timer as his personal timer and that's where the name comes from. Every time you finish "pomodoro", you should mark your progress with "X" and write down how many times you wanted to put off working on the task to skip to another (Web-2).
- Mind mapping: Mind mapping is a method that aims to boost work effectiveness. The technique involves writing down information relying both on image and text, with an emphasis put on the form of representing thoughts. When we use words, symbols, colours, rhythm, three-dimension effects, all the brain's regions are activated, which facilitates creative thinking. Mind maps organise ideas in the form of a circle. The ideas are branches that start from the centre, where the problem or question is placed (Płuska, 2019);
- SMART(ER) Method: This method defines the characteristics of a well-formulated goal. It helps define the effect of a task in a way that will improve the chance of its completion and ensure that it is known what exactly should be done. According to this method, a goal should be:
  a) S (Specific) - a goal should be understandable, clear so that is is known what is aimed at,
  b) M (Measurable) - there should be a way to specify clearly when a goal is achieved. The goal has to be formulated in a way that will make it possible to quantitatively determine the progress made to achieve it,
  c) A (Achievable) – can be accomplished,
  d) R (Realistic) - embedded in reality,
  e) T (Time & Cost oriented) – bound by time and costs,
  f) E (Exciting) - increasing motivation to achieve it,
  g) R (Recorded) – evidence of decisions and implementation, (https://poradnikprzedsiębiorcy.pl/zarzadzanie-czasem);
- A "to-do" list: This method is a classic in time management. It involves deciding on where to write down all the tasks to be completed in the nearest future. A notebook, calendar, smartphone or special block lists can be used for that purpose (Płuska, 2019).
- Eat the frog: It is a method presented by Briana Tracy (2020) in his best-selling book titled "Eat the frog." The author describes 21 methods to increase work productivity and overcome procrastination. The method assumes that the completion of the most difficult task should not be delayed or postponed. A difficult task should be completed within the shortest possible time (Tracy, 2020);
- Time tracker: It is a method that allows us to trace our time and identify the spheres of life we have spent it on. Time tracker makes us more aware of how much time we waste on work-unrelated tasks so that we can eliminate them more quickly and easily. This knowledge allows us to focus on the most important goals (Natalia, 2019, April 2);
- Eisenhower Matrix: It is one of more effective methods for time management, where division of tasks by importance makes it easier to complete a large number of tasks. According to this method, tasks should be divided into the following four groups:
  a) urgent and important – tasks requiring immediate action,
  b) important but not urgent – important tasks that do not require immediate action,
  c) urgent but not important – tasks of little importance that should be completed quickly,

d) not urgent and not important – tasks that can be eliminated (Brett, McKay, 2019).

Mistakes in Time Management and Time Wasters

The most common time management mistakes include:

- doing too many things at once – as we cannot focus consciously on several matters simultaneously. One should always devote 100% of attention to one task and complete it within the time limit, before moving to the next one;
- lack of self-discipline – according to Brian Tracy (2013), the habit of self-discipline guarantees success in professional life. Every successful person has this characteristic (even if it is latent) allowing them to do things regardless of the external circumstances or whether they feel like doing them or not. Lack of self-discipline leads to failure to complete tasks on time and limits personal development;
- no planning – if we are not good at setting goals and do not plan, we will not achieve anything in our professional life. It is recommended to always plan work in advance;
- putting things off – we should follow the DIAO ("Do it at once") principle. The author of this method, Kerry Gleeson (2009), thinks that if there is something we want to do and it will take us not more than 5 minutes, we should do it at once;
- not finishing tasks – we should remember to follow another important principle – GTD (Getting Things Done), i.e. finishing every started thing/task. If we begin to postpone finishing tasks, it will become our habit. As a result, more and more unfinished things will accumulate in our life;
- doing everything on your own – some employees think that unless they do certain things by themselves, no one else will do them well. The best way to save time is by delegating tasks. The principle is simple – if we can do something on our own, we can also teach our co-workers how to do that;
- attention distraction – the main sources of attention distraction are devices such as mobile phones or laptops. In order to fulfil our duties effectively, we need to focus. We should eliminate everything that can interfere with our focus on the task at hand;
- poor space organisation – we should organise our working space, i.e. our desk, computer or other space where we do our work. It is recommended to use binders, document sleeves, boxes and document shelves. It is good to arrange them by theme or alphabetically;
- lack of priorities – we should first do the most important tasks. When planning a day, task priorities should always be set;
- doing unnecessary things – the biggest waste of time is doing things that are completely unnecessary. When working on a specified task, we should always ask ourselves the question: Is the task I am working on important and essential or can it be done at a later time? (Kowalski, http://www.sudeckibiznes.hb.pl/pigulki/5-2.pdf).

Time wasters take up a lot of our precious time and decrease our effectiveness. The most common ones include: lack of motivation, indifferent attitude to work, an attempt to do everything at once, breaks for unplanned phone calls, lack of priorities, lack of discipline, lack of coordination, insufficient task delegation, inability to say "no", work-unrelated chats, putting work off, rush and impatience, staying on Facebook and other social networking sites, computer games, watching TV, mess at home, working place / on the computer / on the telephone, perfectionism, excessive bureaucracy, unexpected guests, chance situations (Web-3).

Research Methodology

In order to analyse the level of knowledge about time management as well as the knowledge and capability of applying time management methods in striving for the best academic performance in a group of working and non-working students, a survey was used. The research tool was a questionnaire. The survey was conducted in person among randomly selected full-time and part-time students. The sample subjected to analysis comprised 132 students, of whom 66 were working students and 66 – non-working students. The questionnaire contained 21 questions, including those related to the

understanding of the "time management" concept, the employment of time management techniques and methods by students, time wasters, self-assessment of time management effectiveness, and how that translated to students' better academic performance. Additionally, the questionnaire contained 5 socio-demographic questions, revealing that 87 females and 45 males participated in the survey. In terms of age, the participants belonged to the following categories: 18-25 – 102 students, 26-30 – 9 students, 31-40 – 8 students, over 40 – 13 students. In terms of the place of residence: 63 students lived in the city, whereas 69 students – in the countryside. The survey was anonymous.

Survey findings and their interpretation

Good time management allows one to do more in less time, reduces stress and leads to accomplishment of a set goal. Based on the analysis of the first two questions of the questionnaire, 120 out of 132 surveyed students declared knowledge of the concept of "time management", which accounts for over 90% of the students of the sample under analysis. Only 10 working students and 2 non-working students admitted not knowing this concept. Nevertheless, 78 students associated the concept of "time management" only with planning and systematic fulfilment of planned tasks aimed at accomplishment of a specified goal, whereas 49 students – with the process of planning and controlling the amount of time devoted to specified actions. Only 4 students indicated that both these issues are significant for proper time management, with one student unable to define the term and indicating "I don't know."

The situation looked different in the case of the knowledge of time management techniques and methods. Only 10 students reported being familiar with such techniques and specified which ones. This group included 5 working students and 5 non-working students. The techniques most often indicated were: the Pareto Method and the Eisenhower Matrix, followed by Parkinsow's Law, Pomodoro method and a "to-do" list.

A total of 130 out of 132 surveyed students reported that they did not employ time management techniques in their student lives. This means that those who indicated knowledge of certain time management techniques do not use them in practice, as only 2 out of 10 students answered positively to the question about the use of such methods, one from each of the groups analysed. Responding to the question "As part of time management, do you set yourself (as a student) goals to achieve?", only 51 students answered positively, mostly indicating the following goals: finding time for oneself, having fun, rest, relax, time for work, meeting new people. This shows that these students are not familiar with the SMART method, which indicates significant characteristics of a well-formulated goal. Only 13 students from that group indicated the following goals: completing an academic term, passing an exam, completing studies, finding a job after graduation or acquiring a language certificate. However, the survey showed that some students used time management techniques and methods quite unconsciously.

With respect to the Pareto principle, the following question was asked: "Do you set tasks to complete as part of your goals?" Of the students who indicated not knowing this principle, as many as 67 reported that they only focused on tasks that could bring specific benefits (including 34 working students and 33 non-working students), which is in line with Pareto principle. A similar number of students, i.e. 28, set themselves tasks to complete, but did not think about their significance, whereas 27 students did not set themselves tasks to complete at all. In the case of the Eisenhower Matrix, it turned out that as many as 103 students from the group that admitted to not knowing time management methods divide the tasks to be completed into urgent, not urgent, important and not important (including 52 working students and 51 non-working students). As far as the Pomodoro Method was concerned, responding to the question "When working on specified tasks for a long period of time, do you take short 5-minute breaks?", 27 students indicated "yes", including 13 working students and 14 non-working students. The biggest number, i.e. 45 students, responded that short breaks improved their concentration and allowed them to look at the problem from a broader perspective. On the other hand, 16 students claimed that they did not tend to take breaks, because it impaired their concentration, and 34 students wanted to finish the task as quickly as possible. However, quickly does not mean well. With respect to the Parkinson Method, students were asked the following question: "When planning to complete a specified task, do you allow for a big time buffer?" Of 122 surveyed students who reported not knowing this method, 51 indicated that they liked having a large margin of time for completing a task, whereas

71 reported trying to fulfil tasks efficiently without unnecessary time margins. Such people accounted for 65.6% among working students, and 50.8% among non-working ones. Another question, this time related to the Time Tracker Method, was: "Have you ever checked what happens to your time – where did you lose it and what spheres did you spend it on?" Over 70.5% of those surveyed answered "yes", with the number of non-working students 9.8% higher. As far as the method of a "to-do" list was concerned, when asked the question "Do you draw up a day schedule to match your tasks to the energy level you can expend?", only 18.0% of those surveyed confirmed writing everything down in a paper or electronic calendar (10 working students and 12 non-working students). This shows that most of the surveyed students were not familiar with this method, although it is among classics in time management. As much as 50% claimed that they had a schedule in their heads, thus risking forgetting about certain things, whereas 32% of students reported not writing down the things to do in their day schedule.

As far as the question "Are you an organised person or do you postpone everything until later?" is concerned, the survey showed that most, i.e. 61.4% of those surveyed, regard themselves as organised people, while the rest postpone everything until later and there is a constant chaos in their lives.

In terms of practical tips on time management, the students were aware of time wasters in their lives that stole their time. Among external time wasters, working and non-working students most often indicated the Internet and social networking sites. Third place was occupied by TV among working students and by commuting to the university among non-working students. As far as internal time wasters are concerned, both working and non-working students mainly indicated: lack of energy, postponing things until later and laziness. The biggest incentives for resisting time wasters were getting a passing grade and passing an exam. Desire to acquire knowledge and new skills came only third. As many as 30 students from all of those surveyed were most motivated to resist time wasters by the fear of failure and shame of not passing all of the exams in a session. This data is presented in Figure 1.

Fig. 1: Distribution of the incentives for resisting time wasters among working and non-working students, expressed in percentage

In terms of planning the process of defining goal implementation programs, the survey asked students to arrange questions that are useful in the planning process from the most important to the least important one. As the first question, the biggest number of students indicated "What should be done?" followed by "When should it be done?", "Where should it be done?", "How should it be done?" and finally "What resources are needed to complete the task?" Figure 2 shows the distribution of the responses in both the groups of students.

Fig. 2: Percentage distribution of the order of tasks taken by students in order to achieve a set goal

To assess the effectiveness of time management among the students, the following question was asked: "How much time do you spend daily on learning apart from university classes?" The survey showed that this time was limited, as only 5.3% of those surveyed devoted to learning more than 2 hours a day. Most of the surveyed students, i.e. 43.9%, spent less than an hour a day on learning. When preparing for an exam or getting a passing grade, those surveyed tended to start learning towards the end of a term (53.8%) or even left studying until the last moment (28%). Only 14.4% of the students studied systematically. The situation was similar in both the groups under analysis. Of those surveyed, only 5.3% completed a fast reading, effective learning and remembering course, and only 3 people in the group of working students perceived the need to take such a course. Interestingly, most students from the group under analysis, i.e. 72.7%, got a passing grades and passed exams at the first sitting (46 working students and 50 non-working students). Only 27.2% of the students declared completing a term sometimes at the first attempt while other times at the second one.

As part of self-assessment, students were asked the following question: "How do you assess the effectiveness of your "time management"?". Analysis of the data showed that only 7 out of 132 surveyed students assessed their effectiveness as very good (4 working students and 3 non-working students), whereas 3 students as terrible (2 working students and 1 non-working student). Most of the students assessed the effectiveness of their time management as good or medium. This data is presented in Figure 3.

Fig. 3: Self-assessment of time management effectiveness among working and non-working students, expressed in percentage

Nonetheless, faced with the question: "Do you see a need to improve the effectiveness of your time management?", as many as 92 (69.7%) students answered "no" (44 working students and 48 non-working students). Only 40 students, i.e. 30.3% of those surveyed, reported seeing such a need, indicating the necessity of eliminating and exercising greater control over time wasters, both those external and internal.

Summary – Survey Results

The survey may not be fully representative, but it indicates certain trends in the awareness and knowledge of the subject of time management in a group of students. The survey results confirmed that students did not have knowledge about time management and were not familiar with methods and techniques for better time management, relying more on intuition. Only 3.8% of those surveyed were able to define this term correctly, and 7.6% were able to name a time management method or technique known to them. Most of the surveyed students employ these methods unconsciously, mainly: the Pareto Principle, the Pomodoro Method, the Eisenhower Matrix and the Time Tracker method. As the survey showed, in striving to achieve the goal of completing a term, completing studies or finding a job, only a small number of students worked systematically with good time organisation. Most of them postponed everything until the last moment. Nonetheless, the students assessed the effectiveness of their time management as good or medium, which can be explained by the fact that in most cases they got passing grades or passed exams at the first attempt.

Summing up, based on the survey, there are no significant differences between working and non-working students in the level of knowledge about time management and effective application of time management methods to accomplish a specified goal.

Abstract

Social farming embodies a strong asset in view of the rural development nowadays. Hence, traditions are preserved, the cultural heritage passed down by our ancestors as legacy is revered, as well as the readiness for innovation and the aspect of adjusting to the good practices of the neighbouring Europeans.Putting farming into practice results in merging blissfully plant cultivation, raising animals with social activites destined to socially deprived persons, disabled individuals, or with psychological or emotional disorders. Social farming metamorphoses the rural area into a site favourable for the people with special needs and could highly contribute to implementing European policies as regards health, social protection and education. The paper presents the most important features of social farming at international and European levels, and analyses its current state at national, regional and local levels based on interviews with representatives of authorised protected entities, cooperatives, family farms, houses of mutual aid, NGOs (associations and foundations), and SMMs. Social farming needs recognition at national level, establishment of a social farming regulatory framework, building up of social farming networks, creation of a social farming database, inclusion in education programmes, in research programmes and in the sustainable development strategy, as well as strengthening of the role of civil society.

Keywords: Social Farming, Rural Development, Regional Development, Social Investment, Sustainability.

Introduction

This article aims at demonstrating that social farming, through its activity, has the power to support sustainably the regional development and mitigation of disparities much accentuated in-between the rural and urban zones. Since the industries and services replaced agrarian activities becoming an engine of the XXth century economy, the rural development has stemmed from the urban systems. The main pattern exhibits the areas where the agrarian activity is prevalent and records a minimum economic growth, whilst in the urban areas it modernizes, taking shape a dual economy (Lipton, 1977). Hence, the regional development is disproportionate, due to an imbalance in power distribution, not only of the available resources throughout the said territory (Walerstein, 1977).

Farming has earned a significant social character, especially considering the fact that the contemporary rural zones face major drawbacks such as a plunge in the degree of poverty, limitation of possibilities of expanding and implementing new investments, depopulation, redundancy, lack of a sustainable development of the intercommunity space. Social farming, as (Andrei and others, 2016; Antohi, 2011) state, is at times associated with the hike in the underdevelopment of rural communities and of the hindrance to their development perspectives than with the pluriactivity and diversification of the role and place of farming within the rural space.

In this respect, social farming is an approach merging innovation and the traditional activities within the farm or agricultural exploitation. This engulfs all those activities which entail agricultural resources to promote or facilitate social services in the rural environment, such as: recovery, healthcare and treatment, creating jobs for the local rural community, ensuring lifelong education, or other activities which support social inclusion (Di Iacovo and O'Connor, 2009).

The type of social farming developed within the community zone represents a genuine form of farming accounting for the fact that it combines the support of the citizens in the rural areas with agricultural practices and social protection. The emergence and development of social farming may be viewed as answer to the growth of insecurity degree regarding rural communities as well as a drop in the buying power and of the paradox of development in the rural environment. The fairly more difficult accessing of financing sources and markets, population migration from the rural areas, a lowering of birth rate and a rise in the price of dietary products has led to finding novel development approaches.

Portraying a pivotal support for the development of the rural communities, social farming purveys a relatively high degree of sustainability and multi- functionality typical of the rural environment. Within social farming it is developed a typical mechanism of intervention and support of certain activities typical of rural communities by means of which it is attempted a dwindling of poverty, a depletion of social vulnerabilities and of the existing economic discrepancies both in-between communities and mainly among the citizens of rural areas.

Starting from these realities, in specialty literature, throughout time there is a main threefold approach considering social farming, as follows (The European Social and Economic Committee, 2012; MADR 2014):

- The Institutional Approach, focused mainly upon the dominant of public healthcare institutions, being typical of a series of states such as Germany, France, Ireland, Slovenia. Regarding these states, it is likewise conspicuous a significant subsidy in undergoing the social objectives within rural communities;
- the second approach bears a deep private, particular feature, normally related to the emergence, diversification and functionality of farms/ranches with a therapeutic aim, pervading in such states as the Netherlands, and Belgium;
- a third approach features a mixed character, engulfing traits of both above mentioned categories, being based upon social cooperatives and private farms, specific to Italy.

Despite playing a momentous role in the local communities' development and in the diversification of intervention tools within these ones, social farming has not succeeded in implementing a generic framework of directives or of criteria which should impose the enforcement of certain specific policies in the community environment. Without guidelines in this regard, it facilitates even more the identification, applying, subsidizing and implementing of the notion of social farming. Even though its applicability enjoys a wider horizon, social farming may be developed and enforced successfully in most fields of activity found in the rural areas, especially for:

- determining the agricultural activities in the rural environment and redirecting the workforce towards these activities;
- an enhanced attention in view of the personal assistance services in the rural zones by increasing and diversifying them;
- appealing to the disfavoured categories in the rural environment, thus enabling social inclusion;
- an approach mainly of the increase of the literacy degree within rural areas and of a further digital literacy.

Agriculture, an indispensable activity in Romania and in some UE member states

In the European context, the adopted agricultural pattern experiences a permanent process of adjustment and valuing of exchanges and transformations engendered within the community economic space, contributing efficiently to supporting the policies of sustainable rural development and to the growth of the rural area inhabitants' standard of livelihood. This standpoint considered, farming embodies for Romania an economic link with deep meanings and a major impact both regarding the compliance with the exigency criteria, typical of a market economy, and mainly in carving the development of rural communities, dependent on the evolvement of this sector. Via the analysis of farming's role and place at the level of the European Union, this one, though it still owns a dwindling percentage in terms of defining the gross value added (GVA), represents an essential branch in the European economy. In fig.1 the GVA structure is devised as regards a series of UE member states, in the year 2018.

Fig.1: The sectoral structure of GVA in some UE member states, 2018 Source: Eurostat (data online code: nama_10_a10)

It is observed in fig 1 that, both at the UE level and concerning the states analysed individually, the primary sector has a reduced weight compared to the secondary and tertiary sectors in shaping the GVA. Therefore, in 2018 at European level, farming contributes to framing the GVA by a sheer 1.6%, compared to 19.5% of the secondary sector and 19.1% of the tertiary sector. In the member states, such as

Bulgary (4.2%), Romania (4.8%) and respectively Slovakia (3.3%), the primary sector records fairly significant values. Instead in the Baltic states, Latvia (3.8%), Lithuania (3.0%) and Estonia (2.6%), values reach around 3 percents. In the developed states of the European Union, such as Great Britain (0.6%) and Germany (0.8%), the weight in creating the GVA is downsized. Even so, farming is still deemed as an essential economic branch within the community environment through the complementary influences it engenders. As (Popescu and Andrei, 2011; Otiman, 2011; Zahiu and others, 2010) state, farming provides a shield of insulation for the population in the rural environment contributing to the hindrance of redundancy consequences ensuring a good part of the consumption of rural households. Hence, agriculture provides an added value to the fulfillment of an array of prominent social objectives with a major effect upon the communities in the rural areas.

As important a feature in measuring the prominence and role of the primary sector for the economy of the European Union is represented by the configuration of the workforce employment opportunities on distinct activities of the rural environment. This thing represents a setback with determined consequences in ensuring the safety of the inhabitants' life standard. Fig.2 displays the activites typical of the rural zone in some UE member states in 2017.

Fig.2: The structure of employment opportunities within the fields, on activities typical of the rural environment, in a series of UE member states, 2017

Source: Eurostat (online data code nama_10_a64_e)

In fig.2 it is conspicuous that farming, as the branch belonging to the rural space displays a stability of the migration of the human resource at European level, whereas the tourism and dietary industry record growths as regards the employment opportunities. Likewise, in some specialty studies (Albu and others, 2012; Toma and others, 2009; Ciutacu and Chivu, 2007), the impact of the new technologies, of digitalization and of optimization of production structures is present in the depletion of the degree of job occupation. The rate of job occupation in farming at UE level, in 2017, is of 0.0%, whilst in the dietary industry is of 1.7%, in tourism of 3.3% and of 2.9% in forestry activities. Tourism tends, thus, to become the suppliant economic

branch of farming in the rural area. The diversity of activities within the rural environment can contribute to supplement the earnings for a significant part of the rural population.

Consequently, social farming can be a sustainable "brainwave" for problem solving in terms of the degree of employment of the workforce in the rural area, having in view the tendency of the human resource migration from the actual agricultural activities of the tertiary sector, tourism, respectively. This reorientation is able to generate even much higher earnings than the agricultural ones and can influence even the direction of finance resources in aid of supporting the investments towards the rural zone. As (Andrei and Alecu, 2016) stated, the rural itself embodies a starting point in framing the governmental social and economic policies towards the rural space, and the permanent comparison with the urban mitigates its significance, transforming the rural in an insipid space, where the principal determinant activity is farming (Andrei and Alecu, 2016).

Spreading the concept of social farming throughout Europe and Romania

In Europe, social farming has spread heterogenically in rapport with its various convictions and economic patterns found in distinct countries.

At European level, there took shape various social local networks so as to enable the global development of the regions based on the experiences in the field of social farming which have displayed an upward tendency.

Holland was a European country where, since the 90s', the notion of social farming has developed and spread through a growth in the number of farms, which also provided therapeutic services and rehabilitation. In short time, Holland's healthcare system has adopted social farming as a purveyor of healthcare services and the phenomenon has already received full support.

With the help of PDR 2007-2013 – The Plan of Rural Development- in Belgium, this contributed to the farm reshuffle, correct acknowledgement and remuneration of farmers. In Norway, social farming has developed within the private medium-size businesses and often faces inclement weather conditions. From this standpoint, most Norwegian farmers were forced to find alternative income sources, including the aspect of supplying social services.

In Germany, social farming is found especially within private and public organizations, foundations and public services, which address to integrating the physically and psychically disabled persons, or those affected by the civil society's social setbacks, where the social aspect is a priority for production.

The French view social farming as an activity endowed with a high social- ethical value with side economical implications. The prime aim of social farming engulfs integrating vulnerable persons in the working field in the fruit and vegetable farms lying in suburban areas. These proceedings have created bridges among companies, characterized by diversity, despite their common inspirational paragon. They are portrayed according to the real territory and the local needs (Shortall, 2004). In Ireland, social farming envisions some restrictive forms. Therapeutic treatment for various persons with special needs, institutionalized or not, includes an array of activities involving animals and growing fruits and vegetables. Great Britain enjoys the concept of "therapeutic garden", lying within the national healthcare system, as well as in the local communities, where the therapy through horticulture is

successfully practiced, whilst in the private zone it is still in incipient phase. In Italy, social farming exhibits a fairly special feature, on the one hand from the legal viewpoint, where there are social structures and organisms which practise farming in collaboration with private societies involved in social activities, and, on the other hand, through the operational aspect, notable being the process of organization and professional adjustment. Moreover, farmers have assumed their commitment, beside the organic approach, to highlight the cultural and ideological thriving of enterprises. In Slovenia, social farming is practised by the structures in the public system, whereas in the private system they do not enjoy the same success, such initiatives being scarce and supported by volunteers without the support of specific policies on behalf of institutions. (Smith and others, 2005).

The situation seems to improve almost everywhere, such as in Italy, where there are more and more organisms willing to join the paragon based on the partnership with the civil society. In Germany, apart from the multitude of public institutions, the difficult access to funds for the private ones determines these ones to find novel approaches on addressing to the issue. In France, the initiatives of the volunteer associations have managed to win even more land for the "therapeutic gardens", by combining the ethical values with the organic productions, involving via a short chain the inhabitants as "the actors consumers".

Considering the above mentioned context, Fig.2 envisions an analysis of the reasons which characterize the social farming in various countries, based on the findings of the SoFar COST Action 866 project, as well as other projects from the international bibliography (Di Iacovo and O´Connor, 2009; Hassink, 2006; Matthews, 2008), with the aim of deriving a conclusion upon the existing various differences. The assessment comprises a scale from 1 to 5, where 1 has a low value and 5 represents the maximum.

Figure 2: Valuation of the main motivations that characterize social farming in Europe
Source: direct survey, SoFar, COST Action 866 Project

The exhibited data conclude that social farming supports social integration and less the rural development and the fight against poverty. Therefore, social farming undergoes a conceptualization refining process in distinct countries, that of pioneer, using social farming for health care, and the developed ones, which are strictly compliant with the community policies.

Materials and Methods

The present article envisions a simultaneous approach by means of a comparative study of social farming in Europe and Romania (FAO, 2015). based both on literature and official data and papers.

Results and Discussion

For a long time and still today in the European debate on rural development the social issues have had a minor consideration. In the ordinary approach the social issues can be faced once the economic development has taken place and the state has redistributed resources also to less favoured and populated territories, like the rural ones. Perhaps in rural areas the provision of social-health services is normally made difficult from the low density of the inhabitants, the increasing concentration of elderly people, the need of generational change as well as the large variety of needs deriving from emerging members of rural communities as a consequence of new flows of migrants (from poor but also from wealthy countries). However, the fact that social and health issues are not integrated in the EU approach to rural development does not help to pursue in this direction.

However, it seems quite evident that the traditional approach has to be reconsidered in light of recent global economic and environmental issues and innovative solutions should be defined. Again that in rural areas social development is strongly connected with the immaterial values of the local offer (product, identity, symbolic values) and that social and economic development cannot proceed separately. This also to avoid the rise of new trends of exclusion and social unsustainability as well as new phenomena of exploitation linked to an unfair use of migrant work. To avoid such threats a larger reflexion on social sustainability in rural areas should be developed also in the perspective to define smart, inclusive and sustainable pathways of change.

In fact, social farming connects the co-production of economic, social, and frequently also of environmental values (most of the social farming initiatives are organically driven) in a different perspective of prosperity based on the regeneration of vibrant and proactive communities. In such a trend the production of health takes directly origin from the territory and community in a perspective where human wellbeing is part of a process able to establish new interdependencies among people, nature, and knowledge.

Back in 2014, the National Rural Development Program (NRDP) published a booklet on the adaptation and implementation of social farming (MADR, 2014) in which it is seen as a way to reduce disparities between regions through the consolidation of economic, social and territorial cohesion. It is seen as playing an important role in rural development programmes by supporting the setting up of rural enterprises involved in co-therapy, social development and inclusion on the labour market, and services for disadvantaged people using agricultural resources. Thus, through cooperation between different administrative and political entities (farming, education, employment, health, justice, social affairs), agricultural services turn into social services: in addition to basic agricultural activities, social farms invite people from disadvantaged groups to participate in agricultural activities, and social farmers are rewarded.

According to Mihalache (Mihalache, N. M., 2015), in social economy the conventional operations include farming crop or animal production and agro-touristic activities. These types of actions are adapted basically in regions where the entrepreneurship benefits of a greater acceptance and subsequently the social economy. Particular productions based on bio-production and processing are encouraged including various forms of short food chains. Aside from the farming and food processing traditional rural crafts are included incorporating manufactures and handmade local products.

As far as social farming is concerned, in Romania they:

- adopted two important laws and a national strategy,
- developed guides to setting up "social enterprises for beneficiaries of guaranteed minimum income", for persons with disabilities, for Roma people, and for "young people over 18 who leave the institutionalised child protection system",
- conducted studies on social economy developing occupations, including their growth potential in farming, with gender mainstreaming on the labour market,
- established 247 LAGs in 17 counties, and they published a brochure on Social Farming, but that was a unique occurrence of the term in both official and non- official approaches.

However, the current state of Social Farming in Romania should be assessed from several points of view:

Proportion

Romania has experienced different forms of social farming beginning with the 90s' by integrating these practices as a novel experience with increased sustainability. Though they do not use such phrases as care farming, farming for health, green care, green therapies, or social farming, the Romanians have unknowingly practiced social farming under the form of different operations or practices in the care, rehabilitation, social reintegration, and training of the disadvantaged people or of people with particular needs, aiming at enabling them to boost self-esteem and participation in social life, to contribute to their well-being, to facilitate learning, to improve health and social inclusion, to re-establish contact with the natural environment and productive activity.

Stakeholders

Ideally, social economy relies on the following entities (Medeleanu, C., 2013), but only black-faced ones are operating in Romania (Nicolăescu, V si altii, 2011): Authorised Protected Entities; Cooperatives; Family farms; Houses of mutual economic aid; Non-Governmental Organisations (associations and foundations); Small and Medium Enterprises.

In January 2019, in Romania, there were 304 Authorised Protected Entities of which none farming-related, 1644 Houses of Mutual Economic Aid, of which 6 farming related, and 114,363 Non-Governmental Organisations (associations and foundations) (RN - ONG, 2019):of the 92,403 NGOs labelled associations, only 3,860 are related to people with disabilities and to disadvantaged people, but none of them social-farming related.

The 12 associations contacted deal with problem-solving linked to the community issues where Roma people minorities live; building healthy and accessible buildings and new community centres; supporting novel and innovative approaches in Romania's rural area, such as the first travel social business entirely based on community"; developing senses in the sensory garden; introducing and emboldening

the rural communities rich in nature and traditions heritage suitable for tourism to introduce forms of responsible tourism with the assistance and the involvement of the community; exchanging knowledge in organic farming; facilitating collaboration between volunteers and host farmers; finding active citizens and developing community-based organizations; Integrating children in loving families; organising annual horse-riding contests for children; organising annual international conferences on complementary therapies in children with disabilities; repairing and rehabilitating buildings; revitalising horse-riding as a sport for children and teenagers; rising awareness on the society, regarding the difficulties of a person with disabilities has to face; training horses; treating children through horse-assisted therapy, people with special needs through horse-assisted therapy, children through horse and dog therapy for neuro-motor disorders (ataxia, dystonia, hemiparesis, infantile cerebral palsy, muscular dystrophy, muscular hypotony, paraparesis, post-traumatic sequelae, Prader-Willi syndrome, pyramidal syndrome, spastic tetra-paresis), neurological disorders (cranio-cerebral trauma, Down syndrome, emotional disturbance, epilepsy, growth disorder, multiple sclerosis, muscular dystrophy, paralysis, Spina Bifida, spinal cord diseases, visual disturbance).

The 6 foundations contacted deal with: building Community-Based Organisations capacity; conducting instructive-educational programmes; improving housing and living conditions; organising summer camps for children in foster care or at risk; preventing family abandonment and school dropout; promoting children rights to prevent abuse, neglect, and exploitation, juvenile justice, migrants‟ integration and social inclusion, children's rights to prevent abuse, neglect, and exploitation; providing access to health services, community prevention services, education for children and for youth, educational support for children with disabilities, employment services for young people from vulnerable groups, entrepreneurship and financial education for disadvantaged people, family houses and children access to hosting, care, breeding, education, emotional support, counselling, independent life skills, preparation for family, social, and professional re-integration or integration, family placement, lobby and advocacy for the NGO sector, protected employment for people with disabilities, services protecting and promoting the rights of persons presenting different incapacities, special services for children and their parents, specialised social services for people from vulnerable groups, vocational counselling and pre- professional training; supporting children in trafficking and migration situations, children with severe, medium, and light mental handicap, inclusion of Roma and other minorities communities, young people aged 18+ to integrate socially and professionally; taking care of foundlings; training foster parents and teachers.

The 9 Local Action Groups contacted deal with: creating and promoting local brands and association in the agri-food sector, associative forms, networks and clusters, operational groups to diversify rural activities, support centres for rural and small urban population: starting associative organisations; developing and modernising villages, associative forms for the diversification of rural activities, non- agricultural activities, rural and micro-urban localities through investments in small scale infrastructure, basic services for population and investments associated to cultural and natural patrimony, social infrastructure, the micro-region through investments in infrastructure and equipment, the social and health infrastructure, villages; encouraging cooperation through association aiming at finding innovative

solutions and at facilitating market access; establishing and developing farms and non- agricultural activities; investing in broadband infrastructure, in creating and developing activities, in infrastructure and equipment, in renewable energy and energy saving, in social and education infrastructure for marginalized groups, in social and health infrastructure; modernising agriculture and agri-tourism businesses, agricultural and fruit holdings; preventing depopulation through job creation in non-agricultural domains; promoting associativity, innovation and transfer of knowledge, innovative solutions for competitive farming / food industry, multiethnicity, social inclusion, sports, cultural and local activities and supporting the administrative capability of civil society, innovative solutions for competitive farming, services and renewing the LAG area; renewing farmer generations through support for young farmers; restoring, consolidating and promoting ecosystems and biodiversity; setting up and developing businesses, non-agricultural activities; supporting associative structures through investments in real estate, innovative solutions for competitive farming / food industry, small and medium farms, the establishment of non- agricultural activities, the integration and promotion of quality schemes for local products, young farmers; transferring knowledge, training and lifelong learning.

The case studies carried out on the 25 Romanian stakeholders, indicate that, of the three main approaches in social farming at EU level, "institutional approach with the prevalence of health/public institutions, private approach based on therapeutic farms, and mixed approach based on social cooperatives and private farms", only the second and third seem to somehow fit social farming in Romania: the private approach rarely concerns therapeutic farms and the mixed approach concerns LAGs and private farms. The Romanian social farming is apparently more oriented towards the public system of health and social care than towards the rural economy and farming.

Financing of social farming in Romania relies on assistance originating from NGOs (associations, foundations, social enterprises), on un-intermediated presence on markets (where they can practice direct selling), on public projects, on rural development policies aiming at supporting social farming launch and development, and on social cooperatives.

Social farming in Romania contain several elements: relays on NGOs involvement and support for private farming as a supplementary income without altering the initial productive activities oriented to the market and happening on agricultural household sites." Social farming in Romania consists in activities that use both plant and animal agricultural aiming at generating social services (lifelong learning, rehabilitation, sheltered jobs, therapy) in semi-rural and rural areas.

The main Romanian institutions dealing with aspects of social farming are: the Ministry of Farming and Rural Development, the Ministry of Justice, the Ministry of Labour and Social Justice, and the Ministry of Regional Development and Public Administration.

As far as social farming networks are concerned, the stakeholders are linked individually since there is no national database and no official network for Social Farming in the country.

There is both state and public support for Social Farming activities in general.

Conclusions and Proposals

Although the EU proposals for next structural fund planning have opened new perspectives, and the fund implementation policy includes among its explicit targets, the fight to poverty, social integration and diversification of farming activities, which can be combined with Social Farming, it seems necessary to highlight this latter's role both in future 2014-2020 planning and the partnership contract, in order to offer the sector a stronger support.

For this, EU and member states together with officials and people in charge of EU Fund management, should strengthen their collaboration to remove barriers that prevent territorial actors to access to the structural funds. With the same purpose, specific steps can be identified to promote the change (Di Iacovo, F and others,2014) like:

a) Scouting of local pioneering initiatives and potential forerunners;

b) Pro-active planning of paths able to support innovation started by forerunners and to facilitate new solutions;

c) Understanding and coding of features, meanings, implications of the innovative solutions, and organizational changes required for key stakeholders;

d) Selecting and mapping actors able progressively to share initiatives and knowledge;

e) Supporting dialogue to facilitate the actors involved in the processes of change, in order to tackle: rational choices, collective sense making, power conflicts and coalitions, the acceptance of new cultural symbols and repertories. Consequently, to enable the dialogue among stakeholders in order to reinforce broader alliances and to avoid the fragmentation of arenas and meanings;

f) Opening, mediating, extending, in a progressive and gradual way, the arenas where debate may run and enlarge from forerunners toward actors of the existing regime, to share key principles of innovative initiatives and to integrate them in the ordinary governance arenas, at different institutional levels.

According with such steps, policies may be re-oriented to support social innovation initiatives in a broader sense, also in rural areas. The debate on European innovation partnerships may be useful from this point of view as well as the opportunity to integrate different policy tools like FESER, ESF and ERSF.

The analysis shows that:

- Social farms are almost inexistent, except for 2-3 cases.
- The public has never heard about Social Farming, however, numerous organisations practice some kind of social farming.
- The main institutions and organizations dealing with aspects of Social Farming are Authorised Protected Entities, Cooperatives, Family Farms, Houses of mutual economic aid, Non-Governmental Organisations (associations, foundations, local action groups).
- The stakeholders are linked individually, since there is no nationaldatabase.
- There is no official network for Social Farming.
- There is some state and public support for Social Farming activities, according to legislation.

Therefore, social farming in Romania needs:

- Recognition at national level;

- Establishment of a social farming regulatory framework;
- Building up of social farming networks;
- Creation of a social farming database;
- Inclusion in education programmes;
- Inclusion in research programmes;
- Inclusion in the sustainable development strategy;
- Strengthening of the role of civil society.

What is becoming clear is that the debate on social services in rural areas opens issues that cannot be addressed only by State intervention. It asks for innovative solutions able to redesign relationships inside the society and to redefine the responsibility of public and private actors and their role the local society but also the possibility to create, at the same time, economic and social values. Social farming initiatives move on the path of EU2020 strategy. It is:

- Smart: In the way they mobilize local resources, promoting a retro- innovative use of farming by the way of "grassroots initiatives" driven by farmers, third sector, public bodies. Social farming initiatives are able to reorganize value creation and distribution by promoting subsidiarity, co-production, civic economy;
- Sustainable: By using plants and animals, rural spaces and time organisation, in order to promote therapy, rehabilitation, social inclusion, education and social services in rural and peri-urban areas, and promoting local farming, local markets, reputation;
- Inclusive: Stimulating active social inclusion, innovative services, vibrant communities towards small groups of people which can live and work together with family farmers and social practitioners on farm. Addressing diverse needs for less empowered people (mental disability, physical disability, psychiatric, drugs & alcohol recovery, children, young people, prisoners (ex), long run non occupied, terminal patients, burn out, elderly people).

In order to achieve such results social farming reorganises in a completely different deepens values in the everyday way of operating of the actors involved. Along social innovation processes the ethic of profit and the role of the State are put under debate creating a new sense of possibility. In this perspective once again rural areas seem to offer advanced solutions thanks to the pro-active role of forerunners. It's up to the public bodies to accompany and to facilitate pathways of change where innovation and innovators are fully recognized and accompanied along transition processes able to reshape right ways to support rural change in a wider perspective of sustainability were also the social components are fully taken into consideration.

The Relationship Between Occupational Stress and Retention in The Service Sector: A Mediating Role of Internal Organisational Factors

Karolina OLEKSA-MAREWSKA, PhD

WSB University in Poznan, Poland

e-mail address: Karolina.oleksa@wsb.poznan.pl

Abstract

The paper aims to analyse the connection between occupational stress experienced by employees in the service sector and their willingness-to-stay on the one hand, and the effect internal organisational factors have on this relationship on the other. An empirical, quantitative study was conducted among 292 respondents employed in the service sector in Poland. Two psychometric questionnaires were used as well as one questionnaire developed by the author. Results of statistical analysis show that there is a negative correlation between the level of stress and employee retention. Importantly, this relationship is mediated by the assessment of organisational factors (studied using a construct of organisational climate), especially the management style of superiors and the possibilities of promotion and development in the workplace. The results significantly broaden the research on employee retention factors, as they indicate that individual level of occupational stress, which depends both on the job context and personal traits, is as important or even more important than the assessment of organisational factors alone (literature usually points to the importance of organisational factors for employee retention). The study thus contributes to the literature on employee retention in the service sector and provides practical conclusions for employers in countries where there is a problem with employee retention and recruitment of the right candidates.

Keywords: employee retention, service sector, occupational stress, organisational climate

Introduction

Employee retention becomes a crucial challenge at the time when employee market is growing in strength, especially for countries with insufficient labour force or high employee mobility and ease of job change. However, because of increasing globalisation and outsourcing, more and more frequently not only countries, but also particular industries experience difficulties with employee retention. High employee turnover contributes to numerous problems, mainly increased costs of employee recruitment, training, or temporary replacements, as well as loss of output and knowledge due to lack of employees, especially highly-qualified ones (Armstrong, Taylor, 2017; Mitchell et al., 2001). One of the sectors where increased retention is of special importance is the service sector (Singh, 2014). The service sector has been contributing to the dynamic development of the global economy for the last 50 years, and its employees are responsible for value-creation both by properly presenting the product or service and by providing customer satisfaction, establishing good relationships, and ensuring an experience of value, which cannot be obtained without the participation of the service provider and the customer (Bowen, 2016; Denison et al., 2012).

In order to increase employee retention, it is important to create a friendly work environment and eliminate factors that put too much strain on employees. Referring to the job demands-resources concept (JD-R) (Demerouti et al., 2001), it is believed that each job comes with specific stress-related risk factors which can be divided into two categories: job demands and job resources. The individual is protected from overload and exhaustion by its resources (e.g. intellectual and cognitive skills, behavioural strategies, social support), which allow to mitigate the costs incurred due to job demands. Importantly, each employee can perceive the level of demands and his own resources differently, which explains why the same work situation can cause different reactions in different employees. This is why it is important to increase the efficiency of a workplace, but also to monitor the factors that affect the psychological well-being of employees, which is the foundation of their job satisfaction and willingness-to-stay. One of the main such factors is organisational stress (Meier, Spector, 2013; Tuten, Neidermeyer, 2004).

This paper focuses on the role of organisational stress and the effect of the assessment of organisational factors on employee retention in the service sector. As a measure of the perception and assessment of organisational factor, the author adopted the concept of organisational climate, which reflects the feelings and reflections of employees about their workplace, co-workers, superiors, and other factor affecting their physical and psychological state (Rosenstiel, Bögel, 1992). It can therefore be assumed that a negative organisational climate can affect the relationship between the level of stress and employee retention.

1. Employee retention in the service sector

The service sector is a domain of the post-industrial era. Around 1970, the service market dominated the economy, providing space to exchange relations, information, products, and other elements between service providers and customers (Bowen, 2016). The service sector provides work for employees performing different kinds of services, i.a. related to trade, food, tourism (traditional services often not requiring high qualifications), as well as banking, medicine, law, or education (contemporary services, often specialized). The service sector deals with individual clients, households, companies, and even government institutions (Kisiel, Wiśniewska, 2016). Moreover, by using knowledge and modern technologies, it functions as the basis for the development of an information society and knowledge-based economy (Kwiatkowska, 2015). Service sector employees are therefore a valuable resource of an organization, contributing to its growth and strategic importance.

The essence of the service sector are the intangible aspects of the person offering a service which affects customer satisfaction – most often interpersonal skills, attitudes, and behaviours of the employee which rarely result from organisational procedures (Bowen, 2016; Kisiel, Wiśniewska, 2016; Morrison, 1996). This is why employee turnover in this area is especially tough on employers who are unable to quickly replace their employees or train others to create the same value as a qualified employee who left the company. "The people that organisations wish to retain are often the ones most likely to leave" (Armstrong, Taylor, 2017, p. 289). This quote suggests that it is especially important to retain talented and experiences employees, but in the context of the employee market and recruitment difficulties it is essential to manage all factors that promote overall employee retention.

Poor employee retention is caused by different factors which can be broadly categorised into internal and external. External factors originate outside of the organisation and incentivise employees to leave (e.g. higher pay, better development opportunities in a rival organisation). Internal factors reflect the functioning of the organisation, its management style, work system, employer branding quality, etc. While external factors are largely beyond organisation's control, it has a huge impact on internal factors. This is why it is important to manage those organisational factors so as to improve the employees' willingness-to-stay. According to Armstrong and Taylor (2017), employee retention is mainly affected by such organisational factors as employer branding, quality of work (terms and conditions of the working environment), leadership quality, social factors, learning and development opportunities, as well as performance recognition and rewards.

Still, the role of personal factors (personality, experience, age, financial situation, etc.) cannot be overlooked, for they can colour the employee's interpretation of the quality of work, social relations, or development possibilities. It is therefore worth taking a look at employee retention from a broader

perspective – as an expression of job satisfaction or dissatisfaction, which according to academic research is a major factor of employee retention (Mitchell et al., 2001; Van Vianen et al., 2004). Job satisfaction is usually perceived as the attitude resulting from the individual's reaction to the surrounding work conditions (Judge, Kammeyer-Mueller, 2012), which suggests the importance of both organisational and personal factors. One of the main factors that reduce job satisfaction is stress in the workplace (Jain, Giga, Cooper, 2013; Karabatak, Alanoğlu, 2019; Meier, Spector, 2013; Tuten, Neidermeyer, 2004). Work-related stress or, more broadly, occupational stress, is a result of an interaction between the work environment and the individual – various organisational factors and situations are assessed by the employee (consciously or subconsciously) and affect his emotional, cognitive, and behavioural reactions. Stressors in the workplace usually put the most psychological strain on employees and lead to anxiety, frustration, intent to quit, and job dissatisfaction (Spector, Jex, 1998). This indicates the importance of reducing occupational stress for employee retention.

2. Effect of organisational stress and organisational climate on employee retention in the service sector

Since employee retention hinges on both organisational factors and employee's personal traits, it is worth taking a look at the factors that put a strain on employees in the service sector and increase the level of stress they experience. Based on the job demands-resources model (Bakker, Nachreiner, Schaufeli, 2001), factors that put a strain on employees in the service sector (job demands) can be divided into three categories: job characteristics, organisational context, and personal factors (Lukić, Lazarević, 2018). Job characteristics include factors specific for a given job, e.g. straining interactions with clients; organisational context include organisational factors (superiors' management style, work overload, development opportunities, etc.); and personal factors include individual traits of each employee (age, personality, sex, etc.). Although management studies usually focus on organisational factors, psychological and sociodemographic context cannot be overlooked, because it has an effect on employees' perception of the workplace and their reactions to different stimuli.

In the service sector, interactions with clients are particularly stressful – clients demand from employees that they meet their needs, both on the cognitive, emotional, and behavioural level, which is especially demanding if the clients' requests stand in contradiction to the company's expectations of the employee or if they require putting in much time and energy (Dollard, Winefield, Winefield, 2003). The highest level of stress is caused by interaction with a so-called difficult client (Hannif et al. 2006). Additionally, work in the services is often emotionally straining, as it is characterised by intense personal interactions, the need to express various emotions in order to cause a desired reaction in the client, and the existence of principles of emotional expression in the organisations (Hochschild, 1983). Employees can cope with emotionally demanding job by modifying their internal experiences

depending on the situation (so-called deep acting) or artificially adjust their expression to suit the existing rules (surface acting) (Grandey, 2000; Gross, 1998). Surface acting is correlated with a higher level of experienced stress resulting from emotional and cognitive overload, which can lead to occupational burnout (Grandey, 2003; Springer, Oleksa, 2017).

Apart from personal and client-related factors, there are also organisational factors that can lead to increased stress, which can be divided into two categories: work content and work context (Leka, Griffiths, Cox, 2003). Work content includes factors specific for a given job, e.g. monotonous or unpleasant tasks, workload, time pressure, lack of control, or poorly organised shift work. Work context includes, i.a., job security (especially in developed countries, where many service workers, e.g. in the financial sector, have their own businesses, work under contract or as freelancers), disturbed career development, unfavourable organisational culture, poor relationships with co-workers and superiors, lack of support, experiencing injustice in the workplace, discrimination, mobbing, or harassment (Leka, Griffiths, Cox, 2003; Landsbergis et al., 2017).

A concept combining the feelings of employees with the assessment of organisational conditions is organisational climate. It is a set of observations and opinions shared by employees on managerial practice, procedures, relationships between employees and management staff, and other attributes of an organisation (Kopelman, Brief, Guzzo, 1990; Payne, Pheysey, Pugh, 1971; Rosenstiel, Bögel, 1992). The impression of the organisational climate is affected by numerous factors. According to Rosenstiel and Bögel, German researches who thoroughly studied the concept of organisational climate, there are six main dimensions of work that influence employees' attitudes and behaviours (Durniat, 2012):

1) Co-workers – relationships and mutual trust among employees;
2) Superiors –general impression referring to whether the management staff is oriented towards people or towards tasks (based on Blake and Mouton's managerial grid theory);
3) Work organisation – work structure, delegation of responsibility, and level of control;
4) Flow of information and communication – model of communication and level of information transparency;
5) Representation of employees' interests – respect shown to the rights of employees;
6) Remuneration and opportunities for development – promotion, training, evaluation.

In order to retain employees it is important to analyse the relationship between the level of perceived organisational stress and the willingness-to-stay, as well as in what way this relationship is affected by the assessment of organisational climate and its dimensions.

Thus, the author decided to verify the following hypotheses:

H1. The higher the level of organisational stress, the lower the willingness-to-stay.

H2. The willingness-to-stay is affected by the assessment of the dimensions of organisational climate.
H3. The assessment of the dimensions of organisational climate mediates the relationship between the level of occupational stress and employee retention.

3. Research design

In order to verify the hypotheses, a survey was conducted among a group of Polish service workers (N= 292) in the first half of 2019. The survey was conducted using three tools: two psychometric questionnaire and one questionnaire developed by the authors.

The level of organisational stress was determined using a Polish adaptation of the Perceived Stress Scale (PSS-10) questionnaire developed by Cohen, Kamarck, and Mermelstein, whose Polish version is called Perceived Stress at Work (Chirkowska-Smolak, Grobelny, 2016). The questionnaire comprises ten questions and the respondents are asked to mark their answers on a 5-point Likert scale. The validation study of the Polish version of the questionnaire (Chirkowska-Smolak, Grobelny, 2016) showed its high reliability; Cronbach's alfa coefficient was 0.85 (N=537). In the authors' own study (N=292) Cronbach's alfa was 0.71, which also shows high reliability of the questionnaire.

Organisational climate was assessed using Durniat's (2012) Polish adaptation of Rosenstiel and Bögel's Organisational Climate Questionnaire. The questionnaire comprises 55 statements; the respondents are asked to mark their response to these statements on a 5-point Likert scale. Polish validity studies showed very high reliability of the questionnaire; Cronbach's alfa coefficient (N=367) was 0.96 (Durniat, 2012). In the own study (N=292) the Cronbach's alfa coefficient was 0.97, which is also a very high result.

Employee retention was measured using a short questionnaire developed by the author which comprises four statements; the respondents were asked to mark their response to these statements on a 4-point Likert scale from "strongly disagree" to "strongly agree". The statements were supposed to determine the level of job satisfaction, which is one of the main determinants of employee retention, and the intention to leave, in line with the assumption that a thought "I intend to leave" often causes people to look for other offers and leave their job (Mitchell et al., 2001). The authors' own study (N=292) showed high reliability of the questionnaire; Cronbach's alfa was 0.92.

4. Sample

The sample comprised 292 employees working in the service sector in Poland. The authors decided to focus on the Polish labour market because of the change it has undergone in the last 20 years – from an employer market into an employee market. In 2000 the unemployment rate was 20%; now it is around 5% , at the same time, after Poland's accession into the European Union in 2004, over a million employees left Poland to work abroad (Lewandowski, Magda, 2018). In 2016, over 65% of Poland's GDP was linked to the service sector; the increase in the country's productivity is also largely due to the development of this sector of the economy (Kisiel, Wiśniewska, 2016).

Globalisation and increasingly accessible travel increases the mobility of workers and contributes to high fluctuations of people employed in the market. Because of this employers in Poland are facing a challenge of retaining their employees, especially those with experience and skills enough to ensure customer satisfaction.

Among the respondents there were 167 women and 125 men, including unqualified salespeople and customer advisors (N=95), qualified financial and insurance specialists (N=87), employees providing advisory and consultative services in various specialised areas, e.g. law, medicine, and IT (N=91), and employees working as education and training providers (N=19).

5. Analysis and results

In order to verify the hypotheses, the authors applied Pearson correlation analysis and linear regression as well as a parallel mediation model with two mediators. Pearson correlation analysis and linear regression were performed using a statistical analysis programme SPSS v26, and for parallel mediation the Process function V.3.4 was used (model 4). Employee retention (measured as employees' willingness-to-stay) was chosen as the dependent variable, and level of occupational stress as the independent variable. It was assumed that the mediator between these variables could be the dimensions of organisational climate.

The correlation analysis shows that employee retention (willingness-to-stay) is negatively correlated with occupational stress (r=-.416) and positively correlated with all dimensions of organisational climate (see Tab. 1).

Table 1: Pearson correlation coefficients between employee retention and other variables

Variable	Occupational stress	Co-workers	Superiors	Work organisation	Flow of information and communication	Representation of employees' interests	Remuneration and development
Employee retention	-.416**	.489**	.690**	.574**	.612**	.649**	.701**

Notes: ** p<0.001.
Source: Own elaboration.

The obtained correlation results show that as the level of stress rises, the willingness-to-stay (employee retention) decreases, and in the case of organisational climate as the assessment of its dimensions becomes increasingly positive, the willingness-to-stay increases as well. Thus, the results confirm H1 and H2.

The main aim of the study was to determine whether organisational climate can significantly mediate the relationship between occupational stress and employee retention. In order to identify those dimensions of organisational climate that could act as significant mediators, multiple linear regression was calculated (see Tab. 2).

Tab. 2. Multiple linear regression for employee retention

Model	R	R^2	Adjusted R^2	Std. error of the estimate
1	.733	.538	.535	2.54284

Notes: Predictors: (constant), remuneration and development, superiors.
Source: Own elaboration.

Two dimensions of organisational climate were included in the model: "superiors" and "remuneration and development opportunities". A significant regression equation was found (F(2.289)=168.199; p<.000), with an R^2=.538, which explained 53.8% of the variance in willingness-to-stay and shows the good fit of the model. The respondents' willingness-to-stay is equal to 1.043+0.235 (remuneration and development) + 0.133 (superiors). It means that when the assessment of remuneration and development opportunities increases by 1 point, the willingness-to-stay increases by 0.235 points, and as the assessment of the relations and management style of superiors increases by 1 point, the willingness-to-stay increases by 0.133 points. Thus, the author decided to perform non-parametric bootstrapping analyses in order to test the mediational model of "remuneration and development" and "superiors" assessment as parallel mediators of the relationship between occupational stress and employee retention (see Fig. 1).

Source: Own elaboration.

Fig 1. A diagram of the parallel multiple mediator model for the interaction between occupational stress and employee retention

Results based on 5,000 bootstrapped samples (with p-value <0.05 considered as statistically significant) indicated that the total indirect effect (which is the measure of the amount of mediation) is -.186. The direct effect of occupational stress on employee retention, independent of the proposed mediators, is -.067 (se=.027; p=.013), whereas the total effect (which is a total sum of direct and indirect effect of X on Y) is -.250 and has higher significance (se=032; p<.000). All coefficients of the model are presented in Tab. 3.

Tab. 3. Regression coefficients, standard errors, and model summary information for the parallel multiple model of the interaction between occupational stress and employee retention

		Dependent variables										
		M_1 (rewards and development)				M_2 (management style)				Y (employee retention)

Results shows that the mediators – remuneration and development opportunities along with the assessment of superiors partially mediated the effect of occupational stress on employee retention. This means that the significance of the path from X to Y is reduced when mediators are introduced, yet it remains significant. Thus, as the level of organisational stress increases, the willingness-to-stay decreases, but this decrease is more pronounced in employees who become increasingly negative about their development opportunities, remuneration, and management style of their superiors as they experience higher levels of stress. At the same time, the analysis partially confirms H3, because the mediation is not complete but partial, which means that the mediators do not fully eliminate the effect of organisational stress on employee retention.

6. Discussion

In accordance with the assumptions based on literature, the independent variable, i.e., the level of stress, is strongly correlated with the dependent variable, the willingness-to-stay. The higher the level of stress, the more reluctant employees are to continue working in their company, as confirmed by other studies (Hannif et al., 2006; Jou, Kuo, Tang, 2013; Lan et al., 2019; Malik, Shahabuddin, 2015).

Development opportunities and a sense of being appropriately rewarded as well as the management style of superiors turned out to be important mediators, in line with the results of other analyses. Development opportunities such as training courses and even opportunities to use one's own skills in one's job promotes a sense of control, and thus helps to better cope with job demands (Landsbergis et al., 2017; Singh, 2014). Offering training courses, skill development programmes, or opportunities to gain new competences required in one's job shows that the employee is appreciated and perceived by

the organisation as an asset worth developing in the long-term (Morrison, 1996; Singh, 2014). The results of analyses also confirm the assumptions of the effort-reward imbalance model (Siegrist, 1996). When employees put effort in their work, they expect a reward in the form of external incentives such as money, but also internal ones such as praise, which raises their self-esteem (Landsbergis et al., 2017).

As for the mediating role of supervision, the results show that employees who perceive the management style of their superiors as people-oriented rather than task-oriented expressed more willingness-to-stay. In the literature, employee retention is connected precisely with managerial support, which promotes better work efficiency and allows to establish satisfying relationships with co-workers (Singh, 2014). The research of Hannif et al. (2006) showed that adopting a unitarist management style, which induces obedience, procedure-orientation, and task-completion, impairs communication between subordinates and superiors and makes employees more prone to stress and stress-related conditions. On the other hand, partnership management promotes establishing support nets which moderate the experience of stress.

The conducted research shows that the selected dimensions of organisational climate only partially mediate the relationships between the level of stress and the willingness-to-stay. The results indicate that organisational factors can increase or decrease the effect of stress on employee retention, but they are not its main predictor. This means that if an employee is offered better financial terms or additional training, but his level of stress remains the same, his willingness-to-stay will probably increase, but not by much, and after a certain time it can decrease again if his level of stress is not lowered. In reality, an employee's level of stress is affected by numerous factors, including mainly work content, organisational factors, and personal factors (Lukić, Lazarević, 2018), which is why a change in organisational factors alone will not bring long-term effects in the case of employees in the service sector, for whom working with clients, ensuring their satisfaction, and meeting their needs are often the most demanding elements of their work.

The results broaden the literature on the relationship between stress, employee retention, and organisational climate, which often points to the key role of organisational factors in increasing or decreasing the level of employee retention (Lan et al., 2019).

7. Practical implications, limitations, and further research

The conducted research provides practical implications for service sector management. Paying attention to organisational factors, mainly such as remuneration, development opportunities, as well as the attitude of superiors and their approach to subordinates, can have a positive effect on the employees' willingness-to-stay and help to alleviate stress. It is important to adjust the organisational

climate to the needs of employees so as to reduce their strain and increase their resources – this can be done by offering training courses developing competences especially useful for service workers, e.g. dealing with a difficult customer, emotion control, or communications techniques. In the service sector it is often important to perform a particular task (in many organisations pay is also linked to results, e.g. bonuses for bringing in a client, commissions on sales), which is why superiors tend to be task-oriented. But in the case of working with a client, the result is affected by the employee's soft skills and his personality, attitude, which is why superiors should also be people-oriented – take care of their employees' needs, offer support, show understanding, especially in stressful situations. By ensuring that their employees feel comfortable doing their job, they can better influence the results they achieve than by constantly controlling efficiency rates and other measures. At the same time, the research shows that proper management of the work environment and motivational factors is not enough to retain an employee – because of the importance of the perceived level of stress it is crucial to ensure that the employee is not overloaded with the amount of work and a busy schedule and that he can develop the resources that will help him reduce stress.

A limitation of the research is the lack of an analysis of factors affecting the perceived level of stress in service workers and the size of the sample (N=292), which does not allow for a generalisation of the results. However, the sample was large enough to attain statistical significance of correlations and mediate effects.

In further research, it would be beneficial to expand the sample size and use measurement methods which will allow to study personal factors (e.g. temperament type or personality) and the assessment of work-content. This could broaden our knowledge about stressors in the service sector, and thus about the factors contributing to the willingness-to-stay, which, along with organisational factors, play a crucial role in employee retention. It is also important to monitor the economic situation and the non-organisational factors which affect the service sector and the employees' frame of mind – the current situation of a pandemic shows that any change in the external environment can severely affect the economy, the market, and the disposition of the workers.

Abstract

The paper proposes the presentation of preliminary research on the use of drones in precision farming so that Romanian farmers can get the optimization of agricultural production. Drones are currently widely used in international agricultural production, mainly in primary crop and livestock production. Demand for drones has increased significantly recently as drone costs have fallen and as drone software in agriculture becomes more sophisticated.The aim of this research is to highlight the importance of drone in agriculture on the basis of SWOT analysis, for monitoring and observing plant vegetation, in order to provide farmers improved crop management and production.

Keyword: Drone, precision agriculture, GPS, sensor

Introduction

Drones have become an integral part of smart agriculture (PA), helping farmers to face a wide range of challenges and to achieve an important number of economic benefits, related to the reduction of operating costs, by reducing uncertainty and the human resources involved in agricultural production. The success of agriculture normally depends on a variety of factors where farmers have little control and forecasting: Soil-climate factors, temperature, precipitation.The use of drone-based agricultural technology can become a real driver of progress for domestic farms. By gaining access to a vast amount of data, farmers can increase crop yields, save time, reducing the expenses through precision actions.Figure 1 shows the pattern of the use of drones in agriculture.

Fig. 1: Scheme of drone use in agriculture
Source: authors contribution

Global sales of drones were worth $ 8,5 billion in 2016 and are expected to exceed $12 billion by 2021 (EC- Digital transformation Monitor, 2019). Many industries continue to rely on increased dependence on drones in areas such as infrastructure, transport, security and agriculture. To better understand the use of drones in agriculture, let us take a closer look at the technology of a drone. Typically, a drone construction includes propulsion and navigation systems, GPS, sensors and cameras, programmable controllers as well as automated flight equipment. The technology used for UAV drones for agriculture is constructed in a way that allows them to collect more accurate information than the airplane and satellites are capable of collecting.Agritech drone-based software processes the data collected and delivers it in an easy-to-read format.The data collection process for the use of agricultural drones includes four steps (Fig.2).

Fig.2: The stages of data collection by drones
Source: Authors contribution

Currently most agricultural drones are medium size (typically used for analysis applications), while larger drones are used when a load is needed (e.g. for planting or spraying applications) however, all such equipment shall be used per season according to tab.1.

Tab.1 Use of drones by season

Season	Spring	Summer	Autumn	Winter
Tasks	*equipment preparation	*application of herbicides	*harvest	*acquisition

Source: EuropeanCommission, Digital Transformation Monitor, Drones in agriculture, 2018

About the history of drones use in Romania we have as an example the launch in 2014 of the project "using multispectral information in crop management" in Brasov , which led to the development of two other viable projects, namely: "Designing , implementing and experimenting with a system of acquisition , processing , storage and transmission of multispectral information (SAPSTIM) for the improvement of the management of agricultural crops" carried out by the university of Brasov and the second project:"Design, development and experimentation of a terrestrial multispectral mobile mecatronic system (SMMMT) for multispectral monitoring of the vegetation status of agricultural crops" at the Technical university of Cluj Napoca , Romania for short MANY CULTS.

Identification of the vegetation condition by multispectral images was possible due to the interaction of solar radiation with vegetation relative to the surface under investigation of the soil.the spectral domains with the best results in the monitoring of vegetation are located between 600-700 nm and between 750 – 1350 nm.

SWOT Analysis

Strengths

Drones and robots are the future of agriculture. Agricultural drones have substantially changed the traditional approach of agriculture and cultivation over the last 3-5 years and in some cases have completely restructured the way many farmers and other entities operate(Drone Deploy/CNH Industrial, 2017).In Romania are opperetead 18 robots per 10,000 inhabitants operate, twice as many as in 2014, but far fewer than in other European countries (Fig.3).

Fig.3 :Industrial robots/10,000 inhabitants Source: International Federation of Robotics,2020

INACO (Competitiveness Initiative) shows that only 1% of the companies active in Romania (Fig.4) in the agro-food industry use industrial robots – compared to the European average of 7%, with its performance: Sweden 31%, the Netherlands 22%, Denmark 16%, Slovenia 10% - in an analysis dedicated to the main challenges of agriculture 4.0, discussed at the Romanian Farmers' Club on 6 February 2020. Romania is the last in the EU in this respect in 2018.

Fig.4. Active enterprises in Romanian agri-food production using industrial robots Source: Eurostat, 2020

Drones supporters argue that for many applications their use will deliver faster and more accurate results than traditional processes and methods, which are generally based on a large human workforce. In addition to the expected speed and time gain for many tasks, drones are expected to bring significant cost savings compared to the employment of human workers. Such savings will be particularly visible in sectors where people have usually done difficult or dangerous work, as safety and compliance costs will be reduced or avoided altogether.The way in which drones can be used for agriculture:

- **Analyzes soil condition**

Smart farming is data-based and allows farmers to take action on the basis of accurate information about soil conditions. The extraction of this data subsequently involves visits on the fields and manual gathering of information. Equipped with intelligent sensors for agriculture, drones can collect and provide this data – in a quick and accurate manner.

- **Establishment of future crops**

The soil is prepared for establishment and a drone throws seeds on it, instead of using techniques to establish old crops. The use of drone for planting seeds is relatively new, however, some companies are experimenting with this approach. Unmanned aircraft can also spray fields with water, fertilizers or herbicides, reducing costs, manual labor and time spent with these processes.

- **Infection and pest control**

Agricultural drones are not only able to inform farmers about soil conditions using thermal, multispectral and hyperspectral technology, but can also detect fields that are flooded by weeds, infections and pests. Based on this data, farmers can decide on the exact quantities of chemicals needed to combat infestations and not only help to reduce expenditure, but also contribute to better health on the ground.

- **Atomization of cultures**

Smart farms also use drones to atomize crops, which helps the limit of human contact with fertilizers, pesticides and other harmful chemicals. Drones can manage this task faster and more efficiently than vehicles and planes; they are also an excellent alternative for farms that still use manual labor. Drones are also irreplaceable when it comes to treatment on site. They can detect sensor and camera infected

areas and work on them leaving the healthy part of the field intact. This not only saves time and increases security, it helps to reduce expenses.

- **Crop surveillance**

Agricultural fields take up large areas and it is often almost impossible to estimate the overall condition of crops. Using drones to map agriculture, farmers can stay informed of the plant health status in a given area and indicate which areas of land require attention. To estimate crops, drones inspect the field by infrared camera and determine light absorption rates. Based on accurate and real-time information, farmers can take measures to improve the condition of plants at any location.Drones can help farmers optimize their use of inputs (seeds, fertilizers, irrigation), react more quickly to threats (weeds, diseases and pests), save time for on-the-spot checks (treatment validation or other actions undertaken), improve their variable application in areas, fertilization / plant protection treatments for each crop, or for real-time estimation of crop yields.High resolution images and data taken by the drone overflying the agricultural land are collected and transmitted directly to the cloud / software made available to the customer. With this data, the user can select the desired information and make different treatment maps depending on the operation the farmer wants to do in the field. The maps can then be loaded onto agricultural equipment, which will adjust the amount of raw materials (seeds, fertilizers, pesticides) to be applied in the field accordingly.

Weaknesses

While the potential for using drones in agriculture is significant, there are still some notable impediments to their progress beyond the niche market it occupies today. Agriculture remains a difficult business, a small margin for many farmers, with governments often helping when the adverse effects of bad weather or difficult market conditions are felt. Despite their saving potential, drones still require substantial investment and technical expertise to be acquired and used properly, making it difficult to justify purchases for many small and medium-sized farms, which are less likely to benefit from large-scale savings.According to the MSA (Farmers' Social Security Organization in France), around 30% of farmers reported income below €350 per month in 2016. At present, drones used in agriculture are generally purchased and used directly by a farmer or farmers' cooperative (to share the costs). Alternatively, they can be operated by a company with drone technology and contracted by the farmer. Regardless of the ownership model, it is clear that drones will have to demonstrate that they can substantially and reliably improve existing processes before they are widely adopted.A standard drone for public use starts at € 1.300.In the agricultural sector, small drones without advanced technologies can be purchased from €2.000 - €3.000. Classic wing-type drones start from around €5.000-3.000, and special drones equipped with superior technologies used excusive for agriculture start from €20 000.

Opportunities

The digital revolution has the potential to profoundly change agriculture: Decision making becomes clearer, smarter and simpler. By combining farmer's instinct with state-of-the-art technologies such as drones, satellite images, variable application algorithms, high-tech sensors, mobile applications or GPS, a farmer can make better informed choices leading to higher yields. Drones can monitor any type of crop in any geographical area. This new technology in agriculture is expected to grow significantly over the next few years as drones offer a wide range of unique applications that improve precision farming.To find out the impact of using agricultural drones, CEMA – European Association of Agricultural machinery manufacturers has provided further answers to questions on the use of drones in agriculture:

Drones fly at an altitude of approx. 50 to 100 m. For more than 50 m in height, a special authorization is required. At present, the use of agricultural drones depends on national laws. However, an authorization is normally required. The packages offered by our specialized companies in the country generally include drone, training, a drone insurance and its authorization. A drone can fly in all weather conditions. Drones are water resistant, but image quality may be degraded if images are taken in rainy weather. This depends on the capacity and size of the drone. Fixed wing drones have longer flight time and can cover multiple fields in one flight. For example, 50 minutes of flight time will cover up to 12km².Drones can take pictures with a resolution of up to a few centimeters per pixel. Drone can

achieve greater image quality and accuracy in real time as they may fly below the cloud ceiling. In addition, a satellite can only provide images once a week or once a month when its orbit is above the

agricultural plot. The data collected by drones are translated into useful information that is easily understood by farmers, thanks to specific algorithms. Some of the formations provided by these images are: Density of plants: Number and size of plants, agricultural batch statistics, compromised or unsown plots.
Vegetative indices: Volume of leaves, detection of anomalies, effectiveness of treatment, infestations, influence of meteorological factors, etc. plant water requirements and drought damage.The agricultural drones provide continuous field monitoring of the crop from crop establishment to harvest.

Threats

- ***Carbon farming***

Covering and maintaining an ever-growing culture on agricultural land is a way to remove carbon (CO2) from the atmosphere and to store it on the ground - private companies invest and government programs develop incentives to do so, in a global carbon market estimated at usd 160 billion today.

- ***Microbial agriculture***

New findings show that microbes, such as bacteria, fungi, viruses and protozoa, have real potential for new developments in agriculture. The microbial agricultural market is estimated at $6 billion by 2022.

- ***Hyper-precision agriculture***

To maximize yields and profits in every inch, using only the resources the harvest needs, hyper-precision agriculture is developing, which is estimated worldwide to be around USD 10 billion by the middle of this decade.
SWOT analysis also has its limitations, as organizations can see some circumstances as very simple and overlook some key strategic contacts that may arise. Moreover, categorizing issues as strengths, weaknesses, opportunities and threats could be very subjective because there is a high degree of uncertainty on the market.

The prospects for using drones in Romania have led to the establishment of research institutions and numerous companies in recent years to develop and implement new technologies for drones. The first, the Institute for Training, Studies and Research - for unmanned vehicle systems (ITSC-SVFP) was founded in Medias, Sibiu in 2016 to promote and develop research, development and education models and to provide advice tailored to the specificities of unmanned vehicle systems.The Institute has developed the first online system that allows the registration of Romanian civil drone holders and operators, whether natural or legal, that allows the introduction, Modification and viewing OF PSPS flights in Romania.FAE roads is one of the Romanian companies with extensive experience in developing and providing solutions for drones, for applications from various branches of the economy: Topography, agriculture, industrial inspection, etc. FAE Dries also provides training services for the pilot of drones.

Currently, Romanian legal framework governing drone use, includes the following regulatory acts:
Civil Aviation Code (2016), Government Decision 912 of 25/2010, RACR-OPS LAAG (2009) , Civil Aircraft Regulation of Romania , RACR-A (2016) , RACR-AZAC (2010) and Law No 257 of 22 May 2001 "on action against aircraft using Romania's unauthorized airspace".

Conclusions

Drones are used in farms in Romania, but significant use has not yet been achieved. Role of drones inagriculture is important in both large and small production areas, with examples of the most common operations being water management and crop diseases Drone businesses will soon be able to offer services such as improving planting and crop rotation strategies. They can also provide a better understanding of how crops grow daily in different areas of a cultivated land.As a consequence, data quality is crucial and should be a key priority for decisions to use drones, while issues such as speed and flexibility of drones should only be secondary considerations.This extent of information on crops could make farms more efficient and help small organizations compete with large, better-developed agricultural organizations.A challenge for Romanian agriculture is the adoption of new technologies and innovative practices. But the solution to this problem requires Romania's support through its institutions and associations, along with European experience in this sector.

Abstract

Digital communication can contribute to a higher efficiency of organizations. This study aimed to describe the physicians' perceptions about the use of digital communication in Romania, with an emphasis on the strengths and challenges in implementing this kind of approach in daily care. Several advantages of digital communication were consistently reported: global scale, user-friendly profile, multi-shaped form, the role of facilitator in what concerns the therapeutic partnership and the progressive construction of more adequate protocols of care. Still, a number of challenges emerged as significant and potentially detrimental for the quality of care and wellbeing of patients: the low consistency of patient decisions across time, the short buying cycle of e-products, including digital communication, the novelty of the e-patient concept, the difficulty in controlling the quality of information delivered or received through digital communication, the risk of self-diagnosis and self-medication, and additional technical issues, related to the shift from classical communication to digital communication and back, GDPR, or the proper selection through DC of cases requiring special treatment. A lot of efforts should be still implemented for increasing the functionality of digital communication in health care systems and the long-term satisfaction of actors involved in the therapeutic process.

Keywords: digital communication in Medicine, advantages, challenges, physicians' perceptions.

Introduction

Successful medical organizations are preoccupied by the strategic alignment of the factors potentially enhancing their efficiency, as a whole, but also by the wellbeing of their members, taken individually. In terms of internal politics, these organizations are characterized by: (a) a continuous learning process at different levels; (b) emphasis on the creation and distribution of knowledge and information; (c) their ability to adapt to change, and (d) the capacity of their employees to improve the organizational performance by learning (Kim et al. 2015).

In practice, and especially in Clinical Medicine, the construction and maintenance of this kind of models is notoriously difficult. In the particular case of Romania, this is due to a number of historical and societal reasons, including conservative routines and traditions, chaotic procedures and regulations, and the low perceived benefit-cost ratio, among many health care employees, of working in such

environments. In these cases, individual "survival strategies" or ad-hoc group solutions are often preferred for managing the difficult relationship with patients (Popa-Velea et al. 2018) or for dealing with professional stress (Popa-Velea et al. 2014, 2019a). The mistrust in the ability of the organizations to deal with current daily problems many health employees face (such as burnout, exhaustion, or lack of motivation) is also highly prevalent (Popa-Velea et al. 2019b).

One possible way of overcoming these obstacles and counterproductive perceptions is the use of new technologies. This study focused specifically on exploring the perceptions about digital communication (DC) among Romanian physicians.

Method

This research aimed to describe the physicians' perceptions about the use of DC in Romania, making an overview of the self-reported strengths and challenges in implementing this kind of approach in daily clinical care. Previous research published in Romania on this theme in the last decade (2010-2020) was reviewed and thematic analysis was used for highlighting the key areas.

Results

1. Advantages

DC has been described by Romanian physicians as having a series of undeniable advantages. A significant part of them is also reflected in the international literature in the field:

- DC is *widespread,* meaning that it allows a large access to information, to both patients and physicians (Purcărea et al. 2014). The continue refinement of user interfaces and the increasing customer satisfaction in using digital instruments have developed constantly to the point they wiped away the original distinctions between "digital natives" and "digital immigrants" (Prensky 2001a, 2001b) and the stereotype considering younger generations as having the exclusivity in being "innately technology savvy and active users of digital media" (Davies et al. 2014; Hargittai 2010; Taipale 2016);

- DC is *user-friendly,* this increasing the probability to utilize it on a daily basis, but also to consider it reliable in case of emergency. Beside strengthening the physicians' existing professional networks, the convenient use of e-tools facilitates the emergence of *patients communities,* which are united by their will to find peers who share similar experiences, in order to ease their decision-making processes (Gheorghe & Liao 2012);

- DC is *multi-shaped* (fig.1) (Weiner 2012; Committee on the Future of Health Care Services, Institute of Medicine 1994), this making it suitable for many health professionals and patients, irrespective of their cultural background or education;

- DC allows an *authentic therapeutic partnership,* as patients using e-technologies are more comfortable seeking information about their disease and participating in their own care (Gustafson et al. 2001; Reents 1999);

- *DC facilitates the communication between primary and secondary health care providers,* allowing continuity, which can be of paramount importance (for example in shifting from curative to palliative treatments);

- DC allows the *implementation of artificial intelligence,* thereby lowering the risk of malpractice and *fostering the progressive construction of more reliable and valid protocols of care.*

Fig.1. Forms of digital communication in Medicine

2. Challenges

Despite these advantages, DC is also described by physicians as creating a number of challenges, which can evolve into real disadvantages, if not properly acknowledged and / or addressed:

- *the effectiveness of DC is variable across time and may largely depend on the context.* Thus, patient's willingness to purchase health care services is considered to be influenced by factors such as source credibility, message strength, perceived risk and usefulness of information. These factors may explain up to 70% of adherence variance (Purcărea et al. 2013). Particular attention should be paid in DC to the reinforcement of physicians' messages, with an emphasis on the match between the needs of the patient and the content of care;

- *the buying cycle of DC is much shorter,* this making problematic the building of interest and of loyalty towards a certain health care provider;

- the *concept of "e-patient" is brand new* for many physicians and health care systems: even if the devices exist, the therapeutic relationships may have not yet met the level of technology. The DC's improper use, with potentially negative consequences, may discourage many individuals in exploiting its full potential;

- *the control of the quality of information* delivered to the patient exclusively through DC can be problematic, as often there is no time to double check its interpretation;

- *technical issues may occur,* such as the difficulty in selecting cases for special treatments, the challenges regarding GDPR, or the continuous *shift from classical communication to DC and back,* which can be exhausting for many clinicians;

- *the risk of self-diagnosis and self-treatment* is always present in telemedicine or in any virtual type of communication, including the digital one.

In the particular case of Romania, a number of specific challenges are reported to complicate this landscape and offer a rather long-term perspective for the functional implementation of DC in health care (Mesko & Győrffy 2019; Purcărea 2010). Among these obstacles, the most important are the insufficient level of digital literacy and skills, the poor penetration of digital technologies in the bureaucratic apparatus, the low interoperability of digital communication services, and the high costs of building a system based in its entirely on digital technologies.

Conclusions

DC is a technology which is still perceived by physicians in Romania as having pros and cons. Despite this, most recent papers dedicated to this topic, written in national literature, emphasize the openness of health professionals to this kind of new technologies and their hope in the positive effect of DC on the quality of the health care system, and on the satisfaction of patients and physicians. DC could ideally bring to all of them a new sense of empowerment and engagement, but the preliminary action of managers and policymakers in this direction is decisive. Helpful vehicles for a smoother and efficient implementation of DC include, for example, extensive use of shared decision-making; management of patients through teamwork; dedicated training for physicians, so that they can address patients from distant locations and properly make use of their datasets; reshaping of the medical curriculum; preserving the general orientation of physicians towards personalized Medicine and compassionate healing, especially in chronic or demanding medical conditions; offering meaningful incentives to clinicians succesfully using DC; creating the possibility to patients and physicians to fully adapt to the cultural changes caused by DC (Purcărea & Vîrgolici 2014).

Strategic Management of Modern Family Businesses on The Example of Poland

Agnieszka PUTO

Czestochowa University of Technology, Czestochowa, Poland
agnieszka.puto@pcz.pl

Abstract

In all economies of the world, family businesses are an important component of economic and social systems. Due to the fact that they are the driving force of the development, it was decided to study more closely the issues related to strategic management in Polish family businesses The research intention of the article was to identify the forms of strategies applied by Polish family businesses and to determine priorities and factors taken into account when building it. The objective of the research is also an attempt to find the response to the question whether the selection of the appropriate strategic option is reflected in the accomplishment of the assumed strategic objectives.

Keywords: Family Business, Strategy, Development, Succession.

Introduction

Family businesses are an important component of economic and social systems. They are a significant driving force of development and create material prosperity and stable jobs. They create their future through the construction and implementation of the strategy. There is a range of specific characteristics which clearly distinguish family businesses from other economic entities and have a significant impact on the process of formulation and implementation of their strategy. The key factor is certainly the combination of ownership and management as well as the integration of the business area with the area of owner family. The outline of the article is the following. The first part contains the information related to the literature review concerning the description of family businesses, including definitions which indicate various criteria in defining family businesses. In the subsequent part, presenting the results of the empirical research conducted among Polish family businesses (n-121), selected problems of strategic management in the surveyed companies are discussed. The forms of the strategies applied are indicated as well as the significance of the components of the environment of enterprises in the strategy building as well as the impact of the applied forms of strategy on the implementation of the assumed strategic objectives. The last part is devoted to the conclusions and future research directions.

Literature Review - An Attempt to Define A Family Business

Family firms represent a significant economic force worldwide (IFERA, 2003). While the structure and number of family businesses is the subject of numerous debates, their significance in the economy does not raise doubts. Their share in the creation of GDP and employment are broadly defined (Abdellatif, Amann, Jaussaud 2010, p. 108; Patel, Pieper, Hair Jr 2012, p. 232).

Family businesses have been the subject of scientific research since 1964 when the article entitled *The Family Business* by R. G. Donolley was published in the journal Harvard Business Review Donelley defined a family business as an enterprise closely linked to at least two generations of one family in which family relationships directly affect the policy of the company as well as the objectives and interests of the family. Since that moment, in many publications, the attempts have been made to create a single universal definition of a family business (Harms 2014, pp. 280-314). P. Sharma (2014), in his article devoted to the current knowledge in the field of family business, draws attention to the existence of certain factors underlying the analysis of family businesses as

separate economic entities other than non-family businesses. These are specific control mechanisms, visions and resource development.

In family businesses, there is a combination of two diametrically opposed systems: the family and the company, which are characterized by different objectives and various value systems. The family is the objectives associated with procreation, ensuring the security of its members, and the business is financial objectives, rationality, enforcement of certain behavior and contribution to development in relation to its members. In the model of the contemporary enterprise, one cannot be limited only to two systems (family, business). Due to social changes (including demographic, intrafamily ones), complicating ownership relations, employing people from the outside, the third component of the system is introduced, i.e. ownership, which, among others, according to A von Shlippe et al. (2011, p. 22), results in the fact that relationships/conflicts on the line of ownership-family are more important that the one on the line of ownership-business.

In practice, there is a three-component model of a family business, which consists of:

- the family system, the components of which are family members, successive generations, with the main objective directed to family members,
- the economic system (company), consisting of all employees, managers, customers; its task is to accomplish the objectives pursued by the company,
- the value system, the components of which are all the company owners – both family and non-family members.

The definitions of family businesses which can be found in the subject literature take into account the specificity, principles and standards of the operation of family businesses and describe basic relationships between the aforementioned components. A comprehensive catalogue of the characteristics of family businesses is presented in the research by Del Giudice (2017), Maloni et al. (2017), Sousa Paiva et al. (2016), Cucculelli & Bettinelli (2016). Some definitions, as the filtering criterion, indicate the strength and durability of family involvement (in work/management and/or capital). Other authors emphasize that family and business relationships must relate to at least two generations (at least one successful succession) to talk about a family business. Sometimes only capital involvement is pinpointed and/or current management of the company (compare: Table 1).

Table 1: Examples of diversity of criteria for defining family businesses

Criterion	Author	An example of the definition
Ownership	R. Donckels, E. Fröhlich	The company is a family business if family members have at least 60% of the capital.
	M.A. Gallo, J. Sven	The family business is the one in which family members have the legal control of ownership.
Ownership and management	P. Davis	Family businesses are the ones the policy and direction of development of which are the subject of a significant influence of one or several families; this impact takes place through ownership and sometimes through participation of family members in management.
	M. H. Stern	The family business is the company owned and managed by the members of one or two families.
Intergenerational transfer	C. Churchill, K.J. Hapten:	The family business is the company in which a younger family member has or will take over the control of the company

		from senior members.
Diversity	R. Beckhard, W. J.Jr. Dyer	The family business is the company which consists of independent subsystems: the company as a whole, the family as a whole, the founder and the board.
	J. J. Chrisman, J. H. Chua, P. Sharma	Differentiate between definitions that focus on family business components, such as ownership, governance, management, and transgenerational succession, and those focused on what a family business is, including the intent of the family to keep control, firm behavior, and idiosyncratic resources arising from family involvement.
	B. Villalonga, R. Amit	Argue that most definitions include at least three dimensions: one or several families hold a significant part of the company's capital; family members retain significant control over the company (e.g., distribution of capital, voting rights) with possible statutory or legal restrictions; and family members hold top management positions.

Source: Own study based on Donckels, Fröhlich (1991); Gallo, Sven (1991); Davis (1983); Stern (1986); Churchill, Hapten (1987); Beckhard, Dyer (1983); Villalonga, Amit (2004); Chrisman, Chua, Sharma (2005).

To sum up the above definitions, it can be concluded that the company, in order to be defined as a family business, must fulfill the following conditions:

- family members must participate in active management of the company,
- there is the advantage of ownership of family members in the company,
- the development of the company is based on successive generations, which means that the company is or is planning to be owned by the family.

When analyzing these characteristics, one must agree with I. Lansberg (1983, pp. 39–49), who suggests that the owner family has an impact on the company in the manner unattainable for family members in companies not belonging to the family. It is precisely the involvement of individual family members in conducting the business that makes it different from the others (Miller, Rice, 2002, p. 44).

A family business can be defined as a business governed and/or managed by a dominant coalition controlled by members of the same family who shape the vision of the business with the intention of transferring it across generations of the family (Chua, Chrisman, Sharma, 1999). Thus, the family nature of a business is essentially determined by the cultural and behavioral aspects introduced by the controlling family, whose members strive to achieve and/or maintain intra-organizational family-based relationships (Chrisman, Chua, Steier, 2005; Litz, 1995; Zellweger, Eddleston, Kellermanns, 2010).

It is also worth indicating a very sensitive aspect of family businesses, namely family succession, the description of which can be found in many references (Baù, Hellerstedt, Nordqvist, Wennberg, 2013). The long-term perspective of business operations conducted by successive generations is the basis for the survival and development of the family business. Succession, which is often a turning/critical point in the life cycle of each family business, consists in the preparation of the company for intergenerational transfer (Suess-Reyes, 2017). In its case, the human factor gains value, which is represented by both employees and family members, often not formally related to the

company. Management succession in family businesses is a vitally important and complex phenomenon in most family businesses (Blumentritt, Mathews, Marchisio 2012, p. 57).

Method

Research context and the population of Polish family businesses

Family businesses are a challenge to contemporary scientists. The first problem they face is a uniform separation of these entities from all entities operating in the market so that the obtained results can be comparable. Due to the fact that, in any Polish legal act, there is no accepted definition of family businesses and in addition there is no consensus among the researchers of the phenomenon, it is difficult to give the number of these enterprises. In Polish realities, family businesses have become the subject of the research relatively recently. It must have been affected by the fact that the Polish economy has become a free market economy only after the economic transformation. In 1989 private business activity was legalized, which resulted in massive setting up companies.

In 2016 the Family Business Institute began the implementation of the project „Family business statistics" under the Program for the Competitiveness of Enterprises and SMEs (COSME) 2014–2020, which was to determine the share of family businesses in the total number of enterprises in Poland. The data presented in the publication indicate that 36% of the surveyed Polish enterprises declare that they are family businesses. These companies generate 18% of GDP to the Polish economy (Lewandowska 2016). Against the background of other European countries, it is relatively low, however, it is worth pinpointing that the authors of the research asked whether entrepreneurs considered themselves as family businesses. In the presented Report, there are some inconsistencies since the same group of the surveyed enterprises, asked about who owned their company, in 92%, indicated that it was in the hands of the family. Therefore, 92% of the companies are "potentially family" businesses, i.e. the ones whose owners are families, however, for some reasons, these companies do not admit to being family ones. For comparison, the social significance and contribution to the generation of GDP in selected countries of the European Union are illustrated in in Table 2.

Table 2: Family businesses in selected European countries

Country	The share of family businesses in the total number of enterprises	The share of family businesses in generation of GDP	The share of family businesses in employment structure
France	85%	65%	50%
Italy	85%	80%	75%
Spain	90%	70%	70%
Germany	91%	55%	57%
Sweden	86%	45%	56%

Source: based on the scientific expertise developed for the needs of the Supreme Chamber of Control [https://www.nik.gov.pl/aktualnosci/firma-rodzinna-czy-to-moze-sie-udac.html accessed on 09.303.2020]

The research into Polish family businesses is hampered by the fact that this group includes both small family businesses, consisting of several people, and also large entities, often conducting their operations internationally, in which the functions of ownership and control are performed by the family. As indicated by the research, family businesses are mostly microenterprises with the local coverage, which are 10-20-year-old, where the owner is male and, in the company's structure, there is no isolated board. Such enterprises operate in wholesale and retail trade and industry. The predominant sectors for family businesses in Poland are wholesale and retail trade (32.2%), industrial processing (16.3%), construction (11.9%) and professional activities (10.6%). From the point of view of classification, it is important to assess the shares in the family ownership. The vast majority, since as much as 92% of business families in Poland, has more than 50% of shares in business, which

corresponds with the size structure of family businesses. Such a package is possessed by micro- and small enterprises. The ownership package below 25% is owned by medium and large enterprises. The owners of family businesses in Poland are primarily male (69%), however, in nearly 1/3 of enterprises, the owners are female. This is consistent with global trends (Lewandowska 2016).

Research Objectives

Having in mind the above context concerning the significance of family businesses in the economy and how significant this number of enterprises is, the research was intended to identify the forms of strategies applied by Polish family businesses and to specify priorities and factors taken into account when building it. On the basis of the previously established knowledge, the objective of the research was an attempt to find the response to the question whether the selection of the appropriate strategic option is reflected in the possibility of the accomplishment of the assumed strategic objectives.

Methodological Assumptions and Demographic Characteristics

In order to explore the issues associated with strategic management in Polish family businesses, the survey was conducted (December 2019 - January 2020), covering a 121-person group of owners (successors and seniors) of family businesses. The research tool was the previously prepared survey questionnaire for the purposes of verification of the research assumptions. The questionnaire contained 29 questions concerning both the issues related to strategic management, the strategy itself, the degree of strategy formalization, the impact of the environment on the company's operation, development prospects. The questions also concerned the issues related to the specificity of family businesses, i.e. the practiced model of the family business or the approach to succession.

The research objective was an attempt to identify and define the strategic context of contemporary family businesses operating in Poland.

The characteristics of the respondents indicated that, among the surveyed companies, the prevailing group was the companies hiring fewer than 10 people (57%). Most companies were service providers (72%). The structure of the enterprises in terms of legal personality is similar to the structure of the Polish economy. In this group, the majority is sole proprietorship (57%). Half of the companies were operating in local markets. The detailed structure is presented in Table 3.

Table 3: Structure of the surveyed companies

Classification criterion	Specification	Percentage share
Number of employees	fewer than 10 employees	57%
	10-50 employees	14%
	51-250 employees	29%
Dominant industry	Services	72%
	Industry	28%
Legal personality	Sole proprietorship	57%
	Civil company, general partnership	14%
	Commercial company (Ltd./S.A.)	29%
Range of operation	Local	50%
	National	36%
	European	7%
	Global	7%

Analysis

One of the components of the general division of enterprises into family and non-family ones is often related to the unaware consideration of family businesses as a homogenous group of entities. Enterprises can be distinguished from each other in terms of the degree of personal and capital involvement of the family, a different share of "strange" components in the ownership and management structure, predominant management style, relationships between employees, level of entrepreneurship and others. When analyzing these factors, it is possible to determine at which stage of development the surveyed family businesses are (more: K.E. Gersick et al., pp. 15–24). Polish companies are in the first stage of development. They are mostly characterized by the founder ownership structure. They are managed by the first generation and thus by the business founders (57%). These entities belong to the owners.

In most of the surveyed companies, the company's owner and founder (in one) is involved in conducting the business (57%). The companies belong to the owners (50%). They are characterized by high entrepreneurship (43%), non-formalized communication (38%) and participatory management style (71%). Participatory management style indicates the fact of the gradual transition of the company to another development stage, i.e. family partnership structure (compare: Table 4). Family partnership is associated with the transfer of shares in the family business to the close family members, usually of the next generation (50%). The company is characterized by an increasing degree of formalization (14%), participatory style dominance (71%) and declining entrepreneurship. Another ownership structure is family consortium related to the dispersion of shares between a greater number of family members of a different degree of kinship. The area of corporate governance becomes complicated. Communication takes formalized forms (14%), where the professional management style predominates (7%).

Table 4: Ownership structure in Polish family businesses

Classification criterion	Specification	Percentage share
Involved family members	Owner and founder in one	57%
	Owner (founder) and a child/children	29%
	Siblings or another narrow group of the close kinship	10%
	A larger family group of a different degree of kinship	18%
Ownership generation	The first (founder)	50%
	The first and second	43%
	The second and/or above the second	7%
Relationships between employees	Non-formalized	38%
	Gradually increasing formalization	14%
	Formalized	14%
Level of entrepreneurship	High	43%
	Average	50%
	Low	7%
Predominant management style	Patriarchal	21%
	Participatory	71%
	Professional, corporate	7%

Source: Own research

The above research results confirm that, due to the time of emergence, most Polish family businesses are at the stage of founder entities for which the strategic challenge becomes the first succession. In

the case of half of the surveyed companies, the owners are planning to transfer the business to their children (50%). There is also a small group of the companies planning to sell (8%) or to liquidate the company (6%) (compare: Figure 1).

Fig. 1: Type of succession planned

Source: Own research

Succession is one of the most important components of the strategy. Its planning may demonstrate a conscious approach to strategic management. Creating and implementing an effective strategy is the basic most important challenge of each company and, in particular the one which wants to grow. It does not matter if this strategy takes the form of expanded documents or if it is a set of well-established thoughts and intuition of the main decision-maker/owner – it must simply exist as the determinant and main factor of the existence and development of the company. In the case of Polish enterprises, in most companies, the strategy exists while taking different forms; 1) it is manifested only in the form of oral transmission, employees are to know what vision of development the company's owner has (36%), 2) it is a set of a number of documents, materials, analyses (36%), 3) it is a single document in which it is accurately described (14%). Unfortunately, in more than every fourth company (21%), the owners claim that there is no such thing as a strategy (compare: Figure 2).

Fig. 2: Percentage of indications of the form of the applied development strategy in the surveyed enterprises

Source: Own research

The research results indicate that Polish family businesses are willing to take individual decisions, often of the key importance for the development of the entire business. Family business owners do not formalize some processes, thus not allowing all in the company to be aware of the motives behind fundamental changes in the company. Such behavior may become the reason for conflicts again: both in the area of the family and the entire family business, bringing about a decline in motivation, involvement and identification with the most important aspects of the family business operation.

In the processes of shaping the development strategy from the perspective of the surveyed entities, the most important was the possibility of extending the company's offer – this priority was indicated by nearly half of the respondents (49%). The respondents also indicated expanding the business to new areas of operation (24%) and entering new geographic markets (21%). The surprising results were obtained in the case of the maintenance of the achieved market position and an increase in the company's value since these priorities were usually indicated as the most significant (compare: Figure 3).

Fig. 3: Priorities taken into account in building the development strategy in %
Source: Own research

The company's development is not a spontaneous phenomenon, it depends on external operating conditions and capabilities of the company. The analysis and scanning of external environmental factors are necessary to capture changes in the market and most of all, to quickly respond to these changes. The flexibility of the strategy involves the ability to follow the changing environment. Currently, most of the scientific papers related to strategic management describe and proclaim agile enterprises, with the dynamic and flexible reorientation of the strategy in relation to the changing environmental conditions. The ability of the company to respond to changes through the adaptation and modification of current organizational activities as well as business models will allow for maintaining its market position. On the other hand, the lack of monitoring of the environment is one of the symptoms of the reckless approach to the conducted business activity. It can be associated with the uncritical implementation of the assumed strategic objectives of the company, but it seems to be a task which, in the long term, will not bring the assumed expectations. In the opinion of the respondents, more than 57% of those questioned indicate the priority of monitoring competitors and the environment in the company's operations (compare: Figure 4.).

Fig. 4: Significance of the analysis of the environment in building the strategy
Source: Own research

The respondents were also asked about the essence and significance of the factors taken into account while observing competitors. The essence of each factor could be rated using the 5-point Likert scale. The structure of responses is presented in Table 5.

Table 5: The essence of factors taken into account while observing the activities of competitors in % on the 5-point scale

Specification	[1]	[2]	[3]	[4]	[5]
Product/service	70	23	0	7	0
Price	64	29	0	3	4
Product/service quality	81	12	7	0	0

[1] Definitely important; [2] Rather important; [3] Difficult to say; [4] Rather unimportant; [5] Definitely unimportant
Source: Own research

The conducted research indicates that only every fifth company does this very often. Half of the companies claim that often (50%), and every third that occasionally. Family businesses analyze all the important aspects of conducting a business activity compared to the operations of competitors. The research results may indicate that family businesses are aware of the significance of the analysis of the competitive environment in building the development strategy. The factors such as:

observation of the competitor's product/service (70% - definitely important and 23% - rather important); price (respectively 64% and 29%), product/service quality (81% and 12%) are the most important in the process of observation. There are three components which are definitely most often taken into account while creating the commercial offer as well as when building future development plans. Half of the companies could not decide on whether they analyzed building relationships with customers by competitors (50% - difficult to say). The companies also do not notice that, in building competitive advantages, sponsorship and social activities are important (38% - rather unimportant and 21% - definitely unimportant).

The findings of the research into the results obtained in the last three years indicate that success in the form of an increased interest in the products offered was achieved by a very large group of enterprises (86%) – see: Figure 5. This result was recorded by small enterprises with the number of employees below 10 (40% of all indications), which mostly deal with services, (76%), are characterized by sole proprietorship (45%) and operate in the domestic market (47%) – compare: Table 6).

Fig. 5: Results achieved by Polish family businesses in years 2016-2019

Source: Own research

More than half of the companies indicated an increase in the sales value of products as their success (57%). These are also mostly small enterprises (47%), dealing with production (70%), conducting their activities as a commercial company (44%), operating in the domestic market (38%). A small number of companies (14%) indicated the implementation of the process of inclusion and transfer of key areas of their operation to external entities as their success. These were medium enterprises (100% of indications), primarily operating in the production industry (96%), in European (47%) and international (49%) markets.

Table 6: Results achieved by Polish family businesses in years 2016-2019 depending on the distinguished characteristic features of enterprises (% of indications)

Classification criterion	Specification	Increased interest in the company's products	Increased sales value of products	Improved reputation of the company	Increased profitability of the company	Increased value of investments	An increase in the number of employees	Entry into a new sector	Outsourcing of key areas of operation
		Percentage of indications (%)							
Number of employees	fewer than 10 employees	40	47	36	45	24	0	4	0
	10-50 employees	22	8	29	4	24	30	6	0
	51-250 employees	38	45	35	49	52	70	90	100

Verification of the hypotheses

When verifying the hypothesis that possessing the defined and detailed strategy for the company's operation is, in the respondents' opinion, a tool to achieve the assumed strategic objectives, the following sub-hypotheses were formulated:

I. possessing a single document in which the company's development strategy is written – in the respondents' opinion has an impact on:
   a. increased interest in the company's products
   b. increased sales value of products
   c. improved reputation of the company
   d. increased profitability of the company
   e. increased value of investments
   f. an increase in the number of employees
   g. entry into a new sector
   h. outsourcing of key areas of operation

In order to analyze the relationships between the selected variables for each combination of variables, the Pearson's correlation coefficient r was calculated, at the assumed significance level of α=0.05.

Table 7: Value of correlation coefficients for sub-hypothesis

Sub-hypothesis testing		Vale of Pearson's correlation coefficient
a)	Possessing a single document in which the company's development strategy is written and increased interest in the company's products	0.356
b)	Possessing a single document in which the company's development strategy is written and increased sales value of products	-0.076
c)	Possessing a single document in which the company's development strategy is written and improved reputation of the company	-0.051
d)	Possessing a single document in which the company's development strategy is written and increased profitability of the company.	0.312
e)	Possessing a single document in which the company's development strategy is written and increased value of investments.	0.503
f)	Possessing a single document in which the company's development strategy is written and an increase in the number of employees.	0.285
g)	Possessing a single document in which the company's development strategy is written and entry into a new sector.	-0.040
h)	Possessing a single document in which the company's development strategy is written and outsourcing of key areas of operation.	0.371

Source: Own study.

When adopting the following five-dimension description of the strength of the relationship between the analyzed variables:

- (0 – 0.2) - no relationship,
- (0.2 – 0.4) - poor relationship,
- (0.4 – 0.7) - moderate relationship,
- (0.7 – 0.9) - significant relationship
- (0.9 – 1.0) - very strong relationship,

it should be concluded that one may talk about the existence of only, at most, moderate relationship between possessing a single document in which the company's development strategy is written and increased value of investments. The relationships between 1) possessing a single document in which the company's development strategy is written and increased interest in the company's products; 2) possessing a single document in which the company's development strategy is written and increased profitability of the company and 3) possessing a single document in which the company's development strategy is written and outsourcing of key areas of operation are poor. This also applies to the relationship between possessing a single document in which the company's development strategy is written and an increase in the number of employees.

The results of the empirical verification indicated that in the case of 1) possessing a single document in which the company's development strategy is written and increased sales value of products, 2) possessing a single document in which the company's development strategy is written and improved

reputation of the company and 3) possessing a single document in which the company's development strategy is written and entry into a new sector, the variables are not correlated.

Conclusions

In the face of changes which are inevitable and taking place at an accelerating rate, family businesses must respond to challenges of the new, variable reality. To be able to skillfully manage changes and direct the company towards innovation and development, it is worth becoming aware of the fact that the strategy is actually the starting point for any major change in the enterprise. The beginning of the strategic process is associated with verifying the efficiency of operations already functioning in the company and often, at this stage, certain shortcomings, inconsistencies and inaccuracies come to light, the solution of which is fundamental for the implementation of changes related to the entire company.

The obtained research results suggest that the strategy of Polish family businesses functions as a set of documents, analyses and materials and in the form of oral transmission rather than a single written document. The main directions of development of enterprises are most of all the desire to expand the offer of companies and to extend business to new areas of operation. Interestingly, entrepreneurs hardly take into account an increase in the market share or an increase in goodwill. The highly competitive environment of enterprises requires careful observation of competitors, primarily in terms of the products and services they offer, their quality and also the price.

The current situation caused by the economic crisis related to the global pandemic COVID19 indicates that the previous conclusions from the conducted research may have been devaluated. The future direction of the research is to study how the issues related to succession planning and the path of development of family businesses have changed in the face of the existing changes. It is worth looking at this problem by comparing the economies of different countries, paying attention to what has been important in strategic management so far and what new strategic challenges are posed to enterprises by new realities. The research results presented in the article are the starting point in relation to new economic challenges.

LCC As A Tool for Assessing Sustainable Business in Circular Economy on The Example of Recycling Industry in Poland Under the EU Project CIRCE 2020

Dr. Dawid GARSTECKI, PhD

Poznan University of Economics and Business, Poznan, Poland
dawid.garstecki@ue.poznan.pl

Abstract

Transition towards the circular economy, a core priority of the EU 2020 Strategy, is particularly relevant for central European industrial areas due to the outstanding use of primary natural resources in various production stages: processing, packaging and transportation. The aim of CIRCE 2020 project is the realization of a set of pilot actions based on the results of local surveys in order to identify the unevaluated waste streams using innovative instruments derived from the MFA, LCC and LCA analysis. The purpose if this paper is to present the results of the LCC analysis of two case studies of Polish companies from the recycling industry. Each case study contains two solutions – BaU (Business As Usual) and CE (Circular Economy). LCC analysis in the first case study covers multi-layered plastic. Current treatment of multipolymer waste is landfilling (BaU). In the CE solution multipolymer waste become the input to the conversion process, include regrinding, shredding, mixing and thermic processing. As an output polymer board is generated, that may be treated as a finished product. LCC analysis in the second case study covers highly contaminated or heavily printed plastic (mostly packings - foils) that cannot be recycled in the traditional way. Current treatment of unpure waste is landfilling (BaU). In the CE solution plastic waste become the input to the extrusion process, which allows to use a different combination of plastic waste. As an output the terrace board is generated. The overall conclusion indicates the efficiency of using the circular economy solution. The LCA analysis showed environmental effectiveness in both case studies, the LCC analysis showed the economic effectiveness of the first case study. The LCC results come from the author's own calculations as LCC expert in the CIRCE 2020 project in Poland.

Keywords: Circular Economy, Life Cycle Costing, Recycling, Activity-Based Costing.

Introduction

In recent years, there has been a significant increase in publications in the field of corporate social responsibility. Generally, CSR represents the impact of an entity on the economic, environmental, and social areas in which it operates (Golub, Podnar, Elving, Nielsen, Thomsen and Schultz 2013, p.177). Those three areas con not be skipped, because companies cannot conduct business in isolation from the environment and the needs and expectations of all stakeholders – both internal and external (Matten and Moon 2005). It must be stated, that "the increasingly important role of socially responsible management has been recognized, which in the long term should guarantee sustainable development, that is, one that achieves the objectives of the company while taking care of its environment – the environment being key

to the company's operation" (Garstecki, Kowalczyk and Kwiecinska 2019). This study focused precisely on the recycling activities as a form of circular economy.

One of the most interesting topics of broadly understood social responsibility is the circular economy. There is a tendency to minimize the environmental impact of business operations. The use of recycling becomes one of such activities. This article presents the results of LCC analysis in two Polish recycling companies that have switched to a circular economy. Each case study was carried out in two solutions - business as usual (BaU) and circular economy (CE). The study is the result of two-year research in the CIRCE2020 project.

Transition Towards Circular Economy

Undoubtedly, economic progress has more or less a negative impact on the environment. However, in recent years there has been an increased interest in corporate social responsibility. It can be stated that one of the many areas of corporate social responsibility is an attempt to minimize production waste and its subsequent storage or incineration. Recycling is becoming more and more important (Zhao 2018) as production waste is reused. According to recent publications "the circular economy (CE) proposes that all materials flow in a close-looped system. Waste generated by one production stage may be useful in another. Thus, the idea of a CE is linked to the goal of zero waste (ZW) and promotes a range of sustainable economic, social and environmental benefits in each sector" (Li, Meng, Leung, Zuo, Tang and Wang 2018). There are several benefits of circular economy (Sehnem, Vazquez-Brust, Pereira and Campos 2019):

- environmental,
- economic,
- operational,
- social.

As we can see, circular economy affects three basic corporate social responsible fundamentals – environment, economy and society. There is a linear relationship between circular economy and CSR (Scarpellini, Marin-Vinuesa, Aranda-Uson and Portillo-Tarragona 2020).

Some authors also point to the fact that circular economy is part of industry 4.0 (Cezarino, Liboni, Stefanelli, Oliveira and Stocco 2019) and highlight positive influence from improving business sustainability by reinserting waste into the supply chain in order to manufacture products on demand (Nascimento, Alencastro, Quelhas, Caiado, Garza-Reyes, Rocha-Lona and Tortorella 2019) in different industries, like fashion (Hvass and Pedersen 2019; Sandvik and Stubbs 2019).

Recycling can be analyzed from the perspective of its impact on the natural environment and the economic situation of an enterprise that applies the principles of circular economy. It is obvious that no company will implement the circular economy if it would be unprofitable even in the long run. Therefore, it is important to assess the environmental and economic benefit of the circular economy together. This approach was used in the CIRCE2020 project.

The aim of the CIRCE2020 and basic assumptions of Polish case studies

Transition towards the circular economy, a core priority of the EU 2020 Strategy, is particularly relevant for central European industrial areas due to the outstanding use of primary natural resources in various production stages: processing, packaging and transportation. The aim of CIRCE 2020 project is the

realization of a set of pilot actions based on the results of local surveys in order to identify the unevaluated waste streams using innovative instruments derived from the MFA (Material Flow Analysis), LCC (Life-Cycle Costing) and LCA (Life-Cycle Assessment) (CIRCE2020). Therefore, the project aims to change the economic path from linear economy to circular economy (CIRCE2020).

Identification and verification of the most relevant industrial waste streams in Wielkopolska region (Polish state) were the initial stages of the CIRCE2020 project. Reaching this goal was possible due to the MFA (Material Flow Analysis) step. Data for the MFA analysis were obtained from the Wielkopolska Marshal's Office and they came directly from companies producing and managing industrial waste.

Taking into consideration the specificity of the studied region economy, the largest waste streams are those generated by sorting of paper and cardboard, ashes and various mixed plastics. Multi-layered plastics and mixed plastics are often contaminated and hard to separate and as such cause difficulties during sorting and recycling. For this reason, improving the reuse and recycling rates for plastic waste is still challenging and gives a lot of space for development of new waste-treating technologies. Due to the above it was decided to put a lot of emphasis on the MFA analysis of this type of waste.

Out of eleven analysed waste streams, up to five were plastic waste, including two streams (EWC: 15 01 02 - plastic packaging, 15 01 06 - mixed packaging waste) have the higher generation parameter indicator of all studied streams (respectively 60.6 and 20.1 thousand Mg produced in 2016). Moreover, several following factors had great impact on the decision to select waste plastics (especially multi-layered plastics) as the most promising stream for the LCA and LCC analysis:

1) plastic waste is a major environmental problem, and therefore the aim is to eliminate plastic landfilling and minimalize its energy recovery,
2) low level of recycling (in the case of 15 01 06 - less than 3%),
3) large expected drop in the amount of generated waste after applying new technological solutions,
4) possible diversion of some waste stream parts for recycling or material recovery instead of energy recovery,
5) openness, fast decision-making process and positive attitude to the idea of the CIRCE2020 project by the stakeholders and the related good data availability for LCA and LCC analysis.

Results of the LCC analysis

First Case Study

LCC analysis in the first case study covers multi-layered plastic. There are a lot of multi-layered plastic products that are delivered to the recycling facilities (packagings, construction elements, pieces of equipment, etc.). Another source of multipolymer waste is the rest fractions coming from recycling processes on the sorting line. Such waste is not homogenous material and it is very difficult to recover individual polymers to process them and to produce regranulates.

Current treatment of multipolymer waste is landfilling (BaU), which means that multipolymer waste goes directly to the landfill. The other option (less likely) is RDF production. RDF is usually used in cement factories or lime works with rotary kilns, where adding RDF allows to replace conventional fossil fuels. This solution was not applied in the study.

In the identified CE solution multipolymer waste become the input to the conversion process. Physical treatment allows to use a different combination of multipolymer waste to produce plastic plates. The main

technological processes include regrinding, shredding, mixing and thermic processing. As an output polymer board is generated, that may be treated as a finished product. What makes recovered product valuable is the potential possibility of many applications, e.g. as a building material or a cargo-transport unit. For example, it is an excellent substitute for original board protected top layer of ground in pigsty.

The main goal of the study was the cost assessment of the plastic board production from multipolymer waste in two solutions: existing business as usual (BaU) and circular economy (CE).
The system boundary of LCC study carried out for the BaU scenario includes processes that occur in the end-of-life stage of multipolymer waste (material composition: HDPE 30%, PP 30%, PC 10%, PA 10%, ABS 10%, Aluminium foil 10%). In the BaU scenario the process of landfilling is considered (Figure 1). The recycling company doesn't run such a process, has no influence over it and as well no access to the specific information (background system). BaU_2 is not included in the LCC study. In BaU solution the system expansion is applied - production of the conventional polymer board, for which secondary data set is used.

Fig. 1: System boundaries of BaU solution (CASE 2)

The system boundary of LCC study carried out for the CE solution includes processes that occur in the stage of plastic board production from multipolymer waste (Figure 2). Following technological unit processes are taken into account:

- shredding,
- regrinding,
- mixing,
- thermic processing.

In the scope of carried LCC study internal transport and packaging process also are included. All above-mentioned processes are the company's foreground system and primary data for them are collected. Finished products, just as waste, are stored in an open space and this process is included in the study (just as in the second case study). In the CE solution there are no co-products, by-products and waste streams. Waste generated after thermic processing (overflow) is reused as an input

in the conversion process. Wastes generated in the foreground system are mostly indirect materials.

Fig. 2: System boundary of CE solution (CASE 1)

The analysis show that the BaU solution is more expensive than the CE solution. The unit cost of the BaU solution is 524.42 PLN/unit and the CE solution is 204.64 PLN/unit. The LCA analysis showed much greater environmental benefit of the CE solution as well. It can therefore be concluded that applying the principles of circular economy is beneficial for the company and the environment.

The total unit cost of the board in CE solution seems to be relatively high. The high cost-consuming production of the board is primarily influenced by:

- high purchase price of wastes,
- high energy consumption,
- high depreciation value of fixed assets.

Additionally, indirect costs were calculated also for each manufacturing phases. Simplified ABC costing was used. It shows that the most cost-consuming is phase II – production of boards. The conclusion arising from the analysis is that the company should implement lean production and lean accounting, in other words looking for savings by eliminating or minimizing bottlenecks.

Second Case Study

LCC analysis in the second case study covers highly contaminated or heavily printed plastic (mostly packings – foils) that cannot be recycled in the traditional way. In contrast to the previous study, it is a single-layered plastic, however, analyzed wastes are a mix of different kinds of polymers (e.g. HDPE, LDPE, PP, PS, ABS) coming from both industrial sectors and municipal sphere.

Current treatment of unpure waste is landfilling (BaU), which means that waste goes directly to the landfill. The other option (less likely) is RDF production. As in the previous study, the first mentioned scenario is considered as „zero scenario" (BaU).

In the identified CE solution plastic waste become the input to the extrusion process, which allows to use a different combination of plastic waste. It is concluded that also multi-layered waste may be processed with the use of designed technology. Realized processes are categorized into two groups: preparatory processes (regrinding, cleaning, drying) and basic processes (homogenizing, extrusion, cooling). As an output also the board is generated. It should be mentioned that the new production is in the early phase of implementation. For the purpose of process testing, production was realized in a very small extent. It is concluded that recovered product is valuable and its most potential application is a terrace covering but it needs to be further processed by polishing, brushing and painting with a protective UV varnish. The outgoing secondary product that was received in pilot production is smaller than a traditional average terrasse board.

The main goal of the study was the cost assessment of the plastic board production from multipolymer waste in two solutions: existing business as usual (BaU) and circular economy (CE).

The system boundary of LCC study carried out for BaU scenario (Figure 3) covers processes that occur in end-of-life stage of unpure plastic waste (material composition - homogeneous fractions: HDPE 30%, LDPE 20%, PP 20%, PS 15%, ABS 10%, sludge 5%). As in the previous case study, the BaU includes the process of landfill (with no access to the specific information) and transport of waste, which is not run by the analyzed recycling company but the specific information about transport are available. BaU_2 was conducted only on the LCA study. Analyzed waste is stored in an open space and this process is included in the study. In BaU the system expansion is applied – production of conventional terrace boards, for which secondary data set is used.

The system boundary of LCC study carried out for CE solutions includes processes that occur in the stage of terrace board production from unpure, homogeneous plastic waste (Figure 4). Those processes are categorized into two groups:

1) preparatory processes – regrinding, cleaning, drying;
2) basic processes – homogenizing, extrusion, cooling.

In the scope of the carried out LCC study for CE solution, internal transport is included. All above-mentioned processes are the company's foreground system and primary data for them are collected. Finished products, just as waste, are stored in an open space and this process is included in the study. In the CE solution there are no co-products, by-products and waste streams. Waste generated after extrusion is reused. Wastes generated in the foreground system are mostly indirect materials and wastewater with sludge.

Fig. 3: System boundaries of BaU solution (CASE 2)

Fig. 4: System boundary of CE solution (CASE 2)

The analysis show that the BaU variant is more expensive than the CE variant. The unit cost of the BaU solution is 9.47 PLN/unit and the CE solution is 31.22 PLN/unit. The LCA analysis showed much greater environmental benefit of the CE solution than the BaU solution. In this case study, the operating company started producing terrace board recently, so initial expenses still affect financial income. It can be assumed that as the scale of operations increases, the unit cost of the terrace board will be lower, and therefore the company's profit as well. The last conclusion is the same as in case 1 - the company should implement lean production and lean accounting in order to lower the unit cost of terrace board.

Final Conclusions and Future Research

First, the CIRCE2020 project has proven that the circular economy is not only environmental but also economically beneficial. This is a pilot project, but it can already be stated that widely understood recycling has a positive impact on the environment, as shown by LCA analysis in both case studies. In one case, LCC analysis showed the economic profitability of production using recycled raw materials. In the second case study, the CE solution turned out to be less profitable, however, this is due to the specificity of the company and the small scale of activity in the area of the analyzed product.

Secondly, the analysis and reports prepared as part of the CIRCE2020 gave both companies the opportunity to implement changes. These changes will also largely affect their economic situation.

Thirdly, the study may be extended to include external costs in the future. In this project externalities were not included in the LCC analysis. Therefore, there is a research gap that can further demonstrate the efficiency of circular economy, due to the reduction of various external costs, such as the cost of renovating public roads used to transport waste or disposal of waste.

Acknowledgment

As an LCC expert in the CIRCE2020 project, I want to thank the European Union authorities in particular for creating this pilot project to promote the circular economy. I would also like to thank Marcin Konopczyński, the president of AMTrans, who is the Polish partner of CIRCE2020 project. I also want to thank Dr Katarzyna Joachimiak-Lechman (PhD.), an LCA expert in Poland, for very effective cooperation. I also thank both companies for providing data for the conducted analyzes.

Abstract

The security of the national economy is largely determined by the economic security of the households operating in it. The stages of this study includes: pre-processing of open statistical data, identifying trends in socio-economic status of the households, determination the factors of influence on the state of economic security of households and formalization of the relevant groups of indicators, grouping municipalities based on significant factors that affect the state of economic security of households. In this article we study the interrelation of internal (availability of own resources, directions and volumes of their use), external factors (social orientation of state budget expenditures) and the state of economic security of the household. Authors propose to use groups of indicators, characterizing the activities of households by functional basis for analyzing the state of economic security of a household. We have developed and applied relative indicators and generalized estimation coefficients that allow us to calculate the normative values of criteria for assessing the state of economic security of households depending on the specified values, as well as to assess the degree of risk of violation of economic security of households.

The positioning of the municipalities of the studied region was carried out according to the criteria of providing households with their own resources, resources allocated from the regional budget, and the use of total resources.

The proposed approach broadens the possibilities of identifying threats and diagnosing the risk of economic security of households. This method can be used in the methodology for assessing the current socio-economic policy of the subject of the Russian Federation and its municipalities.

Keywords: economic security of the household; indicators for assessing the state of economic security of a household; household income; household expenses; socio-economic policy.

Introduction

The attention of the state and the scientific community is gradually focused on the issues of economic security of the household. As a result of changes in internal and external conditions, there is a loss of stabilization factors in the economic security of the household. Because of changes in internal and

external conditions, there is a loss of stabilization factors in the economic security of the household. The principles of market management are being introduced into the practice of state economic policy. The structural imbalance of the labor market is deepening. Social risks associated with a temporary loss of working capacity, unemployment, and limited availability of medical and educational services are becoming more acute. The structure of population expenditures is deformed with the predominance of food and medicine purchases.

Ensuring economic security is one of the urgent tasks that modern Russia tackles. According to the Federal Law "On Security" No. 390-FL dated 12/28/2010, the objects of security are a person, society, and the state *(Alifanova, Nivorozhkina and Evlakhova, 2018)*. In turn, the National Security Strategy emphasizes the need to focus resources on the priority of improving the quality of life and high standards of livelihoods, investment in human capital, strengthening the role of the state in ensuring the development of education, health care, and culture *(Animitsa and Naumov, 2016)*.

Materials for study

The development of the concept of households, risks, dangers and threats to its functioning is carried out mainly in the framework of the resource *(Ivanaeva, 2017)*, factor *(Alifanova, Nivorozhkina and Evlakhova, 2018)*, and institutional approaches *(Ledyaykina, 2019)*. The complexity of the tasks necessitates the search for tools that meet the requirements of an objective and high-quality measurement of the parameters of the safe state of households, as well as deviations from their given values. A variety of research approaches is associated both with the breadth of understanding of the household contents, and with the many processes that determine its safe state.

The processes of functioning of the household are considered by researchers as relatively independent phenomena. Accordingly, a qualitative and quantitative assessment of certain areas of the household activity is carried out: production *(Sedova, 2015)*, exchange, consumption *(Animitsa and Naumov, 2016)*, saving *(Malkina and Khramova, 2017)*, entrepreneurship *(Litvinova, 2016)*, financial activity *(Kislitsyna and Untanov, 2015), (Glukhov, Ostanin and Rozhkov, 2015)*, reproduction of human capital.
The main problem is the issue of the correlation between the internal resource capabilities to ensure the economic security of the household and external sources of its support and strengthening. On the one hand, the economic safety of a household should not depend entirely on the state *(Podolnaya, 2016)*, on the other hand, the state's non-attention can lead to destabilization of both the household economy and the national economy as a whole *(Kaplun, 2015)*.

In the works of Russian and foreign authors, the study of economic security of households is mainly carried out in the following areas:

- assessment of the actual state of households;
- dynamic changes in the state of households;
- threats and risks of household functioning;
- priorities of socio-economic development of households.

In foreign studies, the approach based on actual and factor assessments of the state of economic security of the household is widely used. The economic security of households is affected by guarantees of health care, the presence (loss) of work, the presence (loss) of property *(Dominitz and Manski, 1996)*, *(Kaldor, 1939)*; income from financial assets and securities, social and pension payments *(Popova, Yakimchuk and Nadezhina, 2018), (By a Thread: The New Experience of America's Middle Class | Demos, n.d.)*; structure and volume of ownership, availability (absence) of health insurance, the size of the monthly budget *(Nivorozhkina, 2016)*, *(Hicks, 1939)*. The statistical indicators used in the study quantitatively reflect the social and economic aspects of the life of the household.

Since all socio-economic processes are dynamic, the index method has great scientific and practical significance: the methodological apparatus for assessing the economic security of households is ex-

panding, and the possibility of generalizing and concretizing essential processes is provided. The calculation of indices of the capacity of social institutions, the commissioning of social institutions, the coverage of the population by social institutions, investments in the social sphere, etc. *(Beeferman, n.d.)* is used when analyzing the impact of social infrastructure on the standard of living of the population. A personification of the economic security of a household is achieved by using the quality of life index *(Kaplun, 2015)* and the integral welfare index *(The level and dynamics of quality of life in the regions of Russia 2006-2013, 2015)*. The limitation of the index method is mainly associated with the numerical characteristics of the functioning and development of households, their dynamic states.

Socio-economic indicators visualize a breach of the safe state of the household; scale of threats to economic security; the effectiveness of state policy *(The level and dynamics of quality of life in the regions of Russia 2006-2013, 2015)*. The analysis is carried out according to the absolute value of the indicators, which is justified only when determining the general directions of measures in the field of ensuring economic security of the household.

To assess the effectiveness of public administration, indicators of achieving the set goals are associated with the calculation of rate indicators. The list of relevant indicators includes: the availability of modern education and health care, support for labor employment, advanced training and the quality of labor resources, supplying the population with high-quality and affordable food and medicines, poverty reduction, maintaining a healthy lifestyle, social support for vulnerable society groups, the development of housing and improving the quality of housing and communal services *(Kislitsyna and Untanov, 2015)*. Such an application of the indicator does not allow making an objective assessment of the economic security of the household due to both the diversity of the measures the uncertain dimension of the weight of the indicators.

The indicators find practical application in the process of monitoring the socio-economic state of the household in the aspects of the labor market, demographic trends, and the state of public law *(Found and Belousova, 2018)*. The methodology is focused on evaluating the current level or assessing changes in particular indicators.

It is obvious that a special assessment of indicators is necessary to ensure the economic security of the household:

– proportions ensuring the sustainability and safety of households;
– trends characterizing the socio-economic situation of households;
– systems of factors ensuring the social and economic well-being of households;
– efficiency of social and economic policy of the state;
– the degree of relevance of priorities in the field of economic security of the household.

The need for a comprehensive assessment of the state of economic security of the household makes it advisable to introduce into the methodological apparatus not individual indicators, but groups of indicators that characterize the activity of household households on a functional basis *(Sliva, Gladkovskaya, Gurlev and Mikhalina, 2018)*. As a result, a generalized indicator is formed based on data of different origin and purpose, and groups of indicators are brought to a single measurement system. The proposed approach allows you to:

- establish the normative values of the criteria for assessing the economic condition of households, depending on the set (established) values for relative indicators and estimated ratios;
- diagnose and establish the degree of risk of household functioning;
- analyze the relationship of the social orientation of the state budget policy with the state of economic security of the household;
- identify measures to ensure increased economic security of the household.

Within the framework of the established methodology, taking into account current trends, using an integrated approach, we define the economic security of households as the state of the sufficiency of resources (own and redistributed from the budget), which allows the household to implement its in-

herent functions, counteract threats, and ensure continuous reproduction. The purpose of this study is to develop a methodology for assessing and predicting the state of economic security of households based on the identification of patterns with obtaining mathematical models.

The object of the study is a household that operates in conditions of risks and threats. The subject of the research is trends reflecting the state of economic security of the household.

As a hypothesis, we consider the relationship between internal (own income) and external factors (redistributed income) and the state of economic security of the household. Threat identification and the diagnosis of the economic security risk of a household are carried out according to the income criterion.

We focus the study of household economic security on the relationship between the social orientation of regional budget expenditures and the availability of resources for households in the region.

Methodology

The studied regularities of the influence of factors on the effectiveness of the interaction of the studied groups of indicators characterizing the activities of households in general can be described by the function ψ. The function ψ is a set of indicators in the form of a polynomial of the second degree of the corresponding evaluation parameters:

$$\psi = \varphi(\chi_1, \chi_2, \chi_3, \ldots \chi_m, F, \gamma),$$

where $\chi_1, \chi_2, \chi_3, \ldots \chi_m$ - factors affecting the function ψ;

F and γ - internal "noise", factors that influence indicators, but are difficult to take into account (reporting distortion, emotional background, etc.).
The accepted list of optimization indicators according to the functional basis with factors influencing them is as follows.

The accepted list of optimization indicators according to the functional basis with factors influencing them is as follows:

1. The indicator of economic security of households by the factor of resource availability (ESRA), determined by the formula:

$$\mathrm{ESRA} = \frac{\mathrm{DR-CE}}{\mathrm{DR}}, \quad (1)$$

where DR - disposable resources on average per household member, rubles / person;
CE - current expenses on average per household member, rubles / person.

The disposable resources of households include cash income, savings, borrowed funds, and the value of in-kind income. Consumer expenditures, the cost of in-kind receipts of food and non-food goods, services form the totality of current expenses. To solve partially the problem of assessing the state of economic security of a household by the resource endowment factor, we use the calculation of the financial security coefficient through the ratio of disposable resources and household current expenses.

2. The indicator of economic security of households by resource use factor (ESRU), determined by the formula:

$$\mathrm{ESRU} = \frac{\mathrm{DR-CE}}{\mathrm{CE}}, \quad (2)$$

3. The indicator of economic security of households by the factor of availability of resources distributed from the regional budget (ESSE), determined by the formula:

$$ESSE = \frac{SE}{RB}, \quad (3)$$

where SE - expenditures of the regional budget for the social sphere, including education, healthcare, physical education and sports, etc.;

RB - expenditures of the regional budget.

4. The indicator of the mathematical expectation of household reliability (ESrisk), determined by the formula:

$$ES_{risk} = e^{t/T}, \quad (4)$$

where t - the forecast time period of assessment, year;
T - the estimated time period of evaluation, year;
e - the base of the natural logarithm (exponent).

The mathematical expectation of household reliability (ESrisk) characterizes the "temporary" reliability of the functioning of households (a kind of "risk") *(Gurlev and Khomyakova, 2016)*. The analysis of the functioning of households indicates that basically the termination of economic activity (t, years in relation to T-the total time of operation, years) is "sudden undesirable events", which leads to a consistent design of reliability - an exponential distribution as a special case of the Poisson distribution.

5. The coefficient of the frequency of termination of the economic functioning of households per 1000 households (EFH), determined by the formula:

$$EFH = \frac{n}{N} \cdot 1000, \quad (5)$$

where n - the number of economically inactive discontinued households;

N - the total number of households.

A further analysis of the economic activity of households is advisable to produce by the relative values of the indicators.

The use of relative indicators is appropriate, since the state of the object, characterized by indices, is evaluated in a large numerical range - from thousandths of a unit to as many as tens of units. Therefore, the presented indicators are brought to a single measurement system in which they can be compared with each other. One of such systems is the system of dimensionless (normalized) relative calculus. In the presented study, for each indicator Y_i(i = 1…n) we determine the "best" values (maximum or minimum) Yi_{max} (Yi_{min}) upon reaching which the object accepts the best (maximum) evaluation criterion *(Gurlev and Khomyakova, 2016)*. Analysis of changes in the assessment indicators of the studied objects, expressed by generalized relative (integral) criteria within the unit by the formula:

$$RC_{Yi} = \frac{Y_i}{Y_{i_{max}}} \text{ or } RC_{Yi} = \frac{Y_{i_{min}}}{Y_i}, \quad (6)$$

where RC_{Yi}- the generalized (relative) criteria;

Y_i - the estimated (studied) value of the response function of optimization indicators;

$Y_{i_{max}}$ - the maximum value of the response function;

$Y_{i_{min}}$ - the minimum value of the response function.

The relative indicator under ideal conditions of the most successful combination of optimization parameters should satisfy the condition $RC_i = 1.0$.
In this article authors present the degree of change in economic security of households taking into account the GRP_{reg} of the analyzed region, as the generalized estimated coefficient (integral)

$$GEC_{Yi(GDP)} = RC_{Yi} * 10 * \lg\frac{GDP_{Russia}}{[GRP_{reg}]}, \quad (7)$$

where $RC_{Yi} = \frac{Yi}{Y_{i(max)}}$ - the generalized indicator provided that Yi(max) is the value of the i-th coefficient in the group of indicators should be the largest;
$RC_{Yi} = \frac{Y_{i(min)}}{Yi}$ - the generalized indicator provided that Yi(min) is the minimum value of the i-th coefficient is the best;
$10 * \lg\frac{GDP_{Russia}}{[GRP_{reg}]}$ - is a logarithmic coefficient taking into account the level of Gross Domestic Product of the Russian Federation (GDP_{Russia}) of the estimated period in relation to the GRPreg - of the estimated period.

The value of GEC_{Yi} must satisfy the condition when GEC_{Yi}> 0.0. In this case, the larger the logarithmic coefficient $10 * \lg\frac{GDP_{Russia}}{[GRP_{reg}]}$ is, the more favorable are the conditions for stable functioning of households in the corresponding period of the analyzed object.

In the Table 1 there is a version of their interpretations in the form of the obtained critical quantities (a fragment of the set of solutions) in the form of a generalized indicator (relative estimate) according to the adequacy of the models. Based on the developed mathematical models of generalized indicators, an analysis of the motivated choice of groups of territories of the Chelyabinsk region for a significant contribution to the GRP was made: Chelyabinsk, Miass, Zlatoust, Kyshtym, Magnitogorsk.

The analysis of the obtained models, which have many solutions, it is advisable to produce in tabular form, which shows the results of a joint solution of the system of all the equations obtained. Table 1 shows the found critical indicators by the quantitative and qualitative criteria as optimal – Optim. Optimal critical indicators are a combination of all values of the criteria (critical) of optimization, corresponding to conditions that satisfy all indicators. Factors that determine the optimal relationship (Optim) of the estimated groups of indicators have the following meanings.

Gross regional product per capita of the Chelyabinsk region *(Popova, Yakimchuk and Nadezhina, 2018)*: GRP = 13234 dollars per person; with this GRP disposable resources can be DR = 38126 -...38203 dollars per person with the existing number of households N = 44478 -...44488.

Under these conditions, the optimal critical indicator was determined:

ESSE an indicator of the total social expenditures on education, health, culture, etc. with a value of 0.1902 -... 0.2181 (with GEC_{ESSE} = 1.7756 ... 2.0367).

Thus, the methodology for assessing the state of economic security of households includes the following indicators of the analyzed region:

RC_{ESDR} – indicator (of economic security) of financial security of disposable resources;
RC_{ESCE} – an indicator of financial security of current expenses;
RC_{ESSE} – an indicator of the total (total) social spending on education, healthcare, culture, etc.;
RC_{ESrisk} – an indicator of the mathematical expectation of the effective activity of households (risk indicator);
RC_{EFH} – indicator of the reliability of household activities (frequency of inefficient households);
RC_{SEE} – an indicator of the assessment of spending on education;
RC_{SEC} – an indicator of the assessment of expenditures on culture;
RC_{SES} – an indicator of the assessment of the costs of physical education and sports;

RC_{SEHC} – an indicator of the assessment of health care spending;
RC_{SEOE} – an indicator of the assessment of other regional social expenditures of the budget (i.e., excluding the costs of education, healthcare, physical education and sports).

The developed methodology allows diagnosing the degree of risk, highlighting threats to the economic security of households, assessing the degree of sufficiency of budget social expenditures, taking measures to increase the efficiency of social policy implementation, and predicting the state of economic security of households.

Results

Authors tested the presented methodology for identifying threats and diagnosing the risk of economic security for households using the example of the Chelyabinsk region. The information base of the study was the data on the budget execution reports of the Chelyabinsk region in 2016-2018 *(Hicks, 1939)*, as well as data from the Federal State Statistics Service of the Chelyabinsk Region on the standard of living of the population for the same period *(Animitsa and Naumov, 2016)*.
Options for existing and recommended critical indicators of the analyzed territorial entities are shown in the histogram (Fig 1.). The recommended option of the optimal solutions (the last columns of the histogram) in relative terms by mathematical models will be 0.2181 ... 0.1902, which corresponds to the "critical" indicator of RC_{ESSE} - an indicator of the total (total) social expenditures on education, health, culture, etc. This indicator is the criterion from which economic security is assessed.
In this study all other indicators will have larger values (Table 1).

Table 1: the recommended critical indicators of the analyzed territorial entities

Critical indicators	Range of values
RC_{ESSE}	0.2181 ... 0.1902
RC_{ESDR}	0.263…0.264
RC_{ESCE}	0.376…0.377
RC_{ESSE}	0.190…0.218
RC_{EFH}	0.258…0.374
RC_{ESrisk}	0.347…0.547
RC_{SEE}	0.240
RC_{SEC}	0.233
RC_{SES}	0.249..0.297
RC_{SEHC}	0.248…0.252
RC_{SEOE}	0.304…0.314

(Source: counted by the authors)

The above calculation of indicators for assessing the economic security of households based on the fact of financial security of disposable resources (RC_{ESDR} = 0.263) and the indicator of resource use (RC_{ESCE} = 0.376 ... 0.377) indicates the fact that the availability of resources reallocated from the state budget can lead to significant improvement in household activities. This forecast is indicated by the maximum calculated values of the indicators of the mathematical expectation of the reliability of the functioning of households and the coefficient of the frequency of termination of the functioning of households.

Fig. 1: A histogram of the distribution of territories of the Chelyabinsk region by the "Critical Indicator" with the optimization option (*recommendation)
(Source: compiled by the authors)

Based on the developed mathematical models with a significance level of α=0.05 according to the Plan-ex program, an analysis of the motivated choice of groups in some municipalities of the Chelyabinsk region was performed: Chelyabinsk, Miass, Zlatoust, Kyshtym, Magnitogorsk. Table 1 presents analysis and optimization of the results of the obtained models, which have many solutions. Also in table 1 we present the results of the optimization of the economic assessment of household activities by indicators RC_{Yi} и GEC_{Yi} . All values of optimization indicators correspond to conditions that satisfy the selected criteria.

In the presented optimization variant, the corresponding values of the factors will be as follows (Table 1):

DR=37886 ... .38076 dollars per person;
CE=1027 ... 1031 dollars per person;
SE=$2.769 • 10^7 ... $2.780 • 10^7.
Factors that determine the optimal relationship between the estimated groups have the following values:

- fixed GRP = $ 13 234 per person in 2019 and GRP = $ 14178 per person, as the best option for time forecasts;
- t = 5 ... 9 years at T = 9 ... 11 years.

The developed models allow us not only to analyze the interactions of various groups of indicators, but also to search for solutions that contribute to ensuring the economic security of households. According to the calculated threshold values of generalized indicators (Fig. 1), the municipalities of the Chelyabinsk region were ranked.

The values of the "threshold" of the critical relative indicator were calculated using mathematical models under the condition that RCyi> 0. For example, for the Chelyabinsk region the minimum value of the relative indicator of the mathematical expectation of household reliability is RC_{ESrisk}=0.169 (GEC_{ESrisk}) (Table 1). Moreover, the values of the factors will be: t = 9 years and T = 11 years. And

for the forecast period a critical indicator of the assessment will be the indicator of social expenditures with the value of RC_{ESSE}= 0.103 ... 0.169 with the values of factors SE=$ 2.616 • 10^7 ... $ 2.341 • 10^7. Similar analysis is also possible for other combinations of factors and indicators (see Table 1).

Table 2: assessing the economic security of household functioning in Chelyabinsk region on critical indicators (optimization fragment)

Conclusion

As a result of the study, authors determined that the solution to the problem of sustainable development is associated with the study of the state of economic security of the household. The authors proposed a methodology to identify threats and diagnose the risk of a breach of the security of the household.

The analysis of the results showed on an example that regional social policy measures are not sufficient to ensure the economic security of households. As a function in determining the region's development strategy, as a means of expanding and multiplying the region's potential we should consider competitive advantages, limits of sustainability and imperatives of economic security of households in the region.

The proposed approach can be applied in any constituent entity of the Russian Federation to both directly assess the state of economic security of a household and to predict its dynamics. The findings can be useful in assessing the effectiveness of regional development management, as well as in developing measures to increase the sustainability of the regional economy.

Abstract

Hospitality, like most industries today, is constantly changing. Markets keep growing, consumers are increasingly demanding, and this requires from the hotel units a continuous work to achieve success where often the key factor is differentiation. The present study intends to observe if the cross-selling techniques are important tools for the hotel industry and if they become an effective differentiation factor on what concerns customer satisfaction and loyalty. For the accomplishment of this study, the authors applied surveys to three types of public: a) consumer; b) hotel manager; and c) hotel employee. It was found that, currently, these tools are effectively used in the hotel market and that they contribute to improve the relationship between the customer and the organisation.
This means that these companies, in order to survive in today's market, must create new sales strategies and therefore distinguish themselves from the competition. Furthermore, this study also demonstrates that consumers take into consideration the opinion of others who already know these services. This word-of-mouth trend, now globalized across digital platforms, influences demand, and hotels are already aware of it, leading them to base their strategy on the increase of customer satisfaction, sometimes by implementing cross-selling techniques.

Keywords: Hospitality; Cross-selling; Word-of-mouth; Satisfaction; Loyalty.

Introduction

Cross-selling is still currently defined as offering current customers additional products or services that can provide added value for them.

According to Levine (1996), Cross-selling has been linked to increased sales, greater levels of customer satisfaction, loyalty, and a higher overall level of spending per customer. Therefore, cross-selling can be considered an important tool for organisations to use in support of their customer relationship strategies.

Nowadays, one cannot associate hospitality only to the service of accommodation; it is something far more complex deserving a multi perspective analysis. Guests are more demanding, and the market is more competitive.

Danubianu M. (2008) mentioned that a successful company not only puts customers first but puts customers at the centre of the organization because the changes in customer behaviour determines unpredictable profitability.

When purchasing, the diversity of the offer makes the customer analyse a set of considerations, such as the price, the composition of the services, the location, and other guests' feedback.

Therefore, it becomes crucial for Hospitality units to find new ways of distinguishing themselves and of providing their guests with new and impacting experiences, able to establish a level of customer loyalty. It is the case of *cross-selling* strategies.

These dynamics enable hotels to generate more sales and, therefore, more revenue. Nevertheless, these sales, if applied correctly, may produce a better and longer relationship between the hotel unit and its customers.

Organisations need to adapt to the new market needs, and Hotels are no exception.

All details matter when it comes to gaining a new customer or making a customer loyal to the hotel. To understand the customers' needs it becomes crucial to be able to satisfy those needs.

Having this in consideration, techniques such as cross-selling techniques may present as important in the organisation strategy.

The present study intends to understand if cross-selling techniques are applied to the Hospitality sector and, if so, to understand their impacts.

Cross-Selling

In a research study by Kamakura (2007), cross-selling is referred as a technique previously used by salespeople to increase order size and to transform single-product buyers into multi-product ones, but more recently, also as a technique that has evolved into a strategy for customer relationship management.

In this scenario, and acknowledging that for companies, the cost of retaining a customer is substantially lower than the cost of gaining a new one, many customer-focused enterprises - such as Hospitality companies - are taking advantage of cross-selling techniques as a tool for customer development.

Several authors point cross-selling as a fundamental CRM (Customer Relationship Management) tool to gain proximity with their customers.

When a complementary offer to a customers' purchase is made, the company reveals acknowledgement of its customers' needs, perceptions and behaviours, showing therefore, a distinguishing mark over its competition (Kamakura et al, 2002).

Along the last decades, this practice gained relevance and managers understood that they can raise their sales by satisfying their customers offering them customed products/services, based on their real needs (Sharma and Sharma, 2015).

But cross-selling is far more than proposing a complementary service/product; it is, in fact, a real tool to sell new products/services.

Customer Satisfaction

Customer's satisfaction is measured through a comparison between a service/product performance and the existing expectations regarding that same service/product (Tsiros et al, 2004).

It becomes necessary to understand that what the customer wants from a product or service depends on several factors, being one of them the fact that they already established a relationship with the brand (Aaker et al, 2004).

It is important for companies to measure the level of satisfaction of their clients because that factor directly influences the loyalty to the brand and, therefore, the organisation's sales and revenue (Morgan et al, 2005).

In Hospitality, it becomes difficult to justify the customer satisfaction. This is true since in Hospitality, the satisfaction perceived by customers is measured by their expectations. The fact that customers' profile is different from customer to customer, makes the service evaluated from different points of view, since that same evaluation/satisfaction varies according to customers' personal expectation (Knutson and Yen, 2004).

Based on this reality, Kotler (2007) explains that when performance/result does not meet expectations, customer becomes unsatisfied; if it meets, the customer is satisfied, enlarging the probable customer loyalty to the brand.

Customer Loyalty

According to Afsar, Nasiri and Zadeh (2009), the term *loyalty* gained visibility in 194, being defined as the act of purchasing continuously from the same supplier or brand. When referring to the term customer loyalty we are assuming that this customer has established a relationship with the company/brand he is loyal to, making him more resistant to change (Kim et al, 2009).

Many Marketing researchers try to understand which factors contribute to customer loyalty, concluding that satisfaction can be obtained before the purchase, during it or through after-sale service, influencing, therefore, customer loyalty (Chang and Chen, 2009).

Loyalty cannot always be measured through the amount of times a customer purchases a product or a service. Nevertheless, if the brand fulfils or overcomes customer expectations, he will recommend the product/service to others and, in those cases, one can say that the customer is loyal (Kotler et al, 2007).

The Word-Of-Mouth

Arndt (1967) and Buttle (1998) mentioned WOM, *Word-of-mouth*, as synonymous of oral communication from people to people, between an issuer and a receiver, where the receiver perceives information related to the brand and its products/services as non-commercial information.

As mentioned before, current clients are more informed and before deciding a purchase of a service/product, they analyse all the available information, either through other customers' feedback or through social networks or related websites (Kotler et al, 2007).

A customer knows that a company aims sales and, therefore, the given information will always show the good side of their services/products. Thus, other customers' sharing of opinion regarding a service/product has higher impact amongst customers (Kotler et al, 2017).

The Analysis of The Impact of Cross-Selling in Hospitality

The Hospitality sector has changed along the years, mainly due to its customers' profile change.

Nowadays, customers are more demanding and require from Hotels much more than mere accommodation; they seek for experiences, which starts in the moment they make a reservation and ends when they make the check-out. For that same reason, cross-selling techniques may, effectively, help improving customers' experience.

Although cross-selling in Hospitality is not widely studied, it becomes relevant to produce studies in such thematic.

This way, in an attempt to understand the topic within the hospitality scope, a study, based on Inquiries directed at Customers and Hotel Managers was developed in order to assess the impact of these tools in this particular sector, and also assessing if its application increases customer satisfaction, enhancing their loyalty.

The sample of this study is composed by customers and hotel managers in Portugal. Since the population is large, and in order to obtain answers from specific targets, some exclusion criteria were applied, namely: based on proximity, only Hotels and other accommodation units in Porto were

selected (180 total). Since the study works with a sample, the Survey was done to 20% of the population – 25 hotels.

Regarding Customers, the number of the sample was defined based on the average occupation: 64%[1] in 2018. From these 25 hospitality units, there are, in average, 40 available room to sale. Given the occupation rate average, the number of customers is 25,6. Given the fact that the objective of this study is to understand the impact of cross-selling in Hospitality, for proximity issues, and consequent larger amount of answers, only resident customers were inquired. Such decision is based on the fact that a local customer tends to be more loyal when compared to a foreign customer, whose motive for visiting is normally connected to specific factors.

In the North of the country, in 2018 the number of nights represented 45%[2], meaning that the total amount of customer's sample is 288 (25 hospitality units x 25,6 customers in average x 0,45 nights). The total number of inquired Customers was 324.

Survey *Framework*

Although the Inquiries are different, the content of the proposed questions are very similar, since the aim of the present study is to be able to compare opinions to obtain a final indication of cross-selling impacts in customers satisfaction and, therefore, their loyalty. In the Figure below it is possible to assess the involved dimensions of the present study.

Figure 1: Survey framework.

Source: *Authors' elaboration*

Questions directed to Customers are related to demographic issues, frequency of hotel visiting, and other questions related to several aspects of the hotels (most valued services, importance of available information, impact of other customers' opinion, etc.).
Questions directed to Hotel Managers are related to cross-selling notions, necessary training, the *word-of-mouth*, and the most requested services in their hotels, aiming to know if their awareness of the importance of these techniques to enhance the customer-organisation proximity.

Results Analysis

The Customer Survey

On what concerns the Gender of the respondents, there were no major differences: 142 were male and 182 female – a percentual of 44% of men and 56% of women.

Figure 1: Customers' Gender

Source: *Authors' elaboration*

Regarding Age, 55% of the Customers were under 35 years old.

Figure 2 : Customers' age %

Source: *Authors' elaboration*

On what concerns the Most Valued Services demanded by the customers, besides accommodation, the state of the art reveals that restaurant services are considered essential and highly valued by hospitality customers - 36% of the inquired individuals also agreed with this statement. Nevertheless, the most valued serviced by them (57%) are leisure and wellness spaces, such as the swimming-pool or the Spa. A minority (8%) gave preference to extra activities and a small percentage (3%) preferred other options not considered in the Survey – although the other considered options were the view, the cleanness, and comfort, these aspects are considered as hotel characteristics and not services.

Figure 4 – Most valued services by customers %.

Source: Authors' elaboration

Analysing this topic over the individuals' gender point of view, opinion does not change - both genders consider wellness and restaurant as the most valued services.

Table 1 – Male most valued services

Service	Nº People	% Male Opinion
Restaurant	49	35%
Wellness spaces	79	56%
Extra activities	9	6%
Others	5	4%
Total Respondents	142	100%

Source: *Authors' elaboration*

Table 2 - Female most valued services

Service	Nº People	% Female Opinion
Restaurant	54	29,7%
Wellness spaces	105	57,7%
Extra activities	17	9,3%
Others	6	3,3%
Total Respondents	182	100,0%

Source: *Authors' elaboration*

From the respondents' age point of view, preferences for most valued services do not differ amongst different ages – a large majority of the inquired population refers wellness and, secondly, restaurant as the most valued services.

Figure 5 – Most valued services per age

Source: *Authors' elaboration*

If analysing the same parameter related to the hotel visit frequency, the panorama maintains – independently of the frequency, customers continue to value wellness services as the most valued ones, followed by restaurant services.

Figure 6 – Most valued services based on visit frequency

Source: *Authors' elaboration*

Regarding the Word-of-Mouth impacts on customers, respondents considered it a relevant fact (4, on a scale of 1-5), independent of the customers' gender.

Figure 7 – Other customers feedback importance / gender
Source: *Authors' elaboration*

This same topic valued by age presents some differences: respondents from 25 to 35 years old are the only ones considering the word-of-mouth 100% relevant. The remaining generations, although the majority values this topic, there is a small amount that does not value it particularly.

Figure 8 – Word-of-Mouth importance / age
Source: *Authors' elaboration*

The Hotel Manager Survey

The selected sample for the Hotel Manager Survey was of 25 Managers, although it was only possible to obtain responses from 23 of them.

If through the Customer Survey it became possible to understand that Hotel Information Availability (available services) was a major requirement, the majority of the respondents to the Hotel Manager Survey considered "effectively important" that customers become aware of all the available services at the Hotel. This was, in fact, the most valued topic in Hotel Managers Survey.

Figure 9 – Hotel Services Information availability
Source: *Authors' elaboration*

Regarding the perception of the Most Valued Services by the customers, most of the Hotel Managers consider the extra activities, such as tours and field trips, as the most valued service. After this, the most valued service according to Hotel Managers are the Wellness services, such as the Spa, and only in third comes Restaurant as a valued service for customers.

Two of the respondents pointed "other" services, namely the view and customer service as the most valued ones.

Figure 10: Most Valued Services (apart from Restaurant)
Source: *Authors' elaboration*

On what concerns the importance of the Word-of-Mouth, the Managers Survey mentioned it as the main factor of influence on the customer-organisation relationship since its beginnings – from the moment a customer purchases a hotel unit. More than 50% of the respondents revealed that the positive or negative opinions clients post on the Internet have significant influence on the Hotel purchase.

Figure 11: Digital platforms' influence (eWOM) on the hotel purchase rate
Source: *Authors' elaboration*

When it comes to evaluate the Hotel Managers' perception about the influence of the Cross-Selling Techniques on the customer relationship management, most of the answers did not signed this topic as "essential" to make a difference in the customer relationship management. Nevertheless, Hotel Managers revealed to be aware of these techniques' importance, when correctly applied, on broadening the scope of the relationship with the customer and increasing customer retention.

Figure 12 - The influence of the cross-selling techniques on the customer relationship management
Source: *Authors' elaboration*

Meaning, Hotel Managers do not clearly point Cross-Selling techniques as an "essential" influence on the customer relationship management (and, therefore, the customer loyalty and consequent retention), but they do consider as "highly important" the remaining variables that influence these same Cross-Selling techniques, such as the importance of having the Hotel Services Information available worldwide to customers; the customer-service importance; and the influence of the Word-of-Mouth in the Hotel rate.

Furthermore, nowadays the way the Word-of-Mouth (eWOM) influences a Customer purchase of a Hotel, requires Hotel Managers to use Cross-Selling techniques to obtain total Customer Satisfaction and, therefore, Customer Loyalty.

The objective of the present study was to understand if Cross-Selling techniques were widely used in Hospitality and to evaluate their impact in the sector.

The absence of literature review on the subject raised the question.

Even though the specific question was never exposed during the Customers Survey, since most of the respondents could not be familiar with the term Cross-Selling, the validation made to the remaining topics of the questions, demonstrate the importance they give to these techniques as Customers.

On the other hand, the Hotel Manager Surveys enabled the conclusion that managers consider Cross-Selling techniques important for Customer Satisfaction and, therefore, Customer Loyalty.

Although managers tend to consider these techniques as specific tools apart from several other techniques involved in the customer-service relationship management (and consequent loyalty), it is possible to conclude that, at the end, Cross-Selling techniques are daily used during the entire process of Customer-service management. In fact, the most a Hotel exposes itself to their customers – being present in the digital platforms (such as Booking, etc.); having a website; informing their customers about the entire Hotel services and products; enabling a more direct and closer relationship with their customers, through ways such as the word-of-mouth – the stronger is its Customer-service relationship.

In conclusion, Cross-Selling techniques aim to build loyal and profitable customer relationships, overcoming competitive pricing strategies in customers' attraction from competitors, and developing strong relationships with customers cross-selling them other services, according to their needs.

As Customers require from Hotels much more than mere accommodation, they seek for experiences, cross-selling techniques may, effectively, help improving customers' experience and, therefore, have significant impact in Hospitality.

Abstract

The article proposes the application of a reflexive approach to consumer behavior management in the marketing system of industrial enterprises. It is based on the study of individual behavioral responses of consumers and the organization of influences on them. The analytical model of decision-making reflection, which is the author's modification of V. Lefevre's model of bipolar choice is proposed in the article. The proposed model allows us to identify the rational factors and the irrational factors in which the management will be able to most significantly influence the likelihood of the expected purchase decision, allows assessing the readiness of the consumer to choose before and after the implementation of reflective influence. The results of the study made it possible to identify the main areas of application of reflexive consumer choice management tools in the industrial enterprise marketing system. It is substantiated that the use of reflexive consumer choice management tools in the industrial enterprise marketing system is an important low-cost factor in declining the consumer to make a purchase decision.

Keywords: Consumer Choice, Marketing System, Model of Decision-Making Reflection, Reflective Management.

Introduction

Globalization processes in the global economy, intensification of competition, increasing instability of the external environment, complications of consumer needs require industrial enterprises to seek innovative tools for managing consumer choice. After all, the aggravation of competition in consumer markets leads to a rise in prices and a decrease in the effectiveness of the use of traditional marketing tools. In the unstable conditions of the operation of industrial enterprises, marketing tools should be taken into account. In addition to the rational component, the subjective component of consumer behavior are worth attention as well. The isolation of irrational factors of consumer choice allows the use of low-cost reflexive methods to persuade potential consumers to make a decision on purchase, and, consequently, to achieve the highest efficiency of marketing communications of industrial enterprises. In this context, marketing is considered as a system for managing the development of the network, ensuring consumer loyalty, partnerships that arise between the enterprise and consumers in the process of production and consumption of goods. Therefore, the purpose of the article is to justify the reflective tools of consumer choice management in the industry of marketing of industrial enterprises as a promising and low-cost adjustment direction favorable for enterprises interaction with consumers.

Literature Review

The research of consumer choice issues focuses on the work of many scholars. In particular, D. Kaneman in his work (2011) laid the conceptual foundations of the theory of consumer choice management, taking into account the psychological motives of consumer behavior, putting forward the hypothesis that people can not systematically and consistently make rational decisions because there is always a problem of asymmetry of information. Representatives of the Ukrainian Marketing Association also paid considerable attention to the studying of the influence of psychological and social factors on behavioral responses of modern consumers, the study of the motivational aspects of consumer choice and the management of behavioral changes in consumers when introducing innovations in the market of industrial goods (Reshetnikova and Sahaidak, 2016; Stankevich, 2017). By purchasing industrial and other products businesses should encourage consumers to become their partners, interaction both online and offline lets meet their hidden, emerging and future needs (Liczmańska-Kopcewicz and Wiśniewska, 2019; Nguyen et al., 2018). Also an important factor is consumer choice. It also takes into account the type of consumer's personality (Gangai and Agrawal, 2016; Gohary and Hanzaee, 2014; Pelau et al., 2018) and factors of its multicultural behavior in modern conditions (Manrai et al., 2015). Although culture as a construct has been defined and practiced in many ways. Marketing researchers have acknowledged that it is a comprehensive element that is central to any individual's thought processes, actions, and, of course, consumption practices. Worth of attention and research by scholars on the impact of age, religious affiliation and cultural peculiarities on consumer emotions (Sarofim and Tolba, 2018). The role of emotions in implementing consumer choice is decisive (Bagozzi et. al, 1999; Beckett and Nayak, 2008). Therefore, in the management of consumer choice it is necessary to take into account rational and irrational factors of consumer behavior that form their emotional attitude to a particular product (Julmi, 2019). Practically these situations indicate the presence of a subjective irrational component that affects consumer choice (Levy et al., 2013). The ability to highlight this subjective component would allow low-cost reflexive methods to incline a potential consumer to purchase (Mavrina, 2017). Mathematically this process was presented in his writings by the author of the concept of reflexive games V. Lefevre (2009). The scientist described the human behavior in the form of equations, the parameters of which are the influence of the environment on the behavior of the subject, the subjective image of this influence and the intentions of the subject. Reflexive management in this case is the process of transferring the grounds for making the necessary decision by the subject (Smolyan, 2013; Rusinova and Zhovkovska, 2017). Combining the ideas of reflective management and marketing concept, A. Dlygach formed the concept of system-reflexive marketing, which involves a system distribution of interests of subjects, the coordination of which takes place from the standpoint of a reflexive marketing manager (2017). Therefore, S. Turlakova and J. Shumilo, considering the theory of reflexive games V. Lefevre, suggests that aspects of the behavior of the subjects should be taken into account when they make certain decisions (2016).

Considering the investigations above, it should be noted that many modern scholars are prone to traditional approaches in assessing consumer behavior patterns (Foxall, 2010; Wei and Zhang, 2018); the study of the problems of irrationality of choice attracts much less attention from the representatives of economic thought and is carried out fragmentarily. In this regard, outstanding issues of searching of new, low-cost approaches to managing consumer choice by industrial enterprises remain unresolved, one of which is the reflexive approach.

Methodology and Research Methods

The theoretical and methodological basis of the study is the classical position of the theory of management of economic systems, individual choice and reflexive management and marketing. In the process of solving the tasks, the general scientific and special methods of research were used. They are the dialectic method, it allowed to investigate the factors of consumer choice and the main directions of realization of reflexive

influences in relation to consumers in their interconnection and interdependence. Analysis and synthesis was to determine the directions of use of reflexive instruments in the management of consumer choice by industrial enterprises in the market. Methods of mathematical modeling was used to develop an analytical model of decision-making reflection, which allows assessing the readiness of the consumer to choose before and after the implementation of reflective influence; grouping, matching and scientific synthesis – were used in developing recommendations for the effective implementation of reflexive tools for managing consumer choice in the marketing system of industrial enterprises.

Results

In modern theory of management one of the approaches is based on the study of individual behavioral reactions of consumers. It is a reflexive approach. The image of the enterprise is formed in the minds of the consumer as a result of obtaining information from various sources. At the same time each message received interacts not only with previous one, but also with certain ideas of a person, knowledge, principles and judgments. As a result, in the minds of the consumer is formed a single impression about the company and the product which affects the decision to buy. That is the process of making a decision on the purchase can be regarded as an information process. It is called the way of processing the consumer information (incentives). Purchase is the result of the processing of information. Managing consumer choice with the use of the marketing system of reflexive instruments in this case is to create for the consumer such an information field, which will incline it to the decision necessary for the company, and it is, the decision to buy the goods.

The main directions of reflexive actions affecting the choice of the consumer are presented in Figure 1. Numbers in Figure 1 show the following directions of realization of reflexive influences in the management of consumer choice are indicated:

1. Formation of representations about quality of goods on the basis of quality. This involves bringing to the consumer information about those aspects of the quality in which the goods have advantages, the demonstration of these benefits. About those aspects of quality, in which the goods yield to competitors' products, should either be quashed, or try to reduce the level of their significance in the perception of the consumer.

1'. Formation of new needs based on quality. This implies the formation of the need for those aspects of product quality that were not initially significant to the consumer, but which it has advantages over competitors. For example, when buying cement for internal construction work, the consumer may not be aware of the high waterproofness of a particular cement cement, but information about it may lead to the buyer's choice being directed to this type of cement.

2. Formation of representations of value based on functional characteristics. This implies bringing to the consumer information about the functionality and features of the product, in which it has advantages over competitors. Reduction in the consumer's presentation of the significance of those functional characteristics, in which the goods are inferior to the goods of competitors.

2‘. Formation of new needs based on functional characteristics. This means the formation of the need for those functional characteristics in which the buyer first does not feel the need, but which distinguishes the product favorably.

3. Management of irrational factors based on non-functional features. Influence on irrational selection criteria requires a considerable competence of the seller in psychology, since it is important to establish which irrational criteria can positively affect the choice of the consumer. Examples of the impact on the irrational component of the choice include the following: "This type of cement is popular among

construction industry professionals", "This is the choice of a true professional", "It is this model that is used by the company X, and there, as you know, very high requirements for quality of building materials", etc.

3'. Formation of new needs based on non-functional features. The influence on the irrational factors of choice (3) can be so successful that the consumer for a long time may need to own a product with certain properties, although these properties have no significance in terms of exploitation of the product. Often this may be pseudo-properties in general, which the product does not possess and to check that it is difficult or impossible to have it. Or it may be such properties as any other competing product, but the consumer does not know about it and chooses the product in which this property focuses attention. For example, the inscriptions on packages "made of environmentally friendly raw materials", "certificate of quality", etc., as a rule, taking into account the requirements of domestic legislation, are not binding on the enterprise and in most cases are not taken seriously by the consumer, but for others equal conditions, an advantage may be given to goods having similar distinctive features.

Fig. 1: Areas of realization of reflexive influences by an industrial enterprise in the management of consumer choice

Sources: developed by the authors

4. Management of the emotional state of the consumer. The implementation of these reflective actions requires a constant analysis of consumer reactions to certain reflexive influences, their behavior, emotional state. This type of reflexive management is effectively used together with the management of irrational factors (3), with which it is closely linked, and de facto difficult to separate from each other. However, the main difference here is that there is absolutely no binding to a particular product and its properties, but the main emphasis is on emotions, human values, a sense of patriotism, and the like. Examples of such actions can be: "better domestic goods, high quality, than foreign, with impurities", "I envy you, that you can build from high-quality materials", etc.

5. Formation of price representations on the basis of price. Modern marketing provides a whole set of techniques that allow you to change the perception of a seemingly absolutely deterministic and unambiguous value, as a price. This is not the inclusion in the price of the cost of related goods or complementary goods, the binding to the "favorable" exchange rate, the use of the principle of contrast, and the like.

5'. Formation of representations about quality on the basis of price. An overpriced price for certain consumers may be an indicator of high quality goods. In the absence of other quality criteria, a consumer who wants to buy a quality product will choose an item that is slightly more expensive if he is to make it clear that the high price is due not to a speculative surcharge, but to a high quality of materials.

6. Formation of representations about after-sales service. Informing about after-sales service (free transportation, cement loading of the required capacity) may prove to be a strong argument in favor of a product that is inferior to other criteria. To this end, the industrial enterprise must as accurately as possible identify the needs and expectations of its customers and clearly articulate its logistics profile, adhering to the criteria specified in it service. 6‘. Formation of representations about the price of goods taking into account after-sales service. If the goods are delivered free of charge and in the required quantity, then this fact can be profitable to justify the higher price.

7. Formation of ideas about an industrial enterprise – provided through the use of a number of marketing tools (personal sales, direct advertising, advertising in industry magazines, participation in exhibitions, etc.).

For industrial enterprises, for example, the cement industry, where market is segmented, the proposed directions of using reflexive tools in the management of consumer choice are presented in Table 1.

Table 1: Directions of use of reflexive instruments in the management of consumer choice by industrial enterprises in the segmented B2B market

Tool management	The object of management					
	New needs	The idea of quality	The idea of utility	The idea of the price	Irrational and subjective advantages	Emotional state
1. Quality						
2. Functional characteristics						
3. Distinctive features						
4. Price						
5. After-sales service						
6. Individual emotional influences						

7. Massive influences						
Symbols: – may be present in this market; – especially effective for the given market; – the possibility of this control is not installed						

Sources: compiled by the authors

Since in the segmented market the consumer purchase decision is made more carefully than, for example, in the non-segmented market, the consumer is often interested in additional information about a particular product, the decision on purchase can be taken not immediately, but through several stages of comprehension - this creates the conditions for more flexible and selective use of reflective influence tools of choice with the possibility of observing feedback and assessing the reaction of the consumer to such reflexive influences.

To reach the effectiveness of reduced reflective influences, especially those that are planned in advance, it is necessary to apply analytical models of decision-making reflection that will allow us to assess the readiness of the consumer to choose before and after the use of reflexive influence.

Consider the bipolar case, when some reflexive control of the industrial enterprise m is aimed at inducing the consumer to a specific action A (purchases). Before the consumer, there are two alternatives: to perform this action or not to do so. Technically, such an action can be motivated, for example, in the form of some informational message, which the consumer receives from a certain source.

Let the potential consumer face the choice: to buy the goods of the industrial enterprise (action A), from which received a reflective message, or not. Alternative 1^0 is the purchase of goods – this alternative is desirable and expected for the enterprise. Alternative 2^0a (checking the message, collecting additional information) is less satisfactory for the enterprise, but it is also acceptable if the proposed product has real competitive advantages. Alternatives 2^0b (ignoring the message) and 2^0c (the principle is not the purchase of goods or goods of the enterprise) – are undesirable for the industrial enterprise. The choice of an alternative consumer is affected by the following factors:

The 1st factor reflects the rational component of the choice and shows how much of the product offered in the presentation of a potential consumer meets his needs, or how much his own knowledge of the consumer about this product (its value, utility) correlates with the ability to meet certain needs.

The 2nd factor is closely related to the 1st factor, it is information about the product (enterprise) received / received by the consumer from other consumers, from Internet resources, publications in specialized publications, etc. This information also affects the consumer's perception of the product / company.

3rd factor is information mainly on the advertising nature of the product / enterprise, coming directly from the enterprise or from the media, which provides information about the company;

The fourth factor is trust in certain sources of information. Of course, independent sources (for example, reviews from other consumers) will be more trustworthy when making a purchase decision, for example, an advertising offer.

The fifth factor is any subjective factors that are not related to the rational characteristics of the product and its ability to meet consumer needs. This may be: the desire to buy from the domestic manufacturer, personal sympathies, antipathies to the managers of the enterprise, their own intuitive doubts or beliefs of the consumer, which are not backed by rational factors.

The 6th factor is the desire of the consumer to purchase the goods before receiving a reflexive message (the level at which the consumer was ready to purchase the goods, if he had not had a reflexive effect).

We formalize these factors for the quantification of the readiness (or probability) of the consumer, which is subject to reflexive effects, to the implementation of action A (choice of alternative 1^0), namely the purchase of goods.

1. Let the consumer have some function of the value of the consequences of the purchase A, which expresses the objective (in the opinion of the consumer) the need for purchase, and which acquires value on the interval [0; 1]: $f_0(A) = 0$, if there are no objective prerequisites for the purchase, or the consequences of the purchase give a purely negative result; $f_0(A) = 1$, if all the consequences of the purchase A give a definitely positive result. Let the consumer also have some doubts about the authenticity of his own knowledge of the product, which allows him to doubt the accuracy of the evaluation of the function $f_0(A)$. This parameter also becomes a value on the interval [0; 1]: $\alpha_0 = 0$, if the consumer feels completely incompetent in relation to the characteristics of the product / company; $\alpha_0 = 1$, if the consumer is absolutely sure of the reliability of his knowledge and, accordingly, the accuracy of the evaluation of the function $f_0(A)$. Then the value $\alpha_0 f_0(A)$ – reflects the level of action of the 1st factor – the consumer's own knowledge of the product / enterprise.

2. Let the consumer receive information about the product / company from n independent sources that are not interested in the consumer's opinion in his action A. Let $f_1(A), \ldots, f_n(A)$ estimates of the utility of action A obtained from each source $f_i(A) \in [0;1]$. Denote $\alpha_1, \ldots, \alpha_n$ – the level of trust in the source (its competence, credibility): $\alpha_i = 1$, if the consumer completely trusts the source and is ready to accept his opinion unconditionally, $\alpha_i = 0$, if the view of the source is completely ignored by the consumer. Then the magnitude $\max\limits_{i=\overline{1,n}} \alpha_i f_i(A)$ reflects the level of action of the 2nd factor – the impact of the environment surrounding the consumer on the consumer. Such an assessment may look somewhat simplistic, since in practice it is sometimes possible to observe a multiplier effect, however, in any case, the proposed score does not exceed the magnitude of the influence of factor 2 and in general corresponds to most real situations. The 1st and 2nd factors are conveniently combined into some general factor, which reflects the value of action A for the consumer. This factor $x_1 \in [0;1]$ is estimated by the value:

$$x_1 = \max_{i=\overline{0,n}} \alpha_i f_i(A). \tag{1}$$

3. Let the consumer receive information about the product from k independent sources that are interested in the consumer's opinion in his action A. Similarly to the 2nd factor, the functions $f_{n+1}(A), \ldots, f_{n+k}(A)$ reflect the usefulness of action A, received from each source; $\alpha_{n+1}, \ldots, \alpha_{n+k}$ – the level of competence of the source. Suppose, besides this, the consumer has some estimates of the interest of the sources in the action A: $\beta_{n+1}, \ldots, \beta_{n+k}$, $\beta_i \in [0;1]$: $\beta_i = 1$, if the consumer is absolutely sure that the information on this the sources are biased and directed exclusively to force the consumer to act A, $\beta_i = 0$, if the consumer is absolutely sure that the given source is objective and has no motive to manipulate it (for $i = \overline{1,n}, \beta_i = 0$). Then the value $\beta_i \alpha_i f_i(A)$ is perceived by the consumer as a pressure that forces the choice of action to be beneficial to third parties. Accordingly, the value $\max\limits_{i=\overline{n+1,n+k}} \beta_i \alpha_i f_i(A)$ reflects the level of action of the 3rd factor.

4. The level of mistrust of the source of the message m will be determined by the magnitude $\beta_0 \in [0;1]$, which is determined similarly to the values β_i in estimation of the 3rd factor.
3rd and 4th factors are also convenient to combine into some common factor, which reflects, in the opinion of the consumer, the level of compulsion to implement action A, which is beneficial to manipulators. This factor $x_2 \in [0;1]$ is estimated by value:

$$x_2 = \max\left(\beta_0; \max_{i=\overline{n+1,n+k}} \beta_i \alpha_i f_i(A)\right). \tag{2}$$

Since in practice it is impossible to always unambiguously divide the environment of the consumer information environment into disinterested and interested in manipulating the source of information, it makes sense to estimate the values β_i for all N = n + k sources of information. Then formulas (1) i (2) will be:

$$x_1 = \max\left(\alpha_0 f_0(A); \max_{i=\overline{1,N}} \alpha_i(1-\beta_i) f_i(A)\right); \tag{3}$$

$$x_2 = \max\left(\beta_0; \max_{i=\overline{1.N}} \beta_i \alpha_i f_i(A)\right). \tag{4}$$

It should be noted that even if some sources of information are insignificantly interested in the implementation by the consumer of action A (the value of β_i is slightly different from zero), but it is quite authoritative (α_i is close to one), then they can also have an effect on 2nd factor and the value x_1, which completely corresponds to practical observation.

5. Attempts to formalize irrational factors causing a consumer to carry out Action A are illogical, since the effect of these factors is perceived by the consumer at the subconscious level, and at an informed level it is manifested in the form of intentions whose causes are difficult to explain even to the consumer himself. Therefore, the combined effect of these factors will be denoted by the magnitude $\gamma_0 \in [0;1]$. In this case, if the consumer is aware of the complete absence of a rational component in action A and at the same time there is no pressure that forces the choice of action A (that is $x_1 = x_2 = 0$), then with $\gamma_0 = 0$, probability of choice of action P = 0, and with $\gamma_0 = 1$, probability P = 1.

6. The consumer may think about the expediency of the action A before receiving the information message m, then the consumer is aware of some level of readiness for action A, which depends on the value x_1 (formula (3)), the value x_2 (formula (4) without β_0) and value γ_0. Then the factor that reflects the intentions of the consumer to carry out action A before he receives a message m can be described by the function:

$$x_3 = g\,(x_1; x_2; \gamma_0), \tag{5}$$

where x_1 and γ_0 has a direct effect on x_3, but x_2 – reverse.

It should be noted that the consumer's awareness of his willingness to act A leads to the fact that this conscious readiness becomes an intention to this action, and the actual value of readiness may change. Proceeding from this, the desired function P is the probability of choosing an alternative 1^0 when the consumer receives an informational message m, depending on x_1, x_2, x_3, has the same form as the function g:

$$P = g\,(x_1; x_2; x_3). \tag{6}$$

Let's underline that the above 1-6 factors reflect the impact on making a decision on consumer choice of alternative 1^0, that is, making a purchase. If an alternative to 2^0 was studied by the consumer, it would be possible to collect additional information about the product that would lead to some action $\widetilde{A}$, which is an alternative A, or inactivity in general, then the methodology for evaluating factors 1-6 would remain the same, but proceeding from the formulas (3)-(4), it is obvious:

$$x_1(\widetilde{A}) \geq (1 - x_1(A)); \tag{7}$$

$$x_2(\widetilde{A}) \geq (1 - x_2(A)); \tag{8}$$

$$\gamma_0(\widetilde{A}) + \gamma_0(A) \leq 1. \tag{9}$$

Thus, the value of the alternative 2^0 ($x_1(\widetilde{A})$) does not depend on the value of the alternative 1^0 ($x_1(A)$), as well as the level of coercion to $\widetilde{A}$ ($x_2(\widetilde{A})$) does not depend on the level of coercion to A ($x_2(A)$). And only an irrational component $\gamma_0(\widetilde{A})$, by definition, should be no more $(1-\gamma_0(\mathrm{A}))$. The fact that $\gamma_0(\widetilde{A})+\gamma_0(\mathrm{A})$ may not be equal to units due to the fact that at the subconscious level the consumer feels that his possible actions are not necessarily limited to two alternatives, and alternatives may be greater. Difference $(1-(\gamma_0(\widetilde{A})+\gamma_0(\mathrm{A}))$, reflects the degree of consumer dissatisfaction with all conscious alternatives.

For example, a potential buyer is faced with a choice: to buy one bag of cement with a capacity of 25 kg, or two capacity of 20 kg and 15 kg, with a bag of 15 kg at a discount of 50 %. Despite the fact that the consumer to some extent wants to buy one unit of the product, and two, but remains unaffected, the alternative is not to buy the product at all. This alternative will make a difference $(1-(\gamma_0(\widetilde{A})+\gamma_0(\mathrm{A}))$.

The analysis of formulas (3) - (4) allows us to conclude that the proposed methodology for estimating factors can be applied not only to bipolar choices, but also in situations where choices are faced with more than two alternatives. However, in a bipolar choice, only one of the two alternatives will be evaluated, usually aimed at the implementation of an action (considering the expediency of action A, the need for which the information message was initialized).

In addition, depending on which of the two alternatives was considered by the consumer, probabilities *P(A)*, calculated by the formula (6) can be different. Lets identify $P(A)|_{1)}$, $P(\widetilde{A})|_{1)}$ – the probability of consumer action A, $\widetilde{A}$, if it was considered an alternative 1^0; $P(A)|_{2)}$, $P(\widetilde{A})|_{2)}$ – the probability of consumer action A, $\widetilde{A}$, if it was considered an alternative 2^0. Then:

$$\mathrm{P(A)}|_{1)}= g\left(\mathrm{x_1(A); x_2(A); x_3(A)}\right),\quad P(\widetilde{A})|_{1)} = 1-\mathrm{P(A)}|_{1)};$$

$$\mathrm{P}(\widetilde{A})|_{2)}= g\left(\mathrm{x_1}(\widetilde{A}); \mathrm{x_2}(\widetilde{A}); \mathrm{x_3}(\widetilde{A})\right),\quad P(\mathrm{A})|_{2)} = 1-\mathrm{P}(\widetilde{A})|_{2)}. \tag{10}$$

In this case x_1 has a direct effect, it follows from (3), that $P(A)|_{1)} + P(\widetilde{A})|_{2)} \geq 1$.

Thus, one more factor influencing the probability of choosing an alternative is that where two alternatives are estimated by the consumer. This (seventh) factor is polarity, and this alternative, which the consumer estimates, is a positive pole. Let's underline, that is the source of the message m, makes on P(A) the same influence as any other source of information, and no unique role for him is not given, but getting an informational message triggers the launch of this decision-making process. And if we assume that at first the consumer is in an 'information hunger' with respect to the product and in principle does not think about the possibility of A (purchase), or is conceived in some distant future, then the information message m is the initiator and catalyst for the decision. If $x_1 = x_2 = 0$, then the readiness to choose, by definition, of the 5th factor equals γ_0 and equals x_3: $P(0, 0, x_3) = x_3$. This reflects a situation of free choice when the consumer decides by his conscious intentions. Then we get two extreme points: 1) $P(0, 0, 0) = 0$; 2) $P(0, 0, 1) = 1$.

If $x_1 = 1$, then regardless of the values x_2 та x_3, readiness for selection is equal to one $P(1, x_2, x_3) = 1$. A situation where $x_1 = 1$ is possible only if the consumer is absolutely sure of his correctness and realizes the absolute value of the purchase or when the consumer completely trusts the source of information that declares the absolute usefulness of the purchase. The latter situation explains the effect of aging in decision-making and the desire to follow the authorities. In the case of $x_1 = 1$, regardless of the information message, the level of coercion and its own intentions, will be made the choice to make a purchase. Then we get four more extreme points: 1) $P(1, 0, 0) = 1$; 2) $P(1, 0, 1) = 1$; 3) $P(1, 1, 0) = 1$; 4) $P(1, 1, 1) = 1$.

If $x_1 = 0$, a $x_2 = 1$, then regardless of x_3 readiness to choose is equal 0: $P(0, 1, x_3) = 0$. It is here that the inverse effect of the factor x_2 is manifested: an increase in pressure in the absence of a rational component

leads to a decrease in the influence of internal intentions - the coercion “kills desire”. This situation can also be described as the development of manipulation, when the compulsion to make a purchase, which is felt by the consumer, is directly opposite to this need. In this case, regardless of the initial intentions, the consumer will not choose this alternative. As a result, we get two extreme points:1) $P(0, 1, 0) = 0$; 2) $P(0, 1, 1) = 0$.

Assuming that each of the described variables in a fixed value of the latter affects P linearly, then the function P has the following additive-multiplicative form:

$$P = g\,(x_1; x_2; x_3) = a_0 + a_1x_1 + a_2x_2 + a_3x_3 + a_4x_1x_2 + a_5x_1x_3 + a_6x_2x_3 + \\ + a_7x_1x_2x_3. \quad (11)$$

Substituting the extreme points 1)-8) into (11), we obtain the system of equations:

$$a_0 = 0;$$
$$a_0 + a_3 = 1, \rightarrow a_3 = 1;$$
$$a_0 + a_1 = 1, \rightarrow a_1 = 1;$$
$$a_0 + a_1 + a_3 + a_5 = 1 \rightarrow a_5 = -1;$$
$$a_0 + a_1 + a_2 + a_4 = 1 \rightarrow a_2 + a_4 = 0;$$
$$a_0 + a_1 + a_2 + a_3 + a_4 + a_5 + a_6 + a_7 = 1; \rightarrow a_6 + a_7 = 0;$$
$$a_0 + a_2 = 0, \rightarrow a_2 = 0, a_4 = 0;$$
$$a_0 + a_2 + a_3 + a_6 = 0 \rightarrow a_6 = -1, a_7 = 1.$$

Where

$$P = x_1 + x_3 - x_1x_3 - x_2x_3 + x_1x_2x_3 = x_1 + (1 - x_1)(1 - x_2)x_3.$$

Thus, the three-factor analytical model of the reflection decision-maker's decision to make a purchase will have the final form:

$$P = x_1 + (1 - x_1)(1 - x_2)x_3\,. \quad (12)$$

The proposed model allows us to identify the rational factors and the irrational factors in which the management will be able to most significantly influence the likelihood of the expected purchase decision. This allows you to identify the main areas of application of reflexive consumer choice management tools in the marketing system of industrial enterprises, taking into account after-sales service, formation of ideas about an industrial enterprise.

Conclusions

However, for the successful implementation of the reflective management tools of the consumer choice the industrial enterprise must take into account both rational and irrational factors that influence the choice of the consumer. It depends not only on the effectiveness of marketing communications, but also on successful management in the competitive environment as a whole. After all, knowing how the consumer thinks, what information he has at his disposal, how he decides to buy certain goods through the organization of reflective influences can lead him to the actions necessary for the company to achieve its goals – increase sales and increase the efficiency of activities.

Moreover, in today's conditions of limited financial, time and intellectual resources, the use of reflexive tools in the management of consumer choice is an important low-cost factor in strengthening the competitive position of enterprises in the market. The suggested analytical model of decision-making reflection of consumers, based on the model of bipolar choice V. Lefevre, allows us to assess the probability

of making quick decisions, to predict and evaluate the effectiveness of reflective influences aimed at changing the influence of certain factors influencing consumer choice.

Prospects for further research are the formation, on the basis of analysis of the models of reflection, decision-making by consumers of the strategy of reflexive management of consumer choice, taking into account the specifics of different types of market, the development of information support reflexive management of consumer choice in the marketing system of industrial enterprises.

Abstract

The article presents the results of a study of the process of transferring forest land for lease for the implementation of priority investment projects. In total, 142 priority investment projects in the Russian forest complex were examined with a harvesting volume of 82.7 mln cub. m of timber and investments in excess of 7 mln. $. The largest concentration of priority investment projects falls on the forest regions of Russia: Northwestern Federal District, Volga Federal District and Siberian Federal District. The results of the study show that the forestry business is developing and there are high growth rates in production capacities and product sales. A significant part of the projects demonstrates high efficiency. However, macroeconomic and microeconomic risks remain that hinder the development of investment projects. A risk profile has been built that reflects the characteristics of the level of attractiveness of investing in forestry complex projects. It has been established that a high level of risk of administrative barriers and changes in forest legislation remains in the forest complex. High risk factors in the implementation of investment projects in the forest sector include the demand for products and the organization of production. The lack of a unified methodological approach to presenting preferences to investors reduces the effectiveness of the mechanism of priority investment projects in the Russian forest complex. The most effective measures of state support of the forest complex are tax incentives and financial support for projects. To further increase the investment attractiveness of the forest complex, systematic work is required to expand the resource base of enterprises, as well as the maximum use of all types of wood raw materials in production.

Keywords: Investments, Risks, Investment Projects, Forestry Complex.

Introduction

The forest industry is one of the most promising areas of Russian industry. This is due to several factors, among which are the low cost of raw materials and a wide sales market both domestically and abroad. However, the forest business is still one of the most risky.

Risk is understood as the probability of an adverse event, as a result of which the achieved results and indicators do not coincide with the planned values. Risk accompanies any investment project, but

projects implemented in the forestry sector have a greater risk than other sectors. The problem of risk management in forestry does not lose its relevance (Morkovina S.S.et al., 2018). This is due to the fact that activities in the forest are influenced by a number of factors related to natural, industrial, and social processes (Brumelle S. et al., 1990). The authors note factors influencing the implementation of investment projects in the forest sector of Russia (Kuznetsov S. G. et al., 2018; Morkovina S.S. et al., 2017).

Researchers have noted a high association between risk and project investment in forestry (Runsheng Yin et al., 1996; Rodríguez-Vicente V. et al., 2010).

The mechanism of priority investment projects in the forest sector of Russia has been implemented since 2007 (Karjalainen T. et al., 2013). A priority investment project is a special status that is assigned to investment projects aimed at creating new wood processing plants with an investment volume of 5 mln established by the state. $. up to 13 mln. $. (Petrov A.P. et al., 2018).

Russian legislation also provides criteria for evaluating investment projects, in most cases which are:

- economic efficiency of the investment project;
- budgetary efficiency of the investment project;
- social significance of the project for the region;
- environmental safety of production;
- the quality and cost of production relative to similar products sold on the Russian market (Morkovina S.S.et al., 2018).

Preference is given to projects that have the best economic indicators: the payback period of investments; simple rate of return; net present value; profitability index; discounted payback period.

Despite the development of the mechanism of priority investment projects, the influence of numerous risks reduces the effectiveness of investments in the forest industry (Chudy R.P. et al., 2020; Yakovlev A.V. et al., 2013). The aim of the study was to assess the risks of business in the implementation of priority investment projects in the forestry of Russia.

Methods

To identify and assess risks in the implementation of priority investment projects in the Russian forestry, we used an expert method based on a survey of the forest business.

Heads of forest enterprises were involved as experts; in total, heads of 72 forest enterprises acted as respondents.

To process the results of the survey and risk assessment in the implementation of priority investment projects in the forestry of Russia, two criteria:

1. the result (magnitude of consequences) from the manifestation of risk (scale: from « the consequences are minimal » to «the consequences are very large »);

2. the probability of occurrence of risk (scale: from « manifestation is unlikely » to «constantly manifests itself »).

To assess risk values, the Harrington scale was used, supplemented by a verbal description of each scale interval.

The desirability scale is divided in the range from 0 to 1 into five subranges. Harrington scale average numerical rating:

$$RL_{av} = (0.9; 0.71; 0.51; 0.28; 0.11) \quad (1)$$

Assessing such an indicator as the level of risk, we identified: «critical risk level» (numerical rating=0.9), «dangerous risk level» (numerical rating=0.71), «acceptable risk level» (numerical rating=0.51), «low risk» (numerical rating=0.31). «Insignificant level of risk» (numerical rating=0.11) (Table 1).

Table 1: Risk Assessment Scale

Risk Change Interval	Risk level	Risk description
1.0-RL-0.80	Critical	Very high risk. The consequences of the onset of risk are catastrophic
0.79- RL-0.60	Dangerous	High level of risk. The consequences of risk are critical
0.59 -RL - 0.40	Valid	Medium risk level. The consequences of the onset of risk are significant
0.39-RL-0.20	Low	Low risk. The consequences of the onset of risk are small
0.19-RL-0.00	Minor	An insignificant level of risk. The consequences of the onset of risk are minimal

To calculate the integral risk indicator, we used the function:

$$R_v = f(P_n, W) \quad (2)$$

where P_n – an indicator of criteria assessments;

W – an indicator of the weight of the criteria.

The weights of the criteria were also determined using expert judgment. The sum of the weights for all criteria is equal to one. Since the number of criteria is not large, to determine the value of the weights, the method of pairwise comparisons was used, which made it possible to increase the accuracy of the estimate.

Assessment of the consequences and probability of the implementation of entrepreneurial risk was carried out according to the following formulas:

$$P_{ni} = \frac{\sum_{J=1}^{N} P_{n_{ij}}}{N} \quad (3)$$

where P_{n_i} – risk consequences from the implementation of *i*-risk;

$P_{n_{ij}}$ – risk consequences from the implementation of *i*-risk, according to the *j*-expert;

j – expert number (from 1 to N).

$$P_{bi} = f(P_{n_i} \times W_i) = \frac{\sum_{J=1}^{N} P_{n_{ij}} \times W_{ij}}{N} \quad (4)$$

where P_{bi} - assessment of the probability of occurrence of *i* risk by the *j* expert;

W_{ij} - the probability of occurrence of the *i* risk, according to the *j* expert.

The studied risks were represented by two groups: macroeconomic and microeconomic. Each group analyzed 12 risks (Table 2).

Table 2: Systematization of risks of investment projects in the Russian forest sector

Risk group	Name of risks
Macroeconomic	Risk of restriction of export of forest products
	Buyer default risk, customer bankruptcy
	The risk of adverse changes in tax legislation
	Administrative Barrier Risk
	Risk of unreasonable growth in requirements from forestry authorities
	Risk of adverse changes in forest legislation
	Risk of lack of support from regional government
	The risk of adverse changes in the ruble exchange rate
	Risk associated with reduced demand for products
	The risk associated with high interest rates on loans and the inaccessibility of the latter
	Risk of growth in rental rates and payments
	Risk of rising prices and tariffs for third-party services
Microeconomic	Risk, lack of own financial resources
	The risk associated with the organization of the production process
	Risk associated with failure, equipment breakdown
	Risk of process disruptions
	Risk of forest fires, forest diseases
	The risk of exceeding planned costs and cost increases
	Risk, absence (insufficiency) of forest roads
	Risk of destruction of engineering and energy infrastructure
	Risk, lack of qualified specialists
	The risk associated with an ineffective personnel management system
	Risk, changes in the cost of raw materials, materials, equipment, finished products
	Risk associated with the organization of marketing and advertising of manufactured products or services rendered

Based on a study of the factors determining the occurrence of risk situations, we formed recommendations on the proactive management of investment projects in forestry.

Results and Discussion

Volumes of production of the Russian forest complex currently have a positive trend, the most characteristic period from 1990 to 2016 (Table 3).

Table 3: Indicators of production of selected major types of products of the Russian forest complex in retrospect

Product name	Year value						
	1990	1995	2000	2005	2010	2015	2018
Harvesting, mln cub. m	304	150	165,9	185	175,5	205,2	238
Production of lumber, mln cub. m	75	26,5	20	23,9	28,9	41	26
Paper and paperboard production, thous. t	8325	4074	5312	7448	7583	8196	9058
Furniture production, billion rubles (at current producer prices)	6	12	18	48	89	137	189
Plywood, thous cub. m	1597	939	2777	2556	2689	3607	4018

n 2018, the growth in wood processing and wood products amounted to 10.6%, in the production of paper and paper products - 12.6 percent.

This growth was largely due to the implementation of priority investment projects in forestry.

Participation in the project allows the company to apply a decreasing coefficient of 0.5 to the approved payment rates per unit volume of forest resources and the rates per unit area of a forest plot owned by the federal government for 3, 5, 7, or 10 years, depending on the amount invested in implementation of the project funds. The minimum investment to participate in a priority investment project in the forest sector is 7 mln. $. in case of modernization of the existing production and 7.2 mln. $. in case of creation of forest and timber processing infrastructure facilities.

The risk factor in the implementation of such projects is the methodology for selecting investment projects, which does not take into account the proposals of competitors for the same forest fund. As a result, competition in the implementation of priority investment projects is limited.

We have carried out a study of the process of transferring forest land for lease for the implementation of priority investment projects. In total, 142 priority investment projects in the Russian forest complex were examined with a harvesting volume of 82.7 mln cub. m of wood (Table 4).

When evaluating a priority investment project, the following criteria were considered:

– budgetary efficiency of the investment project;

– economic efficiency of the investment project;

– volume of investment costs.

Table 4: Implementation of investment projects in the forest sector

Federal districts of Russia	Number of investment projects (pcs)	Volume of investments (mln. $.)	Investment structure, %	Estimated cutting area (mln cub. m)
In general in Russia	142	8550	100.0	82.7
Северо-Западный	49	1842	21.0	22.1
Central Federal District	17	733	8.0	3.9
Southern Federal District	1	162	1.0	0.3
North Caucasian Federal District	1	7	1.0	0.03
Volga Federal District	23	480	5.0	8.0
Ural Federal District	10	87	2.0	2.0
Siberian Federal District	29	4630	54.0	38.3
Far Eastern Federal District	12	606	7.0	8.1

During the analysis, we studied the goals of creating investment projects:

– creation of production facilities for processing wood waste, including for bioenergy purposes;

– reduction of energy consumption of production (for investment projects on the modernization of timber processing infrastructure);

– increase in the volume of import-substituting products;

– creating high-performance jobs.

Priority investment projects are aimed at attracting private investment in key sectors of the economy of the country and regions by providing preferences from the state and regions

Investment projects are implemented in 32 constituent entities of the Russian Federation. Among the production areas within the framework of priority projects in terms of wood consumption, the first two places are divided by sawmilling and pulp and paper production - 30% of the total processing volume in all directions.

The highest concentration of priority investment projects falls on the forest regions of Russia: Northwestern Federal District (49 projects), Volga Federal District (23 projects) and Siberian Federal District (29 projects).

The volume of attracted investments in priority investment projects varies from 7 mln. $. up to 4630 mln. $. The maximum investment volume is Northwestern Federal District 21.0% of the total investment and the Siberian Federal District - 54.0% of the total investment in priority projects.

Most of the projects are aimed at the creation and modernization of woodworking facilities. The largest volume of investments (49%) is attracted to pulp and paper production, 30% was invested in

wood processing, and investments in the production of wood-based panels accounted for 16% of the total investment.

It was assumed that priority investment projects will help reduce or eliminate the negative impact of external and internal economic, environmental and social factors on the forest complex. However, an analysis of the main indicators shows that in some cases the indicators declared in priority investment projects were not achieved, with regard to the creation of new jobs, fees for forest use and taxes. This is due to the presence of risk factors in the implementation of investment projects.

The results of a survey of business representatives allowed us to build a risk profile that reflects the characteristics of the level of attractiveness of investing in forestry complex projects (Table 5).

According to business representatives, a high level of risk of administrative barriers and changes at the level of forest legislation remains in the forest complex.

Table 5: The risk profile of the implementation of priority investment projects in the forest sector

Type of risk	Assessment of the significance of risk (magnitude of consequences)	Assessment of the frequency of manifestation (probability)	Final Risk Assessment
Administrative Barrier Risk	0.92	0.65	0.598
Risk associated with reduced demand for products	0.8	0.61	0.488
The risk associated with the organization of the production process	0.58	0.36	0.208
Risk, lack of own financial resources	0.33	0.48	0.150
Risk of rising prices and tariffs for third-party services	0.21	0.36	0.075

An important risk factor for business is the demand for products and the organization of production. The probability of these risks manifesting during the implementation of investment projects in the Russian forest sector remains high and amounts to more than 50%.

Among the pressing issues, the forestry business considers the problems associated with the transportation of raw materials and products (rising tariffs for transport, lack of rolling stock, insufficient capacity of the railway and lack of timber roads) and a lack of qualified personnel.

High level of industry risks (price volatility, weather dependence, exchange rate fluctuations) and geopolitical factors also negatively affect the investment attractiveness of projects in the forest sector.

Despite the fact that borrowed funds are becoming more affordable, and the state subsidizes interest rates for priority projects in the forest sector, most participants highlight the lack of own funds and lack of financing as the main factor limiting the possibility of effective implementation of investment projects in the forest sector.

Despite the fact that the average payback period of priority investment projects is 6.8 years, the level of risk of rising tariffs and prices for contractor services remains high.

Conclusions and Recommendations

Most sectors of the Russian forest complex show significant growth rates in line with global trends. The results of our research show that the forestry business is developing and there are high growth rates in production capacities and product sales. This is due to high consumer properties, environmental friendliness and relatively low cost of production. To support the forest business in Russia, 142 priority investment projects with an investment volume of 8550 mlrd. $. and harvesting volume of 82.7 mln cub. m of wood.

A significant part of the projects demonstrates high efficiency. However, macroeconomic and microeconomic risks remain that hinder the development of investment projects. The forestry business is developing under the conditions of administrative barriers, inaccessibility of credit funds and changing tariffs for services.

This negatively affects the achievement of target indicators of investment projects and reduces the investment attractiveness of the forest complex as a whole. Issues of commissioning new production facilities for the development of deep processing of forests are among the highest priorities, according to industry participants. The lack of a unified methodological approach to presenting preferences to investors reduces the effectiveness of the mechanism of priority investment projects in the Russian forest complex. The most effective measures of state support of the forest complex are tax incentives and financial support for projects. To further increase the investment attractiveness of the forest complex, systematic work is required to expand the resource base of enterprises, as well as the maximum use of all types of wood raw materials in production.

Abstract

Sensory marketing as a new strategic tool, through the stimulation of the five human senses (touch, taste, sight, hearing and smell), seeks to increase profits in the short term and create bonds with customers providing them with unique experiences and emotions, with their brands, becoming one of the success factors of share of mind (brand recall), corroborating the process of fixing it in the consumer's mind. Affection for the brand happens when the needs have been met, the experiences lived and the sensations felt. The objective of this manuscript is to identify the role of sensory marketing in the Rock in Rio Brasil event and the tourist dynamics of the destination Rio de Janeiro. The present study will include a theoretical background reflection, where it is verified on sensory marketing, tourism and the Rock in Rio 2017 event. This study represents an important contribution to the area, since marketing and tourism, need constant planning to obtain effectiveness in the expected results, earning dividends to the brands and communities to which they are inserted. Future studies should continue this work, using a qualitative and quantitative methodology, in addition to the participation of Rock in Rio Academic. Although Rock in Rio Brasil is a consolidated event in the country's Events calendar, there is a lack of scientific research with more data about the event, which brings more originality and value to this study.

Keywords: sensory marketing, tourist dynamics, destination, Rock in Rio Brasil

Introduction

Tourism is characterized as a social phenomenon, which maintains interrelation with several sectors. It is a multifaceted and geographically complex activity, with tourism increasingly creating new (and different) market segments with different individual interests (Sousa, Malheiro & Veloso, 2019). Generally, it can be said that consumers choose a product or service according to the degree of correspondence with their tastes, interests and also taking into account how it can transform them (Sousa & Rocha, 2019). The advancement of technology has changed consumer behavior. In an era marked by information and knowledge, it is imperative to create value and differentiate (Lages; Sousa

& Azevedo, 2018). Tourism is characterized as a social phenomenon, which maintains interrelation with several sectors. It is a multifaceted and geographically complex activity, with tourism increasingly creating new (and different) market segments with different individual interests (Sousa, Malheiro & Veloso, 2019). The advancement of technology has changed consumer behavior. In an era marked by information and knowledge, it is imperative to create value and differentiate (Ferreira & Sousa, 2020; Vilas Boas, Sousa & Fernandes, 2019).

Since sensory marketing is related to consumer experiences with all human senses (sensory, emotional, cognitive and behavioral) (Lovelock; Wirtz & Hemzo, 2011). Through smells, flavors, colors, textures and sounds that Sensory Marketing "seduces" and takes the consumer shopping. Due to a generation that is more demanding in terms of consumption, companies had to reinvent themselves, and before that, Rock in Rio, one of the most popular music festivals in Brazil, in 2017, is no longer just a musical festival and becomes offering entertainment to the participating public and delivering differentiated experiences. Thus, major brands look for the festival and there (in) directly compete for the attraction of the public present. The objective of this research project is to identify the role of sensory marketing in the Rock in Rio Brasil event and the tourist dynamics of the destination Rio de Janeiro. The research problem involves asking, what is the role of sensory marketing in the Rock in Rio Brasil event and what is the tourist dynamics of the destination? The choice of the theme is justified, due to the lack of scientific materials related to the experiences and sensations lived by the public participating in the Rock in Rio Brasil Event and the affection that can be built by the participating public towards the event, after the experiences lived, and for this event one of the biggest in the world.

Therefore, the methodology used is descriptive research, presenting the Rock in Rio Brazil 2017 case as an object of study, where it is verified bibliographically on sensory marketing, tourism and the Rock in Rio Brazil 2017 event. from this article it was necessary to build a solid theoretical foundation that was divided into 3 chapters, the first of which was the approach to marketing actions that were developed for major festivals as well as about and sensory marketing; In the second chapter, whose object of study is Rock in Rio, its history, since its creation, was approached, as well as the sensorial marketing, offered by the sponsoring brands of the event, highlighting the actions developed in each stand to cause unique sensations to the customers and a souvenir after the event; making brands loyal to them; and finally, in the third chapter, the dynamics of the destination of Rio de Janeiro was presented, in front of the Rock in Rio Event.

Sensory Marketing And Events

In the current context of advertising, brands use all the technical / technological devices at their fingertips to express themselves through all possible channels, and then reach their consumers sensorially (Vollmer, Precourt, 2008). The brands are intended to "penetrate our senses and cause pleasant and even affective sensations that lead us to an approximation (Perez, 2016, p. 49). Sensory marketing analyzes consumer behavior and involves it emotionally in a way that associates experiences, sensations and emotions (positive or negative) with the brand, product or service (Sousa, 2019). According to França et al (2015), she says that sensory marketing as: "the activity that involves the sensation of experiencing the part of the world that is supposed to be sold, using the senses: sight, touch, smell, hearing and taste, as a basis to choose this or reject that". Sensory marketing is an action to stimulate consumers' senses, in order to generate engagement through emotional bonds through memories and desires that can make the consumer associate a specific positive feeling with a certain brand (Soares, 2013, p. 09). It lists the set of stimuli (elements) capable of creating a multisensory atmosphere that meets the brand's purposes, whether in the sales environment, in the advertising communication actions and in the product's characteristics (Filser, 2003). According to Schmitt (2000); Silva, Teixeira and Luchini (2018), both reason and emotion drive the consumer to purchase. It is known that all human experiences and perceptions are initially acquired through the senses. Knowing how much the five senses of the human being play a fundamental role in their choices, sensory marketing invests in elements that enhance these senses through increasingly elaborate designers, strong and vibrant colors, fragrant, clear environments and with ambient music (Silva, Teixeira & Luchini, 2018). "Brands that appeal to multiple senses will be more successful than those that focus on

just one or two." (Dooley, 2012, p. 34). Schmitt (2002), reports that "sensory marketing can provide numerous benefits to the company, since it stimulates the desire to buy, differentiates the product or service offered from the competition, strengthens and positions the brand identity, creates image and identification a company, promotes innovations and mainly "induces the consumer to experience, purchase and, more importantly, to consume the product faithfully". Therefore, in the next chapter, the Rock in Rio Brasil event is addressed, based on its creation, until arriving in 2017, in the marketing strategies designed to retain customer loyalty to the event.

An event has as main attributes, the attraction and congregation of people, the intrinsic character of ephemerality, the relationship with leisure and free time, and the space-time selectivity in its realization. It can be represented by exhibitions, fairs, festivals, shows, congresses, meetings of a scientific, cultural, commercial, social and / or political nature, sports competitions, etc., comprising, therefore, different natures, dimensions, scales of reach, duration and it can also sometimes occur regularly and with certain periodicity (Molina, 2016). Mega-events are configured, notably, as urban strategies adopted by the government combined with private initiative, and bring with them a profusion of urban mega-projects (involving various constructions) that directly impact the urban structure of cities (Sposito, 1991; Molina, 2016). The various elements linked to mega-events are directly linked to the proposal for urban development and tourist segmentation, as well as the creation of infrastructure and facilities for their realization, which can and should be extended to the local community, in the search for beneficial results for all actors involved (Silva, Braga & Romano, 2016).

The events segment has been consolidating itself as a prosperous market in the ranking of the tourist economy (Silva et al, 2016). It is configured as an alternative to the struggle of seasonality and countless environmental externalities, contributing, above all, to the multiplying effect of tourism for the cities that host them as well as for the surrounding cities. Piscopo et al (2015) and Coutinho; Coutinho (2007) state that the number of international events hosted by Brazil has grown and the country stands out in Latin America. Getz (2008) explains that one of the main objectives of investment in events is to highlight the city development and marketing plans in most destinations. Events entertain the local population, generate media, helping destinations to develop their confidence and a positive image in the tourism market (Yeoman, Robertson, Ali-Knigth, 2006; Mackay, Barbe, Van Winkle & Halpenny, 2017) . The events aim to attract visitors and tourists to a city, including offering the entire tourism production chain, in addition to the travel experience and knowledge acquired (Turgay; Dikman, 2013, Garbuio; Generoso; Gonçalves, 2018) . Festivals, considered a type of event, have experienced significant growth in the event segment, especially as they highlight the local and / or regional culture of a destination (Zucco, 2012; Garbuio; Generoso; Gonçalves, 2018). They are configured as a strong business opportunity (Yeoman, Robertson, Ali-Knight, 2006; Getz, 2010; Santos; Zucco; Kraus, 2015).

Music festivals have taken on an increasingly important role in the development of tourist destinations around the world (Soria et al, 2014; Dinis, Eusebio & Brenda, 2019). Currently, there is a wide variety of music festivals and have become popular tourist attractions, taking on an important role in the social, cultural and economic development of destinations. It is highlighted in the literature that these events generate positive but also negative impacts (Soria et al, 2014; Moisescu et al, 2019; Dinis, Eusebio & Brenda, 2019; Panomareva & Tkachenko, 2020).

Music festivals have recently undergone an exponential increase (Leenders, Telgen, Gemser & Wurff, 2005; Gonçalves, 2014). Therefore, implementing innovative marketing strategies that allow them to attract and retain visitors while positioning themselves in a different way, personifies the brand. (Gonçalves, 2014). Nowadays "both private companies and public institutions tend to invest in building opportunities so that their audiences can live innovative experiences (Carapinha, 2013; Gonçalves, 2014). Starting from the concept of Kotler (2002, p.44); Silva et al, (2016) that marketing has the function of facilitating and consummating exchange relations, it is understood that brands are increasingly preparing themselves to bring differentiation and value to the business, offering, in addition to the quality of product, a quality of life also for the consumer, providing emotions, innovative experiences.

Rock in Rio Brasil: Event and Differentiation

The challenge of creating a large entertainment event in 1985 was related to the unique moment in Brazilian history, when the country underwent major transformations, after a long period under a military dictatorship and still beginning to take its first steps towards democracy. The established economic fragility made it impossible for large shows to come and corroborated the world's lack of knowledge about Brazil. Given this scenario, believing in innovating through a communication platform with unique experiences, which could bring economic gains to the city of Rio de Janeiro, visibility to Brazil, and possible investors and entrepreneurs to Rio de Janeiro, Roberto Medina, creates the Rock in Rio event (Medina, 2019; Costa e Igreja, 2019).

It had its first international edition, in Lisbon, kept its original name that makes reference to the city in which it originated and to which it returned in 2011, after 10 years of absence. After his last stay in Brazil in 2001, the event took a tour of the world for 10 years and only returned home in 2011, bringing renowned attractions. Currently, the event takes place in Brazil every two years (Silva, Lima, 2014).

Rock In Rio, which this year is 35 years old, is a music festival originally Brazilian. The event has had worldwide repercussions, being recognized as one of the biggest music festivals in the world, if not the biggest, and due to its popularity among the most varied tastes, it took off from the Brazilian territory to Portugal, Spain and the United States, respectively. In all of its 20 editions, eight of them were in Brazil, eight in Portugal, three in Spain and one in the United States. (Lira, et al, 2016) Counting in numbers the entire trajectory of Rock in Rio since 1985, there is the 20th edition of Rock in Rio, the eighth on Brazilian soil, since 1985 (Medina, 2019). Over the years and with new editions, Rock In Rio has become a very interesting branding case. The event starts offering unique experiences in all of its fields that link brands with a meaning of belonging and much greater intimacy with the audience present (Silva et al, 2017). Each sponsoring company has its own exclusive stand to carry out its marketing action and link its name to the event, through advertising. Given this reality, in the next chapter, it will be treated about the experiences lived by the participants of the Rock in Rio Brasil Event.

Sensory Marketing: experiences and emotions in Rock in Rio Brasil

Rock In Rio as an event that provides several brand experiences. For this reason, brands need to be true to their customers in order to really strengthen what they really are (Lira et al, 2016). The brand has three purposes, the first being: name, term, sign, symbol or design. The second is its function, or what it is for: identifying and distinguishing, describing and giving meaning. And the third, the results: differentiate it so that consumers and other audiences have a reason to prefer it over their competitors (Silva et al, 2017).

Vision: Most worked sense in the scope of advertising. When creating a brand the first thing to think about is visual communication and appearance. Colors, shapes, images and symbols are the main elements of this sense.

Hearing: Every time a sound is emitted, the consumer is able to receive the information and can generate a brand positioning. Vignettes, jingles, music and sound effects are the sensory elements worked on at this time.

Touch: The human being likes to touch, touch, hold and feel the product. A key moment at the point of sale after viewing the product is for the consumer to get it. Format and texture are the main elements.

Nose: The purchase stimulus may be linked to the consumer's memory. He remembers the smell, the taste, the image of the product. The fragrance can associate memories and emotions to the customer, so smell and aroma are the elements of this sense.

Palate: Used by food industry brands and is closely linked to smell. Flavor is, therefore, the element worked in this sense (Silva et al, 2017, p.4).

Thinking about the brands, and the meanings worked by them, the Rock in Rio 2017 event in Brazil, had a master sponsor, which was Itaú, 6 Sponsors, which were: Coca Cola, Doritos, Heineken, Ipiranga, Ford and Natura (Almeida, 2017). Next, the most creative stands of sponsors who were present at the Rock in Rio Olympic Park will be presented. They worked on sensory marketing, transforming desires and desires into real experiences.

Itaú, master sponsor of the event in 2017, had the brand Giant Wheel activated, which has been present in other editions, only in these, a little bigger than previous editions, which allowed the consumer audience to have a live marketing (experience marketing) in the environment. Another difference was that it inserted a giant 8 meter phone installed at the entrance of the event, allowing the public to listen to the songs on the playlist of the festival day. It also featured actions such as the presentation of bands in the Itaú arena #issomudaomundo (Silva et al, 2017). It provided a playground; set up a music arena, which will host concerts and offer cell phone recharge points. He set up Bike Rio at the festival, giving the program user the possibility to ride his bike to the festival (Diniz, 2017). As for sensory marketing, Itaú stimulated hearing by offering the playlist of songs from the event; the vision, with the provision of materials and decorative objects, which in addition to entertaining passing the bank's identity; tact, when taking an Itaú bicycle to stroll in the Olympic Park; smell and taste were not stimulated by the brand, as it did not act in this direction.

Heineken delivered to the participating public, one of the most fun and exciting attractions of the festival, in which the company has been present since 2011, the zip line that this time was 22.5 meters high and was one of the most disputed activations, working with live marketing. In addition, Heineken invested in 2017 in a proposal for responsible consumption and recycling, in addition to interactive panels that are sensitive to sound waves that will stay in connection with the track (Silva et al, 2017). The company also distributed the drink at the festival. , there were more than 350 thousand liters of draft beer with 16 water trucks; 190 traveling backpackers and 200 beer coolers installed at the festival's food outlets. Acting as a sponsor since 2011, Heineken even allocates 25% of its marketing investment in the year to the festival (Diniz, 2018) Heineken acted in sensory marketing stimulating the palate when distributing drinks; tact when it stimulated the sensations of height and touch in the structures of the toys and separation of the recyclable; vision when presenting an innovative stand persuading people to look at the structures assembled to serve the customer; as for hearing, they installed interactive and audible panels. They did not act on smell only because they did not relate the smell to the available environments.

Coca-Cola in its planning of brand activation, provided a special stage, the action took the Coca Cola Band, a group formed by young musicians where the general public of the event can sing along with the band the songs of the artists. There was also the presence of the Fanta brand, which was promoted in the Guaraná flavor at Casa Fanta Guaraná on Rock Street Africa, whose theme was Tropical Forest (Silva et al, 2017). At Casa Fanta Guaraná, on Rock Street Africa, the main objective was to generate experimentation of this new drink from the company's portfolio with tasting of the products (Diniz, 2017). Scenography that simulated a tropical forest, in addition to “stone” poufs and released soda, the environment had room flavors. Several vines hung with cell phone chargers will be available to the public. He set up an area of 180m² with musical instruments (Silva et al, 2017). As for sensory marketing, they emphasized the sensations related to hearing, when they joined the band with young people; the palate was also enhanced when offered to Fanta Guaraná, evaluating the drink's flavor; The vision, with the projection of scenery over the forest; the formats and lighting that drew public attention; smell when smells were in the drinks they offered. Lastly, when people need to charge their cell phones, they need to touch the vines that were scattered throughout the stand environment and feel which vines would have the tip with a charger. Coca cola, to stimulate the audience to the 5 senses, previously treated.

Doritos in the 2017 edition, entered the event with a more solid positioning, which was being worked on throughout the year. Bet on the presentation of seven garage bands, in addition to a toy in the style "Megadrop" and launched three items of the special line of snacks, being offered to the public participating in the event that circulated through the stand. One of Doritos' main attractions was a megadrop (free fall tower) of more than 100m working with live marketing in its audience. The brand also promoted shows for 7 garage bands (Silva et al, 2017). As for sensory marketing; one can observe

the stimulus to hearing; with the songs offered by the bands; the taste when offering the special line snacks launched for the event; smell with the smell of snacks; the touch, in function of the megadrop and the sensations stimulated in the free fall and, finally, the vision, with the use of colors, shapes and light that attracts the public to approach the stand, working the 5 senses.

Ipiranga is the sponsor of the roller coaster, one of the main attractions of the festival and the success of the public working on live marketing, covered it using its profiles on Facebook, Instagram and Snapchat and the actions close to the festival. The brand also had an exclusive filter on Snapchat, activated by geolocation only for those in the City of Rock. Thematic playlists about the festival were also launched in the Ipiranga profile (Levin, 2017). "Ipiranga communicated with all types of customers, in a good-natured and relaxed way (Scheller, 2017). For the third time, it arrives in this edition with more activations of the Km de Vantagens program. The actions also include five buses with the Km de Vantagens logo, which will circulate in Rio de Janeiro. Consumers who scan these logos with the application were able to win tickets instantly (Oliveira, 2017). As for the sensorial marketing worked by Ipiranga, there is a stimulus to touch, through the sensations stimulated by the roller coaster, and access to social networks, a vision with the presentation of the brand's layout on the sticky buses, at the brand's stand; listening through the playlists that were played on the stand. The company only did not act on taste or smell.

Natura with its project Nave - Nosso Futuro É Agora, was another novelty of this edition of the festival and a co-creation with Natura, it was a success among the public: over the seven days, the attraction received 100 thousand spectators. The experience materialized the discourse that to build the future it is necessary to change the present, from projections, scenographic and special effects, music and smells to stimulate a look to the future (Guimarães, 2019). As for sensory marketing; one can observe the stimulus to hearing; with the songs played in the presentations; the sense of smell, due to the smell of the environment and finally, the vision, with the use of colors, shapes and light from projections and scenographic effects, which attracts the public to approach the space.

Finally, it is worth remembering that in the identification of any brand, the first meaning that is evident is the visual sense. This sense dominates others, as it is more appealing and gives the first opinion that the consumer builds on the brand. Thus, it can be said that the set of dimensions that arise from the use of the five senses in the image of a brand, will strengthen it and contribute to a better relationship with the consumer (Marques, 2016). This research aimed to analyze the multisensory experience in the brands present in Rock in Rio, making all the senses present in their image, using strategies of image, sound, palate, odor and touch that lead to the strengthening of the image of the brands in the Rock festival market.

The Rock in Rio event and the dynamics of the destination

Tourism and events have been widely used in initiatives aimed at urban regeneration, through promotional strategies framed in the marketing of cities. Events have a comprehensive role functioning as a means of boosting the local economy, stimulating social inclusion, promoting local culture, contributing to urban regeneration and "putting" cities on maps (Rola et al., 2018, Moseiscu, 2019). Festivals as a specific type of event can be great deals for a destination, becoming part of tourism strategies. Event tourism can be used as an instrument to support the development of a city / region. It works as an ally to combat seasonality and help revitalize the culture of a place. Event tourism, if well planned and organized, can positively influence the image of a tourist destination. It can attract visitors or tourists, encourage the economy and enrich the cultural and social life of the regions where it takes place (Marujo, 2015).

The realization of events profiles one of the most beneficial measures in the context of city marketing, states that "Cities see events as engines of development for city marketing.", As they provide the city with opportunities for dynamization at the urban level (such as the construction of new infrastructures or the restructuring of existing ones), social, economic, institutional and even in the projection of the city's image, which stimulates the appearance of new investments, new tourists, new residents, among others (Ribeiro & Sousa, 2016). The benefits and values of a destination must be promoted internally

(for residents), and externally (for visitors, investors), to take advantage of the best results, in terms of notoriety and visibility (Lages et al, 2018, p . 17).

In the second week of Rock in Rio (September 21 to 24, 2017), the ABIH-RJ survey shows that 77% of the rooms reserved. RioCeptur calculations indicate that the occupancy rate was 46,200 rooms, with 258,700 potential guests and estimated revenue of R $ 45 million (Rio Convention & Visitors Bureau apud O Dia, 2017). According to a survey conducted by FGV (2017) Rock in Rio generated R $ 1.4 billion in the city's economy, 65% of the audience came from outside Rio, 20 thousand people worked at the event and 700 thousand people attended the shows during the week of the event (FGV, 2017 apud RJTV, 2017). As can be seen, the events are great stimulators for the development of the destinations to which they are inserted. In addition, the events have contributed to mitigate tourist seasonality, moving the city's economy, generating opportunities for direct and indirect jobs, for the policy of publicizing the location, in addition to the possibility of generating socio-cultural benefits through the exchange of information. carried out among the actors involved in holding events.

Final Considerations and Future Research

Eveno Rock in Rio became known in the world, respected and synonymous with music festival, a case of marketing and brading. Today, the event represents musical diversity and a point of dissemination of brands and entertainment. It was born as a promotional event, and today in the 21st century, it has reached levels, reaching an experimental event with sensory appeal. All the sponsoring brands cited, offered a real and not virtual activity for the public that passed through the spaces. As for sensory marketing, the brands that covered the 5 senses (smell, touch, taste, hearing and vision) were: Coca Cola, Doritos; the brands that stopped working on the sense of taste were: Itaú, Ipiranga, Natura; the stretchers that stopped working on smell: Itaú, Heiniken, Ipiranga. As for tact: only Natura stopped working; Looking at the presentations above, it can be said that Rock in Rio is an important event within the marketing planning of major brands in Brazil and works with the help of sponsors and supporters for shows to happen. This survey became relevant for the company because it managed to obtain consumer satisfaction, and therefore add a factor of great value to consumers, which is the perceived value of the product. The musical and festival of the Rock in Rio brand, according to Le Breton (2009), can be considered suitable grounds for the expression of emotions. When talking about promoting the destination Rio de Janeiro, through the Rock in Rio Event, the importance of event tourism was perceived as one of the ways to enhance the tourist development of a region or locality, increasing foreign exchange, creating the identity of image of the destination, the cultural exchange, being able to assume a fundamental role in the socio-economic and socio-cultural development. It is concluded that the event is a possible stimulator of the dynamics of the destination. The limitation of this research is the bibliographic search in qualis articles, when dealing with the Rock in Rio event. Future studies should continue this work, using quantitative methodology, in addition to the participation of Rock in Rio Academic. Although Rock in Rio Brasil is a consolidated event in the country's Events calendar, there is a lack of scientific research with more data about the event, which brings more originality and value to this manuscript.

Responsibility in Management – The Analysis of The Behavior of Employers Using the Logit Model

PhD Katarzyna OLEJNICZAK-SZUSTER

katarzyna.olejniczak-szuster@wz.pcz.pl

Abstract

The issues of responsibility have become one of the significant aspects of management of the contemporary enterprise recently. On the one hand, this is linked to the growing awareness of stakeholders as to the role of the company in the market and, on the other, the implementation of the CSR strategy by enterprises, relating to taking responsibility for the impact they exert on the environment, while taking into account basic norms and ethical values. Thus, in the article, an attempt was made to estimate the logit model of employers' behavior in terms of responsible management. For this purpose, the survey was conducted among 456 employees, and subsequently 5 logit models were estimated, which were verified in terms of statistical accuracy. All the estimated models showed statistical significance and also quite a large number of correct predictions. The analysis of the obtained results also indicated that the category of responsibility is an increasingly emphasized component of management, while constituting the basis for operations in the competitive market, thus becoming one of the factors for achieving a competitive advantage. Moreover, responsible management ought to primarily relate to establishing appropriate relationships within the company, i.e. the relationships of employee-employer, employer-employee, employee-employee, including the value system in the organization.

Keywords: Responsibility, CSR, Norms and Values, Unethical Behavior .

Introduction

Currently, one of the fundamental aspects of management of the contemporary enterprise is broadly understood responsibility. This is due to the fact that the category of responsibility, usually identified as one of the principles of ethical behavior, has become the factor conditioning the survival of the enterprise and even its success in the market. Until recently many enterprises were governed by tough management rules, seeking merely to maximize their value, often ignoring the so-called ethical-responsible behavior (Wang 2014, Bhardwaj et al., 2018). The consequence of such operations has become the crisis of confidence in the economic system, which is related to the endless wave of scandals, economic or business affairs (among others, the use of child labor by Nike, the Siemens affair, illegal activities in Credit Suisse, Deutsche Bank, Citigroup and Goldman Sachs), which have occurred over the last few decades (Pearce &Stahl, 2015). On the one hand, this has led to an increase in regulatory control over the business world and, on the other, prompted both theoreticians and practitioners of management to pay attention to the category of responsibility, including CSR activities in enterprise management (Treviño, den Nieuwenboer & Kish-Gephart, 2014).

Taking into account the above, the objective of the considerations is to assess the behavior of entrepreneurs, using the logit model. The implementation of the objective of the paper requires responding to the following research questions:

- RQ1: Is responsible management, including the assumptions of CSR as well as observing norms and ethical values, the basis for the functioning of the contemporary enterprise?
- RQ2: What is the most frequent unethical behavior in the contemporary enterprise, including that among employers?

- RQ3: Which of the values (business, ethical, the ones in the working environment) are of the greatest importance for the functioning of the contemporary enterprise?

Responsibility in Management – Selected Issues

As pinpointed by K. McGrath and S. J. Whitty (2018), responsibility is a multidimensional concept relating to various human activities which can be characterized through the prism of many variables (characteristics, actions, motives), thus, it is a concept difficult to unequivocally determine. In general terms, it can be assumed that responsibility in the organization should be considered as a package of obligations related to work or the performed function (Bivins 2006). The category of responsibility in the company is presented in a slightly different manner by D. Mele (2009), who considers it from the point of view of the possession of power by the enterprise and also the freedom of action. In practice, this means that enterprises may (positively or negatively) influence the surrounding reality, taking responsibility for their operations or ignoring social expectations in relation to them. As a rule, responsibility arises when "something goes wrong". Then, responsibility in the enterprise relates to the category of unfulfilled obligations, including penalties. Understanding responsibility in such a sense is reflected in the philosophical approach where responsibility is strictly connected with the issues of punishment and sanctions. Therefore, it is included in the sphere of conscious human behavior. It is also assumed that actions are followed by specific consequences and their performer is responsible for the consequences of their actions (Geryk, 2012, Dziadkiewicz 2012)

In the opinion of A. Kisil (2013), responsibility in the enterprise is the awareness of the moral obligation and also legal responsibility for one's actions and the actions of others, including bearing consequences (collectively or individually). In these terms, responsibility is closely linked to leadership where leaders are an important source of modelling the roles of subordinates. As opposed to traditional leaders, who seek high profits and maximization of value for stakeholders, responsible leaders promote responsibility at each stage of performance of operations, creating responsible organizational culture, due to which people have confidence in the fact that they may rely on the organization (Cheng et al., 2019). It is commonly assumed that corporations bear three types of responsibility, economic - in relation to their stakeholders, social and environmental – in relation to the communities in which they operate (Jha, Cox 2015). In this context, Corporate Social Responsibility (CSR), which, according to Ding et al. (2016), has become the dominant paradigm in the corporate world in recent years, is becoming particularly important. As indicated by Mohr et al. (2001), on the one hand, CSR is the obligation of the enterprise to minimize or eliminate any harmful effects of its activities and, on the other, seeking to maximize its long-term beneficial impact on the society and the natural environment. In these terms, responsibility relates to the actions towards a wide range of stakeholders affected by the policy of the company and the consequences of the decisions taken (Kościelniak, Brendzel-Skowera 2018).

Unfortunately, in practice, there is often a range of negative actions, contradictory to CSR, such as exploitation of employees, their unfair treatment, broadly understood pathologies in the workplace (e.g. mobbing, harassment, discrimination), manipulation, fraud, child abuse, overexploitation of natural resources, no respect for the natural environment, treating CSR activities as bleach and many others. There are many reasons for this situation. They may arise, among others, from:

- excessive pursuit of profit maximization at all costs,
- pressure from superiors, by setting unrealistic goals,
- the attitude of employees themselves for whom moral aspects of work are not the basis for a number of actions,
- lack of adequate knowledge of the company's policy, including the prevailing principles, norms and values,
- the position in the company in order to claim the credit,
- emerging changes (not necessarily negative) and fear of them.

Since enterprise management, based on the category of responsibility, is not easy, taking a decision which would be both ethically and economically efficient also seems to be a difficult issue.

Research methods and procedures

The first step in the search of the response to the primary objective of the research depicted in the introduction, and the related set of research questions, was to formulate the relevant hypotheses and also to construct the research model (Figures 1). Therefore, for the purposes of the research, it was established that:

1. contemporary enterprises attach great importance to responsible management in their activities,
2. in the competitive market, there is a range of unethical behavior in both the company and among employers, which implies responsible management,
3. responsible management largely depends on skillful combination of business, ethical values as well as the ones in the workplace.

Fig.1: Research model

Source: Own study

The constructed research model is the graphical representation of the research questions - RQ 1-3, along with the adequate hypotheses H1-3, requiring statistical testing. Therefore, for the purposes of the verification of RQ1-3, the diagnostic survey, using the survey technique (PAPI and CAWI)[1] was conducted in the 2nd and 3rd quarter of 2019. The questionnaire was addressed to 456 employees, including 71 foreigners. The subject of the study was both management staff (36%) and those employed in non-managerial positions (64%).

Due to the nature of the variables, the so-called qualitative ones, in the subsequent step, the econometric modelling instrumentation was used, within the framework of which multinomial ordered logit models

[1] In the conducted survey, the structured survey questionnaire was used, consisting of 29 main research questions. For the purposes of this study only the research questions (RQ) relating to the activities of employers were used.

were estimated (Kufel, 2007, Gruszczyński, 2010).The starting point for the considerations on the ordered logit model is to define the dependent variable. This variable most frequently shows the result of the rational decisionin a dichotomous form. The result of such a decision in the case of the research discussed is:

- $y_i = 1$, if i-th occurrence of the phenomenon in the working environment,
- $y_j = 0$, if j-th absence of the phenomenon in the working environment.

It should be pinpointed that this type of models describes the probability of occurrence of the analyzed phenomena. Taking into account the objective of the article, the application of the logit analysis related to the determination of:

- in the case RQ2, unfair behavior in the enterprise as well as unethical behavior of employers which determine responsible management,
- in the case of RQ3, the set of values of the greatest importance for responsible management.

For the purposes of the conducted research, responsible management was defined as the implementation of the ethical business conduct (the dependent variable Y). In turn, the set of independent variables (X) included the parameters characterizing the individual aspects analyzed (Table 1).

Table 1: The classification of independent variables

	Perspective of	
	the company	the employer
RQ2	x_1 use of the company's equipment for private purposes, x_2 incomplete use of working time by employees, x_3 frequent failure to meet commitments by coworkers x_4 conflict of interests, x_5 abuse of sick leave, x_6 verbal aggression towards colleagues, x_7 thefts, x_8 mobbing, x_9 use of illegal computer programs, x_{10} corruption, x_{11} discrimination, x_{12} sexual harassment, x_{13} physical violence	x_{14} sexual harassment, x_{15} granting discretionary bonus unfairly, x_{16} delays in payment of salaries, x_{17} the minimum-wage contract, x_{18} lack of respect for employees, x_{19} mobbing, x_{20} lack of respect for private life of employees, x_{21} permission to perform work without formal employment
RQ3	x_{22} business values, x_{23} moral values, x_{24} in the working environment values	

Source: Own study

While searching for the impact of individual aspects on responsible management, the data were sorted based on the answers of the respondents. Thus, using the Gretl software, the full and reduced model was estimated for each group of variables. It should be emphasized that, while creating reduced versions, statistically insignificant variables with the largest p-value ($\alpha < 1$) were reduced, so that, eventually, statistical variables could emerge in the model.

Research Results and Discussion

The conducted opinion survey, in the case of RQ1, indicated that contemporary enterprises should implement the ethical dimension of business in their operations. According to the respondents (Fig. 2), enterprises ought to seek to maximize profit while caring for employees, the natural environment or the local community (45%), therefore, they ought to implement the strategy of CSR.

Fig.2: The directions of the operations of enterprises in the opinion of the respondents
Source: Own study

It may seem that there is no room for responsible actions in business, however, both managers and regular employees acknowledged (94.5% of indications) that business is no longer about just generating profits, but it is interwoven with the social life. For this reason, it is important that they are guided by ethical values in their activities, relating primarily to the establishment of the rules of conduct in the organization and also in relationships with a wide range of stakeholders, the introduction of CSR standards in the management strategy and also determination of sanctions against those violating ethical standards. Interestingly, only two managers concluded that responsible management is not the basis for the functioning of contemporary enterprises. The analysis of the obtained research results also proved that the attachment of great importance to moral values, ethics, CSR activities is marginal (82% of indications). The enterprises that take such actions do that to improve their image and PR activities. It can be concluded that the scope of liability depends on the changing conditions, possibilities of team entities and, finally, social expectations towards the company.

While searching for the response to RQ2, four logit models were estimated, due to which unethical behavior in the company and also among employers was identified (Table 2).

Explanation: The level of significance of the parameters: *** $\alpha = 0.01$, ** $\alpha = 0.05$, * $\alpha = 0.1$
Source: Own study

While looking at the obtained results (Table 2), it can be concluded that, in the case of:

- Model 1 (full model) - not all the identified variables turned out to be statistically significant, such a relationship was indicated by only three variables - x_1, x_6 and x_8, whereas x_1 indicated statistical significance at the significance level of $\alpha = 0.1$, the other two variables indicated such significance at $\alpha = 0.01$,
- Model 2 (reduced model) - goodness of fit was indicated by two of the three variables, i.e. x_6 and x_8; therefore, it can be concluded that the most frequent unethical behavior in the company is verbal aggression towards colleagues and mobbing,
- Model 3 (full model) - only two of the eight variables are statistically insignificant, i.e. the variables x_{17} and x_{20}, the other variables showed the characteristics of significance and underwent further estimation,
- Model 4 (reduced model) - it can be observed that three variables indicated statistical significance, whereas two of them (x_{16} and z x_{21}) at $\alpha = 0.05$, on the other hand, x_{19} at $\alpha = 0.01$, however, the most frequent negative behavior on the side of employers includes: delays in payment of salaries, mobbing and permission to perform work without formal employment.

For the purposes of the qualitative assessment of the estimated models, the measures of fit of the data to the individual models are presented in Table 3.

Table 3: Measures of fit of the data to the logit models 1-4

	MODEL 1	MODEL 2	MODEL 3	MODEL 4
Likelihood Ratio Test	78.4067 [0.0000]	69.2584 [0.0000]	22.7746 [0.0037]	15.6216 [0.0014]

While analyzing the measures of fit of the data to the model, it can be concluded that Models 1 and 2 are characterized by a relatively higher quality of estimates than in the case of Models 3 and 4. The relatively highest quality of the estimated models can be observed in the case of Model 1, where the number of the cases of 'correct prediction' is at the level of 76.3%, which amounts to 348 correctly classified cases of responsible management. While analyzing the measures of fit of the data to the model, it can be concluded that Models 1 and 2 are characterized by a relatively higher quality of estimates than in the case of Models 3 and 4. Moreover, the relatively highest quality of the estimated models can be seen in the case of Model 1, where McFadden's R-squared is at the level of 0.14. While relating to the estimated models, high accuracy indices were obtained, which is illustrated in Table 4.

Table 4: The accuracy of the estimated logit models

Empirical values Y	Predicted values Y			
	0	1	∑	% of correctly classified cases
		MODEL 1		
0	287	34	348	82.47%
1	74	61	135	54.81%
∑	361	95	456	-
number and % of correct prediction				348 (76.3%)
MODEL 2				
0	282	39	321	87.85%
1	72	63	135	53.33%
∑	354	102	456	-
number and % of correct prediction				345 (75,7%)
MODEL 3				
0	319	2	321	99.37%
1	129	6	135	95.55$
∑	448	8	456	-
number and % of correct prediction				325 (71.3%)
MODEL 4				
0	321	0	321	100%
1	135	0	135	100%
∑	456	0	456	-
number and % of correct prediction				321 (70.4%)

Source: Own study

As it can be observed (Table 4), in the first modeling, prediction accuracy of the value $Y = 0$ amounts to 97.8% of a total number of cases, whereas, for $Y = 1$ (responsible management), it amounts to 53.3%. A total number of cases of "correct prediction" is at the level of 76.3%. This amounts to 348 correctly classified cases of responsible management. A similar level of fractions was obtained in the second modeling – respectively 87.8% and 53.3%, and a total number of correct indications amounted

to 75.7%. Other fractions were obtained in the cases of the third and fourth modelling. As it can be observed, the value of correct prediction respectively amounts to 71.3% and 70.4%, and the percentage of the correctly classified cases is at the level of more than 95%.

While relating to RQ3, firstly, the analysis of the obtained survey results was carried out. Subsequently, the logit model was estimated, and it was identified which of the values (business, moral, the ones in the working environment) have the largest impact on responsible management.

In the opinion of the respondents (both managers and regular employees), the largest impact in management of the contemporary enterprise, among:

- business values, is exerted by efficiency of operations, focus on the customer, quality and also performance,
- among moral values, is exerted by trust, respect, honesty, responsibility and justice,
- the ones in the working environment, is exerted by fair wages, broadly understood equal treatment and also equal opportunities for professional development.

While relating to RQ3, firstly, the obtained results of the conducted survey were analyzed, subsequently the logit model was estimated and it was indicated which of the values (business, moral and the ones in the working environment) had the largest impact on responsible management.

In the opinion of the respondents (both managers and regular employees), the greatest importance in management of the contemporary enterprises, among:

- business values, is attached to efficiency of operations, focus on the customer and also performance,
- moral values, is attached to trust, respect, honesty, responsibility and justice,
- the ones in the working environment, is attached to fair wages, broadly understood equal treatment as well as equal opportunities for professional development.

Due to the objective of the research, it was necessary to determine which of the identified three groups of values have the largest impact on responsible management. For this purpose, the logit model with the variables determined in Table 1 was estimated, which is presented in Table 5.

Table 5: The results of the estimation of Model 5* with fit measures and significance test.

Explanation: The level of significance of the parameters: *** $\alpha = 0.01$, ** $\alpha = 0.05$, * $\alpha = 0.1$
Source: Own study

While looking at the data obtained (Table 5), it should be concluded that the identified three variables indicated statistical significance with the significance level of $\alpha = 0{,}01$. Therefore, it can be noted that responsible management is influenced by all the identified values. This means that contemporary enterprises, in their activities, ought to be aware that their skillful combination is a guideline while making a range of decisions, thus creating a competitive advantage. When analyzing the obtained model, it can be noted that it is characterized by goodness of fit, which is confirmed by the value of Likelihood Ratio Test, and also McFadden's R-squared. The correctness of the estimated model is also proven by a high number of correct predictions, at the level of 75.7%. This means that, in Model 5, there are 348 correctly classified cases of responsible management from the point of view of the analyzed types of value. At this point, it should be pinpointed that Model 5 was not subjected to reduction since all the variables indicated statistical significance.

Conclusions

Summing up, it should be pinpointed that all the research assumptions undertaken in the study were verified. On the basis of the conducted survey (RQ 1), it should be noted that contemporary enterprises increasingly pay attention to the aspects of management such as responsibility, ethical standards and values or elimination of unethical behavior, in their operations. Such an attitude of enterprises is due to two main reasons. Firstly, responsible management is demanded by the company's stakeholders. Secondly, such a need is formulated by the business world itself. Therefore, one may conclude that the operations of enterprises based on broadly understood responsibility are almost a necessity.

Taking into account RQ2 and RQ3, it should be noted that all the estimated models showed statistical significance. The analysis of the estimated models (Models 1 and 2) indicates that the most frequent negative behavior in the company is the activities addressed to co-workers, including the employees of the company, like verbal aggression or mobbing. In turn, taking into account the activities of employers (Models 3 and 4), such activities relate to delayed payment of salaries, employment of workers without a contract and also mobbing activities. In the light of the above, it should be noted that responsible management should primarily relate to the establishment of appropriate relationships within the company, i.e. in the relationships of employee-employer, employer-employee, employee-employee. In these terms, a crucial role is played by the system of values in the enterprise. The analysis of Model 5 clearly indicates that values play a major role in the development of responsible management. There is no doubt that values are of the declared nature and, in fact, it is difficult to recognize them properly through the survey. Nevertheless, being driven by one's own set of values (business, moral and the ones in the working environment) contributes to a better achievement of one's own objectives as well as those of the entire company.

It should also be pinpointed that all the constructed models indicated their correct reliability. Therefore, the hypothesis H_0 ought to be rejected for the benefit of H_1. Thus, the category of responsibility should be considered as an important component of modern enterprise management.

Abstract

Motivation: Savings play an important role in economic development. Voluntary savings of households are the most crucial not only for economic development, but also for financial security. However, since 2010, a declining trend in the rate of household savings in the European Union has been observed, which, in the long run, may negatively impact the economy of the region. The research by the World Bank (FINDEX) and other institutions treats the European Union countries as a homogeneous group demonstrating a high level of that phenomenon. Financial inclusion in the EU, in those publications research, constitutes a reference point aimed to show what values may and should be pursued by less developed countries. Yet, even in such a homogeneous group as the EU countries, there is a diversity at the level of making use of financial services, including the gathering of savings.
Aim: The aim of the article is to determine whether the EU countries are a homogeneous group in terms of saving inclusion, and if not, what differences are between them.
Research methods: To analyse the trends in shaping the values of financial assets per capita in the European Union in the years 2008-2018, Hodrick-Prescott filter was used. Verification of similarities between countries was conducted using taxonomic analysis using applying the following methods: (k-means) and Ward's Hierarchical Cluster Analysis.
Results: The conducted analyses indicated that in the savings' structure of the EU by sectors, the largest share is held by the private sector, comprised of non-financial companies' sector and the households' sector, as well as non-profit institutions operating for their benefit. Due to a strong declining trend of the savings' rate in the European Union, there are actions taken to increase the rate of saving inclusion in particular countries. The studies have enabled to divide the member states into two groups, according to the level of saving inclusion, into the rich countries of the old EU, and the poorer, mainly post-communist ones. Taking into account various historical experience in terms of gathering assets, preserving their actual value and the necessity for the citizens to ensure their financial security, it is important to take educational actions in terms of the significance of savings for the inhabitants of those countries.

Keywords : Savings' Rate, Household Savings, Saving Inclusion

JEL code: D14, D31, G51

Introduction

The level of savings has significant impact on any economy, as savings allow to carry out investments, provide basis for long-term sustainable growth, guarantee independence from foreign capital (Cudowska-Sojko & Dzun, 2006), as well as limit the fluctuations of the business cycle (Włodarczyk, 2016; Carroll et al., 2000, p. 2). According to the Classical Theory of Economics, which distinguishes

between forced and voluntary savings, only voluntary savings create a supply of capital and transforms into credit-financed investments. Forced savings, on the other hand, are gathered for the purpose of paying taxes, which means they finance public spending (Kulapka, 2013).

The total amount of savings within the economy comprises: household and company savings, (the so-called private savings), state savings, savings of financial entities, and savings from abroad.

Generally, the terms 'savings' refers to the part of income obtained within a given period, which during the same period was not spent on goods and services (Deaton, 1999, p. 39).

In macroeconomic terms, savings (gross national savings) are considered a part of income of all entities and it is not spent on final consumption. From the microeconomic perspective, savings mean that current consumption is adjourned in favour of future consumption and is often analysed with the usage of utility function.

There is also an asset-based approach to savings, which equals them to the value of assets owned by households, but the asset based definition of savings is more and more frequently extended by tangible assets, mainly, real estates. Such an approach to savings is also exercised by, among others, the ECB in its HFCS studies (EBC).

The amount of savings in the economy is determined by such economic factors as the amount of income, resulting from the pace of economic growth, the real interest rate, the level of development of the financial market, the amount of deficit and public debt, the balance of payment or inflation (Loayza et al., 2000). Equally important, however, are demographic, cultural and psychological conditions which shape the citizens' willingness to make savings, including the gathering of voluntary savings unrelated to, for instance, the mandatory participation in retirement pension programs (Grigoli et al., 2014). Households make decisions on, e.g. what part of their income should be spent on consumption, and what part should be saved, on the basis of maximum utility and budget limitations (Lis, 2011, pp. 49-65). Gathering individual savings is of crucial importance not only for the proper functioning of the economy, but primarily for satisfying the needs of individuals and their family members. The needs are related with the motives for making savings, which include securing financial liquidity, shopping, travelling, providing a financial buffer, old-age security, increasing wealth, transactions, securing one's family's welfare or transfer of giving inheritance (Białowąs & Olejnik, 2016, Browning & Lusardi, 1996).

Due to the significance of savings, both for the economy and for citizens, it is important to limit the scale of saving exclusion in particular countries or, approaching the above mentioned phenomenon from the opposite perspective, to increase the level of saving inclusion.

It should be noted that the phenomenon of saving exclusion is a type of financial exclusion (Figure 1), and the number of entities with no- financial reserves and the scale of gathered savings are considered to be the determinants of financial exclusion (Maciejasz-Świątkiewicz, 2013, p. 106).

Figure 1: Types of financial exclusion

Figure 2: The level of saving inclusion in the EU countries of the European Union in 2017

Source: Global Findex Database

Given declarative responses obtained in the course of the World Bank's studies of households, one can notice a great diversity among the EU countries in terms of participation of individuals who make savings via a financial institution ranging- from 14% in Romania to 76% in Sweden. The above mentioned analyses allowed the authors of this work to formulate the following objectives and research hypothesis.

Regarding the share of persons who declare holding saving in 2017, Poland is ranked 19 within EU countries – eight places from the last one in the ranking (Global Findex Database). It is a consequence of many years' negative experience of citizens in post-communistic countries connected with gathering financial saving and decline of its real value. It had no positive effect on the increase in saving inclusion. Additionally, consumer aspirations of young persons might also have a negative impact on the rate of voluntary individual saving. This phenomenon is confirmed, among others, by the research from 2013 carried out by the Kronenberg Fundation (61% of interviewed persons claimed it is worth to hold saving,

however, the actual percentage of the respondents who acknowledged their saving was only 44%), CBOS's research from 2014 and, Diagnoza Społeczna from 2013 (Microfinance Centre, 2014). The research findings of the Kronenberg Fundation indicate that the level of saving inclusion is a serious problem in Poland because both saving and investment products are the least frequently used financial products at all (Microfinance Centre, 2014). In increasing the scale of saving inclusion, financial literacy plays a significant role., that is not only acquired knowledge and financial skills, but, first of all, financial habits that allow households to exclude part of their income from current consumption, i.e. saving inclusion.

The objectives:

Objective 1. To determine the degree of similarity between the EU countries in terms of saving inclusion.
Objective 2. To identify the number and composition of the groups of countries which show similarities in terms of saving inclusion.

Research hypothesis
The EU countries can be divided into homogeneous groups which demonstrate both similarities and dissimilarities in the behaviours of their citizens in terms of saving inclusion.

Materials and method

For the purpose of analysing the rate of savings in the EU and the tendencies related to it, EUROSTAT quarterly data on gross saving in the EU countries by institutional sectors (in current prices), in million EUR was used, for the period from the first quarter of 2000 to the third quarter of 2019.

In order to analyse the trends in shaping the values of financial assets per capita in the European Union in the years 2008-2018, Hodrick-Prescott filter was used, which allows to remove the cyclical component of a time series from raw data. It is used to obtain a smoothed-curve representation of a time series, one that is more sensitive to long-term than to short-term fluctuations. Yearly data from EUROSTAT database were used for these calculations.

The Verification of the hypothesis on the existence of homogeneous groups among the EU countries by the percentages of individuals who make savings via financial institutions and defining the characteristics of those groups were conducted on the basis of taxonomic analysis using the following methods: k-means and Ward's Hierarchical Cluster Analysis. In the process of calculations, declarative data from the World Bank's studies from 2011, 2014 and 2017 were used.

Research Results

A factor which is of importance for a proper, sustainable growth of the economy is not only the level of savings, but also their institutional sectoral structure. The savings of the both financial and government sectors are much lower than private ones. What is more, during crisis periods, when governments provide support for the economies which face difficulties, the savings of the government sector may be negative. This has occurred in the EU since the first quarter of 2009 (Figure 3). The Figure 3 presents the value of savings in individual institutional sectors in particular quarters, in current prices. Despite the fact that the data is unadjusted, it can be observed that the upward trend in the case of savings of the company sector has more slope than the trend of household savings.

Figure 3: Gross saving in EU sectors (current prices, million EUR, unadjusted data)
Source: Eurostat Non-financial transactions [nasq_10_nf_tr]

In the savings structure within the EU divided by institutional sectors, the biggest share is held by the private sector, which is comprised of non-financial corporations and the household sector, as well as non-profit institutions serving households. Both the Classical Theory of Economy and the Keynesian Economy point to the significance of private savings within the economy. Both theories emphasize the role of savings in financing investments. However, the so-called contemporary saving theories, namely the Life – Cycle Hypothesis by Modigliani (Ando, A. & Modigliani, 1963) and Permanent Income Hypothesis by Friedman (Friedman, 1957), focus predominantly on household savings, underlying their role in the finances of both households and economies as a whole. Thus, the growing share of company savings in private sector savings is not a favourable phenomenon. It is primarily related to companies refraining from investments, which brings about inhibition of economic growth.

It should be remembered, however, that savings may be defined in many ways. They may be considered as flows which are the difference between income and expenses, or as assets cumulated by individual entities. One of the versions of the asset-based definition of household savings, used among others by Eurostat and OECD, is associating them with financial assets owned by households. Those assets include: cash, deposits at financial institutions, bonds (,mainly government ones), private insurances, individual retirement programs, investment funds participation units, stocks and shares in companies, and other country-specific assets. The biggest share in the structure of financial assets is held by deposits, private insurances and individual retirement plans (European Commision, 2018).

The analysis of the trends in shaping the values of financial assets per capita in the European Union, calculated with the use of Hodrick-Prescott filter for the years 2008-2018 indicates a growing value of financial assets of households in the analysed period, and since 2012 the assets of the government sector. However, there are problems related to that. First of all, households allocate a part of their savings in government bonds. Consequently, since households finance the public debt, the amount of assets which are actually available within the economy is lower than indicated by the value of financial assets. What is more, future generations, according to the Rricardian equivalence theory (Barro, 1997), will have to bear the cost of paying that debt, this, in turn, will limit their saving abilities. Secondly, some forms of gathering financial assets are mandatory. It is especially the case for pension systems and some private insurances. For example, participation in retirement pension systems is obligatory in Denmark, where the share of financial assets gathered in that form is high. Private property and life insurances are often required as a form of securing real-estate mortgage loans. An increase in the value of household-owned assets in countries such as Netherlands, Great Britain and Italy also results from the fact that households own fortunes which have been gathered for generations. The Dutch, for instance, own significant amounts in the form of pension programs which have been gathered since the 30's of the 20th century.

The analysis of the value of financial assets gathered by households in the EU countries shows a great diversity (Figure 4). The value of assets per capita in Luxembourg is approximately 10 times higher than in the poorest Bulgaria. The 10 countries with the lowest value of assets held by households are all from Central-Eastern Europe (CEE) or the Baltic countries.

Figure 4: Financial Assets per capita (EUR)

Source: Eurostat

Although the value of financial assets of households is growing, the question arises concerning the cause of that growth. Does it result from the growing value of the assets collected so far, subsidies to the mandatory forms of saving, or is it a result of conscious actions taken by individuals? Looking at the shaping of household savings' rate, it seems that the last factor is insignificant. The gross saving rate of households in the European Union countries (including Non-Profit Institutions Serving Households) is defined as gross saving (ESA 2010 code: B8G) divided by gross disposable income (B6G), with the latter being adjusted for the change in the net equity of households in pension funds reserves (D8net). Gross saving is the part of the gross disposable income which is not spent as final consumption expenditure. Detailed data and methodology on site http://ec.europa.eu/eurostat/sectoraccounts. Diagram XX presents the evolution of the household

savi□gs' rate calculated o□the basis of quarterly data from the years 2000Q1 – 2019Q3 for 28 the EU cou□tries. The calculatio□s i□volved the use of Hodrick-Prescott filter with a multiplier λ=1600 (de Jo□g & □akarya, 2016; McElroy, 2008).

To verify the hypothesis of the existe□ce of groups amo□g the EU cou□tries which are homoge□eous i□ terms of the perce□tage of people who make savi□gs i□ fi□a□cial i□stitutio□s, a□d defi□i□g the characteristics of those groups, a taxo□omic a□alysis was co□ducted, with the use of the k-mea□s method a□d Ward's Hierarchical Cluster A□alysis (Kaufma□& Rousseeuw, 2005; Murtagh & Co□treras, 2011).

Firstly, an analysis of the predictors' significance was conducted (C&RT model), which showed that the least differentiating indicator for the countries is the percentage of saving-holders in 2011, with the value of the significance factor for that predictor being still very high, at over 0.99. Next, statistics of cluster quality were calculated, in order to determine which number is the most optimum for them. Using the pseudo F test and silhouette *index,* it was discovered that the optimum number of clusters is 2. At the next step, for each of the analysed years objects were assigned to clusters, using the k-means method and Ward's Hierarchical Cluster Analysis.

According to the k-means method, group 1 consists of Austria, Belgium, Czechia, Denmark, Finland, France, Germany, Ireland, Luxembourg, Malta, Netherlands, Slovakia, Sweden, the United Kingdom, and group 2 includes: Bulgaria, Croatia, Cyprus, Greece, Hungary, Latvia, Lithuania, Poland, Portugal, Romania, Slovenia. Estonia, Italy and Spain switched groups during various years of the study.
In the Ward's method, the division is as follows:

Group 1: Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Luxembourg, the Netherlands, Slovakia, Spain, Sweden, the United Kingdom.

Group 2: Bulgaria, Croatia, Greece, Hungary, Latvia, Lithuania, Poland, Portugal, Romania, Slovenia, The countries which changed their group are: Cyprus, Czechia, Estonia, Italy, Malta.

Comparing the final results of both methods, it can be concluded that among the EU countries, it is possible to point to groups which are homogeneous in terms of the share of people who make savings in financial institutions in their populations. These are:

Group 1. Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Luxembourg, the Netherlands, Slovakia, Sweden, the United Kingdom.

Group 2: Bulgaria, Croatia, Greece, Hungary, Latvia, Lithuania, Poland, Portugal, Romania, Slovenia. For the remaining six countries, the participation in groups (clusters) changed over time and/or depending on the method employed.

Another research question refers to the differences between the groups and the potential causes of such a situation. In Table B the mean values obtained by clusters in the analysed years were presented.

Table B. Means in clusters

Cluster	2011	2014	2017
1	49.35%	54.86%	57.67%
2	19.55%	24.15%	31.34%

Source: own calculations

Cluster 1 is characterized by a high share of people who make savings via financial institutions. They include countries such as Finland, Denmark, Sweden and Great Britain, where the percentage of people who have a bank account is equal to almost 100%. What is more, those countries demonstrate a well-established tradition of accumulating financial assets, where the motive of long-term savings for the purpose of leaving inheritance and/or securing oneself for the old age plays an important role. Taking into account the high correlation between owning a bank account and making savings via financial institutions, one can conclude that in the countries from group 1 making savings via financial institutions is one of the components of financial inclusion.

Among the countries which comprise Cluster 2 only Greece and Portugal do not belong to the so-called post-communist countries. The remaining ones joined the EU between 2004 and 2013. Greece and Portugal suffered much as a result of financial and economic crisis. In addition, Greece experienced a crisis of public finance debt in 2010, which resulted in a dramatic growth of unemployment and a reduction of salaries in the public sector, whose contribution to the Greek economy is significant. As a result, the economic situation of Greek households has deteriorated. Portugal, on the other hand, was

hit by an economic slowdown resulting from the crisis, which brought an increase in the unemployment rate and a drop of incomes.

Conclusions

The importance of savings – especially voluntary household savings which translate into investments - is crucial for sustainable economic growth. The conducted analyses of the structure of savings in the EU have demonstrated that the greatest share in them is held by the private sector, which consists of non-financial companies, households, and non-profit institutions providing services foe households. On the other hand, in the case of household savings' rate in the EU, there is a strong downward trend. The aforementioned tendencies indicate that a factor of utmost importance for the economy are actions aimed at raising the saving inclusion rate in individual countries. Saving inclusion, which means having savings as well as the habit of excluding a part of income from consumption, is important not only for the economy, but, first of all, for catering for unexpected financial needs or compensating for reduced income after ceasing professional activity by household members. The analyses conducted in the article have allowed to divide the EU member states according to saving inclusion into two groups: the rich countries of old Europe and those poorer, - mostly post-communist countries along with Greece and Portugal. Taking into account varying historical experiences in gathering assets, preserving their real value and the necessity for citizens to ensure their financial security in those groups, it is important to take educational actions on the significance of savings directed towards the inhabitants of those countries.

Abstract

The number of distributed components and devices never cease to increase. As a result, distributed control methods are necessary in order to manage and utilize these devices. Over the past few years agent based technology became an effective tool for engineering applications. As a computational paradigm, multi-Agent System (MAS) appears to be an answer to satisfy the requirement of intelligence in a distributed system. This paradigm also accepts networking and distribution as a basic concept. MAS is a set of agents, situated in a common environment that can act, and interact between each other autonomously with an intelligent behavior and can solve complex problems. Mobility is one property of these agents which allows them to migrate from one host to another to achieve their goals. Researchers in different areas have been attracted by systems based on Mobile Agents (MA), because of their pro-active aspects and their autonomous tasks. Unfortunately, security of mobile agents is very complicated especially when it comes to secure an entity that migrates from one platform to another across the network, and which must be executed correctly and safely on the hosting platform. In this paper we focus on the security aspect of a mobile agent from one platform to another, by introducing a new approach based on cryptographic mechanisms to get a session key, to guarantee a mutual authentication and the confidentiality of data exchanged, as well as a binary serialization to ensure the mobility of the agent across the network.

Keywords: Security, Elliptic Curve Cryptography, Multi-Agent System, Authentication

Introduction

A multi-Agent Systems is a set of agents, that interact with each other, situated in a common environment, with intelligent behavior, and have the ability to achieve a certain goal. Agents can help objects to make autonomic decisions and reduce the amount of communication between platforms. Mobility is one of the most significant abilities of this technology, which allows an agent while carrying information (data or code ...) to migrate from one platform to another.

A Mobile agent is an agent with the ability to move from one node to another to accomplish its mission. There is no standard definition of an agent, but the most common one is Ferber's definition [1] that defines an agent as " A physical or virtual entity able to act in an environment, it possesses its own resources and gives services as individual objectives". In addition to exhibiting mobility, a mobile agent can also clone and multiply itself, carry a payload (data or a program), make local decisions, execute a program etc. The use of mobile agents in a distributed system, has major advantages Bandwidth and latency reduction, discontinuous operation and Adaptability and flexibility.

However the aspect of mobility can raise major security issues while the agent carries very sensitive information from one node to another. The agent can be attacked either by agents or by a malicious platform. In this paper, we model a new automated security protocol based on elliptic curves cryptography and using a multi-agent system, between the hosting and the destination platform, to ensure the migration of a mobile agent. This new approach guarantee the authentication, the confidentiality and the integrity of an agent during its migration.

The rest of this paper is structured as follows. In Section 2 we put the light on the major security issues that can face an agent. In section 3, we summarize the preliminaries of elliptic curve and some

notions used. In section 4, we discuss some related works and security issues. In section 5 we present our proposed MAS model. We verify in section 6 the proposed protocol using Automated Validation of Internet Security Protocols and Applications (AVISPA) tool. Lastly, we conclude the paper in section 6.

Security Issues

The evolution of distributed systems in recent years has seen four different paradigms each of which has its transport mechanism: **Server/ Client**, this paradigm transport data without any mobility. The second one is **Remote evaluation,** which transport data and code. The property of mobility appeared with the third paradigm **Mobile Objects,** this technology, can migrate code and data between two separate entities. Finally the **mobile agent** technology, which can migrate not only the code and data, but also the state of the agent between two different platforms. We can say that mobile agent's technology is an extension to the distributed computing paradigms. A Mobile agent contains:

- Program that defines the agent behavior and actions.
- State of the agents, which resume the activities of an agent during its migration from host to host.
- And attributes.

Security Threats

As we said previously, an agent is composed of code and state, in order to effect a certain operation, according to a specific need. The mobility aspect allows an agent to hop from the native platform to the hosting platform, while keeping its state. Unfortunately this technology can raise many security threats that we propose to categorize into three major threats in an MA environment: Host against agent, agent against host and finally agent against agent.

1. **Host against agent:** when an agent migrates to a destination platform, it exposes its code, data and state, which makes the confidentiality and integrity of the agent at risk. A malicious host can exploit the agent's information, manipulate its behavior, and ultimately change the results of an execution.

2. **Agent against Host:** Once the agent is on the hosting platform, it can present itself as a trusted agent. He can have free access to the resource of this platform. And thus, it could violate the confidentiality and the integrity of this host. If the agent can use the computational resource of the destination platform. It can absolutely launch several attacks.

3. **Agent against Agent:** During agent migration, it can be attacked by other agents. The agent can communicate with the destination agents as trusted ones. So the code, data and state are exposed, and can be exploited in an undesirable way. In this regard there are two types of attacks: The passive attack that collects information from the agent and observe and analyze its behaviors without manipulating it. The active attack, that insert code and data in the agent.

In our paper we focus on the first two cases, by creating a secure channel between native platform and the hosting platform.

Security Requirements to protect Mobile Agents

The Security requirements that are relied upon to be met by the mobile agent security plans are as per the following:

Authentication and Authorization: It is the process of identifying an entity (agent) to give it access to the resources. After that comes the process of checking the privileges given to this entity for access to this resource.

Privacy and Confidentiality: The challenge is to ensure that the information transmitted by the mobile agent is the same, and that only authorized agents (destination platform) have access to this information.

Non-Repudiation: We should log the exchanges of communication between involved entities (Mobile agent and MA platforms) in order to avoid repudiation.

Availability: We must ensure with this requirement the availability of mobile agent services and data. Mobile agent platform must guarantee the availability of controlled concurrency, supporting simultaneous access, exclusive access and deadlock management. Agent host platform must deal with DOS Attacks as well.

Preliminaries

In this section we introduce the concept of ECC (elliptic curve cryptography). To get started, the RSA keys that have the recommended size, keep increasing to maintain sufficient encryption strength, from 1024 bits to 2048 bits a few years ago, are the most common used for SSL certificates. An alternative to RSA keys are the ECC keys. These two types of master keys share the same important property of being asymmetric algorithms (a key to Encrypt and a key to decrypt). However, ECC can offer the same level of encryption power for much shorter keys, providing better security while reducing computing requirements. The use of ECC short keys can help to save obvious costs. This reduced key size also allows us to implement and design strong cryptographic operation, which makes ECC a very attractive option for devices with limited storage or processing power, which is becoming increasingly common in the era of the Internet of Things. **Table 1** gives a comparison between ECC and RSA based on key size for same security level [2]

Table 1: Comparison of RSA and ECC based on key size

ECC Key size	RSA Key size	Key size ratio
163	1024	1:16
256	3072	1:12
384	7680	1:20
512	15360	1:30

Comparing to the existing PKC's [3] [4] (Public Key Cryptosystem). ECC offers better performance and more security. This concept was proposed first by Koblitz and Miller [5]. An elliptic curve E (a, b) over a finite prime field K, where a, b ∈ K is given in Eq. (1) below:

$$E: (x, y) |\ y^2 \equiv x^3 + ax + b \text{ with } a, b \in K \qquad (1)$$

a and b will have to fulfil the following condition $4a^3 + 27b^2 \neq 0$. K can be in the following fields $\{\mathbb{R}, \mathbb{Q}, \mathbb{C}, \mathbb{Z}/p\mathbb{Z}\}$.

Let E be an elliptic curve defined on a field K, and two points P, Q E (K), L the line connecting P to Q (the tangent to E if P = Q) and R the third intersection point of L to E. Let L be the vertical line passing through R. We define P + Q E (K) as the second point of intersection of L' with E. With the law of composition (E (K), +) is an Abelian group whose neutral element is the point to infinity (O). Scalar addition and scalar multiplications are two common operation on elliptic curves. Scalar

multiplication nP over an elliptic curve E (a, b) is defined as repeated additions, as given in Eq. (2) below:

$$n.p = P+P+P+...+P \text{ (n fois)} \qquad (2)$$

Where $n \in K^*$. Security of ECC depends on the complexity and difficulty of solving following problems:

Problem 1: Elliptic Curve Discrete Logarithm Problem (ECDLP).
We suppose a curve $E(\mathbb{Z}/n\mathbb{Z})$ y giving a $P,Q \in E(\mathbb{Z}/n\mathbb{Z})$, with Q a multiple of P. We need to find K that solves the following equation Q = KP. It is a difficult problem to solve. This is called, the discrete logarithm problem or (ECDLP).

Problem 2: Computational Diffie–Hellman Problem (CDHP).
Given three points P, u and v over an elliptic curve E(a, b), where $u,v \in K^*$. It is difficult to solve uvP over in polynomial time.

Related work

To the best of our knowledge, there are few papers dedicated to integrate authentication schemes and multi-Agent system. In [6], the authors proposed an authentication broker that integrate MAS and the single sign-on, to satisfy the confidentiality, integrity and non-repudiation requirement. In [7] an approach to apply MAS to serve the authentication service in the multi-clients and multi-application environment has been proposed, and finally in [8], the authors have developed an interesting security protocol based on a combination of TLS, RSA, ECC signature in order to create a secure channel that guarantees authentication, confidentiality and integrity for migration of a mobile agent from a platform to another while carrying sensitive information. Unfortunately this convergence requires a huge time of calculation, for the generation, the distribution of key and for the signature which increases the execution time.

Proposed Scheme

Mobile agents have certain benefits in a distributed system such as, reducing the network load, encapsulating protocols, overcoming network latency and mobile agent execute asynchronously and autonomously. Security is a critical feature that must be provided in a mobile-agent system, since the agent during its migration has to interact with external systems and resources that are not trusted. Authentication is a process that ensures and confirms a user's identity. And it is the most essential requirement as the agent from the native platform and the hosting one must authenticate each other for secure communication.

In this section we designed a mutual authentication scheme based on elliptic curves and using multi-Agent system. This section we'll detail our MAS model and we'll explain the role of each used agent. Our scheme consists of three phases, initialization phase, registration phase and finally the login and authentication phase.

Notion used in this paper

Table 2 denotes the notations used in our approach:

Table 2: Notions used in this paper

Notation	Description	Notation	Description
ID_N	Identity of Native platform	N_1, N_2	Random numbers generated for ECC parameters
ID_H	Identity of Hosting platform	H(.)	Cryptographic one-way hash function
K_m	Random master key	K	Mutual auth key
K_i	Key for device i	‖	Concatenation
R	Random number	G	ECC generator of point
P	Large prime number of the order 2^{160}	$\oplus$	XOR operator

Initialization Phase

It is the destination platform who is in charge to initiate the parameters for the generation and distribution of keys as shown in Figure 1. We assume that the hosting platform has sufficient storage and calculation capacity to generate and distribute the keys for each session. First the hosting platform chooses an elliptic curve equation $y^2 = x^3$+ax+b over Z_p, where $Z_p(P > 2^{160})$ is the finite field group. The Hosting platform selects two field elements$a, b \in Z_p$. a and b must satisfy the following condition $4a^3 + 27b^2 \neq 0$. G is the base point of the elliptic curve with a prime order $n > 2^{160}$, and O be the point at infinity such that n x G = O. Then the Hosting platform chooses random master secret key K_m from Z_p and computes public key $L = G.K_m$. Finally broadcast the public parameters $K_p \leftarrow (E_p, G, p, L)$.

Initialization

Hosting_platform chooses E_p:$(x^3 + ax + b)(mod\ p)$ where $(4a^3 + 27b^2)(mod\ p) \neq 0,\ over\ \mathbb{Z}_p$
Hosting_platform master secret key $K_m \in \mathbb{Z}_p$ $H = G.K_m\ public\ key.$
G: generator point n.G = ∞, n >2^{160}
Choose random master secret key $K_m \in \mathbb{Z}_p$. Computes $L = G.K_m$.
Broadcast public parameters $K_p \leftarrow (E_p, G, p, L)$

Fig. 1: Initialization Phase

Registration phase

Step 1. Native-platform → Hosting-platform
In order to register with the hosting platform, At the native platform level, we need an agent named "Reg_ag" registration agent who will be in charge of calculating and presenting $I_i \rightarrow h(ID_N||rG)$.

Step 2. Hosting – platform → Native – platform
After the destination platform receives I_i, an agent named "*S_P_ag*" computes the security parameters $K_i = h(N||I_i||ID_H)$, $K_s = K_m \oplus K_i$ and transfer it to "*Co_ag*". "*Co_ag*" is an agent in charge of

generating and calculating $A_i \rightarrow h(K_m||K_i)$ and $A'_i = A_i.G$ of the native platform, computes other security settings $B_i = h(K_s \oplus I_i \oplus A'_i)$ and stores $B_i' = B_i.G$, K_i corresponding to the identity ID_N of the Native platform in its database.

Fig. 2: Registration phase

Login & Authentication phase

In this phase, too agents are involved: The authentication agent "*Auth_ag*" and login agent "*Log_ag*" in the both side, the destination and the native platform.

Step 1. Native – platform → Hosting – platform

The agent "*Auth_ag*" from the native platform computes $P_1 = N_1.G$ and $P_2 = h(N1.A_i')$ sends it with the K_i to the destination.

Step 2. Hosting – platform → Native – platform

The destination platform receives P_1 and P_2. This last computes $A_i \rightarrow h(K_m||K_i)$ by calculating the $K_m = K_s \oplus K_i$ and computes the point $P_2^* = h(P_1.A_i)$. The "Auth_ag" checks whether the value of P_2^* is equal to the received value of P_2. If it is true, it computes the ECC point $P_3 = N_2.G$, $P_4 = N_2.B_i'$ then it sends P_3, P_4, and K_s to the native platform.

Step 3. Native – platform → Hosting – platform

The "*Log_ag*" from the native platform receives P_3 and P_4, computes $B_i = h(k_s \oplus I_i \oplus A_i')$, calculates ECC point $P_4^* = P3.B_i$ and compares the value of P_4^* with the received value of P_4. If it is true, the "*Log_ag*" calculates $V_i = h(P_2 \parallel K)$, where $K = N_1.P_3$ and sends V_i to the hosting platform.

Step 4. Destination – platform → Native – platform

The "*Log_ag*" from the destination platform receives V_i. Then it computes $V_i^* = h((P_1.A_i)||K^*)$ where $K^* = N_2.P_1$ and compares the value to the received value of V_i to authenticate the host. If it is true a mutual authentication between the native and the destination platform has been established.

Fig. 3: Login & authentication phase

Formal verification of the proposed scheme using AVISPA

AVISPA [9] is a push-button tool for the Automated Validation of Applications and Internet Security Protocols. It is used for formalizing and verifying Internet security protocols and their security properties. The protocols are implemented in High-Level Protocol Specification Language (HLPSL) which is a formal role-based language using which data structures, cryptographic operators, control flow patterns and algebraic properties can be specified. The back-ends are implemented using formal algorithms and theoretical axioms and are used to provide protocol falsification, bounded and unbounded verification. Two backs ends used for analysis of the proposed protocol are on the fly model checker (ofmc) and cl-based attack searcher (cl-atse).

The proposed scheme is analyzed using CL-AtSe and OFMC back-ends [10]. The results are shown in Fig. 4 and Fig. 5. The intruder has full control over the network in such a manner that all messages sent by the agents corresponding to the roles are available to the intruder. The intruder may analyze and intercept, or modify messages as long as it knows the required keys. It can act as any agent and send any message to some other agent participating over the communication channel.

Conclusion

In this paper, we have detailed the failures and the security needs that a mobile agent migration environment requires. We have mentioned some related works that has attempted to secure the mobile agent on all platforms. Later we have summarized the prerequisites of the elliptic curve needed to develop a mutual authentication protocol. While emphasizing the utility and benefits that multi-Agent systems can bring in such a smart environment, we proposed a scheme which ensures as a first step, the mutual authentication based on the elliptic curve, using multi-agent system, and secondly, we guaranteed a secure migration for an agent across platforms. This paper provide first attempts to protect the mobile agent. In the future we would like to develop a multi-agent intrusion detection system based on clustering algorithms.

Abstract

the paper analyzes current changes in the social nature of a modern state from the position of law and economics; special attention is paid to the reform of the pension system in Russia and the growth of such a social group as the precariat; a hypothesis has been proposed that identifying justice with efficiency (understood from the position of the Kaldor-Hicks criterion), adherent to «the Chicago school», dominates in Russian public administration, which leads to an increase in the wealth stratification of the population and maintains a high level of inequality; finally, the paper investigates the issue of nature and purpose of the state itself and their transformations that can be observed in the recent times.

Keywords: Law And Economics, Pension, Taxation, Social State, Precariat.

Introduction

The issue of happiness is rarely found in the papers of lawyers and economists; even philosophers turn to it not that often: in the recent public debate of Slavoj Žižek and Jordan Peterson the opponents talked about anything but the matter of dispute – Peterson criticized the Communist

Manifesto and mentioned the hierarchy in the lobsters' world, and Žižek told jokes and declared the contradictions of the modern capitalism.

Putting the word «happiness» in the headline, we consider it after German camerialists in terms of the purpose-setting of the existence of state, even if such a point of view might prompt someone to call the state hedonistic (Filippov 2012). The other two words, «pension» and «taxes» in the context of the paper are manifestations (with all reservations) and means of reaching happiness respectively.

Consequently, we aim to consider the increase in the retirement age in Russia from the point of view of the Kaldor-Hicks criterion. The conceptual framework is the so-called «Chicago school of law and economics» (in particular, the works of R. Posner), even despite the fact that no special unity has been observed for a long time in this school (Mercuro and Medema 2006, p. 175). This criterion is that changes should be made if the winners are able to «hypothetically» (sic!) compensate the losses by the losers (Mercuro and Medema 2006, p. 185). However, it must be clear who in this context wins and who loses. In addition, this approach has been criticized (and continues to be criticized) for a long time, while there is another approach, the 'happiness approach', based on surveys of the population to rank the levels of happiness, which (polls) usually include income (the impact of this parameter in the survey results strongly correlates with the level of inequality), health, family relationships and so on (Law and happiness 2010).

Literature Review

Article 39 of the Constitution of the Russian Federation guarantees old-age pension to *everyone*. Thus, pension provision can be considered as a public good, which, taking into account article 7 of the Constitution of Russia, allows us to consider the Russian Federation at the legislative level as a welfare state.

It should be noted that the notion of the «social state» ("Sozialstaat" (Germ.) is often confused with the notion of the «welfare state» ("Wohlfahrtsstaat" (Germ.). This common confusion comes from, amongst other things, the considerations on what is the aim and purpose of state Not being able to, and does not aim to trace the genesis of this problem, we confine to the works of cameralists, such as N. Delamar (according to him the raison d'être of the state is to contribute to the everyone's natural endeavor for happiness) (Delamare 1705-10), Ch. von Wolf (von Wolf 1740-48, 1721, 1720-24, 1765), Ch. Thomasius (as he had written the purpose of state is reaching public welfare, public happiness) (Thomasius 1705), J.H.G. von Justi (happiness, overall well-being for all citizens, is the ultimate purpose of state) (von Justi 1756). For the more detailed description of the chosen bibliography we refer to the article "Police state - the state of 'general welfare' and 'general happiness'" (Nizhnik 2016). In passing, we note that the studies of the social state are dominated by the works of European (Leibfried and Mau 2008, Castles et al. 2010) and British researchers (Marshall 1950, Titmuss 1974); this is a specifically «European invention» (Flora 1986) that came up as a compromise between labor and capital in democratic European societies (Dahrendorf 1959, Crouch 1999). The reasons of this phenomenon, the investigation of variations existing in social states of different countries and the corresponding bibliography are described in the paper by Saraceno (Saraceno 2014).

Extra civitatem nulla securitas

Von Wolf mentioned above wrote that the purpose of state is to ensure public welfare and security (von Wolf 1765, p. 3-35). Welfare and safety are mentioned in the famous description of Leviathan by Thomas Hobbes, "The Wealth and Riches of all the particular members, are the Strength, Salus Populi, (the peoples safety) it's Business" (Hobbes 1651, p. 1). According to Carl Schmitt, safety can only be reached in a state, 'extra civitatem nulla securitas' (Schmitt 1996, p. 48), "there is no security outside the state". The last thought deserves special attention. In our opinion, this statement is a paraphrase of the famous formula of St. Cyprian of Carthage – 'extra Ecclesiam nulla salus' (Epistles of S. Cyprian 1868, p. 10), "there is no salvation outside the church". Such identification of state with church is not something unexpected for Schmitt. Such an identification of the state with the Church is not unexpected for Schmitt, his phrase opening Political Theology is well known: "Alle prägnanten Begriffe der modernen Staatslehre sind säkularisierte theologische Begriffe" (Schmitt 1934, S. 49), "All concise concepts of modern political theory are secularized theological concepts". We can argue that Schmitt was familiar with the works of Cyprian of Carthage: Schmitt had a monograph about him in his library (Beck 1930). Strictly speaking, Hobbes already calls Leviathan (i.e. the state) "the mortal God", the 'mortall God' (Hobbes, p. 87).

Who remains 'extra civitatem' in a modern state? The prevalence of the doctrine of neoliberalism in economic science and in political practice has led to the fact that until recently the state had the tendency to minimize its interference in the economy, even if only as an arbiter. This is especially true for labor legislation: by setting the framework of organization of labor by issuing laws and orders, modern states avoid direct interference in regulating labor relationships within corporations, calling it "labor market flexibility". It seems as if governments indeed followed the advice of François Quesnay gave to the French dauphin expecting that the demons of unlimited egoism would not be as dreadful as the demons of corrupted and incompetent government (Rosanvallon 1979, p. 102-103, 108).

In turn, companies guided by the principle of economic efficiency "claimed to be a necessary price for retaining investment and jobs" (Standing 2011, p. 6) and do not burden themselves with longterm contracts with their employees. And of course, they gladly get rid of their social obligations towards their employees – refusals in paid vacations and sick leaves, simplified dismissal procedure, hiring without employment contracts, but through temporary contracts (in Russian nomenclature through

"independent contractor agreement"), "fee-for-service" pay, voluntary-compulsory transferring a part of employees into private entrepreneurship, etc. This led to the emergence of a new social group, called by the English sociologist Guy Standing "precariat", derived from the word

"precarious", i.e. "unstable", "unreliable" (Standing 2011).

People belonging to precariat are usually the ones who work in several jobs, partly due to low salaries and partly due to the wish to lower the risk and increase the guarantees. Many of them do "work for work's sake", that is doing jobs that do not give them desirable income, but that must or should be done: for professional networking, reading reports in their free time, etc., for the sake of rather illusory

"new opportunities", to be in good standing with their bosses and, most often, out of fear to fall short of their expectations. Modern labor terms are becoming more and more like a religious cult of totalitarian sects in which the employers act as priests, and employees (and freelancers), as a flock. The future employment and, consequently, salaries and pensions become an afterlife reward (with the similar lack of guarantee) (Thompson 2019). Many people have additional jobs, since their main job does not provide enough income or there is always a risk to lose it.

The quintessence of such "free" relations is the so-called "zero contract", where the required minimum number of working hours per week is not defined at all and the employee works only when the employer has a temporary need in their work.

This situation induces permanent stress in employees due to call at the worst possible moment or (again, most often) with the expectation that they will finally receive the call: the means of existence are running out, and no company or service will just sit and wait for them to pay.

At the same time, precariat is an extremely fragmented social group, especially since its members are often in constant war among themselves (More about individualization of society see Rosanvallon (Rosanvallon 1995, p. 96-105). Non-stop neurotic and fragmental activity, caused by the absence of guaranteed employment, according to Standing, is opium for precariat like gin and beer for the first generation of the industrial proletariat (Standing 2011, p. 131). As the result all over the world there are more and more hysterical people who suffer from their own limitations and short-term planning (Gielen 2009).

The share of precariat usually increases with migrants, university graduates, women denying the 'Kinder, Küche, Kirche' model and focusing on their career and finally, with the retirement age increase in Russia, slightly lower than average life expectancy in the country, with 'everybody, actually', according to Standing (Standing, p. 59).

Quod principi placuit

In the theory and practice of taxation it is customary to distinguish between the concepts of "tax" and "fee"; the criterion here is the principle of "individual gratuitousness" (see, for example, Paragraph 1 of Article 8 of the Tax Code of the Russian Federation). There are multiple researches dedicated to the problem of including insurance payments, including those into the Pension fund, into the total tax burden. However, there is no need to dwell on that within this paper. In our opinion, since employees barely take any part in financing their future pensions (the share of citizens using the services of non-governmental pension funds is below 4%) (Smoliakov and Ogolikhina 2016), and for employers these payments, being mandatory, have no "individual compensation", then payments to the Russian Pension Fund are indeed taxes. The indirect proof of this is the fact that these payments used to be included into the so-called "unified social tax", and from time to time there are initiatives to bring back this practice.

As R. Posner put it, "Taxation sometimes is used only to change the resource allocation or distribute wealth, but mainly it is used to finance public goods" (Posner 2004, p. 641). In the situation when the average life expectancy slightly exceeds the retirement age, and the mortality rate is quite high, the

logical question arises: if the goal of taxation is financing public goods, then what kind of goods exactly? If pension, without a doubt, is a good, but its likelihood is low, then most probably, the goal of Russian taxation is the distribution of wealth. The result is the extremely high inequality level in Russia – 10% of the richest people own 83% of the wealth of the country's households (in the USA – 76%, in China – 60%) (Global wealth report 2019, p. 47). Here lies the answer to one of the questions posed at the beginning of this paper: who is the winner and accordingly the loser after legislation changes. The efficiency criterion (the Kaldor-Hicks criterion), which is a hallmark of the "Chicago school" approach in law and economics, is maintained in Russian legislative practice in the field of pension legislation; however, the increasing wealth of the society is not accompanied with the readiness to pay, but justice is definitely (and not "probably, most often", as R. Posner claims) is identified with efficiency (Mercuro and Medema 2006, p. 186, 187).

Perpetua necessitas

Interestingly, the transition from collecting contributions to finance a future pension after increasing the retirement age is even more reminiscent of the history of European taxation. General (public) taxation in the early Middle Ages was a rarity and always 'ad hoc', i.e. taxes were collected not regularly on a certain date, but for a specific event relating to regnum and patria, for example, for defense of the realm ('casus necessitatis'). Over time 'necessitas regis et regni' opened broad prospects for annual taxation. It is well-known that Friedrich II annually announced 'dira et dura necessitas', "dreadful and severe necessity" for levying taxes in the empire at the time of intense struggle against the papacy. Since the 13th and 14th centuries the state became permanent in most European countries. At the same time its financial needs became just as constant and the notion 'necessitas' became applied not to the special, but ordinary according to the requirements of public administration. 'Necessitas in actu' turned into 'necessitas in habitu' to serve the satisfaction of potential needs in the future, i.e. in 'perpetua necessitas' (Kantorowicz 1957, p. 284-291).

As a result of retirement age increase and the withdrawal of state from more active regulation of labor relationships the insurance nature of payments to the pension fund (that is ad hoc payments) is completely lost.

According to a popular view, the main function of taxation is fiscal, i.e. providing the state with necessary financial resources. In our opinion, another function, regulating, is not any less significant. The aging population, population decline due to natural decrease and other causes make state force its citizens to a certain economic behavior with the help of taxes, in particular, to invest more actively into their future pension through a private pension insurance and security system. This, by the way, can influence the development of the Russian stock market: the example of foreign countries shows that the latest financial innovations are to a great extent induced by the growth of pension funds and such institutions as mutual funds, insurance companies actively working in the field of pension accumulations (Panetta 2006). Introduction of the institution of "self-employed people" into Russian practice also fits into this trend.

Discussion of the research outcomes

With a certain inclination toward idealization, one can also find positive aspects of dismantling the social state. It is known that social security and, in a broader sense, social policy were applied by the totalitarian regimes of the past. For example, Opera Nazionale per la Protezione della Maternità e dell'Infanzia and other similar organizations were used by Mussolini for mobilization and consolidation of the Italian society around the fascist party; forced sterilization in the Nazi Germany is also one of the elements of social state (Quine 2017).

However, the partial refusal of state from social obligations does not mean the refusal from control; it just means the changes in its forms and methods. The basis for this transformation is the transferring to the so-called "platform capitalism". Already in 2013 almost the half of the largest world brands in terms of their total market worth were the companies oriented to the platform format. On the one hand,

this format is: corporatios do not have anything other than a network application and practically do not responsible for the fate of its employees; on the other hand, corporations constantly collect and monetize the personal data extracted from the interactions of individuals with each other or with one of the elements of a digital economy or management structures. As L. Tomin (Tomin 2019) puts it, "Such infrastructure forms the potential threat of increasing state or corporative control over the citizens. In addition, the activity of platform companies has negative impact on the labor market by using the process of precarization of employment. The integrated information and communication infrastructure of platform companies forms the system of a certain "digital tailorism" that deprives an employee of autonomy and privacy in the workplace. Influence of digitalization dedicated to technocratic logic of neoliberal managemental models in democratic countries increases depoliticization of relations between a citizen and the state and shifts the correlation of forces between labor and capital in favor of the latter" (Tomin 2019, p. 33). The observed offensive of content and media corporations destroys person's rights and civil values (Lessig 2004). In the colonization period European countries integrated newly discovered lands only based on the premise that they were first to get there. Modern technological companies in the same declarative way took the right to handle citizens' personal data by claiming that such "supervision" is inevitable in the economy of "big data" and consequently legitimized. The territory of "big data" is, as Sh. Zuboff fairly points out, is the territory of political conflict, not only the part of economical statistics. Considering that modern technologies turn into digitalized knowledge absolutely all phenomena of our life, including behavior, things and various processes, it turns out that the scale of political conflict is indeed colossal. And this conflict includes all three political dimensions: the conflict over distribution, the problem of governance, the problem of power (Zuboff 2019).

Finally, the refusal from social obligations and substitution of justice (even though it is hard to define; it is well-known that R. Posner, who dedicated a lot of effort to this, eventually gave up the attempts to give the moral and philosophical basis for the principle of wealth maximization, settling exclusively upon pragmatic arguments, which is pretty natural for "the Chicago school" with its rejection of such concepts as justice and impartiality which are based on moral philosophy) with efficiency puts states and corporations (them, not freelancers and precariat) in the position of the Foole ('Foole') from Chapter 15 of Hobbes' "Leviathan" (Hobbes 1651, p. 71-80). Modern state (and corporations) can accept a social contract and at the same time not make it compulsory for themselves.

The last aspect that we would like to touch upon in this paper is the differences in the word usage in relation to the concept of state existing in the Russian and English languages. It is known that in English language the difference between the ruler and state was persistently stated by the Republican thought; at the same time several terms were used – 'state', 'commonwealth', 'sovereignty', etc. (Poniatiye gosudarstva 2006, p. 165) (Hobbes, for example, used both 'state' and 'commonwealth', and the latter is clearly a republic; later in England 'commonwealthmen' are radical supporters of republic), when the difference between the state apparatus and its subjects was implemented by the ideologists of absolutism. In Russia the thought of the difference between the ruler persona and the state were instilled by absolutist thinkers (and often by the monarchs themselves), when the subject of action – state – was conceptually opposed to its subjects namely in the nascent republican tradition. In addition, in Russian language up until the 18th century there were no words close to the Latin word 'status' and formation of the concept of state was formed by interpreting "gospodarstvo" (domination) as "fatherland" (Poniatiye gosudarstva 2006, p. 189-191). According to some researchers, this is another proof supporting the hypothesis that state as 'stato' in Russia is failed both at the language level and at the institution level.

Conclusion

In his collection of emblems of 1531 the Italian lawyer Andrea Alciato presented an emblem with the image of a king (fiscus) squeezing out a sponge to the last drop and a motto: 'Quod non capit Christus, rapit fiscus' ("What is not taken by Christ is captured by a fiscus") (Kantorowicz 1957, p. 174). Since Russia is a secular state, everything is captured by fiscus, i.e. taxation that includes, as is shown above, payments into the Pension fund. Financing public goods remains problematic; more and more people are joining the ranks of precariat; not everyone can reach the retirement age; the size of the pension for

the majority of Russian residents means a guaranteed decrease in the quality of life. Another problem is that Russian situation is different from the global tendency when the peak income for an employee happens precisely in preretirement age, which is good for retirement accumulation; in Russia the maximum income is reached mostly at the age of 30-35, after which it begins to gradually decrease, and the rate of decline accelerates as the age of the worker approaches the preretirement age. By retirement all bonuses gained with age and experience are lost. By the age of 70 salary drops to the value observed in the youngest of the considered age groups (20-25 yrs) that is to the level of university graduates who only just entered the labor market (Tsena vozrasta 2019).

Thus, longevity becomes less and less like "one of the more recent privileges in the evolution of humanity" (da Silva 2017, p. 78). Happiness remains undefined and unguaranteed (unlike death and taxes). If the purpose of state is to ensure happiness and well-being of *all* citizens, then from the point of view of economic policy in Russia, the "state failure" (Coase 1964, p. 195) can be stated. At least, the state in the form that we knew up until not that long ago. The dismantling of the social state in Russia, which began in the field of law enforcement practice, has now continued in the legislative sphere.

The impact of Coronavirus on Romanian Automotive Industry

Gina PRODAN

Politehnica University Timişoara, Timişoara, Romania, gina.prodan@student.upt.ro

Abstract

Globalization has made the distribution chains cross borders, making the economies of the countries increasingly interconnected. The coronavirus situation is very serious and affects the entire economy. Globally, there are several economic sectors affected by the measures taken against the transmission of the coronavirus. China is considered the main raw material supplier for Romanian Automotive Industry. The interruptions of its deliveries to Europe generate shutdowns of the production lines. Starting with February the Automotive Industry starts to lose money. The purpose of this paper is to estimate the losses in the Automotive Industry in Romania following the crisis generated by the coronavirus and find solutions for decreasing losses.

Keywords: coronavirus impact, Romanian Automotive Industry, raw materials.

Introduction

According to Boseley, Devlin and Belam (2020) coronavirus is a virus who causes pneumonia. The people who have fallen ill are reported to suffer coughs, fever and breathing difficulties. In severe cases, there can be organ failure. As this is viral pneumonia, antibiotics are of no use and the antiviral drugs that we usually have against the flu will not work. If people are admitted to the hospital, they may get support for their lungs and other organs as well as fluids. Recovery will depend on the strength of their immune system. Many of those who have died were already in poor health.

The General Director Dr. Tedros (2020) of the World Health Organisation affirms on 11 st of March that in the past two weeks, the number of cases of COVID-19 outside China has increased 13-fold, and the number of affected countries has tripled. There are now more than 118,000 cases in 114 countries, and 4,291 people have lost their lives. There are dozens of countries with exponential growth rates. In the next figure is presented daily growth rates of cases:

Fig. 1: Daily growth rates of cases on 06.03.2020

Donnelly, Fisher and Fraser (2004) wrote that the Severe Acute Respiratory Syndrome (SARS) epidemic in 2003 sliced around $40 billion off the world economy, most of it hitting China. The

causative pathogen was identified at the end of February 2003, and the incidence of cases peaked in the second quarter of 2003 in China, as well as in various other countries. In 2020, China's economy is logarithmically bigger with far greater influence globally, and as the Coronavirus spreads, this outbreak is expected to further escalate and impact the global economy until a cure can be found.

Fig 2. Monthly motor vehicle sales in China

(Source: China's Association of Automobile Manufacturers)

China is a member of the World Trade Organization and is the world's largest trading power, with a total international trade value of US$4.62 trillion in 2018 according to Xinhua News Agency (2019). Its foreign exchange reserves reached US$3.1 trillion as of 2019 as is written on Bloomberg News (2019), making its reserves by far the world's largest.

Kozlenkova (2015, p. 586-589) mentioned that China is the largest importer of commodities such as oil, iron ore, and soybeans, as well as electronic parts such as integrated circuits.

In the paper Economic impacts of Wuhan 2019-nCoV on China and the world, Foster et al (2020) affirm that uncertainties over the Wuhan 2019 Novel Coronavirus (2019-nCoV), has interrupted global trade and supply chains, depressing asset prices, and forced multinational businesses to make hard decisions with limited information.

Major car manufacturers sold less than 2 million cars in the country last month, down 18 percent from the previous year. Largely as a result, car sales in China fell 92% in the first half of February, according to the data from the China Passenger Car Association (CPCA). China's association of automobile manufacturers recently forecast a 10% decrease in sales for the first half of the year and a 5% decline for the full year mentioned by Sun Y. and Goh B. (2019). If many factories close until mid-March, it could lead to a reduction of 1.7 million vehicle production in China, according to IHS Markit.

In 2019, China recorded exports of more than $ 2.5 trillion, and imports were about. $ 2.13 trillion, representing a trade surplus of $ 360 billion. China's GDP is over $ 13.6 trillion. According to Vuta (2020) the exports of goods and services as a percentage of GDP represent 19.51%, the percentage related to imports of goods and services, as a share of GDP, is 18.73%.

The global auto industry has been suffering lately due to the effect produced by the advent of coronavirus in China. For this country, the economic situation regarding the automotive industry, respectively the production and export of cars, is increasingly serious.

In the latest years, the automotive industry has been one of the most profitable sectors of the Romanian economy. Much of the Romanian manufacturing industry consists of branch plants of foreign firms. In the West of Romania activate a lot of car industry organizations. Romania depends on imports of raw materials from China. They negotiate low prices for components and this crisis put Romania in a position to refocus on the raw material markets.

In a research study by Yen (2019) is written that the dependence on China has been counteracted by the need to optimize costs by relocating production facilities to China, resulting in lower costs and thus profit margins will be substantial, costs will thus be optimized.

China is considered the main supplier for Romanian's Automotive Sector. China's decision to stop working affect all supply chains. If one of the chains has issues then all the chain will be affected. At this moment China's situation impacts the companies from Romania. In turn, these companies will impact their customers. It is like a funnel in which all the issues gather and focus on the final customer

Fig. 3: The impact on the final customer

To produce a finished product, all the materials that enter into its bill of materials (BOM) must be available. If only one material is missing then the finished product cannot be made. When it happens the costs for the company increase because the products cannot be sold, it will be an excess of raw materials inventory, the warehouse's storage location will be reduced, and the non-operative times increase.

At the end of January China stopped its activity and of course the deliveries of the raw materials to Romania. Because of Chinese New year they send in advance the materials to cover 2 weeks from February. Starting with the third week of February the factories from Romania starts to stop their production. The workers are sent home in technical unemployment. The sales decrease significantly with 28%. Below is a comparison between 2019 and 2020:

Fig. 4: Comparison between Sales Level from February 2019 and February 2020

Companies from the Romanian Automotive Industry must work according to the demands of their customers, but because they did not receive raw materials on time, they will stop first their production, and after that customer's production. The figure below shows the parts produced by the companies and the forecast sent by the customer. It can be seen that from week 7 nothing can produce and deliveries will be missed.

Fig. 5: Produced parts vs Forecast

The production process itself is randomly subjected to disturbance. To ensure a continuous flow it is necessary to maintain a safety stock. The stock constitutes a financing need that involves the allocation of financial resources that involve a certain cost. Therefore its value must be kept at a low level. As mentioned before, for the production of a finished product, all the raw materials need to be available. If only one component is missing the product cannot be built and the rest of the materials cannot be used. This leads to overstock. The following figure shows a comparison between the current situation and the last 4 quarters from 2019, for materials whose coverage exceeds the safety stock already set. In the second month of the 1st quarter, we had 92 materials with coverage bigger than 1 week over safety stock. In the first 10 days of February, we had 637 materials. For the entire month are 1874 raw materials with coverage bigger than 1 week. If each material would cost 1 monetary unit and the storage cost would be 0.5 monetary units then only for February 2811 would be spent monetary units that were not included in the budget.

Fig. 6: Number of materials with coverage greater than one week

Starting with week 07, the directly productive staff will no longer come to work. A part of the administrative staff works at home and the other part approximately 70% are at home. For the company this means losses. They pay salaries without adding value. The average salary for a worker is 10 M.U. and the average salary for an indirect worker is 20 M.U. The company loses by keeping people at home 34000 M.U.

Fig. 7: Workers' repartition

It is difficult to accurately estimate how much a generalized epidemic might cost because such phenomena have very specific characteristics. Currently, we have the following financial losses: salaries paid for people who do not work, maintenance costs for non-functional equipment, overstock, special fright.

In general, all companies have 2 suppliers for every component. If one company cannot deliver then the other can provide support. The main issue is if these two companies are both from China. Then you must find another way to work and minimize the impact.

The first solution is to buy components from brokers. When China announces about Coronavirus the brokers bought all the surplus on the market from unique raw materials. Now when the automotive industries need components because the main supplier doesn't work they buy from brokers at overpricing. Because a desperate situation has been created, the broker gives the materials to those who offer more. Are organized auctions. Usually, most powerfully companies took all.

If a component normally costs 2 monetary units (M.U) and the daily requirement will be 30.000 pieces, the company should spend 60,000 M.U daily. Buying from brokers for 8 M.U it will conduct to daily expenses of 240.000 M.U (the expenses would be 4 times higher). If it normally earns 4 monetary units for each product sold, in this case, the company will lose all the profit and it will also have additional costs of 2 M.U per unit. The next figure presented in case 1 the normal situation when the profit is 120000 UM and the second case where the components are bought from the brokers and the company losses money.

Fig. 8: Comparison between cost and profit in the usual situation and broker situation

Figures show that buying from material brokers to overpricing is not a very good solution, at least not a long-term one. What remains to be done is to try to reorient yourself to other companies in order not to be dependent on a single country. China's situation must be a very good lesson for companies in the auto industry. Dependence on a particular country is not good and you must always have an alternative. In this situation is no possible without China to have the same output but is mandatory to prepare a strategy for the future.

The situation may worsen before they improve. On 11.03.2020 the World Health Organization on Wednesday declared the rapidly spreading coronavirus outbreak a pandemic. Following this announcement, local authorities can extend the period during which the factories are closed to limit the spread of the epidemic.

The Romanian car industry has lost 63600 monetary units so far. If the situation persists the losses will be in the order of hundreds of thousands of euros.

Solutions

The main problem for the Romanian Automotive Industry was that it had 2 suppliers from the same country, respectively China. Both suppliers the main and the secondary came from this country. To avoid this kind of issue in the future, alternative suppliers from different countries must be found. The procedure is not simple.

Developing a procurement strategy is essential. When developing the strategy it is important to take into account the client's requests, even if it will always focus on the result of an optimal purchase. A comprehensive and coordinated strategy is essential to get the following benefits:

- Time-saving (strategic decisions made early and coordinated ensure that misunderstandings are avoided, overlaps and problems during the award procedure)
- Involving all stakeholders
- Timely inclusion of the basic strategies and values (e.g. sustainability strategies, social criteria, etc.)

To make the right decision it is important to make a specific calculation to know how much you could spend on your future acquisitions, Product cost calculation consists of the calculation of all relevant cost elements and revenues over the product lifetime. To ensure a consistent understanding of the different cost types, it is important to have a common understanding of project cost estimation. We will consider two types of costs: material costs and manufacturing costs. The material costs are considered:

- Purchase material
- Production material
- Inbound logistics
- Supplier packaging

The manufacturing costs are considering: machine costs, labor costs, setup costs. The material costs are calculated as landed costs, including all direct and indirect costs for deliveries. Especially for a comparison between different quotations (supplier decision sheet), all logistic and packaging costs must be the same. They usually should be DDP. Material costs consist of costs for:

- Ex-works price of the supplier
- Packaging of material
- Project expenses at the supplier
- Freight / logistics

The price is considered an important criterion. But it is important to take into consideration also the other criteria as having a good quality, short lead time or to have DDP. Sometimes it is possible to save 30% by accepting a seven-weeks lead time instead of four weeks, but it is not all the time a good solution.

After agreeing on the constraints and criteria, the supplier must agree on a hierarchy:

- Lead times from receipt of your order to delivery
- Minimum and maximum order quantities
- Storage and handling facilities
- Specific methods of delivery
- Quality assurance processes
- Payment terms and conditions
- Return policy

In most cases, supplier offerings will differ and there will be tradeoffs involving the criteria: you may get a better price from one supplier (cost) but that supplier insists on contract terms less favorable to you (risk).

Setting the criteria in advance will enable you to evaluate potential suppliers on each of the listed items and ensure that you don't overlook any important requirements.

During the negotiations, samples are made to verify that the quality standard is the one negotiated. Below are all the steps in the production process through which a raw material must go through:

Fig. 9: Raw material life cycle

In general, choosing a new supplier can take up to 1 year because, in addition to the decisions you have to make, you have to take into account the capacity and quality it offers. But in the long term, there will be solutions in case of a supplier's inability to send the goods.

The time when the production is stopped can be used productively. The monthly and annual maintenance of the equipment can be done.

Conclusions

The auto industry is severely affected by coronavirus. The epidemic not only affected production, but also sales. Many potential customers stay in the house and avoid entering the auto showrooms until the epidemic passes. The closed factories will depend on the recession in the auto industry, and the epidemic will force the Romanian manufacturers to reduce production by 30% in the first quarter. Some suppliers from China started their activities but to start production you need all your suppliers to start their activity. The Romanian car industry has lost 63600 monetary units so far. If they do not start production the losses will be higher. Governments must offer their business support in order not to lose any further. A fund of 20 billion euros will be created to reduce the effects of the economic crisis caused by coronavirus.

Abstract

In the conditions of rapidly changing global conditions, the development of the national economy is possible only with an active innovative position of the subjects of the real sector of the economy. The mechanism for stimulating the innovative activity of small businesses should be considered as a system of interconnected elements, with the help of which a single continuous effective development of their innovative potential is ensured. The view that investment policy may have a role in supporting innovation has become widespread. For innovative development of industry, increasing competitiveness, intensive development, small enterprises need financial resources. The research findings indicate that the innovation activity of small businesses depends on the access to investment resources (direct investments and credits, etc.). The scientific and practical significance of the topic is due to the need to increase the efficiency of regional economies in order to overcome crisis phenomena.

Keywords: Small Businesses; Innovation Activity, Investment Policy; Region

Introduction

In the conditions of rapidly changing global conditions, the development of the national economy is possible only with an active innovative position of the subjects of the real sector of the economy. According to a number of researchers, a small role is played by a small business, since it has such advantageous qualities over medium and large businesses as prompt response to market demands, mobility of technical and technological processes, and wide specialization of personnel (Sikatsky and Zhuravleva, 2008). However, innovation is accompanied by significant financial costs, which limits the ability of small businesses to actively implement innovative ideas. In this regard, the development of small innovative business is possible only in conditions of formation of effective mechanisms for its activation.

The mechanism for stimulating the innovative activity of small businesses should be considered as a system of interconnected elements, with the help of which a single continuous effective development of their innovative potential is ensured. At the same time, market requirements; the principle of negative feedback, for the design of which it is necessary to take into account the lag of the delay between the exposure to risk factors and the manifestation of their negative consequences and the presence of internal cyclical mechanisms (including cycles of individual innovative products, technologies and projects).

An important problem and a central issue of the innovation process is the need for its investment financing. It should be noted that a significant imbalance in the resource potential of the Russian regions, affecting their investment potential leads to significant differences and contradictions in their implementation of innovative activities (Donichev, et al., 2016). The article discusses organizational and managerial relations arising as a result of the mutual activity of government and business to

increase the investment potential of the regions, contributing to the growth of innovative activity. The authors analyzed the results of investment activities of the Penza region.

Theoretical Background

Schumpeter's theory laid the foundation for innovation theory and substantiated the link between innovation and economic development (Schumpeter, 1939).

There has long been a discussion among scientists about which specific elements affect the innovative activity of small businesses. Many studies substantiate the impact of the human factor and effective management on innovative development in small enterprises (Cooper et al., 2016; Martinez-Roman and Romero, 2017; Ucbasaran et al., 2008).

Innovation requires both tangible and intangible investments, which have been very important for the growth and competitiveness of the company. The justification of state support is based on the assumption that innovations implemented by enterprises will directly or indirectly stimulate the production of new goods and services. The high riskiness of implementing innovations, the unwillingness of banks to issue loans for innovative projects require public policy measures (Gamidullaeva, 2019; Gamidullaeva, et al, 2017).

The question of whether bank lending can help enterprises to carry out innovative activities in the absence of a significant supply of risk capital is debatable. From the report on the transition process of the European Bank for Reconstruction and Development, it follows that one group of researchers adheres to a rather pessimistic point of view, emphasizing the uncertainty of the nature of innovation, and justifies the lesser suitability of banks as sources of financing for a number of reasons, including the difficulty of using intangibles involved in innovation assets to secure a loan; characteristic volatility of cash flows that does not fit into the inflexible repayment schedules of most loans; lack of expert capacity to evaluate technologies at the initial stage and others.

According to another group, one of the key functions of banks is to establish long-term relationships with companies, which should form a deeper understanding among bankers of borrowers and their business plans. Thus, banks can have all the opportunities to finance innovatively active enterprises.
And finally, even without financing directly or indirectly innovative projects, banks are able to stimulate intra-company innovations, for example, by providing funds directly for working capital replenishment or short-term loans, which can help free up internal resources for their subsequent investment in innovation development.

Public policy measures to stimulate the private sector to increase investment in research and development have always been an important part of innovation policy. Governments, over the past half century to date, have allocated large amounts of public funds to expand the base of scientific and technical knowledge to reduce risks and uncertainties (Cunningham, P., et al., 2013). Various tax and subsidizing measures are introduced to stimulate enterprises to implement innovative projects (David, P., et al., 2000).

Meanwhile, we should admit that the most effective way to stimulate innovation development in the region is to develop an effective system of special investment institutions for innovation support (Gamidullaeva and Tolstykh, 2017).

Research Methodology

The methodology is based on the assertion that the successful implementation of innovative strategies by an enterprise is determined by the stability parameters of the enterprise as a mini-system and the stability parameters of macro-, meso- and microeconomic systems of which it is an element. The developed system of principles of enterprise sustainability management includes methodological, methodological and operational principles. The main methodological principle is the formation of a leading, preventive impact on threats of risk factors in order to prevent their negative impact on the

functioning of the enterprise. In addition, it is also necessary to highlight the principle of adaptation of innovative processes to changes in the external environment, the growth of instability of which is caused by the global financial crisis and the long-term nature of investment decisions, as well as the high probability of inconsistency of technical and economic characteristics of products. The most important aspect of successful resource support of small businesses' innovation is the task of increasing the regional investment potential. At the same time, two directions for achieving this goal are possible: attracting foreign investment and mobilizing domestic investment resources.

Results

The existing system of investment development management in the Penza region is represented by executive bodies of state power in the region and regional development institutions created to implement investment policies and increase the investment attractiveness of the region. This system includes the following elements (Figure 1).

Figure 1: Penza Region Investment Development Management System

The Ministry of Investment Development and Entrepreneurship of the Penza Region carries out its activities in accordance with the Decree of the Government of the Penza Region dated January 31, 2012 N 46-pp. Within the framework of this resolution, the Ministry carries out the functions of developing a unified strategy for investment development, strengthening the entrepreneurial sector of the economy in the Penza region, identifying priorities and development paths for the relevant industries that ensure the sustainable economic development of the Penza region.

Joint Stock Company "Penza Region Development Corporation» carries out preparation of investment sites and the implementation of investment projects to them, the creation and development of industrial and industrial parks for profit, create new jobs and increase the tax base. The sole shareholder of the company is the Penza region represented by the Department of State Property of the Penza Region.
The Council for Economic and Investment Policy under the Government of the Penza Region is a permanent consultative and advisory body headed by the Governor of the Penza Region, created to improve the conditions for the development of investment activity in the Penza Region. Its main tasks are: to ensure a favorable investment climate in the Penza region, coordinate state policy in the field of investment activity, stimulate investment activity in the region, reduce administrative barriers, analyze the progress and results of investment projects, review the results of the Penza Region Investment Strategy, and the results of the implementation of long-term target and state programs of the Penza region, aimed to increase investment potential.

Municipal councils for improving the investment climate and the development of entrepreneurship were created under the heads of administrations in order to monitor the investment climate in the Penza region, make operational decisions and measures in all urban districts and municipal districts of the Penza region.

The Penza Regional Chamber of Commerce and Industry is a non-governmental non-profit organization designed to promote the development of a market economy in the region and its integration as part of the Russian economy into the global economic system. The main task facing this organization is to facilitate the attraction of foreign investment in the Penza region

LLC "Center of Cluster Development" provides support to enterprises and organizations of Penza instrument engineering cluster “Bezopasnost”, a cluster of information technology, engineering and production cluster "Biomed", confectionery cluster "Union Penza confectioners', a cluster of light industry" Light industry "in attracting both public and private investment.

It should be noted that all elements of the investment management system in the region are actively working to create a favorable investment climate in the region and increase its investment attractiveness. Moreover, work is being carried out in all sectors of the region’s economy. In its work, the Ministry of Investment Development and Entrepreneurship of the Penza Region works closely with other regional ministries and departments. As a result of active work of regional authorities, the volume of investments in the period from 2012-2015 increased annually and amounted to 89 billion rubles in 2015 comparatively to 2012. However, by 2016, the volume of investments has significantly decreased, and amounted to about 65 billion rubles (Figure 2).

Figure 2 : The volume of investment in fixed assets, million rubles.[1]

In turn, the dynamics of index of physical volume of investments in fixed assets in the Penza region indicates that during the study period there is an annual increase in investments in the regional economy, with the exception of 2014, when the index of physical volume was 98.4%, and 2016 with an index of 68 , 7% (Figure 3).

[1] Ministry of Investment Development and Entrepreneurship of the Penza Region [electronic resource] // access mode: http://mirp.pnzreg.ru/

Figure 3 : Index of physical volume of investments in fixed assets, %

It should be noted that in the region there is a clear tendency towards a decrease in the growth rate of the index of physical volume of investments in fixed assets.

The structure of investments by type of economic activity is presented in Table 1.

Table 1: Structure of investments in fixed assets by type of economic activity, % [2]

Types of economic activity	2012	2013	2014	2015	2016
Total	100	100	100	100	100
Agriculture, hunting and forestry	12,9	11,1	19,1	20,4	22,1
Mining	0,8	0,1	0,0	0,0	0,0
Manufacturing	16,2	26,1	18,6	16,8	16,3
Production and distribution of electricity, gas and water	5,1	3,9	3,2	2,6	9,3
Construction	0,7	0,7	0,3	0,2	0,6
Wholesale and retail trade; repair of motor vehicles, motorcycles, household products and personal items	1,2	0,7	3,0	2,1	4,0
Hotels and restaurants	0,0	0,0	0,1	0,1	0,2
Transport and communication	35,7	29,5	26,4	44,1	24,2
Financial activities	1,7	0,9	1,7	0,4	0,7

Public administration and military security; compulsory social security	2,5	1,4	2,4	1,1	2,1
Education	2,2	2,4	1,7	1,2	2,6
Health and social services	4,3	3,1	2,2	2,0	3,4
The provision of other utility, social and personal services	7,4	8,6	5,5	0,8	3,2

[2] Ministry of Investment Development and Entrepreneurship of the Penza Region [electronic resource] // access mode: http://mirp.pnzreg.ru/

The data show that for the study period one of the main areas of investment is agriculture. Thus, the share of investments in this industry during the study period increased 12.9% in 2012 to 22.1% in 2016. This is due to the fact that large investment projects of an innovative nature are being implemented in the Penza region. For the study period, with the participation of investors, three dairy complexes for 8,200 cows with milk production of more than 44 thousand tons per year, 1 pig-breeding complex with a capacity of 12.5 thousand tons of pork per year were built in the region, 2 pig-breeding complexes with a capacity of 7 thousand tons were also reconstructed meat per year. The largest poultry farm in the region, OJSC PTF Vasilievskaya, was modernized. The reconstruction and construction of new sites with a capacity of 140 thousand tons of poultry meat per year has been completed. A hatchery was built at 105 million eggs per year. Reconstruction and modernization of the slaughter plant. The total investment in the company for the period from 2004 to 2015 amounted to more than 9 billion rubles.

Currently, the largest project in the Penza region and one of the country's largest projects in the country, APK Damate LLC, is aimed at expanding the industrial turkey farm to 100,000 tons of finished products per year. The total investment in the turkey project, taking into account the expansion, will amount to 25.6 billion rubles. According to the results of 9 months of 2016, the implementation of the project allowed the Penza region to take 1st place in the Russian Federation for the production of turkey meat.

Another major investor, Russian Dairy Company, is completing a project to build an elevator in the Pachelma with a capacity of 100 thousand tons of one-time grain storage. Acceptance capacity will be 5 thousand tons of grain per day - the highest among the elevators of the Penza region. As part of the general concept of creating a closed production cycle, Rusmolco completed the construction of a seed processing center with a capacity of 10 tons per hour in the Bashmakovsky district, which allows the preparation of seeds of almost any direction of plant growing and vegetable growing. The total investment is 1.8 billion rubles. The project will create 50 new jobs.

For several years of work in the Penza region, the company launched a number of serious production capacities that significantly improved the situation in animal husbandry: a dairy complex for 4,600 cattle places in the village was put into operation. Arshinovka located in Nizhny Novgorod Region, designed for the production of 120 tons of milk per day or 46 thousand tons per year. The investment volume of the project amounted to 3 billion rubles, about 200 high-tech jobs were created within the framework of the project.

Under the Protocol of Intent between the Government of the Penza Region and AGSEN Property Limited Liability Company, the construction of the second stage of an elevator complex with a capacity of 100 thousand tons of one-time grain storage is actively underway in the Tamalin district. The created elevator will be equipped with modern equipment for acceptance, storage, drying, part-time sieving, shipment of finished products by rail and road. The total investment in the project, taking into account the expansion, will amount to almost 2 billion rubles. In 2016, Agrofirma Razdolie LLC completed the construction of a modern logistics complex with a one-time storage capacity of 13.8 thousand tons of potatoes and vegetables in Olenevka settlement of the Penza region. The investment volume of the project amounted to 240 million rubles. At the same time, the company is completing the construction of a land reclamation system on an area of 880 hectares. The volume of investments is more than 100 million rubles.

CJSC "Bashmakovsky bread" in the village. The Shiryaevo Belinsky District modernized the logistics complex, as a result of which the capacity of simultaneous storage of potatoes and vegetables was increased to 17 thousand tons. Within the framework of the project, a high-tech line for packing and packaging vegetables and potatoes was acquired. The amount of investment under the project in 2016 is 73 million rubles.

Also, a significant place in the structure of investments is occupied by industrial production. In order to increase the investment activity of business entities, the State Program of the Penza Region “Development of Industry in the Penza Region and Increasing Its Competitiveness for 2014-2020” has

been implemented since 2014. Under this program, from the budget of the Penza region in 2016, the Ministry of Industry of the Penza Region provided a subsidy in the amount of 10.0 million rubles to JSC "Biosintez" for reimbursing part of the cost of paying interest on loans and leasing payments to modernize production and release new, innovative products .

Thanks to active work with the Ministry of Industry and Trade of the Russian Federation, 11 Penza enterprises and industry institutes took part in 6 state programs of the Russian Federation and the Federal Target Program in 2016, while they received about 600 million rubles from the federal budget. on the technical re-equipment of production and the development of new products.

Also, in order to increase the investment attractiveness of the region, the government of the Penza region adopted Law No. 1755 – ZPO "On Investments and Public-Private Partnerships in the Penza Region" dated June 30, 2009, fixing all forms of state support for investment activities, and establishing a progressive system of tax benefits. Under this law, tax incentives in the Penza region can be granted to the following categories of investors (Figure 4).

Figure 4: Categories of investors eligible for tax benefits in the Penza region

As a result of the implementation of this law, the share of equity in the structure of sources of investment in fixed assets has significantly increased (table 2).

Table 2 : Structure of investment in fixed assets by sources of financing, %

Sources of financing	2012	2013	2014	2015	2016	2016 in % comparatively to 2012
Own funds	19,42	16,55	28,29	24,72	42,36	22,94
Involved funds	80,58	83,45	71,71	75,28	57,64	-22,94
budgetary funds	27,51	28,50	18,09	10,12	17,57	-9,93
budgetary funds from the federal budget	17,82	21,80	9,45	5,97	9,51	-8,30
budgetary funds from the regional budget	6,93	4,22	6,88	2,40	4,14	-2,80
borrowed funds from bank loans	20,72	24,40	18,27	20,14	14,07	-6,65
borrowed funds of other organizations	3,70	3,19	5,43	3,80	10,09	6,39
extrabudgetary funds raised	0,35	0,18	0,22	0,11	0,20	-0,15
other borrowed funds	28,29	27,18	29,70	41,12	15,70	-12,59

At the same time, there is an annual reduction in the share of attracted budget funds (both from the federal and regional budgets). At the same time, the share of borrowed funds from other organizations, which include various types of investment funds, increased, which indicates an effective investment policy of regional authorities.

In the Penza region, a number of regulatory acts are in place aimed at stimulating the investment activity of the region and providing additional benefits and preferences to investors (table 3).

Table 3 : Regulatory framework for stimulating investment activity in the Penza region

Legislative act	Content
Law of the Penza Region dated 30.06.2009 No. 1755-ZPO “On Investments and Public-Private Partnerships in the Penza Region” (as amended)	It is aimed at the development of investment activities and determines the legal, economic, social conditions and forms of additional support for investment activities in the Penza region, the procedure for its provision, as well as the basics of legal regulation, principles and procedures for participation in public-private partnerships in the Penza region.
Law of the Penza Region of September 18, 2002 No. 397-ZPO “On the Enactment of the Transport Tax in the Penza Region”	Establishes a list of enterprises exempted from paying transport tax in the territory of the Penza region.
The law of the Penza region of April 26, 2004 No. 596-ZPO "On the procedure for providing state guarantees of the Penza region"	It determines the procedure for obtaining guarantees to the subjects of investment activity when attracting borrowed funds for investment activity
Law of the Penza Region dated 30.06.2011 No. 2098-ZPO “On the Centers for Regional Development of the Penza Region”	Law of the Penza Region dated 30.06.2011 No. 2098-ZPO “On the Centers for Regional Development of the Penza Region”

Law of the Penza Region dated 01.03.2004 N 579-ZPO "On the Investment Strategy of the Penza Region for the Period until 2021 (and for the Perspective until 2030)"	It reflects the system of modern priorities, goals, principles, main directions, tasks and mechanisms for implementing the investment policy of the Penza region.

In order to develop investment attractiveness, development institutions have been created in the Penza region. A Cluster Development Center has been created, through its support is provided to 4 priority industry clusters (biomedical cluster "BioMed", instrument engineering cluster "Bezopasnost", light industry and confectionery clusters).

The successful practice of business development is demonstrated by the "Penza Confectioners Union", which brings together small and medium-sized enterprises in a cluster, the total number of employees at which is more than 1,500 people. Penza region is in the top - 5 regions - the largest manufacturers of confectionery products.

The BioMed cluster provides targeted support to the high-tech segment - manufacturers of medical devices. The cluster products are highly competitive both in the Russian and foreign markets. This is indicated by the leading places of the cluster among domestic manufacturers in the following segments of the domestic market: "artificial heart valves" - 64%, "suture material" - 17%.

As part of the development of instrument engineering cluster "Bezopasnost", focused support is given to manufacturers of high-tech engineering security equipment. In this segment, the share of Penza products in the Russian market is 61%. The volume of products shipped by the cluster enterprises is more than 3 billion rubles annually.

Conclusion

In conclusion, the analysis shows that the Penza region is pursuing a targeted policy to develop the investment attractiveness of the region; all the necessary conditions are created to attract investors.

Thus, the considered investment aspects of ensuring innovative activity on the example of the Penza region allow us to draw conclusions. First of all, it is necessary to actively develop innovative investment funds intended for targeted support of innovative projects in the regions, to attract budget financing and venture capital funds. Secondly, the regional authorities should pay more attention to improving the methods and techniques of strategic planning for the development of regions in order to improve their innovation and investment climate.

Abstract

The article is devoted to research of transforming the role of human capital in the digital economy. The problem of modifying the role of human capital becomes particularly relevant in the context of digital transformation. Due to the growing trends in the transition to the digital economy, there have been a number of changes in the use and development of human capital. It becomes obvious that the availability of human resources and their involvement in the country's economy can provide an unprecedented growth of the state's economy. The transformation of the social and economic system has largely affected young people due to the greater sensitivity and high social mobility of the younger generation. Due to changes in the economic system, Russian youth have experienced changes in their attitude to various fields of activity. Special attention is required to analyze the formation, development and implementation of the human capital of young people in the labor sphere. Based on the materials of sociological research among young people of the Volga region and secondary analysis of data from other studies, the human capital of Russian youth, life attitudes and values in modern conditions are considered. The article analyzes the impact of the current socio-economic situation on the features of effective use and development of human capital. It is proved that a significant labor potential, expressed in a large number of people capable of active labor activity, in the presence of well-thought-out national projects, can ensure rapid growth of the country's economic indicators. the Empirical basis of the analysis undertaken in the article was the materials of a sociological study conducted in the Penza, Saratov region and the Republic of Mordovia in 2018. The results of the study led to the conclusion that there are different behaviors in the minds of young people. The analysis of motivations that make students work showed that material incentives for the purpose of acquiring material wealth were in the first place. The more often young people make long-term plans, the more interesting, creative, high-paid work that benefits people and society is important for them, and the less important is a prestigious job, a job with good working conditions and social guarantees. Responses from working and non-working students led to a conclusion about the "preferred work" model, which includes high pay, as well as the possibility of career growth. In General, for most young people, the most common in the labor sphere is the socio-psychological attitude "work hard and earn good money".

Keywords: Human Capital, Human Resources, Staff Development, Digital Transformation, Digital Competencies, Digital Technologies, Digital Economy.

Introduction

Before proceeding to the presentation of the main material of this study, it should be emphasized that many facts related to the topic under consideration will not be analyzed in detail due to the limitations of this scientific work in the format of the article.

The idea of this work is to talk about the modification of the role of human capital in the conditions of digital transformation of modern youth in the Volga region on the example of the Penza, Saratov region and the Republic of Mordovia, according to the results of the study, in the context of studying the basic values of the young generation.

It is well known that as a result of the formed modern parameter of economic relations, built on the digital transformation of all areas of life of individuals, the current trend is the use of digital technologies, which in turn lead to increased productivity, improved product quality, and an increase in the level of service delivery. Such changes have a beneficial effect on the efficiency of the country's economy, stimulating its competitiveness on the world stage. Thus, the transformation of human capital can serve as one of the most important conditions for effective digital transformation of the economy. Based on the above, the study of the problem of human capital development in order to increase labor productivity in the digital economy is becoming quite relevant.

Research Design & Methodology

Descriptive and exploratory type of study is used in thus study. As part of the grant of the President of the Russian Federation for state support of young Russian scientists MD-328.2018.6 on the scientific research "socio-cultural features of the formation of social potential of youth in the crisis and transformation of Russian society" in 2018-2019, sociological research was conducted among the youth of Russian regions: the Volga region (Penza region, Saratov region, Republic of Mordovia, n=754, 2018).

Study Rationale

This study is an attempt to identify variables factors influencing the independence of them augmentation of physical capital, accumulation of human capital to the digital economy.

Objectives of Study

- To study the relationship between human resources and the growth of the state's economy.
- To research the impact of digital transformation on the development and implementation of human capital of young people in the labor sphere.

Statement of Research Problem

The present study is an attempt to identify variables related to human capital in the conditions of digitalization of the economy. Variables of job motivation among young people have also been examined.

Sampling Design

For this study the data has been secured from young people in the Volga region. A representative **sample of 754 respondents** is taken from higher education institutions operating in Penza, Saratov regions, and the Republic of Mordovia a stratified and convenient sample obtained as a result of segmentation of the gender-age (quota) and their availability to respond to questionnaire, Stratified & Convenient sampling is employed for this purpose.

Sample size: 754.

Sample technique: the sample is quota – based (gender, age).
To process sociological data, a specially developed computer program "Sociology" was used, which allows you to fully automate all processes(actions): from the preparation of the questionnaire to its processing; it is based on scanning questionnaires and automatic recognition of respondents ' responses, makes it possible to use primary and secondary sociological information by creating databases, allows you to conduct both one-dimensional and multidimensional analysis.

Data Collection

Primary data is collected from different educational institutions of the Volga region through a questionnaire (distributed via online/ in person) as well as through direct observation method to collect the data. The research instrument for the collection of data is structured questionnaire. Parameters for questionnaire design is developed on the basis of similar past studies reviewed in the literature review section.

Data collection technique: multipurpose surveys and questionnaires method has be used.

Data collection instrument: Structured questionnaire.

Results and Discussion

Digital transformation refers to the process of integrating digital technologies into business processes that have a direct impact on technology, culture, operations, and the principles of creating new products and services. At the same time, this process encourages the gradual abandonment of outdated technologies, the content of which becomes unprofitable for the organization, as well as a change in the culture, the need for which is to accelerate the processes provided by digital transformation.

The importance of studying human capital in the new modern conditions of a transforming society has been proved by the results of scientific research conducted by the Russian school of Management. The results of the survey were the need to train young professionals in business schools, the need to use their own potential (mentoring systems and internal corporate training) (Gunina, et al, 2019).

Human capital should be viewed from two sides. First, it is the potential of the person himself, and secondly, it is formed by means of a new application of modern, innovative forms and methods of work, typical for the new economic order (Xu and Sylwester, 2017).

In the process of studying the development of human capital, attention should be paid to various ways to determine the content of human capital.

So, according to A. Tkachenko: "the Theory of human capital is directly related to the new concept of "information society", which needs workers who acquire a number of skills and constantly adapt these skills, and is also the basis of the" learning economy " (Anopchenko, 2019).

In the traditional interpretation, human capital is an investment in education, professional experience, health, culture, etc., which can bring income.

Thus, the formation of human capital in the organization should lead to the growth of absolutely all indicators of business processes on the basis of stimulating the motivation of employees and their ability to work in unstable, changing working conditions. This, in turn, will have a positive impact on the development of the country's economy as a whole.

Today, for the effective formation of human capital in the conditions of digitalization, the state has an important task: stimulating the labor activity of young people and the working-age population in order to create high-tech products.

One of the factors of stable functioning of a particular state in the conditions of transition to the digital economy, as well as any process of change, can be the system of formation of values of an individual and various groups of society. It is well known that the value orientations of young people have an impact on the formation of human capital. Human capital can cause economic growth in a country. In this regard, the issues of human capital development in order to increase labor productivity in the digital economy remain relevant (Soboleva, 2010).

The degree of human development is considered a basic indicator of the country's socio-economic development. It has a deep mechanism of influence on the economic growth of the state (Fig. 1) (Baranova and Sorokin, 2017).

Fig. 1 : Key stages of the company's digital transformation

Source: Gunina, I. A., Logunova, I. V., & Pestov, V. Y. (2019). INCREASE OF EFFICIENCY OF USE OF HUMAN CAPITAL IN THE CONDI-TIONS OF DIGITAL TRANSFORMATION. Region: Systems, Economy, Management, 44(1), 18–25. doi:10.22394/1997-4469-2019-44-1-18-25

The peculiarity of the formation of human capital consists in its gradual formation under the influence of various factors, such as the interest of the population, justified by the increasing need for innovative knowledge (Volodin, et al, 2016). Young people are a special age group of society, which is characterized by high susceptibility to the influence of external factors, actively developing, gradually making a choice of their professional and life path. The fear of the younger generation, associated with the inability to ensure a decent standard of living for themselves and their family members, leads to the loss of citizens ' effective labor motivation. An important factor affecting labor motivation is the demand for specialists in the labor market of the region. In recent years, Russia has seen an aggravation of the problem of employment of University graduates. Currently, 25 to 30% of University graduates can't find a job after graduation, only about 20% of University graduates work in the specialty acquired at the University. By itself, education less and less guarantees the possibility of employment and decent earnings. This often leads to dissatisfaction with work and can generally form a negative attitude to work (Martyshenko, 2016).

In the youth environment, late adulthood and consumer attitudes have become quite common. Many young people believe that the state should take care of them, their employment and income. This leads to a reluctance to take responsibility for your life.

Source: Anopchenko, T. Y. (2019). Human Capital Gender Structure as a Factor Of Socio-Economic Regional Development. doi:10.15405/epsbs.2019.04.84

Fig. 2: The impact of human capital on the country's economic growth

Based on the results of a sociological study conducted in 2018-2019 among the youth of the Volga region (Penza, Saratov regions, Republic of Mordovia, 2018, n=754), it was possible to identify the value structure and life attitudes of modern Russian youth, which are mainly made up of traditional values. Based on life attitudes, young people are planning their plans for life in the short and long term (Rozhkova, et al, 2019).

The paper will describe the life experiences of young respondents. As for value orientations, the value of the family is still the most important thing for young people (65.34 %). Among vital values, the value of health (43.97%) and material well-being (36.21%) are very popular (Rozhkova and Dubina, 2018).

Modern society has undergone global changes over the past period, the consequences of which are reflected equally in all spheres of human life, and in particular, on their consciousness. Today's youth grew up in a new reformed society (Dubina,2016).
Due to the ideological uncertainty of the younger generation, the negative effects of the media, planting the psychology of the consumer society transformation of values and life attitudes that have a direct impact on the formation of human capital of the country. Differentiation and material stratification among the population, existing in modern socio-economic conditions, adversely affect the values and orientations in the field of work of the young generation of Russians and stimulate their alienation from workv (Blokhin, 2017).

According to our 2018 survey, a third of respondents (28.31 %) rate the current situation as normal and calm, the majority (59.32 %) as tense, crisis, and another 12.37% as catastrophic. And to answer the question: "Have any impact on your work or may affect a future career crisis, instability in the country, the region?"44.09 % of respondents reported such an impact, 26.04 % noted that the crisis phenomena in the country do not affect their work activities. 29.87 % - found it difficult to answer. Among respondents who believe that the crisis in Russian society has an impact on the labor attitudes of young people, slightly more respondents would like a stable salary. In terms of stability, good earnings are shown in Figure 3 are more important.

Fig. 3 - Distribution of respondents 'responses to the question:" *What would You prefer if you could choose*?" and to the question:" Do crisis phenomena and instability in the country have an impact on your work? »

Source: Rozhkova, L., Vlazneva, S., Salnikova, O., & Dubina, A. (2019). Sociocultural Potential of Modern Youth in Russian Cities. Proceedings of the 1st International Scientific Practical Conference "The Individual and Society in the Modern Geopolitical Environment" (ISMGE 2019). doi:10.2991/ismge-19.2019.116

Research in 2018 shows that today's young people are more likely to think about creating their own business: 20.86 % of young people in the Volga region (Penza, Saratov regions, the Republic of Mordovia). In 2010, according to research by F. E. Gorshkov, this figure was 4.8 % among young people aged 18 to years. There are also significant differences among the young people of the Volga region in their orientation to create their own business with certain opportunities and actually built a business. So, if the Crimean youth often dreams of opening their own business, the youth of the Volga region often already creates it.

Fig. 4 - Distribution of answers to the question: "What is Your attitude to creating your own business?"(in % of the number of respondents for each study)

Source: Dubina A. Sociocultural orientations of modern industrial workers/ / Sociology and society: social inequality and social justice Materials of the V all-Russian sociological Congress. Russian society of sociologists. 2016. P. 39-3947.

Considering the external factors that influence the entrepreneurial attitudes of modern youth, we should highlight the impact of the current socio-economic situation in the country (figure 3, figure 5). It is obvious that the crisis phenomena have a negative impact on the attitude of modern youth to creating their own business. The uncertainty of the economic situation acts as a primary factor that constrains the functioning of modern business (Filimonova, et al, 2016).

According to the research, the need of young people for stable pay increases in the conditions of the crisis. In a situation of tension and crisis, 28 % of young people would like to have a stable salary and 27 % a large salary without guarantees for the future. In a situation where young people view the current situation in the country as catastrophic, young people are more likely to want high wages and less likely to receive less, but guaranteed, pay. When summing up the responses of respondents who assess the situation as a crisis and a disaster, it turned out that 29.96 % of respondents would like a stable salary, and 36.99 % would like to work hard and earn well, even without guarantees for the future. The data is shown in figure 5.

Fig. 5: Distribution of respondents 'responses to the question:" What would You prefer if you could choose?" and to the question:" How can you assess the socio-economic situation in the country (since the beginning of the currency crisis, anti-Russian sanctions)?''

Source: Dubina A. sh. Sociocultural orientations of modern industrial workers/ / Sociology and society: social inequality and social justice Materials of the V all-Russian sociological Congress. Russian society of sociologists. 2016. P. 39-3947.

The socio-economic crisis in the country has a great impact on the labor attitudes of young people, which have an impact on the formation of human capital (Gnatuk and Pechkurov, 2016).. So, among the students who noted the presence of crisis phenomena in modern society, there are more those who would like to have an interesting and non-physically and mentally tiring job, where there is a lot of time for other activities. For young people who assess the current socio-economic situation in the country as normal, calm, interesting, prestigious work with career opportunities is more important (Rajskaya et al, 2019).

It is significant that the worse the youth assesses the current situation in the country, the less significant the work that benefits people is for them, and the work with good pay comes to the fore (Fig.6).

Taking into account the growing trends of the digital economy in the country, young people are becoming a priority in the management of a digital enterprise (Vasin, et al, 2019). Due to the need to attract mobile, fast-adapting employees, create and distribute digital competencies of the employee, develop and implement appropriate motivation programs, and ensure involvement in the process of change, it is the younger generation that best reflects all these requirements (Gamidullaeva, 2019).

If You could choose, which job would you prefer? (multiple answers)	How can you assess the socio-economic situation in the country (since the beginning of the currency crisis, anti-Russian sanctions)?		
	The situation is normal, calm, n=213	The situation is tense, crisis, n=497	The situation is catastrophic, n=44
Interesting, creative	43,71%	49,43%	54,79%
Prestigious	31,74%	21,71%	20,55%
That benefits society and people	24,55%	16,29%	15,07%
Does not cause mental or physical fatigue	7,78%	9,43%	13,70%
With good working conditions	26,35%	29,43%	28,77%
Working with career and professional growth	38,32%	32,57%	28,77%
High-paying	42,51%	51,71%	47,95%
With social benefits and guarantees	13,17%	11,71%	13,70%
With good relationships in the team	21,56%	17,43%	20,55%
With free time for other activities (leisure, family, study)	13,77%	18%	20,55%
Other	3,59%	2%	1,37%

Fig. 6: Preferences of young people in choosing a job depending on the assessment of the socio-economic situation in the country (in % of the number of respondents, n=754

Source: Rozhkova L. V. Sociocultural features of the social potential of youth / L. V. Rozhkova, A. sh. Dubina, I. A. Golubev/ / SEARCH: Politics. Civics. Art. Sociology. Culture. 2018. No. 3 (68). Pp. 88-99.

Thus, irreversible crisis phenomena are taking place in all spheres of our society's life. Including in the sphere of labor, which leads to the transformation of its values and life attitudes that have a direct impact on the formation of the country's human capital. Research clearly shows the close relationship of values and value orientations of modern youth with the crisis phenomena occurring in modern Russian society (Gamidullaeva and Tolstykh, 2019).

Conclusion

Digitalization, being the basis of socio-political and economic stability of the country, leads to optimization of management processes, improvement and increase of transparency of political processes, increase of efficiency and competitiveness in all sectors of the economy, provides creation of high-performance jobs, contributes to the development of social infrastructure and preservation of the environment (Tolstykh, et al, 2018).

Describing the process of transition to the digital economy of our country based on modern realities, it should be noted that Russian able-bodied youth are not involved in most of the current economic and business processes in the country. Moreover, there is a reduction in the working-age population. Most of the territory of the Russian Federation has a significant resource potential
the potential demonstrates a very small labor potential due to the low population density in the North-Western, southern, Volga, Ural, Siberian, and far Eastern Federal districts (Ershova, et al, 2016).

As a solution to these problems, it is necessary to create conditions for the maximum attraction of available human resources and, if possible, to include individuals who are not employed in the economy and who are able to work in the labor process. Work with human resources should be carefully planned and systematized at the level of state policy (Ershova, et al, 2016).

At present, irreversible changes are taking place in all spheres of life in our society. Including in the field of labor, which leads to the transformation of its values. Research clearly shows the close

relationship between the values and value orientations of modern youth and the transformations taking place in modern Russian society.

According to the study, more than half of the respondents rate the current socio-economic situation in the country as tense. At the same time, the higher such negative ratings are, the more significant the values of material well-being and health become for young people. In addition, studies have shown that the crisis and instability in the country and the region have a greater impact on the labor plans of young people and educational strategies than on their political orientation and political activity.

Since one of the most important basic values of young people as the most active and able-bodied population is material stability, employees should ensure constant growth and continuous development of employees of the organization, work on organizational culture and creating a comfortable psychological climate in the team.

Naturally, the state and enterprises will need to invest in human capital, which is the main catalyst for economic growth. Human potential cannot develop without high-quality state support, and, on the contrary, in modern conditions, the state cannot function without the full use of human capital.

Today's young people have significant potential, which is not being used very effectively at the moment. Such qualities of youth as mobility, initiative, susceptibility to innovative changes, technological innovations, and the ability to find adequate responses to social challenges were not fully disclosed. The realization of the interests and satisfaction of the needs of young people largely depends on the specific policies and actions of the authorities, not only at the national level, but also at the level of regions and municipalities. Youth policy acts as a tool for social design.

In line with the influence of youth policy on the formation value orientations of young generation need regular spiritual and moral work by education and socialisation, consolidation and cohesion of young people, all groups of society based on patriotism and citizenship, promoting the principles of social justice and ethics.

Abstract

The article is devoted to the actual modern problem, namely, establishment of a new formation in educational institutions, the University 4.0 that will serve as bases for technology and innovation development. Authors associate this concept with the digital transformation of the economy. Article contains an analysis of this educational formation in the articles of Russian authors. As a result, were described the main directions in the transition to University 4.0 model.

Introduction

The Fourth industrial revolution is rapidly changing the world around us. One of the current trends is the transition to Industry 4.0 and digital transformation. Among the priority areas, the authors of the Strategy of scientific and technological development of Russia until 2035 highlighted digital production technologies, development of systems capable of processing large volumes of data, artificial intelligence and machine learning. With the Order from July 28, 2017, No. 1632-r the Government of the Russian Federation approved the program “The Digital Economy of the Russian Federation”. It defines the goals, objectives, directions and timing of the implementation of the main measures of the state policy to create the necessary conditions for the development of the digital economy in Russia, in which digital data are a key factor of production in all spheres of social and economic activity.

Notoriously, the digital economy is an economy based on the production and use of digital technologies. The transition to Industry 4.0 implies a change in trends in future professions. Companies will need specialists such as Project Manager, Technical Leader, Systems Technologist and Technical Coordinator, that is, trained advanced skills capable of working in an increasingly international environment, to solve the problem of introducing incentive technologies into new production processes, integrating technical and management skills that are critical to production in the future. Therefore, the

task of universities is to train such specialists. For example, Polytechnic University of Turin already offers new master's degree programs organized in close cooperation with leading companies such as: Avio Aero, Comau, Inpeco, Magneti Marelli, Prima Industrie, SKF and Petronas.

Analysis

The first question that comes up in our study is the analysis of the concept of "University 4.0." E. B. Kuznetsov, A. A. Engovatov (2016) in their work indicate that there is no single model allowing to divide the levels of development of universities. The authors propose the classification of universities according to the importance of the value added they form. According to the proposed parameter, a typical example of "University 3.0" is Stanford, whose graduates are such companies as Hewlett-Packard, Yahoo, Google. The annual revenue of the companies created by the university is $2.7 billion.

After analysing a number of studies, it can be concluded that the authors propose to consider the change of "location" of the university relative to several parameters.

V. S. Efimov, A. V. Lapteva (2016) propose to analyze "universities" regarding the following components:

• activity

• social

• anthropological.

In the transition to phase 4.0, the following characteristics are realized:

In activity content: teaching becomes the realization of participation in the creation of virtual realities and immersion in them, participation in the creation of the basis of new practices. New methods and technologies are in place. The student becomes the creator of his new reality.

In social content: the new university is pouring into the surrounding society, becoming one of the basic social institutions. The university is being integrated with society, and the university is becoming a platform for the emergence and existence of various collective intelligence.

In anthropological content: the role of professor and student is united, they become subjects of search, trial activities.

Thus, the key technologies of the new university 4.0 become cognitive technologies, there is an increase in intelligence through the use of IT-technologies. In addition to using these technologies, the university itself becomes a manufacturer and distributor of cognitive technologies.

Neborsky E.V. (2017) proposes to compare university formats according to the following set of parameters:

• requirement of society

• customer

• purpose

• axiological basis

• key category (categories)

• external reviewer

• features of the organization

•p of the educational process

• form of education

• disciplinary kernel

• criterion at "exit".

The author points out the following characteristics of Formation 4.0: analysis of global and local problems, the goal of the new university is the development of the noosphere and individual ecosystems of society, the main categories are creativity, ecosystem, and business. The main criteria, the indicator of work is the creation of a viable product, the contribution to the development of the ecosystem of society, which should contribute to the abolition of the existing formal system of assessment.

The prospect is the use of digital platforms, the use of adapted applications and analytical resources, so-called Learning on Demand. Not only the form of the representation, but also the content will change: theoretical knowledge will be replaced by analytical knowledge.

A similar approach to the analysis of the format "University 4.0" is seen by S.V. Titov in the work "Basic provisions and prospects for the development of the concept" University 4.0. "

It is also envisaged to change the methods of training. The popularity of learning methods such as SCALE-UP is growing, and institutions such as North Carolina State University are enjoying this practice.

- Teaching transformed – how should human teachers focus their efforts if AI and other technologies become used to their full potential in the university experience?
- Personalised adaptive learning – an individualised approach that takes learner diversity, performance and behavior into account.
- Assessment re-imagined – can AI, digital experiential learning and micro-credentials replace high stakes summative tests?
- Intelligent digital and physical estates – this concept is responsive to student journeys and interactions, helping universities deliver efficiencies and a smart approach to campus design.

Distance education experience at Penza State University

PSU has implemented the distance learning technology since 1996. The Center of Distance Education (CDE) is a university's department in charge of distance learning programs administration.

The next step was the development of blended learning programs for a number of higher education programs starting from 2001. The technology included a limited number of face-to face classroom lessons and face-to face tests and examinations with the increased time for independent work of students. To equip students with everything necessary for independent work the learning content was initially issued on CDs / DVDs sent to them, and since 2006 it has been placed in LMS Moodle on the CDE's server. The LMS Moodle has been used to display students' results and counseling since 2006. The CDE has been granted some functions of dean's office to administer distance-learning programs of higher education (Mkrttchian, et al., 2019).

Now PSU uses distance learning programs completely or partially for advanced studies and training of public employees and business managers, university professors and teachers, and a number of other programs. In most cases, LMS Moodle is used to conduct distance learning. For videoconferencing, taking into account the need to optimize the demand on the PSU's Internet channel, the university rents videoconferencing services from an external data center.

In previous research the authors identified two main processes in the case of Penza State University (PSU): development of distance learning and digitalization of training that are represented now at almost every academic university (Mkrttchian, et al., 2019). The authors considered theoretical and practical aspects of the university's transition to level 3 of Distance Learning / Digitalization of traditional training. In these conditions, it is important to improve the university's administration of the educational process concerning the Electronic informational educational environment (EIEE) and to comprehensively implement distance learning, as well as enhance management of external courses

(MOOC etc.). Accumulation of detailed information in the Electronic informational educational environment about current learning outcomes creates opportunities for emerging trends, such as data analysis using Big Data and Machine Learning technologies (Mkrttchian, et al., 2019).

Big data analysis and analytics help user organizations get value in the form of more numerous and accurate business insights. Similarly, universities can get value with Big Data analytics, - one gets a host of new possibilities ranging from new ways of providing students with basic support to new ways of getting students to learn what the faculty needs them to learn. Furthermore, the rapid advancement of big data analytics make it necessary for any university to coincide it with their management and measurement (Mkrttchian, et al., 2019).

Results

As a result, there is a need to build a plan for the transition to University 4.0. Such a transition involves not just changing the name, but changing the status of the university. University 4.0 should have the following trends (Figure 1).

Figure 1: Main trends of University 4.0

From the positions put forward, the perspective was laid within the framework of the National Technology Initiative project.

STI is initially built as a broad coalition action involving the formation of project groups of technology entrepreneurs, representatives of leading universities and research centers, major business associations of Russia, development institutions, expert and professional communities, as well as interested executive bodies. One of the directions of STI work is the educational program of STI University "20.35." (https://2035.university/). University 20.35 is the first university in Russia providing

opportunities for professional development by creating individual educational trajectories and tracking digital skill profiles.

Advancement along the intended STI University "20.35" trajectory implies the planned goal of University 4.0.

According to this concept, it is necessary to organize the transition from the existing program to the development of a student's educational trajectory: the student receives a diploma based on the development of a certain standard (GEF), while he can be actively involved in research and development, undergo practical training at enterprises.

The target is the following educational path: the student receives education on the basis of digital interaction with a network of enterprises, which helps to form professional competencies based on the use of their resources. Such an arrangement of the educational trajectory will make it possible to bridge the gap between the requirements and expectations of modern enterprises and the level, content of graduates' professional competencies formed as a result of training.

The result of this transition should be a flexible digital environment that provides the opportunity to combine training and the formation of professional competencies based on organizations of production practices. As part of working in such an environment, online training will be available, organized in cooperation with international experts in the mastered professional field. It is also possible to organize international project activities, where a combination of professional competencies of each participant will be organized.

In K.G. Razumovsky Moscow State University of Technologies and Management (FCU) has been implementing comprehensive graduation qualification projects for several years, work on which is carried out by a design team of students of various directions and training profiles. The implementation of such a comprehensive graduation qualification work is carried out by order of the leading enterprise in the region. Students of various specialties have the opportunity to complete their educational trajectory based on the application of professional skills that are in demand for a real project proposed by a potential employer.

Conclusion

In this study, the authors raise an urgent problem that arises during the transition to Industry 4.0 - the modernization of the existing formation of the university, University 4.0. The analysis of approaches to the description of this concept in the works of domestic authors. Several directions for such a transition are proposed. The national project of the National Technology Initiative is seen as a platform for transition to University 4.0. In K.G. Razumovsky Moscow State University of Technologies and Management (FCU) is implemented through comprehensive graduation qualification work one of the areas of development proposed by this program is interdisciplinary project teams.

Innovativeness and Innovation Management in Health Service Units

Agnieszka STRZELECKA

Czestochowa University of Technology, Czestochowa, Poland
astrzelecka@poczta.onet.pl

Abstract

Innovativeness is of key importance for any health care organisation in order for it to maintain a competitive position in the medical service market. The implementation and proper management of medical innovations are perceived to be indispensable in the operation of health care entities, which are places where new solutions are implemented in medicine. The purpose of this paper is to show the importance of innovations in health care entities, the approaches and aspects involved in management innovation, as well as highlighting the significance of standardisation in the management process. Health care entities, which are often treated as *sui generis* companies, often require the use of different forms of innovation management to improve productivity and contribute to the change of hitherto activities. This includes the application of communication and information technologies, which is of critical importance in creating the possibility of using new and effective solutions in health service provision.

Keywords: Innovations in Health Care Organisations, Management Innovation, Standardisation

Introduction

Provision of health benefits, as a service offered to consumers by organisations, frequently implements innovative solutions, although they may not always bring the expected effects. Both decision makers and payers, striving to improve overall quality and the quality to price ratio in health care, must pay significant attention to barriers to innovations and the possibilities of applying specific inventions to obtain expected results.

Hospitals are the primary place where innovative solutions, as pertaining to innovative medications, are first introduced. These solutions are the result of innovations in laboratory medicine which, to a significant degree, contributes to the growth of innovative activity in medicine. Yet in spite of the fact that it is a crucial component in advancing health care, it is typically not considered an essential element in achieving expected benefits (effects). The cause of such state of affairs is the often insufficient evidence showing positive relationships between results of laboratory studies and improvements in clinical benefit.

On account of the fact that medical innovations (inventions – in the technical and bio-pharmacological sense) are usually "verified" and implemented in hospitals and clinics, these health care entities or organisations often serve the role of research centres in the health care sector. Furthermore, such health care entities provide comprehensive medical services, the quality (level) of which depends on implementation of new solutions. Both aspects contribute to the fact that the operations of hospitals are often perceived to be based on technological and bio-technological options, or analysed in reference to the introduction of IT systems. It is without a doubt that a significant position must be attributed to new communication and information technologies within hospitals, which offer benefits both to patients and health care systems, as well as society in general. This is because information and communications technology (ICT) offers better management of health resources, may improve safety of patients and reinforce reciprocal relations between the service provider and the service recipient [Dymyt and Dymyt, 2018; Gledic et al., 2011]. Apart from this, application of any type of digital innovation is of major importance in the monitoring of patients' health and in the overall operation of health care facilities [Kozak, Goral and Danioł, 2018]. Their implementation has allowed for the rapid development of e-health, tele-health or m-health,

which are related to the use of state-of-the-art information and communication technologies to connect all actors of the health care market (doctors, health care institutions and patients) [Furmankiewicz, Sołtysik-Piorunkiewicz and Ziuziański, 2016; Botrugno, 2018].

Irrespective of the fact of how a given health care centre operates, every organisation requires proper management. This is especially significant in the case of preparing and introducing new solutions in hospitals, particularly because innovation management is material for the development of these facilities. Innovation management helps deliver the newest ideas in management and practices, which emerge from search processes and are introduced via various forms of organisational changes [Birkinshaw, Hamel and Mol, 2008]. Furthermore, such processes are becoming more frequently adjusted to individual persons, groups or entities. Management consultants act to help implement innovation management as they are well prepared to go beyond organisational inertia and break existing standards. Thus, innovative management consultants are critical in helping prepare and implement "new" solutions.

The author of this paper has adopted the stance that while introduction of new solutions allows for streamlining and improving medical processes, with innovation management involving the participation of consultants, it does not fully exclude existing standardized operations in health care entities.

The purpose of this paper was to present some of the issues involved in the implementation of medical innovations in health care organisations. This includes information related to innovations in a hospital as a health unit, which is both 'recipient' of innovation and supplier of comprehensive services in the health care system. The importance of information and communication technologies in health care entities has been discussed as ICTs support transfer of information in innovative solutions. The role of consultants in the innovation management process is also mentioned. In addition, management innovation has been characterized with respect to standardisation, with a discussion on the differences and intersection between standardisation and innovation.

The author of this paper has drawn examples of innovations in health care systems from published peer-reviewed medical literature as well as websites. The discussion relies on reference books and the analysis is supplemented with the author's remarks.

Innovation In Health Care Units

Medical innovations, which encompass introduction and/or development of tangible and intangible technological innovations or application of new solutions in treatment processes, may be examined as [Djellal and Gallouy, 2007]:

1. Bio-medical innovations or bio-pharmacological innovations (i.e. new medications, new chemical or pharmaceutical substances, etc.)
2. Tangible medical innovations (introduction of technologies and technical systems, which rely on investment goods and various types of technical devices used to ensure care, i.e. for diagnostic or therapeutic purposes)
3. Intangible values of medical innovations (treatment charts, diagnostic or therapeutic strategies, etc.).

Jończyk proposes another division of innovations. According to her, innovations in health care may be divided as follows [Jończyk, 2013]:

1. Organisational innovations: all attempts at modernising the organisation and operation of non-medical divisions of a health care facility, creation of new units to prepare or take responsibility for supply of catering services, accommodation, management, etc. Furthermore, they refer to any innovations, which take place next to a health care organisation, e.g. creation of new types of clinics, reorganisation of administrative and logistic divisions, assessment of health care quality, organisation of work time, etc.

2. Managerial innovations: new techniques and methods of management, including new accounting and financial techniques and procedures, new management methods
3. Relations or service innovations: all innovations affecting the nature of relations between service providers and service recipients, along with families, such as: improvement of quality of places of stay of patients, management of patient flows, shortened waiting times, accommodation for families of patients, etc.
4. Social innovations: processes based on social negotiations and formal and informal compromise leading to changes in the provisions pertaining to coordination and motivation, as well as development of programmes improving employees' condition and conditions of work
5. Innovations in external relations: new, more or less complex forms (depending on the number of engaged entities) of individual relations with customers, suppliers, public authorities, various organisations, etc. They refer to the relationships among partners with respect to the joint use of heavy equipment (medical or logistic equipment), joint purchases of such equipment, as well as mergers of hospitals and sale of services with other hospitals, companies or organisations in other sectors. The scope of services may encompass areas such as: catering, laundry services, logistic services, trainings, counselling, lease of premises for conferences or cultural activities, etc.

In health care organisations, medical innovations are renewed very quickly or replaced by newer solutions of the same problem. For example, invasive tests are often replaced by non-invasive ones, methods using radiation are replaced with methods that do not make use of it and standard surgical procedures are substituted by therapeutic techniques based on interventional radiology. These new solutions are frequently added to the group of existing diagnostic and therapeutic methods; it may thus be claimed that in practice, the life cycle of medical innovations is relatively long [Djellal and Gallouy, 2007].

Laboratory medicine is an area that provides innovative solutions to allow for the improvement of already existing possibilities or the provision of new services (or services on a higher level). Innovative solutions in this area are created around the framework of so-called *Evidence-Based Medicine*, which takes into account clinical teams and financial solutions and management aspects in a given organisation. It is a tool for the further development of modern medical laboratory diagnostics, also in Poland [Naskalski, 2010]. The innovation process may be managed in line with the needs of all stakeholders. The key to achieving success in this area includes determination of unsatisfied clinical needs, awareness of the path of medical care, procuring evidence of clinical and cost efficiency along with successful implementation, which takes into account changes occurring in processes, proper management of resources and monitoring of results. Familiarity with the course of the health care path is a decisive element because it shows how medical tests may be used and which decisions in a given medical case may be made with respect to the use of a test result, i.e. whether it is helpful in screen tests, diagnostics and/or when monitoring treatment [Desmond and Desmond, 2016].

Examples of innovations in laboratory medicine include invention of new bio-markers, performance of genetic tests, preparation of new analytical methods, automation, as well as determination of the manner in which the received results and the knowledge related to them will be delivered to the entities interested in the inventions. An indisputable benefit for the consumer of medical services is the development of the laboratory test technique called *point-of-care testing* (POCT). In this case, various technological [St John and Price, 2014] solutions are proposed during the performance of medical tests, in which the possibility of immediately receiving results may lead to radical changes in health care provision, in relation to the place of service provision, the service provider and the patient's participation in tests [Vashist, 2017]. However, there is a certain risk related to the costs of test performance. Such costs may grow (and this usually happens) as a result of the potential necessity of confirming the correctness of POCT in a central laboratory [Luppa et al., 2011.

However, it is to be noted that the function of innovations in the medical care sector is very often reduced to the introduction of *New Information and Communication Technologies (NICT*). In many studies, a hospital is described as a system of information, whereas innovations in hospitals are analysed with respect to information paradigms i.e. the digitisation of hospitals where integrated IT

systems are used to an increasing degree. In medical care, medical technologies are applied in every form of care for the patient, namely at the start of treatment, during a diagnosis, in the process of treatment and in the course of monitoring. These technologies may be divided into: hybrid medical technologies that combine NICT with other technological elements (robotics, transport, etc.) and NICT which facilitate the receipt of health care services [Jończyk, 2013]. The first group most often includes computer-assisted diagnoses, treatment monitoring and diagnostic equipment automation. The second one, applied much more frequently now, is a form of providing services remotely, which contributes to improved access to offered health care services, reduces the number of unnecessary visits at health care facilities or allows for quicker and more convenient use of specialist services [Nieszporska, 2012; Agomo, 2019; Devanbu, Nirupama and Taneja, 2019]. This is accompanied by introduction of organisational and technological innovations related, in particular, to telecommunications.

In medical facilities, ICT is used for better (quicker) flow of information among entities providing health services, more efficient information management or reduction of undesirable events. All of the proposed and applied solutions are aimed at increasing the level of health services, improving patient safety and raising the quality of servicing recipients by service providers. This may be accomplished by the introduction of electronic data exchange standards, which help the physician in deciding on a patient's treatment based on current medical information [Omboni, Caserini and Coronetti, 2016].

The currently existing standards with respect to the use of IT in the health care sector do not help health care facilities in creating a network that enables exchange of information among health care establishments. Modern technologies are often so complex that they do not find recipients among hospital personnel or outpatient clinics. In consideration of the existing difficulties in communication among health care units, the *Health Level Seven* (HL7) standard was set up, which is aimed at the management and integration of electronic information pertaining to health care [Strzelecka, 2018; Noumeir, 2019].

Summing up the discussion above, any innovation in health care services requires not only new IT tools, but is primarily aimed at improving the quality of services for service recipients or increasing their safety. Nevertheless, whilst analysing innovation in hospitals, three points of view should be considered: introduction of medical technology or a system of information by senior medical staff and hospital managers, providing medical and non-medical services (accommodation, catering, management, logistics, laundry, transportation, etc.), as well as the skilful adjustment to quickly changing environments.

Innovation Management in the Context of Standardisation – Short Considerations

In innovation management, groups of stakeholders are internally diversified, as they bring together various persons/entities who are related to the provision of patient care, which includes the preparation and implementation of technological solutions during care. On account of cooperation among stakeholders and their individual expectations with respect to innovations, certain tensions may appear among these units.

In this situation, the practical approach to satisfying the desires of all stakeholders is the assessment of service performance through the prism of quality improvement and changes introduced in the health care system. These changes affect health outcomes, evolution of the health care system or use of resources related to achieving the results. All innovations affect the relationship between the service recipient and the service provider, as they change the interaction between some health care entities and processes involved in the care [Freed et al., 2018].

Health protection nourishes a common belief that an innovation holds the possibility of capturing three dimensions of health care, namely the product, the process and the organisation. Taking these three aspects into account in any innovation makes it a successful determining factor for a company, as it may help clarify operations in an organisation. However, one should not overlook another

important issue: innovation barriers, e.g. lack of knowledge about the priorities in health care, lack of engagement of all interested parties when considering introduction of a new solution, necessity of taking various aspects of health care into account in the decision making processes and planning implementation [Price, 2014]. In other words, failures during the performance of new activities may result from a low of level of organisation, communication and access to information, incorrect knowledge and employee management, lack of proper leadership and the performance of inadequate activities in reference to badly set (or baldy formulated) goals. Furthermore, the main causes of innovation failure in health care are social insurance programmes that focus more on the quantity of delivered care rather than its value, as well as insufficient information with respect to the quality of provided health care services [Cutler, 2011].

As part of innovation in health care units (often compared to enterprises), consideration of two aspects is of essence, namely innovation and standardisation. They are often juxtaposed, because innovation is creation, discovery and implementation of new ideas and methods, which may contest or replace current models of behaviour and actions, whereas standards and normalisation refer to principles that pertain to similarities, uniformity and continuity of such paradigms. Therefore, it may be said that innovation primarily refers to novelty and diversity, whereas standardisation introduces order in operation or structure and offers a potential for efficiency improvement by determining certain standards of operation, simplification of already applied solutions and greater attention to costs. However, it cannot be claimed that standardisation is not conducive to new solutions. It may offer numerous benefits in the area of innovations by creating common languages (e.g. programming, understanding), methods of study or introduction of gradual improvements based on prior experiences. Consequently, a certain form of creativity seems to be necessary in both cases, as persons introducing new ideas or actions constantly have to clarify them [Ansari, Fiss and Zajac, 2010]. What is more, whilst introducing new solutions, most probably more loose organisational structures are necessary with a distanced approach to standardisation. In other words, organisations (e.g. health care), in order to operate efficiently, have to use both existing knowledge and the potential that they have, as well as having the possibility of discovering or creating new knowledge. It must, however, be emphasised that even though the sole fact of innovation implementation may cause adversity among employees (i.e. persons may perceive introduction of innovations as an attempt to control their work, or result in loss of the unit's identity), whereas innovation management may be understood as a "lack of understanding for prior solutions" [Birkinshaw, Hamel and Mol, 2008], yet forms of innovation management are common techniques for the improvement of productivity and they contribute to the change of hitherto activities. However, it must be remembered that not all elements are always bad and necessarily require changes.

Given the fact that the approach to innovations may be subjective, it is necessary to rely on standardisation during their implementation, at least at the beginning. This happens because while new solutions may be well known on a general level, they may be new and inspiring for a given manager or organisation and may be locally perceived as radical innovations [Mol and Birkinshaw, 2009].

Taking the above into account, innovation management and standardisation should be viewed from various perspectives, namely: the perspective of possible conflicts between innovation management and standardisation (e.g. innovation management delivers new non-standard solutions and is thwarted by standardisation), maintenance of relationships between innovation management and standardisation (e.g. innovation management is supported by standardisation, on which diffusion and implementation depends) and ambivalent relationships between innovation management and standardisation (e.g. innovation management is subjective).

Taking the above analysis into account, use of consultancy services is recommended during the promotion, distribution and implementation of new organisational practices. They are meant to help customers of organisations (patients, physicians) during the implementation of changes, exhibit a higher level of standardisation of activities (including medical) and promote and clarify new ideas and methods of management. A consultant's role is very important because medical companies introducing new technologies, programmes or medications are looking for new and larger orders,

expect better market knowledge (internal and external) and supervision of the operation of organisations. Due to this, consultants often customize solutions to their clients in order to overcome the ostensible contradiction between innovation in medicine and standardisation and control of programmes and methods [Styhre et al., 2010].

Summary and Conclusions

All innovations should be used to meet the needs of patients and persons engaged in patient care. New solutions are mainly created in laboratories, so one may risk claiming that laboratory services drive innovations, where new solutions are deemed to be so-called breakthrough innovations.

The situation is slightly different in hospitals, which often focus on cooperation with one another rather than competing for service recipients as it is important that the applied innovations offer benefits for patients. Also due to this, innovation in hospitals is primarily examined from two points of view: 1) as a set of technical and bio-pharmacological possibilities and 2) an IT system. This happens because medical and IT innovations are tangible and often spectacular. Furthermore, application of modern technologies makes a hospital a "showpiece" of health care and testifies to the degree of modernity and enhances the level of competence of technicians, physicians, nurses, etc. Apart from this, application of ICT plays a significant role in the management of health care units, e.g. by improving communication among parties in the market of health care services and monitoring of treatment results and the costs of an organisation. Therefore, it is necessary that persons who work in hospitals (physicians, directors, managers) take various innovations and entities participating in them into account. Inclusion of all persons and organisational forms in innovative activities of a hospital contributes to improvement of services, economic efficiency and advances the "production" and the financial standing of the overall health care unit.

When analysing the flow of information in health care, it may be concluded that application of ICT in health care plays a vital role in the management of health care establishments, e.g. by improving communication between the parties of the market of health care services and monitoring the results of treatment and the costs of an organisation. Here, tele-health plays a special role, which allows for establishing and/or maintaining relationships among actors in the market of medical services. Existence of this type of inter-dependence facilitates access to health services or improves their quality (e.g. application of portable devices monitoring a patient's condition, performing remote rehabilitation with the use of ICT or the use of robots in surgery).

Whilst analysing innovation management processes in organisations, it must be noted that it may be shaped both by standard programmes or methods, as well as result from conflicts or negotiations. On the other hand, application of standard methods contributes to the preparation of incremental innovations by delivering a methodology that allows for examining and changing (designing anew) the existing practice and behaviour.

In summary, innovative solutions designed and introduced in health care units are primarily aimed at creating new possibilities of providing health care services to improve their quality as well as increasing patient safety and satisfaction. Thus, innovations and inventions in health care, in spite of the fact that they require, as a rule, significant financial outlays, are a necessary element of satisfying the growing needs and expectations of health care consumers. Furthermore, implementation of new solutions testifies to the position of health care units and their "good" perception by potential patients. Also due to this, in order for units operating in the medical service market to survive, a proper approach to innovation management and standardisation is necessary. For this, creativity, the ability to adjust and the "modernity" of management consultants are necessary factors in the face of continually changing external environments, internal conditions and market challenges.

Abstract

Recent studies indicate that organizations have been looking for creative and innovative alternatives to position themselves in the market in a competitive way. Tourism has so far been one of the sectors that has most contributed to the development of the countries' economy and has shown the highest growth rates. Within the tourism sector, one of the fastest growing segments is events. The concepts of creative marketing, innovation and luxury applied in the context of tourist events, specifically in the luxury wedding market, arise in order to establish a dialogue between the areas of knowledge, enabling the construction of new knowledge and the adoption of new event practices, desired by contemporary clients. The aim of this manuscript is to present the relevance of creative marketing, innovation and luxury in the context of tourist events, with an emphasis on new wedding trends: destination weeding, elopement wedding and honeymoon glamping. In specific, this study intends to understand the relevance of creative marketing, innovation and luxury in the context of tourist events. In a preliminary perspective, a research model will be proposed by the study authors. In an interdisciplinary perspective, this study presents contributions to tourism, marketing and event management. At the end, guidelines for the future will be presented.

Keywords: Creative marketing, Innovation, Lux segment, Tourist events, Weddings market.

Introduction

Creativity, considered a skill, inherent in people, is linked to the process of having new, original ideas to be offered to the consumer, who each day seeks a greater number of innovative trends, of great value in the market. Creative marketing is a new theory, where customer and company together, through insights, use creativity, to develop innovative products / services proposals, which will meet the market's wants and needs (Sousa, Silva & Malheiro, 2020). The innovative proposals in this context, are understood as the recombination of old ideas, originating new ideas. Tourism characterized as a social phenomenon, which maintains interrelation with different sectors, is a multifaceted and geographically complex activity, which gives rise to new (and different) market segments with different individual interests (Sousa, Malheiro & Veloso, 2019). Tourism consumers choose a product or service according to the degree of correspondence with their tastes, interests and also taking into account the power to transform them (Machado et al., 2018).

The advancement of technology has changed consumer behavior. In an era marked by information and knowledge, it is imperative to create value and differentiate (Lages; Sousa & Azevedo, 2018). So there

are social luxury events, these, considered a lever for destinations, control seasonality, move the economy, generate direct and indirect jobs, spread the image of the places. The more creative, innovative and luxurious a social event is, the more fans it will acquire. Consequently, the consumption of luxury products and services has grown in recent decades, mainly due to the insertion of consumers from emerging countries in this segment and the emergence of the concept of "new luxury". When talking about luxury, the understanding was reduced to the meaning of power, ostentation, pleasures and waste (Wong & Ahuvia, 1998; Dall'Olmo Riley & Lacroix, 2003 Ferreira & Sousa, 2020). However, luxury is no longer limited to ostentation, and is seen through your senses and pleasure, being more closely related to sensations than to appearances (Kapferer & Bastien, 2008; Atwal & Williams, 2009).

Therefore, the innovations caused in the wedding market stand out, focusing on three luxurious events that have gained prominence today: destination wedding, elopement wedding and honeymoon glamping, these stimulate the consumption of experiences never lived by the consuming public. The objective of this article is to present the relevance of creative marketing, innovation and luxury in the context of tourist events, with an emphasis on new wedding trends: destination weeding, elopement wedding and honeymoon glamping. The theoretical basis was divided into 4 parts, the first being the approach to creative marketing actions and the creative marketing model was created for that; In the second chapter, it was about innovation and its contributions; in the third chapter, we approached tourist events showing how they can boost tourist destinations; and in the fourth chapter, it was about luxury events focusing on the wedding market, thus presenting three luxury events which are: destination wedding, wedding elopement and glamping for honeymoon.

Creative Marketing and Innovation

Creative Marketing

Creativity is a characteristic attribute of human beings, often valued by Western cultures. It is a multidimensional concept since it admits cognitive, environmental and personality variables (Becker et al, 2001; Pocinho & Garcês (2018)). It is a valuable resource that needs to be encouraged, especially at this moment in history, of intense competition and rapid and continuous changes. Changes that occur both at the social and cultural levels, as well as at the political, economic, scientific and technological levels (Bragança, Zaccaria, Giuliani & Pitomba, 2016). If in the past, organizations could respond to market needs almost always with the same formula, now they have to reinvent themselves to maintain their market value. Competition is no longer limited to a small number of similar companies. We currently compete against everyone. In this challenging context, creativity can play a key role for any organization that wants to assert itself or even survive. Organizations must have the capacity to produce innovation and be receptive to it, and people are essential in this process. It is people who are creative in problem solving, decision making, research and development of new products, services or work methods (Williams & Yang, 1999; Braia, Curral & Gomes, 2014)

Creativity is then understood as a set of knowledge that the individual often has unconsciously and appears in different ways, which can be relative, productive, negative or destructive. Relative creativity is one that generates a new idea for the person, but does not add to the existing collection. Productive creativity generates an idea that can be transformed into a really new product or process, producing a competitive advantage. Negative creativity is developed by people who have a very special ability to create obstacles and restrictions, demonstrating the infeasibility of new ideas proposed by others. It is important for the company to know that there are certain times when this conduct must be blocked and, in others, encouraged. Finally, destructive creativity is that used for socially undesirable actions, such as crimes (Vasconcellos, 2007 and Bragança, Zaccaria, Giuliani & Pitomba, 2016).

One of the basic principles that guide this type of marketing is the creation of ideas with the customer and not for him. Nowadays, customers are not only consumers, they are also creators, who develop content and ideas, so working with them allows the construction of a better and more targeted product. Other principles are: engaging in the customer experience from start to finish; treating all customers as if they were an extension of your team; measure the public's digital relationship with products; and

think like an entrepreneur. These are the foundations that define how creative marketing works. Marketeers currently have a more global and entrepreneurial vision, which promotes the creation of more efficient projects with better results (Buzzmedia, 2017; Peneda de Oliveira & Sousa, 2020). Creative marketing is about attracting something creative (original, different, innovative, humor, etc.) that leads to an awareness of the brand, company or self-branding (personal brand). The idea is that your study of possibilities has a focus on innovation and proposals that generate word of mouth (Limeira, 2017). With competition increasingly narrowing the differences between products, it is clear that originality is one of the strengths to be exploited by organizations that want to maintain a market share or increase it when they find an opportunity available before the competition (Menshhein, 2007).

In addition to fully meeting the wants and needs, it is up to the marketer to make products and services unique, different from everything the consumer already knows and even allow the customer to be part of the organization by involving him in the creative process. At certain times the greatest creativity is composed of a simple detail, practically imperceptible and that brings a lot of knowledge, vision and studies. The best and most creative ideas do not come out of nowhere, they are the result of hard work, dedication and effort. (Menshhein, 2007)

Innovation

Throughout history, innovation has been present in all phases of civilization, with events that have marked its evolution, in the most diverse fields of human activity and that have boosted the progress of society. (Bragança, Zaccaria, Giuliani & Pitomba, 2016). An innovation is the recombination of old ideas, giving rise to a new creative idea, capable of modifying the current order. (Bruno-Faria & Fonseca, 2014)

Innovation is a modest or revolutionary initiative, which appears as a novelty for the organization and the market and which, applied in practice, brings economic results to the company, whether they are linked to technology, management, processes or business model. (Simantob & Lippi, 2003; Mascarenhas Bisneto & Lins, 2016) "A marketing innovation is the implementation of a new marketing method with significant changes in the design of the product or its packaging, in the positioning of the product, in its promotion or in price fixing" (Oslo Manual, 2005; Mascarenhas Bisneto & Lins, 2016, p. 90). Innovation can be seen as a specific tool of entrepreneurs, the means with which exploit change as an opportunity for a different business or service, being able to be understood and, as such, to be practiced, leading to a common distinction between invention and innovation (Drucker, 1993). Almost all the innovations reflect existing knowledge, combined with new uses, suffering the concept of innovation as a shift towards emphasis on the interaction between institutions, focus on interactive for the creation, dissemination and sharing of knowledge and relevance of the role of government processes as an important actor in an innovative environment. It is important to clarify the difference between two concepts that, for different times, tend to be confused: Process Innovation and the Innovation Process. Innovation Process is essentially related to the set of steps that tend to incorporate both the market and technology. Companies have the ability to go seizing, building your knowledge base and thus make the continuous improvement of process management (Tidd, Bessant & Pavitt, 2003). Monitor the internal and external environment and analyze the relevant signals will be the starting point. After this, we have the decision about how to respond. Finally, we will implement the project with the development of technology and the domestic and foreign market (Sousa, 2014). The Process Innovation, by the way, combines the adoption of a process view of the organization's business with the application of innovation to key processes. This is the big difference, compared with the Innovation Process, but it allows us to understand its complexity. Process Innovation encompasses the prediction of new work strategies, the actual process activity and the implementation of change in their complex human, technological and organizational dimensions (Davenport, 1993).

For Bessant and Tidd (2009) innovation cannot be seen in isolation as an insight, but rather, as a process, a sequence of integrated activities where the company generates, selects and implements actions mentioning, including, that companies need to develop competencies little by little, through trial and error, as they are not yet created with the capacity to organize and manage the innovation process. Innovations can be classified in terms of incremental innovation or radical innovation. Incremental innovation explores the potential of established structures, improving the functional

capabilities of a technology or practice through small-scale improvements in its attributes, such as performance, safety, quality and cost. Radical innovation introduces new concepts that significantly break with past practices and allow the creation of products and processes based on different scientific and / or technological principles (Carayannis, Gonzalez and Wetter, 2003).

In a world where globalization has become a reality and where cities increasingly compete with each other for investment, turnover, revenue from tourism, media projection, events or even residents, in order to differentiate themselves , a more focused management for the city as a product becomes essential. (Sousa & Ribeiro, 2018) The realization of events is a beneficial measure in the context of city marketing. Cities see events as engines of development for city marketing in that they provide the city with opportunities for dynamization at the urban level (such as the construction of new infrastructures or the restructuring of existing ones), social, economic, institutional and even in the projection of city image, which stimulates the appearance of new investments and new visitors (Tseng et al., 2015; Sousa & Ribeiro, 2018)

The events segment has been consolidating itself as a prosperous market in the ranking of the tourist economy (Silva et al, 2016). Getz (2008) explains that one of the main objectives of investment in events is to highlight the city development and marketing plans in most destinations. Events entertain the local population, generate media, helping destinations to develop their confidence and a positive image in the tourist market (Yeoman, Robertson & Ali-Knigth, 2006; Mackay, Barbe, Van Winkle & Halpenny, 2017) .Special events have grown in the tourism industry as an indispensable alternative product for various destinations, working as generators of additional visits to the destination where a given event takes place (Dimanche, 2008; Rola, Malheiro & Sousa, 2018)

An event has as main attributes, the attraction and congregation of people, the intrinsic character of ephemerality, the relationship with leisure and free time, and the space-time selectivity in its realization. They are subdivided by types, since each type will have its own objective of achievement (Molina, 2016). Given the above, the focus of this research is on social events. These, understood as any meeting that allows interaction, fraternization and entertainment among the participants, have the characteristics of providing a favorable occasion for the meeting of people, gathering them around a specific objective that, simultaneously, constitutes its main theme and justifies the its realization. They are on a considerable scale of annual growth, as the types of ceremonies and gatherings have diversified and increased in number (Mota, Coelho, 2016).

Social events are part of a niche market, which needs articulate, creative and entrepreneurial spirit. The more creative and innovative a social event is, the more fans it will acquire, heating the economy, controlling seasonality in different spaces, which can range from a hotel to a tourist destination. Being creative is being able to transform something that already exists, giving originality to the product / service, making it unique, differentiated, never seen and that, in this way, will be able to attract curiosity and generate people's motivation and interest in to know it, making it desired (Britto & Fontes, 2002).

Within social events, creativity is important so that a worn event, with little demand, is desired and stimulates people's purchasing power. But it is important that in this transformation of the product / service, the customer can participate in the co-creation process with his insights, elaborating something that he really wants to consume. The closer to the unusual, the more real the customer experience can be. It is relevant to understand that a transformed product / service generates demand for a period of time; but as the market always needs to be heated, new ideas are emerging and new products / services are being recreated and innovated, so on, making the “cycle turn”.In view of this fact, the wedding market appears, which is innovated, recreated, to meet the expectations of customers who wish to live unique, innovative and luxury experiences, the focus of the next section.

Events and Lux Segment

Tourism Events

In a world where globalization has become a reality and where cities increasingly compete with each other for investment, turnover, revenue from tourism, media projection, events or even residents, in

order to differentiate themselves , a more focused management for the city as a product becomes essential. (Sousa & Ribeiro, 2018) The realization of events is a beneficial measure in the context of city marketing. Cities see events as engines of development for city marketing in that they provide the city with opportunities for dynamization at the urban level (such as the construction of new infrastructures or the restructuring of existing ones), social, economic, institutional and even in the projection of city image, which stimulates the appearance of new investments and new visitors (Tseng et al., 2015; Sousa & Ribeiro, 2018; Sousa & Rocha, 2019)

The events segment has been consolidating itself as a prosperous market in the ranking of the tourist economy (Silva et al, 2016). Getz (2008) explains that one of the main objectives of investment in events is to highlight the city development and marketing plans in most destinations. Events entertain the local population, generate media, helping destinations to develop their confidence and a positive image in the tourist market (Yeoman, Robertson & Ali-Knigth, 2006; Mackay, Barbe, Van Winkle & Halpenny, 2017) .Special events have grown in the tourism industry as an indispensable alternative product for various destinations, working as generators of additional visits to the destination where a given event takes place (Dimanche, 2008; Rola, Malheiro & Sousa, 2018)

An event has as main attributes, the attraction and congregation of people, the intrinsic character of ephemerality, the relationship with leisure and free time, and the space-time selectivity in its realization. They are subdivided by types, since each type will have its own objective of achievement (Molina, 2016). Given the above, the focus of this research is on social events. These, understood as any meeting that allows interaction, fraternization and entertainment among the participants, have the characteristics of providing a favorable occasion for the meeting of people, gathering them around a specific objective that, simultaneously, constitutes its main theme and justifies the its realization. They are on a considerable scale of annual growth, as the types of ceremonies and gatherings have diversified and increased in number (Mota, Coelho, 2016).

Social events are part of a niche market, which needs articulate, creative and entrepreneurial spirit. The more creative and innovative a social event is, the more fans it will acquire, heating the economy, controlling seasonality in different spaces, which can range from a hotel to a tourist destination. Being creative is being able to transform something that already exists, giving originality to the product / service, making it unique, differentiated, never seen and that, in this way, will be able to attract curiosity and generate people's motivation and interest in to know it, making it desired (Britto & Fontes, 2002).

Within social events, creativity is important so that a worn event, with little demand, is desired and stimulates people's purchasing power. But it is important that in this transformation of the product / service, the customer can participate in the co-creation process with his insights, elaborating something that he really wants to consume. The closer to the unusual, the more real the customer experience can be. It is relevant to understand that a transformed product / service generates demand for a period of time; but as the market always needs to be heated, new ideas are emerging and new products / services are being recreated and innovated, so on, making the “cycle turn”.

In view of this fact, the wedding market appears, which is innovated, recreated, to meet the expectations of customers who wish to live unique, innovative and luxury experiences, the focus of the next section.

Luxury in Tourist Events

When dealing with luxury, the vast majority of available literature, supports the idea of ostentation, comfort, beauty, refinement and a sumptuous lifestyle. Its connection to an object supposedly of superior quality is associated with social codes and behaviors related to pleasure and refinement (Mangorrinha, 2014, p. 118). For Galhanone (2005), as an example, the definition of luxury goes through something exclusive, little accessible to many people (and inaccessible to others), thus preserving its (apparent) exclusivity.

It was agreed to call luxury within marketing and management, all that product or service with quality, aesthetics, price and brand image superior to the conventional ones. (Ko, Phau & Aiello, 2016; Scussel & Demo, 2019). In the luxury fashion brand segment, value creation is associated with the development

of strong bonds with consumers through unique interactions, based on cognitive and emotional aspects (Choi, Ko & Kim, 2016; Scussel & Demo, 2019) . This means that the assessments of luxury consumers are created from their perceptions, especially those related to the quality of service, the anticipation of their needs and experiences (Kim et al, 2016; Scussel & Demo, 2019.).

If luxury is commonly associated with exclusive objects and price, it is understood, however, that it must go beyond this: in detail, in the message, in meeting the needs of the consumer, in satisfaction, in magic, in the empowerment of ecological values, increasingly considered, in short, in the unique experience (Okonkwo, 2016). Luxury goods represent values for individuals, luxury products correspond to the expression of human desires and emotions, it is said that, for through these, one can learn a little about the values, beliefs and attitudes of the individuals who consume it (Lipotetsky & Roux, 2008; Machado & Sousa, 2018).

The philosopher Lipovetsky (2007) defends a change in the status of luxury, initially it was related to the sense of accumulation and ostentation. Today, in the 21st century, there is a change in the meaning and motivations of luxury consumption for the field of the senses, i.e., the consumption of luxury products, is much more focused on experiences, emotions and pleasure.

In this context, the symbolic component is increasingly decisive in the choice of luxury products, becoming a differentiator, through the new present values, where the growth of environmental concern on the part of society is seen (Valente, 2008). In this scenario, contemporary luxury is surrounded by new values and appeals regarding environmental care, as well as social well-being. Companies have resorted to marketing strategies aimed at preserving the environment as a competitive variable. Given these aspects, luxury weddings grow and define the dynamics of this market, which expands every day.

What you see, are newlyweds leaving the traditional patterns and style of weddings, looking for unusual patterns and styles, where they can include their own characteristics in the details of the ceremony. These new values, linked to luxury events, make it possible to immerse a new concept of consumer, one who wants to live unique experiences, in different destinations. Then there are the luxury events that move the world's tourist destinations, they are: Destination Wedding, Elopement Wedding and Glamping for honeymoon, items that will be presented below.

Destination Wedding

The destination wedding is an English term that means, in this context, marriage in a tourist destination. It is considered a mini event, with few people being invited, being family and close friends. Which means that guests who wish to participate in the ceremony, will need to travel to the tourist destination chosen by the bride and groom.

There are three types of destination wedding, the first being the one where the bride and groom are from the same country, but want to have their wedding in another destination. The second type, the groom and the bride are from different countries and one of them will travel to the other's country for the wedding; and the third type, the groom and bride are from different countries but decide to get married in another country. In the three cases mentioned, the wedding may only be for the couple and a few guests as relatives and close friends, totaling approximately 20 people. (Lemos, 2018)

When we talk about these types of weddings, there are two types of financing involved. The first is that the bride and groom are responsible for the overhead costs of the wedding - in addition to the expenses of the wedding itself, it includes round trips and the guests' stay - a very personal issue that varies a lot from couple to couple, depending on everyone’s conditions. What can influence this scenario is to be able to form a package at the hotel of your choice, in which the wedding and accommodation for a certain number of guests encompass a single cost. The estimate is that a wedding for 200 people in the city of the bride and groom will have the same cost as a destination wedding for about 20 people, with the difference that these 20 guests will not simply attend a wedding, but an experience of 4 or 7 days. (Portugal, 2018)

The second is to be invited to pay for travel and accommodation. In this case, it is normal for the bride and groom to send the save the date in advance, so that the guests can go ahead to buy the dresses for the ceremony, air travel if necessary and accommodation. In this type of wedding, where the expenses will be for the guests, the chances of confirmation of presence are much less. This type is the least usual but it can happen. (Portugal, 2018)

The destinnation wedding market segment has a growing trend in much of the world and additionally brings to the country that develops it, a relevant number of new tourists, being a new way to promote national tourism. A Destination Wedding can represent a global revenue of more than € 50,000 considering the multiplier effect of the guests. (Multisector, 2016) An example exercise is done and the average bride and groom spend of € 20,000, plus stays of 20 guests for 7 nights at € 75 per night, we get a value of € 30,500, not counting feeding these guests at the tourist destination and transportation.

The advantages of this type of wedding are numerous for both the couple and the tourist destinations, such as: for the couple - luxurious, intimate wedding; choice of a tourist destination dreamed of being in the mountains, sea, church, tourist spot, among other options; a very small number of people which translates into having very special guests; elegant way of reducing the guest list; the experience that the ceremony will provide to the guests, a place that matches the couple's history or personality, getting to know another culture, differentiated photos and memorable days, always using creativity. For the tourist destination: control of seasonality, entry of additional foreign exchange, sale of hotels, restaurants; dissemination of the image of the destination; return of guests at another time; disclosure of the destination to other people. But the main reason that enchants so many grooms is, without a doubt, the opportunity to confirm the "yes" in the dream scenario and live unique experiences.

Elopement Wedding

Elopement Wedding is nothing more than a wedding for two, that is, only with the presence of the bride and groom. But, despite being a trend of the moment, this appointment is not as new as it seems. According to the Oxford Dictionary, the term “elope” means to secretly flee to marry, and this practice intensified in 1754 due to the need to escape family taxes or impositions. Today, the term "run away to get married" no longer represents something so radical or wrong. (Universo das Noivas, 2019) Modern couples were responsible for redefining the meaning of elopement wedding. This time, couples do have the blessing of families, but they travel to get married without the presence of any guests. (Canudo, 2017; Castro, 2017) The Elopement Wedding has become a luxurious proposal for couples, as it unites infinite possibilities of destinations, an intimate ceremony.

Bride and groom dressed to marry, entitled to veil, wreath, bouquet, suit, boutonniere, a table with multi-storey cake, sweets and flowers, many flowers. A celebrant, photographers, videographers, and so on. No groomsmen, bridesmaids, parents of the bride and groom or guests. The exchange of votes takes place in a beautiful landscape (tourist destination), most of the time, somewhere far from the couple's city. A wedding format that is getting more and more (literally) cool fans. Now, the term comes as an offshoot of another great trend, since the contemporary elopement is a discreet, luxurious wedding, in some paradisiacal destination - perfect ingredients to attract the attention of young famous couples who wish to escape the flashes on the day of the yes. (Caesar, 2017)

The advantage of this type of wedding ceremony: in an elopement wedding, the focus of everything will be the union of the couple and, because of this, the concerns surrounding the ceremony will be much lower than for a wedding with several guests. The question of the economy. With lesser expenses, the wedding for two can be very advantageous for allowing the bride and groom to save on the preparations and spend on what they really want and need. The main advantage and reason why the bride and groom seek an elopement wedding is the freedom to organize everything according to the couple's desire to enjoy their moment, using their creativity to the maximum. Marriage for two allows the couple to have a unique experience, luxury and refinement in the ceremony and live the occasion in an intense, intimate and very true way, without worrying about whether or not they will be pleasing the guests. (Universe of Brides, 2019)

Glamping for honeymoon

The word glamping emerged from the junction of the word glamor with the word camping. This concept translates into a form of accommodation that, like camping, implies a great contact with nature but with a high level of comfort, in a simple and summarized way, it is the practice of luxury camping (Lopes, 2016). Studies on glamping focus on this form of camping as a new low cost tourism trend (Brooker & Joppe, 2013; Rebocho & Correia, 2017), or as a hybrid tourist product, combining camping and luxury, which is considered to be the trend of tourism in 2020 (Ergüven, Yılmaz & Kutlu, 2015; Rebocho & Correia, 2017).The term covers all types of semi-permanent camping structures, such as tents, tree houses, igloos, houses on the water, huts, yurts, among others (Coelho, 2017). These types of structures have served couples on honeymoon very well, who want to experience innovative experiences and have made a destination wedding or an elopment wedding. At a deeper level, glamping is also considered a new way of perceiving and contacting nature, in a truly segregating experience where tourists, places and places interact (Pine & Gilmore, 1998; Rebocho & Correia, 2017). It is a possibility to experience the splendor of the outdoors and contact with nature without sacrificing comfort, removing the negative attributes of camping, such as dripping tents, sleeping bags, improvised food (Boscoboinik & Bourquard, 2012; Brooker & Joppe, 2014) .

When thinking about getting married, the destination of the honeymoon is one of the items of great relevance. In this type of travel, hospitality plays a fundamental role and is usually the second biggest concern for couples. Glamping, being a luxury camping, has been highlighted when it comes to honeymoon, since in these types of experiences, a high level of comfort and amenities are seen, such as: beds with special mattresses, sheets with Egyptian yarns, rugs from rustic to sophisticated ones that accompany the type of tent decoration, heating, catering service, equipped kitchens, private bathrooms, in addition to the experience of breathing fresh air, living days of tranquility together with animal diversity, getting to know untouchable spaces in unusual destinations and places, living the experiences of being in sustainable environments and with high development of social responsibility.

The tourist experience of these couples when settling in a glamping, according to Ryan (2001) is explained by physical intimacy (real contact with the place), verbal intimacy (exchange of words and communication), spiritual intimacy (sharing of values and beliefs) and intellectual intimacy (sharing reflections and disseminating knowledge). Schmitt (1999) and Rebocho & Correia (2017) argue that there are five different types of experiences that can be developed to attract consumers and that are directly linked to various intimacies: Sensory Experiences (senses); Affective Experiences (feeling); Creative / Cognitive Experiences (thinking); Physical, Behavioral and Lifestyle Experiences (acting); Social / Identity Experiences that result from the identification with a reference group or culture (reference). These different types of experiences are transmitted through the form of communication, visual and verbal identity, presence of the product in the media, with the main objective of creating holistic experiences. With all these types of experiences, the high level of comfort of the spaces, the luxury, the innovation, the feeling of nature without returning to the basics, but referring to the rustic chic, make these types of spaces something to be sought by honeymoon customers.

Final Considerations and Future Research

Given the importance of creating innovative products / services for the markets, and offering customers luxury experiences never before experienced, creative marketing emerges with its current model, which is capable of contributing to the construction of projects, focused on customer insights. The wedding market, a type of social event that leverages the economy of tourist destinations, has gained prominence, due to the innovations inserted in the perspective of luxury and unusual experiences. Thinking about the future of luxury, in terms of industry, due to the constant global and socioeconomic changes and transformations that this market has undergone, this industry will continue to adapt to the new circumstances dictated by it, in order to adapt to the future challenges. It is necessary to take a look at the future, in order to foresee the paths where this industry may eventually follow in the coming years. Among these paths, luxury events called destination wedding, elopement wedding and honeymoon glamping are alternatives for social events, of high acceptance, since they arrive to meet the expectations of customers, who wish to live the refinement, the luxury, the elegance of a sophisticated wedding ceremony.

Thus, according to the theories presented and the dynamics of the event markets, the destination wedding appears, as a mini-solemnity option, designed to serve the bride and groom and a maximum of 20 guests, making the event intimate and welcoming. The main focus of this type of event is a tourist destination to be chosen, which offers advantages for both the couple and the tourist destination due to the dividends that are leveraged. The elopment wedding, on the other hand, is aimed at the bride and groom, and the photographer, the cameraman, the wedding planner, and a celebrant are to perform at the ceremony. No other guests are present. Luxury and refinement are present, but this wedding, in addition to being intimate, is super exclusive for the couple and usually happens in a prominent tourist attraction. Finally, both after the destination wedding and after the elopment wedding, couples dream of a honeymoon. So to maintain this differentiation that has already been followed in the types of weddings mentioned above, the option is glamping, a form of luxury camping, in a natural or rural environment, where the couple will have all the glamor of a wedding night with experiences innovative experiences, such as: Sensory Experiences (senses); Affective Experiences (feeling); Creative / Cognitive Experiences (thinking); Physical, Behavioral and Lifestyle Experiences (acting); Social / Identity Experiences that result from the identification with a reference group or culture (reference). In addition to the tourist experiences that are developed when settling in glamping: physical intimacy (real contact with the place), verbal intimacy (exchange of words and communication), spiritual intimacy (sharing values and beliefs) and intellectual intimacy (sharing reflections and knowledge dissemination). So, the event is a possible stimulator of the dynamics of a destination. The limitation of this research is the bibliographic search in qualis articles, when dealing with creative marketing, innovation, luxury in the context of tourist events and the wedding market. Future studies should continue this work, using quantitative methodology, scientific research is lacking with more data on social events: destination wedding, elopement wedding and honeymoon glamping, which brings more originality and value to this study.

Privacy in Electronic Health Records: A Comparative Study

Abstract

Despite the benefits that the use of electronic health records (EHR) provides for doctors, other healthcare professionals and researchers, people have genuine privacy concerns that their data might be leaked or accessed by unauthorised parties. This paper investigates and compares security measures that are implemented in three countries namely Denmark, England and Australia, to protect EHR systems. A comprehensive analysis of literature (including official documentation of EHR in the three countries) was conducted to identify countermeasures related to the technologies, policies and human factors that implemented in Denmark, England and Australia to safeguard their EHR. The findings of this paper highlight the importance of adopting a more holistic approach where strong policies and practices are implemented, and cyber security awareness and training are provided to the users of the system. Such approach will address people privacy concerns and increase their trust in using EHR. The comprehensive analysis has revealed countermeasures implemented to protect EHR in three countries. It shows that more focus needs to be given to users training and awareness to prevent any human related security incidents.

Keywords Electronic Health Record, Information Security, Privacy, Information Security Management, Security Awareness.

Introduction

Over the last decade, there has been a global push for the use of electronic health records (Kanwal, Lonie and Sinnot 2018). There are many benefits to having an EHR. A study has found that EHRs can improve the quality of care, reduce medical errors as well as improve financial and operational performance (Menachemi and Collum 2011). From a research standpoint, EHRs can allow researchers to access more quality data and use data linkage to help them produce more accurate results for their research. For example, data linkage has enabled researchers to compare hospital caseloads with outcomes of oesophagogastric cancer surgery (Smith et al. 2014).

Although EHRs provide several benefits, it also raises several challenges in implementing such a system. Most of these challenges are in the area of privacy, confidentiality and data security. These challenges become of significant concern when EHRs are shared across healthcare professionals, researchers and other interested parties. A leak in the identity of a patient can lead to discrimination or embarrassment. If these fears manifest in the public, people may feel reluctant to disclose their symptoms or even visit their doctor.

Many countries have implemented various forms of EHRs. However, this study will only be focusing on Denmark, England and Australia. Denmark had been selected because of its high adoption rates of

its EHR system, sundhed.dk, with more than 2.4 million unique users each month (OECD, 2019). In contrast to Denmark, England was selected because it had not been so successful which was why it was also selected for this study. It uses Summary Care Records (SCR) to manage their patients' data and later implemented care.data which failed only months after it was released to the public (Godlee 2016). Australia has had a centralised electronic health record system, Personally Controlled Electronic Health Record (PCEHR), since 2012. PCEHR is now known as My Health Record (MHR) and since February 2019, 9 out 10 Australians have a MHR account (Australian Digital Health Agency 2019). Australia was selected because its MHR was not as widely used as sundhed.dk but it also did not fail as care.data did. Thus, this research aims to provide a comparative study of the security measures across Denmark's sundhed.dk, England's SCR/care.data and Australia's MHR.

Methods

To best compare the security measures in place across the three countries, the McCumber cube will be used to evaluate information security (McCumber 2004). The cube has three dimensions: data states, security goals, and security measures. This research will only be focusing on the security measures dimension.

One aspect of this dimension is the technological solutions. The underlying technology plays an important role as it helps sets the foundations for the security measures to be built upon. The cube also highlights the importance to consider the human element that is involved in the security measures. Thus, the paper will also examine the policies and human factors that surround the use of EHRs.

We conducted the literature review in four steps. First, we utilized University of Melbourne's digital library to collect and screen academic journals based on filters detailed in Table 1. Second, we omitted articles that did not focus on electronic health records. Finally, we grouped the articles based on the three factors of security measures. This paper will apply these three areas of the countermeasures as a criterion to compare the security measures of the different EHR systems across Denmark, England and Australia.

Table 1: Research steps

Step	Actions performed	Results
1	Broad search in University of Melbourne's digital library. **Keywords:** *privacy in electronic health records, privacy in Sudhed.dk, privacy in Summary Care Records, privacy in My Health Records* **Year since:** 2009 **Language:** English	Articles found: **2,565**
2	Omit those that did not focus on the technology, policy or human factor element of cyber security	Articles selected: **45**
3	Select documents based on abstract relevance and years since published	Articles selected: **20**
4	Group the articles based on technology, policy and human factors	

Technology

The first security measure that is often proposed is information security technologies. These technologies are IT components, both hardware and software, that are used as security controls to enforce a particular security requirement (McCumber 2004). Although it has been argued that

information technology alone should not be relied upon, it is still an important element of security that must be maintained to improve an entity's security posture (Blakley, McDermott and Geer 2001). In this section we will identify the different technologies employed by each of the countries and examine its effectiveness.

Denmark

Sundhed.dk is an online public health portal that provides healthcare professionals and the citizens of Denmark a single point of access to electronic health records and other information surrounding the health services provided in Denmark. Citizens can log into this portal to view their own patient summary, book appointments electronically, request renewal of medications and view discharge summaries and laboratory results. Healthcare professionals can also use this portal to view their patients' health records and laboratory results.

Secure communication in this network of electronic health services is achieved through the Danish National Health Data Network that was established by MedCom, a publicly funded non-profit organisation. This network is a secure infrastructure that provides both public and private organisations the means to securely transmit and exchange health data, images, as well communication with external systems such as Sundhed.dk.

To authenticate access to the electronic health systems and secure the interactions between systems, the public-key infrastructure (PKI) is employed. From 2010, NemIDs were used to further improve the ease of access to the system. NemIDs is a six-digit security number that can be read from a paper or electronic token which is also used for authentication in banks and other public Danish agencies. This essentially serves as a form of multi-factor authentication to authenticate the user accessing the portal. In 2017, there were a total of 4.7 million Danish citizens that had NemIDs (Agency for Digitisation 2017). Therefore, at the time, almost 5 million Danish citizens could have logged into the Sundhed.dk portal.

Patients can monitor the log files where all activity is recorded and report any discrepancies. A letter is sent to the patient if a healthcare professional who does not have any direct treatment related relationship with the patient, has accessed the patient's record. The patients also can prevent any healthcare professionals from accessing certain information such as medical conditions and current medications.

England

SCR is one of the services provided by NHS Digital. It is an EHR system that contains patient information created from GP medical records. Patient data can be viewed by health care professionals in other areas of the healthcare system who are directly involved in the patient's care. In contrast to Denmark and Australia, there is no portal for the patient to access this data. However, the patient can request to view or add information to the SCR by visiting their GP.

The SCR has three controls in place to control access to its information. The first is through authentication and Role Based Access Control. This is achieved through smartcards that are used in combination with the user's passwords, hence providing multi factor authentication. The second control is through Legitimate Relationships. This requires the healthcare professional to have a legitimate reason to view the patient's SCR. The third control requires patients' consent to be obtained before their SCR is viewed. Legitimate relationships and consent are recorded by a member of the staff. However, selecting emergency access or self-claiming a legitimate relationship will produce an alert. These alerts will be audited by the organisation's privacy officer to ensure that access to the SCR was valid.

Information on the SCR is recorded in a national database, The Spine. Although the Spine is a national database, it is not integrated into a single system and therefore does not link to EHRs obtained through the hospital systems. In 2013, care.data programme was announced which would link patient data from

GPs with data obtained through hospitals and other healthcare organisations. This program had faced many criticisms since its launch and was eventually abandoned in 2016 (Saleem 2009).

Australia

The PCEHR system is a distributed system that provides numerous repositories for essential services. A registered repository must inform an indexing service of the existence of patient data available for retrieval upon request. This essentially interrogates the system to see if there are any atomic data, which is the lowest level of detail. This differs from other EHR systems where they act more like a central repository. Only the data sent to the repositories are used by the MHR system. EHRs are never queried directly. Users of MHR can create patient health summaries and health notes. This includes both the healthcare providers and the patient.

For an organisation to use MHR, they need a Healthcare Provider Identifier-Organisation (HPI-O) and a National Authentication Service for Health (NASH) PKI certificate. These certificates use secure hash algorithm (SHA) technology to send secure messages online. Multifactor Authentication can be enabled through the MyGov portal where a code received via a text message is used in addition to the password.

Once a patient is registered on MHR, healthcare providers will have default access to their records if they have had a relationship with them before. Documents can be restricted but can be revealed if the healthcare professional possess a limited document access code. Once a healthcare provider has accessed to the patient's record, they will be placed on a list. Patients can access this list and remove providers to deny their access. The system logs all access to the patient's records and is available to review as an audit log. The audit logs do not provide information on individual access, but patients can request to see which individuals has accessed their record and notifications can be set when their records have been accessed.

Policy and Practices

Information security policies are used to identify valuable information assets, provide governance over these assets, and strengthen the controls over these assets (Flowerday and Tuyikeze 2016). Policies in nature are more control oriented. Practices, however, are more individually constructed (Burdon Siganto and Coles-Kemp 2016). A practice can be viewed as the procedure that helps ensure the policy is followed (McCumber 2004). Effective policies and practices are required to maintain the security posture. This section will compare the different policies and practices adopted by the three countries.

Denmark

In 2006, Danish General Practice Database (DAMD) was established to record a patient's prescription and clinical data based on their consultations with their GP. By 2013, all 2,100 general practices were obliged to supply their data to the DAMD (Paulsen et al. 2012). This database was initially designed to enable quality improvement in general practice, but the Danish Quality Unit of General Practice (DAK-E) later provided Danish Health and Medicine Authority permission to conduct research using this data. Statistics Denmark, a government institution, would perform linkages with other data sources using a personal identification number that is assigned to all Danish citizens. In 2014, the National Board of e-Health (NSI) and the Danish data protection agency ruled that this collection of data was illegal and ordered all collection of data to DAMD to be stopped and the data on DAMD to be deleted (Christiansen and Rudkjøbing 2015).

EHRs from hospitals are available to researchers through the Danish National Patient Registry. However, the use of this data is regulated by the Data Protection Act (DPA) which acts as an extension of the General Data Protection Regulation (GDPR) since Denmark is a part of the European Union. This act covers the legal basis for the use of personal data. Personal data can be considered as any data that identifies an individual (GDPR 2018).

The use of health data for research also requires permission to be obtained from the Danish Data Protection Agency. If the linkage between various data sources is required, then permission from the Danish Health and Medicine Authority is required. This legislation also governs the way EHRs can be transferred amongst healthcare professionals. There is a provision that states that healthcare professionals involved in the patient's episode of care will by default have access to important information. Health data can be collected electronically without patient consent, but the patient must be informed. Patient consent is required when confidential information is shared with parties outside of their healthcare.

England

NHS England is responsible for providing health services to the citizens of England. The collection of personal data on its patients and other parties involved in the provision of the healthcare services is governed by England's DPA. When care.data was introduced in 2012, some legislations and policies became even less clear. During this time, the Health and Social Act (HSCA) was passed that included a provision where the Information Centre would be created from. This legislation gave the Information Centre the power to collect, collate, and gain access to the medical records of all patients that have received health services by NHS England, including both hospitals and general practices.

To address concerns on the confidentiality of patient data, the amendments to the HSCA was passed through the Care Act in 2014 (Sterckx et al. 2016). This act contained a provision stating that patient data can only be released for the provision of the healthcare services, adult social care or the promotion of health. However, the exact boundaries imposed by this were not clear.

GPs were directed to the Information Commissioner's Office (ICO), for more information on the DPA and the legislation that surround patient data. According to ICO, HSCA gives NHS England the power to direct the Information Centre to collect certain data from a patient's medical record. It also requires the disclosure of the data and therefore is exempt from the DPA. Since this law in the DPA is exempt, both the GPs and the patient are legally not allowed to prevent the transfer of information into the Information Centre. However, Secretary of State for Health offered patients an option to not upload their information to this service.

The HSCA also contains a provision that allows all EHRs to be used for purposes other than patient care, e.g. research. The DPA requires the healthcare professionals to notify the patient of the intended use of their data unless it is impractical to do so. However it has been pointed out that the DPA can be overruled in this instance as the healthcare professional is obliged to transfer such information to the Information Centre and the Information Centre is not obliged to notify the patient on the use of their data, once the data has been "anonymised" (Grace and Taylor 2013).

Australia

Australian Digital Health Agency (ADHA) acts in accordance with the Australian Privacy Principles which can be found in the Privacy Act (1988). My Health Record Rule and My Health Record Regulation were introduced as an extension of the Privacy Act. These legislation gives patients the right to monitor and control access to their data. However, these legislations are not comprehensive in its protection of the patients' privacy. The MHR's privacy policy mentions that the privacy controls used to manage access to patient information, cannot be applied to the Shared Health Summary if it has been uploaded by the GP. The privacy controls are also no longer effective when the documents have been downloaded from the portal.

Data obtained through the MHR portal can be used for secondary purpose such as research. Patients do have the option to opt out of secondary use of their data. The data released for secondary use will not be sold and only provided to organisations that can prove that it will use the data for public good. This means that insurance companies will not be able to access the data and government entities cannot use it to assess eligibility for benefits. MHR's Secondary Use of Data Governance Board will assess all applications that request access to this data. The Secondary Use Framework states that this board will

ensure that the patient's privacy is protected, and the data made available will be of adequate quality (Department of Health 2018).

Under the Privacy Act, organisations are required to notify affected individuals and the Office of the Australian Information Commissioner (OAIC) when a data breach is likely to result in serious harm to individuals whose personal information is involved in the breach. Organisations must also provide suggestions to mitigate the impact. For example, if your credit card details are leaked, the organisation can suggest cancelling your credit card to prevent further unauthorised use of the card. However, the suggestions of similar nature cannot be provided to patients to reduce the impact if their personal details are leaked. A privacy breach victim cannot also claim for emotional distress or other damages.

Human Factors

Human factors are commonly overlooked factors when assessing cyber security measures, but they are just as important as they are often the last line of defence. Improving the human factors can enhance the security posture of the individual and ultimately the organisation (Hadlington 2018). These factors can include motivation, awareness, belief and behaviour (Shouran, Priyambodo and Ashari 2019). This section will investigate the human factors that are present in each of the countries in terms of the use of electronic health records.

Denmark

Government and healthcare entities are required to have business continuity and disaster recovery plans in place. This involves identifying potential security threats, analysing the impact it will have on the organisation and the recovery of specific applications and functions. Healthcare providers train its users who operate the Danish Health Data Network and other services. However, there is no cybersecurity training provided to the healthcare professionals or other end users. A report has found that healthcare organisations requires its staff to frequently update their password which has led to clinicians sharing passwords and not signing out of their computer for others to use (Kierkegaard 2013). An audit is conducted twice a year on a random sample of log files from the Sundhed.dk portal to identify any discrepancies that may have occurred. With these procedures and practices in place, another study has found that that the abuse of the EHR system detected each year is low and only a small portion of cases result in a sentence (Nøhr et al. 2017).

In Denmark, citizens do not have the option to opt-out of the Sundhed.dk system. However, the data obtained through the Sundhed.dk portal is also not used for research and they do have the right to opt out of research on biological samples.

England

NHS England provides a range of free cyber security training to health care providers including a free Government Communications Headquarters (GCHQ) certified board-level cyber security training. This includes a two-hour briefing session followed by online learning modules that are designed for the board members. NHS England has also partnered with IBM to provide health care organisations a limited number of free user licenses to their Immersive Labs cyber security eLearning platform. This platform helps cyber security professionals in a healthcare organisation develop their cyber security skills. Between 25th of May 2018 to 31st of December 2018, 683 notifications have been made to the Information Commissioner's Officers (NHS England 2018).

When NHS England first rolled out its Summary Care Report, it was mandatory for all users of its services. However, due to public pressure, NHS England adopted an opt out model. The opt out model was also used for care.data even though there is no legislation that regulates this.

Australia

MHR provides online training modules for healthcare professionals that cover topics such as privacy and security of MHR. MHR has also published a checklist that healthcare organisations must follow to be compliant with MHR's policies. This includes the requirement to train the staff on how to operate the system and the legal obligations that surround the use of it. Despite these learning modules and checklists, it has been found that only a third of the healthcare organisation implement cyber security awareness and training (Health Informatics Society of Australia 2018).

In 2012, when MHR was initially known as PCEHR, it adopted an opt-in model. In 2014, after it was rebranded to MHR, it used an opt out model. Between 2012 to 2013, under 400,000 people were registered to the system (Department of Health and Ageing 2013). This figure grew significantly to over 22 million people by April 2019, representing 90.1% of the number of people eligible for Medicare (Australian Digital Health Agency 2019).

Discussion

Technology

The technology for all three countries must be robust enough to maintain the confidentiality, integrity and the availability of the data. These three factors are known as the CIA triad is a widely used benchmark that assesses the effectiveness of the information system security (Fenrich 2008). A summary of the security features can be found in Table 2.

Table 2: Summary of Security Features

	Denmark (Sundhed.dk)	England (SCR)	Australia (MHR)
Multi-Factor Authentication	NemIDs	Smart Cards	Temporary Access Codes
PKI	Yes	Yes	Yes
Who has access?	Healthcare Staff and Citizens	Healthcare Staff	Healthcare Staff and Citizens
Access Controls	Through Sundhed.dk	A visit to the GP	Through My Health Records

All three countries use PKI. This is a system that provides a framework for encryption and authenticating of a user. A common challenge with PKI is authenticating remotely for the first time. However, each country has a system in place to address this challenge. For example, in Australia, only organisations registered through the Healthcare Identifier service can request a public key certificate. Studies have found that using PKI can reduce the complexity of the security systems whilst compartmentalising the security risks (Weise 2001). Multifactor authentication has also been utilised by all countries to authenticate all users of the system.

Assurances need to be made that the integrity of the data is maintained even after the authentication of its users. In both Denmark and Australia, the citizens can access the logs through their portal to see who has accessed and/or modified their information as well as biannual audits are conducted in Denmark by the Data Protection Agency. Since there is no technological solution for patients from England to view the access and modification logs, patients will have to rely on the privacy officers of each healthcare organisations. Since the privacy officer is a member of the organisation, if a user has doubts about the staff's use of their data, it can lead to an erosion of trust in the accuracy of the information presented to the patient.

Availability of data is crucial in EHR systems especially in time sensitive situations when someone's life is at risk. The adoption of EHR systems has improved access to health data by healthcare professionals who are in direct care of patients. All three countries have a distributed system in their

implementation of their EHR systems. Research has shown that distributed systems can improve the availability and reliability of the data through the replication of data at several locations (Nadiminti et al. 2006). One of the differences between Australia's implementation of the EHR system compared to the other two countries is that Australia uses multiple repositories to store its data. This provides greater administrative flexibility in terms of managing multiple essential services. One of the greatest threats that a distributed system faces is a distributed denial of service.

Policy and Practices

One of the key reasons why care.data had failed relative to the other EHR systems is because it had failed to obtain its social license. Social license can be described as the expectations of society that exceeds the legal requirements and regulations. One research notes that care.data had failed to obtain the social license in three areas: erosion of public trust in care.data, disruption of the traditional role of a GP and the public's doubts on whether the care.data system can be a public good (Carter et al. 2015). The erosion of trust can be attributed to the legislation that were passed to circumvent the data protection laws. Table 3 summarises the Secondary Use of Patient Data.

Table 3: Secondary Use of Patient Data

	Denmark	England	Australia
Programme	DAMD and Danish National Patient Registry	Care.data	MHR
Use of patient data for research	DAMD abandoned in 2014 but Danish National Patient Registry still operates	Care.data was abandoned in 2016	Yes

Australia's MHR has a similar structure for the secondary use of its data to care.data and therefore faces similar challenges. To address the first challenge on trust as well as to show that this system will be used for the good of the public, MHR has vowed to not sell the data or provide the data to the insurance companies but they can still provide pharmaceutical companies with the data provided that they can show that they will use the data for good. Care.data had promised the same assurances, but the new legislations allowed care.data to still sell the data to these companies.

Sundhed.dk did not face this challenge because they do not permit the secondary use of its data. As a result, a survey of a group of Sundhed.dk users had found that most of the participants had expressed positive attitudes towards the use of this service and half the participants could see the benefits of combining data from various sources (Karampela et al. 2018).

Furthermore, Anderson has defined nine principles in his research that will lead to a more effective privacy policy (Anderson 1996). For the most part, all three countries have policies in place that are compliant to these principles. For example, these countries maintain an access control list and has a responsible officer in charge of maintaining this access control list. However, these countries do not satisfy the principle that requires people who have access to the health data of many people, to be added to their access control list. This is more of an issue in larger healthcare organisations such as hospitals. Typically, in a hospital, there will be large number of staff members that can access an even larger number of patients. This is magnified when all the data is connected in a network. In Australia, the MHR system only allows for the access controls to be placed on healthcare providers who have already accessed the record. In Denmark, all healthcare providers by default have access to all patients' data. For SCR, there is no access control list a that a patient can easily configure. However, patients can visit their GPs and choose to seal their data in a sealed envelope and dictate who can have access the sealed envelope. Although these countries have a role-based access controls in place, they fail to place healthcare providers in a patient-controlled access control list before the healthcare provider has accessed the data.

Human Factors

One study has identified that one of the principal sources of privacy breach is the inappropriate disclosure of data where the data has been exported from an organisation without authorisation (Neame 2014). In England, an incident in 2009 occurred where one GP downloaded a complete patient database, including the medical histories of 10,000 people, on to an unsecured laptop (Savage 2009). This laptop was then stolen and never retrieved. Incidents like this have also occurred in Denmark and Australia. Cyber security training and awareness is required to reduce incidents like these.

All three countries have awareness programs in place. England is the only country to provide tailored cyber security training programs based on the role of the user. This is achieved through strategic partnership with organisations that provide cyber security services. Australia also provides learning modules online to its users in the area of privacy and security, but the module is only aimed at clinicians such as the GP and nurses, not other staff members such as the management team of the larger healthcare organisations. With this combined with the fact that only a third of the healthcare organisations implement cybersecurity awareness and training, 55% of Health Sector data breaches in Australia has occurred due to human error compared to the average of 35% across all other sectors (Office of the Australian Information Commissioner 2019). Denmark does not provide any direct cybersecurity training and as a result unsafe practices can be found in clinics such as sharing passwords with other staff members.

In terms of the opt in/out models used, all three countries have used different approaches and therefore yielded different results from it as displayed in Table 4. The mandatory approach that Denmark took, has contributed to the high monthly users. It can be argued that this mandatory approach was successful due to the transparency in its legislation on data protection. The summary care record and the care.data programme were both initially mandatory, but due to the inadequacy of the legislation and regulation, the public pressure forced NHS England to adopt an opt out model. Australia started with opt-in model that lets individuals decide on whether they want to participate or not. This model will give individuals greater control over their personal information. However, this also poses a challenge to register the critical mass of the population. In the first two years, there were under 400,000 individuals registered to the MHR compared to the 22 million people after the opt-out model was used (McLoughlin, Garrety and Wilson 2017).

Table 4: Opt in/out method used by each country and its respective number of patients registered to the service.

	Denmark	England	Australia
Opt in/out	Mandatory	Opt-out	Opt-out
Number of Patients Registered	Total Population (5.8 million)	96% of population (55 million)	90.1% of Population (22 million)

Limitations

This paper was restricted to the data only available from public sources that are in English. There were documents published in Denmark that may have provided meaningful insights but were not included in this paper as it was written in Danish. Furthermore, the healthcare sector is constantly evolving in terms of both technology and legislation. For example, NHS England are rolling out new strategy that will enable patients to view their own data through a portal like Denmark and Australia (NHS England 2019). As these are proposed projects, they are not included in this research.

This paper only examined the security measures in place for Denmark, England and Australia. However, there are many more countries that have implemented their EHR systems with varying levels of success. Further research is needed to examine the security measures adopted in these countries and its relative success in protecting the patients' data.

Conclusion

All three countries utilise secure technologies such as PKI and multifactor authentication to ensure that the EHR systems can protect the patient's data. However, from the results, it is apparent that strong policies and practices as well as cyber security awareness and training are equally important to keep the patient's data protected. Weak policies and practices allowed government entities in England to sell patient data to insurance companies without their consent. The lack of cyber security awareness and skill has also contributed to higher rates of data breaches.

At the core of a successful implementation of a shared EHR system is the trust and support of its users. Whether it is a mandatory, opt-out or opt-in model, if there is no trust in the system, people will opt out or force the abandonment of the project like what happened to care.data. To combat against this, it is vital that governments provide greater importance in the development of security policies and human factors to strengthen its cyber security measures. These policies should not contain ambiguity on the right of access or ownership of patient data. Providing more tailored cyber security awareness programs to both organisations and the end users can promote safer security practices. Adopting these approaches can in turn help build the trust from its users and contribute to the success of a shared EHR system.

Black-Market Exchange in a Digital Era

Marcin BROL

Wroclaw University of Economics, Wroclaw, Poland
marcin.brol@ue.wroc.pl

Abstract

The paper addresses dilemmas arising in the context of black-market operations in a digital economy. Some of the inherent properties of the World Wide Web, such as the relative anonymity, IP and connection masking, and the asynchronous character of interactions may, in some cases, stimulate and support the development of nefarious uses of digital systems, resulting in a rise of black-market economy. The aim of this study was to present the nature of black-market operations along with some of the most important regularities associated with this form of illicit activity in economies based on digital networks. The findings provide insight into some of the reasons for the rapid growth of black-market operations in the global networking system, including: extremely low reproduction cost of virtual commodities, continued development of connection masking techniques, the rise of cryptocurrencies, and wide dispersion of both supply and demand.

Keywords: Black-Market, Internet, Network Economy.

Introduction

Black market typically bears close associations with criminal actions, organized crime, exchange of stolen property or, in a more general approach, with any type of unlawful or illegal operation deemed as indictable offence and prosecuted ex officio by formally authorized services of the state. However, the term 'black market' is also often invoked in association with the shadow economy. For this reason, it may be advisable to start off with a proper differentiation of the two notions, to ensure a clear and non-ambiguous definition of both the subject and the main objective of this study.

Based on the well-established definition, black market operations are those where income is generated from transactions deemed illegal and made in violation of the adopted institutional norms of market conduct. In other words, if public trade in some commodity is expressly forbidden by the law, then any operation involving exchange of such commodity will be identified as a black-market operation, and persons involved in such an exchange will be recognized as criminals (Feige 1989). In contrast to the above, the shadow economy (or grey economy) represents operations which are legal from a formal standpoint, but made outside the legal taxation framework or otherwise unrecognized by regulators as a taxable exchange (Williams 2005).

The term 'black market' is only one of the many expressions evoked in relation to the phenomenon under study. Professional literature provides examples of related terminology, including: underground economy, clandestine market, and illegal economy. However, all of these terms seem to place focus on the statutory regulations that define the scope of trade considered as legal.

The introduction of the World Wide Web and virtual networks has made a considerable impact on both the volume and the development potential of illegal (black market) trade. One of the earliest and most fundamental commodities exchanged over virtual networks was the unauthorised distribution of digital content (file-sharing), and the rise of this segment was largely stimulated by the lack of methods for effective regulation of this type of exchange. For this reason, the aim of this study was to present the nature of black market and to describe some of the regularities observed with regard to its operation in economies based on digital networks.

Black market valuation of prices

The theory of black-market operation has evolved over the years. The earliest economic evaluations of this concept date back to the era of the US prohibition in the 1920s and 1930s. The modern shape of the concept was solidified in the two decades following the end of World War II. At the time, the axis of the dispute between economists involved in the formulation of the black-market theory revolved around the notion of pricing. Some experts, such as Bronfenbrenner, approached black markets in much the same manner they did any other type of market failure, where black market prices are related solely to the level of formal state regulations (Bronfenbrenner 1947; Plumptre 1947). Others suggested that a black-market price would always be in excess of the market price or the state-regulated price (Boulding 1947). Ultimately, it was generally agreed that supply, in this case, cannot be reduced to a linear function related solely to the officially regulated price and that it need to be closely correlated to the demand. As expressed by Gönensay: "it is inappropriate to represent black market demand as a fixed curve determining a different black-market price for each quantity supplied in that market. In a situation with a given total output, the black-market price changes only if the *slope* of the black-market demand curve changes with different allocations of the total quantity between the official market and the black market" (1966).

A black-market exchange, just like any other form of exchange, is established on three elements: demand, supply, and price. The demand side is represented by economic entities interested in a purchase of goods or services, while the supply side constitutes producers and suppliers of such goods or services. The most important difference between legal and illegal markets can be observed in relation to the pricing process. Prices on black markets may be: below the market price, in excess of the market price, or in excess of the regulated price.

The first scenario is typically observed in relation to such phenomena as fencing of goods and sale of substandard quality merchandise. Here, the black-market price will be markedly lower than that of similar products offered on regular markets, as the goods on offer are often obtained in an illicit fashion or produced illegally to pass for original brands. In this context, some studies emphasize the effects of information asymmetry observed between the buyer and the seller in this type of black-market exchange (Feige 1989). This view bears a suggestion that the seller is aware of the illicit origin of the merchandise on offer, while the buyer is largely oblivious to the fact. This argument, however, cannot be defended. Both parties are equally aware of the illegal character of the exchange, as this suggestion is potently communicated by the difference in price. While buyers are obviously unable to verify the illicit origin of such merchandise, they have all the reasons to come to such an assumption.

Another scenario can be observed when black market prices are in excess of regular market prices. This typically applies to goods and services formally declared as illegal (narcotics, prostitution, human trafficking, etc.) or those with formal access restrictions (prescription drugs, firearms, etc.). Obviously, it may be difficult to make a rational valuation of market price for goods and services expressly prohibited by law. For this reason, professional analyses are often made with reference to substitution prices and assumed relative homogeneity with products offered on legal markets (Feige 1989). In the case of narcotic substances, substitution price will reference legal pharmaceutical products of similar effect and composition; for illegal services such as prostitution, black market valuation can be related to prices registered on foreign markets, i.e. in those economies that tolerate this form of gainful activity. For cases involving human trafficking, price valuation is typically established on the basis of alternative costs. While the cost of human life escapes valuation, it is possible to measure the cost of lost opportunity. Thus, it may be stated that product/service valuation in this case is akin to that employed on the insurance market.

Black market pricing in excess of the relative market prices is the effect of the restricted or prohibited access to specific goods or services. Thus, the demand for such products or services is clearly in excess of the formally regulated supply. Therefore, customers are more inclined to pay a higher price to satisfy their demand. This is one of the crowning arguments on the part of proponents for the legalization of drugs and prostitution. It is assumed that legalization of such products and services would lead to effective reduction of prices and offer improved control and regulation to formally appointed services

(regulatory bodies, state treasury, etc.). However, product regulations as such may also stimulate the development of black markets. The underground market of prescription drugs is good evidence of this scenario. In Poland, black market exchanges in this segment are common for foreign medications which are not yet legally approved by the national pharmaceutical regulator. Illegal trade includes, among others, to weight-control drugs and psychoactive drugs (Brzozowska 2017).

Black market exchanges can also be stimulated by the introduction of goods offered at regulated prices. This applies mainly to products sold at maximum prices, i.e. well below the equilibrium price. This type of regulation results in market shortage, as demand is clearly in excess of supply. In Poland, such scenarios were registered in the times of centrally planned economy, and mostly associated with black market exchanges of food products and foreign currencies (Kochanowski 2010).

The nature of the network economy

The notion of network economy is typically evoked to describe the sum of interactions between economic entities held over the Internet. Although practical applications involve a great variety of other types of IT-supported communication networks, the World Wide Web (Internet) is clearly dominant. The notion of network as such is not a novel addition. According to Giddens, networks have been the staple of social systems for centuries, and their transition has only been stimulated and propagated by the technological development (2012). A network is a structure described by three fundamental properties: flexibility, scalability, and vitality. These, according to Castells, determine the existence of a network society (2013).

Network flexibility describes its ability to adjust to changes in external environment. For example, if a social networking gains recognition, the increased demand may not necessarily involve the development of a single node, as the task may be dispersed over multiple nodes (servers, information processing centres, etc.). This property allows to eliminate many obstacles, such as network congestion. Flexibility can also be analysed in relation to another network property, namely: scalability. This term represents the network ability to adjust its size (by adding new nodes or by redirecting traffic to the existing ones) without any disturbance in network operation. These two properties provide the network with the attribute of vitality, i.e. the ability to sustain its operation even when some of the nodes are removed from the grid, by making use of another network property, namely – their decentralized structure (Castells 2013).

Another characteristic property of networks is the asynchronous nature of interactions, which provides those types of structures with capability to synchronize activities of economic entities without the limits or constraints of time and space. This phenomenon forms the basis for the operating potential of 'markets that never sleep', as the asynchronous nature of interactions is capable of supporting exchanges made between any number of currently active network nodes, irrespective of their physical location (or time zone, for that matter). The notion is also closely related to the capacity for servicing time-delayed interactions (Brol, Czetwertynski 2013). For instance, offers for commodity exchanges can be responded to and serviced at any time, even outside the working hours. It this fashion, trade contracts can be entered to and negotiated at any such time that suits all the parties involved in such exchange.

In addition, the asynchronous nature of network interactions has the effect of eliminating some of the natural barriers to market entry observed on traditional markets. Since offers of supply can be made from any place in the world, they are free from the constraints of local trade regulations (this statement also holds true for the purchasing party). This effect is widely exploited by online distributors registered in countries characterized by lenient approach to intellectual property rights. Networks are not only capable of limiting the effects of the existing legislative barriers, but also of reducing barriers associated with financial position or social status. The former includes cost limitations offered by e-commerce, such as limitation or outright elimination of warehousing facilities or cutting the cost of office space. E-commerce companies can be managed from any place (such as a shared office, or an apartment), and providers of such services are not in any way constrained by the traditional model of retail outlets kept in suitable and attractive (and thus expensive) locations. In effect, e-commerce activities can be

undertaken by persons who – due to their social, financial or educational status – are typically excluded from more traditional forms of economic pursuit. This can also be related to another common phenomenon, namely: conduct of economic activities outside the framework of the formal company registration, although the scale of such practices escapes easy assessment.

Since networks offer the prospect of conducing economic activities without proper registration, on illegal markets, and/or with reference to illegal commodities, it may be assumed that the asynchronous character of network interaction is one of the key determinants in the development of grey and black markets observed in this particular segment. And the sole obstacle to their otherwise unconstrained development is the requirement of dispatching the physical commodities to the buying party. However, even this barrier can be eliminated if the trade applies to illegal copies of digital content, i.e. audio, video and image files, and computer software. One of the newest additions to this list is the STL format of files used to store models for 3D printing. Such models can be reproduced by purchasers in the comfort of their home, mostly from resin, but also from other materials.

Another important barrier to uncontrolled development of black markets is the requirement of transaction settlement. While barriers to trade are negligible in the context of demand and supply fluctuations, transaction settlements must be regulated directly (in cash) or via bank transfer. With regard to the former, physical distance is the main barrier to trade. For the latter, the most important barrier is the ease of tracking and blocking any such order.

Black Markets in a Network Economy

The most fundamental attribute of any type of illegal transaction is the clandestine character of the process – a natural consequence of the fact that they are penalized by law. If such a transaction is revealed, its participants will be pursued by law and tried before proper authorities. For this reason, access to black markets was, from a historical perspective, considerably restricted, and populated largely by intermediaries offering access to illegal products and services (dealers, money-changers, fences, profiteers). In a network economy, this barrier can largely be limited through the use of basic and advanced transaction masking technologies.

While it is easy to refute the popular misconception that the Internet is a warranty of anonymity, some of the recent technological developments already provide support for relatively secure and clandestine communication between users. The most popular solutions in this context involve the use of: public WiFi, proxy servers, the Deep Web (TOR), and VPN services.

The most basic method of access is the use of public wireless networking (WiFi) on offer by municipalities, hotels, restaurants, in trains, etc. These have largely replaced the previously popular services of Internet cafés, which offered per-hour access to the Internet from desktop computers in a dedicated café space. Rapid development of WiFi services has effectively brought an end to this type of service. The attribute of ‘public’ in relation to the Internet access does not necessarily warrant the effective elimination of barriers to access (in the form of passwords or permissions from the owner of such routing service). However, if no such barriers are present, these forms of access to the Internet retain some degree of anonymity, but surely not enough to make them untraceable. On the one hand, users connecting to the network with the purpose of involving in illegal transactions will only leave a trace in the form of their IP address (the Internet Protocol address is a unique numerical sequence assigned to each individual device connected to the Internet). On the other hand, their connections are recorded at login, including the identification number of the device used to access the service (computer, smartphone), the time and duration of their connection, and their approximate geographic location. These bits of information, in tandem with the ubiquitous monitoring and CCTV services (municipal, industrial) are often sufficient enough to ensure effective identification of persons involved in illegal operations. In addition, connections via public networks are typically time-constrained (typically requiring users to resend their login information to the network after 60 minutes) and with poor throughput.

Another solution is the use of proxy servers. These serve as intermediaries for requests passed by users to Internet services, allowing for effective masking of the sender's IP address. Proxy services come in the form of paid subscriptions or gratuitous support (the latter are usually offered at reduced throughput speeds). Paid services are usually more effective in ensuring relative anonymity of their users. Other factors may also play a role in this process, such as the place of company registration, as some national legislations are more supportive in providing user details in response to claims issued by third parties.

The Onion Router (TOR) is a more comprehensive solution designed to offer access to the Deep Web. TOR is not a service (in the sense represented by proxy server functionality) but an entire network localized within the existing Internet structure. This solution prevents authorized services from accessing and analysing network traffic data (a scenario not that unlikely in the case of intermediation services). The TOR network utilizes multilayer encryption and relay techniques (the name is a reference to encryption layers arranged in an onion-skin fashion). Since TOR is a network, it offers anonymity not only to individual users, but also to entire servers, which allows for setting up permanent black-market servers with restricted third-party access. This makes the Deep Web a perfect location for all manner of clandestine platforms to support exchange of such commodities as arms and weapons, drugs, digital content, etc. The TOR network is not impermeable, but the tracing procedures involved are quite complex and can only be used to locate servers, with no capacity to identify and track individual users (Murdoch, Danezis 2006).

Another approach is to mask the data traffic through the use of virtual tunnelling techniques between the existing Internet nodes. The functionality of Virtual Private Network (VPN) services provides methods for tunnelling data traffic into concealed streams to make an impression of a direct and non-intermediated connection between two physical machines in a network. If such solutions are additionally equipped with basic cryptographic techniques, the content of such streams is completely resistant to external capture. The authorities may, however, block the access to VPN servers, as clearly evidenced by the Chinese Golden Shield Project of mass surveillance (Wei Chun Chew 2018).

One of the most important consequences of the relative user anonymity in networks is the decrease in transparency. This, in turn, stimulates the development of black-market transactions. Virtual commodities are particularly susceptible to this form of misappropriation. With reproduction cost reduced to zero, the modern masking and anonymization techniques allow for unrestrained exchange of all types of digital content, from films and audio files, through e-books and other digitized publications, up to .STL files. Aside from the more straightforward forms of piracy or intellectual property theft (Czetwertynski 2017), such exchange may also include illegal content, such as child pornography, weaponry designs, DIY instructions for home production of explosives and psychoactive substances, and so on.

In addition, as already noted, some of the TOR functionalities allow for effective design and operation of permanent networking platforms of support for global exchange of black-market commodities. These, in association with the existing cryptocurrency solutions, offer unrestrained access to global transactions and exchanges which are completely under the radar of any relevant authorities. The only practical obstacle to this trade can be observed with regard to the shipment phase (naturally, this applies only to physical goods). Tracking of transport, deployment or reception of such goods is the sole method available to the authorities willing to capture the transaction.

The volume of Black-Market Exchanges in a Network Economy

For obvious reasons, total volume of black-market transactions is difficult to assess in practice. After all, each and every participant of such exchanges wants to remain anonymous. In addition, the authorities' potential for effective tracking of financial transfers is fairly limited. Hence, the bulk of data available for this segment is produced from forecasts based on anonymous surveys or from extrapolation of police and surveillance reports.

The majority of data available on black market transaction applies to the illegal trade in virtual commodities. The BSA Global Software Survey report is by far the most often quoted source of

information on this segment. The latest edition of the report was based on 22.5 thousand survey responses from 32 countries. The survey findings are employed to calculate estimations of both the volume and the value of unlicensed software installed on personal computers across economies. For Poland, the indices for 2017 suggest that 46% of software installations were unlicensed, and represented an estimated value of 415 million USD. In comparison, the index for the entire EU area was 26% (to a total estimated value of 10.5 billion USD. Thus, it may safely be assumed that only one in every two copies of software installed in Poland comes from a legal source. However, a noticeable decrease of this trend can be observed in the long perspective, as evidenced by the following regression of the index for Poland: 48% in the year 2015, 51% in 2013, and 53% in 2011, and valued at an estimated 447, 563, and 618 million USD, respectively (BSA 2018). Similar trends can be observed for the entire EU area and for each of the countries included in the survey. The main reason for this development is sought in the wide proliferation of software installations based on cloud distribution, i.e. installed and operated in a virtual space controlled by the software provider. This solution allows for effective elimination of the problem of unlicensed use, as each software session requires direct permission from the supplier.

A slightly different scenario can be observed on the black market of illegal psychoactive substances, commonly referred to as drugs. According to a report by the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA), the asynchronous character of network interactions stimulates the development of the following effects: increased organizational and technological complexity of criminal groups; cooperation, coordination and trade specialization between groups; globalization and development of new technologies improving the pace of changes in drug supply, expansion to new (i.e. geographically distant) markets (2016).

Cannabis is by far the most popularly used psychoactive drug offered on the black market in Europe, with a 38% share in the drugs category, and an estimated value of between 8.4 and 12.9 billion EUR. Bracket values are used to signify that the estimates are based on extrapolation of data obtained from police reports. The remaining drugs (in the order of demand) sold on the European black markets are: heroin (28% share in the segment, to an estimated value of 6.8 billion EUR), cocaine (24%, 5.7 billion EUR), amphetamine (8%, 1.8 billion EUR). There is also a notable increasing trend observed on the market, in the form of new 'designer drugs', also referred to as 'legal highs'. In 2015, ca. 100 such substances were identified on the market, with more than 560 identified in 2017 (EMCDDA 2016).

In the case of illegal drugs, economy networking processes seem to stimulate the development of black markets. With regard to cannabis, black market transactions via the Internet are no longer limited to illegal supply of the finished product, as this form of distribution has already expanded to cover other related products or by-products, including a wide assortment of hemp seeds for home-growing purposes. In addition, the network-facilitated ease of access to expert information on methods of hemp cultivation and processing has resulted in a dramatic increase of local production of the drug. Similar effects can be observed in relation to amphetamine production, since the availability of information (coupled with modern technological possibilities) makes it possible to synthesize the drug at home, and from easily accessible by-products.

Other factors – but also clearly associated with the digitalization of economies – can be identified in the context of the observed increase in illegal supply of heroin and cocaine. According to the EMCDDA, the notable increase in drug shipment impound reports, coupled with a similar increase of large impounds (upwards of 100 kg of product) and the fact that such seizures have no observable effect on the markets, can be seen as evidence of the persistent saturation of drug supply. The use of the Internet in this case may focus on providing close coordination of activities between criminal groups, particularly those associated with tracking and protection of shipments, resulting in impressive logistic improvements and, consequently, leading to a rapid increase of drug traffic. Despite these efforts, transport of the physical product remains the most prominent barrier to the development of drug trade.

Another important phenomenon to facilitate the development of black markets in networked economies is the gradual replacement of national currencies by modern cryptocurrencies. Main properties of cryptocurrencies include dispersion and encryption of bookkeeping records and the virtual character of

this particular pecuniary instrument. Modern cryptocurrency solutions are organized around nodes (wallets); each of these can only be fully accessed by a single user – holder of a unique, encrypted key (Nakamoto 2009). In effect, the user has full control over its content, just as they do with respect to cash resources held in a regular wallet. Each transaction held within a cryptocurrency system (and there are many, with at least a dozen representing significant market capitalization) is registered by means of internal algorithms and securely stored in the respective nodes. In theory, this mechanism offers potential for tracking individual financial transaction. In practical applications, such a scenario is highly unlikely, due to the decentralized and global character of cryptocurrency systems. This fact alone makes the instrument an ideal choice for settling illegal transactions on black markets.

However, there is a notable lack of hard data available to directly confirm the above observations. All we have at our disposal is traces and hints of present developments, raised, among others, in a report by the European Union Intellectual Property Office (EUIPO), of "activities based on modern coding technologies, such as TOR and the virtual Bitcoin currency, employed for criminal misuse of intellectual property for gainful purposes and in concealment from the authorities" (2017). The present capitalization of the global market of cryptocurrencies is estimated in the range of 830 billion USD, and is assumed to reach the threshold of 1 trillion USD by the end of 2018 (Comparic.pl 2018). Thus, assuming that only 1% of transactions conducted and settled by means of cryptocurrency instruments represent traces of black-market operations, their total value will still be in the vicinity of 10 billion USD.

Conclusions

Summing up the above considerations, it must be remembered that black market operation can only proceed in the context of largely reduced transparency or the lack of it. The assumed relative anonymity of Internet users is the main stimulus for the development of non-transparent procedures and expansion of black-market activities in modern networked economies. This development is also facilitated by the marginal or negligible cost of reproduction (in the case of virtual commodities). Modern masking technologies offer the prospect of 'concealing' the activities of not only individual users, but also entire servers as potential platforms for global black-market exchanges.

For these reasons, it becomes increasingly more difficult to ensure effective identification and control of such forms of exchange by the respective authorities and services of the state. Similarly, these types of markets are naturally devoid of basic protection against fraud (no transaction guarantees can be offered) and offer no safeguards against proliferation of socially undesirable commodities. Moreover, the considerable fragmentation of supply (particularly in relation to virtual commodities) hampers the potential to track and penalize each and every transaction made. The deterioration of the regulator role on black markets can also be attributed to the decentralized nature of the Internet and to the fact that these types of activities often surpass the limits of national jurisdictions, to the effect of hampering investigation and penalization procedures.

The emergence of cryptocurrencies also seems to clearly favour the effective development of digital black markets.

Virtual currencies of tangible pecuniary value are an ideal solution for the support of illegal trade. Since these forms of pecuniary instruments are issued outside the existing system of public monetary institutions, no formal control from state authorities can be established over such a resource.

Consequently, the bulk of policing interventions and investigations is focused on effective capture of physical shipments of black-market commodities. In other words, police operations seem to emphasize seizures of mass transports of high value merchandize, such as drugs and weapons. However, the criminal world is quite apt in adopting the wealth of new technologies to eliminate even this weak link in their operations. According to many experts specializing in drones (unmanned aerial vehicles – UAV), modern aerial devices may already serve to transport packages of several dozen grams over large distances, including border crossings and checkpoints. In fact, these methods are already employed in practice by criminal groups (Gazeta Prawna 2016). Making use of flight route automation

and destination programming capabilities offered by most devices of this type, the sole risk for perpetrators is the potential loss of a drone. While drones can only be used to shop small quantities of products, they are inexpensive and their movement is automated and unrestrained. These attributes make them perfect for making repeated flights over short distances, resulting in a fairly effective accumulation of the total value shipped in this manner.

Acknowledgment

This research was founded by the InterEkon project, implemented at the University of Economics in Wroclaw, financed by Ministry of Science and Higher Education, from the program 'Regional Initiative of Excellence' for the years 2019-2022.

Abstract

Industrial revolution 4.0 (IR4) has quickly shifted the skill sets required in the workplace and employability skills are the elements employers demand from the fresh graduates. Given this shift in skill sets, it is important to determine whether employability skills will affect the recruitment-base decisions of employers with respect to fresh graduates. The focus towards employability skills in this study was directed towards information competencies, system competencies and technology competencies which were adopted and modified from the SCANS (1991) model. The population of this study is the person in charge who make decision in recruitment, which are employers in Malaysia. Member of Malaysian Employers Federation (MEF) are invited to be the respondents and this research paper is specifically focusing on manufacturing sector employers. A self-administered questionnaire was employed as the data collection instrument, also adopting a purposive sampling method to collect and analyse the data and hypotheses were formulated and tested in order to achieve the aim of the study. The findings of this study demonstrated that employability skills have a significant positive relationship on recruitment-based decisions, implicating that manufacturing employers need to assess the employability skills of fresh new graduates when making recruitment-based decisions. The results of the descriptive analysis also demonstrated that all three specific employability skills were essential in the context of fresh new graduates as well based on the views and opinions of manufacturing employers. Additionally, technology competencies were perceived as the main employability skill that employers seek when recruiting fresh new graduates.

Keywords: Industrial Revolution 4.0, Employability Skills, Recruitment Decision

Introduction

Industrial Revolution 4.0

Industrial revolution 4.0 (IR4) has rapidly advanced on a global scale to many countries, including Malaysia causing wide-ranging disruption to labour markets (World Economic Forum, 2016). Most professional occupations, as a result, are undergoing transformation through the adjustment of many industries (World Economic Forum, 2016) where many jobs are now becoming vulnerable to this change due to replication and the need to transform the necessary skill sets. It is estimated that due to IR4 together with other demographic and socio-economic changes occurring simultaneously, this will cause a loss of more than 5 million jobs in 15 major developed and emerging economies (Cann, 2016).

The World Economic Forum (2016) has reported the net employment outlook based on job families between 2015 and 2020 in Mexico, India, Australia, China, Germany, the United Kingdom (UK), Brazil, Italy, Japan, South Africa, the Association of Southeast Asian Nations (ASEAN) – including Malaysia, the Gulf Cooperation Council (GCC), Turkey, France and the United States (US). There are

2 million total gain of jobs in few smaller job families and 7.1 million total loss of jobs where two thirds sources from the Office and Administrative job family (World Economic Forum, 2016).

Nevertheless, given the exponential vastness of the digital age has yielded unfamiliar technologies, there is a need to anticipate and prepare for the need to gain new skills and acquire new knowledge (Ministry of Higher Education Malaysia, 2018). Specifically, the employability skills that are required for the workplace will undoubtedly transform, given the penetration of the IR4 in society. Sani (2017) mentioned that the problem of Malaysia is surrounding the shortage of skills that new jobs will demand. Thus, graduates in Malaysia will need to quickly adapt and acquire digital-focused skills which will help to identify future marketability (Ministry of Higher Education Malaysia, 2018).

Manufacturing Sector in Malaysia

Manufacturing sectors play an essential role in transforming Malaysia into an industrialised nation and as a major player in the global value chain. The Malaysian manufacturing industry is one of the most important and influential economic sectors that contributes to the nation's GDP (Department of Statistics Malaysia, 2019b) and according to Ministry of International Trade and Industry (2018) its growth has led to attract investments, create business opportunities in the related services sectors and downstream activities as well as stimulate jobs. According to the Department of Statistics Malaysia (2019), in the third quarter of 2019, the manufacturing sector comprised of around 2.286 million jobs, contributing to 26.42% of total jobs in Malaysia. Further, the expectation within the industry is to leverage the high proportion of jobs in the labour market. As such, this study focuses on the manufacturing sector in the context of Malaysia.

According to the Industry4WRD framework, in order to realise Malaysia's vision for the manufacturing sector to embrace IR4, one of the national goals relates to the growth of labour productivity and the shift factor is belong to people (Ministry of International Trade and Industry, 2018). Additionally, the enablers that determine the strategies for producing future talent fall under the category of skills and talent. This strategy requires that students are equipped with the needed skillsets to work in the industry 4.0 environment to ensure the availability of future talent. Notably, one of the strategic outcomes is to equip graduates with relevant and practical industry 4.0 skills.

Therefore, based on the above discussion, fresh Malaysian graduates are encouraged to equip themselves with employability skills to meet future demands. Indeed, this will also assist and support the recruitment needs and decisions of Malaysian manufacturing employers under IR4. Thus, this study aims to measure the relationship between employability skills and recruitment decisions. If employability skills result in a positive outcome regarding employment, the expectation of employers is equally important since they are ones making the recruitment decision. Then, the employability skill (s) that Malaysian employers perceive to be the criteria in making recruitment decision towards fresh graduates is also important to be identified.

Literature Review

Employability Skills

In order to remain competitive, graduates must cater to changes in the emerging workplace, as mentioned by Malaysia's Deputy Minister of International Trade and Industry (The Star Online, 2019). Thus, contemporary employability skills are essential in preparing fresh graduates for IR4.

Employability skills can be defined as skills required to acquire, retain and perform well in a job (Robinson, 2000). Although in this context, employability skills are not specific to a job in general but cut across all job levels within both industries and business (G. K. G. Singh & Singh, 2008). Many researchers have named employability skills like soft skills, generic skills, transferable skills, non-technical skills, necessary skills and core skills (Singh et al., 2013; Ncver, 2003). Further, employability skills are instilled in each individual to produce a productive workforce (Kazilan et al., 2009) since

these are the skills that most people need in performing almost any job (UKCES, 2009). Different counties named employability skills with different terms. For instance, the US names employability skills as necessary skills, Workplace know-how and basic skills, while the UK names it as Common skills, Core skills and Key skills (Wibrow, 2011). Additionally, Canada uses the term employability skills, while France names it as transferable skills (Alrifai & Raju, 2019).

Nevertheless, the most cited employability skills set is sourced from SCANS (1991) which consists of information skills, thinking skills, interpersonal skills, basic skills, system and technology skills, resources skills, and personal quality (Husain et al., 2010). In this research paper, only three competencies are referred to from SCANS (1991) which are information competencies, system competencies and technology competencies due to their relevancy to IR4. This is also supported by Agolla (2016) where education for smart manufacturing and the evolution of IR4 is defined as technology literacy, information literacy, etc., which implicate the relevancy of the competencies mentioned above regarding IR4.

Information Competencies

The function and role played by of information competencies are to gain and apply information in which the elements of information competencies are acquires and evaluates information, organizes and maintains information, interprets and communicates information, and uses computers to process information (SCANS, 1991). Due to IR4, skills acquired to analyse data are anticipated in the workforce as new skills (Aulbur et al., 2016). In the report, the ability to work with data is important and comprises of the ability to process and analyse machine-generated data and information, basic statistical knowledge, and understanding visual data output in making well-informed decisions. This statement is also demonstrated by IR4, which requires expertise to work especially with information from both production and skilled managerial labor (Grzybowska & Łupicka, 2017).

Additionally, not only the emergence of new skills makes information competencies to be important, the CEO of Hays Recruitment mentioned that there are an increase in the number of data-related roles due to the growth of digital information accelerated via the internet (Hays, 2018). As such, this further increases the importance of acquiring information competencies. According to the CEO of Hays, business data without insights adds no value whatsoever. Hence, with the aid of professionals in transforming zeros and ones into feasible insights, new opportunities are generated which are yet to be discovered by human eyes. Hence, it is anticipated that information competencies are one of the employability skills that employers seek when recruiting fresh graduates. Also, due to the need to develop human capital having adequate digital and data literacy in IR4, students from different disciplines will be required to become more literate in the field of data and digital (Haseeb, 2018).

System Competencies

Not to mention, according to SCANS (1991), system competencies can be described as the ability to understand complex inter-relations and elements to understands systems, monitors and corrects performance, and improves and designs systems. According to Aulbur et al. (2016), system skills and cognitive abilities will become more prominent in a vast proportion of jobs rather than simply having physical abilities as key work-related skill sets. The report also describes system skills as one of the subcategories of key work-related skills which incorporate several elements: judgement and decision making, and system analysis. This skill category is recognised as one of the topmost skills relating to three skills expected to in high demand in future and will persist among key work-related skills. Notably, this is because IR4 signifies the growth of digitalisation in the value chain and the emerging interrelationship of objects, people and systems via the exchange of real-time data (Grzybowska & Łupicka, 2017).

According to Rasul & Puvanasvaran (2009), system skills are considered essential for employers from within the manufacturing industry in Malaysia. In future, challenging jobs which are monotonous and ergonomically hazardous will be reduced substantially (Aulbur et al., 2016). This will invariably lead

employees to share jobs with intelligent robots, although skilled employees will continue to make the final decisions, while the artificially intelligent assistant systems will support the work. Aulbur et al. (2016) mentioned that teamwork would be pivotal, not only across horizontal and vertical levels but also with assistant systems at the actual workplace.

Moreover, teamwork with the assistant systems will increase the demand for system-based competencies as employability skills that employers seek when hiring fresh graduates. In addition, the advantage of such systems as mentioned by Aulbur et al. (2016) is where the assembly system is controlled by the remote server autonomously in auto-equipment manufacturers (OEM) and will consequently benefit the company in removing human error, leading workers to choose the correct parts based on the car model. This advantage will further boost the application of system in companies and causes the importance of system competencies in employees to be risen.

Technology Competencies

The tools, technologies and machines utilised will also differ from conventional types due to a higher level of automation and interconnectivity within the manufacturing process via IR4 (Aulbur et al., 2016). Consequently, for every industrial revolution that occurs, the skills required will likewise change, and therefore HEIs must equip graduates to handle new technologies (Mustafa, 2018). In other words, technology competencies will be the competencies that employers seek in future. Technology competencies can be defined as the ability to perform with different types of technologies, in which the elements are selects technology, applies technology to task, and maintains and troubleshoots technology (SCANS, 1991).

Similarly, businesses will continually seek those individuals who can apply artificial intelligence (AI) technology in a consumer context such as AI developers (Hays, 2018) which reflect the requirement of technology competencies in the workplace. This is supported by Aulbur et al. (2016), in which skills in the field of information technology (IT) will be expected in the workforce as new skills given the advent of IR4. One of the sections in their report listed that knowledge about information, communications and technology (ICT) is important in IR4 which includes the knowledge of basic IT aspects and having the ability to employ and interact with smart machines and computers such as robots and tablets and understanding machine to machine communication. In Malaysia, employers with the manufacturing industry also consider technology skills to be important (Rasul & Puvanasvaran, 2009). As mentioned above, IR4 will result in intensifying the application of automation and robotics since these robots are able to function with higher accuracy and more efficiently compared to humans (Aulbur et al., 2016). As such, technology competencies will increasingly be emphasised by employers during the recruitment process.

Recruitment Decision

Before making recruitment decision, employers will take the candidates related information to form the impression towards the candidates. After that, the impression formed by the employer will be compared with the company's requirement for employees before a decision is made to progress to the next stage in the recruitment process. According to the Conference Board of Canada, employability skills are known as skills, attitudes and behaviours that employers look for in employees (Nasir et al., 2011).

Similarly, the Science, Technology, Engineering, and Mathematics Network (STEMNET) compile the Top 10 Employability Skills regularly, in which UK based companies look for in potential employees such as companies like Accenture, AstraZeneca, BP, Cobra, Cogent, Shell, Nokia, and Siemens. STEMNET (2017) defines employability skills as transferable skills that are important enabling an individual to be "employable" and enabling the individual to perform a task to the best extent of their competence, while Saterfiel & McLarty (1995) refer to employability skills as the skills required for acquiring and retaining a job. As mentioned above, employability skills are required to make the workforce productive, and a productive workforce is what employers are looking for from candidates.

Thus, it can be hypothesised that there is a significant positive relationship between employability skills and recruitment decision.

H_A: There is a significant positive relationship between the employability skills and recruitment decision.

Due to the emergence and penetration of IR4, employability skills such as information, system and technology competencies are stressed. Additionally, graduates should aim to equip themselves with relevant and practical IR4 skill sets. As such, it is predicted that these skills will contribute to employability skills, resulting in a positive significant relationship with recruitment decisions.

Research Methodology

This research paper examined the effect of employability skills on the decisions made by employers when hiring fresh graduates. Moreover, in achieving this aim, it was important to gain the opinion of employers having the authority in making recruitment decisions. Here, members of MEF were invited to participate in a survey. In this research, manufacturing sector employers were the primary focus given the vast range and number of jobs in this sector. As such, it was anticipated that by examining the opinions of employers within this sector would offer further insight into the issues and implications in their ability to leverage from a high proportion of jobs in the labour market. In this study, a purposive sampling method was adopted.

The most effective means to quickly gather data is via a survey questionnaire which has the ability to reach many respondents at a single point in time (Hair, Celsi, Money, Samouel, & Page, 2011). Hence, a self-administered questionnaire was developed for respondents to answer without human intervention from the researchers of this study. The exogenous variable of this study signified the employability skills that contributed formatively by Information Competencies, System Competencies and Technology Competencies, while Recruitment Decision acted as the endogenous variable, which was the core element of this study. The measurement items for the variables, such as information competencies, system competencies and technology competencies were adopted and modified from the SCANS (1991) model given the well-established elements that have been widely used by other researchers. While the Recruitment Decision items were adopted and modified from the previous studies such as Ang et al., (2013). The reliability and validity of the measurement items for this research were confirmed via conducting a pilot test before the actual data collection process began.

Findings and Discussion

Findings

Descriptive Analysis

Table 1: Demographic Profiles of the Respondents and Company Information

	Category	Frequency	Percent
Gender	Male	29	35.4
	Female	53	64.6
Age	Below 30 years old	13	15.9
	31-40 years old	19	23.2
	41-50 years old	31	37.8
	Over 50 years old	19	23.2
Highest Education Level	Diploma's degree	11	13.4

	Bachelor's degree	45	54.9
	Master's degree	25	30.5
	Others	1	1.2
Working Experience	< 5 years	10	12.2
	5-10 years	14	17.1
	11-16 years	8	9.8
	> 16 years	50	61.0
Number of Employees	5-29 employees	4	4.9
	30-74 employees	7	8.5
	75 employees	1	1.2
	76-200 employees	15	18.3
	>200 employees	55	67.1

The total number of respondents in this research was represented by 82 of manufacturing employers, in which the majority were female (64.6%). More than 50% of the respondents held a bachelor's degree, with the proportion of other education levels, such as holding a master's degree, diploma/degree and others constituted 30.5%, 13.4% and 1.2% respectively. Sixty-one per cent of respondents were aged above 40 years, which was aligned with the proportion of respondents having more than 16 years of working experience. From these statistics, it was predicted that most of the respondents began work at 24 years of age, which is the graduation age from acquiring a bachelor's degree. This explained the high proportion of bachelor degree holders from among the respondents. Also, since the respondents were manufacturing employers, thus it was not surprising to see that the number of employees for most organisations was predominantly more than 200 employees.

Table 2: Mean and Standard Deviation of the Indicators and Variables

Coding	Indicators	Mean	Std. Deviation
Information Competencies		4.3140	.55945
Information1	acquire and evaluate information.	4.33	.630
Information2	organize and maintain information.	4.30	.642
Information3	interpret and communicate information.	4.28	.594
Information4	use computers to process information.	4.34	.652
System Competencies		3.9715	.68534
System1	understand systems (social, organisational and technological systems).	4.11	.720

Technology Competencies		4.0203	.69556
Technology1	select technology that will produce desired results.	4.04	.728
Technology2	apply technology to the task.	4.06	.709
Technology3	maintain and troubleshoot technology.	3.96	.777
Recruitment Decision		4.0650	.80455

Decision1	I would hire fresh graduates if there is an opportunity to do so.	4.30	.715
Decision2	I am willing to hire fresh graduates for my organisation.	4.20	.838
Decision3	I expect to hire fresh graduates for my organisation.	3.94	.960
Decision4	I want to hire fresh graduates for my organisation.	3.98	.942
Decision5	I intend to hire fresh graduates for my organisation.	3.96	.895
Decision6	I will hire fresh graduates for my organisation.	4.01	.923

As depicted in Table 2 above, Information Competencies was measured through four indicators which acquired the highest overall mean score of 4.3140. With a mean score ranging between 4.28 and 4.34 made it the most important employability skill for fresh graduates as agreed by the employers. In other words, Information Competencies is signified as the most important skill among the three specific employability skills. The second employability skills considered important among the employers was Technology Competencies, which was measured via three indicators having an overall mean score of 4.0203. The highest mean score among the indicators of Technology Competencies was "apply technology to the task" (mean = 4.06, SD = 0.709).

Although System Competencies which was measured with three indicators, had the lowest overall mean score, the value was approximate to 4.0 and was above the neutral level. System1 "understand systems (social, organisational and technological systems)" was the topmost indicator which contributed to System Competencies. This was because the manufacturing employers perceived that understanding systems was a fundamental skill in System Competencies. Thus, it signified the indicator having the highest mean score for System Competencies. There were six indicators measured under the construct of Recruitment Decision in which the overall mean score was 4.065. This implied that employers had the intention to hire fresh graduates if the opportunity was presented.

Inferential Analysis

Measurement Model

First Order Construct

Figure 1: First Order Construct

All first-order constructs, as shown in Figure 1, such as Information Competencies, System Competencies, Technology Competencies, and Recruitment Decision, are represented in a reflective mode. The reflective measurement model consisted of two steps: internal consistency and convergent validity, in addition to discriminant validity.

Table 3: Internal Consistency and Convergent Validity

Construct	Items	Loadings	CR	AVE
Information Competencies	Information1	0.92	0.939	0.795
	Information2	0.936		
	Information3	0.92		
	Information4	0.783		
System Competencies	System1	0.888	0.91	0.771
	System2	0.891		
	System3	0.855		
Technology Competencies	Technology1	0.944	0.96	0.89
	Technology2	0.961		
	Technology3	0.925		

Recruitment Decision	Decision1	0.827	0.967	0.832
	Decision2	0.935		
	Decision3	0.919		
	Decision4	0.948		
	Decision5	0.925		
	Decision6	0.913		

Table 3 indicates that composite reliability (CR) for all constructs are higher compared to the minimum value of 0.70, and the AVE, which is greater than the threshold value of 0.50. Therefore, it was concluded that all first-order reflective constructs achieved reliability and convergent validity. Next, two criteria were employed to evaluate the discriminant validity of the measurement model in a reflective mode which was Fornell-Larker Criterion and HTMT.

Table 4: Fornell – Larker Criterion

	Information Competencies	Recruitment Decision	System Competencies	Technology Competencies
Information Competencies	0.892			
Recruitment Decision	0.273	0.912		
System Competencies	0.655	0.194	0.878	
Technology Competencies	0.541	0.298	0.664	0.943

Table 5: HTMT

	Information Competencies	Recruitment Decision	System Competencies	Technology Competencies
Information Competencies				
Recruitment Decision	0.289 CI.90 (0.126, 0.455)			
System Competencies	0.743 CI.90 (0.623, 0.830)	0.21 CI.90 (0.086, 0.381)		
Technology Competencies	0.583 CI.90 (0.423, 0.712)	0.311 CI.90 (0.126, 0.475)	0.745 CI.90 (0.606, 0.848)	

According to Fornell & Larcker (1981), the square root of AVE for the construct should be greater than the correlation of the construct with other constructs. In Table 4, all diagonal areas which represent the square root of AVE for the constructs are larger than the off-diagonal area, which represents the correlations of the respective constructs with other constructs. Hence, the discriminant validity of the reflective measurement model was achieved.

HTMT was a further criterion used to evaluate discriminant validity for the measurement model in reflective mode. HTMT is defined as the ratio between trait correlations to the within trait correlations. HTMT value greater than 0.90, and the confidence interval consisting of the value of 1 at a 90% confidence level indicates a lack of discriminant validity (Henseler, Ringle, & Sarstedt, 2015). From

the HTMT in Table 5, it can be surmised that all HTMT values were less than 0.90 or even less than the conservative threshold value of 0.85. At the same time, the confidence interval did not contain a value of 1 on any construct. Therefore, this result further supports the achievement of acquiring discriminant validity of the measurement model.

Second Order Construct

Figure 2: Second Order Construct

Since the first-order construct had achieved a satisfactory level, the analysis continued with the second-order construct assessment by attaining a computed latent variable score. Figure 2 presents the Employability Skills as the second-order construct measured with three formative indicators, namely Information Competencies_LVS, System Competencies_LVS and Technology Competencies_LVS.

Table 6: Formative Measurement Model

Construct	Items	VIF	Weights	t-value weights	sig
Employability Skills	Information Competencies_LVS	1.814	0.625	1.667	0.096
	System Competencies_LVS	2.294	-0.359	0.681	0.496
	Technology Competencies_LVS	1.854	0.786	2.054	0.04

Since the second-order construct was a formative construct, a formative measurement model assessment was carried out. Here, two forms of analysis were used to assess the formative measurement model, which were collinearity among the indicators in addition to the significance and relevance of the formative indicators. The results, as shown in Table 6 above, demonstrate that all VIF (outer) of the respective formative indicators were below the threshold value of 5, suggesting that the formative indicators were free from a collinearity issue.

For the formative indicators' significance and relevance, Technology Competencies_LVS was shown to have significant outer weights while the remaining two formative indicators for employability skills had insignificant outer weights. As mentioned earlier, these three employability skills were sourced from well-established and the most cited employability skills sets in the SCANS (1991) model. The popularity of these employability skills sets adequate to confirm the validity and reliability of these three competencies in contributing to the employability skills construct. Although the statistical analysis showed the insignificance of Informative Competencies_LVS and System Competencies_LVS contributing to the construct of Employability skills, both indicators were retained based on theoretical support and evidence.

Structural Model

Following confirmation of the satisfactory results in the first and second-order constructs, the analysis proceeded with structural path model estimation. The first step of the structural model assessment was conducting a lateral collinearity assessment used to ensure that two variables, hypothesised to be in a causal relationship, are measuring different constructs.

Table 7: Lateral Collinearity Assessment (Inner VIF)

	Recruitment Decision
Employability Skills	1

Since one construct, Employability Skills predicts the Recruitment Decision, only one (1) Inner VIF is presented in Table 7, which is lower than the threshold value of 5. This result indicates that the lateral collinearity (Inner VIF) is not shown to be at a critical level. Hence, the evaluation of the structural model could proceed.

Table 8: Hypothesis Testing

Hypothesis	Relationship	Std. Beta	Std. Error	t-value	Decision	R^2	f^2	Q^2	q^2
H	Employability Skills → Recruitment Decision	0.336	0.092	3.644	Supported	0.113	0.127	0.079	0.086

Once confirming that the structural model was free from a lateral collinearity issue, only path model estimation needed to be conducted. The result, as shown in Table 8, indicates that there is a significant positive relationship between Employability Skills and Recruitment Decision with t-value larger than 1.645 at the significance level of 0.05. Also, the R^2 value of the endogenous construct Recruitment Decision is 0.113, which suggests that the exogenous construct - Employability Skills explains an 11.3 % variance in the Recruitment Decision. According to Cohen (1988), if the R^2 value 0.113 is less than 0.13, the model is signified as weak. Here, the effect size, f^2 is equal to 0.127 which is less than 0.15 which represents a marginal effect regarding Employability Skills in producing the R^2 for Recruitment Decision.

Furthermore, a blindfolding procedure was employed to examine the predictive relevance of the model; Q^2 where the value greater than 0 is considered to achieve predictive relevance to the endogenous construct. The value of 0.079, which is above 0 is evidence that the model is sufficient regarding predictive relevance. For the values of 0.086 in q^2 this indicates that employability skills have a small predictive relevance on Recruitment Decision.

Discussion

From the results as mentioned, it can be concluded that employability skills will positively affect the recruitment decision of manufacturing employers with respect to fresh graduates. The results also support the research undertaken by Fulgence (2015) where employers' expectations during the interview process were mostly grouped into the broader aspects of employability skills, and most preferenced factors that influenced the recruitment decision was communications skills which fell under the category of employability skills.

Moreover, among the three specific employability skills, Technology Competencies was the skill that significantly contributed to the employability skills construct. Therefore, it can be concluded that Technology Competencies is the dominant employability skill that explains the positive effect of employability skills on recruitment decisions. That is to say; Technology Competencies is the main employability skill that manufacturing employers are seeking when hiring fresh graduates. The rationale of manufacturing employers in seeking fresh graduates having Technology Competencies is due to the emergence of IR4. Also, the technologies utilised in IR4 are distinctly different, given the high level of automation and interconnectivity in the manufacturing process (Aulbur et al., 2016). Thus, graduates as the future workforce are urged to handling new technologies causes the accelerating importance of Technology Competencies among the fresh graduates that never happen before.

In this research, Information Competencies was found to be the most dominant employability skill for fresh graduates. This finding is also supported from the qualitative research findings of Head, Van Hoeck, Eschler, & Fullerton (2013) where they found that the majority of employers have similar expectations regarding the baseline with respect to information competencies since nearly all the employers in the study expected candidates to have the ability to search online. Even though Information Competencies is one of the important employability skills that manufacturing employers are seeking from fresh graduates, it is not the main skill that employers consider during the recruitment process. The reason is that manufacturing employers perceive information competencies as a necessary skill that fresh graduates will already possess from the education programme of HEIs. Thus, employers anticipate that every fresh graduate would possess these skills. Due to the common of information competencies among fresh graduates, the employers will not take information competencies as the differentiator in evaluating the fresh graduates although it is important in the eyes of manufacturing employers.

With regards to system competencies, manufacturing employers agree that this skill is important for fresh graduates. However, on the other hand, the negative outer weights in this study implicate that employers do not consider system competencies as the criteria when recruiting fresh graduates. This phenomena is because manufacturing employers perceive that system competencies is important for fresh graduates because it will benefit them in the future due to the need for doing space sharing with intelligent robot (assistant systems) (Aulbur et al., 2016). However, it is not important to the extent that employers will consider it as the criteria because the importance level is not that high as compare to information competencies and technology competencies. System competencies acquired the lowest level of agreement from manufacturing employers based on its importance towards fresh graduates because system competencies are perceived as being more technical, which is not a requirement for an entry-level position within these organisations.

Conclusion

Overall, employability skills are perceived as an important factor for fresh graduates to acquire and to gain successful employment in the competitive labour market nowadays given the emergence of IR4. The literature review provided further insight regarding information competencies, system competencies and technology competencies which are important employability skills given IR4. This was also supported via the descriptive analysis conducted in this study, indicating that all three specific employability skills relevant to IR4 are important for fresh graduates to acquire based on the opinions and views of manufacturing employers. Notably, Technology Competencies was shown to be the main employability skill emphasised by the manufacturing employers when making a decision to recruit fresh new graduates.

Nonetheless, based on the findings and results of this research, the practical implication suggested in this study is that fresh graduates should enhance the development of their human capital by acquiring appropriate and needed employability skills that manufacturing employers are demanding in the workplace which include Information Competencies, Technology Competencies and System Competencies. Accordingly, these employability skills sets will enable new graduates not only to be successful in obtaining job offers but also to survive in uncertain workplaces transformed through IR4.

From the perspective of the education provider, higher education institutions (HEIs) should conduct training with respect to the development of employability skills relevant to IR4, as part of the syllabus given these employability skills are increasingly important and needed in the workplace. Additionally, it needs to be highlighted that since technology competencies are the main criteria that employers seek during graduate recruitment, the visibility of technology competencies will add further value to fresh graduates following training. Likewise, the evaluation system with a recorded score will enable employers to easily assess the proficiency level of Technology Competencies of graduates. Also, through the implications awarded via IR4 for fresh graduates and HEIs respectively, employers will find it much easier to employ high productive employees in achieving short term and long-term goals of the organisation and also create a competitive advantage in respect to new disruptive technologies and landscape.

There are several limitations inherent in this study which are next discussed, followed by recommendations for future study. First, this study was limited in the generalisability of the findings given the small sample size of respondents employed. Therefore, it is recommended that future research should include a greater number of respondents. In addition, the respondents of this study originated from the manufacturing sector, which restricts the findings of the study in being applicable or implied to the manufacturing industry only. Accordingly, in order to achieve a wider perspective in a future study, the researchers may invite respondents from different sectors to participate in the survey and to compare the perceptions and opinion of employers from different sectors accordingly. Finally, this study focused on the recruitment decision of employers towards fresh graduates. Thus, the insights gained from this study are only relevant with respect to fresh graduates, and not for experienced job applicants.

Reconstructing the Ontological Perspective of The New Institutional Economics on The Basis of Oliver E. Williamson's Hierarchical Model of Institutional Systems – An Attempt

Slawomir CZETWERTYNSKI

Wroclaw University of Economics and Business, Wroclaw, Poland,
slawomir.czetwertynski@ue.wroc.pl

Abstract

This study represents an attempt to reconstruct the ontological perspective of the New Institutional Economics (NIE) on the basis of Oliver E. Williamson's hierarchical model of institutional systems, and supported by elements of the ontological perspective postulated by Leszek Nowak as a specific set of basic statements. The reconstructed ontological perspective of NIE was then employed as basis for scientific analyses performed using the method of idealization and gradual solidification. The analytical findings served to reveal a strong correlation between individualism and holism as a property deeply embedded in the NIE. Apart from the theorygenic benefits, the study was also intended to reinforce and advertise the scientific achievements of the Polish anti-naturalist school of thought in social sciences.

Keywords: NIE, Idealization, Methodology

Introduction

One of the most important challenges in construing new theories, theoretical systems and paradigmatic theories is to provide a clear definition of their fundamental assumptions. Jerzy Kmita (1973, pp. 113-114) in his lecture on statement-proving in formal disciplines of science emphasizes the need for an underlying *axiomatic system*, consisting of axioms (also referred to as *basic statements* or *axiomatic language*). Each successive set of statements designed in the context of a given theory is a direct descendant of the initially adopted axiomatic system. In other words, each new statement is logically derived from the set of basic statements. This property is characteristic for formal sciences. For instance, the essence of Euclidean geometry is directly descended from the set of axioms originally postulated by Euclid. However, properties characteristic for formal sciences do not necessarily take a similar role in the case of empirical or real sciences. The above reservation can also be applied in the case of social sciences, where sets of basic statements are not always precisely delineated. As suggested by Thomas S. Kuhn (1996), social sciences are still in their pre-science phase of development, as evidenced by the lack of formalized and universally adopted sets of basic statements.

This study represents an attempt to reconstruct the ontological perspective of the New Institutional Economics (NIE) on the fundament of a hierarchical model of institutional systems postulated by Oliver E. Williamson. In other words, the main objective of this study was to formulate a valid set of basic statements for the NIE theory. This challenge was approached in the context of two concepts: (1) the ontological perspective by Leszek Nowak (1977b), and (2) the hierarchical model of institutional systems by Williamson (2000). In this case, the ontological perspective concept plays the role of a formal set of basic statements, while the hierarchical model of institutional systems by Williamson provides the substantive content used for the purpose of the attempted reconstruction of the studied theory. Thus formulated, the above objective was supplemented by a hypothesis that the hierarchical model of institutional systems by Williamson may be employed as a fundament for deducing the ontological perspective of the NIE. In line with the above hypothesis, the diagram conceptualized by Williamson may serve as a point of departure for the formulation of basic statements for the entire theoretical system represented by the NIE concept.

Preliminary notes on the object of the study

The object of this study comprises of two fundamental research elements. The first element is represented by the formal diagram of institutional analyses by Williamson, as a vehicle for the reconstruction of the basic statements of the NIE, the other element is the ontological perspective constituting a formal interpretation of the basic statements of the studied system. Thus defined, the object of the study may be considered important for the purpose of our deliberations for two fundamental reasons. Firstly, each theoretical construct requires a set of fundamental statements – these should be conceptualized in accordance with the selected criteria. Secondly, since social sciences (particularly the economic sciences) display a tendency to develop in a fashion which, after Stephen E. Toulmin (1972), can be described as evolutionary, then no specific points of reference are available to mark the onset of each change in the set of fundamental statements describing such theoretical constructs.

With respect to the former, problems can be observed even at the earliest stage involving the selection of criteria to serve as basis for the formulation of the set of fundamental statement. Two of the most widely recognized concepts postulated in the context of fundaments of any science, namely – Kuhn' paradigms (1996) and Imre Lakatos' analytical concept of research programmes (1978) – provide a clear identification of problems in defining that which can be seen a fundament for the entire domain of science. For Kuhn (1996), a paradigm (or, more specifically, its methodological substance) is assumed to play the role of a set of basic statements. However, aside from the methodological substance, it is important to include the sociological one which serves as a set of norms describing the direction of scientific research. Problems encountered by Kuhn in his formulation of the exact nature of paradigms (Masterman, 1970) suggest that it may be quite difficult to establish a clear and conclusive set of basic statements. Kuhn himself was well aware of these shortcomings, as evidenced by his largely futile attempts to formalize the paradigm concept by evoking the concept of *disciplinary matrix* (Blaug, 1992; Chalmers, 2013).

In contrast to the above, and in line with the concept of scientific research programmes by Lakatos (1978), the role of sets of fundamental statements is served by the 'hard core' – a set of unfalsifiable theses that determines the heuristic potential of a given research programme. For Lakatos, the set of theses forming the hard core of a science is quite formalized. The Lakatos' approach is deceptively simple, since it may be supported by straightforward similes, as in the case of the previously evoked Euclidean geometry. Nonetheless, the concept of research programmes aspires to become an example of a rational and formalized concept of development in science (Chalmers, 2013).

Thus, the approaches cited above can be viewed as either exceedingly general (Kuhn) or extremely simple (Lakatos). In addition, in both cases, the principal objective of the philosophical deliberations was to explain the nature of developments in science. For the purpose of studying, construing and reconstructing the theoretical fundaments of science, it may be useful to employ the concept of *ontological perspective* which helps produce a formal and fastidious image of the perspective adopted in our perception of what is real. This constitutes a competitive angle not only to that displayed in the concepts by both Kuhn and Lakatos, but also to any other approach defined by different heuristic properties, as it invites the deployment of the idealization and gradual concretization method as well as the idealized theory of development in science.

With respect to the other issue at hand, it may be quite difficult to produce evidence of scientific revolutions in economic sciences, in the sense postulated by Kuhn. The prospective breakpoints in this realm are neither spectacular nor obvious. On the contrary: the economic sciences are notorious for their tendency to produce elaborate syntheses that serve to recapitulate and unify rather than provide a breaking point in their development. Given such a trend, the existing sets of basic statements belonging to a given theory may in consequence be subject to uncontrolled change or even bypassed. Evidence for this trend can be observed in comparisons between individual philosophical systems and their subsequent synthetic depictions employed in handbooks. One of the best examples of this trend is the striking case of deliberations by John Stuart Mill (1844) associated with the definition of the object of economic policies. The case in question relates to the concept of *homo oeconomicus*, a staple element

of Mill's theoretical system, which has become a shadow of its former significance in the elaborate synthesis by Paul A. Samuelson and William D. Nordhaus (2009). In contrast to modern approaches, Mill's deliberations of an economic man are made without clear definition of the concept of *homo oeconomicus* as such. Moreover, the synthetic approach of mainstream economics or the neoclassical economics does not provide any central element to serve the role of a set of basic statements.

A similar observation can be made with respect to more heterodox approaches to the economic sciences, including the NIE. Handbooks of New Institutional Economics fail to provide evidence of clear and unambiguous attempts to reconstruct the basic statements of the NIE. Naturally, some notes to that effect have already been put forward, and these can be seen as a sort of preliminary endeavours. For instance, Éric Brousseau and Jean-Michel Glachant (2008) present their view on condensed research objectives of the NIE. These authors postulate the use of three fundamental levels of analysis, namely: organizations, contracts, and institutions. And while their approach may certainly be regarded as apt in describing the objectives of research in this area, it does not offer any valuable insight into the fundaments of the NIE. On the other hand, Eirik G. Furubotn and Rudolf Richter (2005) postulate to extend the framework of neoclassical economics with the institutional dimension, which may be interpreted as a suggestion for employing the basic statements of the Neoclassical school to also describe the institutional angle. At the same time, however, they clearly emphasize the futility of perceiving the NIE as an extension of the neoclassical approach. Nonetheless, these attempts can only be interpreted as indications rather than evidence for the reconstruction of basic statements.

Studies of the gnoseologic attributes of paradigms (Motycka, 1980), i.e. processes associated with formulation and dissemination of paradigms, provide indication that paradigms are not formed as deliberately as the rational philosophers of science would like them to be. Oftentimes, a theoretical reconstruction of such collectively formulated constructs is required. In the case of the NIE, deliberations on the gnoseologic attributes have already been put forward (Czetwertyński, 2019b). These are suggestive of an internal opposition between methodological individualism and methodological holism well-rooted in the NIE concept, but with no conclusive determination of the associated set of basic statements. Attempts have also been made to formulate the new paradigm of economic sciences in a more indirect fashion (Godłów-Legiędź, 2010) by evoking the historical development of individual theories constituting the NIE. Professional literature seems to place strong focus on deliberations of classificatory and knowledge-ordering aspects of the broadly defined institutional economics (Hodgson, 1998; Hodgson, 2004; Stankiewicz, 2014; Ratajczak, 1994). One of the most important problems of the institutional approach is the effective differentiation between the 'old' and the 'new' institutionalism. In his demarcation between the 'new' and the 'old' institutionalism, David Dequech (2002) emphasizes the central significance of institutions and the need for a proper definition of institutions, opening up a prospect for making conclusive judgements on the theoretical fundaments of the NIE. Geoffrey M. Hodgson (1998) declares his intent to expose the hard core of institutional economics by depicting *custom* as its central element, but only in the context of his broader analytical discussion on the ways of the 'old' and the 'new' approach to institutionalism. Hodgson (2000) places his focus chiefly on the evaluation of the 'old' institutional economics, with its hard core defined after Walton H. Hamilton (1919) as a set of five basic statements. Nevertheless, and irrespective of any scientific attempts, this particular aspect can still be seen as a cognitive gap that impedes the development of theoretical fundaments of the NIE.

In this author's view, the original character of this study lies in juxtaposing the ontological perspective postulated by Nowak with the theoretical perspective offered by Williamson. The use of Nowak's concept bears a promise of formal reconstruction of theoretical fundaments of science as a method competitive to that offered by the formal hard core concept by Lakatos. This approach can also be described as alternative to the disciplinary matrix concept by Kuhn, although the latter represents more of an outline, as opposed to the fully formed ontological construct by Nowak. In addition, the use of Williamson's diagram of institutional analysis as a fundament of the NIE offers the merit of combining the internal attribution of methodological individualism and holism.

To sum up, the approach presented herein may serve as a premise for further formulation of the theoretical fundaments of the NIE. It was also this author's intention to publicize the achievements of

the Polish school of methodology, with particular emphasis on the anti-naturalistic idea of science. If this approach proves sufficiently effective, it may serve to constitute a cohesive foundation for the formulation of theoretical aspects of the NIE based on the use of the idealization and gradual concretization method.

The ontological perspective offered by the idealization and gradual concretization method

Before we attempt to depict the notion of ontological perspective, it may be useful to address the concept of idealizational theory of science by Nowak (1977b). The theory is based on the central assumption that science (as one of the aspects of human involvement) is aimed at uncovering a prime (central, or the most significant) factor describing a given phenomenon. Thus, it may be seen as a pursuit for the exact nature of phenomena under study – and this task is realized through the use of the idealization and gradual concretization method. The ontological perspective, on the other hand, serves to construe the set of principles of essential stratification and of the ontic referents that determine the process of idealization of a given phenomenon under.

The idealization concept itself, as a tool for the study of social reality, is largely derived from Max Weber's (1978) reflections on the ideal type (German: Idealtypus). In the context of the Polish school of methodology, these views were developed into a stream of anti-naturalistic epistemological concepts. The most important input on the subject can be found in the works of Oscar Lange (1978), Kmita (1973), and Nowak (1977a; 1977b; 1980; 1991), with the latter strongly influenced by the methodological approach postulated by Karl Marx. Nowak was the first philosopher to develop the method of idealization and gradual concretization into a fully-fledged methodological system envisaging the existence of the ontological perspective. The anti-naturalistic view provides for idealization as a necessary supplement to social sciences, due to the wealth of accessory factors that influence the study of economic phenomena. These accessory factors have the effect of obscuring the true image of the socio-economic reality and may lead to erroneous generalizations and formulations of false scientific rules. Many of the views constituting the anti-naturalistic stream have already received recognition from other authors (Hodgson, 1998; Mäki 1992; Mäki 2004).

The method of idealization and gradual concretization, as the name suggests, consists of two parallel processes: that of idealization, and that of concretization or solidification. The former process serves to determine a central factor describing a given phenomenon under examination. Thus, in the process of idealization, a researcher is involved in successive elimination of items from the list of significant factors, with the view of determining the sole element that is crucial for the purpose at hand. This task is typically approached by means of mental elimination (Lange, 1978), or by the introduction of idealizational assumptions (Nowak, 1977b). In general, the process of idealization involves abstraction from the factual conditions observed in reality, with the purpose of discovering the very essence of any studied phenomenon. In effect, it helps deduce a hypothesis and formulate the idealization rule. However, such a rule can only be used to describe an idealized situation. For it to be able to accurately describe a factual situation, the idealization process must be reversed by means of gradual reintroduction of each individual element that has previously been subject to elimination. This process is referred to as concretization, since it involves solidification of the rule to fit the factual state or situation.

The explanatory power of this method rests in the fact that it offers potential for deducing detailed statements from general rules. Successors of the idealization hypothesis represent corrected detailed hypotheses adjusted to fit real and factual situations. Thus, the rules of idealization may be applied to abstract deliberations, but their testing against real situations requires the use of concretization. The mechanics of the idealization and gradual concretization method is, in principle, a relatively simple task, but in order to operate freely at each stage of the idealization and concretization processes, researchers need to adopt certain principles for the selection, segregation and ordering of significant variables. This objective can be served by the use of the ontological perspective. Without adopting such a perspective, it may be impossible to determine the reasons for any observed course of idealization processes.

Hierarchies of factors deemed significant for the course of a studied phenomenon can be determined by the set of principles of essential stratification. This means that, after determining the composition of the set of significant factors, the set of essential stratification principles can be employed to determine the relative significance of each such factor. The main task in this context is to determine the sequential ordering of the idealization process, i.e. to make informed decisions on which factors should be eliminated and at which stage of the idealization process. In effect, the set of essential stratification principles determines the selection of the most significant factor. Similarly, over the course of concretization processes, the set of essential stratification rules helps us determine the ordering of factors to be included in each stage of the concretization process. To sum the above deliberations in the simplest possible way, it may be stated that the set of essential stratification rules serves to determine the relative levels of significance for each factor deemed significant for the studied phenomenon. Similarly, sets describing the ontic relations between the studied factors provide insight into the reciprocal relations between significant factors. Thus, the ontological perspective serves to determine the advisable course of both processes, i.e. idealization and concretization. It also allows to deduce the relative weights of the studied factors and the actual relations and dependencies between them. Therefore, it may be viewed as a framework structure for the entire course of idealization and concretization processes. At the same time, it should be noted that concretization processes also require the use of the ontological perspective.

Williamson's Diagram of Institutional Analysis

The diagram of institutional analysis by Williamson (2000) is one of the most widely recognized and studied approaches to conceptualization of the methodological base of the NIE (Aoki, 2007; Czetwertyński, 2019b; Hardt, 2009; Hodgson, 2007; Klimczak, 2019; Rudolf, 2015; Rutherford, 2001; Wilkin, 2016). The diagram postulated by Williamson represents a convincing line of approach to the study of relations between the various analytical levels of institutions, supported by a wealth of research material describing each individual level of analysis. Williamson's diagram of institutional analysis postulates a distinction of four distinct levels of analysis, namely: (1) embeddedness, (2) institutional environment, (3) governance, and (4) resource allocation and employment. Each of these levels is described by frequency, i.e. the rate of institutional change, and by purpose. In addition, each of the levels is associated with a specific detailed theory. Thus, the first level of analysis is described by the most generalized theory representing the broadest outlook upon the studied social phenomena, with consecutive levels employing more and more detailed theories addressing specific and narrow segments of the socio-economic reality. In addition, Williamson supplements his analytical approach with a dynamic element, in the form of reciprocal impact and feedback loops between all levels, based on the assumption that any given level of analysis exerts an impact upon the one positioned directly above it, while higher levels are related to the lower ones by means of a feedback loop mechanism.

Embeddedness represents the lowest level (L1) of analysis and comprises such elements as informal institutions, customary practices, traditions, and religious norms. This level is extremely durable. Its constituent elements may remain relatively unchanged for hundreds or even thousands of years. Institutional changes observed at this level will develop in an evolutionary rather than revolutionary fashion. Changes in customs typically extend beyond the time limit of a single generation, and this trend is particularly notable with respect to substantial changes that affect the entire structure of the embeddedness level. Objectives at this level are non-calculative and spontaneous, although a certain degree of reservation must be applied in this context, since clear and precise social objectives can be identified even with respect to informal institutions formed spontaneously in the course of the evolution of the social order. In principle, the embeddedness level contains social norms responsible for practical manifestations of relations between all members of the society as well as forms of social control (Mead, 1925). As such, it represents a source – or the very root – of cultural dynamics and civilizational constructivism (Czetwertyński, 2019a). Karl Polanyi (1957, p. 243) provides an apt description of the substantive meaning attached to the economic science in terms of such relations of individuals with nature and with other members of the society which serve to amass sufficient resources to satisfy individual needs. The dynamic character of relations between the natural and the social environment is a force responsible for the constitution of the spontaneous level of embeddedness, in the shape of sets

of informal norms – customs, traditions, or taboos (North, 1991). As suggested by Polanyi, norms embedded in the social order may play the role of more formal norms that typically regulate the coordination of economic processes in those environments that lack such formal constructs. It may safely be assumed that informal norms, such as those embedded in social and religious beliefs, do indeed exert an impact upon the entire social order, including the economic order. Arguments in favour of this assumption can be seen, for instance, in the classical deliberations of Max Weber (1992) on the significance of the protestant tradition upon the shaping of the capitalist doctrine as well as in more contemporary analyses by Tomáš Sedláček (2012) related to the economic aspects embedded in the cultural domains of various nations throughout history. In the knowledge structure approach, the role of the embeddedness level is played by social theories, as they provide a more accurate explanation of social order and its formation.

The level of institutional environment constitutes the order of formal rules. This level, after Douglass C. North (1990, p. 3), is typically formulated on the basis of the assumption that "institution are the rules of the game in a society or, more formally, are the humanly devised constraints that shape human interaction", with formal institutions commonly defined in terms of constitutional, parliamentary, and legal systems (in the broad sense of the term; see: Hodgson, 2004; North, 1991; Williamson, 2000). Institutions contain not only sets of rules (or limitations), but also those related to the execution of such rules (North, 1990; 1991). Thus, the level of institutional environment represents a system of reciprocally correlated (in a more or less cohesive fashion (Aoki, 2001)) institutions. The institutional environment is formed in a purposeful way, and designed to ensure proper organization of the political and economic environment (North, 1991) or, in more general terms, the entire social environment, although some researchers seem to support the view that this level also displays certain forms of social evolution (Klimczak, 2019). Nonetheless, the main focus is placed on intentional activities, undertaken by (and affecting) individuals. Therefore, changes observed at this level are decidedly more expedient compared to L1, and described by frequency of anywhere between several and several tens of years. A generation would be a sufficient measure in this context, as the institutional environment is often characterized by changes from one generation to the next. Another factor deemed of importance in this context is the arbitrary nature of human decisions, as stressed, for example, by the Hobbesian definition of social contract (Hobbes, 1998). Some insight into the understanding of the institutional environment can also be found in deliberations of Gustav Radbruch (1924; 1938), a legal scholar and philosopher. Radbruch attempted to explain the nature of law formation on the fundament of social custom. To place his ideas in the context of modern institutionalism, the wealth of informal norms serves as a source of more formalized standards. The most significant element in this context can be seen in Radbruch's (1938) 'idea of law' concept, describing law as a triad of: justice, utility, and certainty. Each of the above concepts can be viewed as a manifestation of the human intent to bring some order to the existing state of things, by introducing corrections formed by means of conscious reflection. The mere assumption that informal norms are the source of formal standards does not necessarily give rise to the view that the latter is a direct continuation of the former. On the contrary: they may – in some cases – represent the intent of limiting the effects of customs and informal norms upon societies. As aptly put by Richard H. McAdams (1997, p. 349) "law can influence the norm". In its most extreme form, this process can be described in terms of injudicious institutional engineering, with formal institutions imposed upon informal ones with the intent of affecting the desired change (North, 2005). Jakub Sukiennik, Zbigniew Dokurno and Bogusław Fiedor (2017, p. 130), in their elaboration of the theses postulated by Svetozar Pejovich (1999) suggest, that basic relations between formal and informal institutions can be described in four distinct forms. In their approach, formal institution may: (1) hamper the effects of informal institutions (but without the capacity of changing them – according to Pejovich (1999, p. 170), (2) function in explicit conflict with informal institutions, (3) remain ignored by or be neutral in relation to informal institutions, or (4) function in cooperation with informal institutions in an attempt to harmonise the two constructs. *De facto,* two principal objectives can be established with respect to the formulation of the second level of analysis, i.e. the institutional environment. The distinction involves the opposition between purposeful limitation, reformulation or definitive elimination of the effects of informal institution on the one hand, and reinforcement of their effects by elevating the informal institutions to the rank of a written rule. In an economic dimension, the level of institutional environment can be equated, according to Williamson (2000), with the proprietary order. From this perspective, the economic processes require proper regulation of

proprietary rights. As aptly observed by Radbruch (1938, p. 194): "In a world of limited resources, the regulation of relations between individuals involves also regulation of relations between individuals and objects, and the allocation of objects between individuals". Thus, from Thomas Hobbes (1998) to James M. Buchanan (2000), the shape of institutions designed to regulate the rights of property is believed to represent a direct manifestation of the rules regulating the allocation of resources in the economy. At the same time, it is important to take heed of the fact that, while the very idea of property is a highly stable construct, the formal institutions should be perceived in the specific context of time and space. This view corresponds with the concept of mutable law (Radbruch, 1938; Szyszkowska, 1993), with its content adjusted to specific social, political, and economic requirements. Hence, the level of institutional environment is manifested in theories of property laws and in the positive political theory.

The governance level of analysis represents the formation of governance structures, i.e. regulations characterized by a lesser strength of impact, designed to supplement the formal structures of the law system. As emphasized by Williamson (2000), the institutional environment – regardless of its weight – will never operate in a perfect manner. This means that, at the level of individual activities, practices should never be perceived as parallel to ideas. Consequently, contractual refinements are needed to define and safeguard the relations between individual elements of the social (or economic, in the case of the NIE) environment. Contracts of this type may be used, for instance, to support the transfer of parts of the property rights with the view of increasing the benefits of each party or limiting the social cost of such transfer. A classic example of this can be found in Ronald H. Coase (1960) in his deliberations regarding optimization of relations between parties on the ground of negotiations and contractual agreements held without resorting to formal arbitration at the level of institutional environment. Thus, the governance level represents a network of contractual regulations between entities, including private sector, non-profit organizations, and even those public institutions which are not covered by formal statutory regulations. Compared to formal institutions of the law, solutions of this type are more flexible and more prone to effective change. At the same time, they may – and are intended to – optimize the reciprocal relations between the parties. Their expected timeframe (frequency) is measured in years or decades. In the analytical approach, this level is correspondent with the economics of transaction costs. Significant input to the study of relations at the governance level can also be found in the work of Elinor Ostrom (1990) and her analysis of detailed solutions based on contracts between entities.

The last level of analysis is represented by resource allocation and employment, correspondent with the postulate of marginal value balancing. This level is associated with continuous balancing of relations between resources and their allocation by micro-entities of the economic environment. This level is the most distant from the institutional aspects and most closely related to the theories of neoclassical economics and agency.

The ontological perspective of the New Institutional Economics

The above, and necessarily concise, presentation of Williamson's diagram of institutional analysis may serve as a fundament for the attempted formulation of principles of essential stratification (as the first stage of the process), followed by determination of ontic relations between thus identified levels of stratification (stage two). In principle, Williamson already provides suggestions for the desired direction of idealization attempts. The only difference between the approach presented by Williamson and the mechanics of idealization is the direction of the process. Williamson postulates a natural transition from the first level (embeddedness) to the fourth level (resource allocation and employment), whereas the idealization process will naturally proceed from L4 to L1. This direction will only be reversed by the ensuing concretization process.

Thus, the resulting set of essential stratification principles will take the form presented in Fig. 1. The initial stage of idealization (level zero) will comprise factors belonging to all four levels of Williamson's diagram of institutional analysis. As such, it will examine the effects of both informal and formal institutions as well as contracts and individual attempts of entities designed to maximize the benefits or optimize the objectives function. This stage represents the factual level (concretization),

which is *de facto* free from any idealization attempt. At this level, each factor operates in a 'piecemeal fashion', which – according to Lange (1978, p. 96) – has the effect of excluding any proper formulation of economic relations between individuals or determination of any regularities.

Fig 1. Idealization and concretization, based on Williamson's diagram of institutional analysis.
Source: own research

The first level of idealization involves elimination of L1 from Williamson's diagram of institutional analysis. This represents an abstraction from the instruments of neoclassical economics. In line with Nowak's observations (1991, p. 286), this may be viewed in terms of radical individualism, as a clear departure from ideas represented by pure methodological individualism (Blaug, 1992) or even, in a more radical approach, as existential and essential individualism (Nowak, 1991). The above may also be viewed in the context of the methodological approach assuming the existence of solely individuals, and in line with the assumption that only individuals are the sole elements of significance upon decision-making processes. Entities are only interpreted as collections of individuals. Zbigniew Staniek (2007, pp. 86-87) presents this type of scenario in terms of *methodology of representative subjects*, with holistic phenomena represented by simple summations of individual phenomena. A classic example of the analytical approach employed at the first level of Williamson's diagram can be found in the work of Garrett Hardin (1968) on the notion of self-interest and its effects upon common good. While the first level is involved in the identification of factors that influence individuals in separation from the societal context, the second level of analysis will be devoted to solutions that ensure optimum benefits for entire communities – or, in the nomenclature postulated by Hardin, those that serve to prevent the tragedy of the commons. By eliminating the analysis of individual actions in the context of individual self-interest, deliberations can be shifted towards analytical evaluations of contracts and institutions. Thus, the transition from zero level to level one of idealization constitutes a step in the direction of the factual object of study, namely: that of institutions.

The second level of individualization entails elimination of level two from Williamson's diagram. This step reinforces the notion of formal and informal institutions as the essential objects of the study. Elimination of the governance level brings us to an even more general level of analysis, as it serves to disengage not only the notion of momentary individual decisions (as in the case of the first level of individualization), but also structures designed to elaborate the shape of relations within local communities (Ostrom, 1990). In principle, this step represents the idealization level involved with the study of legal structures superimposed upon such notions as customary practices and taboos, as it serves

to depart from detailed solutions towards deliberations of a more general character, i.e. those that apply to larger social groups, including whole nations with their formal legislation systems.

The third level of analysis, i.e. the level of idealization, is an abstraction from all the formally established constructs. This level is involved solely with informal institutions, therefore it serves to distinguish only the most general and durable correlations which are formed spontaneously rather than by way of conscious and purposeful reflection. Consequently, deliberations at this level bear associations with the social theory. At this stage of the idealization process, in contrast with the zero level, the emphasis is placed on holistic constructs. Their existence (and, therefore, their existential dimension) is, by all means, indorsed, but it is unclear whether their essential dimension is ruled by holistic structures or individuals. If the latter holds true, then facts would necessarily emphasize their social context (Durkheim, 2013). In effect, what we deal with in this case is the transition from methodological individualism to methodological holism. At the same time, following the approach by Williamson, it must be stated that the case at hand is not one of radical holism (in its existential and essential sense), as attested by the shape of relations between the consecutive levels of analysis.

The set of principles of essential stratification, produced on the basis of Williamson's diagram of institutional analysis, suggests that determinants of human actions should be sought in the social strata, i.e. that of informal institutions. After eliminating all the remaining levels of institutional analysis, we are left with raw material of social order founded on the fundament of the most rudimentary social 'tissue'. Thus, the process of idealization should provide us with a root cause (a form of *arché*) – a property founded in informal institutions, and literally embedded in the society it applies to.

The set of ontic relations is described by Williamson (2000) in plain terms, as a rule stating that levels of lower order exert a direct and significant effect upon those of a higher order. Thus, the embeddedness level will significantly influence the level of institutional environment, while the latter will significantly affect the level of resource allocation and employment. Williamson's deliberations display a certain regularity, suggestive of direct and incremental nature of such impact upon levels of a higher order. In practical applications, it seems that the nature of ontic relations is more complex. Lower levels exert their impact upon all levels of the higher order. However, it is also true that a level of a higher order is most strongly influenced by the level directly below it. At this point, it may be useful to introduce a correction with respect to levels of idealization (and, consequently, in the levels of Williamson's diagram of institutional analysis). Namely, levels one, two, and three are products of the institutional approach with certain degree of holism (at least in the existential dimension, while the fourth level is a product of the neoclassical approach.

The first level is a point of departure which, in a sense, can be described as pre-established, due to its duration and frequency. The second level describes a primarily purposeful relation to informal norms of the first level. Thus, it stems from the first level and is produced in response to the need for reinforcing, weakening or eliminating the informal institutions. Nonetheless, and in the context of human activities, this response is based on institutions; and institutions are also the targets of such activities. Human activities at this level are collective in character, and their effects apply to entire social groups. A similar relation can be observed between levels there and two, though it takes a more detailed character. In this case, the structure of governance is formed in response to shortcomings of the lower order or in response to the need for optimizing the solutions produced by the previous level (institutional environment). Institutions still remain the main focus of interest, but the main emphasis is placed on the formal ones. But it is also true that some solutions may be derived from informal institutions, as more effective in this context compared to the formal structures. However, it must be noted that the governance structure should not be in manifest contradiction to the level of institutional environment, unless it is designed to target particular types of structures, such as grey economy. Activities at the third level may be described as a form of contractualization of the lower levels. And though contracts affect smaller groups (with the minimum of two persons), the process requires consideration of interests of at least two parties to such contract.

The fourth level is quite different from the other ones, as it serves the purpose of seeking optimal solutions for market players, established on the firm basis of the existing order. It may be stated to

represent a decision-making mechanics consistent with the economic approach postulated by Gary S. Becker (1976). This level is involved with optimization of costs and benefits within the bounds of the existing structures and conditions, including those descendant from the levels of a lower order. However, levels of the lower order are perceived here on the *ceteris paribus* principle, where decision-makers are only allowed to optimize costs and benefits related to their subordination to informal and formal institutions, and governance structures.

While Williamson (2000) seems to recognize the strength of impact exerted by levels of the lower order upon those of the higher order, he is also adamant in stating that effects of feedback information are characterized by a lesser strength. This statement should not be read as evidence of no strength whatsoever in this relation. Feedback information occurs naturally in all cases, but it may, firstly, be perceived or acknowledged with a delay, and, secondly, their force of impact may be insufficient to exert an effective impact upon levels of the lower order. At the same time, the lower the level of institutional analysis, the more expedient are the immediate effects of such feedback. Another important observation can be made with regard to the fact that, at the first level, the informal institutions are formed in a spontaneous fashion – on the fundament of social relations – rather than as a result of conscious determination of the rules of play. Nonetheless, a certain degree of impact can still be observed, for instance in cases involving purposeful circumvention of governance solutions produced by choices made on the fourth level. Avoidance of contractual obligations may be seen as a symptom generating the need for the improvement or reformulation of such contracts. Similarly, the structure of governance may influence the level of institutional environment, particularly in the context of more mature systems of legislation, which are naturally more susceptible to grass-root initiatives.

It may also be useful at this point to emphasize the fact that feedback information is not necessarily passed between the adjoining levels. One of the most important observations in this context is that activities undertaken at the fourth level of analysis (if sufficiently exposed) have the potential of affecting the level of institutional environment. A good evidence of this can be seen in legislative changes made in response to social pressure or those intended to counteract the effect of pathological behaviours. These represent a special case, as the legislative authorities are purposefully involved in regulation of activities of individual members of the community, as opposed to the frequent practice of making laws in separation from the society (Radbruch, 1938), i.e. formulation of *de facto* pathological laws (Bałandynowicz, 2019). Another special case can be discerned in relation to the fact that individual members of the society are vehicles or carriers of social norms. Therefore, social change may result from spontaneous response to specific conditions. In such scenarios, informal institutions are formed by the practice of human activities, for instance those intended to oppose or circumvent the rules established at the level of institutional environment.

Conclusions

To sum up, it may be useful to revisit the original hypothesis posed at the onset of this study. Reconstruction of the ontological perspective provides suggestion of factual combination (at the level of concretization) between orthodox instruments and heterodox institutional factors. As such, it may be viewed as an elaboration of the popular assumption that institutions are of notable significance. At higher levels of idealization, the analytical significance of institutions is even more pronounced. Despite the fact that the New Institutional Economics is an elaboration of the framework of neoclassical approach by inclusion of the institutional dimension (Furubotn, Richter 2005, pp. 505-506), the real object of study at higher levels of idealization is that of institutions *per se*.

Abstract

The purpose of this study is to define quality as an economic category and its role in the modern economy. The article considers the problem of products and services quality in the context of globalization. To this end, an analysis of approaches to the definition of concepts 'quality' and 'quality management system' was carried out. As an example, the educational system and its role in shaping the quality of educational services are considered. Elements of the analysis methodology of possible labor market conditions of young specialists are presented, taking into account the qualitative and quantitative characteristics. A feature of this technique is that it allows you to determine the optimal strategy for the behavior of higher education institutions in the educational services market and it is the basis for further study of educational services quality. In order to carry out the research, methods of statistical and mathematical analysis were used.

Keywords: Quality, Competitiveness, Services, Products, Market.

Introduction

With the development of Belarus national economy, more and more attention is paid to the quality of products and services. Quality is an integral factor in competition, which provides an economic advantage to an economic entity. It includes the usefulness of a product or service, expressed in ergonomic, aesthetic, technical and other properties. Moreover, a low level of quality can harm the national economy and directly affect the living standard of the population (Borbotko, 2016a, p. 87).

The organization functioning in market conditions and fierce competition forces us to improve constantly the technological processes used in the production of goods. At the same time, an increase in the quality of goods is a reaction to consumer signals that may come in case of recognition and the absence of a trade brand negative image. Competitiveness is determined by a combination of qualitative and cost characteristics of goods, which are aimed at meeting the needs of the buyer. Moreover, the highest competitiveness corresponds to the highest utility in the total cost of the acquired goods (Borbotko, 2016b, p. 26).

The study purpose is to define quality as an economic category and its role in modern economy.

Methods

When preparing the article, first, logical and deductive methods were used, which allowed to define various concepts such as 'organization competitiveness' and 'goods competitiveness' and to highlight the approaches to the 'quality' concept interpretation.

The analysis and synthesis methods made it possible to understand the problem of studying the main provisions of the ISO 9001standard: 2015, closed loop PDCA and to highlight the methodology for young specialists training in the Republic of Belarus.

Results

Today, the Republic of Belarus is actively integrating into the global economic system. This integration is manifested not only in the promotion of goods on the world market, but also in the promotion of services, including educational ones. Almost every organization is faced with increasing competition, increasing the complexity of technological processes, reducing innovative and technological cycles. In this regard, the functioning organizations are the ones whose benefits fully correspond to the preferences of consumers.

There are two concepts that can be distinguished. The first one is 'organization competitiveness', the second one is 'goods competitiveness'. The 'goods competitiveness' is the totality of quality, cost and other characteristics that correspond to certain preferences of consumers and compare favorably with similar properties of other goods. In describing the 'goods competitiveness', a comparative analysis of its combined characteristics and the characteristics of the benefits of competitors is used, in which, as a rule, the cost of consumption is taken into account.

The 'organization competitiveness' is the ability of the organization to use its financial, production and labor potential effectively in order to produce competitive goods. Based on these definitions, new types of goods, or new forms and methods of providing services, are highly competitive.

Historically, the quality concept originates from the approach of 'bad' - 'good' differentiation to the marketing concept. Initially, the quality concept was purely philosophical in its nature, i.e. the good ceases to be by itself when it loses its quality. Now quality is a property of the good to satisfy the actual and hidden needs of a potential buyer. Quality reflects the relationship of the basic elements of an object that characterize its specificity.

As a rule, researchers offer the following interpretations of the concept of 'quality'.

1. Quality is an essential feature, a property that distinguishes one object or one person from another.

2. Quality is the degree of dignity, value, suitability of things, actions, etc., full compliance with what it should be.

3. Quality is the essential certainty of an object, its phenomenon being the object given and not any other (Zabavskaya and Burdyugova, 2015, p. 12).

Based on the quality concept interpretations, we can formulate the following definition of quality. Quality is a certain characteristic that determines the socio-economic feature of an object, and its distinctive properties. At the same time, the socio-economic category, on the one hand, is a combination of existing characteristics, determined by indicators determining consumer utility, and, on the other hand, reflects the consumer's opinion of goods.

The quality concept can be considered in four aspects, i.e. legal, economic, social and philosophical one. As a legal category, quality can be defined as the conformity of the aggregate properties of an object with established regulatory documents. As an economic category, quality can be defined as a set of characteristics of an object that maximize profits by its implementation. The social aspect of quality is realized in the property of an object to satisfy the needs of the population. Quality, as a philosophical category, can be defined as the essential purpose of the given object.

Quality is a comprehensive category that reflects the effectiveness of the entire organization, seeing this, we can distinguish the objective quality, i.e. the quality of a particular good and its ability to satisfy a particular need and functional quality, i.e. the needs satisfaction level of the independent demand (Lisenkov, 2019, p. 147).

In the ISO 9001 standard: 2015, the following provisions are reflected concerning the issue of 'quality concept'.

1. A quality-oriented organization encourages a culture of behavior, relationships, actions and processes that create value by fulfilling the needs and expectations of consumers and other relevant stakeholders.

2. The quality of an organization's products and services is determined by its ability to satisfy consumers and by deliberate or unintentional influence on relevant stakeholders.

3. The quality of products and services not only includes the performance of functions in accordance with the purpose and their characteristics, but also the perceived value and benefit to the consumer.

Thus, the standard proceeds from the fact that the quality of an object is determined by its consumer properties, which is natural.

All existing interpretations of quality can be united into five groups:

1. Concepts that reveal the essence of quality as an absolute assessment, i.e. not measurable sign of good.

2. The concepts that reveal the essence of quality as a property of a product, these concepts consider quality as a derivative of any measurable product characteristic, the higher the characteristic, the higher the quality.

3. Concepts that reveal the essence of quality as the correspondence of a product to its value, i.e. quality is defined as the ratio of the product cost to its usefulness (i.e. the product is useful and cheaper than its counterpart is).

4. Concepts that reveal the essence of quality as the conformity of a product to its intended purpose, i.e. the ability of a product or service to perform its functions (or suitability).

5. Concepts that reveal the essence of quality as a norm of compliance with standards, i.e. compliance of the facility with technical specifications and tasks, including target values of the facility's characteristics.

In modern literature, the 'quality management' and 'quality management system' concepts are used as a generalization of the action to form the quality of an object.

Based on the 'quality management system' concept presented in the standard ISO 9001: 2015, the following aspects can be distinguished.

1. A quality management system is a set of actions by which an organization determines its mission and goals, processes and resources necessary to achieve the desired results.

2. A quality management system is a set of actions aimed at managing the interacting processes and resources required to form the value of the results obtained.

3. The quality management system is a system that allows management to optimize the resources used, taking into account the consequences of their decisions.

4. A quality management system is a set of management tools used to identify actions taken with respect to intentional or unintended consequences in the provision of products and services.

Quality planning is an integral element of the quality management system aimed at setting goals in the field of quality, determining the necessary processes, allocating appropriate resources for the implementation of these processes, and achieving their goals. Quality management is expressed in the preparation and inclusion in the quality plan of indicators to assess the results of the organization, as well as monitoring of these indicators. Quality assurance is a set of measures to build confidence that the facility will meet the stated requirements. Quality improvement, this element of the quality management system is determined by the cyclical nature of the organization.

Such a closed loop control is known as the PDCA or Plan-Do-Check-Act cycle or Deming cycle. The PDCA methodology is the simplest algorithm of the manager's actions to manage the process and achieve its goals. The control cycle begins with planning.

Planning is the setting of goals and processes necessary to achieve goals, planning work to achieve the goals of the process and customer satisfaction, planning the allocation and distribution of necessary resources. Fulfillment is the fulfillment of the planned work. Verification - collecting information and monitoring the result obtained during the process, identifying and analyzing deviations, establishing the causes of deviations. Influence (management, adjustment) is taking measures to establish the reasons for deviations from the planned result, changes in planning and allocation of resources.

The PDCA cycle underlies the management of any activity, i.e. applicable both to the process as a whole and to individual work included in the process. The cycle can be applied to itself. For example, if you apply the PDCA cycle to its Act part, this is an adjustment; you get the following systematic control scheme. For example, Plan is planning, developing corrective actions based on the analysis of deviations. Do is the implementation, implementation of corrective actions. Check is a check of the effectiveness (or efficiency) of corrective actions. Act is the analysis of the reasons for the unsuccessful elimination of the reasons for the deviation and the decision to develop (or not develop) new corrective actions.

In practice, the PDCA cycle is used repeatedly with varying frequency. When carrying out its core business, the PDCA cycle is applied with the periodicity of reporting and planning cycles. When performing corrective actions, the duration of the PDCA cycle can be less or longer than the duration of the reporting and planning cycle and is set depending on the nature, scope, duration and content of measures to eliminate the causes of deviations.

Thus, the quality concept plays a key role in determining the business entity functioning effectiveness and it depends on the technologies used in the work of structural units.

Let us consider the approach to the 'quality' definition, using the example of education system interaction and young specialists' labor market.

The interaction of educational system and young professionals' labor market can be represented through the following categories (Borbotko, 2016a, 2016b).

1. The correlation between the number of graduates and the declared need for them by the labor market (correlation between supply and demand) are the quantitative characteristics.

2. 2. The relationship between the level of residual knowledge of graduates and the level of knowledge determined by the current development of the economy (i.e. the ratio of specialist knowledge to required knowledge) are the qualitative characteristics.

The balance between supply and demand is based on the needs for graduates and the required level of knowledge; a current analysis of trends in technologies used in the economy is necessary. Based on the possible results, a training plan for graduates is drawn up, which is drawn up both in the context of the economy and by educational institutions. Training plans for young specialists are promising, link the additional needs of the economy with the possibility of training in educational institutions, and include:

1. The student enrollment plan is determined for each year of the planned period by the result and by the forms of training in the context of specialties and specializations.

2. The curriculum is determined by the requirements for educational process quality.

3. The graduation plan for young specialists determines the need of the economy for young specialists through a full cycle.

Key indicators for the student enrollment plan.

1. A generalized acceptance indicator is a general indicator reflecting the number of students recruited by educational institutions.

2. A general indicator of graduated young specialists. It is a general indicator reflecting the need of the economy for young specialists.

3. The retirement rate characterizes the dynamics of students' retirement in preparation process.

Key indicators of the training plan:

1. The general indicator of training, which reflects the ratio between the generalized indicators of required and current knowledge.

2. The general indicator of the required knowledge, which reflects the general level of the required knowledge, skills, and abilities presented to a young specialist.

3. The general indicator of current knowledge, which reflects the knowledge of the student or graduate.

Key indicators of the graduation plan for young professionals:

1. The economy’s need for young specialists.

2. The demand coefficient in the current period and in n-periods preceding the current.

3. Needs change coefficient.

Other indicators:

1. The young specialist training cost.

2. The cost of adaptation actions.

3. The share of academic work in the annual time balance.

Assessment of quantitative and qualitative indicators is presented in Figures 1, 2 and mathematically expressed by formula 1 and formula 2.

Fig. 1: Temporal dependence of the young specialists number being trained and who are required by the country's economy (t_0 – educational institution admission time; $t_{мс}$ – young specialists entry time to the labor market)

$$\begin{cases} \Delta k = k_{прог} - k_{Ф} \\ k_k = \dfrac{k_{прог}}{k_{Ф} - \Delta k} \\ k_k = 1 \end{cases}, \quad (1)$$

where $k_{прог}$ – the number of young professionals required by the economy, the measure units;
$k_{Ф}$ – the number of students actually trained in an educational institution, units;
Δk – the difference between the predicted value of the need for young specialists and actually trained educational institutions, current time;
k_k – the need for young specialists coefficient.

The quantitative analysis is based on the social method, i.e. the need for young specialists is determined by social needs.

Fig. 2: Temporal dependence of actual and required education quality (t_0 – admission time; $t_{мс}$ – young specialists entry time to the labor market)

$$\begin{cases} \Delta Q = Q_{Ф} - Q_{прог} \\ k_Q = \dfrac{Q_{Ф} + \Delta Q}{Q_{прог}} \\ k_Q \geq 1 \end{cases}, \qquad (2)$$

where $Q_{прог}$ – education quality;
$Q_{Ф}$ – the actual quality of education;
ΔQ – the difference between the predicted value of educational programs quality;
k_Q – the quality level coefficient of young specialists.

Figures 3 and 4 show the changes in the k_Q and k_k indicators. Let us consider the case when these coefficients are not equal to the unit.

Fig. 3: Time required to create jobs (Δt) depending on the number of trained young specialists (Δk'), provided that the coefficient of demand for young specialists is less than one (k_k <1)

(t_0 – admission time; $t_{пр}$ – the time when the predicted value of the need for young specialists is equal to their graduation)

$$\Delta k' = k_{мсп} - k_{мсф} \tag{3}$$

$$\Delta k = \sum_{t=t_{мс}}^{t_б - 1} \left(k_{мсп}(t+1) - k_{мсф}(t)\right) + \Delta k' - k_п \tag{4}$$

$$\begin{cases} k_ф + \Delta k \le k_п \\ \Delta t = \Delta t + 1 \\ t_б = t_{мс} + \Delta t \end{cases}, \tag{5}$$

where $k_п$ – the number of young professionals needed by the economy in the forecast period;
$k_ф$ – the of students trained by educational institutions;
$\Delta k'$ – the difference between the predicted value of the need for young professionals and actually trained ones by educational institutions;
Δk – the value reflecting the accumulated excess of young professionals in the economy;
$k_{мсп}$ – the number of young professionals trained by educational institutions at the time of graduation;
$k_{мсф}$ – actual need for young specialists at the time of graduation;
$t_{мс}$ – young specialists entry to the labor market;
$t_б$ – the time when the excess of young specialists in the labor market will be eliminated.

Fig. 4: Time (Δt) dependence required to achieve equality between the level of required and existing knowledge of young specialists, provided that the quality coefficient of young specialists training is less than the (kQ <1) unit (t_0 – admission time)

$$\begin{cases} \Delta Q' = Q_{мсп}(t_{мс}) - Q_{мсф}(t_{мс}) \\ \Delta Q = \sum\limits_{t=t_{мс}}^{t_{пр}-1} \left(Q_{мсп}(t+1) - Q_{мсф}(t)\right) + \Delta Q' \\ Q_{пр} = Q_{мсп}(t_{мс}) + \Delta Q \end{cases}, \quad (6)$$

$$\begin{cases} Q_{п} \le Q_{пр} \\ \Delta t = \Delta t + 1 \\ t_{пр} = t_{мс} + \Delta t \end{cases}, \quad (7)$$

where $Q_{п}$ – quality of education in the forecast period;
$Q_{ф}$ – actual quality of education;
$\Delta Q'$ – the difference between the predicted value of the education quality and the actual one;
ΔQ – the difference between the actual value of the education quality and the forecast one at the balance onset;
$Q_{мсф}$ – actual education quality at the time of graduation;
$Q_{мсп}$ – the required education quality at the time of graduation;
$Q_{пр}$ – education quality of at the balance onset;
$t_{мс}$ – the time that young professionals enter the labor market;
$t_{пр}$ – balance between actual and necessary quality of education.

All possible dependencies of the time required creating (Δt) jobs, and the number of ($\Delta k'$) trained young specialists and the (Δt) time necessary to achieve equality between the level of required and existing knowledge of young specialists.

When considering the processes of interaction between the education system and the labor market of young specialists, an integrated approach is needed, i.e. qualitative and quantitative indicators should be considered simultaneously (Table 1).

Table 1: Labor market organizing strategies for young specialists, depending on their coefficient need and the level of training quality of young specialists

Indicator	$k_Q>1$	$k_Q=1$	$k_Q<1$
$k_k>1$	1. High level of expertise of young professionals and the market's lacking for them	4. Necessary level of expertise of young professionals and the market's lacking for them	7. Low level of expertise of young professionals and the market's lacking for them
$k_k=1$	2. High level of expertise of young professionals and the balance between supply and demand in the labor market	5. Necessary level of expertise of young professionals and the balance between supply and demand in the labor market	8. Low level of expertise of young professionals and the balance between supply and demand in the labor market
$k_k<1$	3. High level of expertise of young professionals and unemployment among them in the labor market	6. Necessary level of expertise of young professionals and unemployment among them in the labor market	9. Low level of expertise of young professionals and unemployment among them in the labor market

The ratio between these indicators are the second and fifth strategies. However, if there is a chance of meeting the economy needs for specialists at the expense of the retired, other specialists retraining. It is possible to alternate the third (and the sixth) strategies with the first (and the fourth) strategies. Other combinations are not permissible, since they lead to a disproportion between supply and demand. The seventh through the ninth strategies are not acceptable, as the specialists trained in them do not possess the necessary knowledge.

If the need of the country's economy can be quickly filled, then improving the quality of knowledge is a more complex process (Borbotko, 2016a, p. 88).

The algorithm for basic requirements and their application in an educational institution are as follows:

1. The definition is formed based on the results of the economic sectors development, taking into account the changes in technology over the period of student preparation, and the adaptation period.

2. The procedure of detailing the general required level of knowledge for each year of preparation is carried out.

3. An educational institution forms a training plan for a young specialist, so that they fully take into account the results of the general required level of knowledge, and, if possible, a detailed, general required level of knowledge.

4. The plan for training a young specialist in an educational institution is being detailed.

5. In the process of training young specialists, with a frequency of one year, the quality of the educational process is monitored in the form of an assessment of acquired theoretical knowledge and practical skills.

6. The planned results are compared with the obtained ones and appropriate decisions are made to adjust the preparation procedure.

Young specialist knowledge assessment is a comprehensive assessment. It is calculated for each year and comprehensively for the entire period. The final value ranges from 0 to 1 and is defined as the sum of the theoretical knowledge indicator and the indicator of practical knowledge. Possible correlation between theoretical and practical knowledge is 0.42 / 0.58.

$$Q_j = \frac{\sum_{i=1}^{n} O_i}{\sum_{i=1}^{n} I} * \frac{K_j}{O_{i\max}}, \tag{8}$$

where Q_j – j level indicator;
O_i – i examiner grade;
I – the number of examiners;
K_j – j knowledge coefficient;
$O_{i\max}$ – maximum rating;

$$K_{ОБЩ} = K_T + K_П; K_{ОБЩ} = 1, \tag{9}$$

where $K_{ОБЩ}$ – total coefficient value;
$K_{Т}$ – coefficient of theoretical knowledge;
$K_{П}$ – practical knowledge ratio.

The j knowledge indicator is divided into ranges. Each range is assigned to its own characteristic, i.e. from the lack of knowledge to complete knowledge. This action allows you to summarize indicators of the knowledge level in the educational unit (i.e. group, stream and course).

The following methods of training young specialists in the Republic of Belarus are based on the level of knowledge:

1. Knowledge either exceeds or equals the required level, while the graduation of young specialists meets the market needs.

2. Knowledge either exceeds or equals the required level.

   2.1. The need for the young specialists in the base period is much less, if it is replenished at the expense of other categories (as pensioners, retraining, work contracts, etc.).

   2.2. The graduation of young specialists in the next period is much more due to the lack of specialists in the base period (Borbotko, 2016b, p. 33).

Other options for training young specialists are unacceptable, because either young specialists do not have the necessary level of knowledge, or there is a likelihood of unemployment among them.

Thus, the labor market system for young professionals depends on two groups of indicators:

1. The indicators of the management system in terms of quantity characterize the level of meeting the needs of the labor market in young specialists. The coefficient of need for young specialists should be equal to one. If the indicator exceeds unity, then this indicates errors in forecasts of the need for specialists. If it is less than one, then this indicates unemployment.

2. Quality management system indicators characterize the level of young specialists' knowledge. The coefficient of the quality level of young specialists training should be at least one. If the indicator is less than one, then this indicates the training system inefficiency (Borbotko, 2016b, p. 34).

Discussion

Having completed the analysis and generalization, we can indicate that the problem of quality and its impact on the competitiveness of products and services causes considerable interest among researchers. More than 2,000 articles published only over the past 10 years (Schetkina, 2011; Zabavskaya and Burdyugova, 2015; Loginova and Balzamova, 2018; Lisenkov, 2019) evidence this. At the same time, we can say that all studies are characterized by the absence of a single approach and views on the formulation of basic terms and concepts (Lisenkov, 2019, p. 148).

Only a few authors try to analyze the experience of some states in providing a quality management system for national educational systems (Schetkina, 2011, p. 273).

Acting on the premise that, the authors tried to highlight the main approaches to the formulation of basic categories, derive formulas that allow us to assess the needs of the market for young specialists, the impact of the quality management system on their competitiveness.

Conclusion

The authors propose to formulate the category 'quality' as some characteristic defining the socio-economic peculiarity of an object and its distinctive properties. They concluded that the concept of 'quality' plays a key role in determining the effectiveness of business entity functioning and it depends on technologies used in the work of structural units. To assess the effectiveness of their work, a number of calculation formulas (8 units) are proposed.

Pork Production in the World and in the Main Producing Countries in the period 2009-2019 and Forecast for 2020-2015 Horizon

Agatha POPESCU

University of Agronomic Sciences and Veterinary Medicine, Bucharest, Romania,
E-mail address: agatha_popescu@yahoo.com

Abstract

The paper analyzed pig population, pork production and consumption globally and in the main producing countries in the period 2009-2019, using trend analysis and regression models and forecasting the estimates for the 2020-2015 horizon. Despite that pig livestock declined by 18.4 % due to the African Swine Fever (AFS) and the drift of the breeders to broilers fattening, pork production reached 106.1 Million tons Carcass Weight Equivalent, to which the contribution of the main producing countries was: China (56.4%), EU (19.2%) and USA (9.3%). In 2019, pork comes on the 2nd position with 12.3 kg consumed/capita (35.7% of 34.4 kg in the world). The other main producing countries are: Brazil, Russia, Vietnam, Canada, Philippines, Mexico, South Korea and Japan. China is the top producer with 46.5 Million tons achieved in 2019, which is equivalent to the output achieved by the EU, USA, Brazil, Russia and Vietnam. China is also the largest pork consumer and the top importing country. The EU is the 2nd pork producer and the main exporter in the world. Pig number declined, but pork production increased reaching 24 Million tons in 2019. The EU and the USA are the main exporting countries advantaged by the increased demand and price mainly in the Asian countries after the outbreak of ASF. In 2025 it is expected that the world pork production to reach 110.1 Million tons as the demand will continue to grow, stimulating the increase of price and export.

Keywords: Pork Production, World, Main Producing Countries, Trends, forecast

Introduction

Meat consumption is the key factor influencing production. Meat consumption is imposed by the need of protein in human diet, as protein supplies a large variety of amino acids responsible to synthesize new proteins in muscle tissues, antibodies, and blood cells. More than this, our body is able to produce just 11 amino acids of the 20 amino acids existing in proteins. For avoiding the protein deficiency and for being healthy, humans must consume meat to procure the other 9 essential amino acids.

Meat nutrients are essential for vital functions of humans. Pork is an important source of protein, a tasteful meat prepared in various ways, providing a high nutritional value, a high digestibility, at an acceptable price.

The chemical content of 100g pork consists of: water 51.5g, proteins 41.3g, fats 33.3g, vitamins (especially B3-niacin, B6-pyridoxine and B12-cobalamine), minerals 0.9 g (zinc and iron), and produce an energy value of 357 kcal, which is higher than in case of other sorts of meat as mentioned Soare and Chiurciu (2017).

Meat nutrients are essential for vital functions of humans and also for animals. Pork chemical composition determines meat quality and is deeply influenced by pig breeds, lines and cross-breds (hybrids), feeding type, diet structure and intake, age, sex, growing conditions, live weight at slaughter etc as specified Skobrák and Bodnár (2012).

The optimum slaughter weight is closely connected to the basic chemical composition of pork as mentioned Lukač el al (2015).

The need of protein of animal origin, considered the most valuable protein, has determined producers to develop business in pig, cattle, poultry, and sheep fattening in order to produce more meat.

Along the time, pork has been on the top in the world consumption, but at present it passed on the 2nd position in favor of chicken meat. In 2009, pork represented 40 %, beef 24%, chicken 29% and other meats 5% in the world meat consumption (Anonymous, 2015). In 2019, pork accounted for 35.9%, poultry meat 38%, beef and veal 21.4% and sheep meat 4.7% (OECD-FAO, 2019, OECD-FAO Agricultural Outlook).

This is due to the high competition between pig and poultry sectors regarding meat quality and the change in consumer preferences to a healthier meat, with a low cholesterol content, rich in high value protein and cheaper as broilers' meat (Popescu, 2009 and 2013).

The high competition among meat producers has been an incentive for implementing modern technologies which assure a higher profitability and meat quality. As a result, pork producers and processors are aware that they must be focused on consumer's behavior and preferences in order to develop the most adequate strategies in pork sector to produce more meat and of higher quality and also to benefit of the export opportunities on the international markets, mainly in the countries affected by African Swine Fever (ASF) as affirmed Rotaru (2018).

More than this, the development of pork sector is very important to keep pace with the globe population growth. In 2020, it is expected as the world population to account for 7.79 Billion people and in 2025 for more than 8.2 Billion. And this population needs more food to assure its survival, and especially meat as the main source of protein. Therefore, pork will remain an important meat in human consumption (Plain, 2018).

In this context, the paper aimed to analyze the dynamics on pork production at the world level and in the top producing countries, emphasizing the main tendencies, challenges and opportunities in the period 2009-2019 and to set up the forecast for the 2020-2025 horizon.

The paper is structured as follows: *Introduction* presents the results regarding the pork production importance in the world, *Materials and methods* present the study area, the sources of data, the specific indicators analyzed in this study, and the methodology used in this research. *Results and Discussions* provide the obtained results, comments and interpretations, and *Conclusions* present the main ideas resulting from this research work.

Materials and Methods

Data collection

The paper needed a large range of data which have been provided by FAOSTAT Database, Livestock primary, for the period 2009-2019 and also from other sources like: USDA Reports, USDA, Livestock and Poultry: World Markets and Trade, OECD-FAO Agricultural Outlook, Statista etc.

The studied indicators were:

(i)pig livestock and its distribution among the leading countries in the world,
(ii)pork consumption compared to the other sorts of meat in absolute figure and also in kg per capita at the world level and also in the developed and developing countries,
(iii)pork production at the world level and in the main producing countries,
(iv) a few aspects about imports as a factor destined to cover the domestic market needs in the main pork producing countries and also about exports in case of the countries with high production potential and ASF-free.

Methodological aspects used in this study

Dynamics analysis was used in order to quantify the growth rate on the interval 2009-2019, based on the formula: $I_{FB(\%)} = (Y_n/Y_0)100$, where: Y_n is the value of the variable in the year n and Y_1, the value of the variable in the year 0.

Trend line for each indicator was established using either the linear regression or polynomial models depending on the distribution of value in the graph.

For instance for the linear trend, the used formula (Stefanescu and Dumitriu, 2018) was:

$E_l(y_{ti}) = \beta_0 + \beta_1 \text{ x } t_i$,
where:
$E_l(y_{ti})$ = the value of the linear trend of the variable y_i for the term with the order number i;
t_i = the value of the time variable for the term with the order number i;
β_1 = the trend slope, that is a coefficient associated to the time variable indicating the variation of the trend value when t raises by one unit;
β_0 = a constant, reflecting the value of the linear trend when the variable t_i = zero.
The associated linear regression model has been:
$y_i = \hat{y}_i + \epsilon_i = \beta_0 + \beta_1 \text{ x } t_i + \epsilon_i$,
where:
y_i = the empirical value of the dependent variable;
$\hat{y}_i = \beta_0 + \beta_1 \text{ x } t_i = E_l(y_{ti})$, that is the mathematical model associated to the regression obtained based on the t_i value of the independent variable;
ϵ_i = error, that is the difference between the value given by the regression function and the empirical one, provided by the data; the error is supposed to have a normal distribution with the arithmetic average = 0 and a variance which does not depend on the predictor variable.

Testing the regression equations was based on F test, based on the hypotheses:

H_0: $\beta_0 = \beta_1 = 0$, meaning that the values of the equation coefficients do not significantly differ of zero;
H_1: $\beta_0 \neq 0$ or $\beta_1 \neq 0$, meaning that at least one of the equation coefficients significantly differs from zero.

The interpretation of the regression test of significance: H_0 is accepted if Sign F > 5%, H_1 is accepted if Sign F< 5%.

The determination coefficient, R^2, was also illustrated next to the regression model to explain in what measure the regression equation is valid.

The results were both graphically illustrated and tabled. The conclusions pointed out the main aspects regarding the analysis of pork production in the world in the main producing countries.

Results and Discussions

World Pig Livestock

Pork production evolution is closely related to the number of pigs raised in various countries, herd size, growing and fattening systems, feeding systems, genetic potential of the used breeds, lines, hybrids, number and weight of piglets at birth and weaning, capacity of using feed, daily gain, pig health and maintenance conditions, number of slaughtered pigs, pig live weight at slaughter, carcass weight, carcass classification system and quality as mentioned Babovic et al (2011) and Chirila et al (2012).

Compared to poultry raising, pig farming involves higher input costs linked to the assurance of the biological material (piglets), feedstuff, labor, energy, wastes recycling etc. Pig price per kg live weight at the farm gate increased covering production costs and assuring profit to pig breeders stimulating business in pig fattening as specified by Popescu (2012b and 2012c).

In the emerging economies, pig farming is encouraged by the low input costs and the need to assure farmers' income and living standard of their families.

In the last decade, the world pig livestock registered in general a decreasing trend from 941 million heads in the year 2009 to 767.6 million heads in 2019, meaning by 18.43% less than in the first year of the analysis. The highest number of pigs was 963 million being recorded in 2011, then the pig livestock varied up and down till 2019, when it was registered the lowest level. The R^2 shows that 68% of the variation of world pig livestock depends on the time variable (Fig.1).

In this case, H_0 was rejected, and H_1 was accepted, as Sign F = 0.173 % < 5%, that is at least one of the coefficients of the regression equation is different by zero.

Fig.1: The world pig livestock trend, 2009-2019 (Million heads)
Source: Own design based on data from Faostat, 2020, Data, Livestock primary and Statista, 2020.

The decreasing trend in pig livestock during the last years was determined by many causes, the main ones being:

-the extend of the African Swine Fever (ASF), which restarted since 2014 affected pig breeders in about 50 countries, mainly from Asia (China, Vietnam, South Korea, Myanmar, Indonesia, Philippines, Georgia, Armenia, Azerbaijan etc), but also from Europe (Poland, Lithuania, Russia, Ukraine, Belarus, Slovenia, Romania, Bulgaria, Belgium) and Africa (Zambia, South Africa). It is estimated that about 25 % of the world pig population will die due to this disease, with a deep economic and social impact: pork production decline, the boom of pork price on the international markets, the increase of imports in the affected countries, mainly in China, who is the top pork producer where millions of pigs have been lost. Also, pork consumption will be affected obliging consumers to be focused on poultry, fish, beef and sheep meat, whose price will go up (Anonymous, 2019; Deblitz et al, 2018; Pitts and Whitnall, 2019).

-the increased competition of the development of poultry farming, broilers fattening offering advantages *for breeders:* a shorter fattening period, more growing series per year compared to 2.5 series in case of pig fattening, lower production cost per kg live weight, high profitability, and *for consumers* who changed their preferences being more oriented to lean meat with a high protein content, chicken meat being considered by nutritionists a healthier meat than pork due to its low cholesterol content (Bogosavljevic-Boskovic et al, 2012).

Fig.2: Pig population in the leading countries worldwide in 2018 (Million heads)
Source: Own design based on the data from Statista, (2020).

The distribution of pig livestock on the globe reflects that about 60% of the number of pigs is in Asia and about 20 % in Europe. While in Asia the pig population is increasing, in Europe is declining (Kemp et al, 2012).

The main pig growing countries are China, EU, USA, Brazil, Russia, Canada, South Korea, Mexico, Japan and Ukraine, whose pig livestock is shown in Fig.2.

Therefore, a number of 10 countries in the world keep and grow the largest number of pigs summing 777.15 million heads, representing 99.4% of the world pig livestock in the year 2018.

In 2018, the share of pig number in the main growing countries was the following one: China 56.4%, the EU 19.2%, the USA 9.3%, Brazil 4.9%, Russia 2.9%, Canada 1.8%, South Korea 1.4%, Mexico 1.3%, Japan 1.2%, Ukraine 0.8% (Fig.3).

Fig.3: The share of the main pig growing countries in the world pig livestock in 2018(%)
Source: Own design and calculation based on the data from Statista, (2020).

Taking into account the average annual decline rate in the number of pigs in the analyzed interval, -1,85%, it is expected that the number of pigs to continue to decrease and in 2025 to account for only 686.26 Million heads (Table 1).

Table 1: World pig population forecast for 2020-2025 horizon (Million heads)

	2020	2021	2022	2023	2024	2025
World pig population forecast	753.40	739.46	725.78	712.36	699.19	686.26

World average meat consumption per capita (kg)	34.4	-	69.2	-	26.5	-
World average pork consumption (kg)	12.3	-	23.3	-	9.85	-

Source: Own calculation based on the data from OECD-FAO, 2019, Agricultural Outlook.

The need of protein of animal origin has stimulated meat production whose share in daily diet increased both in the developed and developing countries.

Pork is situated in the 2nd position in the world meat consumption after poultry meat and compared to the other sorts of meat. In the structure of the human diet, in 2019, pork represented 35.9% of total meat intake, poultry meat 38%, beef and veal 21.4% and sheep meat 4.7%. The world average meat consumption per capita in 2019 was 34.4 kg, of which pork 12.3 kg/capita.

However there are differences between the developed countries and the developing countries regarding pork consumption. While in the developed countries, the average meat consumption per capita was 69.2 kg, of which pork 23.3 kg (33.7%) in 2019, being situated on the 2nd position after poultry meat, in the developing countries, the average meat consumption per capita was 26.5 kg, of which pork 9.85 kg (37.2%) in 2019, being situated on the 1st position (Table 2).

World Pork Production

Pork production registered a continuous increase along the time grace to its importance in human diet, except the countries where the religion does not allow pork consumption.

Compared to the year 1985, when the world pork production accounted for 60 Million tons, in 2019 it reached 106.1 Million tons CWE (Carcass weight equivalent), meaning 1.76 times more. During these 35 years, the peak of pork output worldwide, 111.9 Million tons, was achieved in the year 2018 (Fig.4).

Fig.4: World pork production evolution between 1985 and 2019 (Million Tons)

Source: Own design based on the data from Faostat, 2020, Data, Livestock primary and Popescu (2009).

Analyzing the evolution of pork production in the last decade, the output growth was 6.13% in the whole interval from 100 Million tons CWE in 2009 to 106.13 Million tons CWE in 2019.

Fig. 5: World pork production trend line, 2009-2019 (Million Tons CWE)
Source: Own design based on Faostat Data Base, 2020, OECD-FAO Agricultural Outlook, and USDA Reports.

The regression model confirms the increasing trend and R^2 tell us that 55.45 % of the variation of pork production depended on the time variation. The regression model is suitable to this trend line, as Sign. F = 1.02 % is smaller than 5%, and the H_1 was accepted, meaning that at least one of the coefficients of the equation is different from zero (Fig.5).

The increase of pork production is justified by achievements in the developed countries regarding the industrialized and integrated pig farming and processing, the progress in modern technologies based on high performance tetra-linear hybrids for pig fattening, balanced feed rations assuring a high daily gain, the optimum average weight at slaughter 100-110 kg/pig which provide a lean meat and a low fat layer on the back line and in general a lower fat content in the carcass.

In the developing countries there are different swine raising and processing systems, which do not support enough the population's needs of meat, the average consumption being the much lower than in the developed countries.

The distribution of pork production by continent reflects that Asia comes on the top position with 55.9%, followed by Europe with 24.29%, North America 11.53%, South America 4.95%, Central America 1.6%, Africa 1.17% and Oceania 0.56% (Istvan and Vida, 2017).

The average growth rate of pork production in the studied period was + 0.62 % and based on this, the forecast for 2020-2015 horizon estimates that in 2025 the world pork production will reach 109.46 Million tons CWE (Table 3).

Table 3: World pork production forecast for 2020-2025 horizon (Million Tons, CWE)

World pork production forecast	2020	2021	2022	2023	2024	2025
	106.78	107.45	108.12	108.79	109.46	110.14

Source: Own calculation.

The world pork production is sustained by eleven main producing countries: China, the EU, the USA, Brazil, Russia, Vietnam, Canada, Philippines, Mexico, South Korea and Japan, which summed 100.47 Million Tons CWE representing 94.66% of the world pork output in the year 2019 (Fig.6).

Fig.6: Pork production in 2019 versus 2009 in the top producing countries in the world (Million tons CWE)

Source: Own design based on the data from Faostat, 2020.

In the analyzed period 2009-2019, the pork production increased in the following countries: Russia +49.37%, South Korea +28.17%, Brazil +26.99%, USA +19.86%, Mexico +19.62%, EU +8.05%, Philippines +2.82%, Canada + 2.56%, and decreased by -20.93% in Vietnam, -6.81 % in China and -1.15 % in Japan (Anonymous, 2019e; FAO, 2017, Food Outlook).

***In China*,** pork production declined by 6.81 % from 49.89 Million tons in 2009 to 46.5 Million tons in 2019. The highest pork output in China was 57.66 Million tons achieved in 2014 and the smallest performance was noticed in 2019. The determination coefficient reflected that 80 % of the variation of pork production was determined by the variation of time period. The polynomial regression is suitable to the trend in Chinese pork production as Sign F was lower than 5%.

China is the main pork producing country in the world, its contribution to the world output being 43.8% in 2019. China has a high potential in producing pork, its performance of 46.5 Million tons in 2019 being equivalent to the pork production carried out by the EU, USA, Brazil, Russia and Vietnam all together (Fig.7).

Fig.7: Pork production trend line in China, 2009-2019 (Million Tons CWE)

Source: Own design based on Faostat Data Base, Koopman el al (2014) and USDA Reports.

Together with EU and USA, China represents the trio dominating the world pork production, all together producing 83.13 Million tons CWE, accounting for 78.33 % of the world pork output in 2019.

China keeps the top position as pork producer due to the measures taken to consolidate the pork sector regarding herd size and applied growing and fattening technologies, despite the damages caused by AFS. Till 1985, China raised pigs in the small scale family farms, but after the new strategy applied by Government regarding the free trade in the rural areas, China changed its production system in pig farming stimulating the development of larger producing units (Oh and Whitley, N.C., 2011).

The reduction in pig livestock started with the AFS outbreak and after that pork price reached the highest level which resulted in a lower supply. It is expected that at the end of 2020, the pig population in China to decline and reach 275 Million heads, by 40% less than at the beginning of 2018 and pork production to be by 25 % lower. Pork crisis determined many breeders to leave the industry. As a result, pork consumption also declined by about 32% only in two years 2018 and 2019 (Anonymous, 2019c; Stefanescu and Dumitriu, 2018).

China is also the largest pork consumer in the world (57 Million tons) and because the domestic production is not able to cover the population needs, China is the top importing country of pork.

Together with EU and USA, China totalize 74% of the world pork consumption. The average pork consumption per capita accounts for about 38 kg, meaning twice than the world average. This is normal as pork is traditional in Chinese diet being the main source of protein besides the poultry meat. Along the time, pig industry has grown to better satisfy the population requirements and that is why China is the top importing country of pork in the world.

For this reason, China is not among the top exporting countries of pork in the world, as it has first to cover the domestic market and just a small amount of pork is traded in the international market. However, it was notice that China imports pork when the prices are high, and the imports are coming mainly from the USA, Canada, Brazil and the EU affecting the local producers.

However, despite of the high demand on the Chinese market, the Government imposes strict regulations on foreign suppliers which limit the imports if they do not fit.

Pork industry in China is deeply influenced by a large range of factors such as: African Swine Fever and other disease, feed prices, government measures, consumption habits and consumers' orientation to other meats etc (Gale et al, 2012; Istvan and Vida, 2017).

Taking into account the average annual decline rate of - 1.62 % registered in the period 2009-2019, it was estimated that in 2025, China will produce 42.21 Million tons pork (Table 4).

Table 4: Pork production forecast in China for 2020-2025 horizon (Million Tons, CWE)

China Pork production forecast	2020	2021	2022	2023	2024	2025
	45.75	45.02	44.30	43.59	42.89	42.21

Source: Own calculation.

The EU comes on the 2nd position in the world for pork production after China. Along the time, the countries consisting the EU have made important efforts to assure a amount of high quality protein passing from the small scale family farms to industrialized production units of high productivity and efficiency. However, in the EU there are still many family farms dealing with pig farming whose contribution to the EU pork production can't be ignored.

The EU has established strict regulation regarding animal welfare and food safety compared to the USA for example, which is a guarantee of the high quality of pork like of all the other animal species and assures a high export price on various markets (Rees et al, 2014).

In 2019, it produced 24.12 Million tons CWE, by 8.05% more than in 2009, when it achieved 22.3 Million tons. The highest pork production was registered in 2018, accounting for 24.08 Million tons compared to the lowest production 22.3 Million tons achieved in 2014. About 68% of the variation of pork production in the EU was determined by the changes in time (Fig.8).

Fig.8: Pork production trend line in the EU-28, 2009-2019 (Million Tons CWE)

Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

The EU contribution to the world pork output is 22.7% in 2019, being slightly higher than 22.3 % in 2009.

The EU pork production is sustained by the high number of pigs raised in Spain, Germany, France, Poland, Denmark, Netherlands, Italy, Belgium, Unites Kingdom, Austria and Portugal which are the main growing and pork producing countries.

In the EU, pork is satisfactory regarding the population needs, the self sufficiency rate accounting for 110 % (Eurostat, 2017).

The increased Chinese demand, the lower feed prices, the higher slaughter weight of the pigs will advantage the EU to push the production up, despite of the decline in pig livestock, the reduction of sow herds, the decrease in the slaughter rate. However, the expansion of the pork industry is constrained by the EU environmental regulation applied in Spain and in several other Western countries (Flach, 2019).

The decline of the number of pigs in the EU during the last decade will not affect too much pork output as swine sector is well consolidated in the largest producing countries. However, the small pig breeders mainly from Poland, Italy and Romania are affected by the lack of piglets in the market,

high farm inputs (feed, energy, labor). The low price per kg live weight at the farm gate will lead to a low profitability (EU, 2020, Pig meat statistics; Istvan and, 2017; Popescu, 2012a, 2015, 2016).

The expectations for pork production in the EU are high for 2020 and the coming years and also for its exports destined to maintain the EU position as the largest pork exporter in world. Its export are especially oriented to China, and Japan, where their domestic markets are not covered by internal output. Also, its export is oriented to the USA and Switzerland.

However, due to the ASF which affected the Central and Eastern European countries, they will be prevented for a while from taking the advantage of pork production growth and increased demand in the China market.

Because the EU produces more than the internal market requirements, the EU imports of pork are in non significant amounts and made from a limited number of extra EU countries due to the EU strict food safety requirements.

Pork consumption in the EU is high, in average accounting for 33 kg/inhabitant representing 47.3% of the total meat annual consumption which accounts for 69.8 kg/inhabitant. Therefore, the pork consumption in the EU is 3 times higher than the world average.

The highest pork consumption is in Austria, Germany, Spain, Poland, Italy, Netherlands, and France. In the other countries pork consumption is lower than the EU average. Also, during the last decade, despite that it is still in the top position, pork consumption is slightly declining in favor of beef and poultry meat considered healthier having less cholesterol and being richer in high valuable protein (EU Commission, 2020, EU Agricultural Outlook, For Markets and Income; EU, 2020, Pork).

In the EU, pork sector is under a continuous control by strict regulations regarding "animal welfare, environment, human health and spatial planning". The increased demand of pork and high prices in the international market will stimulate EU exports which will have a beneficial effect.

However, the high prices for pork have increased input cost, mainly feed cost which does not account for about 50-55% in the pig cost but for about 70 % which is expected to affect farmers in a while (Rabobank, 2020).

Taking into account the positive average growth rate of pork output in the last decade, 1.16 %, the forecast for 2025 is that the EU will produce about 25.96 Million tons (Table 5).

Table 5: Pork production forecast in the EU for 2020-2025 horizon (Million Tons, CWE)

EU Pork production forecast	2020	2021	2022	2023	2024	2025
	24.51	24.79	25.08	25.37	25.66	25.96

Source: Own calculation.

The USA comes on the 3rd position as a pork producing country. In 2019, it produced 12.52 Million tons CWE pork by 19.86% more than in 2009, when its output accounted for 10.44 Million tons. The highest production was achieved in 2019, 12.52 Million tins and the lowest one was 10.18 Million tons carried out in 2010 (Fig.9).

The main USA states where the pig number and pork production is high are Iowa, North Carolina, Minnesota, Illinois, Indiana, Missouri, Nebraska, Oklahoma, South Dakota, Pennsylvania and Virginia (Rees et al, 2014).

The USA contribution to the world pork production accounted for 11.85 in 2019 compared to 10.4% in 2009.

The USA registered +2.39 % average annual growth rate in the period 2009-2019, double than the EU.

Fig.9: Pork production trend line in the USA, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Pork industry in the USA is stimulated by the increased global consumption, high market share of the country and easy access on various markets (Borror, E., 2016).

The a boost in production in the United States is mainly absorbed by the Asian countries and is advantaged by high international pig.

Pork consumption in the USA registered a declining trend in general from 65 kg/capita in 1950, then registered the minimum level in 1975. In 1980, it went up again and continued to vary up and down 50 kg till 2010 when it declined to about 46 kg, and now it is around 53 kg/inhabitant.

The USA is the 2nd pork exporting country in the world after the EU and on the 4th position as an importing country of pork after China, Japan, Mexico and South Korea (EU Commission, 2019, Meat Market Observatory-Pig).

The USA pork export accounts for about 27% of the world pork export, and comes the 2nd after the EU whose exports represent 45%. Then, the USA is followed by Canada and Brazil, whose shares of the world's pork export are 14% and, respectively 9%.

Because, the USA pork output is raising faster than the world production, its export will increase in order to keep the domestic market in balance and not to face an overproduction.

The main beneficiaries of the USA pork exports are China and Japan (Anonymous, 2017; Plain, R., 2018; USDA Report, 2019).

The forecast established based on this average growth rate in the last decade, 2.39%, estimates that in 2020 the USA will produce 14.08 Million tons pork (Table 6).

Table 6: Pork production forecast in the USA for 2020-2025 horizon (Million Tons, CWE)

	2020	2021	2022	2023	2024	2025

Source: Own calculation.

Brazil is ranked the 4th for its performance in pork output. In 2019, it produced 3.97 Million tons CWE by 26.99% more than in 2009, when it achieved 3.13 Million tons. The highest pork production was recorded in 2019, and the lowest in 2009 (Fig.10).

Brazil is a powerful emerging economy with a high developed agriculture. Its pork production contributed by 3.74% to the world pork output and this share continue to increase.

In Brazil, pork consumption is about 11.5 kg/capita, almost twice less than beef consumption and coming on the 3rd position after poultry meat (Istvan and Vida, 2017). Due to the embargo against Russia, Brazil has become the major pork supplier for this country.

Fig. 10: Pork production trend line in Brazil, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Also, in 2019, the pig culls in China due to ASF diminished pork production and intensified the supply coming from Europe and Brazil accounting for about 10 Million tons. From the middle of 2018, Brazil increased its sales to China by 70% and Spain by 90% (Hancock et al, 2019). Considering the average growth rate of pork output in the analyzed period, +2.97%, for the 2025 it is expected as Brazil to produce 4.74 Million tons (Table 7).

Table 7: Pork production forecast in Brazil for 2020-2025 horizon (Million Tons, CWE)

Brazil Pork production forecast	2020	2021	2022	2023	2024	2025
	4.09	4.21	4.34	4.47	4.60	4.74

Russia is ranked the 5th for pork production, which accounted for 3.24 Million tons CWE in 2019, being by 49.37% higher than in 2009, when the country achieved 2.17 Million tons, the lowest level. The highest pork production was 3.53 Million tons in 2017 (Fig.11).

Fig. 11: Pork production trend in Russia, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Therefore, Russia registered a higher and higher pork production year by year and in 2020 it is expected as the output to equalize the domestic consumption. This will be possible as Russia had

about 23.6 Million pigs in 2019 and it is expected as their number to continue growing (King, 2019a).

In 2019, Russia exported 100,000 tons pork by 20 % more than in 2018 and the exports were mainly directly to Hong Kong and it is expected an open access on other Asian markets like in Vietnam, China, Japan and South Korea (Vorotnikov, V., 2019).

In the analyzed period, the average annual growth rate was +4.24%, which allowed to forecast that in 2025, Russia will produce 4.16 Million tons pork (Table 8).

Table 8: Pork production forecast in Russia for 2020-2025 horizon (Million Tons, CWE)

Russia Pork production forecast	2020	2021	2022	2023	2024	2025
	3.38	3.52	3.67	3.82	3.99	4.16

Source: Own calculation.

Vietnam is situated on the 6th position in the world for pork production achieved in 2019 and accounting for 2.4 Million tons CWE, by 21 % more than in 2009. For this record, Vietnam's contribution to the world output accounted for 2.26%.

Fig. 12: Pork production trend line in Vietnam, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Production declined mainly in the last years due to ASF which affected pig livestock. The highest pork output, 3.73 Million tons, was noticed in 2017 and the lowest one, 2.4 Million tons in 2019 (Fig. 12).

Vietnam is on the 9th position regarding pork consumption in the world. Due to ASF, production and consumption diminished. For this reason important measures were taken to stimulate chicken, fish and seafood consumption and to intensify pork imports to cover the internal market needs. The pork imports are also destined to protect farmers and business and will be severely controlled regarding their origin. Only the large farms will be allowed to develop their business, the smallest farmers being obliged to quip because ASF affected the small households (Anonymous, 2019f; USADA Report, 2019).

Due to the average annual decline rate of -1.83% recorded in the analyzed interval, t is estimated that Vietnam will register a lower and lower pork production in the coming years, reaching 2.15 Million tons in the year 2025 (Table 9).

Table 9: Pork production forecast in Vietnam for 2020-2025 horizon (Million Tons, CWE)

Vietnam Pork production forecast	2020	2021	2022	2023	2024	2025
	2.35	2.31	2.27	2.23	2.19	2.15

Source: Own calculation.

Canada is on the 7th position for pork output, contributing by 1.885 to the world production. In 2019, it achieved 2 Million tins CWE by 2.56% more than in 2009. The highest record was 2.14 Million tons in 2017 and the lowest production 1.94 Million tons in 2010. Pork production varied from a year to another and after the peak of 2.14 Million tons in 2017, it declined to 1.96 Million in 2018 and then recovered to 2 Million tons (Fig.13).

Fig. 13: Pork production trend in Canada, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Canada occupies a good position among the top exporting countries of pork after the EU and USA. Her main beneficiary is China, in 2018, the Canadian exports of pork accounting for USD 514 Million, representing 12.85% of total export value. As China claimed a false certificate related to a pork import from Canada, the Canadian exports to this country stopped for a short period of time in favor of USA, Brazil and Argentina. Then, after clarifying this unpleasant situation, Canada continued its export of pork to China and in June 2019 it reached the highest level, about USD 80 Million (Anonymous, 2019b).

Canada is also a pork importer mainly from the USA.

Canada comes on the 11th position for pork consumption. In 2019, the average consumption accounted for 22.1 kg of carcass weight per capita and in 2020 is expected to reach 22.3 kg (Statista, 2020a).
Based on the average growth rate per year recorded in the analyzed decade, 0.48%, the forecast for 2025 estimates that Canada will produce 2.06 Million tons pork (Table 10).

Table 10: Pork production forecast in Canada for 2020-2025 horizon (Million Tons, CWE)

Canada Pork production forecast	2020	2021	2022	2023	2024	2025
	2.01	2.02	2.03	2.04	2.05	2.06

Source: Own calculation.

Philippines is ranked the 8th among the top pork producing countries. Its contribution to the world output was 1.57% in 2019. In the last decade, pork production increased by 2.82 % from 1.63 Million tons CWE in 2009 to 1.68 Million tons in 2019 (Fig. 14).

About 60 % of the internal production covers the pork demand in the country. About 65 % pig breeders are backyard farmers, while 35 % are large scale farms.

However, Philippines was also affected by ASF which diminished a part of its pig livestock and production mainly after 2016. In this case, higher supply of chicken and imports were required to balance the demand. Pork imports increased by 32 %, but the boom of prices on the sensitive markets has limited the imports.

Pork production recovered and in 2018 it reached 1.63 Million tons and continued to raise reaching 1.68 Million tons in 2019 (Anonymous, 2019a; USADA Report, 2019).

Fig. 14: Pork production trend in Philippines, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

The forecast for 2025 is that Philippines will produce 1.71 Million tons, starting from the pork production in 2019 and taking into consideration the average growth rate in the analyzed interval, +0.53% (Table 11).

Table 11: Pork production forecast in Philippines for 2020-2025 horizon (Million Tons, CWE)

Philippines Pork production forecast	2020	2021	2022	2023	2024	2025
	1.68	1.69	1.70	1.71	1.71	1.73

Source: Own calculation.

Mexico comes on the 9th position in the world for its pork production which accounted for 1.39 Million tons in 2019, when it produced by 19.625 more than in 2009. The highest level was 1.44 Million tons in 2017 and the lowest one 1.16 Million tons in 2009. About 84 % of pork production change was linked to the variation of the time factor. Sign F < 5 % confirmed the regression model and allowed to accept H_1 (Fig. 15).

Pork production in Mexico increased due to the high demand and because it is a cheaper alternative compared to beef. In Mexico, pork demand is much higher than the domestic production, a reason to cover the market needs by imports.

The present pork consumption per inhabitant accounts for 17.9 kg, for which Mexico occupies the 20th position in the world.

Fig. 15: Dynamics of pork production in Mexico, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Pork production was facing various problems among which the most important ones are: infrastructure, diseases, sanitary aspects and processing. Passing from the small scale farms to the largest ones, it was an opportunity to solve most of these problems as Mexico would like to produce more pork and of a higher quality compiling with the international standards in order to increase its exports. As long as at present Mexico is declared ASF-free, the exports will raise. The main beneficiaries of the Mexican pork are Japan, which accounts for 75 % of the pork exports and the USA.

Also, Mexico needs to import pork which represents about 50 % of the consumption. The increased demand is closely linked to the meat taste and high quality, cheap price and the large variety of pork products. About 32% of imports come from the USA (Anonymous, 2018).

In the analyzed decade, pork production average annual growth rate accounted for 1.77% which allowed to estimate that in 2025 the country will carry out 1.51 Million tons (Table 12).

Table 12: Pork production forecast in Mexico for 2020-2025 horizon (Million Tons, CWE)

Mexico Pork production forecast	2020	2021	2022	2023	2024	2025
	1.41	1.44	1.47	1.49	1.52	1.54

Source: Own calculation.

South Korea is on the 10th position among the top pork producing countries. In 2019, it achieved 1.36 Million tons CWE by 28.17% more than in 2009 and contributed by 1.29% to the world output. The lowest production was registered in 2011, 0.84 Million tons and the highest one, 1.37 Million tons in 2019. Despite that the country reported 14 cases of ASF, at present it is free of this disease due to the strong biosecurity measures and production is not any more affected. About 67% of the variation of production was connected to time change. Sign F was smaller than 5%, attesting that the regression model is correct. The H_1 hypothesis is accepted, because at least one of the coefficients of the equation is different from zero. (Fig. 16).

Fig. 16: Pork production trend in South Korea, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Due to the high demand, South Korea imports pork to better cover the domestic market needs. The South Korea is the 5th market for pork exports of the USA. Since 2017, South Korea the amount and value of the imported pork increased year by year. Also, South Korea is supplied with pork coming from Germany, Spain, Canada, and Chile which are the main competitors of the USA on the Korean market.

The protein needs on the Korean market are covered by the imports of fish, pork, beef, poultry and sheep meat (Eastwood, C., 2018; USDA Report, 2019).

Table 13: Pork production forecast in South Korea for 2020-2025 horizon (Million Tons, CWE)

South Korea Pork production forecast	2020	2021	2022	2023	2024	2025
	1.41	1.46	1.51	1.56	1.61	1.67

Source: Own calculation.

South Korea is on the 6th position in the world for its pork consumption which accounts for 36.9 kg/capita being three times higher than the world average.

Considering the +3.38% average annual growth rate of pork production in the analyzed period, the expectations for the year 2025 accounts for 1.67 Million tons (Table 13).

Japan is another important producing country of pork, occupying the 11th position in the world. In 2019. Japan produced 1.3 Million tons of pork by 1.15% less than in 2009, and its contribution to the world output accounted for 1.22% (Fig.17).

Fig. 17: Pork production trend line in Japan, 2009-2019 (Million Tons CWE)
Source: Own design based on the data from Faostat, 2020 and USDA Report, 2019.

Japan is facing a high demand for pork, a reason to make imports to cover the domestic market.
The most preferred is fresh and frozen pork and the main suppliers are USA, Canada, Mexico, Chile, Denmark, Netherlands and Germany.

Based on the last trade agreement concluded between Japan and the USA at the beginning of 2018, which reduced or eliminated the tariffs, Japan is an important beneficiary of 6% of the USA pork and 25 % of beef exports (King, 2019b).

The average annual decline rate of pork production in Japan accounted for -0.1 %, this means a relatively stable production at the level of 1.29 Million tons in 2025 (Table 14).

Table 14: Pork production forecast in Japan for 2020-2025 horizon (Million Tons, CWE)

Japan Pork production forecast	2020	2021	2022	2023	2024	2025
	1.29	1.29	1.29	1.29	1.29	1.29

Conclusions

The paper analyzed the trends in pig population, pork production and consumption at the world level and in the main eleven producing countries in the period 2009-2019.

Pig population declined by 18.4% in the world during the last decade reaching 768 million heads in 2009 compared to 941 million in 2009. This was due mainly to the outbreak of African Swine Fever since 2014 in many countries from Asia, Europe and Africa and the increased competiveness of broilers fattening which is more profitable for breeders and also by the increased consumers' preference for chicken meat considered much healthier than pork due to its lower content in cholesterol.

About 85 % of the world pig population is in China (56.4%), EU (19.2%) and USA (9.3%).

Pork is the 2n meat after poultry meat preferred by consumers. In 2019, from 34.4 kg meat consumed per capita, 12.3 kg represented pork, that is 35.7%. In the developed countries chicken is the most consumed meat followed by pork, while in the developing countries, pork is on the top.

Pork production registered a slight growth in the last decade, 6.13%, so that in 2019 it accounted for 106.1 million tons CWE. About 56% of pork output is achieved in Asia, 24% in Europe and 12 % in North America. About 95 % of the global pork production is produced by eleven countries, whose importance in the decreasing order is: China, EU, USA, Brazil, Russia, Vietnam, Canada, Philippines, Mexico, South Korea and Japan. In the most of countries, pork production increased in the last decade, except China, Vietnam and Japan.

China is the top producer of pork with 46.5 Million tons achieved in 2019, its contribution to the world output being about 44%, equivalent to the pork production achieved by the EU, USA, Brazil, Russia and Vietnam all together. About 78% of the global production is achieved by China, EU and USA.
China is also the largest pork consumer and for this reason is also on the top as an importing country. About 74 % of pork consumption is made by China, EU and USA.

The EU is the 2nd pork producer and the main exporter in the world. Despite that the pig number declined, pork production increased reaching 24 Million tons in 2019.

The USA produced 12.5 Million tons pork in 2019, bringing the country on the 3rd position in the world. Besides the EU, the USA is also an important pork exporter, and this has been stimulated by the increased demand mainly in the Asian countries and by the high price after the outbreak of ASF.

The forecast for 2025 estimates that world pork production will reach 110.1 Million tons CWE grace to the increase of production in almost all the producing countries, except China and Vietnam. It is expected that pork production to reach 42 Million tons in China, 26 Million tons in the EU, 14.4 Million tons in the USA, 4.7 Million tons in Brazil, 4.2 Million tons in Russia, 2.1 Million tons in Vietnam, 2.06 Million tons in Canada, 1.7 Million tons in Philippines, 1.54 Million tons in Mexico, 1.7 Million tons in S. Korea and to remain stable at 1.29 Million tons in Japan.

As a conclusion, the effects of the ASF have led to the intensification of pork production and export in the non affected countries, the increase of pork price on the international market, to more security measures to protect the countries against the extend of this disease.

Pork will remain one of the most important source of animal protein to nourish the globe population in a continuous growth.

Producers and processors are more and more focused on the improvement of pork quality due to the competition with poultry meat.

Trends and Prospects in the EU's Cow's Milk Marketed to Dairies

Agatha POPESCU

University of Agronomic Sciences and Veterinary Medicine, Bucharest, Romania,
E-mail address: agatha_popescu@yahoo.com

Abstract

The paper aimed to analyze the dynamics of raw cow's milk delivered to dairies (RCMD) in the EU-28 and the top 10 producing countries in the period 2009-2018 using the Eurostat data and fixed basis indices, and descriptive statistics. Also, average milk yield (AMY) and the number of dairy cows (NDC), and their impact on RCMD using correlation and determination coefficients, and regression equations. Finally, it estimated RCMD for the 2019-2023 horizon. In the EU, RCMD increased accounting for 160.28 million tonnes in 2018, while the NCD declined. The contribution of the top producing countries to the EU's RCMD is: Germany 19.7%, France 15.9%, United Kingdom 9.5%, Netherlands 8.7%, Italy 7.9%, Poland 7.5%, Spain 5%, Ireland 4.9%, Denmark 3.5% and Belgium 2.5%. AMY was 6,997 kg at the EU level in 2018, but much higher in Denmark, Netherlands, Spain, United Kingdom, Germany and Belgium. Between RCMD and AMY it was found a strong and positive coefficient of correlation, $r > 0.776$, except Italy ($r = 0.125$). Between RCMD and NDC, the correlation coefficient was higher than 0.733 in Ireland, Poland, Netherlands, United Kingdom and Belgium, in France 0.5, and in Germany, Italy and Spain, it was below 0.266. The regression equations and $R^2 > 0.5$ proved that AMY has a deep influence on RCMD, in almost all the countries, except Italy, and that NCD comes on the 2nd position. In 2023, the EU will supply 157.18 Million tonnes, taking into account the Brexit.

Keywords: Trends, Forecast, Cow Milk Marketed to Dairies, Main Producing Countries, EU-28

Introduction

Milk is a basic food for humans and animals and also a raw material for processing industry as sustained by Faostat (2019), Perhrsson et al (2000), Popescu (2011, 2012a, 2015b).

Grace to their high nutritive value, milk and dairy products are very important in human diet as mentioned by Garcia et al (2019).

Milk production followed a continuous ascending trend and the EU-28 is one of the main contributors to the world milk output, being on the second position after Asia as affirmed by Popescu (2006a), De Lucia et al (2017), and Ridder (2019).

In 2018, the EU-28 produced 172.2 million tonnes raw milk representing 33.26 % of the global milk production, which accounted for 517.72 million MT (Popescu et al, 2019; Statista, 2020).

About 97% EU milk production is provided by dairy cows and the remaining by sheep, goats and buffaloes. In 2018, the ewes and goats produced one million tonnes milk in Spain and 0.8 million tonnes in France, while the buffaloes contributed by 0.7 million tonnes to Itlay milk production (Eurostat, 2020, Milk and milk products).

Most of the raw milk is destined to processing industry after subtracting the consumption on farm by farmers' family and animals (calves, cats, dogs, piglets etc) (Popescu, 2005b and 2009b).

In 2018, about 12.2 million tonnes were used on farm by farmer's family and animals, sold directly to consumers or processed directly (Eurostat, 2020, Milk and milk products; Eurostat, 2020, Milk Market Observatory).

The cow milk supplied to dairies must meet the quality standards regarding the percentage of fat and protein, and not to exceed the thresholds concerning the pathogenic germs and somatic cells.

Milk quality depends on the dairy farming system, mainly on milking system, feeding, watering, hygiene measures, the existence of cooling tanks for milk storage till the moment of delivery (Popescu, 2017, Popescu and Angel, 2009 and 2019).

Milk quality determines milk price and together with the marketed amount contributes to farmers' income as found by Popescu (2003, 2006c, 2012b, 2014a, 2014b).

Milk price is also determined by offer/demand ratio, seasonality, geographic location of the farm, the price of farm inputs (feed, electricity, fuel, medicines and veterinary services etc) and also by the economic and political situation as affirmed by Popescu (2015d) and Paura and Arhipova (2016).

Cow's milk is also claimed by milk processing industry being its raw material for achieving dairy products. In the EU-28, about 37.7 raw milk is used for producing cheese, 29.4% for butter,11.9% for cream, 11.1% for drinking milk, 4.35 for acidified milk, 2.9% for powder products, 2.7% for other products (Eurostat, 2020, Milk and milk product statistics).

The abolition of milk quota in April 2015 has stimulated the growth of the number of cows, milk output and milk delivered to processing industry by the large farms in Netherlands, one of the most important milk producing country in the EU, as mentioned by Popescu (2004a) and Groenveld et al (2016).

Milk quota abolition also stimulated much more the exports of the competitive countries compared to the less competitive states as found by Popescu et al (2010), and Persson (2016).

In 2018, the raw milk supply to dairies accounted for 160.28 million tonnes consisting of a mixture of cow, ewes, goats and buffaloes milk, the cow milk representing 97.3% (Eurostat, 2020, Milk and milk product statistics).

Therefore, cow's milk production and the amount of marketed milk reflect the importance of milk sector in the EU-28 agriculture and food industry, and for farmers assuring the perpetuation of their profession, income and the raise of their living standard.

In this context, the objectives of this paper are:

(a)To analyze the dynamics and trend of the raw cow's milk delivered to dairies at the EU level and in the top 10 milk producing countries in the period 2009-2018;
(b)To analyze the dynamics and trend of the number of dairy cows at the EU level and in the top 10 milk producing countries in the same period;
(c)To analyze the dynamics of the average milk production per cow at the EU level and in the top 10 milk producing countries in the same interval;
(d)To analyze the milk production per inhabitant;
(e)To estimate the correlation coefficients between raw cow's milk delivery and the number of dairy cows and average annual milk yield, considered the key determinants;
(f)To determine the regression models reflecting in what measure the number of dairy cows and average milk yield contribute to the increase of raw cow's milk marketed to dairies;
(g)To set up the forecast of raw cow's milk marketed to dairies for the 2019-2023 horizon.

The paper is structured as follows: *Introduction* presents the results regarding the milk production importance in the EU, *Materials and methods* present the study area, the sources of data, the specific indicators analyzed in this study, and the methodology used in this research. *Results and Discussions* provide the obtained results, comments and interpretations, and *Conclusions* present the main ideas resulting from this research work.

Materials and Methods

The study area

The study refers to the EU-28, whose population is increasing and on January 1st 2019 accounted for 513.5 million inhabitants (Eurostat, Statistics Explained, 2020, Population and population change statistics).

Taking into account the contribution to the agricultural output, after the vegetable and horticultural plant sector and before cereals, the EU's dairy sector is its second biggest contributor.

In the EU-28 there is a large diversity of dairy farms, regarding their number by member state, herd size, milk yield, milk output per farm, types of dairy farming systems, economic size in terms of standard output, and all these features are determined by the differences in natural potential and socio-economic development of the member states (Popescu, 2016b; Popescu et al, 2019; EU, 2018, Dairy farms report based in 2016 FADN Data; European Parliament, 2018, The EU dairy sector Main features, challenges and prospects).

Investments in dairy farming based on the EU financial support has substantially contributed in the farm modernization or creation of new modern dairy farms as found by Popescu (2006a).

The number of dairy cows is 22.9 million producing in average about 7,000 kg/year. Also, in the EU-28 there are about 12,000 milk processing plants, of which about 55% are cooperatives (European Parliament, 2018, The EU dairy sector Main features, challenges and prospects).

Data collection

The paper is based on the data collected from Eurostat Database in 2020 for the period of reference 2009-2018.
The main indicators analyzed in this study have been the following ones:
(i)raw milk on farm in the EU-28;
(ii)raw cow's milk delivered to dairies (RCMD) in the EU-28 and in the top 10 producing countries;
(iii)the number of dairy cows (NDC) in the EU-28 and in the top 10 producing countries;
(iv)the average milk yield (AMY) in the EU-28 and in the top 10 producing countries;
(v)cow's milk delivered to dairies per inhabitant in the EU-28 and in the top 10 producing countries.

Methodological Aspects

Index method was used to study the evolution of the indicators mentioned above in the period 2009-2018. Fixed basis Index, $I_{FB,}$ was determined based on the formula is: $I_{FB} = (X_i/ X_0)100$, where $X_{i =}$ the variable in the years i= 1,2,...10 of the chronological series 2009-2018 and X_0 is the variable in the first year.
The structural index, $S_{\%,}$ was calculated based on the formula is: $S_{\%}= (X_i/X_{ij})100$, where X_{ij}= the value of the j variable in the country i. It was used to establish the market share of the top 10 milk producing countries in the EU-28 level.

The descriptive statistics includes: mean, standard deviation, coefficient of variation, skewness, kurtosis, Min, and Max were determined using the Excel facilities.

The Bravais - Pearson correlation coefficient was used to reflect the relationships existing between: raw cow's milk delivered to dairies (RCMD) and number of dairy cows (NDC), on one side, and between: raw cow's milk delivered to dairies (RCMD) and average milk yield (AMY), on the other side. The correlation coefficients were calculated based on the formula:

$$r_{xy} = \frac{n\sum xy - \sum x \sum y}{\sqrt{(n\sum x^2 - (\sum x)^2)(n\sum y^2 - (\sum y)^2)}}$$

t Test (Student), Two-Tails for the significance threshold α = 0.05 was applied for testing the significance of the coefficient of correlation.

Linear regression model, Y=bx + a, was used to reflect the relationship between the dependent factor Y, in terms of raw cow's milk delivered to dairies, RCMD, and the independent factor: X considered either the number of dairy cows, NDC, or average milk yield, AMY.

The determination coefficient, R^2 was also computed in order to reflect in what measure the variation of the dependent factor Y id caused by the variation of the independent factor X. share of influence of the independent factor variation on the dependent factor variation.

Forecast of raw cow's milk marketed to processing industry in the EU and in the main producing countries was based on the average annual gain calculated for the period 2009-2018.
The calculus was made using Excel facilities.

The results were illustrated in graphics and tables, and also they have been interpreted.

Results and Discussions

Raw cow's milk delivered to dairies has registered an increasing trend in the EU-28 in the studied period, from 134.2 million tonnes in 2009 to 160.3 million tonnes in 2018, meaning a surplus of +19.4% (Fig.1).

Fig.1: The dynamics of raw cow's milk delivered to dairies in the EU-28, 2009-2018 (Million tonnes)

Source: Own design based on Eurostat, 2020, Collection of cow's milk (1,000 tonnes).

The descriptive statistics tells us that at the EU-28 level the mean in the analyzed period was 147.85 million tonnes, the deviation standard accounted for 9.62 and the coefficient of variation was very small, 6.5%.

Table 1: Descriptive statistics for raw cow's milk delivered to dairies at the EU-28 level and in the top 10 milk producing countries, 2009-2018

	Mean (Million tonnes)	St. Dev.	Coeff. of variation (%)	Kurtosis	Skewness	Min	Max
EU-28	147.85	9.62	6.50	-1.81	-0/06	134.24	160.28
Germany	30.59	1.60	5.23	-0.22	-0.70	27.46	32.49
France	24.39	0.75	3.07	0.42	-0.71	22.90	25.40
United Kingdom	14.28	0.76	5.32	-1.96	0.04	13.23	15.19
Netherlands	12.68	1.15	9.06	-1.72	0.44	11.46	14.32
Italy	10.61	0.31	2.92	8.45	2.83	10.40	11.49
Poland	10.34	1.05	10.15	-1.40	0.18	9.00	11.95
Ireland	6.12	0.98	16.01	-0.97	0.67	4.94	7.81
Spain	6.39	0.54	8.45	-2.09	0.09	5.74	7.11

Belgium	3.67	0.31	8.44	-1.59	0.36	3.28	4.17

Source: Own calculation based on Eurostat, 2020, Collection of cow's milk (1,000 tonnes).

In the top 10 milk producing countries of the EU, the mean of raw cow's milk delivered to dairies in the analyzed interval was the following one: 30.5 million in Germany,

24.4 million in France, 14.3 million in United Kingdom, 12.7 million in Netherlands, 10.6 million in Italy, 10.3 million in Poland, 6.3 million in Spain, 6.1 million in Ireland, 5.1 million in Denmark and 3.6 million in Belgium (Table 1).

In 2018, the raw cow's milk delivered to dairies reached the following level in million tonnes in the selected countries: 32.4 in Germany, 24.5 in France, 15.2 in United Kingdom, 13.8 in Netherlands, 10.6 in Italy, 11.9 in Poland, 7.8 in Ireland, 7.1 in Spain, 5.6 in Denmark, and 4.2 in Belgium (Fig.2).

Fig.2: The dynamics of raw cow's milk delivered to dairies in the EU-28 top 10 producing countries, 2009-2018 (Million tonnes)

Source: Own design based on Eurostat, 2020, Collection of cow's milk (1000 tonnes).

In the analyzed interval 2008-2018, in the top 10 milk producing countries in the EU-28, raw cow's milk marketed to dairies increased in various percentages from a country to another as follows: Ireland +58%, Belgium +44.1%, Poland 30.7%, Netherlands 21%, Spain 19.6%, Denmark +18.6%, Italy 14.2%, United Kingdom +13.9%, Germany +13.1%, and France +7.3%.

The contribution of the top 10 producing countries to the EU-28 cow's milk sold to dairies is the following one: Germany 19.7%, France 15.9%, United Kingdom 9.5%, Netherlands 8.7%, Italy 7.9%, Poland 7.5%, Spain 5%, Ireland 4.9%, Denmark 3.5% and Belgium 2.5%.

The raw cow's milk marketed to dairies followed a similar evolution like the one of raw milk production. Milk produced by cows has the main share in the raw milk production. The contribution of dairy cows to raw milk production increased from 91.03 % in 2013 to 97 % in 2018 (Fig.3).

Fig.3: The dynamics of raw milk production on farm and raw cow's milk delivered to dairies in the EU-28, 2009-2018 (Million tonnes)

Source: Own design based on EU, 2020, Milk market observatory.

The raw milk production delivered to dairies is determined by the volume of raw milk obtained on farm as mentioned before but less the consumption at the farm level by the farmer's family and animals and direct deliveries to consumers.

The raw milk output on farm is deeply influenced by a large range of factors such as: number of cows, herd size, milk yield, farmer's experience and management skills.
Milk yield is the main factor with a deep impact on milk production and it depends on: breed and its milk potential, reproduction activity, feeding, health conditions, breeding programme applied on farm, the selection pressure assured by the artificial insemination with doses of frozen seminal material from bulls of high breeding value.

The number of dairy cows in the EU-28 registered a general decreasing trend in the last decade.
In 2018, the EU had 22.9 million dairy cows, by 4.1% less than in 2009 (Fig.4).

Fig.4: The dynamics of dairy cows in 2018 versus 2009 in the EU-28, 2009-2018 (Million heads)
Source: Own design based on Eurostat, 2020, Number of dairy cows.

However, in the top 10 producing countries the situation of the number of cows is different from a country to another. In 2018, Germany had the highest number of cows, 4.1 million, by 1.6% less than in 2009. France came on the 2nd position with 3.55 million cows, by 5.2 % less than in 2009. Poland was ranked the 3rd for 2.21 million cows, and their number was smaller by 14.4% than in 2009. Italy had 1.9 million cows, by 3.2% less than in 2009. United Kingdom came on the 5th position with 1.87 million cows by 0.8% more than in 2009. Netherlands was ranked the 6th for 1.55 million dairy cows whose number was by 0.7% smaller than in 2009. On the 7th position was situated Ireland which had 1.36 million cows, by 33.9% more than in 2009, the highest increase in the analyzed interval. Spain came on the 8th position for 0.82 million cows, by 1.3% less numerous than in 2009. Denmark kept its 9th position having 0.57 million cows by 0.7% less than in 2009 and Belgium was placed on the 10th position for 0.53 million cows, a number by 2.1 % higher than in 2009 (Fig.5).

Fig.5: The dynamics of dairy cows in 2018 versus 2009 in the top 10 main milk producing countries of the EU-28, 2009-2018 (Million heads)
Source: Own design based on Eurostat, 2020, Number of dairy cows.

The number of dairy cows, despite of its decreasing trend remains an important factor determining milk production. In the EU countries where milk yield is low, the number of dairy cows supports milk output as affirmed Popescu (2015a, 2015b).

The average herd size. In 2016, the number of dairy cows per farm in LU was in average 33 heads. The highest number of dairy cows per farm was in Denmark, 160 LU and United Kingdom 130 LU, followed by Netherlands 90 LU, Ireland 73 LU, Belgium 70 LU, Germany 66 LU, France 59 LU, Spain 59 LU, Italy 50 LU.

Poland is the only country with 18 LU, meaning by -45.4% less than the EU mean and by -88.7% less than Denmark (EU, 2018, Dairy farms report based in 2016 FADN Data).

However, in the EU, there are many subsistence farms with a very small herd size and their situated in Romania, Bulgaria, Croatia, Hungary, Latvia, and Lithuania.

Various research studies proved that dairy farming at a small scale is not efficient, and compared to the EU-15 there are substantial differences in terms of production, production costs, gross profit, gross margin, and standard output (Popescu and Muresan, 2004 and Popescu, 2007).

Average milk production per dairy cow is another influencing factor of raw milk output delivered to dairies. In the EU-28, the average yield per cow marketed to milk processing plants accounted for 6,997 kg/cow, being by 24.4% higher than in 2009.

Fig.6: The dynamics of average yield per cow sold to the EU-28 dairies, 2009-2018 (kg/cow/year)
Source: Own design and calculation based on the data from EU, 2020, Milk market observatory.

In 2018, a number of 6 countries from the top 10 milk producing countries exceeded the EU-28 average of raw cow's milk as follows: Denmark 9,851 kg/cow and +40%, Netherlands was on the 2nd position with 8,944 kg and + 27.8%, Spain came the 3rd with 8,711 kg and + 24.5%, United Kingdom was ranked the 4th for 7,985 kg and +14.1%, Germany came the 5th with 7,923 kg and +13.2%, Belgium was on the 6th position with 7,900 kg and +12.9% (Fig.7).

Fig.7: The dynamics of the average milk yield in the top 10 main producing countries (kg/year)
Source: Own design and calculation based on the data from EU, 2020, Milk market observatory.

The other four countries registered in 2018 a lower milk yield than the EU-28 average. It is about: France with 6,919 kg/cow and -1.1%, Ireland 5,707 kg and -18.4%, Poland 5,399 kg and -22.8% and Italy 5,220 and -25.4%.

In the studied interval, the average milk yield increased by 52.7% in Poland, by +25.6% in Spain, by +24.5% in Belgium, by +21.8% in Netherlands, by +20.2% in Germany, by +19.5% in Denmark, by +17.9% in Ireland, by +13.2% in France, by +12.4% in United Kingdom, but it declined by -6.6% in Italy (Fig.7).

However, in the EU milk yield is very different if we make a comparison between the EU-15 and the EU-13, representing the countries who adhered since 2004 to the common market. The lowest levels of milk yield are in Bulgaria and Romania.

Milk yield is one of the most important factors which has to be managed in order to increase milk production and the efficiency in dairy farming. The higher milk yield, the higher milk production, the higher gross margin and economic size of the farm as found by Popescu (2004b, 2009a, 2010a, 2010b), Popescu and Condei (2014) and Popescu and David (2014).

Milk production per inhabitant in the EU-28 increased year by year and reached 312.82 kg/capita in 2018, meaning by +17% more than 267.36 kg in 2009.

In 2018, seven countries exceeded the EU average milk production per inhabitant as follows: Ireland 1,625 kg/capita, Denmark 965.5 kg, Netherlands 837.2 kg, Germany 398.8 kg, France 388.6 kg, Poland 373.6 kg, Belgium 368.4 kg.

The other countries recorded a lower milk production per capita: United Kingdom 23.7 kg, Italy 216.5 kg and Spain 179.9 kg.

These figures reflect that in the top producing countries, production assures and exceeds the consumption requirements, therefore self sufficiency is higher than 100.

In the analyzed period, milk production per inhabitant increased in all the top EU producing countries in various proportions as follows: +37.9% in Ireland, +28.4% in Belgium, +15.4% in Poland, +14.9% in Netherlands, +11.5% in Spain, +10.2% in Germany, +8.4 % in Denmark, +5.1% in Italy and +4.3% in United Kingdom (Fig.8).

Fig.8: Milk production per inhabitant in the EU-28 top 10 milk producing countries in 2018 versus 2009 (kg/capita)

Source: Own calculation.

The correlation coefficients between: (a) the raw cow's milk delivered to dairies, RCMD, and average raw cow's milk, AMY, and (b) RCMD and the number of dairy cows, NDC are presented in Table 2.
At the EU level, the coefficient of correlation between RCMD and AMY was r = 0.985 and in the top 10 milk producing countries its value varied between 0.989 in Belgium and 0.125 in Italy. In almost all the countries such as Germany, France, Unites Kingdom, Poland, Ireland, Spain, Denmark, Belgium, the correlation coefficient was over 0.9 reflecting a very strong positive relationship between these two indicators. In Netherlands, it was 0.776 also a strong correlation, but in Italy, the value of the correlation coefficient showed a very weak positive connection between these indicators, meaning that the raw cow's milk delivered to dairies is not related to the average raw cow's milk marketed to the milk processing plants.

The coefficient of correlation between RCMD and NDC registered positive and high values in Ireland, Poland, Netherlands, United Kingdom and Belgium, over 0.733. In France, its value was 0.5, reflecting a moderate positive relationship, while in the other countries Germany, Italy and Spain, it registered the lowest values, below 0.266 showing the existence of very weak connection between the raw cow's milk marketed to dairies and the number of dairy cows (Table 2).

Table 2: The correlation coefficients between: (a) the raw cow's milk delivered to dairies, RCMD, and average raw cow's milk, AMY, and (b) RCMD and the number of dairy cows, NDC at the EU-28 level and in the top 10 main producing countries

	RCMD & AMY		RCMD & NDC	
	r	t_{calc}	r	t_{calc}
EU-28	0.985*	16.07	0.225	0.65
Germany	0.961*	9.79	0.163	0.46
France	0.940*	7.79	0.500	1.63
United Kingdom	0.906*	6.03	0.744*	3.14
Netherlands	0.776*	3.47	0.751*	3.21
Italy	0.125	0.355	0.266	0.77
Poland	0.984*	15.55	0.888*	5.45
Ireland	0.909*	6.16	0.981*	14.22
Spain	0.978*	13.18	0.052	0.14
Denmark	0.970*	11.29	0.232	0.67
Belgium	0.989*	18.85	0.733*	3.04

** Statistically significant for a= 0.05.*
Source: Own calculation.

T Test (Two tails) for α= 0.05 significance level reflected that the coefficient of correlation between RCMD & AMY is statistically significant in case of the EU-28, Germany, France, United Kingdom, Netherlands, Poland, Ireland, Spain, Denmark and Belgium, as $t_{calc} > t_{critical\ (tabled)}$, $t_{criticaL}$ being equal to 2.306 for df = N-2 = 8. The only exception is the correlation coefficient for Italy where $t_{calc} < t_{critical}$, and this proved that its value is not statistically significant.

The correlation coefficients between RCMD & NDC were statistically significant only for United Kingdom, Netherlands, Poland, Ireland and Belgium, while in case of the EU-28 and Germany, France, Italy, Spain, and Denmark were not statistically significant.

The regression models between: (a) RCMD and AMY, and (b) RCMD and NDC, and ***the values of the determination coefficients*** are presented in Tables 3 and, respectively in Table 4.

They could serve for quantifying in what measure an increase by one unit of the independent variable X could change of the dependent variable Y, in this case raw cow's milk delivered to dairies.

Analyzing the situation at the EU-28 level, the regression equation tells us that if AMY will grow by one unit, RCMD will raise by 0.021, in other words if the average milk yield per cow will increase by one kilogram, the row cow's milk delivered to dairies will raise by 0.021 kg.

The values of the determination coefficient, R^2 values higher than 0.5 reflect the existence of a positive and strong relationship the studied variables, while its values below 0.5 show that an increase by one unit of the value of X will have no impact on the Y value.

More concrete, judging the R^2 values for the relationship between RCMD (Y) and AMY (X), we may easily notice that only in case of Italy, the increase by one unit of the average milk yield will have no impact or could have a very reduced influence of the raw cow's milk marketed to the processing industry (Table 3).

Table 3: Regression models between RCMD (Y) and AMY (X), R^2 and Sign F at the EU-28 level and in the top 10 milk producing countries

	Regression equation	Sign F	R^2
EU-28	Y = 0.021 X + 10,044	2.030	0.970
Germany	Y = 0.004 X + 1,277	8.75	9.925
France	Y = 0.0026 X + 7,011	5.23	0.883
United Kingdom	Y = 0.0024 X - 4,396	0.0003	0.821
Netherlands	Y = 0.0018 X - 1.784	0.0082	0.603
Italy	Y = 0.0001 X + 10,071	0.7295	0.015
Poland	Y = 0.0013 X + 4,025	2.67	0.968
Ireland	Y = 0.0036 X - 12.94	0.000267	0.826
Spain	Y = 0.0008 X + 0.221	9.39	0.957
Denmark	Y = 0.0005 X + 0.539	3.22	0.941
Belgium	Y = 0.00059 X - 0.507	5.87	0.978

Source: Own calculation.

At the EU-28 level, the regression equation reflects that an increase of the number of dairy cows by one could determine a decline of the raw cow's milk delivered to dairies by 0.0076. For this reason, the growth of milk production is based on the increase of yield and not of the number of cows, whose trend is declining during the last decade.

Analyzing the values of R^2, in case of the relationship between RCMD (Y) and NDC (X), we may notice that only in Italy, Poland, Ireland and Belgium the number of cows has a deep influence on the raw cow's milk delivered to dairies, in Ireland being the strongest impact. This happens because milk yield is lower than in the other milk producing countries selected in this study (Table 4).

Table 4: Regression models between RCMD (Y) and NDC (X), R^2 and Sign F at the EU-28 level and in the top 10 milk producing countries

	Regression equation	Sign F	R^2
EU-28	Y = -0.0076 X + 326.80	0.5308	0.050
Germany	Y = 0.0044 X + 1,277	0.657	0.026
France	Y = - 0.0064 X + 48.13	0.1405	0.250
United Kingdom	Y = 0.0126 X - 9,157	0.0135	0.054
Netherlands	Y = 0.0093 X - 2,296	0.0121	0.565

Belgium	Y = 0.0027 X -10.56	0.015	0.537

Source: Own calculation.

Forecast of raw cow's milk delivered to dairies for the 2019-2013 horizon was based on the average annual gain (AAG) whose level in the analyzed period 2009-2018 accounted for 2,604.57 thousand tonnes. The average annual gain in the top 10 milk producing countries in the EU is presented in Fig. 9. According to the forecast raw cow's milk which will be marketed to milk processing plants in the EU-28 for the horizon 2019-2013, it is estimated that in 2013, the dairies will be supplied with 173,309.23 thousand tonnes raw milk.

In Germany, milk processing industry will receive 33,560.18 thousand tonnes raw milk, in France 26,358.39 thousand tonnes in Netherlands 14,604.71 thousand tonnes, in United Kingdom 16,121.15 thousand tonnes, in Italy 13,590.19 thousand tonnes, in Poland 13,359.08 thousand tonnes, in Spain 8,763.62 thousand tonnes, in Ireland 9,247.10 thousand tonnes, in Denamrak 6,055.90 thousand tonnes and in Belgium 4,749 thousand tonnes (Table 5).

Conclusions

Dairy cows are the main source of raw milk contributing by 97 % to processing industry in the EU-28.
In the period 2009-2018, raw cow's milk delivered to dairies has continuously increased accounting for 160.28 million tonnes in the last year of the studied interval, and this was a consequence of the increased milk yield and less by the number of dairy cows whose number registered a continuous decline.

In the decreasing order of their contribution to raw cow's milk supplied to dairies, the top 10 producing countries in the EU-28 are: Germany 19.7%, France 15.9%, United Kingdom 9.5%, Netherlands 8.7%, Italy 7.9%, Poland 7.5%, Spain 5%, Ireland 4.9%, Denmark 3.5% and Belgium 2.5%.

The marketed milk to processing industry increased in almost all these countries, the record being registered by Ireland +58%, and on the last position being France +7.3%.

The main influencing factor on this performance was the continuous growth of milk yield sold per cow, which at the EU-level increased from 5,624 kg in 2009 to 6,997 kg in 2018. Denmark, Netherlands, Spain, United Kingdom, Germany and Belgium registered a higher milk yield than the EU average, while France, Ireland, Poland and Italy are situated below this average.

In almost all these countries, milk yield increased in the last decade, the highest growth being 52.7% in Poland, and the lowest one +12.4% in United Kingdom. Only in Italy, milk yield was by -6.6% lower in 2018 compared to 2009.

In 2018, the EU had 22.9 million dairy cows, by 4.1% less than in 2009. The highest number of cows is in Germany while the lowest number is in Belgium. The number if cows declined in various percentages in almost these selected countries, except Ireland where the number of cows increased by 33.9 % and in Belgium by 2.1%.

Raw cow's milk output delivered to dairies accounted for 312.82 kg/capita in 2018, meaning by +17% more than in 2009. Ireland, Denmark, Netherlands, Germany, France, Poland and Belgium exceeds the EU average, and the figures of this indicator reflects a high self sufficiency.

Between raw cow's milk delivered to dairies and average milk yield it was found a strong and positive coefficient of correlation, statistically significant for $\alpha = 0.05$, both at the EU-28 level ($r = 0.985$) and in almost all the main milk producing countries, ranging between 0.989 in Belgium and 0.776 in Netherlands, except Italy were the relationship is very weak ($r = 0.125$).

Between raw cow's milk delivered to dairies and the number of dairy cows, the correlation coefficient had positive values and higher that 0.733 in Ireland, Poland, Netherlands, United Kingdom and Belgium, over 0.733, in France 0.5, while in Germany, Italy and Spain, it registered the lowest values, below 0.266.
The regression equations calculated at the EU-28 level and for each selected country proved that average milk yield has a deep influence on raw cow's milk delivered to dairies, a fact also attested by the value of R^2, which was higher than 0.5 in almost all the countries, except Italy.
The number of dairy cows comes on the 2nd position as importance in determining raw milk delivered to processing industry. The decline of the number of cows at the EU level and in many top producing countries is compensated the growth in milk yield which could more efficiently sustain raw milk production.

The lower milk yield compared to the top producing countries like Germany, France, United Kingdom, Netherlands, Spain determined Italy, Poland, Ireland and Belgium to increase the number of cows for producing more raw milk for dairies.

In consequence, at the EU level and as well as in the top 10 milk producing countries, the supply of cow raw milk to dairies is estimated to grow in the 2019-2013 horizon. In 2023, the EU is expected to produce 173,309.23 thousand tonnes raw cow milk and if we take into account that United Kingdom will leave the EU according to the Brexit agreement, the forecast is for 157,188.08 thousand toness, that is less 9.4%.

marcin.zawada@wz.pcz.pl

Abstract

The main goal of any enterprise is to make a profit. The possibilities of obtaining it are determined, among others, by proper management. Skillful disposal of the resources possessed and their effective use gives an opportunity not only for the profit of the company, but also allows its development. Appropriate planning, organizing, motivating and controlling human resources strengthens the achievement of this goal. Appropriate quality and efficiency cannot be achieved without safe working conditions. The purpose of the article is to show that the costs incurred by enterprises on health and safety at work generate quality and productivity at work. Employer's involvement in health and safety issues may bring economic benefits to the enterprise. Through the analysis of profits and losses, the authors present short-term and long-term economic benefits resulting from the improvement of occupational health and safety in the enterprise.

Keywords: Management, Occupational Health and Safety, Work Quality and Efficiency.

Introduction

All entrepreneur's activities are mainly limited to achieving the highest possible profit with the least financial outlay. However, the entrepreneur must pay attention that the areas in which he optimizes costs do not bring him more losses than goods.

Unfortunately, the experience of the authors of the article indicates that a frequent elements optimizing the costs of the company are the aspects of occupational health and safety (OHS). The vast majority of enterprises (especially those from the micro and small sector) belittle the OHS obligations imposed by normative acts on the employer. This situation means that the employer does not properly care for the safety of employees by not adapting the working environment to the requirements set out in law, thus exposing employees to more frequent accidents at work and adverse events.

The employer should be aware of the hazards that occur in the workplace and effectively counteract them. The costs associated with adapting the work environment to OHS requirements often exceed the psychological capabilities of the company. In the opinion of the authors of the article, this is wrong thinking, because the funds allocated to improving the health and safety conditions in the enterprise should be treated as an investment that can not only pay back, but can bring the real financial benefits to the employer.

Impact of OHS At Work Quality and Efficiency

Appropriate management of the company determines the quality and efficiency of work. The way the employer will approach individual management elements (planning, organizing, controlling and motivating) will have a significant impact on work processes, and thus on work quality and

efficiency. The employer's impact on these factors is very large, because he decides to optimize the work process and manages resources (Cameron, 2006).

Skillful OHS management allows limiting or eliminating an important factor that is meaningful for shaping the work quality and efficiency. It is about loss, lost opportunities or resources that affect the functioning of an enterprise. The occurrence of loss determines specific behaviors not only for the employer but also for the employee, which makes it difficult to get the right motivation to work. Inappropriate management of an enterprise, including OHS management, may result in:

- material losses,
- losses related to adverse effects on employee health,
- other losses depending on the negative consequences arising in the enterprise (Rzepecki, 2002).

It is in the interest of the employer not to allow losses to the enterprise. Therefore, the employer should have an occupational health and safety service that supports him in proper safety management. However, it happens that the interpretation of the enterprise's protection against loss varies. In most cases, the employer sees losses through an economic perspective. The functioning of OHS service understands loss protection as a safe work environment. Differences in the perception of loss confirm that the OHS service plays an important role in the company. Figure 1 presents the types of losses that may arise as a result of the employer's wrong approach to issues related to occupational health and safety (Główczyńska-Woelke, 2009).

Fig. 1. Losses that may arise through improper management of OSH (Główczyńska-Woelke, 2009).

A. Woźny, A. Pacana and others have indicated in their research the impact of management on work quality and efficiency. The authors of the article changed the approach of A. Maslow's pyramid of needs and confronted them with the needs of the company. According to A. Maslow, to meet the needs of a higher order (affiliation, respect and recognition, and self-fulfillment), lower-level needs (physiological and safety) should be ensured. Through the prism of the pyramid of job needs, lower-level needs can be understood as the need to have a job (physiological need) (Woźny et al., 2015).

Each unit signing an employment contract establishes an employment relationship with the employer. Having the status of an employee determines the next level of the pyramid of job needs, namely the need for security. The employer's role is to meet the requirements set out in the Labor Code. Therefore, the employer is obliged to provide a new employee (The Act of 26 June 1974 - Labor Code):

- medical examinations in accordance with the workplace. It is important that referrals for medical examinations take into account all hazards that may occur in the workplace. Hazards identification is carried out in consultation with an OHS inspector who works full-time or provides outsourcing services (Council of Ministers' decree on 2nd September 1997 on occupational health and safety at work),
- general initial training and on-the-job training. General initial training should be carried out in accordance with the company's specific health and safety training program. In addition to the initial training framework set out in the OHS Training Regulation, it is important for the program to include industry-relevant issues that affect employee safety. Professionally implemented on-the-job training in the number of 8 teaching hours (45 minutes) allows not only familiarizing with the workplace, but above all getting to know the processes and people that the new employee will be surrounded by,
- properly assessed occupational risk and inform the employee about its result. Each employer is required to assess the likelihood of adverse events occurring in a given position and to inform each employee about its result. Proper risk assessment allows to detect the most dangerous threats that can result in loss, injury or death,
- familiarize with the safety instructions and procedures. The employer is obliged to draw up job instructions and all equipment necessary for the work process,
- allocate personal protective equipment that is a consequence of proper occupational risk assessment,
- get acquainted with the procedures related to fire protection and first aid (Woźny, Dobosz, 2014).

The number of employer's obligations to create an OHS culture for the employee shows that these issues are very important. The employer's right approach to OHS management enables this key need to be met in accordance with the described pyramid.
Failure to implement the indicated elements may affect the quality and efficiency of work. Meeting the employee's need for security will result in fewer factors that may cause a loss to the enterprise through:

- higher frequency of potentially accident occurrences and accidents themselves at work, which may be caused by the improper use of personal protective equipment,
- lack of knowledge on the safe use of machines and equipment used in the work process,
- extending the technological process as a result of insufficient knowledge of work processes due to the lack of on-the-job training, etc.,
- other losses related to non-compliance with occupational health and safety regulations by both the employer and the employee.

Meeting the needs of the lower level by the employer will determine the quality and efficiency of work, which are the needs of the higher level according to the pyramid of the needs of work proposed by A. Woźny, A. Pacana and others. An employee who is aware of a safe working environment will perform tasks and instructions in accordance with ordinances and procedures.

The needs realized by the employer towards the employee enable reaching the apex of the pyramid of job needs, namely success and self-fulfillment, which are related to the employee's relationship with the enterprise. Employer's commitment to successive pursuit of individual levels of the pyramid means that the employee feels job satisfaction and is ready for greater quality and efficiency. Figure 2. shows a pyramid of job needs.

Fig. 2. Work needs pyramid (Woźny et al., 2015).

OHS management aspect – case study

An analysis of the work needs pyramid has shown that occupational health and safety issues are very important to the company and that they have an impact on the quality and efficiency of work. The subject of the analysis is a transport company, which main orders are based on outsourcing carried out for large logistics centers, warehouses, as well as for small chain stores, etc.:

- permanently employs approximately 40-45 employees,
- has a fleet of 60 cars.

The authors of the article attempted to analyze the selected enterprise in terms of profits and losses resulting from reliable implementation of lower-level needs by the employer. The need for changes in the enterprise resulted from the National Labor Inspectorate's (NLI) inspection in 2017 and the order to change the work organization. The order and the NLI's appearance focused on the area:

- too many accidents and accidental events,
- improper and insufficient selection of personal protective equipment,
- lack of systematic OHS training of employees,
- lack of a dedicated, detailed training program for individual positions,
- bad working conditions.

As a result of the NLI audit carried out in 2017, the entrepreneur decided to change the outsourcing company providing OHS services. The newly recruited occupational health and safety team at the analyzed company began the process of implementing a new health and safety policy in line with the need for security of the pyramid.

The first element showing gaps in the safety management process was the underestimation of occupational risk in the workplace. The previous occupational health and safety inspector assessed occupational risk using the PHA method, and the new occupational health and safety team performed risk assessment using the Risk Score method. Analysis of selected threats included in Table 1 indicates that some threats were underestimated, which increased the likelihood of adverse events (Woźny, Pacana, 2014).

Table 1. Occupational risk update by the OHS team - selected threats (Own elaboration).

Occupational hazard factor	PHA (2 indicators "S","P")	Risk Score (3 indicators "S","E","P")
	Risk assessment before changes	Risk assessment after changes
Physical factors		
Stumble and fall at the same level	D	N
Striking, being crushed by falling objects	D	N
Impact on stationary objects	N	N
Sharp, rough surfaces and edges	D	D
Hit by moving objects	N	N
Overload of the musculoskeletal system	D	N
Changing atmospheric conditions	N	N
Psychophysical threats		
Mental burdens (stress)	N	N

**D - acceptable level of risk*
**N - unacceptable level of risk*

Due to the thorough process of estimating occupational risk, the occupational health and safety team was able to diagnose some of the problems that caused improper organization of work and the increased number of accidents at work. An update of occupational risk has resulted in a change of work clothing, footwear and personal protective equipment. It is noteworthy that before the change, employees used their own private clothing as work clothing, and the safety footwear was of poor quality. As a result of the changes, the employer was recommended to equip employees with:

- summer and winter work clothing (work trousers, jacket, 3 T-shirts, winter jacket)
- work footwear for summer and winter,
- an unlimited number of protective gloves for use in warehouses and when loading and unloading goods at the customer's,
- protective helmets for use in logistics warehouses that required it.

The adaptation of work clothing and footwear as well as personal protective equipment to the guidelines specified in occupational risk resulted in a significant increase in financial outlays. The data in Figure 3 indicate expenditure in the months January-May in 2017 (before NLI control) and 2018 as amended. It is worth to note that the sum of costs before the changes in the analyzed months amounted to PLN 2,518.78, and after the changes as much as PLN 11,144.10.

Fig. 3. Expenses for clothing and footwear as well as personal protective equipment (Own elaboration).

As a result of audit the NLI showed deficiencies in general initial training, position instructions and periodic training. The OHS team updated the detailed training programs and re-trained all employees in line with the new training program. It is worth to mention that thanks to the efforts of the occupational health and safety team, some employees were delegated for specialized training in the operation of electric-powered lift trucks. This was necessarily due to the unacceptable level of risk associated with overloading of the musculoskeletal system. Due to the fact that the employees of the analyzed company work in different warehouses and with different goods, it happened that they had to transport goods exceeding 450 kg with a hand pallet truck, which is not in line with applicable regulations on manual transport works (Regulation of the Minister of Labor and Social Policy of March 14, 2000 on occupational health and safety during manual transport operations).

As a result of the changes, expenditure on training and employee development increased significantly in 2018, compared to 2017. In the examined months of 2017, the cost of training and improvement was only PLN 460, and in 2018 as much as PLN 12,250.

Fig. 4. Expenses for training and improvement (Own elaboration).

In accordance with the obligations arising from the Labor Code, the employer is to subject the employees to initial, periodic and control medical examinations. In the case of the analyzed enterprise, this scope is expanded to include neurological and psychological tests in connection with driving

vehicles. During the analysis of hazards in the work environment, the occupational health and safety team obtained information on a large number of back pain in employees, therefore they recommended employers to facilitate access to private treatment in the form of additions to visits to an orthopedic specialist and a physiotherapist. In 2018, these activities generated expenses of PLN 9,910. In the previous period, the expenditure on occupational medicine doctor and medical care of employees amounted to PLN 2,160.

	January	February	March	April	May
2017	600.00 PLN	240.00 PLN	720.00 PLN	480.00 PLN	120.00 PLN
2018	2 300.00 PLN	1 800.00 PLN	2 400.00 PLN	2 150.00 PLN	1 260.00 PLN

Fig. 5. Expenses for occupational medicine doctors and medical care for employees (Own elaboration).

The last element of the OHS team's activities was a detailed review of the occupational health and safety of work rooms and machinery and equipment used by employees. Due to the nature of the activity, health and safety inspectors focused on the technical condition of the car fleet and hand pallet trucks used by employees. The review showed that:

- poor condition of the tires,
- some of the rearview mirrors on vehicles are cracked or damaged,
- there are no current technical inspections on 13 vehicles,
- there are no hands-free kits in some vehicles,
- no inspection of fire extinguishers or their total lack,
- some of the hand pallet trucks have damaged wheel rollers and piston seals are solid.

The report from the OHS review meant that the employer repaired the faulty equipment and equipped part of the fleet with the necessary elements. This situation caused increased expenses for improvement and equipment of vehicles as well as costs in the operation of hand pallet trucks. In 2017, these expenses amounted just to PLN 780 in the analyzed months, and in 2018 as much as PLN 9,580.99.

Fig. 6. Expenses for improving and equipping vehicles, including hand pallet trucks (Own elaboration).

The changes introduced by the employer and the OHS team not only improved the working conditions, but actually contributed to reducing the number of accidents at work. It is noteworthy that from 2018 all reported potentially hazardous events (records of adverse events were assumed) that may have an impact on the health and safety at the workplace have been registered. The introduced changes caused the number of accidents to be significantly reduced. In the period January-May 2017, there were 9 accidents at work, and a year later only 2.

Table 2. Number of accidents at work and recorded potentially dangerous events (Own elaboration).

Month	2016		2017	
	Accidents at work	Registered potentially dangerous events	Accidents at work	Registered potentially dangerous events
January	2	Lack of registration	0	12
February	4		0	8
March	0		1	11
April	2		1	4
May	1		0	6

** Only applies to reported accidents and potentially hazardous events*

The analysis of profits and losses related to the change of OHS conditions includes costs resulting from employees' inability to work. The authors of the article took into account absence from work:

- as a result of accidents at work (the employer pays up to 30 days),
- sick leave potentially related to the workplace (overload, tear, degeneration, etc.).

Included costs resulting from:

- sick leave,
- overtime paid, etc., resulting from the implementation of the tasks of employees on redundancies.

The statement of costs incurred by the employer clearly indicates that the changes introduced have resulted in less absence of employees related to accidents or diseases arising from the workplace. The employer's involvement in training, personal protective equipment and equipment modernization meant that the costs of incapacity for work in January-May 2018 amounted to PLN 17,200, and in the

same period in 2017 these costs hovered around PLN 33,000. Thus, there was a nearly 50% decrease in costs incurred by the employer due to the employees' inability to work.

Table 3. Costs as a result of employees' inability to work (Own elaboration)

Month	2016		2017	
	Number of sick leave days	Costs for employer	Number of sick leave days	Costs for employer
January	35	PLN 7,000	20	PLN 4,000
February	47	PLN 9,400	18	PLN 3,600
March	25	PLN 5,000	14	PLN 2,800
April	27	PLN 5,400	21	PLN 4,200
May	31	PLN 6,200	13	PLN 2,600

** An hourly rate of PLN 25 was adopted*

Actions taken by the OHS team from the beginning of 2018 caused that the costs of improving the working environment were PLN 42,885.09. In the corresponding period of 2017, these costs amounted to only PLN 5,918.78. Considering the costs of incapacity for work, it can be seen that the balance of costs associated with raising the safety culture is negative. The authors of the article estimated that the sum of costs related to health and safety at work and due to incapacity for work amounted to PLN 60,085.09 in the months of January-May 2018. In the corresponding period of 2017, these costs amounted to PLN 38,918.78, i.e. almost by over PLN 20,000 less.

Table 4. List of costs incurred for occupational health and safety and for incapacity for work in the surveyed months: January-May 2016-2017 (Own elaboration)

	2016	2017
Costs incurred to improve OHS conditions	PLN 5,918.78	PLN 42,885.09
Costs for incapacity for work	PLN 33,000.00	PLN 17,200.00
Sum of costs	PLN 38,918.78	PLN 60,085.09

The balance of profits and losses in the analyzed months (January-May) is negative and it may seem that the improvement of working conditions, and thus the quality and efficiency of work did not have a positive impact on the management aspect of the enterprise's functioning. However, when estimating the costs that the employer may incur throughout the year, profit is noticeable already in December 2018. The actions proposed by the OHS team in the long run will positively affect the economic aspect of the enterprise.

Table 5. Estimated employer's cost for incapacity for work throughout the year, including health and safety costs (Own elaboration)

	No change	After changes
	Median days of inability to work	
	33	17
June	PLN 6,600.00	PLN 3,400.00
July	PLN 6,600.00	PLN 3,400.00
August	PLN 6,600.00	PLN 3,400.00
September	PLN **6,600.00**	**PLN 3,400.00**
October	PLN 6,600.00	PLN 3,400.00
November	PLN 6,600.00	PLN 3,400.00
December	PLN 6,600.00	PLN 3,400.00
The whole year	PLN 46,200.00	PLN 23,800.00
	PLN 38,918.78	PLN 60,085.09
	PLN 85,118.78	PLN 83,885.09

** Considering the median days of inability to work before and after the shifts, it can be assumed that profit resulting from the improvement of health and safety conditions will be possible as early as January 2019*

Conclusions

Each action taken by the entrepreneur is intended to achieve a specific goal. The list of these goals is related to the company's plans and its financial results. Depending on the development plan, the entrepreneur will take measures to make the most effective use of available resources.

In the case of human resources, it is difficult to optimize costs in relation to the development of the company. The example of the analyzed enterprise shows that increasing expenses on health and safety at work can contribute to better quality and efficiency of work. This is indicated by a significantly lower number of accidents and days of inability to work after the changes. Changes introduced in the company only in the first period generated significant costs. In the perspective of the year, the investment related to the improvement of working conditions should definitely pay off looking solely through the prism of accidents and days of inability to work. This approach to the issue of employee safety should be reflected in the quality and efficiency of employees 'work, which means that greater involvement in employees' work can be expected.

Compulsory Banks' Restructuring as An Attempt to Ensure Continuity of Bank Functions That Are Key to The Market – Poland's Example

Ewa KOWALEWSKA

University of Szczecin, Szczecin, Poland, ewa.kowalewska@usz.edu.pl

Abstract

Compulsory banks' restructuring is a relatively new solution introduced onto the ground of national legislation in connection with EU requirements. The mechanism of resolution is also an attempt of a response to the financial crisis that took place in 2007-2008. The basic aim of compulsory restructuring is to ensure continuity of provision of banks' critical functions. Due to the launch in Poland on 15 January 2020 of the first compulsory restructuring of the Podkarpacki Bank Spółdzielczy (PBS) with its registered office in Sanok this issue gained a practical dimension. The purpose of the research is to indicate whether relevant applicable legislation and steps already taken in practice allow the implementation of the basic objective of the resolution process. The research hypothesis was based on an assumption that ensuring continuity of critical functions of a bank that found itself in a bad financial standing is an important element used to stabilize the situation on the banking market. By ensuring critical functions, the requirement launching the payment of guaranteed funds to the depositors will not be met and it will be possible to use solutions which will affect the entire financial market to a smaller degree. The analysis covers currently applicable legislation in the context of mechanisms of compulsory restructuring used in practice. The adopted research methodology was based on the analysis of texts of legal acts that are key to the discussed subject-matter, with reference to selected views expressed in the literature. It needs to be concluded that the method of analysis of applicable law and the case study method were used as the basic research methods.

Keywords: Compulsory Restructuring, Bank, Bridge Institution

Introduction

The mechanism of compulsory restructuring has been in operation in Poland since 2016. Its legal basis is in the Act of June 10, 2016 on the Bank Guarantee Fund, the deposit guarantee scheme and compulsory restructuring (consolidated text: Dz. U. (Journal of Laws) of 2019 item 795 as amended, hereinafter: BGFA), which fully meets EU requirements. The introduced solutions extended the scope of tasks carried out by the Bank Guarantee Fund (BGF) and increase its role in the financial security network on the Polish financial market. Next to tasks involving guaranteeing deposits, the BGF became the organ of resolution.

It needs to be noted that compulsory restructuring is a non-judicial mode that allows making quick changes in the organizational structure of a bank which found itself in a crisis situation (Szczęśniak 2018, p. 2). The legislator prescribed for different instruments of resolution which make it possible to undertake measures adequate to the scale of the phenomenon and best from the point of view of maintaining the continuity of bank's critical tasks. Direct motivation for the conducted research was the BGF's taking a decision on January 15, 2020 to initiate Poland's first compulsory restructuring of the Podkarpacki Bank Spółdzielczy (PBS) with its registered office in Sanok.

Ensuring Continuity of Bank's Core Business as Resolution's Objective

Article 66 BGFA specifies objectives of compulsory restructuring. The most important ones include ensuring continuity of bank's core business, that it guaranteeing continuation of the so-called critical functions performed by the bank. In accordance with the will of the legislator, critical functions need to be understood as bank services, operations or other bank activity cessation of which would lead, in one or a few EU countries, to disturbances in the functioning of the economy, or would threaten financial stability due to the size of the bank, its share in the market, complexity, transnational activity or economic or financial ties. Burzyńska (2014) notices that the term maintaining bank's critical functions should be understood as keeping agreements concluded by banks. BGF's task in such a situation is to strive to limit the loss of value of the banking enterprise with regard to which compulsory restructuring is being implemented. The essence of the achievement of this objective involves maintaining critical functions as active (FSB 2013).

In compulsory restructuring existing owners lose their entitlements to the benefit of BGF (2020b). A need has been observed in Europe to provide bodies responsible for maintaining stability and security on the financial market with appropriate tools necessary to reduce the systemic risk resulting from a bank's bankruptcy at the same time limiting the risk of costs to tax-payers (Davies and Dobler 2011). This leads to a conclusion that under resolution owners and creditors should not suffer losses greater than they would have under regular insolvency proceedings. It needs to be emphasized that resolution is initiated without the consent of the bank or its shareholders, members or creditors and debtors. This means that bank customers (depositors) have no influence over the actions taken. Any consent to apply an adequate measure (instrument) of compulsory restructuring is not required either. Decisions on initiating resolution and on the application of a specific measure of compulsory restructuring are made by the BGF's independent decision. It needs to be taken into consideration that in accordance with the will of the legislator initiating resolution does not cause a launch of the system of payments as part of guaranteed funds (in Poland also by the BGF). Szczęśniak (2018) emphasizes that resolution's aim is to protect public resources. It needs to be noted that in the Polish legal system only a declaration of bankruptcy results in the launch of payment of guaranteed funds for the depositors of the bankrupt operator (i.a. bank). Given the assumption that the amounts of the said payments may exceed the amount of resources gathered for this purpose (in banks' guarantee funds) the possibility to fall bank on the resolution mechanism gains special importance. Initiating it will then fit among BGF's tasks the aim of which is to maintain stability and security on the banking market. Thus, it needs to be expressly stated that BGF's activity strives to protect public interest.

Using a bridge institution in restructuring Podkarpacki Bank Spółdzielczy (PBS) with its registered office in Sanok (Polish example)

On January 15, 2020 BGF issued a decision on initiating compulsory restructuring of Podkarpacki Bank Spółdzielczy with its registered office in Sanok (PBS), on writing down PBS's capital instruments and on applying compulsory restructuring in the form of a bridge institution and appointing an administrator. Thus the BGF took control over PBS. Moreover, the BGF took a decision to suspend temporarily PBS's activity until January 20, 2020, that is for the time necessary for the takeover (BGF, 2020a). The actual launch of the compulsory restructuring took place - in line with statutory provisions - on the date of serving the said decision, that is January 17, 2020 (BGF 2020b). PBS obtained the status of "a company under restructuring".

The BGF began PBS's compulsory restructuring because three conditions, specified by statute, have been met which oblige the BGF to undertake such a solution. They include:

a) threat of PBS's bankruptcy,
b) absence of premises that would point to possible supervisory measures or measures taken up by the PBS itself that would allow removal of the threat of bankruptcy in an appropriate time.
c) initiating PBS's compulsory restructuring was in the public interest.

It may be pointed out that the reason for resolution was PBS's bad capital situation. According to PBS's mid-year report, the bank's balance sheet total at the end of 2019 was approx. PLN 2.8 billion and the Tier 1 capital ratio went down within 12 months from 7.65% to 0.32% where the minimum requirement is 6%. The ratio at this level was without a doubt an instrument demonstrating that PBS was a bank at risk of bankruptcy. It needs to be noted that PBS, contrary to most cooperative banks, was not a member of any Institutional Protection Schemes operating in Poland (that is a special form of protection of "associated" cooperative banks, with the consent of the supervision organ, i.e. the Polish Financial Supervision Authority (KNF)). Before taking the decision on compulsory restructuring, the BGF assessed the value of PBS's assets and liabilities. It is done by an independent company. The assessment demonstrated that PBS's assets are insufficient to cover its liabilities.

As part of its activities, the BGF decided to employ an instrument called a bridge bank and its role was given to Bank Nowy BFG S.A., equipped with the capital of PLN 100 million. A section of PBS including i.a. all deposits of the bank's customers (retail, micro-companies and small and medium-sized enterprises) was transferred to Bank Nowy BFG S.A. PBS's obligations (including all obligations related to PBS's operation, with particular emphasis on obligations resulting from concluded and applicable agreements save certain exceptions) were also transferred to Bank Nowy BFG S.A. Thanks to this the security of deposits stored at the PBS was ensured. It needs to be emphasized that the BGF guarantees PBS's customers' savings under unchanged terms, which is in agreement with the BFG's objects as a deposit guarantor. As a consequence of launching the bridge bank, depositors' bank accounts are still maintained under the previously applicable terms. In the first days of lunching the resolution mechanism, serving PBS's customers was temporarily suspended due to technical requirements associated with transferring the operation to Bank Nowy BFG S.A. The technical break in internet and mobile banking services and in bank branch offices lasted until January 21, 2020 (it included also non-cash transactions performed by means of cards and cash machines). On January 21, 2020 resumption of operation took place under previously applicable terms, with the use of internet and mobile banking.

Searching for an answer to the question of what determined in the case of PBS that the BGF decided to take measures that served to maintain continuity of this bank's core operation, one needs to note that PBS's customers included mostly local government units (LGUs). Due to their role in the local community and the region's economy, the BGF concluded that serving the LGUs is PBS's critical function (mainly given the high value of their deposits). Bearing the above in mind, the BFG assessed that adopting compulsory restructuring towards PBS was necessary in order to ensure continuity of its critical functions. Such a decision was primarily dictated by the fact that funds stored in the bank by LGUs are not covered by a deposit guarantee scheme and thus if PBS's bankruptcy were to be declared, it would lose all its resources (BGF, 2020a). A bridge institution protects the public interest in such a situation. Being under control, the bridge bank gives a warranty of careful operation, aimed at maintaining financial stability (Kerlin 2016).

Conclusions

The global financial crisis has shown inefficiency of deposit guarantee schemes. This is why the solutions at the EU and national level introducing the resolution mechanism were incorporated. It was assumed that ensuring bank's critical functions should not be felt by its customers. This will allow maintaining essential elements of bank's activity (Kerlin 2016).

The risk of PBS's bankruptcy revealed certain deficiencies in the deposit guarantee scheme in Poland, mainly in terms of protection, and strictly speaking its absence, in the context of LGUs' deposits. Forms of activity under resolution allowed by the BFGA made it possible, at least to a great extent, to protect the banking market against negative outcomes of PBS's bankruptcy (that is: LGUs' loss of funds of a high amount). Given the emerged situation of the banking market in Poland, in particular on the cooperative banking market, it needs to be shown that the measures taken are the first attempt to employ resolution, also in protection against bankruptcy and its negative effect on public finances. PBS's compulsory restructuring is performed on the basis of tools prescribed for in the BGFA, including also the use of the banks' compulsory restructuring fund. Finalization of PBS's

compulsory restructuring will allow an assessment whether resources gathered in this fund are adequate to needs.

The analysis carried out for the purpose of this study shows that ensuring continuity of critical functions of a bank which found itself in a bad financial condition is an important element used to stabilize the situation on the banking market. The described case, however, will reveal an important problem and under these circumstances a discussion should be taken up on amending the applicable legislation towards protection of deposits gathered by LGUs.

E-mail:Tomas.peracek@fm.uniba.sk

Abstract

The author of the attached article is currently running a phd programme at the Comenius University in Bratislava in Management on the topic "Management systems for better protection of investors and consumers against investment fraud and financial crises. “The motivation for the subsequent publication was based on the fact that in the meantime, for several years now, new financing possibilities have been available on the block chain such as „Initial Coin Offering“, „Initial Exchange Offering“, and „Security Token Offering,“ in which investors and consumers are increasingly given the opportunity to participate. In the meantime, however, it has become apparent that the new investment opportunities for investors have often been associated with high losses or even total loss.
First of all, the article will describe the currently existing financing possibilities of new ones such as Initial Coin Offering, Initial Exchange Offering and the negative development for investors in recent years, then what measures are/were taken by supervisory authorities to better protect investors and finally the new financing instrument of Security Token Offerings with its advantages and disadvantages for investor protection and whether it promises better protection for investors in the future. In order to present the current status in the best possible way, both previously available literature/books on the topic and current research material from the Internet, some of which is even more up-to-date than information in books, should be used.

Keywords: Initial Coin and Initial Exchange Offerings, Security Token Offerings, regulatory challenges, better investor and consumer protection

Introduction

New financing options for companies such as "Initial Coin Offerings" or "Initial Exchange Offerings" are booming.

These new forms of investment based on the block chain involve considerable risks for investors and consumers, including the risk of total loss.

On the basis of the following article, the author will examine which risks have meanwhile become reality for investors when participating in the new financing possibilities, which measures are being taken by international supervisory authorities, e.g. in Germany, to better protect investors and which further financing model on the block chain is currently in the starting blocks and whether investors can expect better protection in the future. This will be discussed in the following article.

New financing possibilities on the block chain such as Initial Coin Offering (ICO) and Initial Exchange Offering (IEO) with considerable risks

Initial Coin Offerings with high risks for investors

Since 2016, the market for the block-chain-based financing model of Initial Coin Offerings had been developing increasingly.

In 2018, ICO issuers worldwide had raised more than 12 billion US dollars.[1]

Within the framework of a so-called "Token Sale Event", an attempt is made to convince as many investors as possible of the financing project and thus to "collect" as much money as possible from investors so that the project can be financed.

In return, the investors then receive so-called "tokens", whereby they hope to achieve high profits with these.

The "tokens" issued within the framework of an ICO are generated by using block chain technology via program codes stored there and initially appear in the form of encrypted data packets which are transferred to other ICOs using an individual key.

These tokens als transferred to persons and acquired and stored by them in electronic purses, so-called "wallets.[2] Investors therefore only need a wallet that can receive the tokens.

Especially for smaller companies or start-ups, an Initial Coin Offering offers various advantages, e.g. in comparison to pure bank financing or financing through crowdfunding, which was often much more difficult to obtain, implement and cost-intensive.

A white paper describes the product to be financed, the process and conditions of an ICO, the use of funds, the team members involved, investors already acquired and other circumstances related to an ICO.[3]

It is controversial whether the information in the so-called "White Paper" is now legally binding or not.[4]

Furthermore, there are often the so-called "Terms and Conditions", in which the legal framework of the respective project and the properties of the token to be issued are described in detail.[5]

In the final analysis, these "Terms and Conditions" are general terms and conditions, which means that it is often necessary to ask whether these general terms and conditions are valid, e.g. according to §§ 307, 309 ff. German Civil Code (BGB).

Subsequently, the so-called "tokens", i.e. virtual money, which investors receive from an ICO, are or were issued as part of the issue.

In general, a distinction is made between "currency tokens", "utility tokens" and "security tokens".[6][7]

The majority of cryptotokens issued within the scope of an ICO were so-called "utility tokens".
Utility tokens are a kind of medium of exchange for a specific purpose. They are also equipped with certain functions and rights (i.e. they exceed the scope of one currency).

It is important for the utility token not to represent a share in a company. It is therefore not a share or a security.[8]

The Utility Token thus embodies the concrete promise that it can be exchanged for a good or service.[9] Therefore, the "utility token" is sometimes seen "similar to a digital voucher or license.[10]
In the meantime it has become apparent that in many cases, however, investors who had participated in these ICOs did not make any profits but, on the contrary, suffered considerable losses up to total loss. Often ICOs failed quickly and investors had lost some of their money. Subsequently, the monthly ICO financing volume from January to December 2018 had also shrunk by about 90%.[11]

Often promises were made to investors here in white papers that could not be kept, or there was often a fraudulent issue from the outset. This was aggravated by the fact that many providers had set up their ICO from abroad, such as Malta or Switzerland, even though they had addressed investors throughout Europe, making it particularly difficult to bring an effective lawsuit or "enforcement".

As a result, as described above, it has become apparent that in various cases investors have now suffered losses or even suffered a total loss when investing in ICOs.

Initial Exchange Offerings with better protection for investors?

As the market for ICOs has now declined sharply, another financing model has evolved from the ICOs, which aims to offer more security, the so-called "Initial Exchange Offerings" (IEOs).

An Initial Exchange Offering is very similar to an ICO, because here, too, the issuers collect money in the form of "crypto tokens", but this is a "token sale event" that takes place on a crypto exchange.

The big difference between an IEO and an ICO is that IEO issuers do not issue the tokens directly via their own platform, but on a crypto-exchange, and thus a third, independent party comes into play with the crypto-exchange.

This issue on a well-known crypto-exchange can build up considerably more trust with the investor, and in addition, it will probably be easier to prevent fraudulent issues from the outset, because renowned crypto-exchanges are themselves concerned about their good reputation, and a possible total loss of the investors could also damage the reputation of the crypto-exchanges.

The monitoring of the issue by an independent third party, the crypto-exchange, thus offers an additional security aspect for the investor.

Furthermore, an IEO is immediately tradable compared to an ICO.

In the meantime, the volume of IEOs is also increasing significantly, as the trading volume of token offerings has been stagnating since mid-2019. The trading volume, which amounted to USD 653 million in the period from January to May 2019, had fallen to just USD 151 million between June and the end of October 2019.[12]

However, the market of IEO's has experienced market growth.

The auditing company PWC writes here in ist 6th market report:

> *"Despite the general stagnation in token-offerings from June to October 2019, the IEO's have significantly increased their relative share. This growth points to their progressive institutionalization and final establishment as a block-chain-based fundraising instrument."*[13]

In the meantime, there has been a significant increase in the number of offers from IEOs, although investors must be aware that an IEO offers somewhat more security than an ICO by involving the third

party, the crypto-exchange, but still involves many risks which, in the worst case, can lead to total loss (more on this below).

What are the supervisory authorities doing to better protect investors?

In the meantime, the authorities are reacting more strongly to the new financing possibilities, politicians and regulatory authorities are working on a stricter set of rules for the cryptocurrency sector and for the new financing possibilities, e.g. with ICOs:

For example, the Swiss federal authorities have now reacted to the ICO wave by setting up a new so-called "Blockchain Task Force".
In China, there has been a general ban on ICO's since 2017.[14]

The German Federal Financial Supervisory Authority (BaFin) also issued a consumer warning as early as 2017 to warn investors of the risks associated with Initial Coin Offerings (ICOs).

Literally, the BaFin wrote:

> *"BaFin points out that the acquisition of coins - also called tokens depending on the structure - within the framework of so-called Initial Coin Offerings (ICOs) involves considerable risks for investors. ICOs are highly speculative investments. Investors should be aware that a total loss of their investment is also possible. As with most current trends, the high public interest in ICOs also attracts fraudsters."*[15]

Felix Hufeld, the President of the German Financial Supervisory Authority BaFin, also said on 28.10.2018 that it would be a question of an appropriate further development of financial regulation.[16] BaFin had already taken action in this regard: In response to a small inquiry, the German government announced that BaFin had already initiated proceedings against issuers of tokens in 13 cases in 2017 on suspicion of illegal transactions.[17]

In four cases the transactions were even prohibited and the prosecution authorities were involved. In 23 cases, proceedings were initiated to decide in cases of doubt.[18]

The BaFin had therefore also decided not to ban the new financing model of the ICOs, but to issue a warning for consumers and investors and also to take action in individual cases against obviously dubious or fraudulent issuers.

In the USA, too, a middle course is being taken here; ICOs are not completely banned, but neither are they completely open.

In the USA, a distinction is made between a utility token and a security token. In the USA, such companies must be registered with the SEC and are then subject to its entire set of rules. This includes, for example, the implementation of standard know-your-customer (KYC) and anti-money laundering practices (AML).[19]

However, since the beginning/mid-2018 ICOs may no longer be advertised on the major social media platforms Facebook and Twitter.

Furthermore, Google has banned advertisements via Google AdSense on ICOs and cryptocurrencies.[20]

In the USA, the US Securities and Exchange Commission (SEC) also issued a warning to investors participating in Initial Exchange Offerings (IEOs) some time ago.

The SEC points out that (these) crypto exchanges are generally not registered. This is a significant regulatory violation, as IEOs lack many of the investor protection provisions for registered and exempted securities offerings. In particular, the SEC also warns against false promises, also by the stock exchanges, which have an interest in selling via a fee model.[21]

Literally, the SEC states the following:

> *„Be cautious if considering an investment in an IEO. Claims of new technologies and financial products, such as those associated with digital asset offerings, and claims that IEOs are vetted by trading platforms, can be used improperly to entice investors with the false promise of high returns in a new investment space. As described below, IEOs may be conducted in violation of the federal securities laws and lack many of the investor protections of registered and exempt securities offerings.“*[22]

In addition, the SEC points out that IEOs are violating US securities laws in various cases.
If IEOs were to be classified as securities, the crypto exchange would have to register separately with the SEC as a national securities exchange. Non-compliance with the federal securities laws means that the IEO and the trading platform may be "operating illegally and the investor protection and remedies provided under those laws may not be available.“[23]

The SEC also points out the following:

> *„Saying something is registered doesn´t make it so. In addition, be careful if the promoter of the IEO or the digial trading platform hosting the IEO states that they are approved or registered with the SEC.*
> *There is no such thing as an SEC-approved IEO. It is common for a fraudster to make false and misleading statements or exaggerated claims about regulatory approvals and oversight to lure potential investors. It pays to indepently investigate these claims for yourself.“*[24]

The SEC therefore suspects that there are also many dubious providers in the area of Initial Exchange Offerings and thus numerous dangers lurk for investors in the case of an investment up to the danger of total loss.
In particular the explanations of the SEC result in that one assumes here that many providers would need a permission, however, do not have this and therefore also many fraudulent offers are on the market.
It is therefore to be feared that there are also considerable risks for investors in the area of the new Initial Exchange Offerings and only the near future will show whether or not a similar "disaster" as with ICOs is threatening investors.

In any case, the above statements show that the supervisory authorities in Germany and internationally have decided not to ban the new financing models on the block chain such as Initial Coin Offering or Initial Exchange Offering completely, but to allow this often unregulated market to continue to exist nevertheless, but to warn investors against dubious and fraudulent offers and to appeal to their sense of personal responsibility, whether they want to participate in an ICO or IEO or not.

This is understandable, because the supervisory authorities do not want to prohibit promising new financing models from the outset, but it shows that investors themselves are much more challenged to obtain sufficient information about the respective offer and, in particular, that they cannot always trust the information provided by the respective issuer.

Security Token Offerings as a new financing model on the Blockchain replace ICOs: Better protection for investors?

Due to the bad experiences for the investor protection with Initial Coin Offerings (and possibly also Initial Exchange Offerings), another new financing model on the block chain, the so-called "Security Token Offerings" or STOs, is increasingly coming into focus. Here, too, interested companies can collect funds within the scope of a so-called "Token Sale Event". Even with an STO, various costs, such as for custody, can be saved through storage on the block chain.

In a Security Token Offering, unlike an ICO, the issued tokens serve not only as subscription rights for coins to be issued later, but also as actual securities.

Security (or similar) tokens (also called "equity tokens," "security tokens," "investment tokens," or "asset tokens") are tokens whose holders have membership rights or contractual claims to assets comparable to those of a shareholder or holder of a debt instrument (e.g., claims to dividend-like payments, co-determination, repayment claims, interest).[25]

Investors thus secure shares in the company through their investment, including ownership control, interest and intermittent returns [26] and thus like an IPO.

As a result, security tokens are to be qualified as securities and this only to the extent that, analogous to the financial instruments listed as examples, they convey some kind of participation right in the profit or yield of a company or a financial claim against the issuer of the security token.[27]
Security tokens therefore basically represent securities within the meaning of the Prospectus Regulation, the Securities Prospectus Act and the Securities Trading Act and are also financial instruments within the meaning of the Banking Act in Germany.[28]

A STO has to comply with higher regulations than an ICO, such as securities law regulations or the preparation of a securities prospectus approved by BaFin.

A Security Token Offering as a new generation of crypto tokenisation offers investors more security, because the securities regulations must be applied, which is why they must first be approved by securities supervisors such as the German BaFin.

The hope is that STOs will thus be suitable for broader groups of investors.
One expert hopes that a moderate degree of regulation and the resulting requirements to be met by STOs will filter out the lion's share of bad projects.

> *"An STO could generate costs in the six figure range. Typically, no windy or inexperienced start-up can afford such a cost pool".*[29]

It is therefore to be hoped that STOs will also be mature enough in terms of investor protection to be suitable for broader investor groups.

However, even an STO is not possible for the investor without risk, as investors should always be aware that an STO is only as good as the underlying security.
Since it is mainly bonds that are to be admitted for tokenisation, investors are therefore exposed to the same risks with an STO as when investing in bonds.
This is above all the issuer risk, i.e. if the issuer goes into insolvency, the investor is also threatened with total loss in this case.
Numerous bankruptcies of issuers of SME bonds which have occurred in recent years, and in which the author of this article represented a number of investors, show that this is not just a theoretical risk.

Conclusion/Summary

In the financial market sector in particular, major changes could be imminent as a result of the block chain and the so-called "tokenisation of assets", although it is crucial that investor protection does not fall by the wayside.

Experience to date in the area of ICOs shows that investors who have participated in an ICO often suffered high losses, even total loss.

It is questionable whether the financing model of Initial Exchange Offerings (IEOs), which can be seen as a further development of the financing model of ICOs, offers significantly more security.

In the past, the supervisory authorities such as the BaFin were caught between the question of not prohibiting a new, promising financing method and investor protection, which in many cases unfortunately led to investors being exposed to considerable risks when investing in a company, up to and including total loss, and unfortunately investor protection was often neglected.

In the interests of investor protection, it is very welcome that the supervisory authorities have now acted and that higher demands are being made on regulation.

However, further efforts are necessary in the opinion of the author, as the new financing models allow investors to be approached not only nationally but even internationally, and international trade is/was often possible across national borders.

This makes it necessary to standardize regulation at least throughout Europe and thus also to give investors the opportunity to successfully enforce their investor rights internationally, if necessary.

With the new "Security Token Offerings", a new financing instrument is available which could and should offer investors significantly more security than the ICO's/IEO's.

Equity Release Scheme in The Strategy of Solving Problems of The Ageing Polish Society

Adriana TOMCZYK

University of Szczecin, Szczecin, Poland
adriana.tomczyk@usz.edu.pl

Abstract

The phenomenon of dynamic demographic changes involving the ageing of societies is subject to in-depth multidisciplinary research, including research within legal studies. It is especially important to assess whether the existing normative standard of protection of seniors is sufficiently effective or whether changes in the law in this regard are necessary. Looking at this issue from the perspective of Polish law is particularly interesting for at least two reasons. First of all, in the 2050 perspective Poland will be among the oldest societies. Secondly, the equity release market in Poland is in the initial phase of development, similar to the majority of countries of Central and Eastern Europe.
The conducted analyses are a basis for an assumption that on the ground of Polish law changes to the applicable regulations are necessary. Comprehensive regulations need to be introduced which will include not only the loan equity release model, but also the sale model which at the moment is based solely on the provisions of the Civil Code.

Keywords: Equity Release, Ageing Society, Reverse Mortgage, Lifetime Mortgage, Home Reversion

Introduction

The global and irreversible phenomenon of the ageing of societies is more frequently a subject of scholarly examination in a number of fields, especially demography and economy. In-depth research from the point of view of legal studies, which aims to construct a normative basis that guarantees social safety to the elderly also needs to be considered as extremely important. In the light of the concerning prognosis for demographic changes it is a particularly difficult challenge for contemporary legislations. These transformations affect the rise of economic problems of elderly persons, whose old-pension benefits in the majority of cases are insufficient to satisfy their necessary needs. One also needs to conclude that the increasingly noticeable weakening of intergenerational bonds and in consequence the weakening of family's care functions forces seniors to look for additional funds. Foreign financial markets, in particular the American and British market, offer equity release schemes (ERS) dedicated for this social group as a remedy for the elderly's economic problems. They involve "releasing" non-liquid capital accumulated in the real estate they reside in into current financial resources. The Polish financial market of the services in question is at the beginning stage of development, even though according to forecasts Poland will be among the five oldest countries of the European Union in 2050. This makes the analysis of the subject-matter of equity release schemes under the current and postulated state of law from the perspective of a Central and Western European country all the more valuable and desirable.

Equity Release in Poland

The Polish regulation of equity release is not comprehensive. It is a fragmentary regulation since it refers only to the loan model under the Act of 23 October 2014 on reverse mortgage. At the same time, there are no regulations concerning equity release in the sale model, which is increasingly used by the non-banking sector. It needs to be highlighted that at the stage of legislative works a draft bill on life cash performance was being processed at the same time, though unfortunately works on it were discontinued and so far they have not been re-launched. In the course of the six years of applicability

of the said act no bank has introduced reverse mortgage to its offer, which makes it a dead law. Nevertheless, it is worth demonstrating the most essential design elements of a reverse mortgage agreement under the Polish law.

Loan Equity Release Model in Poland

According to the legal definition, under a reverse mortgage agreement the bank undertakes to give to the borrower's disposal for an unspecified period of time a cash amount, the repayment of which will take place after the borrower's death and the borrower undertakes to establish a collateral for the payment of this amount together with due interest and other costs (Article 4(1) of the Act). A form of securing bank's dues may only consist in establishing a mortgage and in entering into the real estate's land and mortgage register a claim for transfer of ownership of the real estate (Article 5(1) of the Act).

One needs to point out that the catalogue of entities entitled to grant reverse mortgage was limited to banks, foreign bank branches, credit institution branches and credit institutions operating a cross-border activity (Article 2(2) of the Act). Walczak (2017) suggests extending these services to insurance companies and operators currently offering equity release services in the sale model, on the condition that certain capital requirements are met by these entities and that their activity becomes subject to state supervision.

One needs to point out that the bank's information obligation boils down only to supplying an information form to the borrower which includes information of the reverse mortgage offer 14 days prior to the conclusion of the agreement (Article 8(1) of the Act). One needs to agree with the voiced postulates of introducing an obligatory, independent consultation with a professional licensed consultant, whose knowledge and experience will ensure protection of seniors at an adequate level (Wieckowska, 2011, p. 35; Willmann, 2016, p. 165). Reliable and comprehensible provision of information in terms of rights and obligations of the parties to the loan agreement and legal consequences of concluding it are extremely important to this particularly vulnerable group of consumers. Due to their age, health status and financial situation, seniors are often helpless and particularly at risk of abuses.

Successors may within 12 months of the death of the borrower pay off the total mortgage amount (Article 21 of the Act) and retain the right to the real estate. Otherwise, the bank's claim towards successors for transferring the ownership to the real estate becomes enforceable. After the contract for transfer of ownership of the real estate is executed the bank is obliged to return the amount that is the difference between the real estate's market value and the total amount due (Article 28(2) of the Act). In a reverse situation, that is should the difference be negative, the sole risk is borne by the lender.

Sale Equity Release Model in Poland

As has already been shown above, Polish law has no separate regulations encompassing equity release in the sale model. Nevertheless, it was noted in the social policy 2030 concerning elderly persons (security-participation-solidarity) prepared by the Council of Ministers that it is necessary to secure the interests of consumers who conclude agreements with operators offering the so-called life-contingent annuity (Polityka społeczna, 2018, p. 39).

Under the current state of law, the life-contingent performances (with the following marketing names: "reverse mortgage", "life annuity", "mortgage annuity") offered by non-banking sector institutions are based on agreements under the civil code. On the basis of the freedom of contract principle they offer products whose basis as a rule involves a life annuity agreement or a paid annuity agreement.

A life annuity agreement involves the real estate acquirer committing to provide the transferor with subsistence for life in exchange for transfer of ownership of real estate. Unless the life annuity agreement provides otherwise, the obligation to provide subsistence for life includes accepting the transferor as a member of one's household, providing him with food, clothing, accommodation, light and fuel, providing him with appropriate help and caring in illness and giving him a funeral in accordance with local custom (Article 908(1) of the Civil Code of 23 April 1964). It is rightly pointed

out that the basis of regulation of the life annuity agreement has the nature of close rations, in particular family relations, which are a certain guarantee of providing the transferor with life performances. This is why these regulations do not sufficiently secure the consumer-financial institution relation, especially at the pre-contract stage (Buzałek, 2019, p. 24; Meluch 2017; Wasylkowska-Michór 2017).

Whereas under an annuity agreement, one party commits to another party to make certain periodical performances in money or in fungibles (Article 903 of the Civil Code). Equity release in the sale model is based on the paid annuity agreement which means that the obligation to make periodic performances for life occurs in exchange for the transfer of ownership of the real estate. The provisions on sale apply accordingly to such an annuity agreement (Article 906(1) of the Civil Code). Moreover, the ownership right of a real estate is encumbered with life right of habitation.

It needs to be noted that upon execution of the life annuity agreement and annuity agreement the ownership right of the real estate is transferred onto the entity obliged to pay life performances or specific periodic performances. The real estate acquirer is entitled to all ownership rights, including the right to transfer the acquired real estate. It needs to be noted that the entities providing equity release services in the sale model are not subject to state inspection implemented in Poland by the Polish Financial Supervision Authority which supervises the financial market in Poland. These entities are not obliged to disclose their financial results. Contrary to their slightly misleading name, they are not subject to the Act of 27 May 2004 on investment funds, neither, as a consequence, are they registered in the funds register (Willmann, 2016, p. 156-167, Lewicka, 2015, p. 107-108). Operation of funds is only subject to *ad hoc* inspection of the Office of Competition and Consumer Protection i.a. in terms of unlawful contract clauses. It needs to be noted that the operator providing equity release services under the provisions of the Civil Code is not obliged to settle any balances with successors (Maj-Waśniowska, Cycoń, 2011, p. 202).

It needs to be pointed out that the absence of regulation in the above scope implicates the emergence of a number of risks. First of all, the risk of inadequate valuation of the real estate and of taking over the ownership of the real estate for a fraction of a market price and lowering the amount of the performances. Secondly, the risk of unfavourable development of rights and obligations of the real estate transferor due to the absence of detailed statutory regulations in this regards, in particular the risk of limited freedom of managing the real estate and the risk of eviction. Thirdly, the risk of insolvency of the financial institution due to the absence of the obligation for it to be capitalised. Fourthly, the risk of excessive security of the institution resulting from the absence of the possibility to foresee the length of life of the service user, changes of interest rates or prices of real estate (Buszko, 2012, p. 60). Provisions of the Civil Code providing the basis for currently offered equity release services in the sale model, and in particular the regulations of the life annuity agreement and the paid annuity agreement, do not sufficiently protect the particularly vulnerable group of consumers - seniors. The consumer's position on the equity release market is demonstratively weaker compared to other markets (Raport z kontroli, 2013, p. 83). Introduction of a regulation aiming to professionalize these services, i.e. due to the fact that elderly persons are a social group most at risk of fraud is key and still awaited (Marciniuk, 2014, pp. 255-256, Raport o hipotece odwróconej, 2018, p. 6). Non-comprehensiveness of the Polish regulation in this scope allowed the emergence of an informal economy of unregulated operators offering annuity agreements based on Civil Code provisions. It is necessary to introduce to the Polish legal system regulations which on the one hand will ensure high security standards, on the other will create conditions for the development of the Polish equity release market. It needs to be noted that society's awareness in terms of opportunities to "release value from the most non-liquid assets of their portfolios" is increasingly growing (Zbrojewski, 2013, p. 10).
New regulations should i.a. take into account the requirement of independent thus objective valuation of the real estate, and moreover, introduce procedures preceding the moment of concluding the agreements in order to ensure full and comprehensive information about the offered equity release product. Undoubtedly, an apt solution in this regard would involve introduction of the obligation to observe a time interval between the first meeting and the date of signing the agreement, and also the obligation for all institutions to provide the same scope of information which makes it easier for the consumer to compare offers of different operators (Wieckowska, 2011, p. 35). Introduction of the obligation of consultation with an independent consultant prior to the execution of the agreement is

also worth considering. The above solutions should also be taken into account in reference to the reverse mortgage agreements in order to maintain full systemic cohesion.

The Use of Instruments of Econometric Modelling to Identify Factors Determining the Perception of The Ethical Dimension of Business

Katarzyna OLEJNICZAK-SZUSTER, PhD

Czestochowa University of Technology, Faculty of Management, Poland,
katarzyna.olejniczak-szuster@wz.pcz.pl

Abstract

The study relates to the identification of factors affecting the perception of the ethical dimension of business among entrepreneurs and employees of enterprises operating in Poland – the Silesian Voivodeship, the Poviat of Częstochowa. The formulated research task was performed on the basis of the subject literature and the results of the survey conducted in II and III quarter of 2019 among 456 employees, including 71 foreign workers. The empirical analysis workshop used the instruments of econometric modelling in the form of logit models, in which the determinants belonging to 5 categories were considered. On the basis of the above, 10 logit models (5 full and 5 reduced ones) were built, indicating the relationships between the analyzed variables. The conducted analyses showed that all the estimated models are characterized by the correctness of fit, which is evidenced by the value of the likelihood ratio test. Moreover, the factor affecting the perception of the ethical dimension of business to the largest extent is the position in the company as well as the size of the enterprise. The factor which has no impact is the age of the respondents.

Keywords: business ethics, CSR, norms and values

Introduction

Business management in the 21st century, in the conditions of the constantly changing environment, requires the ability to harmonize a range of activities with the requirements of the market. This is determined by the fact that contemporary organizations, as increasingly complex entities, have become an integral part of the surrounding social, economic and environmental systems (Goel, Ramanathan, 2014). Therefore, as stated by Singh et al. (2019), the contemporary organization should seek to ensure a smooth synergy between business needs and the needs of the society and the natural environment. This is due to the fact that the modern management model is no longer based solely on the implementation of business values, i.e. profit maximization – value for stakeholders or utility maximization (D. Ghosh et al. 2011), and more and more often it takes into account:

- "moral contract" between the company and its (social and environmental) environment (S. Ghoshala et al. 1999),
- responsibility to act towards the society and the environment (De Bakker et al. 2005),
- transparency and ethical behavior (Kotler, Keller 2006, Weber 2012).

In this context, ethical issues in the company, understood as a wide range of problems, from sustainable development of the environment to social justice and human values, and in particular their perception, are growing in importance (Menestrel, Wassenhove 2009).

The objective of the study is to identify factors affecting the perception of ethical business. It is a theoretical and empirical piece of work. Therefore, the theoretical part focused on the theoretical assumptions of ethical business conduct. In turn, the empirical analysis workshop used the instruments of econometric modelling in the form of logit models. In order to develop logit models, the qualitative variables were used, in the form of the empirical material gathered within the framework of the research *Ethical values and attitudes in modern enterprise management.*

Theoretical assumptions of the ethical dimension of business – the outline of the problem

In general, business activity is seen from the perspective of economic success or, in broader terms - praxeological, i.e. efficiency expressed by effectiveness, being a dimension of the assessment of the result of this operation. The dimensions (efficiency and cost-effectiveness) do not exhaust the options of the economic space and their effectiveness, in the opinion of Gasparski (2002), ought to be valued in ethical terms. This is determined by the fact that the ethical dimension of business is a type of the regulator of conduct, constituting the paradigm guiding human behavior. From the point of view of the human being in the enterprise, ethical behavior in economic life is the real dimension of human activities. What, for some employees, in particular managers, appears to be natural and within the limits of moral conduct may be offensive for others and may determine further cooperation of organizations in the market (Łukasik, 2012). In this respect, the ethical dimension of business has become an essential component of the operation of contemporary enterprises, primarily related to (Totaa, Shehua, 2012, Arnaudov, Koseska, 2012):

- developing values and standards in organizations,
- decision-making in accordance with reasonable principles concerning the equity of the operations,
- classifying the mode of decision-making in enterprises,
- operating in accordance with the standards adopted,
- reducing negative actions on the part of managers,
- reducing operations due to the surrounding pressure and financial results achieved,
- creating ethical awareness among employees,
- ethical behavior at each level of the enterprise,
- responsible operations in the market,
- supporting long-term value with ethical conduct,
- reducing the number of conflicts which may arise throughout all business activities,
- withdrawing from wrong decisions,
- determining the applicable ethical principles,
- introducing moral standards in the management strategy,
- formulating sanctions against those violating ethical standards.

Meanwhile, in the real economic space, there are often negative phenomena, the result of which is increased distrust. It can be said that trust, in addition to transparency, is increasingly considered as a valuable asset, the lack of which becomes an obstacle in gaining competitive advantage. Contemporary managers deal with a range of ethical problems on a daily basis and their decisions are rarely deprived of the ethical dimension. Therefore, it can be concluded that ethics is of the key importance for the proper operation of contemporary enterprises (Sroka, Lőrinczy, 2015) reducing the effects of greed or a number of speculations (Goel, Ramanathan, 2014). In general, it can be assumed that business ethics is an ethical reflection on activities of the company and, in particular, the people managing them, affecting the aforementioned economic efficiency (Georgescu, 2012).

Methodological Aspects of The Research

In order to accomplish the objective of the study formulated in the introduction, the instruments of econometric modelling in the form of probit and logit models were used, in practice defined as probability models or Goldberg models (Wiśniewski 2017). These models can be applied when the dependent variable is strictly dichotomous, i.e. when it adopts the value of 1 when the desired event occurs, and the value of 0 when such an event does not occur. In practice, this variable adopts one of the two values, e.g. yes/no, well/badly, implemented/not implemented, while taking the form (Kufel, 2007):

$$y_i^* = \beta_0 + \sum_{j=1}^{k} \beta_j x_{ij} + u_i$$

where:
y_i^* - the latent variable, adopting:

$$y_i = \begin{Bmatrix} 1 \ for \ y_i^* > 0 \\ 0 \ for \ y_i^* \leq 0 \end{Bmatrix}$$

While making an assumption:

- the logit model takes the form of:

$$y_i^* = ln \frac{P_i}{1 - P_i} = \beta_0 + \sum_{j=1}^{k} \beta_j x_{ij} + u_i$$

where:

y_i^*- is called 'logit'
P_i- is defined as the probability of the dependent variable y_t, determined on the basis of logistic distribution

- the probit model equals:

$$P_i = F\left(\beta_0 + \sum_{j=1}^{k} \beta_j x_{ij}\right) = \int_{-\infty}^{\beta_0 + \sum_{j=1}^{k} \beta_j x_{ij}} \frac{1}{\sqrt{2\pi}} e^{\left(-\frac{t^2}{2}\right)} dt$$

Due to minor differences in the obtained results, the presented models are discussed collectively. This is determined by the fact that all the measures of fit to the model are identical (Gruszczyński, 2009). For this reason, for the purposes of this study, in order to analyze the identification of factors determining the perception of the ethical dimension of business, only logit models were used, including only dummy variables coded based on the respondents' responses (456 employees, working in the area of the Silesian Voivodeship, the city of Czestochowa) concerning the selected research problems of the study on *Ethical values and attitudes in modern business management,* conducted in II and III quarter of 2019, using the survey technique (PAPI and CAWI).

Table 1 contains the dependent variables (y) coded based on the respondents' responses to the four questions (research problems) included in the questionnaire, related to the subject matter of the study.

Table 1: The structure of the respondents' responses to the questions on the basis of which the dependent variables y were coded.

Research problems	Percentage of responses	
	Yes	No
In your opinion, is there room for ethics in current realities of conducting business?	72.1	27.9
In your opinion, do modern enterprises implement the ethical dimension of business?	29.4	70.6
In your opinion, is it important for modern enterprises to be guided by ethical values and principles in their activities?	87.5	12.5
In your opinion, do modern enterprises attach great importance to moral values, ethics, corporate social responsibility nowadays?	43.4	56.6
In your opinion, can promoting ethical values become the asset for the modern enterprise?	62.7	37.7

Source: Own study

When analyzing the data in Table 1, it can be observed that, in the opinion of 72.1% of the respondents, there is room for ethical operations in modern business management, but unfortunately, this is not respected in practice (29.4% of responses). Thus, the respondents had a problem to determine if

enterprises attach considerable importance to such actions or not. However, in the opinion of 87.5% of those questioned, it is important that such actions are taken since they may become an asset for their activities (62.7% of responses).

It should be pinpointed that the dependent variables (y) were dependent on the set of independent variables (x), characterizing the people taking part in the research (Table 2).

Table 2. The summary of the independent variables (x)

Respondents' statistical data		Independent variable	Value %
Gender	Female	x_1	60,7
	Male	x_2	39,3*
Age	under 24	x_3	13,2
	25-34 years	x_4	41,0
	35-44 years	x_5	40,3*
	over 45	x_6	5,5
Position	managerial	x_7	27,3*
	non-managerial	x_8	72,7
Size of the company	Micro	x_9	28,5
	Small	x_{10}	48,1
	Medium	x_{11}	16,6
	Large	x_{12}	6,7*
Job seniority	less than1 year	x_{13}	18,4*
	from 1 to 5 years	x_{14}	44,6
	more than 5 years	x_{15}	37,0

** Reference group*
Source: Own calculations

As it can be observed (Table 2), the set of the independent variables (x) contains 5 categories, including 15 independent variables, on the basis of which the research sample can be characterized. The research sample consists of 60.7% of women and 39.3% of men, selected as the reference group.

Taking into account the age groups, the predominant group of the respondents is people aged 25-44 (81.3% of indications), 41% of whom amounts to people aged 25-34 and 40.3% - people aged 35-44 (the reference group). The majority of the respondents are people occupying non-managerial positions, the so-called regular employees – 72.7%. In turn, 27.3% amounts to the group employed in managerial positions (the reference group).

The respondents are people employed primarily in the SME sector, most of whom - in small enterprises, i.e. the ones hiring from 10 to 49 employees (48.1% of indications), followed by those in microenterprises with up to 9 employees (28.5% of indications), and medium ones (16.6% of indications) with 50-249 employees. The reference group in this category of variables is created by large enterprises (6.7% of indications).

The last category of variables was related to seniority. The predominant group in this category amounts to people working for 1 to 5 years (44.6% of indications), followed by those working for more than 5 years (37% of indications). The smallest group is newly-employed people with seniority of less than 12 months – 18.4% of indications (the reference group).

The Model Approach to the Factors Determining the Perception of The Ethical Dimension of Business – The Research Results

While looking for the responses to the research problems included in Table 1, ten logit models were estimated using the Gretl software, two models for each of the considered dependent variables y, of which:

- 5 full models, taking into account all the variables (x),
- 5 reduced models, taking into account only those variables (x) which indicate the characteristics of significance.

The results of the estimation of logit models for the variables $y_1 - y_5$ are presented in Table 3.

Explanation: The level of significance of the parameters: *** $\alpha = 0.01$, ** $\alpha = 0.05$, * $\alpha = 0.1$
Source: Own study

When looking at the results of the estimation of logit models 1=10, it should be noted that, in each of the estimated models, the age of the respondents was not found a statistically significant factor affecting the probability of perception of the ethical dimension of business in its individual aspects ($y_1 - y_5$).

In turn, taking into account another group, i.e. the gender, statistical significance can be observed only for the variable $y_{3,}$ i.e. the assessment of the significance of being driven by ethical values and principles (the full and reduced models), with the significance level of $\alpha = 0.1$. In other cases, the gender was not found a significant factor affecting the perception of the ethical dimension of business.

In the case of the data analysis in groups isolated in terms of the position, where the reference group was people in managerial positions, it can be observed that this group of factors indicated statistical significance for four out of five variables ($y_{1,}y_{2,}y_3y_4$), which means that this group of factors mostly feels the need for ethical actions. While analyzing the estimated models, it should be noted that, in the case of the variable:

- y_1 (the place of ethics in business), the seniority showed statistical significance at the significance level of $\alpha = 0.1$ (the full and reduced models),
- y_2 (implementation of the ethical dimension of business), y_3 (significance of the implementation of ethical actions), y_4 (attaching importance to ethical actions, including CSR activities), the seniority indicated a very strong statistical significance, i.e. significance at $\alpha = 0.01$ (the full and reduced models).

Taking into account another of the variables considered, i.e. the size of the company, in which the reference group was created by large enterprises, it can be observed that this category of variables x indicated statistical significance in the case of three variables, i.e. y_1, y_3, y_5. While analyzing the estimated models for the variable y_1, it can be stated that, in the case of the full model (model 1), the variables x_{10} and x_{11} indicated statistical significance at $\alpha = 0.1$, whereas, in the case of the reduced model (model 2), the strength of impact of the selected variables increased (significance level $\alpha = 0.05$). The results are slightly different in the case of the variable y_3, where the factor with the largest impact on the perception of the ethical dimension of business is the variable x_9, which indicated statistical significance at $\alpha = 0.05$ in the full model (model 5) and, in the reduced model (model 6), this significance occurred at $\alpha = 0.1$. In the case of the last variable y_5 (ethical business conduct as the asset of the contemporary business), statistical significance can be observed in the case of the variable x_{10} (model 9 – full model) at $\alpha = 0.1$. As it can be noted, this variable did not indicate statistical significance with the reduced model (model 10).
When analyzing the last of the listed variables, i.e. the seniority, it can be noted that this variable is not a statistically significant factor affecting the perception of the ethical dimension of business for four

out of five categories of the variables y. Such relationship can be observed only with model 9 (the full model for the variable y_5) with the significance level of $\alpha = 0.1$, for x_{15}. It should be noted that this variable does not show statistical significance with the reduced model (model 10).

For the purposes of the qualitative assessment of the estimated models, the measures of fit of the data to individual models are presented in Table 4.

Table 4: Measures of fit of the data to the estimation of logit models 1-10

Source: Own study

When analyzing the measures of fit of the data to logit models, presented in Table 4, it can be stated that models 5 and 7 are characterized by a relatively higher quality of estimates than in the case of the other models. Moreover, the estimated models indicate a relatively high number (more than 60%) of cases of "correct prediction", however, their largest number occurs in the case of models 5 and 6 – 87.5%, whereas the smallest number in the case of model 7 – 60.3%. In spite of the arising discrepancies, all the models showed statistical correctness. On the basis of the above, the null hypothesis about the total insignificance of assessment of the parameters of these models must be rejected.

Conclusions

Summing up the considerations discussed in the study, it should be stated that ethical issues in modern business management are an important aspect of the conducted activity. It might seem that there is no space for ethical behavior in business since the profit is crucial. However, in the current market realities, ethical conduct and compliance with certain standards, norms, values, legal regulations are factors for the growth and stability of markets while constituting a determinant of effective and economic

operation. For this reason, the way of perception of ethicality in business is crucial. Thus, the analyses (estimated logit models 1-10) conducted in the study, indicated that the factors with the largest impact on the perception of the ethical dimension of business are the position in the company and also the size of the enterprise since these two groups of variables showed the largest amount of statistical significance. Therefore, taking into account the position, it should be noted that the need for ethical operations is felt by employees in certain positions within which they are responsible for the tasks performed. In turn, taking into account the size of the company, it should be pinpointed that the ethical dimension of business is seen to the greatest extent in small enterprises, i.e. the ones with 10 to 49 employees. In the case of the other variables, it can be observed that the age has no impact on taking ethical actions as well as the seniority (except for the perception of ethical actions as the asset of management and the distinguishing factor) or the gender (except for assessment of the significance of implementation of ethical activities).

Cost Accounting Standards in the Practice of Polish Hospitals in 1998-2019

Jolanta CHLUSKA

Czestochowa University of Technology, Czestochowa, Poland
jolanta.chluska@wz.pcz.pl

Abstract

Hospitals in Poland are entities providing healthcare services. They function as independent public healthcare institutions. They represent autonomous and self-financing entities. They receive funds for their activities from the payer i.e. the National Health Fund. These are public resources that must be managed economically and effectively. Therefore, it is essential that hospital costs are controlled and optimised. The costs should be of interest to hospital managers and the founding and financing entities. Since 1998, legal provisions have been published in Poland concerning recommendations on the design of cost accounting for medical entities, including hospitals. The third version of such recommendations is now being developed. This paper presents the implementation by Polish hospitals of the law on company cost accounts in the years 1998-2019.

The aim of the paper is to indicate important factors affecting the acquisition of information on costs in hospitals.

A research hypothesis was proposed: "the hospital's cost account and information about the costs of its activities are determined by the specificity of the healthcare system and depend on the information expectations of the managers and financing entities".

The research tools used in the study included the analysis of literature, legal acts and surveys in selected hospitals.

Keywords: cost accounting standards, hospital costs, hospital, healthcare institution.

Introduction

Among business entities in Poland, hospitals play a particular role as healthcare institutions. Important characteristics of hospitals that distinguish them from other entities include:

a) numerous legal regulations of their activity,
b) providing health services as socially important services,
c) lack of a clear supply and demand in health services,
d) non-sovereign consumer,
e) the fading price mechanism,
f) the lack of profit motivation,
g) limited competition,
h) lack of incentives for efficiency,
i) financing activity from public resources.

With the specific activities of hospitals, the information about the costs of their health services and the use of this information to manage the entity, including the effective use of resources, is critical. The above characteristics also influence the design of cost accounting and cost information even at its lowest levels in hospitals.

The aim of the paper is to indicate important factors affecting the acquisition of information on costs in hospitals. The analysis of the literature on the subject and the observations of management practice in hospitals leads to the formulation of the following research hypothesis: "the hospital's cost account and information about the costs of its activities are determined by the specificity of the healthcare system and depend on the information expectations of the managers and financing entities".

The research tools used in the study were the analysis of the literature on the subject, legal acts and a survey concerning hospital cost account in 2004 and 2019.

Literature Review. Cost Accounting in Hospitals In 1998-2019

Hospitals in Poland keep their accounts in accordance with the Polish balance sheet law contained in the Accounting Act of 29 September 1994. (Act of 24 September 1994) As independent public healthcare institutions, they determine their own accounting policies (principles). The established accounting policy is the responsibility of the head of the entity. Hospital accounting in Poland includes, among other things, the principles of hospital cost accounting. More than twenty years of operation of Polish hospitals as independent and self-financing institutions required the use of a number of legal acts in the accounting system, regulating the principles of determination and implementation of cost accounting. The term cost accounting is understood as "a set of activities and procedures related to the measurement, recording and processing of costs for financial and management accounting purposes" (Sojak, 2019). This definition sets out the tasks for business entities with regard to the appropriate scope of mandatory hospital accounting policy arrangements. Selected cost accounting definitions are presented in Table 1.

Table 1: Selected definitions of cost accounting

Source	Definition of the cost accounting
Hass-Symotiuk, M. (2008)	"...cost accounting is an essential component of the accounting system and covers the measurement and documentation of costs, their recording, settlement according to the places where costs arise, types of products (medical services), determination of unit costs and development of cost information sets."
Świderska, G. K. (2011)	"...the process of identification, collecting, processing, presentation and interpretation of the cost information for the purposes of assessment and decision-making of users of the information."
Jarugowa A., Malc W., Sawicki, K. (1990)	"...examination and transformation, according to the adopted model of information on the entity's operating costs, that helps users assess the situation, make business decisions and control their realization."

Source: author's own study based on literature.

The use of information on the costs of hospital health services has been of interest to scientists since the beginning of their operation as independent public healthcare institutions. The author also conducted research and observations of hospitals as an auditor examining the financial statements of hospitals, from the moment of their transformation from budgetary entities into independent entities, and as a researcher dealing with the hospital accounting, including their cost accounting. The research work resulted in the development of a model for the calculation of the costs of standard healthcare services in hospitals enabling, among other things, the evaluation and control of the costs of the conducted activities. (Chluska, 2008)

In Poland, the research on cost accounting of hospitals (healthcare entities) was conducted by such authors as M. Hass-Symotiuk, G. K. Świderska, M. Cygańska, W. Baran and A. Kister.

Hass-Symotiuk (2010) and her team proposed a reporting concept for the purposes of integrated evaluation of hospital performance for the recipients of information at different levels, especially the managers, founding entities and the Ministry of Health. Świderska (2011) and her team developed a concept of identification, recording and calculation of costs in healthcare institutions, which resulted

in the preparation of a legal act on the recommendations for standards of cost accounting in healthcare providers in 2015. Work on improving the information obtained from the accounting system was conducted by Cygańska (2018). This author developed a concept for the integration of clinical aspects into the hospital accounting systems in order to obtain information useful from the standpoint of operational management of hospitals. The evolution of the cost accounting was also investigated by Baran (2017). In her research, Baran noticed the possibility of using cost accounting to create management information. Kister (2018) also conducted interesting investigations of hospital costs, and developed a model for improving the quality of public hospital management. The analyses included identification of the costs of non-compliance related to improper implementation of the healthcare activities.

In order to fulfil the postulates of the proper functioning of the hospital cost accounting, it is necessary to include, in the entity's principles of designing the cost accounting, legal acts with the nature of laws and regulations. The legal acts containing guidelines for hospital cost accounting published in 1998-2019 included:

a) The Ordinance of the Minister of Health and Social Care as of 22 December 1998 on detailed principles of cost account in public healthcare institutions,
b) The Act of 27 August 2004 on health services financed from public funds,
c) The Ordinance of the Minister of Health as of 8 July 2015 on recommendations concerning the standards of cost accounting in service providers,

The provisions of the 1998 Ordinance were repealed under the Act of 15 April 2011 on medical activities. (Act 2011) Since 2011, hospitals have been keeping cost accounts on a general basis, without using specific provisions. In 2015, the Ordinance of the Minister of Health as of 8 July 2015 was published on recommendations concerning the standards of cost account for service providers. (Ordinance 2015) This was an executive act to the Act of 27 August 2004 on health services financed from public funds. The provisions of the 2015 Ordinance on recommendations for standards of cost accounting in healthcare providers were to come into force obligatorily from 1 January 2020. Legislative work is underway to repeal this obligation.

The level of detail and number of legal provisions indicates that hospital managers responsible for information aspects of company cost accounting, when formulating their accounting policy in this respect, had an important role in providing correct information on operating costs. The review of legal regulations shows that during the analysed period, the regulations were established in such areas as:

a) the details of identification and cost accounting,
b) guidelines for company cost accounting plans,
c) principles for accounting for direct and indirect costs,
d) determination of unit costs of healthcare services,
e) Determination of the subject, object and type of unit cost calculation,
f) elements of the cost of providing health services.

As independent institutions, hospitals, which have been established since 1998, can use the knowledge on the principles of company cost accounting contained the Ordinance of the Minister of Health and Social Welfare of 15 June 1992 on detailed principles of the recording of revenues and costs in public health care institutions. These provisions have been in force since 1993. The above Ordinance was applied by hospitals in the period when they functioned as budgetary entities. Therefore, it can be concluded that hospitals in Poland have had legal provisions on cost accounting rules since the 1990s. The question arises as to how the managers in hospitals have fulfilled their obligations to establish accounting policies in the area of cost accounting. A partial answer to this question is provided by the analysis of selected problems of applying hospital costing, which the author conducted in 2004 and 2019.

Methodology. Costs in Hospital Management in Light of Research

In order to identify the structure and essence of the hospital cost accounting, its use by managers and prospects for its further development, a question about the cost account conditions was asked in 2004 in randomly selected hospitals from all over Poland. Forty-one entities responded to the survey. The survey was addressed to large hospitals, assuming that these organisationally complex entities would provide the most reliable insights into the essence and state of cost accounting. Similar questions were also asked in 2019 i.e. fifteen years later. During this period, hospitals had time to improve their cost accounting and develop their models to provide cost information to managers. The survey in 2019 involved 26 hospitals from all over Poland. It was conducted in various hospitals. In both surveys, the answers to the questions asked were provided by the chief accountants. They directly implement cost accounting policies of the management bodies. As accounting specialists, they often support and consult this policy. The objectives set by the management bodies of the entities are translated into accounting records.

With regard to the questions:

a) which cost records the entity keeps,
b) how the cost records are kept in the accounting department,
c) whether the places where costs are generated were identified,
d) whether the managers see the need for knowing the model values of the costs of healthcare services provided,

the hospitals, both in 2004 and 2019, responded that they all kept full cost records, i.e. in the cost accounts by type and in the cost accounts by place of cost generation, using information technologies and that places of cost generation were identified (100% of responses). All the respondents noticed the need to know the model values of healthcare costs. The remaining replies from surveys conducted by the author in 2004 and 2019 are presented in Table 2.

Table 2: Results of the 2004 and 2019 hospital cost accounting survey

Question	2004	%	2019	%
1) Did the separation of cost centres depend on				
a) only the hospital's cost accounting regulations,				
b) the hospital's cost accounting regulations and information requirements of the entity's managers for management purposes,	41	100	23	88
c) was the result of other principles (Which?)			3	12
2) Are the entity's managers interested in the unit costs of services?				
a) yes,	37	90	19	73
b) no,			3	12
c) occasionally.	4	10	4	15
3) Are budgeting processes carried out in the entity?				
a) yes,	8	20	8	31
b) no,	15	36	13	50
c) preparatory works are in progress.	18	44	5	19
4) Is there a set of procedures in the entity?				
a) yes,	26	63	5	19
b) no,	3	8	15	58
c) (work in progress)	12	29	6	23
5) Have the costs of these procedures been established?				
a) yes,	24	58	3	12

b) no,	6	15	13	50
c) (work in progress)	11	27	10	38
6) What operational records do the entity's organizational units keep?				
a) according to the requirements of the funding bodies (NFZ),	10	24	11	42
b) for the purpose of accounting and financing services, but information requirements of managers are important,	31	76	15	58
c) another one (Which?)				
7) Is there activity planning implemented in the hospital?				
a) yes,	19	46	9	35
b) no,	19	46	17	65
c) Otherwise (How?)	3 (work in progress)	8		
8) Does the entity use medical standards?				
a) yes,	20	49	9	35
b) no,	20	49	16	62
c) Otherwise (How?)	1 (to a limited extent)	2	1 (implementation in progress)	3

Source: Author's own elaboration.

Already the example of such a small group of entities indicates that cost accounting systems were improved in 2004 and it was noticed that these changes were oriented towards hospital management. It is also important that the entities noticed the necessity and ways to rationalise costs.

In 2019, the replies indicated that the improvement of the cost accounting was slowed down. A significant number of hospitals did not use in management processes:

a) budgeting (50%),
b) costs of procedures for which a standard cost was set (58%).

The number of hospitals that declared a lack of planning processes (65%) and a lack of interest in medical standards (62%) increased. Planning processes and information on cost standards improve the control function of cost information in management. These observations indicate a short-term perspective on hospital management.

Two descriptive questions were also asked about the need for rationalization of the hospital's cost accounting. The question "Which cost areas need to be thoroughly analysed and rationalized in the entity?" was asked in the 2004 survey in the following manner:

- employees' working time,
- costs of procedures,
- costs of drugs and reagents,
- employment costs,
- costs of laboratory and imaging diagnostics,
- costs of axillary activities,
- costs of certain medical procedures,
- costs of third party services,
- fixed costs,

- various indirect costs,
- costs of highly specialized medical procedures,
- wear of medical equipment,
- costs of procedures purchased from other entities,
- the cost of patient treatment.

The same question from 2019 allowed for the indication of the problems in areas such as:

- accruals and provisions,
- drug management,
- unused medical equipment and apparatus,
- lack of appropriate personnel,
- salary costs,
- costs of third party services,
- costs of patient treatment,
- costs of consumption of disposable equipment,
- costs of using medicines and other medical materials,
- paying for procedures rather than working time,
- lack of uniform allocation keys for procedure costs, indirect costs.

The question: "What directions do you see for rationalization and improvement of cost accounting in the entity?" was answered in 2004 as follows:

- increasing the responsibility of the managers of the centres for the results,
- full computerization to track patient treatment,
- unambiguously determination of the principles for recording material and financial donations (based on costs or on capital),
- analysis of the purposefulness of incurring costs across individual organizational units,
- introduction of budgeting processes,
- introduction of controlling,
- Rationalization of patient treatment costs,
- more accurate costs calculation per patient,
- the interest of the hospital department heads in the performance of the wards,
- capturing unjustified costs as relevant information for entity's managers,
- cost accounting optimization,
- staff education,
- computerization of the entity, especially in the field of tracking drug management,
- introducing cost planning,
- development of cost standards, e.g. for material consumption,
- deepening the analysis of costs in order to identify them in detail,
- linking salaries to work effects,
- analysis of the profitability of individual wards and elimination of unprofitable ones if possible,
- cooperation in the field of correct valuation of the procedures between accounting and medical departments.

In response to the same question in 2019, the respondents indicated such directions for rationalization and improvement of costs as:

- costs calculation per patient,
- determining the costs of procedures,
- harmonization of cost accounting principles for all medical entities,
- cost monitoring,
- a thorough cost analysis,
- benchmarking,
- improvement of IT systems that support cost accounting.

The inspiration for the author to repeat the research in 2019 was to direct the draft of 12 September 2019 for the Ordinance of the Minister of Health on recommendations concerning the standards of cost accounting in service providers to public discussion. The group preparing the proposals for recommendations performed a pilot study on the cost accounting situation in healthcare entities in 2019. The analysis included 33 questionnaires from the entities surveyed. In the pilot study conducted by the authors of the draft of new recommendations from 2019, the largest group were the entities for which gminas (gminas are principal units of territorial division in Poland) were the founding entities (28%).

The analyses carried out during the pilot study reveal that:

a) 94% of the entities surveyed kept accounting books,
b) 73% of the entities did not implement the 2015 Ordinance,
c) the entities recorded costs by type and place of cost generation,
d) entities divided indirect costs according to different allocation keys,
e) 97% of entities set the normative costs of materials and 94% the normative personnel costs,
f) in 15% of the entities, the cost accounting used enabled full calculation of the unit cost per a patient, and in 16% of the entities, it allowed for the calculation of individual costs of Homogeneous Patient Groups,
g) in 19% of the respondents, computer systems of the entities surveyed were integrated into the grey and white parts, while owning comprehensive integrated computer systems was declared by 15% of the respondents,
h) to a large extent, the audited entities used spreadsheets for the calculation of unit cost.

Comparing the observations from the above-mentioned pilot surveys, it can be concluded that the observed trends and operating conditions of hospitals are similar to those of the author from 2004 and 2019. The research samples were not representative. However, due to similar internal and external conditions of functioning of hospitals in the Polish health care system, the results of these three surveys can be considered characteristic for most hospitals.

Results. Determinants of hospital cost accounting models in practice

For many years, hospitals in Poland have modified and improved their accounting systems, including cost accounting. In 2004, as shown in the survey, hospitals were slowly implementing the legal provisions concerning their cost accounting. Although five years have passed since the 1998 Ordinance was issued, a number of hospitals have declared that they were in the process of implementing the legislation. In 2019, a draft of new recommendations was published as an executive act to the Act of 27 August 2004 (Act of 2004, Article 31Lc). The explanatory memorandum of the draft states that service providers assessed the 2015 regulations as "incomprehensible, ambiguous and too complicated". In its structure, the 2019 draft largely refers to the regulations from 1998.

Analysis of the period of hospital cost accounting reforms in practice reveals the following causes of failure to implement standard solutions:

a) high dynamics of systematic changes, hindering the improvement of accounting systems, including cost accounting,
b) dominance of short-term management decisions,
c) lack of interest of hospital managers in the cost information,
d) lack of financial funds for modern IT solutions supporting cost accounting,
e) separation of places where costs are generated and settlement of costs aimed to meet the needs of the managers and internal needs,
f) numerous obligations in terms of reporting information for the purposes of settlements with the financing entity (National Health Fund) and other entities, absorbing the administrative staff,
g) no planning processes,
h) limited possibilities to control costs.

Hospitals notice the need to know the unit costs and the model values of costs of healthcare services. At the same time, the interest of managers in these costs is decreasing (2004: 90%, 2019: 73%). According to the respondents, many areas of cost accounting need further improvement. The research repeated such areas of potential improvement as:

a) drug management,
b) human resources issues,
c) costs calculation per patient,
d) calculations of procedure costs,
e) coordination of information of the grey (administrative) and white (medical) part of IT systems,
f) the efficiency of the use of medical equipment and apparatus,
g) settlement of remuneration costs in the unit cost calculation,
h) settlement of indirect costs.

This means that since the beginning of the existence of hospitals, unresolved cost accounting problems specific to these entities have existed. This represents a guide for the authors of new recommendations on hospital costing.

Conclusions

Hospitals in Poland record operating costs in detail. Their comparison across different entities is impossible due to different settlement processes, especially those concerning indirect costs. Funding bodies are interested in the unit costs of health services they finance. Over the last twenty years, the attempts to unify cost accounting in hospitals have failed. The causes for these failures include the specificity of hospital operations and the continuous organizational changes in the healthcare system in Poland.

The creation of information on the costs of hospital health services depends on the principles of their cost accounting. According to the respondents' opinion, the form of the cost account depends on the expectations of the basic recipients of this information, i.e. managers and founding and financing entities. The founding entities are interested in the financial condition of hospitals and the possibility of their uninterrupted continuation. Funding bodies expect comparable information on costs of procedures, costs of patient treatment, costs of man-days of health care, costs of Homogeneous Patient Groups. Conclusions resulting from the analysis of opinions on cost accounting principles in the three presented studies allow for positive verification of the research hypothesis.

The changes in the cost account design that hospitals will have to apply once the new recommendations for a cost accounting standard in service providers come into force will definitely address the needs of the entities which finance the contracts of healthcare services. If comparability of data on hospital operating costs is developed, it will also improve the ability of managers to effectively manage costs.

Abstract

The purpose of the studies was to indicate the most perspective directions of development of the municipalities as well as a safety level at work in the agriculture and in the local industry. The key issue was to assess a quality of natural environment in order to attract the tourists to this community. The studies were performed on the sample of 200 randomly selected inhabitants of the municipalities and 100 arrived tourists. The survey consisted of 15 questions (6 open and 9 closed ones). The results of the survey show that among the most developmental directions of economy the inhabitants of both municipalities put first tourist and agritourism. Also the most of tourists have decided that the natural advantages of municipalities encourage to visit both regions. The multi-criteria analysis showed that commune B is characterized by a higher quality of environment and higher landscape values than commune A. Similarly, the natural environment was assessed by the inhabitants of both communes. The greatest problem in both communes is unsatisfactory air quality, while the greatest problem of safety at work was pain in the lumbar spine, around the neck and shoulder line. Despite this only 13% (commune A) and 6,1% (Commune B) of the expenditures constituted financial support for municipal economy and environmental protection and healthcare.
It results from the data analysis that the described municipalities have significant chances for systematic development in spite of numerous current problems, among which the most important one is unemployment.

Keywords: Development, Municipality, Safety, Environment.

Introduction

The economic situation of rural municipalities as the smallest local government units is determined by a number of internal and external factors. The most important ones include: access to natural resources, degree of economic progression, unemployment rate and environmental values. While

defining the term 'local development', it should be emphasised that it is the process of positive changes, both quantitative and qualitative ones, in specific time. Milán-García et al (2019) and Wojtasiewicz (1996) studied the local development when the actions were taken by the local community, local authorities and entities located on the area of the given municipality are characterised by full harmony and regularity while the trend in the conduct of these entities is useful for the municipality through creation of new solutions and improvement of the existing utility values as well as creation of spatial and ecological order. As Amin (1999) mentioned that over the past few years, the concept of local development has evolved by introducing the concept of Sustainable Local Development (SLD). Mebratu (1998) confirmed that the SLD must have the capacity to feedback and maintain itself over time, respecting the limitations of the surrounding natural environment. Additionally, according to Malizia et al (1999) a public administration should support particularly a weak economic growth.

Sztando (2002) and Tuziak (2006) described a special role in economic development of a municipality is assigned to its authorities since it is them that have the funds at their disposal and distribute them for specific purposes, including investment ones. Functioning of the local government authorities comes down to integration and coordination of local development with consideration *inter alia* of the relations and relationships occurring in the development process. Parysek (2001) studied an impressive impact of the authorities on development raises also interest of the local community which is aware of the legitimacy of the performed changes and sees the general social benefits. However, in order for development to be noticeable, proper pools of funds should be invested in realisation of specific objectives. As it results from Herbst (2012) studies in order to improve their material & living situation, the inhabitants of the local communities go abroad in masses, where they often stay for a couple of years. .
Additionally, Marciniuk-Kluska (2010) analyzed a proccess entry of Poland to the structures of the European Union has created a chance for improvement of the conditions of the social and local economy.. The EU membership generates a positive incentive mainly in the context of the generally accepted development of rural regions. Małecki (2009), described a chance for reasonable use of additional funds in relation to implementation of EU programmes.. Reasonable manner of spending of funds by the municipality authorities contributes to initiation of positive economic changes of the region, which is mainly displayed in creation of development, improvement of management profitability and improvement of social sentiments. Broll (2008) noticed that social capital plays a crucial role in every municipality, as to great extent it drives widely-understood development in the given region..

Szlaska (2007) listed numerous functions that should be performed by the municipal local government in local development, there are several ones which are particularly important. It is mainly about: initiation, coordination, supporting and assessment of social & economic development of the municipality. As it results from the studies performed so far, there are a couple of perspective directions of development of mountain municipalities:

a) development of cross-border cooperation,
b) construction of roads within inter-municipal initiatives,
c) development of tourist and health-resort function,
d) increase of investments from outside,
e) possibility of obtaining of more funds for investments from the central level and special-purpose subsidies,
f) development of agrotourism.

In mountain regions tourism takes on very important role as a strategy for local development. Cunha (2005) mentioned, that tourism is a sector that favours local development because it generates jobs, increases the income of workers and stimulates capital investments through new business opportunities. .

The purpose of this article is to analyse the municipal resources and the potential chances for improvement of the social & economic situation of the selected mountain municipalities being similar

in terms of the number of inhabitants and the amount of the annual budget. The results of this analysis will lead to indication of the areas of the economy of the municipality which from the economic point of view seem to be the most perspective, since it is them that will affect further development of the region to the main extent.

Material and Methodology

In order to analyse the chances and prospects for development, a survey was conducted among the inhabitants of the described municipalities. The studies were performed among 200 inhabitants of mountain municipalities, including farmers. A survey consisting in 10 questions (6 open and 4 closed ones) was used in the studies. Additionally, several questions were addressed to 100 tourists coming there during summer holidays, in order for them to assess the level of attractiveness of the region from their own perspective. Assessment of the impact of the natural environment on the quality of life of the inhabitants of that region was performed. In the field of agrotourism and agriculture, assessment of the safety of work on the area of the examined municipalities was performed.

The quality of the environment in the analysed communes was assessed on the basis of an analysis of the land use plan of the communes, ecophysiographic studies and a review of thematic maps, such as soil maps, hydrological maps, climate maps, etc.

In order to compare the quality of the natural environment and landscape values Kukuła (2000) analyzed communes a multidimensional statistical analysis was applied – the Zero Unitarization Method. This method requires that all assessment indicators (diagnostic variables) are given dimensionless numerical values. For this purpose the assessment indicators were divided into two groups: stimulants and destimulants.

A stimulant is such a diagnostic variable the growth of which should be associated with growth, while a decrease with a decrease in the assessment of environmental quality and landscape values. These variables were normalised according to the formula of Kukuła et al (2014):

$$z_{ij} = \frac{x_{ij} - \min x_{ij}}{\max x_{ij} - \min x_{ij}}$$

A destimulant is a diagnostic variable the increase of which should be associated with a decrease, while a decrease with an increase in the assessment of environmental quality and landscape values. Destimulants were normalised according to the formula:

$$z_{ij} = \frac{\max x_{ij} - x_{ij}}{\max x_{ij} - \min x_{ij}}$$

In these formulas:
i – number of the commune,
j – number of the diagnostic variable,
z_{ij} – normalised variable,
x_{ij} – variable prior to normalisation,
max x_{ij} – maximum value of the variable in a given set,
min x_{ij} – minimum value of the variable in a given set.

Table 1 presents the analysed environmental parameters which are the assessment indicators, as well as their division into stimulants and destimulants. These indicators characterise basic elements of the

environment, such as: topography, climate, air, surface and underground waters, soils, animated nature.

Table 1: Indicators for assessing environmental quality and landscape values

Indicator (I)	Stimulant	Destimulant
Topographical diversity - height difference between the highest and lowest points [m]	X	
Length of growing season [days]	X	
Annual average concentration of PM10 [µg/m^3]		X
Number of days during the year with exceeded permissible number of exceedances of the 24-hour average standard in 2018 [-]		X
Annual average SO_2 concentration in the air [µg/m^3]		X
Share of waters in non-forest land [%]	X	
Dominant ecological status of waters [class]	X	
Number of documented mineral water sources [-]	X	
Predominant agricultural land class [class]		X
Afforestation rate [%]	X	
Ratio of the number of cultivated green areas to the commune area [-]	X	
Ratio of the number of legally protected areas, including Natura 2000 areas to the commune area [-]	X	
Ratio of the number of natural monuments to the commune area [-]	X	
Ratio of the number of protected plant species to the commune area [-]	X	
Ratio of the number of protected animal species to the commune area [-]	X	

The analysis assumes that all assessment criteria are equally weighted. Indicators concerning the number of objects subject to protection were compared to the total area of the commune. The sum of values of standardised z_{ij} variables for the communes, referred to as aggregated variable Q, was the basis for selecting the commune with a higher quality of environment and higher landscape values. The higher the value of variable Q, the higher was the environmental quality assessment.

The assessment made on the basis of multi-criteria analysis was compared with the results of the assessment of the impact of the natural environment on the quality of life in the communes obtained in the survey.

The statistical Student t-test was carried out to determine the significance of differences among financial expenditure in both municipalities.

Results

The number of inhabitants of the examined municipalities was around 20 thousand persons. Population density of these municipalities was respectively: 56 persons per 1 km^2 for municipality A and 60 persons for municipality B. The area of the described municipalities includes places with relatively high population rate but also significantly depopulated ones. The drop of the number of population is entailed by the decreasing rate of natural increase as well as by the negative balance of

population migration. The negative demographic phenomena significantly affect the economic situation of the municipalities, preventing their systematic development and increase of the level of living.

Numerous tourists, pedestrian and bicycle routes, including two transit ones, running along the Sudeten Mountains and constituting the main tourist axes of the municipalities, run through their area. This is why the described regions are so significant in social & economic terms. It is also connected with development of tourism and agrotourism, which enhance the attractiveness and image of the municipalities.

For the purposes of the article, the structure of expenditures of the selected municipalities was analysed as well - Table 2. The percentage distribution of the incurred expenditures of municipality A in comparison with rural municipality B was presented. It results from the analysis that the greatest percentage of them was designated for education and upbringing - respectively 22.4% and 35.8%; expenditures on provision of social aid constituted a significant part as well. Almost 1% of the expenditures constituted financial support for health protection in both municipalities.

Table 2: Percentage distribution of expenditure in the budget of the A community and B community

Item	Commune A [%]	Commune B [%]
Agriculture	3,1	4,4
Public administration	10,0	11,8
Education and upbringing	22,4	35,8
Municipal economy and environmental protection	12,2	5,7
Healthcare	0,8	0,4
Culture	7,6	7,6
Social assistance	22,2	14,7
Transport and communication	3,0	5,9
Housing economy	10,0	5,8
Public safety	1,1	3,3
Others	7,6	4,6

Among the surveyed inhabitants, the vast majority of them is convinced about staying in their current place of residence, at the same time caring about development and increase of economic level of their own region mainly through establishment of own business activity. Almost 30% of the inhabitants are uncertain about their future while 10% of the respondents plan to go abroad in the nearest future to look for a better job. The statistical test results showed that the differences in expenditures in both compared communities are not statistically significant (p-value = 0,44).

The role of the municipality authorities, the priority of which should be caring about proper satisfaction of the needs of the population living there in order to limit economic migration to a significant extent, seems to be crucial here. It is displayed mainly in the aspect of activation of the society through granting of tax reliefs for newly-established undertakings. It is worth referring here to the main function of the local social capital which is widely described by Matysiak (1999), namely reduction of uncertainty both in social life and in economic life upon deciding on conducting of business activity as well as cooperation between the local community and the local government authorities. The effects of proper use of the social capital may lead to increase of the trust of the society to the authorities as well as to support of the widely-understood public & private partnership.

Consequently, an effective policy of the authorities of the described municipality may significantly improve its competitiveness. It results from the developed data that agriculture and low level of activity of the inhabitants of the municipality have the weakest impact on improvement of this aspect. The majority of the respondents asked about the strengths of the municipality which they lived in indicated its good geographic location (35%). A bit fewer respondents, i.e. 21%, indicated attractive investment areas as a factor enhancing competitiveness of the municipality. Among the most developmental directions of economy in municipality A, the inhabitants put first tourist and agritourism (41 responses), industrial production (14 persons) and services (24 respondents), as shown in Figure 1. On the other hand, in municipality B the most persons indicated convenient conditions for development of agritourism (39 persons) and agricultural production (20 persons).

Fig. 1: The most perspective sectors of the economy in community A and community B in assessment of its residents.

Also the work of the local Municipality Offices, labour work and condition of the natural environment were subjected to assessment of the inhabitants. The local community in 65% assesses the functioning labour market as very bad while only 31% of the inhabitants are satisfied with it. The natural environment is assessed very well by 13% of the respondents while the work of the Municipality Office is perceived as good by 64% of the respondents. In municipality B, 40% of the respondents assess the work of the municipal officials as good and 38% perceive the condition of the

natural environment as good. On the other hand, very bad opinions relate to the local labour market as due to lack of jobs in the municipality, the inhabitants travel to work to the near Czech Republic.

During performance of the studies, also the tourists arrived in the municipality were asked a question. In Figure 2, the most important values in the opinion of the tourists, which significantly intensify the tourist traffic of the region, are presented. It results from this data that it is mainly the gastronomic base and the natural values that attract the tourist to municipality A the most.

Fig. 2: Distribution of answers to the question: ***What is the most attractive for tourists in researched communities*****?**

For 14 tourists, it is tranquillity that decides on the unique character of the place, while for 26 tourists these are tourist attractions. It is also known that there are cultural events organised in the municipality, yet their impact on promotion of the region is minor. It is similarly in municipality B, where additionally the accommodation facilities and the unique landscape encourage to visit this region.

In the studies, it was attempted to identify the problems faced by the inhabitants of the municipalities. As it turned out, the most important ones include: unemployment (25 inhabitants), damaged roads (17) and lack of proper support for entrepreneurship (35). The obtained results are presented in Figure 3.

Fig. 3: Current problems identified in the communities according to its residents (number of persons).

Among the problems of the inhabitants determined in Figure 3, the level of natural environment quality and the level of the safety of work were selected for the purposes of assessment of the impact of the specified areas on the level of quality of life of the inhabitants of those municipalities.

Natural Environment Quality

Below it were presented the results of the quality natural environment assessment. Table 3 shows the values of the analysed environmental parameters.

Table 3: Values of the environmental variables considered in the analysis

Indicator (I)	Commune A	Commune B
Topographical diversity - height difference between the highest and lowest points [m]	510.00	970.00
Length of growing season [days]	182.00	214.00
Annual average concentration of PM10 [µg/m^3]	30.00	33.00
Number of days during the year with exceeded permissible number of exceedances of the 24-hour average standard in 2018 [-]	38.00	55.00
Annual average SO_2 concentration in the air [µg/m^3]	25.00	23.40
Share of waters in non-forest land [%]	1.00	6.90
Dominant ecological status of waters [class]	IV	III
Number of documented mineral water sources [-]	0.00	9.00
Predominant agricultural land class	IV	IV
Afforestation rate [%]	32.50	46.0
Ratio of the number of cultivated green areas to the commune area [-]	0.01	0.02

Ratio of the number of legally protected areas, including Natura 2000 areas to the commune area [-]	0.04	0.02
Ratio of the number of natural monuments to the commune area [-]	0.15	0.05
Ratio of the number of protected plant species to the commune area [-]	0.22	0.17
Ratio of the number of protected animal species to the commune area [-]	0.74	0.51

The table 3 shows that commune B is characterised by a more diversified topography, warmer climate, denser hydrographic network, better water quality and higher afforestation rate. In addition, there are mineral water deposits in commune B. Due to this, as well as to specific climatic conditions, spa areas are located in this commune. In comparison with commune A, commune B is characterised by a higher concentration of PM10 and a much higher number of days of exceeding the permissible concentrations. Both communes are dominated by weak soils, belonging to the IV agricultural land class. The number of protected areas and objects in relation to the total area of the communes is also similar.

Table 4 presents the results of the assessment of environmental quality and landscape values in both communes on the basis of multi-criteria analysis.

Table 4. Environmental quality (Q) based on the results of multi-criteria analysis

Commune	Q
A	6.0
B	8.0

The multi-criteria analysis showed that commune B is characterised by a higher quality of environment and higher landscape values than commune A. Similarly, the natural environment was assessed by the inhabitants of both communes. In commune A only 13% of inhabitants rated the quality of the environment as good, while in commune B 38% of inhabitants voted so. This demonstrates a high level of public awareness as regards the environmental protection and the ability to correctly assess the quality of the environment.

Environmental quality and landscape values have a huge impact on the quality of people's lives, as well as on the development of tourism, as evidenced by the results of a survey conducted among tourists visiting both communes. Human beings use the environment and at the same time they interact with it, which has extensive and complex consequences. Anthropo-pressure causes the transformation or contamination of all inanimate elements of the environment, such as air, water and soil, climate change, biological impoverishment, changes in the landscape or a decrease in the productivity of ecosystems. According to Dobrzański et al (2000) these direct effects cause economic losses (e.g. in industry, agriculture, forestry, fishing), worsening of working and leisure conditions, deterioration of health and living comfort, as well as a number of other intangible effects. Environmental threats are associated with diseases, defined as environmental or civilisation-related. These include cancer and cardiovascular diseases, respiratory and nervous system disorders, immune system damage and allergies. It is therefore necessary to take measures to improve the quality of the environment.

Since the greatest problem in both communes is unsatisfactory air quality, especially during the heating season, and unregulated wastewater management, which affects the condition of surface water, these aspects should be included in the communes' action programmes first of all. Both communes are characterised by high natural landscape values and have great potential for tourism

development. It should therefore be supported by investing in tourist infrastructure, increasing the offer of accommodation and catering facilities, as well as promoting the communes.

Safety at work

In the area of the safety of work, assessment of the physical burdens in the musculoskeletal system of the inhabitants of the municipalities was performed. During the studies, the respondents were asked about the intensity and frequency of occurrence of ailments and discomfort in connection with the performed professional work. The results of the studies are presented in Figure 4.

Fig. 4: Pain and discomfort appeared among workers in their musculoskeletal system.

Among the numerous places in the musculoskeletal system, in which the pain centres were reported in the examined group, from time to time (once/twice a week) pain in the lumbar part of the spine, in the neck area and in the shoulder line occurred. Headaches and forearm pain were suffered very sporadically - a couple of times a month and as it was argued, such conditions occurred after long-term engagement of hands, e.g. as a result of accumulation of the performed works. In case of continuous pain suffering, there is a high risk of occurrence of durable ailments, including in particular joint degeneration, limb numbness and greater vulnerability to injuries. Consequently, it leads to absence from work and in extreme cases - to rehabilitation and significant financial outlays on health improvement.

Summary

While analysing the social & economic situation of the described municipalities, it should be emphasised that the condition of the majority of the economic sectors of these units is satisfactory, yet there are some prerequisites for improvement of their condition. Due to orographic conditions, agriculture is not a perspective direction of development, similarly to industry due to lack of mineral raw materials. Both inhabitants and tourists indicate the great tourist potential of both communes, resulting from their location and environmental values. Both municipalities are located in the submontane area, in the macro-region of the Central Sudetes. Diverse terrain relief and relatively large afforestation rate make those areas very attractive. The assessment of the quality of the environment by inhabitants was confirmed by the results of multi-criteria analysis. This demonstrates a high level of public awareness as regards the environmental protection and the ability to correctly assess the quality of the environment. Environmental quality and landscape values have a huge impact on the quality of people's lives, as well as on the development of tourism, especially agritourism. Despite this, in both communes insufficient funds are allocated for environmental

protection and investing in tourist infrastructure, increasing the offer of accommodation and catering facilities, as well as promoting the communes. Investments in these areas would contribute to reducing unemployment, which was recognized as one of the major problems in both municipalities. Actually almost 30% of the surveyed inhabitants are uncertain about their future while 10% of the respondents plan to go abroad to look for a better job.

The development of agritourism is associated with the problem of safety at work on farms. The respondents indicated that this is an important problem in both municipalities. Based on the research, it was found that employees on farms mainly suffer from pain in the lumbar part of the spine, in the neck area and in the shoulder line and the pain of legs. So far only less than 1% of the expenditures constituted financial support for health protection in both municipalities. Therefore, along with the development of agritourism, expenditure on health protection and improvement of working conditions in the agriculture and agritourism sector should be increased.

The development of tourism can also have negative impacts to the environment and health of the local community. It affects a water and air pollution, noise, landscape, invasion of protected areas, etc.

Analysing the economic situation in a cross-sectional way, the occurring developmental barriers but on the other hand the possibilities and the needs to make a lot of infrastructural investments which would contribute to improvement of the social & economic situation should be noticed.

Abstract

In the modern world, terrorism has become one of the primary threats to the national security of countries. According to the Global Terrorism Index 2018, the number of victims of terrorist acts in the world fell by 16 thousand people, but the geographical spread of terrorism increased. Over the past 10 years China has repeatedly become a target of terrorist attacks originating from outside the country; the devastating consequences of these acts of violence threaten the integrity of the country and economic interests. This paper analyses China's international cooperation in the fight against terrorism within the framework of the United Nations. Based on the study, it was proved that international cooperation under the auspices of the United Nations is one of the main forms of China's interaction in order to ensure national security and protect its national economic interests abroad. It is concluded that it is necessary to continue to develop international cooperation in the fight against terrorism, expanding the areas of cooperation, and taking into account not only the interests of individual countries, but the world community as a whole.

Keywords: Terrorism, International Cooperation, Conventions, The United Nations, Counter-Terrorism.

Introduction

In the modern world, terrorism is a global danger; it has already become one of the primary threats for the national security of most countries in the world. The internationalization of terrorism, an extensive network of international terrorist organizations, and the mobility of terrorist forces require the world community to take a collective approach and regular interaction in countering the terrorist threat. International cooperation is becoming one of the effective forms of interaction between countries to fight against terrorism.

For China, international counter-terrorism cooperation is relevant for several reasons. First of all, being a multinational country, China has several hotbeds of instability in Xinjiang Uyghur Autonomous Region and Tibet Autonomous Region where the concepts of extremism and separatism receive external financial and ideological support and become widespread among the ethnic population. In the 1990s, a direct threat of separatist sentiments in the northwestern region of China caught the attention of the Chinese government. The growing regional instability was caused by neighbouring countries of Central Asia (Bukreeva and Popova, 2019).

Secondly, at present Syria has already become a haven for Uyghur extremists, where many of them are trained in militant units. Thirdly, in 2013, China launched a large-scale 'one belt, one road'

initiative; one of the problems that can significantly hamper its development is terrorism. According to the US Global Terrorism Database, 60% of countries located along the route of the Belt and Road Initiative are stable and secure, 25% of countries are at risk to be exposed to terrorist attacks, 15% of countries (Iraq, Pakistan, Afghanistan, Syria) are in high-level risk zone, where terrorist activities pose a threat to people's lives inside and outside the country (Xu, 2019).

According to Russian experts, the low protection of the Chinese initiatives from the growth of terrorism and extremism is a weak point of the Chinese side. Chinese resources are obviously insufficient to completely counteract the possible challenges and threats of international terrorism, especially given the penetration of ISIS militants in Afghanistan and potential zones along the Belt and Road (Luzyanin, 2019).

Research material and methods

During the research process, there were used the following research methods: system and comparative analysis, and an interdisciplinary approach. The research information is based on the materials taken from the official website of the Treaty Database of the People's Republic of China.

The research works of the following Chinese scholars cover the issues of China's counter-terrorism cooperation with the United Nations: Zhang L., Ling Shengli, Wang Fan, SongYan and Li Wei.

Research results

Following the outbreak of civil war in Syria, jihadist supporters moved there: 40,000 militants from more than 120 countries went to Syria and Iraq. According to the United Nations forecast, after ending military campaigns in Syria, from 10 to 30% of them will return to their countries, meaning that some countries and entire regions will face the problem of returning jihadists (Li, 2019).

The Chinese government has admitted the fact that an effective fight against such a global threat as terrorism is possible only in coordination with other countries. On December 27, 2015, the Standing Committee of China's National People's Congress (NPC) adopted the Anti-Terrorism Law of the People's Republic of China, which took effect on January 1, 2016 (Zhang Laney, 2016). Chapter 7 of the law is devoted to international cooperation in the fight against terrorism and specifies the following directions of China's interaction with other countries:

- exchange of intelligence information;
- law enforcement cooperation;
- international cooperation in judicial assistance, extradition, and transfer of sentenced offenders in criminal cases relating to terrorist activity;
- assigning forces on counter-terrorism missions;
- use materials acquired through international cooperation on counter-terrorism as evidence of involvement in terrorist activities in administrative and criminal proceedings.

On March 8, 2019, the State Council Information Office of the PRC issued a white paper, titled 'The Fight against Terrorism and Extremism and Human Rights Protection in Xinjiang'. The document consists of 7 main sections. The last section is devoted to international counter-terrorism exchanges and cooperation of China in the field of combating terrorism and extremism. The document declares that 'China opposes any form of terrorism and extremism, opposes the connection of terrorism and extremism with some countries, nations and religions and does not accept 'double standards' in the fight against terrorism; follows a comprehensive policy, aims to eliminate both the symptoms and the root causes of terrorism. The activities are also aimed at stamping out poverty and eradicating the land that engenders terrorism, and advocates for the strengthening of international counter-terrorism and pragmatic cooperation based on mutual respect and equal consultations (Minakova and Bukreeva, 2019).

Consider the features of China's international cooperation in countering terrorism and extremism within the framework of the United Nations created for maintenance of international peace and security.

For the first time in the practice of international relations, China used the terms 'terrorism' and 'counter-terrorism' at the United Nations Assembly meetings. The Chinese researchers from the China Foreign Affairs University Ling Shengli and Wang Fan have distinguished 3 periods of China's participation in the diplomatic discourse on international terrorism; each of these stages reflects China's perception, position and approach to the problem of counter-terrorism.

1. Opening Stage - consider terrorism in relation to the fight against imperialism, colonialism and racism (1972-1978)

The international practice of combating terrorism in China began in October 1971 with the restoration of China's legal right in the UN, including permanent membership in the UN Security Council. The Chinese Representatives to the UN participated in a discussion on international terrorism at the UN General Assembly, the UN Security Council and the UN Sixth Committee and expressed China's position on terrorism. China's first statement on terrorism was made by its representative Chen Chu on September 22, 1972 at the United Nations General Assembly meeting, he proposed to exclude the issue of countering terrorism from the agenda. This approach of 'ignoring' the problem of international terrorism, the Chinese side reasoned that terrorist manifestations are primarily forms of fighting against imperialism, colonialism, racism and other forms of discrimination, so first of all it is necessary to address the root causes of terrorism.

Thus, at this stage, China openly recognized that the masses could use terror to achieve their goals in the revolutionary struggle, but it did not support terrorist activities carried out by small groups, because it did not comply with the principle 'revolution is made by the masses'. According to China, the correct way to launch revolution is a mass mobilization, not fighting alone. Those days China's negative attitude to counter-terrorism related to the use of the term 'terrorism' in regard to national liberation movements. Therefore, on the one hand, China opposed terrorist acts, and on the other - protected the national liberation movement as a form of political struggle to overthrow colonial oppression and gain independence. According to China, Western countries imposed the problem of terrorism in order to legitimately crush the struggle of colonized countries for independence.

2. Selective approach stage to counter-terrorism (1978-1996)

After 1978, China began integration in the system of international relations; this process was followed by certain rethinking the problem of anti-terrorist struggle. However, positive changes toward this issue did not mean fully joining the international community in the fight against terrorism. Therefore, the Chinese researchers highlight the selective approach of China to counter-terrorism at this stage. In general, there were several significant achievements of China in terms of countering terrorism at this period.

– Positive changes occurred in the vision of the country's participation in the international fight against terrorism. China joined the international conventions on terrorism and rejected the ideology of proletarian internationalism as the main principle of anti-terrorist struggle. In the mid-1980s, China at the United Nations General Assembly meeting raised the issue of distinguishing 'international terrorism' from 'national liberation movement', and after 1992, the political discourse in China raised the need to identify the origins of international terrorism and social factors involved in spreading terrorism.

– China expressed readiness to implement cooperation on countering international terrorism. The Chinese leadership not only signed the International Convention against the Taking of Hostages on December 28, 1992 and agreed to support 'reasonable proposals and recommendations that help prevent and suppress international terrorist incidents', but assured the international community of taking effective measures to prevent acts of terrorism within the country, and also recognized the need for unification of international norms on terrorism.

– For the first time, China initiated a discourse on countering state terrorism in the context of Israeli Zionism. In 1983, at a regular UN meeting, Chinese representative Yang Hushan made a condemning statement of 'large-scale acts of international terrorism conducted by governmental authorities, which are manifestations of state terrorism'. It was also opposed using the fight against terrorism as an excuse for military aggression.

– The Chinese Ministry of Foreign Affairs started showing diplomatic reaction to terrorist incidents in the world, decrying the aggression and expressing concern about the victims.

It should be noted that in the early 1990s, the Chinese government was alarmed by the situation in the neighboring countries of Central Asia: the political processes in the former Soviet republics, serious problems in the socio-economic sphere in these countries, and ideological issues in the post-Soviet space. Almost every Central Asian country faced a serious problem of the rise of politicization of Islam, which became a main messenger of the spread of religious extremism and terrorism in the region (Vozzhenikov, 2007). Thus, at this period, China had an internal motivation to participate in the fight against terrorist activity, caused by the increase in ethnic separatism in the country. In general, the contribution of China to international cooperation against terrorism was very limited, so this period can be described in terms of selective approach towards the problem of counter-terrorism.

3. The active period of counter-terrorism (1996 until the present)

American scholars Medeiros and Fravel concluded that in the 1980s China was 'quite suspicious towards multilateralism' believing that the West would use this approach to 'suppress or limit China'. However, after the 1990s, China's attitude changed, and it began to realize that international organizations could 'promote trade and protect its security interests'.

In the mid-1990s, China became an active participant in international relations. Then the Chinese leaders (previously only a representative of the Ministry of Foreign Affairs) began to express condolences to the victims of terrorist acts in the world and called for the strengthening of international counter-terrorism operations. In 1996, the People's Daily newspaper for the first time published the Chinese Prime Minister's (Li Peng) condolences in connection with terrorist attacks in Israel. International involvement in counter-terrorism struggle has made it possible to more effectively combat the terrorist threat within the country.

At that time, China's position on terrorism was as follows:

1. Faced with the destructive manifestations of terrorism within the country, China strongly opposes all forms of terrorism. 2. China complies with international conventions against terrorism and strictly follows the relevant provisions of the UN Security Council. 3. Calls for the fight against terrorism to be conducted on an ongoing basis avoiding double standards. 4. Stands for recognition and support of the UN as the leading organization coordinating the fight against terrorism at the international level.

For the period 1963-2010, the UN adopted 12 conventions regulating the legal efforts against terrorism, China signed 11 conventions; in 2006, China signed the UN Global Counter-Terrorism Strategy, which indicates China complied with the international legal norms.

Nowadays China plays one of the leading roles in the UN in the development of international cooperation in the fight against terrorism.

On September 25, 2019, at the UN Security Council meeting, the Chinese Foreign Minister Wang Yi made a speech outlining the priority problems of countering terrorism and extremism; according to the Chinese side the following issues deserve primary consideration and resolution:

1. To unify approaches to addressing the problems of terrorism. In this aspect, it is especially important to prevent double standards in relation to terrorists, to suppress situations of selective counteraction to terrorism and the use of terrorists to pursue geopolitical goals, and not to associate terrorism with specific countries, nations and religions.
2. To focus efforts on combatting cyber terrorism; this has already become an effective tool for terrorists using the media and the Internet as an information platform for dissemination of extremist ideology and incitement to terrorist acts.

3. To eliminate the root causes of terrorism, as well as the sources of its 'fuel', destroy the prerequisites for the further spread of terrorism, abandoning the argument of the inevitability of a 'clash of civilizations'. In this case, it is necessary to emphasize sustainable development as a fundamental solution to the problem of terrorism.
4. To strengthen interstate cooperation under the auspices of the UN, while each of the member states should make efforts to solve the global problem of terrorism. Move towards centralizing the role of the UN and the UN Security Council in coordinating cooperation at the national, regional and global levels and actively implement the UN global counter-terrorism strategy and relevant UN Security Council resolutions (Song and Wang, 2019).

On February 12, 2016, after the International Syria Support Group meeting in Munich, the Chinese Foreign Minister Wang Yi said in an interview with Reuters that 'China is opposed to terrorism in all its forms, supports international cooperation in the fight against terrorism and promotes international counter-terrorism cooperation under the auspices of the UN'. At the same time, Wang Yi articulated China's position on participation in the anti-terror coalition against the forces of international terrorism: 'In China's diplomacy practice, it has become a tradition not to join any military coalitions, but this does not mean that we are not involved in resolving international anti-terrorism issues. In fact, China has its own ways of participating in international anti-terrorism cooperation'. (Official website of the Ministry of Foreign Affairs, 2016)

This refers to the provision of humanitarian assistance and participation in international peacekeeping. In April 1990, China for the first time sent 5 military observers to the UN Truce Supervision Organization; it was an introduction to China's participation in UN peacekeeping. For 26 years, China sent more than 30 thousand people / times to participate in UN peacekeeping operations with military units, police and civil servants. In particular, 19 Chinese troops died in peacekeeping operations.

In terms of the number of peacekeepers deployed, the top 10 countries includes only one permanent member of the UN Security Council – China, it takes the 9th place (3045 people: 2839 military personnel, 169 police officers, and 37 military experts) (for comparison: Russia – 80 people, the US – 80 people, the UK –290 people , France – 934 people).

The volume of China's contributions to peacekeeping is gradually increasing; it is associated with the growth of GDP per capita, the status of the country in the UN, and the readiness to maintain peace. In recent years, China has reached 10.29% (period: July 2016 - June 2017), i.e. every tenth dollar in the peacekeeping fund is 'Chinese' (China, 2016).

The issue of the Chinese troops' participation in peace enforcement operations remains open. The presence of special units of the Chinese military in Syria has not received official confirmation from the Chinese authorities, although according to the front-line news agency 'ANNA-News', citing its own sources, in 2017 the military forces of the Chinese People's Liberation Army in Syria can reach up to 5 thousand people. They are soldiers from the special forces of the 'Dongbei tigers' and 'Night tigers', aimed at participating in the fight against terrorist and extremist organizations, including terrorists of the East Turkestan Islamic Movement (ETIM). The number of terrorists of the ETIM is about 2.5 thousand people, according to the Syrian intelligence services; they operate as part of other terrorist groups in one of the suburbs of the Syrian capital in Eastern Ghouta (Mukhin, 2017).

Conclusion

For China international cooperation has already become a prerequisite for ensuring national security and protecting its economic interests abroad. Obviously, the fight against terrorists outside their territory, preventing the penetration of terrorist forces deep into the country, is the most preferred way for the development of counter-terrorism strategy for any country. In this regard, China esteems international anti-terrorism cooperation in its various forms as an effective way to counter terrorism. China sees the UN as an organization consolidating the fight against terrorism, but in the future is

determined to develop such anti-terrorism strategy that would avoid intensifying the conflict in a region located in a proximity to China.

Innovation in Digital Sector and Competition Law: Challenges and Solutions

Marzena RADZIUN

University of Szczecin, Szczecin, Poland

Abstract

Innovation is vital to competition, consumer welfare and long-term economic growth. It has great societal benefits which should be promoted and protected. It is understood that innovation consists of several fundamental elements: creativity, risk-taking, value-addition, adoption, and destruction. Combing these elements allows for powerful new technologies to develop and change the way people travel, work and interact. Given this, a question arises as to whether and how competition law can protect and foster innovation in the digital sector. The aim of this article is to identify the challenges posed by innovation to competition law by demonstrating the difficulties of applying competition law to digital markets. The article also seeks to determine the role competition policy plays in ensuring innovation especially in securing access to competitively important data or preventing mergers that eliminate future rivals. Finally, the article suggests how the identified problems can be accurately solved and what has so far been achieved in this respect.

Keywords: Innovation, Digital Sector, Competition Law.

Introduction

This paper looks at the role competition law should play in protecting and fostering innovation in digital sector. As known, innovation is fundamental to competition, consumer welfare and long-term economic growth. It provides considerable societal benefits which should be promoted and protected. It is understood that innovation consists of several fundamental elements: creativity, risk-taking, value-addition, adoption, and destruction. Combing these elements allows for powerful new technologies to develop and change the way people travel, work and interact.

The aim of this article is to point out the challenges posed by innovation to competition law by demonstrating the difficulties of applying competition law to digital markets. The article also seeks to determine the role competition policy plays in ensuring innovation especially in securing access to competitively important data or preventing mergers that eliminate future rivals. Finally, the article suggests how the identified problems can be solved.

The Concept of Innovation

There have been numerous attempts to define innovation. One of them considers innovation to be 'risky, creative endeavours that add value, stand some chance of widespread adoption, and advance the creative destruction that gives vigour to economic life' (Bethell, Baird, Waksman, 2019, p. 8). Innovation processes can be regarded as the search for development and the creation of new knowledge which is so far unknown (Kerber, 2017, p. 9). These processes are largely creative and highly unpredictable and allow for new problem solutions to be tried out (Kline, Rosenberg,1986). Therefore innovation processes are more like those of experimentation, in which the eventual solution is the result of a step-by-step process whose results cannot be foreseen beforehand (Kerber, 2017). An essential characteristic of innovation is uncertainty (Schilling, 2015) and although it is right to expect technology improvements, it cannot be predicted exactly if, when, and how innovation will occur (Costa-Cabral, 2017, p.13).

The challenges posed by innovation to competition law

In general terms it is claimed that the main challenge faced by competition law in promoting innovation refers to striking the right balance between forcefully contesting anticompetitive conduct that restricts competitors freedom to innovate and ensuring innovative products or services offered by the undertaking will not be deemed in breach with competition regulations. For this reason competition authorities should be ready to enforce competition law by reacting to anticompetitive behaviour. This, however, should not be at the cost of impairing innovation. As the Court of Justice pointed out in *Post Danmark* case: 'competition on the merits may, by definition, lead to the departure from the market or the marginalisation of competitors that are less efficient and so less attractive to consumers from the point of view of, among other things, price, choice, quality or innovation.'(Judgment of the Court of Justice of 27 March 2012, *Post Danmark*, C-209/10, EU:C:2012:172, para. 22). It is therefore for the competition authority to remain vigilant and notice whether the market elimination is due to competitors' ineffectiveness or anticompetitive forclosure'. This is not an easy task.

Commentators and scholars indicate three major areas related to innovation which are of great issue to competition law. These areas include: (1) restrictions on access to data; (2) foreclosure of downstream rivals by digital platform owners; and (3) so-called 'killer acquisitions' that eliminate potential future competitors.

Restrictions on access to data

Digital platforms can be defined as 'technology-enabled tools, which facilitate exchanges between multiple groups – for example end users and producers – who do not necessarily know each other' (Geradin, 2018, p. 2). Some instances of such platforms are Google, Twitter or Facebook. Data gathered by undertakings in digital sector can be regarded as a valuable asset. It allows for a better targeting of advertisements, more personalized services and products (Forrester, 2018, p. 8). It is believed that the undertaking possessing the largest database, controls the competition on relevant market because of the sole fact of having access to databases. It is submitted that competition law needs to ensure access to databases to market rivals. Restricting the access to data can stifle innovation by depriving competitors of an indispensable input (Bethell, Baird, Waksman, 2019, p. 12). The challenge for competition law with regard to access to data concerns the degree of regulatory intervention in this respect. On one hand competition law should promote data sharing, but on the other hand this must not take place at the cost of privacy and incentives to innovate (Forrester, 2018, p. 8). A data sharing obligation enforced by a competition authority is therefore not a solution, however, competition law must not remain passive when restrictions on access to data distort competition.

Foreclosure of downstream rivals

Anticompetitive practices pursued by digital platforms have been of great concern to competition law in the past years. Foreclosure of downstream competitors by digital platforms has attracted a great deal of commentary on the directions competition policy should take in digital markets (Geradin, 2018, pp. 2-3). The concern for competition law here is that dominant digital platforms use their rule-setting power to determine the outcome of competition on the relevant market. The rules set up on a marketplace by a dominant platform can discriminate against other businesses causing foreclosure of downstream rivals (Crémer, de Montjoye, Schweitzer, 2019, p. 62). Concerns have been raised with regard to competition law being able to deal effectively with the above foreclosure problems. It is argued that competition proceedings are lengthy and do not concentrate on the facts of particular cases with suitable attention. Moreover the standard of proof which has to be met by competition authority is very often too high to enforce competition law. It is also claimed that once foreclosure is determined, there are no suitable remedies that could restore competition on the market in a swift way. Moreover, the lack of legal protection can deter innovating companies from offering new or enhanced products on the market (Bethell, Baird, Waksman, 2019, p. 13).

Killer Acquisitions

Another challenge to competition law is that digital platforms eliminate or "kill" future competition by buying up small, start-up companies or by widening their dominant position through the purchase of complementary services in neighbouring markets. As a result, rivals of digital platforms are marginalised and barriers to entry become higher (Lécuyer, 2020, p. 1). Given the fact that digital platforms tend to acquire and integrate services that could otherwise have evolved into direct competitors, a question arises as to whether a bought up start-up company would have been better or worse off, had it not been acquired by a digital platform (Bethell, Baird, Waksman, 2019, p.17). So far no clear answer has been provided to the above question. It is said that when a start-up is purchased by the dominant undertaking, the former is going to negotiate a price for the takeover. This price except from compensating the start-up company for the profit it could have made by entering the market directly, could also be higher in accordance with the dominant undertaking's profit after the purchase (Bourreau, de Streel, 2020, p. 9). Regarding innovation after the acquisition, the concern is that the acquiring, dominant undertaking could decide to kill innovation of the overtaken start-up instead of developing it. This is especially the case when innovation is a close substitute to its products or services and the dominant undertaking has little incentive to develop it, because the incremental profit gains will be insignificant. For this reason, it can overtake the innovating start-up to "kill" potential competition and stifle innovation.

Solutions to the challenges posed by innovation to competition law

There are various viewpoints as to how the challenges posed by innovation to competition law can be tackled. The most obvious way of dealing with them is through legal reforms. It is submitted that these reforms should not take place without the participation and contribution form digital platforms themselves. Contribution by digital platforms could mainly result from their knowledge of both, the market and the products. This in turn could vastly impact the conversation about what digital platform operators could improve to foster innovation (Bethell, Baird, Waksman, 2019, p. 21).

With regard to restrictions on access to data, digital platforms such as Microsoft, Twitter, Facebook and Google have taken action to increase data portability through the Data Transfer Project. The project constitutes an attempt to create an open-source, service-to-service framework allowing individual users to easily move their data between online service providers. The Data Transfer Project participants believe that portability of data are crucial to ensuring innovation and facilitating the consumers to choose among services (Mitretodis, Euper, 2019). There are also initiatives undertaken at the EU level with regard to data access restrictions. The Commission has launched a Digital Single Market project within which it seeks to promote data sharing and sharing best practices (European Commission, 2019). Thanks to the dialogue with key stakeholders the Commission has proposed a new regulation aiming at freeing the flow of non-personal data across borders and increasing availability of data for regulatory control among other areas (European Commission, 2019). As pointed out in this year's communication from the Commission on data strategy, the EU can become a leading role model for a society empowered by data to make better decisions –in business and the public sector. To achieve this goal, the EU can build on a strong legal framework and its internal market with competitive companies of all sizes and varied industrial base (European Commission, 2020). In order to prevent or eliminate foreclosure of downstream rivals by digital platform owners it is suggested that a code of conduct for companies whose position means other markets depend on them be set up. This suggestion was made in the Furman Report according to which the principles and rules of the code would be prepared in close consultation with undertakings in digital markets (Digital Competition Expert Panel, 2019). There are two vital aspects of the above solution. First, providing precise guidance could improve legal certainty for all digital sector operators. This is especially the case with practices that are unclear or even regarded as legal (Digital Competition Expert Panel, 2019). Second quick enforcement of the competition rules and principles of the code would contribute to the fast impact on the market. In this regard the competition authorities could make more reliance on remedies such as commitment decisions or interim measures.

With reference to killer acquisitions which eliminate innovation it is submitted that it is necessary to update merger analysis. In this respect agencies and industry participants should cooperate to make sure that authorities have the necessary tools and knowledge to assess mergers in digital markets. The code of conduct could determine a new practice of requesting detailed information about the transaction which could include testimonies of the acquiring undertaking (Bethell, Baird, Waksman, 2019, p. 26), but also provide information about the rationale behind the deal. This could in turn shed more light on the impact the merger will have on the digital market in question and help to assess the probability of the start-up growing into a serious future competitor in the digital market operator.

Conclusion

To sum up, competition law plays an important role in protecting and fostering innovation in the digital sector. Reforms are indispensable given a number of serious problems posed by innovation to competition law. It can be argued that these reforms should not necessarily take form of far-reaching changes in legal duties and standards of proof but rather they happen through cooperation between digital sector participants, competition authorities and policy-makers. Particularly new initiatives are necessary to be undertaken at both, national and EU level. Providing clear guidelines in the form of a code of conduct for digital platforms, engaging by the competition authorities in a more detailed merger analysis enabled by closer cooperation with digital operators as well as promoting data sharing can all make a difference and ensure innovation in the digital sector.

Abstract

Aim/Purpose – The purpose of the paper is to identify and evaluate forward-looking disclosures in integrated reports published by Polish companies. The article uses the results of literature studies on the subject, the results of previous research, and observations of business practice in the area of integrated reporting. **Design/methodology/approach** – The quantitative and qualitative content analysis of forward-looking disclosures in integrated reporting was performed in order to assess the current status of integrated reports prepared by Polish companies. The analysis covered 33 integrated reports prepared by 20 corporate groups in 2016 and 2017. **Findings –** The results of the research have shown the level of forward-looking disclosures in the examined integrated reports. In addition, the findings proved that most of the items of future disclosures has the nature of qualitative narrations regarding strategy, information on growth opportunities, industry or market risk, environmental risk, while less attention was paid to investment projects, product research and development plans and financial risk. **Research Implications/Limitations –** The findings of the research may provide the basis for proposing the use of a balanced scorecard (BSC) as a tool for the development and presentation of forward-looking dis-closures. **Originality/value/contribution** – The research is aimed at presenting a critical interpretative perspective. The results of the study complement the research gap of current literature on integrated reporting and for-ward-looking disclosures in Polish practice. The research presented in the article contributes to current literature on integrated reporting and future disclosures.

Keywords: Integrated Report, Financial Reporting, Non-Financial Reporting, Forward-Looking Disclosures.

Introduction

The integrated report has undoubtedly become the world's basic form of reporting of non-financial information. However, both the results of practice and literature research indicate a number of problems related to preparing and disclosure of non-financial information. In particular, problems related to lack of compliance of integrated reporting (IR) structure with requirements presented by the International Integrated Reporting Council (IIRC), the absence of external audits of reports, a high degree of similarity with corporate social responsibility (CSR) reports and high convergence with Global Reporting Initiative (GRI), apart from the IIRC principles and lack of forward-looking disclosures are being emphasized. The research emphasizes the board's reluctance to present forward-looking disclosures due to the number of facts:

- accountability towards investors regarding unrealized results;
- fear of lawsuits;
- disclosure of the intentions of the competition;
- failure in obtaining the assumed rates of return.

Therefore, the question may be asked whether the integrated report fulfils its role since it does not add value in comparison to the previously published reports.

In general, the information published in the integrated reports can be divided into two main groups: backward-looking information (retrospective information) and forward-looking (prospective information). Retrospective information refers to past financial results and related disclosures. On the other hand, disclosure of forward-looking information (prospective) refers to current plans and future forecasts that provide information about future perspectives of the company. It should be emphasized that the latter – forward-looking in-formation disclosures – constitute a particular important element of the integrated report content.

As emphasized in the literature on the subject forward-looking disclosures are very important and would be beneficial for all stakeholders, including future forecasts regarding both financial (i.e. future, investment expenditure, income targets, cash flow forecasts and next year's sales) and non-financial items (i.e. risk and uncertainty) (Bravo, 2016).

It should also be emphasized that future orientation is described as one of the key guiding principles of the Integrated Reporting Framework developed by IIRC. Moreover, the Outlook is an important element of the eight content elements described in the IR Frame-work, because it contains forward-looking disclosures and forecasts of the organization's future financial and non-financial performance.

An analysis of voluntary forward-looking disclosures in integrated reporting appears to be necessary to determine whether the integrated report is actually fulfilling its role and facilitating economic decision-making for stakeholders.

The purpose of the paper is to identify and evaluate forward-looking disclosures in integrated reports published by Polish companies. A quantitative and qualitative analysis of forward-looking disclosures was made and a balanced scorecard (BSC) was proposed as a useful tool in the preparation and presentation of such disclosures. The article is based on the results of literature studies, results of previous research, as well as observations of business practice in the area of integrated reporting. The research presented in the article con-tributes to the current literature on integrated reporting and future disclosures in Polish practice.

Forward-looking disclosures as part of IR content

Integrated reporting is the latest approach to organization reporting, the main goal of which is to present a more holistic image of the organization by integrating economic, social and environmental issues in a single report, instead of focusing only on traditional financial statements[i].

The IIRC Framework, published in December 2013, defines IR as “a concise communication about how an organization’s strategy, governance, performance and prospects, in the context of its external environment, lead to the creation of value over the short, medium and long term" (IIRC, 2013, p.7). The presented definition of integrated reporting emphasizes its multidimensional character and the transition from the concept of value for a shareholder to the coherence and connecting the company strategy, corporate governance, business activities and performance as well as forecasts for the future. The IR is a periodic report on the value creation history that provides a measure “to assess the plausibility of what has been reported concerning the present-to-future period [and] in analyzing current capabilities and the quality of management” (IIRC, 2013, p. 17).

It is emphasized that integrated reporting represents the latest stage of development in a long series of initiatives and reporting practices implemented by organizations, including traditional annual reports, as well as sustainable development reports and corporate responsibility reports (Stubbs and Higgins, 2014).

The integrated report is also aimed at presenting the relationship between financial and non-financial performance measures and how these mutual relations create or "destroy" value for shareholders and other stakeholders (Eccles and Armbrester, 2011).

The International <IR> Framework published by IIRC in 2013, the concepts statements (or the framework structure)[ii] of integrated reporting stress that the objective of integrated reporting is a more coherent and effective approach to corporate reporting and to improving the quality of information available to financial capital providers to allow a more efficient allocation of capital.

The integrated report should be useful for all stakeholders interested in the organization's ability to create value, and should present the effects of integrated thinking about the organization. The integrated report's aim is to show the way in which the organization uses its broadly understood capital to create value (IIRC, 2013, p. 4, p. 11-12). The framework structure developed by the IIRC defines six types of capital, namely financial, manufacturing, natural, intellectual, human and, social. The main objective of the integrated report is to increase accountability in relation to these capitals and to provide an understanding of the interrelationships and tradeoffs between them.

In contrast to traditional reporting, integrated reporting is focused on the future and aims to confirm the interrelationships between financial and non-financial performance stimulants (Stubbs and Higgins, 2014). Berg and Jensen (2012) state that through integrated reporting future performance indicators of the organization can be shown. As fundamental concepts of integrated reporting, various resources (capitals) that the organization uses in its activities and value creating processes, i.e. the business model used by the organization are indicated (IIRC 2013, p. 10)

Continuing, the IIRC framework includes eight elements of content including organizational overview and external environment, governance, business model, risks and opportunities, strategy and resource allocation, performance, outlook and basis of preparation and presentation. This requires the company to disclose its future projections, which include future goals, the way these goals will be achieved, and what are the challenges and obstacles in achieving these goals.

The structure of the integrated report proposed in the conceptual assumptions contains seven elements: content elements, organizational overview and external environment, governance, business model, risks and opportunities, strategy and resource allocation, performance, and outlook (IIRC 2013, p. 24.). The conceptual framework published by IIRC also shows the guiding principles (seven basic principles for the preparation of an integrated report), which form the basis for the preparation of the integrated report.

Strategic focus and future orientation is one of the key guiding principles (which form the basis for the preparation of the integrated report). The integrated report should provide insight into the organization's strategy and how it relates to the ability to create value in the short, medium and long-term, as well as its application and impact on capitals (resources).

An integrated report explains how an organization creates value over time. Value is not created only by or within the organization. The created value is influenced by the external environment, and is created through relations with stakeholders and depends on various resources.

The framework structure emphasizes that an integrated report should answer the question: "what challenges and uncertainties is the organization likely to encounter in pursuing its strategy, and what are the potential implications for its business model and future performance?" (IIRC, 2013, p. 28). It is also important to provide information on anticipated changes over time, based on reliable and transparent analysis, concerning the organization's expectations about the external environment that the organization is likely to face in the short, medium and long term, and how the organization is currently prepared to respond to critical challenges and uncertainties that may arise.

Among the other guidelines in the conceptual framework, the following guiding principles were indicated (IIRC, 2013, p.16):

- connectivity of information;
- stakeholder relationships;
- materiality;
- conciseness;
- reliability and completeness;
- consistency and comparability.

Future disclosures are therefore one of the foundations of integrated reporting[iii]. In the literature on the subject, many authors present arguments regarding the advantages of forward-looking information disclosure. First, disclosing forward-looking information mitigates information asymmetry, which arises when some entities possess private information about the firm that is not available to investors and other stakeholders. Further, forward-looking disclosures relative to future operations, plans, strategies and financial targets are useful in estimating expected cash flows and the future value of companies. As backward-looking information is insufficient for investors to forecast possible opportunities and risks, forward-looking information plays a crucial role in their investment decisions (Kılıç and Kuzey 2018; Bravo 2016; Celik et al. 2006). The presentation of forward-looking disclosures in integrated reporting also carries some risks, primarily regarding disclosure of sensitive information to competitors.

On the other hand, entities may hesitate to disclose company specific risks and future perspectives due to concerns about the possible negative impact of such information disclosures on their competitive position (Uyar and Kilic, 2012). It is also important that the future situation is described by uncertain estimates, burdened with risk. The potential inaccuracy of future forecasts reduces incentives for managers to disclose quantitative and forward-looking information due to fear of potential litigation costs (Healy and Palepu, 2001, Oliveira, Rodrigues and Craig, 2011).

To sum up, forward-looking disclosures are a very sensitive area in integrated reporting for both those who draw up integrated reports and also for all interested stakeholders. Risk projections may pose a threat and claims (bringing legal actions) for unrealized returns. In turn, the lack of such information puts into question the future of integrated reporting.

Empirical research on forward-looking disclosures in integrated reporting

Academic research on future-oriented disclosures focus on the relationship between forward-looking disclosures and the volatility of stock returns. For example, Bravo (2016) examined whether forward-looking disclosures and corporate reputation lead to a reduction in stock return volatility. This study measures forward-looking disclosures concerning financial information by analyzing the content of annual reports for a sample of US companies. The results indicate that the forward-looking information disclosed by higher reputation companies has a greater impact on stock return volatility.

Celik, Ecer and Karabacak (2006) investigated the determinants of forward-looking in-formation disclosed by the Turkish companies listed on Istanbul Stock Exchange. The results of these surveys have shown that the total disclosure of forward looking information is positively related with the size and foreign offers, and negatively related with the variables of ownership structure, profitability, the level of foreign investment and the proportion of institutional investors. The study also indicated that the ownership structure and financial performance are determining factors affecting the disclosure of financial forward looking information.

Several other researchers have examined the relationship between corporate governance mechanisms and the level of future disclosures (O'Sullivan, Percy and Stewart, 2008; Wang and Hussainey, 2013).

The results obtained indicate that increasing the effectiveness of corporate governance mechanisms does not improve forward-looking disclosures, which was in line with expectations.

Kiliç and Kuzey (2018), found that most entities tend to provide rather qualitative forward-looking disclosures rather than quantitative ones. What's more, the results showed that gender diversity and company size are positively related to forward-looking disclosures, while financial leverage is negatively related to prospective information disclosures (forward-looking). Contrary to expectations, the authors did not find a significant impact on the future disclosures by the size of the board, structure of the management board, profitability ratio or the industry-type activity.

It should be emphasized that there is a small number of studies on the scope of future disclosures in the integrated reports, while many studies have examined the reporting practices of early IR users[iv].

Research Methodology

The aim of the study was the quantitative and qualitative assessment of future-oriented disclosures in the practice of integrated reporting of Polish companies. Starting from 2013, the number of companies publishing integrated reports has been gradually increasing, and the quality of published reports has also changed. Due to the fact that the objective of the study is to assess the current status, the integrated reports prepared by 20 capital groups in the years 2016-2017 were subject to analysis. Some of the surveyed units prepared their integrated report both in traditional form and in an interactive form, some only in traditional or only interactive form. The research process included the following stages:

- identification of Polish companies preparing integrated reports;
- quantitative and qualitative assessment of future disclosures in integrated reports.

In order to conduct the research, the following research questions were formulated:

1. whether there is a separate part in the integrated reports in the form of outlook?
2. what elements of forward-looking disclosures are most often shown in reports?
3. how the quality of individual elements of forward-looking disclosures is shaped?

For this purpose, the authors defined a list of elements being subject to both quantitative and qualitative assessment. The study evaluated the following areas of future disclosures:

1. marketing;
2. finance;
3. intellectual capital;
4. social responsibility;
5. environmental protection.

The first of these areas (marketing) assesses whether the document presents information on the following issues:

- growth opportunities;
- industry or market risks;
- sales target;
- advertising and publicity plan(s);
- planned products research and development;
- expected market share.

In the area of finances, it was analyzed whether the report contains such information as:

- investment projects;
- capital expenditure plan(s);
- financial risks;
- earnings targets;
- share price;
- expected profitability;
- expected cash flows;
- expected EBITDA.

The next aspect assessed was the disclosure in the field of intellectual capital. In this area, the disclosures about intellectual capital development plans, the elimination of various forms of discrimination, health and safety at work as well as disclosures about the risks associated with human capital were analyzed.

The fourth assessed area concerned the analysis of forward-looking disclosures in the field of social responsibility. In the area of CSR, the presence of such elements as future CSR assumptions and business ethics standards were analyzed in the reports.

The last assessed area concerned environmental protection disclosures referring to the identification of ecological risk and planned pro-ecological activities. In addition, the form of publication of forward-looking disclosures has been quantified. In case of a quantitative assessment, the presence or absence of each proposed variable was assessed. Result 0 was given in the absence of a particular element, while score 1 was assigned if the element was included in the report.

In order to assess the quality of future disclosures, a 6-point Likert scale was adopted, where 5 is the highest rating, and 0 means that the element is absent in the content of the report. The detailed scoring system is as follows:

0 - element not present in the content
1 - element present, but poor description
2 - element present; description based on some quantitative information
3 - element present; balanced description of contents; average quantity of information
4 - element present; good and detailed description
5 - element included in the content, excellent description.

The research sample included 33 integrated reports, prepared by 20 corporate groups, published in 2016-2017. The number of reports in individual years is presented in Table 1.

Research Findings and Discussion

The quantitative and qualitative assessment of forward-looking disclosures in integrated reporting comprised few steps. In the first stage of the analysis, the entire sample of 33 re-ports was assessed in order to obtain a general level of advancement in relation to forward-looking disclosures (tables 2-3). The results of the analysis indicated that the majority of reports do not have a separate outlook part in the structure, only eight reports presented the outlook as an individual chapter. Preparing the forward-looking disclosures, companies use their own individual approach, most often presenting that information as part of the strategy, in the form of description without providing specific data and deadlines. Table 2 presents the level of variables characterizing the examined integrated reports i in the overall sample (20 firms, 33 firm-year observations for year 2016 and 2017). All analyzed reports indicate industry or market risks and future CSR assumptions, health and safety at work are indicated in 88% of reports, and risk related to human capital as well as ecological risk in 85% re-ports. The financial information do not include any data on the forecasted share prices and forecasted cash flows, and to a small extent (only 27%) provide information on dividend policy. In the remaining areas, it can be observed that the majority of reports indicate plans regarding the development of intellectual capital (76%) as well as planned pro-environmental (70%) external activities. A small number of reports (21%) indicate advertising and promotional plans and plans of prevention against various forms of discrimination.

Source: Authors' elaboration.

Elements of forward-looking disclosures occurring in the analyzed integrated reports were subsequently assessed in terms of quality (Table 3) in accordance with the proposed scoring system. In the qualitative analysis of the assessed variables, the results may be more subjective than in the quantitative assessment due to the wider scale of scoring.

Source: Authors' elaboration.

The qualitative assessment shows significant differentiation – only 2 out of 23 items reach the average score higher or equal to 2. The industry and market risks and future CSR assumptions are described in the most detailed and comprehensive way, while advertising and promotional plans are presented in the smallest scope (average rating 0.24), as well as the planned level of dividends (average grade 0.39) (Table 3). These results suggest that the content of future disclosures in integrated reports still needs to be refined, especially regarding financial information.

In the next section of the study, the presence of variables in years 2016 and 2017 was analyzed (table 4). The comparison of the presence of individual variables of forward-looking disclosures over time is difficult due to the different number of published reports, which is why the survey is of an illustrative nature and the relative values expressed by the structure ratios have been compared.

Table 4. The presence of variables characterizing forward-looking disclosures in years 2016 and 2017

	2016 15 reports		**2017 18 reports**	
Variables	Quantity	%	Quantity	%

Source: Authors' elaboration.

The presence of variables characterizing forward-looking disclosures in two analyzed years does not show a significant variation, which indicates the stabilization of the forward-looking disclosures in practice, although this does not mean that the level of disclosures is satisfactory. The growing interest in integrated reports did not translate into a significant increase in the number of reports published by Polish companies in 2017 compared to 2016.

The average scoring of forward-looking disclosures in integrated reports (table 5) indicate that the results for most items (except for the elimination of various forms of discrimination) are at a similar level in 2016 and 2017. Deviations in the level of average scores of the analyzed variables in the majority do not exceed 10%. A significant improvement occurred in the case of such items as capital expenditure plans, planned dividend level, health and safety at work and planned pro-ecological activities.

Table 5: Average scores on the single items characterizing forward-looking disclosures in years 2016 and 2017

Item	Variables	2016	2017	2017/2016 %
1	Growth opportunities	1,93	1,94	101%
2	Industry or market risks	2,47	2,67	108%
3	Sales target	1,47	1,06	72%
4	Advertising and publicity plan(s)	0,33	0,17	50%
5	Planned products research and development	1,27	1,06	83%
6	Expected market share	1,07	1,06	99%

24	Goals and tasks in various areas of activity	2,40	2,61	109%

Source: Authors' elaboration.

In the light of the research findings, it can be concluded that the quality of forward-looking disclosures is not satisfactory. The companies only briefly present prospective in-formation. Many reports show the lack of reference to achieving the goals of previous periods, in spite of that this is one of the main goals of the IR. Considering the expectations of stakeholders, that information seems to be crucial when making strategic investment decisions. Therefore, the question is whether IR fulfills its role in accordance with the IIRC, or whether it requires the use of other management tools to fulfill its role.

The authors' proposal is to use balanced scorecard to present forward-looking disclosures. BSC as a commonly adopted performance management framework, in the practice of integrated reporting could also be applied to the presentation of forward-looking disclosures and to assess the goals achievement scope. Many researcher have addressed the use of various management accounting tools in integrated reporting such as: value chain analysis, BSC, life cycle analysis. A special role was attributed to a balanced scorecard due to the wide dissemination in practice as well as the integration of various areas being the subject of IR. In authors' opinion, similarly to German-speaking countries, the presentation of the entity's intentions in the form of BSC would enrich the content of the integrated report and meet the expectations of stakeholders. It should be emphasized that the BSC would include both the organization's future goals, as well as measures and methods of implementation. The use of BSC would enable a more clear presentation of future plans. In addition, the adoption of a unified solution would make it easier to check and evaluate the implementation of objectives in subsequent reports and provide important information in accordance with IIRC requirements. At the same time, organizations should refer to the implementation of these goals in subsequent reports, which would make future disclosure more transparent and read-able.

Conclusions

The results of the research have shown that the level of forward-looking information disclosures very significantly in the examined integrated reports. In addition, the author's findings proved that most of the items of forward-looking disclosures had the nature of qualitative narrations regarding strategy, information on growth opportunities, industry or market risk, environmental risk, while less attention was paid to investment projects, product research and development and financial risk. The results also showed that the majority of reports (70%) present a significant amount of quantitative disclosures on environmental issues, such as forecasts of greenhouse gas emissions, reduction of consumption of various energy sources or the use of recycling. Most of the integrated reports do not include forecasted financial information forecasted, e.g. expected cash flows, and opportunities for growth in quantitative terms. The companies also avoided disclosing quantitative and qualitative information about the expected share price. Summing up, according to the authors, the forward-looking disclosures are the weakest element of the companies' integrated reports, which undoubtedly requires improvement so that the integrated report would fulfill its role and would significantly differ from the existing ones. This is a difficult issue to deal with, and companies are reluctant to these disclosures. The limited scope of forward-looking disclosures in integrated reports may be due to the fear that the information is potentially significant to competitors and not revealing it is the source of competitive advantage for the organization. Negative forecasts also raise concerns about the potential reaction of financial markets and stakeholders.

Abstract

The objectives of this paper are to investigate the mediating and moderating effects of job satisfaction and organizational commitment on the relationship between HRM practices and organizational performance in Abu Dhabi agriculture and food safety authority. Cross-sectional survey research design has been used and a structured self-administered survey questionnaire was used to collect from the respondents in Abu Dhabi agriculture and food safety authority. Different statistical measures such as descriptive statistics, Partial Least Square (PLS) were used to explore research observations and statistical verification of findings. Apart from these statistical measures, a single mediation moderating models has been tested to know the mediating and moderating effect of job satisfaction and organizational commitment on the relationship between HRM practices and organizational performance, empirical findings revealed the indirect effect of human resource management practices through organisational commitment on organisation performance are significant with the exception of career planning and performance management practice which are not significant. The human resource management with most significant indirect effect on organisational performance through organisation commitment is selection and procurement, followed by job security, then followed by empowerment, then followed by incentive and rewards, and finally by training and development, the research does not found significant mediation of organisational commitment between career planning and performance management as indicated and respectively. Thus, organisational commitment mediates the relationship between human resource management practices (selection and recruitment, job security, empowerment, incentive and rewards, and training and development) and organisational performance significantly. Job satisfaction significantly moderates the influence of empowerment, job security and incentives and rewards on organisational performance but does not significantly moderate the influence of incentives and rewards, training and development, selection and recruitment, and career planning on organisational performance.

Keywords: Human Resource Management, Job Satisfaction, Organizational Commitment, Organizational Performance.

Introduction

Every organization whether in the public sector or private sector aspires to achieve its goals, objectives, or set targets efficiently and effectively. For these to be achieved, the organization has to focus on best practices in various human resource management practices including recruitment/selection, planning,

reward management, training and development, and quality working life among others. Dhar, Masruki, Mutalib, Rahouma, Sobhani, and Absar, (2018) there is little understanding of mechanisms through which HRM influences performance. Proper management of human resource is critical which can be achieved by proper understanding of the mechanisms through which HRM influences performance.

It may be argued that while there is a growing body of theory and empirical research demonstrating relationships between HRM policies, collective employee attributes, and firm outcomes, additional studies in this area are needed (Jawaad, Amir, Bashir, and Hasan, 2019). Furthermore, although it was accepted that HRM is positively related to organizational performance, there is a great need for additional evidence to support the HRM-performance relationship from different contexts (Stoermer, Hitotsuyanagi-Hansel, and Froese, 2019).

Most Organizations is suffering a lot of bureaucratic departments, that believe in the centrality of the decision and the lack of delegation of authority to subordinates, leads to delays in the completion of the business and to the large number of steps or stages in which the completion of transactions and approvals relating to work and who might have negative consequences at all levels (Aktar and Pangil, 2018). Despite the increase in the perceived necessity of change and attempts at implementing organizational commitment initiatives, it has been estimated that at least two-third (2/3) of organizational commitment efforts do not result in their intended aims nor do they foster sustained change, employee resistance is the most often cited problem encountered by management when trying to implement commitment, yet for an organization to change, it is essential that the employees of that organization are committed to their responsibilities, therefore, employee cooperation with organizational commitment efforts is indisputably connected and related to either the ultimate success or failure of the organization (Kariuki and Kiambati, 2017).

Previous studies on the relationship between HRM practices and organizational performance has concentrated on a single HRM practice, with growing number of research it has been argued for instituting complementary bundles of HRM practices to enhance organizational performance. The problem addressed by the current study stems from observations and experiences developed by the researcher that indicate low interest by Abu Dhabi Agriculture and Food Safety Authority in connecting HRM role with the performance in the (Korff, Biemann and Voelpel, 2017).

In recent years, one of the most devastating problems encountered in Abu Dhabi Agriculture and Food Safety Authority is that employees are not satisfied with their job and the result is high turnover rate. Organizations that have a high level of organizational commitment are more active and efficient. Because the possibility of being late for work, leaving work, engaging in negative behaviors such as absenteeism of these individuals, are lower than those without strong loyalty. Those who adopt goals of organizations and make effort above and beyond to achieve these goals improve the competitiveness of organization. In addition, those who work with high organizational loyalty, express positive opinions to others about the organization, facilitate the organization to appeal qualified personnel (Saridakis, Lai, Muñoz Torres, and Gourlay, 2018).

Similarly, it was found out that there is lack of studies relating to the effects of job satisfaction and organizational commitment on the relationship between human resources management practices and organizational performance especially in Abu Dhabi agriculture and food safety authority, therefore, this research aimed to fill this gap.

Methodology

The methodological framework that was used in attaining the stated aims and objectives of the study is bases on positivist paradigm i.e quantitative research methodology. It shows how the research hypotheses postulated were empirically determined and examined through relevant methodological approaches adopted in the study (Mackey and Bryfonski, 2018). The research design, types and sources of data was examined along with the procedure employed in testing the hypotheses and accomplishing the study objectives. The methodology of this research paper focused on the study populations/sample frame and its characteristics, sampling technique chosen, and a description of the choice of data

collection instruments, questionnaire design, methods of data measurement, analysis and presentation were contained. The methodology employed was quantitative in nature and SPSS and Smart-PLS software were used to analyse data collected from the field.

Analysis and Results

Response Evaluation Criteria

The first research question and objective of this research are descriptive and therefore required descriptive analyses to determine the level. As such, an evaluation criterion is adapted from other studies in order to evaluate the various constructs of the research. A 5-point likert scale was used throughout the research with different constructs having similar or different scale descriptors. However, the difference in descriptors, the construct has uniform mean ranking scale. Accordingly, the ranks were numbered between level one (1) which was lowest level to level five (5), which was highest level. This research adapted the mean score decision interval based on the works of Kasim *et al.* (2013), Hassanain and Iftikhar (2015) and Abdullahi (2017) from which the following interval decisions were deduced. This is shown in table 1 below.

Table 1: Response evaluation criteria

S/N	Level		Mean Interval
1	Very low	Strongly Disagree	1.00-1.80
2	Low	Disagree	1.81-2.60
3	Moderate	Neutral	2.61-3.40
4	High	Agree	3.41-4.20
5	Very high	Strongly Agree	4.21-5.00

Table 1 contains the evaluation criteria used to evaluate the responses to the questionnaire questions. The research objectives require the establish the level of human resource management practices. Thus, a response of strongly disagree, disagree, neutral, agree and strongly agree implies very low, low, moderate, high and very high level respectively. Accordingly, the research constructs are evaluated descriptively using tables and mean ranking as presented in subsections below.

Evaluation of Measurement Models

PLS-SEM requires the measurement models to achieve certain quality criteria prior to assessing the structural model. These quality criteria involve the assessment of reliability of the measurement models through composite reliability, convergent validity and discriminant validity. The reliability assessment is carried out using composite reliability. The composite reliability measures the homogeneousness of a block using *Dillon-Goldstein's (or Joreskog's) rho* (Vinzi et al., 2010). The second step in measurement model's evaluation is assessing validity of the model. Two measures of validity are assessed - convergent validity and discriminant validity (Hair et al., 2014). Assessment of indicators' factor loadings and Average Variance Extracted (AVE) are used to establish convergent validity. The measures shows the measurements models capability of indicators' variance (Wong, 2016). Heterotrait-Monotrait (HTMT) criterion, Fornell and Larcker criterion and the outer models' cross loading are measures used in assessing discriminant validity of the measurement models. The subsection discusses these evaluations.

Reliability Assessment

Reliability refers to the degree to which a scale yields consistent and stable measures over time which applies to reflective items in the measurement model (Lowry & Gaskin, 2014). Reliability is defined as the measure of how the scale is free from random error and measures the degree to which measurement scale responses are consistent across constructs (Pallant, 2011; Creswell, 2014).

Although the most common measure of reliability is the Cronbach's alpha (Awang, 2012), composite reliability is preferable than the Cronbach's alpha when dealing with PLS-SEM (Joe F Hair, Sarstedt, et al., 2011; Memon & Rahman, 2013; Wong, 2016).

Composite reliability is required to be a minimum of 0.7 for measurement model to be reliable (Wong, 2013). However, composite reliability of 0.6 is also regarded as adequate to attain reliability particularly for freshly developed scales (Chin, 1998, Hair et al., 2011, Bagozzi & Yi, 1988). The reliability of the measurement models is presented in table 2 below.

Table 2: Measurement Models Reliability

Constructs	Cronbach's Alpha	rho_A	Composite Reliability
Career planning	0.969	0.970	**0.974**
Employee job satisfaction	0.975	0.976	**0.977**
Empowerment	0.936	0.937	**0.948**
Incentives and rewards	0.947	0.948	**0.958**
Job security	0.967	0.967	**0.974**
Organisational commitment	0.977	0.978	**0.979**
Organisation performance	0.975	0.976	**0.978**
Performance management	0.962	0.963	**0.967**
Selection and recruitment	0.887	0.886	**0.924**
Training and development	0.955	0.956	**0.964**

Table 2 shows the composite reliability of the measurement models. It shows that the composite reliability ranges from 0.924 to 0.979 above the recommended minimum of 0.7. The other measures of reliability Cronbach's alpha and rho_A – are equally above the recommended threshold of 0.7. This indicated that the measurement models are reliable.

Convergent Validity Assessment

Measurement models are required to explain the variance of the manifest items to achieve convergent validity. It is the assessment of how the measurement model is able to accurately predict or explain the variance of the manifest variables (Wong, 2016). Convergent validity is regarded as the extent to which a manifest variable is related with other manifest variables in the same underlying construct (Hair, Hult, Ringle, & Sarstedt, 2014). The explanation of the manifest variables' variance is assessed by evaluating the Average Variance Extracted (AVE) and items factor loadings and their significance level (Lowry & Gaskin, 2014; Memon & Rahman, 2013; Wong, 2016).

Factor loadings for manifest variables are required to be high on their own measurement model than on others. To achieve convergent validity the loadings is required to be a minimum of 0.7 (Hair et al., 2014). However, in exploratory research, factor loadings of 0.6 to 0.7 is considered acceptable (Hair, Ringle, & Sarstedt, 2011). Manifest variables with factor loadings lower than 0.4 are required to be removed from the measurement model. Items with lower loadings are equally recommended to be deleted from the measurement model to improve the Average Variance Extracted (AVE) (Hair et al., 2014). The factor loadings are required to be significant and are required to converge after few iterations less than the maximum 300 iterations (Wong, 2016).

AVE is the mean of the squared loadings of measurement model's manifest variable which represents the communality of the measurement model (Hair et al., 2014). AVE of the measurement models is recommended to be above 0.5 (J F Hair et al., 2014; Jeo F Hair et al., 2014; Joe F Hair, Ringle, et al., 2011; Lowry & Gaskin, 2014; V. E. Vinzi et al., 2010; Wong, 2016). This implies that at least 50

percent of the variance of the outer model should be explained by the manifest variables. The result shows that the factor loadings of the measurement model range from 0.735 to 0.945 which were all significant. Similarly, the Average Variance Extracted (AVE) were 0.823, 0.731, 0.722, 0.793, 0.883, 0.725, 0.784, 0.747, 0.753, 0.713 for CPL, EJP, EMP, IRW, JSC, OCM, OP, PMG, SER, and TDV respectively all above the recommended minimum of 0.5 (Jeo F Hair et al., 2014). Similarly, the measurement models converged after few iterations (Wong, 2013). Therefore, based on these assessments, the measurement models of the research achieved convergent validity.

Discriminant Validity

Discriminant validity measures the extent to which measurement models are distinct from other research constructs. It evaluates how a particular measurement model is unique from other models in the structural model (Memon & Rahman, 2013). Traditionally, discriminant validity is assessed through two criteria – The Fornell and Larker criterion and Cross-loading criterion. Recently, the use of Heterotrait-Monotrait (HTMT) criterion in assessing discriminant validity has gained both theoretical and empirical support (Henseler, Ringle, & Sarstedt, 2015).

Heterotrait-Monotrait ratio (HTMT) is the average of the heterotrait-heteromethod correlations (i.e., the correlations of indicators across constructs measuring different phenomena), relative to the average of the monotrait-heteromethod correlations (i.e., the correlations of indicators within the same construct) (Henseler et al., 2015). Discriminant validity is achieved between measurement models if the Heterotrait-monotrait (HTMT) ratio with other measurement is less than 0.85 or more liberally less than 0.9 (Henseler et al., 2015).

Fornell and Larcker (1981) criterion of assessing discriminant validity requires that the square root of the AVE of each measurement model should be greater than the correlation of the model with any other model in the structural model. Therefore, the square root of the AVE of each outer model should be higher than its correlation with any other construct (Jeo F Hair et al., 2014).

The cross-loading criterion is advocated by Chin (1998). The criteria require that items should load on their underlying constructs higher than their cross-loading on other constructs (Jeo F Hair et al., 2014; Wong, 2016). Thus, this research used all the three mentioned discriminant validity assessment criteria to establish the distinctiveness of each measurement model from one another as presented in tables 3, 4, and 5 respectively.

Table 3: Discriminant Validity using HTMT ratio criterion

	CPL	EJP	EMP	IRW	JSC	OCM	OP	PMG	SER
CPL									
EJP	0.736								
EMP	0.709	0.852							
IRW	0.778	0.742	0.729						
JSC	0.728	0.811	0.836	0.687					
OCM	0.750	0.845	0.732	0.798	0.826				
OP	0.750	0.824	0.798	0.734	0.806	0.840			
PMG	0.652	0.749	0.687	0.739	0.703	0.693	0.751		
SER	0.746	0.835	0.873	0.732	0.791	0.839	0.772	0.656	
TDV	0.644	0.791	0.782	0.705	0.706	0.764	0.807	0.666	0.785

The assessment of discriminant validity using HTMT ratio criterion is presented in table 3 above. The result shows that the highest HTMT ratio among the measurement models is 0.873 between EMP and SER followed by the 0.852 between EJP and EMP which are still below the recommended maximum liberal value of 0.9 (Henseler et al., 2015). The remaining HTMT values are all below the

recommended maximum conservative value of 0.85 (Henseler et al., 2015). Thus, based on this criterion, discriminant validity is achieved.

Table 4: Discriminant Validity using Fornell and Larcker Criterion

	CPL	EJP	EMP	IRW	JSC	OCM	OP	PMG	SER	TDV
CPL	***0.907***									
EJP	0.717	***0.855***								
EMP	0.679	0.816	***0.850***							
IRW	0.746	0.713	0.687	***0.890***						
JSC	0.706	0.788	0.795	0.658	***0.940***					
OCM	0.730	0.824	0.702	0.767	0.803	***0.852***				
OP	0.731	0.806	0.765	0.707	0.785	0.822	***0.886***			
PMG	0.632	0.727	0.653	0.706	0.680	0.672	0.729	***0.864***		
SER	0.693	0.779	0.799	0.675	0.735	0.785	0.721	0.609	***0.868***	
TDV	0.621	0.764	0.741	0.672	0.680	0.740	0.780	0.640	0.725	***0.904***

Table 4 above shows the Fornell and Larcker criterion of assessing discriminant validity. The square root Average Variance Extracted (AVE) is diagonally inserted into the table, bolded, italic and coloured. The values below the diagonal are the correlations among the measurement models. The result indicated that all the square root of AVE of each of the research measurement models are greater than their correlations with all the other measurement models. Thus, the discriminant validity of the research measurement models is also achieved using this criterion.

Evaluation of Structural Model

The second stage in PLS-SEM evaluation criteria is the evaluation of the structural (inner) model (J F Hair et al., 2014). The structural model establish the causal relationships between the measurement models in the structural model (Hair et al., 2014). The specified interrelationships are intended to answer the research questions and to test the research hypotheses. The major objective of structural model evaluation is to assess the model quality based on its ability to predict the endogenous constructs. The structural model is evaluated by assessing the path coefficients and their significance through bootstrapping procedure; the coefficients of determination (R^2) of the endogenous construct; the effect sizes of the exogenous measurement model through Cohen's f^2; the model's predictive relevant using cross-validated redundancy (Q^2); and the global goodness of fit of the model (*GoF*) (Goh, Ali, & Rasli, 2014; J F Hair et al., 2014; Joe F Hair, Ringle, et al., 2011; Lowry & Gaskin, 2014; Memon & Rahman, 2013; V. E. Vinzi et al., 2010; Wong, 2016).

The structural models are presented in figure 1 and figure 2 depicting the model's coefficients and t-statistics respectively below.

Figure 1: Structural Model without Moderation Effect

Figure 2: Structural Model without Moderation T-statistics

Figure 3: Structural Model with Moderation Effect

Figures 1, 2, and 3 were used to shows the structural models for the research. The first two figures show the models without moderation effect, while the last figure shows the structural model with the added moderation effect. The following subheading presents the result of the structural model and its quality fit.

Path Coefficients Assessment

One of the evaluation criteria for structural model quality is the examination of the path coefficients. The path coefficients represent the strength of a relationship which ranges from -1 to +1 with coefficients closer to +/-1 showing strong relationship (Hair et al., 2014). To ensure quality of the structural model, the path coefficients are required to have significant ones. This research's path coefficients are presented in table 5 below.

Paths	Coefficients	T Statistics	P Values
DIRECT EFFECTS			
CPL -> OP	0.114	1.736	0.083
EJP -> OP	0.083	1.014	0.310
EMP -> OP	0.054	0.791	0.429
IRW -> OP	-0.071	0.956	0.339
JSC -> OP	0.222	2.381	0.017
OCM -> OP	0.381	5.524	0.000
PMG -> OP	0.145	2.671	0.008
SER -> OP	-0.108	1.438	0.151
TDV -> OP	0.171	2.531	0.011
CPL -> OCM	0.065	1.241	0.215
EMP -> OCM	-0.256	4.776	0.000
IRW -> OCM	0.280	4.991	0.000
JSC -> OCM	0.415	6.616	0.000
PMG -> OCM	0.010	0.242	0.809

JSC -> EJP	0.166	2.334	0.020
PMG -> EJP	0.178	3.499	0.000
SER -> EJP	0.146	2.595	0.010
TDV -> EJP	0.182	3.102	0.002
SPECIFIC INDIRECT EFFECTS			
CPL -> EJP -> OP	0.008	0.758	0.449
EMP -> EJP -> OP	0.019	0.935	0.350
IRW -> EJP -> OP	0.002	0.336	0.737
JSC -> EJP -> OP	0.014	0.839	0.401
PMG -> EJP -> OP	0.015	0.960	0.337
SER -> EJP -> OP	0.012	0.880	0.379
TDV -> EJP -> OP	0.015	0.917	0.359
CPL -> OCM -> OP	0.025	1.153	0.249
EMP -> OCM -> OP	-0.098	3.834	0.000
IRW -> OCM -> OP	0.107	3.645	0.000
JSC -> OCM -> OP	0.158	4.204	0.000
PMG -> OCM -> OP	0.004	0.235	0.814
SER -> OCM -> OP	0.117	4.472	0.000
TDV -> OCM -> OP	0.072	2.807	0.005
MODERATION EFFECTS			

CLP*EJP -> OP	0.000	0.008	0.994
EMP*EJP -> OP	-0.231	3.483	0.001
IRW*EJP -> OP	0.073	1.144	0.253
JSC*EJP -> OP	0.213	2.917	0.004
PMG*EJP -> OP	-0.107	2.610	0.009
SER*EJP -> OP	0.025	0.411	0.681
TDV*EJP -> OP	0.033	0.550	0.582

The structural model of this research has direct effects, indirect effects and moderation effects. The result indicated that out of the 23 direct path, 14 were significant leaving only 9 insignificant paths. This shows that most of the paths are significant and therefore attest to the quality of the structural model. Similarly, the specific indirect path has 5 significant path all attributed to the mediator. The insignificant paths are mostly the indirect paths to the dependent construct through the moderator variable. Also, the moderation is 3 significant paths with for insignificant. Cumulatively, the significant paths in the structural model exceeds the insignificant paths; the structural model can be said to have good quality.

In the main endogenous construct, four paths coefficients were found to be significant while the remaining were not. Similarly, three out of the six paths leading to AEE were significant. However, none of the paths leading to PRU was found to be significant. Since the major endogenous construct has most of the paths leading to it as significant, the structural model can be said to be good based on the path coefficients.

R^2 Assessment

R^2, also called coefficient of determination, is the measure of how well the dependent construct is explained or predicted by the independent constructs. It measures the predictive accuracy of the inner model by explaining the percentage of constructs variance in the model (Hair et al., 2014; Memon & Rahman, 2013). Although there is no generally acceptable level of R^2 value, (J F Hair et al., 2014) provided a general rule of thumb for evaluating R^2 value. Accordingly, R^2 values of 0.25, 0.50 and 0.75 are considered weak, moderate and substantial respectively. The R^2 of the endogenous constructs of the research are presented in table 6 below.

Table 6: R^2 Assessment

Constructs	R Square
Employee job satisfaction	0.790
Organisational commitment	0.804
Organisational performance	0.801

Table 2.25 shows the R^2 level of the endogenous constructs. The shows that employee job satisfaction, organisational commitment and organisational/employee job performance have R^2 values of 0.790, 0.804, and 0.801 respectively. Based on the evaluation criteria, the R^2 values are within the substantial level. This based on R2 criterion, the model has good fit.

Effect Sizes (F^2) Assessment

Relative contributions of exogenous constructs to R^2 are evaluated by the means of effect size, denoted by f^2. Chin (1998) submitted that effect size displays the relative effect of certain exogenous constructs on endogenous construct(s) through estimating the changes in the R-squared values. The effect size of each construct in the structural model is determined using Cohen's f^2. The formula is based on eliminating a particular construct from the model to note the changes (Hair et al., 2014).

Effect Sizes: $f^2 = \frac{R^2 incl - R^2 excl}{1 - R^2 incl}$

Where:

f^2 = effect sizes
R^2 incl = R^2 inclusive (R^2 with a particular construct included in the model)
R^2 excl = R^2 excluded (R^2 with a particular construct excluded from the model)
1= Constant
Cohen (1988) provided an evaluation criterion based on a rule of thumb such that effect size is considered small, medium and large if the size is 0.02, 0.15, and 0.35 respectively. Based on this criterion, the effect sizes of the study constructs were evaluated as presented in table 7 below.

Table 7: Effect Sizes (F^2)

	EJP	OCM	OP
CPL	0.015	0.007	0.040
EJP			0.001
EMP	0.063	0.080	0.029
IRW	0.001	0.128	0.010
JSC	0.038	0.253	0.009
OCM			0.103
PMG	0.061	0.000	0.059
SER	0.029	0.137	0.015
TDV	0.057	0.066	0.093

Table 4.26 shows the effect sizes of the exogenous constructs on the endogenous constructs. It shows that on EJP, CPL and IRW have small effect sizes as indicated by values of 0.015 and 0.001 respectively. The remaining constructs have medium effect on EJP. Similarly, on OCM, CPL and PMG have weak effects, EMP, IRW, SER, and TDV have medium effect while JSC has large effect on OCM. Finally, EJP, IRW, JSC and SER have small effect sizes on OP while all the remaining constructs have medium effect sizes on the OP. Thus, most of the research exogenous constructs have medium effect sizes on their respective endogenous constructs.

Predictive Relevance (Q^2)

Predictive relevance is assessed using Stone-Geisser's (Q2) which verified that the data points of all indicators in the outer model of endogenous constructs are predicted accurately (Wong, 2016). This method uses cross-validated redundancy based on sample re-use technique which deletes part of the data matrix, estimates the model parameters and predicts the deleted part using the estimates (Hair et al., 2011; Hair et al., 2014) through blindfolding procedure.

Chin (1998) submitted that a model with a Q2 value greater than 0 have good predictive relevance. The predictive relevance of the structural model is assessed using cross-validated redundancy as presented in table 8 below.

Table 8: Predictive Relevance (Q^2)

	SSO	SSE	Q^2 (=1-SSE/SSO)
CPL	3,008.000	3,008.000	
EJP	6,016.000	2,806.789	0.533
EMP	2,632.000	2,632.000	
IRW	2,256.000	2,256.000	
JSC	1,880.000	1,880.000	

OCM	6,768.000	3,105.360	0.541
OP	4,512.000	1,878.953	0.584
PMG	3,760.000	3,760.000	
SER	1,504.000	1,504.000	
TDV	2,256.000	2,256.000	

The cross-validated redundancy of the structural model is presented in table 8 above. The result shows that all the endogenous constructs have Q^2 value above 0 indicating that the structural model of the research has the required predictive relevance.

Goodness-of-Fit (GoF)

Unlike the covariance-based SEM, there is no generally accepted goodness of fit measure for PLS-SEM (Henseler & Sarstedt, 2013; V. E. Vinzi et al., 2010). However, Tenenhaus et al. (2004) proposed a global criterion of goodness of fit called the "GoF" index. The index is the geometric mean of the average communality (AVE) index and the average of the coefficients of determination (R2). It can be determined using the formula below:

$$GoF = \sqrt{\overline{Com}\ X\ \overline{R2}}$$

According to Akter (2011), GoF is considered small, medium and large if the values are 0.1, 0.25 and 0.36 respectively. Thus, the goodness of fit of the structural model is calculated below.

$$GoF = \sqrt{0.7778\ X\ 0.7983}$$

$$GoF = \sqrt{0.6209}$$

$$GoF = 0.788$$

The result of the GoF index produced a value of 0.788 far above the 0.36 value considered large. Therefore, the research structural model is fitted well.

Mediating effects of organizational commitment on the relationship between human resource management practices and organizational performance in Abu Dhabi Agriculture & Food Safety Authority

The first research objective sought to find out the mediating effects of organizational commitment on the relationship between human resource management practices and organizational performance in Abu Dhabi Agriculture & Food Safety Authority. In the conceptual framework, organisational commitment is hypothesized to mediate the relationship between human resource management practices and organisational performance. The essence is to establish the extent of indirect effect of the mediating construct through the direct paths (J F Hair et al., 2014). The main objective of the mediation analysis is not just to expose any significant path coefficients but rather to identify the level of significance and the important indirect effects of the relationship. Various methods of assessing mediation analysis abound in literature. However, recent developments in PLS-SEM advocated the use of specific indirect effect to assess mediation effect (Memon *et al.*, 2018). This study therefore assessed the mediation effect using this method the result of which is presented in table 9 below.

Table 9: Mediation effect of organisational commitment

Paths	Coefficients	T Statistics	P Values	Remark
Specific Indirect Effects				
SER -> OCM -> OP	0.117	4.472	0.000	Supported
JSC -> OCM -> OP	0.158	4.204	0.000	Supported
EMP -> OCM -> OP	-0.098	3.834	0.000	Supported
IRW -> OCM -> OP	0.107	3.645	0.000	Supported
TDV -> OCM -> OP	0.072	2.807	0.005	Supported
CPL -> OCM -> OP	0.025	1.153	0.249	Not Supported
PMG -> OCM -> OP	0.004	0.235	0.814	Not Supported

Table 9 shows the indirect specific effects of organisational commitment. The result showed that the indirect effect of human resource management practices through organisational commitment on organisation performance are significant with the exception of career planning and performance management practice which are not significant. The human resource management with most significant indirect effect on organisational performance through organisation commitment is selection and procurement (β=0.117; t=4.472; p=0.000), followed by job security (β=0.158; t=4.204; p=0.000), then followed by empowerment (β=0.098; t=3.384; p=0.000), then followed by incentive and rewards (β=0.107; t=3.645; p=0.000), and finally by training and development (β=0.072; t=2.807; p=0.005).

However, the research does not found significant mediation of organisational commitment between career planning and performance management as indicated by (β=0.025; t=1.153; p=0.249) and (β=0.004; t=0.235; p=0.814) respectively. Thus, organisational commitment mediates the relationship between human resource management practices (selection and recruitment, job security, empowerment, incentive and rewards, and training and development) and organisational performance significantly.

Moderating effects of job satisfaction on the relationship between human resource management practices and organizational performance in Abu Dhabi Agriculture & Food Safety Authority

The second research objective sought to find out the moderating effects of job satisfaction on the relationship between human resource management practices and organizational performance in Abu Dhabi Agriculture & Food Safety Authority. PLS-SEM is very instrumental in achieving this objective because in addition to estimating linear relationships it also has the ability to incorporate moderator variable which influences the strength or even change the direction of relationship between the independent and the dependent construct in the structural model (Becker, Ringle, & Sarstedt, 2018; Wong, 2016). Moderation refer to the influence of an antecedent that alters that strengthens or alters the relationship between variables in structural model. Thus, a moderator "influences the nature (e.g., magnitude and/or direction) of the effect of an antecedent on an outcome" (Aguinis, Edwards, & Bradley, 2017). Moderation is "where a relationship between an independent variable and a dependent variable changes according to the value of a moderator variable" (Ali Memon et al., 2019).

A moderator variable can be either categorical or continuous depending on the theoretical conceptualisation of the research model (Ali Memon et al., 2019; Hasan, Mohd Saad, & Iteng, 2019; Kee & Rahman, 2017). For categorical moderator, Multi group analysis (MGA) is mostly conducted. For the continuous moderator, three measure methods product-indicator, two-stage, and orthoganalising approaches are used (Ali Memon et al., 2019). The use of either of the methods depends on the nature of the structural model. This research uses two stage methods to test the moderating effect of job satisfaction between human resource management practices and organisational performance. The two-stage approach involves calculating the latent construct scores and saved before subsequently building up the interaction term as element-wise product of the construct scores of the independent construct and the dependent construct. The interaction term is then used as a regresor on the latent

variable scores of the dependent (Ali Memon et al., 2019). The moderation test result is reported in table 10 below.

Table 10: Moderating effect

Paths	Coefficients	T Statistics	P Values	Remark
EMP*EJP -> OP	-0.231	3.483	0.001	Supported
JSC*EJP -> OP	0.213	2.917	0.004	Supported
PMG*EJP -> OP	-0.107	2.610	0.009	Supported
IRW*EJP -> OP	0.073	1.144	0.253	Not Supported
TDV*EJP -> OP	0.033	0.550	0.582	Not Supported
SER*EJP -> OP	0.025	0.411	0.681	Not Supported
CLP*EJP -> OP	0.000	0.008	0.994	Not Supported

The result of moderating effect of job satisfaction on the relationship between human resource practices and organisational performance is presented in table 10. The result found three significant moderating effect. The result found significant moderating effect of job performance on the relationship between empowerment and organisational performance (β=-0.231; t=3.483; p=0.001). Thus, job satisfaction significantly moderates the influence of empowerment on organisational performance.

Similarly, job satisfaction significantly moderates the relationship between job security and organisational performance (β=0.213; t=2.917; p=0.004). Also, the result shows that the relationship between performance management and organisational performance is significantly moderated by the presence of job satisfaction (β=-0.107; t=2.917; p=0.009).

However, job satisfaction does not moderate the influence of incentives and rewards, training and development, selection and recruitment, and career planning on organisational performance as indicated by coefficients values of 0.073, 0.033, 0.025, and 0.000, t-statistics of 1.144, 0.550, 0.411, and 0.008 as well as p-values of 0.253, 0.582, 0.681, and 0.994 respectively.

Thus, it can be concluded that job satisfaction significantly moderates the influence of empowerment, job security and incentives and rewards on organisational performance but does not significantly moderate the influence of incentives and rewards, training and development, selection and recruitment, and career planning on organisational performance.

Conclusions

The current study seeks to establish a mediating and moderating effects of job satisfaction and organizational commitment on the relationship between HRM practices and organizational performance in Abu Dhabi agriculture and food safety authority. All HRM practices are associated with one another. Training and development, discipline and compensation system were significant predictors of secondary school teachers' performance. Job satisfaction played as a mediator on the relation between HRM practice and operational performance. Training & development, discipline and compensation were related to teachers' performance effort through job satisfaction. The association between compensation and performance is spurious in absence of job satisfaction. Again, job satisfaction is not only predicted performance but also mediated the relationship between HR practices and operational performance. The findings revealed that, there is an indirect effect of human resource management practices through organisational commitment on organisation performance are significant with the exception of career planning and performance management practice which are not significant. The human resource management with most significant indirect effect on organisational performance through organisation commitment is selection and procurement, followed by job security, then followed by empowerment, then followed by incentive and rewards, and finally by training and development, the research does not found significant mediation of organisational commitment between career planning and performance management as indicated and respectively. Thus, organisational commitment mediates the relationship between human resource management practices (selection and recruitment, job security, empowerment, incentive and rewards, and training and development) and

organisational performance significantly. Job satisfaction significantly moderates the influence of empowerment, job security and incentives and rewards on organisational performance but does not significantly moderate the influence of incentives and rewards, training and development, selection and recruitment, and career planning on organisational performance.

Abstract

Health status has been adjudged critical in enhancing the efficiency and productivity of human and capital resources, hence necessary for attaining and sustaining welfare and growth in the long-run. This study examines the role of health on economic growth in Sub-Saharan Africa for the period 1990-2015. It adopted the Solow growth model and estimated it using static panel estimation technique. The evidence from the empirical investigation shows that growth responds to the indicators of health (life expectancy and under-five mortality) negatively in the region. This indicates that the state of health in the region mitigates the growth potential which is directly suggestive that the weak healthcare policies and financing in the region has contributively enhanced the burden of diseases. The study recommends that SSA economies and policy makers in the region ensure more financial allocation and commitment to reducing the burden of preventable diseases in the region and strengthen institutions that are charged with implementation and monitoring of health intervention programmes and ensuring equitable access to healthcare.

Keywords*:* Health, Economic Growth, Panel Data Analysis, Sub-Saharan Africa

Introduction

Health is pertinent to human capital which is one of the main inputs for economic growth and development. The World Health Organization (1946) defined health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity". "Many factors combine together to affect the health of individuals and communities, whether people are healthy or not, is determined by their circumstances and environment. To a large extent, factors such as where we live, the state of our environment, genetics, our income and educational level, and our relationships with friends and family all have considerable impacts on health whereas the more commonly considered factors such as access and use of health care services often have less of an impact" (WHO, 2013).

According to WHO (2013) the determinants of health include: the social and economic environment, the physical environment, and the person's individual characteristics and behaviour. Health also plays an important role in economic growth, as the saying goes 'Health is Wealth'. Health is a determinant of human capital. According to Barro (1996) health is 'a capital productive asset and an engine of economic growth'. Also, human capital formulation which consists of health and education leads to the

[1] The paper is an abridged and updated version of a research dissertation submitted to the Department of Economics, Covenant University.

attainment of economic growth, this is similar to the assertion by Grossman (1972), Bloom and Canning (2000) who posits that individuals who are healthy in terms of assimilating knowledge are more efficient and as a result of this obtain higher productivity (see also Rico, Turrbiates and Hernandez, 2005).

In the past decades, global efforts have geared towards improving health outcomes in Africa; this is reflected in the Millennium Development Goals (MDGs) and Sustainable Development Goals (SDGs). Out of the Eight Millennium Development Goals (MDGs) adopted by 189 countries following the signing of the United Nations Millennium Declaration in 2000, MDG 4, 5 and 6 relate directly to health which are: to reduce child mortality by two-thirds between 1990-2015, improve maternal health by three-quarters between 1990 and 2015 and combat HIV/AIDS (HIV means Human Immunodeficiency Virus while AIDS means Acquired Immune Deficiency Syndrome), malaria and other diseases by 2015. According to World Development Indicator (2013) looking at the MDG 4 which is to reduce child mortality in developing countries the under-five mortality rate fell from an average of 95 per 1000 per live births in 1990 to 56 in 2011, but rates in Sub-Saharan Africa and south Asia remain much higher. The introduction of the SDGs is premised on this performance and expected all countries to reduce under-five mortality to at least at low as 25 per 1,000 live births in 2030.

Also most children die from causes that are readily preventable and curable with existing interventions, such as pneumonia (18%), diarrhoea (11%) and malaria (7%). Almost 70% of deaths of children under age 5 occur in the first year of life, and 60% of those in the first month. Preterm birth complications account for 14% of deaths, and complications during birth accounts for another 9% (UN Inter-Agency Group for Child Mortality Estimation, 2012; WDI, 2013). There is need to address the causes of neonatal and infant mortality such as inadequate ante-natal, pre-natal and after birth care, poor sanitation and malnutrition and high vulnerability rate to diseases. This becomes expedient as statistics has rightly showed that lower infant and child mortality rates are, in turn, the largest contributors to higher life expectancy in most countries (World Development Indicators, 2013).

Sub-Saharan Africa remains the centre of the HIV/AIDS epidemic, but the proportion of adults living with AIDS has begun to fall even as the survival rate of those with access to antiretroviral drugs has increased. By the year 2010, 6.5 million people worldwide were receiving antiretroviral drugs and this represented the largest one-year increase in coverage but still fell short of universal access (UN, 2012; World Bank, 2013; Ogundipe, Olurinola and Ogundipe, 2018). Jack and Lewis (2009) in a view to investigate the determinants of health itself, particularly the evidence on the impact of public expenditure point out that in general there appears "to be growing evidence that the public policies only improve health when institutions are of sufficiently high quality, and that good institutions themselves are likely to have a more important direct effect on growth than growth through health".

The role of institutions in healthcare has been adjudged important. The absence of sound institutions undermines health investments and leads to ambiguous evidence supporting the relationship between healthcare services and health status. Accepted indicators of healthcare performance such as hospital infection rates, utilization statistics, or surgery survival rates are rarely collected even when required, for lack of some combination of oversight, regulation, and enforcement. This applies in middle income countries as well as poorer ones. Indirect indicators of poor performance that are increasingly relied on in the absence of more direct measures include provider absenteeism, lack of basic medical supplies and drugs, poor management of purchases, leakage of funds, and under-the-table payments by patients, all of which highlight the nature of the performance lapses that undermine effective service delivery' (Lewis, 2006; Jack and Lewis, 2009). Institutions with regards to health play an important role in achieving growth, where institutions are generally weak or unable to function; public spending on health will not improve health, let alone impacting on growth. Therefore more attention should be paid to upgrading healthcare institutions.

Health has been seen to have effects on economic development as it improves productivity and human capital. Good health improves the ability and capacity to learn and work while chronic illness undermines current productivity and future output outcomes. According to Spring (2005) 'improvements in health have both level and growth effect on per capita income. Level effects from improved health results from increases in effective labour inputs. Improved health contributes to this

in two ways: first by increasing the supply of labour inputs due to less time missed due to disease. Secondly by the increase in the efficiency in labour inputs due to improvements in the quality of labour when individuals are healthier. Growth rate occurs because a lower incidence of disease increases (the private and social) rates of return to human capital investments, which in turn leads to higher rates of economic growth".

The study by Sorkin (1977); Rico et al., (2005) shows the various channels in developing nations through which economic development could be impacted through health. The gains from productivity through the improvement in the hours of work are the first way through which health could impact economic development. Also, the development of previously unsettled regions is made possible. Lastly, this could also be seen through the turnaround in people's attitude through the improvement made in innovation and entrepreneurship. Good health plays an important role in the attainment of economic development. Hence, there is need to establish and implement good health policies aim at improving the health stock if sustainable development is to be attained.

Overview of Health in Sub-Saharan Africa

Available statistics for Sub-Saharan Africa over time shows that between 1990 and 1999 the PPP GNI per capita growth was 17 percent ($1,087 to $1,278) and this increased to 58 percent ($1298 to $2060) between 2000 and 2009. The international development assistance flows to countries in this region to fight HIV and other sexually transmitted diseases increased by 35 percent from 2007 to 2009; there have also been a decrease in the average number of children per woman from 7 to 5 in 1980 and 2009 respectively (Africa Development Indicators Factoids, 2011). According to the Macroeconomics and Health Commission Report (2001) three million people died of AIDS in the year 2000 and about 2.4 million of these deaths were in Sub-Saharan Africa.

Taking cognisance of some facts about Sub-Saharan Africa relative to the world, Sub-Saharan Africa has the second highest malnutrition rate of 42 percent, South Asia is the highest with 47 percent malnutrition rate and the lowest is North America with 4 percent malnutrition rate. The Sub-Saharan Africa prevalence of HIV for people ages 15-49 is 5.4 percent relative to 0.8 percent for the World and this means that it is about 6.5 times the world prevalence. Child mortality rate has declined since 1990 by 33 percent and 28 percent in the world and Sub-Saharan Africa respectively (Ogundipe, Olurinola and Ogundipe 2016). Although the average life expectancy at birth is 52.5 years for Sub-Saharan Africa relative to 71.5 years and 69.2 years for North Africa and the World respectively, the increase has been more (5 percent) in SSA compared to the World (3 percent) between 2000 and 2009. The rate of improvement in access to safe water between 1990 and 2008 in Sub-Saharan Africa has increased by nearly 22 percent compared to the World's 13 percent. Also, during the same period there has been increase in the rate of improvement in access to sanitation in the region by 15 percent while the rate of improvement for the World is 16 percent (Africa Development Indicators Factoids, 2011).

Health is a necessary and sufficient asset in the promotion of an individual's wellbeing as it addresses the essential aspects of life and this can be seen in (WHO, 1946) definition of health as the complete physical, mental and social wellbeing and not only concerned about the presence and absence of diseases. The present state of health in Sub-Saharan Africa has been an issue that has drawn the interest of many researches, institutions and some countries as this not only affects Sub-Saharan countries but is a major global issue. This can also be seen in the UN's MDGs, where out of eight MDGs three were set aside to address the issue of health (reduce child mortality, improve maternal health and combat HIV/AIDS, malaria and other diseases by 2015).

Apart from the fact that health is a global concern, studies and reports have shown that majority of these health inefficiencies are found in this region. SSA region has been found to have the highest maternal mortality rates, according to WHO (2013) more than half of maternal deaths occur in Sub-Saharan Africa and a quarter in South Asia. This region has also been the centre of HIV/AIDS epidemic and characterized with high rate of child mortality. Child vaccination which is proven to safeguard children from been susceptible to these diseases have been stagnated, as the two highest mortality regions which are South Asia and Sub-Saharan Africa have stagnated over the last three years with less

than 80 percent coverage. The SSA region has also been attributed with the lowest response rate and this has contributed to the sluggish development pattern experienced in the region. The SSA economies need to address these health issues, especially by diverting funds and resources to check preventable diseases, if sustainable growth and development is to be actualised.

Review of Related Literature

Health and Economic Growth

The relationship between health and economic growth is one that has drawn the interest of various researchers, institutions and nations as health is an important human capital input and also a determinant of economic growth and development. A main feature of this relationship is the two way causation between health and the economy, as better heath promotes economic growth through an increase in productivity, as a healthy workforce is more efficient. Also economic growth can also encourage more accumulation of health capital (Barro, 2013). In examining some works focusing on the relationship between health and economic growth, there tend to be a general consensus on a positive relationship (see Baker, 1998; Weil, 2006; Canning, 2005; and Rico et al., 2005).

Despite the vast number of literature, obvious gaps persist. One of such is the challenges associated with measurement; most of the empirical studies on the impact of health on economic growth used life expectancy as a proxy variable for health. This choice has some limitations as it does not cover all dimensions of health, it only accounts for mortality while morbidity, disability and comfort are ignored and these are pertinent to the welfare and development of a nation. According to Rico et al. (2005) this becomes a problem despite the reliable link between health, productivity and economic growth. Also, the use of life expectancy negates a major assumption of the pioneering study by Grossman in 1972, whose model opined that human capital depreciates overtime. It thus implies that life expectancy takes into account the lifetime of the stock of human capital with less regards for the quality of the human capital stock. Also, the challenge of endogeneity that exist between health and income needs to be addressed. Luft (1978) and Rico et al. (2005) explained the endogeneity challenge as "a lot of people who otherwise wouldn't be poor are, simply because they are sick; however, few people who otherwise would be healthy are sick because they are poor". Hamondi and Sachs (1999) and Bloom et al. (2001) suggested the use instrumental variables technique to address the problem.

Health is a necessary factor for improvement in productivity as a healthier workforce is more efficient than a non-healthy one; education also promotes productivity as it improves an individual's ability to adapt to modern technology. These two are connected in the sense that they have the same end which is to increase productivity and efficiency which makes them very important focus points for any nation if a self-sustaining growth and development is to be achieved. Therefore, there is need for a simultaneous investment as a nation unilaterally cannot focus on health (education) and not considering education (health). Considering how health leads to income growth via human capital accumulation, Jack and Lewis (2009) identified two pathways; first, healthier and well nourished children are better learners and spend more time at school and this prepares them to earn higher incomes. Second, the human capital accumulation of children are affected by the health status of their parents as dead parents cannot invest in their children and even when these orphans receive support, they are often given less than if their parents where alive.

According to Research Analyst, DSAED (2010) economic development may lead to better health as wealthier countries have a greater chance and capability to invest in healthcare and public health measures. Alternatively, improvements in health can contribute to economic development through a number of path, channel or reasons such as: an increase in productivity, as better health improves or enhances workers productivity because days taken out of work due to illness are lesser and this brings about an increase in output. This can also be applied to a family setting where improved health of family members reduces the direct costs incurred as a result of the time lost to taking care of family members. Another channel is through reduced family size, as this reduces the number of dependants in the country leading to an increase in the workers to dependants' ratio, hence increasing the national savings. According to the Harrod-Domar growth model, this increased savings ought to improve

growth by providing more new investments, the increase in the level of investments is a channel by which health can contribute to economic development and this can be viewed via capital accumulation as healthier individuals tend to save more and increase growth. Also, a healthy environment attracts tourist and this contributes to the Gross Domestic Product (GDP). According to the World Travel and Tourism Council, Tourism's direct contribution to Gross Domestic Product (GDP) in 2012 worldwide was USD2.1 trillion. Well educated or healthier workforce also serves as an incentive for companies to invest.

As the saying goes "prevention is better than cure", reduction in the cost of illness can be seen as a channel as it has been observed that the cost of preventing an illness is lesser than the cost incurred in curing it. This enhances efficiency as it makes available capital for other productive uses in the future in which government can invest in. In all aspects, for any economic agent be it the individual, firm or government prevention is better than cure as it improves welfare and enhances efficiency. Increase in Human capital is another channel through which health could contribute to economic development as healthier children tend to profit more from schooling as they are less absent from school and also proper nutrition in the early stages of childhood enhances the mental ability.

More so, literature has established link between investing in a population's health and the inflow of foreign capital. Bell and Lewis (2004) suggest that the high risk of environments as a result of some communicable disease such as SARS (severe acute respiratory syndrome) reduces the inflow of foreign capital through tourism since it wards off investors and visitors (Jack and Lewis, 2009). Health also increases productivity and success in education as healthy children are able to learn better, have better education, are less absent due to illness and also earn higher as adults. Healthier workers are more energetic and robust in terms of physical and mental terms and this reduces the rate of absenteeism from work due to illness either of themselves or their families and this also makes them productive, earn higher wages and also attract foreign direct investment (Working Group 1 of the Commission on Macroeconomics and Health, 2002).

Healthy workers are more energetic in physical and mental terms and they are more productive and earn more wages because they are less likely to be absent from work due to illness while ill workers don't tend to earn more and this can be seen in most developing countries where hourly wages are being paid in manual labour and this consists a high proportion of the workforce compared to industrial countries (Bloom et al., 2004). Health can enhance workers productivity by increasing their physical capacities which include strength and endurance as well as their mental capacities such as cognitive functioning and reasoning ability (Bloom and Canning, 2005).

A positive relationship is expected between health and productivity for both skilled and unskilled workers as this can be seen at the microeconomic level in the works of (Schultz and Tansel, 1992; Strauss and Thomas, 1998; Savedoff and Schulttz, 2000). Bloom and Canning, (2005), Strauss and Thomas (1998) examine the empirical relationship between health and productivity and found a correlation between physical productivity and some health aspects such as nutrition. Bloom and Canning (2000) and Rico et al., (2005) explains how due to the higher level of physical energy and mental clarity, healthy population tend to be more productive. Health has been a key concern or issue in the world today and should not be overlooked as it is a great determinant for the welfare of nations. Various health institutions, preventive and treatment measures have been developed to address the health challenges in the world today but despite these level of development some nations, particularly developing nations, are still been affected by these challenges. The Sub-Saharan Africa region is not left out in this issue as relative to other regions of the world, evidence has shown that this region has shown low response.

The various health challenges faced by developing countries according to WHO; Todaro and Smith, (2011) include: Absolute poverty, Malnutrition, HIV/AIDS, Malaria, Tuberculosis, Acute lower respiratory infections, Hepatitis B, Ascariasis, Cholera, Dengue, Leprosy (Hansen disease), Dracunculiasis (guinea worm disease), Chagas disease, Leishmaniasis, Lymphatic and filariasis (elephantiasis). Curbing the prevalence of these illnesses cannot happen on its own therefore there is need for a collective effort by both the affected areas and other donors to eradicate this global challenge. It was calculated that if the donor countries were to contribute 0.1 percent of their GNP, that is, one

penny for every $10 of income and coupled with a good increase in the effort within the low income countries, about 8 million deaths per year could be prevented by the end of a decade (Working Group 1 of the Commission on Macroeconomics and Health, 2002). Especially, deaths arising from preventable diseases such as tuberculosis, malaria and HIV/AIDS can be reduced to the best minimum.

A number of studies that empirically established the link between health and growth abounds in the literature using various health indicators (such as life expectancy, adult survival rates and others) and methods.
Barro (1996, 2013) in his empirical work suggested that health status as measured by life expectancy or other similar macro indicators is a better predictor and an important contributor to later growth than initial education. This shows the significance of health in attaining future growth. Also, Barro (1997) also showed that life expectancy is significantly correlated to subsequent economic growth as 1 percent increase in life expectancy could raise economic growth by 0.4 percent yearly (Working Group 1 of the Commission on Macroeconomics and Health, 2002). Similarly, Weil (2001) using a calibration process measured the relationship between health proxy with adult survival rates and labour productivity across countries. His result showed that one percentage point increase in adult survival rates resulted into 1.68 percentage increase in labour productivity and that health differential which accounted for about 17 percent of the variation in output per worker across countries had roughly the same magnitude with respect to the differences accounted by physical capital (18 percent) and education (21 percent). This shows that health is a pertinent form of human capital and requires an equal attention as given to both physical capital and education in the development process (Bloom and Canning, 2005).

Similarly, Bloom and Canning (2005) using a model of conditional convergence in a panel study observed confidence interval of 1.2 to 4.3 percent and this concurred with Weil (2001) though the result is higher and it implies that health plays a larger role in explaining cross-country differences in the level of income per worker than education. Also, in reconciling the micro and macro evidence of health and economic growth they found out that the estimated macroeconomic effects of health are positive and not significantly different from the microeconomic estimates. Bloom *et al.,* (2001) estimated the effect of health on economic growth using a panel data for 1960-1990 and showed that health has a positive and statistically significant effect on economic growth as one year improvement in population's life expectancy contributes a 4 percent increase in output. This makes their result consistent with the theoretical argument and microeconomic evidence. Also, Rico *et al.,* (2005) conducted an empirical study of the impact of health capital on economic growth as it extended its definition to include the four determinants of health (health services, lifestyles, environment and socioeconomics) taking into account the impact of each of them and this is a unique contribution to previous studies. A panel data analysis for the years 1970-1980 and 1980-1990 was used and the result showed that health capital has a significant effect on economic growth and that health services was of greater significance than the rest of the determinants. Apart from the fact that the result concurred to the theoretical argument of health's relationship to growth, the definition of health was also broadened.

Weil (2006) looked at how human capital in the form of health varies among countries using three health indicators which are average height of adult men, the adult survival rate (ASR) for men and the age of menarche (onset of menstruation) for women. Using ASR for men as his standard estimate and a measure of health, he found out that eliminating health gaps among countries would reduce the variance of logged GDP per worker by 9.9 percent and he concluded that health is an important determinant of income variation and that the effect of health on income is economically significant.

Various studies have examined and explained the effect of illness as proxied by malaria on the economies in Africa countries. Gallup and Sachs (2001: 91); Acemoglu and Johnson (2009) argued that Africa's per capita growth rate could increase by as much as 2.6 percent a year if malaria is wiped out in Sub-Saharan Africa and this also explains the consequences that some morbidity issues such as diseases have on an economy and their level of growth. Between 1965 and 1990, an average per capita GDP growth of 0.4% per year and 2.3% per year were experienced by countries with high malaria transmission and other countries respectively and this suggests that malaria plays a significant role in preventing long term economic growth and development (Working Group 1 of the Commission on Macroeconomics and Health, 2002) and this explains one of the significant reasons for the disparities

in growth among countries. In the Abuja declaration of 2002 signed by 53 African heads of state it was noted that the growth in African countries have been slowed down by 1.3% per year as a result of malaria and this made the GDP for African countries to be 37% lower than it would have been if malaria were to be absent (Ashraf, Lester and Weil, 2009).

Some studies have also been done to examine the impact of HIV/AIDS in Africa. As found by studies carried out in Côte d'Ivoire and Rwanda, household consumption expenditures of families affected with AIDS have reduced due to health expenditures also, another study saw that although the population in Botswana may fall by 20%, the government expenditure in 2010 will be cut by 20% due to AIDS (UNAIDS, 2000; Commission on macroeconomics and health, 2002). Young (2005); Acemoglu and Johnson (2009) in evaluating the effect of the recent HIV/AIDS epidemic in Africa using micro estimates and calibration of the neoclassical growth model, notwithstanding the substantial disorder and painful experience caused by HIV/AIDS, a reduction in population as a result of this disease may increase per capita income. This can be attributed to the influence that population has on the per capita income.

Some other studies have looked at the impact of some illness on productivity and income. According to Luft (1999), in Indonesia anaemic men were found to be 20 percent less productive than men who were not anaemic and when these anaemic men were treated with iron, their productivity increased almost to those that were non-anaemic (Working Group 1 of the Commission on Macroeconomics and Health, 2002). Case and Wilson (2001) in examining the relationship between chronic conditions such as heart trouble, stroke, asthma and cancer and income in South Africa found a negative correlation (Working Group 1 of the Commission on Macroeconomics and Health, 2002).

Furthermore, several methodological approaches have been considered on the effect of health on economic growth, this include: Barro (1996) using data from three periods 1965-75, 1975-85 and 1985-95 estimated the effect of health on economic growth using the 3SLS (three stage least squares) using lagged values of some regressions as instruments, period random effects and life expectancy as the proxy for health and his result aligned with theoretical argument that health has a positive and statistically significant relationship with economic growth. Barro and Lee (1994) and Barro and Sala-I-martin (1995) using data from two periods 1965-75 and 1975-85, used the SUR (seemingly unrelated regression) estimator with country random effects and their result was consistent with theory and life expectancy was the proxy for health. Bharagava *et al.,* (2001b) used a 25year panel at 5 intervals covering 1965-90; he estimates the effect of health on economic growth using dynamic random effects estimation. The study used the Adult Survival Rate (ASR) as health variable and found a positive and significant relationship with growth. Bloom *et al.,* (2000) adopted the same data period and life expectancy as the health indicator, the study used the pooled OLS estimator and the result was also consistent with theory.

Consequently, Bloom and Malaney (1998), Bloom and Sachs (1998), Bloom and Williamson (1998), Gallup and Sachs (2000) and Sachs and Warner (1997) used life expectancy as the health variable and a 25 year cross sectional data used the OLS (ordinary least squares) method of estimation and their results concurred with the theoretical argument. This method of estimation can be inconsistent or inappropriate and can also render the estimates of the coefficients unreliable due to the presence of reverse causality which creates a correlation between the explanatory variables and the error term. In this light, Caselli, Esquivel and Lefort (1996) used a 25-year panel at 5 year intervals from 1960-85 and with life expectancy as the health indicator adopted the GMM (generalized method of moments, Arellano bond method) estimator but the results showed that health as indicated by life expectancy had a negative and not significant relationship with economic growth as 1% increase in health will bring about 0.1% decrease in economic growth. This result do not concur with theory therefore there is either an explanation for this result or the there is need to question the methodology used.

From the above works, all the studies that used life expectancy as the health indicator found a positive relationship between health (as indicated by life expectancy) and economic growth which was shown by the positive coefficients except in the work of Caselli *et al.,* (1996) which had a negative coefficient of -0.001. From the literature reviewed it is discovered that health as represented by various indicators

shows a positive relationship with growth, though the possibility of measurement errors should not be overlooked in some of the extant studies due to multidimensional nature of health.

Therefore, the use of single indicator such as life expectancy or adult survival rates are not adequate as they only take account of the mortality aspect of health leaving other aspects such as morbidity, disability and discomfort. Therefore, this study in improving existing works seeks to extend the proxies of health to account for both the mortality and the morbidity aspects of health.

Methodology

The study adopted the Solow neoclassical growth model which implies that economies will conditionally converge to the same level of income if they have the same rates of savings, depreciation, labour force growth and productivity growth. The Solow growth model is a modification of the Harrod-Dormar growth model as it allows for substitution between capital and labour assuming that there are diminishing returns to these inputs.

The aggregate production function, Y= F (K, L) is assumed to be characterized by constant returns to scale and this can be seen in a Cobb-Douglas production function at any time t, below:

$$Y_{(t)} = K_{(t)}{}^{\alpha}\ (A_{(t)}.L_{(t)})^{1-\propto} \qquad 1$$

Where Y is the gross domestic product, K is the stock of capital (which consists of human capital and physical capital), L is labour, and A(t) represents the productivity of labour which grows at an exogenous rate over time.

4.1 Model Specification

This study is based on the Solow neoclassical growth theory and draws from the specification of Bloom *et al.,* (2004). The implicit form of our specification is presented as follows:

$$PCI = f(GCF\ LAB\ SSE\ LFE\ U5M\ HIV\ INST) \qquad 2$$

Where PCI is GDP per capita, GCF is gross fixed capital formation, LAB is Labour force, SSE is secondary school enrolment, LFE is life expectancy, $U5M$ is under-five mortality rate, HIV is prevalence of HIV as a proxy for health taking into account the morbidity aspect and $INST$ is a measure of institutional quality.

The explicit form of the model is illustrated below:

$$PCI = GCF^{\beta_1}\ LAB^{\beta_2}\ e^{\beta_3 SSE+\beta_4 LFE+\beta_5 U5M+\beta_6 HIV+\beta_7 INST} \qquad 3$$

Transforming equation (3) into an econometric log-linear form, the equation becomes

$$logPCI_{it} = \beta_0 + \beta_1 logGCF_{it} + \beta_2 logLAB_{it} + \beta_3 SSE_{it} + \beta_4 LFE_{it} + \beta_5 U5M_{it} + \beta_6 HIV_{it} + \beta_7 INST_{it} + \varepsilon_t \qquad 4$$

The apriori expectation for the relationships between the explanatory variables and the dependent variable of the model based on economic theory as explained below. It is expected that $\beta_1 > 0$, $\beta_2 > 0$, $\beta_3 > 0$, $\beta_4 > 0$, $\beta_5 < 0$.

Technique of Estimation

The study adopted the static panel data analysis comprising the fixed effect and random effect specifications. The former controls the unique characteristics of the entities and its impact or bias on the predictor variables. This reduces the effect that the time invariant characteristics may have on the predictor variables so that the net effect of the predictors can be seen. On the other hand, random effects assume that the variations across entities are random and do not correlate with the predictor variables in the model. This means that the time invariant variables are included in the model unlike in the fixed model where it is absorbed by the intercept.

To determine which model is suitable and efficient, the Hausman's test was adopted as the selection criterion. It tests whether the unique errors (u_i) are correlated with the regressors or not. Under the

Hausman's test, the null hypothesis is that the model is random effect specification is efficient and reliable while the alternative is that the preferred model is fixed effects.

Other diagnostic tests to be conducted in order to ascertain the reliability of the parameter estimates for the purpose of policy inferences are as follows:

a. The test for multicollinearity which checks whether there is correlation among the explanatory variables and this can be done using either the pair wise correlation (pwcorr) or variance inflation factor (vif).
b. The test for random effects using the Breusch-pagan LM test and this is used to check if there is a difference between the random effect and the pooled OLS.
c. The test for heteroskedasticity as to whether our residuals are normally distributed with a mean of zero and a constant variance.

Data Sources and Measurements

The data used for the empirical analyses were obtained from reputable sources (see Table 1 in Appendix), precisely from the World Development Indicators of World Bank Publication 2016 and World Governance Indicators of World Bank Publication 2016. These variables include GDP per capita, Gross Fixed Capital Formation, Gross Secondary School Enrolment ratio, Life expectancy, under-five mortality rate, prevalence of HIV and institutions. The data spans 1990-2015 for Sub-Saharan African countries.

Discussion of Results

This aspect presents empirical analyses of the study; the results for the static panel analysis were obtained (see Table 3 in the Appendix) and discussed.

Multicollinearity Test

This attempts to ascertain the extent of collinear relationship among the explanatory variable in the model. To achieve this, the Variance Inflation Factor was adopted and shows no evidence of serious collinear relationship among the explanatory variables. The rule of thumb here is that once the VIF is less than five then multicollinearity does not exist (see Table 2 in Appendix).

Having estimated the fixed effect and random effect specification, the Hausman test was conducted for the purpose of ascertaining the most efficient and reliable specification. The test result failed to reject the null hypothesis, thus implying that the random effect specification posed the efficient and reliable estimates. Also, in order to control for heteroskedasticity in random effect specification and check the possibility of inflated variances and standard errors, the robust option was applied on the standard errors for efficiency of parameter estimates.

Table 5 presents the results of the robust random effects, the indicator of capital stock (GFCF) was positive and had a significant influence on the GDP per capita in Sub-Saharan Africa. This outcome aligns with theoretical position and meets the priori expectation, as increase in the stock of accumulated capital translates into future investments which will generate income. The indicator of labour force exerts a negative and significant influence on GDP per capita. The obtained sign fails to meet apriori expectation and this can be attributed to the low contribution of labour force economic productivity in the region. This is due to structural features of most SSA economies; they are heavily dependent on extractive industries (mostly commodity sale) for a larger chuck of their foreign earning. This industries is highly capital intensive, most of which are supplied by expatriates. This couple with the weak human capital development has constantly weakened the contribution of labour force to national output. On the other hand, the inverse relationship between labour and growth could be attributed to high pressure on available resources and high level of morbidity in this region which reduces the level of efficiency and thereby responsible for the weak response of growth to labour force participation in the region.

Also, education exerts a positive significant influence on growth, this conforms to the apriori expectations and consistent with human capital theory as education increases the quality of labour force and enhances economic growth. It increases the ability of the labour force to produce. On the other hand, education increases the knowledge required for proper maintenance of health which tends to improve the level of efficiency of the work force, as a healthier work force has a higher level of productivity than a less healthy one.

Life expectancy which an indicator of the state of health exerts a negative significant influence on the GDP per capita; this implies growth responds inversely to life expectancy in SSA. The evidence suggests that health impacts growth negatively in SSA regions. This negates the apriori expectations and this can be attributed to the generally weak healthcare services in the SSA economies which are evidently visible in low access to healthcare, inadequate healthcare personnel and facilities, weak implementation and monitoring of health intervention programmes and inadequate financing. These have accentuated the rate morbidity and mortality mostly caused by preventable diseases; hence reducing the level of human and capital resources efficiency to stimulate growth. Alternatively, the high level of non-market activities (such as subsistence farming) and the predominance of the informal sector could make length of life or life expectancy not to necessarily lead to an expansion in national growth. This evidence obtained was consistent with Lefort (1996) who found an inverse relationship between life expectancy as health indictor and economic growth. Also, Gallup and Sachs (2001); Case and Wilson (2001) found that morbidity plays a significant role in mitigating long-term economic growth. Similarly, the findings align with Luft (1999) who found that in Indonesia anaemia reduced the efficiency and productivity of men by 20 percent. On the other hand, the result obtained contradicts empirical findings by Baro (1997); Bloom and Canning (2005) and Ogundipe *et al.,* (2016). Also, for the purpose of robustness of parameter estimates and resolving some empirical irregularities, the study adopted under-five mortality as an alternate measure of health. The evidence was similar to life expectancy but the latter (u5mr) shows health status in SSA mitigates growth more than the former (lfe). Precisely, under-five mortality exerts a significant negative variation on growth in the region; with the largest magnitude of about 40% reduction in income due to 100% changes in u5mr; this reflects that health status of the populace is critical to the long-run growth.

The prevalence of HIV in Sub-Saharan Africa does not exert any significant influence on GDP per capita at the 5% traditional significance level. It implies that growth is weakly responsive to HIV prevalence in Africa in terms of significance and magnitude. This can be attributed to the fact that HIV is just a subset of the burden of diseases component in the region. Also, the various concerted efforts of local and global contributions and efforts towards reducing this prevalence are yielding some positive returns to scale. Alternatively, the evidence reveals the effect morbidity could have on growth since the infected individuals do not necessarily die but experience a decrease in efficiency and productivity. The introduction of multiple antiretroviral drugs such as the highly active antiretroviral therapy (HAART) which increases the expected level of efficiency, helps in reducing the burden of the disease, and enhances the functioning of the immune system are capable of reducing the susceptibility of infected person. Hence, this enhances the expected level of productivity and efficiency of the individual which will result in an increase in output, income and economic growth.

Conclusion and Recommendation

This study examines the role of health on economic growth in Sub-Saharan Africa for the period 1990-2015 using the static panel estimation procedure. It submits that health status in the SSA region is critical for attaining and sustaining long-run growth, as it is critical in enhancing the efficiency and productivity of human and capital resources of SSA economies. The study adopted life expectancy and under-five morality as a measure of health status. These duo indicators are considered in order to ascertain the robustness of health parameter and contribute towards resolving empirical irregularities in the extant literature. Similarly, the study attempted the generalized method of moments but the results obtained were similar to the robust random static panel specification, the latter was sustained.

The evidence from the empirical investigation shows that growth responds to the indicator of health (life expectancy and under-five mortality) negatively in the region. This indicates that the state of health in the region mitigates the growth potential which is directly suggestive that the weak healthcare policies and financing in the region has contributively enhanced the burden of diseases in the region. The under-five mortality rate was found to exert more dwindling effect on growth in the region. This might not be unconnected to the fact that children are more likely to die before their fifth birthday in Africa than any other region. This indirectly affect long-run growth and in the short-run reduces the efficiency and productive of parents and care givers, as the opportunity cost of bearing, caring and seeking support for unhealthy children due to diseases infections is completely lost. In the same manner, the HIV prevalence was used to capture the effect of morbidity, the study found that though negatively related with growth but the effect was not as large as life expectancy and under-five mortality. This effect was negligible and could be linked to the popular campaign and introduction of multiple antiretroviral drugs to enhance efficiency and reduce fatality. The study recommends that SSA economies and policy makers in the region ensure more financial allocation and commitment to reducing the burden of preventable diseases in the region and strengthen institutions that charged with implementation and monitoring health intervention programmes and ensure equitable access to healthcare.

Abstract

Customer satisfaction appears important not only in service companies, but in industry where product differentiation is increasingly difficult, too. The product is considered a global package "good & service", services adding value to the product use. The study reveals information about measuring and monitoring business quality indicators in automotive industry. The case study has started from the decrease of the customers' satisfaction. The quality indicators and their evolution over time were monitored. The input data were collected by direct observation, indicators and targets were set, and then the results were compared using different quality instruments. The purpose of this paper is to diagnose after-sale activity undertaken by a service unit through SIX SIGMA concept. Specifically this article will focus on the actions and activities of the service during the warranty period when a customer purchases a new vehicle. A practical solution for scheduling the clients, documented in a procedure, followed by specific training and hiring technical staff has been set in place.

Keywords: Quality, Customer, Customer Satisfaction, Continuous Improvement, Performance Indicators, Process-Based Guidance.

Introduction

Quality requirements applicable in automotive industry appear constantly at higher level and they may different from country to country. In the tough competitiveness of reaching and maintaining expectations of the customers, organizations combine the quality of the product and the quality of the services.

At the Equip' Auto (Paris, 2015)**,** Renault President Carlos Ghosn said: "Services are the most important points of progress in the automotive world. Only the combination of the quality of the product and the quality of the services allows reaching and maintaining a high level of customer satisfaction". The similar ideas had the authors Kwon, Y.I. and Son, J.-K. (2018), Malecskaia-Malevich, E.D. &amp (2018) and Kwon, Y.I. and Son, J.-K. (2018).

The automotive industry in Romania is an important factor in the national security status, being the fourth largest manufacturer in Central and Eastern Europe.

In the continuing struggle to keep customers and attract new ones, organizations are aware that customer satisfaction is an important stake. For car manufacturers and after-sales service providers, the requirements represent quality orientation. The benefits are well documented for the industry and increasingly in the service industry.

The purpose of these requirements is developing of the management quality system which allows continuous improvement and which acts in the same time for the prevention of defects and the reduction of losses.

In this paper we applied the Six Sigma concept for determining and measuring the current performance of a company in a critical situation, closely related to customer satisfaction dropping-off.

Pande P.S., Neuman R. and Cavangh R. (2013) says that "Six Sigma is driven by the use of static facts, information and analysis to understand the needs of the client closely, as well as the special attention given to managing, improving and reshaping the business precession." The similar ideas had the authors Chen, C. and Roth, H. (2005), Maniu, A.I. (2008), Pande, P.S. (2009) and Taghizadegan, S. (2006).

According to Oprean C. and Kifor C.V (2006) in order for the improvement process to be effective, Six Sigma methodology must be carried out according to the steps of the DMAIC method (Define, Measure, Analyze, Improve, keep under Control). The similar ideas had the authors Jasinska, K. and Jasinski, B. (2018), Konnikov, E.A. &amp (2019), Nae, I. and Severin, I. (2018) and Nae, I., Severin, I. and Solomon, Gh. (2016).

Pyzdek T. and Keller P. (2003) said in his work that the main purpose of this approach is to achieve a level of quality and reliability that will meet and even exceed the demands and expectations of today's demanding customers. The similar ideas had the authors Andreeva, T. &amp (2019), Evans, J.R. and Lindsay, W.M. (2006), Fonseca, L.M. and Domingues, J.P. (2017), Malecskaia-Malevich, E.D. &amp (2018) and Mitrache, I.A., Stinga, F. and Severin, I. (2020).

Defining the problem - Process diagnosis through SIX SIGMA concept

This study has been based on the current situation of the Mechanical Department within a company, from the automotive industry, who reported under-target performance indicators. These results are reflected in the difficulty to perform the repair of vehicles in a timely manner and implicitly in the low level of customers' satisfaction.

Following the completion of this study, we aim to improve the activities planning so as to shorten the waiting time and timely delivery of vehicles to customers.

The study's coverage area is defined: Reception, Back-office, Workshop and Storehouse of Department of Mechanics – a company with an annual average of 2000 customers who have cars under warranty. This company is a Romanian investment company established in 2011, which has developed a partnership with Dacia-Renault car brand and which, at present, is one of the most modern concessions. The organization offers car sales services, post-sale maintenance services and damage claims.

The study has been run between January 2019 and April 2019 and the input data was collected from the working processes at all levels performed in service and through direct observation.

Defining

An efficient Six Sigma improvement process should be carried out according to the steps mentioned above. As well as other improvement processes, DMAIC is based on PDCA cycle (Plan –Do-Check-Act).

At national level, there is a network of all Dacia-Renault accredited service units. In order to stimulate the service units to comply with the deadline for handing over vehicle required by law and to avoid sanctions, the manufacturer imposed a series of indicators monitored over 4 months, these being modified three times a year (in January, May and September).

By following these indicators, the correct communication of incidents from technical point of view, the accuracy of encodings and the quality of information transmitted to the manufacturer are desirable. Thus, the manufacturer ensures that the repair units will consistently apply the correct procedures for treating the vehicles under warranty.

It should be noted that each service unit is autonomous in collecting the results. The indicators are monitored in a national base where each measured parameter has limits and the system automatically rejects the indicator when the result is outside the limits.

The Key Performance Indicators and their abbreviations are presented in table 1.

Table 1: Key Performance Indicators

No.	Indicator	Abbreviations	Definitions
1	**Cost of repaired vehicle**	**C.V.R.**	average cost of a repaired vehicle under warranty
2	**Coding quality**	**C.Q.**	percentage of interventions automatically cancelled by the system of all interventions
3	**Failure to perform Special Technical Operations**	**F.S.T.O.**	rate of vehicle affected by red* or blue** special technical operations who went through manufactory and have not been achieved or have achieved after the authorized term
4	**Application indicator of the reactivity process**	**K.P.I. - R.**	ratio between the orders transmitted in real time and the total number of open orders
5	**Deadline for submitting documentation**	**D.S.D.**	time between date of opening the order and sending the request for refund
6	**National Average**	**N.A.**	arithmetic average of the results of each service unit

*Legend: *The vehicle has a manufacturing issue that must be solved urgently as it affects passengers' safety; ** The vehicle has a manufacturing issue that must be solved, but it does not address the passengers' safety;*

- C.V.R. – If this indicator is less than or equal to N.A. it received 1 point. If it is bigger than N.A. it received 0.
- C.Q. – If it is less than or equal to 3% it receives 1 point. If it is bigger than 3% it receives 0.
- F.S.T.O. – If this indicator is equal to 0% it receives 1 point and if it is bigger than 0% it receives 0.
- K.P.I.-R. – If KPI-R value is bigger than or equal to 95% it receives 1 point. If it is less than 95% it receives 0.
- D.S.D. – The objective is that 75% of the postcards to be sent in maximum 5 days. If the indicator value is bigger than or equal to 75% it receives 1 point. If it is less than 75% it receives 0.

The maximum cumulative score that can be obtained is 5. Depending on the score obtained, distribution of results in the general classification is done by colors:

- Red – if the score obtained is equal or less than 2;

- Yellow – if the score obtained is equal to 3;
- Green – if the score obtained is equal or bigger than 4.

Results

Measure

Centralization of the changed parts, number of defective units and number of defects grouped by category are represented in table 2. Indicators' results related to the 4 months for the service unit are presented in table 3.

Table 2: Centralization of the changed parts

Month	Entries	No.	Category	Number of defective units (DU)	Number of defects (DP)
January	247	1	Engine and gearbox assembly (1)	1	1
		2	Load - bearing elements (2)	196	292
		3	Electric (3)	50	7
February	145	1	Engine and gearbox assembly (1)	0	0
		2	Load - bearing elements (2)	80	63
		3	Electric (3)	65	6
March	689	1	Engine and gearbox assembly (1)	4	7
		2	Load - bearing elements (2)	459	148
		3	Electric (3)	226	35
April	571	1	Engine and gearbox assembly (1)	6	15
		2	Load - bearing elements (2)	420	371
		3	Electric (3)	145	19

Table 3: Indicators' results

No.	Indicators	Results		
		Results	Objective	Score
1	C.V.R.	170€	171€	1
2	C.Q.	3.23%	3%	0
3	F.S.T.O.	0%	0%	1
4	K.P.I.-R.	88.1%	95%	0
5	D.S.D.	46.6%	75%	0
			Total score	2

- Share of defective units (DU) – the percentage of defective products in a sample of products;

DU = (number of defective units)/(total number of units) (1);

DU1 = 11/1652 = 0.66% (2);
DU2 = 1155/1652 = 69.92% (3);
DU3 = 486/1652 = 29.42% (4);

- Number of defects per unit (DPU) – the average number of defects of all types relative to the total number of sampled units;

DPU = (number of defects)/(total number of units) (5);

DPU1 = 23/1652 = 1.39% defects per unit (6);
DPU2 = 874/1652 =52.9% defects per unit (7);
DPU3 = 67/1652 =4.05% defects per unit (8);

- Number of defects per occasion (DPO) – weight of defects in the number of occasions in a group of units;

DPO = (number of defects)/(total number of units)* (number of occasion)/(unit for realization of defects) (9);

DPO1 = 23/(11*1652) = 0.00126 (10);
DPO2 = 874/(1155*1652) = 0.00046 (11);
DPO3 = 67/(486*1652) = 0.00008345 (12);

- The number of defects per million occasion of achieving a defect (DPMO) is calculated as:

DPMO = DPO x 1.000.000 (13);

DPMO1 = 0.00126 x 1.000.000 = 1260 (14);
DPMO2 = 0.00046 x 1.000.000 = 460 (15);
DPMO3 = 0.00008345 x 1.000.000 = 83.45 (16);

- Global efficiency (ηgl) – fraction of the total number of units delivered that had no defects;

ηgl = 1- ∑DUi /3 (17);

ηgl1 = 1-0.0066 = 0.9934 = 99.34% (18);
ηgl2 = 1-0.6992 = 0.3008 = 30.08% (19);
ηgl3 = 1-0.2942 =0.7058 = 70.58% (20);
ηgl = 1- (0.9934 + 0.3008 + 0.7058)/3 = 1-0.6667 = 0.33% (21).

Based on this score, the service unit has been under RED color starting with May 2019. In order to solve the situation, the next stages of the DMAIC method should be continued.

Analyze

At the level of Mechanical Department, a brainstorming session took place to determine the causes; the subject was presented and discussed. Based on the developed criteria, ideas were combined and evaluated in a systematic manner. Ideas were processed through the questionnaire method “5 Way” and these ideas are presented in table 4.

In order to plan the improvement phase, understanding the relationship between cause and effect is needed. The causes found after applying the questionnaire “5 Why” were prioritized according to severity and frequency using Pareto Diagram. After tracing Pareto Diagram, AMDEC (Analyse of Failure Modes and their effects) analysis was used. Pareto is represented in figure 1. The AMDEC analysis for the first three vital causes is represented in table 5.

Table 4: The method "5 Way"

Problem	Why 2	Why 3	Why 4	Why 5	Root cause	Preventive action
Unsatisfied customer	High waiting time	Delay in car delivery	Delay in vehicle repair	The mechanic receives several works in the same time	Insufficient employees	Personal hire
	The attitude of receptionist towards the customer	Poor communication	No mood	Fatigue / Loading with repair orders	Lack of an efficient style of organization	Communication training
	High waiting time at reception	Heavy customer takeover	More than one appointment at the same time	Planning performed improperly	Lack of information held by call centre operators	Training
Unfavourable results for indicators	Transmission time of documentation gather than 5 days	Parts un-availability	Delay in repair	The warranty file is not delivered during the required time	Stock shortage of parts	Perform the work on the basis of two commands
	Documentation returned	Index non-consultation	Missing the task and symptom code	Neglect / lack of time of the receptionist	Programs made improperly	The responsible for the warranty verifies in detail the guarantee file
	Rejection of lines of mechanical work	Mechanical work wrong	Improper coding of operations	Incorrect identification of mechanical workmanship	Lack of experience in using the program	Training program use

Fig. 1: Pareto Diagram

According to Pareto diagram the first three vital causes were identified, as follows:

- No working procedure between Reception – Back Office – Manufactory – Depot
- Insufficient employees
- Inappropriate appointments

Table 5: AMDEC analysis

Criteria / Problem	Emergency (0.2)	Chronicles (0.3)	Impact (0.2)	Time (0.1)	Costs (0.2)	Total (1)
No working procedure	5	5	5	4	5	4.8
Insufficient employees	4	2	3	3	2	2.8
Inappropriate appointments	4	3	4	2	3	4.2

Improvement

The improvement phase will be carried out following the identification, then the evaluation of alternatives.

Identification of alternatives. Within the same brainstorming session, for each identified cause, three alternatives were proposed. The alternative selection matrix is presented in table 6.

Table 6: Alternative selection matrix

No.	Cause	Alternative 1	Alternative 2	Alternative 3
1	No working procedure between Reception – Back Office – Manufactory – Depot	Analysis of existing procedures in each compartment and their completion	Modification of personnel tasks and implicit procedures	Introducing a working procedure between Reception – Back Office – Manufactory – Depot

2	Insufficient employees	Mechanicals hiring	Selection of personnel from other departments and training	Programming reduction
3	Inappropriate appointments	Introducing predefined repair times into the programmer and scheduling clients at 15 minutes intervals	The appointments will be made only by the back office and front office, without the call centre	Hiring front office advisers

Evaluation of alternatives. Following the evaluation of different improvement alternatives, the team agrees on one alternative that is supposed to promise the most. This matrix can be used to evaluate alternatives in relation to certain evaluation criteria. The following notation is used:

3 – Very favorable impact;
2– Medium favorable impact;
1 – Weak favorable impact.

The evaluation of the alternatives is presented in tables 7, 8 and 9.

Table 7: The evaluation of the alternatives – the first cause

Cause I: No working procedure between Reception – Back Office – Manufactory – Depot			
Selection criteria	**Alternative 1**	**Alternative 2**	**Alternative 3**
Total cost	1	2	3
Impact on the problem	3	2	3
The cost-benefit relationship	3	2	3
Resistance to change	2	1	2
Implementation time	3	1	3
Uncertainty and effectiveness	2	1	3
Health and safety	3	3	3
Score obtained	17	12	20
Solution: Introducing a working procedure between Reception – Back Office – Manufactory – Depot			

Table 8: The evaluation of the alternatives - the second cause

Cause II: Insufficient employees			
Selection criteria	**Alternative 1**	**Alternative 2**	**Alternative 3**
Total cost	3	1	2
Impact on the problem	3	1	2
The cost-benefit relationship	3	1	2
Resistance to change	1	2	1
Implementation time	3	1	1
Uncertainty and effectiveness	3	1	1
Health and safety	3	3	3
Score obtained	19	10	12
Solution: Mechanicals hiring			

Table 9: The evaluation of the alternatives - the third cause

Cause III: Inappropriate appointments			
Selection criteria	**Alternative 1**	**Alternative 2**	**Alternative 3**
Total cost	2	2	1
Impact on the problem	1	1	2
The cost-benefit relationship	2	2	1
Resistance to change	3	3	2
Implementation time	3	3	2
Uncertainty and effectiveness	2	2	3
Health and safety	3	3	3
Score obtained	16	16	14
Solution: Introducing predefined repair times into the programmer and scheduling clients at 15 minutes intervals. The appointments will be made only by the back office and front office, without call centre.			

Comments on Results

In the control phase, the voice of client was reassessed based on data for 100 clients to confirm the significant difference obtained by implementing the solutions in table 9. KPI (Key Performance Indicators) indicators were also evaluated and the results are presented in table 10. The comparison of results before and after applying the DMAIC method is presented in table 11.

Table 10: KPI indicators evaluation – after improvement project

No.	Indicators	Results		
		Results	**Objective**	**Score**
1	C.V.R.	159€	171€	1
2	C.Q.	2.37%	3%	1
3	F.S.T.O.	0%	0%	1
4	K.P.I.-R.	81.5%	95%	0
5	D.S.D.	86.6%	75%	1
			Total score	4

Table 11: KPI results comparison – before and after improvement project

No.	Indicators	Results		
		Initial results	**Current results**	**Objective**
1	C.V.R.	1	1	1
2	C.Q.	0	1	1
3	F.S.T.O.	1	1	1
4	K.P.I.-R.	0	0	1
5	D.S.D.	0	1	1
	Total score	2	4	5

It can be seen that the implementation of the improvement project is positive and the objectives have been reached. The waiting time indicator at reception was not reached; therefore, an action plan will be established, as given in table 12. The control chart summarizes the action plan for this process which is not under control yet.

Table 12: Plan for implementing the improvement actions

No	Causes	Corrective action	Necessary resources	Responsible	Term
1	No working procedure between Reception – Back Office – Manufactory – Depot	Introducing a working procedure between departments	-Time for elaboration -Time for implementation -Responsible for Quality Dep. -Meeting room equipped with electronic equipment	Head of Quality Management service	S21
2	Insufficient employees	Mechanicals hiring	3 mechanicals	H.R. Manager	S17
		Implementation of a periodic training program for employees	-Personal -Documentation - Meeting room equipped with electronic equipment	Technical coordinator	
3	Inappropriate appointments	Introducing predefined repair times into the programmer and scheduling clients at 15 minutes intervals. The appointments will be made only by the back office and front office, without call centre	-2 computer scientists -2 computers with related software -Time for training -Meeting room equipped with electronic equipment	Deputy Director Head of IT department	S18

Changes will be made to the scheduling hours. The interval at which the appointments will be made will be changed from 15 to 30 minutes. The change will be tracked in the programmer by the head of the Quality Management Service. The activity will be monitored in the next thirty days. The audit for the operational use of the closed loop is presented in table 13.

Table 13: Audit results for the operational use of the closed loop

	Category	Result obtained	Maximum results	Realized [%]
I	The principles of the implementation system	54	60	90
II	Planning	52	60	87
III	Execution - Tracking	102	170	60
IV	Reporting - Review	59	130	45.3
V	Improvement program	85	100	85
	Total	336	520	65

Conclusion

Tendency to ignore customer complaints and not looking for their causes had serious consequences for the business. The improvement team estimated that for any complaint received from a client, there are 26 others thinking the same, but does not outsource to the company. Dissatisfied customers will call for less or no company services and that is why it is necessary to emphasize the importance for the organization of applying 6 Sigma.

It was found that the improvement solutions identified and implemented have led to a significant reduction of the waiting time in the service unit in order to carry out repairs.

As a result of this study, the personnel for telephone communication and client programming were trained. Three mechanics were hired, a new working instruction was developed and a weekly training program for mechanics was established. As one may notice, based on the audit result, new problematic areas appear, so as the continuous improvement process turn on regularly.

The study has aimed to evidence the sequence of tools to implement in order to sustainably improve customer satisfaction. Similar logic may be applied for different problematic issues, but depth approach is needed to track and report relevant results.

Abstract

The risk management process is in a constant development, as organizations have to always be prepared for the unexpected and aware of the stages in the risk management process, since a successful practice contributes to meeting the objectives. In order to achieve this, the risks in the organization and the causes that favored their emergence must be identified, the risk assessment and management identified, following all the six stages of the risk management methodology.
The paper herein aims to highlight the steps in the risk management process within an organization. This is the reason why it is imperative to examine the main risks identified in an organization, while considering the probability of occurrence and their impact upon the company objectives.

Keywords: Risks, Risk Management, Risk Matrix.

Introduction

The purpose of the paper is to diagnose the risks associated to the activity in an organization, to assess and minimize them by using the available resources. To manage the risks, we conducted an analysis of the micro- and macro-environment factors, spotted the risks, made an evaluation, refined the response strategies to risks and conducted the risk monitoring, reporting and control.

According to SR EN ISO 31000:2018 Standard, "The risk management operates on a set of principles and assists in the decision-making processes, in an organized and structured manner." During the first stage of risk management, the organization is studied from both the internal and external environment angles and the company main objectives in terms of risk management are formulated. To establish the context, the organization identifies internal and external parameters and uses them to perform the risk management while stating the risk criteria and the scope.

In compliance with the SR ISO 73:2010 Standard, "Criteria represent reference terms to help estimate the risk significance, as deriving from laws, standards and other requirements and are conditioned by the company objectives and its internal and external environment."

Methodology

Depending on the organization requirements, the context of the risk management process varies and is represented through the following:

1. Identification of the needed resources and detailing the objectives and purpose of the risk management activity;
2. Assigning the responsibilities within the risk management process;
3. Establishing the time and location characteristics for the risk management process;

4. Recognizing the relations between projects, activities or processes;
5. Labeling the risk management assessment methods and the efficiency of their evaluation;
6. Devising and implementing the decisions to be about being made.

1) Establishing the external context

The external context stands for the environment in which the organization aims to meet its objectives and comprises the economic environment at the international, national, regional or local level, financial, technological, social, political, legal, and cultural and the factors leading to the organization objectives and the external relations.

The importance of conducting the analysis of the external context comes from taking into account the objectives of the interested parties in the risk management process.

2) Establishing the internal context

During the first stage of the risk management process, the analysis of the company internal context is performed, along with the environment of its operation, with the purpose to meet the objectives, in line with the company strategy, processes, culture and structure.

The company internal context is shaped by how the risk management is approached and features the following factors:

a) The risk management is influenced by the company internal objectives;
b) The organization objectives has a direct effect on how are established the goals and the criteria of the activities, processes and projects within the company;
c) Inability to recognize the opportunities hinder meeting the company objectives, while affecting the organizational credibility and trust.

The identification of the internal context is an information source regarding:

- structure, management, roles and responsibilities held by the company employees;
- strategies and policies the organization implements to meet the objectives;
- organizational culture;
- information flows and the decision-making processes;
- standards, handbooks and models the company emulates.

The understanding of the internal context is paramount, since it provides the company with data on the organizational structure, policies and strategies being implemented, information systems as well as the standards and handbooks being adopted.

3) Defining the risk criteria

The risk criteria used by organizations to assess the risk importance are influenced by their values, objectives and resources and they are defined at the beginning of each risk management process. Such criteria guide the employees in determining the significance of each risk, based on the impact and the possibility of manifestation. According to SR GHID ISO 73:2010 Standard the risk criteria are closely linked to the organizational policy, are regularly revised and depend on the following main factors:

- nature, types of causes, consequences and manner of their assessment;
- manner of identification for the probability;
- scale of probability and/or consequence;
- manner of identification for the risk;
- the risk acceptance or tolerance threshold;

• manner in which multiple risks are managed.

4) Risks Identification

An essential stage in the risk management process is to identify the risks within the organization. This identification is defined as the process of finding, recognition and description of the risks while examining the source and also their likely negative consequences. This analysis helps us with understanding the nature of the risk and determination of the risk level. Identification is achieved through interviews, surveys, charts, risk lists or meetings.

Pritchard C.L., PMP,PMI-RMP,EVP (2014) said that for an optimum identification of the risks, the risk management plan and the organizational environment have to be clear and assumed by the employees, as these two facilitate the organization and classification of the identified risks, with the purpose to examine and tackle them.

The activity risks identification aims to structure the risks the society is facing with, so the decisions to deal with them are easier to be made.

In the book by Ionescu S.C. (2014) the process of risks identification relies on two key activities:

• determination of the risk-generating sources;
• identification of the incidence risk factors.

The general goal of this process is the identification, both of the pure risks that might negatively affect meeting the company strategic objectives and also of the opportunities with a potential to improve the organization performance.

Following the process of risks identification, the results are collected in the risk register, which includes information related to the risks characteristics and typology.

The risk register is a crucial document to conduct the risk management, since it is filled up with every stage of the process and it provides a complete image of the risk profile within the organization and its time evolution.

Upon identifying the risks, according to SR GHID ISO 73:2010 Standard, they are thus described:

a) Name of the risk;
b) Nature and type of the risk;
c) Occurrence causes for the risk;
d) Risk effects on the company.

The purpose of the identification activity is to compile a full list of risks, which helps the company to devise strategies to eliminate or reduce the risk probability or impact.

5) Risks evaluation

The risk assessment is a global process, through which risks are identified, examined and evaluated, so as to establish the risk level. The information derived is used by the company to take the optimum decisions for the risk management. According to SR BS 31100:2013 Standard, the assessment involves the analysis of the risk occurrence probability and of their impact, thus diagnosing the exposure to risk of the organization.

The purpose of risk assessment is to identify the optimum manner of allocating the resources in the context of certain unfavorable events, prioritizing the investments based on the risk severity, as well as devising strategies so that the organization continues its activity and meet its objectives.

The risks assessment involves:

- definition of the objectives, terminology and methodology in use;
- involvement of the factors of interest;
- transparency and responsibility.

The assessment of the probability of manifesting the risk or the frequency with which the risk might manifest should be based on the knowledge, experience and judgment of the personnel.

Table 1: Evaluation of the probability of risk manifestation (Source: Moldovan, Neamţu (2016))

Risks	Description
High (H)	It is very likely that the risk manifests several times during the activity.
Medium (M)	There is the possibility that the risk may occur occasionally during the course of the activity.
Low (L)	It seems unlikely that the risk will manifest during the course of the activity.

The impact represents the consequence of having the risk materialized, which can be manifest in the organization objectives, tangible assets, human resource, economic resource and environment. For pure risks, the impact is negative in the form of losses whereas the consequences are positive when the risks are speculative.

Upon risks assessment, SR BS 31100:2013 Standard said that the risk scenario can be formulated with the below parameters:

- Name of risk – type of risk, severity and the potential effects of the risk upon the company activity;
- Factors being affected by the risk materialization;
- Frequency/Occurrence probability;
- Risk-generating sources;
- Reference events.

To assess the risks within an organization, an instrument called the risk matrix is used. This matrix is run to evaluate risks depending on their occurrence probability and the impact they have on the organization. The risk matrix contributes to the risks ordering as a function of the risk index, since it is a resultant of the possibility of risk materialization and its impact on the organization.

Moldovan, Neamţu (2016) in their article said that depending on the impact of the risk and the probability of occurrence, the risk matrix can be represented as follows:

	PROBABILITY			
		low	moderate	raised
IMPACT	grave	M	H	H
	moderate	L	M	H
	low	L	L	M

For a good risks management, organization X has to attach a great importance to each stage of the risk management process and to how they interact with one another.

In order to identify the risks and the events with an unfavorable impact that may affect the good operation of the organization, an analysis of the microenvironment and macro environment has been conducted. Following the microenvironment and macro environment analysis, the main categories or risks in the organization X have been labeled as the disaster risks and the financial risks.

The disaster risk is the risk of recording the direct or indirect losses derived from a wide range of factors associated to the processes performed in the organization, to the company staff, infrastructure and technology in use.

The risk of interest rate is the risk due to the exposure of the organization to the unfavorable fluctuations of the interest rate, thus having a direct influence on the income and expenses pertinent to the interest-bearing assets and liabilities, variable or fixed.

SR EN ISO 31000:2018 Standard mentioned that the compliance risk comprises the risk pertinent to KYC procedure (know your client), the fraud risk derived from the source of client funds, the risk of non-compliance with the legislation regarding the personal data processing and the risk coming from the lack of documents required to open the transactional account for the client.

The credit risk is the risk of registering losses or not making profit estimated as a consequence of non-compliance with the contract requirements on the part of the client or a counterpart. The risk to registering losses due to non-compliance with the duties by the debtor can have two causes – a) debtor bankruptcy and b) debtor bad faith.

The risk pertinent to the employees is the risk of registering losses due to the identification of fraud cases. Another source is represented by the employees leaving the organization, thus impeding the meeting of the objectives.

The liquidity risk is the risk when the company faces difficulties in fulfilling its obligations related to the financial debts that are reimbursed in cash or through the transfer of another financial asset.

The market risk is the risk that the price variation in the equity instruments, exchange rate and interest rate affect the company earnings or the value of the financial instruments in possession. The goal of the market risk management is to monitor and control the exposures within certain acceptable parameters and optimize the investment returns.

The currency risk is the risk expressed by the probability to register losses from the international commercial agreements or other economic relations, due to the change in the currency exchange rate between the agreement conclusion date and its maturity date.

The response strategies to risks within organization X are:
Acceptance R12. The currency risk – the organization uses the tolerance strategy since most of the transactions are conducted in the Romanian national currency, hence avoiding conversion into other currencies. **R2.** The risk of employee resignation – the organization uses the tolerance strategy since the low employment offer in the capital market reduces the possibility of the employees to accept a job from the competitor and the payment conditions consolidate the employees' decision not to leave their current job.

Mitigation R6. The risk of non-fulfilling the compliance procedure – to mitigate this risk, the organization will draft a survey to be implemented and add into the process of creating the transactional account by which a client profile will be built when using these data to improve the service being provided. **R8.** The interest rate risk – to mitigate this risk, the organization will shorten the time interval for the repayment schedule; hence, it can avoid the financial losses due to the fluctuations in the interest rate.

Transferring R4. The hazard risk – to manage this risk, the organization uses the strategy of transfer of responsibility by concluding an insurance contract with a relevant company. Moreover, the organization will provide regular courses in security and training so that employees have the knowledge on how to prevent and manage such situations. **R7.** The risk of a cybernetic attack – to manage this risk, the organization uses the strategy of transfer of responsibility by concluding an insurance contract with a relevant company that will assume such risk against an insurance policy. **R9**. The credit risk – to manage this risk, the organization uses the strategy of transfer of

responsibility by concluding an insurance contract with a relevant company. The organization turns to the strategy of transfer since a large part of the financial earnings come from short- or long-term credit granting to third parties. To have a good management of this risk, the organization conducts an analysis of the debtor's capacity to pay off the credit within the term and contract conditions being stipulated.

Avoidance R1. Risk of transactional platform overloading – to manage this risk, the organization will purchase a license for a new transactional platform and improve the equipment and servers required for operating the platform, thus increasing the execution speed for the transactional orders. **R3**. Fraud risk – to manage this risk, the organization will devise a series of procedures to increase transparency within the organization. **R5**. The risk of non-compliance with the legislation regarding the personal data processing – to manage this risk, the organization will implement a new system through which the employees have a restricted access to the clients' personal data; hence confidentiality is at its highest. **R10**. Liquidity risk – to manage this risk, a fund will be created and hold an amount of money as provisions so as to avoid the situation where the organization does not have the cash asked by the clients. **R11**. Market risk – to manage this risk, a team will be gathered within the organization that will analyze the market and thus provide predictions of a better accuracy.

Conclusion

In conclusion, we have identified the risks of a high probability and a very strong impact upon the organization, out of which we have chosen the risk of the transactional platform overloading (R1) in order to make an investment to avoid the risk. The investment project consists in purchasing a license to use a new transactional platform, along with new servers of a larger capacity and a smaller failure probability that will correspond to the present requirements of the clients.

Abstract

The article substantiates the role of social investment in the corporate social responsibility development and proves its influence on the investment and economic development of the European Union countries in the context of sustainable development. The purpose of the article is to analyze the directions of social investment in the countries of the European Union for the effective realization of corporate social responsibility in the conditions of sustainable development of the economy of these countries and to determine the possibilities of their implementation in Ukrainian practice. The methodological basis of the research is the data of the rating agencies as Global Sustainable Investment Alliance, CSR Europe, Center for Corporate Social Responsibility Development, Forum Nachhaltige Geldanlagen, data from the United Nations Conference on Trade and Development, European Commission, European Fund and Asset Management Association, Boston College Center for Corporate Citizenship. The article defines the essence of the "social investments" concept, defines their types, analyzes the dynamics of social investment in the countries of the European Union, and defines the main directions of socially responsible corporation development in these countries. The quality index of social investments of the corporations of the leading countries in the field of social responsibility (Denmark, Germany, France, and Sweden) was calculated and a comparative analysis with the Ukrainian leader was carried out, which allowed determining and comparing the effectiveness of the social investment directions implementation, based on the selected indicators. The findings outline ways to develop social investing that will allow companies to formulate an effective corporate social responsibility strategy and increase their financial profitability.

Keywords: Social Investment, Corporate Social Responsibility, Social Investment Index, European Union Countries.

Introduction

Prospects for the economy development depend on the intensity of the investment flow processes in it. The cooperation of investors, governments, NGOs and corporations is vital for realizing a country's investment potential and improving its investment climate in a sustainable development environment.

In the global economy, there is a growing understanding that social investment and responsible investment are a prerequisite for global sustainable development. In the context of the European Union's orientation towards sustainable development, dynamic processes of social investment are a necessary prerequisite for enhancing the corporation competitiveness. Social investment is necessary in order to overcome the current negative trends in the economies of different countries, due to the discrepancy between the short-term economic and financial interests of corporations and the long-term goals of sustainable development of the country's economy as a whole. Responsible investing plays an important role in the implementation of the corporate social responsibility strategy and also influences the investment attractiveness of the country as a whole. The need to justify and search for effective directions of social investing, formation of new approaches to cooperation between stakeholders in the implementation of corporate social responsibility strategy, analysis of qualitative assessment of social investments in companies determines the relevance of the chosen topic for the article.

*Recent research and publications analysis***.** Research on the features of social investment development plays an important role in the research of international organizations, and the performance of business entities in this area is evaluated by leading rating agencies and the World Bank and discussed at international and national economic forums. In the contemporary economic literature, the following scholars have studied the problems of social investment: Benlemlih M, Bitar, M. (Benlemlih, 2018), Neimanns E., Busemeyer M., Garritzmann J. (Neimanns, 2018), Ho A., Dai Zotti M., Hallman L. (Ho, 2018), Hemerijcj A. (Hemerijcj, 2017), Ferrera M. (Ferrera, 2017), Orlova N., Kharlamova A. (Orlova, 2014), Wielki J., Stopochkin A., and Sytnik I. (Wielki, 2019). Some aspects of social investment have been investigated by scientists, ambiguity in the interpretation of the concept of "social investment", the nature of the social investment process, the classification of social investment, the impact of social investment on the economy development. However, a number of key questions regarding the study of social investment and the experience of their use in developed countries and the need to implement its mechanisms in Ukraine remain unresolved.

The purpose of the article is the analysis of social investment trends in the European Union based on calculation social investment index for the effective realization of corporate social responsibility within the conditions of sustainable economic development of the EU countries.

Main part of Research

Social investment is an integrated factor in sustainable economic development. Social investment is a major tool and an important feature of social responsibility at all levels, with the aim of producing a useful social effect in the future (Melnichuk, 2016).

Social investment is the long-term investment of financial resources into social assets aiming at improving people’s quality of life. Such a general definition emphasizes the long term of social investment, which is one of their defining characteristics (Shkura, 2016).

Therefore, social investment is a form of financial or other resource assistance to a corporation for the implementation of long-term and, as a rule, joint partnership programs aimed at reducing social tension in the country and improving the standard of living of various sections of society.

A necessary element of any national economy realization is responsible investment, as a mechanism of the basic directions development of company responsibility. Responsible investing is aimed at incorporating the concept of sustainable development into the practice of investment activity. UN

supported Principles for Responsible Investment (PRI) adopted by more than 1,000 investment institutions with total managed assets exceeding $30 trillion. The US is based on the claim that environmental, social and corporate governance issues can be of practical importance to the financial interests of long-term investors. The future success of FDI investing companies and assets depends on the ability to understand and manage the factors of long-term financial risk and profitability, which include climate change, resource scarcity, global demographic and political change, human capital and social issues in an increasingly complex global chain supplies (CSR Review, 2017).

The list of social investments includes all types of long-term social projects and programs. Social investment is most often attributed to: sponsorship and corporate charity, engagement with the local community, government, and corporate partnership programs (Table 1).

Table 1: Types of social investments

Type of social investment	Description
Company shares	A non-transferable investment in a joint stock company or a beneficial company is withdrawn. This is a form of equity because investors get a share of the organization.
Secured loan	An investment that works as a home mortgage. An investor lends an organization a loan for an asset (often a building or equipment) as a "security". An organization pays back a loan on an agreed basis (for example, regular monthly payments), usually with interest.
Social Investment Tax Relief	Tax relief for individual investors in charitable and social enterprises. Investors receive 30% of their investment value through a subsequent income tax account, so subject to certain conditions. Investors cannot sell their shares or repay the loan for 3 years, although they may receive interest on the loan.
Loan security (including overdraft)	An investment that is not secured by an asset (building or equipment). The investor gives the organization a loan, the organization returns it on the agreed base, usually with the agreed amount of interest.
Social Property Funds	Funds managed by a specialist firm that raises money from investors and then uses the funds to purchase property that can be used by a charitable organization to provide its services. Charity rents property from a social property fund.
Social Impact Bonds (SIB)	It is a pay-as-you-go agreement when social investors pay for an organization to provide the service and the government returns the interest to investors if the service is successful.
Crowd-financed investments	An investment that is raised through an online platform and is not protected against assets (buildings or equipment). The group of individual investors lends (mostly) small amounts to the organization's loan, and the organization returns it on an agreed basis, usually with interest at the top.
Quasi equity	An investment that reflects some of the characteristics of the stock but without providing a stock organization. Instead of paying a set amount on a monthly basis, payments are usually based on the results of the organization's activities such as profit or revenue.
Charity bonds	Trade credit from a group of social investors to a charitable or social enterprise for a fixed period of time with a fixed interest rate.
Blended - part of the grant, part of the loan	A financing package that is a mix of investments which needs to be paid back and a non-repayable grant.

Source: complied by authors on the basis of Hemerijcj, 2017, Orlova, 2014, Wielki, 2019, Melnichuk, 2016, Shkura, 2016, Good Finance, 2019

According to Nachhaltige Geldanlagen Forum, the most popular responsible investment strategy in Germany, Austria and Switzerland is the use of exclusion criteria (for instance, not investing directly to manufacturing and distribution companies). Almost two out of every three dollars - a total of $ 19.8 trillion - was invested this way in 2018 (Swiss Sustainable Finance, 2019).

In Germany and Switzerland, the second most popular method is positive screening. The goal is to invest in those companies that are most effective in sustainability criteria. In Austria, the second place is screening for compliance with specific international standards or norms, such as the Global Compact, International Labor Organization standards. In 2018, the Swiss investment market has increased by 83% to reach 716.6 billion Swiss francs. This indicator covers all registered stable investment funds (an increase of 102%), stable mandates (an increase of 22%) and stable assets of their owners (an increase of 91%) (Swiss Sustainable Finance, 2019). The strong growth of the sustainable investment market is explained by the greater market reach, as well as new sustainable financial market products offered to investors and first-time investment approaches. More and more institutional investors are choosing sound investment strategies, and many asset managers are now also integrating sustainability criteria as a standard into their selection process, addressing environmental, social and management issues in investment decisions.

The effectiveness of responsible investing is first and foremost related to the achievement of its main goal - to realize the possibility of combining financial profit and ethical values of the investor. Social investment involves the following types of effect for the company:
financial efficiency (risk insurance, marketing and sales, reduced operating costs, etc.);
non-financial efficiency (company image and reputation, customer and staff loyalty);
the effectiveness of influencing the situation on the territory of presence.

In today's world, as a guarantee of sustainable economic and social development, improving the quality of life is the socially responsible behavior of all, without exception, subjects of society - the state, business, population.

According to the International Standard on Social Responsibility ISO 26000, social responsibility is the responsibility of the organization for the impact of decisions and actions on society, the environment through transparent and ethical behavior that promotes sustainable development, including public health and well-being; respects the expectations of the stakeholders; complies with applicable law and international standards of behavior; integrated in the activities of the organization and practiced in its relations.

In the international sense, social responsibility is interpreted as the voluntary contribution of business to the development of society in the social, economic and environmental spheres, directly related to its core activities and beyond the statutory minimum. Social responsibility includes: honest business practices, staff development, health and safety, environmental protection, local community development (Maistrenko, 2013).

Socially responsible investing is a way of realizing corporate social responsibility through targeted programs that meet the social needs of the main stakeholder groups - consumers, staff, and local communities. Investments in social responsibility are economically justifiable, that is, ultimately helping to increase companies' profits. According to a study by the Boston College Corporate Citizenship Center, after the introduction of a social responsibility policy, companies increase their financial performance by strengthening the company's reputation (77%); attracting promising employees (55%); responses to public inquiries (35%); increased operational efficiency and reduced costs (34%); increased competitiveness (33%); opening new opportunities for development and enhancing risk management (23%); improving access to capital (4%) (Boston College Center for Corporate Citizenship, 2017).

Results

Research conducted by WalkerInformation agency revealed a direct dependence on the growth of a company's prestige and the performance of its economic activity on social investment. Increasing a company's social potential by 1% boosts its social prestige by 0.55%, while increasing its economic potential improves its economic value by 0.32% (Walker Information, 2019).

That is, a wider introduction of the practice of conducting socially responsible business by companies will help to develop existing and create new markets in the country, solve social and environmental problems, increase access of Ukrainian companies to international markets and increase their capitalization, promote sustainable development of the country as a whole.

Despite the adoption of the new Europe 2020 economic development strategy, it does not include social investment; responsible investment processes have become widespread in developed countries and are substantially supported by international organizations, financial advisers and institutional investors.

In 2017-2018, global socially responsible investments increased by 34% to $30.7 trillion. Climate change has become a major issue for investors in 2018. Investors invest in corporations that integrate environmental, social and governance principles. The investment portfolio of such corporations is about $17.5 trillion that is 69% higher than in 2016. Assets focused on corporate activity and shareholder activism around environmental and social issues have grown to $9.8 trillion in 2018 which is $8.4 trillion more than in 2016 (Chasan, 2019).

Europe remains the largest region for sustainable investors, targeting around $14 trillion, 11% more than in 2016 (Table 2).

Table 2: Global trends in the social investment market development in 2014-2018

Region	2014	2016	2018	Growth Per Period		Compound Annual Growth Rate 2014-2018
				Growth 2014-2018	Growth 2016-2018	
Europe	€9885	€11045	€12306	12%	11%	6%
United States	$6572	$8723	$11995	33%	38%	16%
Canada	$1011	$1506	$2132	49%	42%	21%
Australia / New Zealand	$203	$707	$1033	248%	46%	50%
Japan	¥840	¥57066	¥231952	6692%	307%	308%

Source: complied by authors on the basis of Global Sustainable Investment Alliance, 2019

Almost half of the world's social investment is managed by Europe. From 2016 to 2018, social investment grew at a slow pace, but not as fast as the total pool of professionally managed assets in Europe, which reached a record €25.2 trillion, according to the report of the European Fund and the Asset Management Association for 2018. France and England remain the undisputed leaders of socially responsible investing in Europe. Their share in the European market for responsible investing is 46%, which is almost half.

A European Commission study on the social investment market in Europe has made it clear that most countries have some of their own elements of a social investment approach as far as possible.

According to this study, the European countries are conditionally classified according to the social investment development into three groups. The first group includes countries with a well-established approach to social investment, which supports it and continues to promote good institutional links between different policy areas. These countries include Austria, Belgium, Denmark, Liechtenstein,

Germany, Slovenia, and Sweden. These states also tend to maintain and further develop institutional links between different policy areas, especially when addressing key social problems.

For example, in Austria in general the federal government has shown a commitment to the idea of "social investment", and this trend has recently been growing. However, Austria does not adhere to a truly integrated approach to social investing due to the fact that the respective policy areas are shared between the Federal Republic and the Federal Provinces.

Belgium is a country with a relatively well-developed social investment economy having issues such as differences in access to certain services and the development of different regions.

The UK social investment market is widely recognized as one of the most advanced in the world. In 2018, the social investment market was over £1.5 billion. The Government continues to support the market and is committed to strengthening the social investment market, ensuring that future programs will facilitate access by organizations to relevant investments (Big Society Capital, 2016). UK companies work with investors, fund managers, social enterprises and charities to facilitate the use of social investment. Recently, there has been a rapid increase in investment funds that complement financial goals with social, environmental and ethical factors when selecting and implementing an investment strategy.

Tax benefits are an important government initiative to encourage investment in smaller companies that can innovate in the economy. More than 30,000 businesses can benefit from the Social Investment Tax Relief (SITR) privilege, which offers enormous untapped potential, according to research conducted by Big Society Capital and supported by the Department of Culture, Media and Sports.

The SITR, the youngest of these benefits, was introduced in April 2014 to allow investors who subscribe to qualifying stocks or debt investments in social enterprises that meet SITR requirements to claim 30% of the amount invested in income tax. The SITR recently ranked fourth out of 46 in a pan-European study on the effectiveness of tax incentives to promote social investment (Mills, 2018).

In Denmark, Iceland and Norway there has long been considerable experience in social investing. Liechtenstein does not have a specific “social investment program”, but many ideas of the European Commission's social investment development strategies are reflected in the national government strategy.

In 1997, the Swiss Foundation for Sustainable Development (Ethos) was founded in Switzerland. Ethos aims to promote socially responsible investment, as well as a stable and prosperous socio-economic environment that protects the interests of civil society nowadays and in the future. Ethos analyzes all Swiss companies and all companies in the world indexes. Ethos surveys existing portfolios on the basis of environmental, social and corporate governance (ESG) criteria. Ethos creates a detailed report that provides a consolidated portfolio overview as well as a thorough analysis by region and asset class.

An in-depth sustainability analysis covers all environmental, social and management criteria associated with the company. Environmental and social assessment covers a variety of topics, such as corporate strategy and the environmental management system, human resources, sustainability of products, human rights, suppliers and relations with civil society. The governance parameter includes such topics as transparency, capital structure, composition and functioning of the board, remuneration system, shareholders' rights and business ethics.

The second group of countries is demonstrating increasing awareness of social investment and is using social investment in several specific policy areas. The group includes Spain, Hungary, Ireland, Malta, Poland, which are still developing a clear or prevailing approach to social investment and have applied social investment in several policy areas. For example, in Hungary, social investment is not a central topic of financial policy. However, some investors focus on social investment.

Ireland has elements of a social investment approach, but social investment must compete with other financial products (in some cases, contradictory company strategies).

In Malta, social investment is not a central link in social issues. Social policy aims to increase human and social capital and improve the chances of less stressful situations in the future.

Poland does not have a separate social investment policy agenda, but many of the ideas of the European Commission's social investment package are reflected in the mid-term strategic documents adopted by the government in 2013. For example, the Human Capital Development Strategy for 2020, which aims to develop human capital and help people reach their full potential so that they can fully participate in social, political and economic life at all stages of life.

The third group covers countries where the social investment approach has not yet made many significant achievements in the economic policy process. The third group includes Bulgaria, Croatia, Estonia, Italy, Lithuania, Latvia, Romania, and Turkey.

FDI inflows to Bulgaria maintained a stable course in the early 2000s, reaching $2.05 billion in 2018, from $ 2.6 billion last year. With one of the lowest corporate tax rates in this area (10%) and low labour costs, the country is relatively favourable to foreign investment that is not subject to government review. Bulgarian experts, identifying progress in the country in the field of social investment development, point out that there is a need to improve coordination between different stakeholders and to ensure a holistic and integrated approach to social investment (Import-Export Solutions, 2019).

Having experienced a period of growth in 2005-2008, FDI inflows to Croatia collapsed as a result of the global economic crisis. Since then, foreign direct investment flows have been trying to return to pre-crisis levels. According to UNCTAD, in 2018 the total foreign direct investment inflow reached $1.15 million and slightly decreased compared to last year - $2 million. The sectors receiving most of the foreign direct investment are financial services (29.9%), wholesale (8.6%), real estate (6.7%) and telecommunications (6%). In addition to the unfavourable economic context, Croatia is suffering from a bad image linked to corruption, high taxes and an inefficient judicial system, although reform efforts have been made in recent years. However, the country has quality infrastructure and high tourism potential, a well-educated workforce and strategic position. According to the World Economic Forum, the country ranked the 74th in the Global Competitiveness Index 2017-2018. Croatia ranks 58th out of 190 economies in the World Bank's 2019 Business Report, eight positions down from its previous estimate. In Croatia, social policy is not based on a coherent approach to social investment, or at national, regional, and local levels. Social policy remains largely passive (Import-Export Solutions, 2019).

Estonia is open to foreign direct investment. In 2018, the net inflow of investments into Estonia amounted to $1.3 million, which is a slight decrease compared to last year by $1.7 million. The country is well-advanced in the attractive investment fields of IT, biotechnology and green industries. In Estonia, despite the low costs and small number of participants compared to other European countries, the progress regarding social investment has recently become more remarkable. While active labour market policies were mainly funded by external resources (ESF, EURopean Employment Services) in 2009-2011, most since 2012, resources have come from labour market services and support from the Unemployment Insurance Fund that indicates the sustainability of the current level of funding. In Estonia, although recent developments are more focused on social investment, the overall structure of social spending indicates that Estonia still spends relatively little on health care, natural family benefits, active labour market policies and social exclusion (Import-Export Solutions, 2019).

In Latvia, although social investment is not a central theme of social policy; policy priorities since 2009 are clearly focused on supporting the health and well-being of the nation.

In 2018, foreign direct investment flows to Romania totalled $5.8 billion and increased slightly compared to the previous year ($5.4 billion). In Romania, the political intentions of the incumbent authorities are proposing a change in social policy towards a more favourable, integrated social system focused on increasing access to all social services and quality of service. CSR Romania was initiated in 2006 by the Romanian Foundation Forum of International Communications. The forum was one of the first non-governmental organizations in Romania to focus in detail on the concept of corporate social responsibility through the creation of a dedicated CSR Romania platform in order to offer Romanian companies a space to share knowledge and experience with CSR, to promote CSR in business and to strengthen the dialogue (CSR Europe, 2019, Bouget, 2014).

Methodology for calculating social investment index

The European market for socially responsible investing continues to show steady development. Research has investigated that good investment practice companies improve reputation and image, a stakeholder engagement strategy that leads to better investment opportunities. Table 3 presents the top 10 European best-performing companies with responsible investing practices.

Table 3: Top 10 European best-practice companies with responsible investing practices

Rating	Country	Company name	Weighted score on company's reputation on the market (on a 100-point scale)
1	Denmark	LEGO	69.4
2	Denmark	Novo Nordisk	68.7
3	Germany	BOSCH	68.1
4	France	Michelin	67.6
5	Sweden	IKEA	67.2
6	UK	Rolls-Royce	67.2
7	Germany	BMW	66.9
8	Netherlands	Philips	66.9
9	Germany	Siemens	66.5
10	Germany	SAP	66.4

Source: complied by authors on the basis of CSR Europe, 2019, Bouget, 2014, e-CSR, 2018

In the first place of the rating, the Danish company Lego that is a leader in the field of "transparency" and "social contribution" and had the highest marks in the dimension of "management". Last year's announcement that the company was replacing its plastic sources with vegetable cane plastic was a major and a bold step for the company, showing that Lego products were consistent with its responsibility for social contribution and business transparency.

The second position in the ranking is held by the Danish company Novo Nordisk. The top 10 continue to be represented by companies from countries such as Germany, France, Sweden, the United Kingdom, and the Netherlands. The consolidated rating proves that Danish and German companies pay the most attention to responsible investment and social investment.

The absence of clearly defined norms in responsible investing leads to the fact that each company treats it differently, offering its own proportion of income and social responsibility. Therefore, investors willing to invest in socially responsible companies should independently select the criteria for the company inclusion in this list, as well as independently conduct a comprehensive analysis of the company for its compliance with these criteria. Before investing in an enterprise, European investors take into account the main indicators of the enterprise's activity: compliance with the law, development and well-being of employees, confidentiality and protection of customer data, ethics and integrity, quality and value of services, interaction with local communities and their support, environmental sustainability, innovation and economic performance.

To measure the social investing development within companies, the quality social investment index is applied, which also shows how deeply responsible investing is integrated into the business strategy and its operational activities.

The qualitative social investment index for the i-th company IK (i) means the level of complexity of a company social activity and is calculated as follows:

$$IK(i) = \left(\frac{1}{m} \cdot \sum_{j=1}^{m} X_{ij} \right), \quad (1)$$

where Xij – Boolean variable acquiring value 1 if j-th value is present in i -th company and 0 if this value is absent;
m – the number of features by which the social performance of companies is assessed.

The qualitative social investment index for the j-th value IK (j) is a measure of the presence of that qualitative value in the statistical sample of the respondent companies and is calculated as follows:

$$IK(j) = \left(\frac{1}{n} \cdot \sum_{i=1}^{n} X_{ij} \right), \quad (2)$$

where n – the number of companies participating in the survey, n=5.

The overall qualitative index of social investments IK shows the level of complexity of social activity of the surveyed set of companies and is calculated as follows:

$$IK = \left(\frac{1}{nm} \cdot \sum_{i=1}^{n} \sum_{j=1}^{m} X_{ij} \right), \quad (3)$$

The calculation of the social investment index is carried out on the example of the companies in Europe that have the best practices of responsible investing: LEGO (Denmark), BOSCH (Germany), Michelin (France), IKEA (Sweden). In order to compare the foreign experience of social investment with the domestic, the authors will carry out a comparative analysis of the above-mentioned enterprises with the company PJSC "Myronovsky Hliboproduct" (Ukraine), which is the first in the rating of socially responsible companies of Ukraine.

The overall qualitative index of social investment IK is 0.82, which indicates a sufficiently high level of complexity of social activity of the surveyed set of companies.

The set of features has to be elaborated so that each of them is important for each company. Characteristics of responsible corporate investment: compliance with legislation (1), employee development and well-being (2), confidentiality and protection of customer data (3), ethics and integrity (4), quality and value of services (5), engagement with local communities and their support (6), environmental sustainability (7), innovation (8), economic performance (9), the fight against corruption (10) (taking into account the particularities of the individual European countries development, including Ukraine). Thus m = 10.

It is possible to represent in the form of a matrix the provision of the listed features by corporations, where the object receives a rating of "1" if the feature is present and "0" in its absence (Table 4).

Table 4: Matrix of social activity features in corporations

Feature	LEGO (Denmark)	BOSCH (Germany)	Michelin (France)	IKEA (Sweden)	PJSC "Mironivsky Hliboproduct" (Ukraine)
1	1	1	1	1	1
2	1	1	1	0	1
3	1	0	1	1	0
4	1	1	1	1	0
5	1	1	1	1	0
6	1	1	0	1	1

7	1	1	1	1	1
8	1	1	1	1	1
9	1	1	1	1	0
10	1	1	0	0	1
IK (i)	**1**	**0,9**	**0,8**	**0,8**	**0,6**
IK (j)	**2**	**1,8**	**1,6**	**1,6**	**1,2**

Comparing IK (i) indices for different companies allows identifying leaders and outsiders by the complexity of organizing the social investment process. The results of calculating the level of complexity of the company's social activity show that the complexity level of the social activity of LEGO companies is 1, which confirms the comprehensiveness and effectiveness of the company's responsible business policy. BOSCH is 0.9, 0.1 more than Michelin and IKEA, and 0.3 more than Myronovsky Hliboproduct.

The calculation of the indicator of a qualitative feature presence in the statistical sample of the surveyed companies suggests that the measure of the presence of social investment value in the activities of corporations LEGO (IR (j) = 2), BOSCH (IR (j) = 1,8), Michelin (IR (j) = 1.6), IKEA (IR (j) = 1.6) is significantly higher than this indicator in PJSC Myronovsky Hliboproduct (IR (j) = 1.2), which indicates that social investing and responsible investing in European companies is more effective than responsible investing in Ukraine.

Conclusions

On the basis of the conducted research of social investment development it has been determined that social investment is a tool of effective social responsibility realization for corporations and sustainable development enhancement of economy as a whole. The positive social and economic effects of social investment development include: increasing employment rates, improving health indicators, high scientific and technical potential, improving the quality of education, high housing availability, creating and improving transport infrastructure, improving the environmental situation, increase of investment attractiveness.

Analysis of the world investment market has made it possible to determine that Europe remains the largest region in the social investment market development. The practice of European corporations proves that higher financial performance is characteristic of companies that implement responsible investment projects. The leaders of socially responsible investment in Europe are France and England, whose share in the European social investment market is 46%. The main areas of social investment in these countries are climate change, environmental protection, the social sphere and governance.

Studies of the European experience of social investment development trends have shown that the main indicators of investment object selection for investors are: compliance with legislation, development and well-being of employees, confidentiality and protection of customer data, ethics and integrity, quality and value of services, engagement with local communities and receiving local communities support, environmental sustainability, innovation, economic efficiency. Based on the calculation of social investment index and comparative analysis of social investment development one can conclude the directions of social investment development in Ukrainian companies: increasing transparency of corporations, informing business awareness of social investment development in the national market, ensuring ethics of doing business and adhering to the principles of integrity in the implementation of company development strategies, improving product quality in accordance with international standards.

Reducing the Value Added Tax (VAT) Gap on the example of ERP software

Marek GALAZKA

Adam Mickiewicz University, Poznań, Poland
galazka@amu.edu.pl

Jerzy SZYMANSKI

Adam Mickiewicz University, Poznań, Poland
jesz@amu.edu.pl

Abstract

Member States in the European Union are losing billions of euros in value-added tax (VAT) revenues because of tax fraud and inadequate tax collection systems. The VAT Gap, which is the difference between expected VAT revenues and VAT actually collected, provides an estimate of revenue loss due to tax fraud, tax evasion and tax avoidance, but also due to bankruptcies, financial insolvencies or miscalculations. The purpose of the article is to show how to implement and provide a solution in Polish companies required by Polish government regulations in SAP ERP or S/4HANA systems, which significantly reduces the number of tax frauds.

Keywords: ERP systems, VAT Gap

Introduction

The tax on goods and services is one of the pillars of Poland's budgetary revenue. If this income is reduced, the state struggles to perform its functions.

As the irregularities have increased, reducing budgetary revenue, Poland's VAT gap has been in the political and media spotlight. The concept of the VAT gap is not defined in Polish law. It is an academic term used in reports, analyses and comparative studies. Its scope and how it is measured have been formulated by particular tax administrations and international organisations, such as the OECD and IMF. According to the United States' Internal Revenue Service (2018), the tax gap allows the scale of missing tax returns and unpaid tax to be measured. It is defined as the difference between the tax that should be paid and the amount that reaches the state budget (Małecka-Ziembińska, E., 2017). The Slovak Republic's Institute for Financial Policy of the Ministry of Finance has a more extensive definition: "The tax gap is the difference between the tax paid and the tax that should have been paid if all natural and legal persons declared their actions and transactions correct-ly, in accordance with the spirit and letter of the law (the provisions' wording and the legislator's intention). The tax gap is calculated after taking into account the costs of tax audits by the tax administration" (Institute for Financial Policy 2012).

For many years, organisations measuring the VAT gap warned that it was deepening in Poland, especially after 2008 (CASE, 2016, 2017, 2018), (PwC, 2015, 2017).

From January 1, 2020, an act was introduced in Poland introducing a new list of VAT taxpayers (the so-called "White List").

The list includes NIP (Polish Taxpayer Identification Number) and bank account numbers of VAT payers. If payments are made to an account other than indicated on the list, such expenditure will not

be treated as tax deductible from the PIT / CIT (Personal Income Tax / Corporate Income Tax) point of view. In addition, joint responsibility for the supplier's obligations regarding VAT will be disclosed.

In accordance with the provisions of Article 17 section 2a of the VAT Act, with regards to the exercise of due diligence, it is an obligation of a taxpayer to verify tax activities of their counterparty. Polish companies need to check the NIP (Polish Taxpayer Identification Number) and Bank Account Number against the White List published daily as the file on government websites by the Polish tax authorities. This file allows to verify whether the entity to whom the payment is made is an active VAT taxpayer or an entity exempt from VAT and whether the bank account number to which the transfer is made is registered in the White List database (MF, 2020).

Many Polish companies use the ERP systems. The term ERP abbreviated from "Enterprise Resource Planning", was introduced by the Gartner Group in the early 1990s (Arif, M., Kulonda, D. J., Proctor, M., and Williams, K., 2004) and represent computer and software systems that combine and integrate all related processes of the enterprise, and serve users for the management of all functions within the enterprise (Swartz, D., and Orgill, K., 2001). Researchers referred ERP systems as enterprise system (ES), enterprise resource management (Cobarsí, J., Bernardo, M., and Coenders, G., 2008), and business system respectively (Davenport, T. H., 1998, 2000). (Klaus, H., Rosemann, M., and Gable, G. G., 2000) conceptualized ERP System as comprehensive packaged software solutions of Information System (IS) designed to integrate all business processes and work to present a complete outlook of the business from a singular IT and information architecture (Klaus, H., Rosemann, M., and Gable, G. G., 2000). (Davenport, T. H., 1998) also described ERP an information strategy that merge all information within an organization and create a comprehensive information infrastructure involving all organizational units and functions. (Marnewick, C., and Labuschagne, L., 2005) clarified that ERP system is more than just a product or software and they further conceptualized ERP into four components. The first component is software component (Finance, Human Resources, Supply Chain Management, Supplier Relationship Management, Customer Relationship Management, Business Intelligence), which is the visible part to users and seen as ERP product. The second component is process flow, which deals with the information flow among modules within ERP system. Third is customer mind-set, that define the influence of ERP system on users, team, and organization. And the final component is change management, this component deals with the adoptability of ERP system implementation within the organization, that are user attitude, project changes, business process changes, system changes.

Many Polish large companies use the SAP ERP system. In this article is described an example implementation of functionality needed to check NIP (Polish Taxpayer Identification Number) or EU VAT ID when the user completes the NIP / EU VAT ID field, e.g. in transactions to create/modify supplier's basic data and when completing a one-time supplier's data in a document in the SAP system.

For the second option is to check of the data in the White List when the data of the supplier or recipient is saved in the SAP system. The system verifies in a flat file (White List) provided by Ministry of Finance the correct combination of the NIP number and bank account (MF, 2020).

Description of the solution in the SAP ERP or S4/HANA system

This section is divided into functional description and technical description

Functional Description

The control of NIP (Polish Taxpayer Identification Number) is carried out both for Polish Tax Identification Numbers as well as for tax identification marks in EU countries (EU VAT ID). Polish NIP numbers are verified based on two sources:

- checking only the NIP number.
- Flat file from the Ministry of Finance list: the so-called White List of VAT payers - pair checking: NIP number and bank account (MF, 2020).

For the first option, the control is called automatically when the user completes the NIP field, e.g. in transactions to create/modify supplier's basic data and when completing a one-time supplier's data in a document.

A check of the data in the White List takes place when the data of the supplier or recipient is saved. The system verifies in a flat file (White List) provided by Ministry of Finance the correct combination of the NIP number and bank account. If the system encounters the first inactive bank account, a warning is displayed. If you want the system to skip the checking of an inactive account, you need to enter 'X' in the 'Reference data' field.

Bank Details

Ctry	Bank Key	Bank Account	Acct holder	CK	IBAN	IBANValue	BnkT	Reference details
DE	68390000	1385291				DE03683900000001385291		X

Fig. 1: Bank details of supplier

Accounts marked in this way will also not be taken into account when creating payment proposals in F110 transaction.

In case that payments should be allow on inactive account the “Reference field” should be marked as “Y”.

Vendor 100105 Bären Auggen GmbH Auggen

Bank Details

Ctry	Bank Key	Bank Account	Acct holder	CK	IBAN	IBANValue	BnkT	Reference details
DE	68390000	1385291				DE03683900000001385291		Y

Fig. 2: Bank details of supplier

In other cases, i.e. when creating business documents (invoice, order, sales order, etc.), the control uses a standard SAP mechanism in the form of customer blocking at the business unit level. This status is updated once a day (or less frequently), e.g. at night, with the help of the provided report.

As a result of the control, the mechanism notifies the user with a message:

„NIP 999-999-99-99 inactive” or
„NIP 999-999-99-99 cannot be checked - notify the administrator” or
„NIP 999-999-99-99 is not controlled” (entity exempted from control) or
„NIP 999-999-99-99 active”

In the first two cases, the user's transaction is blocked by an error message (the tool's configuration allows to generate a warning message). In the system it is possible to process such NIP/transaction by a user with special privileges.

Each NIP check is saved in a LOG file, which can be viewed in a report prepared and delivered as part of the solution.

In addition, the solution includes a report that allows for managing supplier/recipient NIPs in the system on a mass basis. As a result of running such a report in real mode, suppliers/recipients with inactive NIP are blocked (test mode does not impose a blockade). Please note that selecting the option of checking the data in a flat file (White List) in real mode results in blocking the supplier or recipient in a situation when at least one of the bank accounts is inactive (accounts marked with an "X" in the Reference data field are omitted during checking).

Technical Description

To check if the Polish company's NIP (Taxpayer Identification Number) is valid, you need to create the SAP Web Service Consumer (Website URL: https://ppuslugi.mf.gov.pl/?link=VAT)

To control the EU VAT ID, you need to create also the SAP Web Service Consumer and verify the number in the VIES database of the European Commission (http://ec.europa.eu/taxation_customs/vies/).

To verify data against the White List, you need to download flat file (White List) from the website (MF, 2020) and store data to the database. There are several steps needed to be developed:

Prepare a data store for the White List content

The content of the White List file contains 3 parts of data for which you need to create database tables:

- **Header data**
  This part of the contains crucial information about the number of times the hash function has to be performed for the specific date of data publication.
- **Hash list**
  This list must be searched for given combination of Date & NIP Number & Bank Account Number. You can consider storing it in the form of 64-byte raw data to keep the key as short as possible. Otherwise, a 128-char long key is needed. The type of the partner can be also stored here.
- **Mask list**
  A list of 26-character long masks, which should be searched for the Bank Account number in case that searching for the explicit Bank Account number is unsuccessful (see the specification of the file (MF, 2020)). You can consider to store it together with a mask directly interpretable using ABAP tools (wildcard form or a regular expression).

Download and store the White List

This process should be scheduled every day based on the time the file is published by the PL Tax Authority.

- **Download the 7-zip file**
  Define a HTTP Connection to External Server in transaction SM59 to the PL Tax Authority server where the files are published.

Fig. 3: Transaction SM59

Update the URL with the file name based on current date.
Use class cl_HTTP_Client to get the file and save it on the application server (filename can be specified based on logical file name defined in the transaction FILE).

- **Unpack the content of the file**
  The 7-ZIP format is not supported by SAP, you need to get a 3rd party software to unpack it depending on your OS, i.e. the p7zip package for Linux (Posix OSs) or an .exe program for Windows.
  Define an external OS command (using the transaction SM69) to run the unpacking tool with the appropriate parameter for extracting.
  Run this external command using the function module SXPG_COMMAND_EXECUTE.
  There a possibility to verify the checksum hash of the json file against the second file at this step.
- **Parse the JSON file**
  A data structure according to the JSON file content should be created and then the method Deserialize of the class /ui2/cl_JSON=>Deserialize can be used to parse the file.
- **Store the parsed data in the prepared tables**

Check a specific combination of Date & NIP Number & Bank Account Number

- **Create the search string**
  According to the specification of the White List, create a string consisting of the three attributes.
- **Create the hash**
  Perform the SHA512 function for the number of times specified by the header data for the given date. The method cl_ABAP_Message_Digest=>Calculate_Hash_For_Char can be used for this; be aware that the string must be lowercased in each pass.
- **Check presence of the final hashed string in the Hash list table.**

- **Use the Mask list**
  If the explicit Bank Account number is not found, select all masks from the Mask list table that the Bank Account number fit, mask the Bank Account number according to the PL White List file specification and repeat for it steps.

Then you need to find places in the source code of the SAP system where the veryfication of the NIP number, EU VAT ID and bank account are necessary (eg.: create vendor).

To verify the Polish NIP number we can use so called BTE Enhancements (business transaction events). For Polish NIP numbers is suitable the extension **BTE 00003050.**

To check EU VAT ID you have to implement the extension to **the EU_TAX_NUMBER_CHECK function module.**

To validate of correct combination of the NIP number and bank account you have to implement **BAdI BADI_OVF_PL_WHITELIST.**

At the end you need to create List of Tax Identification Numbers. The program will allow you to check the NIP / EU VAT ID status for selected/all clients. In addition, the program has the ability to block mass vendors/receivers with erroneous NIP / EU VAT ID.

Implementation of the solution in the SAP ERP or S4/HANA system

In this section is showed the source code of the Program for Downloading and Storing of Data from flat file (White List) (MF, 2020) (the most difficult part of the implementation). The program is written in ABAP (programming language in SAP system)

```

Abstract

Transport service is one of the basic requirements that creates the preconditions for the operation of the destination, especially when it comes to the concentration of a large number of people, the seat of industrial and other companies, including shopping centres, along with a number of architectural and tourist sights. It is not different in the second largest city of the Czech Republic with a population of 380,000 inhabitants. This number does not include daily commuting working people, university students and tourism participants, who increase this number by several tens of thousands. More than half a million people move around the city every day. In order for everyone to reach their goals, it is necessary to have a well-functioning transport network in the city. This applies not only to the city of Brno, but also to cooperation throughout the South Moravian Region. Thus, regional carriers (including Czech Railways) must work together to ensure coherent public transport. [1]

Key words: Transport Service, Transport Fleet, Transport Connection, Passengers

Introduction

The transport service of the territory as a public service is provided from the level of the state, region and municipalities. Each of these levels has its specific position and role. It is about ensuring adequate transport on all days of the week for reasons of public interest, especially travel to work, schools, offices, medical facilities, including THE transport back. Therefore, the following principles for ensuring the operation and development of public transport systems had to be divided according to these levels in order to allow their trans-regional integration. [1, 2]

The state is responsible for ensuring public service – transport services of the territory. By delegating this obligation in the form of self-governing powers to regions and municipalities, this obligation is not relieved.

The state obligations must then be assessed in two respects. The first is to ensure transport services of supra-regional importance, and the second is to create the conditions for ensuring transport at regional level, including the creation of conditions for mutual cooperation of regions towards trans-regional integration.

The main objectives of the Transport Policy of the Czech Republic, based on the EU transport policy, include creating conditions for the development of a quality transport system based on the use of technical, economic and technological characteristics of individual modes of transport, competition principles with regard to environment and public health. Brno, the second largest city in the Czech Republic, plays a decisive role in the fulfilment of the transport policy objectives in the Czech Republic and constitutes a significant conurbation.

The aim of the article is to analyze the current state of transport services of the city of Brno and its positive and negative aspects. Based on the analysis, the selected optimization solutions are designed to improve the quality of the detected state.

The article uses results based on publicly available data of the City of Brno, as well as data obtained from the verification of data from the Methodology - Ensuring Operation and Development of Public Transport Systems of Persons Supporting Trans-Regional Integration.

The findings and subsequent proposals are based on the SWOT analysis, which made it possible to define a strategy for the development of transport services in the city of Brno.

Current State of Transport Service in Brno

Public transport on the territory of Brno and its vicinity is provided by Brno Public Transit Co. Inc. The transport is realized by means of trams, buses and trolleybuses and in the summer season by boats. They are numbered 1 to 99, with night lines beginning with 89 and preceded by the letter "N". Out of the 99 lines, 60 are now operated by the public transport company, of which 9 are tram lines, 13 are trolleybuses and 38 are bus and 11 night bus lines and 4 are school lines. There are more than 480 vehicles on these lines daily. [3,4]

Transport fleet, its structure

The fleet of the City of Brno has 837 vehicles. There are 364 trams, 334 buses (of which 160 are CNG-powered) and 139 trolleybuses (of which 10 are partial with batteries). The transport company operates a much differentiated fleet. [5,6]

Number of passengers carried in recent years

According to the annual report of the Brno Public Transit Co. (BPTC) for 2017, we can say that the number of passengers increased by approximately 0.6% compared to 2016.

Table 1: Number of Passengers Carried in 2014-2017 [in thousands of people], Source: BPTC annual reports 2016, 2017

Vehicle	Year/Number of Passengers [in thousands of people]			
	2017	2016	2015	2014
Trams	196 021	193 590	193 647	195 350
Trolleybuses	44 693	46 679	45 448	43 731
Buses	115 612	114 488	115 594	114 859
Boats	245	244	211	175
TOTAL	356 571	355 001	354 900	354 115

The table shows that with each year the total number of passengers increases by hundreds of thousands of people. It is also possible to observe a fall in the number of passengers in trolleybuses by less than 4%. [6,7]

Transport Hubs

Brno has several important transport hubs. They are located very close to the city centre. These are the main railway station, Czech street (Česká), Mendlovo Square/náměstí. Other interchanges, mainly in relation to regional transport, are the stops Stará Osada, Jírova, Osová, Zoological Garden. The Central Bus Station is a separate hub where the bus connections of the Integrated Transport System depart to the entire South Moravian Region.

Frequency of Connections Through Traffic Hubs

With the help of the server Idos.cz a table was created with frequency of connections at larger traffic junctions in the city of Brno. The table is divided into several columns. The first column shows the name of the transfer node, the second shows the number of tram connections, the third shows the number of bus connections providing transport around Brno, the fourth shows the buses of regional lines and the last column shows trolleybus connections. The data was collected 7 February 2019 at 3 p.m. The time range is one hour.

Table 2 : Frequency of Connections through Traffic Hubs in 1 Hour

Frequency of Connections through Traffic Hubs in 1 Hour				
	Tram	Bus public	Bus REGIO	Troll
Main Railway Station	150	73	8	21
Česká	136	3	0	24
Mendlovo náměstí/Square	73	27	7	46
Stará Osada	0	79	15	6
Jírová	24	23	6	0
Osová	48	16	11	10
Zoological garden	60	17	6	9
Královo Pole, Railway Station	17	57	2	9
Bohunice Hospital	0	40	14	24
Central Bus Station	0	12	32	0
Data www.idos.cz/Departures 07.02.2019 3 p.m. * Main Railway Station lockout **Zábrdovický most/bridge lockout				

The table shows that most trams will pass through Hlavní nádraží/Main Railway Station with 150 vehicles, followed by the hubs Česká with 136 tram vehicles and Mendlovo náměstí with 73 rail vehicles. Buses will mostly pass through the Old Town with 79 vehicles, followed by the Main Railway Station with 73 buses and the Královo Pole Railway Station with 57 bus connections. Of course, the most regional connections are faced by the Central Bus Station with 32 connections, followed by Stará Osada with 15 connections and right behind it is the Bohunice Hospital stop with 14 connections. In trolleybus traffic, Mendlovo náměstí with 46 connections leads. The second most frequented trolleybus hub is run by the Česká and Bohunice Hospital stops with 24 connections, followed by Main Railway Station with 21 connections.

Positives and Negatives of The Transport in Brno

Positives

Information to passengers

Traffic information can be found on several platforms, whether in electronic or physical form. The current closures can be found on the Transport Company of Brno website (DpmB) as well as on the Facebook page of the transport company. There is also a Facebook profile "DpmB current", where you can find current specials or news from operation. Furthermore, the mobile application "DpmBinfo" is available for passengers, where you can find essentially the same as on the company's website. These include data about current departure, vehicle location, connection finder, enumeration of exclusions and updates (extraordinary), line diagrams or tariff information including SMS tickets. Throughout the IDS (integrated transport system), passengers can take advantage of the "IDS JMK Poseidon" application, developed by Kordis JMK, JSC.

In cars, a panel for displaying the line, driving direction and stops is standard as well as an acoustic stop announcement. Some cars also have LCD panels to display this information.
The transport company also informs its passengers by means of information leaflets and stands. Flyers and brochures are distributed in the case of closures by DpmB staff (whistle-blowers), who are available at the affected locations of closures or at hubs. Information racks are also located at lockout locations and provide a greater view of lockout content, such as maps or diagrams.

Night Connections

Night traffic around the city is very well thought out. This is provided by special bus lines, so-called delivers. 11 night lines ensure transport in Brno always after the end of daytime service until the early morning of the next day, when the daily lines depart again. These buses start their night ride at about half past eleven in the evening and end at about half past six in the morning (one hour later on non-working days). The specialty of these night connections is that 22 buses start at one time from one point to all directions. The point is Main Station and it usually happens every hour (the night before a non-working day (abbreviation NPD) every half hour) starting at 11 p.m., and then at 23.30, 0.00, and so every hour (with extra connections at 0.30, 1.30 and 4.30 in NPD) until the early morning.

Public Transport Preference

There is a preference for public transport vehicles around the city, which is a modification of the cycle of traffic lights at intersections when a public transport vehicle arrives. This change can be triggered by the vehicle control information system, which sends a request to the traffic light control system (SSZ), which then modifies the signal plan for the smooth passage of the car. The preference works on two principles – without dynamic control or with dynamic control of traffic lights – where without dynamic control SSZ only prolongs the phase (cycle) of the intersection and with dynamic control adjusts the whole control of the cycle as needed. An example would be a delayed tram that arrives at the junction and instead of waiting for the entire SSZ cycle, the tram waits only half a cycle, or the SSZ control system releases it immediately. Another example is stopping car traffic in front of a public transport stop for easier vehicle handling. Such an intersection can be found, for example, at Šilingrovo náměstí/square on Husova Street. [8, 9]

Alternative transport, reinforcement transport

The transport company has a sophisticated system of substitute (backup) transport. In the event of an accident or breakdown of the vehicle, the dispatching centre sends a replacement vehicle, usually a bus, to replace the missing link. These vehicles can be dispatched from the depot, but more frequent use is of stand-by (stand-by) buses standing at junctions, such as Main Railway Station, Mendlovo náměstí/square or Stará Osada. The dispatching centre always tries to remedy the traffic as quickly as possible, which is often secured within a few minutes of reporting an emergency.

According to the observations made, it can be stated that transport is also very well ensured during sporting or cultural events, such as ice hockey matches or the annual Ignis Brunensis fireworks show. For these events there are prepared reinforcement links and after the event distribution of visitors to their homes. [10]

Less air pollution during bus operation

The air around us is increasingly polluted by so-called greenhouse gases, a mixture of carbon dioxide, methane, nitrogen dioxide, hydrogen fluoride and water vapour. These gases contribute to global warming and thus to the destruction of our planet. Therefore, the transport company decided to improve the situation on the territory of Brno and since 2014 the transport company has started to gasify the bus fleet. That year, the first 12 buses for compressed natural gas were delivered and at the same time a filling station was built in the depot of Slatina. The start of delivery of 160 low-floor buses (including articulated buses) to CNG, which was completed in 2018. A total of 4 types of these buses now run around the city. These include the Iveco Citelis 12M CNG, the Iveco Urbanway 12M CNG, the Iveco Urbanway 18M CNG and the SOR NBG 12. [11]

Air conditioning in passenger lounge

Air-conditioned space for passengers was not always obviousness in public transport in Brno. The cars had air conditioning only in the driver‘s cabin, not in the passenger lounge. Since 2018, the Public Transit Company has also started to install passenger air conditioning in its Urbanway 12M CNG buses and by April 2019 all 56 buses of this type should have been air-conditioned. They won‘t be the first cars with air conditioning. The company also owns an additional 60 buses and 11 air-conditioned trolley buses in which the air-conditioning is located.

Negatives

Traffic Jams

Traffic congestion is created on some roads due to higher traffic density. This negatively affects the smoothness of public transport. If the vehicle gets into such a situation, it can take up to several minutes delay. This disrupts the circulation on a given line and creates gaps between individual links, which may affect the continuity of other lines. The worst sections are the city circuits, especially in the vicinity of Zvonařka (Olomoucká - Hladíkova - Zvonařka - Opuštěná), Židenice (Otakara Ševčíka, Gajdošov, Svatoplukova to Provazníkova) and also in Komárova (Hněvkovského and Svatopetrská streets) or in Štýřice in Jihlavská street.

Missing additional reporting in cars

In the case of an ongoing exclusion, information is provided to passengers via leaflets and in electronic form. Awareness would be further improved if the exclusion report was made directly in the car on the lines concerned.

Overcrowded vehicles

During morning and afternoon peak times, or rush hours, on some lines, the capacity of the cars is not sufficient and the connections are overcrowded. Such situations occur mainly on tram lines 1, 4, 8 and 12 and also on bus lines 44, 50, 53, 61, 67 and 84. However, this problem is difficult to solve. In most cases, this can be solved by inserting another joint at a given time. But then it is necessary to solve what to do with the vehicle as soon as the onslaught of passengers fades away so that the car does not run unused (does not run empty). The solution is to transfer the car to another line (so-called crossing) and thus help another line. However, such behaviour is more demanding in terms of planning and must be analysed and evaluated in detail. Another solution is to purchase cars with a higher passenger capacity, but this solution is more expensive.

Based on the above mentioned information, a SWOT analysis was prepared, on which the strategy for transport services of the city of Brno is based.

Table 3: SWOT analysis

SWOT analysis	+	-
Internal factors	• Central management of transport services • Sophisticated alternative transport system • Wide structure of transport routes	• Overcrowded vehicles in peak hours • Delay reports missing in vehicles • Lack o air conditioning in part of vehicles
External factors	• Extending dynamic traffic management • • Reducing environmental pollution • • Purchase of new tram and trolleybus trains • • Tram length adjustment	• High traffic density - congestion • • High prices of new means of transport • • Insufficient length of tram stops • High costs of public transport implementation

From this SWOT analysis a strategy was chosen that counts on the purchase of new means of transport for the city of Brno and completion of public transport stops technically corresponding to newly purchased trams.

Lack of two-way trams

The Brno Transport Company has 38 KT8 type two-way trams in its fleet. Many of them were purchased in 1989 and even though they have been modernized during that time, their end of life is approaching. Modernization means complete renovation and adding a low-floor part to the middle section. A low number of these cars can be considered as a negative. 18 cars are needed daily on the line No. 8, which is the only one not to have a loop at one of its end stations but a deadhead. Other cars are dispatched by the guarantors of low-floor connections on other lines. So, if there is a lockout where double-sided cars are needed, there is a complicated scheduling of the line service.

The solution is to eliminate the problem of lack of double-sided trams. This may be a proposal for the purchase of suitable cars for operation in the Brno environment together with a quantification of the costs of their purchase and maintenance.

By surveying the market for low-floor bidirectional trams, suppliers from the Czech Republic offer the best pricing. Pragoimex, JSC. and Škoda Transportation, JSC.

The required parameters could be met by 4 types of trams, which are Škoda Transportation For City Smart, For City Alfa, For City Plus and Pragoimex Vario LF3 / 2. The cars meet the requirements based on low floor and manoeuvrability to meet current traffic needs.

All cars are on a chassis with a gauge of 1435 mm and a width of 2500 mm. The cars have air conditioning in the passenger lounge and in the driver‘s cabin and a camera system.
It should be noted that the For City Smart and Alfa models are so far only catalogue cars, i.e. they do not run anywhere in normal operation, and therefore some figures may differ during implementation.

Table 4 : Table of technical information of trams, source Škoda catalogue and Pragoimex website.

Model	Vehicle length (in mm)	Number of sections	Number of seats	Maximum occupancy (4 ps/m^2)	Maximum speed (in km/h)	Low-floor
For City Smart	37 140	3	72	313	80	100 %
For City Alfa	41 000	4	62	238	70	100 %
For City Plus	41 360	5	66	339	80	92 %
Vario LF3/2	30 100	3	54	194	65	50 %

The first option is the For City Smart model. The selected variant has 3 sections with a total length of 37,140 mm. It is 100% low-floor and the design speed is up to 80 km/h. Maximum occupancy is up to 313 people (72 of whom are seated).

The second option is the For City Alfa. The selected variant has 4 sections with a total length of 41,000 mm. It is 100% low-floor and design speed is up to 70 km/h. Maximum occupancy is up to 238 passengers (of which 62 are seated).

The third option is the For City Plus. The selected variant has 5 sections with a total length of 41,360 mm. The low floor is 92% and the design speed is up to 75 km/h. Maximum occupancy is up to 339 people (66 of whom are seated).

The last variant is the Vario LF3/2. This version has 3 sections with a total length of 30,100 mm and is the closest to the replacement type KT8. However, the low floor ratio is only 50%. Design speed is up to 65 km/h. Maximum occupancy is up to 194 persons (54 of whom are seated). [13, 14, 15, 16, 17]

The three-section For City Smart model with a total length of 37,140 mm has become the recommended model among the proposed vehicles. This model was chosen on the basis of a good occupancy / length ratio. Estimated price of one vehicle is 55,000,000 CZK without VAT.

Picture 1 : Visualization of a tram - profile, source: Škoda catalogue

Visualization of the tram is not given, but the design can be inspired by a similar order of the Pilsen Transport Company for two-way three-section cars with dimensions up to 33 meters. [18]

Picture 2: Graphic visualization of the Pilsen order, source: PMDP press release

In terms of utilization and coverage of transport needs, it would be optimal to deliver 15 vehicles in the total price of CZK 825,000,000 excluding VAT. The delivery date is unclear, as other fleet renewal orders are planned in the near future. Implementation could be considered between 2022 and 2025. Financing would be provided mainly from the own resources of the transport company with an agreed repayment schedule and would be partly solved by subsidies from the European Union.

Simultaneously with the introduction of new tram sets with a tram length of 37 meters, it will be necessary to extend some tram platforms on the route of line No. 8, where these trams would be dispatched. These are mainly areas in Bohunice and Starý Lískovec. Overall, the transport company would have to adjust 6 stops as follows:

- Dunajská stop (extension to the centre by 4 m, shift from the centre by 5 m forward, shift of the pedestrian crossing by 5 m)
- Švermova stop (extension to the centre by 4 m)
- Běloruská stop (extension to the centre by 4 m)
- Krematorium stop (extension from the centre by 3 m, to the centre by 3 m)
- Bělohorská stop (extension from the centre by 2 m, to the centre by 2 m)
- Mifkova stop (extension by 3 m)

In total, it is an extension of 25 meters of tram stops (sidewalks), one shift of the pedestrian crossing over the rail superstructure and two shifts of stop markers (including cabling to electronic panels). Estimated price of adjustments is up to 200,000 CZK without VAT. [19]

Conclusion

The transport service of the city of Brno represents an important attribute of the life of the inhabitants, but also of all participants of tourism, which represents a very important part of its

activities in the city. Finding ways to improve the current situation and its strategic planning is an important part of the city‘s development.

Abstract

Citarum is the largest and longest river in West Java Province, Indonesia with a watershed area of 6614 km^2 and river length of 297 km. Citarum River plays an important role for socio-economic life, especially in West Java and DKI Jakarta. Citarum is also a major water supplier for industrial activities, however, in the last twenty years, environmental conditions and water quality throughout Citarum have been deteriorated. The impact of deteriorating water quality from the Citarum River is broadly classified into health effects and environmental degradation also impacts the Upper Citarum River Basin. Therefore, vulnerability index analysis is very necessary to assess the condition of the Upper Citarum Watershed. The vulnerability index method is a combination of two indexes, namely the water stress index and adaptive capacity index. Data collection methods used in this research are literature review. The findings of this study can be used for further research, namely the calculation of vulnerability index. This research aims to find out what intervention strategies are appropriate to maintain the sustainability of river ecosystem functions. In this study an appropriate method was analyzed to achieve the sustainability of the function of the Upper Citarum Watershed Watershed by calculating the vulnerability index. After analyzing the vulnerability index, the intervention strategy is carried out to maintain the sustainability of the river ecosystem function. The intervention strategy consists of social inteventions, extended producer responsibility (EPR) and corporate social responsibilty (CSR), and policy interventions, which used to sustain the function of the Citarum River ecosystem.

Keywords: Citarum; River; Vulnerability Index; Intervention Strategy; Sustainability

Introduction

As evidence of damage to water catchment areas, especially rivers in Indonesia, there has been an increase in critical watersheds every year. Water crisis is closely related to the sustainability of river ecosystem functions, especially in the upstream area. In 1984 there were twenty four critical watersheds and then increased to thirty nine critical watersheds in 1992, increased again to fifty nine critical watersheds in 1998, and in 2003 increased to sixty two critical watershed. Of the sixty two critical watersheds as many as twenty six critical watersheds are located in Java (Sudodo and Prastowo, 2005). According to data from Sarana Multi Infrastruktur Persero (2017), it is estimated that the supply of clean water needs in Indonesia is mostly, around 60% done through piped water while the remaining 25% is sourced from springs and 15% from ground water. Demand for water will continue to increase with regional growth and population growth.

Based on data from the Ministry of Public Works, the regions of Java and Bali have the highest level of surface water demand compared to other regions, both for domestic and irrigation needs, as well as for industrial needs. Since the early 1990s, the two islands have experienced water balance deficits in the dry season. This is in line with the population density in Java and Bali which reaches 62% of the total population of Indonesia. Java as an industrial development center also plays a role in the water balance deficit while the potential of water resources in the region is very limited, less than 10% of the total national water availability.

Related to the water availability, quoted from "Analysis of Java Island Water Balance", Nugroho (2007) stated that around 77 percent of districts/cities in Java experienced a water deficit and is expected to increase to 78.4 percent in 2025. Particularly in the Greater Jakarta Area, where water supply is relatively secure, in 2003 around 50 percent of districts and cities experienced a water deficit and is expected to increase to 100 percent by 2025. It is estimated that the water balance deficit throughout Indonesia, especially in the dry season, will increase in 2025 if there is no improvement to the national water infrastructure.

The rate of population growth greatly affects the increasing need for clean water. In accordance with SNI standards in 2002, the domestic water requirement for urban residents is 120/liter/day/capita, while the rural population is 60 liters/day/capita. Projected population growth conducted by the Central Statistics Agency (BPS) shows that Indonesia's population is expected to continue to increase from 238.5 million in 2010 to 305.6 million in 2035. The need for clean water for households in 2010 is estimated reached 7.8 billion cubic meters. It is predicted that household water needs will continue to increase to 11.15 billion cubic meters in 2035.

The need for clean water continues to increase while the availability of clean water decreases causing environmental problems for the community. In 2025, the International Water Institute, mentioned Java and several other islands included in the region of the water crisis. Based on the study of Water Resources Development (1990), in 1990 Java had experienced a water deficit, from the needs of 66.336 million m^3/year it could only provide 43,952 million m^3 /year. Pitono (2003) also assessed that in the dry season of 1993, 75% of Java had experienced drought due to water deficits and it was estimated that 17 water deficits would increase in 2000 to 56%, an alarming number and need to be watched as carefully as possible. This is also caused by the declining quality of the river.

Citarum River is one of the rivers in West Java with an area of watersheds of 6614 km ^{2} and river length of 297 km. The Citarum River crosses 10 districts and 3 cities in West Java. The geographical location of the Citarum River is 106°51'36 "- 107°51' East Longitude and 7°19' - 6°24' South Latitude. Citarum River has 3 large reservoirs that are used to supply water for irrigation, fisheries, and hydropower, namely Saguling, Cirata, and Jatiluhur. Land use around the Citarum watershed is settlement, agriculture and fisheries (Utami, 2019) . The Citarum watershed is divided into three parts namely upstream, middle and downstream (Bappenas, 2018).

The impact of deteriorating water quality from the Citarum River is broadly classified into health effects and environmental degradation. This also impacts on the Upper Citarum (Salim, Triharyanto, & Gunawan, 2005). The Citarum Hulu watershed area from Bandung Regency (29 sub-districts), Cimahi City, Bandung City with 26 sub-districts and part of Sumedang District (Cikeruh, Tanjungsari and Cimanggu Sub-Districts) traversed by the Citarum Hulu DAS. It is part of the regency and city areas in West Java province that are traversed and influenced by the Citarum River Basin. The study area of the Upper Citarum Watershed is an area or region in which there is the capital of West Java Province, Bandung (Wilda, 2018).

Geographically the Upper Citarum Watershed is located between 107º30 '-108º East Latitude and 6º43'LS - 7º15 South Latitude with the following boundaries:

a. North side is bordered by Purwakarta Regency and Subang Regency.
b. West side is bordered by the western part of Bandung Regency.
c. East side is bordered by Sumedang Regency and Garut
d. South side is bordered by Cianjur and Garut Regencies.

Changes in river hydrological conditions greatly affect people's lives at local, regional and global scales. Therefore, since more than 40 years ago, researchers in the field of water have stated the importance of integrating social sciences into hydrology in order to understand the relationship between the community and the water system (Xu, Scrooge, Wheater, & Kajikawa, 2018).

Sustainability of ecological functions Watershed River Upper Citarum threatened, its main function is as a source for drinking water and clean water show was an interruption in the socio-hydrological system in the basin. Human behavior is one of the important factors causing ecological damage and

decreasing water quality in the Citarum River. Good or bad water quality, one of which can be influenced by the presence or absence of water pollution. Therefore, the vulnerability index analysis method is obtained to determine the condition and sustainability of the function of the ecosystem of the Upper Citarum River Basin.

Based on Babel *et al*. (2011), water system vulnerability can also be defined as the ability of water systems consisting of environmental components or physical components and socio-economic components, to continue to function in conditions of change, both socio-economic changes due to development or environmental changes due to climate change. Vulnerability is expressed as a function of water stress and adaptive capacity. Water stress is associated with environmental and socio-economic changes. Adaptive capacity is associated with the capacity of people and ecosystems to deal with pressure.

According to Jaramillo *et al*. (2018), quantitatively, resilience can be reflected as a vulnerability index value . Vulnerability is defined as the potential for a system to experience damage. The two main indicators of vulnerability are water stress and adaptive capacity. Water stress is a variable associated with changes in hydrological conditions and socio-economic changes. Adaptive capacity is a variable associated with community capacity and the ability of ecosystems to deal with pressure. The results of the measurement of vulnerability index in a river basin will be translated as the resilience level of the river's socio-hydrological system. High vulnerability index value can be interpreted as a low level of resilience, and vice versa. Furthermore, the results of resilience analysis can be used as a basis for the formulation of a more appropriate and comprehensive water management system for the sustainability of river ecosystem functions.

In this study an appropriate method was analyzed to achieve the sustainability of the function of the Upper Citarum Watershed Watershed by calculating the vulnerability index. Formulas for calculating vulnerability index will be explained in detail in this article. After analyzing the vulnerability index method, then an intervention strategy is carried out to maintain the sustainability of the river ecosystem function. The intervention strategy consists of social inteventions, extended producer responsibility (EPR) and corporate social responsibilty (CSR), and policy interventions, which used to sustain the function of the Citarum River ecosystem.

Data collection methods used in this research are literature review. The findings of this study can be used for further research, namely the calculation of vulnerability index. The right calculation will affect the sustainability of the function of the Upper Citarum Watershed. In addition to finding the right method, this research aims to find out what intervention strategies are appropriate to maintain the sustainability of river ecosystem functions.

Methode

The method of this research is literature review with output intervention strategies for sustainability assessment function river ecosystem. The study of intervention strategies was carried out using descriptive analysis method. The key literature in this study is Jaramillo *et al*. (2018) and Babel *et al*. (2011). According to Jaramillo *et al*. (2018), vulnerability is defined as the potential for a system to experience damage. So, the vulnerable condition is a condition that is not resilient. The two main indicators of vulnerability are water stress and adaptive capacity. Based on Babel *et al*. (2011), vulnerability is expressed as a function of water stress and adaptive capacity. Water stress is associated with environmental and socio-economic changes. Adaptive capacity is associated with the capacity of people and ecosystems to deal with pressure.

The application of the vulnerability index method has not yet been carried out in the Citarum River in Indonesia, which is why this research has the potential to become a sustainable research.

Discussion

River is channel open that occurs naturally in the earth's surface, not only holds water but also stream it from the upstream toward the downstream and into the estuary (Junaidi, 2014). According to Putra (2014), a river can be interpreted as an open flow with a geometric size (visible latitude, elongated profile and slope of the valley) changing with time, depending on discharge, base material and cliffs,

as well as the amount and type of sediment transported by water. Based on the above opinion it can be concluded that the river is a container or natural or artificial channel in which it not only holds water but also flows from upstream to the estuary.

Changes in river hydrological conditions greatly affect people's lives at local, regional and global scales. Therefore, since more than 40 years ago, researchers in the field of water have stated the importance of integrating social sciences into hydrology in order to understand the relationship between the social with the water system (Xu, Scrooge, Wheater, & Kajikawa, 2018)

The sustainability of the Citarum River's ecological functions is threatened , therefore in this study a socio-hydrological review is needed, the main objective being to analyze and predict dynamics in the hydrological and social systems, and the interrelationships between the two, as a basis for analyzing vulnerability strategies that can encourage the achievement of sustainability functions ecological in water source ecosystems (Sivapalan et al., 2014). It can be said that the socio-hydrological system loses its ability to function is a system vulnerable, which has been declining resilience (Folke, 2006). Biggs et al., 2015 states that resilience is an approach that can also be used to analyze the level of sustainability in the Citarum river ecosystem because a vulnerability index measurement is needed .

According to Jaramillo et al. (2018), quantitatively, resilience can be reflected as a vulnerability index value. Vulnerability is defined as the potential for a system to experience damage. So, the vulnerable condition is a condition that is not resilient. The two main indicators of vulnerability are water stress and adaptive capacity. Water stress is a variable associated with changes in hydrological conditions and socio-economic changes. Adaptive capacity is a variable associated with community capacity and the ability of ecosystems to deal with pressure. The results of the measurement of vulnerability index in a river basin will be translated as the resilience level of the river's socio-hydrological system. High vulnerability index value can be interpreted as a low level of resilience, and vice versa. Furthermore, the results of the vulnerability analysis can be used as a basis for the formulation of a more precise and comprehensive water governance system.

Citarum River is the longest and largest river in West Java. The upstream of the Citarum River starts from Wayang Mountain, Bandung Regency and ends at the mouth of the Java Sea which is located in Muara Gembong, Bekasi Regency. The Citarum River plays an important role as PDAM drinking water, supplying electricity in Java-Bali and providing irrigation rice fields in West Java (Pratiwi, 2018). The Natural Resources Research and Development Center and West Java BPLHD state that the water quality conditions of the Citarum River have not been able to meet water quality standards throughout the year, especially in the dry season based on SK. West Java Governor No. 39/2000. Citarum River is still categorized as a heavily polluted river (BPLHD, 2013).

In addition, pollution of the Citarum river water especially in the upstream areas is increasingly being reported, research shows that river water quality has drastically decreased where 127 km or 47.1% of the Citarum river has been heavily polluted, it is estimated, every day the Citarum River holds 280 tons of waste. In 1992 domestic contributed 55%, industry 40%, agriculture and livestock 50% pollutant burden on the Citarum River. One of the main causes of pollution in the Upper Citarum River is agricultural activities around the watershed. The following is a method of vulnerability index analysis to determine the condition and sustainability of ecosystem functions in the Upper Citarum River Basin.

The Vulnerability Index (VI) method is a combination of two indexes, namely the Water Stress Index (WSI) and the Active Capacity Index (ACI). The combination is formulated to be the ratio of WSI to ACI, so that high water stress will reflect a high vulnerability. Classification of the status of vulnerability in a river basin based on Yohe *et al.* (2006) are as follows:

VI < 1 : no vulnerability or very small vulnerability;
VI = 1-2 : moderate vulnerability;
VI = 2-3 : significant vulnerability;
VI > 3 : extreme vulnerability due to stress levels that have damaged the ability to adapt

Vulnerability Index Formula :

$$Vulnerability\ Index\ (VI) = \frac{Water\ Stress\ Index\ (WSI)}{Adaptive\ Capacity\ (AC)}$$

Water Stress Index Measurement Method

Water stress indicates the pressure on the ecosystem of water sources originating from socio-economic activities and environmental changes. Water stress is also a major parameter of damage to fresh water sources. Water stress is defined into 4 main parameters to reflect these pressures, namely Water Variation (WV), Water Scarcity (WS), Water Explotation (WE) and Water Pollution (WP). These four parameters are normalized on a scale of 0-1 and 1 reflecting the highest level of stress . Water Stress Index (WSI) is the sum of 4 (four) indicators that have been weighted. WSI is calculated as a result of the sum of the four variables that have been weighted (Babel *et al*., 2011).

The WSI formula is as follows:

$$WSI = \sum_{i=1}^{n=4} wiWPi$$

Water Resource Variation (WV) is a parameter used to calculate potential water shortages caused by variability in water sources. Variations in water resources over the years determine the reliability of annual water availability. To reflect variations in water resources over the long term, the coefficient of variation (CV) of rainfall over the past 30 years was calculated, with a setting of 0.30 as a critical level of variation (Huang and Cai, 2008). CV is calculated as the ratio of the standard deviation of the average value of precipitation (rainfall).

Water Resource Variation (WV) formula :

WV= $\frac{CV}{0,3}$, jika CV < 0,3

WV=1 , jika CV ≥ 0,3

Information:

WV = Water Resource Variation,
CV = Coefficient of Variation

Water Scarcity (WS). This parameter connects water resources with population and is defined as the ratio of the Falkenmark threshold value of 1700 m^3/person/year (Falkenmark and Widstrand, 1992) for water stress and the availability of water resources per year per capita, in a river basin. This parameter is designed so that if the value increases, the overall value of water stress will increase, and then the vulnerability will increase. Although the water scarcity threshold can vary by region, community group and social class, it has been established as a constant using the Falkenmark threshold value.

Water Resource Scarcity (WS) formula:

WS = $\frac{1700}{WR\ per\ capita}$,

if WR per capita > 1700 m^3/year

WS = 1, if WR per capita is ≤1700 m^3 / year

Information:

WS = Water Scarcity
WR = Water Resource

Water Resource Exploitation (WE). This parameter shows the level of development of water resources, for example the ratio of water utilization to exploitable water resources, which is also used to show the inability of river areas to carry out healthy renewable processes. A threshold value of 40% is set as a critical threshold (UNCSD, 1997).

$$WE = \frac{\frac{Total\ Penggunaan\ Air}{Ketersediaan\ Sumberdaya\ Air}}{0{,}4}$$

if (Total water use/availability of water resources) <0.40 ,

WE = 1

if (Total water use/availability of water resources) ≥ 0.40

Information:

WE = Water Exploitation (WE)

Water Pollution (WP). The development and use of water, in addition to influencing the cycle and hydrological process, will also produce waste and pollute the ecosystem of water sources. Thus, the contribution of water pollution to water resource vulnerability is represented as the ratio of the volume of liquid waste (WW) to the availability of water resources (WR) in a river basin. The critical level of discharged liquid waste discharged into the river is 15% of the available water resources (Babel and Wahid, 2008).

$$WP = \frac{\frac{WW}{WR}}{0{,}15}, \text{ if } \frac{WW}{WR} < 0.15$$

$$WP = 1, \text{ if } \frac{WW}{WR} \geq 0.15$$

Information:

WP = Water Pollution
WW = Wastewater
WR = Water Resources

Adaptive Capacity Measurement Method

The ability to adapt to water scarcity is very important when the availability of clean water resources becomes a limiting factor to meet the needs of clean water. To strengthen the capacity of adaptation it is very necessary to understand the current capacity and explore the potential to increase the capacity. The overall adaptation capacity of social systems and ecosystems is stated in 4 (four) parameters, namely natural capacity, physical capacity, human resource capacity and economic capacity . These parameters are defined so that they are normalized on a scale of 0-1, where scale 1 shows the highest adaptation capacity limit. In contrast to the water stress parameter where a value of 1 reflects high vulnerability, the adaptive capacity parameter of value 1 means that vulnerability is low or ignored.

Natural Capacity (NC). Removing vegetation from the land will change the hydrological cycle and will contribute to the vulnerability of water source ecosystems. Therefore, the natural capacity parameter is defined as the percentage of vegetation cover (eg forests or wetlands) in a river area.

Natural Capacity Formula:

% vegetation cover

Physical Capacity (PC). This parameter reflects the integrated capacity of all stakeholders ranging from farmers and local communities to local and central government in managing water to meet water needs. The main indicators are the coverage of irrigation services and the coverage of clean water services, each of which is used with appropriate weighting to represent physical capacity . In areas with considerable industrial activity, water use for industry is also used as an indicator. Higher service coverage shows the availability of physical infrastructure and adequate financial resources to treat and utilize water, and reduce the possibility of continuous exploitation of water resources in the future (reducing water stress in the future). These indicators are associated with high adaptive capacity in the system to deal with stress .

Physical Capacity formula:

PC = (w1 X Coverage of Irrigation Services) + (w2 X Coverage of Clean Water and Drinking Water Services)

Information:
PC = Physical Capacity
w1 = Percentage of water use for irrigation against total water use
w2 = percentage of water use for drinking water and clean water for total water use

Human Resources Capacity (HRC). This parameter reflects social resources to adapt and meet other human needs. This parameter also shows how flexible individuals in society can adapt to new conditions or new life patterns that occur due to water stress . This parameter is guided by the idea that the working-age population and the educated population have a greater adaptive capacity to deal with water stress . An aggregation of two indicators, namely the literacy rate and economically active population , with a balanced weighting on both, is used to calculate HRC.

Economic Capacity (EC). This parameter is used to explore the level of access to technology and financial resources that can be used to adapt to water stress . The key indicator of this parameter is people's per capita income. This parameter is expressed as a normalized GDP index on a scale of 0-1. The aggregation of 2 (two) indicators, namely the GDP index and the contribution of non-agricultural income as% of total income, with a balanced weighting in both, is used to estimate the economic capacity of the community to deal with water stress.

Economic Capacity Formula:

$$GDP\ Index = \frac{\log(per\ capita\ income) - \log(min)}{\log(max) - \log(min)}$$

Information:

The maximum and minimum values used are based on the Human Development Index by UNDP (2006), which is 40,000 USD (max) and 100 USD (min).

Furthermore, after analyzing the vulnerability index, intervention strategies can be determined for the sustainability of river ecosystem functions.

Intervention Strategy

According to Winardi (2001), strategy is a group of decisions, about what goals will be achieved, the actions needed, and how to utilize resources to achieve these goals. According to Effendy (2003), strategy is planning and management to achieve goals. Meanwhile, according to Adnanputra (2005), strategy is an integrated part of a plan, where the plan is a product of planning which in the end planning

is a basic function of the management process. Vulnerability intervention strategies consist of social interventions, extended producer responsibility (EPR) and corporate social responsibility (CSR), and policy interventions.

Social Intervention

Social intervention is an action that aims to help individuals or groups or families or communities in the context of their social life (Hardjomarsono, 2014). The implementation of the intervention will involve three sets of values that are held, namely (1) personal values, (2) professional values, and (3) values from the wider community (Morales & Sheafor, 1977). In the process of the growth and development of an individual as a member of an adult society the process of absorption of community values occurs by individuals through the process of socialization (Hardjomarsono, 2014).

Extended Producer Responsibility (EPR) and Corporate Social

Responsibility (CSR)

Extended Producer Responsibility (EPR) according to the Organization for Economic Cooperation and Development (OECD) is a policy approach in which producers are given significant responsibility, financially and/or physically-for the care or disposal of post-consumer products. This in principle can provide incentives to prevent waste at the source, promote product design for the environment and support the achievement of product recycling. According to (Wibisono, 2007), CSR can be defined as: corporate responsibility to stakeholders to act ethically, minimize negative impacts and maximize positive impacts that include aspects of the social economy and environment (triple bottom line).

Policy Intervention

Policy interventions involve any action, program or activity taken or mandated by national or international authorities and non-state actors with regulations. Examples include market-based incentives, information schemes and infrastructure provision. Policy interventions often discuss various steps including technology, processes, practices, and behavior (IIIEE, 2019).

Sustainability of River Ecosystem Functions

The river ecosystem needs to be maintained because it has an important role to play in the survival of humans and living things. The main function of the river is as a carrier of water and sediment. Broadly speaking, the main components of rivers can be divided into two, namely watersheds (DAS) and river systems (Kodoatie & Sjarief, 2010). In its role of channeling water from watersheds to the sea, the role of rivers as an element of the ongoing hydrological cycle plays a very important role, besides that rivers carry deposits of erosion and pollutants and participate in the continuation of erosion cycles. These two roles affect the balance of ecosystems and the sustainability of river ecosystem functions (Herlina, 2011).

Acknowledgement

The author gratefully acknowledges the support of the School of Environmental Science, Universitas Indonesia to undertake her master studies, also acknowledges Dr. Setyo Sarwanto Moersidik and Dr. Linda Darmajanti for their constructive criticism of the manuscript, which led to important improvements being made to this paper.

Conclusion

To assess pollution in the Upper Citarum River Basin, a vulnerability index assessment method is needed which is a combination of 2 (two) indexes, namely the water stress index and the adaptive capacity index. Furthermore, the vulnerability index method analysis, carried out intervention strategies to be able to maintain the sustainability of river ecosystem

functions. Vulnerability intervention strategies consist of social interventions, extended producer responsibility (EPR) and corporate social responsibility (CSR), and policy interventions.

Moderationas A Form of Group Work in The Teaching Process

Alicja SZOSTKIEWICZ

WSB University in Gdansk, Gdansk, Poland
alicjaszostkiewicz@wp.pl

Abstract

These theoretical inquiries aim to identify the essence, the significance and the specificity of moderation as a method of group work in the teaching process in higher education settings. The application of moderating solutions affords adults a range of opportunities, including (1) competition, which results in enhancing the effectiveness of their learning processes; (2) participation in open discussions; (3) the creative exploration of solutions, drawing on a range of varied positions; (4) the establishment of partnerships and the development of collaborative capacities. Moderation offers an excellent alternative to the expository methods which are commonly applied in higher education.

Keywords: Moderation, Group Work Form, Teaching Process, Higher Education

As ubiquitously observable today, information society is developing new principles that inform functioning across its various spheres, including social, cultural, economic and political life. Universities and research institutions are not to only actors to introduce new theories, solutions and concepts. Fuelled by globalisation processes, the abrupt development of civilisation has triggered multiple fundamental changes in all spheres of human life. These still ongoing changes have produced enhanced implications for and expectations towards the education sector at all its levels. In this respect, education, perhaps counterintuitively, is by no means a passive object of the changes at hand, but – on the contrary – actively contributes to them (Małecka& Mirecka, 2014, p.196). Responses to the transformations occurring in education include the implementation of an array of innovations, the foundation of alternative schools and the emergence of a new learner category – an adult learner, a HEI student prioritising learning based on innovative methods.

New theories, models and concepts, including those related to the research field of adult education (andragogy), are being devised and implemented in teaching at all levels of education. The specific features of teaching adults are broadly explored and described in the literature.

The teaching process itself can follow a variety of trajectories. In their learning process, some learners need freedom, the individual pursuit of goals, the observance of partnership rules and respect for their autonomy. Others, on the contrary, need control, orders and directives (Pierścieniak, 2005, p. 19).Adult learners form a group which is diversified in terms of age, developmental stage, level of knowledge, experience and type of motivation for learning.The andragogical model of learning proposed by S. M. Knowles fundamentally differs from the assumptions of the entrenched pedagogical model, which was widely embraced by teaching professionals until quite recently(Knowles, Holton, &Swanson,2005, p. 61). Knowles's andragogical model is underpinned by the idea of learners' need and capacity for independent decision-making. The four basic differences between the traditional teaching of children and adolescents and the teaching of adults, as listed by Knowles, are: (1) the different perception of learners and their self-concepts; (2) the experience possessed by learners; (3) learners' readiness to learning; and (4) the learners' orientation to learning(Knowles, Holton, &Swanson, 2005, pp. 64-67).

Motivation is an elementary condition of involvement in educational activity. The level of motivation for learning often depends on the educational offer. For the effectiveness of teaching to increase, the teaching content and the selected methods should be aligned with needs and expectations. In adults, motivation is primarily driven by curiosity, interests, needs and self-interest. This means that every person should know the aim s/he seeks to achieve and that this aim should be of considerable

personal value (Szostkiewicz, 2019, pp.129-130). In the case of adults, internal motivation is dominant, for they learn of their own accord. Another characteristic feature of adult learning is that it is instrumental. As adults are outcome-oriented, they seek to immediately master knowledge and skills which are relevant to and applicable in practice. Knowledge is an individualised structure and the accumulated information is of scientific nature, but adults increasingly frequently are exposed to knowledge coming from life experiences. Experience is a vast source of knowledge both for learners and for other actors involved in the process of learning (Matlakiewicz&Solarczyk-Szwec2005, p. 37). To sum up, it is very important to properly design the teaching process, in particular to plan and apply appropriate methods of didactic work with adults. Moderation is one of the methods of working with adults which, I argue, should be adopted in higher education on a large scale.

The etymology of the notion of moderation is quite complex in itself. The first segment of the word – "me(d)" – means to wander, to cover/measure in steps, to pass, set/demarcate oneself an aim, to measure out and to take measure. Crucial to my argument is the word modus, which primarily denotes measure/manner. This semantic scope encompasses, on the one hand modestus (modest, moderate) and on the other moderare (mitigate/restrain) (Kopaliński, 2007, p. 369)1. Complicated as it is, the very etymology of the term suggests that it refers to a certain manner of guiding and leading from one stage to another (Małecka& Mirecka, 2014, p. 200).

Moderation has also its philosophical underpinnings. Its basic cornerstone is provided by a particular mindset. This mindset is the source of all the techniques used within this method of group work in the didactic process (work in groups, participation in discussion, brainstorming, role-playing, simulations, visualisations of work outcomes, etc.).Emphatically, the method also builds on the resources of several scholarly disciplines: education sciences, sociology, management sciences and psychology. The main principles of moderation include mutual respect, respect for the individual as a member of the group and respecting other members' right to hold their own, different views. Hence, it is crucial to express views in ways that make it possible to use the knowledge and develop the competences and skills of all the group members (Neuland, 2001, pp. 58-59).When applying the moderation method, it is important to abide by certain tenets in working with the group: (1) group work is always supervised by a moderator/moderators; (2) works is planned and purpose-oriented; (3) all the participants are on equal footing in their mutual relations; (3) information is fully shared by the participants; (4) extensive visualisation of work; (5) activities follow the pre-arranged moderation agenda; (6) the course of work is constantly monitored and its effects are controlled; (7) the time of work is pre-defined, and (8) the problems which are the object of moderation must be developed and solved (Łasińsk&Głowicki, 2006, pp. 639-646). Consequently, moderation can be described as a method of group communication the main aim of which is problem-solving. In this method of working with the group, an important role is assigned to the moderator who helps determine the subject, aims and sequence of work, establish the expected outcomes, search for solutions to problems and select heuristic methods and techniques. Additionally, the moderator fosters an appropriate atmosphere, monitors the course of moderation and helps arrive at a consensus or a compromise (Potocki&Łukasik 2014, pp. 21-31).The method of moderation has both advantages and limitations which affect the didactic process.

Table 1: Advantages and limitations of the moderation method in the didactic process

Advantages	Limitations
- highly engaging due to the opportunity to express feelings and emotions; - makes it possible to find out about various points of views, proposals and arguments;	- group size (maximum 15–20 people; most effective in groups of 10–12 people) - time - time-consuming preparation of

[1] This etymological explanation is partly based on "moderation" and "med" entries in the *Online Etymological Dictionary* available at https://www.etymonline.com/ (Accessed 20 March 2020).

- strong identification with the outcomes of work; - promotes mutual support and help; - triggers the synergic effect in relation to the compiled ideas; - promotes the self-reliant determination of the division of work	moderation

Based on G. Łasiński& P. Głowicki (2006, pp. 639–646)

Depending on the selected problem and expected outcomes, the course of moderation in the teaching process can follow various trajectories. Effects which are interesting in terms of the didactic process can often be achieved by combining a theoretical problem with a practical one. The moderator can chose techniques of group work depending on how much time is planned for the activity. Importantly, it is useful to divide the group into smaller subgroups which implement respective parts of moderation (Kowalewski&Głowicki, 2017, p.136).

The Figure below visualises the cycle of moderated group work.

Figure 1: The classical cycle of moderation

Based on G. Łasiński& P. Głowicki (2006, pp. 639–646)

New approaches to higher education insist that it should be student-oriented. This causes the shift of the paradigm from teaching to learning (Malewski, 1998, p. 47), and the central goal is defined as preparing students for living, working and managing the challenges of the quickly transforming reality (Wróblewska,2012, pp. 14-16).Given this, the advantages of relying on moderation in the didactic process lie not only in that it provides support for the commonly used expository methods of teaching, but also in that it affords ample opportunities of improving organisation, self-organisation and self-education in the work and development of students who, while mastering the curricular content, form their attitudes and perfect their competences and skills within university classrooms.

Interactive learning at Science Centres and Museums

Associate Professor Jolanta KRUK

University of Lower Silesia
Wroclaw
Poland
jkruk@wsb.gda.pl

Abstract

In modern Science Centres and Museums, a number of activities take place including learning according to the principles of constructivist didactics. The article presents a research project on optimal rules for constructing experimental stations. Other research queries relate to conditions that an interactive learning model should meet to initiate a participant′s cognitive change. Interactive learning seems to meet these criteria to a large extent.

Keywords: Interactive learning, Science centres and museums, activity station, developmental cognitive change.

Introduction

The forms of education available today at science museums and centres are considerably diversified, and there is currently no entrenched model of educational practice at these institutions. Hence, a lot depends on the inventiveness and ingenuity of the organisers. Exhibits and activity stations at respective science centres sometimes initiate a lively research process, including the formulation of problem questions, the development and testing of hypotheses and the comparison of possible solutions. However, visitors are often simply asked to read and closely follow the attached instructions, performing experiments step by step to achieve the pre-planned outcome. This represents what is known as the *reactive model* of learning, which constrains the participant's cognitive autonomy. As observable in a typical classroom, the participant's research involvement is diluted and subject to external control. Some exhibits themselves are constructed as instructional pieces and suggest a fixed sequence of activities. However, situations in which neither the course of activities nor the expected didactic effect is prearranged by the organisers are in fact much more desirable and valuable in educational terms. In this approach, only certain input data included in the exposition are provided, while the expected outcome is not defined. In this *inter-active* learning model, the meaning of actions is only established while exploring an exhibit, which makes for the cognitively most valuable form of learning. *Interaction*- based learning is a conscious process that differs from instruction-based and imitative learning, which is, against all appearances, not infrequent at vigorously bustling science centres and museums. The constructivist premises which underlie interaction-based learning also underpin the research project described in this paper.

Justification of the research goal, problem questions and the research strategy

In order to augment knowledge about the specific features of learning at science centres, I have recently embarked on a research project which continues my years-long studies on the strategies employed at science museums and centres. I carried out those investigations at multiple science centres across Europe, including the Museo Nazionale della Scienza e della Tecnologia Leonardo da Vinci (Leonardo da Vinci National Museum of Science and Technology) in Milan, the Museo Tridentino di Scienze Naturali (Tridentine Museum of Natural Science) in Trento, the La Vilette Science Centre in Paris, the Science Museum in London, the Deutsches Museum (German Museum of Science and Technology) in Munich, the Spectrum Science Centre in Berlin and the Phänomenta - Experimentarium in Peenemünde, Germany. As a result of this research, I identified a number of educational strategies implemented by European science centres and museums. My observations and

interviews at these institutions made me realise that neither technologically advanced displays nor imagination- and engagement-stirring collections of exhibits fully guarantee that the goal of initiating an interactive learning cycle will be accomplished. Consequently, I have commenced a comparative research project at Polish science centres in order to expand and supplement my prior insights.

My project is informed by theories of learning which draw on early 20th-century progressive pedagogical movements and the contemporary tenets of psychological constructivism. The idea of learning based on the interactive didactic model has received ample theoretical support. The model originates from the broadly understood active school, whose founders, such as John Dewey, Georg Kerschensteiner, Helen Parkhurst, Célestin Freinet, Ovide Decroly, William Kilpatrick and Carleton Washburne, called for progressive experience-based education, in which learning proceeds "from touch to understanding". The active school model, which was picked up and continued within the constructivist movement, initiated by the works of Jean Piaget (1966), Jerome Bruner (1996), Lev Vygotsky (1989), Michael Tomasello (1999) and later in cognitive sciences Antonio Damasio (2011) and Daniel C. Dennet (2016) in , became the leading approach to museum education in the 20th century and was soon embraced by science centres, as it was far better adaptable to the learning conditions they offered than the traditional school, entangled in the formalised pedagogy of Johann Friedrich Herbart.

Espousing the constructivist paradigm, the contemporary champions of the active school recognise that learning is an activity in which conscious subjects construct their objects of knowledge through intensive exploration. This involves launching operations which serve to identify the resources of meanings, new concepts and relations among them as well as engaging in communication with the co-participants in the research process. Such processes are promoted by properly arranged learning environments. Science centres and museums are ideal sites that foster active learning; observably, however, research processes are not always sparked off as the participants engage in their activities.

In order to operationalise this issue, I will use the example of "colour mixing," an activity station comm only featured at the optics sections of science centres. The item includes a screen and three tubes coloured red, yellow and blue. By projecting the colour from the tubes onto the screen, participants can obtain varied effects, depending on how many colours are mixed and how intense they are. The experiment comes in a wide array of variants. In its very frequent version, the participants are guided by a script, which prevents mistakes, and find out about the theory of colour and colour mixing by testing it in the experiment as described in the manual. This approach precludes genuine experimentation since the entire exercise is pre-set by the organisers, as a result of which the activity boils down to imitating the steps fixed in the instructions to arrive at a predictable outcome. This framework can be described as (reactive); learning by following.

In another version, the exhibit is the same, but learning conditions change, because solely the preliminary data and a general description of colour mixing are provided without any detailed guidelines. The participants have coloured tubes and a screen at their disposal. Additionally, thematically related activity stations may be placed in the same display zone. This represents an organised environment of interaction, in which explorers are encouraged to engage in an experimental activity whose ultimate outcome is not pre-supposed. Since there is only an exhibit amidst an arranged situation, the participants are prompted to search for answers as questions offer themselves. The moments of the participants' engagement and focus on the exhibit in the process of exploration carry the greatest educational value. A cognitively appealing learning environment is indispensable to sustain this attention, and science centres are known to boast enormous possibilities of galvanising the visitors' active involvement. In this context, we may inquire to what degree this involvement will translate into deeper conceptual knowledge, and what conditions are necessary for the experiment-initiated learning process to persist in time beyond the science centre.

Continuing my studies on education at science museums and centres, I currently seek to answer the following questions:

- What conditions should be met by the interactive model of learning at science centres and museums?

- What properties of activity stations and exhibits at science centres and museums contribute to triggering intensive learning founded on independent exploration and experimentation?
- What conditions must be met for a study station to catalyse a developmental cognitive change in participants? What factors hinder the initiation of such a change?
- Which experimentation- and exploration-serving exhibits at science museums and centres stimulate interactive learning? What are its distinctive features?

Consistent with these research questions, the project will rely on visual ethnography as the method of data collection, including observations supported by video recordings and photography, interviews with the staff of science centres and people who arrange expositions, and also short conversations with visitors. The coding and interpretation of research results will be performed based on thus-registered data sets. The obtained categories will be employed to construct a model of interactive didactics. Additionally, the materials compiled when conducting research in the centers listed above, will also be used in the project. For the purposes of comparative analysis, these resources will be complemented with the data collected at Polish science centres and museums: the Copernicus Science Centre in Warsaw, the Hewelianum Science Centre in Gdansk, the Hydropolis in Wroclaw and the Museum of Municipal Engineering in Cracow.

The significance of research into interactive learning at science centres and museums

The interactive model of learning in the conditions offered by science centres generates an explorative attitude which is only possible if the participants' cognitive activity remains unrestrained. Admittedly, these conditions at science centres are not natural, but they offer ample opportunities of discovery and imaginative involvement, whatever the discoverer's specialist knowledge. The organisers of experiment stations activate the participants' inventiveness and facilitate hypothesis-testing, by passing school instruction. That the learners' attention is consistently sustained is caused not by external demands but by an interest which is spawned by the interactive features of the experiment station. Exhibits, so to speak, "call for" the participants' attention and involvement in explorative activities. At this point, we should reflect on the essence and characteristics of the phenomenon of interactive learning which in fact resembles the "trial and error method."As observed by the museum education researchers John Falk and Lynn Dierking (1995) and E.P. Alexander, experiments at the museum characteristically leave the initiative to the learners, who decide on their own what, how and with whom they learn. Such situations can easily involve random choices and superficial learning. For this reason, the educational conception of the exhibition, the structure of the display and the construction of the exhibits should all be carefully devised. When designing experiment stations, one should have in mind possibilities of active exploration in which the impression-registering senses play a dominant role. But the process of exploring and knowing can take another shape, one in which the rules of logic which govern the experiment are applied, and the question "why does this happen?" is a prelude to involvement in the research process. An understanding of the principles of constructivist pedagogy, the methods of eliciting and sustaining attention and the dynamics of cognitive processes is critical to constructing an effective experiment station and avoiding the pitfalls of quasi-interactivity, in which learners engage in sometimes uninformed intensive actions but do not grasp the core of the issue and solve the problem by following a manual, rather than by mobilising their own resourcefulness.

The research project as outlined above has been undertake in response to numerous observations not only revealing the wealth and diversity of stations and exhibits at science centres but also pointing out real difficulties which organisers of interactive exhibitions must confront. Learning at science museums and centres is an unusually valuable activity which furnishes the participants with sensory and observational materials from experimentation. As a consequence of interaction with objects, the learners acquire procedural knowledge, which can become a seedbed for complete representations that form the system of conceptual knowledge. Museum education research which addresses interactivity at science museums and centres may considerably support these processes.

Abstract

Recent studies point to the discussion of two relevant topics in cruise companies; sustainability, which is the company's ability to manage its activities and create long-term value, while adding social and environmental benefits to its stakeholders and marketing 4.0, which is the company's ability to insert technologies into its operations, to horizontalize procedures; include emerging consumer markets and share experiences of social recognition. Cruise Tourism becomes one of the most promising segments, as it provides a new way of traveling, combining transportation, accommodation, food and several itineraries, being able to visit more than one city / country. By combining these themes, the object of this research is the company MSC Cruises, which has excelled in the market for innovating its vessels, including sustainable technologies that minimize impacts to the environment, approaching customers and creating products aimed at their needs. Therefore, the objective of this article is to present the challenges that the company MSC Cruises has faced in the face of sustainability and 4.0 marketing in its operations. One wonders, what are the challenges that the company MSC Cruises has faced in the face of sustainability and 4.0 marketing? In this sense, a descriptive research was carried out, with bibliographic basis in books, scientific articles, magazines, newspapers, master's dissertations, doctoral theses and on the MSC Cruzeiros website. It was observed that there is a lack of scientific research on the subject, which brings more originality and value to this article.

Keywords: Sustainability. Marketing 4.0. Cruise Tourism. MSC Cruises.

Introduction

Sustainability arises as a response to the turbulence of globalized economies, in which companies began to orient their priorities towards business and to make commitments related to environmental and social concerns as part of a strategy to create added value to the products and services offered. Therefore, Marketing 4.0 is a natural development and deepening of Marketing 3.0, and its major premise is to adapt to the profound changes in customer behavior in the "era of connectivity and the digital economy" - a more horizontal, inclusive and social era (Sebrae, 2017). Therefore, cruise lines that want this new

client / tourist - inclusive, social and horizontal - will have to invest in a marketing plan that includes actions aimed at aligning their communication with them. With this in mind, the company MSC Cruises forms partnerships with international suppliers, seeks to ensure projects of the highest level of integrity and invests in projects that provide quantifiable benefits to communities, protect the environment and support the UN Sustainable Development Goals. All this while continuing to apply the latest and best sustainable marine environmental technologies to all new ships (and existing ones). And we are increasingly investing in supporting the development of next generation technologies for zero-carbon operations.

The construction of this manuscript is justified, due to the lack of scientific material related to the junction of the sustainability x marketing 4.0 area and sea cruises. Therefore, the general objective of this article is to present the challenges that the company MSC Cruises has faced in terms of sustainability and 4.0 marketing in its operations. One wonders, what are the challenges that the company MSC Cruises has faced in the face of sustainability and 4.0 marketing? The methodology used was the research of a descriptive nature, presenting MSC Cruzeiros as an object of study, with bibliographic basis in books, scientific articles, magazines, newspapers, master's dissertations, doctoral theses and on the MSC Cruzeiros website. It was observed that there is a lack of scientific research on the subject, which brings more originality and value to this article. The theoretical basis was divided into 3 chapters, the first of which was the approach to sustainability. In the second part, it was about marketing 4.0; in the third chapter it focuses on Cruise Tourism showing how they can boost tourist destinations and on MSC Cruises and their challenges in terms of sustainability and marketing 4.0.

Theoretical Background

Sustainability

Concerning about the environment can be seen since the 18th century in Europe, and over time, clearly the proportions of this concern have increased and spread to other regions of the world. This has influenced the holding of conferences to discuss environmental issues, such as the United Nations Conference in Stockholm (Sweden) in 1972, and the “Eco 92” in Rio de Janeiro (Brazil) (Pinto da Silva, Brandão & Sousa, 2019). Despite the complexity, sustainability can also be attributed to tourism, because this activity contributes on preservation, can provide funds to invest in a region and can be a tool for social inclusion. According to Körössy (2008), the systematization of tourism in a sustainable way becomes essential for the good development of the activity, but according to Hanna et. al, (2017) not all forms of tourism are potential to become sustainable, because the most propitious being those that have the environmental issue as a focus (Sousa & Silva, 2019).

Sustainability comes from the Latin “sustentare” which means to sustain, to support, to keep in good condition (Paz & Kipper, 2016). There are several meanings arising from the integration of different intellectual and political currents, such as (Gatto, 1995; Mebratu, 1998; Paehlke, 2005; Ciegis et al., 2009; Feil & Schreiber, 2017): a) defense-oriented biology the correct exploitation of natural resources, which manifests itself in a constant and perpetual income; b) ecology, which is linked to the preservation of individual species in ecosystems subject to human intervention; 3) the economy, which adheres to economic growth without compromising natural resources; and 4) sociology, which is linked to a development that preserves society, maintaining social relations. Then there is the difficulty of finding a unique and comprehensive concept that brings together the different currents.

Sustainability is discussed as a state in which three types of interests (or conflicts) are fulfilled (or resolved), simultaneously: (i) the interest of the current generation in improving their real living conditions (economic sustainability), (ii) the search for an equalization of living conditions between rich and poor (social sustainability), and (iii) the interests of future generations that are not compromised by meeting the needs of the current generation (environmental sustainability) (Horbach, 2005; Sartori, Latrônico & Campos, 2014). Martinet & Reynaud (2004) and Sartori, Latrônico & Campos (2014) contribute to the understanding of the role that organizations can play in society. According to the authors, companies would move between two extremes: a financial extreme and a

sustainable extreme. The financial extreme encourages a short-term horizon, standardizing growth models, which seeks control and submission to formal procedures. The sustainable extreme, as opposed to the financial extreme, aims, in the longer term, to develop internal skills, concern with the social management of employees and concern with the ecological impact given the organization's activities. Furthermore, sustainability can be achieved through an integrated and holistic management of the human environmental system. Jabareen (2008) and Feil & Schreiber, (2017) emphasize that the protection of the environmental, social and economic issues of this system must integrate the process of sustainable development. This protection effort must be carried out through the union of all stakeholders - public, business, social policies, among others - at the international, national and regional levels (Sousa & Rocha, 2019).

Since the term sustainability emerged in the business world, a growing number of companies have realized the importance of sustainability to leverage their business. (Global Reporting Initiative (GRI), 2014; Campos et al., 2013 and Paz & Kipper, 2016). A company to be sustainable and competitive today must seek eco efficiency in all its actions and decisions, produce more and better with less pollution and less use of natural resources, in addition to being socially responsible. Ignoring this reality will cost you sooner or later (Almeida, 2002 and Paz & Kipper, 2016). The search for sustainability must undoubtedly generate organizational innovations, companies need to reformulate products, technologies, processes and often business models that transform the competitive scenario, the author in his studies demonstrates the innovations created by different organizations based on sustainability needs (Nidumolu, Prahalad & Rangaswami, 2009, Wals & Schwarzin, 2012; Silveira, 2013; Paz & Kipper, 2016). This item will be better presented in the next seccion.

Marketing 4.0

Since the beginning of the 20th century, marketing has evolved its direction, starting from an orientation centered on the product, going to a greater focus on the customer and, until then, on an approach that takes into account the human being itself. However, from 2010 to the present, the behavior of individuals has changed, mainly due to the technological revolution caused by smartphones, which have expanded the power of convergence of content, entertainment and experience (Monteiro & Barretto, 2017). The convergence culture provided a new habit for internet users regarding media consumption, because within the same media environment it is possible to consume texts, images, audios and videos, without the need for a different device for each format. The countless pages and websites on the internet have also allowed the user a type of experience where he can acquire information from anywhere on the planet, all in one device (Monteiro & Barretto, 2017). Brands need to offer solutions that help customers save time, in addition to making life easier and bringing more socialization in the exchange of interests. There are several ways to put Marketing 4.0 into action. Storytelling (with the creation of relevant stories), Content Marketing (with the creation of personalized content, aimed at customers), gamification (simulation of games), are strategies that contribute to arouse curiosity about your brand. Advertisements and advertising campaigns give rise to relevant materials that add value to the company's image, as well as the creation of a persona, with behaviors and values (Moreira, 2017).

For Kotler (2017), loyalty needs to be interpreted as the customer's willingness to defend the brand. Therefore, the intention of marketing 4.0 is to provide this. The main transformations of marketing 4.0, were: Traditional vs. digital; focus on the social, ends of hierarchies and horizontalization; humanization of the brand; need for inclusion; change from 4P’s (product, price, place and promotion) to 4C’s (Customer, cost, convenience and conversation); Wow moments (the company goes beyond good service); multichannel experience (multiple channels and technologies to get what you want); mobile experience (access to applications via smartphones); promoting clients (Tardelli, 2018). Marketing 4.0 translates into an approach that combines online and offline interaction between company and customers, between digital and traditional. Based on this reality, the role of marketeers is to accompany the consumer in all its stages, from the attention given to a product / service to the defense of the brand. Marketing 4.0 argues that the AIDA paradigm (attention, interest, desire and action) is already outdated, thus implementing a new one: the five A's model: aware (awareness), appeal (appeal), ask (questioning), act (action) and advocate. These five A's are related to the consumer travel process (Moreira, 2017). In addition, he is an apologist for the fusion of the “connectivity” and

"transparency" aspects that the internet has now reinforced, of brands that reflect friendliness and accessibility, but also vulnerability. The mechanical side of the brands and the obsession with perfect appearance have been intimidating the consumer. The humanization of brands, translated into an assumption of eventual failures on the part of them, in an approach to the customer and in the creation of differentiating experiences, will never disappoint (Kotler, 2017).

Cruise Tourism

Interest in niche markets is not new. The novelty is, however, in the increase in the diversity of markets and in the technologies that allow new approaches to marketing (Dalgic and Leeuw, 1994; Sousa & Simões 2010; Vilas-Boas et al., 2019; Ferreira & Sousa, 2020). In tourism, niche products need further development and commercialization in response to the evolution of world tourist demand, in order to increase per capita tourist revenues (Hall, 1999; Sousa & Simões, 2010). Nautical Tourism is all navigation made by vessels on the water, be it river, sea, ocean or lake. It differs from other types of tourism since the main attraction is the vessel that serves as a means of tourist transport at the same time (Ministério do Turismo do Brasil, 2010; Marques, 2019). Based on this classification, it is possible to include Cruise Tourism and River Tourism in the Nautical Tourism segment. Cruise tourism is the focus of this research. A cruise is a transport vehicle, to which the journey begins at a port of embarkation, which is mostly where it will be the point of disembarkation from it (except for longer journeys such as around the world, where you embark in one country and disembarks in another), with stops, which would be the predetermined scales (Machado & Peluso, 2013).

Sea cruises have become a phenomenon of tourist activity in the world, representing one of its most promising segments, as pointed out by the Cruise Line International Association, an association that represents the world sector (Clia, 2015; Farias & Trigo, 2016). They start to provide a new way of traveling, with packages and closed itineraries, where they did not have to worry about adversities, such as delays, flight cancellations, lost luggage, among others, that can be found on any trip. The combination of transportation, accommodation, food and several itineraries, being able to visit more than one city / country at a closed price, has caused the number of cruisers to increase (Santana, 2017). Teye and Paris (2010) and Marques (2019) state that the ship itself, its characteristics and the goods and services it offers can be a major motivating factor for some tourists to opt for cruises, even arriving (for some) the ship to be considered the tourist destination itself. Another motivating factor is the fact that most cruise vacations are sold in all-inclusive packages, making it an "easy" vacation with almost everything available in one place. The combination of different ports of call instead of a single holiday destination can also be a strong motivation for choosing this type of tourism as it allows passengers to experience multiple destinations, often in different countries or continents, in one trip.

For the cruiser, the main objectives of his trips are based on the desire to relax, get away from daily obligations, learn something, be "pampered" in his needs, have fun and have a new experience (Mancini, 2010; Ramoa & Flores, 2014). About the experiences Perez (2016, p. 49), comments that the brands have the intention "to penetrate our senses and cause pleasant and even affective sensations that lead us to an approximation. The goal is to establish a connection - and if it is emotional, so much the better". What can be observed is that the market for people who want to live "the experiences" has grown in the most diverse sectors and on cruises this is no different. Thinking of meeting the needs of customers / tourists and offering activities that exceed their expectations, cruises have invested part of the money destined for general investments, in the purchase of new ships that cause less damage to the environment, in innovative but also sustainable actions, in tourist itineraries that in addition to adding value to the products that offer to bring customers closer to their brands, providing them with unique experiences.

Therefore, the global cruise market has been divided between four major companies, Carnival with 46.2% of the market, Royal Caribbean Cruises, with 21.8%, Star Cruises with 7.9%, Mediterranean Shipping Cruises (MSC) with 6.0% and the remaining 18.1% distributed among other companies (Clia, 2012; Ramoa & Flores, 2014). When dealing with this global market, an analysis was made to see if the placement in size of these companies, remained the same, and it was perceived that partially yes. In the first place is the Carnival Cruise Line with a fleet of 29 ships, in second place Royal Caribbean Cruises, with a fleet of 26 ships, in third place Princess Cruises, with a fleet of 20 ships, in fourth place

Mediterranean Shipping Cruises (MSC) with a fleet of 19 ships tied with AmaWaterways, but among them, MSC has more popularity, because it provides trips to more continents (Dreamlines, 2020). In the next chapter you will be approached about the MSC cruise company, for having agreed that it has invested in improving its fleets, being considered one of the most luxurious in the world, for being concerned with sustainability, reducing its impacts on the environment, for being in compliance with the requirements of customers in terms of experience offering diversified sustainable routes, and for being attentive to the most different technologies, since the moment has been lived when people in the world consume technology and are connected (online and offline) to search for the brands that best communicate in the most diverse environments with your needs.

MSC Cruises and its challenges in the face of sustainability and marketing 4.0

MSC Cruises is a cruise brand that has achieved a high growth rate compared to other cruise lines in the world. Headquartered in Geneva, Switzerland, MSC Cruises is part of the Cruise Division of the MSC Group, Switzerland's largest logistics and transportation conglomerate (Yoshida, 2019). MSC Cruises' fleet consists of 19 modern and innovative ships and is one of the most environmentally advanced in the sector (Dreamlines, 2020). The company is committed to environmental management and works to minimize and continuously reduce the environmental impact of its fleet at sea and on land, using innovative marine and environmental technologies. (Yoshida, 2019). With an unprecedented investment plan in the sector of 11.6 billion euros, MSC Cruises' fleet will increase to 25 ships by 2027. In addition, the MSC Group's Cruise Division is investing another 2 billion euros in a new luxury cruise brand, including four super yacht ships, launching one per year between 2023 and 2026. (Yoshida, 2019).

Sailing to more than 200 destinations across five continents, MSC Cruises brings together more than 180 nationalities from around the world, offering an enriching and immersive cruise experience, inspired by the company's European heritage. It offers international dining options, world-class entertainment, award-winning programs for families and the latest technology for guests on board. (Yoshida, 2019). The global maritime industry recognized MSC Cruises' sustainability efforts with the 2019 Neptune Award, as “Greenest Shipowner of the Year”. The recognition was presented at the Global Maritime Transport and Sustainable Ports Forum in Copenhagen, Denmark. The award is given annually to a ship company that has demonstrated excellence in reducing the environmental impact of its fleet's daily operation, implementing cutting-edge technologies and practices, boosting the maritime sector's journey towards a sustainable future. (Msc, 2019)

Having embarked on a journey of continuous improvement to achieve a "zero impact" future, MSC Cruises is taking many initiatives to continue minimizing its impact on the environment, through the development and deployment of marine technologies to preserve and protect the environment. throughout its fleet (Msc, 2019). MSC Cruises has, for more than 10 years, equipped its ships with advanced wastewater treatment systems that purify effluents to a quality close to tap water. All ships in its fleet are equipped with modern systems to reduce, recycle and reuse solid waste. An extensive range of single-use plastic items on board has also been eliminated (Msc, 2019). In addition, in its most recent ships, it cared about environmental management technology and received the “Green Star 3 Design” award from the International Classification Society RINA, which specifically recognized that the MSC achieves the highest levels of ecological compatibility, reducing the impact during its operations.

Among the innovative items created specifically for MSC ships include: energy-efficient hull and overall design. The overall design of the ship, the hull, the rudder and the bulbous bow are configured to achieve hydrodynamics, aerodynamics and maximize energy and fuel efficiency (Ambiente Magazine, 2018); Trim optimization, software to monitor ship stability in real time. This technology supports ship officers to reduce fuel consumption and optimize performance; Hull paint on all MSC Cruises ships is coated with special ecological paints that prevent the growth of barnacles, algae and marine organisms in order to significantly reduce resistance (Environment, 2019). Exhaust Gas Cleaning System (EGCS) to minimize sulfur and emissions of specific particles, as an EGCS removes up to 97.1% of sulfur dioxide and greatly reduces particulate emissions. By the end of 2020, 13 of the 19 ships in the MSC Cruises fleet will be equipped with an EGCS; Shore-to-ship energy since 2017,

they are already equipped to receive land energy (also called “cold ironing” - a means of connecting cruise ships in ports to the local power grid). This technology that can potentially help to reduce atmospheric emissions in port areas; Ballast water treatment system: To protect the marine ecosystem in which the ship sails, it meets the standards established by the international body for Ballast Water Management, the International Maritime Organization (IMO) (Ambiente Magazine, 2018).

Other advances regarding environmental issues, specifically designed for MSC ships were: offsetting direct carbon dioxide (CO2) emissions from the fleet's maritime operations through a set of carbon offset projects developed in accordance with the highest standards leading international institutions that take immediate action on greenhouse gas emissions. Blue carbon offsets are a specific focus of the commitment to ensure carbon neutrality with immediate effect, directly benefiting the oceans and communities that live by the sea; State-of-the-art selective catalytic reduction (SCR) that helps reduce nitrogen oxide emissions by 80% through advanced active emission control technology. The nitrogen oxide from engine operations is conducted through a catalyst - a high-density device made of noble metals - and is converted into nitrogen and water, both harmless compounds and started the construction of MSC Europa, the first of five powered ships LNG (liquefied natural gas) and which will enter service between 2022 and 2027.

MSC also thought and adapted its boats for Environmental Management on Board, where every ship in the fleet has an environmental management plan and each ship has a dedicated Environment Officer in order to ensure that this plan is constantly monitored and complied with correctly. This officer also has a duty to instruct and train crew members on board on environmental and waste management; Advanced wastewater treatment that goes well beyond regulatory standards and meets industry high standards. The Wartsilä / Hamworthy system treats wastewater to a very high quality, better than most on-site municipal waste standards worldwide. The ship is also equipped with an electronic tool that helps to fully comply with several other local and regional environmental regulations; for consumption optimization (Ambiente Magazine, 2018).

Finally, regarding the adaptations of ships to environmental sustainability, energy-saving LED lighting was added: MSC use only efficient LED energy and fluorescent lighting; Intelligent heating, ventilation and air conditioning (HVAC) system, this is one of the biggest energy consumers on a cruise ship, but the system on board was created in an intelligent way to reduce energy consumption. It distributes heat and cold intelligently and is configured to recover heat, for example, from the laundry room, which can be used to heat swimming pools or other parts of the ship. (Ambiente Magazine, 2018).

It is observed that all the adaptations made on MSC ships, had the intention of inserting technologies but thinking about sustainability, effective actions to minimize and / or continuously reduce the environmental impact. Regarding the insertion of technologies, modernization of spaces, inclusion of social and sustainable projects, training of staff and awards, they are made available to their clients / passengers through advertisements, blogs, content of materials on numerous pages and website, always approaching the customer / passenger to the brand.

Thinking about the quality of travel and meeting the needs of customers / passengers on board, providing unique experiences, MSC launched a program of sustainable excursions, called Protectours, which initially proposes 22 visits to unique places on the planet, with the guarantee of reduced environmental impact and close contact with nature (Publituris, 2020). These tours mainly serve two purposes: first, they represent an opportunity for MSC to enable its tour partners to diversify their offer to include more sustainable activities and, second, to influence them to operate in their business in a more sustainable, committing to the Global Sustainable Tourism Council certification program by the end of 2020 (Publituris, 2020).

Protectours offer guests the opportunity to enjoy unique insights into the natural world, while preserving its beauty and helping to ensure a greener future. What sets the tours apart is the exceptional service and the element of adventure on land that guests experience with MSC, in different environments around the world. (MSc, 2020)

The 22 (twenty-two) trips created by the Project and the experiences offered are presented below. It is important to mention that all the descriptions of the trips were extracted from the official website of MSC Cruises, since because it is an innovative project, there are still no materials published in other media. Thus, the first description of the trip is the Walk through the forest with dogs rescued by 'Animal Haven', in Montego Bay in Jamaica, offering the experience that allows travelers not only to walk with dogs rescued from 'Montego Bay Animal Haven'. Haven dogs are affectionately nicknamed hooligans. Each of them suffered from hunger, dehydration, injury or abuse (Msc, 2020). It was observed that for the MSC to be closer to the customer, horizontality was inserted, making it possible to create projects of experiences of sustainable experiences in Protectours trips, in the way that their clients / passengers desired, causing the Wow moment, overcoming service. Thus, in the vast opportunities for sustainable travel, customers / passengers have the experience of discovering destinations in a unique way, in addition to making a positive contribution to the planet, through activities designed to protect and preserve it.

Final Considerations and Future Research

Sustainability has become part of the routine of organizations aware of the demands of the planet, however it is still unnoticed in the lives of many people. Adopting sustainable measures goes far beyond the noble choice of protecting the environment, but it can be a means of reducing production costs and the final value of products and, mainly, for strengthening the brand. Therefore, in order to stimulate the implementation of the European Directive on waste on board ships, as well as to create incentives for waste reduction, recycling, reuse and CO2 reduction, MSC Cruises has adopted serious attitudes that impacted economic investments which provided, insertion of sustainable technologies in their vessels, connection to the local electricity grid at the port, reduction of emissions to energy efficiency, management of solid waste and wastewater, more economical lighting, innovative hybrid exhaust gas cleaning systems, modernization fleet, LNG insertion, among other advances that have enabled the company to stand out in terms of reducing the environmental impact of the daily operation of its fleets. In addition, the insertion of marketing 4.0 in the company MSC, enabled profound changes in the behavior of customers in the “era of connectivity and the digital economy”, a more horizontal, inclusive and social era. So to strengthen this contact between company and client, meeting the market needs, MSC Cruises creates twenty-two sustainable travel itineraries called Protectours, strategically designed by the company in order to continue the actions to reduce the environmental impact, to assume its commitment to the 2019 Neptune Prize Award, as “Greenest Shipowner of the Year” and being able to bring unique experiences to customers / passengers. It follows that MSC Cruises has fulfilled its role as a sustainable company, and has continuously taken steps to reduce its impact on the environment, partnering with world-leading certification companies to ensure that all ship operations have no impact on oceans, but also on land, for the benefit of all populations that are affected by operations worldwide. Future studies should continue this work, using a quantitative methodology, as there is a lack of scientific research with more numerical data on sustainability and 4.0 marketing, related to the operations of the ships, which brings more originality and value to this manuscript.

Effective Development of Consolidated Group of Taxpayers in Russia and Their Fiscal Regulation

Ekaterina Vinogradova

NUST MISiS, Moscow, Russia
ketrin.vino@yandex.ru

Abstract.

In the Russian Federation, a consolidated group of taxpayers (CGT) appeared relatively recently, while after a few years the government began to impose moratoriums on the creation of new CGT and the expansion of existing ones. At the moment, from 2023 it is planned that the already created CTG will cease to exist in the Russian Federation, despite the fact that in world practice this category of taxpayers is developing quite successfully not only in national economies, but also at the interstate level. The purpose of this article is to assess the activities of tax incidents in the tax aspect, as well as to give the main directions for their development and fiscal regulation based on international experience and their own vision of their development in Russia.

Keywords: Consolidated Group Of Taxpayers, Profit, Tax, Control, Efficiency, Budget, Income

Introduction

The category "consolidated group of taxpayers" in the Russian Federation was introduced only at the end of 2011 (No. 321-FZ dated November 16, 2011) and in 2012 the first taxpayers were formed, however, already in 2018, Federal Law dated 03.08 2018 No. 302 -FZ a ban was introduced on the registration of new CTGs, as well as on joining organizations to the existing one. All registration applications submitted since 2016 were declared unregistered. From this we can conclude that for 6 years the tax authorities received very good reasons for the cancellation of this category of taxpayers.

Nevertheless, we know that in other states (for example, Australia, Japan, the USA, France, the Netherlands, Italy, Germany, Spain, the list of which is not exhaustive), quite successfully there are consolidated groups of taxpayers.

In this article, the author will try to figure out the reasons that influenced the rather quick decision of the fiscal authorities of Russia to abandon CGT, as well as determine the possibility of further development of CGT in Russia and their successful tax administration both technically and economically.

Identifying the reasons for refusal of tax authorities from CGT.

Considering that the decision to "abandon" the CTG was made in 2018, we will assume that the tax authorities were based on the data obtained for 5 years and it took them one year to make the corresponding decision and fix it at the legislative level.

Thus, we turn to statistics and follow the dynamics on the basis of quarterly form No. 5-KGN "Report on the tax base and structure of accruals for corporate income tax for consolidated groups of taxpayers" published by the Federal Tax Service of Russia on website of the Federal Tax Service of the Russian Federation www.nalog.ru. We study the process in the context of the number of created consolidated groups of taxpayers by federal district (table 1).

Table 1: Dynamics of changes in the number of consolidated groups of taxpayers (by the number of participants included in these groups) by federal districts and cities of federal appointments from 2012-2016. (in units)

he number of participants of the CTG	Period					01.01.2017/ 01.01.2013	
	01.01. 2013	01.01. 2014	01.01. 2015	01.01. 2016	01.01. 2017	Deviations, in units	Rates of growth,%
Russian Federation	1497	2048	2190	2294	2401	904	60,39
Central Federal District	365	546	646	613	734	369	101,10
Moscow region	47	64	75	72	80	33	70,21
Moscow city	102	157	206	194	222	120	117,65
Northwestern Federal District	261	403	416	407	429	168	64,37
Leningrad region	35	43	43	43	48	13	37,14
city Saint Petersburg	46	92	106	110	120	74	160,87
North Caucasian Federal District	157	70	66	57	63	-94	-59,87
Southern Federal District	0	203	216	209	221	18	8,87
Volga Federal District	313	413	430	414	495	182	58,15
Ural federal district	145	237	268	264	307	162	111,72
Siberian Federal District	137	239	238	208	247	110	80,29
Far Eastern Federal District	119	140	126	122	126	7	5,88

Thus, the beginning of the period when the category “consolidated group of taxpayers” was introduced in the Tax Code of the Russian Federation, 1,497 groups were created, by districts the largest volume falls on the central district - 365 units (24.38% of the total number of groups), in second place the Volga region - 313 units (20.91%), in third place the northwestern district - 261 units (17.43%). In the remaining districts, the distribution of consolidated taxpayer groups is approximately the same: the Ural Federal District - 9.69%, the Siberian Federal District - 9.15%, the Far Eastern Federal District - 7.95%. An analysis of the number of units of such groups by federal cities allows us to conclude that the largest number of such taxpayers is concentrated in Moscow — 102 units (3.14%), and St. Petersburg — 46 units (3.07%).

An analysis of the dynamics of changes in the number of consolidated groups of taxpayers allows us to note that their number increased by 904 units or by 60.39%, the largest growth was in 2013 - 551 units, in 2014 142 units and then about 100 units each. The growth in the number of groups occurred mainly in the central district - 369 units (including Moscow - 120 units), in the northwestern district - 168 units (including St. Petersburg - 74 units), the Volga Federal District - 182 units, the Ural Federal District - 162 units.

Since a consolidated group of taxpayers is created on a voluntary basis with the aim of calculating and paying corporate income tax, taking into account the total financial result of economic activity, we further analyze the statistical material in two categories: the tax base for corporate profit tax (table 2) and the amount of corporate profit tax (table 3). The study was conducted from the beginning of the functioning of the group in the territory of the Russian Federation until 2016, inclusive.

Table 2: Dynamics of changes in the tax base for income tax of consolidated groups of taxpayers by federal districts and cities of federal designations from 2012-2016. (billion rubles)

Tax base based on share	Period					01.01.2017/ 01.01.2013	
	01.01. 2013	01.01. 2014	01.01. 2015	01.01. 2016	01.01. 2017	Deviations, in units	Rates of growth,%
Russian Federation	2513,675	2310,374	2557,502	2418,826	1479,199	-1034,48	-41,15
Central Federal District	930,9805	637,7503	459,2897	435,4025	427,0737	-503,91	-54,13
Moscow region	46,93832	34,84585	22,62326	21,48922	17,27696	-29,66	-63,19
Moscow city	783,5844	492,4446	298,864	229,8004	291,5552	-492,03	-62,79
Northwestern Federal District	184,1302	304,9194	414,5548	360,0322	175,3362	-8,79	-4,78
Leningrad region	30,82185	58,71951	196,5641	167,1369	36,21859	5,40	17,51
city Saint Petersburg	19,52508	97,28859	24,87522	27,02144	33,62796	14,10	72,23
North Caucasian Federal District	134,3034	31,45643	21,58559	15,22086	16,16569	-118,14	-87,96
Southern Federal District	0	135,6684	124,639	112,5646	72,75103	-62,92	-46,38
Volga Federal District	340,0153	313,3051	273,0449	307,705	258,3541	-81,66	-24,02
Ural federal district	639,0359	557,0831	944,8532	871,9605	271,9523	-367,08	-57,44
Siberian Federal District	147,3717	217,345	180,5059	170,7971	197,9351	50,56	34,31
Far Eastern Federal District	103,6724	112,8461	138,92	145,1427	59,63066	-44,04	-42,48

The results obtained clearly show the trajectory of a decrease in the tax base for consolidated groups of taxpayers.

Consider the amount of calculated income tax of consolidated group taxpayers (table 3).

Table 3: The Dynamics of changes in the amount of the calculated income tax of consolidated groups of taxpayers by federal districts and cities of federal designations from 2012-2016 (billion rubles)

Tax base based on share	Period					01.01.2017/ 01.01.2013	
	01.01. 2013	01.01. 2014	01.01. 2015	01.01. 2016	01.01. 2017	Deviations, in units	Rates of growth,%

Far Eastern Federal District	17,76858	20,24066	24,87281	26,12569	10,47484	-7,29	-41,05

Thus, the dynamics of the amount of calculated corporate income tax for 2012-2016 similar to trends in the tax base.

In conclusion, we analyze the trends in the three indicators discussed above and establish the relationship between the number of registered groups and the volume of calculated corporate income tax:

1. An increase in the number of participants in groups does not lead to an increase in the tax base and corporate income tax. This is confirmed by the following data: the growth in the number of group participants in 2015 compared to 2012 amounted to 153.24%, while the tax base on corporate income tax decreased by 3.77% and, accordingly, the tax amount by 8.47 % At the same time, the lowest growth rates are observed for the calculated amount of corporate income tax. The average

corporate income tax rate paid within the group is: in 2012 - 17.19%, 2013 - 17.19%, 2014 - 16.23%, 2015 - 16.35%, 2017 - 17.77%.

2. Losses in 2012 amounted to 18.79 billion rubles., 2013 - 22.5 billion rubles., 2014 - 25.27 billion rubles, 2015 - 26.08 billion rubles, 2017 - 17.37 billion rubles.

Now we consider the conditions for the creation of CGT in the Russian Federation and the features of functioning. Firstly, the consolidated group of taxpayers is not a legal entity and acts on the basis of an agreement that must be registered at the place of registration of the responsible participant of the CTG.

This group differs from other categories of taxpayers in that this group is characterized by the presence of a management system. At the same time, the control system is linear and this group is led by a responsible member of the group, group members act as subordinates.

It can be noted that the functions of the two entities of the consolidated group of taxpayers are clearly identified and delimited. The nature of relations within the group is medium-term, which is confirmed by article 25.2 p. 7, which states that the group is created for five years (earlier than 2 years, changes were introduced by federal law No. 325-FZ of 11.28.2015), thereby implementing the principle stability, which is the basis for the formation of the tax system of the Russian Federation.

Consider the conditions under which a group can be created. Quantitative and qualitative conditions for creating a group are legally defined:

1. The participants in a consolidated group of taxpayers are interdependent persons (article 25.2 of the Tax Code of the Russian Federation - direct and (or) indirect participation of one organization in the authorized capital of another - at least 90%);

2. Economic indicators should correspond to the following volumes (the calculation is made for the calendar year preceding the year of submission of documents on the creation of the group):

- the total amount of taxes (VAT, mineral extraction tax, excise taxes, corporate income tax), excluding taxes paid in connection with the movement of goods across the customs border of the Customs Union, is at least 10 billion rubles;
- the total revenue from the sale of goods (works, services) is at least 100 billion rubles;
- the total value of assets according to the accounting (financial) statements is at least 300 billion rubles;

3. All members of the group must be Russian organizations and does not apply to organizations that are prohibited from creating such groups, for example, organizations of the financial sector of the economy, organizations that pay the tax on gambling, and the like, on the basis of Article 25.2 p. 6 of the Tax Code.;

4. One organization may be included in only one consolidated group of taxpayers.

From the analysis of the conditions for creating a group, we can draw certain conclusions:

- the responsible member of the group may be the largest taxpayer;
- it is most profitable to create a group for organizations that are taxpayers of mineral extraction tax, this is confirmed by practice, the group was created in such large holdings as Rosneft, Severstal, Gazprom, Lukoil, Novatek and Mechel.

As can be seen from the calculations, the main reason for the refusal of the tax authorities from the CTG was that during the specified period there was a significant reduction in tax revenues. According to the author, this is due to the following factors:

- CGTs participants read out losses against the profits of different organizations in the current tax period, and not in different ones, as this could be done within one organization;
- use of benefits at the tax rate in regions.

All this did not coincide with the global strategy for introducing the CGI institute, it was assumed that the income tax redistribution of large companies would occur and they would go to the budget of the subject of the Russian Federation where the profit is consolidated, and not of the subject where the parent company is located. However, in practice, the tax base is often redistributed to those regions where lower rates of corporate income tax are established, which is done in order to reduce the tax burden on the consolidated group.

The second reason for refusing CGT was the desire to equalize the tax conditions for large and medium-sized businesses in view of the fact that big business is more self-sufficient and does not so much need tax benefits, which, as it turned out, were not supposed to be provided for CGT in Russia.

In a research study by Sidorova E.Yu. and Tikhonova A.V. (2017) during tax reforms, two rules of the systems management theory must be observed: 1. Taxes and taxation is a system, precluding stability and sustainability of its function, and of its elements' interaction. 2. Within taxation system the effect of the feedback loop emerges, which can have both positive and negative impact.

The positive points include:

1. The group's control in the field of transfer pricing is excluded, which allows optimizing taxes (with the exception of transactions the subject of which is extracted minerals);
2. Consolidation of the tax base and reporting of enterprises in the group;
3. Reducing the time for tax control procedures;
4. Getting the opportunity to transfer losses in the tax period of their receipt. The consolidation of the tax base for corporate income tax brings effect on the whole group. However, by far the greatest economic effect is gained by the group members who have a profit at the end of the tax period.

The negative aspects of creating a group include:

1. An increase in tax risk, since there is a high probability of errors in calculating corporate income tax;
2. Possible increase in tax rates for other taxes. For example, in 2015, Article 2 of Federal Law of November 28, 2015 No. 325-FZ changed the formula for determining the base value of a unit of catch fuel, the correction factor increased from 0.15 to 0.2051 points, which affected the participants of a consolidated group of taxpayers carrying out natural gas production (for example, Gazprom).

A comparative analysis of the economic indicators for classifying taxpayers as a consolidated group of taxpayers and the largest taxpayers allows us to conclude that the group has higher rates of economic activity.

International practice of CGT development.

In order to determine the possibility of developing CGT in Russia, and not completely abandoning this category of taxpayers, the main countries with CGT were studied: Germany, Spain, France, Japan, USA, Italy, Netherlands, Australia.

Based on the results of the work done, the parameters of the CTG were determined, as set out in table 4.

Table 4: Differences and similarities between Russian and foreign CGT

General parameters	Excellent parameters
voluntary application of the regimen	the presence of criteria characterizing the size of the group of companies (revenue, assets, taxes paid)
the ability of the parent company to independently determine the circle of participants of the CTG	the inability to include foreign companies in the group
procedure for determining the consolidated tax base	the inability to set off previously received losses and the distribution among the participants of losses incurred during the consolidation period in the event of the participants leaving the group or its liquidation
formation of a single tax return and tax payment by one member of the group	the lack of the possibility of limiting the amount of liability of each participant of the CTG
	in Russian legislation there are no special provisions on taxation of intragroup transactions for CTG, while if there are general rules for the property of parent and subsidiary companies (subparagraph 11 clause 1 of article 251 of the Tax Code of the Russian Federation), then there are no such provisions on income and expenses

In the work of Babenko D.A. (2014) marked the following trends in CGT in world practice:

-development of international tax consolidation;
- simplification of procedures for joining the CTG;
- ensuring the availability of the calculation of the tax base of CGT;
- simplification of fiscal regulation of CGT.

Conclusion

Based on the analytical work on foreign practice and its application to Russian reality, it should be noted that not all principles of the development of CGT are applicable in the Russian Federation in view of the historical development of business and the tax system, as well as the existing mentality.

In the author's opinion, CGTs in Russia can be effective and develop only with more stringent fiscal regulation. Sidorova E.Yu. (2015) mentioned simple methods of analysis are currently ineffective. The author offers the following development parameters of CGT:

1. CGT should include all organizations, for example, having affiliation in accordance with Federal Laws No. 135-FZ dated July 26, 2006 "On Protection of Competition" and No. 948-1 dated March 22, 1991 "On Competition and Limitation of Monopolistic Activities in Commodity Markets ", Or revised art. 105.1 of the Tax Code of the Russian Federation "Interconnected Persons". This will violate the boundaries of the voluntary choice of the CTG participants, but at the same time it will not allow certain legal entities to profit beyond the limits of the CTG.

2. The loss that CGT can account for as a profit can only be associated with investment and innovation activities, such costs can include, in particular, the following costs:

- costs associated with new construction, reconstruction, expansion, technical re-equipment, modernization of fixed assets;
- expenses in the form of interest on loans and credits for investment and innovative purposes;
- expenses for research and development.

In this section, we can separately distinguish separately the costs of investing in the development of green energy (renewable energy sources) and innovative activities in terms of creating clusters. In a research study by Kostygova L.A. and others (2019) was suggested the increase in cluster's membership is proposed to be implemented with increasing a number of majors and commercial organizations operating in cluster's specialization field. Considering that the largest holdings, which are capable of incurring similar costs, have predominantly united in CGT, additional preferences for their investments in renewable energy sources and cluster creation points, within the framework of CGT, can lead to good synergies between the state and business in this direction.

3. A significant reduction in economic indicators in terms of the total tax amount, total revenue and total asset value so that CGT could form a medium-sized business, which, according to the author, will positively affect its development in general and the flow of funds to the budget in particular.

4. The Russian tax system needs to consider the possibility of Russian organizations participating in international CTG. In this case, the business will have more confidence in the domestic tax authorities, the international community will note that Russia has taken another step towards international rules and norms. This step can be very difficult and lengthy in view of the difficult dialogue between foreign and Russian tax authorities, however, with the globalization of business processes, the achievement of tax agreements at the international level under the CTG will be necessary in the future.

Abstract

The article is devoted to the development of theoretical principles and practical recommendations for the formation and development of digital ecosystem based on corporate model of open innovation, which allows adapting an innovative ecosystem to the conditions of global competitive market and integrating it into the global innovation space in order to consolidate competitive advantages and achieve technological superiority. The analysis of Russian and foreign practice of innovative development of technology corporations and companies is performed; practical approaches to managing innovative development of corporations in the context of digitalization are highlighted; methodology for assessing innovative maturity taking into account readiness for digital transformation was developed and tested

Keywords: Digital Ecosystem, Digitalization, Industry, Open Innovations

Introduction

Innovation happens when great ideas, people and challenges intersect. In order to develop breakthrough innovations, companies turn to new management models, such as open innovation (collaboration with external partners), design thinking (developing new solutions focused on people's needs), corporate venture funds and incubators.

By open innovations we mean a model of active interaction of companies with the external environment in the process of innovation with the aim of exchanging technologies, knowledge and competencies, which is realized through the use of the following tools: innovation project competitions, financing of external innovation projects to finalize proposals, corporate accelerators, corporate business incubators, corporate technology parks, corporate venture funds, spin-offs of internal developments, acquisition of companies and others.

Industry is on the verge of radical structural changes. Digital transformation carries both huge potential and serious challenges. The study of Roland Berger “Digital Transformation of Industry", conducted in conjunction with the German Industry Federation (BDI), examined the causes of digitalization and its impact on industry in Germany and other European countries.

The overall economic effect of digitalization was also calculated. In particular, experts found that digitalization of industry until 2025 alone in Germany could create an additional potential for creating value of 425 billion euros. The total figure for Europe is 1.25 trillion euros. If the region fails to turn the transformation into its own advantage, its industry may suffer a total loss in a huge amount of 605 billion euros.

Methods and Materials

The research methodology is based on existing theoretical developments in the field of innovation management and corporate governance. In the research process, the dialectical approach, system analysis methods, economic and mathematical methods of information analysis, strategic management methods, expert assessments, modeling, clustering, system-activity method, value-oriented, cultural-historical methods, methods of social constructivism, functional analysis, were used, as well as the prognostic method, etc., which provides a high degree of validity and reliability of the main conclusions and results of study.

We have analyzed the Russian and foreign practices of innovative development of technology corporations and companies. The main tool of methodological approach was the research program, which includes the following stages: presentation of problem, goals and objectives of study; research project selection; determination of research methods; collection of information; analysis of information collected. To implement methodological approach to classify the tools and practices of corporate governance of open innovation, both desk and field studies were conducted. The sample scope for a survey of company executives ("United Aircraft Corporation" PJSC, "EFKO" group of companies, Rostec) amounted to 30 people. Data collection method – is a questionnaire.

As a result of implementation of methodological approach to classify the tools and practices of corporate governance of open innovation, the tools of corporate open innovation (Table 1) were integrated with the resources for implementing the tool and stages of innovation.

Table 1: corporate open innovation tools

Action	Description	Examples
Events and workshops	Participation in internal and external events and workshops focused on innovation and entrepreneurship	Entrepreneurship SP, Startup Weekend, Minas Startup, Innovation Week, Innovation Show, ANPEI
Executive Forums	Forums where future strategies and innovation are discussed at senior management level	Strategy Review Meeting (RAE) and forums with the participation of specialized consultants
Problem Solutions	Exposure of business and technology problems so that the solution is given by internal and external participants	Hackathons, pitch fights, marathons with internal and external audiences
HR Development	Planning and implementing actions to develop and / or attract highly skilled young talents	Programming Marathons, Mathematical Olympiads, EADs on internal processes of innovation
Market Trials	Experimental service offerings	Connected house, IPTV over Gpon, Music MVNO
Strategic Partnership	Establishment of alliances to develop technologies and / or business models	CPqD, Inatel, Nokia, Universities, URI-Erechin, CERTI Foundation, TeleStax, IBM, 100 Open Startups
Support team	Dedicated structures for planning and developing all innovation processes in the company	IMO (focus on innovation management) and R&D (focus on research and development)
Customer Integration	Usage research, trials and visits to customers' environments	Studies based on customer complaints and use of services, field visits to clients and local authorities and forums with opinion formers
Joint development	Collaboration with objective of reaching a certain public or market	Connected house, IPTV over Gpon, Music MVNO, MDN

The list of tools that corporations can use depends on the stage of innovation and the cost of tools. The largest number of tools is applicable at the stage of searching for ideas, the smallest - at the stage of scaling. If the company doesn't have a significant amount of financial resources, it can use inexpensive tools, for example, events for startups and idea contests. If the company has significant financial resources, it can use tools such as corporate venture fund, laboratories, etc. As promising areas in the innovative development of corporations, it's possible to single out the use of digital platforms, collaboration and others.

3M's ability to keep churning out new innovations is very much dependent on the company's long-standing commitment to open innovation, both internal and external. 3M has developed organically across consumer, electronic, transportation, industrial, safety, security and display, and electronic markets. The entire technical community at 3M includes about 10,000 R&D people in 73 labs around the world. About 15 to 20 percent of those people work in corporate research, which is responsible for developing, transmitting, and supporting technologies throughout the company. The corporate technical operations committee, or CTOC, ensures the development, health, sustainability, and transmission of 3M's tech capabilities across all the businesses, geographies, and industries in which 3M operate.

Airbus makes intersections between great ideas, people and challenges happen by partnering with the outside world to translate innovative ideas into aerospace breakthroughs more quickly than ever before. The way Airbus works with partners is open and agile. This is Airbus approach to accelerating innovation.

Innovations are the part of the EFKO's philosophy, and success of the Company was the result of its implementation: in the processing of raw materials, production of high-tech fats and branded products. The research laboratories and centers of applied research are created in all Company's divisions: in the branded division – Service on the new products development; in Fat&Oil Division – Center for Applied Research and Pilot Facilities, which develops and tests fat products for the lines of healthy food and innovative recipes based on the needs of the food industry manufacturers. In 2013, the company has created Innovation Center "Biruch", and on its basis in 2016 – Innovation Center "Biruch – NT" for solving urgent research problems of existing businesses and for the formation of a reserve of growth drivers. EFKO Group pays special attention to cooperation with leading research institutes, and is actively working with specialized higher education institutions, accelerators of start-up projects and supports the competitions of scientific ideas. EFKO is always looking for new drivers of growth and is interested in supporting of talented professionals with proactive lifestyle, whom it's ready to provide the unique opportunities for self-realization as a developer of new technologies and innovative projects, and future business leaders based on these projects.

In the context of general digitalization of socio-economic processes, the company's readiness to transform all processes, or the so-called "innovative maturity", comes to the forefront, which is reflected in the system of indicators of methodology for assessing the innovative maturity of companies taking into account readiness for digital transformation.

The digitalization indicators of Russian economy show a greater growth potential compared to the level of Internet penetration. For example, access to digital services in Russia and in the European Union according to a number of indicators: the share of electronic commerce in the total retail volume (Russia - 4%, EU - 7%), the share of organizations using CRM systems (Russia - 13%, EU - 26%), the proportion of citizens who made purchases online (Russia - 29%, EU - 57%), the proportion of citizens who received public services via the Internet (Russia - 29%, EU - 48%), the penetration of mobile Internet (Russia - 46% , EU - 63%), smartphone penetration (Russia - 60%, EU - 62%), Internet penetration (Russia - 76%, EU - 84%).

Thus, the Russian Federation has the necessary prerequisites for the active growth of digital economy. State support programs for the development of innovation sector are actively implemented in the Russian Federation. In accordance with Decree of President of the Russian Federation dated May 7, 2018 No. 204, the national program "Digital Economy of Russian Federation" was reformatted by the

government of Russian Federation into a national project and cascaded into six federal projects. The total funding will amount to 522 billion rubles ($ 7.8 billion).

The methodology for assessing innovative maturity is designed to conduct independent diagnostics of the current level of innovative maturity of company, determine development directions and identify suitable recommendations for practical application.

The methodology for assessing innovative maturity taking into account readiness for digital transformation includes four stages: assessment of innovative maturity; strategy development and roadmap development; pilot project; scaling. It is proposed to evaluate innovation maturity in seven areas: strategy and aspiration; processes and practices; culture and people; organizational development; openness to external influences; readiness for rapid changes; readiness for digital transformation. For each direction, system of evaluation criteria is proposed, based on the results of expert evaluation of which it's possible to calculate the integral index of innovative maturity, to determine the level and category of maturity of companies and corporations.

The methodology for calculating the final index of innovation maturity is as follows: companies are evaluated by experts on the proposed criteria on a scale of 1 to 10 points, where 10 - the criterion is strongly pronounced; 0 - the criterion is not pronounced. The average of obtained values is the final score. After that, a rating of all respondents is compiled. All participants in the study are divided into quintiles (champions, innovators, followers, observers, opponents) depending on the overall score.

Results

Testing the methodology for assessing innovation maturity for five companies in 2019 is presented in Table 2.

Table 2: testing the methodology for assessing innovative maturity according to data of companies for 2019

Direction and criteria of assessment	Merkator Kaluga LLC	Orbita CJSC	DIAKONT JSC
1 Strategy and aspiration	8.3	7.3	8.3
1.1 The degree of influence of innovation on the results of company	8	6	8
1.2 Willingness and ability of company to invest in innovation and take risks	8	7	9
1.3 The role of internal customer in innovation	9	9	8
2 Processes and practices	7.8	8.0	7.6
2.1 Organization of innovation management model	7	7	8
2.2 Organization of project management processes	8	10	9
2.3 The process of approval and decision-making	7	7	7
2.4 The process of piloting and implementing projects	9	7	8
2.5 Availability of innovation tools	8	9	6
3 Culture and people	7.8	8.6	7.2
3.1 Coverage of financial motivation	8	9	8
3.2 The proportionality of financial motivation	7	7	6
3.3 System of key performance indicators (KPI)	6	10	7
3.4 Non-financial motivation	9	8	8
3.5 Culture of experimentation and perception of innovation risks	9	9	7
4 Organizational development	7.3	9.3	7.7

Direction and criteria of assessment	Merkator Kaluga LLC	Orbita CJSC	DIAKONT JSC
4.1 Focus on customer	7	9	7
4.2 Leadership and involvement of employees	8	10	8
4.3 Introduction of practice transfer tools	7	9	8
4 Openness to external influences	8.5	8	7.5
4.1 Search for new ideas and projects	8	8	8
4.2 Openness to ideas and new opportunities	9	8	7
5 Readiness for rapid changes	8	9	7.5
5.1 Risk acceptance	7	9	7
5.2 Acceptance of innovation by employees	9	9	8
6 Readiness for digital transformation	9	9	9
INDEX OF INNOVATION MATURITY	**8.1**	**8.5**	**7.8**
Category of innovation maturity	The champion	The champion	The champion

Source: calculated by authors

The first Russian innovative champion Merkator Kaluga specializes in the design and manufacture of road maintenance special machinery and equipment in collaboration with the BUCHER MUNICIPAL Swiss concern. The plant produces multipurpose road maintenance vehicles, vacuum sweepers on a commercial and self-propelled chassis, garbage trucks, as well as various attachments. The equipment produced by Merkator Kaluga is used for winter and summer maintenance of city roads, trunk-lines, sidewalks and other areas with hard surface. In addition to domestic sales, the company's products are exported to the Republic of Kazakhstan. Currently, projects are being realized on selling the Merkator Kaluga machines to such countries of the near abroad as: Kyrgyzstan, Uzbekistan, Azerbaijan, Belarus, Armenia, Moldova.

The second Russian innovative champion Orbita, CJSC is one of the leading manufacturers of regulation and monitoring equipment (RME) for space vehicles and satellite electric power supply (EPS) systems. The enterprise’s team has created the regulation and monitoring equipment for electric power supply (EPS) systems of space stations Salyut, MIR, International Space Station (ISS), as well as converters for the manned and cargo spaceships SOYUZ, Progress, Starliner. The company's products are designed for use in telecommunication and scientifi c space vehicles, orbital stations, manned spaceships and other autonomous objects. The products manufactured by Orbita, CJSC are exported to the USA. Exports are planned to India, Pakistan, Brazil, Angola.

Another Russian innovative champion Diakont group of companies is one of the world’s leading manufacturers and designers of high-tech equipment aimed at improving safety and effi ciency in such fi elds as nuclear energy, oil & gas, industrial manufacturing, housing and public utilities. The company’s product range includes: robotic diagnostics and maintenance systems, radiationresistant television cameras, automated control systems for nuclear power plants, electromechanical drives. A branch in the United States (San Diego) was opened in 2011. A branch in Italy (Arezzo) was opened in 2014. A branch in China was opened in 2019. The company occupies a leading world position in the production of radiation-resistant chambers for nuclear power plants and is actively developing a business in the fi eld of drive technology. At the moment, it successfully sells the high-speed power actuators of its own production. About 20% of all products are manufactured for export.

Conclusion

The conclusions should be based on the assessment of differences between the five quintiles of companies. Additionally, a study of large companies was conducted - champions of innovative maturity, taking into account readiness for digital transformation. Average revenue in 2018: 3.2 billion rubles. Average number of employees in 2018: 663 people. Average age of the company in 2018 году: 19,2 years. Average revenue growth rate over the past five years (CAGR methodology): 24%. Average

share of R&D expenses in revenues for the last three years: 21%. Average share of costs for technological innovation in revenue over the past three years: 30%. Average share of revenue from new products over the past three years: 78%. Average revenue from exports in 2018: $ 456.0 million. The average share of exports in revenue over the past three years: 23%.

Using the recommendations presented, the company can run diagnostics of the current state of innovative maturity and determine the directions for development that will allow it to move to the next level of maturity. Depending on the level of innovation maturity, companies should balance between indicators of “actions” related to building the company's potential in the field of innovation (more for beginners) and “results” (more for innovators).

Abstract

The paper examined the content, goals and objectives, principles, main directions, tools and stages of digital transformation of industry. The systemic problems of digital transformation are identified, on the basis of which a general digital transformation scheme and digital business model are proposed. The presented developments will make it possible to comprehensively transform the industry on the basis of transition to new business models, communication channels with customers and suppliers, products, business and production processes, and corporate culture, which are based on fundamentally new approaches to data management using digital technologies, with the aim of significant increase of industrial efficiency and long-term sustainability.

Keywords: Digital Transformation, Digitalization, Industry, Chief Digital Transformation Officer, Digital Business-Model

Introduction

At present, it is becoming apparent that the main trend is the arrival of IT technologies in the industry, which will drastically reduce the cost of production. Not only machines, but also conveyors and entire plants should be integrated into one network. In addition, consumer and industrial goods will also be on the Internet (the so-called technology of “Internet of things”, “industrial Internet of things”).

Industry is on the verge of radical structural changes. Digital transformation carries both huge potential and serious challenges. The study of Roland Berger “Digital Transformation of Industry", conducted in conjunction with the German Industry Federation (BDI), examined the causes of digitalization and its impact on industry in Germany and other European countries.

The overall economic effect of digitalization was also calculated. In particular, experts found that digitalization of industry until 2025 alone in Germany could create an additional potential for creating value of 425 billion euros. The total figure for Europe is 1.25 trillion euros. If the region fails to turn the transformation into its own advantage, its industry may suffer a total loss in a huge amount of 605 billion euros.

Methods and Materials

The research methodology is based on existing theoretical developments in the field of innovation management, corporate governance, competency-based approach.

In the research process, the dialectical approach, system analysis methods, economic and mathematical methods of information analysis, strategic management methods, expert assessments, modeling, clustering, tools of fuzzy production cognitive maps, system-activity method, network analysis methods, value-oriented, cultural historical methods, methods of social constructivism, functional analysis, as well as the prognostic method, etc., which provides a high degree of validity and reliability of the main conclusions and results of study.

Results

The digitalization indicators of Russian economy show a greater growth potential compared to the level of Internet penetration. For example, access to digital services in Russia and in the European Union according to a number of indicators: the share of electronic commerce in the total retail vol. (Russia - 4%, EU - 7%), the share of organizations using CRM systems (Russia - 13%, EU - 26%), the proportion of citizens who made purchases online (Russia - 29%, EU - 57%), the proportion of citizens who received public services via the Internet (Russia - 29%, EU - 48%), the penetration of mobile Internet (Russia - 46% , EU - 63%), smartphone penetration (Russia - 60%, EU - 62%), Internet penetration (Russia - 76%, EU - 84%).

Thus, the Russian Federation has the necessary prerequisites for the active growth of digital economy. State support programs for the development of innovation sector are actively implemented in the Russian Federation. In accordance with Decree of President of the Russian Federation dated May 7, 2018 No. 204, the national program “Digital Economy of Russian Federation” was reformatted by the government of Russian Federation into a national project and cascaded into six federal projects. The total funding will amount to 522 billion rubles ($ 7.8 billion).

Due to the incompleteness of a number of tasks of the previous reforms, the remaining negative management practices at industrial enterprises reduce the opportunities for introducing modern digital technologies.

The purpose of this article is to develop conceptual and methodological aspects of digital transformation of industry, the results of which should be a significant increase in industrial efficiency, as well as achieving long-term sustainability and global competitiveness.

The evolution of digitalization of processes includes three stages: automation → digitalization → digital transformation. Automation is characterized by the introduction of IT solutions that repeat the existing processes. Digitalization improves existing processes by introducing IT; Lean methods for optimizing processes; process reengineering.

Thus, digitalization is “the use of digital technologies to increase the efficiency of company and improve the quality of life of its employees”.

With digital transformation, there is a sharp decrease in transaction costs due to the emergence of new activity models, primarily digital platforms; the combination of technology capabilities and traditional sphere of activity of organization leads to appearance of new products and processes with fundamentally different qualities.

According to R. King, FedEx Corporation's corporate vice president, “when we talk about digital transformation, we’re not just talking about digitalization and automation. We have been doing this for many years. For us, transformation is a real transition from the old style of work to completely new methods”.

For some people, digital transformation is too often used synonym for IT strategy. For PwC, this concept goes beyond the simple use of new technologies. Digital transformation is a new way to solve problems, create a unique experience in interacting with customers and employees, and accelerate business efficiency. It has a huge impact on the human resources of organization.

In the context of general digitalization of socio-economic processes, the company's readiness to transform all processes, or the so-called “innovative maturity”, comes to the forefront, which is reflected in the system of indicators of methodology for assessing the innovative maturity of companies taking into account readiness for digital transformation.

From the point of view of digital transformation, some organizations can be attributed to the category of companies aimed at increasing efficiency, which use digital assets to increase the efficiency and speed of their business; others relate to modernization-oriented companies that are building up new competencies to modernize their business; still others are among the reformers that change their core business models to restructure their business; finally, another category is industry pioneers who enter new markets or develop new industries.

Organizations carry out large-scale initiatives, so for to get a clear idea of the threats and opportunities in advance is a good help for them in making informed decisions that provide a balance between innovation and risk appetite.

The list of tools that corporations can use depends on the stage of innovation and the cost of tools. The largest number of tools is applicable at the stage of searching for ideas, the smallest - at the stage of scaling. If the company doesn’t have a significant amount of financial resources, it can use inexpensive tools, for example, events for startups and idea contests. If the company has significant financial resources, it can use tools such as corporate venture fund, laboratories, etc. As promising areas in the innovative development of corporations, it’s possible to single out the use of digital platforms, collaboration and others.

In order to develop breakthrough innovations, companies turn to new management models, such as open innovation (collaboration with external partners), design thinking (developing new solutions focused on people's needs), corporate venture funds and incubators.
As a result of implementation of methodological approach to classify the tools and practices of corporate governance of open innovation, the tools of corporate open innovation (Table 1) were integrated with the resources for implementing the tool and stages of innovation.

Table 1: corporate open innovation tools

Action	Description	Examples
Events and workshops	Participation in internal and external events and workshops focused on innovation and entrepreneurship	Entrepreneurship SP, Startup Weekend, Minas Startup, Innovation Week, Innovation Show, ANPEI
Executive Forums	Forums where future strategies and innovation are discussed at senior management level	Strategy Review Meeting (RAE) and forums with the participation of specialized consultants
Problem Solutions	Exposure of business and technology problems so that the solution is given by internal and external participants	Hackathons, pitch fights, marathons with internal and external audiences
HR Development	Planning and implementing actions to develop and / or attract highly skilled young talents	Programming Marathons, Mathematical Olympiads, EADs on internal processes of innovation
Market Trials	Experimental service offerings	Connected house, IPTV over Gpon, Music MVNO
Strategic Partnership	Establishment of alliances to develop technologies and / or business models	CPqD, Inatel, Nokia, Universities, URI-Erechin, CERTI Foundation, TeleStax, IBM, 100 Open Startups
Support team	Dedicated structures for planning and developing all innovation processes in the company	IMO (focus on innovation management) and R&D (focus on research and development)
Customer Integration	Usage research, trials and visits to customers' environments	Studies based on customer complaints and use of services, field visits to clients and local authorities and forums with opinion formers
Joint development	Collaboration with objective of reaching a certain public or market	Connected house, IPTV over Gpon, Music MVNO, MDN

Working in the field of high technologies, it is not enough to reach a certain level - Rostec create a system of continuous innovations. It is not enough to be a national leader - Rostec want to act globally. A large number of industries today is not an advantage - a portfolio of "smart" products is needed. Therefore, having completed collection and consolidation of disparate industrial assets in 2014, State Corporation Rostec moved to the stage of active growth which required actualization of the Development Strategy. The main task of the Corporation at the stage of active growth is to reach the scale of the leading global competitors. Going out to the scale is not only a matter of competitiveness but also the task of preserving Russia as a world technological leader.

According to a digital transformation study conducted by PWC in 2018 (in which 1,155 executives of manufacturing companies in 26 countries were surveyed), data were obtained according to which “only 10% of global manufacturing companies are “Digital Champions”, with almost two-thirds who are only at the initial stage or haven’t started their digital path at all.

According to the results of another study conducted by KPMG in 2019, the following eight became the key technologies for digital transformation in Russia:

1 robotization (RPA);
2 Big data analysis and predictive analytics;
3 chat bots;
4 artificial intelligence (AI);
5 virtual and augmented reality VR/AR;
6 Internet of Things (IoT);
7 optical recognition;
8 blockchain.

The primary task within the framework of the beginning of digital transformation of industry is the appointment of CDTO with the assignment of its corresponding functions and powers and the formation of Competence Center.

CDTO – is a conductor of single digital development policy; provides management of implementation of digital transformation projects; coordinates strategic documents and budgets for informational support and digital transformation; coordinates the structural divisions of digital transformation and digital development; organizes data management; forms the Competence Center, performs other tasks.

The functional structure of digital transformation unit includes: a project office for implementation of digital transformation and digital development projects (within the authority, subordinate institutions, and supervised sphere); Process Transformation Office to create digital products/services; data management office; center of competence (it’s possible to use an external center).

The digital transformation of industry is carried out in several successive stages:

1 positioning;
2 planning (formation of ideas);
3 testing (implementation of pilot projects on digital transformation);
4 scaling.

The general scheme of digital transformation is presented in Figure 1.

STRATEGIC VECTORS OF DEVELOPMENT OF INDUSTRIAL ENTERPRISES			
Increase of profit	Growth of market share	Expansion of partner network	The study of demand, consumer needs
Point of sales and distribution channels	Introduction of innovations	Brand recognition	Corporate culture

↓

DIGITAL OPPORTUNITIES			
Ecosystem for customer solutions	Operating ecosystem	Technological ecosystem	Personnel ecosystem

↑

DIGITAL INVESTMENTS	
Digital culture	Realization of innovative potential: operational and systematic implementation of innovations, acceleration of business cycle and the launch of new products on the market

Fig. 1: General scheme of digital transformation of industrial enterprises

Based on the study, we can conclude that the digital transformation of industry is a complex social challenge that requires agreements between key stakeholders: citizens, state and business.

Since digital transformation is a business transformation, the structure of industrial enterprises, infrastructure and corporate culture that existed before its implementation could become barriers to implementation.

The effects of digital transformation are not immediately apparent therefore targets are set for deadlines that take into account not only the direct implementation of digital transformation activities, but also the period for obtaining the result.

Additionally, a study of large companies was conducted - champions of innovative maturity, taking into account readiness for digital transformation.

The share of R&D expenditures in the revenue of champion companies was on average 16% for large (with revenues of more than 2 billion rubles), 12% for medium (revenue from 800 million to 2 billion rubles) and 19% for small companies (revenue up to 800 million rubles). The share of technological innovation costs in revenue amounted to an average of 23% for large, 26% for medium and 25% for small companies. The share of new products in revenue amounted to an average of 53% for large, 53% for medium and 64% for small companies.

Conclusion

Previous attempts to introduce information technologies in industry have led to the creation of disparate information systems and often duplicated, without changing, “paper” processes.

Digital transformation requires a different approach to the development of digital solutions, to processes, to implementation of changes, to culture. The new wave of digitalization should use not only new technical solutions, but first of all management technologies that allow keeping people’s transformations in focus.

Digital transformation at the level of the whole Russian Federation is possible only with a new approach to roles in teams and the emergence of digital transformation teams uniting regions, municipalities, federal authorities, business and citizens.

Innovative Management Instruments in Polish Local Government – - An Example of Urban Prototyping

Daniel WACINKIEWICZ

University of Szczecin, Institute of Legal Studies, Szczecin, Poland
daniel.wacinkiewicz@usz.edu.pl

Abstract

The system of local government in Poland has recently been an area of introduction of a number of innovative management instruments and methods. Their aim is i.a. to improve the availability and quality of public services and thus better satisfaction of residents' needs. One of such innovative methods is urban prototyping – an advanced consultation-research-design process. The paper includes a synthetic characteristic and assessment of urban prototyping implemented in the Polish local government.
This method is extraordinarily helpful in transforming public spaces. Urban prototyping actively involves residents who have the opportunity of direct influence on how the transformed space may satisfy their real needs better. Therefore, this process allows local government units - as stakeholders responsible for execution of public tasks for the benefit of residents - to achieve their goals effectively and efficiently.
From the point of view of management in local government the basic value of urban prototyping involves simultaneous achievement of participatory, research and design objectives.

Keywords: Urban Prototyping, Satisfaction of Residents' Needs, Local Government

Introduction

Meeting the needs of self-governing communities is local government's basic aim and task in the Polish organizational conditions. It may be carried out in a number of various ways, and the choice between them is made by the local government itself.

One of the biggest challenges faced by local government units is the following problem: by means of what tools, instruments, methods should local affairs be managed in order to achieve the organization's objectives? How to best satisfy the needs of its residents? This implicates the need of constant search for new solutions, adequate to the changing cultural, economic, social and legal conditions.

One of such innovative instruments (methods) is urban prototyping. The characteristic of urban prototyping requires a multidimensional analysis of i.a. strategic contexts and spatial policy (including planning determinants and spatial planning) and the role and significance of urban prototyping for local democracy and participatory processes (such as citizens' initiatives, collaboration with NGOs, consultation, participatory budgeting). These issues will be the subject of analysis in this study.

Direct motivation to undertake the subject-matter of urban prototyping in the Polish local government involves an analysis (assessment) of basic problems and challenges faced today by local government authorities, including in particular authorities of large Polish cities. To a great extent these are issues common to many (if not majority of) contemporary (not only European) large cities and they include problems of sustainable urban mobility, pro-ecological challenges, encouraging the processes of self-organization of the civic society and many others.

This must be met with an adequate response from self-government authorities. The more it is rooted in values and ideas that underlay local government (such as subsidiarity, participation and citizenship), the better it will meet the expectations of contemporary civic society.

In line with the research hypothesis adopted in the study, the role of urban prototyping in socializing decision-making processes in local government as well as in the process of self-organization of the civic society will increase.

Practical experience also backs up the undertaking of this subject-matter. In 2019, as vice-president of the city of Szczecin, I was responsible for the implementation of one of the largest projects of this type in Poland. Together with Paweł Jaworski, urban planner and philosopher, acting on the basis of his proprietary concept of urban prototyping, we managed such a project - performing activities aimed at changing the function of one of the most important public spaces in the city.

Satisfying the needs of self-governing communities as a primary role of Polish self-government

The analysis must start by outlining the role and objectives of local government in the Polish organizational system.

The territorial regime of the Republic of Poland ensures decentralization of public authority. An extraordinarily significant role in governance falls on local government which is responsible for an essential part of public tasks carried out in the country.

Local government, participating in exercising public authority, acts in its own name and on its own responsibility, and its independence which is a basic and immanent feature of this corporation is subject to court protection. Independence means in particular that when creating public tasks, the legislator must secure a specified scope of freedom in the choice of the manner of local government's implementation of public tasks which meet the needs of its residents.

The Polish legislator used the term "satisfying the needs of self-governing communities" in a specific constitutional norm interpretable from Article 166 section 1 of the Constitution of the Republic of Poland of 2 April 1997. By making "the needs of residents of a local (regional) government" a legal category, the legislator conferred upon it both the relevant rank in the Polish legal order as well as a special status of a determinant for tasks of local government units *in genere.*

One can actually conclude that satisfying society's needs is the basic public objective (interest) (public value) that local government units are obliged to implement (Szydło, p. 42)

Entities whose needs are to be met are self-governing communities created by the residents of local government units. The category of self-governing communities encompasses both individual and collective aspects, including in the subjective scope both individual residents of territorial corporations, groups of residents which can be distinguished due to different criteria (e.g. residence in a part of the territory or community of interest), and the total of residents understood as a community (full community in question) singled out on the basis of the fiction of identity of needs and of integration of the corporations. The object of satisfaction involves human needs (individual, collective). Of the various formulas of understanding needs on the ground of views of Polish administrative law scholars and commentators, their understanding as objective conditions of existence and functioning (i.e. as what is essential or useful in human life (Duniewska, p. 148-163)), as conditions of reaching optimum efficiency in retaining themselves and ensuring their own development (Sowiński, p. 135), was adopted for the analysis.

The needs in question may be ordered e.g. according to Maslow's classification (2013). This involves in particular: physiological, safety, belonging, cognitive, aesthetic or self-actualisation needs. However, it needs to be remembered that when creating his hierarchy of needs which later became known as the "pyramid of needs", Maslow meant individual needs. In the conditions of community life that we are dealing with in local government they must to be supplemented with needs that are an expression of what is indispensable (useful) to the residents in the conditions of community life. Let us call them infrastructural needs (Wacinkiewicz, p. 341-342).

Local government units faced with the task of satisfying self-governing community needs may do so in two basic ways: 1) by providing residents with specific goods that satisfy their needs and 2) by making it possible for them to use specific goods. A far as the first method involves provision to residents of specific goods (material or non-material) that indirectly satisfy their needs, the second one consists in providing the possibility of using specific goods (public things) made available by entities obliged to cater for residents' needs (Wacinkiewicz, p. 342-346).

It is the second way of satisfying the needs of residents that is crucial from the point of view of urban prototyping projects. Public spaces which as a result of the prototyping process we are trying to transform (e.g. town squares, boulevards) are public goods made available for public use (that is to anyone) in all circumstances and access to them does not depend on meeting requirements specified by the law. Through use and enjoyment of them satisfaction of residents' needs takes place, which can be classified e.g. under needs associated with being in fresh air, recreation and relaxation, building interpersonal relations, pursuing one's own ideas and projects or use of a cultural offer (on the basis of entertainment projects for public places). We can find the physiological, belonging or aesthetic needs here without a doubt. Since public spaces made available to residents may serve satisfaction of their certain needs and this in turn is a basic task of local government, it seems obvious that everyone - local authorities as well as residents - should be interested in the best possible use of their potential. Urban prototyping is the method leading to optimization of design decisions resulting from the participation-research process.

The essence of Urban Prototyping

One of such innovative instruments (methods) is urban prototyping. It needs to be defined as an advanced consultation-research-design process as a result of which residents gain decisive influence over how public space is transformed.

The urban prototyping method is based on an approach to shaping public space that is different to the traditional approach. In the model approach to planning an expert discussion takes place, strategic studies and planning regulations are drawn up and on their basis design and implementation takes place. In the case of urban prototyping - thanks to feedback from residents - new elements emerge between architectural design and implementation, which make it possible to avoid the risk of conflict around the re-developed space or the risk of emergence of inadequate solutions. Thus, it can be said that prototyping is a way to solve difficulties inscribed in the traditional model as Jaworski (2017) notices in his Report.

We are dealing here with action called iterative design. Thanks to the iterative structure of the design, errors in the adopted assumptions may be discovered in the course and not at the end of implementation of the project, after extensive resources have been invested. As concluded by Jaworski and Karłowska (2017) this makes it possible for the project to evolve reasonably, allowing avoidance of the problem of lack of comprehensive knowledge.

Three fundamental stages can be identified in urban prototyping as a project (Jaworski, 2017). The first concerns activities preceding the creation of the prototype. Inventory of the current state of the public space that is to be covered with the project takes places, reference data is collected which will be used throughout the process, preliminary analyses are prepared including in particular transport (that is parking) behaviour, a concept of a contemporary change in traffic organization is developed and the prototype itself is built. At this stage first essential informational steps are taken focused on residents. They are also involved in individual actions (a consultation point for residents, distribution of leaflets, talks and meetings) and diagnostic and design workshops with their participation are held. Also at this stages discussions with various public space stakeholders take places - entrepreneurs or NGOs operating there, structures grouping residents engaged in public life (e.g. neighbourhood councils). Through this information is collected which will then serve to create the prototype of changes in the public space. If the design assumes socialized creation of prototype elements (e.g. joint construction of urban furniture, aestheticization of green areas) these actions are also held with direct, physical involvement of residents.

The second stage is associated with establishing the prototype and has fundamental research importance from the point of view of the entire process. Testing the prototype and response takes place here.

Prototyping assumes gradual introduction of changes which may be constantly corrected. Through testing the possibility of physical use of the transformed public space is ensured, making people accustomed to the changes before they become irreversible (e.g. residents may verify what kind of activity in public space revives it best, or find out how safety on the street is influenced by traffic calming). An answer to the question about residents' readiness for modification of their surrounding space is obtained on the basis of their real experience and not on a declarative approval or disapproval, which is particularly important. What is more, residents' needs may be flexibly responded to, improving or modifying the prototype at the testing stage.

At this stage all informational activity is continued, including in particular inclusion of residents in the process involving sharing opinions on the prototype. Research is also carried out on moving about in the area covered by the prototype, on traffic intensity, on the use of parking spaces, etc.

In turn in the third stage, already after the prototype has been liquidated, further informational activity takes place, inclusion of residents in the process of project analysis is continued by means of meetings and workshops closing the process, and also the final report is drawn up and publically presented, which constitutes the summary of the project.

Holistic Approach to Urban Prototyping

Thinking about a certain public space and the urban prototyping process itself cannot be carried out devoid of arrangements for the entire city. Justification of such a holistic approach is provided by an obvious observation resulting also from experience, that it is not possible to solve problems of a specific public space by focusing solely on it. A city does not consist of separated fragments of space, but forms a complex system in which changes introduced in one place (e.g. construction of a parking lot) cause specific implications in the surroundings (e.g. generating enhanced road traffic). What is important, these implications are often difficult to predict - even with having the possibility to use modern simulation and measurement tools. This one relationship alone out of a number of others occurring in contemporary cities is encouragement to a broader and comprehensive look at the interesting fragment of the city's space.

Within the vast scope of issues that should be taken into account in the process of urban prototyping we shall demonstrate three crucial ones. First of all, placing it in the strategic context of the city's activity, secondly, taking into account its role in the implementation of the urban policy of sustainable development, thirdly, the role that urban prototyping may play for participatory processes in the city.

Therefore, referring to the first issue, one needs to begin with an obvious observation that the urban prototyping process must be located in the framework outlined by strategic documents adopted in the local government (including in particular: development strategies or spatial studies containing conditions and directions of spatial development). Strategic goals will be the first essential reference point outlining at the same time the framework within which urban prototyping solutions will be developed. Development strategies adopted at the level of local government should demonstrate where - in the categories of the hierarchy of needs - issues such as quality of life, care for ecology or sustainable mobility are placed. In turn, basic instructions that shape the spatial policy for a given specific area (city fragment) will result from the spatial studies. They will show in particular whether a given area has distinguishing features which include both spaces and valuable objects located there which have historical, ecological, artistic, architectural, ideological, etc. values. In an obvious way they should be protected on the one hand and exposed on the other. Both indicated elements, strategy and spatial studies, outline a basic framework for prototyping activity.

Urban prototyping must be looked at in the context of sustainable mobility in the city - one of the main current development challenges. The strategic documents referred to, especially the spatial study, show special conditions concerning individual spaces in the city as well as instructions concerning transport issues which outline the framework of the sustainable mobility policy.

The fundamental problem of many contemporary cities involves the fact that natural values of urban areas in the course of the last decades have been marginalized as a result of an extremely dynamic increase in

the number of used cars and the resulting domination of individual transport over mass transport. Similar to what is happening in an ever greater number of European cities, including Polish ones, implementation of this policy is to counteract negative effects of the increase of motorization. As a result, public spaces which should mainly serve users-pedestrians have been annexed for transportation and parking needs. This is why recovering public spaces and squares for pedestrians and improving their social and functional quality is one of the fundamental contemporary challenges.

From the management perspective, spending financial resources is rationalized as an effect of urban prototyping. It is because we gain in-depth knowledge on residents' needs and the probability of spending funds on a project (investment) that will not be socially accepted decreases radically. What is more, we are gaining an additional criterion of assessment of validity of spending funds on the project which is "well-tailored" to the needs of the public space users. Good surveying of needs also makes it possible to design infrastructure which will not include unnecessary (and often costly) elements. These measures serve to optimize decisions concerning public spaces taken by self-government authorities. Therefore, urban prototyping allows affective achievement of goals by an organization (local government unit).

Why is urban prototyping so important in local government? Most of all because through discussion on public space it serves a greater goal, that is improving the quality of public debate.

Among many pro-citizens activities that encourage residents' greater involvement in public matters in the local government, urban prototyping stands out due to its character and scope of inclusion of residents. In a number of procedures that are expressions of local democracy (referenda, consultations) residents have the opportunity to choose between certain specific options. In the urban prototyping process, we are dealing with something much deeper than a simple choice between ready-made variants.

The requirement for real and fullest participation in the process involves equipping participants in the greatest knowledge on the prototyped space, its conditions and capabilities. Thanks to this, the "socializing of knowledge" takes place and process participants have the opportunity of fuller participation in the act of creating the prototype by holding crucial necessary information. The weight of this factor needs to be expressly emphasized, given that a frequent reason for lack of residents' engagement with public affairs (e.g. concerning urban planning, architecture) involves a belief that it requires specialist knowledge, often even seen as expert knowledge. An antidote for the "exclusivity of knowledge" perceived in this way involves intuition and solutions based on one's own experiences which are applied in the urban prototyping method and interpretation of which does not require specific competences. From the participatory point of view, the chances for active participation in public life are enhanced by it, also of those persons who by default do not participate in typical consultations due to marginal (in their opinion) force of this path of participation - removing one of the potential access barriers.

The factor of "socializing knowledge" is crucial also from the point of view of responsibility for the project. Thanks to information and knowledge residents are aware of the effects of introduction of such solutions for testing. It is an important element encouraging responsible and multidimensional perception of processes occurring in the urban tissue, their causes and consequences, opportunities and threats. It encourages shaping and reinforcing responsible ways in place of demanding attitudes and requests not justified by needs. For participatory processes, such awareness has a relevant impact on the quality of public debate.

The need for urban prototyping is revealed most fully in a situation that requires facing controversial issues that are not commonly accepted – those that require dialogue in order to find solutions to them. The above-mentioned issues of availability of public space for individual road transport, especially parking, are an exemplification of this problem. However, let us look at them from the perspective of challenges and tasks that must be put before the prototyping process. One may feel that from the perspective of many participants of this process (residents, entrepreneurs) this question is a central issue. Entrepreneurs point to their own needs (e.g. supply) as well as the needs of their customers. Residents of the public space which is to be transformed point out that it is not only public but also "their" terrain. Both expect certain preferences exclusively for themselves. This overlaps with the problem of parking places dedicated to

disabled persons, high-rotation parking places, traffic safety of all traffic participants - including pedestrians and cyclists, limits on movement speed, closing certain areas for road traffic and many others. Domination of this issue pushes issues that are significantly more important to the margin, such as entirely fundamental, development of new functions for public spaces, improving their quality, adaptation to users' needs, etc. This is why, the aim of joint action and arrangements made with the space users (residents, entrepreneurs, activists, non-governmental organizations and institutions), on the basis of conclusions coming from testing, should involve establishing jointly with the residents alternative solutions that will best satisfy their real needs. Under Polish legal circumstances this means in particular discussing instruments such as exemption from the requirement of locating parking places in a specific area by new (e.g. residential) investments, limiting admissible number of parking places, limiting access of cars to certain zones (areas) of the city or introducing high fees that enforce rotation in car parks in a given zone. *Conditio sine qua non* for stopping domination of road traffic consists not only in the indicated organizational and economic instruments, but most of all in priority for public transport and creating competitive conditions for moving within it, which are an integral part of the discussion of transforming public space.

In the urban prototyping process, through dialogue with residents supported by surveys, analyses and testing, we are aiming to be fully aware of the benefits of a change in the surrounding space and of improving its quality - which often requires residents' readiness to self-limitation (even with regard to the said transportation habits).

Conclusion

The system of local government in Poland (covering the local and regional level) has recently been an area of introduction of a number of innovative management instruments and methods. Their aim is i.a. to improve the availability and quality of public services and thus better satisfaction of residents' needs. One of such innovative methods is urban prototyping.

In this process, residents interested in transforming public space participate in designing it jointly by creating a prototype and then testing it. Prototyping assumes gradual introduction of changes which may be constantly revised (e.g. residents may verify what kind of activity in public space revives it best or find out how traffic calming affects safety on the streets). Moreover, comments reported by them in the course of the entire prototyping affect the guidelines (which conclude the process) which in turn are the basis for further action. Therefore, it may be reasonably stated that prototyping occurs in the residents' surroundings and with their direct participation.

From the participatory perspective it is an important instrument of development of the culture of dialogue in local government. In may be treated as a special form of consultation. However, it has a distinguishing feature that it does not boil down to studying preferences or making a choice between ready-made, imposed solutions. It happens through direct contact with residents (in this specific urban context - users of public space), based on numerous meetings, discussions and extensive research.

An undoubted value of methods such as urban prototyping involves building residents' awareness of the conditions of their surrounding reality and anchoring in them a belief in the effective impact that they have on public matters. It is a process in which substantive arguments which convince experts may be juxtaposed with users' arguments. What is more, urban prototyping directs activities on users' real needs, verified as a result of an experiment. From the point of view of management at the communal level, this social project is an optimal interactive synthesis of perception, valorisation, use and co-creation of space, based on an enhanced participatory process.

Quality Management in Transport Related to Thermal Treatment of PVC Profiles in Windows Production

Rafał KARAŚ

WSB University, Dąbrowa Górnicza, Poland, rkaras@wsb.edu.pl
rafal.karas@gmail.com.pl

Abstract

Polish export of windows made of is one of the biggest in the world. Achieving such level would not be possible without relevant management of the process of preparation of windows construction for their transport. One of the main factors that determine the construction quality is the method and the conditions of the thermal joining of profiles in production. The article describes two methods of thermal joining and then analyses their application in the production process with parallel presentation of strength tests. Strength tests are connected with the implementation of the construction from polyvinyl chloride (PVC) – white and coloured in mass as well as composite structures made from polyvinyl chloride and polymethyl methacrylate (PVC+PMMA). Further on some chosen methods of window construction protection in transport are shown. Generally speaking, the article presents the complex analysis regarding designing aspects of the production process that can be the starting point for setting the future directions of management of the development of companies that produce PVC window profiles.

Keywords: Transport, Technology, Production, Windows PVC.

Introduction

At the present moment Poland is the global window exporter, overtaking such countries as Germany and China. The dynamic development of export has resulted in pressure on high quality requirements concerning production and forms of window protection in transport. One of the most important factors affecting the quality of windows are the thermal conditions in which the windows are produced. The conditions concern kinds of thermal welding methods of PVC and composite profiles and the forms of window quality protection I transport. In 2017 Polish producers exported windows and doors for a total value of 835 million USD. This level of export corresponded with 27,8% share of Polish door and window export in the total world export of doors and windows, due to which Polish producers were 2,5 times ahead of the German and 3,5 times ahead of the Chinese producers. [5,20]

Table 1: Shares of transport of particular countries in total world transport in 2017

number	Country	Percentage share
1	Poland	27,8 %
2	Germany	11,5%
3	China	7,6 %
4	Romania	5,6 %
5	Slovakia	4,6 %
6	USA	4,5 %
7	Czech Republic	4.01 %
8	Turkey	3,5 %
9	Canada	3,1 %
10	Others	27,8 %

Table 2: The level of world trade exchange of doors and windows within the period of 2015 - 2018

Year	Value of world trade exchange in USD milliards
2018	3,5 USD milliards
2017	3,1 USD milliards
2016	2,9 USD milliards
2015	2,8 USD milliards

In 2018 Polish producers denoted father increase of percentage share in the world export of doors and windows up to 34%.[5,20]

Research Problem

The Author of the paper has conducted a thorough simulation research concerning both strength and design aspect of the production process that are to support quality management in transport in relation to thermal joining of PVC profiles.

Simulation research concerned the parameters of efficiency of production lines in two variants. The first one was applied to the production line equipped with the device for thermal joining of profiles and the device for cutting off the excess material. The second variant of production line was based on the application of the milling device preparing the profiles to be joined.

The strength research of thermal joining of profiles concerned the evaluation of strength of profiles joined in case of different components (white PVC profiles, brown PVC profile – coloured in mass, composite profiles PVC+PMMA). The research was carried out for thermally joined profiles in the following temperatures 190°C, 200°C, 210°C, 220°C, 230°C, 240°C, 250°C, 260°C.

The design research was carried out for two ways of corner protection. The solution proposed here is meant to protect thermal connection of profiles in windows from damage during their transport.

In the analyses carried out it was discovered that the weakest point in welded PVC constructions is the corner of the window which is most exposed to damage in the process of production, storage and transport. [5] High requirements concerning the quality of the method used for thermal joining of profiles has an influence on the level of window transport from Poland. The transport may be organized by vans, trucks and ships. The displacement of the structure causes unavoidable strikes to its corner. The weakened (cracked) corner may affect the safety of the user and some window properties such as e.g. thermal permeability of windows, sound insulation and tightness. [11,12]

Fig. 1: Most probable places of window damage during transport

Method of Profile Extrusion

The profiles under investigation were produced by extrusion, i.e. after supplying the base material in the form of granulate it is heated up to the temperature of 250 °C, and then – as a result of te screw process – extruded outside. The hot section is cooled mostly by spraying with water. In case of profiles coloured in mass the granulate has modified composition with predominance of brown dye. Another type of technology, in which the profiles may be manufactured is he co-fabrication process. It involves extruding sections on two extruders simultaneously. In the final extrusion stage the profiles pressing systems are connected which makes it possible to produce profiles made of several different materials e.g. polyvinyl chloride and poymethyl methacrylate (PVC+PMMA). [1,2]

All production technologies described in the article may be used by companies depending on whether the profile is to be manufactured in white, brown or composite version (PVC+PMMA). The type of profile production technology used has an impact on the strength of the welded joints that are realized in the process of producing window construction.

Simulation Research of Production Line Efficiency Depending on The Variant of Production Technology

In order to analyze the efficiency of the two types of production line the FlexSim programme was applied. The analysis concerned two variants of production of the construction. [4,8]

Variant I of the thermal connection of profiles

Variant I of profile connection is conducted by the way of heating the surfaces that are to be joint by heaters within the temperature range of (190°C – 260°C) for 30 seconds and then compressing the profiles one to the other during another 30 seconds. The whole process lasts 60 seconds. While the profiles are compressed to each other they are shortened by about 2-3 mm, due to which the excess material flows out of the profile. Then after cooling the joint surface for 60 seconds the excess material is cut for 120 seconds.

Fig. 2: The scheme of production line obtained by the FlexSim programme application for the variant I of thermal connection

Variant II of the thermal connection of profiles

Variant II of thermal connection of profiles that is implemented in industry is carried out by preparing the profiles in the machine for thermal joining by milling them. The process last 30 seconds. Then the heaters slide out and the material is heated in the temperature range of (190°C – 260°C) for 30 seconds. The final stage is the compression of profiles one to the other for another 30 seconds. The whole process last 90 seconds. The technology in the variant II has the shortened technological line because it does not need any additional cooling or milling of the excess material.

Fig. 3: The scheme of production line obtained by the FlexSim programme application for the variant II of thermal connection

The results of simulation research of production line efficiency for the variant I of profile connection and the variant II of profile connection

As a result of the simulation research concerning technology management the parameter of efficiency of the production line was obtained for each of the two variants of profile connection. The research was based on the time simulation of the production of 15 pieces of melded profiles of the dimensions of 1000 mm x 1000 mm.

Table 3: The list of parameters concerning the management of technology production

Variant of thermal connection of profiles	Profile milling	Profile heating	Profile compressing	Profile cooling	Cutting of excess material	Production line working time	Percentage
Variant I	-	30 s.	30 s.	60 s.	120 s.	1896 s.	100%
Variant II	30 s.	30 s.	30 s.	-	-	1395 s.	73,6 %

The conducted research shows that the production by the application of the variant II of thermal connection of profiles is 25,4% more efficient compared to the variant I.

Strength tests for the variant II of profile connection

In order to carry out the strength tests samples of four cut out corners were taken **(1,2,3,4)**. For this purpose melded profiles of the dimensions of 1000 mm X 1000mm were prepared at a joining temperature (± 1°C) **of 190 °C, 200°C , 210 °C , 220 °C, 230 °C, 240°C, 250°C, 260°C**. The samples were stored for 24 hours before the strength tests. The tests were carried out in testing

machine in which the actuator was applied that caused pressure and determined the maximum force of thermally connected profiles expressed in Newtons (N).

In the research three types of profiles were used.

a. The PVC base profile made in white colour
b. The PVC profile coloured in mass
c. The composite profile PVC+PMMA

Diagram 1: The results of strength tests of welded by method II (PVC white profiles - a)

Diagram 2: The results of strength tests of welded by method II (PVC profiles, coloured in mass - b)

Diagram 3: The results of strength tests of welded by method II (composite profiles – PVC+PMMA - c)

The Results of Strength Tests

As a result of the research carried out in order to determine the strength quality of technological processes of thermal joining of profiles I variant II the optimal values of temperature were estimated accordingly to the type of profiles used.

a. for PVC white profile the optimal temperature is 250 °C.
b. for PVC profile coloured in mass the optima temperature is 240°C.
c. for composite profile – PVC+PMMA – the optimal temperature is 255 °C.

Windows Protection in Transport

In order to achieve proper quality management of thermal connections of windows for long distances two forms of mechanical protection are applied.

- transport strip – it protects the bottom edge of the window from damage caused by windows displacements. The strip screwed to the bottom of the window protects its edges.
- Transport blocks – the elements usually made of wood – are fixed to the edges of the window and are meant to protect the edges from the damage during transport. These elements are mostly used in windows transport to France and Italy because of the profile shapes.

Transport strip	Transport block
	
Fig. 4: Methods of windows protection in transport with the application of transport strip and transport blocks

Both methods of window protection in transport May be applied regardless of the method used for thermal joining of profiles.

Summary

The simulation research carried out with the application of the FlexSim algorithm resulted in the choice of the more favourable type of production line for PVC window production regarding their quality. The investigation proved that the production line for 15 pieces of joined profiles equipped with the device for thermal joining of the corners and machines for cutting the excess material (variant I) need 1896 seconds. In case of the variant II, i.e. using the milling machines for thermal joining of profiles the same production level can be reached in 1395 seconds. Furthermore, the simulation research showed that window production realized with the application of the production line arranged according to the variant II is by 26,4% more efficient than the one of the variant I.

The results of the research indicate that there is a necessity to apply appropriate thermal parameters for joining profiles for the materials used in the production process. At present the producers most often use one thermal parameter e.g. 240°C for different materials, which is not proper taking into account all new technologies presently used. The situation in which the thermal parameters are not relevant has negative influence of the strength and quality parameters of windows obtained in the production process.

From the conducted research concerning quality management in transport in relation to thermal treatment of profiles it follows that the method of joining profiles and the type of material influence strength properties of window constructions. Moreover, the research shows that the method of thermal treatment has a significant influence on the management of production technology of windows. The described examples have relevant contexts in the ways of window protection in transport. Optimal parameters of thermal joining of profiles are as follows: for PVC white profiles – the temperature of 250°C, for PVC profiles coloured in mass – the temperature of 240 °C and for the composite profiles PVC+PMMA – the temperature of 255 °C.

The Author also presented the design works of the methods of protection of the joined profiles in windows, that should be used during transport. The security means undertaken to protect windows are very important. The damage or thermal break of the joined profiles in windows decide on the safety of their usage. It follows from the fact that in the place of thermal joining of profiles in the frames the hinges are installed and in thermally joined profiles of window sashes there are heavy

glasses. Moreover, windows protection in transport is important for fulfilling the declared properties of windows such as tightness, thermal permeability or acoustic protection. Damage following from the greak of thermal joining of profiles during transporting the windows from the factory to magazines and then to the place of building permanently destroys the quality of windows.
The paper presents the complex research and the analysis of production and transport of windows. The management goals to be achieved according to the Author are: high level parameters connected with efficiency, quality and transport of windows. The Author suggests that the tasks connected with management are to be realized In interdisciplinary way. The Author claims that the application of different research, simulation and designing methods helps in decision making of strategic character in production companies. In future, the research simulation programmes and designing tools will become the basis for the development of companies of global importance in PVC window production.

Dual Studies with Psychomotricity as an Innovative Form of Educating Special Educators

Joanna KRUK-LASOCKA

University of Lower Silesia, Wroclaw, Poland

jzj@poczta.onet.pl

Abstract

The purpose of this article is to present an innovative proposal for training special educators specialising in: "Education and Rehabilitation of the Intellectually Disabled Persons with Psychomotricity." The discussion of the innovative concept is preceded by an introduction on the criticism of special needs education. Next, a number of results of studies on failures in including students with the Down syndrome and the ASD (Autism Spectrum Disorder) are provided as examples that substantiate the presence of special needs education in teaching students with intellectual disability. Legitimacy of changes in special needs education was pointed out. Introduction of the dual studies project as discussed herein — strictly connected with practice, exploring the concept of psychomotricity — is an attempt at reforming special needs education to enable its existence as an alternative to inclusive education and closely combine with it.

Keywords: Special Needs Education, Inclusive Education, Psychomotricity, Concept Of Innovative Dual Studies In Special Needs Education

Introduction

In recent years, the world is discussing the effectiveness of educating people with intellectual disability in line with the idea of inclusive education. The research results referred to in the article show that inclusive education is not the best solution for all students with intellectual disability.

The purpose of this article is to present an innovative proposal for training special educators specialising in: "Education and Rehabilitation of the Intellectually Disabled Persons with Psychomotricity." The discussion of the innovative concept is preceded by an introduction on the criticism of special needs education. Next, a number of results of studies on failures in including students with the Down syndrome and the ASD (Autism Spectrum Disorder) are provided as examples that substantiate the presence of special needs education in teaching students with intellectual disability. Legitimacy of changes in special needs education was pointed out. Introduction of the dual studies project as discussed herein — strictly connected with practice, exploring the concept of psychomotricity — is an attempt at reforming special needs education to enable its existence as an alternative to inclusive education and closely combine with it.

Forms of educating special educators proposed in the project have been described in detail. The author's concept of Psychomotoricity of the Meeting was discussed as a bridge between a typically developing student and a student with I.D. Psychomotoricity of the Meeting was shown as a platform on which a teacher and an SEN teacher meet with children - students with different needs

1. Special education versus inclusive education — implications for the innovative dual studies discussed herein: "Education and Rehabilitation of Intellectually Disabled Persons with Psychomotricity."

Special education stems from the medical model of disability (Rayner, 2007). As such, for many years, it was placed between medical sciences (especially psychiatry) and psychology, where it focused on persons burdened with a deficiency or a dysfunction. It was the type of deficiency that determined the choice of type of special school the person attended. Revealing the deficiency entailed 'labelling', confirmation of a certain inability, disorder, being someone different. This resulted in the needs of the dysfunctional person being marginalised, and, ultimately, lead to social exclusion. Special education

was offered in special kindergartens and schools where specially-trained educators ran special education programs. This pattern was followed in special education until mid-1980s. And it was impossible to continue any longer. The views of postmodern philosophers such as Foucault (1983), the studies of educators — Freire in his "Pedagogy of the Oppressed" (Calves, 2009), the perception of a weaker man in the works of authors such as Levinas (Benaroyo 2016), all facilitated the creation of the social model of disability in the 1990s (Oliver, 2013). The views of critical educators and philosophers demonstrate the value of an intellectually disabled person in confrontation of a healthy person with a less capable one. According to Levi-Strauss (1983), we are only two variants of the form of transformation of a common mind. Levinas (1991) called to the man: "To accept the Other means to give". "Nothing is more important, noble and sacred than the responsibility for the Other". Levinas stressed that there is only one way to discover oneself: by discovering the responsibility for another person as the path to yourself. Experiences related to the cruelties of war, Hitlerism, devaluation of humanity were all significant for the Europeans in the development of the social disability model (cf. Bettelheim, 1967; Levinas, 1997).

Turning towards a weaker person as to one who deserves the same rights to wellbeing and living in a society resulted in the special education beginning to lose its identity, giving way to integrative education and later inclusive education. In 1994, according to the Salamanca Statement, schools with inclusive orientation are the most effective means of combating discriminatory attitudes, building an inclusive society and achieving education for all. Moreover, the Statement suggests that they can offer an effective education to the majority of children and improve the efficiency, and, ultimately the cost-effectiveness of the entire education system (UNESCO, 1994). According to Ainscow (2005), this was probably the most important international document ever published in the field of special educational needs. Many years earlier, in mid 1980s, special education was criticised for being segregative and discriminatory (Lipsky, Gartner, 1987) in which students with special educational needs attending special schools learn very little. As stressed by Kauffman, Anastasiou, or Maag (2017), this ruthless criticism gave rise to the decline of special education. Taylor advised against inclusive education as a radical reaction to exclusion of disabled students due to numerous assumptions and practices within the framework of special education (Taylor, 2006).

Inclusive education developed on the ruins of special education for nearly 30 years. Some countries, such as Italy, completely abandoned special education, while in others, such as Poland, integrative education was an intermediate link. Integrative education is a stage between the separative model and inclusive education (Thomazet, 2009). Shortcomings of integrative education were pointed to in numerous countries. Following the analysis of deficiencies and shortcomings, the inclusive education model was re-analysed. What critical remarks were addressed at integrative education? Integration assumes education of the disabled in schools available to the general public and, on the other hand, the need for special educators in the process of education. We are faced with the theory of two groups: disabled children are taught by a special educator and healthy children are taught by a teacher. Consequently, as in the segregative model, two communities are formed; the difference being they exist within one territory, that is, closer to one another.

The inclusive paradigm assumes that the class teacher is responsible for education of all children. The special educator's role is that of a methodological consultant in diagnosing the sources of problems and seeking solutions to them. Not only does the inclusive model assume change in the principles of financing and organization of the education conditions, but a shift in the centres of gravity as well. While the integrative approach is focused on building individual curricula for disabled students, inclusive education is committed to the development the strategy of holistic education of children in a community such as a class. This assumes relatively unified content introduced with the use of similar methods. The quality of social relations, equality in playing roles and emotional functioning, as well as mastering of school knowledge are taken into account in the inclusive approach. The inclusive thinking and acting is centred around the class at school as a heterogeneous group of students who need both individualised and shared education at the same time. The consequence of inclusive education should be empowerment of disabled adults.

The results of studies on inclusive education conducted all over the world demonstrate the full complexity of the social inclusion process. This complexity could be contemplated in the examples of

inclusion of children with the autism spectrum disorder (ASD) and the Down syndrome (DS) in the stream of generally-available (inclusive) education.

As a result of parents' pressure and legal guarantees, an autistic child or a child with the Down syndrome can be a student in a common school. Meanwhile, studies on inclusion of autistic children (Read, 2012) demonstrate that mainstream-educated children failed to obtain better results in education and social adjustment. On the other hand, children who attended special schools benefited from such form of education. Their behavioural issues were reduced, and their stereotypies and hyperactivity symptoms became minimal. According to other authors discussing the results of the studies conducted in Australia, an autistic child is isolated and estranged in a generally-available school. His or her needs are not recognised and fulfilled. Healthy students abuse an autistic student whose behaviour is beyond their understanding (Liley, 2014). Therefore, various solutions are proposed that could help in securing the developmental needs of an autistic child as early as possible.

In the light of the studies conducted in Netherlands in 2013, 74% of children with the Down syndrome start their education in the generally-available stream, with only 17% of them finishing the primary generally-available school (Van Wouwe et al., 2014). On the basis of other studies conducted by De Graaf, Van Wouve, and Haveman (2014) involving a population of Dutch children, an obvious tendency include children with the Down syndrome in the mainstream education has been observed since mid-1980s. Between 1993 and 2000, 70% learnt at generally-available schools. However, the group of children with the Down syndrome in the public schools decreased as the number of years spent at school increased (higher forms). This means that after 7 years of school education, the number of students decreased by as much as 60%. On the other hand, the studies conducted by these authors also indicate a downward trend in the number of children accepted into inclusive education over the last years. At the same time, after the year 2000, the number of students transferred from publicly-available to special schools started to increase.

Based on the analyses conducted by Giaouri et al. (2010), one could expect that even better-performing children with the Down syndrome will have difficulties in social relations in late childhood and adolescence. The characteristics of the reasoning and thinking deficiencies (and also psychologising-mentalization) have consequences for their ability to interpret complex social situations that are common in interaction between their peers. Similarly, Fidler and Nadel (2007) pointed to the fact that children with the Down syndrome may display difficulties in emotional and social functioning when cognitive aspects (intellectual processing capability) are involved in making decision on such functioning.

Campbell and Gilmore (2003) analysed the place of a child with the Down syndrome amongst their healthy peers in the opinions of the teachers. The study participants were a group of 274 students in teacher-training programs who were surveyed twice during the experiment in their first and second year of studies and in their fourth year of studies. The authors cite studies on teachers' attitudes towards disabled students. They stated that the teachers had tended to accept inclusion of students with mild physical disability in a generally-available school. They were, however, reluctant to inclusion of intellectually disabled students. Such attitudes towards inclusion, as described in American and Australian publications, are also present in Poland in connection with the present trends in perception of a disabled student within the class. It is difficult to tell what the causes of this phenomenon are. The review of papers on research into teachers' opinions on disability, analysed by Campbell and Gilmore (2003), suggests that a negative attitude results in low expectations from a disabled person which, consequently, might lead to limitation of their opportunities to learn. As a result, disabled persons have limited opportunities to act, experience, and learn from mistakes. Consequently, the teachers lower their expectations even further. The child, in turn, loses its motivation to work and take challenges.

How can the presented study results be interpreted?

An important objective of inclusive education is to allow each student to have their place in the common school. However, inclusion is not as important as effective teaching which must be the primary objective of each education. The statement that all disabled students may be educated in the inclusive system is a global issue (Kauffman, Felder, Ahrbeck and others, 2018). Full inclusion is not in the

interests of all disabled students. We are still probably unable to create the conditions to facilitate the implementation of full inclusion concept (Kratochvílová 2015). These shortcomings are also pointed to in various papers included in the work of Lindsay, Dockrell, and Wedell (2020). The paradox is that inclusive education may become the secondary exclusion instrument (Roger, 2018). At that moment, it becomes illusive and superficial, and even deceptive (Gardiner, 2017). It promises benefits, but it brings losses affecting the students with special educational needs (SEN) in the first place and their parents.

It should be admitted that there were also positive aspects of special education despite numerous disadvantages, and, in the first place, failure to respond to the challenges for disabled persons that are created by the society these days. These include:

- Good education and high competences of special educators.
- Transparent special education curriculum carried out on the basis methods adopted to students' capabilities in the institutions equipped with teaching aids necessary for special education.
- Numerous children are unable to learn in generally-available schools and will not cope without systematic support from a special educator.
- Most of all, however, many students learn in a place that provides a feeling of safety and facilitates conditions for success, meeting friends, and learning under the supervision of a friendly teacher. (Unfortunately, the cost of being a special teacher is disproportionate to the assessment of special education. The burnout rate of special school teachers is exceptionally high in comparison with most other professions. 50% of special education teachers give up their work within 5 years. Half of those who stay for 5 years will resign within 10 years. (Dage, 2006).

In the recent years, there have been hardly any works that demonstrate the necessity for special education in schools dominated with inclusive education. We could reference monographs by Kauffman, Hallahan, Pullen, Badar (2018) and Howe, Boelé, Miramontes (2018). Both these books were written many years ago. However, it is evident from the prefaces to the latest editions and re-editions that inclusive education failed to provide a solution in the case of numerous children with special educational needs.

Confronted with the introduction mentioned, our team decided to prepare an innovative dual studies curriculum to train special educators.

We assume that a special educator specialising in "Education and Rehabilitation of Intellectually Disabled Persons with Psychomotricity" will be needed in special education institutions. Special schools should not cease to exist until reasonable solutions are found. Reasonable solutions are actual inclusion. If it appears that special education is more beneficial for the child, then he or she will be allowed to attend such school.

A special educator will be able to work in mainstream kindergartens and schools running classes in a proprietary version of psychomotricity called "Psychomotricity of Meeting". Psychomotor settings can be arranged in an individual or group form. Activities in the form of play creates many opportunities for all children to do things together and help build mutual openness. At the same time, this allows the special educator to check the wellbeing of the entire group and its individual members, provides insight into difficult situations, and the problems experienced.

Why Psychomotricity?

An increasing number of intellectually disabled children learn at integrative and inclusive schools, even in our country. Psychomotricity is a holistic concept of supporting child's development that enables free manifestation of the needs and interests of all children, opening them to joint interactions (Zimmer, 2019). Psychomotricity entails intersection of mental and motoric aspects. In its broad sense, movement is the key to interpretation of various behaviours of the child. Motion is not only perceived as motor acts preceded by motoric planning and related with motional coordination, manipulation, and praxis,

but also as the whole-body language that includes a non-verbal code for conveying information which a child is unable to convey otherwise. However, otherness does not matter to children and when they passionately play together, the activity they are all involved in is important to accomplish the objective of the game. Elements of other known methods can be employed in psychomotricity and included in the created scenarios, since psychomotricity is a holistic child support system. Psychomotricity in the German-speaking regions is more focused on work with a group and in a group of children with various needs, whereas the French psychomotricity will be more useful in individual therapy of a children with deeper and deep disabilities (Rivière 2010),What a deeply disabled child manifests in its incomprehensible behaviour is considered to be a message, or means to convey information: about the way the reality is built, how a problem is solved, on transformations in the relationship between the child and its closest ones. The assumptions of psychomotor observation of playing children are as follows:

- Open up to a child to find out more about them than they could tell us themselves,

- Watch closely during the activity (play) proposed by the child

and in the “room for observation” developed together with the psychomotorist,

- The observation should not be focused on how the children solve the tasks, but on the relationships and interactions that the children create and function in.

- The observation should not be oriented on the standards, but on recognition the children's resources.

We develop our knowledge on the child as we perform activities together with him or her. The child tells us his or her story with his or her behaviour and the messages that we try to receive. We make assumptions as to the nature of his or her problem, we try to give his or her story a meaning. To giving meanings is to make assumptions on his or her problem, on the origins of the problem. This is a dynamic process — every new experience is the starting point for developing the room for mutual relationship, provokes new challenges, changes the present state of psychomotorist's knowledge on the child and on the entire group. Each step in the joint activity (play) is a step closer to fully understand children's needs, his or her strengths and weaknesses; each step opens us up to the meeting with the child.

When we think about persons with deeper and deep intellectual disability, the skills (training) we have mastered is not enough to handle the complex, unclear, multi-layered social reality of our times. It is often impossible to develop the competencies. The subject of our attention needs us as an intermediary, a friend, a teacher of subtle shades of emotion, a helping hand in solving ethical and moral dilemmas. In the psychomotor practice, we are often confronted with persons who will not achieve the level of empowerment that would enable them to be self-sufficient. Such cases require unconventional psychomotor support methods. In these settings, the support should be focused closer to the individual therapy that is fully oriented on developing the fundamental needs. Failure to meet these needs prevents taking the next step.

This is where the Psychomotricity of Meeting plays a crucial role (Kruk-Lasocka, 2016). During the meeting, a man meets the master, his teacher from whom he learns how to be there for another man. One may ask the question: “Who is the teacher and who is the student?” In the psychomotor play, psychomotor meeting, we learn how to follow the other party, to read their messages with attention. The other one teaches us about themself in this way. We try to find meaning in their behaviour. And these are difficult to find, we are often confronted with a person who has built an “empty fortress.” Children who are difficult to understand, adults with multiple intellectual disabilities, cerebral palsy, contorted faces, unable to control their arms, eyes looking away from our eyes, inarticulate sounds coming out of their mouth. Sellin, the mute autistic poet, wrote: “This poem is to my mute sisters and brothers; we should be heard and offered as place, so we can live amongst other all other people in the society” (Sellin, 1995). This justifies the decision to include Psychomotricity of Meeting in the study curriculum.

3. Presentation of the project of dual studies titled “Education and Rehabilitation of Intellectually Disabled Persons with Psychomotricity”

The project was prepared as a submission for a competition organised by The National Centre for Research and Development in 2018. This is the only project in special education amongst 69 projects that successfully completed the call for tenders procedure.

The project was prepared by a team consisting of the coordinator, a subject-matter consultant, a specialty tutor, an internship coordinator.

What are dual studies?

Dual studies are innovative, experimental studies combining special education with inclusive education through psychomotricity.

Dual studies entail alternating education in the form of classes at university and practical training in various institutions of special and inclusive education.
