These studies were launched in the field of Special Education with the major field of: Education and Rehabilitation of Intellectually Disabled Persons with Psychomotricity. The execution of the curriculum includes lectures, tutorials, workshops, and work placement, internships, international study tours.

These are 3-year full-time studies concluded with that the award of a bachelor's degree entitling to work as a special educator. The students will have opportunities to obtain certificates attesting to the proficiency in using multiple educational and therapeutic methods.

The objectives of the dual studies are as follows:

- To improve the knowledge, skills, and competences of persons participating in higher education in response to the needs of the economy, labour market, and society in the field of special and integrative or inclusive education.

- To contribute to increase the potential of institutions conducting educational and therapeutic work amongst intellectually disabled persons and acting to the benefit of social integration of disabled persons.

Execution of the curriculum

Execution of the curriculum involves various forms of education which are contained in the following key terms:

Student-discoverer (participation in educational and psychomotor classes conducted in Germany, Poland, France, Austria — discovery of various educational systems in the work with intellectually disabled persons). The student discovers the importance of the profession they are trained for and its prestige. The student learns respect him or herself as to a special educator by observing the work of educators in the forgoing countries.

Student-researcher (participating in the studies conducted at the university involving intellectually disabled persons, writing Bachelor's thesis)The student may become involved in the conducted studies as an assistant to the researcher, an interviewer, a creator of small “case study” projects.

Student-competent judge (assisting in the works verifying the selected tools and their usefulness in conducting studies). The student experiences the process of creating scenarios, psychomotor plays, he or she is at the centre of the process of transformation and development of special education.

Student-attentive observer closely following the client (assistance in the diagnostic and therapeutic activity — Diagnosis and Therapy Centre for children with developmental difficulties operating at our university). The student learns how to recognize the needs in therapy of children requiring additional support and parents looking for therapeutic methods for their children. The student learns how to be

patient and open to the problems of the families he or she meets and assists in conducting therapeutic activities.

Student-holistic therapist (familiar with multiple therapeutic methods described). The student will be able to use them depending on the character of his or her future work and propose additional forms of supporting the child in need of more targeted support, e.g., to relieve excessive tension or improve fine motor skills.

A student-psychomotorist treating his or her work with passion and creativity, able to utilise psychomotor settings and include them in activities that are educational in nature.

First of all, however, this will be a student who is an attentive future teacher, a thoroughly-trained special educator provided with knowledge and competence.

Courses in selected methods included in the Educational Cycle

- Alternative and supportive communication — constitutes the necessary addition extending the special educator's toolset with methods of communicating with a mute student, a student with cerebral palsy, an autistic student, or a student with multiple disabilities.

- Dog-assisted therapy complements the therapeutic methods, especially in work with pre-school children or a student with a deeper intellectual disability. This method helps relieve tensions, channel emotions, teaches a friendly attitude towards animals. It could constitute a bridge between the teacher and a special-care child in situations when the student fails to make contact with other persons and is unwilling to communicate with a group. This could be the starting point for a dialogue between children in an inclusive school.

- Sherborne Developmental Movement — a popular method used in both kindergarten and school. Group activities facilitate work in a diversified group of children in the inclusive education stream teaching mutual tolerance, openness, and group work.

- The hand therapy course — provides a special educator with competences in the field of rehabilitation of children with cerebral palsy, autism, mild sensory integration disorders, fine motor skills, praxis, visual and motor coordination, and motoric planning.

- New technologies in work with children with disabilities — with this course, a special educator will be able to implement elements of education with the use of available multimedia means of communication into the teaching process.

- The holiday camp counsellor course is necessary for the student to be able to work with a special educational needs person in the capacity of an attendant, assistant, or a counsellor during organised rehabilitative stays and also with a group of children participating in various holiday camps in the inclusive stream.

Internships included in regular education at the university, study tours, work placement

During their studies, in addition to lectures, tutorials, and participation in courses, the students are obligated to complete a 3-month internships at various special education institutions: early childhood development support centre, kindergarten, school for children with mild, moderate, and severe disabilities, occupational therapy workshops, a nursing home for adults permanently staying at the institution. To make this possible, the student spends two days in a week at the institution where he or she acts as an assistant to a teacher, counsellor, or therapist working with the clients. This internship facilitates deeper understanding of the issues related to intellectual disability of a child and confrontation with the students on a daily basis.

Study tours are visits to institutions where students broaden their competencies in the work of a psychomotorist, special educator, and educator:

- The students learn various forms of psychomotor interactions and freedom in creating their own psychomotor solutions.

- The tours broaden students' knowledge the education of empowerment and holistically-perceived psychomotricity.

- The tours demonstrate various practices in variety of special and inclusive education institutions.

- Help build an image of a special educator as a sensitive, open, and creative person learning in the complex educational reality.

During the study tours, the students visit psychomotor education institutions:

- The Institute of Psychomotricity in Vienna: the students are familiarised with Austrian psychomotricity based on examples of work with children with special educational needs in a diversified group of kindergarten children and with psychomotricity for elderly people with intellectual disability.
- Pierre and Marie Curie University in Paris — Faculty of Psychomotricity

The students are familiarised with the concept of French psychomotricity perceived as "an attempt at reading the story told in the person's body language." They observe sessions involving persons with deeper intellectual disability on the basis of prof. R. de Lubersac's views and assumptions on psychomotricity.

- At the University in Osnabrück, Germany, students will have an opportunity to experience prof. R. Zimmer's psychomotricity, one of the world's renowned schools of psychomotricity.

Participation in these tours is an essential requirement to obtain a certificate in psychomotricity. Each internship lasts five days.

Study tours to model educational institutions were included in the series of classes within the studies to allow students to make observations and gradually form their own opinions on various systems of education of students with special educational needs.

These are the schools in Germany. The proposed schools conduct proprietary experimental programs aiming at preparation of intellectually disabled students to living in the society. These schools developed their own tools to evaluate the progress made by students. The curriculum enables seamless transition from special to inclusive education. The education concept, is based on the intensive collaboration with the environment and offers perspectives for employment and living on one's own (e.g., assisted living). Observations of lessons at schools might inspire the university students to create a new concept of special education.

Hans-Peter-Ruf-Schule in Schwabach has been participating for many years in international exchange of teachers under the Comenius (presently Erasmus) programme. With this international activity, the school implements the latest, most effective and diversified concepts and projects to support students with intellectual disability, especially innovative, proprietary approaches with the use of the psychomotricity of empowerment.

Rosenberg Schule — this school is an example of good practice. This is a model institution in the local environment. It functions as an element of a model (system) of inclusive education of students with intellectual disability and adults.

Other institutions— these were proposed to allow students to compare organization of the special education institutions to make critical reflections. In two of such facilities, the student has a chance to experience everyday life with persons with moderate and severe intellectual disability by living with the students, helping them at school, with daily chores, and planning their activities.

In addition to the aforementioned forms of education, the student is obligated to complete a total of 310 hours of work placement (over a period of 3 years). Each of these work placements is different in nature and carried out in different special or inclusive education institutions. The work placement is continuous which means that, over its course, the student must come to the institution every day and complete the activities as instructed. The students perform various tasks as part of the work placement which are related to the names of work placement types:

- observational, teaching
- guardianship and tutorage
- teaching in lessons
- therapeutic
- project-based in inclusive education

Education with the use of new technologies

This demonstrates the opportunities of using the developments in computer science, cybernetics, and robotics in the work of a special educator. This module includes:

"New media in rehabilitation of persons with disability" (30 hours)

The "New technologies in the work with children with disabilities" course (30 hours)

In addition, children have an opportunity to experience and use new technologies by means of helping in research on the project: Social Robot in Recognition of Autism Spectrum Conditions in Pre-School Children. Students also participate

in testing the usability of the "Scale for the assessment of the child's interaction with the robot" prepared by the project team members.

Summary

The studies on the empowerment of persons with intellectual disability entail firm continuation of the social model of disability and consistent departure from the biological (medical) model. Research studies and practical solutions are not based on theories of special education embedded in medicine and clinical psychology, but in a broad, historical and cultural context. Therefore, the term of 'research on disability' is proposed, where disability is perceived as a phenomenon construed by social valuation (Kuo, 2015; Vaughn, Swanson, 2015). In this approach, education of a teacher takes a new meaning; his or her personality traits are emphasised: openness, sensitivity, readiness for self-education. An empowered teacher can shape an empowered student (Aloni, 2013). There are no doubts about the development of the social model of disability. This, in fact, is the only reasonable path of education that can lead to coexistence of all citizens in the society. However, this goal does not always have to be achieved through inclusive education. Perhaps the understanding of special education should change, maybe other areas of this education should be emphasised, or the role of special educator should be redefined. The confrontation of theory with practice and flexible adaptation of forms of education to individual needs and abilities of students are the fundaments of the project presented herein. The emphasis was also placed on the training of the special educator: an open and creative person who is aware of the significance of his or her work and its importance for the society, ready to include persons with intellectual disability in the stream of open community. Presumably, implementation of the project presented will facilitate revision of current opinions on minor importance of special education and special educator in educating students with intellectual disability.

Abstract

The development of an organisation is inevitable, especially taking into account the challenges and requirements that contemporary organisations face. Hyper-competition, virtualization, development of new technologies, decreasing life cycles of products and the dynamics of customers' expectations force organisations to search for tools that will enable them to develop in an orderly, balanced way. This is because the acceleration of the pace of development requires that organisations deal with many problems. Undoubtedly, the business models of process maturity can be regarded as a tool for improvement and development of an organization. Such models, apart from describing particular levels of maturity, allow to focus the development of an organisation on better process results on the one hand and on the other hand on increasing the efficiency of entire organisations. The aim of this article is to contribute to the BPM theory by presenting a wider perspective of business process maturity models as a tool for organisational improvement and development, particularly in relation to the functions performed by the models of process maturity and the impact of the use of these models on the development of an organisation.

Keywords: Business Process Orientation (BPO), Process Maturity Of The Organisation, Business Process Maturity Models (BPMM), Organisation Development, Improvement

Introduction

It is inevitable that each organisation undergoes a development process, especially considering both the challenges and requirements that contemporary organisations must face. Hypercompetition, virtualisation, evolution of modern technologies, product lifecycles becoming shorter and shorter as well as the dynamics of customer expectations force organisations to develop continuously. The foregoing applies not only to businesses, but also to public institutions and other organisations.. The growing development momentum forces organisations to tackle a multitude of problems. Consequently, it is recommended that each organisation assumes a specific development pace, which conforms with the concept of increasing the maturity of its processes. Following the idea that an organisation is only as efficient as its processes are (Rummler, Brache, 2000, p. 76), one can claim that the pursuit of process maturity corresponds to the organisation's growth-related needs, while process maturity models may be perceived as process improvement and organisation development tools. There is a number of publications representing the literature of the subject elaborating upon the way in which process maturity models function (Rosemann and de Bruin, 2005; de Bruin 2007, Hammer, 2007; McCormack and Johnson, 2001; Lockamy and McCormack, 2004; OMG, 2008; Zwicker, Fettke and Loos, 2010; Röglinger et al., 2012; Kohlegger et al., 2009), but most of them present the relevant models with reference to the potential for increasing process maturity. However, not all business process maturity models take the broader perspective of an organisation into account, as some of them only make it possible to establish process maturity of a single process or a set of processes used to perform certain functions, instead of that of a set of interlinked processes (Dijkman et al., 2016, p. 720). The criticism towards maturity models often pertains to the fact that they disregard the business results of the processes being improved. Many of models not only describe

individual levels of process maturity, but also constitute records of the knowledge about the way to implement high-performing and efficient processes. They should basically also enable the organisation's development to be oriented towards increased efficiency of processes as well as of entire organisations.

In summary the above elaborations one may arrive at a conclusion that many of the available studies focus on presenting the essence of how business process maturity models are built as well as their characteristics mainly from the perspective of the potential for increasing process maturity, while perceiving process maturity models as tools for organisational development represents a separate approach to the matter of their application. The article was conceived to fill a knowledge gap in this respect, highlighting that the demand for business process maturity models is far more extensive than that which stems from the BPM related needs. The purpose of the article is contribute to the development of the BPM theory by presenting a wider perspective of business process maturity models perceived as tools for organisation improvement and development. In order to fulfil the pre-assumed goals of the publication, the following research objectives were assumed:

1. Interpretation of the notions of process maturity and organisation development.
2. Review of selected business process maturity models from the perspective of their contribution to organisation development.
3. Identification of the relationship between the application of business process maturity models and organisation development.

Individual parts of the publication address the above problems, and the article itself comprises structurally interlinked sections. In the first one, based on the review of the literature of the subject, the notions of process maturity and organisation development have been defined. What follows is an analysis of the problem of business process maturity models, highlighting the functions they perform in terms of developing the business process orientation in organisations. By analysing the opportunities created by their use, the relevant research gap has been identified, and it has been concluded that they can be applied much more extensively than in the BPM sphere only. The research methodology has been described in further paragraphs. The results and discussion section proposes to perceive business process maturity models as organisation development and improvement tools. The article closes with the conclusions stemming from the research in question and the elaborations provided.

Background

According to Kohlbacher and Reijers (2013), the relevant aspects of process maturity comprise process documentation, involvement of the management, process ownership, process measuring and monitoring as well as methods and techniques of continuous process improvement and the organisation's culture and structure.

Increasing process maturity has become one of priorities in the development of numerous organisations. One can also perceive it as a form of development. Both development and improvement of process maturity consist in transition from less desirable states, considered less effective, to more desirable states, considered better and more efficient from the perspective of a pre-defined criterion or set of criteria. Having assumed such an approach, every future state is regarded as better than a past state. On the basic level, it typically corresponds to developing the awareness of processes being implemented within an organisation. On a higher level, process identification and documentation appear. An impulse for further changes is the willingness to control processes and to seek to improve them. With the highest level of process maturity comes the need for defining links and correlations between interfunctional processes as well as for identifying and building relationships with suppliers and customers. In order to enter the level of process optimisation, organisations are required to deploy specific mechanisms for control of entire value chains encompassing business partners and customers. Another level of process maturity should be accompanied by the growing process capacity to accomplish the pre-assumed goals, which is reflected by efficient strategy implementation and improved quality of products and/or services. Entering the higher level of process maturity should trigger improved control of process deliverables,

more accurate forecasting of goals, costs and effectiveness, improved efficiency in pursuing pre-defined goals and increased capability of organisations to plan and implement organisational changes (Lockamy, McCormack, 2004).

Organisations can pursue development by introducing many internal changes which may lead to better economic results, improved customer satisfaction, as well as higher quality of the products and/or services delivered. From the business's point of view, it may apply to either one of its parts or to its entirety, to all or to one of its operating areas, e.g. goals, structure, technology or human resources, but it may also concern the processes being deployed. Many contemporary concepts place emphasis on sustainable development by taking needs of different stakeholders into consideration. Unlike growth, which mainly pertains to quantitative changes, the notion of development also encompasses changes of qualitative nature. Development is not only about increasing the scale of activity, but also about other aspects of operations, including improvement of the quality of products or services delivered.

Development as such is primarily assumed to prevent exclusion from the market and to increase competitiveness, while sometimes it results from the organisation's natural needs. Development should proceed according to pre-established rules and deliver intended effects, typically better than those achieved before. Therefore, the changes one faces in this respect should be intentional in nature. Development is also essentially a long-term phenomenon, as it proceeds gradually and emerges as a result of consecutive changes being introduced. In order to make changes possible, organisations must surmount the strong urge towards stabilisation (Hammer, Champy, 1993, p. 23). There are three distinctive approaches to the research of organisation development addressed in the literature of the subject (McKelvie, Wiklund, 2010, p. 277). The most extensive of these approaches considers development as a dependent variable and research activity as a means to explain the factors conditioning development. Another approach focuses on results of development, and development is perceived as an independent variable. The research activity concentrates on the changes that take place in an organisation as a consequence of its development, and individual stages of development as well as the organisation lifecycles are taken into consideration. In line with this approach, organisations develop gradually, going through different phases. The third approach in question perceives development as a process, stressing the manner in which organisations develop, and particularly what happens to them while they develop.

Business Process Maturity Models (BPMM)

A review of the available literature of the subject implies that there is no single and commonly acceptable definition of a business process maturity models. It may be generally described as a set of recommendations and good practices used in the pursuit of efficiency in implementation of processes. They reflect the evolutionary path of development which enables organisations to move from the condition of having deployed incoherent and non-interlinked processes to processes that are structured, monitored, managed and improved. Pullen (2007, p. 11) suggests that it is also an "organised set of elements which describes the characteristics of efficient processes at different stages of development. It also highlights points which delimit individual stages and indicates methods making it possible to move from one level to another." Business Process Maturity Models (BPMM) can be applied to measure efficiency and maturity of:

- specific business processes, and
- maturity of overall business process management, i.e. of all business processes deployed in the organisation (Rosemann and de Bruin, 2005; de Bruin 2007, Hammer, 2007; McCormack and Johnson, 2001; Lockamy and McCormack, 2004; OMG, 2008; Zwicker, Fettke and Loos, 2010; Röglinger et al. 2012).

M. Kohlegger, R. Maier and S. Thalmann (2009, p. 54) claim that, in conceptual terms, business process maturity models represent qualitative or quantitative stages of growing capacity of the model's components to perform the tasks assigned for purposes of their assessment in pre-defined areas. This definition does not fully reflect the very essence of maturity models, as it only focuses on the diagnosis of the current state of matters, while there are numerous other functions these models

perform as well. An analysis of the available literature implies that one can distinguish between the main functions performed by process maturity models:

1. Diagnostic function which enables identification of the organisation's current weaknesses and comparing them with other parties.
2. Development function which orients organisations towards their further development compared to the pre-assumed improvement plan. With reference to the current level of process maturity, one can establish specific measures aimed at reaching a higher level.
3. Decision-making function which helps in establishing action priorities conditioning the decisions being made.
4. Evaluating function. Models make it possible to evaluate the improvement of the results achieved as time passes, and therefore they can be used as a means to monitor the changes taking place within the organisation, oriented towards the pursuit of excellence.
5. Comparative function. Models enable a comparative analysis to be conducted inside organisations, industries and even countries (Rosemann, de Bruin, 2005, pp. 3-4).

According to P. Cronemyr and M. Danielsson (2013), organisations need business process maturity models because the latter help them reduce the risk of failure in process management and match individual process changes with the time and the budget in disposal, orienting the transition to higher levels of maturity towards an increase in product quality, assuming that more efficient processes ensure higher product quality. What followed the evolution of the process approach was further maturity models.

The very pillar of business process maturity models is the phase model of development and use of information systems conceived by Nolan who created the stages of growth theory in the early 1970's (Nolan, Gibson, 1974). Some inspirations to create these models can also be tracked to Maslow's motivation model (1954) and Kuznets's theory of economic growth created in 1965 (Gabryelczyk, 2016). It is commonly believed that the first properly structured maturity model oriented towards quality maturity of businesses is the Quality Management Maturity Grid developed by Ph. Crosby at the end of the 1970's (Mullaly, 2014). It gave rise to a wave of maturity models being developed in different areas of organisations, including those dedicated to process management. Crosby's concept is considered to be the starting point for preparation of the first process maturity assessment model referred to as the Capability Maturity Model (CMM) by the Carnegie Mellon University Software Engineering Institute (Gibson, Goldenson, Kost, 2006; SEI, 2006). The key maturity models originating from this trend are the Business Process Management Maturity Model (Rosemann, de Bruin, 2005; Rosemann et al., 2006), the Business Process Orientation Maturity Model (McCormack, Johnson, 2001), the Process and Enterprise Maturity Model (Hammer, 2007), the Business Process Maturity Model (OMG, 2008) and the Process Maturity Ladder (Harmon, 2007).

In an attempt to group the existing business process maturity models, the following four sets can be formed (compare Aukszol, Chomuszko 2012, p. 42):

- models based on the Capability Maturity Model (CMM) designed by the Software Engineering Institute. It was originally used for purposes of enterprise computerisation responding to the frequent failures of IT projects in an attempt to satisfy the need for better choice of software providers. Further versions more appropriately adjusted to other organisation areas sprang from this model as time passed. It is now referred to as the CMMI (Capability Maturity Model Integration), and it is integrated in nature;
- Business Process Maturity Model (BPMM), developed in 2002 by the Object Management Group (OMG) association. To a large extent, it is inspired by the CMMI model, however, it is more extensive in terms of the range of applications. According to its authors, the BPMM can be used as the main process structure or as an add-on to other models or sets of good practices, such as COBIT-2000, ITIL, ISO 9000, where it is applied for purposes of maturity assessment and improvement;
- industry-specific models, often inspired by the CMMI or BPMM models, precisely addressing the needs of a specific industry or area of operations. An example of this group is

the IT Architecture Capability Maturity Model which focuses exclusively on objective assessment of all processes related to the architecture of information processing systems;

- more general organisation models comprising certain elements of maturity. One of them is the Information Technology Infrastructure Library (ITIL), containing a separate part connected with process maturity referred to as the Process Maturity Framework (PMF). What one creates in some of these models is a detailed description of a process maturity assessment procedure, which is the case of the Six Sigma method-based model, for instance.

The study of the literature of the subject supports the finding that one of the most highly developed business process maturity models applicable to both process improvement and development of process-oriented organisations is the OMG Business Process Maturity Model (BPMM) developed in 2002 by Object Management Group (Raschke et al. 2010). It describes processes against the context of an entire organisation, assuming that improvement of processes leads to improvement of the whole organisation, and the improved processes cannot be sustained if the organisation is not mature enough to do so. It also presents an evolutionary path of development which allows organisations to make a transition from the level of incoherent and uncoordinated business operations to the level of structured and continuously improved processes. Therefore the BPMM is not only a tool used to determine the process development level, but also a methodology supporting development of organisations in a broader perspective. This model supports learning of organisations, enables innovative improvements and helps them to avoid mistakes in various areas (Röglinger et al., 2012, p. 330).

Compared to other business process maturity models, the one devised by Rummler and Brache (2004) clearly stands out, as it is based on the assumption that every organisation is a system, and that the diverse processes it has implemented span various areas of the organisation. It places special emphasis on the necessity to correlate the actions undertaken across the organisation (coordination of goals and methods for designing and managing on three levels: organisation, process and position) and to eliminate the problems emerging in the sphere of functional interconnections for the sake of improved efficiency of the whole organisation (Rummler, Brache, 2000, p. 46). The process management level assessment conducted under this model uses the Process Performance Index (PPI) (Rummler-Brache Group, 2004). The model comprises 10 success measures which – according to its authors – exert a significant impact on the organisation's capability to implement the process management methodology. A significant advantage of the perspective assumed in the model is that all improving actions are initiated on the basis of a pre-defined strategy, and this solution ensures that development proceeds consistently and in line with the long-term vision of operations. This approach removes the need to optimise a certain area of operations without taking into account the final consequences for the functioning of the entire organisation. The comprehensive approach postulated in the Rummler-Brache model creates an opportunity to assess an organisation more extensively, not only focusing on its inside, but also with regard to its relationships with the environment, the analysis of which provides a premise for launching adaptive actions.

Another model based on the CMM and CMMI concepts is the BPTrends Pyramid proposed by P. Harmon, describing a model organisation featuring mature processes and determining the organisation's capacity to improve processes (bptrends.com). This model pertains to three levels: enterprise, process and implementation. On the enterprise level, strategic goals are matched with those of business processes, performance indicators are defined for the entire organisation, and then they are adjusted to match the value chain and the key processes. Consequently, one may claim that the actions undertaken on the enterprise level include establishing the process management system and planning the ways to recognise all the organisation's needs with regard to implementation of individual processes as well as setting priorities and planning actions intended to enable their improvement.

Although the models addressed in the study were created for purposes of process management, their underlying logic should be applicable in other areas of the operations performed by organisations. An important aspect of the problem should be the use of maturity models in a broader context, namely as an integral part of maturity assessment of entire organisations (Dijkman et al., 2016 p. 719) against

the assumption that the more mature the organisation, the higher the capacity of the processes it has implemented, leading to improved product quality and business results.

BPMM are not free from deficiencies, and they have inherent limitations, such as oversimplification of the reality, an implication that there is but one way to act in all organisations, as well as disregarding the internal and external conditions in which organisations function (compare Röglinger et al., 2012). The use of these models is also exposed to a certain risk of failure which becomes imminent when one rigidly adheres to the model provisions without flexibly adapting to current requirements and the given organisation's practice (Kania, 2011, p. 83). Moreover, there are many cases when consulting companies make an excessive display of the advantages the said models offer as well as the need to apply them, promising the potential benefits overly optimistically. Maturity models prove particularly useful for organisations initiating formalised process management, as they make it easier to identify the current state of matters and ensure sufficient motivation to act, while at the same time they suggest the best practices to be applied. The fact the organisation has implemented one of the models is not always tantamount to its genuine development. Much depends on the model type and the extent to which it is actually utilised. Many of them provide development-related recommendations, which does not automatically mean that they will be put into practice. The concept underlying BPMM is based on the assumption that the more mature the organisation, the higher the capacity of the processes it has implemented in the pursuit of its pre-defined goals, leading to improved product quality and maximised business results.

In conclusion, one may claim that business process maturity models are intended to channel organisation's development towards top process efficiency without compromising results of entire organisations, therefore the perspective of using the models may extend far beyond that of the BPM related needs exclusively, and so that can also find their practical application in the sphere of organisation improvement and development. The above conclusion points at the knowledge gap which consists in the insufficient exploration of the opportunities to make use of business process maturity models for the sake of organisation development.

Research Methods

This publication is essentially an overall review of the problems in question, and consequently the research process primarily consisted in studies of the literature of the subject and proceeded according to the phases summarised in Table 1.

Table 1: Research process

Phase	Activity	Effect
Initial preparation for the literature review	Adoption of search criteria.	Selection of search terms
	Identification of journals, choosing key words	
Conducting the literature review	Searching databases, i.e. Emerald, EBSCO, Google Scholar	Selection of the most relevant publications
	Review of titles and abstracts of selected papers	
	Evaluation of full texts of selected papers	
	Analysis of compact library resources	Selection of publications covered by detailed analysis
Compilation of the text	Critical analysis of selected publications that meet the adopted criteria	Synthesis of the results in the context of the issues raised
		Identification of the gap in knowledge

Source: *Own study*

In the first stage of the research work, specific search criteria were defined and key words selected, including *business process maturity model* and *organisation development*, used to browse through databases. The constraint applied was that the databases were only investigated in search for articles spanning the last 15 years (2003-2018). Analysing titles, abstracts and key words, individual articles were picked as those assumed to be matching the problems in question best, and then they were pre-selected. This step was complemented with an analysis of publications available in libraries and internet resources, including books and other scientific papers. By these efforts, it was possible to select the publications to be analysed in detail, and so among the initially chosen 45 publications, 18 were eventually subject to critical analysis. The papers which had met the assumed criteria were extensively analysed in the pursuit of the knowledge gap. Consequently, the final stage of the research work enabled a synthesis of the results thus obtained, providing sufficient grounds to define the knowledge gap and formulate conclusions with reference to the literature review.

Results and Discussion

The functions performed by business process maturity models, as described in the literature review, confirm their notable impact on the organisation development, and this implies that the models can be used as organisation improvement and development tools.

Business process maturity models form a pattern of gradual evolution of organisations, which is why they are also referred to as “stages of development”, “stage models” or “stage theories” (Plomp, Batenburg, 2010). Using them is, one the one hand, an attempt to tackle the problem of organisational excellence in a holistic manner, and on the other hand, they are tools dedicated to managers and intended for improvement of management (compare Haffer, 2011, p. 37). Once deployed, they enable systematic assessment and improvement of process skills and competencies needed by the organisation to attain high efficiency (Van Looy et al., 2011). This corresponds well with a statement that BPM has become a discipline that can be used to improve the entire range of organisational activities (Harnaus et al., 2016).

Based on literature studies, Dijkman et al. have compared several business process maturity models from the perspective of their relationship with organisational performance. Table 2 provides references to individual studies, the models applied and the researchers who managed to observe the said relationships.

Table 2: Relationship between maturity and organisational performance

Study	Research method	Maturity model	Confirmed relations
Jiang et al. (2004)	Survey (154 respondents)	CMM	Improved learning Improved control Improved product quality and productivity Improved communication Improved flexibility
Lockamy III and McCormack (2004)	Survey (523 respondents)	SCM Maturity	Improved overall performance of the supply chain management (SCM) function
Raschke and Ingraham (2010)	Survey (356 respondents)	BPMM	Improved overall performance of the purchasing and order fulfilment functions
Jung and Goldenson (2003)	Secondary data (752 units)	CMM	Improved ability to meet schedule and budget
Filbeck et al. (2013)	Secondary data (348 units)	CMM	Improved stock performance

Source: *based on Dijkman et al., (2015, p. 721).*

Drawing generalised conclusions from the aforementioned studies, one may claim that there is evidence to support the assumption that using certain business process maturity models generally improves the organisation's efficiency and contributes to its development.

Despite the limitations stemming from the design of the models as well as the fact that, to a large extent, they disregard alternative paths of development, which leads to simplification of the organisational reality, one may claim that they can be successfully used as organisation improvement and development tools. It is so because they are sources of knowledge about the performance and efficiency of process implementation. Using a more efficient method of process management is the means to ensure regularity and repeatability of the actions undertaken. For this reason, it should contribute to improving the organisation's efficiency and development. Implementation of business process maturity models involves the organisation's pursuit of development of its relationships with customers, organisational flexibility as well as development of the coordination system. They allow the organisation to develop in a more structured manner and to introduce changes which will not be incidental. Attaining a certain level of iterativeness is both desirable and reasonable, but in order for such efforts to ensure organisation development, they must be undertaken in the operating as well as the strategic dimension. Therefore, one should seek to improve the functioning of the organisation as a system coexisting in a specific environment. Using business process maturity models cannot be limited to the mere improvement of individual processes without evaluating their impact on other elements. However, it should be stressed that business process maturity models must not be used without reflection and a dose of criticism. What they require of managers is that they use them efficiently, aware of the existing limitations and in combination with other approaches which place more emphasis on elements disregarded in a specific model.

Conclusion

The elaboration provided in the article is based on the assumption that business process maturity models can be used as organisation development tools. The authors have referred not only to selected models, considered relevant for the very reason that they enable a wider perspective of assessment to be adopted and are not limited to the process dimension, but mainly because of their impact on the functioning of entire organisations. The positive correlation between using business process maturity models and organisation development will be more evident if the application of the former stems from firm conviction of top managers and relates to the strategic goals adopted by the organisation. However, it should be emphasised that transformation of strategic goals into development goals, reorienting operations towards an increase of process maturity, requires numerous measures and financial resources to be involved (compare Kihn, 2010).

Upon transition from a lower to a higher level of maturity, one should first expect the improvement to take place in the sphere of the processes themselves, then in the business areas (divisions) where individual processes have been implemented, and finally across the entire organisation. Attaining the above positive results is not unconditional, since the model application itself is no guarantee of success. The model is but a tool which – when used properly – provides the organisation with opportunities to develop. And in order to use it correctly, one must first establish how advanced the process management is as well as keep improving the solutions already deployed. When claiming successive levels, one must not lose sight of sustainable development of the entire organisation as well as synergetic operation which generally ensures optimised effects. The fact that the organisation has advanced to a higher level not always entails sustainable development. Focusing on fragmentation in terms of improvement of the given area without analysing its impact on other elements is a rather risky endeavour which by no means guarantees that positive long-term results will be achieved. Another important realisation concerns the fact that it takes time as well as involvement of the top management to succeed in introducing any change whatsoever.

Limitations

This article has its limitations, which basically boil down to its specific nature as an overall review based on studies of the literature of the subject. Bearing the foregoing in mind, future research should seek to empirically confirm the theoretically confirmed relationship between the use of business process maturity models and the development of an organisation perceived holistically as a system or with regard to its individual elements.

Model Development and a System of Factors Affecting the Organizational Management Structure

Elena POLEVAYA

Peoples' Friendship University of Russia (RUDN University), Moscow, Russia,
polevaya16@gmail.com

Abstract

The object of study is a change in the organizational management structure (management system) under the influence of factors of the internal and external environment (concept factors). The subject of the research is the methodology and sequence of logical-linguistic (semantic) modeling to establish a connection between groups of factor concepts and assess their impact on the system of organizational transformations. The applied research methods: constructing a qualitative model of system dynamics in the form of a graphic diagram, a cognitive modeling method for weakly structured systems, a dynamic and static analysis method, a fuzzy mathematics analysis method, a Pearson (r-Pearson) linear correlation coefficient scale, a method for constructing a cognitive map by V.B. Silov (1995), a method for constructing a consonance matrix based on data from logical-linguistic (semantic) modeling. In the process of research, a methodology has been developed for the sequence of constructing a logical-linguistic (semantic) model based on the disclosure and impact of factor concept groups on changing the system of organizational and managerial transformations, with their further consideration in changes in the organizational management structure. The developed methodology allows defining the intensity of the relationship between groups of factors of the external and internal environment that affect the system of organizational transformations.

Key words: Logical-Linguistic (Semantic) Model, Influence/ Impact, Assessment, Linguistic Variable, Organizational Structure, Factor Concept, Cognitive Map

Introduction

The relevance of the research topic is the difficulty of establishing the relationship between the factors of the internal and external environment (factor concepts) impact on the change in the organizational management structures. They are based on several inherent features:

– The difficulty to access the impact of factors of the internal and external environment on the change in organizational management structures due to fuzzy (informal) measurement of descriptive nature;

– The presence of possible multi-factoriality and interconnectedness of factor concepts and occurring processes that lead to the difficulties in establishing and studying them separately. It results in the need to determine the aggregate of the impact of factor concept groups on change in organizational management structures;

– The adequacy in comparing the considered factor concepts about the normatively established properties based on the study of the intensity of their impact on the changes in organizational management structures.

The above arguments lead to the conclusion that there is a poorly structured system that does not allow assessing the degree of change in the organizational management structure using absolute quantitative indicators.

It is necessary to use a cognitive approach associated with the construction of a logical-linguistic (semantic) research model to carry out modeling of this organizational transformation system under the influence of factor concepts. Generally, a logical-linguistic model represents a higher level of cognitive modeling in terms of using the principle of formalization and taking into account the logistical aspects of the simulated system.

Consideration of a variety of interpretations of the fuzzy variable representation included in the logical-linguistic model determines the need to build a semantic model, which allows increasing the efficiency of determining the impact of internal and external factor groups on the changes in organizational management structures.

A model built in this way using logical-linguistic relationships will not only reveal, but also anticipate the impact of many factors on the change in organizational management structures with their further consideration in the changes, as well as determine the intensity of communication between groups of factors of the external and internal environment that affect the change organizational transformations.

Building of a semantic model will make it possible to use elements and methods of the system of a logical-linguistic model constructing and determine not only the strength of the influence of relations between factors, but also establish the degree of their group influence organizational and managerial transformations, under the changes in the internal and external environment.

The need to find a solution to the specified problem. The existing and currently developed methods for constructing logical-linguistic (semantic) models are not fully objective. It occurs under the conditions of considering various interpretations of theoretical and practical studies, which for one or another reason of subjectivity reflect a different research methodology. It is a factor of absence of a complete and uniform approach to the analysis of the object and subject of research. There is no possibility of a study aimed at establishing the impact of external and internal factor groups on changing the organizational management structure. It complicates the process of its adaptation to changing conditions of the business environment in the absence of taking into account this connection.

The degree to which the problem is developed. The main directions of the theoretical development of cognitive modeling and linguistic concepts are represented in the works of the following foreign and domestic scientists and researchers involved in cognitive modeling. They are T. Kun (1956); Ch.Loomis, E. D.Dyer, T. Buzan (1973); R. Axelrod (1976); L.Zade (1976); Ch. Loomis (1977); E.Tolman (1980); K.Saeed (1986); D.I.Pospelov (1986); C.Eden (1988); N. Chomsky (1991); K.Warren (1999); J.Forrester (2003); I.V.Chernov (2004); Hemdy A. Taha (2007); V.P.Strogalev, I.O.Tolkacheva (2008); D.Yu.Katalevsky (2011); G.V.Gorelova G.V. (2012), and others [12, p. 123].

In the process of cognitive modeling concept evolution the development of the system for constructing fuzzy cognitive maps is manifested as a result of the fusion of fuzzy logic and system dynamics. Currently, cognitive modeling is the basis for temporary dynamic modeling systems in finance, politics and business (Igoshev, A.N., 2019, p. 153).

The vastness of the application of cognitive modeling in various areas of socio-economic life of society leads to the need for an individual approach to the development of a methodology for analyzing the system (changing the organizational structure of management) under the influence of factor concepts (factors of the external and internal environment).

Materials and Research Methods

The study applied the methodology for constructing a qualitative model of system dynamics in the form of a graphic diagram that reflects direct and inverse causal relationships. It was based on establishing the mutual influence of factor concepts on each other and the system as a whole.

It is taken into account that positive values express an increase (decrease) in the impact of a factor concept on an increase (decrease) in influence a research system. Negative values express inverse

proportionality: an increase (decrease) in the factor concept leads to a decrease (increase) in the effect on the research system.
The method of cognitive modeling of weakly structured systems is used. It means the study of the analysis of changes in the organizational management structure by constructing a model based on a cognitive map. The use of the building a cognitive map methodology reflects the subjective ideas (individual or collective) of the problem (and) or the situation under study associated with the functioning of a poorly structured system.

The main elements of the cognitive map are concept factors, which allow specifying the influence of changes in the structure of management (system) based on of defining the strength of cause-effect relationships. As a methodology, the method of constructing a fuzzy cognitive map by V.B. Silov was used (Silov, V. B., 1995, p. 61). It is based on fuzzy linguistic variables, representing an extension of the classical concept of a cognitive map with an indicator of the mutual influence intensity of factor concepts on the system under the study.

To analyze and interpret the results obtained, the methodology of dynamic and static analysis is used as trends in the development of the situation in time, taking into account the methodology of fuzzy mathematics analysis.

Formally, when constructing a linear dynamic model based on a cognitive map, a factor is defined as a variable taking values from a certain numerical scale. To establish the degree and intensity of the mutual influence of connections between conceptual factors and the system under the conditions of linguistic variables, the model uses the Pearson linear correlation coefficient (r-Pearson) scale. It allows interpreting the values of linguistic variables into quantitative indicators based on the method of comparisons.

Using this method makes it possible to assess the intensity of the mutual influence of factor concepts and the system in the range from [-1] to – [1] for the further construction of the consonance matrix according to the cognitive map algorithm by V.B. Silov (1995).

A grouping of external and internal factors affecting the change in the organizational management structures will allow assessing the degree of mutual influence of the considered groups of factor concepts and their combined impact on the system when constructing the matrix of mutual influence and the semantic model. This direction provides the possibility of grouping factor concepts, ranking them by degree of importance. It also gives the possibility to identify their most intense impact on changing organizational management structures as a system using a logical-linguistic (semantic) model. The study applies general scientific methods. The data obtained on the factor concepts based on with the application of this research methodology are reliable, based on the tendency of changes in the internal and external environment.

Research Results

The process of establishing and change of organizational management structures is ambiguous. In the course of evolution and globalization of economic systems and relations, a spectrum of factors that affect organizational transformations and changes is formed.

In these conditions, it seems necessary to conduct a study of factors of the internal and external business environment, their grouping and an assessment of their impact on changing the organizational management structure, as part of the cognitive modeling method implementation.

The methodology of cognitive modeling, originally developed by P.Axelrod (1976), is purposed for analysis and decision-making in difficult-structured systems based on cognitive modeling using the expert method. It does not involve any difficulties in its use for poorly structured control systems.

Currently, the methodology of cognitive modeling is developing in the direction of improving the analytical apparatus and situation modeling concerning the dynamics of changes in factors that are inherent in the informal (descriptive, fuzzy) type.

The emergence of the methodology of cognitive modeling and its dissemination in the study of socio-economic, scientific phenomena and processes led to the formation of non-traditional and integrated logical models based on the description and inclusion in the model of formal (clear) and informal (fuzzy) linguistic variables, the analysis system of which is presented in the works of L. Zade (1976) and D.A. Pospelov (1986).

A cognitive map construction according to V.B.Silov's method allows establishing a methodology for creation of a logical-linguistic (semantic) model. It increases the efficiency of defining the impact of internal and external factor groups on changes in the organizational management structure.

The cognitive map will be a causal relationship of the factor impact of the internal and external environment on the change in the organizational management structure in the following form: : $G = \langle E, W \rangle$, where E is the totality of the set of internal and external factor concepts, W is the binary ratio, the intensity of links between factors to be included in the semantic model.

The binary relation, reflecting the intensity and direction of influence between concept-causes and concept-effects, expresses directly or inversely proportional influence of the concept-reason.

When developing a semantic model on the impact of internal and external factor groups on changes in organizational management structures the usage of the methodology for constructing a cognitive map by V.B.Silov (1995) leads to the necessity to establish a fuzzy binary relation W elements of w_{ij}. It characterizes the degree of intensity and direction of influence between concepts $w_{ij} = w(e_i, e_j)$ subject to the following restrictions optimal for this model (Vokueva, T.A., 2012, p.127):

$$\begin{cases} -1 \le w_{ij} \le 1; \\ w_{ij}=0 \text{ when the impact of } e_i \text{ on } e_j \text{ is absent;} \\ w_{ij}=1 \text{ when } e_I \text{ influences } e_j \text{ maximum positively;} \\ w_{ij}=-1 \text{ when } e_I \text{ influences } e_j \text{ maximum negatively;} \\ -1 \le w_{ij} \le 1 \text{ when } e_I \text{ influences } e_j \text{ both positively and negatively} \end{cases}$$

When conducting an analysis of changes in the organizational management structure based on the influence of factors of internal and external effects of constructing a cognitive map, a static task will be solved to study and analyze the interaction of factors in the current situation based on the mathematical analysis of fuzzy graphs.

Static analysis using the methods of constructing a cognitive map by V.B.Silov (1995) will allow determining:

1. The cumulative result of the impact of changes in the organizational structure of management in the interaction of the considered factors;

2. The degree and intensity of the impact of internal and external environment factor combination on the change in the organizational management structure;

3. The degree and intensity of the impact of groups of factor concepts (a group of factors of the internal environment, and a group of factors of the external environment) on the change in the organizational management structure, both through direct and intermediate influence.

Accordingly, a static analysis of the cognitive map is based on a matrix to assess the interactions between factor concepts, between groups of factor concepts, and assess their impact on the system as a whole. The model for constructing a fuzzy cognitive map is presented in Fig. 1.

Fig. 1: Building a cognitive map by V.B.Silov on the impact of factor concepts on the organizational management structure changes

To assess linguistic, fuzzy variables in constructing a cognitive map by V.B.Silov (1995) the Pearson linear correlation coefficient (r-Pearson) scale is used. It estimates the intensity of the relationship between the considered factor concepts (Table 1).

Table 1: The proposed assessment of the intensity of the mutual influence of factor concepts in constructing the consonance matrix using the cognitive map algorithm by V.B.Silov

Linguistic fuzzy variable of concept factor	Weak	Moderate	Significant	High	Significantly high
		(average intensity of influence)		(strong intensity of influence)	
Intensity of factor concept influence	$\lvert 0{,}1 - 0{,}3 \rvert$	$\lvert 0{,}3 - 0{,}5 \rvert$	$\lvert 0{,}5 - 0{,}7 \rvert$	$\lvert 0{,}7 - 0{,}9 \rvert$	$\lvert 0{,}9 - 1{,}0 \rvert$

Interpretation of the intensity of factor concept impact based on the construction of a cognitive map is calculated by the combined positive and negative influence of factor concepts. Data are presented in matrix form (see Table 2).

Table 2: Model of the consonance matrix of the cognitive map by V.B. Silov

Factor concept	e_1	…	e_j	Concept impact on the system
e_1	w_1	…	w_{1j}	$c_{ij} = \frac{w_1 + \cdots + w_{1j}}{\lvert w_1 \rvert + \cdots + \lvert w_{1j} \rvert}$
…	…	…	…	…
e_i	w_{i1}	…	w_{ij}	…

In this case c_{ij} − represents the consonance of the impact of factor concept I on factor concept j.
To assess the groups of factor concept impact on the system, it is proposed to use the construction of a grouping of the considered internal and external factors based on the creation of a semantic model in the form of a matrix:

$$\begin{array}{ccc} & e_1 & e_j \\ e_1 & 0 & w_{1j}, \\ e_i & w_{i1} & 0 \end{array}$$

where w_{i1}, w_{1j} are the availability of mutual influence of factor concepts, equal to [-1], [1].

In the process of constructing the matrix, the sum of the values of the assessment intensity of the mutual influence is estimated by the factor concepts, horizontal and vertical rows and columns of the matrix. It leads to the formation of a systematic interaction of external and internal factor concepts in the aggregate.

Further, it is necessary to classify the factor concepts and summarize the obtained values by groups of external and internal influence. It will result in the formation of a holistic value for assessing the interaction of factor concepts based on the sums of causes and sums of the consequences of the dynamism of factor concepts.

Based on the construction of the matrix, according to the influence of factors I on j, and j on I, the ranking of factor concepts is performed in descending order. It significantly affects the change in the organizational management structures.

Thus, the application of the methodology of the sequence of logical-linguistic (semantic) modeling will allow assessing the level of connections, the degree of their interaction and mutual influence by establishing the consonance values of linguistic variables.

Discussion of the Results

When the development of a methodology for creating a logical-linguistic model for assessing the factor impact on changes in organizational management structures, the method of constructing a cognitive map by V.B. Silov was used (Silov, V. B., 1995, p. 92). The transfer of influence intensity parameters of linguistic fuzzy variables based on the Pearson linear correlation scale was conducted (Nazarova, M.G., 2016, p. 87).

The system of the semantic model for the mutual impact of factor concept groups on the management system using a cognitive map allows establishing a relationship between external and internal factors. It has a significant impact on changing organizational management structures. When using logical-linguistic modeling, the opportunity arises to systematize problems into a single structure. It allows analyzing factor concepts in aggregate (Igoshev, A.N., 2019, p. 158).

In this case, manipulating the data of linguistic variables and determining the mutual influence of factor concept groups will directly proportionally determine the type of impact intensity on the change in the system, that is comparable with the studies of A.E. Gorodetskiy (2010).

The higher the intensity of the mutual influences of factors, the higher the impact intensity of the factor group aggregate on the change in the organizational management structure (Fig. 2).

Fig. 2: Aggregate of connections formation and the impact intensity of factor concept groups on change in organizational management structures

Thus, the proposed sequence and methodology of logical-linguistic (semantic) modeling will make it possible to establish the priority of factors that have the most significant effect on the change in the management structure when analyzing the obtained values of consonance by factor concepts.

Further study of the impact of external and internal factors on the change in organizational management structures based on logical-linguistic (semantic) modeling is aimed at establishing weights of the influence of factor concepts by the method of hierarchy analysis. It is purposed to consider the possibility of constructing an integrated model using the significance and intensity of their combined impact on change organizational management structures.

Conclusion

On the research topic, the development of a logical-linguistic (semantic) model on the impact of factors of the external and internal environment on the change in the organizational management structure based on the construction of a cognitive map is proposed. At present, in the course of theoretical studies, there is an absence of a methodological approach to taking into account groups of factor concepts on the considered study, under the conditions of using their mutual influences indirectly from each other. It makes it impossible to identify the relationship between groups of factors and on the studied system of organizational transformations. The methodology represented for the development of a logical-linguistic (semantic) model allows establishing the influence intensity of both the relationships between the factors and the degree of their group impact on organizational and managerial transformations.

The scientific novelty of the study is in building a methodology and sequence for the development of a logical-linguistic (semantic) model based on the disclosure and prediction of factor concepts' impact on the system of organizational changes. It also includes their further influence on the management structure and determining the methodology for assessing the intensity of communication between concept factors groups affecting the system of organizational transformation.

Given methodology for constructing a model based on the elements of logical-linguistic modeling using a semantic model allows establishing the degree of external and internal impact of groups of

factors on organizational and managerial transformations, while achieving the possibility of establishing a connection between the considered groups of factor concepts.

Further research is planned to build an integrated model linking the weight significance of the considered factor concepts and the intensity of their impact on changes in organizational structural transformations.

Optimization of COVID 19 Deescalation Attempts in Poland – From the Law on Crisis Management to the Law on Emergency States

prof. dr hab. Bernard WIŚNIEWSKI

WSB University Dąbrowa Górnicza, ul. Cieplaka 1C, 41-300 Dąbrowa Górnicza, Poland,
bfwiśniewski@o2.pl

Abstract

The considerations contained in the paper constitute a synthetic analysis of Polish legal solutions that can be introduced to prevent, counteract and combat COVID 19. The paper presents results of a research which are of a reflective nature due to the changes that have their origin in a claim that *the legal measures prepared for emergency situations are nowadays of a universal nature*. In addition, the character of these measures becomes more and more a kind of routine nowadays. A systematic literature of open access studies and papers as well as legal acts review was the key method applied in the research. Besides this method, further theoretical methods such as synthesis, comparison, generalization, inference and abstraction were applied as well. Due to the scope of the paper, there are mainly (but not exclusively) studies of Polish authors presented.

Keywords: Threat, Security, Epidemic, Law, Emergency States, Crisis Management, COVID-19

Introduction

Security [1] is the key value which obviously deserved extraordinary protection in democratic countries. The basic factors influencing security level envisage efficient functioning of the state institutions (Marczak, 2004) as well as potential to forecast threats (Zielinski, 2017) and their prejudicial developments which could negatively impact the citizens and the state security [2].

Threats that appear in a security environment are featured by limited predictability of plenty dynamic variabilities. Epidemical outbreak, like the current COVID 19, is a clear example of such specificity in security environment. Maintaining appropriate security level is one of the oldest public tasks which is fully bound with public authority. It surely relates to the legal order being in place, incorporating complete spectrum of the state functioning from normal status, through emergency situations, up to states of emergency.

Method

A systematic review and analysis of literature on law, management and security as well as legal regulations on national security was the key method applied in the research. There are mainly Polish authors' research results referenced due to the specificity of the research problem indicated in the title of this paper. This approach is highly advisable since there is a strong linkage between conditions of Poland's internal security and the system of legal standards which is an elementary determinant of the effectiveness of the security system in Poland. Secondly, a limited time perspective, determined by the appearance of the first cases of COVID19 in Poland, basically influenced admitted as well.

Due to the author's long-standing expertise covering the issues of the state and internal security systems as well as crisis management, the paper contains a broad review of scientific literature relating to the following issues: legal regulations of the state security management in crisis situations, the states of public disorder and natural disaster.

The research also addresses to legal regulations applied in case of the response to the pandemic outbreak which took place this year in Poland. These acts are not a part of the legal regime on crisis management and states of emergency by definition, however, the consequences of their introduction apply similar rigors towards the public as those one which are used for a state of emergency, with an exception on the limitation of human and civil rights and freedoms. Therefore they could be classified as a midterm regulations.

The research allowed to survey the causes and conditions required for application of the legal solutions, to diagnose their first effects and to identify theoretical and practical doubts on this processes.

Crisis Management Law – Legal Status Analysis

The analysis of concepts regarding identification of the crisis management process allows to distinguish two approaches to the problem [3]. One of them reduces the issue of crisis management exclusively to civil protection [4], while the second refers to the issue of specific security management [5].

A subject and an object of crisis management (Sosnowski, 2001) seem to be extremely important for security [6], especially in respect to the internal security considerations due to a constant increase of a threats level [7]. This growth - usually painful - is often approved due to an extraordinary potential of humanity that is being released, both in these who are going through a crisis and in those who try to accompany them on this path [8]. It is some kind of a secret that a crisis is the path of development [9]. These people have to pay a price of suffering if they want to achieve something that really has a value. Unpredictability, uncertainty inherently present in the process of life do not allow us to eliminate the possibility of confrontation with something that in a subjective perception of a person will be interpreted as incomprehensible and overwhelming his or her capacities. An acceptance of this reality leads to a satisfaction of overcoming, passing "to the other side", of the crisis. A satisfaction which probably might not be comparable with anything else [10].

Currently, in the Republic of Poland the crisis management aspects are regulated by a document of statutory rank, namely the Act on *crisis management* issued on the 26 of April 2007, which defines crisis management as the activity of public administration bodies incorporated in the broader management process of the state security system [11]. The legislator assumed that this legal act would be an important element in managing the state security [12]. The explanatory memorandum to the draft of this act states that “it will lead to the improvement of the state of universal security in the scope of both protection of life and health of citizens as well as protection of critical infrastructure through more effective actions of public administration”(Socha, 2011). This legal act primarily "regulates issues related to the principles of organs before, during and after the crisis” [13]. It also defines the structures and scope of logistics, organizational and financial tasks related to crisis management [14].

Crisis management is seen in terms of strategic management [15]. In the context of the above, it should be noted that the provisions functioning in the Polish legal system serve to strengthen the structural and functional capacities of the state in the field of crisis management, mainly due to emerging threats [16]. As a result, the effectiveness level of the internal security system elements [17] as well as the efficiency of institutional and legal resources disposal were increased (Ciekanowski, 2011).

It should be emphasized that crisis management is implemented in the cycle of four phases such as prevention, preparedness, response and recovery [18].

Cause-effect phenomena [19] is the key linkage based on the successive mode between these phases [20]. The essence of the prevention phase is to conduct actions aimed at eliminating or reducing the likelihood and/or impact of adverse events. Preparedness covers such activities as planning processes including developing crisis management procedures, building and maintaining resources which can

be used in crisis situations and so on. The third, response phase is introduced while a crisis phenomenon generates its first negative impacts. The main goal of this phase is to accomplish activities which are aimed at providing an urgent assistance to victims and reducing secondary damages and losses.

Finally, the recovery phase triggers activities which lead to reconstruction of the state organization back to the normal, or even better, status of functioning (build back better rule) (Zwęgliński, Radkowski, 2015). Recovery can be divided into short and long term actions. Short term cover restoration of vital systems to minimum operational standards while long-term are associated with complete reconstruction of the state status, however, they can last for several years after a hit.

Crisis management processes require systematic improvements, including capacity building of all institutions involved (Falecki, 2013), which are facing many serious obstacles (Sowizdraniuk, 2007). For example one of the most important psychological and social barrier is low acceptance of general public for this efforts (Letkiewicz, 2007) .

States of Emergency Diagnose

As an organization, the state naturally undertakes actions and efforts to ensure its continuity [21]. Therefore, it reserves the legal right to introduce a state of emergency which basically is a tool to restore an acceptable level of security in extraordinary conditions [22]. It can be done while normal, constitutional means, are ineffective in realization of the state key function which is security provision (Sagan, 2001). In the Republic of Poland, this applies to three emergency states [23] options such as: the state of public disorder [24], the state of natural disaster (Alexander, 2001) and the state of martial law [25].

To compare, Germany, at least on the federal level, does not have in place uniform statutory solutions relating introducing a state of emergency in case of an epidemic. The states (Länder) are the key administrative units appointed for crisis management and civil protection in case of an epidemic. Their competence is to manage the state of natural disaster, including the executive as well as the legislative aspects. Each state regulates its own law on introducing this type of state of emergency. The first case of introducing the state of natural disaster took place in Bavaria on the basis of the Bavarian Act on Protection against Natural Disasters (Katastrophenschutzgesetz). Then for the first time it applied to the entire state, not - as it had been in the past - only to a part of its territory.

On the federal level there is in place the Act on the Prevention and Control of Infectious Diseases (*Infektionsschutzgesetz,* IfSG) launched on January 1, 2001. It replaced the federal Act on combating late blight and the Act on combating venereal diseases. Furthermore, it is worth to underline that on March 23, 2020, the German government adopted a draft amendment to the Act on the Prevention and Control of Infectious Diseases (Infektionsschutzgesetz), which essentially expands the competence of the federal government, shifting some more power from the Länder up on the federal level (in this case the Federal Minister of Health) in this respect.

In the Republic of Poland the three emergency states can only be introduced in the course of implementing specific legal acts by authorized bodies in a strictly defined manner [26]. It is of greatest importance since a state of emergency results in human [27] and citizen (Siemiński, 1980) rights and freedoms restrictions [28]. In Polish legislation, besides the Constitution, the states of emergency are regulated by statutory acts such as:

- Act *on the state of public disorder* issued on the 21 of June 2002 [29],
- Act *on the state of natural disaster* issued on the 18 of April 2002 [30],
- Act *on the martial law, competences of the Supreme Commander of the Armed Forces and the rules of its subordination to the constitutional organs of the Republic of Poland* issued on the 29 of August 2002 [31].

Analysis of the legal acts provisions, specifically the chapter XI of the Constitution, makes it possible to distinguish certain general principles required to argue introducing a state of emergency (Wołpiuk , 2002). In accordance with article 228 implementation and maintenance of a state of emergency must meet following principles (Paździor 2006):

- uniqueness - implementation of a state of emergency may take place only in a situation of extraordinary threat which leads to a crisis situation not able to be managed in a sufficient way in the regime of ordinary constitutional measures,
- legality – ensures legal mode of a state of emergency implementation, i.e. only on the basis of an appropriate legal act and ordinance which is conditioned by public disclosure,
- proportionality - the authorities decision and the measures undertaken as a result of this decision have to be proportional to the threat against which the decision is taken. This principle enable to use only such measures which are the least burdensome for the general public in the existing reality of the situation. Actions must correspond to the degree of the threat and should aim at restoration of the normal functions of the state as soon as possible,
- purposefulness - actions are aimed only at restoration of the normal functions of the state as soon as possible,
- protection of the democratic legal system foundations - changes in the legal regulations that are fundamental for the democratic political system are forbidden,
- protection of the elective political bodies - changes in the structures of elective bodies during an emergency state is prohibited.

Preliminary analysis of the legal acts on states of emergency allows to conclude that there is a coherent approach to the regulations structure. It could be perceived as a sign of diligence between the initiating and legislative political bodies constructing these regulations.

Characteristics of the state of public disorder and the state of natural disaster

The legal acts on the state of public disorder and the state of natural disaster determine following rules [32]:

- general provisions - implementation and abolition mode, the scope of restrictions on human and citizen freedoms and rights, conditions and the purpose of introducing a state of emergency, duration and the territorial coverage,
- public authorities functioning rules specification - bodies responsible for restoration, state entities participating in direct restoring actions, detailed scope of restrictions on human and citizen freedoms and as well as authorities' competences to enforce these restrictions,
- criminal provisions - criminal proceedings and sanctions to be applied in case of neglecting the provisions.

There are enumerative rationales for the states of emergency implementation, namely for [33]:

- the state of public disorder - a specific threat to the constitutional system of the state, the security of citizens or public order, including events caused by terrorism and/or cyber acts which might not be mitigated in the course of ordinary constitutional measures [34],
- state of natural disaster - aimed at prevention from further development of natural or man-made disasters' or technical failures' consequences (Szwajca , 2011). The relevant legal act defines a *natural disaster* as a natural disaster, *per se*. or technical failure, which impacts life or health of a large number of people, property of large sizes or the environment in large areas, while an assistance and protection can effectively be implemented only by extraordinary measures, in cooperation (Krzyżanowski, 1999) of various bodies and institutions as well as specialized services or forces and formations operating as a uniformed entity (Radkowski, 2011). Furtherly, the act defines a natural

> disaster as an event triggered by natural forces, in particular lightning strikes, seismic shocks, strong winds, heavy atmospheric precipitation, prolonged extreme temperatures, landslides, fires, drought, floods, ice phenomena on rivers and the sea as well as lakes and water reservoirs, mass occurrence of pests, plant or animal diseases or contagious human diseases, etc. [35]

It is worth emphasizing that the state of natural disaster may be introduced by the Council of Ministers on its own or on a request of a province governor. This is slightly different for the state of public disorder which requires a resolution of the Council of Ministers submitted to the President of the Republic of Poland as a form of request to introduce a state of public disorder.

The implementation of states of emergency has significant impact on society in a form of the possible limitations to the rights and freedoms of a citizen (Jasudowicz , 1997). In the area where a state of emergency was imposed, all persons staying there, even temporarily, are forced to accept restrictions on human and citizen freedoms and rights. These restrictions apply accordingly to legal persons and organizational units having their registered office or operating in the area of the state of emergency coverage (Wiśniewski, Socha, Zwęgliński, 2017).

Actions taken to de-escalate COVID 19 – results of indirect measures

It is worth to underline that the gradational approach to the rigors of legal regulations used in emergency situations, on one hand, allows to select appropriate measures to the actual requirements of the given situation, and on the other hand, it withholds the state authorities from the obligation to always resort to the final and most drastic measures or to use emergency measures, disproportionate to the weight and scale of existing threats [36].

In scientific studies, the term "particular threat states" is often used. According to S. Gebethner (1982) this term can be classified by the criteria of a threat to:

- sovereignty, independence and territorial integrity,
- constitutional institutions and functioning of constitutional bodies of the state,
- public and legal order as well as security of citizens which were violated .

Taking into account the nature of the effects of COVID 19 outbreak, on the basis of the Act *on preventing and eradicating infections and infectious diseases of humans,* on the 13 of March 2020 the Minister of Health announced in a form of ordinance a state of epidemic threat in the entire territory of the Republic of Poland. The ordinance states that from March 14, 2020 until further notice there is in force the state of epidemic threat related to SARS-CoV-coronavirus infection-2 (this regulation was amended twice on 14 and 16 March). This provision introduced some restrictions for example:

- prohibition on public gatherings exceeding 50 people,
- closing bars and restaurants, cinemas, theaters, clubs, swimming pools, libraries, museums,
- limitations to trade in shopping centers,
- limitations to transport sector,
- prohibition on exporting respirators and cardio monitors.

An important issue is that the current regulations allow, inter alia:
to limit functioning of specific institutions or workplaces temporarily, to introduce an injunction to provide administrated or owned facilities, to prescribe providing transportation means required for anti-epidemic measures.
It should also be added that the legal act on preventing and eradicating infections and infectious diseases of humans allows to direct people who are medical employees or were contracted for the health service to conduct anti-epidemic works.

Currently, in Poland experts are discussing regarding the existence of a de facto state of emergency, or a state of natural disaster, due to restrictions introduced by an attempt to de-escalate COVID-19, however, not officially in legal procedures confirmed by decision-makers. The arguments given relate to introduced restrictions, i.e. suspension of educational institutions, forced quarantine of persons coming from abroad, or restoration of border controls. Despite the existing regulations, it was decided to introduce the so-called "Special act", i.e. the Act of on *specific solutions related to the prevention, to prevention and counteracting of COVID-19, other contagious diseases and crisis situations caused by them* launched on the 2-nd of March 2020. This law regulates many areas of the state and citizens functioning.

Despite of the existing similarities to acts on states of emergency, e.g. on ad hoc restrictions introduced, regulatory action allows, among others bypassing the rigors of time limits or the need to postpone elections, but also to indicate precisely the areas requiring specific actions. In this respect an example would be the adoption of additional care allowance. In addition, it also allows for relatively quick introduction of additional changes forced by the situation, e.g. as mentioned above suspension of educational facilities.

Conclusions

In the current situation, the scale and dynamic of COVID 19 spread, in most countries of the world, have undoubtedly revised standardized thinking about preparatory phase of crisis management, indicating the need for a necessary update in this respect for the future, but also it revealed a need for revision of resources dedicated to be implemented in response phase in case direct confrontation with an epidemic threat caused by viral agents.

In order to stimulate response efficiency, the state introduces a number of legal and organizational solutions, relating inter alia to crisis management [37]. The characteristic feature of the solutions mentioned above is cooperation [38]. Its universality means that it is not always possible to realize that cooperation takes place (Zwęgliński, Morgado, 2018). Usually, cooperation [39] is discussed in situations of spectacular activities, omitting from the permanent, "ordinary" intermingling activities of various institutions (Prońko, Wiśniewski, 2004).

Joint implementation of tasks requires compliance with the adopted rules and proceedings in accordance to the will of the coordinator of activities (Konieczny, 2001). Cooperation effectiveness depends on the quality of performance of tasks on all levels (Opolski, Modzelewski, 2004). To ensure high quality and efficiency of the cooperation, all negative phenomena in this respect should be minimized [40].

Presented outline of the legal solutions clearly shows that the dynamic materialization of a threat sometimes requires ad hoc new solutions besides those existing legal regulations. Solutions which allows relatively quick adaptation to the situation.

Comprehensive and systematic solutions certainly will not only be the subject of scientific explorations, but beyond that, will also become a challenge for all countries in the world. Uncertainties carried by plenty of different phenomena, including their unpredictable scale, are becoming more and more a routine in the security environment. It obviously reveals a need for revision of existing schematic plans in order to make them upgraded to multi-scenario and modular projects that require regular competence of flexibility from decision-makers.

Riyadh, Saudi Arabia

Abstract

Mobile payment has become more popular and has a large number of users. This paper enhances the security aspect of M-payment by determining the most appropriate biometric authentication method to authenticate user identity. Evaluation of biometrics to determine the most appropriate one was done based on three factors: user preference, accuracy, and usability with mobile payment. As a result of the evaluation, we recognize that finger printing is the most appropriate authentication method with mobile payment.

Keywords: M-payment, mobile payment, biometrics, authentication, finger print, face recognition

Introduction

With rapid change and increased dependence on technology, it has become important to increase attention on all security aspects, especially in Internet payment processing and online mobile payments (M-payments). One of the important aspects is authenticating user identity. Users can be authenticated using multiple methods, including (a) something one knows (e.g., a password), (b) something one has (e.g., a credit card), (c) somewhere one is (e.g., a home address), and (d) something one is (e.g., biometrics). Each authentication method has advantages and disadvantages.

Something one knows is the most common authentication method because it is the cheapest method, easy to implement, and easy and common for users. On the other hand, this authentication method is the weakest method. Passwords are easy to guess, log, or hack using various attacks such as brute force attacks and password dictionary attacks. Something one knows authentication is effective to use in website accounts. It is usually integrated with other authentication methods such as using a password with a token sent to a mobile number.

Something one has includes credit cards, badges, and one-time password OTP. This method is usually used as multifactor authentication with other authentication methods to ensure user identity and prevent attacks such as replay attacks according to Kambou and Bouabdallah (2019). It is often used for important registration on web sites and social media as a second authentication method in addition to a password.

A relevant location is used to uniquely identify an authorized user by his or her geographic location, and it is commonly used in banking transactions for advanced authentication of user identity. The something one is authentication method (e.g., biometrics) will be the main focus of this paper.

Something one is method means authenticating users using biometrics. Biometric authentication means verifying personal identity by measuring and analyzing unique physical or behavioral characteristics such as fingerprints. This paper will present a review of the most common authentication methods, then will evaluate predefined authentication methods to be used in M-payments and show conclusions and open research topics in this field.

Overview

Biometric authentication means verifying personal identity by measuring and analyzing unique physical or behavioral characteristics. Physical characteristics are related to unique human characteristics, including body shape, and thus vary from person to person. Behavioral characteristics are related to a person's behavior (e.g., a signature) as mentioned in Kodituwakku, (2015). In this section, challenges, working methods, reasons of use, and compatibility in M-payment for most common biometric authentication methods will be presented.

Fingerprints

Fingerprinting is a common method used to authenticate user identity. Fingerprint authentication started in the late 19th century according to Jain, Feng& Nandakumar (2010). There are many reasons why fingerprint authentication is the most common authentication method, but the main reasons are because it has low cost, fingerprints do not change over time, a fingerprint is a unique human characteristic even for twins, it easy to implement, and the availability of compact and relatively inexpensive fingerprint readers Feng & Nandakumar (2010). Fingerprint authentication uses the ridges and valleys (minutiae) found on the surface tips of a human finger to identify an individual as mentioned in Chhabra & Dutta (2016). Fingerprint patterns differ among people. The major fingerprint pattern types are arches, loops, and whorls. Figure 1 from Jain, Feng & Nandakumar (2010) shows these patterns types.

Fingerprint recognition and authentication are normally done in two phases. The first phase is called the enrollment phase, where the reader will capture fingerprint details. This requires capturing fingerprints from many dimensions. Then the capture result will be stored in a database. The second phase is the recognition phase where authentication actually happens by capturing a user's fingerprint then comparing it with the database. Once they are matched, the user is authenticated according to Jo, Jeon, Im & Lee (2016).

Fingerprint authentication has multiple advantages, but it also has weaknesses. One of fingerprint recognition and identification systems' challenges is they are highly dependent on quality of data. Al-Jumeily, Al-Azzawi, Mahdi, & Hind (2017) came up with a new approach that used the swarm intelligence methodology and built a robust rotational and spatially invariant fingerprint recognition and verification model. According to Aithal (2018) , fingerprint authentication systems must have requirements to act with high performance, where components for an ideal authentication system are user friendliness, ideal and consistent input and output, ideal process, and ideal performance evaluation matrices.

Fingerprint authentication methods nowadays are commonly used for smart phones, according to Jo, Jeon, Im, & Lee (2016). The researcher presents vulnerabilities and possible attacks and recommendations to prevent such attacks.

The focus of this review is to determine the feasibility of biometric authentication to be used in M-payment. Fingerprint authentication is applied in various methods in mobile phones as presented in Khalil & Wan (2012). Fingerprint payment is commonly used, according to Priya (2017). It is considered a good and feasible method because it is easier, reliable, and secure Priya (2017).

Face Recognition

Face recognition has several potential application domains, especially for security purposes, such as access control and identification. It can be defined as "the ability of a computer system to recognize a test face in a given image, video frame or database of images" Irhebhude, Celestine & Aget (2019).

Face recognition is one of the most usable authentication methods. It requires no special arrangements and disturbances to the person being identified. In another word, it is a natural and nonintrusive biometric measurement Haq, Shahzad, Mahmood, Shah, Muhamma & Akram (2019).

In general, face recognition approaches are based on deep networks that use a classification layer trained over a set of known face identities and then take an intermediate layer as a representation used to generalize recognition beyond the set of identities used in training Parkhi, Vedaldi & Zisserman. It compares the facial features in two different images to determine whether they are of the same person under constrained conditions, such as different illumination, facial expression, variations in pose, various viewing angles, image resolution, sensor noise, and viewing distance. Face recognition approaches perform in two ways, verification and identification. In general, facial recognition algorithms test many datasets that have been created against each of the aforementioned conditions. Each dataset is designed to test a specific task, such as expression, occlusion, pose, or illumination Haq, Shahzad, Mahmood, Shah, Muhamma & Akram (2019).

Face recognition technology processes the face authentication by first recording the facial features (the positioning of eyes, nose, and mouth and distances between these features) in a database. After that, it normalizes and rescales the face region to a fixed predefined size. Then, it computes and stores the facial metrics in a face template. After that, input image characteristics are compared to the previously stored image database for recognition Kodituwakku (2015).

Despite significant recent advances in the field of face recognition, efficiently implementing face verification and recognition is quite challenging, and the outcome can be influenced by the aforementioned factors (e.g., different illumination) according to Schroff, Kalenichenko & Philbin (2015). To overcome the challenges of face recognition, recent scholarly studies mainly focused on improving approaches to imitate the brain's ability to accurately recognize a face that it has previously seen Irhebhude, Celestine & Aget (2019). Google is one of the Internet giants that has made recent advances in the community. It uses a face recognition method beyond the capabilities of most international research groups, particularly in academia. Google's face recognition method was trained using 200,000,000 images and 8,000,000 unique identities Parkhi, Vedaldi & Zisserman. Even so, illumination, facial expression, variations in pose, various viewing angles, image resolution, sensor noise, and viewing distance are factors that cause variations in appearances, which challenges the recent face recognition approaches and leads to a lack in the public large-scale datasets such as Google's Schroff, Kalenichenko & Philbin (2015). Figure 2 shows an example image from a dataset for six identities with variations in appearances Parkhi, Vedaldi & Zisserman.

Nowadays, face recognition is widespread, especially in M-payment authentication, and in some mobiles, it replaces fingerprint authentication (e.g., iPhone). Despite the considerable interest in face recognition, many people do not have the complete image of the capability of this technique. In M-payments, people still make extravagant claims about this method. People do not consider face recognition a trusted method, especially if it is about their money according to Priya (2017).

Iris Recognition

Iris recognition is a method for authenticating user identity. It can be defined as "the use of the features found in the iris to identify an individual" as mentioned in Chhabra & Dutta (2016). There are many reasons behind using iris recognition for authentication: the iris scan is completely different even for identical twins, it is easy to use since (e.g., like taking a photo), and the iris is and controlled by only two muscles, which makes the iris shape far more predictable according to Chhabra & Dutta (2016). It also has an advantage over fingerprints because an iris can be captured from up to 40 feet away as mentioned in Irshad, & Hassan (2017).

The main advantage of iris recognition is the possibility of iris imaging in on-the-move and at-a-distance scenarios as compared to fixed range imaging in near-infrared light according to Raja, Raghavendra, Vemuri & Busch (2015).

Figure 3 shows an iris scan of an eye taken from Raja, Raghavendra, Vemuri & Busch (2015). Iris scan recognition is done in two steps. First, a special camera captures an eye image, then the features of eyes are determined (e.g., inner and outer edges). After that the noise is removed, then the scanned iris information is stored, and it is impossible to have two persons with the same iris information. The second step is a verification if identity, where the camera will capture a person's iris, identify features, and isolate them from noise, then algorithms will be used to determine the identity verification.

There are challenges of implementing iris scans on mobile phones. One of the challenges was presented in Raja, Raghavendra, Vemuri & Busch (2015). Because approximating the radius of iris and pupil in the unconstrained iris images is a challenge for any of the segmentation methods in visible spectrum, the researchers present a new, high-accuracy algorithm that solves this challenge. Another innovative algorithm was presented by Al-Waisy, Qahwaji, Ipson, Al-Fahdawi, & Nagem (2018). The researcher built deep learning representations for images of both the right and left irises of a person, and this algorithm has high robustness and is fast.

Many researchers have studied the feasibility of using iris recognition for M-payment. Irshad, & Hassan (2017) found iris scanning is effective and reliable for safeguarding against the various kinds of fraud occurring in E-commerce transactions because it prevents identity theft and fake verification and increases customer data safety.

International Biometric Group (2005) and National Physical Laboratory (Mansfield et al., 2001) have assigned accuracy of iris scans as "very high according to Raja, Raghavendra, Vemuri & Busch (2015) did a scan of surveys to determine the scale of user preference for iris scans as "medium."

As a result, iris scanning is a good form of security authentication. It can be implemented for M-payment when a high level of authentication is needed. The problem with iris scanning is that it needs a special camera to perform the authentication process.

Hand Geometry

Hand geometry is an authentication method in multiple authentication systems as presented in Ross, Jain, & Pankati (1999), because the hand shape, thicknesses, length, distance between fingers, and other hand features are different for each person and do not change over age Kodituwakku (2015). Hand geometry is a unique human characteristic used for biometrics authentication, but it is also considered behavior authentication in some cases according to Song, Cai & Zhang (2017).

There are many reasons behind using hand geometry as an authentication method. Selecting hands as an authentication method is suitable because most people have hands, and in case of people with disabilities, hand geometry can be reengineered to be usable for them. Another advantage of hand geometry is that the scanning measurements are easily collected. Hand geometry is also appropriate to integrate with other authentication methods such as passwords and fingerprints based on Jo, Jeon, Im & Lee (2016).

The hand geometry authentication process is done in two steps. First, a hand is captured, noise is removed, and skin color is determined. In the second phase, authentication is done by comparing scanned data to a database to authenticate users Ross, Jain, & Pankati (1999). Figure 4 shows a hand geometry scanner.

Song, Cai & Zhang (2017) presented a solution that solved a problem of behavioral authentication that led to less accurate authentication or poor user experience by using hand geometry and behavioral characteristics recorded in the multitouch traces and used for authentication in mobile phones. In addition, Yassin, Yao, & Han (2016) discussed possible identity-based attacks on remote user authentication methods, and they proposed a solution that overcame these attacks by using hand geometry. They proposed a secure biometric-based remote authentication scheme using biometric characteristics of hand-geometry.

Overall, hand geometry has good accuracy and it is commonly used for authentication to access a certain area. In our case, hand geometry in M-payments is not the best method, because the size of smartphones is not able to scan hands and authenticate users, and the method requires special hardware to be integrated with phones to authenticate users in M-payment processes.

Retina Geometry

The retina is "a thin layer of neural cells located at the back of the eye and it is responsible for human vision" Ong, Xu, Wang & Liu (2015, p. 2720-2724). The retina's blood vessel structure is also called the eye print because of it is complex and unique from one person to another. Retina biometrics has recently attracted more attention for use in high-security applications Ong, Xu, Wang & Liu (2015). [19]. Therefore, the retina is a secure, unforgeable, and reliable source of person recognition because the retinal blood vessel pattern hardly ever changes during a person's life. The retina is located in the back of the eye, which makes it beyond threats posed by the external environment. The retina is stable and has distinctive features that can be extracted from the vascular structure. Retina verification and identification processing times are short due to the small size of the retina's features Ong, Xu, Wang & Liu (2015) Kodituwakku (2015). Figure 5 shows an image of the retina.

The retinal authentication system is based on the unique blood vessel pattern of the retina. This system is performed in three main steps: image acquisition, feature extraction, and feature matching. In image acquisition, the retina is captured using a fundus camera. To capture the eye image, a user must position his or her eye close to the camera. The retinal scanner contains a retinal camera. The retinal scanner uses a low-power infrared laser to scan the retinal image. Then retinal the camera identifies information patterns on retinal blood vessels. At the feature extraction stage, the retina image is analyzed to extract the various features from the blood vessel structure. These features are unique for each individual and stored as a reference pattern. After extracting the retinal image features, they are matched with the prestored template in the database depending on some criteria. If the criteria result in a match, then the person is authenticated Mazumdar & Nirmala (2018).

Despite significant recent advances in the field of retinal recognition, the use of this method is restricted by some challenges (e.g., retinal characteristics can be changed due to certain diseases). On the other hand, retinal scanning technology cannot perfectly read the retinal structure of people wearing glasses or contact lenses. In addition, some people have concerns about putting their eye close to the light source and the high cost of the devices used to capture the retinal images Kodituwakku (2015), Mazumdar & Nirmala (2018).

Retina authentication is an unfavorable method, especially in M-payment. Retinal scanning requires a user to be close to the eye scanner and look into a given point. If the user wears glasses or contact lenses, then he or she has to remove them and get close to the eye scanner. Some people have concerns that this is not practically convenient. On the other hand, retinal recognition devices are expensive, and they are relatively large. This restricts the use of retinal recognition in M-payment according to Priya (2017). However, this method has been replaced by iris scanning Kodituwakku (2015).

Digital Signature

Digital signature is a biometric verification method presented as a signature, which is a "notable variability even between successive realizations" (Galbally, Cabrera, Ferrer, Barrero, Morales & Fierrez , 2015, p. 2921-2934) . It is one of the biometric traits that people learn to produce Galbally, Cabrera, Ferrer, Barrero, Morales & Fierrez (2015). A handwritten signature has a widespread and global use either in business, banking, companies, schools, etc. Patel, Desai, Desai and Damani (2018). Digital signature is an attractive biometric authentication method that has social and legal acceptance Morocho, Morales, Fierrez & Garcia (2017). This acceptance is because people used to use handwritten signatures before the evolution of the technology and due to the ease of acquiring a handwritten signature Galbally, Cabrera, Ferrer, Barrero, Morales & Fierrez (2015). Figure 6 shows two examples of signature comparisons.

Comparing a handwritten signature with its sample previously taken on paper is the traditional way of verifying a signature. This traditional technique is time consuming and error-prone. Nowadays, this method is done by technology. It can be operated in either static or dynamic modes. Static mode is done by recognizing the handwritten signature from paper by an optical scanner or camera. After that the biometric system analyzes and then recognizes the handwritten signature. This mode is also called the off-line mode. On the other hand, dynamic mode is done by the user writing a signature on a tablet device or a Personal Digital Assistant (PDA). After that the recognition system on the digital device (tablet, Personal Digital Assistant (PDA), smartphone, etc.) will recognize the signature. This mode is also called the online mode Patel, Desai, Desai and Damani (2018).

Static and dynamic modes use five steps: preprocessing, feature extraction, matching, verification, and output. In preprocessing, signatures are scanned in gray. This phase aims to standardize and get the signatures ready for feature extraction. Scaling of the signature will be applied as well as background elimination, noise reduction, width normalization, and skeletonization. After preprocessing, the feature extraction phase extracts the inputs of the training phase. These features provide information about specific cases of the signature shape, information about directions of the lines of the signatures, and overall signature appearance information. After the feature extracting phase, the recognition system matches the template image with the input image and finds similarity between them. In the verification and output phases, the recognition system verifies whether the template image and the input image are related to the same person. After that the result is shown on the screen as an output that shows whether the signature is verified Patel, Desai, Desai and Damani (2018).

The digital signature method has relatively slow performance compared to the other authentication methods (e.g., face recognition, iris scanning, and fingerprint recognition). This slow performance has many causes, such as the higher difference among samples of the same individual compared to that of physiological biometric traits that people are born with. With this low performance the accuracy of recognition systems will decrease over time Galbally, Cabrera, Ferrer, Barrero, Morales & Fierrez (2015).

Signature verification is a highly accepted verification method. The reasonable accuracy in operating signature verification devices are an important factor that allows the digital signature to be one of the favorable M-payment methods Priya (2017)

Discussion

This review paper aimed to determine the most appropriate biometric authentication method that can be used with M-payment. In the previous section, we have presented the most common biometric authentication methods, how they work, challenges, and their compatibility with M-payment. This section will discuss the most appropriate biometric authentication method in M-payment.

Many biometric authentication methods can be built and used in mobile devices and M-payments. To compare and determine the most appropriate method, three factors will be considered. The user preference factor is adopted from Chhabra & Dutta (2016), biometric authentication method accuracy is adopted from Ghorbani, Alizadeh, Omran, & Asem (2018) and M-payment usability of this authentication method is based on reading many research papers. Table 1 illustrates how these factors vary for various types of biometrics:

As shown in Table 1, we can recognize that fingerprinting is the most appropriate authentication method with M-payment because it has very high accuracy and is accepted and preferred by users. It is easy use in M-payment because no external special hardware is needed to authenticate users, especially because new smartphones have built-in fingerprint readers.

Face recognition is also considered an appropriate authentication method with M-payment because the authentication can be done with a normal smart phone camera. Iris scan has good security authentication and high accuracy but, in our case, it is not usable with M-payment because it requires a special camera for scanning and authenticating, same as retina geometry.

Despite the user acceptance of this authentication method, it still not a favorable one because of the time consumed in processing signature authentication. This excludes digital signature authentication from the list of the most suitable M-payment authentication methods.

Conclusion and Open Research Topic

The main goal of this paper was to review and present common biometric authentication methods, then determine the most appropriate methods that can be used in M-payment. The evaluation of authentication methods was based on three factors: user preference, accuracy, and usability with M-payment. After evaluation, we recognize that fingerprint scanning is the most appropriate authentication method with M-payment.

Biometric authentication in M-payment is a rich area for research. Combining fingerprint authentication with other biometric authentication methods will provide a good contribution in this area. There is also a gap in hand geometry authentication in M-payment research that can be considered as a topic for future research.

Abstract

The European economic integration process was both necessary and beneficial for all the actors involved, reshaping for long run the global economic and political landscape. One of the most complex and pressing challenge for the European Union is to maintain an appropriate level of economic, social and territorial cohesion between its Members. In an increasingly interdependent world where it is difficult to maintain the status of global economic actor, the European Union needs more than ever a high level of convergence both between states and regions and within them. As the process of European economic integration has entered a new stage, the variables on which the prosperity-generating process is currently dependent are different. The Member States of the European Union need solidarity, a vital principle of integration that has been increasingly challenged in recent years. Sustainability, vital to any public policy, means economic efficiency, social responsibility and ecological resilience. Real convergence, complementary, but much more complex than the nominal one, depends on many macro and microeconomic variables. In this paper, we have tried to study economic convergence in the European Union by taking into consideration two labour market determinants: labour productivity and labour costs. In this respect, we have compared the evolution of productivity and also calculated the ratio between these two determinants. Our study suggests that the labour productivity surpassed the costs between 2000 and 2018 at aggregate level. However, the analysis of New Member States and Old Member States clusters illustrates divergent trends in the labour market. Our results show that in the upcoming years, the labour costs will increase with a higher pace than productivity, which could also hamper the integration of the labour markets between the Member States.

Keywords: European Union, Central and Eastern Europe, economic convergence, labour market integration, labour costs, labour productivity.

Introduction

In the last decades, the process of economic integration at European level has offered many useful lessons to the international community, but it has also left some societal members expectations unfulfilled. The whole integration process, whether we analyse the deepening component (the evolution from the customs union stage to the one of economic and monetary union) or the enlargement one (increasing the number of Member States from 6 to 28), had as vital macroeconomic prerequisite convergence. The European Union is a synergistic interstate architecture that targets both the unity of the markets of goods (goods and services) and the factors of production (capital and labour) placed in a new societal paradigm. In this new paradigm, analysts have focused not only on income as the main determinant of the economic convergence, but also on other dimensions, including the integration of the labour market variables. The main purpose of this paper is to study convergence between Member States, taking into consideration the integration between the national labour markets. In this respect, we have analysed convergence by taking into consideration three dimensions: a) aggregate – all the Member States; b) cluster – Old Member States (EU 15) and New Member States (EU 13) and c) individual Member States. We have focused our study on two main determinants - labour productivity and costs - and we have analysed the evolution of the ratio between these indicators.

Literature Review

Throughout the entire process of the European economic integration, one of the main objective aimed the convergence of economic performance between countries and regions. Conceived initially almost exclusively on its economic component, the process of increasing the level of convergence has expanded to include the social and ecological components. For this reason, lately the researchers and decision-makers have expanding the scope of real convergence by including the labour market indicators such as the compensation of employees, the labour productivity and costs or the employment rate both at national and regional level. Marelli and Signorelli (2010) considered that in the short term, convergence implies catching up in terms of output or input determinants, while in the long term, it assumes the reduction of the structural differences between economies.

With the accession of the countries from Central and Eastern Europe, analysts started to be interested in studying the evolution of the labour market determinants. Reaching similar levels of labour productivity, costs, wages or unemployment rate is considered nowadays by some voices an important objective of the European Union that may enhance the cohesion between the Member States. Consequently, not only GDP per capita is relevant in the analysis of the economic convergence, but also the integration of the labour market. Some analysts have studied the evolution of individual determinants (Niebuhr and Stiller, 2004; Mora et al., 2005; Martino, 2015; Naz et al, 2017), while other were interested in identifying potential links that may exist between the labour market indicators (Duarte and Restuccia, 2010; Pasimeni, 2018) or between the labour market indicators and other economic variables (e.g. the relationship between nominal criteria and real determinants, including the labour market - Šaroch et al., 2005; Soukiazis and Castro 2005; Tokarski, 2019.

Tokarski (2019) studied nominal and real convergence in three founding Member States - Germany, France, and Italy. In the field of real convergence, the analyst focused on competitiveness, income level and labour market indicators. Tokarski concluded that the rigidity of the labour market has increased the economic divergence between the Member States. From a different point of view, Soukiazis and Castro (2005) were interested in studying the link between the Maastricht criteria and the Stability and Growth Pact and the real convergence within the European Union. Soukiazis and Castro investigated if these measures aiming nominal convergence also affected the real dimension, mainly the productivity, the living standards and the employment. According to the researchers, the criteria regarding inflation was the only variable that negatively influenced the increase in labour productivity. From the perspective of Šaroch et al. (2005), the Maastricht criteria overestimate the importance of monetary and financial indicators, disregarding the real economic determinants.

Mora et al. (2005) studied the convergence of wages, labour productivity and costs between 1981 and 2001. In this respect, analysts have identified that the discrepancies in terms of nominal wages and labour costs decreased, but not in the case of real wages and productivity. According to Mora et al., the process of stagnation, which debuted in 1997, suggests that the introduction of the common currency did not had a crucial role in role in the wage convergence. Naz et al. (2017) was also interested to test the hypothesis of wage convergence, but at regional level. In this respect, analysts have found evidences for wage convergence in all the European regions, which tends to be absolute rather than conditional. The tendency of wages to reach their own equilibrium state can be explained by the restructuring process of the labour market and by the individual characteristics of the local markets (e.g. the role of public institutions).

Martino (2015) studied the evolution of labour productivity during 1991-2007 in the European Union's regions. In this respect, the analyst identified the existence of the absolute convergence process in financial, real estate and business services, which may have been catalysed by the liberalization of the capital markets. In contrast, in the case of the manufacturing sector and of the transport, communications and distribution services, the analysts didn't identified convergence of the labour productivity. The study of Martino suggest that productivity gaps have constantly increased in the last years, mainly between so-called central and peripheral countries.

At the same time, Naz et al. (2017) rejected the hypothesis of wage convergence between border regions. Consequently, the analysts consider that the reduction of physical and administrative borders, often from the "grey area", is not sufficient in order to integrate the labour markets. Similar, Niebuhr and Stiller (2004) studied the catching-up process in terms of income and unemployment rate in the border regions of the European Union. In this respect, the analysts pointed out that although the abolishing of the formal barriers within the internal market should have facilitated the integration of the border regions, informal barriers still obstruct the convergence of labour markets.

Pasimeni (2018) studied if the increasing of labour productivity was accompanied by the growth of productivity for European Union and other developed countries from 1970 to 2017. The analyst identified a strong relationship between labour productivity and compensation in the advanced economics. However, it seems that productivity gains are not always reflected in the increase of wages. In the European Union, an increase of productivity growth with one percentage point was translated into the rise of compensation with 50 – 60%.

From another perspective, Duarte and Restuccia (2010) investigated the link between productivity and structural transformations. The results of the study suggest that structural transformation can lead to a stagnation or slowdown of the economic performances, with the relocation of the labour force from industrial to services sector. The authors identified that the productivity gaps between countries are significant in the case of the primary and tertiary sectors and smaller in the case of the secondary one. Furthermore, Duarte and Restuccia pointed out that productivity catching up in the secondary sector determines aggregate gains between countries of 50%. In contrast, the lack of productivity in the tertiary sector determines a process of regression or decrease of aggregate performances between countries.

Methodology and Results

The main purpose of our paper is to study the integration of the labour markets at Community's level. In this respect, we have studied the labour market determinants from three main perspectives. Firstly, we have compared the aggregate evolution of labour productivity and costs in the European Union between 2000 and 2018. Then, we have focused on the performances of two cluster of countries: a) EU (15) which comprises the founding Member States and the countries that joined the European Union in the 20th century and b) EU (13) which included the New Member States that joined the regional group in 2004, 2007 and 2013. Lastly, our analysis takes into consideration the individual performances of the 28 Member States in 2018. The results of our study are presented below:

Figure 1 compares the evolution of the real labour productivity per person with the nominal labour costs per person between 2000 and 2018, also illustrating the ratio between these two determinants. According to our analysis, the productivity per person at aggregate level surpassed the labour costs between 2000 and 2018 and the ratio varied between 1.07 in 2000 and 1.02 in 2018. However, the values of the labour unit costs tend to increase with a higher pace then labour productivity (with 22% between 2000 and 2018, comparing to 16%), which suggest that the ratio between them could equalize in the upcoming years.

Fig. 1: The evolution of the labour productivity and labour cost per person in the European Union between 2000 and 2018

Source: Authors' processing based on data provided by Eurostat

Another purpose of our paper was to identify if the indicators of the labour market have similar evolutions or by contrast, are diverging. Consequently, in this section, we have tried to compare the evolution of the labour market determinants in the EU (15) – Old Member States, with those experienced by EU (13) – New Member States.

In this respect, Figure 2 illustrates the values of labour productivity and costs and the evolution of the ratio between these two indicators between 2000 and 2018. The labour productivity per person increased with 30% at Community's level, while in the EU (15), the cluster that comprises the Old Member States, only with 13%. According to the data provided by Eurostat, the labour costs almost doubled between the 19-year period at Community's level. In the EU (15) cluster, the labour costs surpassed the productivity as the former increased with 32% and the latter only with 13%. The productivity-cost ratio was until 2008 above par, while since 2009, labour costs have surpassed the labour productivity.

Fig. 2: The evolution of the labour productivity and costs in EU (15) between 2000 and 2018

Source: Authors' processing based on data provided by Eurostat

Figure 3 shows the evolution of the labour productivity and costs in the EU (13), which comprises the New Member States. The EU (13) cluster experienced a significant increase of labour productivity of almost 56%. Consequently, we identified divergences between the two clusters of countries in terms of labour productivity: while the Old Member States recorded a modest increase during the 19-year period, the New Member States improved with more than a half the value of this indicator. However, the increase of labour costs (with 75%), surpassed the growth in productivity. This trend suggests that the labour market at Community's level is still not integrated and convergence of economic performances remains an objective to achieve in the future. Consequently, until the outbreak of the economic and financial crisis, the labour productivity per person was above the labour costs.

Fig. 3: The evolution of the labour productivity and costs in EU (13) between 2000 and 2018

Source: Authors' processing based on data provided by Eurostat

Figure below illustrates the labour productivity and costs, based on the data provided by Eurostat for the 28 Member States in 2018. The highest values of real labour productivity per person were recorded by Slovenia (115), Greece (110), Ireland and Lithuania (109). By contrast, the smallest rates of productivity were experienced by Hungary (99.3) and Spain (99.5) in 2018. As far as the nominal labour unit cost per person are concerned, the highest values were recorded by Czech Republic (118.3), Luxembourg (116.5) and Ireland (114), while the lowest by Italy (97.2) and Sweden (97.2). The ratio between productivity and costs was equal or above 1 for Greece, Italy, Sweden, Portugal, Belgium, Latvia, Germany, France and Croatia. For the rest of the European Union's Member States, the ratio was below par, which suggest that the labour costs surpassed the labour productivity.

Fig. 4: The evolution of the labour productivity and costs in the Member States in 2018

Source: Authors' processing based on data provided by Eurostat

Conclusions

The main objective of this paper was to study convergence in the European Union, taking into consideration the most relevant labour market determinants. Including in our panel data referring to labour productivity and costs for all the Member States between 2000 and 2018 and measuring the productivity – cost gap for European Union, but also for two cluster of countries: Old Member States and New Member States, the authors obtained a more complete picture of the developments that have taken place in the real convergence plan. In this respect, we have illustrated that although at aggregate level, the labour – cost ratio is still above par, the costs tend to rise at a higher rate than the productivity. Moreover, the cluster analysis suggests that both in the Old Member States and the New Member States group, costs with the labour factor increased faster than productivity. The analysis of the individual Member States in 2018 confirms that for the most of the Member States, the costs have surpassed productivity. This trend could not be sustainable on long term and could pose into question the objective of integration of the labour markets. Consequently, European decision-makers should adopt measures in order to strengthen the cohesion between the national labour markets and the productivity of the labour factor.

Abstract

This study aimed to find out residents' degree of satisfaction with local public services provided by local authorities. It also intended to identify the determinants of citizens' satisfaction. The research adopted a quantitative approach, through the application of a questionnaire survey to residents in the municipalities of *São Nicolau* in Cape Verde. Globally, citizens are satisfied with the municipality where they live. For the variables of Global Satisfaction with the municipality of residence and Global Satisfaction with the financial management of the local authority, there are no differences by the municipality of residence regarding citizens' satisfaction. As both are located on the island of *São Nicolau*, in principle, there should be no discrepancy in their form of action due to characteristics associated with insularity. Citizens' satisfaction is influenced positively by the Image of the Municipality, Quality of Basic Infrastructure and Services and Quality of Life in Leisure, Access to Culture, Environmental Quality and Safety. Quality in Economic Terms, on the other hand, seems to have not influenced the citizen´s satisfaction.

Keywords: Citizens' satisfaction, Local government, Public services, Municipalities.

Introduction

Local authorities, being the entities closest to citizens for service provision, pay increasing attention to matters such as the quality of life and services, citizens' satisfaction, and responding to citizens' demands and expectations. Citizens' level of satisfaction, their experiences and perception of local services and the performance of those in charge affect local authorities' success either positively or negatively.

Local development as a whole can only be considered when a significant improvement in citizens' lives is confirmed. Local Administration must invest in the results, control and assessment of processes, in defining objectives and in satisfying the recipients of public services (Sá, 2003).

The quality of services provided together with the citizens' satisfaction with the situation in Cape Verde has been a great challenge for local leaders.

This research aims to determine residents' satisfaction with their local authority, by analysing a set of aspects that characterise their area of residence and represents an assessment of the work done by town halls in Cape Verde to stimulate, grow and develop their council areas.

The study is extremely relevant in that it can reveal and assess residents' satisfaction with their local authority, analysing several aspects that characterise it, and providing leaders of the councils studied with instruments to discuss and assess local public policies.

Following this introduction, the article presents four more sections. The second presents the theoretical framework on the topic. The following one presents the study domain, the measurement scales and the data-collection instrument. Then the data-collection instrument is characterised, together with the analysis procedures, sample selection and consequent data treatment. Next, the data gathered are presented and analysed, with discussion and interpretation of the results and identification of the determinants of residents' satisfaction. Finally, the last section presents the main conclusions of the study.

Literature Review

Today, citizens have a range of services available to them. However, these are no longer distinguished by their quantity, but rather by their quality and how the services are provided.

A service is public when it has direct or indirect State intervention and is in the public interest.

According to Caupers (2001, p.116), public services are organisational structures responsible for preparing and carrying out the decisions of collective organs operating in Public Administration. The concept of public service, according to Soares (2002), covers institutions, services and systems in which leaders or managers intend to obtain citizen-oriented results, following government policy through harmony with objectives and goals already defined.

Shvoong (in Silva, 2012) defines public service as what Public Administration provides to society and is considered essential for the survival of the social group and the State itself, such as policing and public health services. However, the author also considers that Public Administration provides society with other types of services, either directly or indirectly, following rules or on their orientation, for example, public transport and electricity (Shvoong in Silva, 2012).

The concept of satisfaction is closely linked to the customer, the institution and the service provided. A growing multiplicity of services is available to citizens. However, demanding citizens are no longer interested in the quantity, but rather in the quality of the service and the satisfaction it brings.

Kotler (2000) argues that the consumer's satisfaction or dissatisfaction is characterised by the feeling of pleasure or dislike, resulting from a service received compared to the expectation. Consumers will be dissatisfied if the product/service is far from their expectations, whereas if performance exceeds their expectations, they will be satisfied (Kotler, 2000).

In the case of Public Administration, Carapeto and Fonseca (2005) consider that measurement of users' satisfaction is essential to promote participation in continuous improvement of Public Administration's provisions and determine recipients' perspectives so that the public sector can define techniques that correspond to what citizens expect.

For local authorities to provide their residents with a quality service, they need to know their real needs and expectations, something which is not always easy to determine.

Increasingly active and demanding citizens have made the State's role in the relationship more complicated. Consequently, public service feels obliged to bank on quality with more significant concern about performance and the characteristics of the service provided, making it imperative to transform the culture of Public Administration, and in particular Local Authorities, the level of Administration that is closest to citizens. It must invest in the results, control and assessment of processes, in defining objectives and in satisfying the recipients of public services (Sá, 2003).

Different governments have been creating alternatives for modernisation, implementing measures aiming for a more modern, efficient Public Administration, able to respond to citizens' needs and seeking to satisfy new public management. The modernisation of Public Administration is based primarily on implementing new management practices taken to be international success references, where one of the priorities is the promotion of service quality (Gomes, 2014).

Innovations in Public Administration imply seeking efficiency and quality in public service provision (Gonçalves et al, 2002). Pereira (2000) points out that considering citizens as customers means giving them due attention, respect and attending to their needs.

According to Furtado (2007), local authorities are becoming prominent in configuring Public Administration and the very structuring of the State, playing a fundamentally important role in formulating and implementing development policies with direct impacts on the resident population in their territories.

Fontoura (2013) believes that local governments now act in an increasingly competitive and dynamic environment, which means that local authorities must work with more precision and determination to satisfy residents' needs. The author adds that if this does not happen, residents are forced to seek local authorities with services that meet their needs and provide them with better living conditions (Fontoura, 2013).

Method: Study Scope, Measuring Scales, Data Collection and Sample

The previous study in the field of citizen satisfaction with public services has for example been interested in the relation between trust and satisfaction (e.g., Van Ryzin, 2007, Morgeson and Petrescu, 2011), the role of expectations in the formation of satisfaction (e.g., James, 2007, Morgeson, 2012, Jacobsen, Snyder, and Saultz ,2014), satisfaction with specific services (e.g., Favero and Meier, 2013; Jacobsen, Snyder, and Saultz ,2014), and citizen satisfaction as indicators of service quality (e.g., Giannocarro, et al, 2008).

This study aims to ascertain residents' satisfaction with their local authority, seeking to analyse several aspects characterising that council. Citizens measure the quality of the services provided by local authorities, thereby allowing assessment of the level of satisfaction with services. From the citizen's perspective, it aims to analyse/identify:

- citizens' image of their local authority;
- the quality of necessary infrastructure and services provided by the local authority;
- quality of life, in terms of leisure, access to culture, environmental quality and safety, provided by the local authority;
- citizens' opinion about some aspects related to the cost of living and other economic aspects;
- the factors residents value in assessing their satisfaction with the local authority, including evaluation of the work done by municipal bodies with local authority responsibilities.

This study defines a municipality as the local authority of residence and concerns assessment of the work done by town halls to stimulate, grow and develop their council areas. The subject of study is residents on the island of *São Nicolau* in Cape Verde, in the local authorities of *Ribeira Brava* and *Tarrafal de São Nicolau.*

Considering the objectives defined and the literature review performed, in order to respond to the latent variable (Citizen satisfaction), the following dimensions will be considered: 'Local Authority Image', 'Quality of Basic Municipal Infrastructure and Services', 'Quality of Life in Economic Terms' and 'Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety'.

When it comes to data collection, it was used a survey based on the questionnaire by Machás in Ralha et al (2015). In order to complete the questionnaire, two criteria were required of the citizen-resident: a) being officially resident in one of the two councils (*Ribeira Brava* and *Tarrafal de São Nicolau*) and being at least 18 years of age.

The first five questions aimed to gain citizens' perception of their local authority's image. In order to measure each item, a five-point Likert-type scale was used, from 1 – Completely disagree (CD) to 5 – Completely agree (CA).

The variable of 'Quality of Basic Municipal Infrastructure and Services' concerns the aspects most related to the quality of necessary infrastructure and services in education, health, sanitation and basic public services and local authority services (in a total of four indicators). Similarly to the previous items, a five-point Likert-type scale to measure each item, from 1 – Completely disagree (CD) to 5 – Completely agree (CA).

To measure the variable of 'Quality of Life in Economic Terms, ' four indicators were defined. Construction of this variable intends to measure residents' opinion of the quality of life in their local authority versus the cost of living there. The objective is also to determine residents' perception of aspects related to the local authority's potential to create jobs and opportunities for them, relevant aspects of the council's attractiveness. A five-point Likert-type scale was used to measure this variable, with 1 meaning 'Very Bad' and 5 meaning 'Very Good' (1 – Very Bad (VB), 2 - Bad (B), 3 - Reasonable (R), 4 - Good (G) and 5 – Very Good (VG)).

The fourth question intends to measure the 'Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety'. This aspect represents the quality of life in the local authority regarding the environment – environmental quality, access to and provision of cultural or leisure events and provision of other commercial and service activities. Regarding the construction of the variable, five indicators were considered, measured on a five-point Likert-type scale, as in the previous variable. The fifth and sixth questions assess residents' global satisfaction with their local authority in general, and regarding the work done by the council concerning the financial resources available. A five-point Likert-type scale was used to measure each item, from 1 – Very dissatisfied (VD) to 5 – Very satisfied (VS).

The seventh question aims to find out residents' opinion concerning the fulfilment of their expectations of satisfaction with the local authority. The question was measured on a five-point Likert-type scale, presenting the following information:

1 – Very far from ideal and from expectations (VFI),
2 – Far from ideal and from expectations (FI),
3 – N eutral (N),
4 – Close to representing the ideal and meeting almost all expectations (CI) and 5 – Represents the ideal and meeting all expectations (RI).

The fifth, sixth and seventh questions allow construction of the 'Citizen Satisfaction' variable, formed of three indicators:

- Citizens' Global Satisfaction with their local authority in general, as the place of residence;
- Global Satisfaction with local public entities' management, in improving the local authority;
- Local authorities' Fulfilment of Expectations of Satisfaction, considering their financial capacity and resources.

The last set of questions (six in total) are socio-demographic, concerning gender, age, occupation, marital status, educational qualifications and respondents' gross monthly income.

Given the impossibility of studying the whole population resident in the local authorities, it was decided to select a random sample, giving residents equal opportunity to be part of it.

Some questionnaires were applied face-to-face and others were left in public institutions for voluntary completion, between February and May 2018. A total number of 723 questionnaires were applied, approximately 56,4% of the population. In obtaining 723 questionnaires, sample error was 3,55%, assuming a 95% level of significance, making the sample representative of the universe studied. The sample was intended to be representative of the population of the island. In a universe of 12.818 inhabitants, 50,5% of the sample live in *Ribeira Brava* and 49,5% in *Tarrafal de São Nicolau*.

Data analysis and Results

Analysis of Participants' Characteristics

As for the gender variable, of the 721 responses to the questionnaire, 394 (54,5%) were male and 327 (45,2%) female. It was, therefore, concluded that the majority of residents in *Ribeira Brava* and *Tarrafal de São Nicolau* are male. Concerning age, 11,6% of residents are 18, 14,8% between 19 and 24, 27,4% between 25 and 34, 27,2% between 35 and 44, 10,8% between 45 and 54, 4,7% between 55 and 64 and 3,5% are 65 or older. So the largest number of residents of *Ribeira Brava* and *Tarrafal de São Nicolau* is between 25 and 34, followed by the 35 to 44 age-group. Regarding the level of education, 36,2% of residents have completed secondary education (12th year/equivalent), followed by higher education – 15,6% with a degree, basic education – third cycle (9th year) with 13,7% of residents, basic education – second cycle (6th year) with 13,6%, basic education – first cycle (4th year) with 12,9%, higher education – diploma with 6,9%, higher education – master with 1%, and higher education – PhD with 0,1%. As for marital status, most residents in *Ribeira Brava* and *Tarrafal de São Nicolau* are single (60,6%), 31,7% are married or live in a civil partnership, 4,3% are divorced or separated, and 3,5% are widowed. 45,8% of residents in *Ribeira Brava* and *Tarrafal de São Nicolau* are employees, 17,6% are students, 15,1% are self-employed, 12,7% are unemployed, 5,4% are retired, and 3,5% are housewives. In relation to the variable of individual gross monthly income (rather than that of the household), 35,3% of residents in *Ribeira Brava* and *Tarrafal de São Nicolau* have no income, 19,1% have an income between 181,38€ and 362,75€, 15,2% receive between 362,76€ and 498,79€, 10,5% receive between 55.000€ and 770,86€, 10,1% between 104,29€ and 181,37€, 4,6% up to 99,76€, 3,2% between 770,87€ and 906,90€, and 1,9% receive 906,91€ or more.

Perceptions of Citizen Satisfaction

This section makes an exploratory, descriptive analysis (frequency, mean and standard deviation) of groups one to seven on the questionnaire. These groups of questions intended to measure citizens' satisfaction with their local authority (*Ribeira Brava* and *Tarrafal de São Nicolau*). Whenever mean values are above three points, there is a level of agreement with the variable studied; mean values under three points indicate disagreement with that variable.

Regarding the variable of 'Local Authority Image':

- To the statement "It is a local authority with great visibility (it is known in Cape Verde, spoken about on the news, because of its culture, gastronomy, size, tourism)" respondents' answers do not agree with the item (2,89 mean; 0,754 standard deviations).
- To the statement "The local authority has become more modern (i.e., the introduction of more modern services, new cultural activities, technology etc. is noted)", residents have a negative opinion (2,60 mean; 0,784 standard deviations), with 6,8% indicating "Completely disagree" and 37,2% "Disagree".
- Regarding "The local authority is relevant nationally (i.e., it contributes to the country's Gross Domestic Product (GDP), being important for the national economy...)", residents give negative answers (2,64 mean; 0,793 standard deviations), with 8% indicating "Completely disagree" and 30,7% "Disagree".
- The statement of "The local authority has developed (i.e., it has grown in population, the number of houses, tourism,...)" presents little agreement (2,97 mean; 0,816 standard deviations), i.e., 5,9% "completely disagree", 14,7% " Disagree" and 57,5% are "Neutral".
- To the statement of "This is a local authority where people live well (i.e., where citizens/residents have a quality of life)" (3,16 mean; 0,871 standard deviations), residents agree with this item, with 52,4% indicating "Neutral", 27% "Agree" and 5% "Completely agree".

The results obtained for the variable of 'Quality of Basic Infrastructure and Services' show that:

- Residents responded positively to the statement "Teaching: Quality of schools and teaching, young people's access to education (primary, secondary), quality of school facilities" (3,52 mean; 0,802 standard deviations), with 51,3% indicating "Agree" and 6,1% "Completely agree".
- As for "Health: Quality of local Health Centres, access to Hospitals, and health services generally, availability of medical services (appointments, emergencies,...)" (2,36 mean; 0,770 standard deviations), residents have a negative opinion, with 10,9% stating "Completely disagree" and 48,7% "Disagree".
- Residents' answers to "Sanitation and basic public services: Quality of public services (water, sanitation, energy, rubbish collection/treatment,...)" show agreement with the item (3,38 mean; 0,843 standard deviations), with 43,2% indicating "Agree" and 5,4% "Completely agree".
- To the matter of "Municipal services: Quality of municipal service in dealing with residents, good service, professionalism,…, Townhall,…", residents responded positively to this item (3,56 mean; 0,978 standard deviations), i.e., 42,7% "Agree" and 14,7% "Completely agree".

The results obtained reveal that for the variable of "Quality of Basic Infrastructure and Services" the item of "Teaching: Quality of schools and teaching, young people's access to education (primary, secondary), quality of school facilities" registers the highest agreement (51,3%). Concerning the item of "Health", approximately 48,7% of residents show disagreement.

For the variable of 'Quality of Life in Economic Terms', the results obtained can be summarised as follows:

- To the question "How do you assess the quality/cost of living relation in the local authority?", residents did not agree with the item (2,93 mean; 0,716 standard deviations), with 5,5% indicating "Very Bad", 12,2% "Bad" and 67,4% "Reasonable".
- To the matter of "Employability (supply of work – employment), jobs… it creates jobs..., or it is where more job opportunities are generally found", 16,7% considered this "Very Bad" and 47,6% "Bad" (2,23 mean; 0,769 standard deviations), indicating that residents responded negatively to the item on employability.
- Regarding the "Capacity to attract companies to the local authority (attracting important or large companies, creating advantages to attract new companies...)" (2,45 mean; 0,877 standard deviations), residents did not agree with this aspect, with 15,9% considering it "Very Bad" and 32,8% "Bad".
- Regarding the "Capacity to provide housing with a good quality-price relation, the quality housing supply has grown", residents' answers indicate a favourable opinion (3,03 mean; 0,847 standard deviations), with 51,9% indicating "Reasonable", 23,7% "Good" and 3% "Very Good".

In general terms, concerning the dimension of 'Quality of Life in Economic Terms', the capacity to supply housing with an excellent quality-price relation is the item with the highest percentage of classification as reasonable.

Respondents' perceptions of the variable of 'Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety' reveal the following results:

- Concerning "Quality of cultural events (local traditional festivals, music/concerts, museums, exhibitions...), diversity of cultural events and actions promoting access to culture…" respondents agreed with the item (3,03 mean; 0,840 standard deviations), with 52,7% considering this "Reasonable", 23,5% "Good" and 2,8% "Very Good".
- To the item "Access to and quality of leisure services (e.g., cinema, restaurants, diversity of entertainment)" residents give negative responses (2,35 mean; 0,777 standard deviations), finding that 11,6% answered "Very Bad" and 48,3% "Bad".

- As for the "Quality of public safety services (having good police and surveillance services, security and prevention)", residents agreed with this aspect (3,14 mean; 0,943 standard deviations), 39,8% considering it "Reasonable", 35,1% "Good" and 3,6% "Very Good".
- Regarding "Good air and environmental quality (no pollution, green spaces, parks)" residents consider that the local authority has excellent air and environmental quality (3,72 mean, 0,931 standard deviations), as 46,5% indicate "Good" and 18,7% "Very Good".
- Concerning the "Quality of natural resources in the area: Nature, fish stocks, ..., a local authority standing out for its gastronomy (guava, papaya, *chalupa*, *modje*), ... natural environment and resources of the area…" residents are found to consider that their local authorities have a good quality of natural resources (3,9751 mean, 0,99552 standard deviations), with 39,7% considering it "Good" and 33,9% "Very Good".

The 'Global Satisfaction' variable was analysed through a single item. To "What is your global satisfaction as a resident of the local authority?" residents are found to be satisfied with it (3,43 mean, 0,838 standard deviations), with 49,8% being "Satisfied" and 4,4% "Very Satisfied".
The variable of 'Global Satisfaction with the Work Done by the Local Authority considering the Public Financial Resources available' is also formed of one item. Residents showed agreement with this (3,24 mean, 0,857 standard deviations), with 36,9% indicating "Neither Satisfied/Nor Dissatisfied", 42,3% "Satisfied" and 2,1% "Very Satisfied".

The variable of 'Expectations of Living in the Local Authority' was also analysed through one item. Regarding the question "In your opinion, to what extent does living in the local authority meet your expectations?", residents presented positive results (3,02 mean, 0,811 standard deviations).
50,5% of these indicate "Neutral", 24,3% "Close to representing the ideal, fulfilling almost all expectations" and 1,9% "Represents the ideal, fulfilling all expectations".

Determinants of Citizen Satisfaction

The study went on to analyse identification of the determinants of Citizen Satisfaction, estimating the following multiple linear regression model:

$$SatisfMunicip = \beta_0 + \beta_1 ImageMun + \beta_2 QualInfrast + \beta_3 QualLife + QualLeisure + \varepsilon_i$$

More precisely:
SatisfMunicip (Citizen Satisfaction) represents the dependent variable (global variable formed of three factors);
ImageMun (Local Authority Image), QualInfrast (Quality of Basic Infrastructure and Services), QualLife (Quality of Life in Economic Terms) and QualLeisure (Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety) represents the independent variables potentially influencing citizen satisfaction;
Finally, ε_i represents the errors estimated.

The coefficients obtained with the estimation of the Ordinary Least Squares model of the variables analysed are presented in Table 1. For each variable, its estimated coefficient is presented and the *t* statistic in the case of the null hypothesis being right and the minimum level of significance from which the null hypothesis is rejected, to determine whether the independent variables are significant in explaining the dependent variable (Citizen Satisfaction).

Table 1: results of the linear regression

Model	Variables[a]	SatisfMunicip[b]				
		Non-standardized coefficients		Standardized coefficients		
		β	*Standard Error*	β	*t*	*Sig.*
1	(Constant)	0,815	0,138	-	5,914	0,000*
	ImageMun	0,345	0,054	0,268	6,335	0,000*
	QualInfrast	0,181	0,051	0,148	3,557	0,000*
	QualLife	0,033	0,071	0,033	0,463	0,644
	QualLeisure	0,231	0,091	0,202	2,545	0,011*
	R	0,560				
	R^2	0,314				
	Adjusted R^2	0,310				
	F	81,987				
		(0,000)*				

a.Independent variables; b. Dependent variable
*Method: Enter; * significant for a 0,05 level of significance.*

The results show that the dependent or explained variable is only influenced significantly by three variables. The model estimated presents a coefficient of determination of 0,310 (AdjustedR^2), which means that the independent variables analysed explain only 31% of the variance observed in the Citizen Satisfaction variable. The model estimated presents weak robustness due to an AdjustedR^2 under 50% (suitable value in social science studies, according to Marôco (2018).

The *F* statistic, with a value of 81,987 associated with a p-value of 0,000 (α=0,05) allows the conclusion that the model is statistically significant. That is, the linear model obtained is suitable to explain the relation between Citizen Satisfaction and the variables considered in the analysis. Citizen Satisfaction is influenced positively by Local Authority Image (ImageMun), Quality of Basic Infrastructure and Services (QualInfrast) and Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety (QualLeisure). The variable of Quality of Life in Economic Terms (QualLife) does not influence citizens' satisfaction. It is noted that the variable of 'Local Authority Image' (ImageMun) is the one contributing most to the determination coefficient (β=0,268). The regression coefficients are significant for all the variables for a 5% level of significance, α=0,01 (constant: t=5,914, ImageMun: t=6,335, QualInfrast: t=3,557, QualLeisure: t=2,545). Therefore, considering the results obtained, the following regression model is formed:

$$SatisfMunicip = 0,815 + 0,268ImageMun + 01,48QualInfrast + 0,032QualLeisure$$

The next step was to confirm the fulfilment of the assumptions of normality, homoskedasticity and independence of the residuals, to ensure the robustness of the model obtained. The assumption of normality was validated through the exact test of residual distribution – Kolmogorov-Smirnov test with Lilliefors correction. The results obtained show acceptance of the null hypothesis that the non-standardized residuals present normal distribution (p-value>0,05). From the statistic obtained from applying the Durbin-Watson test, the assumption of independence of errors (d=1,426) was validated. The assumptions were confirmed. Also, for a 5% level of significance (p=0,057), the results of a normal distribution of residuals were confirmed, in that most of the points are to some extent above the main diagonal.

The descriptive statistic of residuals indicated the possible existence of outliers and/or influencing cases (Stud. Deleted Residual = 0,050). Similarly, the result of the maximum centred leverage indicates the presence of a multivariate outlier (equal to 0,000). Analysis of the influence of outlier observations on the model's quality of adjustment revealed that the model is not significantly influenced by outliers. So it was decided not to exclude them.

Final Remarks, Implications, Recommendations, Limitations and Future Lines of Research

This research aimed to determine and assess citizens' satisfaction with their local authority, analysing a set of aspects characterising that council area.

Regarding citizens' perceptions of the Local Authority Image, the results reveal that they tend to adopt an impartial stance. Citizens do not consider that image as relevant in contributing to satisfying their needs as residents.

Citizens have a negative opinion of the quality of necessary infrastructure and services concerning health. This aspect seems to be a situation warranting the attention of the local authorities studied.

Citizens also have negative perceptions of the local authorities' quality/cost of living and the capacity to create employment and attract companies to the area. These seem to be another aspect in need of attention by local authorities, to understand what leads to residents' discontent in seeking to increase the level of satisfaction.

Respondents' perceptions of the variable reveal the following results:

"Access to and the quality of leisure services (e.g., cinema, restaurants, variety of entertainment)" seems to be the item among those included in 'Quality of Life in Terms of Leisure, Access to Culture, Environmental Quality and Safety' which residents are least satisfied with.

The results show there are no differences in the local authorities regarding citizen satisfaction. Their geographical location determined the results obtained. As both are situated on the island of *São Nicolau*, at the outset there should be no discrepancy in their actions due to characteristics associated with insularity.

The practical implications of this research lie in providing local leaders with instruments allowing them to assess local public policies, in order to increase residents' satisfaction with their local authority.

Although it is considered that the previously defined objective has been reached, simple application of a questionnaire does not allow a full appraisal of the situation. So in future research, the intention is to extend the data-collection method to include interviews with residents of the local authorities studied. It is believed that interviews could provide higher contrast, analysis and depth of a variety of information.

Acknowledgments

This study was conducted at the Research Center in Political Science (UIDB/CPO/00758/2020), University of Minho/University of Évora and supported by the Portuguese Foundation for Science and Technology (FCT) and the Portuguese Ministry of Education and Science through national funds.

Abstract

With the rapid development of electronic commerce, the problem of "information overload" leads to the difficulty that user can't search the required goods effectively, personalized recommendation technology has been applied in e-commerce and popularization. With a visualization tool called CiteSpace, this paper investigated the intellectual structure, development, and evolution of personalized recommendation quantitatively to provide a systematic review of the current state of the personalized recommendation literature in China. According to 1999 articles focusing on personalized recommendation, we have identified the most influential authors, institutions, publications and keywords in this field, as well as the hot topics and future trends. Some useful conclusions can be drawn as follows: The annual of published paper is relatively stable in 2009-2013, and began to enter a large-scale development stage in 2014; Recommendation systems, recommendation algorithm, application environment and cold start are the hot topics in the last 10 years; The cooperation between authors and research institutions is weak, and authors' cooperation has a significant geographical limitation. This paper filled the gap in personalized recommendation system research through discovering the exiting themes, hot topics, and potential future research directions.

Keywords: Personalized Recommendation; Knowledge Mapping; CiteSpace; Bibliometric Analysis

Introduction

With the rapid development of e-commerce, the rapid growth of commodity types and the limited ability of customers to select goods have formed a sharp contrast, the emergence of goods "information

overload"(Pessemier, Dhondt, & Martens,2016) leading to customers to accurately select goods, businesses to obtain customer personality needs is steeply difficult. It is not uncommon that searching for information or buying complex products (e.g. digital products) via the Internet are always frustrated (García-Sánchez, Valencia-García, & Martínez-Béjar, 2005). In this regard, customers hope that e-commerce will help them quickly purchase satisfactory products. Businesses hope that e-commerce will help them dynamically and accurately obtain customer demand to improve service quality and visits, customer experience and loyalty (Tewari & Barman, 2018). Personalized recommendation technology is an important method to improve information overload. The personalized recommendation system can create user flies through user behavior and other information, and recommend the most suitable items for users automatically, thus effectively reducing the information overload problem (Chen, 2019).

Although personalized recommendation research is evolving rapidly in both industry and research, there is still much to learn about personalized recommendation research and how it can enhance electronic commerce. So far, some integrated reviews of personalized recommendation system that may help researchers keep abreast of knowledge developments have been presented (Liu, Nie,& Chen, 2007; Lu & Cao, 2016; Shi & Han, 2018; Xie &Li, 2017; Dubey & Nair, 2015). However, few works use visualized and graphical bibliometric analysis to explore the internal relationship among articles, authors and references. This is critical for making a comprehensive evaluation of the area such as personalized recommendation. Thus, this paper concentrates on filling the gap in personalized recommendation system research by carrying out a visualized bibliometric analysis to discover the exiting themes, hot topics, and potential future research directions.

Literature Review

Recommendation systems have been traditionally used by some e-commerce sites to solve the personalization problem by guiding customers to find the products they would like to purchase. A number of recommendation systems have been proposed for different businesses. Traditional recommendation systems mainly include collaborative filtering, content-based recommendation method and hybrid recommendation method (Shrivastava & Rajawat, 2013).

The most classical algorithm is the collaborative filtering approach, which leverages interaction information between users and items based on users' past preferences. However, this method is limited by data sparsity and cold start problem. When dealing with new customers, this type of recommendation systems cannot recommend any product as no historical preference records are available (Shi, Zhao & Shen, 2017). The content-based recommendation approach, on the other hand, uses the items that users have selected to find other similar items for recommendation. However, it is often inhibitive to estimate the preference similarities between various customers (Shu, Shen, & Liu, et al., 2017), because it is difficult to obtain the accurate customer ratings of products especially when special knowledge is needed for rating. The hybrid recommendation method which integrates the multi-source heterogeneous information can alleviate the problem of data sparsity and cold start in the traditional recommendation system (Wang & Wang, 2011). However, due to the complex

characteristics of auxiliary information, such as multimodality, heterogeneous data and uneven distribution, the research of hybrid recommendation method for multi-source heterogeneous data fusion still faces severe challenges.

Although there are many publications related to personalized recommendation system, few people can understand the overall structure of the personalized recommendation knowledge landscape accurately. Therefore, it is necessary to study personalized recommendation system with the help of a quantitative analysis tool CiteSpace. CiteSpace is a Java-based information measurement soft-ware which designed to clarify the knowledge evolution structure and to detect emerging trends and transient patterns in the scientific literature. It has been widely used to identify hot topics in the field of science and technology (Chen, 2006).

Methodology and Data Sources

Methodology

Bibliometric analysis is defined as ‘‘the quantitative analysis of publications in a given field’’. It can be used to analyze article information in regard to keywords, authors, references, journals, institutions, countries, and even directions for future research (Mayr & Scharnhorst, 2015). Through the process of bibliometric analysis, researchers can conduct a longitudinal meta-analysis of a special field to investigate the birth, origin, development, and evolution of this field, as well as the current status and possible trend of such field (Hérubel , 1999).

With the development of information technology, bibliometric analyses can be used to generate network images and therefore providing more visualized information rather than words only (Cao, Huang & Wang, et al., 2012). CiteSpace is one of the most popular software tools for analyzing co-citation networks in bibliometric studies. It allows for analysis of diverse co-occurrence networks including articles, authors, keywords, and even turning points, research front and focus (Chen, 2006). In addition, network maps generated by CiteSpace can facilitate data interpretation.

Data sources

The research data used in this paper come from the general library of academic journal online publication of CNKI (China National Knowledge Infrastructure), which is the world's largest continuous dynamic update of Chinese academic journal full-text database. After entering the database, using CNKI’s advanced retrieval function, the retrieval condition of thematic words is "personalized recommendation" or "recommendation algorithm", with a time span of January 1, 2009 to December 31, 2018. After the retrieval, a total of 2138 documents were obtained, and 1999 valuable research samples were finally obtained after removing the non-academic papers; exporting the basic information of the documents in Refworks format, such as titles, authors, units, abstracts and keywords and so on, naming the exported files according to the requirements of the visualization software

CiteSpace, and finally using the data conversion function of the software to complete the conversion of the data.

Research Results and Analysis

The number of published articles

Through the statistical analysis of the number of articles published, it can be found that the research on personalized recommendation in China is on the rise as a whole. During the period from 2009 to 2014, the growth was relatively slow, fewer scholars worked in this field and the amount of publications is slowly growing. During the period of 2014-2016, the growth rate suddenly increased and the number of published articles increased sharply, which may be attributed to the arrival of the era of big data. In particular, the wide application of information technology, such as e-commerce, social network has made the application background of personalized recommendation more abundant. Growth has fallen since 2016, but it is still rising steadily, which also indicates that the theme of personalized recommendation research has been widely popular in recent years (Fig 1).

Fig. 1:The number of published articles per year

The research hotspots in personalized recommendation research

The key words are the extraction of the core contents of the literature, so the statistics and analysis of the high-frequency keywords can be used to determine the research hotspot in the field of a certain subject (Duan & Cai, 2016). At the same time, the centrality of the key words derived by the CiteSpace can also reflect the research hotspots. This paper combines the frequency with the centrality of keywords to analyze the hot topics.

By running CiteSpace, a clustering knowledge map can be obtained, in which the cross joint represents the centrality of the keywords, and the size of the node represents the frequency of the keywords. As can be seen from the Fig 2, the term “collaborative filtering”, “recommendation system”, “personalized recommendation”, “recommendation algorithm” and “personalization” are the five keywords with the

highest frequency in turn, which indicates that they are the hot issues of personalized recommendation research in recent 10 years.

Fig. 2: Co-occurrence analysis of keywords

In addition, the frequency and the betweenness centrality of keywords are derived from CiteSpace. Keywords with a centrality ≥ 0.1 are selected, as shown in Table 1. It can be clearly found that "personalized recommendation", "recommendation system", "personalization", and "data mining" are the most prominent, reflecting hot topics in the field of personalized recommendation.

Table 1: Key words co-occurrence frequency, centrality (≥ 0.1)

No.	Keyword	Frequency	Centrality
1	Collaborative filtering	721	0.06
2	Recommendation system	496	0.24
3	Personalized recommendation	482	0.27
4	Recommendation algorithm	280	0.1
5	Personalization	113	0.15
6	E-commerce	84	0.04
7	Matrix Decomposition	78	0.07
8	Similarity	73	0.11
9	Data Mining	65	0.15
10	Social network	64	0.08
11	Big data	56	0.11
12	Cold start	52	0.11

The research hotspots in the field of personalized recommendation can be classified as four knowledge groups: personalized recommendation system (recommendation system, personalized recommendation), personalized recommendation algorithm (collaborative filtering, recommendation algorithm, personalization, matrix decomposition, similarity, data mining), personalized

recommendation application environment (e-commerce, social network, big data) and the problem of cold start, which represents the hotspots in the research field of the personalized recommendation.

The Evolution of Research Hotspots

By selecting the TimeZone under the visual interface of CiteSpace, the time zone map of keywords can be obtained. Based on CiteSpace visualization analysis, the time zone map can reflect the co-occurrence relationship between time and keywords, thus revealing the evolution process of research in a certain field (Cai, Ma & Yuan, 2019).

According to the emergence of key words in different time quantum, the evolution process of research hotspots in this field can be directly and clearly reflected. When conducting analysis, researchers tend to choose a wide range of words with generality and establish a large research structure. In the later stage, with the increase of research, more problems appear. Researchers may study a specific detail at a deeper level, so as to select more specific keywords. This shows that the research on personalized recommendation has gone through a process from shallow to deep, from extensive to detail in China.

Fig. 3: TimeZone view of research hotspots

Research frontier in personalized recommendation research

Burst keywords refer to words that appear more frequently or are used more frequently in a relatively short time. According to the change of the frequency of burst keywords, the frontier and trend of the research field can be judged. According to the related analysis of , CiteSpace, we get the topic of personalized recommendation, the corresponding emergent rate and cited history curve, as shown in Figure 4., "e-commerce", "personalized recommendation", "personalization", "similarity",

"personalized recommendation system", "digital library", "data mining", "personalized service", "cloud computing", "label", the first three of which are mainly reflected in 2009-2012. "Similarity" is reflected in 2010-2014, "personalized recommendation system" and "data mining" are mainly reflected in 2011-2013.

Top 10 Keywords with the Strongest Citation Bursts

Keywords	Year	Strength	Begin	End	2009 - 2018
电子商务	2009	5.6369	2009	2012	
个性化推荐	2009	14.1516	2009	2012	
个性化	2009	4.0791	2009	2012	
相似性	2009	3.8411	2010	2014	
个性化推荐系统	2009	3.5513	2011	2013

Analysis of Cooperation Network

Analysis the Institutions Cooperation Network

In order to study the cooperation between different institutions, CiteSpace is used to generate the institutions cooperation map in the field of personalized recommendation, as shown in Fig 5. It can be seen that the institutions with high publication in the field of personalized recommendation research are *School of Information Management, Wuhan University* (20 articles), *School of Information Science and Engineering, Shandong Normal University* (17 articles), and *School of Optoelectronic Information and Computer Engineering, Shanghai University of Technology* (15 articles).

Fig. 5: Analysis of Cooperative Network of institutions

However, the research groups in this field are scattered, and there are fewer links between different institutions. The cooperation or contact between domestic research institutions in the field of personalized recommendation is not frequent with the characteristics of regional proximity. Among them, there are four relatively clear cooperation networks, which are the subgroup between *School of Information Management of Wuhan University* and *Wuhan University Information Resource Center and Computer School of Wuhan University*; the subgroup between *Shandong Normal University* and *New Key Laboratory of Distributed Computer Software of Shandong Province*; the subgroup between *School of Marketing Management* and *School of Business Administration at Liaoning University of Engineering*; and the cooperation subgroup between *School of Computer Science and Technology at Anhui University* and *School of Management at Hefei University of Technology* .It can be found that the cooperation between institutions is limited to the province or even the school, and there is little cross-regional cooperation.

Table 2: The number of documents issued by institutions

No.	Amount of published	The earliest year of publication	Institution
1	20	2011	School of Information Management, Wuhan University
2	17	2015	School of Information Science and Engineering ,Shandong Normal University
3	15	2015	School of Optical-Electrical and Computer Engineering ,USST
4	13	2013	National Digital Switching System Engineering & Technological R&D Center
5	13	2010	College Of information Science and Engineering, Yanshan University

6	13	2013	University of Chinese Academy of Sciences
7	12	2015	School of Computer Science and Technology of Anhui University
8	12	2009	College of Computer Science, Chongqing University
9	11	2015	School of computer, Guangdong University of Technology
10	10	2015	College of Computer Science and Engineering, Nanjing University of Science and Technology
11	10	2013	College of Management and Economy, Tianjin University

Cooperative network of authors with high publication volume

CiteSpace can be used to analyze the cooperative relationship between researchers in a research field. The group of authors with certain academic influence is one of the epitomes of scientific research activities in a certain subject area. Through the high-impact authors and the research on the cooperative network between them, it is helpful to understand the active authors and their scientific research practice in the field of personalized recommendation, and to grasp the trend of development and research in the field of personalized recommendation. We take 1 year as a slice interval, analyze the cooperative network of authors who published the results of research on personalized recommendation from 2009 to 2018, and obtain the cooperative network diagram as shown in Fig 6.

It can be seen from the Fig 6 that the cooperation between the researchers of personalized recommendation field is still relatively large in China. From the cooperation of two people to the cooperation of many people, the connections between the authors are relatively close. As can be seen from Table 3, *Jianguo Liu* has published 11 documents and formed the largest co-operation subgroup network ,in which he's the center. then, *Haiyan Zhao* published 10 documents, and Jian Cao published nine documents, with two of them as the center, and *Qingsheng Chen*, *Ying Wang* formed a relatively small cooperative subgroup network. In addition, most of the scholars conducted their research in an independent way, and they have published a large quantity of articles, such as *Junhao Wen* published eight articles, *Fuzhi Zhang* published six, and so on.

Fig. 6: The cooperation between authors in the field of personalized recommendation

Table 3: Author with high publication volume（>5）

No.	Amount of published articles	Author
1	11	Jianguo Liu
2	10	Haiyan Zhao
3	9	Jian Cao
4	8	JunhaoWen
5	7	Hui Lee
6	6	Fuzhi Zhang
7	6	Hong Wang
8	6	Pinghua Chen
9	6	Jun Peng

Conclusions

Despite the developing industry and research, there is still a limited understanding of the development and evolution of personalized recommendation research. Therefore, we provide a bibliometric analysis on personalized recommendation research using CiteSpace to summarize previous research, provide research trends, and guide new researches. According to 1999 publications from CNKI, we have conducted the network analysis on authors, institutions and keywords, and the key authors, institutions, articles and major topics of this field were identified. Furthermore, we also deduce the hot topics and potential future trends.

As can be seen from the co-occurrence map of keywords, the structure of the co-occurrence network of keywords is relatively loose and its density is not too high, which indicates that researchers are deepening their research's topic, research's content and research's direction, starting to study deeper research problems, and choosing more and more accurate keywords.

From the map of cooperative network of institutions, it can be seen that the institutions involved in the study of personalized recommendation have a wide distribution, but the cooperation between the institutions is less.

From the influential authors and their cooperative networks, several prominent cooperative networks have been formed centered on *Liu Jianguo*, *Zhao Haiyan* and *Cao Jian*. But the strength and extent of the cooperation are still at a low level.

In short, the bibliometric analysis is of great significance for identifying the exiting themes, hot topics, and potential future research directions of personalized recommendation system research. However, it should be pointed out that there are still some limitations in this research. For example, keywords are not comprehensive when searching for data, which can lead to the omission of partial data. In order to verify the accuracy of the research results and broaden the scope, collecting data with from other data source such as Web of Science and SCOPUS, conducting specific research on one or more core journals in this field to do an analysis are expected in further study.

Management by Values and Sustainable HRM: A Comparative Analysis

Rafal MROZIEWSKI

Wroclaw University of Economics and Business, Komandorska 118/120, 53-345 Wroclaw, Poland

rafal.mroziewski@gmail.com

Abstract

The article focuses on the comparative analysis of two management strategies – Management by Values and Sustainable HRM. Such an analysis is necessary because of the growing significance of the concept of sustainable development. It becomes important to answer the question of whether Sustainable HRM can be called an element of Management by Values. The first part of the article focuses on a detailed discussion of both concepts, giving practical examples of their use in companies. A positive impact of both strategies on human capital development was found, as well as on the long-term competitiveness of the organizations that implemented them. Then, on the basis of the literature, a comparative analysis was carried out based on 16 criteria constituting the most important features distinguishing both concepts. The identification of many common elements proved that Management by Values and Sustainable HRM are interrelated. At the end of the article, appropriate conclusions and proposals for further research on the subject are presented.

Keywords: Management by Values, Sustainability, Sustainable HRM, Green HRM

Introduction

Over the past few decades, we have witnessed a momentous change in approaches to company management. Until quite recently, we focused on the primary role of financial results, and especially profit, as the priorities guiding company management boards in making any and all decisions. These were the times of Management by Goals, often understood as imposing goals on employees. Over time, an idea developed which focused not only on the interests of the owners, but also on the values that are relevant to other stakeholders as well. According to Lachowski (2012), customer satisfaction, employee satisfaction, sustainable development or activities supporting local communities have gained more importance.

By emphasizing the essence of shared values in building an organization, in 1980 Waterman and Peters created the 7S model, which consists of seven elements forming an organizational chart: strategy, structure, skills, staff, style, system, and shared values that are the focal point for all other elements of the organization (Jacuk, Kolasa). The concept of management by values stems directly from the 7s model. This concept was first used by Blanchard and O'Connor in 1997. According to these authors (Blanchard, O'Connor, 2015), an organization managed by values is a driving force and connects four pillars representing groups of people for whom the company is responsible. Those groups are as follows:

- Customers, for whom the key element is the extraordinary quality of services provided – ultimately they should become brand ambassadors,
- Employees, looking for a motivating environment that increases their quality of life and increases their commitment – they are treated as the most valuable resource,
- Owners, for whom it is necessary that the company generates profits in an ethical and honest manner – they develop organizations that they wish to be proud of, and
- Other important groups, such as suppliers and competitors.

As indicated above, the concept of sustainable development management has recently gained much importance. This idea is described as a process connecting the economic and social areas, while taking into account ecological balance and environmental protection. It had emerged by the 1960s as a response to the rapidly growing population and associated risks, such as the excessive use of natural

resources, environmental pollution, high unemployment, malnutrition, destruction of the Earth's surface (especially forests), etc. The discussion of the global environmental problem was initiated by the "Limits to Growth" report, published by the Roman Club, founded in 1968.

According to Antkowicz and Dyrdoń (2019), the report presented a pessimistic vision of the Earth. The concept gained popularity, in 1987 when, the Brundtland Commission defined sustainability as "development that meets the needs of the present generation, but does not reduce the chances of meeting the needs of future generations" (World Commission on Environment and Development). A holistic approach to sustainable development has been adopted, addressing global issues in the long term, taking into account many stakeholders and adding a social dimension to the environmental and economic spheres (Mazur, 2017). Kwil, Piwowar-Sulej and Krzywonos (2020) concluded, that one can also define sustainability as a complex problem that includes environmental issues, the economy, and health. Moreover, the idea of sustainable development has recently been transferred to the field of human resources management. Sustainable Human Resources Management is defined as "adjusting, over the long term, human resource management strategies and practices that would allow companies to meet financial, social, and environmental goals along with their impact on the enterprise and its environment, while controlling unintended side effects and negative feedback" (Ehnert et al., 2016). This concept is also sometimes referred to as green HRM, socially responsible HRM, or ethical HRM.

The overall aim of the article is to analyse the interrelationships between Management by Values and Sustainable Human Resources Management. A critical analysis of the literature provided an answer to such questions as: "What are the common features of both concepts?", "In what aspects do these ideas differ?", and most importantly: "Can Sustainable Human Resources Management be called an element of Management by Values?" The first part of the article characterizes both concepts. Then, using Polish and foreign literature on the subject, comparisons of the theories were made. Finally, the author of this article presented the conclusions, formulating the thesis that Sustainable Human Resources Management is a targeted form of Management by Values (MBV).

Management by Values

These days, no owner of a company would disagree with the statement that employees are the foundation of the company. It is people who are the deciding factor in the success of an enterprise, regardless of whether we are talking about a start-up or an international corporation. Thanks to company values, employees feel united, become more involved, and as a result – their potential, passions, and talents can be fully utilised. Cameron and Quinn (2003) argue, that the lasting market success of companies is now less directly related to market forces than to the values they profess.

Recently, a direct relationship between MBV and the organization's economic performance has been noticed. A case in point is the survey by the National Tooling & Machine Association, which shows that companies focused on improving quality by adapting their activities to the core values, i.e. reliability, responsibility, and integrity, achieve greater profits than those focused only on quality (Stachowicz-Stanusch, 2007). Therefore, it is not surprising that values are sometimes referred to as profitability generators; it is thanks to them that the company achieves increasingly better financial results.

The achievement of the desired result is determined not by declarative values, but by those that have been truly implemented and which function throughout the entire organization. Therefore, the process of introducing the MBV concept and later efforts to maintain consistency in the relevant activities are crucial here. The larger the organization, the longer it takes to implement Management by Values, but it can be assumed that this process might take about 3 years. In order to ensure genuine functioning of MBV, it must then be implemented in the long term, in all areas of the organization (Blanchard, O'Connor, 2015) – including predominantly as part of Human Resources Management (HRM).

Due to the fact that employees are the company's most important resource, a proper selection of candidates for work is an important element that should be in place from the moment of implementation of Management by Values. Acquiring employees for the organization whose standards and goals coincide with those functioning in the company will significantly contribute to its success. At the same

time, such principles can be used as an attractor for talented candidates adhering to similar values. In fact, values are an increasingly appreciated recruitment tool. And consequently, attracting and choosing the right people, these people will play an important role in the further expansion of the company.

I□successful compa□ies, the example to follow always comes from the top; therefore, strict complia□ce with adopted standards by owners, the board, and managers is a prerequisite for success. To achieve the expected results, as Świątek-Barylska (2010: 574) aptly puts it, "employees must know the values and accept them (identify with them), while the management techniques used in the company should support the declared values, e.g. by including them in the employee assessment system".

In the long run, maintaining values as a compass for company's business is undoubtedly not easy and it requires consistency. Determined and strong leaders are needed – to act as role models as well. In order to check whether leadership through values functions not only at the strategic level, but also at the operational level, a diagnosis should be made that would determine the compatibility between the two levels. It is recommended to focus on indicators which link work to company values. For example, one can check the level of identification with the organization, the existence of an informal structure supporting communication, dignity-based job satisfaction, the type of motivational system, and the emotional relationship with products or services (Ambroziak, 2012).

For the purposes of this article, the values of three companies have been analysed that fit perfectly into both management concepts being discussed, and which simultaneously show their mutual relationships. The first is the American ice cream maker Ben & Jerry's Homemade Inc., whose mission is to create ideal conditions and benefits for anyone who is associated with their business: suppliers, employees, farmers, customers, franchisees and neighbors. The company is managed by the following principles:

- By definition, production generates waste. We strive to minimize our negative impact on the environment.
- We strive to show our deep respect for people inside and outside our organization and the society in which they live.
- We strive to create economic opportunities for those who have not had them before and to introduce new models of economic justice that are sustainable and reproducible.
- We support sustainable and safe food production methods that reduce environmental degradation (Ben & Jerry's).

Another noteworthy company is the Austrian provider of transport and logistical services Gebrüder Weiss GmbH. The company has a strong corporate culture. It's four main values form the pillars that support the international structure, connect people inside the company, and are part of the mission translated into daily activities. One of the pillars is "the orange way of sustainability." It means being aware of the fact that in order to achieve long-term success, it is necessary to remain competitive through investment and innovation. At the same time, there is full awareness of the great responsibility in the area of transport and logistics to develop and implement the latest solutions and systems that are environmentally-friendly and which ensure sustainable development. Prudent use of available resources is a significant aspect. Increasing fuel efficiency and, as a result, reducing greenhouse gases remains the highest priority (Gebrüder Weiss).

An extremely interesting example is the Finnish fuel producer Neste Oyj. Paradoxically, a company that by definition should contribute to significant environmental degradation lists responsibility as its most important value. The organization cares about the well-being and safety of others, ensuring that the activities undertaken by Neste have the minimum possible negative impact on the natural environment and the surrounding society. It supports projects that improve the quality of human life. The idea of this business is to fight climate change. Therefore, Neste provides value in the form of renewable, low-emission fuels, mainly for air, road, and sea transport. Sustainable development is an integral part of the strategy. To create renewable fuel production opportunities, the manufacturer has invested 1.5 billion EUR. Thanks to this, it produces Neste MY diesel fuel, which is made entirely of renewable raw materials, such as used frying oil and animal fat from industrial waste. In comparison to other fuels, this product reduces greenhouse gas emissions by 50 to 90% (Neste).

As can be seen from the analysis of the above values, enterprises with different cultures focus on various principles as they formulate their business strategies. Increasingly often, however, noticing the irreversible changes taking place in the natural environment of our planet, they become more sensitive

to social and climate problems, and thus they prioritise management that, more or less, takes into account sustainable development.

Sustainable HRM

Currently, HRM must remain up-to-date with the business demand directed more and more towards pro-environmental activities. Therefore, companies often employ professionals from the environment protection industry to support the development of the company's strategy in the area of sustainable development. This process, according to Cohen et al. (2010) appears to be irreversible due to:

- progressively strict environmental regulations, which are increasingly frequently and widely implemented in many countries (such as reducing plastic consumption in the European Union) and
- corporations as well as smaller companies demanding that their suppliers provide environmental data as a condition for winning contracts (for example, Microsoft requires its suppliers to provide detailed sustainability reports).

Sustainable development in the field of human resource management, however, goes beyond employing specialists in environmental protection. Stankeviciute and Savaneviciene (2018) have mentioned, that for the organization to survive, it is necessary to treat staff in such a way that provides current and future employees with:

a) the will to work for a given company,
b) the skills needed to perform their duties in a proper manner for a given business, and
c) the opportunity to perform work while maintaining health and work–life balance.

That is why Sustainable HRM focuses on demonstrating integrity towards employees, ensuring a decent work environment, providing good conditions for development and on taking care of employees' physical and psychological well-being. Sustainable HRM is primarily intended to provide businesses with stable access to qualified resources. It promotes increasing employee employability and developing their personal responsibility and a harmonious work–life balance. This approach is beneficial to both parties, both for employees and employers, because satisfaction from meeting individual needs contributes to maintaining the competitiveness of companies. It should be borne in mind that the crucial condition for the implementation of sustainable development by the entire enterprise is the integration of Human Resources Management at the strategic planning stage (Lopez-Cabrales, Valle-Cabrera, 2019). Piwowar-Sulej (2016) states, that in this way sustainable HRM is associated with the concept of Strategic Human Resource Management.

The distinctive features of the Sustainable HRM concept are presented in the literature (Zaugg, Blum, Thom, 2001; Cohe□, Taylor, Muller-Came□, 2010; Eh□ert et al., 2016). First of all, attention is paid to the future. Taking into account the long-term consequences of decisions and actions becomes a priority. The future availability of staff and their needs should be taken into account, while eliminating the approach which prioritizes short-term employment. Ehnert suggests integrating the future with the present – today's managerial decisions should have a positive impact on the future. The recruitment of the right staff is all the more important. The choice of employees should focus on people who will contribute to the long-term development of the company, but who also support it in times of change or economic crisis (Harry, 2014).

Because the human being is at the heart of sustainable development, it is not surprising that caring for employees is another distinguishing feature of the concept of Sustainable HRM. Companies should ensure that a healthy and productive workforce is maintained. Ybema, van Vuuren and van Dam (2017) state, that to this end, attention should be paid to health and safety conditions at work, workload, and work–life balance. As part of Sustainable HRM, employers can introduce pro-environmental programs by subsidizing commuting by public transport or by bicycle, as well as paying for time spent volunteering in non-profit organizations aimed at protecting the environment.

Increasing employability is of particular importance for young people and the disabled. This is because progressive automation and the application of artificial intelligence reduce the demand for their work. Companies that implement Sustainable HRM understand local labor market needs and ethical principles that should ensure job security. Ensuring valuable positions and equally dividing labor in society have gained importance. Creating new jobs on the local market can even become a reason for

establishing a company. This was the case with Sonnentor, the Austrian manufacturer of tea and herbs. Its organizational culture is based on human dignity, cooperation, solidarity, democracy, transparency, and environmentally-friendly sustainable development. With such ethical values as a foundation, it is not surprising that the company is particularly eager to employ employees who have been unemployed for a long time, and many more disabled people than is required by law (Aust, Matthews and Muller-Camen, 2019).

A characteristic feature of Sustainable HRM is also, unsurprisingly, care for the environment. Young people, who are increasingly more aware of environmental issues and environmentally-friendly, force businesses to comply with sustainable development requirements. In some cases, employer branding activities focused on highlighting the environmental responsibility of an organization are carried out in the fight for young talent. Attracting candidates who value the sustainable development of an organization is easier because they are more willing to apply; at the same time, the likelihood that they will want to stay in the company increases in the long run. For some candidates, pro-environmental values may even be more important than earnings or other benefits. Cohen et al. (2010) mentioned it is why some companies promote environmental protection even at the recruitment stage to intentionally draw attention to their values. One example is the outdoor clothing manufacturer, Patagonia, which asks its candidates to be environmentally responsible when preparing application materials.

On the one hand, employers have also begun to reward employees for activities conducive to e□viro□me□tal protectio□; o□ the other ha□d, they themselves undertake such activities as energy saving, printing documents only in justified cases, transferring processes to cloud computing or recycling waste. Conversely, as Savitz and Weber (2013) state, companies that do not care about the environment, or which have a negative impact on the planet because of the nature of their industry, will have more and more problems finding valuable employees. While the level of interest for the environment increases, employees want to be with organizations that are the solution to the problem and not the cause of it

Profitability has always been at the heart of any business. A balanced approach does not negate this i□dispe□sable eleme□t of every e□terprise; however, it is suggested that employees could be included in the distribution of profit, e.g. by paying out performance-based bonuses or by receiving shares in the company.

Employee participation is also an important aspect. It creates conditions for a fruitful social dialogue between the employer, employee, and – possibly – trade unions. Thanks to their participation in the life of the company and decision-making processes, employees begin to be treated as subjects and not as objects. Open, two-way communication is an integral part of Sustainable HRM (Stankeviciute, Savaneviciene, 2018). Unlike limited, patriarchal management models, democratic decision making positively affects the employee's sense of value, dignity, and willingness to share information. A special case here may be a company that does not have a management level, such as one of the largest tomato processing entities, The Morning Star Company. It has a system in which each employee negotiates his scope of responsibility with his own team and makes commitments voluntarily (Aust, Matthews, Muller-Camen, 2019).

In light of this theory, the development of employee competences means that one should focus not only on the currently needed skills, but rather on such sets of competences that the employee will need in the future. This entails treating employees as the most important resource in the organization, while investing in them, according to Becker (2011), is the best possible investment. Many companies - such as Mondi Polska, which specializes in personnel consulting - believe that if resources allow it, it is more important for a company to invest in continuous training and education of staff than in infrastructure or equipment. In the long run, both the employee and the employer gain: the former increases his/her competence, in addition to realising personal ambitions, and the latter achieves success and profit by maintaining competent employees. At the same time, a company offering extensive training and continuous employee development is able to attract the best talent. In this way it sends a clear signal that it is only interested in long-term cooperation, because investing in employees who would be expected to leave the organization soon would be irrational.

The concept of Sustainable HRM places great emphasis on flexibility. It gains particular importance of a time when companies have to respond to adverse changes in their environment. As Carvalho and

Cabral-Cardoso (2008) state, having employees with broad qualifications who are able to adapt and are mobile within the company structure is particularly important. Thanks to such staff, organizations also minimize costs, because – on an as-needed basis – they can involve more or fewer resources for handling key tasks relying only on internal employees. Flexibility also means meeting the needs and expectations of employees. Flexible working hours, work in the home office system, extra days off, and extended holidays are appreciated.

The last two distinctive features of a personnel strategy that takes into account sustainable development are cooperation between employees and equality - justice. The company should internally be one team. Thanks to cooperation in the form of exchange of information and best practices, trust and respect, the quality of work and productivity are increased. Hong and Kim (2019) mentioned, this is particularly important in the case of enterprises with many branches, including foreign ones, and operating in highly competitive markets. At the same time, it should be borne in mind that the principles, rights, and responsibilities should be exactly the same for all employees in the organization (Stankeviciute, Savaneviciene, 2018).

Equality and justice are part of companies' increasingly frequent participation in the fight for human rights. An interesting example is the manufacturer of outdoor and sports clothing, Patagonia, which employs over 2,000 people. The company has developed many HR-related tools to ensure that suppliers implement human rights practices. For example, the rules of conduct for all suppliers say that they may not use human trafficking or modern slavery in recruitment. In order to check compliance with the recommendations, Patagonia checks how its suppliers' employees were recruited, what type of employment contracts were signed, how they are remunerated and whether passports were not taken from them (Aust, Matthews, Muller-Camen, 2019).

The literature also presents the so-called Holistic Model of Sustainable HRM, which is based on four perspectives, enumerated by Mazur (2017):

1. the sociological approach – connecting an employee, employer, and society through such activities as health protection or a pro-family approach,
2. the psychological approach – focusing on employees and their needs, especially their self-development, work–life balance, and autonomy,
3. the strategic perspective – drawing attention to the impact of a balanced approach on traditional HRM (recruitment, selection, rotation, and incentive systems), and
4. the environmental perspective (Green HRM) – focusing on the environmental aspects of the organization's operation, suggesting a pro-environmental approach in employer branding.

An example is Corporate Knights – a magazine published in Canada, describing itself as the "voice of pure capitalism", i.e. focused only on companies that respect a balanced approach to development. Corporate Knights is the first printed magazine in the world to be a "Certified B Corporation", which means it meets stringent standards of social and environmental responsibility and transparency. Interestingly, 100% renewable energy is used to operate their website.

Every year, during the Economic Summit in Davos, the magazine issues the Most Sustainable Corporations in the Word – Global 100 report. It takes into account such factors as productivity, waste management, water use, the fight against poverty, decent working conditions, the use of renewable raw materials, employee turnover, equality, and activities contributing to environmental protection. The winner of the 2019 ranking was the Danish company Chr. Hansen Holding A/S. (Corporate Knights, 2019). The mission of this organization is to develop natural solutions for the food, pharmaceutical, and agricultural industries. Is a supplier of bacterial cultures, probiotics, enzymes, and natural colorants. The company's strategy is Sustainable Development. The company's culture is based on the interaction of the following principles:

- We work to improve the world.
- We operate autonomously.
- We rely on ourselves.
- We deliver results.

The company's mission, strategy, and values fit into the idea of sustainable development. The organization try to improve our environment, simultaneously providing more and more value to investors from year to year, achieving a profit of 340 million EUR in the recent period (Chr. Hansen).

Summing up the factors distinguishing Sustainable HRM, it should be stated that the implementation of this concept definitely contributes to the development of human and social capital within the organization and, in the long run, it positively affects the competitiveness of the company. Wirtenberg et al. (2007) conclude, implementing this idea helps create a more productive and committed team that ultimately contributes to the success of the organization. The company may potentially improve its reputation, productivity, and ability to acquire the best talent from the job market. Moreover, it reduces employee turnover and increases employee involvement while contributing to cost savings or access to capital (Cohen et al. 2010).

MBV vs. Sustainable HRM

There is no doubt that MBV and Sustainable HRM intertwine. As early as 2006, Porter and Kramer noticed that in order to release another wave of innovation and growth, organizations must redefine capitalism through a model of "shared values" that would take into account the social and environmental challenges the society is facing (Porter, Kramer, 2006).

Table 1 summarizes the most important features of both concepts. The following comparison criteria were adopted: idea, time frame, care for the environment, stakeholders, stable access to a qualified workforce, ensuring harmonious work–life balance, promoting personal responsibility, increasing employability, caring for employees, employee sharing in profit, employee participation, employee development, work flexibility, teamwork, equality and justice, and care for the company's image on the job market. For the purposes of the analysis, the theory of both concepts presented in the literature and information from their practical application were used.

Table 1: Comparison of MBV and Sustainable HRM concepts

Criterium	MBV	Sustainable HRM
Idea	basing the management process on values	basing the management process on achieving financial, social, and ecological goals while controlling side effects
Time frame	long-term, but rather limited to a given generation	long-term, covering current and future generations
Care for the environment	potentially one of the values	obligatory
Stakeholders	includes customers, employees, owners, and other significant groups such as suppliers and competitors	broader stakeholder approach covering virtually all inhabitants of the Earth
Permanent access to a qualified work force	yes	yes, one of the basic assumptions
Ensuring a harmonious work–life balance	yes, gaining importance	obligatory
Promoting personal responsibility	yes, gaining importance	obligatory
Increasing employability	not really	yes, much broader social perspective
Care for employees	yes, gaining importance	obligatory
Employee sharing in profit	extremely rare	more frequently
Employee participation	yes, starting from the formulation of shared values	yes
Employee development	definitely yes	definitely yes
Work flexibility	yes, gaining importance	obligatory
Teamwork	definitely yes	definitely yes
Equality and justice	definitely yes	definitely yes
Care for the company's image on the job market	definitely yes	definitely yes

Source: own study

As the analysis of the above table shows, the distinguishing characteristic of Sustainable HRM is, above all, a broader approach to stakeholders. While in MBV we have four groups of stakeholders (employees, customers, owners, and other important ones, such as suppliers or competitors), Sustainable HRM actually affects all of humanity. Therefore, when creating and implementing a strategy, organizations consider the widest possible impact of the effects of their activities.

The second important element that is taken into account in the case of a pro-environmental strategy is the long-term time frame. It focuses on how our present-day actions will affect the lives of future generations, and not just the current generation. This is also reflected in the multi-generational positive impact of actions on the financial results of businesses.

Other elements can be found in both MBV and Sustainable HRM, though with varying degrees of intensity. And, as shown in many examples, caring for the environment can be one of the rules followed by compa□ies; i□the case of a sustainable development strategy, however, this is an obligatory element. The situation is similar with ensuring work–life balance, promoting personal responsibility, attention to employees and their participation in decision-making, or work flexibility. None of these aspects

appear only in one of the analysed management strategies, a fact which only confirms how similar they are to each other.

Conclusions

Increasingly, values are becoming an indispensable tool used in management strategies. The concept of Management by Values has already reached maturity. The relatively younger idea of sustainable development, due to changes occurring on the job market and in nature, is developing extremely rapidly both in the scientific literature and in practice. Organizations are increasingly more and more aware that they □eed to develop sustai□able busi□ess models; by taki□g actio□today, they will □ot □egatively impact the opportunities of future generations.

Therefore, one may be tempted to say that Sustainable HRM is MBV focused on specific values, taking into account future and placing particular emphasis on the environment and related environmental interests of all of humanity. Therefore, Sustainable HRM is not intended to contribute to the total transformation of HR departments, but rather to direct their activities by making values related to sustainable development an indispensable element of the company's personnel policy. As the author showed in this article, sustainable development is one of the values that, by gaining importance, can add a new dimension and impetus to the further development of the concept of Management by Values. Against this background, the fate of the MBV concept comes into question, and the question whether or when Sustainable HRM will replace MBV arises. Research on which values are preferred by people on the job market would undoubtedly help in answering this question. As long as employees are not convinced of the need to implement the idea of sustainability, it is impossible to effectively implement the concept of Sustainable HRM.

Economic and Non-Economic Determinants of The Return of Polish Labour Migrants (The Example of Lower Silesia)

Justyna ROKITOWSKA-MALCHER

Wrocław University Of Economics And Business, Wroclaw, Poland,
Justyna.Rokitowska-Malcher@Ue.Wroc.Pl

Abstract

The Purpose of The Article Is to Identify the Determinants Of Return And To Establish The Role Of Economic Factors Among Them. The Article Consists of the Theoretical Part, Which Uses The Critical Analysis Of The Scientific Literature On Return Migration And The Practical Part, Which Presents The Results Of Surveys Conducted Among Return Migrants In The Lower Silesian Voivodeship. The Main Results of The Conducted Research Showed That Among Emigrants, Decisive For Return Were The Non-Economic Factors, With A Clear Predominance Of Longing For The Family Left In Poland. Economic Considerations, Such As: Achieving the Intended Economic Goal, Decreasing The Subjective Assessment Of The Profitability Of Work Performed Abroad, Finding Work In Poland Or Losing Work Performed Abroad Were Of Less Importance. The Conducted Analysis Is A Preliminary Examination. Although the Information Collected In The Course Of The Research Is Not Representative And Cannot Be Extrapolated To The Entire Group Of Polish Emigrants, In Relation To The Deficiencies Of Polish Migration Statistics, Based Solely On Residence Data, They Allow The Analysis Of The Return Migration Process And Factors Determining Arrivals To Poland From A New Perspective. The Obtained Results Complementary Knowledge In The Area Of Determinants Of Remigration.

Keywords: Return Migration, International Migration, Remigration, Economic Factors Of Migration

Introduction

The Growing Phenomenon Of Population Mobility And The Consequences Associated With It Are Some Of The Most Important Challenges For The Whole World[1].

There Is A Number Of Conditions And Factors That Have Added A New Dimension To Migration Processes In The Modern World, Thus Affecting Their Scale. As Proven By Theories (Ravenstein 1889, Harris And Tadaro 1970, De Haas 2007, Doeringer And Piore 1971, Bohning 1995) And Current Research Carried Out, The Main Factors Of Mobility Are Variations In Diversity, Especially In Pay, In Different Places Around The World. The Disparities Are Particularly Intensified Between Developing Countries (LDC) And Developed Countries (MDC); Intensified In The North-South Divide. In Addition To Income And Social Disparities, An Additional Factor Of Increased Migration Has Become The Strong Demographic Pressure In Ldcs, Caused By A Relatively Larger Birth Rate And Shorter Average Life Expectancy, And Thus Domination Of Young People On The Market, Especially Those Who Are Willing To Change Their Current Place Of Residence (Okólski 2018).

An Equally Important Reason For Increasing People's Mobility Is: The Synergy Of Globalisation With The Flows Of People And Capital Existing Across National Borders; Easy And Cheap Access To Information, As Well As Transport Development. These Factors Not Only Enabled Gathering Of Messages And Comparing Living Conditions, Especially Pay, As Well As Legal And Social Conditions In Various Places Around The Globe, But Also Fast And Relatively Inexpensive Movement Between Areas Of The World (Castles And Miller 2011).

In Polish Conditions, The Intensification Of Poles' External Mobility Is Additionally Influenced By, In Addition To The Above, Other Factors. First Of All, It Is The Country's Accession To The European

Union In 2004 And The Gradual Opening Of Foreign Labour Markets (In 2004: Great Britain, Ireland And Sweden, As Well As New Member Countries; In 2006: Spain, Portugal, Greece, Finland, Iceland And Italy; In 2007: The Netherlands And Luxembourg; In 2008: France; In 2009: Belgium, Denmark And Norway, And In 2011: Germany, Austria And Switzerland). The Free Movement Of Polish Employees Within The European Economic Area Was Synchronised With The Entry Of The Baby Boom Generation In The Labour Market (In The Years 1975-1985, 700,000 People A Year Were Born[2] (Statistics Poland)). The Growing Shortage Of Jobs And, At The Same Time, The Possibility Of Travelling Abroad, Was The Reason For The Increase In The Scale Of Migration. Currently, It Is Estimated That There Are 2.5 Million Residents Outside Poland (This Is The Number Corresponding To The Number Of Births In Poland In The Last Six Years) (Statistics Poland).

The Situation On The Labour Market Caused By Structural And Spatial Mismatch Also Has A Special Impact On The Outgoing Movements From Poland. The General Availability Of Education At Universities Has A Significant Impact On This State. Higher Education, Which Used To Be A Rarity, And Thus Made People Stand Out On The Labour Market, Is Almost A Norm Nowadays. There Are Significant Differences Between The Jobs Offered And The Competences Of Those Who Want And Can Work. As A Result, Difficulties In Finding A Job Increasingly Apply To Educated And Young People. Almost Every Fifth Person Under The Age Of 30 Declares Problems With Finding A Job, While In Higher Age Groups The Difficulty Of Finding Employment Is Reduced By Half. Therefore, Young People, More Often Than In Previous Years, In Search Of Better Living Conditions, Decide To Migrate To A Large Urban Agglomeration Or Abroad.

All This Resulted In A Very Large Increase In Departures, But There Was Also A Large Scale Of Returns, Intensified Especially After The Global Economic Crisis In 2008. The National Census Conducted In 2011 Showed That About 730 Thousand People In Poland Had At Least One Year's Stay Abroad In Their Biography (About 330,000 In The Years 2002-2011). Based On An Earlier Census Of 2002, It Was Found That Between 1989 And 2002, 85,500 People Returned To Poland Permanently. In Turn, According To LFS Data, The Scale Of Return Migration Is Estimated At 580,000 From 2004 To 2008. Almost Half Of These People Returned To Poland In 2007 Alone (Kaczmarczyk Et Al., 2016), Which Corresponds To Two Thirds Of The Number Of Births In Poland During This Period.

Remigration, Although Smaller In Recent Years, Than In 2007, Is Therefore An Important Phenomenon, Whose Economic Effects And Conditions Are Important For The Polish Economy And Its Development Prospects. They Are Of Particular Importance In The Face Of Progressive Depopulation, Intensified Primarily In Smaller Regional Centres. Young People, Who Do Not See Development Prospects In A Polish Province, Leave Regions Characterised By Slower Development Dynamics. Among These People, According To Research, Women Dominate[3] (Jończy 2010a). The Potential For Migration Is Also One Of The Basic Resources That Should Be Considered, Not Only In The Context Of Demographic Load Indicators (In 2008, There Were 41 People In Retirement Age For 100 People Of Post-Working Age. In 2060, According To Official Forecasts, There Will Be 91 People (Team For Analyses And Thematic Studies 2011)), But Also Growing Gaps In The Labour Market, Temporarily Filled With Immigration From Ukraine (Forecasts Show That In 2030, Around 16 Million People Will Work Out Of 20 Million Employees Needed; There Will Be A Shortage Of Both Highly Qualified And Basic Employees (Team For Analyses And Thematic Studies 2016)).

In The Above Context, It Is Important To Gather Information About The Return Determinants Of Those From Abroad. Therefore, The Purpose Of The Study Was To Determine The Role Of Economic Factors Among The Motives For Returning To Poland. The Following Research Question Was Adopted: What Is The Role Of Economic Factors In Remigration Decisions? Because Return Migration And Its Determinants Are A Relatively Poorly Studied Area, This Text Is An Attempt To Provide Knowledge On Possible Ways To Stimulate Return Flows Of Migrants. In Addition, Due To The Difficulty Of Reaching People Who Have Returned To Their Country Of Origin, Most Of The Existing Research Covering The Subject Of Remigration Was Based On Statistical Data; Hence The Originality Of The Empirical Research Presented In The Text Consists In Using The Survey Method To Analyse Return Determinants.

The Structure Of The Text Is As Follows. The First Part Presents Selected Migration Theories. A Synthetic Review Of Contemporary Return Migration To Poland Was Then Carried Out. The Rest Of

The Article Presents The Results Of Empirical Research On The Motives For Returning To The Country.

Theoretical Grounds

There Is No Broad Theoretical Framework In The Literature On The Subject To Analyse Return Migration. Understanding The Size And Dynamics Of Returns To Countries Of Origin Is Possible Thanks To General Theories Of Migration, Which Also Include The Aspect Of Return Migration.

The First Is The Neoclassical Approach, In Which, In The Absence Of A Reduction In The Pay Gap Between The Place Of Origin And The Host, Remigration Should Only Occur If The Migrant's Aspirations For Higher Net Wages Have Not Been Met. The Reason For Not Meeting Expectations May Be The Presence Of Unemployment In The Country Of Migration, Lower Wages Than Expected Or Higher Psychological Costs Of Moving (Constant And Massey 2002; Dumon And Spilgovel 2008). In This Sense, Return Is Seen As A Failure, The Effect Of Not Achieving The Expected Benefits In The Country Of Emigration (De Haas Et Al., 2014). It Should Be Noted Here, That In The Neoclassical Theory, Return Migration Only Applies To People Who Left For Work And Their Experience And Skills Were Not Rewarded As Expected. At The Same Time, As Research Shows, Highly Qualified Migrants Will Be Less Willing To Return From Countries Where There Are Smaller Pay Disparities (Grabowska-Lusińska 2013). What's More, Returns Are Characterised By Negative Selectivity Regarding Success In Terms Of The Expected Amount Of Pay, Employment, As Well As Professional Achievements Gained In The Country Of Migration (Constant And Massey 2002).

The New Economic Theory Of Migration (NELM) Presents A Different View On Return Migration. According To The Assumptions Of This Model, Unlike In The Neoclassical Approach, Return Migration Is Treated As A Success And Is An Inseparable Element Of Emigration. Remigration Is The Result Of A Household Strategy And Is The Logical Consequence Of Successfully Achieving All Migration Goals (Cassarino 2004). According To King, Savings Brought From Abroad, Which Always Accompany Returns, Can Be Used As An Investment (King 2012). The New Economic Theory Of Migration Assumes A Negative Selection Of Return Migration In Terms Of Work Effort/Time (Constant And Massey 2002).

Another Possible Perspective For Analysing Return Migration Is The Structural Approach Proposed In The 1970s And 1980s. It Combines The Features Of Sociological, Geographical, Social And Anthropological Sciences. According To This Theory, The Migration Process And The Return Decision Can Only Be Considered In A More Global Approach, By Identifying All Elements That May Affect Emigration And Return, Namely: The Technological Environment, Economic, As Well As Social (Piche 2013). Thus, In The Structural Approach, Return Is Not Only Analysed In The Context Of Individual Migration Experiences, But Also In Relation To Social And Institutional Factors In The Country Of Origin. Notably, Structuralists Attribute A Greater Impact On The Innovation Potential And Reintegration Of Returnees To Values And Traditions In A Familiar Place, Than To Financial And Human Capital Of Returnees (Cassarino 2004).

In The History Of Polish Return Migrations, Researchers, In Relation To Historical Events Relevant To The Polish Nation, Distinguish Three Phases Of Returns, Namely: Traditional Remigration That Took Place Up To World War II, Migration That Took Place During World War II And Directly After Its Ending, And In The Period Up To 1989, As Well As Returns After 1989. Empirical Research Conducted In This Area Proves That, Depending On The Contextual Framework, The Mechanisms Of Remigration Have Changed, And Thus The Factors Determining The Decision To Return Have Changed And Are Still Changing (Slany And Ślusarczyk 2010).

Polish Studies Of Contemporary Return Migration Are Divided Into Two Phases: Studies On The Transitional Period: 1989-2004 (Iglicka 2002; Jończy 2010b; Heffner And Sołdra-Gwiżdż 1997; Fihel And Górny 2013) And Studies On Post-Accession Remigration, I.E. After 2004. According To The Researchers, In The First Of The Periods Discussed Above, Primarily Entire Families Returned, Among Them Well-Educated People Who Know Languages (Fihel Et Al. 2008). Changing Economic Conditions, Primarily The Freedom To Leave Poland And Return To The Country, Caused The Dominance Of Short-Term Circular Migrations At That Time, Including Incomplete Migration (Jaźwińska And Okólski 2001; Jończy 2010b).

After Poland's Accession To The EU, The Mobility Of The Polish Population Became More Free. The Opening Of Borders, Access To Foreign Labour Markets And Globalisation Have Led To Significant Changes In The Intensity Of Migration And Return Migration. These Phenomena Have Become The Subject Of Not Only Lively Political And Public Debate, But Also An Increasingly Popular Direction Of Scientific Research (Especially Intensified After The Economic Crisis In 2008). Iglicka Made A Significant Contribution To The Study Of Return Migrations. The Author Found That, In The Case Of Three Quarters Of Respondents, A Return Was The Result Of The Adopted Migration Strategy (Iglicka 2010). Subsequent Studies Of This Period Were Focused On The Return Of Poles From Specific Countries, Including Great Britain, USA, Iceland. The Authors Made Arrangements Regarding Factors Determining The Return, Distinguishing, Among Others, Family, Professional And, Less Often, Educational Considerations; Indicating, For The Most Part, The Predominance Of Non-Economic Incentives. At The Same Time, The Market Situation In Poland And The Host Country Was Also Important When Making Decisions On Remigration (Małek 2012; White 2014; Budyta-Budzyńska 2017). In Addition To The Above, Regional Analyses Were Also Carried Out. Research Projects Of This Type Were Most Often Carried Out At The Request Of Voivodeship Labour Offices With Co-Financing Of The European Social Fund (CDS 2010).

Data and Methodology

Due To The Complexity Of Migration Processes And The Fact That They Are Of Interest To Many Scientific Disciplines, Both Researchers And State Institutions Are Facing Difficulties With A Clear Definition. There Are Many Different Definitions Of Return Migrations Available In The Literature, Both General And Clearly Targeted On The Nature Of The Author's Deliberations. In This Study, A Return Migrant (Interchangeably A Remigrant) Refers To A Person Who, After Staying At Least One Year Abroad, Decided To Return To Poland Permanently, And Whose Departure Was For Work Or Educational Purposes.

Using The Multiplied Snowball Method, The Study[4] Covered A Group Of 312 Residents Of The Lower Silesian Voivodeship. Participants Were Recruited In 26 Lower Silesian Poviats And 4 Cities With Poviat Rights (In 2019). An Anonymous Questionnaire Was Used To Collect Empirical Material, In Which Respondents Were Asked To Choose The Factors That Were Relevant When Deciding To Return To Poland And To Indicate The Deciding Factor. Guided By The Results Of The Pilot Study Respondents Were Offered The Most Frequently Appearing Answers; Among Which Were: *"Loss Of Work Performed Abroad, Earnings Abroad Are No Longer Satisfactory, Finding A Job In Poland, Starting A Business In Poland, Achieving The Intended Economic Goal, Starting A Family In Poland, Longing For Family Left In Poland, Illness/Death Of Someone In The Family, Family No Longer Needs Additional Income, Return Of Friends/Relatives With Whom I Stayed Abroad, Obtaining The Right To A Pension, Loss Of Social Benefits Obtained Abroad"*. The Respondents Were Also Allowed To Enter Other Reasons, For Answers Not Provided In The Multiple-Choice Questions. By Comparing The Obtained Empirical Data And Metric Features Of The Respondents, Arrangements Were Made For The Selectivity Of Return Migration Relative To The Determinants That Cause It.

It Should Be Emphasised, That Although The Information Collected In The Course Of The Research Is Not Representative And Cannot Be Extrapolated To The Entire Group Of Polish Remigrants, In Relation To The Deficiencies Of Polish Migration Statistics, Based Solely On Residence Data, They Allow The Analysis Of The Return Migration Process And Factors Determining Arrivals To Poland From A New Perspective.

Table 1 Presents The Characteristics Of Respondents, Including: Gender, Age, Marital Status, Number Of Children, As Well As The Year Of Return.

Table 1: The Research Group Broken Down Into Metric Features: Gender, Age, Marital Status, Number Of Children And Year Of Return

Particulars	*Participation %*
Gender	
Women	49.04%
Men	50.96%
Age	
18-25	6.73%
26-35	40.38%
36-45	25.00%
46-55	6.73%
56-65	5.77%
>65	1.92%
Marital Status	
Single	26.92%
Married	67.31%
Divorced	5.77%
Number Of Children	
0	17.31%
1	27.88%
2	29.81%
3 And More	8.65%
Year Of Return	
2004-2007	4.81%
2008-2010	11.54%
2011-2014	12.50%
2015-2020	70.19%

In The Group Of Respondents, The Share Of Women And Men Is Almost The Same (49% To 51%). Breakdown By Age Shows An Over-Representation Of Persons Under 35 Years Of Age. On The One Hand, This Reflects The Age Structure Of Contemporary Polish Emigrants, Among Which People In The 20-40 Years Age Range Dominate (Jończy 2010a), Which, At The Same Time, Indicates That Young People Are More Likely To Permanently Change Their Current Residence, Having No Professional And Family Obligations. Incidentally, 60% Of People Aged 26-35 Are Women, Which Is Associated With The High Feminisation Of Post-Accession Migration Outflows From Poland.

Notable Is, That In The Sample Over 70% Of Respondents Returned After 2015; Considering The Age Of The Respondents, It Confirms That The Analysed Phenomenon Of Remigration Is, To A Large Extent, A Derivative Of Post-Accession Migrations That Took Place After Poland's Accession To The European Union.

Results

The Factors That Prompted Migrants To Return To Poland Were Associated With An Economic Or Non-Economic Motive (Figure 1). In This Question, The Respondents Could Indicate More Than One Answer.

Fig. 1: Factors For Returning From Abroad

Nearly Two Thirds Of The Respondents Pointed To Their Longing For Family As One Of The Determinants Of Remigration, The Next Important Factors When Deciding To Change Their Current Place Of Residence Were: Achieving The Intended Economic Goal (28.85%), A Decrease In The Subjective Assessment Of The Value Of Earnings Obtained Abroad (23.08%) And Finding A Job In Poland (21.15%). A Clear Advantage Of "Longing" Over Other Answers Loses Importance When The Motives For Returning To Poland Are Divided According To Their Economic Or Non-Economic Nature (Table 2). It Turns Out, That The Share Of Answers In Each Group Is Similar (94% To 94%), Which Makes It Possible To Believe That Economic Factors Are As Important When Making A Decision On Remigration, As Those With Non-Economic Grounds.

Table 2: Economic And Non-Economic Factors

Economic Factors	*% Of Indications*	*Non-Economic Factors*	*% Of Indications*
Achieving The Intended Economic Goal	28.85%	Longing For Family Left In Poland	57.69%
Earnings Abroad Are No Longer Satisfying	23.08%	Starting A Family In Poland	18.27%
Finding A Job In Poland	21.15%	Illness/Death Of Someone In The Family	9.62%
Starting A Business In Poland	10.58%	Return Of Friends/Relatives From Abroad	5.77%
Loss Of Work Performed Abroad	7.69%	Family No Longer Needs Additional Income	2.88%
Obtaining The Right To A Pension	2.88%		
Sum	**94.23%**	**Sum**	**94.23%**

More Accurate Data Is Provided By The Comparison Of Remigration Factors Declared By Respondents With Their Metric Features, Such As Gender And Age. The Year Of Return From Abroad Was Also Taken Into Account In The Analysis (Table 3).

The Comparison Of Factors Determining A Return To Poland, Broken Down By Gender, Provides Significant Conclusions. Almost Every Economic Response Is Dominated By Men. The Situation Is Reversed Among Women, Where Non-Economic Factors Were More Often Indicated. This May Not Only Be Evidence Of Polish Cultural Conditions, In Which Women More Often Stay At Home To Look After The Family, But Also Reflect The Relatively Difficult Situation Of Young Women On The Lower Silesian Labour Market. Despite The Decrease In The Unemployment Rate In The Lower Silesian Voivodeship From 13.1% In 2013 To 4.3% In 2019, The Percentage Of Women In The Age Groups Up To 44 Years Old Without Work Is Much Higher Than That Of Men; In 2017: In The Age Group 18-24 – Women Constituted 12.1% [Men: 7.3%], 25-34 Years Old – Women: 32.7% [Men: 16.7%], 35-44% – Women 26.4% [Men: 20.9%] (Lower Silesian Labour Office 2018).

Several Clear Tendencies In The Formation Of Motives For Making A Decision To Return To Poland Can Be Seen By Analysing The Answers Given With The Age Of The Respondents. First, As One Of The Reasons For Making A Decision On Remigration, Occurring Only Among Young People (Up To 35 Years Of Age), Was The Return Of Friends/Relatives From Abroad. In Older Age Categories This Reason Was Not Indicated. Secondly, The Number Of "Starting A Family In Poland" Responses Was More Frequent, The Lower The Age Of The Respondents. Regardless Of The Age Of The Person Asked, The Most Frequently Motivated Return Motive Was Longing For The Family Left In Poland.

The Variety Of Indications Is Also Noticeable In The Division Of Respondents In Respect To Their Year Of Return From Abroad. Among Those, Who Migrated In The Years 2011-2014, The Most

Frequently Occurring Factor That Had An Impact On The Decision To Return Was The Achievement Of The Intended Economic Goal (53.9%), Which Can Be Interpreted As An Advantage In The Study Group In Those Years Of Conservative Returns. In Addition, In The Case Of The Direct Post-Crisis Period (2008-2010), There Is A Noticeable Decrease By 100%, In Relation To 2004-2007, Of The Significance In The Motives For The Migration Of Responses: Starting A Business In Poland – This May Be Directly Related To Macroeconomic Changes In 2007-2008, Caused By Global Economic Crisis.

In-Depth Data Is Provided By The Analysis Of The Answer To The Question About The Decisive Factor In Returning (Figure 2).

Fig. 2: The Decisive Factor In Returning

Longing For The Family Left In Poland Was The Decisive Motive For The Migration Of Every Third Respondent. Less Important Economic Motives Were Those, Such As: Achieving The Intended Economic Goal (13.46%), A Decrease In Satisfaction With Foreign Earnings (12.50%) Or Finding A Job In Poland (4.81%). These Results Correspond With Earlier Studies Of Contemporary Polish Migrations And Return Migrations, In Which Researchers Have Proved The Advantage Of Economic Incentives Over Those Non-Economic To Leave Their Current Place Of Residence, And That Non-Economic Factors Are More Important (Than In Emigration) When Making A Decision About Return Migration (Jończy 2010; Iglicka 2010; Grabowska-Lusińska And Okólski 2012).

Non-Economic Factors Become Even More Important When The Answers Are Divided Into Two Groups; Economic And Non-Economic Factors (Table 4). Exactly Half Of The Respondents Indicated A Non-Economic Incentive As The Decisive Motive For Return. Economic Factors Were The Most Important Factor When Making A Decision On Remigration For 36.54% Of Respondents. Other People Questioned Did Not Answer This Question Or Pointed To Other Factors.

Table 4: Economic And Non-Economic Factors – A Decisive Factor In Returning

Economic Factors	*% Of Indications*	*Non-Economic Factors*	*% Of Indications*
Achieving The Intended Economic Goal	13.46%	Longing For Family Left In Poland	26.92%
Earnings Abroad Are No Longer Satisfying	12.50%	Starting A Family In Poland	12.50%
Finding A Job In Poland	4.81%	Illness/Death Of Someone In The Family	3.85%
Loss Of Work Performed Abroad	3.85%	Return Of Friends/Relatives From Abroad	5.77%
Starting A Business In Poland	1.92%	Family No Longer Needs Additional Income	0.96%
Sum	**36.54%**	**Sum**	**50.00%**

Interesting Data Is Provided By The Analysis Of The Distribution Of Answers About The Decisive Return Factor With The Year Of Return (Table 5). Namely, The Indication Of Starting A Business In Poland Only Appears In Relation To The Latest Remigration That Took Place After 2015. The Migration Of Almost Every Fifth Respondent Returning In The Period Immediately After The Global Economic Crisis, I.E. After 2008, Was A Return To Disappointment In The Host Country (Loss Of Work Performed Abroad). This Type Of Return Was Less Important In The Case Of People Who Returned In 2011-2014 (7.69%), And Almost Never Occurred Among Remigrants After 2015 (1.39%). A Similar Tendency Is Noticeable When The Subjective Assessment Of The Profitability Of Work Performed Abroad Decreases.

Table 5: Decisive Factor For Return From Abroad, Broken Down By Respondents' Particulars

		Return Factors								
	Family Does Not Need Additional Income	*Starting A Business In Poland*	*Loss Of Work Performed Abroad*	*Illness Or Death Of Someone In The Family*	*Finding A Job In Poland*	*Earnings Abroad Are No Longer Satisfying*	*Starting A Family In Poland*	*Achieving The Intended Economic Goal*	*Longing For Family Left In Poland*	*Other*
Gender										
Women	1.96%	0.00%	1.96%	5.88%	3.92%	7.84%	3.92%	13.73%	13.73%	**25.49%**
Men	0.00%	3.77%	5.66%	1.89%	5.66%	16.98%	13.21%	13.21%	**26.42%**	9.43%
Age										
18-25	0.00%	0.00%	0.00%	0.00%	**28.57%**	**28.57%**	0.00%	0.00%	**28.57%**	0.00%
26-35	2.38%	2.38%	0.00%	2.38%	2.38%	9.52%	14.29%	16.67%	**26.19%**	23.81%
36-45	7.69%	3.85%	3.85%	7.69%	3.85%	11.54%	11.54%	11.57%	**23.08%**	15.38%
46-55	0.00%	0.00%	0.00%	14.29%	0.00%	**28.57%**	14.29%	14.29%	**28.57%**	0.00%
56-65	16.67%	0.00%	0.00%	0.00%	0.00%	0.00%	16.67%	16.67%	**50.00%**	16.67%
>65	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%	0.00%	**100.0%**	0.00%
Year Of Return										
2004-2007	0.00%	0.00%	0.00%	0.00%	0.00%	20.00%	**40.00%**	20.00%	20.00%	0.00%
2008-2010	0.00%	0.00%	18.18%	0.00%	0.00%	18.18%	9.09%	9.09%	**45.45%**	0.00%
2011-2014	0.00%	0.00%	7.69%	0.00%	7.69%	15.38%	7.69%	23.08%	7.69%	**30.77%**
2015-2020	1.39%	2.78%	1.39%	5.56%	5.56%	11.11%	12.50%	11.11%	**29.17%**	19.44%

Diversity In The Most Important Motive Prompting Remigration Is Visible In The Breakdown By Gender Of The Respondents. Male Remigration Was More Often Associated With The Economic Motive, Including With The Start-Up Of A Business In Poland, The Loss Of Work Performed So Far, Finding A Job In Poland Or A Decrease In The Subjective Assessment Of The Profitability Of Work Abroad. For Both Women And Men, The Share Of People Whose Return Was Part Of The Adopted Migration Strategy (Achieving The Intended Goal) Was Comparable (Around 13.5%).

Return Because Of Finding Work In Poland Was The Position Of The Youngest People (18-25 Years). However, Irrespective Of The Age Of The Respondents, Longing For Family Was The Factor That Most Determined The Return To Poland.

Conclusions

Although the Analysis Contained in This Text Is Not Representative, It Allows Drawing Important Conclusions on The Motives for Return. As Demonstrated by Empirical Research Conducted Among Remigrants, Decisive for Return Were the Non-Economic Factors, With A Clear Predominance of Longing for The Family Left in Poland. Economic Considerations, Such As: Achieving the Intended Economic Goal, Decreasing the Subjective Assessment of The Profitability of Work Performed Abroad, Finding Work in Poland Or Losing Work Performed Abroad Were of Less Importance.

Nevertheless, Despite the Fact That Non-Economic Reasons Are Extremely Important in The Remigration Decisions of The Examined Group (97.11% Of Responses), In A Summary of The General Factors Determining the Decision to Return, According to Their Nature, It Turns Out That Economic Motives Are Equally Important (91.35%). This Conclusion Is Extremely Important in Relation to The Problems Poland Is Currently Facing, Including Depopulation, An Ageing Society (With A Simultaneous Decline in The Fertility Rate) And an Increasing Supply Gap in The Labour Market. While It Is Not Possible to Influence the Occurrence of Family Factors Inclining the Return of Migrants, An Attempt to Encourage Remigration to The Country of Origin by Stimulating Economic Pull Factors Seems Possible. First of All, Through Adjustment Measures on The Labour Market, Consisting in Offering Employers Jobs Adequate to The Requirements of Employees, Both in Terms of Pay and Types of Available Vacancies. A Number of Measures to Achieve A Positive Migration Balance Can Also Be Taken by The State, By Stimulating Remigration. The Most Important of Them Include Appropriate Fiscal Policy, As Well As Simplification of Procedures and Reduction of Costs of Starting Business Activity and Employment in Poland.

Acknowledgment

The Project Is Financed By The Ministry Of Science And Higher Education In Poland Under The Programme "Regional Initiative Of Excellence" 2019 - 2022 Project Number 015/RID/2018/19 Total Funding Amount 10 721 040,00 PLN

[1] Currently, about 3.5% of the world's population lives outside their area of birth (Trends in International Migrant Stock 2019).

[2] For comparison: in 1985-2003, an average of 352,000 children a year were born in Poland, which is half of the baby boom summit 1975-1985 (Statistics Poland).

[3] The feminisation of migration, that has been noticeable in recent years, is caused by the lack of jobs for women in local labour markets

[4] The study was carried out as part of work on the doctoral dissertation.

The Situation on The Local Labour Market as A Determinant of Internal and External Youth Migration – Example of The Lower Silesian Voivodeship

Alicja DOLIŃSKA

Wrocław University of Economics and Business, Wrocław, Poland
alicja.dolinska@ue.wroc.pl

Abstract

The problem of spatial displacement in the population has an increasingly stronger stigma in the areas it concerns. Today, a particularly important phenomenon in the scope of migration processes is the increased mobility of young people from peripheral areas towards the centres of regions and abroad. The relatively large loss of youth from peripheral areas is a significant problem, because the standard of living in local communities will depend on the activity and quality of actions taken by young people. The aim of the study is to determine the impact of the situation on local labour markets on the level of internal and external migration of young people in the Lower Silesian Voivodeship. The results of the completed research indicate that only about ¼ of respondents prospectively intend to remain in areas with high unemployment rates.

Keywords: Migration, Youth, Labour Market, Unemployment

Introduction

Mobility of the population is constantly increasing and the reasons for this phenomenon should be seen in at least several factors, which include: increasing socio-economic disproportions between countries, as well as within them, especially in the centre-periphery model, manifesting, among others, in a disproportionately faster development of economic activity and the labour market in large regional areas; increasing access to information on living and working conditions in various places, which facilitates the comparison of many potential destinations and makes the decision on migration and choosing its direction easier and easier (Zięba 2008); transport accessibility – development of the transport network, bus and flight connections, which means that the movement of people, both inside the country and abroad, is faster, easier and cheaper (Zając 2012).

The phenomenon of the increase in population mobility also applies to Poland, where it has been further compounded by Poland's accession to the European Union and the opening of Western labour markets (Jończy 2010; Kaczmarczyk 2012; Kaczmarczyk, Okólski 2008), as well as the growing aspirations of young people, which result from almost unlimited and free access to studies, but they cannot be satisfied through offers of local labour markets (Iglicka 2010).

The good economic situation of Poland and the related low unemployment rate (for Poland, the registered unemployment rate according to Statistics Poland at the end of December 2019 was 5.2%[1], while according to Eurostat 3.3%) on the whole indicates a very good situation on the Polish labour market. While, according to Eurostat data, the average unemployment rate for the member states of the European Union at the end of December 2019 was 6.2%, with the highest level being maintained in Greece (16.2%), Spain (13.7%) and Italy (9.8%), while the lowest in the Czech Republic (2.0%), Germany (3.2%) and the Netherlands (3.2%)[2]. Considering such statistics, it can be assumed, that young people in Poland should not have a problem finding a job. However, it should be noted, that such a low unemployment rate is largely influenced by the good situation on the labour market of the agglomerations of the five most economically attractive Polish cities, i.e. Kraków, Poznań, the Tricity, Warsaw and Wrocław, and also (though to a lesser extent) other regional centres. On the other hand, looking deep into individual regions, strong differences can be noticed, especially areas located at a

considerable distance from urban agglomerations are characterised by high levels of unemployment. An additional problem is the structural mismatch in the labour market, the surplus of highly qualified people and the shortage of low-qualified employees.

While data on the labour market can be obtained in a relatively simple way, the availability of migration data is much more limited, and its quality can be easily questioned. In the case of some areas of Poland, characterised by intensive mobility, the scope of actual final migration turn out to be many times larger than those officially registered in the form of de-registrations (Jończy 2010, 2017; Śleszyński 2013), hence public statistics are not a sufficient basis for this type of analysis.

This situation allows to formulate the hypothesis that one of the main factors determining population movements is the situation on the local labour market. Difficulties in finding a job consistent with one's education (more and more often at a higher level), as well as work for which attractive salaries can be obtained, or even any job (especially in the peripheral areas of Poland), means that (especially) young people often make decisions about migration.

In this study, it was decided to verify this hypothesis by analysing the migration preferences of people from low and high unemployment areas. High school graduates were chosen as the research group, because they are the most mobile. It was decided to examine the intentions and not real migrations, because these young people can still be found in their areas of origin and, at the same time, they have plans for the near future quite well defined. In order for the results of the conducted studies to be compared, only general education high school graduates were subjected to the study (in this way it was intended to avoid distorting the results by the answers provided by respondents from profiled schools, who are studying in a direction according to work available/unavailable in their area of residence). In addition, the universality of general secondary schools causes that, in each of the areas selected for research, there will be a large enough group of students (in Poland, persons graduating from general secondary schools constitute almost half of the representatives of individual age groups) that it will be possible to conduct research in the most typologically homogeneous group representing the most common form of upper secondary education.

The Lower Silesian Voivodeship was selected as the research area because it is characterised by significant disparities in the level of socio-economic development between its centre (Wrocław agglomeration) and the majority of the remaining area. The strategic geographical location of the voivodeship also seems to be important, enabling easy access to attractive European cities, which is conducive to migration decisions. Guided by the main purpose of the research, it was decided to carry them out on contrast samples, which consists of taking samples from groups differing from the point of view of a certain variable important for the research. To accurately illustrate the scale of the problem of "youth drain" and to determine to what extent the situation on local labour markets determines youth migration decisions, it was decided to compare two groups of poviats of the Lower Silesian Voivodeship. The unemployment rate in individual poviats of the Lower Silesian Voivodeship became the key criterion for the selection of the sample. As a result, based on the available statistical data, three poviats with the lowest unemployment rate were selected, i.e. the city of Wrocław (unemployment rate 2.2%), the city of Jelenia Góra (unemployment rate 3.3%) and Lubin poviat (unemployment rate 5.1%), and in contrast three of the highest values: Lwówek Śląski (unemployment rate 12.8%), Kłodzko (unemployment rate 12.2%) and Góra (unemployment rate 16.1%) poviats[3]. Based on the two groups of poviats created in this way, an analysis of the results of completed research will be conducted.

Literature Review

By entering the literature review related to the topic, it should be emphasised that research on migration is located on the border of many social sciences, among which sociology, economics and geography should be distinguished. Thus, they are considered to be extremely complex and having an interdisciplinary and multi-faceted dimension. For this reason, it is difficult to expect one comprehensive and fully satisfactory theory explaining the behaviour associated with the mobility of the population. Bearing in mind the subject of this study, the focus was therefore on the economic approach, which was founded by E. G. Ravenstein. Although in his scientific work he represented

geography, and in an article published in 1885 entitled "Rights of migration" presented all the important legal, social, cultural and political factors of human mobility, he concluded with the statement that "none of the migration streams (caused by these factors) can match the stream caused by the natural tendency among (most) people to improve their material situation" (Ravenstein 1889; Brzozowski, Kaczmarczyk 2018). Migration as a means to achieve spatial economic balance is also indicated by the classical theory of migration. Treating migrants as a factor balancing labour markets and assuming that every person intending to migrate aims to maximize their income, having full knowledge of achievable benefits, and all employees have the same qualifications and needs, and at the same there are no barriers to migration (Castles, Miller 2011). Neoclassical theory also plays an important role in research into economic migration. Assuming that potential migrants have full knowledge about the level of earnings and chances to find employment in the target regions and that their migration decisions depend on this factor to the greatest extent possible (Castles, Miller 2011). This theory is based on pull and push factors, i.e. conditions in the place of residence (high unemployment, low earnings – push), which induce the population to move to places where the earnings are higher and the unemployment rate lower (pull) (Massey et al. 1993; Jończy 2010).

Also in the modern world, most of the migrations observed are economic, and living needs come to the fore. Among the reasons for the huge scale of migration, differences in the standard of living, difficulties in finding a job and a lack of prospects for the future are of particular importance. On decisions about migration, the desire to raise one's own standard of living resulting from perceiving one's own financial situation as relatively worse than other members of society is also significant (Kozielska 2014; Danilewicz 2006). Therefore, economic migrations are closely related to the search for a job that allows them to obtain the necessary resources to survive, and the desire to improve living conditions outside the country or region of origin (Makrowski 2008; Korczyńska 2003). And the economic situation of the country and the situation on the labour market often "shape" life strategies of the young generation (Hałaj, Stec 2007).

In the context of this work, the state of knowledge and research on youth migration undertaken as a result of the difficult situation on the local labour market should be indicated. This phenomenon has been affecting the countries of South-West Europe for a long time: Germany, Portugal, Southern Italy, Greece and Spain. In Italy and Spain, this process began in the second half of the last century, when the population left peripheral regions and moved to larger cities (Andrada 1981). Today, this phenomenon is compounded there by the high level of unemployment in local labour markets, as well as discrepancies between the needs of the labour market and the directions of education of young people (Selva et al. 2016), the consequence of which is a large-scale brain drain (Santos 2013). Eastern Germany also has a strong drain of young educated people from peripheral areas, the research conducted there showed that the main factor pushing them out of their current residence are worse career prospects and a significant economic backwardness (Lang et al. 2015). Youth migrations in the periphery-centre system also apply to Central and Eastern Europe, including Lithuania, where population concentration is observed in the Vilnius agglomeration, while peripheral areas, both rural and smaller cities, are depopulating (Ubarevičienė et al. 2016), as well as the Czech Republic, where there is a strong concentration of population in the capital of the country and simultaneous depopulation of the periphery (Vaishar, Pavlů 2018), or peripheral areas and smaller cities of Romania, where the phenomenon of declining job offers and the strong ageing of the population are common (Bănică et al. 2017). Migration of young people from the periphery and into the direction of several major cities is also observed in Russia, where the swelling process of large centres takes place at the expense of rural areas and small and medium-sized cities (Mkrtchuan 2014).

Also in Poland, migrations undertaken by young people are a common phenomenon that is of interest to many researchers. Research in this area is carried out at the Department of Economics and Development Research at Wrocław University of Economics (Jończy et al. 2013; Jończy, Grabowska (ed.) 2013; Dolińska et al. 2020a; Dolińska et al. 2020b). Relevant to this publication, the conclusions of this research boil down to the findings that the main component of current migration movements, which has a decisive impact on depopulation taking place in the spatial system of the country, are youth migrations undertaken after graduating from upper secondary schools, especially people who are pursuing readily available and massively undertaken studies, and after their completion no longer

returning to their areas of origin, which in consequence leads to a weakening of the intellectual potential and social activity of drained areas. The phenomenon of migration of Polish youth is also dealt with by the research centre "Youth Research Center" at the Warsaw University of Social Sciences and Humanities, where one of the research topics undertaken is to determine the role of the place of residence in taking up your first job in Poland or abroad. The negative effects of long-term post-accession migration of Polish youth are pointed out by K. Iglicka, who points to the phenomenon of a potentially dangerous "migration trap loop" when young Poles returning to the country are disappointed with this return and decide to go abroad again (Iglicka 2010). Other research carried out in Poland addresses the issue of youth migration from peripheral areas (villages and small towns) in the direction of European economic centres, where they have the chance to fulfil their professional ambitions. This is a series of studies aimed at verifying the hypothesis about the positive aspect of this type of migration, which may be a better allocation of labour resources, imprisoned there until now (Kaczmarczyk, Okólski 2008; Grabowska-Lusińska, Okólski 2009). In the course of these studies, it was also found that many of these young migrants can return to Poland, rather not to the place from which they left, but to major economic centres where there are better employment prospects.

In the literature on the subject, one can also find publications based on the results of research, the purpose of which was to approximate the image and specificity of migration of young people in the Lower Silesian Voivodeship (Grabowska, Jończy (ed.) 2013, Rokitowska 2017), where, among others, issues of the impact on the level of local development on the scale and directions of migration of secondary school and university graduates are discussed. As well as a study aimed at presenting the nature of the metropolis and its impact on smaller, neighbouring urban centres, with particular emphasis on the phenomenon of youth migration (Kulczyk-Dynowska 2012).

Referring to publications that focus on the phenomenon of youth migration as a key feature of modern society, one can indicate a lot of research that results in the conclusion that migration is attractive to the young generation and is a way to build a life and career path, that has both positive, as well as negative aspects. However, it should also be noted that the research carried out so far has not explicitly analysed the migration intentions of young people from one territorial area and, at the same time, strongly differentiated in terms of the unemployment rate in terms of smaller regional units, which the author of this study attempted.

Research Methodology

A quantitative data acquisition method was used to collect empirical material. The questionnaire was conducted in the form of an auditorium survey, in the period prior to issuing grades and with good attendance and, at the same time, when the vast majority of secondary school graduates already had precise plans for the next stage in life.

To ensure the representativeness of the surveyed secondary school students for the entire population in individual cities, the survey was conducted in such a way, that in smaller centres, where the potential number of respondents did not exceed 200 people, it was decided to examine all of them, while in larger centres quota sampling was used. Due to this method of selecting the respondents, the interpretation of the results was based on participation and not the number of respondents declaring individual answers. The survey was conducted in a total of 17 secondary schools and included 815 graduates.

The questionnaire was developed by a group of people dealing with youth migration issues, including the author of this study. The questionnaire used consisted of 21 questions and an extensive metric data sheet. The questions included in it concerned, among others:

- Intentions of secondary school graduates for the near future,
- Educational plans,
- Professional plans,
- Intentions regarding the place of future residence,
- Causes and directions of migration,

- Opportunities on the domestic labour market,
- Salary requirements in the domestic and foreign labour market,
- The number and structure of households,
- Scale and directions of international migration of household members.

This study presents only a fragment of research results concerning only two of over 20 analysed issues, these are the respondents' answers concerning:

- their intended future residence,
- the main reasons for young people definitively leaving their native land in the opinion of the surveyed youth.

Results

The results of the research were presented in the two groups of poviats discussed earlier, the first of which consists of three poviats with the lowest unemployment rates in the Lower Silesian Voivodeship (poviat of the city of Wrocław, Jelenia Góra and Lubin), while the second includes three poviats with the highest unemployment rates (poviat of Góra, Kłodzko and Lwówek Śląski).

As a result of the research, the intentions of the youth regarding their future place of residence after completion of studies and starting work were determined (Figure 1).

Fig. 1: Declared permanent residence of respondents after completion of studies and starting work

Nearly half (45.5%) of the surveyed youth from poviats with low unemployment rate and only slightly more than a quarter (26.6%) of those surveyed from poviats with high unemployment rate intend to remain in their current place of residence permanently. Almost half (47.8%) of young people from poviats with high levels of unemployment declare that, after completing education and taking up a permanent job, they will live in the city outside their current place of residence, but in the Lower Silesian Voivodeship. In turn, among respondents from poviats characterised by the best situation in the voivodeship on local labour markets, 29.9% of respondents gave such an answer. The unemployment rate on the local labour market does not significantly differentiate the answers of respondents intending to live permanently outside of Poland.

The answers of respondents thus forming provide important information on the scale of potential permanent migration of young people and allow to believe that the situation on the local labour market is significant in migration decisions. Young people who currently live in areas with high unemployment rates are more likely to undertake definitive migrations compared to young people living in poviats with low unemployment rates. It is also worth noting the high proportions of people intending to go abroad in both examined groups. Higher preferences regarding foreign emigration in an area with lower unemployment can be explained in a sense by greater aspirations, but also by limited incentives for internal migration. On the other hand, greater mobility between the area of residence and Wrocław of young people from areas of higher unemployment can be explained in such a way, that such mobility (in their opinion) already gives significant progress.

In order to determine which Lower Silesian city they are definitely going to migrate to, those who chose this option were asked to indicate this city (Figure 2).

Fig. 2: Declared cities of permanent youth migration within the Lower Silesian Voivodeship

Intentional permanent migrations to "another city in the Lower Silesian Voivodeship" are highly concentrated. Respondents' answers indicate that the direction of permanent migration within the Lower Silesian Voivodeship will be Wrocław, in the case of the vast majority of respondents, which was indicated by 86.4% of respondents from poviats with low unemployment and 87.9% of respondents from poviats with high unemployment rates. It is worth emphasising, at this point, that among 86.4% of respondents from the group of countries with a low unemployment rate there are only people from the poviats of Jelenia Góra and Lubin, since the respondents from the poviat of Wrocław already live there, thus the relative intensity of this migration is even bigger.

The huge scale of intentional permanent migrations within the Lower Silesian Voivodeship, from the perspective of sustainable spatial development, is worrying, because the significant level of youth drain from the areas of the Lower Silesian Voivodeship surveyed, especially in the direction of Wrocław, will lead to depopulation of these areas and their peripheralization. And because the quality of life in local communities depends, to a large extent, on the involvement of young people, this relatively large loss of young people will undoubtedly deepen the problem of developing the areas where they come from.

An important point of the research was to determine the motives of young people leaving their homeland for good (Figure 3).

Fig. 3: Main reasons for young people definitively leaving their homeland in the opinion of the surveyed youth

Regardless of the current situation behind the labour market of the areas inhabited by the respondents, the largest percentage of respondents indicated that the most important factor prompting young people to migrate is *the desire to improve the financial situation and/or living conditions of their own or their family*. This motive, as the most important determinant of migration, was indicated by almost half of the respondents from both surveyed groups. The *lack of work in the place of residence*, as the most important factor causing youth migration, was more often indicated by respondents living in poviats with high levels of unemployment (30.3%) than respondents from poviats where the unemployment rate is the lowest in the voivodeship (21.3%). However, this variant was indicated relatively often in both examined groups, so it can be concluded that the lack of work in the place of residence is generally conducive to undertaking migration. The determinant of migration in the form of *the desire for professional and personal development* was more often indicated by people living in poviats with a low unemployment rate (21.0%) than youth from poviats with a difficult situation on the local labour market (12.6%). Other non-economic motives of migration were indicated much less frequently by the surveyed youth, and with similar frequency.

Conclusions

The presented research results (despite the fact that, for methodological reasons, they are based on the declarations of the surveyed youth, not the accomplished states) allow to draw some important conclusions regarding the impact of the situation on local labour markets on youth migration. They show that definitive migrations to a much greater extent concern young people living in areas with a high unemployment rate, where only about a quarter of the respondents intend to live in the future. There is no doubt, therefore, that depopulation related to emigration will be a serious development

problem in their areas of origin, as it will lead to the loss of a huge portion of human capital. Youth coming from areas with high unemployment – much more often than those coming from areas with low unemployment rates – plan to live in the city outside their current place of residence in the future, however in the Lower Silesian Voivodeship, most often in Wrocław, thus showing a high tendency for definitive internal migrations. On the other hand, almost half of young people from areas where the unemployment rate is relatively low intend to stay in their current place of residence (it should be noted that a significant proportion of these respondents live in Wrocław). However, also in this group of respondents, almost one thirds declare their intention to permanently live outside their place of residence, but in cities of the Lower Silesian Voivodeship, indicating the goal of definitive migration as Wrocław in almost 90%.

As a result of the research, the main factors determining why young people leave their places of origin were also identified. At this point, it should be emphasised that, in relation to young people living in areas characterised by a difficult situation on local labour markets, push factors from the places of current residence are more active, especially the lack of employment opportunities. On the other hand, young people from poviats with a relatively low unemployment rate are more strongly affected by factors attracting to new places of residence, manifesting themselves in, for example, opportunities for personal or professional development. However, this does not change the fact that, among the reasons given for migration, in both examined groups, the strictly economic ones dominate, manifested in the desire to get a good job, and thus improve the material situation.

The results of the conducted research prove that the situation on the local labour market effectively determines the process of migration of young people from underdeveloped areas to large regional centres and abroad. On the other hand, the return effect of such a large scale of young people's displacement is the depopulation of Lower Silesian areas with high levels of unemployment, which certainly contributes to the slowdown in development and continuous reduction of the quality of life in the surveyed poviats.

Abstract

International integration and capital concentration made assigning a homogenous national origin to capital groups a very difficult task. The inflow of foreign capital in the form of FDI to Poland became an integral element of the Polish economic reforms commenced in 1989. Three decades of constant presence of foreign investors and methodical increase in employed capital allowed for reducing the shortage in resources (capital), technology and knowledge, but also revealed an entire spectrum of international enterprises' behaviours characteristic for cultures of their home countries. In practice, two key criteria for a capital group's national identity can be identified: the country from which the parent company is derived and the top management's national composition.

There is the question of whether the capital group's national identity affects the implementation of the strategy of minimising the income tax burdening the group's companies. The study was conducted on the group of the biggest 30 companies registered in Poland, belonging to international capital groups. The study demonstrated that:

- effective income tax minimisation in companies belonging to international capital groups is not dependent on their national identity identified by the country of origin,
- similarly, there is a related lack of homogeneity in groups of companies identified by their activity's industry.

Keywords: international capital group, corporate income tax, tax minimisation, national identity.

Introduction

International integration and capital concentration – especially realised by foreign direct investment (FDI) as well as mergers and takeovers – makes assigning a homogenous national origin to capital groups a very difficult, albeit not impossible task. The ambiguity of this relation causes presentation of two opposite positions in literature, both of which are constantly questioned.

The first view contradicts the existence of a national identity in capital groups and points out that the globalisation process features a total loss of the national character of international capital groups, understood as the group's relationship with a specific home country. This conclusion was made mainly based on the capital ownership structure. The growth of international capital markets and legal regulations in the scope of company law favoured and still favour production internationalisation in relation to the simultaneous process of capital transfer in exchange for shares or equity.

The processes concerning takeovers and acquiring new financing sources favour the internationalisation of the share (equity) ownership structure of entities belonging to a capital group.

An individual investor or a group's parent company can currently acquire equity or investment funds virtually from all over the world and can establish the registered seat or place of business anywhere around the world. The location and registration of the parent company's (managing the group) registered seat does not necessarily have to be synonymous with the capital's country of origin or the place of business, or place of affiliate companies' registration. This type of dispersal constitutes one of the main aspects of globalisation, related to the activity of international groups and mobility of capital across borders. Simultaneously, such behaviour of entities constitutes the essence of internationalisation of capital groups forming a structure of affiliated capital companies, the registered seats of which are located in many different countries. In addition, the geographical range of activity conducted by many modern international groups simultaneously in many countries brings them closer to a global dimension.

Companies forming international groups can change their nationality without major constraints by changing the registered seat's country in search of various preferences, e.g. a milder tax regime. Moreover, regardless of the registered seat's location, entities can move production around the world, e.g. in order to optimise the product's manufacturing costs, reduce the distance from the selling market and to maintain effective co-operative relationships between the group's units. Furthermore, wanting to acquire capital in the form of foreign direct investment, countries entice investors with favourable tax solutions for them to conduct their activity within their territory. Liberal legal solutions makes it easy to re-locate the registered seats of parent, subsidiary and affiliated companies from their home countries to any other country. There are companies with seats registered in tax enclaves in the Cayman Islands, Cyprus, Malta, the Channel Islands, which are actually conducting their operating activity in other countries or even other continents, i.e. Africa, China, India, Eastern Europe countries.

Research aim & Literature Review

When searching for theoretical bases to formulate a view on the lack of capital groups' national identity, it is worth recalling the definition established by the OECD and concurrent with the UNCTAD definition. According to these economic organisations, an international capital group (*Transnational Corporation, TNC*) is a structure that encompasses entities located within at least two or more countries, wherein:

- the entities are related in terms of ownership (through shares or stocks) in such a manner that one entity is able to substantially affect the activity of other entities, including especially deciding on the share in knowledge, resources and liability,
- the group functions within a decision-making system allowing for exercising common strategies implemented by the decision-making centre that controls foreign assets.

It is possible to observe that the same condition featured in the phrase "entities located within at least two or more countries" brings a certain belief about a transnational, stateless and entirely independent nature assigned to a capital group as a global economy entity (Zorska A., 2007). A group constituting a single economic entity (in economic terms) is not bound to any country and functions separately from home countries in which the registered seats of particular group companies are located. In other words, an international capital group is a group of entities with various nationalities and locations linked with common ownership bonds and subject to a common management strategy (Geldner M., 1986).

The peculiar statelessness of the biggest international capital groups also lies in their activity's scale and in the economic power manifested in revenues comparable to the gross domestic product (GDP) of a medium-sized developed country. This relation brings forth a certain simplification – since international capital groups are so strong that no country can affect them, it means they are transnational. The ideas of Khan, Server and Galbreith also contributed to specifying capital groups as transnational by treating them as "quasi states" posing a global political and economic threat due to the strength of the capital base. Without a doubt, the phenomenon's increasing scale is possible thanks to the high mobility of capital which became entirely internationalised.

Additionally, the stateless perception of the capital groups is also reinforced by the convergence of stereotypical economic behaviours which have no national features (Ohmae, 1995). Regardless of the registered seat's location, all companies are trying to achieve an analogous overarching objective of maximising profit and increasing the enterprise's value and strive to achieve this objective in a similar way.

The opposite view states that only capital lacks identity, but capital groups still bear the mark of nationality, which makes specifying them as American, French, Germany, Japanese or other groups justified (Doremus P.N., Keller W.W., Pauly L.W., Reich S.,1999). There is the question of the criteria used to identify the nationality of international capital groups acting transnationally.

The criterion of the group companies' location – due to the virtually unlimited possibilities of registering anywhere around the world – is currently purely technical and is not necessarily related to the capital's country of origin or the place of activity. The country of origin effect (Drelich-Skulska B., 2007), based on the fact that the products of specific indrusties became established in collective consciousness as products specific to a given country, can be equally misleading. For example, cars are recognised as German products, while cosmetics – as French products. In consequence, the country of origin effect evokes an association related to the capital group's national identity. It is not an entirely justified conclusion, because product brands are subject to re-sale and the associations formed in collective consciousness can be used for marketing purposes. For example, the Wedel brand (chocolates), which is recognised as a Polish brand, does not actually represent Polish capital, but since 1991 was successively the property of an American group (Pepsi co.), British group (Cadbury), once more an American group (Kraft Foods) and currently a Japanese group (Lotte).

In practice, in order to unify the phenomenon, two key criteria for a capital group's national identity can be identified (Jarczewska-Romaniuk A., 2004):

- the country from which the parent company is derived (place of obtaining legal personality) and in which the control centre or headquarters is located,
- top management's national composition.

Their joint consideration enables avoiding the erroneous interpretation of identity as result of registered seat changes, re-location of the production place related, among others, to fiscal conditions or with acquiring a recognisable product brand.

The parent company's country of origin is mainly recognised as the headquarters' location, where all of the main decision-making, management and control functions are located. It is also obviously the centre in which the corporate governance is conducted over the management personnel, which makes key decisions related to the entire capital group's functioning and development. In the light of the previous considerations, it is possible to deny the existence of a relationship between the headquarters' location and capital's origin, however practice demonstrates that corporate governance is related to the initial capital's or basic capital's origin. This derives from the rights of the share control package owners or majority shareholders, because only investors with substantial share are table to conduct governance. On the contrary, dispersed ownership or minority shareholders are not able to participate in the corporate governance due to its dispersal and slim rights. Therefore, corporate governance (indirectly) links the main capital owners with the parent company's location. We come to a situation where the international capital group's national identity is identified not only through the parent company's location, but also through the identity or place of residence of the owners of the capital constituting the source of rights to govern the group.

This aspect is all the more relevant because the registration documents of the group's companies are public, published and available directly on government websites or via access to online applications redacted by commercial entities (economic information agencies). The registration data often allow for tracking the ownership path of capital in the group's hierarchy – down to the source of origin of the parent company's initial capital. The fact that international capital groups determine their national status themselves on websites created for marketing purposes is not insignificant. In addition, by

publishing information about mergers, takeovers and foreign direct investments, investors disclose the source of origin of the majority capital, thereby giving the capital group a specific national identity.

Insofar as national identity identification by the capital owner's home country can be deemed as questionable in terms of the previous deliberations, in practice this methodology is suffers the smallest error and is easiest to execute.

Another important issue in studying the problems related to the international capital groups' national identity is corporate governance conducted by the parent company. The governance covers all relations between the parent company and the subsidiaries, and can in principle be executed by using code control tools, i.e. by the action of supervisory councils and auditing committees (Mierzejewska W., 2018). However, of crucial importance are the non-code tools resulting from the dominance and dependency relation, which are executed by appointing the management, i.e. appointing the top management and the lower hierarchy by designating various level managers.

The adoption of the top management composition criterion to determine the capital group's national identity is justified in terms of the management theory (Morden T, 2016), because the leaders shape both the measurable and reasonable organisational components (structure, technologies) as well as symbols, ideologies and language (Murdoch A., 1999). Currently, the top management composition, more specifically its national origin can safely be a functional criterion for the national typology attributed to the capital group (Kobrin S.J., 1976). It is important to note that the UNCTAD data (tab. The world's top 100 non-financial MNEs, ranked by foreign assets, 2017) shows that there is a clear correlation between the parent company seat's country and the top management's country of origin.

An analysis of the personal composition of the top management in the biggest corporations points to a far reaching national homogeneity in their compositions, which is naturally accompanied by cultural homogeneity (Welge M.K., Holtbrűgge D., 2006). The share of employment of managers from the subsidiaries' host country decreases along with the increase in the companies' decision-making hierarchy level. The very low share of foreigners in the top managements is contrary to the relatively high share of foreign personnel in the general management composition, which confirms the thesis about the strict relation between the group companies' top management and the parent company's country of origin.

Despite the fact that managers are often perceived as a homogeneous vocational class (Ohmae K. 1995), the observance of management methods, especially of the used incentive systems, points to large differences directly related to the culture of the country of origin. In the case of internationalisation covering various countries, the differences often lead to clashes of cultures with fundamental differences in core values, such as in the case of the Islamic and Western worlds (Barber B. R., 1996). Similar cultural distinctions distinguish managers deriving from European and Asian environments, including Japanese, Korean, Chinese (Rymarczyk J., 2004).

Several determinants designating the business culture built by the companies' management boards are of key significance in this case (Hofstede G., Hofstede G.J., Minkov M., 2011; Hampden-Turner Ch., Trompenaars F., 2002):

- board members' individualism (e.g. the Netherlands) *versus* collective action (e.g. Germany, South Korea),
- quick profit on investment (e.g. USA) *versus* long-term strategies (e.g. Germany, Japan),
- innovative strategies' acceptance *versus* traditionalism,
- varied approach to human resources management,
- large decision-making freedom of subsidiaries' managements *versus* strong subordination to the parent company.

The top management, acting as leaders, also affect organisational culture which strongly differentiates entities in an international scale. In the case of a specific organisation, its set of values and standards of conduct accompanied by certain rituals and aimed at integrating employees around key objectives and performing important integrating functions is usually easily discernible (Aniszewska G., 2004). The cultural values represented by the board members and medium-level managers is the permanent basis of national identity which extends throughout the entire organisation, giving it specificity, but also affects behaviours and competitiveness in times of global rivalry (Hampden-Turner Ch., Trompenaars F., 2002).

The language used by the managers can also be an element that enables specifying the capital group's nationality, because the popularity of the English language in business does not mean that groups acting internationally adopt it automatically as a means of communications. In crisis situations, people with a homogenous national identity act like a compact, psychologically marked group by communicating in their native language (Nigh D., 1997). The choice of language used in managerial relations can be a manifestation of actual authority in the organisation and can be imposed in the communications with the management boards of subsidiaries located in various countries (Welge M. K., Holtbrügge D., 2006)

Aside from the specified cultural implications that shape the capital groups' national identity, it also affects the relations of groups with their home countries. States see the economic interest and political benefits related to the internalisation and expansion of capital, whereas the symbiosis between states and their economic entities operating transnationally is bi-directional.

From the home country's point of view, strong capital groups become a nexus for the economy-stimulating policy in their countries – both in the conditions of growth and crisis, causing them being treated as a national treasure (e.g. the German Volkswagen group). Furthermore, the economic power of international capital groups favours lobbyist action in the political arena of not only their home countries, but also globally, starting with the European Union.

The strong relations between groups and their home countries also translate into numerous benefits for native capital owners, whereas the nature of the offered aid can have many forms. In many countries, especially deriving from collective cultures – such as Japan or Germany – the state protects group companies against undesired or hostile takeovers through legal regulations and rigours on financial instruments. States often use legal and tax solutions that not only support the foreign expansion of native entities, but also ensure a certain protection in case of its failure caused by factors attributable to the third (host) country. Typical tax preferences include favourable settlement of foreign losses in the home country or tax exemption for profits transferred to the home country. In extreme cases, the support is particularly large in terms of financing, e.g. prior to its ultimate downfall, the non-existent Daewoo group (car production) incurred unlimited debts because all liabilities were guaranteed and repaid by the home country government (South Korea).

This way, the legal mechanisms implemented by the home country can substantially improve the group's competitive position in comparison to groups from other countries. It is worth noting that capital groups without a doubt identify their national identity when they address claims concerning systemic aid to the home country government.

The presented argumentation speaks for the conclusion that despite the high spatial mobility of international capital groups, related to the transfer of capital and resources as well as their economic position in the global economy, we do not experience a unification of groups and their detachment from home countries.

At the current globalisation stage, treating the phenomenon of national identity of international capital groups solely as an issue of record does not reflect the actual state of affairs. Identity derives from permanent functional features in the activity of entities, the lineage of which reaches cultural distinctions deeply rooted in the consciousness of people making the decisions on internationalisation and conducting international activity. The diversification of the business running cultures,

organisational cultures and languages used by top management personnel constitutes an additional component of capital groups' national identity. Practice confirms that viewing international capital groups through the lens of their national identity is not an anachronous phenomenon generated on the basis of habits or stereotypes, but derives from an organisation's permanent functional features. The national identity of the analysed entities ultimately translates into benefits for both them and their countries of origin.

As specified above, substantial functional differences between international capital groups – depending on the country of origin – concern corporate governance. The relations formed between owners and managers, institutional structures authorising governance as well as the nature of expectations towards the management have their important national reference (Doremus P.N., Keller W.W., Pauly L.W., Reich S., 1999). Therefore, it should be expected that meeting owner expectations in exercising management will carry the stigma of national distinctiveness. There is the question of whether the capital group's national identity recognised by the top management's national composition affects the implementation of the strategy of minimising the income tax burdening the group's companies. Such research issue can raise doubts concerning the cause and effect relationship, because it refers to two entirely different conceptual categories – to the capital group's national identity, which implies subjective functional associations and to the income tax, which is an objective financial category. However, despite the apparent lack of relationship, the juxtaposition of these two concepts has a deep logical justification.

The basis for this relation are the state tax regulations and the inclination of all economic entities – regardless of the organisation's size and complexity – to search for methods of minimising tax burdens.

Taxes are an objective category, but – in principle – only in the making of law understood as a system of detailed legal and tax regulations. However, in terms of law application, taxes are subject to numerous tax minimisation strategies. Omitting deliberations concerning the acceptability of tax strategies by the tax authorities of various countries, it is in principle possible to distinguish two groups of tax strategies:

- simple strategies based on the statutory right of choice, i.e. use of tax preference mechanisms dedicated to specific companies,
- complex strategies that require taking internal action in the capital group's scale, because they are intended to benefit not only a single company, but the entire group and require the engagement of at least two affiliated companies.

Regardless of the tax minimisation strategy's type and scope, its planning and implementation are tasks of not only the management of a single company belonging to the capital group, but of the entire group's top management. This is derived from several aspects of international capital groups' activity:

- firstly, each company belonging to the group maintains its legal and tax autonomy, which means that each is a separate tax payer and is subject to the tax jurisdiction of the country in which its registered seat is located,
- secondly, despite the legal and tax autonomy of particular companies, the capital group in essence constitutes a single organism in an economic sense, which is managed by a decision-making centre located in the parent company, which means that the tax minimisation strategies are complex as well as are planned and implemented with the participation of the group's top management.

Research Methodology and Study Results

The study was conducted on the group of the biggest 30 companies registered in Poland, belonging to international capital groups, in order to answer the question of what is the impact of national identity on the effective implementation of the income tax minimisation strategy. The study did not include financial companies (banks, investment funds, leasing companies, insurance firms) deemed as conducting a specific and incomparable operating activity. The subject of the study was especially to compare two values demonstrated by each studied company:

- corporate income tax due for 2018, deriving from the annual tax return (according to the tax law),
- total revenue disclosed in the annual financial statement (according to the balance sheet law).

In order to ensure the data's comparability, each case featured the calculation of the corporate income tax due on 1 million revenue disclosed in the annual financial statement (regardless of the adopted currency, the CIT/1 million relation remains the same).

This relations was deemed the most interesting, because the corporate income tax is a result-based tax, which directly lowers the profit on activity and its relation with the generated revenue is more readable than in the case of other taxes. Furthermore, the structure of the Polish income tax is dynamic (analogously for most tax jurisdictions, despite small differences between states) making each decision on revenues, costs, reliefs and deductions affecting the final tax amount. For this reason, this tax title burden is very susceptible to the applied tax strategies.

The tax relief data of the selected tax payers is public and their use does not infringe fiscal secrecy, because from 2012 the Polish public finances minister (currently the Minister of Finances) makes public (https://www.gov.pl/web/finanse/indywidualne-dane-podatnikow-cit) the individual tax payer data included in their annual corporate income tax reliefs (CIT-8. According to Article 27b of the Act of 15 February 1992 on the corporate income tax (Polish Journal of Laws; Dz. U. of 2019, item 865 with amendments), the publishing obligation applies to tax payers with taxable revenues achieved within a fiscal year of more than EUR 50 million. Individual tax payer data cover the tax payer's name, tax identification number (NIP) and the tax relief information, including: achieved revenues, incurred deductible expenses, achieved profit and incurred loss, tax base and due tax amount. According to the data, in 2018, the revenues criterion was met by a total of 2,687 companies.

The tax data was supplemented with the information included in annual financial statements which are published on the website administered by the Polish Ministry of Justice from 2018 (https://ekrs.ms.gov.pl/). The information presented there are public, generally available and its use does not infringe trade secret. The information from the financial statements was collected in several areas:

- National Court Register (KRS) registration number,
- predominant type of economic activity (industry),
- main brand,
- international capital group's home country,
- revenues disclosed in the profit and loss account, calculated jointly for the operating activity, other operating activity and financial activity.

The corporate income tax (CIT) amount was calculated per 1 million of revenues disclosed in the financial statement based on the acquired data.

Source: own elaboration based on data presented on public websites: https://www.gov.pl/web/finanse/indywidualne-dane-podatnikow-cit (administered by the Polish Minister of Finances), (https://ekrs.ms.gov.pl/ (administered by the Polish Ministry of Justice)

The results show that the studied companies effectively implement corporate income tax minimisation strategies, because for the biggest 30 companies belonging to capital groups deriving from various home countries, the tax amounted to a maximum of 3.36% of the revenues disclosed in the financial statement in 2018. In relation to PLN (polish currency) 1 million in revenues, this corresponds to amounts from PLN 0 to 33,639, i.e. for the specified 30 companies, the tax amounts to PLN 7,325 on average on revenues of PLN 1 million (identical relation in any other currency), which is objectively low amount.

Someone may ask whether the low tax is a result of tax strategies or whether it is due to the high level of costs in a given branch. Due to the fact that the tax amount is affected – aside from revenues – by costs which can vary for different types of activity, the specified relation for companies listed by industry was studied.

Table 2: List of 30 Polish joint stock companies with the highest revenues achieved in 2018, sorted by industry (amount in Polish currency – PLN)

Industry	Tax payer name	Country of origin	CIT amount per 1 million of revenues

Source: own elaboration based on data presented on public websites: https://www.gov.pl/web/finanse/indywidualne-dane-podatnikow-cit (administered by the Polish Minister of Finances), (https://ekrs.ms.gov.pl/ (administered by the Polish Ministry of Justice)

One would expect that the income tax amount (in relation to 1 million in revenue) will be similar for companies conducting activity in the same industry. The case is not so, however. For example, in the "telecommunications" industry with services with a relatively homogenous nature, the tax amount ranges from zero to PLN 33,639 (in relation to 1 million in revenues). This relation seems to support the hypothesis that companies with the same profile of activity exercise different tax strategies resulting in various fiscal effects of income tax minimisation.

Then, the companies were listed by the home country identified for the international capital group to which the companies belong. The assumption was that the groups' national diversity should be reflected in the diverse action of the top management, which in turn should be translated into various tax effects for companies grouped by national identity.

Source: own elaboration based on data presented on public websites: https://www.gov.pl/web/finanse/indywidualne-dane-podatnikow-cit (administered by the Polish Minister of Finances), (https://ekrs.ms.gov.pl/ (administered by the Polish Ministry of Justice)

The listed data shows that companies belonging to various capital groups, but with the same national identity, use tax strategies with varying degree of effectiveness.

Conclusions

The presented study shows that affiliation with the same home country does not translate into homogenous fiscal effects in terms of the use of tax strategies by different capital groups. There is also another conclusion – national identity does not contribute to distinguishing the given country of origin in terms of corporate income tax minimisation effects, because there are no clear differences between sets of companies belonging to groups deriving from various home countries, including companies representing Polish capital.

If that is the case, the reasons for the differences between the fiscal effects – achieved through implementing corporate income tax minimisation strategies – must be sought elsewhere. One of such reasons can be the Polish income tax structure and the Polish tax system's mechanisms available only

for some entities, e.g. tax exemption for companies conducting activity in a special economic zone. Another reason can be the given company's ability to achieve fiscal effects, more specifically it can be the given capital group's general fiscal strategy. It is also necessary to consider the abilities of external counselling entities engaged in exercising the group's tax strategy.

However, this does not change the fact that the due corporate income tax in companies in the presented study group is very low. Without a doubt, the co-authors of the impressive effects in terms of corporate income tax minimisation are the capital groups' top management personnel. This permits the conclusion that contrary to previous consideration the international capital groups' top management personnel takes analogous action for the purpose of tax minimisation. The nationality of the top management or the capital group is of little consequence. The primary determinant is the capital group's ability to achieve a fiscal effect and a tax system structure in countries with affiliated company seats that allows for tax minimisation within legal boundaries.

Abstract

This article is devoted to the analysis of job turnover influence on job performance. It is assumed that the reliability of IT solutions is one of the factors potentially influencing that relation. Empirical research is conducted to verify formulated hypotheses based on results obtained from 263 organizations from Poland to determine whether IT reliability is a moderator of the relation between job turnover and job performance. To verify the moderation effect – a regression analysis with a moderator was used. The results of the research display that IT reliability has a positive impact on job turnover and the job performance of employees. Moreover, IT reliability is a moderator for the relation between job turnover and job performance of employees and has a positive impact on this relation, which means that an increase in the rate of IT reliability reduces the negative impact of job turnover on job performance for employees.

Keywords: IT reliability, Job turnover, Job performance, Management

Introduction

At the turn of the last few decades, there have been changes in Human Resources Management (HRM), which has resulted in a change in approach to the employees in the organization (Kostera, 1994; Listwan, 2010). Until recently, the employees in an organization were treated only as a cost necessary to be covered by the employer (Kostera, 1994). Nowadays, the employees have become the organization's most valuable asset, determining its competitiveness (Kostera, 1994; Listwan, 2010). Therefore, all activities undertaken by the organization in the field of HRM should focus on the effective use of employees' potential (Pocztowski, 2007), because their knowledge, skills and features conducive to performing certain tasks (Bieńkowska and Brol, 2011, p.177) determines the performance of the whole organization.

However, these activities, may be disturbed by the recently observed increased turnover of employees (Adams et al., 2006, Purohit, 2016). Employees who leave the organization take with them all those competencies - knowledge, skills and qualities - that determine their job performance (Listwan, 2010; Ampomah and Cudjor, 2015). Moreover, staff turnover is also often contributes to reducing the morale of employees staying in the organization (Munck, 2001; Coomber and Barriball, 2007; Chambers and Honeycutt, 2009). However, as some research suggests that job turnover has also some positive influences - exchange of blood in the organization and the flow of young blood (Urbancová and Linhartová, 2011; Ampomah and Cudjor, 2015). Nowadays organizations that rely largely on employees knowledge and skills are the leading market players (Blackler, 1995; Bieńkowska and Ignacek-Kuźnicka, 2019). Hence, the job turnover is becoming a rather critical issue in HRM (Adams et al., 2006). Consequently, the main question for HRM professionals is: how to reduce job turnover or how to mitigate the negative impact of job turnover on job performance.

In the times of dynamic high-tech development and the already mentioned domination of knowledge-based organizations on the market, IT support becomes another aspect that determines the competitiveness (Davis, 1989; Tworek, 2019). It is obvious that the use of IT solutions by the organization supports its operations and thus, increases its performance, through its employees (DeLone & McLean, 1992; De Wet et al., 2016). IT solutions can be successfully used for various activities performed in the organization, they can support decision making in the organization, or they can collect, manage, store and share knowledge so important for the organization (Kompaso and Sridevi, 2010). Such IT solutions capabilities may reduce the negative impact of job turnover on job performance, as knowledge in the organization is maintained by them. Moreover, IT solutions increase the comfort of employees' work in the organization, increasing their job satisfaction, which can also effectively reduce turnover (Mitchell et al., 2000; Lambert & Hogan, 2009; Sweis, 2010). IT solutions are significant in the context of maintaining employees in the organization and moreover, their influence on job performance is already confirmed (Bieńkowska et al., 2020). Hence, this article will concern on the reliability of IT as the factor potentially influencing such relation. Considering that research gap, the article aims to examine whether IT reliability affects job turnover and job performance and most importantly, whether it moderates the relation between them.

Literature Review and Hypotheses Development

IT reliability in organization

The reliability of IT in organization is understood as measurable property of IT, useful for its control and management, identifying its quality level and pointing out potential problems (Zahedi, 1987) and it is directly linked to the efficiency of IT components, especially those critical to its proper operations. Therefore, it can be said that IT reliability in organization is a notion build by factors connected to 3 different IT theories. First one is DeLone and McLean success model (DeLone, McLean, 2003), second one is Lyytinen (1987) 4 types of IS failure and third one is TAM model (Davis, 1985). The final model of IT reliability in organization has been developed by Tworek (2019) and verified in various business contexts (Tworek, 2019). The reliability of IT in organization consists of 4 factors: reliability of information included in IT in organization, reliability of support services offered for IS in the organization and reliability of system itself, which also includes the usability of this system. Each factor is built by series of items, listed on Figure 1.

Fig. 1: Model of reliability of IS in organization ***Source: (Tworek, 2018a)***

The essence of Job turnover and its relation with Job performance

Job turnover is an increasingly frequent field of study of contemporary researchers and practitioners (Hom et al., 2017). There are many concepts related to job turnover that depend very often on the turnover model (see e.g. Mobley, 1977; Price and Mueller, 1975; Steers and Mowday, 1981; Allen and Griffeth, 2004). One of the first concepts was put forward by Porter and Steers (1973, p. 153), who focused on "turnover intention" and "intention to leave", which, according to researchers, is defined as "the next logical step after experienced dissatisfaction in the withdrawal process" (Aburumman et al., 2010). Fishbein and Ajzen (1975), who are explaining the factors of turnover, noted that the behavioral intention to leave an organization is a major antecedent of real leaving (Mobley et al., 1978; Coomber and Barriball, 2007).

The turnover intention (or an intention to leave/reside) is considered to be a consequence of the outcome of the various affective variables, and job satisfaction seems to be the most important one (Davis, 2006; Parry, 2008). Therefore, in the context of this article, the job turnover will be understood as an intention to leave an organization caused by job dissatisfaction. There is an ambiguous position of researchers regarding the impact of job turnover on job performance. On the one hand, job turnover brings young blood into the organization (Urbancová and Linhartová, 2011; Ampomah and Cudjor, 2015), on the other hand, employees leaving the organization take with them the knowledge and experience that is important in the context of shaping the organizational performance (Listwan, 2010; Ampomah and Cudjor, 2015) and reduce the morale of those employees who stay in the organization (Munck, 2001; Chambers and Honeycutt, 2009).

Job performance is also considered from various point of view in the literature (see e.g. M. Eysenck, 1998; R. Maathis and J. Jackson, 2000; G. Bohlander, S. Snell and A. Sherman, 2001). Employees' job performance theory is defined as "synonymous with behavior that is something people do and can observe". (Campbell et al., 1993, p.96). Any effect of the work, which is evidence of performance, is associated with a direct result, but Campbell (1993) believes that the effect can also be seen in behavior (June and Mahmood, 2011). Therefore, the effect can be seen as behavior that leads to results (Skowron - Mielnik, 2009), because these behaviors have a significant impact on employees' work (Johari and Yahya, 2012). Borman et al. (1993) also support this concept by defining performance as a set of behaviors that help employees perform their tasks and ensure long-term job performance (Johari and Yahya, 2012). Therefore, in the article, job performance will be defined by behaviors that help to build it permanently.

IT reliability role in shaping the relation between Job turnover and Job performance

In the age of IT development and its key role in shaping the organization's competitiveness, the type of implemented IT solutions, their efficiency and quality, turns out to be an important factor for the proper functioning of the organization (Thomas and Michael, 2001; Shaukat and Zafarullah, 2009).

It is more and more often observed that IT solutions affect the organization as a whole, also through their impact on employees allowing them to easily contact their co-workers, clients and make working hours more flexible (DeLone and McLean, 1992; De Wet et al., 2016). This is because IT solutions in organizations primarily support the functioning of the organization at various levels of management (Sutherland and Canwell, 2004; Van Assen et al., 2009; Potocan and Dabic, 2012). Various solutions are available on the market that ensures integration of all information flows in an organization, from financial and accounting information to human resources management (Umble et al., 2003).

The research conducted by Sweis (2010) proves that the investment in IT solutions incurred by the organization directly translates into growing satisfaction of employees with working conditions and relations with co-workers. Additionally, IT solutions in the organization increase employees' creativity and abilities, as well as have a positive impact on shaping social status (Sweis, 2010), increasing the employees' sense of value. Employees' job satisfaction, which is defined as the positive emotional state created by work experience (Mitchell et al., 2000; Lambert and Hogan, 2009), is an important criterion for deciding to leave the organization. Employees who are dissatisfied with working conditions are more likely to leave the organization than those who feel satisfied (Seta et al., 2000; Ghiselli et al., 2001; AlBattat and Som, 2013).

Another aspect affecting job turnover is the employees' organizational commitment (Meyer and Alen, 1997, Bańka et al., 2002). Shaping an appropriate level of the employees' commitment to the organization influences the employees' behavior, limits their willingness to change work, and thus has a positive impact on the employees' willingness to stay in the organization (Lambert and Hogan, 2009; Ponnu and Chuah, 2010). According to contemporary research, there is a relation between IT-business alignment and organizational commitment (Tworek, 2019). Employees' organizational commitment is built already at the moment of employees' introduction to work (Kompaso and Sridevi, 2010), that the main step, more and more often, is to receive access to all kinds of IT solutions functioning in the organization. The way employees perceive this step may determine their later commitment to the organization (Luftman et al., 2017). IT solutions in an organization improve communication within a group of employees, which contributes to building a positive sense of participation in the life of the organization (Kompaso and Sridevi, 2010). Moreover, IT solutions make it possible to provide employees with training materials to improve their competences, which in turn has a positive impact on their level of commitment (Luftman et al., 2017).

However, it turns out that the users are not only affected by these solutions, but also by their actual use in their daily work, which largely depends on the reliability of the solutions and the information processed by them (Tworek, 2019). Consequently, it is not possible to focus only on the implementation

of IT solutions in the organization, because their reliability turns out to be much more important (Tworek, 2019).

Based on the above considerations, which prove that IT solutions are an important element shaping job satisfaction and organizational commitment, it can be concluded that also their reliability has the potential to shape job turnover (limiting it). This allows to formulate the following hypothesis:

H1: There is a negative relation between IT reliability and Job turnover

Investment in IT solutions in an organization significantly increases the employees' comfort of work in such organization (Sweis, 2010). As mentioned before, the implementation of IT in an organization gives it new possibilities and improves its performance (Thomas and Michael, 2001; Shaukat and Zafarullah, 2009). Many IT solutions can be implemented into an organization with the potential to improve its performance (Umble et al., 2003; Tworek, 2019).

Since the development of IT, researchers have focused on verifying the impact of used IT solutions on user performance and productivity (Yoon and Guimaraes, 1995; Abugabah, 2009). The precursor of research concerning the impact of IT solutions on performance was Davis (Davis, 1989), who stated that it is dependent on many factors, such as system quality, information quality, usage, user satisfaction, individual and organizational impact (Adams et al., 1992).

Other researchers have also highlighted the multidimensional nature of this relation (Igbaria and Tan, 1997; Rai, 2002). Various factors directly related to the functioning of IT solutions influence the user's performance – especially those considered to built IT reliability (Tworek, 2019). Consequently, IT reliability will also significantly influence the job performance of employees, what was already established by Bieńkowska, Tworek and Sałamacha (2020). As known, IT reliability is grounded in the IT success model (DeLone & McLean, 2003), Lyytinen (1987) types of IT failure and Technology Acceptance Model (Davis, 1985; Tworek, 2019). The IT success model indicates that solutions are used to build a positive impact on the organization by influencing individual employees (Tworek, 2019). It was determined that the quality of the solution itself, the quality of information contained in it and the quality of support for the solution's operation affect the level of use of IT solutions and employees' satisfaction with the use of the particular IT solution (Tworek, 2019). Hence, it is clear that it contributes to the increase in their productivity. Based on the above considerations, the following hypothesis can be formulated:

H2: There is a positive relation between IT reliability and Job performance.

Employees' job performance is key in the context of shaping organizational performance. Caring for organizational performance and thus also for the employees' job performance is important to keep a competitive advantage on the market (Liu and Chiu, 2018). When employees leave an organization, they take with them their knowledge, which is defined as a loss of human capital for the organization (Asamoah et al., 2015). In the age of knowledge, competitiveness is determined by the technological capabilities of the organization, which depend primarily on the knowledge and talents of its employees. For this reason, it can be concluded that it is the employees who are the main carrier of competitiveness of the organization on the labor market and important is to effectively manage their knowledge and talents (Smith and Kelly, 1997; Jamal and Saif, 2011). Therefore, it is important to verify the impact of job turnover on job performance, as researchers suggest that job turnover can be problematic regardless of the size of the organization (Ampomah and Cudjor, 2015). It is interesting to know whether the impact of job turnover on job performance will be positive or negative (Durbin, 2000; Ampomah and Cudjor, 2015).

On the one hand, a change of organization by employees create opportunities to develop their competences and career, and every new employee is a so-called "young blood", which introduces a new experience to the organization (Urbancová and Linhartová, 2011; Ampomah and Cudjor, 2015). On the other hand, job turnover is a costly phenomenon the whole organization (Durbin, 2000; Allen and Bryant, 2012). The cost associated with job turnover has also another dimension (Beer, 1981;

Butali, 2013). Specifically, new employees who are accepted to replace those, who have left the organization, are not only performing worse at the beginning but also have less experienced (Armstrong, 2001). Moreover, there is also a decrease in the employees' job performance who train newly adopted candidates to join the organization (Beer, 1981; Butali, 2013). Therefore, this phenomenon reduces the employees' job performance and thus, the performance of the whole organization. Understanding the need to keep employees in the organization and gain benefit from their participation will help to strengthen HRM policy and build a highly productive workforce (Babcock, 2005). Long-term employees generally have higher job performance than any new employee due to their long experience (Armstrong, 2001). The researchers confirmed the negative impact of job turnover on job performance (see e.g. Lee and Whitford 2008; Moynihan and Landuyt 2008; Meier and Hicklin 2008). Although, job turnover is not always a negative phenomenon and as it has been proven - it can be beneficial to the organization, this article focuses on the negative impact of job turnover on job performance. Based on the above considerations, the following hypothesis can be formulated:

H3: There is a negative relation between Job turnover and Job performance.

Nowadays, when technology and innovation are the key values determining the competitiveness of an organization, not only employees, their knowledge and talents have become the strategic value of the organization (Smith and Kelly, 1997; Jamal and Saif, 2011), but also their ability to properly use given IT solutions seem to became especially important (Tworek, 2019).

This impact of IT reliability on job turnover and job performance established above forces to reflect on the possibility of a moderating effect of IT reliability on the relation between those notions. Employees' job performance is reduced due to the departure of human capital, which, as is known, is difficult to replace (Pocztowski, 2007; Jamal and Saif, 2011) and is heavily impacted by the reliability of used IT (Tworek, 2019; Bieńkowska et al., 2020).

Although the organization is increasingly often and effectively dealing with the problem of collecting employees' knowledge, unfortunately, the process of collecting a "tacit knowledge" is still proving problematic. (Johari and Yahya, 2012). Therefore, among others, organizations decide to invest more and more in IT solutions because, as it turns out, IT solutions implemented in the organization are becoming more and more effective in collecting information and employees' knowledge (Bhatt, 2001; Malhotra, 2005; Akram et al., 2011, Tworek, 2019). When employees will me more eager to use those IT solutions (due to their high reliability), the negative effect of job turnover on job performance may be somehow mitigated by the ability to retain such knowledge in the organization. Hence, the reliable IT solutions, thanks to the high quality of knowledge collection, storage and, processing, may prove to be effective in reducing the negative impact of job turnover on the job performance (Shaukat and Zafarullah, 2009; Tworek et al., 2015; Tworek, 2019). As a result, even if a highly qualified employee wants to leave the organization, the knowledge, thanks to reliable IT solutions, will be kept in the organization (Kompaso and Sridevi, 2010).

Moreover, IT reliability will also affect the employees' job satisfaction - much easier access to knowledge and highly developed IT improving functioning in the organization - will positively contribute to employees satisfaction with working condition (Mitchell et al., 2000; Lambert and Hogan, 2009; Sweis, 2010). As a result, the high employees' satisfaction with their working conditions will affect their intention to stay in the organization, and thus the optimal level of job performance will be kept. Based on the above considerations the following hypothesis can be formulated:

H1M: Among organizations with lower IT reliability, the influence of the Job turnover on Job performance is higher than among organization with higher IT reliability. IT reliability is a moderator for the relation between Job turnover and Job performance.

An overview of all formulated hypotheses is presented in Figure 2 and is aligned with the main aim of this article: the verification of IT reliability as a moderator of the relation between Job turnover and Job performance.

Fig. 2: IT reliability as a moderator of the relation between Job turnover and Job performance.
Source: own research.

Research Methodology and Results

The survey was conducted in order to verify the proposed hypothesis. The main survey was preceded by the pilot survey conducted in the fourth quarter of 2019 among the group of 25 managers (acting as competent judges). According to obtained results, some ambiguous questions were rewritten and it was established that proposed questions are understood by respondents as it was intended by researchers (which is a prerequisite for establishing a questionnaire as a valid measurement method (Czakon, 2019). The main research was conducted using a CAWI method in December 2019, among 263 organizations located in Poland, which was the only condition limiting the sample (organizations were surveyed regardless of size, industry or type of business etc.). The overview of the sample is shown in table 1 and confirms that the sample is sufficiently diversified to form scientific conclusions based on the obtained results.

Table 1: Research sample characteristics

Organization size	Manufacturing organizations	Service organizations	Trade organizations	Total
Micro (below 10 people)	12	11	9	32
Small (11-50 people)	37	15	11	63
Medium (51-250 people)	42	26	24	92
Large (above 250 people)	37	11	28	76
Total	128	63	72	263

Variables Measurement

In order to examine the proposed hypotheses, key variables were defined: *IT reliability*, *Job turnover and Job performance*.

IT reliability was measured taking into consideration all IT solutions used in the organization, basing on the list of four elements of IT reliability and using a Likert scale (from very poor to very good with the middle point: fair), which seems to be an appropriate choice. First of all, reliability of IT in organization is a subjective notion. Employees own perspective and opinion concerning aspects of IT reliability is the best source of knowledge, since their perception matters the most, that is because IT influences the organization mainly through its potential to influence every-day work of the employees. Quantitative methods are commonly used to assess the software and hardware features linked to the

reliability. However, they do not give the information concerning the actual perception of this notion within the organization (Tworek, 2018).

Job turnover was measured Job turnover was measured as a intention to leave the organization by the employees. It is assumed that job satisfaction has a very significant role to shaping the level of job turnover in the organization (Davis, 2006; Parry, 2008). Therefore, if employees are satisfied with their work and works' conditions, they will not feel the willingness to change the organization. The study uses an opposing phrase, assuming that job dissatisfaction will increase the employees' willingness to leave the organization.

Job performance was measured according to the definition by Campbell (1990) and Borman (1993). The scale contains four items referring to the quality, timeliness, efficiency and effectiveness of the employees' tasks at the workplace using and was based on the 5-point Likert scale.

Descriptive statistics and reliability analysis of scales

The reliability of scales of each variable was verified as a first step of the presented research and the results are presented in table 2. The obtained results show that Cronbach's α was high for every variable, which indicates a high internal reliability of the scales and measurements.

Table 2: Defined variables along with the results of the reliability analysis of scales

No.	Variable	No. of scales	Alfa-Cronbacha
1	IT reliability	4	0,797
2	Job turnover	1	--
3	Job performance	4	0,816

Source: own work

Relations between IT reliability, BCM maturity and benefits obtained due to BCM implementation

In order to verify the proposed hypothesis, the correlation analysis was performed between IT reliability, Job rotation and Job performance. This step allows to verify hypotheses H1 and H2. The results show that IT reliability is statistically significantly correlated with Job turnover (r(255)=-0,330, p<0,001), which is the basis for accepting hypothesis H1. Moreover, the correlation between Job turnover and Job performance is also statistically significant and negative (r(255)=0,-403, p<0,001), which allows to accept hypothesis H2.

IT reliability as a moderator for the relation between BCM maturity and benefits obtained due to BCM implementation

The relation between *Job turnover* and *Job performance* was analyzed in the context of *IT reliability.* This step was taken to verify whether IT reliability can be considered as a statistically significant moderator of the analyzed relation. The results of the regression analysis with moderator (which was used to determine that) are presented in table 3. As a first step, new variable – moderator – was introduced, built as a product of two standardized independent variables (*Job turnover* and *IT reliability* as a second independent variable). As a second step, three regression models were built (the analysis was performed using Process macro for IBM SPSS Statistics). The first model was built as a base model for comparison, only independent variables were added as predictors. The second model was built using independent variables (*IT reliability* still as a second independent variable) together with the moderator as predictors to verify whether the moderating influence is occurring in sample. To

confirm that, the third regression model was built using only Job turnover and the moderator as predictors.

Table 3: Regression models' statistics

Model description	*R^2*	*Delta R^2*	*Moderator coeff.*	*Standard error*	*t Stat*	*P Value*
IT reliability, Job turnover, Moderator *dependent v.: Job performance*	0,325	0,027	0,127	0,039	3,186	0,016

Source: own work.

The obtained model clearly shows that IT reliability is a moderator of analyzed relation. The delta R2 is showing a sufficient fit and the model is statistically significant (F (3, 251) = 40,406, p < 0,01). Therefore, obtained results are the basis for accepting the hypotheses H1M confirming that *IT reliability is a moderator for the relation between Job turnover and Job performance.*

Discussion

The article concerns the issue of job turnover and its impact on job performance, looking for factors to reduce the negative effects of this relation. It turns out that the IT solutions, or their reliability, can affect this relation. The performed research confirmed that job turnover has a negative impact on the job performance of employees. The verification of IT reliability as a moderator of the relation between turnover and job performance, mitigating its strength, filled in the research gap in this field to a certain extent.

The results clearly show that IT reliability has a positive impact both on reducing the level of turnover and increasing the level of job performance. It also reduces the negative impact of job turnover on job performance. It provides information to organizations which have a problem with the turnover that the use of IT solutions themselves may not be effective until they ensure the reliability of those solutions (Sweis, 2010; Tworek, 2019). The use of intuitive, reliable IT solutions will affect the comfort of employees and thus, increase their job satisfaction (Igbaria and Tan, 1997; Rai, 2002; Sweis, 2010).

What's more, the results of these research also provide important information for organizations that do not have a problem with employees' turnover, indicating that using reliable IT solutions will contribute to the increase of employees' job performance. This is very important because the job performance of individual employees affects the performance of the whole organization and determines to a large degree the fulfilment of organizational goals (Ali et al., 2016).

Also, even if an organization has a fairly large job turnover and is unable to cope with the constantly decreasing job performance (caused largely by the loss of such valuable human capital), it turns out that the use of reliable IT solutions will mitigate the declining job performance (Shaukat and Zafarullah, 2009; Tworek et al., 2015; Tworek, 2019). When faced with the loss of employees - their capital, knowledge and skills - it seems obvious that organizations should invest in increasing the reliability of IT solutions used for knowledge management (Shaukat and Zafarullah, 2009;). Thanks to such solutions, which collect knowledge, process it and distribute it further, even if some employees leaves the organization, the new employees who replace them will be able to recreate this knowledge quite easily (Bhatt, 2001; Malhotra, 2005; Kompaso and Sridevi, 2010; Akram et al., 2011; Tworek, 2019). The level of knowledge accumulated in the IT solutions depends on their reliability, and the strength of the mitigating impact of IT reliability on the relation between turnover and job performance will depend on it.

Conclusions

The article concerns an important and wide problem of the job turnover negative influence on job performance and establishes that IT reliability is a factor, which can potentially mitigate this influence. The impact of IT reliability on job turnover and job performance has been explained by the obtained results. It has been shown that IT reliability strengthens job performance and also has a positive impact – as a moderator – on the relation between job turnover and job performance, reducing the negative effect of job turnover on job performance. This is a very important conclusion because it shows that IT reliability is important for the contemporary organizations because it increases job performance, reduces job turnover and reduces the negative impact of job turnover on job performance. Therefore, it can be concluded that the identified research gap has been successfully enriched by the performed research, however, it can be filled in further with more extensive empirical data, e.g. additionally include research groups from other countries. Most importantly only a fragment of the phenomenon has been examined. As a consequence, the research does not show how IT reliability can impact on other factors influencing the job performance of employees from various organizations.

However, it does provide the opportunity to further explore the topic and conduct further research in this area. Therefore, the results obtained allow for initial verification of the raised issue. For that reason, no binding theories on IT reliability and its impact on job turnover and job performance can be created, but first step was taken exploring interesting area for further research. Despite research limitations, the indicated aim of the article was achieved by the authors.

These results give a preliminary view to the management of the organizations that IT reliability should be a factor more appreciated by them, mostly among organizations observing a problem with job turnover, but also among organizations that do not have a problem with this phenomenon but want to enhance their job performance.

Abstract

The Information Science field has discussed different shared specifications of conceptualization which comprises the diversity of support, processes, resources and people by which the library needs to adapt. The question remains about the conceptual identification of the terminology hybrid libraries. The aim is to contribute for the literature in the Information Science field by proposing a concept of hybrid library which comprises the social sphere, in the range of developments existing in the society, in libraries. The study is theoretical and aims at discussing and improving theoretical and conceptual foundations. It is a qualitative and bibliographical research. The method of Discourse Analysis is used to analyze the concepts of hybrid library developed by authors who study the theme. It is noticed that in the hybrid library environment there is a greater flexibility in products and services offered, since it originates from an organizational structure which proposes multiplicity of languages in the institution practices. The epistemological discussion in the construction of a concept of hybrid libraries needs to take into account the impact between the use of technologies and the provision of services that promote the social inclusion of communities in each hybrid environment, considering their culture, values and principles.

Keywords: Hybrid libraries. Concept of hybrid libraries. Epistemological proposal.

Introduction

As this theme is still controversial in the Information Science field, the discussion about the concept of hybridity in libraries for social development is essential so studies in the field can evolve. Therefore, the research herein, currently at the Doctorate level, represents the development of initial discussions regarding a field study initiated in the Master's Degree, which sought to analyze, through a field research, the national (Brazilian) hybrid libraries and the international ones (English and Scottish) and their relationship with the development of communities. The research resulted in an exchange program to Europe, revealing that in countries like England and Scotland, the cultural sphere shows itself as a hybrid factor in informational equipment, involving technologies as tools that help in the development of library activities. Hence, the conception of hybrid libraries given by researchers from such territories: that they are cultural equipment that must integrate technologies in order to help the individual in the community.

Some similarities between libraries in the United Kingdom and Brazil are closely related to the proposal that the role of these libraries is to promote cultural actions in order to create reading and writing opportunities for all groups in their user population. However, the big difference lies on the fact that the former have a strong theoretical basis in the hybrid literature for the development of their practices, while the later are based on the literature on living libraries (Da Silva, 2017). Therefore, it was noticed that the hybrid concept in libraries, both in Brazil and internationally, is still confused and contradictory. In the light of the above, some questions could be raised: “What is a hybrid library?", “Why is it misunderstood by the concept of living libraries? "What is the relationship between them?", “What are the social and technological requirements needed?", “What are the aspects involved?”, “Where do they come from?”, “In what situation?”, “In what context?”, “Why do many libraries claim to be hybrid, but in practice they do not act in the cultural sphere of their community?". Therefore, the problem of this research is related to the divergence of opinions about

the concept of hybrid libraries which, at the same time that they contribute to the discussions about the theme, they can negatively influence the production of content about the theme, as well as the professional performance in informational equipment.

The hypothesis is that, when they are not sure about how they should operate in hybrid environments, librarians may manage the institutions where they work in a way in which they focus their activities only on technological aspects of information, failing to emphasize the cultural sphere and the social inclusion of the community in which they operate. To this end, the proposal is to raise discussions involving experts, librarians and institutions that work with the concept of hybrid libraries in order to analyze them and define the basic characteristics for a hybrid concept in libraries. The following question was intended to be answered: "Taking into account the divergences arising from the opinions of researchers, the different cultural spheres involving hybrid libraries, as well as the need for an epistemological contribution for the development of concepts, what are the basic requirements that underlie the hybrid concept in libraries?". Therefore, this study aims at contributing for the Information Science literature proposing a concept of hybrid library which encompasses the social sphere, within the scope of existing developments in society, in libraries.

The aim was to discuss not only the involvement of technologies in libraries, which seems to be the common sense of hybridity in this respect, but also the way in which the hybrid library can contribute for the development of communities. More specifically, it aimed to: collect concepts from authors of the theme at national and international levels to understand the different opinions about the theme and propose a consensus on the importance of the social sphere to work on hybridity; substantiate the epistemology of institutions considered hybrid; highlight the characteristics and rationale which contextualize the hybrid concept beyond technology; analyze the resources (human, technological and social), as well as the relevant services for building a hybrid concept in libraries which can be accepted in the Information Science literature.

In face of the above, one of the main ways of reporting the importance of contributing to the epistemological discussion about the concept of hybridity for libraries is showing that these environments support diverse users in different cultural circles. Thus, the ultimate aim of this research is for libraries to become spaces for entertainment, communication, social interaction, study, research and extension, that is, to act actively in its cultural sphere.

The method

The research is characterized as theoretical and seeks to discuss and improve theoretical and conceptual foundations. Its nature is qualitative and bibliographic because, based on the analysis of concepts given in the literature and by institutions considered hybrid at national and international levels, it sought to retrieve information about the universe of research, examining a particular concept, using instruments of data collection and analysis. The study uses the method of Discourse Analysis to analyze the concepts of hybrid libraries developed by the authors who study the theme.

Still in development, in the data analysis part, the method of Discourse Analysis will support the ways of understanding the discourses in the texts of those researchers who study about hybrid libraries in the Information Science field, in order to understand why they have acquired such a conception and not the other, thus highlighting the subject-form of the discourse, as well as the discourse-interdiscourse relationship, and encompassing its paraphrase and polysemy, for the construction of an Archeology of Knowledge. For this purpose, the institutions in which the discourse is produced, the historical and social conflicts which define the discourse and the space that each discourse takes within the interdiscourse were designated as forms of analysis. The study intended to develop a discursive analysis of the concept of hybrid libraries at literature, documentation and governance of hybrid libraries and compare different countries' models through that. Some interviews were also developed to hybrid librarians. Regarding to Foucault 1971, the Discourse Analysis provides the development of an Archeology of Knowledge, because no discourse, or materialized text, is autonomous or enough, but it rests on others. The subject of the new discourse is

created to develop an interdiscursive purpose with previous discourses. Thus, the construction of an Archeology of Knowledge is appropriate for the development of the concept of hybrid libraries, because it provides the evolution of the concept of hybridity in libraries.

Firstly, the Discourse Analysis context established was the articles founded in the literature review about hybrid library concept carried out on the following databases: Library and Information Science Abstracts (LISA), *Base de Dados de* Periódicos em Ciência da Informação (BRAPCI), Web of Science, and Scopus. There are founded 37 texts about the concept of hybridity in libraries: (Pinfield et al., 1998a), (Pinfield et al., 1998b), (Pinfield 1998), (Oppenheim et al., 1999), (Leggate, 1999), (Guy, 2000), (De Marcas et al., 2000), (Mlekus, 2000), (Gambles, 2000), (Garrod, 2001), (Pinfield et al., 2001), (Breaks, 2002), (Dent et al., 2001), (Brophy, 2002), (Roberts, 2002), (Casserly, 2002), (Garcez et al., 2002), (Guy, 2003), (Kolloffel et al., 2003), (Hamilton, 2004), (Covi et al., 2004), (Pugh, 2004), (Pugh, 2005), (Carr, 2006), (Orera-Orera, 2007), (Miranda et al., 2007/2008), (Pinto et al., 2012), (Da Silva et al., 2017), (Da Silva et al., 2017), and (Da Silva et al., 2018). These articles will be analyzed from a Fairclough perspective. In a later approach, we intend to go to personally in American hybrid libraries (to be established yet), to analyze their documentation and governance. A brief analysis of the production process showed that the concept of hybrid libraries is being developed in countries like England, Scotland, Wales, Brazil, United States, Denmark, Israel, Slovenia, Australia, India, Africa, Germany, Belgium, Spain, and Colombia. All the authors analyzed reference sources from the United Kingdom, where, historically, the concept was born. Nowadays, the concept of hybrid libraries has been more discussed in countries where the libraries are becoming hybrid (such as developing countries). On the other hand, in countries where most of their libraries are hybrid, such as United States and European countries, the concept of hybrid libraries is discussed in order to understand how the convergence of technologies can contribute to the development of communities.

Development and libraries

Originally, the public sphere was perceived as a forum where public opinion was formed. However, with the development of market strategies and the commercial character of mass media, it started to operate not only as the view of civil society, as opposed to the State, but considering the diverse public in society, being the public sphere in a place of conflict between interest. In the public sphere, libraries are found as institutions which work with conflicts of social interest through the treatment and provision of information to its public. The several types of libraries, including hybrid libraries, offer different types of development to society. For Da Silva et al. (2017), hybrid library is a cultural equipment which integrates aspects of traditional libraries, as well as digital libraries.

In face of that, it is understood that, in addition to the convergence of technologies, hybrid libraries must be a cultural space, adapting to cultural characteristics of each community in which they are operating. According to Habermas (2000), society experiences three major axes of macro development: human, social and economic development. In these types of development, there are underdevelopments, as it is the case of the technological development which, in the current context, faces the development of software, within the perspective of three macro developments. The institutionalized organizational development, as part of the economic and social development, opposes the professional development and, in the context of libraries, the development of collections, in addition to the human development. The cultural development is subsidized by the social development. Finally, all these developments surround the idea of privacy versus accessibility of information, the political development, and the citizen participation in society.

The concept of development, since the Classic Philosophy, with Socrates and Plato, brings the idea of the act power, that is, an action powered by some other action. After the Second World War, with the technological transformations occurred, development came to be seen from the point of view of a relative growth or potential possibilities to transform something or an action. Development is, therefore, situated in specific space and times, capable of creating thought and political actions (Sachs, 1993). In general, development results from the economic growth and from the improvement

in the quality of life, including issues of "poverty, unemployment, inequality, health conditions, nutrition, education and housing" (Vasconcellos et al., 1998). Thus, development needs to be understood as a complex process of economic, human and social changes, being more than growth, but a way to transform and satisfy the diverse needs of human being. In relation to human development, it can be seen under the emphasis of the individual's historical-social process, and the same acquire knowledge and assets by interacting with other individuals in society (Furtado, 1974). With regard to the social development (Shera, 1977), traditionally, the sector includes education and health fields. Smith (2006), when dealing with economic development, highlights that it turns to market laws, that is, to the creation of products and services that generate competitive advantage in economy. In the social sphere, this type of development is manifested in the distributions of revenues, considering its direct and indirect costs.

Concept of hybrid libraries

"The idea behind the label of hybrid library is not new and has been expressed by a number of writers8who recognized early the need to join-up all the available types of information resources in order to come to a fully interlinked information environment" (Breaks, 2002). Therefore, the hybrid library is characterized by being a place that keeps its traditional and digital collection, using the Web as an additional mechanism of delivery, where users can access electronic information as well as relevant physical resources. To this end, the ways hybrid libraries operate aim at integrating a wide variety of traditional and new resources in the most uniform way possible, by means of print and digital meta-information. In this perspective, "The term 'hybrid library' is only a label to help our thinking of how libraries are developing" (Breaks, 2002).

According to Orera-Orera (2007), the hybrid library is "a mixed entity, where traditional documents, digital information and services offered in the facilities of the library coexist with other services offered online". Therefore, those libraries serve in person and remote users, becoming a sum of the real and virtual. Moreover, according to Orera-Orera (2007), some relevant aspects of those libraries are 1) the new role of the librarian, whose importance is increasing due to the large amount of existing information and the need to treat it with defined quality criteria; and 2) the information management, which requires the provision of diversified training to cover the diversity of professionals required in the different roles played by libraries.

Under the changes in libraries due to the arrival of digital medias, López Jiménez et al. (2005) understand hybrid libraries as models of libraries where the user, through a Web interface, pages or computer screens, can access digital resources. Therefore, "the title hybrid library is the most adequate in the transition from the traditional to the virtual, because it goes from the digital to the virtual without abandoning the print documents" (López Jiménez et al., 2005), thus keeping physical and virtual spaces in its structure. That being said, it is understood that in the hybrid library, the information on paper is handled in parallel to the electronic information, requiring the information professional, as a hybrid librarian, to know how to work with the information recorded in different media. Thus, Villa Barajas et al. (2005) claim that "the motivation behind the concept of hybrid library is the need to deal with diversity, which is an important issue when libraries advocate for a world where the information is globalized". Therefore, the information on a large scale is at stake. For that reason, Koltay (2008) considers that hybrid libraries are frequently identified as digital libraries. However, according to Ramírez Céspedes (2006), hybrid library is "an intermediate environment between the traditional and the virtual library, where both formats coexist, and traditional services may exist as well as in digital environment".

In a more social view, Da Silva et al. (2017) understand that, in addition to the convergence of technologies, the hybrid library must be "a cultural space that fosters dialogue, where individuals and technology interact, so that information kept in the library comes to life as it is useful to users and therefore used". Therefore, the environment in these libraries is interactive and stimulating, capable of building a multicultural relationship of data, information and knowledge, with the concept of hybridity present in the promotion of information. In this context, like Vuren et al. (2009), Da Silva et

al. (2017) state that hybrid libraries are only possible when the institutional structure and the professionals working at the institution work together, in order to build access and to use the information wisely. Thus, the idea of hybrid libraries includes the need to better understand the users' requirements and behavior and, therefore, the competence in information, which must be part of the different departments in the library, so that professionals can act in order to recognize the potential of the hybrid library (Edwards et al., 1999). Hence, for the hybrid library environment to be able to serve all users of the institution, cultural differences need to be recognized by these libraries administration, requiring that such locations offer a variety of information sources, creating new ways of communicating and disseminating discoveries, in order to facilitate, among users, the discussion about the information received. It is, therefore, a space of continuous learning, where employees and users need to acquire a variety of skills to deal with the information.

Preliminary Results and Discussions

The term hybrid libraries originates from the combination of the concept of traditional, electronic, digital and living libraries, from the point of view of environments that meet to offer greater access to information and a better understanding of the librarian expertise in contemporary social contexts of innovation. The processes adopted by these libraries have attributes of languages used by each institution, with purposes that meet the informational needs of users in innovative operating environments.

The impact of social development for hybrid libraries lies in the fact that, from the moment the individual becomes more important than the techniques and technologies of information processing for the development of their products and services, those institutions become characteristics of a new concept. Such concept focus on a field of study where hybrid libraries are no longer understood only by the convergence of technologies in the same environment, but by the use of Information and Communication in the process, meeting users' needs and desires.

In this scenario, it is discussed a social institution which values the understanding of human uncertainties, raising resources and procedures to ensure that these uncertainties are eliminated through qualification and participation of the individual in society. In this sense, the technologies, always present in hybrid library tasks, are now characterized as auxiliaries in the library processes, whose main objective is the information access by users, so that they become autonomous individuals in the use of the information accessed. For this reason, hybrid libraries are potential agents for transforming their communities at intellectual and social levels because, in addition to being mediators, they are active entities in accessing education, information and knowledge. Therefore, the hybrid informational equipment must consist of professionals who aim to manage the knowledge existing in society and, in order to do so, they need to understand how the library operates as an organization, as well as the relationships among the people in this organization. In this sense, it is assumed that the hybridity applied to libraries can improve the information management processes and, consequently, the management and organization of people. Hybridity, as a perspective of socio-cultural inclusion, assumes the social development as it directs the work of libraries towards the management of information based on the development of their communities.

It is noticed that in the hybrid library environment there is a greater flexibility of products and services offered, since it originates from an organizational structure that proposed multiplicity of languages in the work of the institution, encompassing not only physical resources, by mainly the human resources for taking decisions. Therefore, hybrid library must be a cultural space that allows the promotion of dialogues under the view that the information registered in site must come to life as they are used. Thus, it can be said that the concept of hybridity in libraries meets the most recent research in Information Science in the world context, involving paradigms that did not exist before.

When observing historical construction of hybrid libraries, it is possible to understand that, when the concept was first considered, it focused on the implementation of digital technologies in the library scope. In this perspective, the aim was to understand how the library management should behave in

relation to the acquisition of information and communication technologies, as well as the expenses, costs and benefits that these new technologies would bring to the library context, emphasizing the economic development for the technology development. Thus, it was necessary to study the costs of acquiring new software and hardware, understanding the benefits and harms of this acquisition for both the institution and the public. The vast majority of studies on this subject, in the late 90s and early 2000s, are linked to the technological development undergone by traditional libraries and to the software development covering data interoperability and library development programs.

With the understanding of the best and most adequate software and hardware necessary for the library routine, in addition to the acquisition and installation of those in the library environment, these institutions faced a technological convergence, however, these technologies would be of no use without professionals trained for their proper use, according to the mission and vision of the organization. In this scenario, in the late 90s and early 2000s, studies on professional development emerge within the human development aspect, that is, the ways in which it would be possible to enable information professionals to make better use/benefit of language convergence provided by these locations.

Along with professional development, understanding the urgency to study the focus of the institution – the users -, a trend was started around the training of these professionals not only on their information needs, but also on their professional desires. Thus, the concept of hybrid libraries comprises the study of users and communities, in order to understand their contexts and develop products and services according to their demands, falling once again on human, social and economic development. In the third stage, in the early 2000s, researches on hybrid libraries focused on the collection development, taking advantage of the great possibilities to access information (in the institution itself or other institutions) brought by electronic and digital technologies. In this view of data exchange, the analysis of the privacy versus accessibility issue was initiated, with the aim at offering a wide variety of information to the users, however, without violating their physical and/or legal rights; it was the counterpart between the traditional and digital environments, from the point of view of institutionalized organizational developments (with purposes not only in the market, but also in the social character of their actions) and social developments, which has an impact on human and economic developments.

In this perspective, the concept of hybrid libraries is seen, in the first instance, from the perspective of social development, emphasizing its political and cultural aspects, since it expanded according to institutional (library) and cultural (employees and external community) policies, including an organization structure approach (internal environment) and the external contexts surrounding them (other institutions, public and private policies, among others). Thus, in a second instance, the institutionalized organizational development of these cultural equipment was emphasized, to the extent that organizational studies would range from initial approaches of understanding the concept of hybridity in libraries (technological and software development) to human, social, economic, collection, political, professional and cultural developments, that is, they would span human, technological and financial resources of these organizations, institutionalized under the law in society. In this penultimate perspective, the focus of the processes of hybrid libraries was at the operational (library performance) and tactical (library management) levels, since it focused on short and mid-term planning, always highlighting the social development when dealing with users and employees of these organizations.

The the mid-2000s, the hybrid library starts to stand out in the medium and long term management, encompassing the strategic, tactical and operational levels. In this context, the concept of hybrid libraries is essentially focused on human and social developments, having an economic impact as it understands that human resources are the most complex to be worked within organizations, as they are subjective beings and that, like technologies, they are constantly renewed. In this scenario, when taking into account that, in order to work on the institutionalized organizational development of hybrid libraries, which generates information products and services that impact their economic development, it is necessary to understand their human and, consequently, social development, which show themselves to be the focus of these libraries.

Preliminary Conclusions

Hybrid organizations must understand that they are largely driven by the access to content in multiple sources, as well as by changes originated from users' needs, which affect the range of services provided by libraries. In this sense, the hybrid library operates in the cultural sphere when its communities operate in the work of the library. The technologies are characterized as tools that assist the development of services offered by libraries, that is, in professional practices within libraries that aim to make users able to interpret the information they receive and, thus, generate and share knowledge in society, which allows a greater participation of these subjects as citizens, in the different contexts in which they find themselves. Thus, the epistemological discussion in the construction of a concept about hybrid libraries that can be applied to different locations in the world , according to their cultural, values and principles (and, for that reason, individuals from each location will internalize a concept according to their characteristics and beliefs) needs to take into account the impact between the use of technologies and the provision of services that promote the social inclusion of communities in each hybrid environment.

Therefore, there is the need to different discussions about fundamental themes in order to have a conceptualization of an object of study, due to the multiplicity of conceptions brought by various subjects. From this point of view, and understanding that the concept of hybrid library results in several possibilities, conceptually standardizing the term is feasible for systemic context of that library, in order to achieve semantic interoperability in the exchange of information.

The study showed that, currently, the main type of development in hybrid library environment is the social development, since, although the technological development is part of the constitution of the concept, these libraries make use of technologies as strategic tools in order to achieve social development. Social development is understood as educational activities performed by hybrid libraries in order to socially include their users. In addition, it is possible to find political, professional, software, organizational, economic, collection, accessibility and cultural development in the hybrid library environment.

For a more didactic reading, we recall that the macro developments investigated in this study for the general context of societies are: human development, social and economic development, which together form the institutionalized organizational development, when it comes to the context of an institution. The underdevelopments provided by hybrid libraries are: technological development, political development, professional development, software development, collection development, privacy versus accessibility development and cultural development. Thus, by encompassing the aspects that constitutes human and social development, it is possible to enter the institutionalized organizational development of hybrid libraries, capable of providing valuable products and services for the society (assets). It works with the means by which this library must plan so that its products and services can meet the informational needs of its users, making them autonomous researchers and able to generate new knowledge. It is not, therefore, about waiting for users to come looking for library services, but about taking the information to them through the development of educational activities and attractive environment, with convergent technologies and services for all the public of the institution (regardless of race, age, gender, etc.), when working with the users' informational and educational desires. It is a complex way of accomplishing the macro developments mentioned in this study, along with their underdevelopments.

Threat Perceiving in The Environment of a Contemporary Organization – A Concept of Theoretical Approach

Bogdan ĆWIK

Military University of Technology in Warsaw, Warsaw, Poland
bogdan.cwik@wat.edu.pl

Abstract

The article presents a concept of a theoretical approach to threat monitoring in the environment of a modern organization. The dominance of non-deterministic situations, including the increasing complexity, diversity and dynamics of events and phenomena are all characteristic for this environment. This places increased demands on security systems, including threat monitoring systems. The result of the work is presenting the concept that includes an integrated signal perceiving model, organizational system model, a model for the qualitative evolution of the organizational system, and a spiral model for organizational systems development. The research methods applied include analysis and criticism of literature, analysis and logical construction as well as heuristic approaches: the "new insight" and analogical transfer method. The deductive and enumerative induction method were also applied in tandem.

Keywords: Perciving of warning signals, monitoring of organizational security, organizational system, qualitative evolution of systems, evolution of systems

Introduction

The environment of a modern organization is filled with threats posed in various areas, and are, at the same time, increasingly complex, diverse and extremely dynamic. The scale and scope of these threats is so significant that it proves impossible to exclude or eliminate all of them. Researchers are already talking about a "risk society" (Adam, Beck, & Van Loon 2007; Franklin, 1997). This places increased demands on security systems, including: the ability to preempt so-called consequential threats (Ćwik, 2017a) and to properly assess the situation (Naderpour, Lu, & Zhang, 2016; Panteli & Kirschen, 2015; Neisser & Runkel, 2017), appropriate preparation for potentially dangerous events (Said & Chiang, 2020; Li & Liu, 2020), proper interpretation of risk (Eiser et al., 2012; Xiaowei & Tiezhong, 2020), the ability to properly respond to the risk (Wang, Goh, Ding, & Pretorius, 2019) and resistance to potential consequential threats (Antronico, De Pascale, Coscarelli, & Gull, 2020).

In order to achieve consistency of argument, the author suggests distinguishing the concepts of causal threats, which are different types of interactions (energy or information), and are measurable (quantitative) and constitute the underlying cause for specific consequential threats. In turn, consequential threats present the possibility of creating specific effects, caused by causal threats. An example here is the level of water in a river (causal threat) and the related consequential threat of flooding the surrounding areas (qualitative changes) (Ćwik & Świerszcz, 2018).

The next assumption is that phenomena such as threat or associated risk are individually perceived by each observer, or threat analyst. In his detailed analyses of threat monitoring, the author suggests distinguishing the perception of impressions, which bears the hallmarks of objective processes, from perceiving that combines the objective processes of signal perception with their subjective interpretation, covering the main subjective cognitive processes (Fig. 1).

Another assumption is to adopt a systemic perspective on the perceiving of phenomena in an organization's environment (both internal and external) (Ćwik, 2019). The environment of an organization is dominated by non-deterministic processes, (Ćwik, 2017b) where, on the one hand, the

observer should be aware of such processes, and on the other, be familiar with models that enable the future development of the situation to be assessed (Ćwik, 2017b). The organizational system model is a proposal that meets the above-mentioned requirements for security systems (Fig. 2).

The main objective of this article is to propose a model for assessing the development of a situation in the environment (external or internal) of a modern organization (social, administrative, economic, political, cultural and other), primarily from the point of view of the security of its functioning.

The research methods applied involve the analysis and criticism of literature, including a systematic review of literature in the studied area. The second is the method of logical analysis and construction, and the heuristic methods: the "new look" method, and the analogical transfer method, as applied for creation of models linked with interpretation of the notion of threat. Furthermore, the communication of the results of the author's own studies and observations of people perceiving of different signals relies on deduction and enumerative induction methods. The article is conceptual.

Perceiving Model for Monitored Signals

Theoretical Introduction

The environment monitoring systems of a modern organization must deal with a significant number and variety of sources providing information on potential threats. This monitoring consists in reading the signals that convey information concerning threats. At the same time, the reading of any signal is characteristic of an experience consisting in the recording and identification of a specific graphic symbol, electrical, light, magnetic, sound or other impulse and the specific interpretation associated therewith. The final effect of this experience is an internal decision formed in the mind of the observer, generating and introducing into consciousness specific content, which is a product of detailed processes that can be called processes of signal recognition and identification. The definite – for the given (both temporal and spatial) circumstances – identification and recognition of signal is thus the result of sensual, mental and cognitive processes.

When addressing the issue of signal identification and recognition, we notice that the terms perception and perceiving (noticing, revealing) are treated interchangeably in subject literature (Sussman, Jin, & Mohanty, 2016). It seems that it is more appropriate to use the concept of perceiving, as illustrated by the model from Fig. 1, presenting the integrated signal perceiving model.

Fig. 1. Model of the integrated signal perceiving process
Source: own work (Ćwik & Świerszcz, 2018)

The model in Fig. 1 presents a perceiving system that integrates the components of the perceiving process of any signal or set of signals. The model captures components of sensory processes, basic mental processes, and higher mental processes (thinking, inference, imagining). As a result, the final identification and recognition of the signal is a result of so-called bottom-up processes from the senses and top-down processes from the mind (Fig. 1).

In this model, the processes of perception are mainly the basic processes of signal transmission encoded in the course of our biological evolution. Their characteristics include the relatively low complexity and relatively low energy expenditure on the implementation of their course. They mainly utilize sensory and operating memory. These processes are repetitive and are percepted identically by their respective observers. The so-called higher mental processes originate from the more advanced areas of brain, and mainly include the higher cognitive and mental processes. These are the so-called top-down processes. Unlike the bottom-up processes, these processes are individual for each respective observer. Their course largely depends on individual experiences and cognitive resources, as well as the current psychophysical condition of the observer. These processes also require greater energy expenditure. The result of the confrontation of bottom-up and top-down processes is the integrated process of signal perceiving.

The model identifies the basic subsystems that affect the effectiveness of identification and recognition of warning signals. One of them is the attention system (Fig. 1.). Attention ensures that only part of the stimuli reaching the senses that monitor signals is actually perceived (Susan et. al., 2016). This is an evolutionarily developed subsystem of perceiving, saving the observer's expenditure of energy, and reducing the excess of incoming information (Manning, 2020). The presence of this subsystem is the result of observer's perceive and cognitive limitations that make him or her able to process only part of the potentially available stimuli from the surroundings.

Attention can be imagined as a condition of specific tension or of readiness of the observer's cognitive structures to identify and recognize a particular object or phenomenon. Researchers distinguish different degrees of attention, stating that attention can be focused on a small number of stimuli only, in the process of so-called intense attention, or there may also be so-called distracted attention that focuses on a large number of stimuli (Neisser & Becklen, 1975; Spelke, Hirst, & Neisser, 1976). Intense attention is accompanied by sharpened awareness of the content falling within the so-called the field of attention, while extensive attention means a weakening of the awareness of what is in its field.

Another important element of the threat perceiving system is the memory system (Fig. 1). In the subject literature, memory is understood as the ability to record, encode, store and retrieve data in the form of sensory impressions, associations, information, where:

- recording is the process of acquiring the incoming data;
- coding is the process of organizing and transforming incoming data that enables its inclusion in memory, wherein it is coded in symbols;
- storage is the process of keeping encoded data in memory;
- retrieving is the process of accessing data stored in memory.

As featured in Fig. 1, the sensory memory, operating memory or long-term memory are basically collections of so-called memory traces. In turn, such traces are well-established neurochemical signal transduction pathways, associated with signal transduction in different areas of the brain (Pignatelli et. al., 2019; Takamiya, Yuki, Hirokawa, Manabe, & Sakurai, 2019).

Discussion

In the model from Fig. 1, the recorded signals are first transformed into stimuli, then into impressions (Zimbardo & Gerrig, 2014). They are further transmitted as part of the bottom-up process, where they are confronted with parallel selection and categorization processes carried out with the participation of memory and thinking, as part of the so-called top-down processes. Their consequence is the recognition and identification of signal content. Perceiving following this path is a process consisting in active reception, analysis and interpretation of sensual phenomena.

A number of constituent mental processes are integrated in the perceiving process, as a result of which a person reflects (creates cognitive representations of) objects of reality currently impacting its receptors and recognizes the significance of these objects – it decodes the incoming information using its representations stored in the brain. Such perceiving processes are supported by attention, memory and thinking processes.

The aforesaid processes of cognitive activity are characterized by the active nature of their course, as a result of which people receive information concerning the world, process this information, integrate the acquired data and integrate it into knowledge systems, and then apply it to make choices, formulate evaluations or judgments, or to make decisions.

The various models included in long-term memory resources should also include, among others, models that enable proper assessment in non-deterministic situations (Fig. 1). It is proposed that the presented model of integrated warning signal perceiving should be included in the activities of early

warning systems analysts, not only those involved in economic, military, crisis warning systems, but others too.

Model of the organizational system

Theoretical Introduction

Ever more frequently the monitoring of surroundings of a contemporary organization occurs in the so-called non-deterministic circumstances (Ćwik, 2017b). What can facilitate perceiving in these situations is the inclusion of a systemic model for universal perceiving of reality surrounding the contemporary organization. This will be a model of the basic element constituting this reality, reflecting the basic features of the surrounding of this reality. The basic features of the environment of a modern organization include: the pursuit of integration, including the creation of holistic structures, pursuit of complexity, growing dynamics of change, and development towards intangible forms.

The working title of this model is the organizational system, as we assume that it will join characteristics of both a system and an organization. When creating such an element, the concept of a system, as understood according to the theory of general systems by Ludwig von Bertalanffy (Von Bertalanffy, 1973), was taken into account as a separate fragment of reality in the form of a set of components and the relations between them, along with the concept of an organization, defined as a whole organizing its internal components to implement a joint action.

It is assumed that any organization as well as the environment within which it functions, shaped by the presence of other organizational systems, can be understood as such an organizational system. The diagram of such a system, functioning in any environment (economic, biological, social, physical), is presented in Fig. 2.

Fig. 2: The model of the organizational system
***m_1, m_2, m_w,* – mass flows; *e_1, e_2, e_w,* – energy flows; *i_1, i_2, i_w,* – information flows**
Source: author's own elaboration

The model of such a system remains an open structure, equipped with a specific infrastructure, organizing the internal and external flows of: mass, energy and information. The organization of these flows is not accidental, but arranged according to a specific principle (logic) that permeates the individual elements of the system. The model is universal (general), and thus applicable to all forms and levels of reality. The essence of individual flows can be interpreted as follows:

- the mass flow includes the part of reality that has mass, the elements of this stream flow into and out of the system, move inside it, and may also undergo transformation;
- Energy flow – it conditions the existence of movement and initiates the mass flows;
- Information stream – it conditions the control, including the optimization of mass and energy flows.

The organizational system formulated in this way has a specific structure defining the location and organization of its components, including the network of couplings between these elements. The structure of an organizational system can be simple, or complex. The structure can be divided into holistic elements as well as sets of constituent elements. Maintaining the structure requires the separation of resources (energy and information), and that all changes in that structure are of qualitative nature.

Organizational systems build or develop infrastructure in their structures to maintain transport, communication and location relations. Elements of the infrastructure are communication channels, enabling the functioning of the information flows, and transport channels, ensuring mass and energy flows inside the system, as well as from the external environment. These types of channels can be seen at every level of contemporary organizational systems: that of single atoms, chemical compounds, biological organisms, symbiotic structures, economic structures, social structures and other networks of organizational systems.

The entirety of the aforelisted elements of the organizational system, structures and relationships constitute a specific "principle" (logic) that determines the behaviour of the respective organizational system. In a digital environment, for example artificial entities in the form of simple computer programs (cellular automata), which, once stored in the computer's operational memory, having the internally encoded "principle", for example, to connect with others based on colour, shape, etc., demonstrate activity, move, combine, resulting in a wide variety of structures. Extensive research on this type of structures has been carried out by, among others, Stephan Wolfram (Wolfram, 2002). In the case of a natural organizational system (social unit, enterprise, eukaryotic cell, organism) this principle is "the logic of universal optimization". This logic is revealed in fact that every operation of the organizational system is implemented in such a way, as to perform it using the least amount of energy.

Discussion

Each organizational system performs functions and tasks from the superior level. Such a system organizes its activities so as to carry out all activities and behaviour in accordance with the "principle", i.e. the logic to which it is subject. Natural organizational systems (physical, chemical, biological, social) are subject to the logic of universal optimization – that is, all of their actions or behaviour are implemented with the least energy input possible. As a result, a falling stone selects the shortest path to earth, water spilled on a slope chooses the path that ensures the lowest loss of flow volume, the movement of electrons around the nucleus of an atom, or the movement of the planets around a star are performed in the most energy-efficient way. In nature, optimization is widespread, and visible in the behaviour of molecules, cells, organisms and societies. Generally speaking, it can be said that within an organizational system every action is subjected to optimization, and all flows are optimized, the structure being optimally designed along with the infrastructure. At this point, one might cite Kenneth J. Arrow who stated that "everyone strives for optimal organization" (Anderson, Arrow, & Pines, 1988), or Henry Bergson: "each of the species through which life permeates has only its own convenience in sight. It pursues what requires the least effort" (Bergson, 2012). Generally speaking we may formulate the thesis that "the universal optimization logic" is the main driving force behind the development and behaviour of organizational systems.

The logic of universal optimization in natural organizational systems is the overriding principle guiding all processes related to the organization of structures and the flows of mass, energy and information. The mechanisms resulting from this logic shape the reality constituting the external surrounding of the contemporary organizational system, encouraging it to integrate, to create scale-free networks, strive for less and less energetic solutions, for cooperation, for the emergence of an increasing number of intangible forms. The use of ever decreasing energy-consuming forms and structures that are ever lighter, less material-consuming, faster and more efficient, more and more effective and successful are all effects of the existence of this logic. A further result is the increasing loosening of relationships, increasing networking, complexity, diversity, immateriality – coding universality, and the universal usage of symbols. The mechanisms arising from the "logic of universal optimization" can explain the concepts of the "selfish gene" and the "blind watchmaker" of Richard Dawkins (Dawkins, 1976; Dawkins, 1982; Dawkins, 1986). The idea of the "logic of universal optimization" is also consistent with Martin Luhmann's concept of social systems (Holmström, 2007; Gonnet, 2015) and the "theory of communication behaviour" by Jurgen Habermas (Ross & Chiasson, 2011), and it also coincides with Henry Bergson's theory of "elan vitae" (Bergson, 2012; Bergson, 1998; Artuso, Roldán, Scolaro, & Carlucci, 2016).

Qualitative Evolution of Organizational Systems

Theoretical Introduction

One of the characteristics of organizational systems is that they are subject to qualitative evolution mechanisms. The essence of the qualitative evolution of organizational systems is its transition to ever higher levels of development, whose subsequent levels are increasingly complex organizational systems resulting from qualitative changes. Such changes are presented in the "Model for qualitative evolution of organizational systems" (Ćwik, 2019). In a simplified form, this model can be presented as in Fig. 3.

Fig. 3: Model for the qualitative evolution of organizational systems
Source: author's own elaboration based on (Ćwik, 2018).

Let us consider an S organizational system with its internal mass, energy and information flows. This system has mechanisms to produce its copies, which are made with minor variations. These copies constitute the new S' system and become subsystems for it (possessing mass, energy and information flows), creating a new system, building structures, transport relations, communication relations. In doing so, they are guided by the principle of universal optimization. It also creates the appropriate structure and allocates some resources to the infrastructure. To create optimal mass, energy and information flows, each of the subsystems produces transport, energy and information channels to exchange resources with other as efficiently as possible. After a certain degree of complexity is reached, and to provide a solution for worsening problems with the coordination of activities, the S' system produces and expands the C control system. At the same time the individual systems specialize; the transport, energy and information infrastructures are expanded and the network of relations in the S' system becomes more dense. The copies created by the S system are subsystems S1, S2, ... Sn. Each

copy makes subsequent copies, which also feature certain variances. The result is a multi-level structure that requires control and even more complex forms of action and behaviour. It is crucial that out of this complexity a control system evolves to organize the information flows. In the emerging multi-level control system, each level is associated with a certain activity, characteristic for this level. If A is an activity at the respective control level of a certain system, then in the transformation of the organizational system, a new activity will emerge, i.e. a new control system. Let this be activity A. Controlling activity A results in the new activity A', which we can write down as:

Control of A = A'

A classic example here is the qualitative development of a multicellular organism. The S system can then be a single cell, capable of operating independently. Cell reproduction processes and their integration creates the S' organizational system, which is an organism made of millions of cells. At the beginning, the control process, consisting in keeping the cells together is primitive, most frequently based on the laws of nature, and it occurs without any distinct substructure. However, in the subsequent transformation processes of such organizational systems, cell specialization evolves, and the complexity level increases. One can imagine a situation where several cells cooperate in the exchange of mass, energy and information, and so, for proper coordination of this cooperation, it becomes necessary for some cells to specialize in providing information. This is most likely how nerve cells evolved, followed by other types – tissue specialization was born. In the result of these processes, organisms have evolved, in which a multilevel hierarchy developed, and cells were organized in tissues, tissues in organs, and those in the body, and the whole was controlled by the nervous system. What was also developed was an internal infrastructure for securing the superior operation of such a system.

As time passes, the developed structures age, are subject to disorders, distortions, and the flows they facilitate become less and less effective. They may even break up. Biological organizational systems have developed recovery processes, which ensure the operational continuity of these structures. The most effective way to ensure continuity is to be able to replicate – that is, to make their own copies. It should be emphasized that copying is the most optimal way to ensure the continuity of structures, as creating a new structure is always very expensive and time consuming. Therefore, the diversion of some of the resources to structural support, as well as the production of mechanism for their replication, is a common feature of all living organisms.

Within such a developing organizational system, communication and transport tasks are performed. The system builds flow and communication infrastructure – the nervous system, vascular systems, transport and communication networks. At some point in time the system forms, shapes and distinguishes a control system (for regulation, management and coordination). It is becoming more and more logical, increasingly advanced – it builds structures, secures its existence, and builds infrastructure in a broad sense. Guided by the logic of universal optimization, the organizational system constantly looks for benefits, establishes cooperation, or if necessary decides to initiate a conflict. In the course of qualitative evolution, the system begins to use coded strings of symbols to convey information, and looks for increasingly sophisticated coding methods, while at some stage initiating the coding of energy flows as well as the coding of product flows. One result of the presented mechanisms is that humanity invented money to encode the value of goods during their exchange. Another example are the media used for storing and managing information. In the course of emergence, new forms of organizational systems are developed. The systems within the subsequent levels replicate and integrate at increasingly higher levels, creating hierarchies of entities.

Discussion

The evolution of organizational systems brings qualitative diversity and quantity overload, leading to competition and selection. We observe this at all levels of evolution, from bacteria to the political, scientific, artistic and religious movements. Evolution is a continuous process of the emergence of more ordered and complicated systems from simpler ones, based on a series of consecutive phases. Every evolution is a creative and unique movement, following the so-called "time arrow" (Shu-Kun Lin, 1991) – a consequence of the existence of "universal optimization logic". The result of the above is the eternal movement, eternal flow, directed towards increasingly complex forms of systems that

become more and more immaterial, and increasingly impermanent and complex. None of this occurs in a deliberate manner, but as a result of energy and flow activities, implemented as part of Markov chain processes (Karpenkov & van Son, 2020).

For example, the result of the development of biological organizational systems is the development of control systems – the specialization of eukaryotic cells to form nerve cells, and consequently the development of the nervous system and then the brain to manage the body. Further examples are the development of the enterprise management systems, the development of automation and artificial intelligence (mobile management, cargo route tracking systems, process automation in all areas of logistics, the widespread presence of IT systems, the universality of mobile computer systems, on-line systems, ubiquitous and persuasive systems).

The Development Spiral of Organizational Systems

Theoretical introduction

The development of organizational systems, considered as a result of the qualitative evolution of these systems, can be illustrated in the form of a "development spiral" model. The considerations include the concept of universal evolution of systems and Karl R. Popper's Three Worlds. The Three Worlds divide reality into the world of matter, the world of mental phenomena and the world of abstract objects (Popper, 1972). A spiral designed in this manner presents the model for the development of organizational systems, considered in two directions at the same time – i.e. vertical and horizontal. In each of these dimensions we can distinguish further two dimensions. Vertical dimensions are: a dimension including the objective systems and processes, i.e. the ones objectively existing, and a dimension including subjective systems and processes, i.e. those existing in the mind and consciousness of human being. In contrast, the dimensions in the horizontal direction are: the dimension covering individual systems and processes (existing or considered as a whole) and the dimension including collective systems and processes (existing or considered as sets of individual elements). Therefore we end up with four bi-dimensional areas through which the theory of development (evolution) of organizational systems passes. Achieving the appropriate level of development in a given area, as expressed by a certain level of complexity, as well as the ability to create holistic structures, results in transition to the next area. These areas, which can be interpreted, as long as we remember the previous considerations, as follows:

- The "upper right" (UR) area consists of objectively existing wholes (individual elements, organized holistic structures, including holons or network nodes) that cover objectively existing entities, ranging from the simplest physical elements, through the simple biological forms, to the increasingly complex holistic structures of organisms and societies.
- The "upper left" (UL) are includes the psyche of individuals, their minds and their consciousness. For the evolution to reach this area it requires prior development of appropriate individual forms and structures (e.g. nervous system, brain), forming part of the UR area.
- The lower left (LL) area covers collective awareness (of a company, group of people, society, etc.). It concerns the population of people and its intersubjective states of consciousness and states of mind. What is prerequisite for reaching this area of evolution is the prior creation of advanced forms of information transfer (gestures, speech, writing) and an appropriate level of development in the UL area.
- The "lower right" (LR) area includes objectively existing communities (systems of networks), collections of matter, collections of biological organisms, individual forms for shaping of social systems. Our current stage of development includes complex economic (market), technological and social systems. What is prerequisite for the transition to the respective development level in this area is the achievement of appropriate levels in the remaining areas.

Fig. 4: The development spiral of organizational systems

Source: author's own elaboration

The development spiral of organizational systems can be represented in a 4-dimensional space. This spiral rises to higher and higher levels, attaining an increasingly complex structure. Individual forms transform in the ever more complex forms. This occurs simultaneously for the material and spiritual forms as well as abstract forms (as separate entities). All changes are constantly controlled by the logic of universal optimization.

Discussion

The presented development spiral of organizational systems presents a model of transition to ever higher levels of development, taking into account the various dimensions of this development. So, for example, in this model a company is the result of individual awareness development processes (UL area), level of culture and collective awareness (LL area), as well as the development levels of science, technology, institutions, and market mechanisms, which all belong to the LR area.

Looking at the development spiral vertically, it can be observed that the "left" areas represent the development of subjective (internal) forms and structures related to consciousness, emotions, subjective phenomena (both individual and collective), while the "right" areas relate to objective (external) reality, organizational structure, scientific knowledge and other items. Whereas, when we consider the development spiral horizontally, it can be seen that the "upper" areas refer to individuals, their internal and external structure, while the "lower" areas relate to the community and its subjective and objective characteristics.

In the presented spiral the development includes the emergence of the subsequent grades of organizational systems, linked with their respective levels of information carriers, as well as specific levels of energy.

Results

The work presents an integrated model for the perceiving of a warning signal. This model captures the basic factors affecting the efficiency of perceiving, and presents components of the perceiving process. Effectiveness is significantly influenced by the course of higher mental processes (top-down processes), wherein the cognitive processes play the crucial role.

The work formulates a suggestion to introduce, in addition to the model of integrated perceiving of the warning signal, the model of the organizational system, the model of qualitative evolution of organizational systems and the model of the spiral of organizational systems development, which should be included in the cognitive resources of the threat signal monitoring observer.

It should allow us to increase the perceiving (perception) effectiveness of warning signals in non-deterministic situations, or in conditions of uncertainty, when there is a large number of unknowns. The migration of people from the southern hemisphere to Europe, where large differences in income and standard of living exceeded the boundaries of mental energy (motivation) required to initiate the migration is just one example that can be predicted with the said approach. The creation of communication channels, mobile telephones and the Internet coincided with this, as well as the reduction of the transport barrier through the Sahara and the creation of transport channels through the Mediterranean.

Final Conclusions

The presented models – the model of the integrated process of signal perception, the model of the organizational system, the model of the qualitative evolution of organizational systems and the model of the development spiral of organizational systems – can be applied to interpret various aspects of reality constituting the external environment of a contemporary organization. As a result of the qualitative evolution of organizational systems and their quantitative development, continuous creative processes are ongoing in this environment, with parallel copying processes that are relatively slow in biology, lasting millions of years, yet much faster in the case of social processes. The evolution of organizational systems continues in all of Karl R. Popper's Three Worlds. At present, transformation processes have achieved such a pace that biological evolution is lagging behind social, economic, and technical evolution, and the evolution of systems of symbols. Continuous improvement, the search for the lowest costs, the cheapest solutions, resulting from the logic of the universal optimization of organizational systems, are the driving force behind evolutionary processes. Evolutionary processes can be imposed at some stage on purposefulness and course of action, which is only possible when the processes can be controlled. However, at some stage of development, the "control threshold" is exceeded, where complexity causes a return to universal mechanisms, where the resultant of intentional actions of many individuals is spontaneous, creative, unknown and uncertain activity. Furthermore under such conditions the sole item that can be included in predicting or forecasting is the universal perspective for the perception of organizational systems, based on the models listed in the present work.

It is suggested that the models presented in this study should be taken into account by the manager or employee of an organization, whenever faced with the need to decide on a direction of development of

an unknown, or relatively unfamiliar issue, related to its current activities, to manage, plan, rationally and effectively design possible scenarios for the development of such a situation. Consideration of the above models should also improve the effectiveness of contemporary security systems.

Mediation in Collective Dispute and Its Role in Industrial Relation System – Case of Poland

Leszek CICHOBLAZINSKI

Częstochowa University of Technology, Częstochowa, Poland
leszek.cichoblazinski@pcz.pl

Abstract

The presented paper focuses on the resolution of collective disputes, i.e. conflicts between trade unions and employers. A collective dispute is the main form of institutionalisation of a conflict between an employer and employees in the Polish legislation. The act regulating this type of conflict was introduced in the period of system transformation in 1991. It allows for control over the course of industrial conflicts, setting a procedure to resolve them, where an integral part is mediation between the parties to the dispute. This paper consists of two parts. The first one is devoted to the place of the collective dispute and mediation in the system of industrial relations. The second part presents an empirical study based on a case study analysis, which was used to present an analysis of mediation in a collective dispute in an enterprise.

Keywords: Collective Disputes, Industrial Relations, Organizational Conflict Management, Mediations, Trade Unions

Introduction

The presented paper focuses on the process of resolving a collective dispute with special attention paid to the mediation stage, understood as a process of seeking an agreement between the representatives of conflicted parties - employers and employees, with the participation of a third party, the mediator.
The collective dispute process is presented from the mediator's perspective. The main research problem is: which actions should the mediator take in order to reach an agreement? On which factors should such choice depend on and which actions are the most efficient? The cognitive goal of the paper is to examine the role of mediation in the resolution of collective disputes as an instrument for managing an organisational conflict.
The application goal of the paper is to prepare a model of effective mediation which could be used by mediators in their work during collective dispute resolution.

Research Background

Collective labour relations are regulated by the collective labour law. There is no legal definition of collective labour relations. In most general terms, they refer to collective and not to individual representation of employee interests. The entities of collective labour law are primarily trade unions and employers. In both cases, the entities are legal persons and not natural persons, even if the employer is a specific person who is, e.g., a company owner.

What is the object of collective labour law? First of all, it regulates the operation of trade unions and rights of the workplace personnel. This law also regulates the operation of employers' organisations, collective dispute resolution and establishment of autonomous labour law standards such as, e.g., collective labour agreements, remuneration regulations, labour regulations, etc. These standards are called autonomous, as they are not created by legislative state authorities, but directly by parties of a labour relation, whose interests are represented collectively (Cichobłaziński and Soares Filho 2018).
The overall idea of collective labour law is collective representation of employee interests. This primarily results from the fact that a workplace is a social system and multiple aspects of its operation are of collective nature; secondly, the bargaining position of the employer vis-à-vis an individual

employee is usually much stronger. This imbalance is reduced by collective representation of employee interests and the trade unions are vested with relevant rights in this respect.

Collective Dispute Resolution

In a further part of the discussion, one aspect of collective labour relationships will be analysed, i.e. collective dispute resolution. The problems discussed to-date have been analysed primarily from the legal perspective; however, from the management perspective, the manner in which conflict resolution between trade unions and employers affects the key decision making in an organisation is essential. Conflicts between employers and employees are a natural element of industrial relations. Their course and resolution is regulated by one of the main players of market economy, i.e. the state. Relevant legal provisions are used to this aim, which civilise the process of determining interests between the major actors of industrial relations in market economy (Cichobłaziński, 2015).

Initially, it must be emphasised that the collective dispute institution is strongly rooted in the Polish legislation, as it is referred to in the Polish Constitution. "In the Polish legislation, the Constitution of the Republic of Poland of 2 April 1997 makes a direct reference to the issue of negotiations with trade unions. Based on the interpretation of Art. 59(3) of the Constitution of the Republic of Poland, trade unions and employees and their organisations are authorised to participate in a collective dispute resolution at the stage of negotiations. (...) Art. 59(2) of the Constitution of the Republic of Poland refers to the concept of a collective dispute. As opposed to the collective labour agreements and other agreements, it does not specify that the trade unions, employers and their organisations are vested with a right to initiate and to conduct collective disputes, but that they only have a right to negotiations, <in particular to resolve collective disputes>." (Jarota 2014)

Various solutions are applied in the European Union in this respect. The major differences refer to the level on which the collective disputes are solved. The Anglo-Saxon approach may be distinguished, where the theatre of a collective dispute is a company and an approach which may be encountered for example in Germany, where collective disputes are solved on the industry level. In Poland, the first solution was adopted as part of which the parties to a collective dispute may be an employer in a specific company and trade unions operating in such company. Each of these solutions has its advantages and disadvantages. The industry level is more advantageous for the trade unions, as in the industry scale they have a much greater bargaining power; apart from it, the conflict is taken outside of the company. On the other hand, such conflicts most often cover the whole country and are deeply rooted, which is sometimes manifested in great demonstrations taking place in several locations at the same time. The Anglo-Saxon solution atomises the conflict and reduces it to one company or an institution. In such situation, the conflict does not have a national dimension, but often the actual decision-maker is outside of the company, for example in the headquarters of a concern operating in another country, or it is the owner authority (e.g. local government) in the case of public institutions (Kloc, 2012).

Definition of Collective Dispute

Włodzimierz Broński and Maciej Jarota provide one of the simplest definitions of a collective dispute: "(...) a collective dispute is a conflict between the employees and the employer" (Broński and Jarota, 2015). Another issue worth discussing is the object of a dispute. It is defined in very general terms. "Pursuant to the Polish Act on solving collective labour disputes, the object of a collective dispute may be exercise of employees' interests in the aspect of work conditions, as well as the content of employment relationships, i.e. not only the circumstances of labour provision, but also in a broader aspect - all factors determining directly and indirectly the content of an employment relationship." (Broński and Jarota 2015, p. 35) The Act also stipulates that the object of the dispute may include: work conditions, conditions of wages or social benefits and trade union rights and freedoms of the employees and other groups (who are vested with the right to form trade unions).

In practice, the catalogue of the most frequent causes of initiation of a collective dispute is as follows (Męcina, 2009, p. 147 - 148):

- violation by the employer of obligations resulting from the provisions of the collective labour agreement;
- reorganisation of the company, its development, ownership transformations; company management;
- failure to commence negotiations; refusal to conclude a collective agreement;
- current economic and social policy of the company;
- work or interests of a group/ specialisation of employees;
- tariffication of employment and pay;
- pay raises;
- organisational and legal transformations and outsourcing;
- employment guarantees;
- unjustified termination of labour relationships as part of collective redundancies.

In line with the Act, a collective dispute has the following stages:

1. Presentation of a list of demands of the trade unions to the employer. The demands may exclusively refer to the issues listed in the Act and are as follows:
wages and work terms, social benefits and trade union rights and freedoms. From the point of view of the conflict dynamics, the regulation only vesting the employees with a right to initiate a dispute is very important – the employer is not vested with such a right. Thus, the initiative in a collective dispute always belongs to the employees, whereas the role and the position of the employer in a collective dispute is, in principle, defensive.
2. The employer's response. Further course of the dispute depends on the employer's reaction. It may be dual:
a) positive: all demands are fulfilled;
b) negative: at least one demand has not been fulfilled.
3. If the employer's response was negative, a collective dispute is initiated within the meaning specified in the Act, which the employer is required to report to the District Labour Inspectorate.
4. Negotiations: bilateral talks of the employer and trade unions aimed at resolving the disputable issues. Four stages of negotiations may be distinguished:
- commencement of negotiations (the parties learn each other's standpoints, terms and climate of negotiations);
- consolidation: a thorough discussion about the essence of the conflict;
- finalisation: an agreement is reached or its failure;
- formalisation: a protocol of understanding or a protocol of divergence is signed. It must be emphasised that "(...) the employer is required to immediately commence the negotiations with the aim of concluding an agreement. (...) The time of negotiations is not regulated in legal provisions. However, it may be assumed that collective negotiations should be conducted as long as there is a chance for reaching an agreement."

5. Mediation: if the negotiations resolved the conflict, the collective dispute is ended. If the negotiations did not lead to an agreement, the next obligatory stage is mediation, which forms a separate institution and consists of several stages. Their type and number depends on the path selected by the parties of the dispute, as the Act offers them certain freedom in this respect.

A) selection of a mediator. A mediator may be a person from a list kept by the Ministry of Family, Labour and Social Policy (a mediator can also be any other person not included in the list). Then, the trade unions send an application to the Social Dialogue Department to appoint a mediator, accompanied by a protocol of divergence. If its content differs from the conditions of collective dispute initiation specified in the Act, the Ministry refuses to appoint a mediator. The parties may also elect a mediator without the agency of the Ministry, both when such mediator is from the list or outside of it. Irrespective of the mode of electing a mediator, both parties have to agree to him/ her. If the parties fail to reach an agreement on election of a mediator, then at the request of one of them, the mediator is designated by the minister from the list of mediators.

One of the conditions for designating a mediator is preparation of a protocol of divergence. Parties are not always able to present such report in the Social Dialogue Department. This mainly happens due to the employer who, not wishing to commence the mediations, avoids signing such document. However, the employer has to respond in written form to the trade union's demands, thereby detailing its standpoint in the collective dispute. In such situation, the Social Dialogue Department may acknowledge the standpoints of parties presented in separate documents as the basis to appoint a mediator pursuant to the binding Act.

B) The appointed mediator (after prior approval for the commencement of the mediation mission) reads the content of the protocol of divergence, which he/ she received from the Ministry or directly from one of the parties and contacts the representatives of the employer and the trade unions to set the date for initiation of mediation. Given the fact that in line with the law, a collective dispute may only be initiated by trade unions, they most frequently suggest the candidacy of a mediator, as well as report it to the Ministry. Less frequently, a mediator is proposed by an employer, yet such cases also take place (Antolak-Szymanski 2018).

C) First contact with the parties to the dispute. It usually takes place in the company's premises. There are also exceptions from this rule. During this stage, the mediator learns the justifications of the parties' positions, which were detailed in the protocol of divergence. The mediator also agrees the amount of his remuneration; the Regulation of the Minister of Family, Labour and Social Policy only specifies the bottom threshold of the remuneration, and signs a mediation agreement with the parties. These last circumstances do not form the essence of the dispute, yet they basically affect the initiation of the process of mediation and, as such, they will be an object of analysis.

D) Tripartite talks. After initial clarifications, the mediator may invite the parties for direct talks or may suggest talks without direct contact, conducted exclusively via the mediator. The mediator also has an indirect strategy at his disposal, which consists of both "face to face" talks, as well as talks carried out with the use of a "single text" technique. Irrespective of the selected form of mediation, at this stage of mediation the mediator informs the parties about the essence of the mediation procedure and his role in it.

E) reaching an agreement, in reference literature on negotiations known as "striking a bargain." At this stage, the mediator's key task is to identify an area of a possible agreement, as well as to capture a moment when the parties are ready to approve it. The task is quite difficult as the parties most frequently are only partially satisfied with the mediation and are still hoping that they could accomplish more. The mediator should, on the one hand, suggest that the parties accept the terms which he considers best that can be accomplished in specific conditions on the basis of his own knowledge and on the other, he should remember that the parties themselves decide about accepting or rejecting an understanding and they are fully liable for it. A good tool which the mediator may use at this stage is BATNA. The use of BATNA consists in presenting the parties with a best alternative to a negotiated agreement, i.e. the end of the mediation with a protocol of divergence which gives the trade unions the right to reach for to the arbitration procedure or a strike. Even if trade unions do not intend to use such possibilities, the dispute remains open and will have to be solved at a later date. Most frequently, the employer is well aware of the atmosphere among the employees and may, with greater or smaller probability, estimate the danger of a strike, whereas the trade unions are also usually aware of it.

Yet another solution for which the mediator may reach at this stage of mediation is suspension of mediation. It is justified when the parties expect that at the time of suspension of talks new circumstances emerge, which may affect a change in the terms of the agreement. In this case, these may be such circumstances as: an independent legal opinion, emergence of additional resources for distribution which may result in the fact that distribution type negotiations will be reformulated into integration type negotiations, and all types of terms independent from the parties of the conflict such as, e.g., expected new legal regulations. Then, suspension of mediation may play a positive role both in reference to the essence of the dispute, as well as in reference to inter-personal relations. Time has decisive impact on the perception of the opponent, as well as reduction in the level of emotions.

When suspending the mediation, the parties may prepare a note which forms a report from the first part of the negotiations or may do it only on the basis of an oral agreement. The mediator should communicate both these possibilities to the parties. The stage known as "striking a bargain" may also include writing down a protocol of understanding (if the parties overcame all the differences between them) or a protocol of divergence (if at least one point of the report prepared before the mediations has not been agreed on). In principle, there is no third option. Every protocol of divergence, including at least one minor issue, gives the trade unions a right to start a strike. However, there are cases when parties of the dispute write down a "protocol ending the mediation" which is partially composed of an agreement and partially of divergences. Such solution allows both parties to "save face" in the conflict and may be used, in spite of the fact that the Act does not stipulate it *expressis verbis.* Nevertheless, it does not seem to contradict the intentions of the Act. Preparation of a protocol at the end of mediation is rarely a mere formality.

It happens that after detailing the arrangements in written form, the parties become aware that earlier they understood them differently and the negotiations focus on individual provisions, which are, in some cases, very detailed. In some cases, mere preparation of the protocol of divergence is a success, as it is difficult for the parties to agree on any provision under which they could sign their names together. It is difficult for them to decide about things that they do not agree on. At this stage, the mediator's job is to find compromise provisions, as well as to eliminate from the content of the protocol any type of justifications of standpoints, which only leads to the auctioning of one's arguments. Sole standpoints, without justification, are fully sufficient to write down a protocol ending the mediation, irrespective of the fact if it ends with an agreement or absence of it.

6. Arbitration. This is another non-obligatory stage of a collective dispute. The trade union may file a request for solving a conflict to the Social Arbitration Board operating by a competent District Court.
7. Strike. If the mediation ends with no agreement, the trade union has a right to commence a legal strike. However, it is conditioned by a referendum carried out among the employees on this issue.

8. The mediator may also take up a "good will mission" which usually happens when the conflict is solved in omission of the procedure foreseen in the Act, e.g. when the mediation already took place and ended with signing a protocol of divergence, but the trade union does not intend to move to one of the next stages of the dispute foreseen in the law, namely arbitration or strike. Another situation may take place when the parties wish to solve a conflict without initiating a collective dispute in the legal sense. In both cases, the mediator may take up the "good will mission." Such institution is not, in principle, foreseen in the provisions of the Act, but it is neither contradictory to it. Therefore, as evidenced by the mediation stages discussed above, the context in which a collective dispute takes place has a significant impact on the course of mediation; the dispute has its own dynamics and conditions pertaining to such issues as the essence of the conflict, deadlines, modes of moving to next stages, also the ones that may take place after the mediation ended with lack of understanding. Sole mediation is one of several elements of the collective dispute institution even though - which must be emphasised - a very important one, as it primarily helps prevent escalation of the conflict to a form in which would get completely out-of-control (2004).

Methodology

The empirical part of the paper will rely on the case study method. Mediation in a collective dispute in which the author took part as a mediator is going to be analysed. The mediator, as a third party in the negotiations, is meant to manage them in a mode that allows the parties to reach an agreement. It is possible to list the conditions of effective mediation. Listing them is the object of this paper.

Results – Case Study

The conflict emerged in a hard coal mine in the southern part of Poland. The mediator was notified and appointed by the Ministry of Family, Labour and Social Policy. The problem that caused the conflict was distribution of the social fund. The social fund is a part of the company's budget intended for the

employees, yet it is not paid directly to them. Set off from the employees' wages, it may be distributed in the form of loans for house or apartment renovation, funds for holiday trips or subsidies (funds transferred to the employees without the necessity of return). The company's president and representatives of all trade unions decide how to distribute the fund.

In this case, an agreement was already reached, but one of the trade unions rejected it and decided to re-negotiate. The problem consisted in the fact whether the money assigned for loans could be disbursed and distributed among employees. If the funds were given to the employees not as a loan, but in the form of distribution, they would not have to be returned. The trade union carried out a referendum among the employees, where the employees supported its proposal.

The first meeting was held with the company's president who invited a legal counsel and a deputy president for financial affairs to take part in the talks. They decided that the conflict was initiated by the smallest and, simultaneously, the least influential trade union out of all six trade unions in the company. The company's president dubbed the referendum illegal and conducted in a mode that the voters gave answers expected by the trade union. Together with the team, the employer called the methods which were used by the trade union tactical; in consequence of them, the trade union became popular and influential among the employees. This seemed a typical trade union strategy: an attempt at challenging the employer's credibility.

Justifying rejection of the trade unions' demands, the employer stated that "the earlier agreement was reached in cooperation with all trade unions."

Next, the mediator met with the trade unions who were invited by the employer via telephone. The meeting took place in a large conference room which could accommodate approx. one hundred persons, and was also used as a place for rescue operations.

The representatives of trade unions listed two arguments for which the social fund should be re-negotiated. First of all, the referendum showed that this was what the employees wanted. Secondly, the old agreement was unjust and was not in the employees' best interest. Money from the loan fund would have to be returned, and the company made use of interest charged on loans. What is more, the fund was used exclusively by persons renovating their apartments or houses. The trade union believed that the fund should be divided equally among all employees of the company, without the necessity of its return.

The mediator asked the trade unions the following questions:

1. The agreement was reached among all trade unions of the company. Why did only one trade union object to it?
   Answer: we do not know why; besides, we are not interested in it. We are not interested in what happens in other trade unions. Results of the referendum are the most important for us.
2. How do you respond to the employer's objection who claims that the referendum was not carried out in compliance with the law?

   Answer: It is always possible to find a reason to criticise us.

Tripartite Session

The session took place in the same conference room. The tables were set in the shape of letter "U." The parties sat opposite each other. The mediator was asked to take the seat at the top of the table, where the management board usually sits, also during rescue operations. This position was a clear sign that the parties to the conflict agreed for the mediator's participation in the talks. The mediator started with explaining his role and presented the basic principles of mediation. Then, both parties presented their standpoints. After a long discussion and exchange of opinions, the mediator decided that the position

presented by the board had better justification. In spite of it, the trade unions did not change their standpoint.

The mediator asked the parties for a short break and the parties agreed to it. During the break, the representatives of the trade union remained in the conference room, whereas the representatives of the management board went to the president's office. The mediator moved from one place to the other and talked to the parties. Representatives of the trade union talked to the company's lawyer. During an informal meeting, the lawyer found common language with the trade union members and convinced them to agree to the company's standpoint.

After the break, the atmosphere of negotiations definitely improved and the parties quickly reached an agreement. The trade union members realised two basic issues: first of all, the funds that they were fighting for were not real money (they understood it during the break); secondly, the agreement could not have been changed without the participation of other trade unions. It was necessary to wait with the potential changes in distribution of the social fund until the meeting with other trade unions. The last point was included in the protocol of understanding prepared after the mediation session was closed.
This was a classic example of a solution which allowed one party of the conflict to save face, in this case the trade union. The total mediation time amounted to approx. 6 hours.

Discussion

Summing up, the following questions should be asked:

1. What was the actual cause of the conflict?
2. Why were the parties unable to prevent the conflict earlier?
3. What was the mediator needed for?
4. How did the conflict escalate to the proportions of a "collective dispute"?

Answers:

1. Insufficient understanding of economic issues by the trade unions.
2. The official cause of the dispute notified by the trade unions was distribution of the social fund, but in reality it was lack of familiarity with its functioning.
3. The mediator created conditions for understanding, which the parties reached independently, without the mediator's direct participation.
4. Weak communication between the management board and the trade unions.
5. Other remarks. Every time the members of the trade unions did not understand the questions asked to them, they responded negatively.

This is one of the few examples of mediation which does not directly refer to pay-related issues. Yet indirectly, the trade unions tried to gain "live cash" which would increase their wages.

Conclusion

The collective dispute procedure presented above was introduced in 1991 and thus it is over a quarter of a century old. It was prepared for the period of transformation and was meant to protect the process from excessive claims of trade unions. However, Polish economy today is, in principle, fully market and consultations are carried out with respect to changes in the act. One of the examples of proposed changes is the definition of the employer. This change seems to be necessary on account of the mode of functioning of international corporations where basic decisions referring to issues which form the realm of a collective dispute are made far outside of an enterprise operating in Poland, whose management is the employer within the meaning of the current act. This is only one example, as the entire issue lies beyond the scope of this paper.

Abstract

The main purpose of the paper is to discuss the nature of enterprise architecture of the blockchain platform (EAoBP). Authors highlighted as well how main technology challenges for enterprises are addressed through the proposed solution. The paper consists of the introduction and 3 chapters. Chapter 2nd presents related works about blockchain technology and defines platform concept as such. Architecture layers which are required to build enterprise blockchain platforms are described in 3th chapter. 4th chapter constitutes implementation aspects of the EAoBP. Permissioned blockchain systems leverage cross-organizational collaboration model, what constitutes cooperation within the network without 3rd party authorities. Open source character of implementation technology and clear guidance of the scope of each layer clarified in the article should help with business applicability of the concept.

Keywords: Blockchain, enterprise architecture of the blockchain platform (EAoBP), Distributed Ledger Technology (DLT), platform, Hyperledger Fabric, architecture layers

Introduction

The blockchain concept constitutes new opportunities for enterprises and enterprise networks nowadays. The first blockchain network created by Satoshi Nakomoto in 2008 is dedicated and limited to manage transactions behind BITCOIN cryptocurrency (Nakamoto, 2008). Open character of the network and anonymous character of peers causes that business usability of blockchain technology was questionable. Despite of business weaknesses the concept was so promising that many of authorities concluded it as disruptive for business models and processes nowadays (Risius 2017; Beck et al. 2017). Seeing huge commercial potential industry like Amazon, IBM, Microsoft Azure, Hewlett Packard, Oracle and SAP (Onik et al. 2019) started working on the new technology. In short time blockchain has been generalized to the distributed ledger systems that process all types of transactions within the network far beyond cryptocurrencies (Swan 2015, Sitarska-Buba 2018, Wörner et al. 2016, Hofmann 2018).

Blockchain is not a completely new technology, rather it is just new mechanism utilising existing multifaceted technologies together – such as distributed ledger technology (DLT), mathematical hashing, distributed networks, asymmetric encryption techniques, digital signatures and programming (Onik et al. 2019, Badr et at. 2018). Blockchain technology brigs the possibility to embed cross-organizational collaboration model (Norta 2016) joining entities that already cooperate into chains eliminating redundancy of transactions storage through common distributed ledger.

The goal of the article is to present enterprise architecture of blockchain platform and highlight how main technology challenges for enterprises are addressed through the proposed solution. Chapter 2nd presents related works about blockchain technology and defines platform concept as such. Architecture layers which are required to build enterprise blockchain platforms are described in 3th chapter. 4th chapter describes implementation aspects of the EAoBP.

Blockchain technology and platform concept

The first generation of blockchains, which were public (permissionless), consists of distributed nodes working together in a peer-to-peer model (e.g. Bitcoin, Ethereum). Anyone at any time can join and leave the public blockchain ecosystem enjoying full access to read and write (Onik et al. 2019). Blockchain systems operates under governance model to build trust between participants on a shared network (Wu 2019). Each participant's (node) has equal rights in approving the transaction. The transaction is an elementary component of the Blockchain system. This model rejects the creation of a central authority needed to approve the transaction. Authentication is processing within the network by each node. The transaction is asymmetrically encrypted and marked with a one-way hash function, which is collision-resistant and irreversible (the transaction cannot be played back, knowing only its shortcut).

The new transaction is transmitted into the blockchain network, what means that each node receives information about adding a new entry at the same time, in order to either confirm or reject it. The decision to add a new block should be made autonomously by each of the nodes based on the accepted consensus mechanism (e.g. Proof of Work (PoW), Practical Byzantine Fault Tolerance (PBFT)). If consensus is reached, the new block is added to the current system. A newly added block will store the hash of the previous block, which allows to keep the data structure in the system.

Introduction of smart contracts starts the second generation of blockchain systems (Blockchain 2.0). Smart contracts (Omohundro 2014) were introduced as semi-autonomous programs running on the blockchain. Consensus is implemented in the form of smart contracts, which are programmable rules/codes allowing transactions to result from the execution of user-defined programs (Rimba et al. 2018). Moreover, smart contracts are responsible for ensuring that all new transactions are complaint with agreed consensus (Tschorsch et al. 2016). It allows even parties who do not fully trust each other to conduct and reliably control mutual transactions without relying on the services of any trusted middlemen (Rimba et al. 2018) Smart contracts cover agreed within the network business rules and business agreements and are used to build trust within the network.

Only smart contracts implementation enabled the embedding of cross-organization collaboration models that was executed through private (permissioned) and federated (hybrid/consortium) blockchains. In the private blockchain the access is restricted, read and write access are controlled based on the roles of the nodes or other restrictions as defined by the protocol (Onik et al. 2019). Federated blockchain is moderated accordingly to the consortium need, access can be restricted, or reading/writing rights will be limited and defined a priori. The flexibility proposes by federated blockchains create the optimal environment to build cross-organization collaboration models addressing real business needs.

Synergy effect of usage well known technologies like DLT, mathematical hashing, distributed networks, asymmetric encryption techniques, digital signatures and programming make possible to create new generation of IT systems characterized by features like **immutability (**resistance towards the modification of data) and **non-repudiation**. Systems are also **forgery resistant**, certain researchers believe that even quantum computers are not able to change transactions (process the fraud) within so distributed network (Singhal 2018). Public blockchain systems are fully **democratic**, what is partially limited in permissioned or federated systems, which allow to create Regulator role or build internal channels to limit transaction exchange within (HF01 2020). The way data structure is defined, and data are stored, blockchain systems are **double-spent resistant**. Other very important feature of the blockchain technology is **consistent state of the ledger** achieved through implementation of the proper consensus mechanism (Singhal 2018). If the ledger is consistent and immutable the whole system is

auditable, because all transactions (historical and current) are stored. Peer-to-peer processing makes blockchain systems resilient. Even if a single node will be lost the security and consistency is not threaten because the same ledger copy is store by all other nodes.

On the top of features described above blockchain technology enable **digital tokens** to be distributed around the network participants. In the Blockchain world, tokens have emerged as the artefact of choice to represent assets, utility or a claim on something inherent to a specific blockchain project. Tokens exist due to their usefulness of representing something digitally (Pilkington 2015, Oliveira et al, 2018). Researchers identify tree main types of tokens: **cryptocurrency**, **utility tokens** (use as internal payment method, reward for reaching a consensus, workload performance reward, voting right confirmation or as a digital asset) and **tokenised security** (equity or funding tokens). Equity token confers to its holder a right to equity-related earnings, such as profit-sharing, application rents or platform fees and funding tokens are defined in the initial coin offerings (ICOs) process to perceive as a long-term investment from the holder's perspective, and as a financing vehicle for the project's team (Oliveira et al, 2018). Cryptocurrency and utility tokens are mostly used in permissionless blockchains, where the lack of trust nudges them towards the platform's distributed consensus (Lewis 2015). In opposite to that permissioned blockchain lacks the need of issuing tokens outside of mere choice or pure funding aspirations (BlockchainHub 2017, Lewis 2015). Before any implementation of tokens will be processed within commercial (permissioned) blockchain systems their usage and business values should be discussed first.

There are several limits identified for the blockchain technology that have to be addressed during business implementation. According to the authors most critical are transaction throughput and transaction latency. For bitcoin the average **transaction throughput** (number of transactions processed per second) is between 3.3 and 4.8 TPS (Blockchain 2020, Croman et al. 2016, @wandererli 2019). Comparing to the payment systems like Visa where there is around 2 000 TPS rate (Croman et al. 2016) it is clear that bitcoin will not replace payment transaction systems. **Transaction latency** can be understood as time needed to add new transaction within the system. The latency time is dependent on the consensus mechanism implemented in the network. In Bitcoin chain, where PoW consensus is implemented, 10 min are needed to add new block to the system. Blocks are relatively small around 1MB (@wandererli 2019). So huge latency is not acceptable for transaction systems, what meant that the scalability of the system is questionable according to the business usage.

Technology itself will not help developers to build blockchain based systems, scientists emphasize that industry should also provide a **platform**, that is considered as the development framework to create multiple applications (Pillai et al. 2017). Developers should be able to write their own application code using specific components of the platform. Not only technical challenges like security, performance, data integrity, privacy and scalability (Yli-Huumo et al. 2016) should be addressed but also quality aspects like usability for developers and suitability for integration within the network (Pillai et al. 2017).

Enterprise architecture of the blockchain platform (EAoBP)

This section proposes enterprise architecture of blockchain platform in details, presenting all required layers.

Limits of the blockchain systems, described in the previous chapter, cause that the pure architecture was not implementable in the enterprise environment. Based on the research the following requirements need to be considered for enterprise implementation of a Blockchain network:

- **Participants must be identified/identifiable** – enterprise usage of the Blockchain platform requires from the participants to be fully identifiable to keep the trust into a real transaction without 3rd party authorisation.
- **Networks need to be permissioned** – in the business reality the network is not open for everyone. It is limited to identified participants who were invited to be part of it. The permission mechanism should be easily implementable.

- **High transaction throughput performance** - one of the weaknesses of the public networks is transaction execution time, which can be even up to 10 min to processed single transaction (@wandererli 2019). It is must have condition to implement acceptable transaction execution time.
- **Low latency of transaction confirmation** – each transaction should be confirmed within the blockchain network as soon as possible, delays or too high latency causes low efficiency of the network and participants lost the trust.
- **Privacy and confidentiality of transactions and data pertaining to business transactions** – enterprise networks will not share their data worldwide, they will require to keep privacy and confidentiality of their data within the network and outside of the network.
  (IBM 2020, Forrester 2018, HF02 2020).

Authors defined enterprise architecture of the Blockchain platform that meet business requirements and trays to address constrains and limits of the public blockchain network (Fig. 1).

Authors Panda, Dhameja and Singhal proposed the Blockchain 2.0 system architecture, which consists of five layers. Each layer plays different role and is responsible for execution of specific functionality that determines Blockchain 2.0 as a whole (Singhal 2018). Authors agree that application, execution, semantic, propagation and consensus layers are critical to build blockchain platform.

The **application layer** is responsible for communication with end-users, providing them with specific business functions and IT services, allowing them to process transactions in accordance with business rules defined. Because of the peer-to-peer processing model the recommended development/programming frameworks are those which allow to create applications hosted on web servers, where new features are developed at the server level and communication with users is managed through API. Moreover, applications should support proper identity management and workflow management.

The **execution layer** is responsible for executing the instructions that are called by the application layer. The same set of instructions must have to be executed by each node independently to claim new transaction. By instructions we understand single scripts, algorithms or programs such as smart contracts. Deterministic execution of a specific instruction on the same input dataset and under the same restrictive conditions always provides the same output dataset for all nodes. This features of the blockchain technology ensure data consistency, **immutability** and **trust** within the distributed ledger.

The **semantic layer** defines the logical structure of the blockchain system. Each transaction, correct or not, is processed at the execution layer. Semantic layer is responsible for the validation and consequently approval or rejection of the transaction in the system. Semantic layer constitutes definition of transaction's validation rules, data models and data structure. In general, blockchain structure is a timestamped list of blocks, where blocks are connected through hash function (Wörner et al. 2016). It means that data are hash pointers that encrypt transactions of a given block. Each block stores its hash function and remembers the hash function of its predecessor up to the generic block (Drescher 2017). At the semantic layer, system developers implement smart contracts, which are autonomous algorithms or mini-programs performing additional operations written in their code during transaction execution (Klinger et al. 2017). The extensive use of smart contracts allows for the creation of new virtual goods that constitute business value in a specific Blockchain system.

The **propagation layer** is responsible for the definition of communication and synchronization within the blockchain platform. Per design the blockchain network is a peer-to-peer network, where each node is autonomous and there is no central authority approving transactions. For the public chain it is necessary to ensure the visibility of all nodes in the chain and the rules for adding new nodes so that they become equivalent members of the network. Next step is to agree the synchronization process between nodes. In Bitcoin blockchain when the new block is generated, it is immediately validated within entire network. If this block passes the correct validation, it is synchronized throughout the network. Transaction throughput and latency are most critical weaknesses of the public chain that make a business value of the whole solution questionable.

For example, this issue has been addressed in Hyperledger Fabric by dividing workload of the nodes between endorsing and committing peers and transaction ordering nodes, more about in chapter 4 (HP01 2020).

Other positive deviation in private chains is the possibility to create a role of central authority (regulator), whose approval will confirm creation of new transaction in the network. There are business models, especially in government area where regulator is needed but all other blockchain features can be used to create added value for the network participants.

The **consensus layer** is the most important and basic layer to meet general assumption of the blockchain technology. This layer defines the consensus on the basis of which transactions or blocks within the entire network are approved. The basic goal of each blockchain network is to achieve consistent state of the ledger. Each blockchain system may implement and execute a different consensus algorithm, but as to the assumption, the result is to validate one common version of the registry within the network without the participation of central authority. The security, trust, and immutability of a given network is determined by the effectiveness of the consensus algorithm.

For commercial usage of blockchain systems that very often require implementation of shared business processes, additional aspects affecting the architecture must be considered. Authors propose to extend the traditional list of layers through permission, data privacy and integration layers. The enterprise architecture of the Blockchain platform is presented on the figure 1.

Fig. 1: Enterprise architecture of the Blockchain platform (EAoBP)
Source: own research, based on (Sitarska-Buba 2018)

EAoBP will be mostly dedicated to participants of the business networks that already cooperates. They have a need to create distributed transaction ledger and share their business results within the network. To meet this request authors defined **permission layer** that is responsible for the definition of the access rules for network participants. The business entity will be allowed to access the blockchain network only when other participants agree or only based on the invitation. How the permission layer will be automated is up to the business agreements between current participants. There are examples of Blockchain implementation where networks are fully private like two polish cases: Durable Medium, KIR and e-Voting, KDPW. Those examples, described in more details in next chapter, confirmed the need of permission layer definition. The implementation of the permission layer can be executed in traditional contracts signed between individual companies or implemented in a blockchain code.

Permission layer has been highlighted at the end-user level as well. It is natural consequence of the closed access for nodes that is further distributed for application users as well. If the blockchain platform is private, access for the users is private as well. The access could be granted based on the invitation that has to be confirmed by the authority within the chain or by the network itself. In the second case invitation code could use consensus mechanism already implemented and manage each access as a specific type of the transaction.

Going deeper into blockchain platform layers authors identified **data privacy layer** that provides to participants the possibility to identify and limit transactions that will be processed within the blockchain system (on-chain and off-chain distribution) (Xiwei et al. 2016, Xiwei et al. 2017). This requirement is not only related to data privacy regulation defined by European Union (GDPR). This layer was created to ensure the flexibility for participants to define access level for specific type of transactions exchange between nodes. For example, Hyperledger Fabic v.2.0 provides private data collection mechanism which allows to exchange specific data only between a priori defined nodes. Still peer-to-peer data distribution is used but nodes send transactions only to the organization that is authorized to see them (HF01 2020).

Enterprises that decided to create blockchain platform usually build them above other IT systems and platforms that already exists in their organization. Different backend systems, frontend platforms and data hosting environments have contributed to define **integration layer.** The layer is responsible to workout common technology platform where notes will be hosted and maintain. Within this layer nodes will create integration code responsible for transaction extract from internal IT systems, translate them into blockchain transaction and based on the data privacy protocol distribute around the network.

Implementation of the EAoBP based on the IBM Blockchain platform

Authors decided to present implementation example of the EAoBP based on the IBM Blockchain platform and Hyperledger Fabric v2.0, which is an open source blockchain framework designed for business.

The main reason for this choice was that Research Everest Group assessed IBM Blockchain Services as Leader in a field of 30 service providers in the Blockchain Services PEAK Matrix Assessment 2020. Everest specifically noted IBM's strength in integrated services and solutions, global delivery footprint and vast network of partners across industries, and ability to enable consortia cooperation and governance (Doshi et al. 2019). Figure 2 presents PEAK Matrix graph.

Fig. 2: Everest Group Enterprise Blockchain Services PEAK Matrix™ Assessment 2020
Source: (Doshi et al. 2019)

IBM Blockchain platform is integrated with Hyperledger Fabric framework. Hyperledger or the Hyperledger project started in December 2015 is an open source collaborative effort created to advance cross-industry blockchain technologies. It is a global collaboration, hosted by the Linux Foundation, including leaders in finance, banking, Internet of Things, supply chains, manufacturing, and Technology. Hyperledger Fabric was first of the Hyperledger projects. Cooperation between IBM and Linux Foundation was so efficient because Hyperledger Fabric enterprise-grade permissioned distributed ledger technology (DLT) platform, designed for use in enterprise contexts (HF02 2020). **The permission layer** is an integrated part of the solution, where all participants are well known and authorized to be part of the consortium. Entities that are part of the network having common business goal, cannot trust each other, therefore consensus mechanism like crash fault tolerant (CFT) or byzantine fault tolerant (BFT) are provided.

RAFT is a crash fault tolerant (CFT) ordering service based on an implementation of Raft protocol. Raft follows a "leader and follower" model, where a leader node is elected (per channel) and its decisions are replicated by the followers (HF03 2020). RAFT consensus is highly recommended by Hyperledger Fabric those days.

Data Privacy layer is provided by Hyperledger Fabric through channel architecture and private data feature mentioned in the previous chapter. Using channels, participants of the network can establish a sub-network (private data collection) where members can see selected set of transactions. Private data collection allows data exchange between selected members of a channel, providing the same protection as channels without the need of creating and maintaining a separate channel (HF02 2020).

Consensus, semantic, propagation and execution layers are constituted by smart contract's implementation and execute-order-validate approach. Chaincode (smart contracts) are processed according to new sequence (HF02 2020):

- **execute a transaction** and check its correctness, thereby endorsing it,
- **order transactions** via a consensus protocol, and
- **validate transactions** against an application-specific endorsement policy before committing them to the ledger.

Predefined endorsement policy specifies how many nodes is needed to meet the consensus or how many is needed to vouch for the correct execution of a given smart contract. Endorsement policy is defined for each specific blockchain network, what means that channel architecture, channel leader election rules and regulator role are established separately. This rule brings us to the position that each transaction need only be executed (endorsed) by the subset of the peer nodes necessary to satisfy the transaction's endorsement policy. This allows for parallel execution increasing overall performance and scale of the system (HF02 2020).

New way of transaction processing significantly increases overall performance of the platform. Based on the newest results published by (Gorenflo et al. 2019) the platform is able to support up to 20 000 transactions per second (TPS).

Hyperledger Fabric is ready to use development framework that provides implementable modules for each blockchain solution like:

- **ordering service** establishes consensus on the order of transactions and then broadcasts blocks to peers,
- **membership service provider** is responsible for associating entities in the network with cryptographic identities,
- An optional peer-to-peer **gossip service** disseminates the blocks output by ordering service to other peers,
- **smart contracts** ("chaincode") run within a container environment (e.g. Docker) for isolation,
- The ledger can be configured to support a variety of DBMSs,
- **endorsement and validation policy** enforcement that can be independently configured per application (HF02 2020),

what is the perfect example of the EAoBP application layer.

IBM creating new blockchain solution provides integration layer that help to integrate data transformation and business services within cloud, on-prem or hybrid environments.
To create effective blockchain solution for business there are at least three must have conditions defined by IBM. First of all, the group of enterprises should have **real business problem** that can be addressed only through blockchain based system. The Blockchain ecosystem requires to build a network of organizations that are interested to resolve this business problem. The last condition is a need of trust that has to be created by blockchain system. Taking into consideration above conditions IBM successfully implement blockchain solution in different business areas proving efficiency and future of the technology.

Food Trust is one of the most successful blockchain projects from IBM. It is a food supply chain based on blockchain technology. Designed as a private, permissioned blockchain network for monitoring food supply from farm to consumer basket. As early as 2016, Big Blue and Walmart began testing blockchain to reduce the time to track goods. A proof of concept done with the Tsinghua University of Beijing focused on China's massive pork market, reduced the time taken from days to minutes. The result is a customizable suite of solutions that can optimize process of distribution, monitor food safety and freshness, minimize waist or health risk, trace exact provenience of the food and securely store required certifications. Walmart issued a mandate to all its suppliers of leafy greens stating that they had to get on to the blockchain by a deadline of the end of September 2019. Food Trust application is also a source of crucial information for consumer itself who can finally learn about his food from secure source which is blockchain based immutable record. Other leaders and competitors in food sector are currently joining the solution and testing the application for their needs. The system is also very attractive for restaurant and all others for whom the credible information on their food are important.

KIR, infrastructure institution of the Polish banking sector, and IBM created a platform prototype (Reliable Documents Sharing) for a durable medium deliberately based on a generally available, open source blockchain technology solution (KIR 2020). KIR chose as the basis for its platform the Hyperledger Fabric 1.1 framework from the Linux Foundation and an electronic stamp tool that it

developed itself (IBM2, 2020). The prototype durable data carrier has been designed to help banks adapt their internal systems to the requirements of the EU Directive 2007/64 / EC on payment services in the internal market in the field of customer communication, by digitizing publication, approval and search processes. KIR has built a prototype platform for the entire banking sector in Poland, whose task is to provide an online service aimed at verifying the existence and originality of documents, both public and private, published by banks for users.

KIR's durable medium blockchain solution acts as a secure database for banks and their customers that is not controlled by any single party. The platform provides a proof-of-existence service that enables users to register and verify documents through timestamped operations stored on a distributed ledger (IBM2, 2020). This ensures that every exchange of information receives an electronic timestamp and a unique cryptographic signature, which means that any subsequent changes to the information entered are immediately visible to the relevant users of the blockchain. This means that the entire lifecycle of documents issued and exchanged by banks and their clients can be traced and audited by all parties with access to the blockchain platform (IBM2, 2020). The above features indicate that all blockchain technology assumptions have been met by that implementation.

The Central Bank of the Republic of Azerbaijan and IBM developed a **Digital Identification System** based on Hyperledger Fabric, to verify the reliability of the documents related to both individuals and legal entities for use with banks, credit providers and similar organizations. The system will simplify and automate the "Know Your Customer" validation process and will be used by both clients and credit organizations serving citizens of Azerbaijan.

IBM designed for KDPW, National Depository for Securities in Poland **eVoting** platform for the Capital Market. It supports general meetings of public companies, including voting using digital devices. The eVoting application is integrated with the KDPW application used for providing issuers with lists of persons entitled to participate in general meetings (KDPW 2020).

Conclusion

The main idea this paper discussed is enterprise architecture of blockchain platform. Authors identified 8 layers that define the architecture, highlighting that permission, data privacy and integration layers are required in the business implementation of blockchain solutions. Those layers constitute the permissioned blockchain platform that is implementable at the execution level.

Applicability of the platform was verified based on the IBM Blockchain platform and Hyperledger Fabric. New approach of transaction processing (execute-order-validate) available in current Hyperledger Fabric code significantly increase solution scalability up to 20.000 TPS. The achieved result establishes the position of blockchain systems within the enterprise solutions, implementing effectively cross-organizational collaboration model.

Abstract

The article focuses on the problem of promoting economic security in the emerging digital economy. The main emphasis is placed on solving the problems of preventing threats and cybersecurity risks in the era of rapidly developing digital technologies. The basic approaches are related to the construction of an infrastructure to combat cybercrime: formation, technological improvement of IT software and hardware, regulation, the use of finance and insurance, support for the media and the development of a safety culture. The results of this study can be applied to the design of information security systems at all levels.

Keywords: Digital economy, competitiveness, sustainable development, cybercrime, cyber threats, IT-technologies, information security, outsourcing, innovations, blockchain.

Introduction

Today's world witnesses the rapid emergence of digital economy, which refers to a part of the economic relations in production, distribution, exchange and consumption, mediated by the network organization, the Internet, mobile communications, digital and IT technologies. New technologies combined with the development of telecommunication, computer, banking, and other networks, provide the opportunities for the rapid movement of information and money resources around the world, regardless of distance and time. The Internet is becoming a key economic infrastructure and serves as a platform for innovation; it creates a virtual space into where manufacturers and consumers are actively moving. Technology is reshaping the way people live by providing more choice of digital goods and services, lower prices, more complete information, more distribution channels, and promoting the emergence of information-oriented transactions for market players (e-commerce, online health care, distance education, online banking, etc.)

Digital technologies are transforming the socio-economic paradigm of human life. This is a new foundation for developing public administration systems, economy, business, social sphere, and a society as a whole. In the G20 Leaders' Declaration (on June 29, 2019, the final document of the G20 meeting was signed - "Osaka G20 Leaders' Declaration"), the section "Innovations: Digitalization, Free Data Flow with Trust" is of greatest interest from the perspective of the immediate future of humankind. In fact, it speaks of a new social formation, the concept of which is shared and welcomed by all G20 members. Japan is promoting this system and called it - Society 5.0. Society 5.0 combines technologies such as the Internet of Things (IoT), robotics, artificial intelligence (AI) and big data to make fundamental changes in industry, social and economic spheres. In Society 5.0, people, things and systems are interconnected in cyberspace, and the results obtained with the help of AI, exceeding human capabilities, "return" to the physical space. Society 5.0 is supposed to eliminate all barriers related to regions, age, gender, and language. Sustainable Development Goals (SDGs) - are "plans for international cooperation". This global project is also called "Transforming Our World: the 2030

Agenda for Sustainable Development". "The main goal of the new society is to make human life as comfortable, high-quality and safe as possible," the G20 Leader's Declaration says.

At the same time, the theory of the digital economy describes the new nature of rapid succession of boom and bust, increasing cyclic recurrence, and greater expectations. The changes are based on increasing velocity, volume, complexity of relationships and transactions, which intensify volatility, create uncertainty and reduce predictability. The development of a modern economy relying on the use of the state-of-the-art digital technologies, the creation of new materials, the analysis of big data, and the development of new management systems leads to a change in the principles of competitive relations. Competition is taking place not only for redistributing existing market shares in the "red ocean", but more for the formation of new markets for goods, services, technologies in the "blue ocean", competition for control systems based on new digital platforms. In such a situation, the digital economy is changing the concept and essence of the economic security of a nation, region, business, individuals, and poses new threats and risks for actors in economic processes and relations.

Review of relevant studies and problem statement

Since the end of the last century, researchers have been considering post-industrial development as a problem of the information society formation. In their works, they describe the theoretical models of the information society based on an analysis of trends in the global society development, international politics, socio-economic processes and other aspects [Bell, 1980; Beniger, J. R., 1986; Toffler, 1981]. Information confrontation and information security were dealt with by such scientists as Pipkin (2000), Gordon, (2002), Cherdantseva (2013). Their theoretical research was about the potential impact of information on political, economic, military and cultural processes in modern international relations. We can say that the emergence and scientific elaboration of the "information security" concept is directly related to the comprehension of the informatization phenomenon and the study of the information society formation. Information Security refers to a set of methods, technologies and processes designed to protect the networks integrity, programs and data from digital attacks, that is, it provides protection against cyber threats [Andress, 2014].

A cyber threat is the illegal intrusion or threat of malicious intrusion into virtual space to achieve political, social or other goals [Khandpur et. al., 2017]. A cyber threat can affect the computer information space, in which data is located, and where the materials of a physical or virtual device are stored. An attack typically affects a storage medium specifically designed to store, process, and transmit user personal information [Sapienza et. al., 2017; Okutan et al., 2018].

Today we can say that cyberthreats affect economic and political processes to a greater extent than ever before. Accordingly, the issue of the information society development and analysis of the problems associated with this, are still relevant, but is becoming increasingly significant, while the issues of predicting cyber threats come to the fore. The study of ways to distinguish malicious events from ordinary ones we see in the works by Zhang et al. (2008) и Li et al. (2012). The development of correlation systems for cyber threat warning based on models built on previous experience was addressed by Yang et al. (2009) and Xu et al. (2011), this issue was further researched in studies by Shadi et al. 2017). Companies rely on a huge amount of digital data for reliable incident detection [Bhatt et al., 2014]. Digital data is an integral part of our modern life. In fact, we live in the era of the digital economy, therefore, we consider it important to dwell on the definition of what the "digital economy" is, since this is important for the purposes of our study.

To date, there is no unified interpretation of what the "digital economy" is. For example, the World Bank gives this definition: "A new economic structure is based on knowledge and digital technologies, within the framework of which new digital skills and opportunities are being developed for society, business and the nation" [World Bank, 2016]. The following definition was given by the European Parliament: "The digital economy is a complex structure consisting of several levels / layers interconnected by an almost infinite and ever-growing number of nodes" [European Parliament, 2015] The European Commission defines the digital economy as "the economy dependent on digital technologies" [European Commission, 2014], and it takes the view that "The

digital economy is the main source of growth. It will inspire competition, investment and innovation, which will lead to an improvement in the quality of services, broader choice for consumers, and the new jobs creation" [European Commission, 2018]. According to the audit company Deloitte, digital economy is the economic activity that results from billions of everyday online connections among people, businesses, devices, data, and processes. The backbone of the digital economy is hyperconnectivity which means growing interconnectedness of people, organisations, and machines that results from the Internet, mobile technology and the internet of things (IoT). [Deloitte, 2019].

Such a number of interpretations leads to the conclusion that, in international practice, a harmonized definition of the digital economy has not yet developed. In the majority of studies, when describing the digital economy, the emphasis is on technologies and related changes in the ways of interaction between economic agents. In so doing, either specific types of technologies or one or another form of change in economic processes may be mentioned in them.

With the growing popularity of Internet technologies, the field of cybercrime is also expanding. Here we can conclude that the main threat to the emerging digital economy may be the loss of confidence in technology due to cyber threats.

Information security is based on data protection and sees the fight against cyber threats as its mission. Attacks take place more often and become more sophisticated. The number of intruders is growing. As a result of digital transformation and the introduction of new technologies, companies face new threats.

Research Methodology

The purpose of the study is to consider the main approaches to ensuring the economic security in the country and regions, solving the problem of preventing threats and risks of cybercrime in the era of rapidly developing digital technologies.

Based on the purpose, the following tasks are solved:

- to demonstrate the competition of control systems based on new digital platforms;
- to investigate cybercrime as a new threat to the security of the nation and business;
- to consider the basic methods of eliminating threats and risks for the digital economy.

Of great importance in the development of the digital economy in order to restructure and increase competitiveness is not only the development of a clear strategy, its focus on the formation of progressive technological structures, but also the ability to use the whole arsenal of instruments of direct and indirect state regulation.

The emergence of a new type of crime - organized cybercrime - forces economic agents and the state to single out the main tasks to prevent cyber threats in the following areas:

- personal data protection.
- security of commercial information systems.
- security of government institutions' information systems.
- protection of production environment, technologies and instruments.

The main research methods used are institutional, systemic, structural-functional and statistical approaches.

Results and Discussion

The expansion of the digital service, the individualization of many types of services increases the risk of fraud while reducing the control by users or providers. The risk of data leak requires better protection of e-systems. Currently, cyberthreats and damage from cybercriminals come immediately

after technological disasters in the world [Monakhova, 2016]. In the media, we constantly see data confirming these trends:

- 6.4 billion fake emails are sent daily around the world [Dark Reading, 2018a];
- 550 million phishing emails were sent as part of a single attack in the first quarter of 2018 [Dark Reading, 2018b];
- 50% of local authorities in England use unsupported software for their servers [Computing, 2018];
- 1,464 public servants of one state used Password123 [The Washington Post, 2018];
- 2 million stolen accounts were used to falsify the results of the American study of network neutrality [Naked Security, 2018];
- $ 729,000 was stolen from one businessman using the simultaneous use of fake accounts on social networks and directed phishing [SC Media, 2017];
- $ 3.62 million is the average damage from data privacy violations over the past year [Ponemon Institute, 2017].

A survey of 1,440 respondents conducted in the framework of the "International EY study in the field of information security, 2018-2019" showed that 39% of the companies surveyed reported that less than 2% of all IT services specialists work exclusively on cybersecurity projects. Among the companies surveyed, more than half (55%) do not include cybersecurity issues in their strategy. This problem unexpectedly turned out to be more relevant for larger companies, but not for smaller ones (58% and 54%, respectively).

According to Richard Watson, EY Asia-Pacific Cybersecurity Risk Advisory Leader, more and more companies are beginning to see the magnitude of the threat. Over the past 12 months, there has been one important change for the better, partly due to a series of major cyber attacks at the global level - now almost everyone realizes that information security is necessary not only to maintain data confidentiality, but also to ensure business continuity. The study indicates that 53% of the respondents increased spending on cybersecurity this year and 65% plan to increase spending next year (Table 1).

Table 1: Forecast of corporate cybersecurity spendings for the next 12 months [E&Y, 2019a]

Corporate cybersecurity spendings	During the current year.	Next year
Will increase by more than 25%	12%	15%
Will increase by 15-25%	16%	22%
Will increase by 5-15%	25%	28%
Will remain at approximately the same level (from + 5% to -5%)	40%	31%
Will decrease by 5-15%	4%	2%
Will decrease by 15-25%	1%	1%
Will decrease by more than 25%	1%	1%

An interesting fact is that the vast majority of companies (77%) are still at the very beginning of the path to ensuring cybersecurity and resistance to attacks. Organizations sometimes do not even have a full understanding of what information and assets are critical to them and where they are stored, to say nothing of their effective protection.

Therefore, many companies need to continue allocating resources to achieve a basic level of cybersecurity. First of all, it is necessary to identify key data and intellectual property objects, then analyze the available opportunities for ensuring cybersecurity, access control processes and other means of protection, and only then develop measures to strengthen the perimeter to fend off cyber attacks.

The effectiveness of cybersecurity activities depends on understanding, which information is the most valuable. Obviously, it is customer and financial information, as well as strategic plans, that the

company should protect on the first priority basis. Then it is followed by top management information and customer passwords. Information on suppliers is last on the list of top ten, and this indicates that the concept of joint protection throughout the supply chain is not made sufficiently well known. The ranking of the top 10 most valuable data types for cybercriminals [E&Y, 2019b] is shown in Fig. 1.

Figure 1: Ranking data types according to their value for the company

The second component that affects the effectiveness of a company's cybersecurity policy is understanding which cyber threats are the most relevant for the company. The most successful cyber attacks began with phishing and / or the deployment of malware. This is followed by attacks aimed at disorganizing activities and embezzlement of funds. Despite an active discussion of attacks by their own personnel and state-sponsored hacker groups, the threat of hacking from within occupies the eighth line on the list, while espionage - the last. The ranking of types of cyberthreats according to their hazard level is shown in Fig. 2.

Figure 2: Ranking of types of cyberthreats according to their hazard level

One of the underlying problems is the lack of personnel. It is estimated that over five years the deficiencies in information security specialists will reach 1.8 million people [E&Y, 2019b]. Even in properly resourced sectors, companies often cannot find employees with the right skills.

Speaking about Russian reality, it should also be noted that cybercrime in Russia is growing faster than any other types of crime.

From January to September 2018, 121247 crimes committed using ICTs or in the field of computer information were recorded in Russia. As the Prosecutor General notes, in comparison with the same indicator for 2017, the number of such crimes has almost doubled.

In the first eight months of 2019, 180153 cybercrimes were recorded in Russia. This is 66.8% more than in the same period of the previous year, the Prosecutor General's Office reports on its website. These are crimes committed using ICT or in the field of computer information. The Prosecutor General's Office of the Russian Federation characterizes the growth of cybercrime as "very significant". When compared with the data that the agency provides for other types of crimes, the growth rate in this segment is the highest.

According to PJSC Sberbank, the losses of the Russian economy from the hackers' activities in 2019 amounted to about 2.5 trillion rubles. In 2020, this figure may increase to 3.5-3.6 trillion rubles due to the projected increase in the number of cyber fraud by 40%. At the same time, in 2018, the loss amounted to 1.5 trillion rubles, PJSC Sberbank reported on January 28, 2020.

The retreat of crime into virtual reality, according to experts, can be a serious blow to business, regardless of the industry in which the company operates. Experts record the interest of cyber fraudsters not only in their traditional banking, financial and IT organizations, but also, as follows from the report of the IS company Positive Technologies, in the industrial sector, and the number of successful cyberattacks in Russia in 2018 is growing at the rate of 27 %. In 49% of cases, hackers attacked the infrastructure, in 26% - companies' web resources. In 30% of cases, criminals stole personal data, in 24% - account data, in 14% - payment data. In general, the number of attacks aimed at data theft demonstrates growth.

In April 2019, the management of Rostelecom reported that by the end of 2018, the number of cyber attacks in Russia had doubled, while the income of hackers exceeded 2 billion rubles. Over 2018, experts at the Rostelecom Solar JSOC established for monitoring, investigation and response to cyber attacks recorded 765,259 incidents - 89% more than in 2017. Credit and financial organizations, as well as e-commerce and gaming enterprises, were victims of 75% of cyber attacks.

Recently, due to the lowering in the threshold for this activity, organized cybercrime is aimed at personal data theft through mobile devices and financial mobile applications.

In 2019, Microsoft and TAdviser conducted a study. The results are presented in the report "Assessment of the cyber security in Russian business". The study was conducted on a survey of respondents - heads of IT departments, heads of information security offices, heads of functional departments, as well as other persons who influence decision-making in the field of IT and information security. The study revealed the main protection equipment that are used in companies (Fig. 3).

Figure 3: Technical protective equipment used by Russian companies in 2018

Companies are accustomed to working with typical security solutions that have been implemented in organizations for many years: antiviruses, firewalls, IPS / IDS. We see that following the growth of information security threats, companies are starting to use new technologies for protection: sandboxing, network traffic analysis systems, solutions to detecting, investigating and responding to complex cyber threats (endpoint detection and response), as well as specialized APT protection solutions (advanced persistent threat).

Since January 1, 2017, the new standard of the Bank of Russia STO BR IBBS-1.3-2016 has been in force in the Russian Federation, the document establishes information security requirements in financial organizations and operating payment systems, which should help preserve the security of the banking system. The development and control of information security of the banking system, interaction with the security services of commercial banks is carried out by the cybersecurity center of the Central Bank of the Russian Federation.

Massive DDoS attacks aimed not only at banks, but also at ICOs of new cryptocurrencies and their infrastructure facilities, increased by an order of magnitude. The reason for this is the insufficient amount of necessary protective equipment, software and capacities, the lack of special services, in addition, many hybrid protection solutions do not completely solve the security problem; it requires a transition to combined, cloud and operator information protection technologies. The Central Bank of the Russian Federation in 2018 recorded almost 700 cyberattacks against banks, but hackers' incomes are declining. The main methods of attacks on Russian banks are presented in Fig. 4 (according to Positive Technologies and FinCERT).

Figure 4: Main methods of attacks on Russian banks in 2018

Group-IB forensics laboratory experts concluded that in 2018 hacker activity against the financial sector accounted for about 70% of all. At the same time, 74% of banks were unprepared for attacks as Group-IB notes: more than half of the banks showed traces of attacks in the past, they could not centrally manage the network to localize the attack, and they spent more than four hours on coordinating work to eliminate the attack.

Group-IB experts also analyzed attacks on bank customers: more than 80% of cases of money theft were committed using social engineering methods. Fraudsters call victims and pretend to be bank employees, offering services, or representatives of the security service, who allegedly detected suspicious activity. In 2018, banks monthly faced an average of 3,000 attacks using such methods. The dynamics of unauthorized Russian cards transactions according to the Central Bank of the Russian Federation is shown in Fig. 5.

Figure 5: Unauthorized Card Transactions

In 2018, fraudsters managed to steal almost 1.5 times more money from Russian cards - 1.4 billion rubles, according to the Central Bank, this is 44% more than a year earlier. Prior to this, fraudsters income has been declining for three years in a row.

Despite the fact that information security is the basis of the competitiveness of modern business, according to a survey of 248 Russian firms by PwC in 2017, it turned out that 40% of Russian companies do not have an information security strategy, while 50% do not have a plan for responding to information incidents security, while 48% of companies do not have employee training programs aimed at improving business information security.

Such an attitude to cybersecurity leads to great damage and economic losses, to violation of data confidentiality, disclosure of trade secrets, the possibility of industrial espionage, breach of business standards, unforeseen problems of business processes, intellectual piracy, lower quality of products and services, and creates conditions for the appearance of a threat people's lives. But, recently, investment in cybersecurity by enterprises has begun to increase dramatically. According to Canalys analysts' data released March 28, 2019, the dynamics of total global spending on cybersecurity is shown in Fig. 6.

Figure 6: Cybersecurity costs, US $ billion

The diagram shows that in 2018, sales of equipment, software and services designed for information security reached $ 37 billion, an increase of 9% from a previous year ($ 34 billion). Despite the fact that many companies prioritize the protection of their assets, data, endpoints, networks, employees and customers, cybersecurity accounted for only 2% of total IT spending in 2018. However, there are more and more new threats, they are becoming more complicated and frequent, which provides manufacturers of information security solutions with new opportunities for growth. In 2020, total cybersecurity costs are expected to exceed $ 42 billion.

According to Accenture's September 2019 assessment, the cybersecurity services market is growing at a rate similar to Digital and IT market. Accenture predicts that by 2021 the global market for information security will have increased by 66% to $ 202 billion. The largest manufacturers of information security products according to Canalys (cybersecurity analysis) are shown in Table. 1.

Table 1: Worldwide: top five cybersecurity vendors

#	Vendor	Q4 2917 share	Q4 2018 share	Growth rate
1	CISCO	8.7%	9.6%	22.5%
2	PALOALTO	5.9%	6.9%	28.7%
3	Check Point	6.4%	6.3%	8.0%
4	FORTINET	5.5%	6.1%	21.5%
5	IBM	5.5%	5.8%	15.7
Others		68%	65.3%	6.3%
Total revenue (US$)		9.1 billion	10.1 billion	10.5 billion

Source: Canalys estimates, March 2019

In total, the five largest manufacturers account for more than 30% of the proceeds from the sale of information security products.

An innovative, digital way of life, the implementation of new information programs and technologies, the tasks of big data analysis (BigData), the change of the technological era, the advent of Blockchain technology, the Internet of things (IoT), force companies to feel rather different about their own human resources, knowledge, and knowledge assets that have their own specifics, as they are not yet evaluated from the standpoint of their scarcity and depletion. The use of the state-of-the-art digital technologies, the requirements for the new competition conditions makes companies change their attitude to the selection, training, retraining and retention of specialists. Digital companies need digital advisors who possess not only computer technology knowledge, but also high emotional intelligence, carry out extensive missionary activities to motivate team members, and are able to aggressively and confidently pursue innovative policies in the context of digital globalization. In the rapidly developing Russian companies Yandex and X5 Retail Group, in 2017, former HR managers took CEO positions.

Significant costs to eliminate threats to economic security are borne by the power and manufacturing industries of the Russian Federation, since power plants, infrastructure, and factories were built during the Soviet era and most of them do not meet modern information security requirements. The digital transformation of business processes and technologies increases the cost of information security and infrastructure. A study by Qrator and Wallarm “Information Security in the Financial Sector” showed that in 2016 out of 150 Russian banks, the expenses on information security increased in 32% of banks and in 39% of banks remained at the same level, which increases overall prime cost of financial services and loans. According to the Information Security Association (BISA), the main consequences of information security incidents, in market participants’ view, are financial risks (32%), reputation risks (38%) and license revocation risks (24%). Recently, financial institutions and payment systems have begun to use third-party solutions to protect against threats of DDos attacks, many banks initially pass information traffic through an external server, thereby increasing the ability to counter unauthorized access to the main server [Monakhova, 2017]. The global trend in the development of the theory and practice of cybersecurity is that information security departments should not be a superstructure over the company's business processes or government, but become an integral part of a single mechanism, fit into the overall development strategy.

External challenges, deep digital import dependence of the economy, dictate to Russian companies the task of participating in intense international competition for creating added value in the cyber environment, which requires finding ways to commercialize and protect intellectual property, legislative addressing the issues related to the digital technologies and software turnover, and ensure information security when launching digital platforms and technologies. To do this, it is necessary to ensure the security of the main tools of the digital economy - the protection of electronic signatures and payments, tokens, SIM cards, online services, the protection of information in electronic clouds, databases, the development of cryptography and identity authentication technologies, the protection of electronic document management systems, transmission channels, servers, commercial and public electronic trading platforms, and scientific laboratories. A separate task is to protect against cyber

attacks against artificial intelligence, robots, unmanned aerial vehicles and transport, the latest Blockchain technologies, and the Internet of Things (IoT) [Shcherbik, 2015].

The main threats to the information security of the digital economy today are encryption viruses, for example "cryptolocker" which penetrate not only personal computers, but also into networks of strategic objects and can cause technological disasters. Losses and damage from such penetrations are estimated in the world by hundreds of millions of dollars. A serious threat is posed by attacks on initial public offerings of shares (ICOs) of companies in the blockchain space with the aim of stealing assets or destroying platforms (for reference: the Telegram messenger's ICO volume in 2018 is more than $ 1.2 billion), attacks on cryptocurrency infrastructure and services, theft of electronic wallets, passwords, attacks on banks, etc. According to Group-IB, over the past three years, the number of cyber incidents in Russia has increased by 72%, and the damage from them by 200% with a forecast of a triple increase.

New digital technologies provide new opportunities for the analysis of big data, computer vision allows you to automatically process a huge number of images, photographs, find the desired object, which helps in the search for attackers and terrorists. The danger of new technologies is that the visualization of information flows forms a new subculture of the Internet, sometimes negatively affecting the psyche of people with its minimalism, "aesthetics of gray concrete", and hopelessness, which carries with it the threat of criminals exploiting suicide and death, especially among young people. Instagram has become the new mainstream of mass culture, where you can create an illusion and "edit" ideas about your own life, while being forced to be influenced by the imposition algorithms created by search engine robots [Mamayeva, 2016].

In 2017, more than 3 thousand addressees, 250 companies in 12 countries received phishing emails with infected files from the Cobalt hacker group, and three weeks later a cyber attack occurred with an average check of $ 100 million, from which not everyone could defend themselves. Among many cybercriminals, the most famous organized hacker groups who have committed cybercrime where the amount involved is equal to hundreds of millions of dollars around the world are Lurk, Buhtrap, Lazarus, Carbanak, Cobalt. The damage from their criminal activity is estimated not only at the amount of stolen, caused harm and destroyed infrastructure, but also at inflicting invaluable moral damage to the injured citizens and firms, harming the global economy by the fact that many organized cybercriminals recruited, involved in criminal plans and actions the best minds of cyberspace, young people passionate about digital technology, who have not found their place in the legal economy. A separate issue is the establishment and development of specialized public electronic departments and the unleashing of invisible computer wars over the spheres of influence both in the economy and in politics. There are already many examples of such computer wars and conflicts, starting with attacks on the infrastructure facilities of Iran's nuclear program and ending with alleged claims about "interfering" in the US presidential election. The creation by countries of "troll factories" that distribute fake news has marked the beginning of a new era in which imaginary information becomes a custom-made product and can bring down a stock quote or a policy-maker rating in a matter of minutes [Shcherbik, 2015].

In Russia, to date, the electronic databases of various ministries and departments are so fragmented that there is no single database, there is no single electronic signature of a citizen, and an electronic signature issued in one department is not accepted in another. The accelerated reshaping of the Russian economy into a digital environment depends on the access to patents and inventions. our country can use the experience of the Bell Labs laboratory (AT&T), which in order to accelerate technological progress in 1948 provided access to information on the invention of the transistor, in 1958 to integrated microcircuits; in 1971 it published data on the microprocessor, and in early 2000 on prototypes of DNA machines.

Conclusions

In the era of the rapid development of digital technologies, the main goals of maintaining the economic security in Russia and solutions to the threats and risks of cybercrime are as follows:

- Constant data communication on information incidents and protection technologies among companies and public organizations at the international level. Implementation of round-the-clock response to cyber incidents at the facilities to identify, analyze and prevent cyberthreats.
- Improving the information security competencies of IT-specialists, employed in all services of companies and government agencies, organizing the interaction between business units, IT specialists and economic security departments.
- Further work of the RF CB Cybersecurity Center to improve the banking system security and payment systems.
- Constant media coverage of the impact of the struggle with cybercrime.
- The propagation of digital "hygiene" right out of high school, the organization of school programs, and cyber literacy lessons.
- Improvement of the technical support for systems information security, constant update of antiviruses, installing firewalls, prevention of leak protection, the use of telemetering services and routers, protection of automated process control systems from malicious software.
- Legislative regulation of cyberspace, cryptocurrencies and blockchain technologies.
- Financing cyber intelligence programs to search for cybercriminals and destroy a criminal business.
- Early completion and implementation of the program “Digital Economy of Russia”.
- Launch of new cyber threat insurance products and programs.
- Initiation by the Russian Federation of activity aimed at adopting the United Nations moratorium on the use of cyber weapons.

Applying new digital technologies, short parsing of big data allows producing a realistic economic projection. The goal of matching individual consumer preferences leads to the fact that competition between manufacturers develops in the direction of the struggle for information about the preferences and dreams of the buyer, for a database of his lifestyle, health, and hobbies, which increases the risk of unauthorized access and theft of personal data.

The international struggle for political and economic influence in the context of the digital economy development poses a new threat to economic security. The prevention and elimination of threats and risks to the digital economy and ensuring the security of the IT environment have become today the basis of competitiveness for people, businesses and the states. The prevention and elimination of threats and risks to the digital economy and ensuring the security of the IT environment have become today the basis of competitiveness for people, businesses and the states.

Abstract

Research Motivation: a subject of research in article is process of assessment of efficiency of insurance of projects with use of real options on the example of the metallurgical companies. The purpose - specification of a formula of calculation of the expected effect of implementation of the project with use of real options. The research hypothesis - application of more objective formula of calculation will allow to increase efficiency of insurance of projects and to use the additional opportunities which are contained in them. ***Research Methodology***: systematization of main types of real options allows to expand the range of application of management decisions. Application of more objective formula of calculation of the expected effect of implementation of the project with use of real options (at restriction – only for real assets as basic) confirms the made hypothesis. ***Main Findings***: the direction of future researches - formalization of a pricing model when calculating the price of the option contract for the real option.

Keywords: Real Option, Metallurgical Company.

Introduction

Classical analysis methods involving the use of an action template (passive management) laid down at the initial stage of the project implementation do not take into account the possible occurrence of synergistic positive effects, underestimate investment opportunities and ignore the fact that the manager can change the decision based on new information. Such an opportunity must be predicted. The discounted cash flow method (DCF) assumes (indirectly) that the organization does not account for real options that can be embedded in real assets and which can be used to gain a competitive advantage. That is, the DCF is static and "conservatively" analyzes the investment situation, not taking into account the possibility of changing investment and managerial decisions depending on the project's scenario. This makes it difficult to change the actions planned in the business plan of the project in the direction of obtaining new opportunities for more effective development of the organization through its implementation. Scenario analysis using conventional approaches also does not solve the problem of taking into account dynamic changes in real investment objects (RIO) and uncertainty in the external environment - as a result, an averaged version is accepted, taking into account the uncertainty of the project implementation in accordance with the established assumptions.

An organization usually uses (consciously or unconsciously) real options as the main approach for acquiring competitive advantages in the face of uncertainty and achieving its strategic goals (maximizing the value of the company or the welfare of the owners). Using real options changes the function of the company's offer and the range of products it produces. Therefore, the analysis from the point of view of the concept of real options is a search for additional opportunities for the development of the organization through the implementation of the project.

Theory

A real option is a derivative tool[1] that provides the ability to change previously made investment and management decisions in the face of risk and environmental uncertainty, the management of which and its value depend on the underlying process, characterized by the uncertainty of the course, and the real (non-financial) asset (enterprises, oil reserves, projects, equipment, industrial investments, etc.).

The concept of real options distinguishes two groups of additional features contained in the project: 1) changes in project parameters over time: refusal to implement it (its reduction / expansion) after receiving additional information, changing sources of raw materials, etc.; 2) the implementation of one project makes it possible to implement another.

"Opportunity" can have its own value, and the more "opportunities" the project contains, the greater the cost. This concept allows you to quantify, using the same indicators as the classical theory, the opportunities available in the project and take them into account when calculating its cost, which plays a key role in making investment decisions: if additional opportunities are evaluated only qualitatively, at best, they serve as an additional positive factor for the project when comparing its quantitative parameters ceteris paribus.

Materials and Methods

In practice (in conditions of risk and uncertainty of the state of the external environment and many internal parameters of the project), different cash flow options can be implemented and, accordingly, various estimates of efficiency can be obtained, which complicates the process of formation and justification of investment and management decisions by traditional methods. The real options approach (RIO) (embedded, hidden) - a quantitative method for assessing the attractiveness of an investment project as the value of an exchange option, based on the transfer of option pricing techniques to the management of the investment portfolio of real options approach from the point of view of hedging it allows you to take into account the possibility of changes of these decisions.

This method is widely used in assessing large (strategic) projects, including analysis of the probabilities of their scenarios, forecasting the whole range of positive and negative effects, especially in conditions of significant uncertainty in the development of market conditions. Unlike the DCF, the use of ROA allows you to evaluate in monetary terms also the risks that arise during the implementation of projects and the organization's opportunities for more efficient use of limited investment resources. Although uncertainty remains, management has the ability to adapt over time to a changing situation and make more effective investment and management decisions when additional information is received.

At the same time, as a result of the project implementation, there are more opportunities to obtain "breakthrough" technical solutions, larger economic benefits or means of compensation for damage in the form of a set of real project options, to increase the efficiency of the RIO portfolio being formed. The use of real options when managing an organization allows reducing the value of making costly "most accurate" forecasts, directing more funds and efforts to identifying possible alternative ways of its development and increasing managers the value of their company, expanding opportunities for it or reducing losses.

[1] These are mostly simple options, but there can be exotic ones, for example, a composite "call to call to project", etc.

Results and Discussion

Let us analyze the main types of real options (Fig. 1) on the example of projects of metallurgical companies.

Fig. 1: Types of real options for projects

A real option to continue investing (abandonment of a project (exit from it) can be represented as a "put" option with a strike price equal to the value of the assets of a real project in case of their sale or more profitable use This option insures to a certain extent against the failure of its implementation and is applied if a metallurgical company, for example, operating in the field of high technologies, implements projects that do not provide the minimum required profitability or even with negative net present value (NPV), justifying this with their strategic importance, for example, the ability to take a place in the market and be able to conclude a contract for the production of other products (services) in the implementation of another next project.

The opportunity to invest in project no. 2 is a real option "call". Given the objective uncertainty of the future, investments in project no. 2 may not bring / bring income, which ensures the strategic value of this option for continued investment, allowing you to abandon project no. 2 if the investment does not bring income, or invest in it if it provides the required profitability (Fig. 2).

The value of this option takes into account the market niche occupied by the metallurgical company. In turn, the implementation of project no. 2 will give a real option for project no. 3, etc., and the implementation of projects no. 2, 3 will compensate for the shortfall in income from project no. 1. That is, it is necessary to take into account and evaluate the value of a real option for continued investment, showing how profitable with a high degree of uncertainty and fast growth of the market of products (services) the possibility of subsequent investment.

Fig. 2: Accounting for a real option for continued investment in the formation of the investment portfolio of a metallurgical company

An example of this option is the Tata Steel ltd steel plant construction project. in the city of Kalinganagar (India). At the 1st stage, it was planned to build a plant with a design production capacity of 6 million tons of steel / year with investments in the construction of industrial infrastructure ≈ 3.5 billion dollars. However, the implementation of the 1st stage would allow the company to reach the breakeven point only, but would not have formed an added value for shareholders, therefore the 2nd stage involved the expansion of production to 8 million tons of steel / year with less (compared with the 1st stage) investment.

This option allows the metallurgical company to exit the project with a sharp deterioration in the market situation, for example, by recovering part of its losses by selling assets or using them for other, more efficient investments. A venture fund can exit the project if it is successfully implemented through the stock market mechanism, and use the funds received as payment for the services of its managers, owners' income and investments in other projects. This option was not taken into account by POSCO in the implementation of its project to build a plant with a capacity of 12 million tons of steel / year in the state of Odisha (India) with a total value of 12 billion dollars. The company in 2005 concluded a memorandum of understanding and construction with the state government, but until 2012 it was not able to obtain the necessary permits for construction (mainly due to the resistance of local residents and environmentalists) and was forced to stop investing in 2017 and return the land acquired for construction.

An example of an analysis of the stages of making managerial decisions and calculating a real option to abandon a project for the release of new products sold by a metallurgical company with the aim of

expanding the sales market, reducing the cost of goods sold and optimizing the product range is shown in Fig. 3.

Fig. 3: Stage investment decision for a real option to abandon the project

It is assumed that at the end of each year, the metallurgical company makes the next investment decision. Each "branching" means the adoption of such a decision or the next stage. The number in parentheses is a net investment. In the interval from the 3rd to the 6th years (t = 3-6) the cash flows generated by the project are shown. Investments in this project are made in 3 stages:

1) if the metallurgical company decides to implement the project at the point t = 0, it should spend 50 thousand dollars to conduct marketing research. Her managers estimated the probability of a favorable result about the market potential at 80 %. If the project is stopped at this stage, the company's costs will amount to 50 thousand dollars;
2) if, according to the results of marketing research, the metallurgical company comes to the conclusion that the project will continue, then at time t = 1 it is necessary to invest 100 thousand dollars to produce an experimental version of the new product. The managers of the metallurgical company estimate the probability of a positive outcome at 60 %;
3) if new products are satisfied with potential consumers and design experts, the metallurgical company at the time t = 2 should invest 1 million dollars. to purchase production equipment and start production of new products. Metallurgical company managers estimate the likelihood that potential customers and design experts are satisfied with new products at 60 %. If a metallurgical company starts production of new products, then, according to managers, operating cash flows will be generated within 4 years of the project's life, the magnitude of which will depend on how well the new products will be "accepted" by the market: the probability that inflows cash will be ≈ 1 million dollars / year – 30 %, ≈ 400 – 40 % and ≈ 200 thousand dollars / year – 30 %.

Joint probability characterizes the expected probability of each result. Upon completion of the project NPV = 1525 thousand dollars. with a probability of 0.144 (Fig. 3). In turn, the costs of rejecting the project are significantly reduced to 50 thousand dollars. with a probability of 0.2 and 137.9 thousand dollars. with a probability of 0.32 (Fig. 3). If, in this example, the metallurgical company had an alternative to using the equipment of this project, for example, to produce a fundamentally different type of product, the project could be terminated with lower losses and the risk of its implementation would be less.

A real waiting option (the possibility of deferring investment in a project with a positive NPV, for example, to study the situation in order to have the right to choose[2], thereby reducing project risks) can be represented as a call option on a project executed when a metallurgical company starts to implement it. At the same time, the company must possess assets (patents for inventions, know-how, unique technologies, etc.), ensuring that others do not occupy its market niche. Delaying the implementation of the project is most attractive in conditions of: a) high risk and uncertainty, and b) when the cash flows lost or delayed during the period of such a temporary delay are small during project implementation, its financial results depend largely on management decisions and management is able to make "flexible" decision data when new information appears that affects the implementation of the project (Fig. 4).

Fig. 4: Consideration of a real option for waiting time for investment in the formation and implementation of the investment portfolio of a metallurgical company

A classic example of the implementation of this option is the Simandou project of Rio Tinto in Guinea, which received in 1997 the right to develop the largest (2 billion tons) iron ore deposits in the world worth 21 billion dollars. After receiving the first ore in 2015, production was suspended due to

[2] The real option and choice are not identical. If the metallurgical company does not have the opportunity to carry out the project in stages or exit it before the project is completed, minimizing losses, it is faced with a choice that does not contain real options: invest or not "now".

a deterioration in the price situation on the iron ore market (during 2017 its cost (62 % of the market, the port of Tianjin (PRC)) decreased from 160 dollars / ton to 60 dollars / r) so as not to create "pressure" on prices in the market with an additional offer.

A real (technological) **option to develop new innovations** depending on the effect in the form of products of intellectual activity. This option is divided into: a) positional (involves small investments simultaneously in several technological areas to insure if the main direction chosen by the company does not justify itself), b) intelligence (used if the company can develop the technology, but does not know, in to what extent the market will perceive it) and c) "bridge" (short-term and small investments in unknown market niches to use the experience gained when creating "breakthrough" technologies in the company or in prospective x market niches). An example of the first is PJSC Severstal's investment in IMBS South Africa (a 25.6 % stake in its shares) developing Fine smelt technology (extraction of iron ore concentrate from low ore or spent tailings of iron ore deposits). At the 1st stage, it is supposed to identify the possibility of its use for obtaining iron ore concentrate with a commercially reasonable cost and construction of a demonstration plant), in the future - the global scaling of this technology at other sites.

When evaluating this method, the amount ($\boldsymbol{i}$) paid for the right to own a technological option represents an investment in a R&D project to improve and refine existing products and launch new generations of technological products in which the company has a strong image and position. The cost of further investments necessary for the implementation of this project is the price $\boldsymbol{P}_0$ that the investor determined at time $\boldsymbol{t}$, $\boldsymbol{P}_1$ is the sum of the conditional profit from the project that the investor will receive at time $\boldsymbol{T}$. If $\boldsymbol{P}_1 \leq (\boldsymbol{P}_0 + \boldsymbol{i})$ it is sometimes advisable for the investor to exercise the option to partially cover the initial costs of R&D. This option is useless if the R&D project is not associated with high risk.

The option for not produced new products allows the metallurgical company to receive an interest-free loan, while the buyer-broker makes a partial prepayment. The trading methodology, which provides for the possibility of putting up for sale a section of options for a new but not yet produced product, suggests that the buyer, having paid 20-40 % of the cost of the entire batch, receives the right to distribute it as it is produced. Payment of the remaining 60-80 % of the cost is carried out as new goods are delivered. The contract stipulates that in case of refusal by the metallurgical company to supply, the interest-free loan turns into a commercial one with a rate not lower than commercial bank loans, the conditions of a possible reduction or growth (redistribution of income from the sale of products between the manufacturer and the buyer) of the current prices are also stipulated.

Using **a real option as part of a leasing contract** allows you to plan and invest production. An example of this strategy when forming an ARI portfolio is the situation when a lessor, under a contract with a lessee, enters into a put option with a third party (a real option to sell an object (for example, equipment) for a metallurgical company project.

The sellers of this option may be stock speculators, counting on the unclaimed need of the option right by the lessor to receive profit under the option contract in the form of an option premium, or potential buyers wishing to purchase this ARI at a price known to be lower than the market price. This allows the lessor to sell the equipment to the seller of the real option at the price specified in the contract (strike price) during the agreed period of the option contract, and the option gives its buyer only the right to sell, and not an obligation (the fulfillment / non-fulfillment of the option contract depends entirely on the lessor). The strike price is set based on the market value of the leased asset at the time the real option expires, taking into account its physical and moral depreciation, and remains unchanged for the entire term of the real option. That is, the lessor is insured in case of default by the lessee by selling the seized leased asset at a fixed price. In this case, the premium paid to the seller of the real option may be included in the lease payments as the insurance amount in the lessor's investments. The lessor, as the buyer of a real option, expects that the strike price will be higher than the market value of the seized leased asset. Therefore, when acquiring a real option, he should be guided by the forecast of the market value of the used ARI.

Operational (operative) leasing may also be a real option for the lessee, which implies the possibility of early return by the lessee of the leased asset.

A real option for the transfer of know-how under a licensing agreement during the implementation of the project. One of the important points in concluding a license agreement is to familiarize specialists of a potential buyer (metallurgical company) with the technical solution intended for commercial implementation, and to demonstrate its operation. However, having familiarized himself with the know-how, the licensee may refuse to conclude an agreement and begin to use it free of charge without any liability before the owner. Therefore, on the one hand, in the process of demonstration, the essence of know-how should not be disclosed, on the other hand, a potential licensee wants to get acquainted with the know-how and evaluate it before signing a license agreement.

To solve this problem, it is envisaged to conclude a preliminary option agreement at the negotiation stage in order to keep a potential licensee secret and to prevent unfair use of the know-how by paying the advance payment to the seller for acquaintance with the know-how transferred on deposit to the licensor's account, according to which the licensor undertakes to familiarize the potential licensee with the know-how. If the latter, having read the know-how, does not sign a license agreement, he does not have the right to disclose, transfer to third parties the information received from the seller and use it industrially. If the licensee signs a license agreement, then the advance payment is made against future payments under the license agreement. All information requested in writing can also be transmitted only after the conclusion of an option agreement or license agreement containing a confidentiality clause.

A real hiring option implies the possibility of extending, after an agreed period of time, a contract with an employee of a metallurgical company or a member of its sports team for their hiring (rent) for a period specified in the contract, for example, according to the "1 + 3" scheme (after 1 year for another 3 years) or the possibility of refusing to renew the contract after 1 year.

A real option for the possibility of changing the scale of the project. In a favorable situation (increased demand for products, the number of customers, etc.), additional investments may be made, in case of deterioration, a part is withdrawn. This real option is advisable to apply in cyclic production.

Real options on RIO, encountered in practice, are usually more complicated than those considered. For example, you can refuse to implement a project not only in a single case, but at any time. The price for refusing to implement the project may change over time and, as a rule, is not known in advance. In addition, even abandoning the implementation of the project, it is possible to return to its implementation in the event of more favorable circumstances for investment. It is also possible to use exotic real options for RIO insurance.

Variability for holders of real options creates upward potential, while the option contract limits losses. On the other hand, the metallurgical company, while the project has a positive NPV, seeks to exercise a real option in order to receive cash inflows. If the cash flows are high enough, the metallurgical company will exercise the call option ahead of schedule.

Model

Calculation and accounting of the value of real options for projects is an important mechanism for increasing the efficiency of forming the investment portfolio of a metallurgical company. Valuation of investment projects using the real options method is based on the assumption that any investment opportunity can be considered as the right to create or acquire (sell, return) an asset for a certain time. The well-known formula for calculating the value of a project using real options does not take into account a number of long-term costs associated with the use of real options. Therefore, the authors provide an updated formula for calculating the expected net present value of an $\overline{NPV}$ project under conditions of risk and uncertainty using real options

$$\overline{NPV} = \sum_{i=1}^{n} NPV_i \cdot P_i,$$

where P_i is the probability of the implementation of the i-th scenario of the project when $i = 1, ..., n$; NPV_i is the discounted net income of each project implementation scenario, defined as

$$NPV_i = \sum_{t=0}^{T} \frac{CF_t}{(1+E)^t} - \frac{\text{CPO}}{(1+E)^t} - \frac{\text{DACAURO}}{(1+E)^t}$$
$$= \sum_{t=0}^{T} \frac{R_t - C_t^{-I_t}}{(1+E)^t} - \sum_{t=0}^{T} \frac{I_t}{(1+E)^t} - \frac{\text{CPO}}{(1+E)^t} - \frac{\text{DACAURO}}{(1+E)^t},$$

where in the period $\boldsymbol{t}$ of the project implementation $\boldsymbol{CF_t}$ is cash flow; $\boldsymbol{R_t}$ is current results in monetary terms; $\boldsymbol{C_t^{-I_t}}$ is current costs excluding investments $\boldsymbol{I_t}$ in monetary terms; $\boldsymbol{T}$ is the calculation horizon when evaluating the project; SRO is the cost of real options available to the metallurgical company or built into the project; DACAURO is discounted additional costs associated with the use of real options; $\boldsymbol{E}$ is the general economic discount rate determined by the Fisher formula

$$1 + E = (1 + i) \text{ x } (1 + \alpha) \text{ x } (1 + r), \quad (1)$$

where $\boldsymbol{I}$ is the nominal (percentage) rate on short-term 3-month government bonds; $\boldsymbol{\alpha}$ is the average rate of inflation; $\boldsymbol{r}$ is correction for the unsystematic component of the overall risk of a particular project.

That is, the $\overline{NPV}$ of the project is the sum of the expected net present income from it without the possibility of adapting it to changing conditions of implementation (risk and uncertainty), the cost of real options available to the metallurgical company or built-in options for the project, and the discounted long-term costs associated with it using real options, namely: 1) a change in the company's approaches to doing business and organizational culture; 2) revision of business plans and, as a result, a possible loss of strategic guidelines due to excessive "flexibility" in making management and investment decisions; 3) accounting: a) the price that will have to be paid for the rejection of the project, which is usually not known in advance and may change over time; b) opportunity costs of investment, the value of which is comparable to the value of a real option; c) the possibility of transforming investment costs into irretrievable costs (for advertising, hiring / firing and training employees, special products of equipment and services), which will make investment irreversible. Therefore, investors usually do not start investing until the income substantially exceeds the long-term average costs, taking into account the fact that these processes can be postponed without starting.

The risk of the project and, as a consequence, the discount rate taken into account in formula (1) when using real options will be less.

When analyzing real options, it is often impossible to apply the calculation formulas derived for financial options, since options that have real assets as the underlying ones differ significantly from financial options. The difference between financial and real options is related to the risk-free interest rate used for them. In the first case, the yield of the least-at-risk asset default asset is used - short-term 3-month government bonds. For the second, a similar interest rate is usually determined individually for each project, or, for example, this is the average return on investment in the industry or the refinancing rate of state central banks for the least risky projects.

Conclusion

Economically developed countries with regulated market economies widely use real options for RIO. For Russia and Kazakhstan, this is also very important, in particular, for projects in conditions of investors having a psychological distrust of long-term and large volumes of private investment. On the other hand, the cost of creating a real option may not be justified, for example, the ability to increase output (investment in additional production capacity) may not be provided by an increase in demand for it.

Systematization of the main types of real options makes it possible to expand the range of application of these decisions for people making managerial and investment decisions, while the use of exotic real options should also suggest the development of a method for their application.

When evaluating the effectiveness of each project included in the investment portfolio and the portfolio as a whole, it is necessary to take into account and evaluate the real options embedded in them. The use of a more objective formula for calculating the expected effect of the project using real

options allows you to increase the effectiveness of RIO insurance through real options in conditions of risk and uncertainty and use the additional opportunities contained in the projects for more efficient development of metallurgical companies.

Human Resources as A Key Determinant of Success in An Expedition Project

Pawel B. MICHALSKI

Wroclaw University of Business and Economics, Wroclaw, Poland

pawel.michalski@ue.wroc.pl

Abstract

The purpose of this article is to demonstrate the key role of human resources in achieving success in an expedition project. The author defines the concept of an expedition project and presents a set of features that should be perfectly matched by a team. At the same time, the unusually important role of the leader was presented and the criteria described in detail, the fulfillment of which defines the success of the expedition project. The impact of the human factor on the success of an expedition project is conditioned by a properly selected team managed by a leader who builds partner relationships and motivates subordinates accordingly.

Keywords: Expedition Project, Human Resources, Leadership

Introduction

World markets never sleep. The flow of people, goods and money lasts around the clock. Societies in the 21st century are overworked. In the little spare time they have, they want adrenaline. Holidays on a Greek island, a rest on a luxury yacht or a visit to Stonehenge are not enough. The demand for more active rest has increased. A new market segment has been created, offering holiday experiences in conditions which, until recently, have been reserved only for people involved in competitive sports or people professionally working in the industry. More and more companies offer spending a week in the African jungle (survival), on Mt. Blanc (mountaineering) or hiking in the Sahara (extreme rally). The result of this trend is the creation of specialized agencies, which, in addition to providing tourists with the desired adventure, also organize and supervise projects implemented by scientific/research and government units.

In the literature on the subject and in the publications of societies which associate professionals in project management, so far no aspects of design analysis have been implemented in the provision of services in the sector of professional expedition tourism (extreme).

Expedition Project

The author has created a definition of an enterprise that combines all the previously cited elements. The expedition project is an organized expedition aimed at carrying out set tasks using project solutions. This is a specific undertaking, not only unique in the sense of the planned goal, but also in terms of organizational and interpersonal complexity and the level of participants' security. Individual stages of the project take place not only in the comfort of offices and conference rooms and with the support of the latest software. It is often a struggle against the elements, our own weaknesses. It is a dynamically changing scene of events where planning of individual operations is not always possible beforehand. Decisions there, are often made quickly, at the project site, in extreme conditions.

The Definition of Success

In the case of business projects, the adoption of a certain type of success evaluation criterion does not pose many difficulties, as the exponent becomes, for example, the achievement of specific profits through the sale of a new product, the successful introduction of innovative technology or the construction of a new warehouse to facilitate distribution. The expedition project requires a different

approach. Achieving success by a scientific expedition is reaching, collecting samples, measurements and tests carried out by the team as a whole. An extremely opposite example is the mountaineering expedition, where summiting of at least one participant is the success of the whole expedition. The organizer's financial profit and customer satisfaction on the other hand are important factors, but it is equivalent to define a limit, exceeding which means not only failure in the substantive sense, but above all it can pose direct threats to project participants (Lock, 2007, 17-19). Defining the success of the project depends on the adopted evaluation criterion, which is determined by the assessor (Young, 2016, 14-15). In the case of an expedition project, the customer (primary criterion) comes first, followed by the organizer (secondary criterion).

Basic criteria:

- degree of goal / goals achievement
- safety (including health) of participants
- duration not exceeded (with due tolerance - depending on the nature of the project)
- assumed budget not exceeded
- an adequate level of service quality maintained

Secondary criteria:

- financial success (the project generates a surplus of revenues over costs)
- obtaining further orders by the organizer
- sustention / reputation growth of the organizer.

The success of the project is determined by effective management of information flow, timely perception and proper assessment of emerging threats and opportunities, as well as quick communication of ideas between project organizers, the project team and the client - the recipient of the project. The manager (leader) has a great impact on the success of the expedition project, whose indispensable feature is creativity, but understood not so much as coming up with new ideas, but creativity as the ability to combine facts, analyze their connections and create new solutions based on them that better respond to current needs of the project.

The project has a good chance of success when:

- the competences of the project implementer will be professional and pro-social
- there will be proper promotion of the project and effective recruitment of clients
- skillfully selected partners and staff
- expected results will be achieved
- there will be effective project management

Only then can you talk about effective goal-oriented project management.

Does meeting only some of the presented criteria (primary and secondary) mean a lack of success? The implementation of an expedition project should never be evaluated in terms of binary categories. For example, if the schedule and costs are exceeded, but the goal is achieved - the expedition reaches, for example, an alpine peak, it will mean that the final result is positive. A different case may be in the sports-scientific expedition, which did not achieve the sports goal (e.g. climbing a new route), but collected the planned samples for analysis from a distant corner of the globe. The assessment of success then depends on the importance of individual goals.

Expedition project of a mountaineering character

A great example of an expedition project is a mountaineering expedition. The specificity of this type of projects, especially in the context of planned goals, best illustrates the overall activities that, when properly combined and coordinated, create maximum opportunities for success.

The expedition project has negligible chances of success without prior precise determination and analysis of parameters shaping individual organizational phases. These parameters are interdependent and form a kind of system that must remain in balance for the success of the project (Michalski, 2010, 101-106). Those are:

- **The scope** defines the project boundaries, defines the activities that must be performed at each stage of the project. This does not mean, however, that the scope of the undertaking will not change during the project duration. Appropriate management allows for ongoing adaptation of activities to changes (Wysocki and McGary, 2003, 23-24)
- **The substantive purpose** of the intended expedition determines the direction of preparation of appropriate logistics facilities. Each mountaineering expedition project is specific in its own way and requires a different approach.
  For example, the goal could be:
  - the summit is reached by the simplest climbing route possible
  - the summit reached by a new climbing route
  - climbing a new route without reaching the top
  - reaching the maiden peak
- **Quality** for an expedition project can be considered in two categories:
  - quality of service - the key factor for the customer is the satisfaction of the expedition, both in terms of achieving the goal as well as the organizational level and the level of safety during the project (PMBOK Guide, 2017, 275)
  - quality of expedition project management - is an important element of the undertaking's success. This means the need to constantly control the quality of management and to find ways to improve it. The basic control tools are a reliable team of experienced professionals and an appropriate communication system.
- **Time management** allows for planning the date and the duration of the expedition..
  - the date depends on the geographical location of the project objective, and so it depends on the time of year when the expedition may take place
  - project duration is defined by a schedule consisting of basic elements such as: starting date of expedition, duration of individual stages, time needed to reach intermediate goals and the main goal, deadline for project completion
- **Project costs** include setting the expedition budget, allocating funds for the implementation of individual project phases, and attempting to estimate the increase in costs over the duration of the project, which often has the effect of limiting or abandoning some of the intended objectives.
- **The resources of the expedition project** are divided into human and equipment (capital):
  - human resources are an essential element forming the enterprise team. The manager - coordinator is the person who is the most experienced both from the technical side of the specific project as well as from the organizational and logistics field.
  - equipment (capital) resources depend on the choice of project implementation location (climate zone), nature of the expedition (sports, commercial) and the purpose of the project (reaching the summit, establishing a new climbing route).

Human resources management in an expedition project

No expedition project, regardless of profile, purpose and scope, can be implemented without the appropriate staff coordinating all activities during individual phases of the project. Project team members should be selected in such a way that specialists of each of the relevant parts of the project are included in it. The concept of the expedition project team is perfectly characterized by Kezsbom and Edward (2001, 455), describing the team as a set of people who must rely on the cumulative knowledge, skills and talents of each of the interdependent team members. Each team is a group, but not every group is a team. A team is a special term given to a group of people who are aware of the essential nature of their dependent roles and the skills and talents each of them has. These, in turn, complement their efforts and guarantee achievement of goals. The effect of team work can best be explained using the concept of synergy. Thanks to effective joint work, the team can generate

solutions to problems that are much better than those that could be created by each team member individually.

The importance of leadership in an expedition project - project leader

Leader's predispositions should include the ability to motivate subordinates, look at current events and independence in the assessment of facts, and in the organizational context of the project - negotiating skills, vital interest and concern for the success of the enterprise, focusing on achieving the set goals and thinking in terms of the project as a whole. Regardless of the size and purpose of the project, what counts is the ability to make decisions in conditions of limited information availability and the ability to implement a style of targeting both tasks (the need to obtain the required project implementation parameters in the system: scope, time, costs) and people (the ability to create and maintain an atmosphere of creative involvement of team members). An extremely valuable feature, and often underestimated, is openness to non-standard working methods and skillful ways of communicating within the team and that of the team with the environment, by creating a favorable atmosphere for the free flow of information in the team. The leader of the expedition project should have high professional qualifications, i.e. the ability to estimate costs and anticipate the time to complete the tasks, the ability to plan and predict possible types of risk, events and the planning of adequate actions in advance, as well as to be reasonably proficient in a foreign language of the region where the project is implemented (Meredith and Mantel, 2009, 111-112).

There is a very large group of features and skills that a good expedition leader should have, but it should be noted that none of them can replace a partnership approach. A partnership approach means managing in such a manner that the created team works together more effectively than the sum of the units participating in it. The synergy of the team's operation is a feature that is very difficult to achieve. Gathering the best specialists, but not forming a team, does nothing more than the sum of their individual actions. The leader will gather people, but if he cannot approach them like a partner, he will not succeed. Understanding habits, preferences, and justification are the features of a partner who is also a leader in the project. The partner does not treat people as his or her inferiors but puts him or herself in their place and tries to understand their behavior. Those behaviors, when combined and summed, create more than individual activities. The team created in this way could be compared to a network. A network, skillfully connected and cooperating, whose links pursue one goal. One of these links is also a leader. He or she created it and allocated tasks, but they do not stay outside. For someone on the outside, he or she are one of the links, not at all visually different from other links. The differences remain only in the possessed and used competences - leadership and partnership.

Managing an expedition project in the mountains is more difficult than managing ordinary projects. In the case of expedition projects, the work form is more casual and changes occur more often. The associates (partners) do not know each other at first, many things are different and they change more frequently. Also, the future is not always obvious, making management a bigger and more complicated challenge.

The style of management (leadership) during expedition projects falls within the area of so-called integrative style. The degree of intensity of the features of this style - focus on people and tasks - can be different depending on the specifics of the undertaking and the form of its implementation.

The ability to manage people means linking leadership with a partnership approach. Most of the leaders, selected from a group desired for each expedition project, have come to their positions through numerous successfully completed projects. Each of them was a subordinate of a different leader. He used valuable remarks and carried out orders, but he wanted to be treated like a human being. Relations between the manager and employee or, in the case of an expedition project, the leader and a team member should be carried out on a partnership basis, but everyone should know the scope of their tasks and be responsible for them. A well-managed team is a team of partners pursuing a common goal under the guidance of a phenomenal leader - a leader with character.

Selection of Team Members

In the literature on the subject several types of selection methods can be found. The most common are:

- biographical information analysis,
- references,
- interview,
- tests

The selection of members of the expedition project team is based on a method that uses some elements of the listed types of selection depending on the profile of the project. The circles from which climbers are recruited constitute a relatively closed environment in which classical selection methods do not apply. Recruitment for a specific expedition project is not made by placing an advertisement in the press, but through informal contacts. The next stage, after gathering a group of people interested in the project, is to analyze the achievements of candidates in terms of experience in a given climbing specialty. The next very important element of selection is collecting opinions, i.e. information from third parties about the personal nature of the candidate (information from persons who together with the candidate took part in other expedition ventures). The last stage is a conversation about the expectations and responsibilities of the candidate for a team member. In the case of people with an established position in a given environment and their extensive experience - the stage of collecting opinions is unnecessary, therefore it is often overlooked. There are two critical stages throughout the entire selection cycle, the analysis of which allows selection of the right candidate. These are the experience analysis and the interview stages. These two elements complement each other and on that basis it becomes possible to directly verify a potential participant in an expedition project.

The influence of the human factor on the success of an expedition project

Since the beginning of time, people have united and joined groups to achieve individual and collective goals through joint efforts, because such cooperation was easier than working on their own initiative. Nowadays, this is still the case, only the terminology and terminology has changed.

Climbing the summit is the culmination of many months of preparation, of fighting the elements of nature, of conquering your own body and mind. Achieving this goal is usually not possible without teamwork. This means that the success of a mountain expedition project, to a large extent, depends on the characteristics of the team that implements the project. Each trip is concerned with different purposes, various technical assumptions and diverse geographical area. This means that the selection of human resources must be very precise each time, which, in turn means that the set of features of a potential team, matching each expedition project, is very narrow:

- **a common goal** - the group needs a common task, or a common goal that all members of the group know and accept. They can focus around this goal and it will point them in the direction of the project activities
- **rules of behavior** - no group can exist without specifying game rules or norms, i.e. rules of behavior that are accepted and applied by group members. They are defined by the group's goals and can be divided into formal and informal rules. By applying these rules, many conflicts within the group can be avoided and managing your team will be more effective.
- **understanding of dependencies in a group** - this feature relates to the knowledge of mutual relations that team members have and to the significance they attach to these relationships. The interdependence results from the scope of joint actions of team members that are necessary to achieve the goal (Pinto and Kharabanda, 1995, 226-230).
- **sense of community** - arises in a team when they perform common tasks as part of an expedition project, which promotes an atmosphere of unity and has a positive effect on personal relationships within the group

- **integrating personal and group goals** - one of the tasks of an effective team leader is to integrate personal goals and team goals. In order for the team as a whole to achieve its goals, its members must first be able to achieve their personal goals within the overarching goal structure of the whole team. Motivation is maximum when team members see the opportunity for self-development while working on a project
- **level of trust** - within the project team it is a very important factor determining the well-being of a group member. In other words, it means a sense of being comfortable and of working in a team, which translates to the willingness and ability of members to honestly express different opinions, values and relationships, and to treat them appropriately. A high level of trust in the team minimizes the risk of conflict on a scale that may affect the success of the venture.
- **commitment** - during the expedition project the team is often exposed to sleepless nights, exhausting physical exertion, stress and even life threatening situations. It is imperative that all physical and mental forces be focused on the goal. In other words, the team members must be fully involved (and therefore convinced) in what they do.
- **personal diversification** - team members come, in principle, from different environments and professional groups and are specialists in various fields. In addition to differences in professional skills, team members differ, also in principle in, their ability to solve decision-making problems, as well as, in team collaboration skills. The right mix of skills and viewing perspectives represented by team members allows for creating solutions to difficult and diverse problems by using the right people at the right time. An effective team also needs members with diverse personalities.
- **the level of integration** - determines the coherence of the team, and, in practice, of the achievement of a balanced degree of integration, in accordance with the principle "no extreme is good". On the one hand, there is a risk of a complete lack of team integration, which means complete disagreement between members and complete breakdown of decision-making processes, on the other hand, full team integration, which may result in uncritical acceptance or conformity to dominant points of view, as well as aversion to creativity or individual responsibility

  - **the size of the project team** - depends on the specificity of the expedition project (Soles and Powers, 2003, 43-45). These can be large national expeditions (12-15 people), milieu expeditions (4-8 people) or projects organized by small, mobile teams climbing in a fast and light style (2-4 people).

Conclusions

Creating an expedition team is a kind of art and there is no ready recipe (Orr, 2004, 91-92). It is based on the skills of proper selection of participants and the ability to work with them so that, in a short time, a group of people transforms into a team. The project leader must demonstrate knowledge and ability to use firm methods of approach and techniques of project management in practice. An ideal situation arises when there is an optimal, well-motivated project team involved in the task.

Human resources are key to realizing the pursued goal in an expedition project. Factors that, during the planning and implementation phases, affect the project, constantly create threats that lead to failure, not only in the substantive sense (lack of success), but may lead to the loss of health or life of the participants. They are related to the elements connected to the planning of mountaineering expeditions (e.g. definition of the target, budgeting, official activities) as well as to the dynamic implementation phase (e.g. logistics of reaching the foot of the mountain, climbing action schedule, supply). Individual team members are responsible for specific areas and stages of the project, and the whole operation is coordinated by the leader. Cooperation during a mountain expedition is based on the goal. The team has a common, overarching goal, and everyone knows precisely what they are responsible for. It is important for team members with hidden individual goals to be able to surrender them for the group. If this can be determined much earlier, then there is a chance of success. Motivation is also extremely important. At all stages of the expedition project under extreme conditions, the body refuses to obey. In addition to short moments of rest at the Base Camp at the foot of the mountain, climbers are constantly struggling, physically and mentally with the surroundings (difficulty of climbing route, ice crevasses, weather conditions) and threats - lack of

oxygen causing altitude sickness, avalanches, frostbites and others. To overcome these adversities and convincing yourself of a seemingly lost fight, both individual (built long before the expedition) and team (mutual between team members) motivations are needed.

Acknowledgement

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Abstract

Research Motivation: when organizations switch to an innovative type of development to staff training, new requirements are put forward: constant updating, expansion and deepening of existing knowledge of workers, specialists and managers at all levels. This article offers a solution to the problem of increasing motivation and efficiency of employees in the organization through the use of a system of continuous training and innovative technologies for obtaining continuing education. The hypothesis of this study: in organizations that use methods of continuous learning and innovative technologies for obtaining continuing education, employees are more effective and have greater potential within the organization. **Research Methodology:** quantitative-Kettel's Questionnaire (16-PF) and Rean's questionnaire "motivation for success and fear of failure" (MSF). The concept of "continuing education", its main characteristics and tasks are analyzed. The relationship between the use of the continuous learning system and innovative technologies of continuous education in the organization and the motivation and performance of employees is revealed. An empirical study of the impact of the continuous learning system and innovative technologies for continuing education on the effectiveness of employees of the organization. **Main findings:** it is concluded that the system of continuous training and innovative technologies for obtaining continuous education positively affects the motivation and efficiency of activities in the organization, as well as the personal characteristics of employees.

Keywords: Innovations, Education, Lifelong Learning.

Introduction

Relevance of the research. The development of innovative technologies for continuing education in the organization is necessary to the development of innovative technologies of continuing education in the organization and insufficient theoretical study of this problem and social need of the society, organizations and their employees in a harmonious and effective integration of innovative technologies, continuing education in your organization's operational processes and insufficient integration.

Theory

Innovative technologies for continuing education in the organization.
Definitions of continuing education is education with the next characteristics: 1) lifelong learning (LLL); 2) adults; 3) continuous and professional.

The central idea of continuing education is the development of a person as a person, subject of activity and communication throughout his life.

Continuing professional education includes: basic professional education (including second and third higher education); professional development (and professional retraining); professional self-education.

Continuing education promotes three main objectives: 1) the preparation of man for inclusion in the system of modern public and professional relations; 2) improving human development, is already included in social production, with a view to its timely adaptation to constantly changing conditions; 3) comprehensive development of personality, formation of its Outlook, moral, aesthetic, physical and other qualities, interests, needs, General culture.

Elements of the system of continuous education in the organization: testing; onboarding; basic training program; foreign language training; formation of a staff reserve.

The functioning of continuing education is based on the principles that define its specifics: 1) humanism (testifies to the appeal of education to the person, the freedom of choice by the individual of forms, terms, types of training, professional development, self-education); 2) democracy (assumes the availability of education at any age in accordance with the capabilities and needs of each person); 3) mobility (expressed in the diversity of the means, methods, organizational forms of system of continuous education, their flexibility and readiness for rapid restructuring in accordance with the changing needs of industry, society, person); 4) timing (based on scientific forecasting requires faster and more flexible development, restructuring schools, the use of new forms and methods of the continuous education system towards the needs of public practice, mobile updates of their activities); 5) openness (obliges educational institutions to work with different age groups and groups of the population that differ in the level of education and professional training, increased potential in professional activities, attitude to education in terms of its orientation to professional orientation, positive life aspirations).

Continuity is a sequential chain of educational tasks throughout the educational process, passing into each other and ensuring the progress of students in each of the time periods.

Continuity in this point of view means the continuity at the borders of different stages or forms of education, the unified organization of these stages or forms within an indivisible system of education. In relation to the educational process, innovation means the introduction of new goals, content, methods and forms of education, the organization of joint activities of the teacher and students.

Innovative technologies are sets of methods and tools that support the stages of implementation of innovation that provides innovative activity, and are focused on the formation of systematic, creative, technical, innovative thinking and outlook, and, as a result, the ability to generate non-standard technical ideas when solving creative, production tasks.

The emergence of new information technologies associated with the development of computer tools and telecommunications networks, made it possible to create a qualitatively new information and educational environment as a basis for improving the quality of pedagogic process, enable strategic development management methods of training in information and communication environment, economic and organizational aspects of informatization of the system of continuous education and, as a consequence, the development and improvement of the continuous education system as a whole.

The main goal of innovative educational technologies is to prepare people for life in a constantly changing world, in the case of organizations – in the labor market. The goal of innovation is to make a qualitative change in the student's personality in comparison with the traditional system.

Characteristics of innovative educational technologies are: activity-based, providing active involvement in learning, problem-based (developing the ability to act in various problem situations)

and system-based (reflecting the specifics of a multi-variant professional activity); reflexivity (the ability to understand not only the content, but also the process of activity, to combine management and self-management), adaptability (focusing on needs, motives, individual opportunities); dialogic (ability to organize a system of multi-level contacts between teachers, students and employers).

Materials and Methods

The study sample was 40 respondents – employees of HR departments of the 2 companies (20 people – employees of company "A", which introduced the system of continuous education and innovative technology continuing education for the last 10 years, 20 employees of organization "B", in which it is not). The minimum age of the Respondent is 22 years, and the maximum age is 50 years. The median age was 34 years. Among them, 26 (65 %) are women and 14 men. All study participants live in Moscow (70 %) and the Moscow region (Table 1).

Table 1: Distribution of respondents by gender and age

Age / Gender	Men	Women	Total
22-30	5	9	14
30-40	5	11	16
40-50	4	6	10
Total	14	26	40

The company "A" uses the following methods of innovative training: personal-oriented (self-development program: each employee has quarterly and annually prescribed goals that they must achieve during this period, the results of which are further discussed with the Manager); problem-based (regularly held forums, heuristic training, brainstorming, debates, Socratic dialogue, business basket, forum, discussion in a low voice, "think and listen"; panel discussion, where the goals and results of the team are discussed, as well as global issues to work on); block-modular (test forms of final control of knowledge (decision tree, business and role-playing games: used during various trainings for employees of companies – on working with customers, leadership); remote (online courses on stress management, staff performance assessment, recruitment, cybersecurity, etc.).
This study uses qualitative and quantitative methods to evaluate the effectiveness of staff performance, depending on the presence or absence of a system of continuous innovative education in the organization.

Quality performance management (PM) method. The results, methods and competencies of employees are evaluated, areas of development are identified, and the employee's career is planned: employee training and career development plans are drawn up. All categories and positions of the company take part. The emphasis is placed on the feedback of the Manager with the subordinate in the form of regular contacts once a year (formally) and more often (as needed, informally). Task-setting interviews and final interviews are held once a year, where the employee is provided with feedback on their work and developed directions for the development of their success and quality of work. These interviews are conducted jointly by the manager and subordinate.

Quantitative methods (the Kettel test (16-PF) and the MSF Rean questionnaire) were used on employees of both companies to test the hypothesis about the relationship between innovative training in the company and employee performance. The first one examines factors: the General level of intelligence, the level of imagination development, susceptibility to new radicalism, emotional stability, the degree of anxiety, the presence of internal tensions, the level of self — control development, the degree of social normalization and organization, openness, isolation, courage, attitude to people, the degree of dominance-subordination, dependence on the group, dynamism. The second diagnoses positive motivation (hopes for success) and negative (fear of failure), primarily in educational activities.

In the first test, the Respondent had to choose one of three answers to 187 questions in the questionnaire, and in the second questionnaire, they had to agree or deny 20 statements.

Results and Discussion

The Kettell test is a 16 – factor test, some of which are combined to form additional factors. The following characteristics were studied: leadership qualities (dominance (E) + independence (Q2)), motivation and anxiety (anxiety (O) + ego-tension (Q4)), flexibility (diplomacy (N), receptivity to the new (Q1)).
For this purpose, the average value of these 6 factors for both organizations was calculated for employees of organizations "A" and "B" in each age range for men and women separately (tables 2-4).

Table 2: Factors of dominance and independence in «A» and «B» companies

Age/ Gender	«A» Company		«B» Company	
	Men	Women	Men	Women
22-30	7; 9	10; 8	7; 7	8; 6
30-40	10; 8	7; 7	8; 7	7; 7
40-50	7; 6	5; 8	6; 5	6; 6

Table 3: Factors of anxiety and ego-tension in «A» and «B» companies

Age/ Gender	«A» Company		«B» Company	
	Men	Women	Men	Women
22-30	5; 3	6; 4	2; 5	3; 5
30-40	2; 1	2; 4	5; 5	4; 6
40-50	2; 4	3; 3	6; 5	5; 4

Table 4: Factors diplomacy and receptivity to the new in «A» and «B» companies

Age/ Gender	«A» Company		«B» Company	
	Men	Women	Men	Women
22-30	3; 1	2; 3	8; 6	8; 5
30-40	2; 4	3; 3	7; 3	9; 4
40-50	2; 3	1; 4	5; 4	6; 3

Analyzing the results, we can see that the employees of the organization "A", where the system of continuous training and innovative technologies for continuing education are used, have higher leadership potential, flexibility, efficiency of thinking and anxiety than the respondents from the "B" company. Interestingly, women of all ages are more independent and dominant than men, as well as anxious and ego-unstable. Men, on the other hand, have shown themselves to be more flexible and diplomatic employees. The biggest difference in average age between companies "A" and "B" is in the factors of "diplomacy" and "receptivity" to the new. Respondents of all ages from company "B", where there is no continuous training system, are cautious about innovations, and are used to using already "known schemes".

Results processing and evaluation criteria for the MSF Rean questionnaire.

For each match of the response with the key from the questionnaire, the respondent is given "1" point. The total number of points scored is calculated. If the number "1" to "7", it is diagnosed the motivation to fail (fear of failure), if the number from "14" to "20", it is diagnosed the motivation to

succeed if number is "8" or "9", there is a definite trend of motivation to fail, and if the number of points "12" or "13", there is a certain trend motivation for success.

Motivation for "success" refers to positive motivation, when an employee, starting a business, assumes that as a result of achieving something constructive, positive. At the heart of human activity is the hope for success and the need to achieve success. Such employees are usually self-confident, responsible, proactive and active. They are distinguished by perseverance in achieving the goal, purposefulness. The motivation for the "failure" refers to a negative motivation. This motivation is based on the idea of avoidance (human activity is associated with the need to avoid failure, blame, punishment, failure) and the idea of negative expectations. Starting a business, a person is already afraid of possible failure in advance, thinking about ways to avoid this hypothetical failure, and not about ways to achieve success. People who are motivated to "fail" are usually characterized by increased anxiety, low confidence in their abilities, try to avoid responsible tasks, and when it is necessary to solve super-responsible tasks, their situational anxiety in these cases becomes extremely high. However, this can be combined with a very responsible attitude to business.

The text of the MSF Rean questionnaire is: 1) starting the work, as a rule, optimistic hope for success; 2) active; 3) is prone to creativity; 4) to perform critical tasks trying to find the reasons for rejection; 5) often choose the extremes: either low light job, or unrealistically high in difficulties; 6) when meeting with obstacles, as a rule, do not back down, and looking for ways to overcome them; 7) with the alternation of successes and failures tend to re-evaluate its success; 8) productivity depends mainly on my own determination, rather than on external control; 9) when performing fairly difficult tasks, under time constraints, the effectiveness of my activities deteriorates; 10) I tend to be persistent in achieving the goal; 11) I tend to plan my future for a fairly long term; 12) if I take risks, it is more likely with intelligence, rather than recklessly; 13) I usually do not; 14) I prefer to set myself average difficulty or slightly inflated, but achievable goals than unrealistically high; 15) in the case of failure in the performance of any task, its appeal is usually reduced; 16) when alternating success and failure tend to overestimate their failures; 17) I prefer to plan my future only for the near future; 18) when working under time constraints, the effectiveness of my activities usually improves, even if the task is difficult enough; 19) in case of failure in the performance of something, I usually do not give up the goal; 20) if the task has chosen itself, then in case of failure, its attractiveness increases even more.

When answering the questionnaire, you must choose from the answers "Yes" or "No". If you are at a loss for an answer, remember that "Yes" combines both an explicit "Yes" and "rather Yes than No"; the answer "No" combines an explicit "No" and "rather No than Yes". The respondent should answer questions quickly, without thinking for a long time (the first answer that comes to mind is usually the most correct).

Key to the questionnaire is: answer is "Yes": 1, 2, 3, 6, 8, 10, 11, 12, 14, 16, 18, 19, 20; answer is "No": 4, 5, 7, 9, 13, 15, 17.

The MSF Rean questionnaire calculated the average motivation rate for employees of organizations "A" and "B" in each age range for men and women separately (Table 5).

Table 5: Motivation in «A» and «B» companies

Age/ Gender	«A» Company		«B» Company	
	Men	**Women**	**Men**	**Women**
22-30	16	15	14	14
30-40	16	14	10	8
40-50	11	12	7	5

The average score of employees of «B» company, where there is no system of lifelong learning is lower than that of employees of "A" company, which uses a system of continuous learning and innovative technologies continuing education (the motivational pole is not bright sized of 10, and the

motivation for success is 16). The lowest score in «A» company is 11 and the highest score is 16, while in «B» company the lowest score is 5 and the highest score is 14. Interestingly, that in «A» company, which uses a continuous learning system and innovative technologies for continuing education, the average indicators of motivation for success are higher or equal to the average, while in «B» company, the motivation for "failure" begins to prevail with age growing. In other words, the employees of «A» company are more self-confident, responsible and proactive, while the employees of «B» company try to avoid the responsibility, which can lead to a state of anxiety. Also, you can see that with the growing age, the motivation begins to decline, especially this is shown in «B» company, where there is no system of continuous training.

Conclusion

1. The employees of «A» company have higher motivation for effective work, than the employees of "B" company. Male respondents showed higher scores on the scales of flexibility, leadership traits, while women showed greater anxiety, motivation was about the same for both sexes. The age group from 40 to 50 has reduced indicators for many factors in comparison with the age group from 22 to 30, which is more actively using innovative education technologies. As the result, the hypothesis about the relationship between the innovation of continuing education within the organization and the effectiveness of employees is confirmed.

2. The organization's motivation is strongly influenced by the organization's use of the continuous learning system and innovative technologies for continuing education for employee training. Regular innovations and innovative teaching methods increase employee loyalty to education within the organization, their flexibility and ability to adapt, and, as a result, affect their motivation and efficiency.

Abstract

Various EU member states have employed various techniques to measure consumer preferences in postal markets that link senders and recipients. This is a challenging task that needs careful consideration of technical, economic and social environment evolution of postal consumer needs. The aim of this paper is to use a discrete choice modelling methodology for measuring consumer preferences for postal services in Slovakia. The analysis examines how these consumer preferences vary across 260 residential consumers, specifically focusing on differences between vulnerable (70) and non-vulnerable (190) consumers. The valuations of letter services are measured relative to the price of a stamp, and the total WTP for these services indicates that consumers value the speed of delivery and are willing to pay the higher price of a stamp when deliveries are made earlier about one day. Morning time of delivery was not important for residential consumers, while they value later deliveries higher in general. Residential consumers valued higher to have postal service delivery to their work or home place. We observe that residential consumers were satisfied with the current state of the postal offices' network coverage. They were not highly valued the opportunity to increase or decrease the number of delivery days, and they preferred the status quo in this attribute.

Keywords: Consumer preferences. Decision theory. Discrete Choice Experiment. Postal services.

Introduction

The objective of this study was to develop recommendations for the future development of the universal postal service in Slovakia in the context of the postal market best practices especially in the European Union. The definition of the postal services is based on the Act 324/2011 on postal services, which was amended by the Act 547/2011. The wider context is based on the First Postal Directive 97/67/ES from 15. December 1997, Second Postal Directive 2002/39/ES from 10. June 2002 and Third Postal Directive 2008/6/ES from 20. February 2008.

The specific conditions of the provision of the universal service in Slovakia are defined in the Decision of the Postal Regulatory Office 815/001/2012 on the Granting of Postal license to the company Slovenská pošta, a.s. for the period 1.1.2013 to 31.12.2022 for the provision of universal postal service and the obligation to provide the postal payment service. The Postal license 815/001/2012 was amended by the Decision 599/ORPS/2014, which came into effect on 1. January 2015, but this change did not have impact on this study. The quality requirements on the conditions of the universal service are stated in the relevant decisions of the Postal Regulatory Office issued in 2012.

The overall aim of this study was decomposed into several sub-tasks. The first one was to analyse the current state of the universal postal service in Slovakia and its benchmarking against the other EU member states. The second step was to develop methodological framework to measure the customer requirements and preferences of the users of postal services. This approach was than tested on the pilot

sample and the methodological framework was updated to reflect the feedback from the pilot project. The final stage consisted of the nation-wide data collection and final evaluation of the project results.

Literature Review

Now postal services are a large and still growing sector of most economies (Boronico, 1997) in the world. The major issue that postal services must consider involves consumer satisfaction and consumer preferences. Service quality is at the root of consumers' satisfaction and is linked to such behavioural outcomes as word-of-mouth. At present, new digital technologies have a strong impact on the provision of postal services (Otsetova and Dudin, 2018) worldwide. Customer satisfaction with postal services largely depends on their ability to meet their needs. The importance of segmentation in the current market environment is important (Štarchoň and Tóth, 2012). According to Edum et al. (2019), the demand for postal services is currently increasing due to the increasing need to meet their needs through online shopping in various e-shops. Brand origin country can be essential in slovak consumers preferences (Smolková and Štarchoň, 2013).

Several authors have addressed customer satisfaction in postal services in their research (Boronico, 1997), for example in Bulgaria (Otsetova and Dudin, 2018), Turkey (Yavas, 2000), Serbia (Ratković et al., 2017; Pavlović et al., 2018; Unterberger et al., 2018), in Malaysia (Edum et al., 2019; Isa and Kiumarsi, 2019; Kiumarsi et al. 2015), Indonesia (Manalu, 2019; Khanooja and Prathabhan, 2019), Ireland (Cahill and Palcic, 2018), Denmark (Kristensen et al., 2000) or in the United States (Crew and Kleindorfer, 2008). According to vigorous studies, a trend has emerged in recent years the creation of new services in the postal sector, which is subject to requirements and preferences customers (Ratkovic et al., 2017; Otsetova and Dudin, 2018). Corporate identity gives the company a face (Vilčeková, 2006). It plays an important role in the customer's preference competitiveness of postal companies. In a competitive environment, postal service providers must identify the determinants of the success of their distribution channels in terms of service quality and their impact on satisfaction and customer loyalty (Águila-Obra et al., 2013). Currently, postal operators are largely limited in their ability to adapt to consumers if they are obliged to provide universal postal service and are regulated in terms of tariffs and quality of service (Cahill and Palcic, 2018). Postal services that are extremely important worldwide suggests that emphasis should be placed on the implementation of timely and reliable services (Ratković et al., 2017; Otsetova and Dudin, 2018) and competitive prices. (Boronico, 1997).

Research Methodology

Our approach was based on the "Study on appropriate Methodologies to Better Measure Consumer Preferences for Postal Services" by Rand Europe developed for the European Commission. This study recommends conducting the surveys by using the Stated preference discrete choice experiment (SPDCE).

Discrete Choice Experiment

Discrete Choice Experiment (DCE) method describes, explains and forecasts selection among two or more independent alternatives. It is used in various fields from economy, through environmental management, urban planning to transport and telecommunications. It is often used when analysing the consumer buying behaviour. It aims to understand and predict the behaviour of consumer, when he selects from multiple options. The method identifies factors influencing the decisioning process and provides understanding of the value, which consumers assign to individual products and services. From the scientific perspective it is based on the analysis of the microeconomic theory of demand and consumer behaviour. It is considered relatively precise method of estimating the consumer preferences. As opposed to the standard consumer models, where the key question is "how much", the DCE is focused on the question "which". The theory states, that the individual from the utility perspective values specific attribute/characteristic of the product and not the product itself and therefore selects the alternative, which maximizes the highest possible benefit among the offered options. The basis of the DCE approach is to determine, why individual prefers specific alternative compared to other option by comparing one to other.

DCE was initially developed by Louviere and Hensher (1982) and Louviere and Woodworth (1983). Since then, many authors has used discrete choice experiments in their studies, e.g. environmental decision making (Hoyos, 2010), smoking cessation behaviour (Goto et al., 2007), willingness to pay (Meenakshi et al., 2010; Schlereth, 2012) and many other.

DCE is widely used for the surveys in the public sector as it allows to measure the value of the public services from the citizen perspective. Therefore, it is also suitable in the postal sector to determine the customer priorities in the context of market and demographic changes.

Attributes Selection

In the experiment design phase, the first step consists of identification of the all relevant attributes. As the number of attributes, which can be researched is limited, it cannot cover all attributes of the postal services, but they need to be prioritized. The common practice is to limit number of factors to maximum 15 to avoid the overload of the respondents and their confusion. As the survey was also covering the specific segments of vulnerable persons (people older than 65 years, disabled people or people with low income) this aspect was very important. The selection of the relevant attributes has been consulted with the representatives of the relevant ministry and the Postal Regulatory Office. The following step was to involve price as the evaluation factor, which would allow the quantitative analysis of the results. The price was considered the monetary/numerical variable.

Questionnaire Definition

The questionnaire consisted of three main parts:

- **Classification and descriptive questions** – this part ensured that the sample surveyed is statistically representative and provided additional information to cluster our findings.
- **Discreet choice experiment section for the letters** – this part measured relative importance of the individual attributes of the universal service letters. We offered respondents various combinations of the different levels of letters service at the given price points and they were selecting, which one they prefer.
- **Additional services** – we allowed customers to provide ideas about new services, which they would welcome from the universal service provider.

Evaluation Methodology

We have used statistical system to evaluate the results of the survey. We have followed the 5 steps approach.

Attributes selection and questionnaire

Each attribute was represented by 2 or 3 levels, where 1 level was considered to be the reference level. Reference level was set based on the current legislative requirements. Independent variables very classified as:

1. Nonmonetary variables,
2. Monetary (category) variables.

Nonmonetary variables represent reduction or increase in the quality of service compared to current level. For example, for the delivery speed the Next day delivery is better service than the current D+2 level and on contrary the D+4 is the reduction in the level of service. The monetary variable, the price of service, cannot be evaluated independently, because its value is derived from the other qualitative parameters.

The basis for the setting of the levels of the attributes analysed was the current level of the universal service in Slovakia. For the definition of the level of increment/reduction of the individual attributes

we have followed the recommendations of the Rand Europe study. These values were than tested on the pilot sample and minor adjustment very made to reflect the learnings from the pilot survey.

Table 1: The individual attributes and their values

Attribute	**Levels**		
Speed of delivery	D + 4	D + 2	Next day delivery
Delivery frequency	Monday, Wednesday, Friday	Monday - Friday	Monday - Saturday
Time of delivery	Delivery by 9:00 AM	Delivery by 5:00 PM	
Place of delivery	To the post office	To the home	To delivery box
Price	EUR 0,23	EUR 0,45	EUR 0,68

Speed of delivery is measured by the maximum allowed number of days from the day of collection (D) to the delivery day. Currently the letters are delivered within two working days (D+2).

Delivery frequency defines the days on which the items are being delivered. Currently it is every working day.

Time of delivery defines the latest time, when the items are delivered on the last day of the delivery period. Currently all items are delivered by 5:00 PM.

Place of delivery defines, if the items are delivered to the address, or some other place. The delivery box is a place created by the service provider less than 1 km from the delivery address.

Each respondent after filling in classification and descriptive questions in questionnaire was introduced into the context of the survey by short explanatory text. After that he was presented several hypothetical scenarios among which he was required to select his preferred option. Each combination contained product description consisting of various levels of individual attributes. The offered options were pushing respondent to compromise between individual attributes of the product, thus revealing his preferences. For each discreet choice experiment we provided 6 selection steps, while in each step the respondent was required to select one from two options provided. Based on the recommendation from the Rand Europe study we did not allowed the respondent to reject both options.

Table 2: Questionnaire section product description example

Selection #3 - Letters	Alternative A	Alternative B
Place of delivery	Delivery home	Delivery box
Delivery days	Monday, Wednesday, Friday	Monday - Saturday
Time of delivery	By 9:00 AM	By 5:00 PM
Delivery frequency	D+2	D+4
Price	EUR 0.45	EUR 0.23
Selected option	□	□

Each respondent expressed his preferences by making 6 selections from the combinations provided. There were different variants of the questionnaires used. For the sample of 350 respondents we have therefore collected 2100 answers. Towards the end of the questionnaire each respondent was requested to state the importance of the individual attributes of the service. This question was used for the quality control purposes.

Attributes Evaluation

The basic principle of the DCE method is the maximization of utility. The respondents are selecting the option, which maximizes his utility. The evaluation model is described by the formula bellow:

$$
\begin{aligned}
RES = {} & b_{RDL_1D}\ RDL_1D \\
& + b_{RDL_4D}\ RDL_4D \\
& + b_{PDD_PSP}\ PDD_PSP \\
& + b_{PDD_PS}\ PDD_PS \\
& + b_{CD_9}\ CD_9 \\
& + b_{MD_Post}\ MD_Post \\
& + b_{MD_DS}\ MD_DS \\
& + b_{Price}\ Price
\end{aligned}
$$

Independent variables are represented by following proxy variables:

- Next day delivery (RDL_1D)
- D+4 delivery (RDL_4D)
- Delivery days – Monday, Wednesday, Friday (PDP_PSP)
- Delivery days – Monday – Saturday (PDD_PS)
- Delivery time by 9:00 AM (CD_9)
- Place of delivery – post office (MD_Post)
- Place of delivery – delivery box (MD_DS)
- Price – numerical variable

Dummy variables are most often used for the quantification of qualitative variables (e.g. gender, education, qualification, buying preferences). The approach of dummy variables uses only two levels – 0 (the attribute is not represented in the selected alternative) or 1 (the attribute is represented in the selected alternative).

For example, RDL_1D represents the proxy variable for the Next day delivery option. If respondent is interested in the improvement in the delivery frequency than RDL_1D = 1, otherwise RDL_1D = 0. The same approach is used for other proxy variables for all other attributes in the survey. The abbreviation of the proxy variable consists of the abbreviation of the attribute and abbreviation of the corresponding level.

Regression Model Estimation

We have used the conditional logit model to estimate the regression model to predict, which alternative the respondent will select. The conditional logit model has been selected due to the fact that the attributes are defined. If the model evaluation would be done without ex-ante defined attributes it would be required to use unconditional logit model.

The logit model was supplemented by the adding stratum variable, which was matching the specific respondent to his answers, which allowed model evaluation for specific categories of respondents. Regression coefficients (marked as coefficients b) represented respondents stated preferences, therefore they were indicating the respondent's attitude towards the potential increase/decrease in the quality of service in comparison to the reference level.

Model Evaluation

For the residential customers the model evaluated 3120 inputs, which were represented by 1560 different questions with two possible alternatives (260 respondents, where each answered 6 questions by selecting from 2 alternatives). For the corporate respondents the model analysed 1620 inputs (90 respondents, where each answered 6 questions by selecting from 2 alternatives).

Table 3: The explanation of model results for residential customers

	Coefficient b	Statistical error	Value z
RDL_1D	0.880***	0.11052	7.965
RDL_4D	-0.905***	0.13669	-6.624
PDD_PSP	-1.022***	0.12393	-8.253
PDD_PS	-0.035	0.09839	-0.361
CD_9	-0.316**	0.10378	-3.043
MD_Post	-0.772***	0.14197	-5.435
MD_DS	-0.466**	0.17572	-2.654
Price	-1.957***	0.28393	-6.895

Table 4: The explanation of model results for corporate customers

	Coefficient b	Statistical error	Value z
RDL_1D	0.797***	0.195	4.096
RDL_4D	-1.003***	0.236	-4.258
PDD_PSP	-0.841***	0.205	-4.101
PDD_PS	0.003	0.170	0.018
CD_9	-0.054	0.180	-0.303
MD_Post	-1.288***	0.270	-4.770
MD_DS	-0.692*	0.300	-2.304
Price	-1.833***	0.531	-3.452

In the first column the coefficient b demonstrates respondents' attitude towards potential increase or decrease in the quality of the given attribute compared to the current level. Stars indicate statistical importance of the given coefficient for the model. The importance factor is calculated from the value z. Importance factor shows the quality of given attribute. If the coefficient does not have any stars attached it means, that the impact of the given level does not have significant impact on the overall result.

The second column shows the statistical error of the estimate of the given coefficient represented by the standard deviation, which is caused by the fact that results are only statistical prediction. Its size does not impact results and is dependent on the size of the sample surveyed. The third column provides the value of the tested statistics z, which is used to test the significance of the estimated coefficient b and is calculated on the basis of the statistical error. As the model predicts respondents' behaviors and the results are probability estimates, the value z would change if the model is recalculated, however the difference should minimal.

Calculation of the marginal willingness to pay

Marginal willingness to pay (MWTP) indicates the value, the respondents are willing to give up in order to purchase the additional unit of the product, service or to avoid unpleasant event. MWTP is calculated by multiplying coefficient b of the nonmonetary variable and the coefficient b of the monetary variable -1. For example, the Next day delivery for the letters' discreet choice experiment the MWTP can be calculated from the following formula:

MWTP = (bRDL1D* RDL1D)/(bRDL* Price)

Table 5: MWTP calculation for residential customers

	MWTP	0,025	0,975
RDL_1D	0.4496	0.2956	0.7003
RDL_4D	-0.4625	-0.7192	-0.2913
PDD_PSP	-0.5225	-0.8061	-0.3478
PDD_PS	-0.0182	-0.1309	0.0774
CD_9	-0.1613	-0.3126	-0.0525
MD_Post	-0.3941	-0.5236	-0.2802
MD_DS	-0.2382	-0.4052	-0.0730

Table 6: MWTP calculation for corporate customers

	MWTP	0,025	0,975
RDL_1D	0.4348	0.1913	1.1373
RDL_4D	-0.5473	-1.4313	-0.2330
PDD_PSP	-0.4590	-1.2803	-0.1812
PDD_PS	0.0017	-0.2573	0.1901
CD_9	-0.0297	-0.3442	0.1554
MD_Post	-0.7027	-1.2418	-0.4807
MD_DS	-0.3777	-0.8090	-0.0783

First column displays MWTP, for example for the RDL_1D respondents are willing to give up maximum of 0,4348 units to speed up delivery by one day. Next two columns are showing interval, which defines minimum and maximum values, which attribute can contain in the case of repeated estimates.

Conclusion

The coefficients b for the letters survey are provided in the table below:

Table 7: Coefficients b for Residential and Corporate and Corporate Respondents

	Residential	Corporate
Price	-1.958	-1.833
Delivery days (Mo, We, Fr)	-1.023	-0.841
Delivery speed (D+4)	-0.905	-1.003
Delivery place (post office)	-0.771	-1.288
Delivery place (delivery box)	-0.466	-0.692
Time of delivery (by 9:00 AM)	-0.316	-0.054
Delivery days (Mo-Sa)	-0.036	0.003
Delivery speed (Next day)	0.880	0.797

Overall there were minimal differences between the results for the residential and corporate customers. The only difference was the desire of the residential customers to extend the delivery days by Saturday, even if the price of the service is increased. For the corporate respondents, the coefficient b was also positive, but very close to zero. It is not significant from the statistical point of view. As most of the businesses are open only during the working days, the delivery on Saturday, would not be relevant to them. Both residential and corporate respondents would welcome an increase in the delivery speed to the Next day delivery, on the other hand, delivery in 4 days was the least preferred option. From the table, we can see that the most preferred option for a delivery place is home address and not post office or delivery box. These two disliked options were more disliked by corporate customers than residential customers. In the attribute time of delivery was the more preferred option by 5 PM which is the current

state, then by 9 AM. Negative coefficient b for price indicates that customers have a preference for cheaper postal services.

Expeditionary Risk Management Concept

Pawel B. MICHALSKI

Wroclaw University of Business and Economics, Wroclaw, Poland
pawel.michalski@ue.wroc.pl

Abstract

The purpose of the article is to present sources and methods of risk management in the area of expedition projects. The specificity of this type of projects requires a modified approach to risk management compared to classic ventures. Risk not only affects the success / failure of an expedition project, but can also have a negative impact on the health and life of participants. This is due to the uniqueness of the planned goal, but also to the organizational and interpersonal complexity as well as the dynamically changing event scene. Planning individual operations is not always possible beforehand, and often decisions are made instantly, at the project site in extreme circumstances. In such conditions, proper identification, minimization of effects and monitoring of potential threats is difficult and requires the use of appropriately selected tools.

Keywords: Expedition Project, Risk Management, Project Management

Introduction

Risk is one of the most popular concepts appearing in many scientific disciplines, such as economics, sociology, psychology, law, medicine, technical sciences. Observing the development of man and his environment, it is easy to see that risk has always existed. There have not been and there are no human activities that are not associated with risk.

Risk management in the area of expedition projects (organized extreme expeditions aimed at carrying out the tasks outlined using project solutions) has an even deeper meaning, because it directly affects not only the success / failure of the project, but can also affect the health and life of participants. Expedition projects form an integral part of the global trend of project management and constitute an extremely important extension of this field into an area not yet included in these categories. Expedition ventures can be found not only when conducting research in remote corners of the globe, carrying out travel expeditions or high-mountain expeditions. Team building trips within the corporation, kayaking on rivers or ski-touring in the Alps have the hallmarks of the expedition project. This means that the field of project management has gone beyond the boundaries of offices and construction sites. It concerns not only classic projects implemented within enterprises, but has spread to other areas of life. The development of expedition projects is inevitable.

Expedition projects are a specific group of projects under which activities are carried out to reach the designated place, which is often associated with the extreme use of human resources, where the risk increases with each stage of implementation. The expedition project risk management is a system of methods and activities aimed at identifying, assessing and responding to threats appearing throughout the entire project life cycle with the effect that the project goals are achieved while maintaining the highest safety standards.

Sources of risk in an expedition project

When analyzing the sources of risk in the context of an expedition project, two areas of origin can be seen – mutually interpenetrating. On the one hand, there is the well-known risk, typical of classic projects implemented within the organization, on the other, we are dealing with no less significant risk occurring only in expedition ventures, but having an equally large impact on the success of the

venture. This is an expeditionary risk to which project participants are directly exposed. Four categories can be considered (Fig.1):

- external risk (unpredictable) – this group includes risks that are beyond the control of the manager (leader), team and participants involved in the project. These types of risk can be defined but cannot be assigned to a specific expedition project. The origin of this type of risk is, for example, force majeur, wildlife attack or altitude sickness (pulmonary or brain edema).
  Minimizing this type of risk is very difficult, because it is impossible to predict all possible threats. Based on experience from the implementation of previous expedition projects, analyzing the conditions under which the next project will be carried out and maintaining far-reaching care for safety, allows for certain chances for immediate protective actions in the event of an emergency.
- external risk (foreseeable but uncertain) (Nokes and Kelly, 2007, 276) – this group includes risks that are beyond the control of the manager (leader), team and participants involved in the venture, however it can be predicted that they will affect a given expedition project, although it is difficult to determine to what extent. This risk group is estimated on the basis of data available from various sources (previous projects, experts, media). This allows for a definition of a certain norm of occurrence of phenomena affecting the project, which unfortunately may differ from the actual conditions during the project duration (higher or lower level). This type of risk should be considered in terms of objective risk, i.e. independent of the participants, but predictable to some extent. This could be a snow avalanche or an ice crevice, ethnic riots or an increase in the cost of hiring porters.
- internal technical risk – which results from internal solutions applied to implementing the undertaking from the technical side of matters (Watt, 2014, 177-178). This type of risk remains under the full control of the project manager. Depending on the specifics of the expedition project, the risk relates to personal equipment, means of transport and communication, as well as other technical devices necessary to achieve the goal.
  Internal technical risk often results from the lack of experience of the expedition (team) project manager. Complete evasion or significant risk minimization is highly dependent on proper project preparation in the planning phase, both in terms of equipment and of logistics.
- non-technical internal risk – results from organizational errors at all stages of the project duration, with particular emphasis on human, material and financial resources management (Chong and Brown, 2000, 41-42). This type of risk remains under the full control of the project manager and the persons responsible for the individual stages of the project
- legal risk – there are two aspects to consider:

  – risk related to issues associated with the location of the expedition project - for example, mountain expeditions buy a climbing permit to conduct mountain activities on a given mountain or in a given region, exploration of tropical forests in Brazil requires a special permit by local authorities, and a polar expedition cannot stay on the Antarctic continent without first informing the relevant international institutions. In all these cases, there is a risk of not receiving a permission/consent or it being withdrawn during the project.
    These types of legal risks, to some extent (especially permit issues), remain under the control of the project leader.
  – risk related to issues arising from contractual provisions between participants and project organizers (between legal entities and individuals).

When planning the implementation of an expedition project, you should pay attention to all the factors described above, while defining a set of specific procedures (depending on the nature of the project) which determine success, and in the extreme case, minimize failure, e.g.

- precise determination of the scope of the project
- making quick and decisive decisions and their consistent implementation
- continuous risk control
- providing the best staff for the project
- clearly defined roles of team members (organizer and client)

- motivating project participants (clients)
- good communication in all phases of the project
- training of participants (behavior in specific conditions, operation of professional equipment and devices, first aid)
- developing a contingency plan for specific types of risk

Fig. 1: Expeditionary risk categories

Source: own data

Expeditionary Risk Management

From the project point of view, the risk referred to as expeditionary means a smaller or larger occurrence of unexpected circumstances causing delays in the project, lack of implementation of a certain scope of the project or an increase in costs related to the course of the expedition. This means that as part of project management, it is necessary to take into account events that may disrupt the project, analyze the probability of their occurrence, predict their impact and define appropriate responses.

Risk management is a management method focused on identifying and controlling areas or events that can lead to unwanted changes. It is simply an integral element of management (Pritchard, 2014, 23-24]. Proper risk management will not lead to the disappearance of threats, but only to their minimization. In the case of an expedition project, this is a systematic and regular study of the risk that threatens people and their activities in achieving goals and developing and implementing policies to control this risk.

Expeditionary risk management boils down to having practical knowledge on how to eliminate the risk of failure at the level of the entire course of the project. Risk in the venture mainly comes from the inability to eliminate the uncertainty associated with future events at each stage of the project resulting from the dynamics of the schedule, variable team performance, incorrect planning and external environment factors. At the expedition planning stage, it is worth carrying out a simplified expeditionary risk analysis consisting of three stages:

- risk identification - the correct and complete identification of all threats is a strategic task (Harrin, 2007, 69-70). These are activities aimed at detecting sources of risk and then systematizing them according to accepted categories, which constitute groups into which all adverse events that may occur during the planning and implementation of the project can be qualified. The introduction of categories (less often called profiles) enables the systematization of all risks occurring in the

expedition project. It is important that the adopted categories are correctly selected depending on the specifics of the expedition and thus correspond to typical sources of risk for the given conditions or area in which the project is carried out. The most common risk categories are: technical risk, project management risk, organizational risk and external risk.

The risk identification process can be supported by many tools and techniques. This seems obvious, because predicting what events can significantly affect the failure to complete planned project tasks is a difficult and not always fully feasible activity. The most important techniques include:

- documentation review – the first step in the risk identification process. The management team analyzes project plans and assumptions to identify potential threats
- techniques for gathering information on sources of threats – which include: brainstorming, Delphi technique, surveys and analysis of strengths, weaknesses, opportunities and threats (SWOT)
- check lists (Frame, 2003, 50-54) – can be created on the basis of archival data and knowledge accumulated in similar projects implemented in the past, as well as on the basis of other sources of information. The lowest level in the risk-sharing structure can also be treated as a checklist. Although checklists speed up and simplify risk identification, it is impossible to create a list containing all risks. It is therefore necessary to examine the risks that do not appear on the list. As part of the project closure, a risk checklist should be reviewed to improve it for future projects (PMBOK Guide, 2017, 450)
- analysis of project assumptions – aims to identify risk resulting from inaccuracy, inconsistency or incompleteness of assumptions
- techniques based on diagrams – they allow for easy identification of risk symptoms and transparent arrangement of cost and effect patterns. Popular diagram techniques include: cause-and-effect diagrams (e.g., Ishikawa diagrams, fish bone diagrams), system block diagrams, influence diagrams (Murray, Grantham and Damle, 2011)

Underestimating or ignoring one of the threats may result in irreversible impact on the future of the project. Depending on the needs, participants in the risk identification process include, among others: project manager, team members, non-team experts, and even clients. The most important thing is that these people have experience in coordinating the expedition, knowledge of the environment at the place of implementation of the project and the scientific or sports field which is the scope of activities.

- describing the risk - presenting the features of specific threats in a way that allows them to be compared and balanced. Performing this task properly, minimizing the occurrence of an error, causes potential threats to change their risk status.
- risk assessment - allows to estimate what is uncertain, what to fear in the internal factors of the venture (e.g. physical condition, skills, likes and dislikes of the participants) and external factors (e.g. the area of activity) as well as what phases of the expedition project are most vulnerable to failure. Two key parameters should be considered in the risk assessment. The first is the probability of occurrence of the event causing the risk, and the second is the size of the potential loss (Wysocki, 2009, 183-184). Risk assessment gives the opportunity to determine priorities in the treatment of individual risks.

Having the above data, but taking into account the dynamics of the expedition and factors affecting it, it is important to verify the risk map on an ongoing basis, thus providing the venture with the maximum chances of success.

Conclusions

Expedition Project Risk Management includes processes related to carrying out risk management planning, risk identification and analysis, risk response, and project monitoring and control. Most of these processes are updated during the duration of the project (Khamooshi, 2004). The goal of project

risk management is to increase the likelihood and effects of favorable risk and to reduce the likelihood and effects of adverse risk to the project.

The types of risk occurring in an expedition project require verification of the classic approach to risk management, both in terms of their source and perception. The expedition venture, with all the features of a project implemented in an organization, differs in the way it is interpreted in the context of the impact of the types of risk on the entire project.

Sources of risk occurring in the expedition venture are determined by the nature (goal) of the project, place (environment) of implementation and degree of difficulty. In contrast to the risks in classic projects, the required response time must be much shorter, often immediate, in order to prevent failure and, in extreme cases, to avert dangers to the participants.

Expedition projects, based on proper planning and use of resources, under constant supervision and control, have the greatest chance of success. However, the most important thing is the ability to detect risk that will always accompany projects.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Does Being Part Of A Capital Group Provide An Opportunity To Generate Additional Cash Benefits?

Edyta MIODUCHOWSKA-JAROSZEWICZ

University of Szczecin, Faculty of Economics, Finance and Management, Szczecin, Poland

edyta.mioduchowska-jaroszewicz@usz.edu.pl

Abstract

The aim of the article was to examine whether being part of a capital group brings cash benefits to the participant. For this purpose, two indicators were used: the ratio of the holding company's cash flows to the corporate group's total cash flows (CF) and the holding company's operating cash flows to the corporate group's total operating cash flows (CFO). This article follows on from the research carried out in 2013 by expanding it to include more capital groups and a longer study period. Eighty-five consolidated and individual financial statements for 2009-2018 of the capital groups listed on the Warsaw Stock Exchange were used to verify the research question of whether being part of a capital group generates any additional benefits to the participant. The research results do not unequivocally indicate that capital groups generate additional cash or total and operating flows, which means that belonging to capital groups does not generate additional benefits to the participants. The results of the analysis show that the hypothesis of the research has been verified negatively. There are no indications that additional benefits can be gained through functioning in a capital group such as additional cash generated by the capital group as an entity accumulating surpluses from all group members.

Keywords: Transfer Pricing, Cash Pooling, Thin Capitalization

Introduction

The purpose of the present study was to examine whether participating in capital groups brings benefits to their members. The synergy effect that boosts performance through cost reductions is the most frequent motive for merging into corporate groups. As research indicates, however, at least over the first several years the efficiency of operations carried out in groups decreases rather than increases, while the market value of the holding company falls. The questions that arise, therefore, are: why do companies merge into corporate groups in the first place? and does that generate any additional benefits? One of the motives behind such a choice is to transfer profits and assets from the holding company to its subsidiaries in order to generate intra-group cash flows which drive the company's value. Mergers into corporate groups give rise to an internal capital market, thus creating added value for such groups. An intra-group financial market is created as a result of using tax and balance-sheet policy tools. The identification, analysis, and evaluation of both internal and external cash flows related to the functioning of the internal market in affiliated entities will enable a correct evaluation of the financial condition of the corporate group (Kee-Hong, Jun-Koo, Jin-Mo, 2002).

The following research thesis is explored in the paper: certain determinants of a corporate group's financial policy affect its consolidated cash flows and generate additional benefits. The structure of the paper follows the three below-listed research phases aimed at verifying the thesis:

1) presentation of selected aspects affecting cash flows in a corporate group: transfer prices, 'thin capitalization' and cash management, and legal regulations in Poland;
2) an attempt to analyze the impact of these factors on cash flows in a corporate group based on the example of a selected corporate group;
3) lastly, presentation of research results.

The objective of our analysis of the above-mentioned factors was to verify the proposed hypothesis and the research question of whether being part of capital groups generates additional benefits to the participants.

Literature Review — determinants of cash flows in corporate groups

The factors shaping cash flows stem from one of the three spheres: the macro-environment, the market, and the corporate group itself. The first two groups of determinants are known as external factors that have an indirect impact on the cash flows in a corporate group. However, every corporate group is affected by internal factors, as well, resulting from the conditions and forces being an inherent part of each organization. There are several types of the macroeconomic environment, whereas their classification is based on their economic, technological, socio-cultural, legal, political and international aspects. The market, also known as the competitive or sectoral environment, emphasizes the subjects – the microenvironmental actors – instead, and particularly identifies the owners, competitors, customers, suppliers, trade unions and strategic allies. Internal factors may be of either a qualitative or quantitative nature. The first group mostly includes (Siemińska, 2002): the quality of management processes, the quality of staff at every level of management, the quality of information systems, information asymmetry, shareholders' ability to control the company and the efficiency of such control, the quality of the organization's assets – particularly the long-term ones, the organization's market position, and the organizational culture. The list of qualitative factors is long and diverse. What they all have in common, however, is that they affect to a lesser or greater extent the financial condition of the organization. They drive certain types of costs or sales, thus defining the efficiency of financial and investment decisions undertaken by managers, which in turn translates into cash flows in the company.

In this paper, the focus is exclusively on factors stemming from the quality of the information system allowing for the functioning of corporate groups, such as the balance-sheet or tax policies. Such policies are widely used by corporate groups, while their application in a corporate group is expressed in the adopted transfer prices, thin capitalization and cash management.

Transfer Prices

Transfer prices play a significant role in the operation of corporate groups, mostly those whose members are all involved in the operating activity, or those where the holding company is only a 'manager' of the whole group. Transfer prices enable a hidden transfer of benefits among the group members. The level of transfer prices exerts an influence on the transfer of profits between group members. The transfer of profits, in turn, may have a huge impact on the financial performance of the group through reducing taxes and other duties. Two main activities within this dimension can be identified (M. Trocki, 2004):

1) the transfer of profits following the direction of the transfer of goods: by setting prices below their market levels,
2) the transfer of profits in the opposite direction than the transfer of goods: by setting prices above their market levels.

Transactions between affiliated entities based on transfer prices are a relatively common practice in business. Owing to the relations between the organizations involved, these prices may favor or be beneficial to one of these organizations. The level of transfer prices exerts a direct influence on the level of profits achieved by both parties thus affecting their tax burden (Pagan, Wilkie, 1993).

Thin Capitalization

Undercapitalisation (or thin capitalization) is a term describing a situation where shareholders contribute a minimum amount of share capital and the operations are financed with loans instead. In other words, it is a certain misuse of debt by shareholders, as the behavior poses a threat to the balance between the company's liability towards its shareholders and the amount of its share capital (Forodyńska and Partyka A. 2009).. This issue is of relevance if viewed in terms of the fiscal policy of the state, since currently where a loan is provided by shareholders the interest on that loan is deducted from the tax base. The situation is especially disadvantageous to the State Treasury Moreover in the case of loans from foreign entities where, pursuant to the principle of the avoidance of double taxation, the interest is not subject to taxation at the source, i.e. in Poland. Furthermore, if the company uses a

debt to a minimum capital share contributed by shareholders, the situation of the creditors is impacted negatively; it is much easier to repay loans granted by shareholders than return their capital contributions. Bearing in mind the above arguments in particular, the Polish legislature introduced new tax law regulations that limit the allowed extent of thin capitalization (Art. 16 sec.1 points 60 and 61 of the Act on Corporate Income Tax). Thin capitalization can be approached in tax law from either broad or a narrow perspective (Forodyńska and Partyka A. 2009). Both meanings were used in the OECD report of 1987. Thin capitalization sensu largo refers to a company financing its operations mostly using loans granted by its shareholders. In this case, the loans are in fact hidden capital contributions aimed at replacing share capital with loans/credits only for the purposes of securing tax benefits. Thin capitalization sensu stricto, in turn, defines an unfavorable ratio of the company's debt in the form of loans granted by shareholders to the total share capital. It is measured by way of the debt to equity ratio that serves as an indicator of the safe level of liability towards shareholders. Wherever the ratio's limit as set in law is exceeded, thin capitalization is implied and the implementation of thin capitalization rules becomes justified.

On January 1, 2018, Polish regulations on thin capitalization were amended, which saw the removal from the Corporate Income Tax Act of the two former methods for calculating non-deductible interest on financing (mostly loans). Instead, the Polish legislature introduced a new thin capitalization regime to the country's tax system, which is based, in principle, on the EU ATAD Directive dated July 12, 2016 (No. 2016/1164). According to the current amendment to the CIT Act, the new limit is to be calculated according to 30% EBITDA. The new method is applicable not only to loans received from affiliated parties, but also to financing (in a wider sense, including also specific cases of lease) coming from third parties (Banasiewicz, 2017).

Thin capitalization enables corporate groups to reach and implement investment decisions that exceed the potential of a given subsidiary acting on its own. The resources required to finance these needs are provided by shareholders as credits or loans. The profits made by these companies are used mostly to repay the loans (credits) granted by the shareholders, including any relevant interest. If interest is paid to owners based in countries that have an agreement on the avoidance of double taxation with Poland, such money is exempt from tax. The interest is taxable, yet it may be included in the cost of revenues. If such is the case, the resources are transferred from subsidiaries to the holding company much faster than dividends are, since dividends cannot be paid out until the financial year is over and the ordinary shareholders' meeting has reached relevant decisions (Trocki, 2004).

If the holding company grants a loan to its subsidiary, more benefits related to using debt as a source of financing are to be enjoyed. The positive impact of debt on financial performance is universally known as leverage, which is understood as the ability to raise the return on equity by using debt. Another benefit related to loans provided by holding companies, i.e. as part of thin capitalization, is the increased profit of the lenders resulting from the "double" return on the invested capital taking the form of interest on the loan and the dividend from the capital contributed to the subsidiary. The subsidiary, in turn, obtains access to a loan the granting of which does not require an investigation of creditworthiness. Furthermore, it wins extra net profit by decreasing its income tax through generating higher costs of revenues in the form of interest and – possibly – depreciation, should the loan be spent on investment. Owing to a higher net profit, the additional depreciation together with the loan drive the subsidiary's cash flow, which constitutes a double contribution to improving the company's liquidity. The above-presented procedure related to internal financing – thin capitalization within a corporate group – is clear evidence that a holding company in a corporate group may enjoy serious benefits such as higher financial cash flows within the group (Mioduchowska-Jaroszewicz, 2010a).

Cash Management System

Cash management systems aim at ensuring sufficient liquidity for the company, a condition which is essential to its existence. Cash management is responsible for handling short-term cash flows and cash reserves. It serves mostly as a guarantee of the ability to pay, minimizing the cost related to maintaining liquidity and maximizing the profit from excess liquidity (Szumielewicz, 2009, p. 62.). Of all of its aspects, cash pooling and netting play the most important part as instruments used for balancing internal liquidity in corporate groups. Cash pooling involves the consolidation of liquidity from the companies'

operating accounts into one pooling account in order to reduce excess liquidity. The pooling account represents the net balance of the group's liquidity. Cash pooling results in the centralization of cash and cash equivalents in the group, making it easier for the group to plan and manage its liquidity and minimize the losses on holding cash. The excess cash may be invested as profitable deposits (such as overnight deposits) (Trocki, 2004). Cash pooling is a non-standard form of financial management used by members of corporate groups or entities with multi-departmental organizational structures. This form ensures optimization of the interest-related effects by compensating balances in bank accounts of corporate groups or multi-departmental corporations. This outcome is achieved through shifting excess cash accumulated in individual bank accounts (subaccounts) of entities reporting surpluses to accounts (subaccounts) of entities reporting overdrafts (Dłubek, 2006). Cash pooling offers several advantages to an entity operating as a corporate group, such as:

1) interest-related benefits,
2) financial collaboration based on more efficient and standard procedures,
3) better liquidity of the group as a whole.

Interest-related benefits are derived from consolidating the surpluses and overdrafts from group members' individual accounts in a single account. Credit facilities in current accounts of some group members are compensated with bank deposits held by other group members on their own accounts. Financial collaboration based on more efficient and standard procedures is a consequence of the fact that cash pooling requires standard procedures that define the scope of bank services, and employs standard (and optimum) bank fees – due to the economies of scale – and interest rates offered to all the members of the corporate group. The overall liquidity of a corporate group may be improved by means of an extensive system of analysis of the structure of deposits and credits which become the basis for central management of cash of corporate group members.

Methodology

Two indicators were used to verify the research hypothesis. The impact of qualitative factors strictly related to being part of a corporate group is reflected in the number of cash flows generated by the group. The author argues that an investigation of the relationship between operating cash flows of the individual corporate group members and the operating cash flows of the corporate group as a whole, as well as the relationship between the total cash flows generated by the individual enterprises and the cash flows of the group as a whole, allows the evaluation of the impact that factors such as transfer prices, thin capitalization and cash management have on the increase in cash flows of the corporate group. To support her thesis, the author defined two indicators (Mioduchowska-Jaroszewicz, 2013a):

1) the ratio of the holding company's cash flows to the corporate group's total cash flows (CF), calculated using the formula:

$$CF = \frac{CF_{PD}}{CF_{GK}}$$

2) the ratio of the holding company's operating cash flows to the corporate group's total operating cash flows of the (CFO), calculated using the formula:

$$CFO = \frac{CFO_{PD}}{CFO_{GK}}$$

where:

CFPD — cash flows of the holding company,

CFGK – cash flows of the corporate group,

CFOPD – operating cash flows of the holding company,

CFOGK – operating cash flows of the corporate group.

CF and CFO ratios with values below 1 provide evidence to support the thesis that corporate groups generate higher cash flows than their individual group members do. The following conclusions can be drawn for WCF and WCFO estimates:

For CF and CFO < 1 – the corporate group is a cash generator, i.e. the factors shaping its operations generate added value.

For CF and CFO > 1 – the holding company generates a higher amount of cash than the corporate group as a whole, which means that the factors affecting the corporate group have a negative impact on the consolidated cash flows and are detrimental to value.

Empirical Results

The indicators were formulated in order to verify the research hypothesis proposed in the present study. These ratios were used to analyze 85 listed corporate groups in Poland over a study period from 2009 to 2018, and the results are presented in the appendix. For the analysis, 85 financial statements of consolidated capital groups and individual units of the parent company for 10 reporting periods were used. This brought about 1,700 results (the values of the indicators are listed in the table in the appendix) indicating that it cannot be unequivocally stated that the entities operating within a capital group will always generate additional value of cash, even despite the availability of a number of balance sheet and tax policy tools enabling such groups to create and increase its cash opportunities. Although the very idea of merging into a capital group with greater capital, technological and resource capabilities appears to be beneficial, parent companies are frequently observed to demonstrate higher levels of operating flows and/or total cash flows than capital groups. The research results indicate that capital groups consist of members that are either cash generators or cash absorbers. Table 1 presents results of a descriptive statistical evaluation of the ratios.

Table 1: Descriptive statistics

Ratio	Obs.	Mean	Median	Std.Dev.	Min.	Max.
CF	763	5.33	0.95	11.69	-5.6	25
CFO	764	1.4	1.25	0.85	0.5	2.6

** All the results summarized in the table were based on the calculated indicators presented in the Appendix.*
CF — the ratio of the holding company's cash flows to the corporate group's total cash flows
CFO — the ratio of the holding company's operating cash flows to the corporate group's total operating cash flows

The CFO and CF indicator statistics shown in Table 1 differ significantly in value. The mean and median for the CF index are very different. The CFO indicator is closer to the normal distribution, while its median and mean values differ only slightly. Finally, the value of the mean CFO is greater than that of its standard deviation, implicating that the indicator is characterized by a much lower variability than CF, the latter demonstrating a contrary behavior. The values of the descriptive statistics indicate that CFO is more useful than CF.

The values of the CF and CFO ratios (in the attachment) the examined capital groups were assessed, in order to indicate whether functioning in such a structure gives the possibility of generating additional cash or on the contrary the cash generated by the capital group is being destroyed. The results are shown in Table 2.

Table 2: CF and CFO values

Type	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
CF>1	23	30	35	31	36	37	35	31	33	37
CF<1	39	43	41	45	44	45	48	50	40	37
CFO>1	25	26	32	29	32	31	35	31	33	37
CFO<1	37	57	44	47	48	51	48	58	53	48
CF>1	37%	41%	46%	41%	45%	45%	42%	38%	45%	50%
CF<1	63%	59%	54%	59%	55%	55%	58%	62%	55%	50%
N	100%	100%	100%	100%	100%	100%	100%	100%	100%	100%
CFO>1	40%	31%	42%	38%	40%	38%	42%	35%	38%	44%
CFO<1	60%	69%	58%	62%	60%	62%	58%	65%	62%	56%
N	100%	100%	100%	100%	100%	100%	100%	100%	100%	100%

An analysis of the results presented in Table 2 indicates that the majority of the capital groups studied were cash generators in terms of cash from operating activities and overall activity. In each year of the study period, the number cash generators prevailed among the capital groups. The capital groups generated far more operating cash flows than the parent companies. Consequently, CFO <1 was found in 56% to 69% of the capital groups, and CF <1 was found in 50% to 63% of them. However, the results failed to fully verify the research hypothesis, and hence no generalization can be made claiming that every capital group will generate additional financial benefits through its structure.

Conclusions

The aim of the article was to indicate that operating within capital groups generates additional cash benefits. In the first part of the study, the factors influencing the generation of additional cash benefits were classified and described. It was indicated that the most popular financial motives for merging into a capital group are transfer prices, thin capitalization and cash management. This article follows on from the research undertaken in 2013 (Mioduchowska-Jaroszewicz., 2013a), which was an attempt to measure cash benefits resulting from being part of a capital group. The value of this research is in its verification of the relevance of two indicators: CFO, which is the ratio of the holding company's operating flows to consolidated operating flows, and CF, which is the ratio of the holding company's total cash flows to consolidated cash flows. The adequacy of the indicators was verified to assess cash benefits resulting from operating within a capital group. It was assumed that if the values of both the ratios were below one the capital group would generate additional cash value, but if the values were greater than one the capital group members would 'destroy' the value, or conversely the value of cash generated by the parent undertaking would exceed the cash generated by the capital group itself. The range of research periods and capital groups from the previous 2013 study (Mioduchowska-Jaroszewicz, 2013a) was expanded here in order to raise the cognitive value of the indicators. However, it remains impossible to confirm that every merger of entities into capital groups is bound to yield a synergy effect, at least when measured based on external cash flows. Therefore, the scope of research into this area should be widened to include internal cash flows, as well. Further research is required that will significantly expand the ability to verify the claim that merging into and operating within capital groups yields certain financial benefits, the latter being clearly the most important business objective for any undertaking. Nevertheless, there are serious research limitations regarding the availability of data on cash flows between members of capital groups, since such information is not public knowledge. However, the author's familiarity with information from the financial statements concerning events occurring in affiliated entities allowed her to create a scheme for calculating internal cash flows (Mioduchowska-Jaroszewicz, 2013b). Research which will follow up on this foundation will represent a significant expansion of the research sample to include other capital groups and subsequent periods of study, where internal cash flows in such capital groups will be calculated and evaluated.

Abstract

At EU level, there are a number of concerns among specialists to promote and create some specific information to support sustainable revitalization of rural areas as a place of work and work. We note that it is necessary to start a new regional policy, to increase rural prosperity and the viability of rural areas, given that there can be a balanced territory to ensure socio-economic and environmental sustainability. For agriculture and rural growth, the new regional policy aims to better mobilize all local and regional actors for investigations in the distribution and transport network. In our study, we aim to follow the way of achieving the objectives of the new policy, to target the intelligent villages for 2020, to take care as a starting point of definition and to apply "intelligent tools" based on the reality of the area under consideration, Chiscani Commune, Braila county. In order to be able to use functional, efficient and sustainable tools, it is not desirable to realize or analyze the reality of Chiscani Commune, Brăila county, if the role of local and regional authorities can be applied in the application of a policy framework, knowing the concept of "intelligent villages" such as and the notion of "smart rural area" and include initiatives in the local rural agenda so that synergies can be encouraged and created and spread in small communes, in smart rural areas.

Keywords: Smart Village, Smart Rural Areas, Smart Cities.

Introduction

Bottom-up approaches to local development, such as LEADER and, more recently, through community-led local development (CLLD), believe that innovation brokers should play a catalyst role for the potential of rural areas.

Innovation brokers are those who identify the strengths and opportunities of the village / rural area concerned and bring together the relevant institutions (third level, local authorities, funding sources, etc.), to coordinate present and future activities and potential sources of financing. It is their responsibility to involve and inform the community and to get its support to develop a vision, take responsibility and share the benefits.

These innovation brokers can stimulate product development by small businesses and can help remove obstacles to the functioning of the internal market, encouraging proximity consumption and short supply chains with agri-food products. Local and regional authorities are in the ideal position to perform this function; In some cases, they already play such a role, through development councils, business support offices, public procurement procedures, etc. it is essential to have access to funding for small-scale projects, accessible to local authorities. It should also include support for innovative projects and initiatives that can be tailored to the specific needs of rural communities across the EU, including in outlying regions.

Chiscani City Hall and Braila County Prefecture can be a real facilitator by integrating a "smart" approach in the planning and spatial planning strategies. Such strategies may include the assessment of regional resources and capabilities, the identification of sites that offer the possibility of grouping services and the adoption of economic policies that facilitate this approach.

Materials and Methods

The starting point of our analysis is the Cork Declaration, which defines ten guidelines that strongly support the European policy and which we want to identify in Chiscani Commune, Braila County, as follows:

- What is the situation of the investments in the connection to the broadband networks in Brăila and Galați counties? There are measures planned to overcome the digital divide through fast and reliable broadband investments. Thus, ICT infrastructure is proving to be a determining factor for the potential of Union regions in the area of area development. We refer here to the lack of access to the most important public services.
- Are there any measures in the Local Development Plan to combat long-term depopulation? Revitalizing rural areas through actions that encourage and support sustainability, renewal of generations and the ability of rural areas to attract newcomers is a vital goal.
- Are the initiatives of the local authorities known to take simple, easily reproducible and accessible actions even for very small communes, which do not have intelligent actions?
- What are the challenges facing peripheral rural regions, which, in addition to the problems related to broadband infrastructure, are facing major difficulties in terms of connectivity in the field of transport and energy, knowing the concept of "testing in rural areas" and integration into the initiative for smart rural areas, for the development of general initiatives, with implications for rural areas;
- Peripheral border regions are facing increasing difficulties and the need to strengthen opportunities and programs for cross-border cooperation to address these challenges.

Results and Discussions

We consider that the starting point in the existence of the smart village is related to the provision of Internet networks, more precisely, the access of the individual households in the rural area, a computer connected to the Internet (Fig.2. and 3).

The expansion of broadband networks in rural areas and the challenge of connecting up to the last kilometer are directly linked to the dominant position on the market and the role of traditional providers. It has succeeded in giving it local speed in agriculture to create a time- resolved problem that will allow the rule to stimulate the introduction of alternative operators for general access to generations and encourage innovative investment for the initiative. local actors. In Fig. 1, it is shown that 51.9% of the number of rural households have access to a home computer in 2017, up 14.4% from 2013 [2]. This growth is much faster than the urban average. Given the location of the study in Chiscani Commune, Braila, where agricultural activities are a priority, we believe that farmers and the agricultural sector as a whole should be the main beneficiaries of the digital training measures, in order to facilitate the implementation and development of digital tools and methods in this sector [2].

Source: own processing based on statistical data, NIS, 2020.

Fig. 2: Evolution of the number of households that have access to the Internet at home, in the rural area during 2007- 2014
Source: own processing based on statistical data, NIS, 2020

The emergence of the new Wifi4EU program, meant to improve internet connectivity in local communities, but we note that the projects were selected on the basis of the "first come, first served" principle, and did not have the expected effects. In our localization, the project selection process should take into account more of the additional obstacles that the local rural authority faces, because it does not have financial resources such as the urban authorities, when we talk about co-financing.

Although urbanization leading to the emptying of rural areas is a general phenomenon in Europe, the trend is also dramatic in Romania. The territory of Romania has a population density of 84.5 inhabitants/km^2, one of the lowest in Western Europe, as well as Spain, Greece, Cyprus[2].

Fig. 3: Evolution of the number of immigrants in the 2008-2018 session, in Braila county
Source: own processing based on statistical data, NIS, 2020

The lack of young people means that the population does not recover, and the regions lose entrepreneurs who could generate jobs and stimulate the local economy. Measures in Spain have recently been proposed by reducing taxes for areas with less than 8 inhabitants/km^2.

Countries where governments have supported entrepreneurship by improving business infrastructures and facilitating access to loans to finance investments have the best economies.

The successful economic model in Europe is characterized by a dynamic private sector, which promotes entrepreneurship and social responsibility, and is supported by a simple and efficient regulatory framework.
It promotes profit-oriented economic activity, along with social and environmental responsibility. The 2000s promoted the European social model and became the official project of the European Union, reiterated in the Lisbon Agenda as a solution for the development and growth of employment in Europe.

In our study, the Chiscani City Hall, in the survey we carried out in 2019, showed that it does not have a development plan oriented to family businesses with simple actions, accessible to future entrepreneurs even for very small companies, which do not have smart actions.

We consider that the future Local Development Plan of the Chiscani Commune should include objectives with short-term results, namely [7]:

(a) Supporting immigration is the key to repopulating the area, creating layer-ups and increasing jobs. Entrepreneurs and family businesses need an economic environment in which they can thrive, and this entrepreneurship should be rewarded (Fig. 4).

(b) Providing support for honest entrepreneurs who have failed to quickly get a second chance;
(c)Applying the rules according to the Think small principle;
(d) Adaptation of public instruments to the needs of SMEs: facilitating the participation of SMEs in public procurement and the more judicious exploitation of the possibilities offered to SMEs to benefit from state aid
(e) Encouraging and supporting SMEs to take advantage of the growth of global markets.

Among other examples of opportunities for the rural environment, it refers to the production of wind, solar, as well as biomass and biogas for electricity production, the role of biomass (for example wood) and / or biogas for heating. We emphasize here the need to give local and regional authorities the power to initiate and manage targeted environmental measures and to allow them to introduce territorial contracts, jointly signed with the rural fuel / electricity suppliers of local origin. We present in Fig. 5, the evolution of the different types of energy at national level. We observe the increase of the importance of the different energy, wind and solar after 2013.

An explanation would be the simplification of the access procedures to the sources of financing, it is necessary in the current period of rural development, because there is a considerable gap between the number of requests for expression of interest and the much smaller number of complete applications, which is due difficulties in meeting the requirements of such an approach.

Fig. 4: Connectivity to different types of energy in the period 1992-2018 in Romania (KW/h) Source: own processing based on statistical data, NIS, 2020

At European level, there is a digital platform, when high-speed broadband connections are available in every home in the rural area, generally available in the specialized center. A number of benefits and care centers, care cannot solve the digital divide, but it does require a role to play in situations, revitalizing a satellite to centers, providing jobs and training opportunities for rural residents.

We do not intend to present a model of functions for a digital platform, as a point of care for electronic services, such as: electronic health (online consultations), electronic legal advice (legal advice), electronic governance (electronic vote, tax declaration) online, applications for social benefits), e-commerce (online banking, agricultural products sales, etc.) specific to the analyzed rural area (Fig. 5).

Fig.5: Connection to the smart rural area
Source: own processing based on statistical data, NIS, 2020.

According to the model of smart cities, one can consider the smart rural area that must adopt a comprehensive country approach and an innovation, which should take care to include all dimensions of the family.

We mention that this configuration is based on the results of the survey carried out in 2019, conducted at the level of a focus group, with representatives of local companies and the local community but also of the conclusions of the swot analysis in 2019.

The concepts of "smart city", respectively "smart rural area / smart village" should not be viewed as contradictory, but should be viewed as complementary, each supporting and enhancing the success of the other.

Strategically, a rural area does not end at its administrative border, but interacts with neighboring, rural or urban entities and plans its development in harmony with its environment. Consideration should be given to establishing mutually beneficial relationships between the rural and urban population, without the rural environment becoming a mere service provider for urban areas.

A housing system, to be considered as a whole, will not be viable without ensuring the viability of all its elements, from large cities to small villages.

The smart cities model can rely on a large number of actors to promote and carry out different initiatives, while this is not valid in rural areas, where the level of human and administrative resources is generally more limited. These differences should be reflected in the elaboration of the future policy framework and funding possibilities.
The European Innovation Partnership (IEP) Program on "Smart Cities and Communities", which seeks to promote and consolidate experiences in smart areas of the EU, but regretted, so far, rural areas have not been included as well. before activating these activities.

The connection and existence of sustainable transport networks are the most important essential to be able to connect the digital figure, to be able to provoke care indications that can be confronted in the area on the point of seeing the dispersed population and the higher costs.

The European Smart Satellite Documentation mentions the provision of Europe's Interconnection Mechanisms (MIEs) which may allow an opportunity to extend to the EU to provide an office and request more details on how to handle these finances and can be used for a connection support to rural areas, especially for the more famous remote rural areas.

There are a number of economic, social and ecological opportunities of local energy production (electricity and heat), as well as the possibility of creating synergies with the help of regional and rural regions and with the CAP (pillon 2 principle).

Fig. 6: Evolution of the number of people (16-74 years) who used the computer, by residence environment, on the frequency of its use
Source: own processing based on statistical data, NIS, 2020

There should be no time gap between urban and rural in terms of using a PC, especially if we are talking about accessing a financing program, in order to maintain an upward dynamic and the current level of development.

Specialists believe that in order to be successful, funding applications must encourage networking and clusters and participation in them, as well as cooperation - these issues are usually needed in smart rural areas to enable the expansion of activities and learning.

Conclusions

Smart areas could be based on their socio-cultural heritage to develop and manifest a well- defined sense of belonging to the entire infrastructure, especially the general services needed to carry out an economic activity, and to attract the relocation of urban enterprises.

A challenge for local and regional authorities is the need to stay informed about and have access to funding opportunities. An important role in sharing information, supporting networks and providing examples of good practices, including through the work of the European Commission's Broadband Platform, is provided by educational institutions, training and education centers.

For a mobilization in accessing the financing programs, we propose the establishment of an annual award recognizing the achievements of the smart village or the most successful smart zone in the EU. Existing networks such as the European Enterprise Network (EEN) and their local partners in the Member States could also be used to provide up-to-date information on a range of topics relevant to entrepreneurs in villages and rural areas.

Progress is still unsatisfactory and uneven, with disparities still remaining, especially between urban (Braila) and rural (Chiscani). The dimension of the challenge is demonstrated by the fact that in 2019, many of the households in Braila county did not yet have a fixed broadband network, and 90% of them were in rural areas. In our opinion, efforts are needed to guarantee the same capacity of the high-speed telecommunications network throughout the region, as a prerequisite for then competitiveness and economic growth of rural areas.

At EU level, the goal is to have connections faster than 30 MB/s by 2020, throughout Europe, including in rural and remote areas. This is, however, only an average value at EU level, with considerable variations between different states and areas, especially in rural areas and in the most remote regions, where speeds of 10 MB / s are encountered quite often, even in more economically developed member states.

10 MB/s is the usual speed for a typical household, in order to benefit from the most popular online

services. The lack of broadband connections fast enough represents a serious challenge for territorial cohesion at present.

At European level, efforts will be intensified to develop high-speed internet in rural areas, recognizing internet access as a public interest service by setting acceptable minimum standards for broadband connections, which, beyond reliable Internet access [5].

in Switzerland and Finland, where access is guaranteed up to the "last kilometer". In any case, this should be considered at least as an ex ante conditionality for any kind of financing for smart villages.

Based on the obtained results, the following recommendations are made:

A first recommendation would be to encourage collaborations between local public administrations and companies and to reuse the developed solutions, while facilitating their interoperability. Support the provision of training courses for different age categories on how to use digital technologies and adapt teaching to target groups, given the digitization of certain public services at local or other levels (form requests, tax returns, electronic invoices, traceability, CAP, etc.). It is currently discussing the concept of digital literacy, which will allow all citizens to have access to these training courses in order to carry out elementary tasks in the new digital environment, and calls for them to benefit from funding through structural funds and funding. European investments;
Testing in rural areas. For the local authority, testing in rural areas means evaluating policy options, in order to be sure that the most equitable solutions for rural areas are adopted.

Competition between the USA and China in the Geoeconomic Space

Konrad STAŃCZYK

Military University of Technology, Faculty of Logistic, Warsaw, Poland,
konrad.stanczyk@wat.edu.pl

Abstract

The growing importance of economic factors in the foreign policy of states and the transfer of rivalry from the military to the economic plane has shaped a new category known as geoeconomics.
The geoeconomic approach, without giving up such elements as: geography, history, political science, sociology, cultural studies, draws attention to the dominant role of the economy in the modern world and the related need to move to the geoeconomic model of describing the spatial diversity of the modern world. The purpose of the study is to present the category of geoeconomics in relation to the theory and practice of contemporary international relations and make a geoeconomic assessment of the US and China as well as mutual economic relations between these countries. These assessments will be prepared using methods of analysis using statistical tools, including descriptive statistics, and analysis of available scientific studies and substantive sources of information.

Keywords: Geoeconomics, International Relations, Security, Economic Security

Introduction

The power of modern countries is determined not only by their military potential, but also by their economy, which means that currently, one of the most important strategies of a country is its economic policy, which by its nature influences foreign policy, affecting the position of the state on the international arena. The increasing importance of economic factors in foreign policy and the transfer of rivalry from the military plane to the economic sphere have shaped a new category – geoeconomics. The geoeconomic approach includes elements such as geography, history, political science, sociology as well as cultural studies. It emphasises the dominant role of the economy in the modern world and the related necessity to transition to the geoeconomic model of describing the spatial diversity of the modern world.

Geoeconomic rivalry is currently the main form of competition between the biggest countries. The wall formerly separating politics from economics collapsed, which is why the current political conflicts occur via the system organising the global economy (Leonard, 2016, p. 15). The most important instruments of this fight have not been limited to the economic war or economic sanctions for a long time. Countries are increasingly using more sophisticated methods, which enable them to compete in the geoeconomic space. The key factors include persuasion, problem coalition, convincing and effective competition, as well as organising promotional campaigns for investment.

At the turn of the 1980s and 1990s, enormous changes took place in the international architecture. The Union of Soviet Socialist Republics collapsed, the Cold War ended, and the United States took over the role of a superpower dictating the world order. This manifested itself in the participation of this country in the democratic changes in Europe, the Middle East as well as Asia, making the US the world leader in the political, economic and military spheres. This advantage was reduced by the attack of the 11th of September 2001, introducing another enemy i.e., broadly understood terrorism. Upon these changes, China emerged as a new competitor to the US, which somewhat in the background, has built its political empire potential based on economic development and expansion.

The aim of the current study is to present the category of geoeconomics in relation to the theory and practice of contemporary international relations, with particular emphasis on the rivalry between the USA and China. The selection of these particular countries as well as the analysis of their biopolarism was determined by the effect of power distribution, as a result of which these empires

accumulated material potential measured by the universal GDP index many times greater than that of other powers e.g., Russia, Japan or India.

The concept of Geoeconomics

Ray H. Whitbeck is often considered as a forerunner of geoeconomics. In 1929, he published an article titled *A science of geoeconomics*, in which he emphasised that the existing economic laws should take into account the local and regional geographical context, for which the economic geography creates an empirical basis. On the other hand, geoeconomics formulates the economic principles and laws of action in given geographical conditions (Whitbeck, 1929, p. 117).

The contemporary ancestry of the *geoeconomics* category is derived from the article written by Edward Luttwak titled *From geopolitics to geo-economy* (Luttwak, 1990), which was published in 1990 in the National Interest. The article was subsequently presented in the book titled *The Endangered American Dream; How to stop the United States from becoming a third world country and how to win the geo-economic struggle for industrial supremacy* (Luttwak, 1993), which was published by the same author in 1993. In 1998, the article was also presented in the work titled *Turbo-capitalism. Winners and losers in the global economy* (Luttwak, 1998 and 1999). E. Luttwak opposed geoeconomics to geopolitics. In his considerations, he noticed and emphasised that after the end of the Cold War, rivalry in the economic field noticeably intensified and the situation changed. Americans, Europeans and Japanese, who were no longer forced to maintain solidarity resulting from the fear of the Soviet Union, began numerous new conflicts, termed "strategic", which related to the trade rules and leadership in various sectors of the economy – from aviation and space flights to television series. Smaller countries did not take part in these battles, but pursued their own goals in the economic development, aiming to improve the chances of some sectors in the global competition, which threatened small and economically vulnerable groups with liquidation.

In Edward Luttwak's opinion, in geopolitics, the role, rank and size of a country are determined by the military potential and natural resources, whereas in geoeconomics, these aspects are determined by the country's economic efficiency and strength. Thus, the era of geoeconomics came, in which the military power was replaced by the economic power as the key instrument influencing the international environment and securing the status of an empire. E. Luttwak argues that currently, there is a transition from the politics of power to geoeconomics. Traditional power politics utilised means such as the army, diplomacy, propaganda and new types of weapons. The goals of power politics included territorial security, expansion, impact on other countries and prestige. Power politics was the predominant method of operation in the international environment; however, it is currently limited to underdeveloped areas remaining on the periphery of the world system. States engage in geo-economic competition through both through assisting or directing domestic private entities, or through direct action opposing foreign commercial interests:

- states assist private entities through supporting high-risk research and development, initiating overseas market-penetrating investments, and through production over-investment for market-share forcing;

- more directly, states impose taxes and quotas on foreign products, bolster regulatory or covert impediments to imports, engage in discounted export financing, initiate national technology programs, and collect economic and technical intelligence.

According to Luttwak, offensive weapons are more important in geo-economics, as they are in war. Moreover, state-sponsored research and development is the most important of these weapons. "Just as in war the artillery conquers territory by fire, which the infantry can then occupy, the aim here is to conquer industries of the future by achieving technological superiority" (Luttwak, 1999, p. 154). The "infantry" in this analogy corresponds to commercial production, which can also be supported by the state through various forms of subsidies. Yet another geo-economic weapon is predatory finance. If operation subsidies are insufficient to allow domestic exporters to overcome strong competitors, states can offer loans at below-market interest rates. The United States' Export-Import, for example,

provides loan guarantees to finance exports, and equivalent institutions exist across all major industrial countries. "Thus foreigners routinely pay lower interest rates than local borrowers, whose taxes pay for the very concessions that foreigners receive. That already amounts to hunting for exports with low-interest ammunition, but the accusation of predatory finance is reserved for cases where interest rates are suddenly reduced in the course of a fought-over sale. Naturally, the chief trading states have promised to each other that they will do no such thing. Naturally, they frequently break that promise (Luttwak, 1999, p. 156).

The goal of geoeconomics is to obtain (or defend) an important position in "strategic" industries characterised by high added value (telecommunications, IT, biotechnology, aviation and space travel, modern components for the automotive industry). The winners play key financial, creative, control and high-level management functions. The losers can be content with the assembly line (Luttwak, 1999, p. 160-161). According to Luttwak, the reorientation towards geoeconomics will not change the nature of international relations. The international system will still be organised on the basis of the rule of anarchy, states will remain functionally undifferentiated, forced to ensure security(Waltz, 2010, 156). The logic of the conflict and the game of either/or will not disappear either. Only the forms and means of this rivalry will change. Luttwak also pointed out that the transition to the geoeconomic competition would proceed across the world unevenly. Certain regions of the world, in particular the Euro-Atlantic circle, will be more likely to use the geoeconomic strategies (Szymanowski, 2016, p. 323). According to this researcher, the economic success is the most essential in the modern world, and for highly developed countries, the old-fashioned territorial wars have lost their significance (Luttwak 1998, p. 152-153).

World Pensions Council economist M. Nicolas J. Firzli has argued that “adhering to the laws of geo-economic gravity” including financial self-sufficiency and the existence of advanced, diversified transportation infrastructure are now essential to ensure the effective sovereignty of a state. From that perspective, investment attractiveness and the capacity to project soft power across considerable distance as China has done through its Belt and Road Initiative are also viewed as a key determinants of geo-economic strength (Firzli, Nicolas, 2017, p. 45). Here, large private sector asset owners such as pension funds are expected to play an increasingly important part, alongside US and Chinese state actors. Even the self-absorbed, thrifty ‘America first’ policy makers in the White House eventually realized they couldn’t ignore these fateful geo-economic developments. In November 2018, vice-president Mike Pence travelled to Asia to promote President Trump’s ‘Indo-Pacific Vision’, an ambitious plan backed by tens of billions of dollars in new loans and credit-enhancement mechanisms to encourage “private investment in regional infrastructure assets”, insisting that “business, not bureaucrats will facilitate our efforts”. The new great game has just started, and pension investors will be courted assiduously by both Washington and Beijing in the coming years – not a bad position to be in in the ‘age of geoeconomics” (Firzli, 2019, p. 82).

Geoeconomics is the analysis of the economic order strategies, in particular the commercial ones, which are decided by countries in relation to policies striving to protect the national economy or other issues closely related to the economy, to achieve control over key technologies or to gain certain sectors on the global market associated with the production and distribution of a certain product or a range of relevant products, the possession or control of which gives the owner i.e., a state or a state-owned enterprise, an element of power and impact on the global economy, and contributes to the economic and social strengthening (Lorot, 1995, p. 71). The essence of the geoeconomic strategy of a state is determined by prioritising economic goals, which are treated as independent variables. At the same time, the modern concept of geoeconomics in international relations refers primarily to the international activity of states, the purpose of which is to create a geoeconomic space. It is a higher order space due to the features of the internal structure determined by technological, commercial, production and financial relations. It is the creation and opening of international markets, economic zones, integration groups, preferential agreements and currency zones. In other words, it is believed that the great game played by the strongest powers, which was foreseen in various geopolitical doctrines, is currently in full swing. However, the character of the game has changed, because instead of increasing their military arsenals, the players prefer to use their economic potential (Blackwill, Harris, 2015, p. 41).

Geoeconomic Space Creators

The analysis of the nature of the modern global economy reveals that the development of a post-industrial society has led to tremendous changes in the management system. Powerful economic forces are currently transnational and defy state control. Economic governance is shifting to a regional, supranational or global level, as the state level is no longer able to guarantee the effectiveness and efficiency of numerous economic activities. The global economy is regulated by a distributed decision system consisting of various geopolitical and geoeconomic actors (Jean, 2003, p. 210).

It is assumed that in the modern world, three centres of economic regional integration exist:

- Europe with the key role of the European Union;
- America with the predominant role of the USA and NAFTA structures;
- The Asia-Pacific region with a dominant role of China or Japan with the APEC structures.

The dynamics of international relations will be determined by the economic relations between the "triad" involving the EU, NAFTA and the Asian "yen-bloc" (Jesop, 1997, 35). However, Russia's superpower aspirations should not be overlooked, mainly due to its potential, centralised nature of the state and the role of the state intervention in the economy.

The extensive network of commercial and investment connections, integration processes as well as the flow of production factors and technologies between these centres create a new economic world order. It should be noted that new market participants as well as emergence of new technologies significantly alter both the structure of foreign trade and the mechanisms governing it. In particular, the widespread use of information technology allows for the introduction of goods and services on the market, which were previously excluded from it. Over the past 20 years, the value of trade between countries has grown tremendously, reaching unprecedented levels. Currently, the global economy is highly integrated, and traditional trade in finished goods has been largely replaced by global supply chains.

At present, the largest and most technologically advanced economy in the world is the US economy. It accounts for 24.5% of the nominal global GDP and 17% of the global GDP calculated according to purchasing power parity. In 2017, the US GDP amounted to USD 19.390 billion (IMF 2018). Moreover, the GDP per capita is USD 62,606 (MFW 2019). The private sector sphere (generating over 87% of the GDP) is dominant.

The USA is the headquarters for many global corporations and financial institutions. American companies constitute the key players in numerous fields of activity of many industries, including new materials, electronics, telecommunications, IT, conquest of space, energy, nanotechnology, biotechnology, medicine, bioinformatics, genetics and chemistry. However, the roots of the American economy are found in agriculture, which was its fundamental strength until the mid-twentieth century (to date, the United States is the world's largest food producer). Later on, intensive development of the industry (mainly automotive, oil and steel) took place, and the rich and diverse raw material base, highly qualified workforce and the socio-economic system (market economy) developed its versatility and modernity. America quickly turned to finance, electronics and new technologies. The vast area of the country enables the extraction of raw materials on a large scale. The country is the world leader in mining many of them. The basis for the development of energy is hard coal (2nd place in the world in extraction, 1st in the export) as well as crude oil (from 2018 – 1st place in the world) and natural gas (2nd place in the world). Metal ore deposits, such as iron, zinc, lead, copper, bauxites, vanadium and tungsten ores are mined on a large scale. In addition, chemical raw materials are also exploited: phosphates, potassium, salt and sulphur (1st place in the world). Gold is mined in Alaska and California (the largest resources in the world).

From a geoeconomic point of view, the possibility of massive oil extraction by the US plays a significant role. In 2018, the USA was ahead of Saudi Arabia in terms of the oil extraction volume, followed by Russia, and became the largest oil producer in the world. This is mainly due to the discovery of rich shale deposits in Texas and the possibility of oil extraction by means of hydraulic fracturing (*i.e. fracking*). These opportunities resulted in the US not being dependent on the oil

supply from the Middle East. Of course, it should not be forgotten that due to the enormous needs of the American petrochemical industry, the US is also a large importer of this raw material. The rich resource deposits are accompanied by huge energy production. The USA is the second largest producer of electricity in the world. For decades, the country has also invested in the automotive industry (corporations such as General Motors and Ford were created here) and aviation. The USA is the largest producer of weapons and armaments in the world. Moreover, the budget is heavily funded by tourism revenues – the USA is one of the three most-visited countries in the world (next to France and Spain). The world's largest industrial corporations are located in the US: General Motors, Ford Motor, Chrysler (automotive industry), IBM, General Electric (electronic and energy). The value of private investment abroad, mostly in Western Europe, Canada and Latin America, is estimated at USD 260 billion. Mines and factories are privately owned. Most enterprises merge into monopolies (capitalist associations influencing the level of production), which decide on prices and conduct economic policy aimed at obtaining the highest possible income. In addition to large metropolises, small enterprises, which employ less than 50 people, also operate.

The United States is the third exporter in the world. The value of US exports equates to USD 1.024 trillion. The export mainly consists of: machinery and equipment, computers, aeroplanes, equipment for industrial facilities (thermal, hydro and nuclear power plants, refineries, smelters, factories) and for cars, cars, weapons, artificial materials, pharmaceuticals, crops, tobacco. Furthermore, the US is the largest importer in the world. The value of goods imported into the US amounted to USD 1,869 billion. Imports mainly include passenger cars, ships, computers and electronic equipment, mineral resources, fuels, sugar, fruit, tea, coffee, clothing, footwear, wood.

America has a great influence on various international financial institutions, such as the International Monetary Fund and the International Bank for Reconstruction and Development, as it is the largest net payer to the budgets of these organisations. The US dollar is probably the most important means of payment and the most convertible currency in the world.

Nevertheless, the most dynamically developing economy in the world is the Chinese economy. Over the past 30 years, it has achieved an average growth rate of 10% per year (MFW 2020). China's economy is classified as the second (after US) global economy. It is also the largest exporter in the world. Its GDP for 2017 amounted to USD 12,015 billion (IMF 2017).

China belongs to developing countries with a centrally controlled economy. Agriculture plays a major role in the Chinese economy. Despite the small amount of arable land per capita as well as frequent damage caused by floods and droughts, agriculture generates over 20% of the country's national income. China is at the forefront of cultivation of many crops. In the harvest of rice, wheat, sweet potatoes, common potatoes, cotton, flax, rapeseed, peanuts, tobacco and apples, China occupies the first place in the world. It holds the second place in the cultivation of corn, millet, hemp, sesame, tea and tomatoes. In addition, it is in the third place in the cultivation of sorghum, sugar cane and soybeans. The variety of fruit grown in China is also enormous.

China is one of the world's most resource-rich countries. The country holds the 1st place in the world in the mining of hard coal, as well as in the extraction of tungsten, antimony, tin and iron ores. The largest coal opencast mine in the world is located in the Fushun province. The extraction of crude oil and natural gas also plays an important role in the domestic energy. On the other hand, heavy industry predominates in China's manufacturing industry (approximately 40% of the industrial production value). The main branches of the processing industry include metallurgy and engineering. In the means of transport industry, rolling stock production, shipbuilding and tractor production are the most developed. The car industry is primarily focused on the production of trucks. The main centre for the production of passenger cars is Beijing. The chemical industry is also growing rapidly, an example of which is the production of fertilisers. China ranks 1st in the world in the production of nitrogen fertilisers and is one of the frontrunners in the production of phosphate fertilisers. The role of plastic production is growing. Additionally, the refining industry is developing as a consequence of the growing oil production. The electronics industry is also developing intensively and typically involves cooperation with Japanese companies. Traditionally, the textile industry is of great importance, especially the cotton industry, which accounts for 95% of the entire industrial textile production. The food industry, including the sugar, fat, milling, meat, tobacco, tea, wine and spirits industries is also of significance.

For many years, China is the world leader in terms of the value of trade turnover. In 2003, it amounted to USD 850.9 billion. The value of exports in 2003 was USD 438.1 billion and the value of imports was equal to USD 412.8 billion. In the following years, these values grew at a tremendous rate and in 2017, China became the world's largest exporter. The export of this country reached USD 2.157 billion (TWF 2019). In addition, from a geoeconomic point of view, it is also important that China has become the second largest exporter of production capital (after the USA) and the owner of various production assets abroad. Machines and equipment constitute the most exported goods. Then there are textiles and clothing, footwear, toys, sports equipment and fuel. China exports to countries such as USA (21.1%), Hong Kong (17.4%), Japan (13.6%), South Korea (4.6%), Germany (4%). On the other hand, China imports machinery, electronic equipment, fuel, plastic, iron, steel and chemicals. The partners of the Chinese import include Japan (18%), Taiwan (11.9%), South Korea (10.4%), USA (8.2%), Germany (5.9%).

Economic aspects of the rivalry between the US and China

The word "rivalry" is derived from the Latin *rivalis*, which originally indicated a person competing with someone else for access to water from the stream (*rivus*) (Sondel 1997, p. 847). According to the definition found in the *Oxford Advanced Learner's Dictionary of Current English*, competition is "a state, in which two people, companies, states compete for the same thing" (Oxford 2000).

According to Robert E. Kuenne, an important feature of competition is the *non-anonymity* of its participants. In competitive relations, opponents are aware that their actions are likely to affect their rival, who in turn acts to protect themselves and their own interests (Kuenne 1989, p. 555).

There are two key elements, the existence of which allows for a relationship to be considered as rivalry: conflict of interest and mutual recognition as a rival. However, there are a number of examples, where countries do not want to clearly identify themselves as rivals (Rasler, Thompson 2000, p. 513). One of the reasons for this reluctance may be the interdependency, in which modern international relations abound. States can compete with each other in one sphere, e.g. the economic sphere, or in one of the regions, while having common interests in another sphere, e.g. the military sphere or in another part of the world. Although competition can be the cause of conflicts, it is not necessary for their emergence. Competition should also not be equated with the arms race, which may or may not be associated with it (Goertz, Diehl 1993, p. 55–156). It can be one of the aspects of (military) rivalry taking place on many levels. The Cold War between two superpowers – the USSR and the US – was one of the manifestations of the multifaceted competition between them. It should be noted that the arms race rarely occurs outside of rivalry (McGinnis, Williams 1989, p. 82). Today, warfare between rivals is relatively rare. This is, among others, a consequence of the rivalry being transferred from the military-strategic dimension to the economic sphere. While wars and disputes usually end in a truce or peace treaty, competition can last for hundreds of years, without formally announcing its beginning and end. The slowing down of competition in general, or in one sphere, is often a result of a change in the international order, or the emergence of a common threat from another country or a coalition of countries. The global crisis, or the so-called international terrorism, includes threats unrelated to a particular country; however, it also often slows down the rivalry between competing actors. The signing of an agreement relating to one of the spheres of competition is not synonymous with the termination of other ones, if they exist (Włodkowska-Bagan, 2015, p. 248).

Currently, one can notice pragmatics of the US departing from multilateral agreements and building the concept of Western unity, which until now was a strategy in both basic political directions – Atlantic and Pacific. China is successfully taking advantage of this situation. The uniqueness of China's contemporary policy lies in the country's lack of involvement in wars as well as political confrontations provoked as a result of them. However, China does not combine this absence with the economic factor, making it an economic superpower. A sensible choice of international strategy many years ago, manifesting in the preferential treatment of the economic goals, while abandoning the arms race, is a structural premise for China referring to geoeconomics, which is understood as the creation of a geoeconomic space utilising appropriate instruments of geoeconomic action (Haliżak 2017, 92). Other countries are not afraid of the Chinese military power, but of the fact that modern China has great opportunities to use trade and investment for its own political purposes. This is

confirmed, for example, by the fact that China is also increasingly displaying its aspiration to lead APEC (*Asia-Pacific Economic Cooperation*), which is a supranational institution created for economic needs. Although APEC does not have the status of an international organisation and operates on the principles of an integration agreement, it is important in resolving economic disputes and creates a forum for discussing economic issues, which are strategic for its members. Its creation has accelerated the trade and investment flow both on a regional and global scale. The most important tasks of the Cooperation include liberalising trade by streamlining customs procedures, promoting economic integration, carrying out works on establishing technological agreements, creating free trade zones and influencing economic growth, while maintaining sustainable development. APEC also reacts to political and economic changes; therefore, in 2002, one of the organisation's goals also involved the fight against terrorism, which poses a threat to the development of free trade.

2018 is considered as the beginning of the escalation of rivalry between the US and China, and the event that symbolically confirmed this state was the speech of the US Vice President Mike Pence at the Hudson Institute on the 4th of October 2018, which was indisputably anti-Chinese in nature, and which claimed that the US was opposed to China's own vision of international order (Pence, 2018). That year also saw the first threats of the US appealing to the economic war in the relations with China, primarily in the sphere of trade. These geoeconomic activities were reflected by new regulations introduced by the EU and the United States, hindering the takeover by China of technologically advanced small and medium-sized enterprises by merger and acquisition. Such activities were also manifested by the US initiating a trade war with China aimed at eliminating approximately USD 325 billion (2018) in trade deficit by imposing an additional 25% customs duty on Chinese imports. It was the geoeconomic aspirations of both powers that led to the situation that for the first time in history, the Asia-Pacific Economic Community Summit (APEC) held in Papua New Guinea in 2018, ended without a joint communication from the leaders of the member states. The dispute primarily concerned commercial issues. The two largest economies in the world are currently in conflict, which the Chinese ministry identified as the largest trade war in the economic history. Washington has already imposed criminal duty on goods imported from China, which are worth USD 250 billion annually. In turn, Beijing responded with tariffs on the American products worth USD 110 billion annually (TVN 24, 2020). Both sides suffered losses in this trade war. However, they have had an asymmetrical character, because the losses on the Chinese side were much greater. In the face of economic losses, during the G20 Summit in Buenos Aires on the 1st of December 2018, the leaders of both countries announced a 90-day truce and proposed solutions to the problems through trade negotiations. From a geoeconomic point of view, trade war also has a negative impact on the growth rate of the Chinese economy as well as on the trade with some countries. Many goods produced in China are a result of globalisation processes and relationships within the global supply chains. Components, especially in sectors such as computers and electronics, electrical devices and machines, come from various countries. Hence, the effects of trade wars will be felt in these countries. Moreover, the introduced duty rates force reconfigurations in the supply chain. One of the reasons for the trade war is China's dissatisfaction with the current institutionalised system of the global economy, which was created by the West and gives this part of the world pertinent privileges. Despite its economic empire and power (15% in the global product), China is marginalised in this respect (it is estimated at 6% of the decision-making calculated by the International Monetary Fund). During his speech at the 2019 World Economic Forum in Davos, George Soros said that although China is not the only "authoritarian regime" in the world, it is the richest, strongest and the most technologically advanced state. This makes President Xi Jinping the "most dangerous opponent" of the Western, open society.

There seems to be a real fear that if China shapes the international order, influences various countries and regions in the economic, social and political spheres, it will do so in its own image. The attitude of other countries towards this developing conflict is also noteworthy. One may be tempted to argue that the countries of the region do not perceive the new superpower bipolarity as a threat, but as an opportunity to obtain political and economic benefits, often balancing between the two forces, putting stability and the willingness to develop above competition.

Summary

Currently, a reorientation of the goals of various countries is noticeable in the international environment. In the new approach, these goals are increasingly focused on economic prosperity rather than on the more narrowly understood and rarely perceived national security. In addition, many countries try to base their security on the economic potential and transnational economic cooperation. This creates a network of interdependence of the world economy, which overlaps with the traditional division of international relations. Military strength is no longer the main domain in the hierarchical building of the architecture of the modern world; however, it should not be forgotten that it is still present and can be used in specific situations, especially that the expenditure on armaments by China has become a factor of growing importance in the 21st-century American-Chinese relations. Washington's legitimate concern about the military investments in China (also in the context of purchasing advanced Russian weapons) is associated with both US commitments to its Asian allies, including Taiwan, and the American international burdens, including the war against terrorism.

The opportunities and threats for European countries are also important in this battle. In the face of the great Chinese-American rivalry, Europe will have to choose a side. This will not be easy to achieve. To neutralise the European Union, China is trying to divide it and make it dependent on it. In turn, the position of the Trump administration regarding Europe is inconsistent. It seems that European nations are capable of playing a key role in the decisive battle of the 21st century – between China and America. On the other hand, the conflict can allow Europe to be reduced to a weak, divided region, which will fight for influence. Undoubtedly, Europe has the potential to be an effective and strategic player; however, it needs to demonstrate greater coherence to be able to do so.

Abstract

The article is part of a series of publications on virtual supply chains. The first section characterizes determinants defining virtual supply chains. Nine areas affecting virtual supply chains have been identified. The next stage of research concerned the isolation of risk factors affecting virtual supply chains. Presented findings are supplemented by FMEA risk analysis for virtual supply chains. The research was conducted at the turn of 2019 and 2020. The objective of the research paper is to present aspects (areas) where the risk related to virtual supply chains is the most significant.

Keywords: virtual supply chain, FMEA risk analysis, supply chain, risk, risk factors,

Introduction

In the era of digitization and computerization, there is a continuous transformation of supply chains. The digital age creates new opportunities in this area. The development of information technologies creates the possibility of creating a digital logistics network which goal is to concentrate as many processes as possible in the virtual sphere. The digitization of logistics processes and supply networks is supposed to help to achieve huge savings and competitive advantage by supporting new thinking and management methods. Supply chains are shifting to the internet. Data and information processing in the cloud computing enables greater freedom and mobility of supply chain management. The use of cloud computing makes it possible to cope with the growing speed of change in unstable economic and political conditions. The virtual sphere not only allows for easier, faster and more precise management of the growing amount of data and information, but also creates digital supply chains. The most important element of managing digital supply chains or the physical flow of goods and services using IT solutions is cooperation with each link in the supply chain in real time. Optimization and digitization of logistic and economic processes can help business entities to achieve significant savings and competitive advantage. The efficiency of the entire supply chain is also increasing, and the use of enterprise resources is improving. Storage and processing of data and information in the cloud helps to remove physical restrictions on access to data, supports quality and leads to improved communication within the supply chain. Faster, more efficient and qualitatively better communication contributes to the possibility of conducting analyzes at every stage of the flow of goods, which may contribute to equitable decisions (online.norwich.edu, 2019; Saniuk, Saniuk, pp. 212-216, 2018; Kulińska, Dendera-Gruszka, pp. 113-117, 2019).

FMEA risk analysis

The subject of the article is risk analysis for virtual supply chains. Conducted research has been focused on identifying determinants characterizing virtual supply chains for which risk factors have been developed. Based on this analysis, an FMEA risk analysis was carried out, which is presented in Table 1. The FMEA analysis aims to show potential disadvantages and threats in the functioning of virtual supply chains and factors affecting them, as well as to draw attention to the greatest disadvantages and threats.

The FMEA (Failure Mode and Effects Analysis) method is designed to detect defects at the earliest stages of the process. The FMEA method consists in the analysis of factors that may affect the analyzed process and which relate to process methods, instrumentation, environmental impact along with determination of control measures (Folejewska, 2010; Pałubicki, Kukiełka pp. 90-96, 2017).

The first stage of the FMEA method is to select operations that should be analyzed, followed by designation of the scope of the analysis. The number of parts and levels of the method depends on the complexity of the process.

The second stage involves specifying the activities related to the FMEA analysis. Firstly, there shall be defined potential defects that may occur in the analyzed case. After determining the sequence of events: cause - defect - effect, each defect should be assessed with an integer ranging from 1 to 10, considering three criteria: risk - possibility of defect - cause.

The last stage of risk analysis using FMEA method describes the elements in which changes should be made in order to reduce the risk of defects (Wyrębek, pp. 151-165, 2012, Dendera – Gruszka, Kulińska, pp. 1968-1978, 2018).

Fig. 1. FMEA Sheet

Area	Potential type of defect	Potential effect of the defect	Meaning	Potential causes of the defect	Occurence	Preventive measures	Detection	RPN
Technology	Lack of current system updates	Outdated software	9	No investment in software update	9	Software update	2	162
				No system support	9	Purchase of system licenses. IT support	1	81
				Loss of license	8			72
				Lack of technical and personnel support in updating the systems	8			
				Lack of resources	7	Investment in adequate equipment	2	112
	Lack of adequate technical equipment	No hardware performance	8					
		Longer data processing time	9	Lack of adequate equipment	7			112
				No access to new technologies	6	Participation in trade fairs and training in order to be up to date with new technologies	3	162
	Lack of adequate software	No possibility of cooperation with other entities in the supply chain	10	Failure to fulfill assumed functions. Purchase of unverified software. Dynamic changes on the IT market. High costs of implementing new technologies. Dynamic changes on the IT market.	4	Adjusting the software to other entities in the supply chain	4	160
		Inability to function in the virtual world	8		3	Implementation of additional systems	4	96
		Inability to settle administrative matters	5		2	Introduction of a unified IT system in the supply chain	4	40
	No access to the telephone network	Lack of communication and no access to the Internet	10	No possibility of cooperation with other entities in the supply chain	2	Change of location of the enterprise	3	60
	No synchronization of telephone network with IT systems	Limited cooperation opportunities	8	Lack of adequate technical facilities	6	Introduction of ICT investments	6	288
				Lack of funds for ICT	5			240
				No desire to develop technical facilities	6			288
	No access to fast internet network	Lack of timely response to customer inquiries	7	Wrong location	7	Change of location of the enterprise	5	245
		Longer data transmission time						

				High costs of implementing a high-speed Internet network	7		4	196
	Unfair competition	Loss of customers	5	Intrusion into information systems. Patent refusal	7	Closer analysis of entities involved in the supply chain	7	245
		Theft of know how	9		6		8	432
		Theft of technological knowledge	9		6	Additional system security	5	270
	No access to new technologies	Lack of technological development of the organization	5	No rights to use individual technologies. No interest in new technologies. Poor decision-making in area of new technologies. Lack of suitably qualified workforce responsible for implementing new technologies.	5	----	2	50
		Loss of market attractiveness	6				3	90
		Loss of customers and contractors	6		5		2	60
	Barriers present on a given market			Geographical distance. Time zones. Internet access. Differences in software. No connectivity		Change of location f the enterprise	4	120
		No possibility of establishing cooperation	4		3	Systems synchronization	4	0
	Poor information flow	Loss of customers and contractors	7	No access to information	7	A more detailed analysis of information. Securing of data carriers. Information security.	6	72
				No access to public information	4		3	84
				No access to documents	3		2	42
				Disruption of information flow	8		2	112
				Informational noise	4		4	112
				Lack of information flow model and procedures	10		3	210
				Loss of information carriers	7		3	147
				Loss of information	7		2	98
				Excess or lack of information	9		1	63
				No current information	9		2	126
				Lack of credibility of information	9		2	126
				No link between information and the given environment	7			98
	Intrusion into a computer or Internet network	Data theft. Loss of information. Loss of customers and contractors	9	Poor cyberspace security	9	Securing a computer or Internet network	3	243

	Intrusion into the telecommunications network		8	Previewing and eavesdropping on conversations, video conferences and audiovisual broadcasts	4	Securing telecommunications network	3	96
	Dependence on interactive media	Sharing too much information using interactive media	7	Fashion	9	Careful sharing of information on the network	3	189
		Inability to verify all interactive media users					2	126
		Ease of data and information loss					2	126
		No control over the transmission of information using interactive media					5	315
	Database corruption	Loss of data	10	Virus	8	Aktualny program antywirusowy w pełnej wersji	2	160
				Data theft	7	Data encryption	4	280
				Database intrusion	6		2	120
				Sale of data	5		2	100
				Public data sharing	2		3	60
				Hacker attack	5		2	100
	Unauthorized physical access to an important room with processed data			Unfair competition	5		1	50
				Downloading data from foreign portals	8		2	160
				IT crimes	6		2	120
				Breach of personal data processing rules	3		2	60
	The possibility of a sudden change of business model by cloud service providers	Possibility of occurence of single points of failure	5	Insufficient authentication methods. Lack of continuity of service. Link failure. Low quality of services offered	6	Service provider verification	3	90
		Loss of data confidentiality	9		6	Additional database security	4	216
		Disclosure of data to third parties					2	108
		Deleted company data can still be stored in the cloud					2	108
		Inability to audit the service					3	162
		Phishing					6	324
		Unconscious or accidental sharing of					3	162

		information						
	Illegal downloading of source code from a file server	Loss of data	10	Cyberterrorism. Criminal networks. URL Control Vulnerability	7	Systems update	3	210
		Information and data manipulation				System configuration	2	140
	Threats from other systems on which our resource is based	The ability to install spyware	8	High security costs. Use of pirated software/pirated content within the organization, administrator absence. Cyberintrusion. Operator errors.	7	Not opening messages from unknown senders. Not downloading files from an unknown source. Not opening insecure websites.	6	336
		Hacker attacks					5	280
		Interference					5	280
		User manipulation					4	224
		Disclousure of confidential data					3	168
	IT systems failures	Taking control over systems by unauthorised persons	10	Bad data protection on digital carriers. Lack of interest and funds for innovation. Increase in investment expenditure on the latest technologies, servicization and digitization of entities	7	----	7	490
		Loss of data						
		Errors in entering data						
	Cabling failure	Delays in realisation implementation plans	6	Lack of adequate infrastructure	7	Regular checks of the technical condition of the infrastructure	8	336
	Hacking into online banking	Loss of funds on bank accounts	10	Insufficient electronic bank account protection	6	Logging into online banking only from trusted websites	2	120
		Incurring financial obligations by third parties in user accounts				Not sharing access passwords with third parties	2	120
Time	Emerging markets expansion	Wzrost konkurencji	7	No possibility to catch up in terms of costs and time to eastern markets	5	Getting new customers. Increasing the number of suppliers	2	70
		Loss of customers					1	35
	Lagging behind technological, technical and IT advances	Using outdated systems and software	6	No investment in technical infrastructure	5	Market research. Participation in industry fairs. Hiring an IT specialist	3	90
		Labor disturbance						
		Taking too much time						
		Delays in the flow of information						

	Too late response or no response to customer queries and wishes	Loss of customer	6	Distraction of employees. Insufficient employee involvement. Employee overload. Hiring employees with insufficient qualifications and experience	6	Staff training. Incentive awards. Acquiring employees from abroad	1	36
Location	Reduction of spatial barriers	Increased competition	4	Accession of the country to the economic union	6	Extension of sales and purchases offer to other countries	3	72
				Internet accessibility	6		4	96
				Globalization	6		4	96
				Transferr of production to Asian markets	7		9	252
				Changes in economic conditions on international markets	9		2	72
	Transport network	Lack of adequate transport or communication network	2	Location of the plant in economically underdeveloped areas	8	Change of location of the enterprise. Cooperation with enterprises active in the virtual sphere	3	48
	Technical network	Lack of appropriately synchronized information network	3	Cooperation of entities at various levels of technological advancement	8	Technical network synchronization	3	72
	Lack of integration of ports with the customs systems	Need to settle administrative matters personally	4	Lack of coordination of the ministry of transport operations, industrial development, communication and finance	5	Access to administrative portals. Trusted Profile. Electronic signature	4	80
	Port automation							
Economic	Unconventional forms of employment	Overtime	3	No contact with the employer. Lack of supervision over employees. Addiction to technical means. Secondment of employees. Outsourcing of professional duties to third parties	9	Control over assigned tasks	2	54
		Distruption of faily life	4		8		3	96
		Limiting social and professional contacts	4		8		3	96
		Lack of control over the flow of information	7		9		5	315
	Impact of the virtual world on global stock exchanges	Employment drop	3	Workforce suppression by modern technologies	6	----	5	90
		Staff shortages	7	Too high requirements for candidates. Unemployment. Migration of population. High level of emigration. Aging of the society. Lack of labor force in working age.	9		2	126
		Lack of human capital	7		7		2	98
		Lack of qualified labor force	5		6		3	90
	Situation of global markets	Financial Crisis	5	International economic situation. Conflicts between countries	4	----	6	120

	Volume of currency turnover	Loss of potential shareholders	5	The crisis on the global stock markets. Company bankruptcy. Speculative bubble	4	----	4	80
	Turmoil in the energy markets	Energy crisis	8		6		7	336
	Exchange rate changes	Fall in the value of shares	9		5		6	270
		The inflow of external capital	7		6		5	210
		Inflation	5		5		5	125
	Cryptocurrency quotes	Fall in the value of cryptocurrency	10	Cyberaatcks Political attacks	7	----	4	280
	E-services	More services dedicated to the virtual sphere	4	Lower demand for traditional services	3	----	4	48
	Digital economy	Underestimation of GDP	4	Digital services that are challenging to conceptualize	3	----	2	24
		Overstating the level of inflation	4		5			40
Political and legal	No regulations on digitization, computerization and virtualization	The increase in internet crime	6	Ineffectiveness of law enforcement agencies in tracking and enforcing crimes in the virtual sphere	7	----	2	84
	No cyber security strategy on the national and international arena							
	Inability to respond to cyber crimes							
	Lack of information exchange in the international law enforcement environment		6	Lack of properly trained specialists in knowledge of internet crimes	7	Hiring specialists from the IT industry. Appropriate remuneration for specialists and consultants.	2	84
	There are no law enforcement agencies operating only in the virtual world							
	Lack of structures for cyber resilience, cybercrime and defense activities							
	No exchange of information between the private sector and government entities		4	Reluctance of the private sector to share research results with public administration entities and centers	8	----	3	96
	Changes in legal regulations	Unfavorable and complicated legal regulations	4	Professional groups strikes. Transfer investment to other regions. Social policy of the state.	6	----	2	48
	Changes in legal and social relations	Unfavorable legal and social relations	5		6	----	4	120

	No assistance received from public funds	Lack of funds for enterprise development	2	No public funds for the area. Lack of classification of the entity to obtain assistance from public funds. Insufficient pool of public funds. Insufficient argumentation in application for assistance. No proper support program available	5	Acquiring new contractors, new production orders	3	30
		Rejection of the application for investment co-financing	1		7		2	14
		Insufficient funds for the investment	1		9		5	45
	Changes in economic conditions	Lack of creditworthiness	4	Other credit obligations. Loss of production orders. Enterprise debt	6		7	168
		Inability to repay the credit	3		2		8	48
		The need to introduce foreign capital	1		1		2	2
	Unfavorable government policy towards enterprises	No help from public administration	1	Lack of understanding of the situation by state administration offices. Rigi and predetermined procedures	8	Joining the business association	2	16
		Complicated and time-consuming administrative procedures	2		9		2	36
	Export Value	Lack of international competitiveness	8	Difficulties in getting international customers. Not attractive company offer for foreign contractors	7	Searching for new markets	6	336
Economic	Low economy innovation	Lack of support from government institutions for scientific research and production development	4	Low attractiveness of enterprises abroad	6	Starting cooperation with new suppliers	3	72
	Degree of concentration of production	Increased competition	3	100% of production realization in one place	4	Use of outsourcing. Signing a contract with a subcontractor	7	84
	Export Rate	Low export rate	6	Sales regress	4	---	1	24
	The level of strategic transaction execution	No strategic transactions carried out	2	Directing production only to one specific type of product and cooperation with only one final customer	2	Acquiring strategic investment and implementing smaller production orders	3	12

Source: *Self-reported data*

Table 1 presents all aspects that may affect virtual supply chains. In the table above, individual areas of activity of business entities involved in the flow of services in the virtual world have been analyzed. The potential type of defect was defined along with its effect. The severity of occurrence of a defect is determined on a scale of 1 to 10. The value of 1 is assigned to an improbable (insignificant) situation, while 10 - to a very probable situation. The details of the value assignment are given in Table 2.

Fig. 2. Determining the severity of a defect

R	Severity	FMEA service/construction
1	Improbable (insignificant)	An imperceptible impact on the service
2–3	Minor	The defect is small and has a small impact on customer satisfaction
4–6	Average importance	ustomer dissatisfaction is observable
7–8	Important	The defect happens cyclically and has a big impact on customer dissatisfaction
9–10	Extrely important	An extremely important defect, which affects further work, safety and is contrary to the law

Source: *Self-designed scale*

The next step is to determine the cause of the defect along with determining its value. Also, in this case, the cause of the defect is determined on a scale of 1 to 10. The value of 1 is assigned to an improbable situation, and 10 to a very probable situation. The details of the value assignment are set out in Table 3.

Fig. 3. Determining the probability of occurrence of a defect

W	Probability of occurrence of a defect	FMEA service/construction/process
1	Improbable	No possibility of defects
2	Very low	Very low probability of occurrence of a defect. Defects occur individually and very rarely
3	Low	Low probability of single defects
4–6	Average	Defects occur randomly in small quantities
7–8	High	Disadvantages occur very often
9–10	Very high	Very high probability of a defect

Source: *Self-designed scale*

In the next step is to specify preventive measures and estimate the detection parameters determined on the basis of Table 4.

Fig. 4. Determining the probability of detection

D	Detection	FMEA service/construction/process
1–2	Very high	Certain defect detection
3–4	High	The chances of detecting a defect are high, a test or functionality check is used
5–6	Average	Control leads to average defect detection
7–8	Low	Obstacles in defects detection
9–10	Very low	Detection of a defect is difficult or impossible

Source: *Self-designed scale*

The final stage of FMEA analysis is the assignment of the RPN parameter. Assigning the above parameters to the FMEA spreadsheet allows to specify the priority number of RPN risk, which is calculated according to the following formula:

RPN = Severity (S) * Occurrence (P) * Detection (D)

RPN makes it possible to determine which threats carry the highest risk and the hierarchy in which order preventive actions should start.

FMEA analysis is a method of identifying and preventing problems related to the analyzed process before its implementation. It focuses on preventing process or product defects, increasing process security, financial security of the project, work safety and environmental protection. FMEA analysis is carried out at the design stage of the process or product to avoid the biggest threats and flaws in the implementation phase. This is an important technique for identifying and eliminating potential defects and errors in processes and products.

The study aimed to demonstrate the relationship between the determinants and the sources of risk in virtual supply chains. During the analysis, RPN = 100 was determined, below which the impact of factors on virtual supply chains is insignificant. For the examined supply chain, technological aspects have the greatest impact, primarily related to the lack of adequate equipment, loss of data and information, and theft of know-how. Further aspects affecting virtual supply chains include an increase in energy prices, no control over information transmission, or a decline in cryptocurrencies.

Summary

Access to the internet and ubiquitous digitization enables fast and flexible flow of goods and services. Currently, to become competitive in a given market, speed of response to customer inquiry and flexibility are becoming the paramount features. Without access to the Internet and the use of specialized computer software, achieving a market leadership position would be impossible. However, virtual supply chains, which are primarily oriented on the Internet, carry some danger and risk. Risk factors that have been highlighted in tab. 1, are the first stage to analyze the risk of virtual supply chains.

Abstract

The study focused on ascertaining the roles of trade unions in the attainment of the educational goals in Nigeria. Survey research design formed the design of the study. The population of the study comprised of 380 respondents which were drawn from the teaching and non-teaching staff of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria. Data for the study was collected through the use of a structured questionnaire, which was distributed to the 380 sampled population of the study. The data obtained were analysed using descriptive statistics. Based on the result obtained from the data analysed, the study found out among others that trade unions play a significant role in ensuring that educational goals are accomplished. The study also revealed that issues relating to the conditions of service, depleted states of infrastructure, underfunding of the tertiary institution, and non-payment of arrears and entitlement are the major factors promoting disagreement between the Management of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria and the Unions. Thus, the study recommended, among others, that labour dispute management committees in the College of Education should be set up to deal internally with all union issues in order to further increase productivity. A tripartite committee of the Government, the National Industrial Court and the Trade Union should be set up to recommend the review regularly.

Keywords: College of Education, Educational Goals, Nigeria, Roles, Trade Union

Introduction

Globally, education is seen as a key agent of change, which is concerned with the renewing, remoulding and transformation of the human mind, with focus on exposing man to diverse and innovative ways of doing things to bring about change in all dimensions of the society. Today, the benefits inherent in education have been widely acknowledged by governments of both developed and developing nations. Thus, to take due advantage of the educational processes, many countries in the world have resorted to stratifying education into stages, which learners are expected to progress from to gain proper mastery of the educational phenomenon. Hence, today, we have the elementary level down to the tertiary level (Uko and Nnaji, 2015, Abasilim, Eyo, Adah. and Popoola, 2016).

World over, Tertiary education is seen as the third stage of education. It is an umbrella name used to give identity to institutions of higher learning such as Universities, Colleges of Education, Polytechnics and Monotechnics as the case may be (Bamiro, 2012). Tertiary institutions as the third

tier of education are widely perceived as the bank of excellence where knowledge is dispersed and acquired by those who seek such knowledge. In the view of Ogunlade, Ekundayo and Omodan (2015), a tertiary institution can be seen as an academic community occupied by such intellectuals as teaching and non-teaching staff cum administrators in charge of teaching and non-teaching activities of the system. To this effect, it implies that for these diverse strata of intellectuals who comprised of the academic community will bring to bear their philosophies and outlook to things, which of course may not align with the aspirations of the other strata of the community cum the broader community which entails government, and management. Thus, to solve the problems which may emanate from the academic environments, the various strata of the members of the academic community may decide to come together as a body which reflects the combined aspirations of these members of the academic community. These bodies formed are generally called Trade Unions.

The emergence of trade unions in the tertiary education system in Nigeria was necessitated by the need to address issues affecting the stakeholders in the education system as well as the future of education in Nigeria. It has been noted that though conflicts are essential features of any human organisation, conflicts in the tertiary institution system are, however, more complicated and challenging to resolve. That is because the parties involved operate at a higher level of intellectual orbit. Moreover, they are very much familiar with their inalienable rights as humans as well as legal provisions already put in place on matters at hand. Thus, they frown at being outwitted, especially when in loggerhead with persons or groups outside the higher education system such as government (Foluso, 2010).

There is, therefore, no doubt that the effective and efficient functioning of the tertiary education system is a function of collaborative efforts put in place by the various stakeholders in the tertiary education community. It is against this background that this paper focused on ascertaining the roles of trade unions in the attainment of the educational goals in Adeniran Ogunsanya College of Education, Otto/ Ijanikin Lagos State, Nigeria.

Literature Review

The Concept of Trade Union

The meaning of trade union varies significantly from country to country and is influenced by the perception of workers and the legal meaning accorded to it by the laws guiding the activities of labour unions in such a country. Trade Unionism is seen as a broad term which is used to identify a community of people who are related by their occupation and are bound together by a common shared goal. It is the organisation of the labour force within an organisation which is an essential element in the process of production. It is the total of people who render services by using their capabilities or skills, with focus on earning a living, as well as to develop themselves and the economy at large (Fakunle, 2017).

From the definition above, it can be deduced that the principal roles of the members of trade unions to their members include adopting strategies towards promoting the economic, social, welfare, political, psychological benefits of its members, as well as to create the opportunity for its members to get involved in managerial functions in the organisation. This is perceived as the most fundamental roles of trade unions. Though trade unions alss promote the attainment of organisational goals, its principal concern is to advance the common interest of its members. To do so, they often engage the management of the organisation to promote policies which could foster the growth and total wellbeing of its members. Trade unions are also co-partners of management as relating to the maintenance of industrial relations in the organization (Pemede, 2007).

Broadly, the roles of trade union in tertiary institution include promoting work relations between employees and management as well as employees to employees; to enforce the attainment of the educational goals at institutional levels. The role of academic trade unions also entails securing structures with purposive leadership which allow for the advancement of knowledge through scientific research. Hence, these unions also advocate for the disbursement of fund for the provision

of physical structures for learning as well as the establishment of laboratories which promotes learning and research. They are also concerned with the education of her members as well as pursuing professional excellence (Uzoh and Anigbogu, 2013; Oyewunmi and Oyewunmi, 2018; Abasilim, Gberevbie and Osibanjo, 2019).

Types of Trade Unions

Basically, Trade Unions are often comprised of people of similar or related works of life who are pursuing same or related goals. Thus, the typology of trade unions is influenced by such factors as trade specialization, the management agreement of union as well as the membership of the union. According to Oyewunmi and Oyewunmi (2014), the widely known forms of trade unions include the following;

Crafts Union: the membership of this union is predominantly traders and craftsmen such as electricians, iron workers, machinists, printers, plumbers, bricklayers and carpenters, among others. In a nutshell, a craft union is a union whose organization is done in a way that people of same trade or craft are grouped together as members of a union. Just like every other Trade Union, Craft Unions are also concerned with improving the wage levels of her members as well as to secure better working conditions for its members. Examples of crafts union include the Aircraft Mechanics Fraternal Association in the United States, the Navigators Union in India, and the Nigeria Union of Teachers and many others.

General Unions: Just as the name implies, membership of general unions are comprised of people from various works of life. General Unions are often concerned with sustaining the solidarity of the working-class examples of general unions which include the Nigeria Labour Congress, Nigeria Workers Council. General unions serve as the representatives of all workers/labours within a given region or country.

Industrial Union: This is otherwise known as vertical unions whose membership is comprised of labourers/workers of various levels, that is, both skilled and unskilled who are engaged in the same industry. Examples of such unions include the National Union of Petroleum and Natural Gas Workers, National Union of Healthcare Workers, and the Nigerian Bar Association among many others. The emphasis in Industrial Union is not on the level of skill, sex, grade or even position of individuals; rather, it is on the industry in which these individuals are engaged in.

Staff Union: This is closely related to industrial unions. Staff union, as the name implies, are often comprised of people engaged in the same industry, executing similar functions within a given country. Staff unions are often concerned with securing uniformity in a condition of service and wages of members employed within the industry, in various locations in a given country. These unions serve as representatives of each member, and thus, their advocate is always based on the welfare of all members. Staff unions may have branches in different states. However, their various conducts is governed by the rules and regulation guiding all other members in the country. Examples of staff unions include the Academic Staff Unions of Universities (ASUU), College of Education Academic Staff Unions (COEASU), Academic Staff Union of Polytechnics (ASUP), Non-Academic Staff Union of Universities (NASU) and many more others.

Objectives of Trade Unions

What a trade union is created to achieve is influenced by the circumstances surrounding its creation, especially as trade union mostly exist to serve its members. Below is a summary of some trade unions in Nigeria, and their objectives as contained in their charter:

Nigeria Labour Congress (NLC): As the parent union of all other trade unions in Nigeria, the objectives of the Nigeria Labour Congress include the following:

1. By strengthening collective bargaining in all sectors of the Nigerian Economy, the NLC seeks to promote and sustain good industrial relation practices in Nigeria;

2. To secure equity for women, as relating to their status and condition of service within the corporate community and the society at large;
3. To advance the welfare of the Nigerian workers, as well as to safeguard their economic, political and social rights;
4. To make a meaningful contribution to the industrial growth of Nigeria as well as to fight for the protection of jobs, as well as the work environment;
5. To encourage the actuality of one trade union and/or one federation of trade unions in every industry; as well as the creation of a central labour organization in Nigeria;

Academic Staff Union of Universities (ASUU): As the umbrella union for all teaching staff within the University community, the objectives of ASUU according to the ASUU constitution of 1978, amended in 1984 are summarized as follows:

1. To safeguard and promote the socio-economic and cultural interest of the Nigerian Nation.
2. To secure and sustain a just and appropriate condition of service for academic staff engaged in the university community.
3. To interface between academic staff and university management/government
4. To advance the place of education in Nigeria through the creation and sustenance of a high standard of academic performance as well as professional practice.
5. To improve the quality of its members through education and training.

College of Education Academic Staff Union (COEASU): Very similar to ASUU, the objectives of COEASU is summarized thus;

1. To negotiate for better working conditions for its members.
2. To interface between academic staff and university management/government.
3. To foster teaching effectiveness through the promotion of professionalism.
4. To promote the development of research facilities within the college community.

Academic Staff Union of Polytechnic (ASUP): ASUP is an umbrella name union which represents all the teaching staff engaged in government-owned Polytechnics in Nigeria. The objectives of ASUP is summarized thus;

1. To employ the principles of good governance in the achievement of the Nigerian educational goals at Polytechnic/Monotechnic levels through an active partnership with the Federal and State Governments.
2. To advance the place of education in Nigeria through the creation and sustenance of high academic performance as well as professional and technological practice.
3. To stimulate the increased involvement of its members in the advancement of technical education and commerce in Nigeria.
4. To interface between academic staff and Polytechnic/Monotechnic management/government
5. To improve the quality of its members through education and training.
6. To secure and sustain an appropriate condition of service for its members.

Historical Antecedents of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria

The establishment of Adeniran Ogunsanya College of Education,Otto/Ijanikin, Lagos State, Nigeria can be traced back to the year 1958 which saw the emergence of the institution as a Grade III Teacher Training College, which took off with a total number of ninety students in its first year. The institution continued to make progress in terms of the number of students matriculated each year. However; in the year 1982, the institution encountered some challenges which were influenced by the absence of basic infrastructures, and modern facilities crucial in meeting up with the increase in population, thus; the institution was moved from its pioneer location Surulere to Otto-Ijanikin, Lagos State, Nigeria which is its present site.

Over the years, the institution has undergone a change in nomenclature from Lagos State College of Education, to Adeniran Ogunsanya College of Education as we know today. The institution has also

expended her scope by moving from a Grade III Teacher Training College to a fully-fledged college comprising of 6 schools, which includes the School of Arts and Social Science, School of Science, School of Education, School of Vocational and Technical Education, School of Early Childhood and Primary Education and School of Languages. However; all this would not have been possible without the relentless effort of COEASU, which is the representative of academic staff in the institution and that of the other unions in the college. COEASU performs the following roles within the college community:

Maintenance of peace and stability in the institution: The union, through its regular interface with management/government on behalf of its members, has contributed to the peace and stability of the institution immensely. Peace and stability are important conditions that need to be met by a nation, organizations and even families for any meaningful progress to be made. Communication is the life wire of any organization because the daily operation of the institution is dependent on the flow of communication from management to employees. When there is a breakdown on information which may lead to a repressed feeling, feeling of injustice or other forms of intimidation, such an organisation runs the risk of seeing productivity level go downwards, and in worst-case scenario unrest. COEASU, prevents the onset of this development in Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State by interfacing between members and management, communicating the concerns of members to management in a manner that maintains peace and orderliness as well as communicate the concern of management to members (David, 2013).

Creation and sustenance of high standard of academic performance as well as professional practice: A fruit cannot fall far from its tree. This means that it takes quality to create quality. Hence, the union encourages the professional and personal development of its members, through training, participation in seminars, conferences and workshops (Djastuti, 2010). Through this practice, the union is able to produce a quality-oriented workforce which in turn transmits the quality to students at Adeniran Ogunsanya College of Education.

Contribution to the increased availability of physical, technological and research infrastructures within the college community through advocacy: The need for the increased availability of these aforementioned infrastructures has been among the core demands of the union. It is important to note that the little development enjoyed in the tertiary community today came to be through the struggles and doggedness of trade unions. COEASU, through its advocacy, is able to attract intervention projects worth over hundreds of thousands of naira from bodies like TETFUND, ETF among others. These intervention projects contribute to creating a conducive environment for learning to occur by building and renovating old structures. It also increases learning facilities and promotes by providing up to date laboratory equipment, library, IT and ICT infrastructures and as well provides funds for research and continuous upgrading of the teaching staff (Tony, 2014). All of this is channeled towards enabling the education institution and her products to measure up to their counterparts in other parts of the world.

Notably, COEASU as any other organisation comprised of humans is liable to some pitfalls. Due to a breakdown in communication between the Union and Management, the Union has embarked on a series of industrial actions which has interfered with its mandate in the college community. The decision to opt to strike as a last resort by the union has generated lots of criticism from students, who are the casualty of any industrial action as well as parents who are imposed an untold hardship of taking financial responsibility for the extra academic years for their children due to strike. One of such instances is the strike action of 2013 ran for a period of 8 months (Abayomi and Arenyeka, 2013).

This has been followed by series of strikes and other forms of industrial action. In 2014, two unions in the college which are Colleges of Education Academic Staff Union (COEASU) and the Senior Staff Union of Colleges of Education Nigeria (SSUCOEN), embarked on a protest, in which movement to and fro of the college was halted. As a way of expressing their displeasure to the failure of the college management to pay its members' salary arrears, the union locked the entrance to the institution, thus preventing students and even the Provost of the college from gaining entrance into

the college, except for GCE examination takers who were granted access into the college. This approach by the union truncated activities in the college, and thus was tagged selfish and inconsiderate. Specifically, Mr. Bashorun O. Wasiu, the Provost of the institution as at that time, expressing his displeasure was quoted as saying "the issues raised were not new and that we expected the union leaders to adopt a collaborative approach in dealing with them".

In 2019, the academic activities were crippled following the strike action of COEASU, over issues relating to the payment of arrears, payment of ₦350 million bailout; constant power supply, as well as IGR schemes. In reaction, the government of Lagos State made a payment of ₦210 million out of ₦250 million that was agreed upon. This response from the government did not go well with the union. The refusal of the union to shift grounds, however, earned her so much criticism even from the members of the college community. Specifically, Mr. Muhideen Sheu , the Registrar of the college, was quoted as saying "the unions could never be pleased because their agitations were always unpredictable" (Punch, 2019). Hence, the major pitfall of trade unions in Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria lies in their strategic approach to issues, which indirectly places the quality and standard of education obtainable in the institution in jeopardy.

Theoretical Review

For this study, the General System Theory (GST) is adopted for analysis. The General System Theory was birthed through the efforts of Ludwig von Bertalanffy in the year 1940. Ludwig von Bertalanffy, in his theory, concerned himself with the exploration of laws that can be generalized across various systems. A system, according to the theory entails an arrangement which is constituted by two or more elements/ parties, sharing a given degree of interdependency in the sense that the actions, decisions, cum behaviour of one element/party asserts influence on the behaviour of other elements/parties involved in the arrangement. Thus, the behaviour and the effect of such behaviour of each element on the whole system are interdependent; and while subgroups of the elements all affect the behaviour of the whole, none has an independent effect on it (Skyttner, 1996). Also, the General System Theory proposes the existence of an intertwined relationship between various groups and subgroups in a given organisation.

According to the theory, this intertwined relationship is so delicate in the sense that the action of any subgroup or group affects the whole system. For instance, in an organization, the decision of the manager may affect the whole organizational procedures. Thus, Morgan (2009) has noted that "organizations contain individuals (which are systems themselves) who belong to groups or sections that also belong to larger organizational divisions, and so forth. Towing this line, the Polytechnic here is referred to as a system, and the academic staff, non-academic staff, the management staff and the students are the elements that make up the system. None of these elements is independent as they all work together; the actions influence each other".

The General System Theory finds its applicability in this study in the sense that it tries to highlight the intricate nature of the relationship existing between various stakeholders in organisations, with focus on emphasizing how the various actions of each element/stakeholders in the system affect all other stakeholders and the organisation at large. On a more specific note, in the tertiary institutions, the management, the teaching staff, the non-teaching staff, government as well as students are the core elements that make up the tertiary institution.

Applying the General System Theory, it can be said that the behaviour of each element in the set will greatly determine the actions and response of every other element. This is exemplified in the events of disagreement between government/management with the teaching and non-teaching trade unions in the tertiary education community, which in most cases, leads to the disgruntled union striking. The onset of strike automatically affects every other aspect of the institutions as academic and administrative functions are suspended as the case may be, which the students are sent back home unplanned. The general effect on the institution is seen in a setback in the attainment of a given academic calendar and the crippling of the overall functioning of the institution.

Methodology

This study employs a survey research design. This design finds its suitability in this study because of its ability to describe events /things that have occurred and examine the relationship between them without any manipulation of conditions that are experienced. The population of the study comprised of a sample of 380 participants which were drawn from the parent population of 7,298, through the use of Taro Yamane sampling techniques. To ensure even distribution, simple random sampling was used to pick representatives from each group of participants. Thus 5% of the study population was drawn from the teaching staff at various cadre, 30% from non-teaching staff with a focus on principal officers in the college, while the remaining 35% was distributed evenly among the students in the six (6) schools, which includes the School of Arts and Social Science, School of Science, School of Education, School of Vocational and Technical Education, School of Early Childhood and Primary Education and School of Languages.

Data for the study was collected through the use of questionnaires which were administered and collected on the spot by the Researcher. The data obtained from the study participants were analyzed using a relevant statistical method such as frequency count, mean and standard deviation.

Data Presentation and Analyses

Table 1 : What are the roles of trade unions in the attainment of the educational goals of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria?

ITEMS	N	Mean	Std. Deviation
Engaging government/management so as to mitigate the numerous challenges impeding the attainment of effective teaching and learning	369	3.95	0.941
Promoting research and scholarship	369	4.30	0.745
Sharing the task of maintaining industrial relations with management	369	3.82	0.884
Interfacing with the government/ management on behalf of its members	369	3.45	0.843
Securing infrastructural development through its advocacy	369	4.15	0.739
Valid N (listwise)	369		

Source: Field Survey, 2019.

Table 1 above shows the roles of trade unions in the attainment of the educational goals of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria. The table reveals that, on average, the survey respondents agree with all the statements in the table. Furthermore, respondents pointed out that there are some roles and activities of the trade union that needs to be reviewed and redefined so that the union can attain their educational goals. The respondents noted that there is a need for the union to keep organising seminars and workshops in order to be redefining and restating the goals of the union. The study also found that it is necessary for the union to fine-tune their medium of communication as the respondents noted that the communication channel seems to be poor and to contribute more to lack of the accomplishment of the union's goal. This is because it was noted that bad communication channel creates a form of wrong information which end up as a wrong perspective and mindset of the union. The union also needs to create a good welfare package for its members while developing a platform which allows for the greater participation of the members of the trade union in the management decision making processes.

Table2: To what extent does the management of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria promote peaceful coexistence between trade unions and management?

Descriptive Statistics			
ITEMS	N	Mean	Std. Deviation
Adopting transformative leadership	369	3.94	0.943
Imbibing integrity in all its dealings with the trade unions	369	4.31	0.750
Creating a good and comfortable work environment for the members of the trade unions	369	3.73	0.898
Providing good welfare packages of the members of the trade union	369	3.33	0.808
Creating a platform which allows for the greater participation of the members of the trade union in the management decision-making processes	369	4.16	0.750
Valid N (listwise)	369		

Source: Field Survey, 2019.

Table 2 above reveals the mean scores of the respondents' responses on the extent to which the management of Adeniran Ogunsanya College of Education promotes peaceful coexistence between trade unions and management. The mean shows that, on the average, the survey respondents agree with the statements. The responses show that the management adopts a transformative kind of leadership; imbibes integrity in all its dealings with the trade union; creates a good and comfortable work environment for the members of the trade union; provide good welfare packages of the members of the trade union; and create a platform which allows for the greater participation of the members of the trade union in the management decision-making processes. All these enable a smooth and cordial relationship between the management of the institution and trade union in the college.

Table 3: What are the factors promoting disagreement between the management of Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria and trade unions in the institutions?

ITEMS	**N**	**Mean**	**Std. Deviation**
Issues relating to the condition of service	369	4.02	0.912
Underfunding of the tertiary institution	369	4.31	0.704
Non-payment of salaries	369	4.01	0.780
Depleted states of infrastructure	369	3.82	0.834
Non-payment of arrears and entitlement	369	4.12	0.698
Valid N (listwise)	369		

Source: Field Survey, 2019.

Table 3 shows the responses on factors that promote disagreement between the two parties in the college. While the table shows that the respondents, on the average, agree to all the factors listed in the table, the respondents further note that the union end up electing immature personnel to the various crucial positions in the union, which leads to improper handling of the activities of the union as well as taking a decision on several issues as may arise in the operations of the union. They also noted that the union also needs to get rid of individuals of unquestionable character occupying various positions in the union. They stated that some of the leaders of the union do not maintain integrity required of them, hence, denting the image of the union. The respondents went further to state that mature individuals who have integrity and are proactive should be elected to union leadership in the interest of the progress of the union.

Table 4: How can the identified problems of trade union grievances in Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria be resolved?

Descriptive Statistics			
ITEMS	**N**	**Mean**	**Std. Deviation**
Collective bargaining	369	4.05	0.888
Dialogue	369	4.31	0.701
Granting autonomy to the tertiary education system	369	3.93	0.818
Systematic need assessment of the tertiary institution	369	3.75	0.848
Increased compliance on the part of the government to honour agreements reached upon by the two bargaining parties	369	4.19	0.694
Valid N (listwise)	369		

Source: Field Survey, 2019.

Table 4 reveals respondents' suggested solutions to the identified problems. The respondents, on the average, agree to all the items in the table. Moreover, the respondents also noted that for a union to realize its goals and objectives, there is the need to maintain a cordial relationship with the management of the school. The respondents noted that in the face of disagreements between the union, or possible industrial action, there is the need to realise when to retreat and get back to the negotiation table to avoid straining the relationship that exists between the pair. It was pointed out that in the face of disagreement, especially in the wake of industrial action, there is dwindling of the institutions internally generated revenue, which subsequently affect both parties in the long run. There is also the need for the union to use their platform to call on their members to maintain the professional ethics and they need to monitor the activities of their members and mete appropriate punishment for those that err, to serve as a caution to others.

Conclusion

This paper was aimed at ascertaining the roles of trade unions in the attainment of educational goals in Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria. Based on the findings it is imperative to note that in order to reposition educational institutions in Nigeria, the continued existence and efforts of the Union are essential. Meaning that trade union remains relevant to the extent that the educational institution requires members of the union to achieve corporate goals. Once the continuing relevance of those driving the system's principles is disconnected, it will undoubtedly call for some level of introspection. In general, it should be noted that the trade union structure also needs specific transitional steps to promote negotiations with the government, which in effect translates into improved terms and conditions of employment for its members.

Recommendations

The recommendations below are based on the findings and the conclusion reached in this study:

i. Although the right to association is a fundamental one, Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria must continue to accept employee organizations, but the demands of such unions must be met through dialogue to prevent incessant strike actions because it is now clear that ramified interference and the absence of a systematic regulatory mechanism for industrial relations and guidelines for membership in the activities of unions, associations, clubs and societies have weakened the ability of successive public university administrations in Nigeria to define and enforce responsibilities, rights and privileges in relation to each other.
ii. All laws that are subject to collective agreements freely entered into by unions and management should be reviewed for approval by the Labour Minister. In order to ensure speedy arbitration with a premium on ease of access, affordable cost and consistency and legitimacy of award / outcome, there must be a continuous campaign for improvements in the administration of labour law.

iii. Labour dispute management committees in Adeniran Ogunsanya College of Education, Otto/Ijanikin, Lagos State, Nigeria should be set up to deal internally with all union issues in order to further increase productivity. A tripartite committee of the Government, the National Industrial Court and the Trade Union should be set up to recommend the review constantly.

Microtools Based on The Relational Data Model for Improvement of Information Processes – Multiplicity of Relationships, and Mandatory Nature of Relationships and Attributes

Bartosz SZCZESNIAK

Silesian University of Technology, Faculty of Organisation and Management, Department of Economics and Informatics, Gliwice, Poland, bartosz.szczesniak@polsl.pl

Abstract

Spreadsheets are very popular among a multitude of different contemporary organisations. They can be used in practice to provide a platform for building one's own tools that support and automate information processes. Independently developed, the tools created in spreadsheets may be consistent with the author's signature concept of Microtools Based on the Relational Data Model. In order to create them, one must apply adequate solutions enabling representation of entities, ensuring data integrity, and acquisition of the reports and collations assumed to be generated. In this article, the author has proposed and discussed three solutions supporting data integrity assurance in the scope of verification of the assumed multiplicity of entities, as well as one solution which supports data integrity assurance in the scope of verification of the mandatory nature of relationships and attributes. In accordance with the concept in question, the solutions proposed in the paper make use of standard spreadsheet features and components, without involving any additional code created in any programming language.

Keywords: Spreadsheet, Database, Business Process Improvement, Information Process

Introduction and Literature Review

In order to function properly, every contemporary organisation is required to collect and process massive amounts of information. All processes which involve such activities are referred to as information processes (Oleński, 2001; Oleński, 2002). In a decided majority of cases, implementing and performing information processes is inextricably linked with using adequate IT tools. Even though numerous advanced integrated solutions are in use, it is relatively frequent that one still comes across processes which require sufficient tools to be created quickly and independently to support them. What proves to provide a great platform enabling such tools to be built is spreadsheets, popular and commonly used in organisations. This group of tools can be applied in very diverse functional spheres of organisations. Numerous publications have proposed to use spreadsheets for purposes of quality management (Knight, 2006; Szczęśniak, 2010b; Szczęśniak and Molenda, 2013), financial management (Jackson and Stauton, 2013; Wilczewski and Wrzód, 2008), cost analysis (Gabler at al, 2000), sales and marketing (Carlberg, 2009; Winston, 2011), or knowledge management (Dohn at al, 2013). Further interesting concepts are those which imply to combine spreadsheets, the relational data model, and the SQL language (Cunha at al, 2009; Witkowski, 2003; Witkowski, 2005). In most cases, they pertain to making use of various extensions. There are also concepts based on the assumption that spreadsheets can be used without extensions as an environment in which data describing a structure conforming with the relational data model can be successfully stored and processed. The year 2010 saw the publication of a concept according to which the spreadsheet would be used as a relational database engine (Tyszkiewicz, 2010). The paper in question demonstrated the possibility to perform the actions intended for the relational data model by means of solutions based on standard spreadsheet features. This concept was later complemented with a proposal to implement a recurrent sorting algorithm in the spreadsheet (Sroka at al, 2015), as discussed in the literature of the subject in 2015. Roughly at the same time, i.e. in 2010, a tool designed to support the timetable preparation process for a special education school was discussed in another paper (Szczęśniak, 2010a). This tool was built on the basis of a relational data model dedicated to the problem analysed, and all of its assumed functionality was acquired by means of standard spreadsheet functions as well

as such features as conditional formatting, data validation, and name manager. The tool description highlights its three main aspects, namely the manner of representation of the model's entities in the spreadsheet, the problem of ensuring integrity of the data stored, and the problem of producing all the required collations and reports based on the data thus stored. This solution gave rise to an approach which was used multiple times in the years to come while creating various spreadsheet tools intended to support analyses (Szczęśniak and Molenda, 2013) or managing processes in an organisation (Szczęśniak and Wolniak, 2016; Zasadzień at al, 2017). In 2016 (Szczęśniak, 2016), the concept of creating tools such as these received the official name of Microtools Based on the Relational Data Model, abbreviated to MiRel.

The relevance of the possibility to use the relational data model for purposes of data analysis in spreadsheets was also recognised by developers of this type of software. Starting from the 2013 version, the most popular spreadsheet, which undoubtedly is MS Excel, enables defining a data model by identifying tables and the relationships between them. However, insofar as the MiRel concept envisages building tools to be used for processing of sets of continuously acquired data, the data model embedded in MS Excel can only be used to put them in order for purposes of the reports and analyses being created. Its capabilities are considerably limited in terms of defining and executing the assumed data integrity constraints. Despite these limitations, when combined with the pivot tables and charts created on the basis of the said model, the latter may provide a very convenient extension to the tools designed in accordance with the MiRel concept.

The solutions proposed under the MiRel concept pertain to the three aforementioned aspects. The papers concerning this concept published to date have discussed the aspects of entity representation (Szczęśniak, 2017), the transition from type II to type I of entity representation (Szczęśniak, 2018a), and data integrity assurance vis-à-vis ensuring conformity between the values of foreign keys and the values of primary keys (Szczęśniak, 2018b). The content provided further on in this paper supplements the previous publications, and it pertains to the problems of data integrity perceived from the perspective of the multiplicity and mandatory nature of relationships between entities, as well as the mandatory nature of individual attributes. The solutions proposed in this respect have been provided in the subsequent two sections.

Solutions used to ensure the required multiplicity of relationships between entities

The first of the cases examined is an arrangement where every value of the primary key of the parent entity must occur at least once in the linked child entity. A model arrangement of entities for this case has been illustrated in Figure 1.

Fig. 1: Arrangement of entities in the first case

In the tool created in line with the MiRel concept, one should signal a situation where the values of attribute "KeyAttr1" entered in the table representing entity "EntityA" never exist as the values of attribute "Attr1" in the table representing entity "EntityB". The manner in which this is signalled should enable easy identification of the problematic values of attribute "KeyAttr1", making it possible to quickly correct an erroneous data arrangement. In accordance with the MiRel concept, tables representing both entities are placed in separate worksheets. The problem at hand can only be identified in the worksheet containing the table representing entity "EntityA". A solution which allows for quick identification of incorrect values in this case is based on the conditional formatting mechanism. This solution has been schematically illustrated in Figure 2. It has been assumed that –

similarly to all the other solutions discussed further on in this paper – the range in which data can be entered comprises 10 successive rows, starting from row 2. Such a range of rows is taken into account in the cell addresses in the formulas provided. The formula which occurs in the given range (column or group of columns) is presented for the top left cell of the range, and its form in other cells of this range results from standard rules of formula copying in spreadsheets.

Fig. 2: Schematic representation of the solution proposed for the first case

This solution entails adding two auxiliary columns "K1" and "K2" in worksheet "EntityA". What is defined in column "K1" is the number of occurrences of the current value of attribute "KeyAttr1" among the values of attribute "Attr1" in worksheet "EntityB". In column "K2", the value of "1" is used to mark the rows in which the values of attribute "KeyAttr1" should be highlighted by conditional formatting.

The second case subject to analysis corresponds to a situation in which each value of the parent entity's primary key can occur as the value of the linked child entity's foreign key one time at the most. Such an arrangement has been illustrated in Figure 3.

Fig. 3: Arrangement of entities in the second case

In the tool created in line with the MiRel concept, one should signal a situation where any of the values of attribute "KeyAttr1" from the table representing entity "EntityA" will occur several times among the values of attribute "Attr1" in the table representing entity "EntityB". Where this is the case, the problem at hand can be signalled both in the worksheet containing the representation of entity "EntityA" as well as in the worksheet containing the representation of entity "EntityB". Figure 4 provides a schematic diagram of the solution intended for this case.

Two auxiliary columns have been added to worksheet “EntityA”. In column “K2”, the number of occurrences of attribute “KeyAttr1” among the values of attribute “Attr1” in worksheet “EntityB” is verified. In column “K2”, the value of “2” is used to mark the cases in which the current attribute occurs more than once. The values from column “K2” constitute the basis for applying conditional formatting in range “A2:A11”. In worksheet “EntityB”, auxiliary columns “K3” and “K4” have been added. What one defines in the first of those two is the number of occurrences of the current value of attribute “Attr1” among all the values of this attribute. In the second one, the value of “2” is used to mark the attributes which occur more than once. This column is used by applying conditional formatting to range “C2:C11”. The solution in question allows to tool user to identify – both in worksheet “EntityA” and in worksheet “EntityB” – the values which violate the pre-assumed relationship multiplicity principle.

Fig. 4: Schematic representation of the solution used in the second case

The third of the cases analysed represents a situation in which each value of the parent entity’s primary key should exist from “n” to “m” times as the value of the corresponding child entity’s foreign key. Such a case has been illustrated in Figure 5.

Fig. 5: Arrangement of entities in the third case

In the tool created in line with the MiRel concept, one should signal both a situation in which any value of attribute “keyAttr1” from worksheet “EntityA” exists as the value of attribute “attr1” in worksheet “EntityB” less than “n” times or does not exist at all, and a situation where this value

exists more than “m” times. The problem at hand can be signalled both in worksheet “EntityB” and in worksheet “EntityA”. The solution which announces a problem in the case discussed has been schematically depicted in Figure 6.

In line with this solution, two cells “KeyAttr1 Min” and “KeyAttr1 Max” have been added in worksheet “EntityA” representing the parent entity, and in these cells, one enters the values of “n” and “m”, respectively, to define the multiplicity of the relationship. Additionally, two auxiliary columns “K1” and “K2” have been added in the same worksheet. Formula “FC01” in column “K1” determines the number of occurrences of the current value of attribute “KeyAttr1” among the values of attribute “Attr1” in worksheet “EntityB”. Formula “FC02” to be found in column “K2” returns the value of “2” if there are too many occurrences, or “1” in the event that the occurrences are too few. With reference to the values in column “K2”, making use of the conditional formatting mechanism, the values of attribute “KeyAttr1” with too few or too many occurrences are highlighted by means of pre-defined and clearly distinctive formats. At the child entity, i.e. in worksheet “EntityB”, two auxiliary columns have also been added. Formula “FC03” in column “K3” determines the number of occurrences of the current value of attribute “Attr1” among all the values of this attribute. Formula “FC04” in column “K4” returns the values of “1” and “2” in the event that the number of occurrences is too small or too large, respectively. This column is used by the conditional formatting mechanism to highlight the values of attribute “Attr1” accordingly.

Rule	Applies to:	Format
=E2=2	=$A$2:$A$11	AAA
=E2=1	=$A$2:$A$11	BBB

Rule	Applies to:	Format
=F2=2	=$C$2:$C$11	AAA
=F2=1	=$C$2:$C$11	BBB

FC01	=COUNTIF(EntityB!$C$2:$C$11;EntityA!A2)
FC02	=IF(A2<>"";IF(D2<$F$2;1;IF(D2>$G$2;2;0));0)
FC03	=COUNTIF($C$2:$C$11;C2)
FC04	=IF(C2<>"";IF(E2<EntityA!$F$2;1;IF(EntityB!E2>EntityA!$G$2;2;0));0)

Fig. 6: Schematic representation of the solution used in the third case

Mandatory nature of relationships and attributes

The problem related to this aspect consists in the necessity to identify situations in which the values of mandatory attributes have not been entered for the entity’s occurrences which have been entered. What one establishes as mandatory attributes is all attributes without pre-defined optionality as well as foreign keys linked with mandatory relationships. For the arrangement shown in Figure 7, in entity “EntityA”, the optional attributes are “Attr4” and “Attr3”, while the mandatory attributes are “KeyAttr1”, “Attr2”, and “Attr5”.

Fig. 7: Arrangement of entities with mandatory and optional attributes

In the tool created in line with the MiRel concept, one should signal a situation in which, in any row of the table representing entity "EntityA", there is an entered value of at least one of the attributes "KeyAttr1", "Attr2", "Attr3", "Attr4", or "Attr5", while at the same time, there is no value of any of the attributes "KeyAttr1", "Attr2", or "Attr5". Figure 8 provides a schematic diagram of the solution proposed for this case, in which an auxiliary column has been added in worksheet "EntityA". Every column of this table is linked with the corresponding column in the table representing entity "EntityA". Values "R" or "O" have been entered in the headers of individual auxiliary table columns, depending on whether or not the attribute corresponding to the given value is mandatory or optional, respectively. The uniform formula "FD01" entered in the entire table uses the value of "1" to mark the cases in which the corresponding cell of the table representing entity "EntityA" remains empty even though it should contain some value.

	A	B	C	D	E	F	G	H	I	J	K
							FD01				
1	KeyAttr1	Attr2	Attr3	Attr4	Attr5		R	R	O	O	R
2	KA1_V1						0	1	0	0	1
3			A3_V2				1	1	0	0	1
4	KA1_V3	A2_V3			A5_V3		0	0	0	0	0
5	KA1_V4	A2_V4	A3_V4	A4_V4	A5_V4		0	0	0	0	0
6	KA1_V5	A2_V5	A3_V5	A4_V5			0	0	0	0	1
7	KA1_V6			A4_V6	A5_V6		0	1	0	0	0
8							0	0	0	0	0

Conditional Formatting

Rule	Applies to:
=G2=1	=$A$2:$E$11

FD01 (ver.1)	=IF(AND(COUNTA($A2:$E2)>0;A2="";G$1<>"O");1;0)
FD01 (ver.2)	=IF(AND(COUNTBLANK($A2:$E2)<COLUMNS($A$2:$E$2);A2="";G$1<>"O");1;0)

Fig. 8: Schematic representation of a solution which identifies the missing values of attributes.

This formula has been presented in two versions. Version one, being less complex, can only be applied in the event that all attribute values are manually keyed in. Version two is more universal. It can also be used in the case when it is possible that values of certain attributes are entered by formulas. The values in the auxiliary table provide the basis for the conditional formatting mechanism which highlights the cells containing the missing attribute values.

Conclusions

With regard to the problem of ensuring the pre-assumed multiplicity of relationships between entities in a tool created in line with the MiRel concept, the following three cases have been analysed:

1. The least complex case, where each instance of the parent entity must be linked with at least one instance of the child entity;
2. The case where each instance of the parent entity can be linked with one instance of the child entity at the most;
3. The most complex case, where the number of instances of the child entity, with which every instance of the parent entity must be linked, is defined by the n–m range.

For each of the aforementioned cases, a distinctive solution has been proposed and discussed as a means to support data integrity assurance. Furthermore, another solution which has been proposed is to support verification of the assumptions pertaining to the mandatory nature of individual attributes and relationships of entities. All the solutions proposed in the paper make use of a relatively limited set of built-in spreadsheet components and features, including the conditional formatting mechanism as well as functions such as IF(), COUNTA(), COUNTBLANK(), COLUMNS(), AND(), and COUNTIF(). It has been demonstrated that the problem of data integrity assurance analysed from the perspective of the multiplicity of entity relationships and the mandatory nature of relationships and attributes can be solved in a relatively simple manner without having to use a code written in any of the programming languages. The solutions proposed by the author as the means to ensure conformity of primary keys in parent entities with foreign keys in child entities, along with those discussed previously in the literature of the subject, represent the set of solutions to the problem of data integrity assurance proposed under the MiRel concept.

Analysis of the Routing Stage for an Oversize Vehicle in Poland from the Traffic Safety Viewpoint

Igor BETKIER
Military University of Technology, Warsaw, Poland
igor.betkier@wat.edu.pl

Abstract

The article discusses the routing stage for an oversize vehicle as a component of the process of planning the carriage of oversized cargo. As part of this concept, based on the analysis of Polish and foreign literature as well as normative documents, the main factors determining the route were presented in a synthetic way: vehicle parameters, maximum single axle weight, gross vehicle weight and atmospheric conditions. Their multitude generates a negative impact on both the infrastructure and other traffic participants, and any negligence in the area of their analysis may have fatal consequences. The author aimed at determining the requirements set by planners, as well as confronting the needs of the oversize transport market with both Polish and EU regulations being currently in force. In addition, the article cites actual examples covering elements of infrastructure that do not meet technical requirements, requirements of traffic participants as well as legal aspects.

Keywords: Oversize Transport, Traffic Safety, Route Planning

Introduction

Along with the economic growth and development of the industrial sector, and consequently the sectors encompassing mining, energy generation, construction and metallurgy, the demand for special transport services necessitated by cargo dimensions has increased. Thus, oversize transport was born, strictly correlated with the implementation of large public investments. The transport market for oversize cargo enforces an individual approach to each order, appropriate logistic preparation, obtaining appropriate permits and the use of specialised equipment, including both the vehicle fleet and transhipment machinery. On the other hand, these orders also require specialised staff possessing proficient analytical skills. Transported cargo may reach dimensions requiring complete closure of some road sections, conducting detailed expertise, rebuilding infrastructure elements as well as detailed planning which sometimes might even last from a few to several months. These aspects cause the oversize transport to be termed an “elite” one.

Planning oversize transport is a multi-stage process and a tedious one at the same time, considering the degree of impact on the infrastructure and other traffic participants. Its duration generates costs which are associated with administrative activities, specialised equipment, a significant amount of work from the persons involved and interference with the existing road infrastructure. The requirements set for the modern oversize transport enforce, among others, continuous updating of data on traffic incidents and the state of infrastructure. In the report by Polish Central Statistical Office (2017), the amount of transported cargo significantly increases year by year, which, taking into account the increase in the number of traffic participants and the lower road capacity, further complicates implementation of travel.

The purpose of the article is to analyse the routing stage for an oversize vehicle along with an indication of the key components which are necessary to be included in the planning process.

The research problems were defined in the form of questions:

1) *What aspects does the stage of oversize vehicle routing include?*
2) *How should specific components be considered so that the planned route will guarantee safety during the execution of a transport task?*

The following research methods were used in the article: quantitative analysis and synthesis, deduction and inference.

The stage of routing as a component of the planning process

Oversize transport is an activity which requires both comprehensive service of transport and forwarding service and is associated with increased requirements for road infrastructure, i.e. a set of elements having specific technical parameters. This is related to the need for transporting cargo, whose specificity implies an individual approach to the transport process. Since an oversize vehicle is a means of transport exceeding the parameters specified in road traffic regulations, i.e. weight, maximum axle weight, height, width or length, it has a greater degree of impact on the transport system. Table 1 shows the dimensions which determine the said vehicle.

Table 1: Parameters defining an oversize vehicle

Parameter	The length of the semi-trailer combination	The length of the combination with a trailer	Width	Height	Gross vehicle weight
Value [m, t]	16.5	18.5	2.55	4	40

Source: *Traffic Law Act.*

On account of exceeding the presented dimensions, undertaking carriage with this type of vehicles requires a lot of work, both for the transport organisation staff and operators or drivers performing the carriage. This type of transport is usually associated with a problematic cargo which generates a specific logistics task (Jóźwiak & Kawa 2009). All these components contribute to the oversize transport being an elite and niche segment of the transport services market (Juściński 2017). The process of planning the movement of vehicles exceeding the permissible dimensions set forth in road traffic regulations therefore encompasses a number of activities aimed at the efficient and safe transport of cargo to the destination. In the article by R. Barcik (2015) an analysis of the planning process in a selected enterprise was made, and the types of planning and organisational activities relating to routing stage with their duration were specified as shown in Table 2.

Table 2: Activities carried out as part of the oversize transport planning process (routing stage)

Type of activity	Duration [weeks]	Description
Routing	3	Initial determination of the optimal route
Trial journey	2	A journey along the determined route in order to evaluate its parameters and potential problems during transport
Determining alternative routes and journeys along them	6	Determining alternative routes which skip the sections of the original route on which problems occurred
Final route selection	4	Analysis of alternative routes in terms of time, distance and cost of travel, route selection and submission to the General Directorate for National Roads and Motorways (GDDKiA)

Source: Barcik (2015)

When analysing Table 2, it should be emphasised that several carriage routes should be taken into consideration when planning the journey with an oversized load. This is due to the changeable road situation; thus, an optimal solution is sought, and many transports are planned well in advance. That was, among others, the case for the transport nominated for the ESTA Awards 2017, conducted by MTD Skuratowicz, which had to evaluate the capacity of transporting the reactor along the Klaipeda – Grodno route three years in advance.

The main factors determining the course of the carriage route

The process of planning an oversize vehicle movement consists of key activities, at the stage of which the difficulty of the transport task is finally determined. Determining the initial route, and then alternative routes, allows one to perform a real calculation of the cost, which consists mostly of permissions obtained and dismantling works performed along the route. Determining the optimal route is a task which requires the analysis of many parameters closely related to road infrastructure and parameters of the travelling vehicle.

Vehicle Height

The height of the cargo brings about a number of difficulties that have to be foreseen at the planning stage. Data from transport companies shows that cargo may be as high as 5.8 m. The regulation of the Minister of Transportation and Marine Economy on technical conditions to be met by public roads and their location (1999) specifies that the clearance gauge is, respectively:

- 4.70 m - over the A, S or GP class road;
- 4.60 m - over the G or Z class road;
- 4.50 m - above the L or D class road.

According to the experience of transport companies, the type of cargo transported may exceed the technical parameters of the engineering objects located on the roads, even in the case of the highest class of roads. The *Regulation* cited earlier indicates that *the linear infrastructure running transversely over the road must not violate the clearance gauge of the road*. In fact, there are many places where the clearance gauge deviates significantly from the value specified in the regulation. Figure 1 shows the railway overpass along the provincial road 631, which is classified as class G road in the town of Nieporęt. The location of the object and its clearance forced the road administrator to introduce a limitation of the clearance gauge of the passing vehicles to 3.7 m. It should be emphasised that the above-mentioned restrictions must be respected not only by companies operating oversize transport, but also by other carriers whose vehicles' height along with the cargo may oscillate around 4m, without forcing them to obtain permissions.

Fig. 1: Railway overpass in Nieporęt on route No. 631

Source: www.googlemaps.com.

The functioning of the facilities that do not meet the requirements imposed by the regulations, as well as the prolonged process of their modernisation, stipulates additional analysis of the transport route. An additional obstacle in the transport of oversized cargo is the location of overhead power lines or other elements of linear infrastructure, at a distance from the ground. The analysis of the dynamic envelope along the transport route should take into account the possibility of temporary increase of its value, by lifting the overhead power lines with special poles. On the other hand, it is also necessary to specify areas where the linear infrastructure, i.e. heating pipelines, prevents non-standard vehicles from passing through. In this case, options such as the passage of the truck combination after unloading the cargo (wheeled vehicles), or passage with partially deflated tyres should be considered.

Vehicle width

Oversized cargo may pose danger to other traffic participants, both during the manoeuvre of overtaking and passing from the opposite direction. In addition, a moving vehicle may damage elements such as: traffic signs, lampposts, road signs, advertisements or other elements located within the route area (Barcik 2015). The possibility of transporting cargo, whose width may be even more than 8 meters, depends on the width of the roadway, which consists of both lanes (including emergency lanes) and hard shoulder. The lane width in Poland varies and depends on the road class. The lane width should be (Journal of Laws 1999 No. 43, item 430):

- for A-class roads - 3.75m,
- for S-class roads - 3.75m or 3.50m (depending on the number of roadways),
- for GP and G-class roads - 3.50m,
- for Z-class roads - 3.00m,
- for L-class roads - 2.75m,
- for D-class roads - 2.50m.

In many cases the roadway width, which results from the regulation, is not sufficient to occupy one lane. Although problematic oversize transport usually takes place at night and requires piloting team, in many cases partial disassembly of the elements located near the road is necessary. In addition, it is necessary to ensure safety and the possibility of travel for other road users. The possibility of passage for an oversize vehicle with a wide cargo is also affected by elements located directly in the axis of the road, such as refuge islands. Although the cargo is usually located more than 50 cm above the ground, and the traffic signs can be dismantled, running over the island's curb with a semitrailer tyre of the standard size 205/65R17.5 usually results in its damage. It should also be emphasised that such a manoeuvre may result in the loss of stability.

The experience of transport companies shows (Loos 2017) that in normal conditions an oversize vehicle moving at night covers on average 100 - 200 km per day. Therefore, when planning the route, care must be taken to identify rest areas for the crew. In the case of a wide vehicle, it is important as stopping such a vehicle on the side of the road for longer than required may lead to the paralysis of local road traffic. The stopover place for such a vehicle is usually a truck parking lot located at filling stations, or motorway rest and service areas (RSA), as they usually have sufficient space.

Vehicle Length

Vehicles with long oversized cargo cause a number of difficulties, requiring analysis at the planning stage. In general, road infrastructure with a linear character offers a considerable capacity for transporting long loads. The problem in their transport, however, is posed by any significant change in the direction of travel. While top-class road curves offer great manoeuvrability, it is often the case that some segments of G-class roads cannot be negotiated due to the length of the travelling vehicle combination. It follows from the Regulation of the Minister of Transport and Maritime Economy on the technical conditions that should be met by public roads and their location (1999) that the radius of a circular road curve depends on the road class, speed limit of this segment and the road grade.

Table 3 shows the values of these parameters together with the relationships between them for G-class roads and higher class roads.

Table 3: The values of the circular arc radius depend on the predicted speed on a road section in the light of applicable regulations

Operating speed (km/h)	**Circular arc radius in the plane (m) with transverse roadway slope[1)]**						
	as on a straight section	2% do 2.5%	3%	4%	5%	6%[2)]	7%[2)]
130	≥4000	≥3500	2500	1800	1400	1100	≤900
120	≥3500	≥3000	2000	1500	1200	900	≤750
110	≥2800	≥2500	1800	1400	1000	800	≤600
100	>2200	≥2000	1400	1000	800	600	≤500
90	≥1600	≥1500	1000	750	600	500	≤400
80	≥1200	≥1100	800	600	450	350	≤300
70	≥1000	≥800	600	400	300	250	≤200
60	≥600	≥500	350	250	200	150	≤125
50	≥450	≥350	250	175	125	100	≤80

[1]) The transverse slope of the roadway for a radius with an intermediate value should be interpolated and rounded to 0.5%.
[2]) Application at the operating speed above 90 km/h requires justification.

Table 3 shows that for the lowest vehicle speed, the arc radius should be over 450m in the absence of a roadway slope and up to 80m in the case of 7% roadway slope. As the road infrastructure in Poland has been underinvested for many years, and a large part of the road sections requires thorough modernisation, planning the route of an oversize vehicle with a long load requires the knowledge of some arc radii. Important points that require proper analysis are road junctions, intersections (especially in urban areas) or unconventional large angle bends. An example would be a bend of more than 90 degrees near Grodzisk Mazowiecki Interchange on regional road no. 579, which belongs to G - class roads, shown in Figure 2. In this case, the transport capacity is also reduced by the fact that there are acoustic screens along the aforementioned bend, which prevents the load from being carried with the help of a semi-trailer equipped with a turntable.

Fig. 2: Satellite image of route No. 579
Source: www.googlemaps.com.

The existence of such solutions as those shown in Figure 2 requires a more detailed analysis of the potential route, bearing in mind, that there are some solutions that do not meet the requirements imposed by the *Regulation (...)*.

Another aspect related to the length of the vehicle is the occurrence of vertical curves, resulting from a diverse terrain relief, including both convex and concave landforms. The line of the intersection of the vertical plane passing through the road axis with the road surface is called the gradeline and its profile determines the possibility of the passage of a vehicle with a long load. Figure 3 shows the diagram of a gradeline and its components.

Fig. 3: Diagram of a gradeline relative to a long vehicle

Source: the author's own elaboration

The gradelines are designed according to different conditions, i.e. visibility allowing proper braking distance, overtaking or travel comfort. In figure 3, T marks the tangents to arcs, $x_{1,2,3,4}$ specifies the horizontal distance from the beginning or from the end of the arc ,$y_{1,2,3,4}$ values represent the vertical offset of the arc from the tangent at a distance of x, while $i_{1,2}$ are the absolute value of the slope of straight sections. The capability of traversing a vertical curve by a vehicle with a long load can be determined from the following dependencies:

$$T = R\frac{i_1 \pm i_2}{2} \qquad (1) \qquad\qquad y_i = \frac{x_i^2}{2R} \qquad (2)$$

where:

T – arc tangent,
R – arc radius,
$i_{1.2}$ – straight sections sloping (absolute values),
y_i – vertical offset of the arc to the tangent at a distance of x,
x_i - horizontal distance from the beginning or end of the arc.

The dependencies presented above are helpful in determining the capability of traversing a hill for a long vehicle. It is important to keep in mind that it may not be possible to obtain adequate ground clearance when transporting tanks. M. Ptaszynski (2016) emphasised in his work, based on materials from the company Siemens, that the minimum vertical arc radius for vehicles transporting wind farm elements should be from 300 to 500 m, and the slope from 11 to 15 percent for the carrying vehicles and 4 - 8 percent when moving backwards (the span depends on the equipment used and the road condition).

Another problem in long load transport is the occurrence of intersections, in particular those, that have a roundabout form, i.e. intersections with circular traffic. Such solutions include a central island around which vehicles move and which effectively reduces the capability of passage for a vehicle with an oversized cargo. Despite the fact that roundabouts are treated as the major barrier to the movement of oversized loads, a marked increase in their number can be observed especially in

urbanised areas. In this way, the need for traffic lights to control the movement of vehicles is eliminated and the traffic volume is smoothly discharged. A study in the United States showed that a roundabout reduced traffic delays by 89% and the number of accidents decreased by approx. 37 – 80% (WSDOT 2011). Unfortunately, in many cases the construction of a roundabout limits or even prevents the passage of an oversize vehicle. In addition to building up the internal zone of the roundabout, its capacity is also influenced by diameter values – both of the central island and of the outside perimeter of the roundabout. Table 4 shows roundabout dimensions and their scope of application depending on the road class.

Table 4: Roundabout parameters depending on the place of occurrence

Roundabout type	Middle island diameter [m]	Outside diameter of roundabout [m]	Scope of application
mini	3 – 5	less than 22	Housing estates
small	10(5) – 28(33,5)	26(22) – 40(45)	GP -, Z -, L - class roads: approach roads to cities, suburban areas, urban housing estates, outside built-up areas
medium	28 – 50	41 – 65	GP - and G - class roads: outside a built-up area, approach roads to cities, suburban areas
large	greater than 50	greater than 65	S -, GP -, G - class roads: outside a built-up area

Source: Journal of Laws 1999 No. 43, item 430

The diameters specified in Table 4 are in many cases insufficient in the context of vehicles transporting long loads. Moreover, in many cases there occur high curbs on them, which may result in serious damage to the travelling vehicle combination. Analysing a typical roundabout, the author distinguished several crucial zones regarding its throughput capacity. They are presented in Figure 4 and described using the radius value calculated from the geometric centre of the roundabout.

Fig. 4: Identification of roundabout zones with regard to its capacity

Source: the author's own elaboration.

The innermost zone is the central *internal zone of static limit*, which usually takes the form of an earthen embankment, but it can be even a building structure in some cases. None of the manoeuvring vehicle points can be found within the outline of this zone. Its radius R_1 defines the furthest

protruding element/segment limiting the horizontal dynamic envelope, counting from the centre of the roundabout. The zone with the border defined by the radius R_2 is the *zone of non-invasive internal off-tracking of the vehicle*, which was delineating from the obstacle limiting the horizontal dynamic envelope, which is located on the inner island, to the internal curb of the roadway, or the beginning of the *truck apron* zone. In this zone, the points which are located near the centre of the left side of the semi-trailer moving straight ahead, turning back or turning left, move most often. The *truck apron* zone, with an outer radius R_3, may occur between the road and the middle island and it increases the space for the manoeuvring vehicle along with the lowering of the internal curb. If it does not occur, it means that we only deal with a *driving zone*, marked between the roundabout curbs, which constitutes the zone within which the wheels of the vehicle move. Its outer edge is marked with the radius R_4. Crossing this zone by both the tractor and semi-trailer may cause damage to the tyres and disturbance of the vehicle's stability. The next zone is the *zone of non-invasive external vehicle offtracking* with the border radius R_5, which was delineated from the outer curb of the roundabout to an element of the infrastructure which is possible to remove and then restore to its original state. Most often such obstacles are road signs, lanterns, or posts/gates separating the pedestrian area from the roadway. In this zone, the points of the offtracking semi-trailer move most often and, as a rule, its radius should be at least 1.4m larger than the outer radius of the roundabout. The outermost zone is the *outer static limit zone*. The boundary of this zone was delineated from the centre of the roundabout to the furthest, irremovable R_6 element, constituting the horizontal limit, the removal of which is impossible or economically unfeasible. The zone is important when transporting particularly long cargo with the help of modular semi-trailers forcing the cargo to be moved above the ground, even a few meters outside the road outline. The *TA* zone is the corridor marked by the inner part of the roundabout, used for driving straight ahead. It can take the form of a widened *truck apron* for easier manoeuvring of the vehicle or constitute a hardened culvert through the central part of the roundabout.

Foreign literature already recognises the need to build roundabouts with the so-called unconventional geometry, characterised by a variable width of the middle roadway. These types of solutions aim at narrowing the width of the road in places where the fastest trajectories of passage occur and widening it in places where the radius of the arc is larger. Figure 5 presents a comparison of a traditional roundabout with a roundabout having a variable-width road and a smaller central island.

Fig. 5: A juxtaposition of a traditional roundabout and a two-geometry roundabout
Source: the author's own elaboration.

Analysing both examples, the greater possibility for turning right is clearly visible, as is the possibility of driving straight ahead for an oversize vehicle in the case of a two-geometry roundabout. This is due to both the smaller diameter of the central island and the widening of the road with

trajectories having larger arc angles. The key factor in this case is also the use of the *truck apron* zone, intended for heavy goods vehicles, occurring between the central island and the roadway, characterised by a low degree of inclination and the lack of a curb or the use of a low one (maximum 8 cm) (Gazzarri A., Pratelli A., Souleyrette R.R. & Russell E.R. 2014). Another solution is to adapt the central island to straight-ahead driving by building a driving lane across it, which is normally out of service. These types of infrastructure elements can be found in Denmark, where straight-ahead travel is possible after using a chip card, which on the one hand opens the barrier enabling passage, and on the other one gives the possibility of recording the use of roundabouts by transport companies. Separation of the central drive-through part may also take place through the installation of traffic signs, i.e. U-3 embedded in RS sockets, so that they can be easily dismantled if necessary. This way of installing road signs should be used within the entire roundabout, allowing greater manoeuvrability for the passing oversize vehicle without the need for invasive removal of traffic signs.

Maximum single axle weight

Maximum axle weights – in the light of Polish regulations, individual permissible values of the pressure exerted by a single driving axle of a vehicle on the road surface are linked with the road class and amount to, respectively (Journal of Laws 1999 No. 43, item 430):

- A, S and GP class roads - 115 kN;
- G and Z class roads - from 100 kN to 115 kN, depending on the type of traffic structure;
- L and D class roads - from 80 kN to 115 kN, depending on the type of traffic structure;

In fact, however, the provisions of the Directive 96/53/EC of the Council of the European Union forced Poland to adapt the roads on which heavy goods vehicles travel in international traffic to the maximum weight required by said legal act up to 11.5 tonnes per driving axle and 10 tonnes per non-driving axle within a period not exceeding 31 December 2010 (Council Directive 96/53/EC). After the end of the transitional period, tens of thousands of overloaded vehicles were detained as a result of the actions taken by Road Transport Inspectorate, and the total fines imposed on carriers amounted to over 60 million, and it should be emphasised that many of them were imposed contrary to EU regulations. After referring the case to the European Commission, the Main Inspectorate of Road Transport (GITD) in the letter No. GGI.012.39.2015.003 of 30 October 2015 specified that it was necessary to waive the imposition of fines on carriers if the following conditions were met:

- the vehicle does not exceed the GVW (gross vehicle weight);
- the weight determined during the measurement exceeds the limit values for the road, but does not exceed 11.5;
- the carriage route along the road with lower parameters is associated with unloading or loading of goods which are subject to international transport;
- there was no alternative road allowing a single axle weight up to 11.5 t leading to the place of unloading or loading;
- the carriage route minimised the use of the non-modernised section of the secondary road network;
- the entity performing the transport has a Community license or other authorisation to perform international road transport.

While the ruling of the Court of Justice of the European Union in the case C-127/17 quite unequivocally resolves the problem of the axle weight in international transport in Poland, the clarity of provisions applicable to domestic carriers is questionable. Considering the Annex XII to the Accession Treaty and Chapter 8, which deals with the transport policy, it should be emphasised that all road investments made from Community funds should take into account the capacity to transfer permissible pressure exerted by up to 11.5 tonnes. In addition, by adopting the principles of non-discrimination and equality, access to all other roads for loading or unloading should be enabled for national carriers provided that the single axle weight does not exceed 11.5 tonnes. In fact, when planning the movement of oversize vehicles, both Polish legal acts and EU directives should be taken into account, taking all possible steps to avoid financial liability for the transport. An important factor

affecting the values of the pressure exerted by individual axles of a vehicle lies in the design limits determining the permissible load capacity, taking into account the type of potential cargo, and, on this basis, adjusting the appropriate number of axles to them. Nevertheless, sometimes the permissible axle weights are exceeded due to the wrong choice of the means of transport or the wrong location of the cargo in relation to the cargo space (May 2017). Overloading a vehicle or improper distribution of the cargo results in reduced vehicle handling, extended braking distance and, above all, it has an adverse impact on the road surface. This in turn leads to lowering the so-called load capacity limit state and suitability for use, which falls between 20 and 30 years depending on the road class and surface type. Taking into account the regulations governing maximum axle weight is essential because, on the one hand, it may result in high fines and, in extreme cases, the loss of a transport license. The applicable regulations also specify that the transport entrepreneurs bear full responsibility for any irregularities concerning permissible weights. However, if the contract between the carrier and the consignor/consignee provides otherwise, the transport company may be released from liability, as provided for in Art. 43 of the *Transport Law Act*.

Gross Vehicle Weight

Gross vehicle weight – pursuant to the *Traffic Law Act*, it is a component of the vehicle weight, including all equipment as well as cargo and people present therein. It plays the key role when a vehicle passes through or over engineering facilities, which include all types of bridges and road overpasses. Each bridge is assigned to the so-called load class, which is the largest movable normative load from a given standard which meets all strength conditions for a given structure. In the case of transporting oversized cargo, it often happens that the gross weight of the vehicle exceeds the permissible load of the bridge which can appear without any limitations. The passage of this type of vehicle is then possible only if the structure is checked for strength and after determining the route in the cross-section of the facility. If the internal forces caused by the load do not exceed the forces caused by a given load class assigned to the facility, such load may be permitted. This is performed as part of obtaining the permission from the road administrator to travel along a given section. The transport of heavy cargo may also occur on a mass scale and may be crucial as far as the defence of the Country is concerned. Owing to the operations of the Polish Armed Forces and allied forces translocating with equipment whose weight is often over 100 tons (sometimes moving in a column), the Minister of Infrastructure issued an ordinance regarding the establishment of the MLC class (*Military Load Classification*) for all the facilities located within the Basic Network of Public Roads (PSDP). The MLC class is a military load classification which applies to both bridge structures and military vehicles. The STANAG 2021 agreement provides for 16 load classes in the MLC4 - MLC150 range, to which 16 hypothetical wheeled vehicles and 16 tracked vehicles are assigned and their mass is expressed in US imperial tons (1 t_{USA} = 2000 lbs = 907.2 kg = 0.907 t) (Łopatka & Zelkowski 2009). An object holding a given MLC class can transfer a load of column moving in one direction, or two columns moving in two directions if the MLC class of these vehicles is equal to or lower than the MLC class of that object. For example, an MLC 80/100 bridge can be passed in one direction by a column of MLC100 class vehicles, or in both directions by a column of MLC80 class vehicles. The introduction of these classes was the result of the NATO STANAG 2021 standardization agreement, which stipulated both the establishment of classes for existing facilities and including the requirements in the facilities being designed. Under these regulations, each bridge with a roadway having at least two lanes possesses four MLC load classes:

- two for tracked vehicles passing in one (one column) or two directions of movement (two columns),
- two for wheeled vehicles passing in one or both directions.

Determining the MLC load class is possible owing to the following general dependency (Ratajczak 2018):

$$\max\left[F_{(MLC)}\right] \leq F_{(N)} + \frac{F_{(p)}}{\phi} \tag{3}$$

where:

$max\ [F_{(MLC)}]$ - internal forces in the most strained element of the structure from the highest MLC class calculated for a wheeled vehicle or a tracked vehicle moving in one column and separately in two columns,
$F_{(N)}$ - internal forces in the most strained element (in the same $F_{(MLC))}$ as determined from the standard load for which the bridge structure was designed,
$F_{(p)}$ - internal forces from the service load of the pavement,
ϕ - dynamic coefficient.

If the above dependency is not met, the tension conditions should be checked, due to the fact that the structure has a load capacity reserve of several percentage points. Only these calculations constitute the final criterion for assessing the MLC class.
Similarly, as for high vehicles, when transporting heavy loads with a concentrated mass, it is allowed to drive separately both a vehicle and a load, while stopping traffic on the site. In this way, among others, bridges are crossed by low-loader vehicle combinations carrying MBTs such as Challenger 2 and M1 Abrams. The tracks of the vehicle are then secured with rubber pads so that they will not damage the road surface.

Weather Conditions

Meteorological factors associated with rapid weather changes are crucial in a situation where, despite maintaining safety conditions by drivers who reduce speed, the loss of traction on the wheels cannot be avoided. Such phenomena include, first and foremost, strong crosswind gusts. According to police statistics, the impact of wind was the cause of about 300 traffic incidents in 2017, resulting in 30 deaths and nearly 400 injuries. For high profile vehicles, wind gusts play a definitely vital role in road safety. A typical truck has a large side surface of the semi-trailer, which is on average 40m^2 (MEGA semi-trailer). Such a large surface, often connected with too high a centre of gravity, is prone to losing stability. Such vehicle's behaviour is influenced by the lateral force on the road wheel tires, resulting in a change of the travel path. A truck moving in a rectilinear motion, under the pressure of the lateral force generated by the wind, spontaneously transits into a curvilinear motion. In this case, the travel path is calculated from the dependency (Prochowski & Kozioł 2011):

$$R \cong \frac{L}{tg_{\delta}+(\alpha_2-\alpha_1)} \tag{4}$$

where:

R – transient radius of the travel path,
δ – average value of wheel turn angle,
α_1, α_2 – value of the thrust angle for the wheels of the front and rear axles.

Figure 6 shows three possible travel paths of the *C* vehicle's centre of mass, moving in a rectilinear motion at the speed *V*, which is affected by wind pressure with the resultant F_Y force, depending on the dynamic properties of the truck.

Fig. 6. Possible travel paths of the vehicle's centre of mass under the influence of crosswind thrust

Source: (Prochowski L. & Kozioł S. 2011)

The way the vehicle behaves under the influence of F_Y lateral force depends on the location of three points: the vehicle's centre of mass, the centre of the lateral wind thrust and the vehicle's centre of lateral drift (the point where the conventional application of F_Y lateral force causes equal thrust angles on the wheels of both axles) . The close location of these three points relative to each other reduces the value of the resultant wind thrust force and thus has lesser impact on the vehicle's stability. C. J. Baker in his work (1986) distinguishes three typical behaviours of a vehicle exposed to the impact of crosswind:

- overturning,
- sideslip;
- rotation around the vertical axis by a certain angle.

M. Batista and M. Perkovič, in one of their articles (2014), set out the following criteria allowing one to determine the type of vehicle behaviour due to a sudden crosswind:

- the wheel contact force drops to zero,
- all wheels reach the friction limit,
- one wheel reaches the friction limit.

Vehicle behaviour is determined by the occurrence of forces and moments of force whose individual values affect the type and intensity of a particular event. There are three forces and three moments of force that should be considered when analysing the impact of wind on a moving vehicle:

$$F_D = C_D A \frac{\rho V_A^2}{2} F_S = C_S A \frac{\rho V_A^2}{2} F_L = C_L A \frac{\rho V_A^2}{2} \quad (5)$$

$$M_R = C_R A h \frac{\rho V_A^2}{2} M_P = C_P A h \frac{\rho V_A^2}{2} M_Y = C_Y A \frac{\rho V_A^2}{2} \quad (6)$$

where: $C_D, C_S, C_L, C_R, C_P, C_Y$ - dimensionless aerodynamic coefficients,
A – frontal area of the vehicle,
h – height of mass centre,
V_A – apparent wind speed,
$F_{D,S,L}$ – forces (drag, side, lift),

$M_{R,\,P,\,Y}$ – moments of force (rolling, pitching, yawing),
ρ – air density.

To accurately calculate the values of forces and moments of force (5) and (6), it is necessary to know the aerodynamic coefficients, which can be calculated based on vehicle tests in the wind tunnel. To accurately calculate the values of forces and moments of force (5) and (6), it is necessary to know the aerodynamic coefficients, which can be calculated based on vehicle tests in the wind tunnel. Based on many studies, the general relationship between the value of aerodynamic coefficients and the angle ψ between the vehicle speed vector and the apparent wind vector was determined. In his work *High Sided Articulated Road Vehicles In Strong Cross Wind* from 1988, CJ Baker defined the generalized values of each coefficient for a truck depending on the angle mentioned earlier ψ. Based on his publications, M. Batista and M. Perkovič (2014) conducted the analysis of a moving vehicle exposed to crosswind. On this basis, they derived equations enabling the calculation of the apparent wind limit value for which a specific stability loss event occurs. The need to eliminate the effect of crosswind on the vehicle is noticed by car manufacturers who are developing a technology called *crosswind assist.* Car models like Mercedes Sprinter or Ford Transit are equipped with this type of solutions. The operation of the mentioned system is based on the ESP (*Electronic Stability Program*) system, which brakes the wheels on the windward side of the car, which results in no need to correct the travel path, and thus significantly improves the level of safety.

Conclusions

The issue of transporting oversized loads forces continuous improvement of structural solutions including an increase of the axle turning radius, hydraulic height adjustment, increasing the strength of the structure while reducing its weight. All these aspects will result in increased transport capacity and less harmful impact on the elements of the transport system. There is also a need to access infrastructure data collected by road managers. The knowledge of the exact parameters of engineering facilities by private carriers may improve the planning process and avoid significant errors because accidents occur as a result of choosing wrong routes. Usually, they are expensive for both the carrier and the local community. Due to the location of Poland, which constitutes a corridor for trade exchange, being both an intra-Community one between Western European countries and the Baltic States, as well as between the European Union and Russia or Ukraine, both the functioning infrastructure and project plans must take into account the needs of the oversize transport segment to a greater extent. On the other hand, the current stance of the European Union forces most countries to change their energy policy, and statistics (Eurostat 2019) show that in the renewable energy segment, the total value of the energy generated by wind turbines doubled over 2007-2017. It should be expected that the consequence of this fact will be a further increase in the quantity of long load transportation. The article also recognizes the need to allow the possibility of straight-ahead driving across roundabouts, as well as the reconstruction of engineering facilities that do not meet the requirements of applicable regulations. In addition, the need to build appropriate Information Communications Technology (ICT) systems, which synergize the data of private carriers and the information collected by road administrators, should be highlighted. Furthermore, systems supporting the driver's work in adverse weather conditions, as well as improving safety during manoeuvring, should be further improved.

Abstract

The article presents the historical development process, analysis and forecast of the Russian retail market for the short term. The largest mergers and acquisitions deals for 2018 and 2019 are analyzed, a review of the activities of the largest market companies is carried out, key trends and restrictions on the development of this market are considered. The authors also analyze the Russian Internet trading market. The theoretical basis of the study was the work of foreign and domestic scientists on the study of the competitiveness of retail companies. As research methods, the method of synthesis, analysis, generalization and grouping of scientific data was used. The study showed that the main changes in the traditional retail sector are associated with the expansion of the geography of networks. In addition, there has been an increase in online trading, the development of new payment methods, the share of sales of retail stores in discounter format is growing.

Keywords: retail market, Russian retail companies, digital economy, mergers and acquisitions.

Introduction

Retail is a large part of society. Trade is a necessary element of the national economy, which provides a link between the sphere of production and consumption (Panfilov and Chernovolov, 2006). With the accelerating pace of scientific and technological progress, the development of the Internet, the appearance of digital technology, the retail sector is undergoing significant changes. The purpose of this study is to study the characteristics of the development of the Russian retail market, highlight the main stages, determine the prospects for retail trade in the M&A sector and make a forecast for the development of the Russian retail market, in particular, the Internet retail market.

Methods

The theoretical and methodological base of the research was composed by the works of Russian and foreign scientists, including A. Smith, M. Porter, T. Danko, Z.A. Vasiliev, O.M. Khotasheva, Y.V. Trofimova et al.

The research information base includes analytical reviews of leading consulting companies, in particular, Deloitte, PwC, McKinsey, as well as annual reports of the largest companies in the industry.

As research methods, methods of generalizing scientific data, synthesis, analysis and grouping were used.

Four key stages can be distinguished in the development of the Russian retail market. At the first stage (1994 - 1998), food markets began to develop actively despite a decline in living standards and a decrease in retail trade turnover. At this stage, there was a transition from wholesale to retail. The development of network trade began, namely, the first Russian companies began to open, including “Lenta”, “Sedmoy Kontinent”, “Paterson”, etc. In addition, the first foreign Ramstore network (Turkey) entered the Russian retail market. As a result of the 1998 financial crisis, stores began to

appear in the format of "discounters" instead of the previously popular expensive supermarkets. The "discounter" format was based on five key benefits for consumers: low prices, convenient location, optimal product mix, quality assurance and professional service. Existence in the format of discounters is ensured by reducing the cost of delivery or pre-sale preparation. Retail has taken hard hit by this crisis. On the one hand, the country's population sought to buy a large amount of goods with light money. On the other hand, most retailers did not have time to adjust prices and were forced to purchase new lots at prices already increased several times. In this context, it is important to emphasize that at the time of the crisis, many companies in the industry did not have an established accounting system and were not able to calculate losses, debtors, etc. It was in 1998 and 1999 that most modern retail companies began to open their first stores, while some of them shifted from wholesale to retail. Thus, many large retailers emerged as a result of diversification of the business of distribution and wholesale companies. At the second stage (1998-2000), there is an increase in domestic production and, as a result, a reduction in food imports. Retailers are beginning to expand their product range and are striving to lower their margins. The format of "discounters" (Pyaterochka, Dixie, Magnit), designed for the population with middle and low incomes, continues to gain popularity. At the same time, the number of regional retail chains is increasing both due to regional expansion, and due to the appearance of local retail companies. At the third stage (2000-2005), competition began to intensify to a greater extent due to the emergence of multinational corporations on the Russian market, as well as the massive entry of foreign networks, including Ikea and Metro Cash & Carry. The revitalization of foreign retail chains has led to the active development of federal chains in the regions. There has been a rapid increase in the number of mergers and acquisitions, in particular in the regions. New formats began to emerge, including "hypermarkets" and stores in the "cash & carry" format. It is at this stage that conflicts arise between retailers and manufacturers. The fourth stage began in 2005, when large groups of retail companies began to appear with a turnover exceeding $ 1 billion. Retail companies began to actively attract external sources of financing, in particular, bank loans, bond loans, investment funds, etc. Moreover, during this period, the number of trading floors increased due to the construction of shopping malls and shopping centers (Fetisova, 2009; Hayrapetyan and Kondenkova, 2013).

Retail prospects in the M&A sector

The regional expansion and the entry of companies into the stock market prompted the retail sector to increase mergers and acquisitions deals. Back in 2004, the mergers and acquisitions market was valued at $ 22.8 billion, and trade accounted for only 1.6%. In 2017, this indicator reached 7.8%, and the number of transactions in the retail sector increased to 71. Table 1 shows the largest transactions in the Russian retail market for 2017 and 2018.

Table 1: Largest mergers and acquisitions deals in the Russian retail market (2017-2019)

Subject	Consumer	Seller	Acquired share (%)	Transaction amount (mln. USD)
Holland & Barrett International	LetterOne Group (Mikhail Fridmann)	The Nature's Bounty Co, The Carlyle Group LP	100%	2 250
"Magnit"	Private and institutional investors	Sergei Galitskii	7,5%	734
GK "Detskii Mir"	Private and institutional investors	JSFC "Sistema", Russian-Chinese Investment Fund, private shareholders	30,5%	325
"M.Video"	Group "Safmar"	Public investors	24,7%	310
"M.Video"	Information on investors is not disclosed	Group "Safmar"	24,7%	300

Note: The table is based on KMPG's information (KPMG in Russia and the CIS, 2018)

Thus, Holland & Barret International, acquired by LetterOne Group, comes first in terms of the transaction amount. The Russian Investment Fund has acquired the largest European chain of health food stores. The subject of the transaction was more than 1,000 stores in China, the UK, India, the UAE and the Netherlands. Over the past seven years, the network has opened more than 300 outlets and has managed to enter new markets. Definitely, Holland & Barrett is a leader in the market of healthy eating in the UK and has attractive growth prospects in other markets of the world. In addition, it is important to note that interest in the company was shown by the private investment firm Sycamore Partners, the American KKR, as well as the Hong Kong company AS Watson.

The second largest transaction was the sale of a 7.5% share of "Magnit" retail chain. The founder of the network sold part of its share to VTB. "Magnit" ranks 11th in the ranking of the fastest growing retailers in the world (Deloitte, 2018). The retail sector has long been deprived of the presence of the state as a business player. However, after the sale of "Magnit", the situation has changed significantly. If you look at quotes of "Magnit" at the time of its sale, we can conclude that the initial attitude of investors to this event was negative. This judgment is supported by a 4% fall in retail chain shares. It is still difficult to judge why VTB needs this deal and whether it will stop or continue to consolidate the retail industry. To date, VTB has another 4% share in "Lenta". In this context, it will be interesting whether VTB will strengthen the competitive advantages of "Magnit" or will lobby the interests of the entire industry as a whole. No doubts that Russian retailers can significantly strengthen their competitive positions with the support of large government agencies. There are prospects for a qualitative transformation of the business, namely the development of channels in the online segment. However, there are concerns regarding whether the state will increase its influence on retail prices through a large retail network.

The third largest transaction is the sale of Detskii Mir, the largest Russian children's goods store. Fundamental agreements on the sale of a controlling interest in Detskii Mir were reached only in November 2018. Thus, the transaction itself can take place either at the end of 2018, or at the beginning of 2019. In early September 2018, 12 potential buyers of the company were announced, and subsequently their number was reduced to three. The successive increase in interest in this asset is clearly seen. The company's shares can be considered attractive for several reasons: the double-digit rate of increase in revenue, the high rate of increase in the number of retail space. So, in the third quarter of 2018, the company's revenue increased by more than 15% in annual terms. The company continues to expand actively, in particular in the CIS countries. In addition, it should be noted that there is a risk of further postponement of the terms of sale or even cancellation of the transaction due to a drop in personal income.

In the fourth and fifth positions of the rating, the subject of transactions is the retail network "M.Video". In both cases, the "Safmar" Group appears: first as a buyer, and in the second case as a seller. First, the leadership of "Safmar" acquired the shares of "M.Video", as well as another retail company engaged in the sale of equipment and electronics, "Eldorado", with the aim of creating "Safmar Retail". Despite the fact that during the sale the share of "Safmar" will decrease, the controlling interest will still belong to this group.

It should be noted that active consolidation in the retail sector began in 2004. Prior to this, companies preferred an organic growth strategy, and starting in 2005, the number and amount of transactions began to grow steadily. Despite the fact that at the moment the Russian market of mergers and acquisitions is at the stage of growth, sanctions impose certain restrictions. One of the distinguishing features of the Russian market of mergers and acquisitions is the increased participation of the state not only as a regulator, but also as a buyer. In part, this process is associated with the government's desire to control the retail market even more.

In the foreseeable future, there are no opportunities for conducting M&A transactions among the largest companies in the market. Pricing in the retail sector is currently low, which means it is unlikely that asset owners will be willing to sell them. Most likely, leading Russian retailers will seek organic growth in parallel with complementary acquisitions. Priority for retail chains will be

operational efficiency to ensure high return on investment in an increasingly competitive environment. In addition, until 2019, a significant increase in consumer spending is not expected, which means that pressure on the market from the demand side will continue.

Overview of the Russian retail market

The dynamics of the retail market reflects the fact that the crisis of 2015 and 2016 has strongly affected the sectors that are associated with consumption. During these two crisis years, retail sales declined by about 15% (Borovikov, 2017). Thus, after three years of stable growth, in 2015, retail trade turnover fell to the level observed in 2010 (Figure 1).

Fig. 1: Retail turnover (trillion roubles)
(Source: 'The dynamics of retail sales since 2012', 2018)

Despite a slight increase in 2017, the Russian retail market has not yet been able to achieve pre-crisis performance. According to the forecasts constructed by the author, the retail industry will reach pre-crisis levels in 2019. In this context, it is necessary to pay attention to the decline in real incomes of the population, which could not but affect the development of retail trade. The negative trend continues for the third year and significantly changes consumer behavior. At present, Russian buyers have begun to pay much more attention to promotions, the demand for goods sold under the brands of retail companies has grown significantly, and the consumption of more expensive products has decreased. Many suppliers are faced with a situation in which goods began to be sold only if they are subject to a discount. For such items as household chemicals, alcohol, coffee and confectionery products, the presence of discounts is reflected even more. The reason lies in the desire of Russian consumers to save despite the growth in purchasing power. In addition, consumers began to pay more attention to products manufactured under the brands of retail companies. Retail companies have ceased to regard the creation of their own brands as an instrument of price struggle, as well as strengthening their positions in relations with suppliers. Companies began to focus not only on low prices, but also on increasing the quality of their products and, as a result, there was an increase in consumer interest. As part of this, many large companies in the industry are rebranding their own brands, introducing new lines, and also significantly expanding the range. So, "Lenta" launched its own brand Bonvida, "Auchan" is constantly expanding its product range, in particular, recently introduced premium chocolate. In turn, the X5 Retail Group, instead of manufacturing goods, prefers to enter into strategic partnerships with manufacturers. In particular, together with one of its suppliers, it owns "Sarafanovo" dairy product brands. The conclusion of such agreements with manufacturers of semi-finished products and groceries is in short-term plans of the company. The company management does not see the advisability of building its own plants and the potential for vertical integration in the retail sector.

Among other things, there is a tendency to reduce the average bill in real terms, as well as reduce the number of customers. In such a market environment, large retailers operate most efficiently despite pressure from the Federal Antimonopoly Service and some legislative restrictions. The rating of the five largest Russian retail chains includes X5 Retail Group, "Magnit", "Lenta", "Auchan" and "Dixie". At the same time, in terms of revenue, X5 Retail Group and "Magnit" significantly outperform their competitors. In 2019, X5 Retail Group will slow down the pace of opening new stores. For the coming year, the company plans to open about 2 thousand of new stores, of which more than 1.5 thousand stores will fall on the "Pyaterochka" chain, since it occupies a significantly larger share in the company's revenue structure. The slowdown in the opening of stores is associated with the desire to improve their quality, as well as focus on attractive segments in terms of profitability and return on investment. The closest competitor of X5 Retail Group, "Magnit", also plans to open about 2 thousand stores for 2019. In addition, the network seeks to expand its geographical boundaries and increase the number of regions in which it presents. "Magnit" plans to launch online trading projects. In this context, most likely we are talking not only about the online store, but also about omnichannel offers of various kinds. The company seeks to create an ecosystem in which customers can also participate in resolving assortment formation issues. Digitalization allows the optimization of the work of "Magnet". For example, updating forecasting systems can significantly increase turnover and reduce inventory. "Magnit" has a sufficient database to analyze many trends in consumer behavior. Like many retail companies and chains, "Magnit" is moving more and more towards personalization.

The rating of the five largest retail chains in the Russian market includes the "Auchan" foreign network. In 2019, a major French retail chain plans to begin a radical transformation of its stores in Russia. Back in 2018, the company introduced the new "Odastor" concept, within the framework of which a new design and color scheme of the chain stores, as well as an updated range were identified. "Auchan" tops the ranking of the largest foreign companies in terms of revenue in Russia. Moreover, Groupe Auchan owns Decathlon sporting goods stores, as well as Leroy Merlin home and construction products.

An analysis of the activities of the largest Russian retail companies allows us to draw a conclusion about the main directions of development of industry companies: geographical expansion of networks, the intensification of the introduction of digital technologies, personalization, as well as an increase in the share of network companies.

Past data is taken from market research conducted by RBC (Figure 2). The author extrapolated using the linear prediction function. Thus, the share of the 10 largest chain retailers will increase to 37.8% by 2022. In addition, it is noteworthy that the revenue of large chains grew more due to the opening of stores in formats such as "neighborhood shops" and "discounter". Supermarkets and hypermarkets grew at a much lower rate.

Considering key retail trends for 2018 and 2019, one should mention government initiatives, in particular, issues of labeling and control of the circulation of goods. Until 2024, Russia plans to launch a unified system for marking goods with control marks. Such a system allows you to fully control the circulation of all goods (continuous traceability system). This initiative is managed by five departments together with "Rostec" Group of Companies. The marking of goods will be carried out in the same way as the marking of drugs using QR codes and cash registers of new generation. As part of this, a conceptual and legislative framework will be prepared, and Russia, in turn, may become the first country in the world to fully control all merchandise operations. It should be noted that such a measure will significantly reduce the share of the shadow sector in the country's GDP.

(Source: Borovikov, 2017)

If we talk about trends related to the activities of the retail companies themselves, then this is omnichannel, increased customer loyalty, strengthened position of loyalty programs, noticeable advertising and self-service. Even now, the leaders of retail companies are coming to an understanding of the need to bring the business to the online segment. In this regard, there is a trend of omnichannel, namely the integration of online and offline sales channels into a single system. This term was first used in the USA in 2011 (Aliyev, 2017) and replaced the phenomenon of multichanneling. We can say that the omnichannel model evolved from multichannel and took into account its key shortcomings. Despite the fact that the essence of omnichannel and multichannel lies in the use of digital and traditional distribution channels, the difference lies in how exactly the customer interacts with these channels. With the omni-channel approach, two channels are integrated and do not operate independently. Thus, omnichannel allows you to create a single customer service, covering several points of consumer interaction with the company at once: traditional shops, online resources, mobile application, social networks, chat rooms, etc. At the same time, the company analyzes and tracks information from all channels. This approach allows us to provide the so-called seamless consumer experience (Verhoef *et al.*, 2009). In the multi-channel model, there is a risk that the channels may begin to compete due to different price offers, independent logistics and storage capacities, etc. In turn, omnichannel provides a flexible, client-oriented and personalized approach. Since an important role in the development of this model is digital transformation, one of the main obstacles to the implementation of an omnichannel model is the inability to work with modern digital solutions, in particular, “big data” technology. The main asset of this approach is a knowledge base that allows you to achieve the so-called personal communication effect, implement strategies more efficiently and analyze results faster. Solutions that are analyzed using the technology of “big data” make it possible to segment consumers into a large number of groups and change tactics responsively. In addition, the technology of “big data” gives companies additional competitive advantages and increases their value in the market (Bradlow *et al.*, 2017; Grewal, Roggeveen and Nordfält, 2017). Despite the fact that it is too early to talk about the complete automation of marketing processes in Russian companies, today digitalization allows you to combine several tools at once. There are many examples of integrating a CRM system with e-mail marketing platforms. Obviously, such solutions can significantly reduce and simplify work with the customer database. In the future, more and more communication channels will be integrated into a single fully automated system.

In addition, retailers are interested in increasing customer loyalty, as attracting new customers is much more expensive for companies. It is about strengthening individual work with customers and compiling individualized offers thanking to technologies such as Wi-Fi tracking, CRM marketing, *etc*. (Chang, Park and Chaiy, 2010). Along with this, the introduction of bonus and discount programs, the creation of their own mobile applications, etc. The self-service trend, as a rule, develops in large chain stores. Self-service systems can effectively save space, and also increase customer loyalty. For example, two traditional cash registers can be replaced by six self-service cash registers. Such a system is most relevant during peak hours, as it allows you to speed up the process of making a purchase and reduce queues in stores. Another relevant trend of 2018-2019 is the so-called noticeable advertising aimed at ultimate delivery of advertising and informational messages of the store. Sales areas are equipped with digital advertising panels, which are installed either on a display case or at the cash desk.

Special attention should be paid to trends related directly to personalization. Firstly, it is the marketing of micro moments. An example of micromoment marketing action is a technology such as iBeacon, which allows companies to send an advertisement to the phones of passing by people. Due to the development of push notification mailing services, this trend is starting to reveal itself in a new way in the online space. Such a channel allows delivering contextual offers as efficiently as possible. Secondly, this is a high degree of personalization based on elements of artificial intelligence. Machine learning and artificial intelligence form the core of all modern personalization platforms. Technologies allow not only collecting data about consumers, but also using them effectively and constantly modifying recommendation algorithms. Thus, AI-marketing has become a leading trend today and can significantly increase the competitiveness of retail companies in the long term, in particular, due to a better understanding of potential consumers and increased loyalty to their audience. The system can monitor customer purchases and identify patterns. After that, the system begins to predict the time when the buyer wants to purchase this or that product again, then the system notifies the buyer of interesting promotions and offers related to its shopping cart. This trend will be relevant for many years to come. Thirdly, it is client-oriented marketing. At the present stage of development, it is the consumers who build the marketing strategies of retail companies.

Russian web-based market

Competition in the retail market is now moving into a radically new stage. Russian consumers have become more trusted when doing online shopping. Given the growing share of consumers representing generations Y and Z, consumers will increasingly resort to shopping for goods over the Internet. The growth dynamics of online sales is observed in almost all segments. So, for example, online coffee sales grew by more than 25% in real terms, while no sales growth was observed in the offline segment. Convenience and time saving fuel the continued growth of the online retail segment. In turn, retail companies are constantly improving the conditions for online shopping. Despite the fact that in Russia the e-commerce market accounts for only 4% of all retail trade (in developed countries - 10-15%), the desire of Russian companies to increase their presence in the online segment, as well as pressure from foreign Internet resources significantly accelerates the development of this direction. (Ishchenko, 2018). In 2017, Russian consumers spent almost 400 billion roubles. in international online stores, which is 25% more than the previous year. Thus, there is an increase in the presence of foreign online stores in the Russian market. Most foreign online purchases came from China, the European Union and the United States. In monetary terms, orders from Chinese online stores accounted for 53%, from the European Union - 22%, and from the USA - 12% (Habibrahimov, 2018).

Among the key trends of this market, it should be noted that high rates of growth in the number of orders have been maintained, in contrast to the traditional retail market, slightly pronounced negative dynamics of the average check, as well as market growth in money terms (approximately + 18%).

While maintaining growth rates at 18%, online sales in 2019 will reach 1.3 trillion rubles (Figure 3).

Fig. 3: Online sales in 2018 (billion rubles)
(Source: Virin and Ovchinnikov, 2018)

While the FMCG segment dominates in the traditional retail sector, categories such as electronics and appliances, clothing, shoes and accessories, as well as home and repair goods. At the end of 2018, electronics and equipment were most purchased through the Internet resource dns-shop.ru, and clothes, shoes and accessories through wildberries.ru. However, the leader in online trading is the Alibaba Chinese store. Of the Russian online stores one should distinguish "Ulmart" and Ozon. Traditional Russian retail stores are also starting to enter the online market and sell their products on the Internet. Not so long ago, X5 Retail Group launched its online store based on "Perekrestok" supermarkets. The opening of an online store is one of the new directions of "Perekrestok" and is designed to satisfy the needs of those customers who prefer to make purchases in the online space. For customers of the online store, the entire assortment range is available, which has more than 13 thousand items. The collection and delivery service is organized in a hybrid store, which was specially built to launch this project. The hybrid store includes a regular supermarket chain, as well as a specially organized warehouse. This scheme is designed to provide high performance. In addition, X5 Retail Group plans further development in the field of electronic commerce. For 2019, the company plans to launch the issuance of online orders in "Pyaterochka" stores under the Click & Collect scheme. In addition, the company plans to establish automated pick points for issuing online orders inside traditional stores.

Separately, it is important to mention such a thing as m-commerce. The volume of the Russian mobile commerce market began to develop dynamically due to the growth of the mobile Internet audience, as well as the growth of the non-cash payment instruments market. In Russia, one in three people actively uses the Internet through mobile devices ('In 2017, the volume of the Russian m-commerce market will exceed 2.5 trillion rubles', 2014). Russia in the global m-commerce market lags significantly behind the USA and European countries, however, it is ahead of many developing countries, in particular Brazil. Among the key trends in this market, we should note the shifting from Internet sites towards applications. Due to its convenience and speed, applications can become one of the most effective sales channels. In addition, often mobile platforms have the ability to pay directly from mobile wallets, which greatly simplifies the purchase process. However, attention should be paid to the fact that many consumers around the world are not yet ready to fully switch to mobile payments due to mistrust of this technology and fears of hacking (Leu, Huang and Wang, 2015).

Results and Discussion

Already, the Russian retail market is approximately on a level with the UK market and is one of the three leaders in the European market, second only to the German and French markets. However, sanctions and the so-called "trade wars" affect consumer demands. Despite the fact that customers are partially limited in their choice of products, retailers adapt to the modern realities and requirements of their customers. So, for example, in 2018-2023, a significant increase in sales of locally produced goods is expected. It is safe to say that sanctions by the US and the EU will be in effect for the next 2-3 years. Although these restrictions do not significantly affect the consumer goods market, they provoked the development of the production of Russian goods, including retail chains. Most likely, this trend will continue until 2023.

Key changes in the traditional retail segment will be associated with the expansion of the geography of networks. There is an increasing trend in the development of retail chains not only within large cities, but also in remote areas and small cities. Not so long ago, "Magnit" entered into an agreement with the Russian Post and in the near future will be able to use the logistics of the Post. This agreement is cost-effective for the distribution network.

In turn, online trading will continue to grow, and to a greater extent due to those online stores that sell goods at the lowest prices. Over the next few years, Alibaba will continue to dominate the online segment. A promising direction for online trading is the development of new payment methods that facilitate the purchase process, in particular, Apple Pay, Samsung Pay Pal, etc. A possible direction of development is payment with bitcoins. It is noteworthy that such an opportunity appeared in September 2017 at "Ulmart".

Conclusion

Thus, the overall outlook for both the traditional retail market and online trading is positive. This market will experience moderate growth.

Abstract

The article is devoted to the audit activity reformation considering innovations in its development. In the framework of this article, the main stages of the audit formation in the Russian Federation are identified. Over the past few years, attention has been focused on the activities of participants in the audit services market, provoked by the mass cessation of organizations activities belonging to the category of socially significant, obliged to undergo an audit procedure annually. In accordance with the requirements of the legislation of the Russian Federation, an organization acquires the right to provide audit services after inclusion in the register of a self-regulatory organization of auditors, which systematically monitors its members of auditors and audit organizations. The authors, analyzing the opinions of scientific economists by the method of analysis and comparison, guided by relevant information about the state of the market for audit services and self-regulation of the audit industry, conduct independent research in this area.

Keywords: Audit Activity, Check-Up, Self-Regulation, Licensing.

Introduction

The purpose of the study is to reveal the competitiveness problems of medium and small audit companies and develop recommendations to strengthen their position in the audit services market in order to avoid monopolization of the audit market.

The purpose of the study is to show flaws in the legislation of the Russian Federation in the field of audit as the main factor in the provision of low-quality audit services.

The research relevance. The issues of implementation quality of the audit activities are currently gaining high relevance, which is mainly associated with the mass cessation of socially significant organizations that received a positive audit report confirming the accuracy of the information

reflected in the financial statements of the company. In connection with the fact that the mechanism for regulating audit activities is changing, it is necessary to focus on the main aspects of regulating the activities of audit services in Russia, the specifics of the current state of the audit market, as well as the prospects for regulating auditing in Russia, which are based on the main trends in reforming the control of audit organizations, auditing business entities belonging to the category of socially significant.

The key basis in the article is the interaction analysis of the state control body and self-regulatory organizations of auditors in relation to audit organizations. In addition to considering the main aspects of control activities to market entities of audit organizations, the author studies the role of self-regulation and the possibility of applying control activities results carried out by self-regulatory organizations of auditors in the course of state control over the activities of audit organizations.

Methods

The research methodology is based on the use of general scientific and specific methods of cognition. As part of the study, a systematic and active monitoring of the development of the audit activity regulation was carried out in the light of legislative innovations in the Russian Federation. As part of an empirical study, the authors uncovered, analyzed and generalized the problems of providing quality audit services. In the course of solving these problems, the opinions of economists on the issue were summarized. An analysis of audit relations allowed us to propose measures to strengthen the position of small and medium-sized audit companies, which are not able to compete with the giants of the market. The synthesis of theoretical material and the results of empirical research made it possible to develop an integrated approach to achieving the goal.

Results

At present, the market for audit services is going through a difficult period because it is regulated by the state and self-regulatory organizations, which requires the timely adoption of such measures as:

- it is necessary to introduce compliance with financial responsibility;
- tightening state oversight;
- increasing the professionalism of auditors;
- taking measures and developing assistance programs for medium and small audit companies.

The last-mentioned measure should become a priority, since at present small newly-formed audit firms are not able to compete with market giants that have been established in the market for decades.

The support measures consist of:

subsidizing and sponsoring projects aimed at improving the specialization of audit entities;
the possibility of benefits when participating in tenders;
the provision of tax benefits.

Discussion

Domestic scientists study the audit activities regulation in a number of works. However, it should be noted that audit regulation issues are not covered in sufficient detail in scientific works, and a number of sources, due to repeated regulatory and organizational changes in the audit services market, have lost their force. This article accumulates modern requirements for audit regulation in Russia based on the relevant provisions of regulatory legal and methodological documents, and reflects the results of control activities in relation to subjects of audit services market (Zizekalova, 2019).

In modern economic conditions, the importance of audit activity is growing because the audit company report on the reliability of the audited entity that can be a decisive argument for attracting investor funds.

There are several stages of the audit development in Russia.

1. The origin of Russian audit activity dates back to 1987-1993. The joint-stock company named 'Inaudit' was created back then in the USSR. It provided audit services to Soviet and foreign companies (Bychkova and Itygilova, 2017).

2. The period of from 1993 to 2001. At this stage, the Interim Audit Rules are established, common audit standards are developed, auditors are certified and licensing for audit activities is issued.

3. Legislation of governing audit activities saw its development in the period from 2001 to 2008. The Federal Law #307 'On Auditing' was enacted (The State Duma, 2017), and the Federal Auditing Standards were approved.

4. Audit activity was transformed into self-regulatory in the period from 2009 to 2014. At this stage, audit regulation became liberalized, self-regulatory audit companies were created, a new tax code was enacted to regulate the audit activities of these companies, and 'The rules for the Independence of Auditors and Audit Companies were introduced' (Asfandiyarova and Rafikova, 2017).

5. The application of international audit standards since 2018. This stage of development is determined by a change in Federal Law #307 by the Russian Ministry of Finance, in which the federal audit standards were eliminated and the International audit standards were approved (*Ministry of Finance of the Russian Federation*, n.d.).

At present, the audit activities quality issues, and the issues of audit regulation, are becoming particularly relevant because many objects of a mandatory audit, shortly after receiving an audit positive opinion on the reliability of the audited statements, cease their activities because of bankruptcy or regulatory deprivation of a license.

This industry's draft legislation is one of the most important events in the audit. The project was developed by the Central Bank and was finalized jointly with the Russian Ministry of Finance. Enactment of the law means a change of the regulator and supervision among auditors, the number of employees' requirements, the external quality control procedure and the revision of entities, which are subjected to audit will change as well (Budunova, 2018).

The idea of transferring powers to supervise and regulate audit from the Ministry of Finance to the Central Bank has been under discussion since 2016. In May 2017, the Central Bank prepared a draft legislation, coordinated it with the Ministry of Finance over the summer, later the document was submitted to the State Duma and adopted in the first reading. However, after this, the Ministry of Finance prepared its own version of the reform and introduced the Central Bank on November 26. It took the parties more than a year to reduce their positions; only on January 24, a new version of the bill of the Ministry of Finance appeared, approved by Central Bank (Ministry of Finance of the Russian Federation, 2018).

The most important innovation of the document is a change of the regulator and supervisor in the industry. Currently, the Ministry of Finance is such a regulator, and the Federal Treasury exercises external control over the quality of auditors work, that is, supervision. However, after the law comes into force, the Central Bank will take on the role of the Ministry of Finance and the Federal Treasury (Arskaya *et al.*, 2017).

The idea of changing the regulator in the audit market was not approved by everyone. Many auditors opposed, while severely criticizing it. They expressed the view that the regulator should be a state

body, unlike the Central Bank. However, many of the bank auditors were in favor of a regulator change.

The enactment of the above-mentioned project is associated with the inevitable reduction in the number of entities falling under the mandatory audit. Currently, organizations, which are to be audited, are the ones whose revenue exceeds 400 million rubles or whose assets amount to more than 60 million rubles. However, in view of the newly adopted law these criteria were increased, i.e. the revenue should be from 800 million rubles, and total value of assets from 400 million rubles.

At the same time, three registers of audit organizations and socially significant organizations, which will be maintained by the Ministry of Finance, as well as a register of auditors of socially significant organizations of the financial market, which will be maintained by the Central Bank, will appear. Currently, there are two self-regulatory organizations in the audit market, the Russian Union of Auditors and the Commonwealth Audit Association.

The reform threatened the market not only with a work reduction, but also put forward new requirements for the number of auditors in companies. Auditors of socially significant organizations will have seven auditors at their main place of work from 2023 up to 12; auditors of other socially significant organizations will have three auditors at their main place of work, from 2023 up to 5). The remaining audit organizations should have at least three auditors at their main place of work. However, many organizations note that in Russia there are regions in which so many auditors with a certificate are not recruited. Representatives of the Russian Union of Auditors are afraid that auditors from Moscow and St. Petersburg will be involved in the verification of regional companies (Kalutskaya and Terekhovskaya, 2015).

According to official statistics of the Russian Federation Ministry of Finance, as of January 1, 2018, only 4,800 entities have the right to engage in audit activities, which is 300 less than the relative ones on January 1, 2016 and 200, relative to the statistics of 2017; 4,200 entities are audit organizations. It is worth noting that the number of such organizations decreased from January 1 to December 31, 2018 by 100 units. The number of individual auditors has not changed since 2017 and amounts to 600 people (Expert RA, 2020).

The total number of auditors as of January 1, 2018 was 19,600, of which only 4,000 passed the qualification exam for a single certificate. Every year, the number of qualified specialists is growing, and already by December 31, 2018, it reached the mark of 4,300 people.

The largest share of Russian auditors (49%) for 2018 was recorded in the Central Federal District. The second largest number of registered subjects of audit activity is the Volga region, there are 2,700 subjects. The smallest number of auditors in the years of 2017 and 2018 was registered in the North Caucasus Federal District in 2018; their number was 300 entities, which is approximately 1% of Russian audit firms (*The Federal Security Service of the Russian Federation. Official statistics*, n.d.). The territorial distribution structure of audit organizations for 2018 is presented in Figure 1.

Fig. 1. The territorial structure of audit organizations distribution in Russia in 2018
(***The Federal Security Service of the Russian Federation. Official statistics*, n.d.**)

If we talk about the duration statistics of audit activities, in 2018 the share of entities conducting audit activities for more than 5 years amounted to 78%.

In the audit services market, 90% of organizations are small, but large audit firms account for the largest share in the total volume of services rendered. The system of audit organizations by the volume of work and the volume of services rendered is graphically presented in Figure 2.

Fig. 2. Audit firms differentiation in terms of scope and size of audit services provided in 2018
(***The Federal Security Service of the Russian Federation. Official statistics*, n.d.**)

The audit market is saturated with small enterprises that are not able to compete with large companies in the audit market. Large companies in the audit services market care about the qualifications of

their employees, namely, they give their wards the opportunity to take specialized advanced training courses, provide the opportunity to study foreign languages for cooperation with international companies, conduct training courses to improve the service, that is, intensively engage in the development of skills and professional knowledge of their wards. Such market giants include 'KPMG', 'Ernst & Young', 'Deloitte and Touche CIS' and 'PricewaterhouseCoopers Audit' (RAEX Analytics, 2018).

Table 1 reviews the list of leading organizations engaged in audit activities, based on the results of 2018.

Table 1: Leading organizations engaged in auditing (Expert RA, 2020)

Performance position 2018	Auditing companies	Organization profitability, RUR
1	KPMG	10 668 524
2	Ernst & Young	6 977 116
3	Deloitte & Touche CIS	5 611 112
4	PricewaterhouseCoopes Audit	5 505 617
5	BDO Unicon	1 690 865
6	Fbk	1 199 580
7	Crow Expertise	407 348
8	FinExpertiza	402 157
9	Crow Rusaudit	398 352
10	MEF-Audit	350 269

It can be concluded that the audit sector is monopolized. There is a need to develop programs to support small Russian companies. Using methods of system analysis, the main indicators of the audit services market are considered, according to which in recent years there has been a decrease in the number of audit activity subjects.

The number of audit organizations from 2016 to 2019 decreased by 0.3 thousand and amounted to 4.1 thousand. However, the number of individual auditors over the course of three years has remained at the same level of 0.6 thousand. The number of auditors also decreased from 2016 by 2 thousand people (Sheremet, 2017).

As mentioned above, the new reform will lead to a reduction in auditors and audit organizations. The fact that the new bill could undermine a large number of auditors in the regions, several experts suggested at once.

As for the Belgorod region, the number of audit organizations in the region as of October 2019 is 39; the number of auditors is 132 people. The regulation of auditing in the Russian Federation has a long history, but in July 1, 2009, the history of this profession received a new twist.

The New Federal Law #307 'Auditing' has replaced the licensing rule with the standard for admission to a self-regulatory organization.

In accordance with the will of the legislator, organizations and individuals began to join in non-profit partnerships. The number of auditors and audit organizations by self-regulatory organizations of auditors as of January 16, 2020 is shown in Figure 3. According to the Control copy of auditors and audit organizations register.

Fig. 3. The number of auditors and self-regulatory organizations of auditors as of January 16, 2020 (*The Federal Security Service of the Russian Federation. Official statistics*, n.d.)

Two self-regulatory audit organizations decided to unite, i.e. the Russian Union of Auditors and the Association of Auditors 'The Commonwealth'.

Thus, one self-regulating organization of auditors reminds that the licensing, which was earlier, made the financial burden much less. With the activity of one self-regulatory organization, the financial burden may increase. For example, now the procedure for acquiring a single certificate of an auditor is unreasonably expensive, the percentage of completion is very small, and therefore there is no influx of young specialists into the audit profession.

One self-regulatory organization is clearly a decrease in competition. According to the Big Four, a self-regulatory organization will have to take the costs of auditors and this is not only membership fees, but also, quality control payments, which periodically conducts self-regulatory organizations in relation to audit organizations and, accordingly, a number of 'small' audit firms cannot financially exist.

Thus, audit activity is an integral part of the economy as a whole. By conducting a mandatory audit of organizations, potential investors can make decisions about supporting the enterprise. Since the market for audit services is in the process of significant changes, the professional community and the government need to develop methodological and organizational approaches to address the existing problems.

Conclusion

Regulation audit measures should be mainly aimed at improving the professional climate in the market of audit services, since it is the audit activity that affects public and state interests. It is necessary for the audit profession development to implement a set of measures that will attract young professionals and will motivate existing participants in the audit market to continue their professional activities. The state and self-regulatory audit organizations influence the current situation of the audit market subjects quite largely. Since the issuance of a false audit report will adversely affect the business reputation of self-regulatory audit organizations and lead to the risk of its existence, it is necessary to review the system of penalties by self-regulatory audit organizations and their members, which will stimulate the subjects of audit activity to conscientiously and efficiently render audit services.

Abstract

The problem of creating a health-oriented system of professional training of future managers is highlighted in the article. The aim was to ground the organizational and pedagogical aspects (innovative forms, methods and tools of health-preserving study) in the system of professional training of future managers with the help of the following methods: theoretical analysis; synthesis of philosophical, psychological, pedagogical, educational, methodical and professional scientific literature, legal documents on education and healthcare; analysis of Internet resources; pedagogical observation; surveys, questionnaires; methods of mathematical statistics. The analysis of the level of employers' interest (top level management) in the hiring to work managers with health-oriented management skills is presented. The basic principles and approaches in the process of studying students-managers of health-oriented management are allocated. The essence of the content of the program of author's special workshop "Basic notions of health-preserving for future managers" is revealed. Effective organizational and pedagogical aspects of formation the health-oriented management skills of future managers are revealed. It is stated that the organizational and pedagogical aspects in the content of the professional training of students-managers are crucial for the implementation of a health-oriented concept of the content of their professional training. The organization of training of students-managers on the basis of such a concept ensures the integrity of their perception of the organization's environment and embraces health-oriented planning of all sides of the workforce.

Keywords: Health-Oriented Managerial Skills, Health-Preserving Study, Students- Future Managers, System of Professional Education of Future Managers.

Introduction

The 21st century requires new approaches to management sphere, namely: flexibility and dynamism; using of the modern analytical systems, information technologies; understanding the sense and importance of human development and health capital; application the mechanisms of economic enrichment of companies on the basis of social protection of working people. All of these points to the neediness of improving the professional training system of future managers. Analysis of curricula, programs, qualification requirements, necessary competences of students, which studying specialty 073 "Management" allows us to generalize what future manager should know and be able to do. Unfortunately, everything comes down to the economic component and doesn't take into account the necessary of man-centred management. In general, the essence of future managers' studying consist: development the skills of search, assessment of market opportunities and the formation of business ideas; promotion the ability to develop business plans, to create new projects and business products;

mastering the technique of financial planning and forecasting; realization the assessment of investment projects in different investment and financing conditions. Although the work of a manager in fact primarily involves managing people. The fate of people, their health and, consequently, the implementation of all economic projects in organization depend on the quality of such a management. Today, any successful university that prepares managers must be strong with its advanced methods of forming future graduates' readiness to create a health-preserving microclimate in the business structures in order to increase the health capital of working people. Since human development, the formation of human potential depends on the health capital, the issue of studying the effective health-oriented management of labor resources are urgent, relevant and practically significant (Zavydivska N. & Zavydivska O., 2015).

Given the foregoing, it is obvious that modern Ukrainian universities, where students-future managers are studying, need to develop modern organizational and pedagogical aspects, namely, the introduction of innovative forms, methods and tools of study. In our opinion, using of new approaches in the systems of professional education of students-managers, will allow them to create the competencies which they need in real work for doing HR-management in the conditions of a shortage of time.

Material and Methods

Scientists from all over the world are studying the problems of effective management, in particular M. Nebava, M. Meskon, L. Yakokka, D. Grayson, V. Hoyer, P. Druker etc. The philosophical, theoretical and applied principles of management were studied by G. Osovska, A. Gerasimchuk, Z. Tymoshenko, S. Sheiko, O. Kuzmin, O. Melnyk and others. Improving the quality of management through the development of individual managerial skills discussed in scientific papers of V. Novak, Y. Symonenko and others. The development of human and intellectual capital through effective management has become as a subject of research for O. Koshulko, O. Yermolenko and others. To study the competence of the manager, human resources management and self-management as the social technologies of realizing the manager's personal potential devoted works of V. Shepel, M. Lukashevich, M. Burmaka and others. Strategies of professional development of individuality, the issues of psycho-diagnostics in the manager profession, the issue of improving the quality of personnel management were learning by O. Sergeyenkova, G. Besiedin, V. Kompaniets etc.

Scientific developments the problems of modernization of modern education are devoted to I. Zyazjun, O. Padalko, O. Pyehota, A. Nisimchuk; the means of improvement of educational activity and psychological and pedagogical influences are disclosed in publications of V. Molyako, V. Davydov, D. Mazoh, V. Bezpalko; the questions of health preserving study discussed in scientific papers of O. Dubogay, E. Vilchkovskyi, D. Davydenko, Y. Prystupa, M. Nosko, N. Zavydivska, B. Shyyan etc.

Based on the above, the problem of improving the content of education is devoted to numerous studies. But in most of them, the problem of improving the professional training of students - future managers through improving the organizational and pedagogical aspects of the system of professional training, namely, the introduction of innovative forms, methods and tools of health-preserving study concerns only a few issues.

The research (qualifying experiment) was conducted during 2016-2018 years. Lviv institute of SHEI "Banking University", Lviv State University of Physical Culture, National University "Chernihiv Collegium" named after T.G. Shevchenko server as an experimental basis. The survey of top level management workers (heads of enterprises, companies, banking institutions) was held in Lviv and Lviv region (Ukraine). In total, 184 people participated in experimental work.

The aim of this work is to substantiate organizational and pedagogical aspects (innovative forms, methods and means of health-preserving study) in the system of professional training of future managers. To achieve the aim we have solved the following **tasks**:

1. to analyze the level of employers' interest (top level management) in the hiring to work managers with health-oriented management skills;
2. to highlight the basic principles and approaches in the process of teaching students-managers of health-oriented management;
3. to reveal the essence of the content of the program of author's special workshop "Basic notions of health-preserving for future managers";
4. to identify the effective organizational and pedagogical aspects of formation the health-oriented management skills of future managers.

To achieve the tasks the following research **methods** were applied: theoretical analysis and synthesis of philosophical, psychological, pedagogical, educational, methodical and professional scientific literature, legal documents on education and healthcare, analysis of Internet resources, pedagogical observation, surveys, questionnaires, and methods of mathematical statistics.

Results

Effectiveness of future managers' studying of health-oriented management depends on many factors; the most important is the right choice of methodology, technology and teaching methods, focused on the needs of nowadays labor market in the field of management. We see the solution of the problem of improving the professional education system of future managers in such directions: through fundamentalization, universalization and integration of the content of professional disciplines; creation of such a system of interdisciplinary connections, which will promote the professional education of students-managers to be more focused on social demands in management sphere; creation of a modern complex of educational and methodological support and using the modern forms, methods and tools of conducting classes (Zavydivska N. & Zavydivska O., 2015).

The separation of health-oriented concept from the content of professional disciplines in a methodological plan is a rather complicated process. The uniqueness of such a concept is related to the multidisciplinary character of the system of professional studying of future managers, which forms their system competence in health questions. The organization of students-managers' study on the basis of such a concept ensures the integrity of their perception of organization's environment and embraces health-oriented planning of all sides of the workforce. To do this, in the process of teaching the specialized disciplines, it is necessary to implement a systemic (interdisciplinary) approach, as opposed to an academic (disciplinary) approach, based on the allocation of narrow functional disciplines (vertical type) in curriculums and their in-depth study. These are such disciplines like macroeconomics, microeconomics, marketing, labor economics, financial management, etc. During practical implementation of professional training of students-managers, there is a need for the integration and systematic using of diverse methods, approaches and technologies that are developed not only by previous mentioned, but also by others disciplines. The difficultness for both students and teachers is in neediness to unify not only certain aspects, but also the interconnection in content of all disciplines, which can substantially serve as a tool for the formation of future managers' readiness to health-oriented management activities. On the one hand, it should be taken into account that any introduced pedagogical innovation can serve for creation another one, more perfect and effective. On the other hand, one must understand that the best pedagogical result can be obtained from the special combination of the simultaneous using of several techniques and technologies (Zavydivska N. & Zavydivska O., 2014).

The results of our express-researches at the stage of the qualifying experiment showed that formation of future managerial skills in health-oriented management causes employers' (top level management) a practical interest, which is primarily connected with the neediness of their ability to create a healthy climate in the company. The surveys conducted by us during three years show that each year the number of employers (top level management) which, during hiring managers to work, pay attention on level of their readiness to introduce health-preserving measures in the conditions of labor processes is growing. This indicator grew from 16.70% in 2016 to 56.90% in 2018 (Figure 1).

Fig. 1: Results of surveys on the interest of employers (top level management) in hiring to the work managers with health-oriented management skills, (%)

The results that we received after analyzing respondents' responses in the age-old context show us that the largest numbers of such top-managers who are interested in managers with ability to create health-oriented environment in organization are young people aged 25-30 (21.4%).

The obtained data suggests that top managers in senior age are less thinking about problems of creating a health-oriented organization environment. This is probably caused by fact that young people are more likely to get known foreign experience of organizing health-oriented management. Moreover, it's not unfortunate, but this fact - our young people know English and other languages and this knowledge allows them to study the advanced foreign experience on the issues of introducing advanced health-preserving technologies into the production processes of companies (Figure 2).

Fig. 2: Analysis of respondents' responses in the age-old context regarding to the interest of employers (top level management) in hiring to work managers with the ability to create a health-oriented organization environment

The results of the qualifying experiment and our own pedagogical observations suggest admitting that the organizational and pedagogical aspects in the content of the professional training of students-managers are crucial for the implementation of a health-oriented concept in the content of their professional training.

The analysis of curricula and training programs of future managers' education gave us an opportunity to eliminate several key problems that exist today on the way of creation the health-oriented system of their professional training. In our opinion, these problems are in the neediness to identify complementary aspects of theoretical, methodological and practical concepts:

- the problem of understanding the nature and positioning of disciplines in the curriculum, which are able to make influence on the formation of health-preserving managerial skills of among students-managers. The theoretical study of student-managers should be based on the strong ideological foundations of human-centeredness approach, and the multidisciplinary nature of the content and the systematic approach will provide a synergistic effect during the formation of their

ability to health-oriented management. We should understand that these aspects affect on the successfully formation of theoretical readiness for health-oriented management activities of future managers;

- the problem of combining theoretical and practical components of learning. Practical-oriented, technological nature of pedagogical technology should ensure the mastering of tools for creating a health-oriented environment. It is about using information technologies, understanding of analytical systems, modelling ways of realization of business projects through improving health, increasing productivity and working capacity of employees people;
- the methodical aspect in the problem of professional training of future managers is in the fact that the theoretical, abstract teaching of the theory of health-oriented management doesn't cause internal motivation without which it is impossible to rely on good knowledge. Practice in the process of health-oriented study can generate motivation, but without a good theoretical and methodological foundation will not provide all the depth of generalized experience and as a consequence the practical possibility of applying acquired health-oriented managerial skills in the future.

Many years of educational and research work with students-managers allowed us to develop own vision of the conceptual organizational and pedagogical principles of a dynamic model of active training for health-oriented management teaching, as well as to formulate basic principles, approaches and methods of it. The proposed concept has a clear target setting on the formation future managers' competence in the questions of organization of health-oriented environment in the conditions of labor processes. The essence of this concept is in the fact that the central figure in management is a person, his/her needs and interests. The basic principle of management – to focus on the neediness to prolong the healthy life of working people. It is common known that knowledge is constantly changing and quickly becoming obsolete. Because of this, the essence of training the future managers of health-oriented management involves not only knowledge transfer, but also updating, obtaining and assimilating of knowledge (Zavydivska O., Zavydivska N., Khanikiants & Rymar, 2017). Self-education and self-training in a system of health-oriented professional training of future managers represent a process where trainees (teachers) and those who are studying (students) are involved in the joint activity of learning something new, but not just involved in the process of knowledge sharing. In our opinion, the basic principles and approaches in the process of health-oriented management studying of students-managers are follows:

- the principle of problem-oriented learning. It involves the transition of training aimed at transfer of knowledge and past experience to the training aimed at creating and obtaining knowledge, managerial decisions which are based on the practice of health-preservation. This principle is aimed at eliminating the gap between training and current problems of management sphere;
- the principle "learning in action". It involves the transition from training through the transfer of knowledge to the orientation of making training in action (formation of health-preserving skills and competencies). The implementation of this principle involves the predominant using of teaching through activities and own practice experience. Execution of this principle, for example, is carried out during students-managers' analysis and solving tasks connected with development of various projects of the health-oriented environment in organization;
- the principle of project training. Provides a transition from the orientation, aimed at the learning process, to the orientation focused on the result. This allows teachers to motivate students for creative work and receiving completely new results, as well as using such elements as design and modelling;
- systemic approach in studying. Often, the system approach is declared, but not implement in the educational process as well as in the creation of curricula. Application of the system approach requires teachers to have a system of health-oriented thinking, which should be used during the development stage and stage of implementation of the curriculum;
- simulation as an opportunity of creative improvisation. This is an important conceptual tool that must be used during teaching the professional disciplines for the development of future managers' creative imagination about health-oriented environment in the organization. For simulation, students need to find answers on important questions and be creative in approaching the creation of a model that promotes the emergence of an integrated set of managerial decisions.

For the improving pedagogical method of forming student-managers' readiness to create a health-oriented environment in the organization we have revealed a special workshop "Basic notions of health-preserving for future managers", which was used as an active pedagogical factor. The program and the content are composed in such a way that both the teacher and the student had the opportunity to make changes and to update the content, thus covering more and more notions. The program is used as:

- a tool for studying ready-made terms and notions: the teacher can provide an interpretation and definition;
- a tool for student's self-study on certain topics: the teacher can post there exclusively such terms that the student should describe at home;
- a tool for the development of creativity among students: the student can itself complement the data presented there, which had not previously been.

This approach allowed the using of the program as a mechanism for communication between teachers and students, and, at the same time, to accumulate conceptual notions and means for the formation of knowledge about health-preservation problems. The advantages of created program, despite it is easy to use it, are: there is the possibility of hosting such a program in the network, which allows conducting web-lessons, and, if necessary, you can add and modify the content.

Today, in the system of professional education of future managers educators (Davydenko & Shklyarenko, 2006; Petrov, 2003; Zavydivska O., Zavydivska N., Khanikiants & Rymar, 2017; Zavydivska O., Zavydivska N., Kovalchuk & Khanikiants, 2018) use a lot of organizational and pedagogical forms, methods and tools as traditional as interesting, innovative. The most traditional are lectures, seminars, practical and individual classes. However, we would like to focus on those that as we think are the most effective for the possibility of exacerbating and solving problems associated with the formation of future managers' health-oriented managerial skills.

Situational method is based on the possibility of reaching an understanding of the neediness of health-oriented management through the consideration, learning and discussion of various specific situations. The method of T-groups (training-groups) involves the division of students during classes on T-groups for getting the possibility of implementing various organizational aspects up to the using of elements of psychotherapy. Such training lessons don't provide a rigid planning and structuring, since it is considered that the process is more important than content. *Syndicates* – training based on one group of several subgroups for the simultaneous solution of the task, or for solving various problems which are interrelated. Syndicates are used as a motivation tool to attract as many students as possible to the learning process. *Case-methods* are a group-based solution of problems illustrating the practical effects of approaches and concepts. This is a kind of study during the training lessons the situations (usually from real life, but can be fictional) to study with the help of material analysis and the definition the ways to solve the problems encountered in the case. *Business games* involve the study by student-managers the information, while taking the decision and playing the situation. Thus, a sequence of different situations is being studied in order to make a single, correct management decision. In our opinion, in the process of forming the readiness of future managers to create a health-oriented environment, take place such a verbal teaching method as the *storytelling.* The effectiveness of such a method in the content of the professional training of students-managers is increasing today. The bottom line is that the teacher should to tell stories about the effectiveness of health-preserving technologies in the content of professional disciplines. ***T****he Delphi method* (expert evaluation method) is carried out by writing questionnaire (survey) of a group of students who become as experts on the subject under discussion. The main prerogative of this method is not such a sense of answers, but the ability for students to discuss the results and predict various managerial actions and situations. *The labyrinth of actions* – is another effective way of learning which, in our opinion, will contribute to the intensification of the process of formation the readiness of students-managers to create a health-oriented environment. Students are given the opportunity to study a particular situation and show as many alternative management actions and solutions as are possible, that is, to pass a certain maze in the process of learning health-oriented management skills. *Brainstorming* – is a way of activation the creative health-oriented thinking. This technology allows involving to the discussion even the most

closed and shies students, create a creative atmosphere and evaluate the way of making managerial decisions. *Buber Dialogues* – searching of compromise solutions in the studying process on the basis of dialogue between students. Such an approach is necessary for future managers, because it allows them to focus on the possibilities of cooperation and teach the ways to avoid conflict situations. The creative dialogue allows the teacher to pass control over the discussion questions to the students. Teacher should ask questions, controversial statements, but exclusively for the discussion. It stimulates students to open, creative discussions of various tasks and teaches them to take responsibility for the management decisions they made. A focused conversation between the teacher and the students outside the university contributes to informal communication between them on various topics on health preservation. Take place a sincere discussion of situations, however, the effectiveness depends on the teacher's skills to manage such a conversation. Educational technology of creative projects about health-oriented management activities involves students to perform their respective tasks and presenting their ideas to the whole group. *Coaching* – is a method that combines the principles of consultancy and training, but not in the classical form. The difference is that in coaching the main place belongs not to the edification, but to the motivation of students to solve training tasks. If the teacher becomes a coach, then he/she will never give any strict recommendations to the students. The purpose of coaching is in the improving health-oriented managerial skills, to increase the effectiveness of study. *Learning in action* – is the creation, a kind of simulation of situations which future managers can get; this will contribute to the development of health-oriented managerial thinking. Most important, that learning by action (in action) allows to form future managers' beliefs in the neediness to learn and improve throughout their lives.

Discussion

According to the basic provisions of scientific works (Apanasenko, 2007; Davydenko & Shklyarenko, 2006; Dubogay, Alyoshyna & Lavrynyuk, 2011), the uniqueness of the content of health pedagogy in the system of professional training of future managers is in that it teaches how to develop of intellectual health. Our researches confirmed the opinion of Nebava M. (Nebava & Zayukov, 2014) that the future profession of student-managers is connected with insufficient of information as well as excess of information, which leads to information overload. That is why intellectual health is an impetus for free-targeting in the information space, searching and selection of relevant information. It should be noted that during the study of health-oriented managerial skills by student-managers it is necessary to maintain a balance between creativity and analytics. This means that the creative approaches of future managers for creating a health-oriented environment in organization should be backed up by analytical information. In view of this, organizational and pedagogical conditions of learning should combine rational, intuitive and creative approaches. Health-oriented management, in our opinion, is an intellectual activity, which on the one hand depends on the level of already formed health culture of managers, and on the other – determines the level of this culture. Scientists (Dementiy, 2005; Kizyan, Nebava & Adler, 2014) argue that social factors play a leading role in the provision of public health. But the health culture is a much more complex and ambiguous phenomenon than influences which take place during studying process of managers, for example, economic and political factors. Health culture of different nations and generations reflects the accumulated for years set of habits and behavior of people. The future manager through cross-cultural management must be able to identify the unifying factors of interaction between working people. Science confirms the general unity of people in trying to be healthy. Using of cross-cultural management in modern companies determines the health culture as an organizational and unifying resource of management. In the system of HR-management, cultural features become as one of the reserves of the organization's development, which objectively necessitates the consideration of this range of problems not only at the applied level, but also in the theoretical aspect.

Based on the learning of modern trends and innovations in education (Osovska, Osovskyj & Maslovska, 2015; Petrov, 2003), we discovered that using of new information technologies helps teachers create real conditions for the development of additional health-oriented management skills and strategies of students-managers; traditional tools are no longer capable. Nowadays web technologies are one of the most relevant forms of professional training of future managers. Under

such conditions, students-managers have the opportunity to keep in touch with everyday life, everywhere and at any moment widely use the usual for them sources of information, that is, the Internet. Our analysis of scientific and pedagogical literature, special and informational sources, as well as Internet resources allows us to talk about the availability of information about health-preserving technologies. Of course, the Internet today is such resource that allows future managers to study on their own, but there are not enough methodological guidelines and recommendations regarding the using of such forms of health-preserving lesson as the Web-lesson. In the context of our research under the web-lesson we mean specially organized learning through the using of web technologies at various stages. In our opinion, implementation of such method of teaching special disciplines in the context of health-oriented aspect needs to determine the structure of the lesson and the methodology of realization in the system of professional training of future managers. The main advantage, in our opinion, is that such classes are available at any time. This enables the teacher to intensify the work of students not only during classroom lessons, but also during doing their individual homework. Moreover, there is an opportunity for a closer relationship between a teacher and a student outside the institution, which is an extremely important argument for the formation of future managers' health-oriented management skills. In order to successfully and efficiently conducting of web-lessons the teacher should have a special tool that will allow creating and managing web resources. Nowadays, there are many systems which allow to management electronic resources, but one of the most common and easy in using are programs which developed specially for more thorough assimilation one or another discipline. Such programs enhance the ability of student-managers to learn health-oriented knowledge and, at the same time, let to save time during the teaching of professional disciplines.

Conclusions

Speaking about the development of management system in our state, we observe two interrelated aspects: on the one hand, managers should strive for self-development, expansion of managerial skills, and on the other – any organization is interested in highly skilled managers. Ideally, these factors must coincide, not contradict each other, which should be understood during creation the basic technology of health-oriented professional education of future managers.

Having read Alan Mumford's work, we want to indicate that in the system of professional education of future managers, it is necessary to combine random (informal), planned (formal) and integrated (make influence on the studying) technologies. Such a combination will be ineffective if any technology is poorly thought out by the teacher and incomprehensible for the students. The implementation of teacher's idea should be focused on students and take into account existing health-oriented managerial experience. The potential of studying also depends on other factors, for example, on the environment where specialization classes are taking place. We mean organizational culture, the microclimate in a group, the level of health culture of students, the ability to learn management skills. An important condition in this sense is not just the development of motivation, but enthusiasm, courage and flexibility. Teachers need to remember that all students who will subsequently hold positions of managers, have different abilities, learning experience, abilities to transfer own knowledge to their future work, features of behavior and the desire to introduce in future health-oriented technologies for improving health of working people. The content of the professional competences of student-managers should include social characteristics.

Modern educators share the idea that studying should be concentrated on the student. The student is a key figure in the educational process. It's about the fact that student is the centre of efforts for the teacher, and the teacher is a coach for creating the optimal content and conditions for learning. We are talking about the fact that student also should manage the system of professional education, the process of learning in some way, not only teacher. The choice of training methods should correspond to the types of individual preferences of students who have chosen a managerial profession. Didactic training courses, courses with active participation, conferences, exhibitions, games, video films, psychometrics, extreme-trainings, open and distance learning, e-learning, etc. – all these should take place during the formation health-oriented management skills of future managers.

Abstract

Care for the social environment is becoming an important value in the activities of today's enterprises. It is internalized so deeply that it becomes part of the company's ethical identity. This identity can be communicated, among others, in organizational missions. The aim of the article was to: determine the types of values appearing in missions of the largest Polish enterprises (as part of their organizational identity); identify sponsorship areas in the largest Polish enterprises; identify the relationship between the presentation by the largest Polish enterprises of particular types of values in their missions and the posting by these organizations of information about sponsorship areas on corporate websites. The analysis of the content of websites (including information contained in reports or similar documents) was used. The collected data were subjected to qualitative and quantitative analysis. IRAMUTEQ software was used as well as Microsoft Excel and Statistica. The Mann-Whitney U test was performed to test the validity of formulated hypotheses. It was found that the largest Polish enterprises that shared their missions on corporate websites informed the public about more sponsorship areas compared to those that did not. In many cases, the type of values in missions also differentiated the study population in terms of the universality of information on sponsorship areas. Enterprises presenting development values in their missions informed about the sponsorship of the largest number of areas. Organizations that declared identity related to CSR *sensu stricto* were not, as might have been presumed, those that reported about the largest number of sponsorship areas.

Keywords*:* Organizational Identity, Mission, Values, Sponsorship, Communication

Introduction

In the traditional paradigm, commercial enterprises used to be perceived as entities that should focus on development, competition, and on making profits. Over the past decades, however, this view has been reevaluated. The very functioning of enterprises has also changed towards active, civic commitment to the local environment. An example of this is the development of corporate social responsibility (CSR) programs. Initially, as argued by Carroll (1991), commercial organizations had an economic and legal responsibility, i.e. they were obliged to produce goods and services and to comply with legal regulations. Over time, other categories of responsibility gained importance, namely ethical and philanthropic (Carroll, 1991; cf. Carroll and Shabana, 2010; Pinkston and Carroll, 1996). Organizations, thus, would start to engage in activities that went beyond legislative standards but which embodied the standards and expectations of stakeholders that were considered by them as moral. Not only that, they would also launch initiatives that strive to improve the conditions of human existence.

The changes so far have been profound, and in a sense, they concern the essence of what enterprises and the people who create them are all about – that is, their identities. Gray and Balmer (1998, as cited in: Fukukawa et al., 2007) introduced the concept of 'corporate ethical identity' to describe transformations taking place in the area of corporate identity, ethics and CSR. Corporate ethical identity can be defined as 'the set of behaviors, communications, and stances that are representative of an organization's ethical attitudes and beliefs' (Berrone et al., 2007, p. 2) and includes its ethical values, behaviors and communication concerning ethical commitment that can improve business performance.
Fukukawa et al. (2007) referred to the creating of ethical identity as the process of 'ethicalization' which is made up of four aspects. The first (foundations, triggers, and motives) concerns motives and factors of ethical ethos adaptation. The process of shaping ethical identity is prompted by one of the

following three forces: (a) the altruistic beliefs of the leader; (b) strategic alternatives to gain a competitive advantage in the face of global competition; and c) external forces, e.g. changes in social legislation/norms. The second aspect (management) focuses on managing ethical identity. The decision to increase a company's social reactivity is associated with the need to introduce changes, including reformulation of the goals (and thus the overarching goal - that is, the mission - including determining the values that will be exposed in it), principles and procedures of operation, defining tasks and responsibilities as well as methods of monitoring and review. The third aspect of ethics (action and communication) exposes the relationship between communication and demonstrated activities in the area of CSR, corporate identity and ethics (sponsorship of different areas of social engagement can be one of such activities). Identity (who we really are) and communication (what we say about who we are) should be mutually consistent. This is what we refer to as *authentic identity*. Otherwise, the organization presents a false image. The fourth aspect of ethicalization (image and stakeholder perception) takes into account the importance of enterprise perception among the stakeholders' customers who may, nonetheless, have different expectations and ideas about the organization.

According to Gray and Balmer (1998), image management in an organization requires the creation of a coherent identity communication system using various types of media. This involves, among others, the formation of coherent links regarding the reference in the organization's mission and values to the issues of responsibility for the local environment with real actions undertaken in this area, as well as with their subsequent communication. For this reason, organizations that want to successfully build their ethical identity should not only take care of their interests, but also engage in activities benefiting the social community. An example of such initiatives is financial support lent to activities in the field of culture and art, sport, education, health care, social and humanitarian causes, etc. Depending on the company's motives, it may opt for either commercial or philanthropic sponsorship (Meenaghan, 1991; cf. Lii and Lee, 2012; Walliser, 2003). At the strategic level, enterprises can integrate sponsorship with organizational culture programs and use it to build organizational identity, employee identification, engagement and performance (Cunningham et al., 2009; Farrelly and Greyser, 2007, 2012; Garry et al., 2008; Grimes and Meenagham, 1998). The use of sponsorship also allows organizations to shape their external image. Last but not least, feedback communication with external stakeholders both reinforces and reaffirms the identity of the organization (Cunningham et al., 2009).

Organizations communicate with stakeholders either directly or indirectly. Nowadays, the importance of proprietary, modern corporate media, including websites, is on the rise. Due to the growing number of Internet users, companies invest in graphic design to increase their visibility among stakeholders. This forms part of the online corporate communications strategy and completes the mix of digital media (Garcia Garcia et al., 2017, p. 140).

No research has been identified in Poland on the relationship between the identity of an organization expressed in missions and communication of sponsorship. Therefore, own study in this area was undertaken. The purpose of the research was to: (1) determine the types of values appearing in the missions of the largest Polish enterprises (as part of their organizational identity); (2) identify sponsorship areas in which the largest Polish enterprises most willingly engage; and (3) identify the relationship between the presentation by the largest Polish enterprises of particular types of values in their missions and the posting by these organizations of information about sponsorship areas on corporate websites. The article is divided into sections, which are: introduction, literature review, methods, results and conclusions.

Organizational identity and image

The theoretical construct described in the literature as 'organizational identity' originates from studies on organizational behavior and has a clear relationship with psychological and sociological understanding of identity. Scholars in this field began to consider how staff develop a common understanding of the organization they create. The key question in this case was 'Who are we?'. According to Albert and Whetten (1985), organizational identity is formulated around the central, permanent and distinctive elements of the organization. It refers to what its members perceive, feel and think about their organization (Hatch and Schultz, 1997). For the needs of their membership identification model, Dutton et

al. (1994) further divided it into 'perceived organizational identity' and 'construed external image'. Perceived organizational identity is all those features of the organization that its members consider to be basic, distinctive, and permanent. Meanwhile, construed external image is about members interpreting how the main attributes of the organization are perceived by others.

Some researchers exploring the identity of formalized secondary groups focused on the issue of how organizations present themselves to employees and customers. This construct is known as 'corporate identity' and is closer to the marketing approach.

Melewar and Karaosmanoglu (2006) termed identity as presenting the organization to each stakeholder. They argue that identity consists of what makes the company unique among others in terms of organizational communication, design, culture, structure, employee behavior, and strategy. Identity is understood as a planned demonstration of the organization's image. In the early works of this research trend, the term 'identity' was used interchangeably with the term 'image' (Simones et al., 2005), meaning the image that appears in the audience's mind when they hear the name of the organization or see its logo (Gray and Balmer, 1998). In other words, it is the impression that the organization makes on others. Also noteworthy here is the conceptual relationship between organizational identity and personality that can be found in the literature. Organizational personality is often synonymized with specificity, uniqueness. In this context, Berenstein (1984) argued that each enterprise has its own uniqueness, individuality and personality. Personality is the sum of all the organization's features. Accordingly, identity can be seen as a mechanism by which the personality of the enterprise is conveyed to a broader audience (Simones et al., 2005).

When defining identity, authors often list its constituent elements. In Gray and Balmer (1998; cf. Balmer and Soenen, 1999), for example, identity is the reality and uniqueness of the organization, which consists of its strategy, philosophy, culture and design. Many researchers (Cunningham, et al., 2009; Gray and Balmer, 1998; Martinez et al., 2014; Stuart, 1999) emphasize the importance of mission as an element of identity. A mission is the source of expression of business philosophy (Collins and Porras, 1991; cf. Bartkus and Glassman, 2008). In a concise form, it clearly expresses corporate identity, corporate purpose and strategic intent (Hirota et al., 2010). Also interesting from the perspective of this study is the fact that mission can be a tool for articulating beliefs regarding, among others, the significance of social responsibility in the activities of an organization (Hirota et al., 2010)[1].

Organizations today strive to consciously communicate the identity to the public and thus shape their external image. Balmer and Soenen (1999; cf. Balmer and Greyser, 2002) distinguished four types of identity, among them communicated identity, which includes information provided to stakeholders, both in a controlled and uncontrolled manner. The main media through which organizations can communicate in a controlled manner with the public are electronic media, including corporate websites. They provide a space for sharing not only basic information about the organization, but also that about activities confirming its identity, including ethical identity. One of such activities is sponsorship. Such initiatives can help to position the company's image among external and internal stakeholders by communicating its desired identity (Martinez et al., 2014).

Methods

The conducted research consisted of the following stages[2]: formulation of questions, goals and hypotheses, determination of units of analysis, identification of texts, preparation of the coding scheme, testing it, purifying and/or detailing, collecting, coding and analysis of data.

Answers to the following research questions were sought: Q_1: What categories of values are included in the missions of the largest Polish enterprises? Q_2: What sponsorship areas do the largest Polish companies communicate on their corporate websites? Q_3: What relationships exist between the presentation by the largest Polish companies of information about sponsorship areas on corporate websites and the types of values contained in their missions?

Subsequently, two research hypotheses were put forward: H_1: Posting a mission by the largest Polish enterprises is irrelevant to presenting by them information on specific sponsorship areas[3] on corporate websites. H_2: The type of values contained in a mission of Polish largest enterprises is irrelevant to presenting by them information on sponsorship areas on corporate websites.

To test the H_2 hypothesis, the mission typology proposed by Cardona and Rey (2008) was used. Four categories of values were included in the missions (and the fifth distinguishing type - CSR *sensu stricto*). 40 partial hypotheses related to 5 value types and 8 analyzed sponsorship areas were formulated.

The research included companies from the ranking of the 200 Largest Polish Companies published by the weekly 'Wprost', which was based on the revenues, profits, assets and equity of several hundred Polish companies with predominantly Polish capital ('200 Największych Polskich Firm 2018' / '200 Largest Polish Companies 2018'. [Online], https://rankingi.wprost.pl/ 200-largest-companies/2018, retrieved: February 24, 2019). A total of 198 out of 200 entities listed in the ranking were analyzed[4]. They differed in terms of sector (Table 1), size and geographical location. Capital groups (groups of companies) constituted over half of them (64.6%). Production enterprises (30.3%), as well as those dealing in wholesale and/or retail trade (29.29%) were the most numerous.

Table 1: Analyzed enterprises by sector

Sector	**Number of analyzed enterprises [N]**	**Share [%]**
Industry (mining, food, chemical, wood, metal, etc.)	60	30,3
Wholesale and/or retail trade	58	29,3
Construction and building materials	22	11,1
Services (finance and banking, logistics, security, job placement, etc.)	17	9,7
Energy	7	3,5
Transport	7	3,5
IT	6	3,0
Media	4	2,0
Machinery, devices, tools	3	1,5
Automotive	3	1,5
Other	11	5,6
Total	198	100

Source: own study based on: '200 Największych Polskich Firm 2018' ('200 Largest Polish Companies 2018'. [Online], https://rankingi.wprost.pl/200-najwiekszych-firm/2018 (Retrieved: February 24, 2019)

It was assumed that, since the companies from the 'Wprost' list were financially successful, they probably have their own, easily accessible website containing information sought in this study. It was also assumed that such companies have sufficiently large marketing budgets to conduct social activities and inform about them through their corporate websites.

In the second quarter of 2019, proper research was conducted, consisting of the analysis of the websites content. If it was not possible to locate the sought information via a link, the 'Search ...' tool was used instead. Not only the text contained on the site was taken into account, but also that from any additional documents included on the website - reports, strategies, ethical codes, etc. Whenever the relevant information could not be found, further investigation of the site was abandoned.
In the first stage of the research, the missions of the organizations on the 'Wprost' list were identified. When coding the values they contained, the taxonomy of Cardona and Rey (2008, p. 94) was used, who distinguish the following categories: 1. 'Business values: values relating to the company's business and profit-making activity. Examples include perseverance, efficiency, professionalism or results orientation. 2. Relational values: values that Foster quality in interpersonal relations. They include, for

example, communication, team work or respect for people. 3. Development values: values aimed at differentiating and continuously improving the company. Examples include innovation, creativity, learning or continuous improvement. 4. Contribution values: values aimed at doing more for stakeholders than strictly required by the business relationship. They include, for example, customer satisfaction, interest in people, social responsibility'. Since the last of these categories takes into account the satisfaction of various stakeholder groups, including clients or shareholders, we decided to add an extra category related to CSR *sensu stricto*.

During the research, not only specific words and phrases contained in the missions were searched, but also their synonyms. The context in which they were used as well as the links between the most common terms were also considered (using to this end the IRAMUTEQ software[5]). In the next stage, data on social activities implemented by the analyzed enterprises was identified (e.g. areas and forms of engagement, beneficiaries). After that, we examined how these entities presented information on sponsorship areas on their corporate websites.The collected data was quantified, which allowed for its further statistical processing (cf. Babbie, 2008; Silverman, 2009). Thus, both qualitative and quantitative approaches were combined in the content analysis. Statistical analyses were conducted using Microsoft Excel and Statistica, allowing calculating arithmetic means, medians, standard deviation, coefficients of variation. The Mann-Whitney U test was also performed to test the validity of the formulated hypotheses.

Categories of values included in the missions of the largest Polish enterprises

In the course of the research, it was found that over two-thirds of the analyzed companies (133, i.e. 67.17%) posted their missions on corporate websites. The remaining companies either did not have them formulated or decided not to make them available online.

The analysis of the content of identified missions was supported by the IRAMUTEQ software, among other tools. Due to the fact that it does not contain a Polish dictionary, it was necessary to translate the missions into English. To this end, the text was prepared in accordance with the program requirements, and conjunctions, prepositions, most particles, etc. were removed. The software's automatic lemmatization feature enabled reducing 'various inflectional forms found in the analyzed text to the basic form of the word, as well as identifying what part of speech they are' (Glińska-Neweś and Escher, 2018, p. 86). The words that appeared at least ten times in the missions' content were qualified for further analysis. The number of individual words is shown in Fig 1.

Fig 1. Word cloud formed of the words most often found in the missions of the largest Polish companies *Source: own study*

Based on the analysis of the identified missions, it can be synthetically said that the customer was at the center of interest of the analyzed companies (this term or its synonyms appeared in almost half of the missions - 48.1%), to whom high-quality products and services were provided. Every fourth mission (25.6%) emphasized the importance of business development, while every fifth (21.1%) - safety,

including a safe environment (14.3%). Common good was included in the missions of 16 enterprises (12%) (Fig 2).

Fig. 2: Relationships between the most common words used in the missions of the analyzed Polish enterprises

Source: own study

Let us recall that, when coding the values contained in the missions of the studied Polish enterprises, the taxonomy of Cardona and Rey (2008) was used, and the fifth additional type was distinguished, namely CSR *sensu stricto*. The analyzed categories appeared in missions on a standalone basis (creating the so-called 'pure' types) or more often - in different constellations, i.e. when the missions contained at least two categories of values (creating the so-called 'mixed' types) (Table 2)

Table 2: Categories of values in the missions of the largest Polish enterprises

Categories of values in missions	'Pure' mission types		'Mixed' mission types	
	N	%	N	%
Contribution	23	11,62	117	59,91
Business	10	5,05	102	51,52
Development	2	1,01	48	24,24
Relational	1	0,51	10	5,05
CSR *sensu stricto*	0	0,00	37	18,69

Source: own study

The analysis showed that both among enterprises which included only one category of values in their missions and among those which included several of them, the ones in which attention was focused on meeting the needs of people not related to the enterprise (customers, the public, etc.) were predominant - thus, contribution values were exposed (11.62% and 59.91%, respectively). Subsequently, the missions most often included business values (5.05% and 51.52%, respectively) and development values (1.01% and 24.24%, respectively). On the other hand, reference was least frequently made to relational values (0.51% and 5.05%, respectively). Let us add that in every fifth mission representing the "mixed' type, values associated with CSR *sensu stricto* were exposed (18.69%; no mission was identified that focused solely on CSR). As a consequence of the relatively small number of 'pure' mission types, most further analyses were carried out for the mixed types.

Sponsorship areas in the largest Polish enterprises – results of the analysis of messages posted on corporate websites

The prevalence of information posted on corporate websites regarding the sponsorship of various areas of social activity implemented by both public institutions, non-governmental organizations and natural persons was analyzed as part of the research. This included: 1. culture and art, 2. sport, 3. education, 4. social assistance, 5. safety, 6. social community, 7. environment protection, 8. health care[6].

More than half of the analyzed enterprises reported on their corporate websites that they (co-)financed social community (55.05%), sports (54.4%) and/or social assistance projects (51.52%). Almost every second (49.49%) said that they sponsored education. Nearly as many reported that they supported culture and art (44.44%) and/or health care (40.91%). Among the analyzed companies were also those that declared their contribution to financing activities related to environmental protection (33.33%) and/or safety (21.72%).

Differences were found in the number of areas sponsored by companies that presented their missions and by those that did not. The latter reported smaller numbers of such activities (Me=1,0; $\bar{n}$ = 1,95, Mo=0). Data dispersion for both analyzed groups was very significant[7], especially for the companies that did not post their missions online (Table 3). It should be noted that, based on the analysis of the collected material, it was not possible to determine either the number of social initiatives pursued by companies or the value of financial resources that they allocated for that purpose.

Table 3: Number of sponsorship areas in the largest Polish enterprises and the presentation of missions - messages posted on corporate websites

Enterprises	Number of enterprises *N*	Number of sponsorship areas						
		Min	Max	Arithmetic mean $\bar{n}$	Median Me	Mode Mo	Standard deviation SD	Coefficient of variation V [%]
Presenting missions on corporate websites	133	0	8	4,26	5,0	0	2,90	67,95
Not presenting missions on corporate websites	65	0	8	1,95	1,0	0	2,66	136,15
Total	198	0	8	3,51	4,0	0	3,02	86,08

Source: own study

Due to the differences identified, further analysis was carried out with reference to the relationship between the categories of values contained in the missions and the sponsorship areas.

Categories of values in missions and sponsorship areas – based on messages posted on corporate websites

Companies presenting development values in their missions (Me=6,0; $\bar{n}$=5,25; Mo=8) informed about the sponsorship of the largest number of areas. On the other hand, the number of those areas was the smallest in the case of companies exhibiting relational values (Me=4.0; $\bar{n}$=4.00; Mo=4)[8]. It is worth noting that organizations indicating in their missions CSR *sensu stricto* were also keen on communicating sponsorship in many areas (Me=6,0; $\bar{n}$ = 4,65, Mo= 7), albeit not as frequently as companies focused on development. Data dispersion for each of the analyzed groups was very significant. The highest value of the coefficient of variation was recorded for business values and contribution values, while the smallest – for relational and development values (Table 4).

Table 4: Number of sponsorship areas in the largest Polish enterprises and the categories of values in missions - messages posted on corporate websites

Categories of values in missions ('mixed' types)	Number of enterprises N	Number of sponsorship areas						
		Min	Max	Arithmetic mean $\bar{n}$	Median Me	Mode Mo	Standard deviation SD	Coefficient of variation V [%]
Business	102	0	8	4,15	4,5	0	2,84	68,49
Relational	10	0	8	4,00	4,0	4	2,45	61,24
Development	48	0	8	5,25	6,0	8	2,66	50,70
Contribution	117	0	8	4,42	5,0	7	2,80	63,40
CSR *sensu stricto*	37	0	8	4,65	6,0	7	2,81	60,47

Source: own study

A nonparametric test for independent random samples, the Mann-Whitney U test (with continuity correction), was used to test the hypotheses[9]. This helped determine, among other things, whether posting missions is important for presenting information on the sponsorship of individual areas on corporate websites. The obtained results are shown in Table 5. On their basis, it can be concluded that the distributions of the analyzed variables in each case differed from each other. There were therefore grounds for rejecting the H_1 hypothesis.

** U - Mann-Whitney test value used for small numbers <20*
**Z - Mann-Whitney test value used when number of both groups is greater than 20*
**P - significance level for the test for the Z test value*
** Z adjusted – test value adjusted for combined weights*
**p - significance level for Z adjusted*
**N valid – numerical amount of groups*
- highlighted results significant at p<,05000

Using the Mann-Whitney U test, we also analyzed whether declaring specific categories of values (business, relational, development, contribution; CSR *sensu stricto*) in corporate missions is related with presenting information on the sponsorship of particular areas on corporate websites. The obtained results are shown in Table 6.

Table 6: Results of testing partial hypotheses regarding categories of values in missions and sponsorship areas

Source: own study

Grounds were found for rejecting the majority of the partial hypotheses (23, i.e. 57.5%) (detailing the main assumption H_2) regarding equality in the distribution of the analyzed samples (Table 6). In the case of development and contribution values, it can be considered that these distributions differ from each other, which means that we have reasons to reject the partial hypotheses H_{2r}-H_{2y}, as well as H_{2z}-H_{2ag}[10]. Analyzing the relationship between relational values and sponsorship areas, the opposite was observed – i.e. no grounds for rejecting the partial hypotheses H_{2i}-H_{2p} (regarding equal distribution) were found. In the case of business values and CSR *sensu stricto*, only some of the partial hypotheses were rejected. Further analysis was then carried out, the results of which are shown in Table 7. It contains information about individual types of enterprises in terms of the values they declare in their missions in connection with the messages they communicate about the sponsorship of different areas.

Table 7: Categories of values included in the missions of the analyzed enterprises ('mixed' types) and the content of messages posted on corporate websites regarding sponsorship areas

Categories of values in missions	Number of enterprises presenting categories of values	Content of messages about sponsorship areas	Number of enterprises presenting messages about the sponsorship of different areas	Share [%]	Coefficient of variation V [%]

Source: own study

The most diverse population (in terms of the universality of presenting sponsorship content) were those enterprises that did not post missions on corporate websites. However, the most homogeneous group, but still strongly diversified, were companies that declared development values in their missions.

Enterprises presenting their mission on corporate websites most often communicated to the public the financing of activities for social community - regardless of the displayed category of value (in the majority of these categories, the percentage share of organizations that posted such messages was at least 70%). Companies that did not post missions online also reported about their support for such activities (although they more often emphasized their commitment to sport and social assistance). On the other hand, the least frequently communicated was the provision of assistance in two areas: environmental protection and safety - also regardless of the category of values contained in the mission.

In companies in which business values were declared in missions, the information concerned the support of education (62.75%) or sport (60.78%). Organizations geared towards interpersonal relations in their missions focused on the sponsorship of health care (70%), sport and education (60% each). Development-oriented enterprises relatively often reported about supporting sport (79.17%), social assistance (70.83%), and less often culture and art (68.75%), education (68.75%) and/or health care (66.67%). Companies declaring contribution values most often communicated about the financing of sports (64.96%), education (64.10%) or social assistance (64.10%) initiatives.

Finally, let us point out that organizations displaying CSR activities *sensu stricto* most often shared on their websites messages about the sponsorship of education (70.27%), culture and art, and/or social assistance (64.86% each).

Conclusion

The mission and its values constitute the organization's credo, a declaration of its philosophy, and inform about the reasons for its existence, including its functions in relation to the social community. In other words, they are part of the organization's identity. This identity should in turn be credited by

undertaking consistent actions, which will then be communicated to the public. The analysis conducted in this study aimed at determining the relationships, among others between the presentation by the largest Polish enterprises of particular types of values in their missions and the posting by these organizations of information about sponsorship areas on corporate websites.

In the course of the research, answers to the formulated research questions were determined, and the hypotheses were tested. It was found that, among the values contained in the missions of the analyzed Polish companies, contribution values (including customers, the public) were predominant (reported in nearly 60% of the missions). The number of organizations that declared CSR values in the strict sense in their missions was three times smaller. It was also established that almost half of the analyzed enterprises had the customer at the center of their interest, who - according to the declarations from the enterprises - was provided with high-quality products and services. Much less often (in every tenth case) care for common good was a factor.

The analyzed enterprises most often reported on their corporate websites about the financing of activities related to social community, sport, social assistance, and education. It was found that those companies that shared their mission on corporate websites were more likely to inform the audience about more sponsorship areas compared to those that did not. In many cases, the type of values in missions differentiated the studied population in terms of the universality of information on sponsorship areas on websites. Enterprises presenting development values in their missions informed about the sponsorship of the largest number of areas. It was also the most homogeneous group in terms of the universality of posting sponsorship content.

It is worth emphasizing that the organizations that declared their identity related to CSR *sensu stricto* were not, as might have been presumed, those that reported about the largest number of sponsorship areas. Instead, it was the organizations that identified with values such as innovation, creativity and continuous improvement (most of them also declared values associated with contribution to others). Such companies could perceive issues associated with CSR and communication with the social community through modern media as a manifestation of modern company management. So, did the declaration of innovation, development etc. to some extent replace declarations of social responsibility in the analyzed Polish enterprises? The answer to this question requires further research.

We are aware that the research methods we used were not without their limitations. During the study, the content communicated by enterprises through corporate websites was analyzed. As a consequence: (a) only company declarations on those websites were checked, (b) information gaps could arise due to the fact that enterprises do not always inform the public about their activities, (c) only some manifestations of organizational identity (missions, values) were considered, and (d) motives for using sponsorship were not analyzed (i.e. whether it was commercial or philanthropic). Let us add that the research was carried out among the largest Polish enterprises, which is why it had a specific cultural context. In the future, it is worth conducting comparative studies in enterprises of a different size, as well as among companies from other countries. Such studies could be in-depth and they could use the techniques requiring direct contact, interviews, observations, surveys, case studies, etc.

---

[1] In the context of Central and Eastern Europe (CEE), the issue of mission was analysed by, e.g. Biloslavo and Lynn (2007), Dvorský and Slintak (2019), Gavric et al. (2018) and Papulova (2014).

[2] Inspired by the research scheme proposed by Insch et al. (1997).

[3] Based on the data available on corporate websites, it was not possible to identify the motives for sponsorship. Since we could not determine whether the companies engaged in philanthropic or commercial sponsorship, we used a general term – sponsorship.

[4] The website of one of the enterprises did not load, while the other excluded company was transformed in 2018 by the owners (both in terms of the scope of activity and the name of the organization).

[5] IRAMUTEQ is used for 'extracting data from text materials, their structuring by searching for key words, phrases, sentences, and coding them in the form of numerical variables, as well as their subsequent statistical processing to discover (and often also to visualize) the existing relationships between

them' (Glińska-Neweś and Escher, 2018, p. 85; see more: Camargo and Justo, 2013; Loubčre and Ratinaud, 2014).

[6] Over half of the enterprises communicated the supporting of NGOs (52.53%) and/or public organizations (50.51%), while every fourth (24.75%) – of individuals.

[7] When interpreting the coefficient of variation, it was assumed that: 0-20% means a slight variation in the value of the variable, the group is relatively homogeneous, the arithmetic mean is an adequate measure characterizing the group; 20-40% - a moderate variation in the value of the variable, the arithmetic mean is an acceptable measure for a given variable; 40-60% - a strong variation in the value of the variable - the dispersion of the variable is significant, the arithmetic mean has low cognitive value; 60% or more – a very strong variation in the value of the variable, the group is heterogeneous, the arithmetic mean has no cognitive value (Zając, 1988, p. 209; cf. Marcisz, 2013).

[8] However, let us remind that the group of enterprises that presented relational values in missions was also the smallest.

[9] It is used when the data is measurable but its distribution is abnormal and when the variables are of the ordinal type (cf. Blalock and Blalock, 1971; see more: Nachar, 2008) [or when the variables are measured on a dichotomous scale (i.e. 0-1), as is the case of the nominal variable, which is also an ordinal variable; http://www.naukowiec.org/wiedza/statystyka/test-u-manna-whitneya_755.html]. These conditions were met. The null hypothesis assumes in the Mann-Whitney U test that the types of distribution of the analyzed samples do not differ significantly from each other, while the alternative - that they differ significantly from each other (see more: Field, 2013; Rabiej, 2012; Rovai et al., 2013). If the p-value is below the adopted threshold of significance, there are reasons to reject the null hypothesis (Moczko, 2014).

[10] It was found that out of the 48 companies declaring development values, 43 (approx. 90%) also declared values related to contribution to others. These groups overlapped to a large extent, which means that the discussed identity elements were interrelated in the analyzed enterprises. Interestingly, there were only 15 development-oriented companies organizations from among those with CSR *sensu stricto* values in their mission (31%). This confirmed the presumed isolation of this separate category of values in corporate missions.

State Policy in Land Relations Sphere in Terms of Ukraine's Agrarian Reform

Abstract

The article outlines the main stages of land relations formation in the process of agrarian reform implementation in Ukraine and their impact on the socio - economic component of rural territory living standards. The results of the agricultural land denationalization have been considered and the transformation of the relationship between the owner, the manager of the land resources and their user has been analyzed. The need to develop a comprehensive approach to ensure the free ownership and disposal of land resources, taking into account the needs of society and the historical traditions of the Ukrainian peasantry, has been emphasized.

Keywords: State Regulation, Land Market, Land Relations, Agrarian Reform.

Introduction

Developing a country's management strategy is the basis for developing its economic system. The strategic goal of the country's socio-economic development substantiates the choice of the course for the economic growth of the main macro indicators. Integrating into the world community, it is important for Ukraine to take into account current trends and make maximum use of its own natural, labor, and financial resources, which allow to take care of the country's food security, economic growth, and hence its sovereignty. Ukraine, which has strong land potential, has every opportunity to become one of the leading players in the global agricultural market, where demand for food is growing.

Sustainable development of the economy agrarian sector largely depends on the available production resource potential, one of the key aspects of which is the agricultural land, which serves both as a means of production and as economic object of property relations, rent in particular. The development of market relations in the agrarian sector of the Ukrainian economy, the introduction of

private land ownership, the formation of a real owner, user of land and economic structures of market type, necessitate the substantiation of qualitatively new methodological approaches to the agricultural land use organization in order to provide an effective mechanism for their rational use and protection. The structural land relations restructuring in the countryside, which in the process of land reform and collective agricultural enterprises reform during the 90s of the 20th century, was the spur for the formation and development of lease land relations in agricultural production. Despite the world's highest level of land resources involvement in economic circulation, high soil fertility, diversity of land and resource potential, it was not possible during the Ukraine's independence period to realize the main task of land reform, that is the transfer of land in possession of effective landowners and transforming these lands into a key determinant of economic growth.

The analysis of recent research and publications

The problems of land relations reforming and establishing, as a component of socio-economic relations, have always been in the focus of domestic agricultural scientists. A significant contribution to their solution, as well as research on the development specifics at the present stage, has been made by the following scientists: P.I. Gaidutsky, S.I. Demianenko, T.G. Dudar, P.M. Makarenko, P.E. Matkovsky, V.Ya. Messel-Veseliak, L.Ya. Novakovsky, O.M. Onyshchenko, P.T. Sabluk, A.M. Tretiak, V.V. Yurchyshyn and others. The research they conducted provided a basis for reforming and developing land relations in Ukraine. Scientific development of scientists is of great theoretical and practical importance in terms of land relations transformation process. At the same time, the development of the economy agrarian sector at the state level in the direction of the European integration requires the justification of the algorithm of land reform completion in Ukraine in terms of agricultural land market introduction, which determines the urgency of conducting in-depth scientific studies concerning land relations development in rural business.

The aim of the article

The purpose of the article is to analyze the stages of land reform development in Ukraine, to determine the land relations formation in connection with agricultural land denationalization, and the creation of new forms of farming in agricultural production based on private and private – lease ownership. It is also necessary to generalize scientific approaches to defining the content of the categories "agricultural land market" and "agricultural land turnover" as economic categories at the stage of market land relations forming and defining the basic calculations of the land reform institutionalization.

The Main Material Statement

Land is the leading natural resource in the world. At all stages of social development, man has been inextricably connected to land. In the process of transition to a sedentary lifestyle, land resources began to function as both objects and means of work, serving as the basis for the production of food and raw materials for various industries. The agricultural land availability is one of the components of each country's population economic and social well-being. During Ukraine's centuries-old historical development, the peasantry has traditionally occupied a significant place as an ancient community, directly related to agriculture. The peasantry's labour activity plays a significant role in the sustainable creation of food resources to meet the needs of the country's population, to guarantee its food security at the world market.

Land resources play a leading role in Ukraine's economy as they are a working tool for the production programs implementation for the formation of food and raw materials for the processing industry. The total area of agricultural land in Ukraine is about 70% of the country's entire territory and is 42.7 million hectares, 32.5 million hectares of which is arable land. The presence of such a category of land resources defines the agrarian sector of Ukraine as one of the key segments of its economy, where within 60% of the consumption fund is formed and more than 10% of gross domestic product is created. At the same time, the incompleteness of agrarian reform, limited market operations with agricultural land, lack of a consistent state policy on land use, disposal and ownership

impedes investment into the agricultural sector, causing negative socio-economic consequences of the rural economy.

Speaking about the role of the agrarian economy, it should be noted first of all that this industry is the main resource potential in creating jobs for the rural population, and at the same time, it provides jobs in a number of other sectors of the domestic economy – food and processing industry, trade, transport and etc. Therefore, agricultural production functioning and development in rural areas directly affects the level of unemployment, labor migration, socio-economic component of living standards of rural areas. At the same time, no development of agricultural production can exist without the basic means of production, that is without land. After all, the development of society, in the process of its evolution, at all stages is directly connected with land.

The Constitution of Ukraine determines that land in Ukraine is a major national wealth and is under special state protection, since land resources occupy a special place in the country's economy. According to Article 13 of the Constitution of Ukraine, land is the object of property rights of the Ukrainian people. On behalf of the Ukrainian people, the rights of the owner are exercised by state authorities and local self-government bodies within the limits defined by the Basic Law of Ukraine. Ukraine's desire to restructure land relations in agriculture and to develop them in accordance with world standards, objectively led to the formation of an adequate system of land relations, primarily focused on the formation of a full-time land owner in the countryside.

Private ownership of land is one of the most important and inseparable elements of protection of the civil rights system, state guarantees of business and investment activity, and according to V.K. Zbarskyi, economic freedom is "the foundation and integral part of civil society freedoms" (Zbarskyi, 2004). According to the French philosopher François-Marie Arue (Voltaire), "private property is the key financial guarantee of the individual's personal freedom" (Voltaire, 2005). Taking into account the fact that a person is a social being, having one's own private property allows one to feel independent and to be more self-confident within society.

The reform of the agrarian sector of Ukraine's economy took place in stages. One of the main stages was land reform, initiated after the resolution of the Verkhovna Rada of Ukrainian SSR "On Land Reform" of December 18, 1990, which helped organize the search for an effective user of agricultural land. According to this statutory document, the redistribution of lands with simultaneous granting of them to permanent hereditary possession of citizens, to permanent possession of collective farms, state farms and other enterprises, organizations, institutions was envisaged. That is, agricultural land was provided only for indefinite use, while the monopoly of the state on land ownership was preserved. The land leasing into permanent possession gave the right to use it at own reasoning without instructions, but did not allow to dispose of it, i.e. did not give the right to sell and lease. The laws of Ukraine: "On the Peasant Farming", "On the Collective Agricultural Enterprise", "On the Form of Land Ownership", Land Code of Ukraine, adopted in 1992 played an important role in the formation and improvement of legislation on land reform.

The land relations were reformed and the collective farms were reorganized into collective agricultural enterprises, to which the state transferred the agricultural land to the collective ownership for free. Motivated by socio-economic aspects, most domestic scientists in the early 90's purposefully argued that the land should be brought closer to the producer, that a system of land relations, which functions only on state land ownership, prevents the formation of conditions for more efficient use of land, labor as well as financial resources.

According to the Decree of the President of Ukraine of August 8, 1995 No. 720/95 "On the order of lands partition transferred to collective ownership of agricultural enterprises and organizations", the partition of agricultural lands between members of collective agricultural enterprises was conducted. In fact, newly established collective farms were no different from the collective farm model, the only difference was the transition from the state form of land ownership to the collective one, with the subsequent division into land shares to which private property rights were acquired. The lack of ecological and economic justification for the redistribution of land resources led to the crushing of

27 million hectares of agricultural land (65% of the country's agricultural land) between 6.9 million citizens. In other words 46.4% of the rural population acquired the land shares which were given to them into private property. The average size of the land share in Ukraine was 3.9 hectares. Depending on the available agricultural resources and people – members of collective agricultural enterprises in the regions of Ukraine, the average size of the land share varies from 1.1 hectare to 8.8 hectares.

The peasants became the owners of land certificates, which confirmed their right to land shares, while land shares were not allocated in kind in the area. There was no significant change in agricultural production, the establishment of collective farms continued to operate on the principles of collective farms, that is, collective ownership, and therefore the peasants did not feel much difference from the reform of the collective farms. Agricultural production in Ukraine continued to develop extensively, which inevitably deepened the crisis situation of the industry. In 2000, the production of gross agricultural products in the country decreased by 46.6% or by UAH 131752 million compared to 1990 production.

Presidential Decree No. 1529 of December 3, 1999, "On Immediate Measures to Accelerate the Reform of the Economy Agricultural Sector" encouraged the creation of agro-formations with the involvement of private equity-based investment flows. Business societies, private enterprises and other forms of economic structures, leased peasants' land shares with the aim of developing their own agricultural production and the main purpose - profit.

The limited financial resources of land owners (shares), and sometimes their complete absence have become decisive factors in the choice of lease relations according to the land lease for newly created agro-formations. Almost 99% of the share owners in the early 2000s have leased their land shares completely. The same tendency remains today. Within 97% of agricultural lands, private, communal, and state-owned, are rented by different organizational forms of agro-formations (Table 1).

Table 1: Comparative characteristics of land use in European countries and Ukraine for 2019*

Indicator name	Ukraine	European countries	EU countries
Land area, million hectares	60,4	1015,6	437,4
Area of black earth, million hectares	28	84	18
Area of agricultural land, million hectares	42,7	474,8	177,7
The share of agricultural land in the total area, percent	70,7	46,8	40,6
Area of arable land, million hectares	32,5	277,8	115,7
Percentage of leased agricultural land, percent	97	62	53
Investment cost, thousand USD US / hectares	1,0	4,0	5,5

** Source: formed by the authors*

At this stage of land transformation in the Ukrainian countryside, the development of leasehold land relations is extremely important in terms of land owner's income generation, which he receives in the amount of rent and the corresponding tax revenues to the budgets of different levels from the rent received. In fact, after the Presidential Decree No. 1529 of December 3, 1999, "On Immediate Measures to Accelerate the Reform of the Economy Agrarian Sector", the stage of forming a lease relationship began between peasants who acquired the right to land share and newly created agro-formations on the basis of reformed collective agricultural enterprises (CAE).

As a result of collective agricultural enterprises reform 10833 in 2000, 14241 agricultural enterprises were created with a new legal status on the basis of private, privately-leased property. The largest

share of newly formed agricultural companies was occupied by companies, mainly limited liability companies (6761), which made up 47.5%. These companies were based on the private property of individuals. In turn, the company used the land and property shares of former members of the reformed CAE on the basis of lease deals. In addition, 2,901 private enterprises were created (20.4%). Collective form of management still remained attractive, but different from the CAE. Agricultural production cooperatives based on the shareholding of former members of the reformed CAE also turned into CAE. They contributed their shares to the authorized capital of the production cooperative, and leased land shares to the enterprise created by them. According to this form of management, 3325 (23.3%) of agricultural production cooperatives were created during 2000. 1254 farms were created on the basis of reformed CAE (8.8%). It should be noted that most of the newly established leasehold enterprises continued to use the land of the former CAE with the only difference being that up to 80% of the used agricultural land was leased from land shares owners and 20% was state-owned land.

The introduction of a moratorium on the agricultural land alienation since 2002 outlined the use of leased land as an important legal form of land circulation. Most entities that use agricultural land, namely land shares, operate through the development of lease relations, which have become the main way of land areas forming by agricultural producers.

Agricultural rent is one of the indicators that reflect the state of land relations development. The amount of rent should increase with the increase of agrarian production efficiency and tenants' economic status, since the main criterion of land ownership is the income that can be obtained from it.

Thanks to the formation of highly competitive environment for arable land use, especially in the last ten years, there is an increase in the average rental rate at which land owners transfer their land to use. So, if in 2000 the amount of rent for the land share was equal to one percent of the rented land share value determined in accordance with the law, Presidential Decree No. 92 of February 2, 2002 "On additional measures for social protection of peasants – land owners and land shares" as amended by Decree No. 725 of August 19, 2008, stimulated an increase in the rent to 3% of the value of the land share. If in the beginning of the 2000s the lease term for agricultural land generally did not exceed the five-year term with 1- 1.5% of the normative value of leased land, from 2015 the percentage of lease deals with a term longer than five years increased, the rent increased in average from 7% to 12% of the monetary land valuation (Table 2).

Table 2: Duration of land shares lease deals in Ukraine, %*

The term of the contracts	2000	2005	2010	2015	2019
1-3 years	45,7	26,2	10,0	3,1	-
4-5 years	41,2	61,4	49,0	35,5	22,4
6-10 years	11,3	10,2	30,6	46,4	57,5
From 10 years	1,8	2,2	10,4	15,0	20,1
The average rent in % of the land value	1%	1,5%	3%	4,5%	8%

** Source: prepared by the authors in accordance with the State Land Registry*

Increasing the minimum lease term is a positive step, as short-term lease of land is a way of earning income with minimal cost to preserve soil fertility. Therefore, in most developed countries, long-term lease deals (90% of them) are generally concluded for a term of 9-10 years or more. The laws of these countries set a minimum lease term for land. The laws of these countries set a minimum lease land term. For example, in the Netherlands, it is between six and twelve years, in France nine years, and in Belgium between nine and twelve years.

Agricultural land is the main means of agricultural production, and given that the agricultural sector is a priority direction for the state economy development and in recent years confirms its leading position, the farmers' interest in expanding the agricultural land use contributes to increasing demand

for land lease, which in turn causes the increase of the rent for the leased peasants' land. At the same time, the absence of a legally defined land market, the inability to legally exercise their rights to alienate a land share (give, sell, put as subject of mortgage) determines almost only one direction for land share owners – that is the land lease. The protracted nature of the moratorium on the agricultural land alienation leads to widespread debate and speculation in political circles on the Ukraine's legislative acts introduction, which would definitively define mechanisms of land circulation.

Table 3: Preconditions for the agricultural land market formation in EU countries and Ukraine*

Country	The start of land reform	Particle of agriculture in the country's GDP,%	Particle of agricultural land, %	Opportunity agricultural land sale to foreigners	Price per 1 hectare of agricultural land, thousand dollars USA
Bulgary	1990	6,7	60,4	limited	4,6
Estonia	1990	4,3	22,3	allowed	5,2
Latvia	1991	4,1	29,2	limited	1,2
Lithuania	1991	4,0	44,8	allowed	1,4
Poland	1990	4,2	48,6	limited	10,3
Romania	1990	6,4	32,1	allowed	6,1
Hungary	1989	4,1	59,0	forbidden	4,2
Ukraine	1991	11,9	71,3	forbidden	-

** Source: formed by the authors*

The issue of the state-owned agricultural land use is acute. At the beginning of the agricultural land moratorium introduction in Ukraine, there were 12 million hectares, as of 01.01.2020 there were 10.4 million hectares. The dynamics of state-owned agricultural land utilization is presented in figure 1.

Fig.1: Analysis of the state-owned agricultural land use in Ukraine*

Source: formed by the authors

The results of the conducted studies of organizational and economic foundations of land tenure and land use transformation processes make it possible to state that in historical retrospect these issues have occupied and still occupy a central place in the country's development economy as a subject of debate for many generations. The diversity of theoretical and practical ways and methods of solving the problem differ diametrically. At the same time, the current state of agricultural land use, rural development trends, and the ongoing dissatisfaction of a part of the population with the system of land relations indicate the incompleteness of institutional transformations, the presence of unresolved questions that need to be answered irrespective of the political system, economic structure or each individual's consciousness.

Conclusions

The study of land relations development in Ukraine substantiates that the economy agricultural sector reform involves the transformation of land relations to a market type, the final stage of which should be the formation of the agricultural land market and the provision of the right to dispose of these lands to land owners.

Despite the fact that land relations are one of the debated and politicized issues of Ukraine's agrarian policy, within which disputes have been going on for two decades, there is no unanimity about the mechanism of market circulation formation. Views on this problem solution are different - from the formation exclusively of the land lease market to the removal of any restrictions on the agricultural land transfer to ownership. At the same time, it is undisputed that the actual realization of ownership, use and disposal rights is possible only in the conditions of land market functioning with appropriate infrastructure and institutional support. Lack of private land ownership reduces its efficient use and slows down the intensification of production in the agricultural sector.

Despite the implementation of a number of important organizational, economic and legal measures related to the transition to private land ownership, the Ukrainian peasantry expects a positive settlement of the next stage of land reform, which should provide the legal foundations for the land market formation, without any sharp conflicts in the villages and in society.

Abstract

This article analyze how reputational risks affect the long-term performance of banks, which should include the antecedent conditions of the experience of the persons involved in the decision-making process in identifying the causes of their occurrence, to understand how they can be prevented and for identify the best action solutions. Using a fuzzy-set qualitative comparative analysis (fsQCA), this study looks at how mechanisms for pre-dealing with sanctions imposed by national and international bodies can be identified, if any financial losses are passed on to the reputation, if the banks communicate in a transparent way financial results and if there are early warning mechanisms of any elements that may generate risks that may affect the bank's reputation. It analyses the factors involved in the decision-making process at the level of banks in terms of reputation management, proposes the conceptual framework focused on a configurational approach to find out if there is a link between the reputational risk and the performances of the banks, starting from the opinions of the specialist in the field. The QCA value for this current research is based on the existence of conditions that are sufficient (but not necessary) to determine the outcome. Using coherence (analogous to correlation) and coverage (a value of effect size), QCA explains how causal configurations lead to a certain outcome. Banks have sought to identify the best ways to create a structure that is as efficient as possible for managing reputational risk. This trend is likely to accelerate, as more managers understand that, while the compliance function tends to become routine, the risk function needs to become strategic, with one eye for identification and the other for risk management, with the purpose of adapting banking strategies.

Keywords: Reputation, Risks, Banks, Compliance

Introduction

The purpose of this study is on the one hand to understand whether reputational risks affect the long-term performance of a bank and, on the other hand, to identify the best solutions to prevent their occurrence.

Using a qualitative comparative analysis of the unclear set (fsQCA), this study analyzes the interdependence between reputational risks and bank performance.

The possible financial losses communicated transparently do not directly and immediately affect the reputation of banks, but the main problem identified seems to be to find early warning mechanisms of the occurrence of reputational risks and to apply the best methods of counteracting the effects.

A strategy configuration framework is proposed to be applied by key banks, on the one hand to prevent reputational risks and on the other, to find the best strategies to act to limit financial losses in the case of their occurrence.

Theoretical Background

The relevant body of knowledge in the reputation management outlines the factors involved in the decision-making process at the level of banks in terms of reputation management.

Banks are struggling with anticipating, mitigating and managing reputational risk, "Establishing a reputational risk management framework is difficult when there are questions about its definition and which department should be responsible," says Thomas Kaiser (2014) in the study or regarding current practices in reputational risk management.

The management of reputational risk in banks has become an important concern for the management of banks, due to the complexity and dynamism of the business environment, as well as the positioning of the regulatory bodies (Maghyereh and Awartani, 2014). In the last two decades, significant progress has been made at international level to improve risk management practices in financial institutions (Chortareas et al., 2011). To this end, the Basel Committee on Banking Supervision has established an internationally recognized set of principles to deal with the various risks, officially called the Basel Agreement (Basel I, Basel II and Basel III). Central banks and other regulatory authorities in different countries have taken rigorous measures, in order to implement the Basel agreements in the banking sectors, in order to strengthen their coherent risk management systems (Masood and Fry, 2012).

There is a close correlation between a bank's reputation and its credibility. Credibility is directly linked to performance - it can be defined as the belief that the bank will achieve its strategic and / or operational objectives. "Credibility is defined as the degree to which the public believes that there has been a change in policy, when indeed such a change has occurred. In general, it seems that the reputation derives from that amount of credibility. A bank with a good reputation is , therefore, a credible bank "(Eskenazi 2015).

In this study, we will try to identify the best means of efficiently managing reputational risks. Even if the idea that reputational risk management is an attribute of bank management is unanimously accepted, there are other actors who play an important role in this process (Risk,
Compliance, Communication).

We believe that the manager area, the risk and the communication have key roles; the communication department ensures that the appropriate channels and methods are used so that the message is brought to the attention of the interested parties.

Research Method

Qualitative comparative analysis (QCA) is a research technique that aims to eliminate the gaps between qualitative and quantitative analyzes (Rihoux și Ragin, 2009). Unlike quantitative research, QCA creates the opportunity to analyze how multiple causal configurations affect an outcome (Ragin, 2014). The QCA value for this current research is based on the existence of conditions that are sufficient (but not necessary) to determine the outcome.

Using coherence (analogous to correlation) and coverage (a value of effect size), QCA explains how causal configurations lead to a certain outcome (Woodside, 2010). Qualitative comparative analysis (QCA) really introduces the concept of "equifinality", based on the idea that more ways can coexist to a desired result in a configurational research design (Fiss, 2007). he research process aims to highlight the significant contribution of the QCA in identifying concrete ways of action in case a potential reputational risk is identified, in order to limit any immediate or medium and long term financial losses.

This study explores how the **causal configurations of the antecedent conditions** associated with the research model (the existence of mechanisms by which sanctions can be prevented; the influence of

financial losses on banks' reputation; transparent communication of results by banks; use of early warning mechanisms) have a significant impact on the **expected result**: the interdependence between a bank's ability to manage its reputational risks and its long-term performance. The research model (Figure 1) reflects the expected result as a linear function whose arguments are the four antecedent conditions.

Fig. 1 - The conceptual model of the research

The design framework exposes the causal configurations of the occurrence of the reputational risks (sanctions applied by international and national bodies, the non-transparent communication of the financial results, the lack of early warning mechanisms of the occurrence of the reputational risks and the direct effects of any financial losses on the reputation) and emphasizes the interdependence between the risks reputation and performance of Banks. The research approach uses a convenient sample (10 employees in the top 5 banks in Romania - in terms of assets), which hold positions only in the fields of Compliance, Management and Risk, because a significant degree of expertise is required for the configurational design of research – Fig. 2.

Fig. 2 : Categories of respondents

The 5-item questionnaire was designed and posted online on Google Forms (https://goo.gl/forms/V4slJ6z14PS8GsJt2), but it was also transmitted directly to key persons, with experience in the 3 targeted areas. The distribution of respondents from the point of view of their experience is presented in Fig. 3.

Figure 3: Experience of respondents

Findings

The questionnaire was divided into two sections, depending on the need for a configurational approach. The first four items of the questionnaire reflect the antecedent conditions, being interpreted as strategies applied or observed by the respondents in the banks where they work. These are evaluated using a five-point Likert scale (1 – Strongly Disagree … 5 – Strongly Agree). The fifth item highlights the outcome: the interdependence between reputational risks and bank performance, being evaluated on a five-point scale: (1- Certainly not … 5 - Very likely)

1. The bank you work for has mechanisms through which it can prevent the sanctions imposed by national and international bodies in order to defend its reputation?

Fig. 4: Distribution of answers received at question no. 1 from the questionnaire

On this item, 60% of the respondents considered that the bank they work in has mechanisms that can prevent the sanctions imposed by national and international bodies. This answer has 2 components:

- Banks carefully comply with all international regulations regarding E&S (Embargoes and Sanctions), as well as national legislative regulations.
- In key areas of the bank there are employed specialists who have the experience and the training necessary to act professionally and to make the best decisions.

2. The periods in which the Bank registers financial losses shall have an impact on its reputation?

Fig. 5: Distribution of answers received at question no. 2 from the questionnaire

If on the first question the opinions of the respondents were clear, on the second question the opinions seem to be different. The banking system is quite influenced by the economic environment, and in times of recession, the performance of banks decreases.

The opinion of the specialists doesn't reveal a direct link between financial losses and reputation. This subject will have to be analyzed in a further study, since the source of financial losses will have to be established:

If it is a "natural" loss - generated by the economic environment, impacted throughout the banking system;
If it is a loss caused by an operational risk - internal or external;

If it is a loss caused by a legislative change.

3. The bank you work in uses appropriate methods to communicate financially in a transparent manner to strengthen the reputation?

Fig. 6: Distribution of answers received at question no. 3 from the questionnaire

Of the four topics discussed in this questionnaire, this seems to be the strength of the banks. From the point of view of the specialists who answered the questionnaire, the bank where they work uses appropriate methods to communicate financial results transparently. Transparency strengthens the reputation of banks and ensures a fair working environment. It is worth noting that two of the five banks in which the respondents of this questionnaire work are listed on the Bucharest Stock Exchange, where clear, periodic communications are required.

A clear, correct communication of the financial results, ensures:

- For the situation where the results are positive - the reputation of that bank is strengthened and a "trust capital" is accumulated, which will be useful in the event that in the future various negative events may occur;
- For the situation in which the results are negative, the bank management assumes the result, identifying the causes and identifying an action plan for recovery; It also shows to clients and investors that the situation is kept under control and that the necessary measures have been taken or will be taken to recover the financial situation.

4. The bank you work with has the ability to use effective early warning mechanisms to manage reputational risks?

Fig. 7 : Distribution of answers received at question no. 4 from the questionnaire

This item shows the most sensitive point identified - prevention area.
In an uncertain, unpredictable economic environment, a bank must identify risk scenarios to quickly find solutions to counteract the causes and limit the effects produced by reputational risks.
The area of early warning could be the key to effective management in managing reputational risks in the banking field. Only 40% of respondents say that the banks they work in use early warning mechanisms to manage reputational risks. Most of the time, these mechanisms are empirical and are based on some subjective perceptions of the specialists - especially from the fields of activity of the respondents to this questionnaire (Management, Compliance and Risk).
However, it is important to manage the alerts that may come from the technical area of the bank (financial, non-performing loans, etc.), but also from the commercial area, when an appetite decrease is identified in certain periods for the bank's products.

5. Reputational risks affect the performance of the bank in which you work?

Fig. 8 : Distribution of answers received at question no. 5 from the questionnaire

60% of the respondents of this questionnaire, specialists in the field and people who actually work in this area, strongly affirm that the reputational risks affect the performance of the bank in which they work. The answer to this fifth item is actually the final conclusion of this questionnaire - that there is a clear interdependence between the reputational risks and the performance of a bank.

We will analyze in the next chapter and from a technical point of view, through the fsQCA analysis, how these multiple causal configurations affect the obtained result and whether this result is relevant and validated.

Calibration Process

The research project focuses on the assumption that the relationships between the antecedent conditions used in this study are asymmetrical, because the causes of the risks are different. Therefore, alternative combinations of causal conditions may result.

We have transformed the values for the causal conditions (sanction mechanisms, the effects of loss of reputation, early warning and transparent communication) and the result (interdependence between reputational risks and bank performance) into scores of the fuzzy sets from 0 (categorically no) to 1.00 (categorically yes).

Table 1 reflects the calibration of the causal conditions and the result, taking into account their values from the specific evaluation scale.

Table 1 : Calibration of the scale

The point of the scale	Fuzzy-set value	Membership
Completely agree / Very likely	1	Full agreement
Agree / Probably	0.75	Rather in agreement, than in disagreement
I do not approve or disapprove / Possible	0.5	somewhere in the middle (neither agree nor disagree)
I don't agree / Probably not	0.25	More disagreement than agreement
Completely disagree / Definitely not	0	Completely disagree

Ragin, C. C. (2014). The comparative method: Moving beyond qualitative and quantitative strategies. Berkely and Los Angeles, USA: University of California Press.

The definition of the values of the fuzzy sets for the antecedent conditions is in accordance with the same rule for the calibration of the result, reflecting the logic of the constructions in approaching the configuration design.

We defined a new MPMA variable as a result of calculating the values of the fuzzy sets of the antecedents of the conceptual model (sanction mechanisms (mecs), the effects of loss of reputation (pfin), early warning (avertimp) and transparent communication (metcom)) using the fsQCA software:
MPMA = fuzzyand(mecs, pfin, metcom, avertimp)

Table 2: Distribution of fuzzy-set values

mecs	pfin	metcom	avertimp	riscrepperf
0.75	0.5	1	0.5	1
0.5	0.25	0.75	0.25	1
1	1	1	0.5	1
0.75	1	0.75	0.75	0.75
1	0.75	1	0.5	0.75
1	0.75	1	0.75	1
1	1	1	1	0.5
1	0.75	1	1	0.75
1	1	1	1	1
0.5	0.75	1	0.25	1

Source: fsQCA software

Table 3 : Computed variable MPMA

fsqca

File Variables Cases Analyze Graphs

mecs	pfin	metcom	avertimp	riscrepperf	MPMA
0.75	0.5	1	0.5	1	0.50
0.5	0.25	0.75	0.25	1	0.25
1	1	1	0.5	1	0.50
0.75	1	0.75	0.75	0.75	0.75
1	0.75	1	0.5	0.75	0.50
1	0.75	1	0.75	1	0.75
1	1	1	1	0.5	1.00
1	0.75	1	1	0.75	0.75
1	1	1	1	1	1.00
0.5	0.75	1	0.25	1	0.25

The FsQCA allows flexibility in the evaluation of cases by calibration. As mentioned above, each case is assigned membership scores for important causal conditions, such as the impact of the MPMA on the riscrepperf.

Results of FsQCA analysis

The first stage of the analysis aims to combine the conditions that are sufficient to obtain the result. This examines whether a causal prescription of conditions is always present when the result is present.

We continued the analysis of consistency and coverage scores on the XY plot of the fuzzy sets (Fig. 9). The visual representation of the cases on the XY graph shows that the antecedent conditions are sufficient to obtain the result, due to the positioning of the majority of the cases above the diagonal of the graph.

The plan XY shows whether a specific condition is necessary or sufficient to obtain the result, emphasizing how consistent a given condition is, with the assertion that it is a necessary or sufficient condition. In addition, the XY plan provides graphical information on how empirically relevant the research proposal is.
The consistency score (the extent to which a combination of causality results in a result) is 0.92, while the coverage score (how many cases result is a particular causal condition) is 0.657143. These scores imply that the distribution of the fuzzy sets is consistent with the claim that MPMA is a subset of the result (risrepperf). We can also say that the MPMA coverage of the result (risrepperf) is 92%.

The high consistency value reported by the XY plan indicates that the condition is sufficient to obtain the result. Although the values of consistency and coverage range suggest causality in this research project, determining causality requires interpreting the configurations using the truth table analyzes.

Fig. 9: Graphical distribution of cases on XY Plot

Source (fsQCA) software

The complex solution provided by Quine-McCluskey algorithm reveals one combination of antecedents conditions leading to the outcome; thus, the principle of equifinality (multiple paths lead to the same outcome) is not supported.

```
Model: riscrepperf = f(mecs, pfin, metcom, avertimp)
Algorithm: Quine-McCluskey

--- COMPLEX SOLUTION ---
frequency cutoff: 5
consistency cutoff: 0.92
                                  raw        unique
                                coverage    coverage    consistency
                               ----------  ----------  ----------
mecs*pfin*metcom*avertimp      0.657143    0.657143    0.92
solution coverage: 0.657143
solution consistency: 0.92
```

Fig. 1: Complex solution provided by Quine-McCluskey algorithm

Performing the analyzes to find the complex solution implies compliance with the condition: a consistency limit of 0.92, which means that the membership score of the result (interdependence between reputational risks and bank performance) is consistently higher than the membership score of the causal configurations (sanction mechanisms, the effects of loss of reputation, early warning and transparent communication).

Conclusions, limitations and Future Research

The major benefits of this first study are twofold.
First, it is one of the first QCA studies specifically targeting the interdependence between reputational risks and bank performance.

Secondly, this study shows the elements that directly influence the reputational risk. Efficient communication of financial results, on the one hand prevents the emergence of reputational risks, and on the other hand it consolidates the existing reputation. At the same time, avoiding sanctions applied by national and international bodies, is equally important in the management of reputational risks.

The study also showed that :

There is no such strong connection between the weaker financial performances reported by banks in certain periods and their reputation; unfavorable financial results do not directly affect the reputation;
There is no such strong connection between the weaker financial performances reported by banks in certain periods and their reputation; unfavorable financial results do not directly affect the reputation.

This study used the fsQCA to identify sufficient conditions in order to understand what are the causes of the emergence of reputational risks seen through the eyes of decision makers in banks.

From the perspective of managerial implications, the causal recipes in this study provide valuable information on how to prevent the occurrence of reputational risks, above the reaction capacity.

The limitations of this study are as follows:

First, the data were collected only for 10 employees from the activity areas with an impact on reputation (Management, Compliance and Risk);
Second, this study examines only four antecedents of the outcome, which could be challenged by other researchers and practitioners for their relevance.

Last but not least, the current study could be extended in the future by including banks from other countries or by comparing banks in Romania with mother banks in Western Europe, to obtain more diversified results. It may also be useful to understand the management systems for the reputational risks of banks in different countries or continents. Using a similar methodology, we can expect to obtain interesting and diverse results.

Abstract

The article shows that the modern Russian system of mortgage housing lening is characterized by a low level of development, which is exacerbated by huge imbalances in the development of mortgage lending in the regions. Under these conditions, a massive and effective solution of the housing problem of the population is a strategic task of the state. This study is devoted to the development of a differential indicator and the ranking of local mortgage markets to form an address mechanism for state support of mortgage lending in the Russian Federation. To achieve this goal, the article conducted a comprehensive statistical analysis of the main factors in the development of mortgage systems in the regions based on the methods of factor analysis. The following scientific results were obtained:

- a model of a differential indicator characterizing the level of development of the region's mortgage lending system is justified;
- a graphic model of a differential indicator for assessing the development level of a regional mortgage system is proposed;
- the method of system ranking of regions of the Russian Federation on the basis of the differential criterion characterizing the level of mortgage development of Russian subjects is developed.

Methods of system analysis, statistical multivariate factor analysis and methods of graphic modeling were used as methodological tools of the research.

Keywords: Mortgage Market, Region, Differential Indicator, Factor Analysis

Introduction

The current stage of the development of the mortgage housing lending (MHL) system in the Russian Federation is characterized by an extremely low level. According to the main indicator of mortgage lending development - "total outstanding residential loans to GDP ratio", Russia is at the level of states with emerging economies such as India, Albania, Cambodia, Nicaragua. As shown in figure 1, at the end of 2018, the total debt on residential mortgage loans in Russia as a percentage of GDP was only 6.2%.

For comparison, in Albania, this figure was estimated at 6.87%, in Cambodia-6.28%, India-5.42%, while in the developed states, which are the leaders in the development of mortgage lending, in Sweden and Denmark-87.5% and 84.6%, respectively. Simple comparisons show that the level of development of mortgage lending in Russia is 14 times lower than in Sweden and 8.5 times lower than in the USA, where after the crisis of "liquidity" in 2008-2009 by 2018, the trend has changed to reduce the mortgage portfolio.

Fig. 1: Total Outstanding Residential Loans to GDP Ratio as of 01.01.2019

(*compiled by the authors on the basis of data EMF Hypostat 2019, Central Bank of the Russian Federation, Federal Reserve System, Helgilibrary)*

In addition to the overall low volume of mortgage lending in the Russian Federation, the level of development of mortgage instruments in some regions is still much lower. For example, (see Fig. 2), the share of the Chechen Republic in the total mortgage loans of Russia as of November 1, 2019 was only 0.06%, the share of the Republic of Ingushetia - 0.02%, while the share of Moscow was 11,06%. The variation of values across the subjects of the Federation is more than three orders of magnitude, which indicates a deep regional disproportion in the development of mortgage lending systems in the Russian Federation.

There is also significant variation in another important indicator - total outstanding residential loans per capita. So, if the total outstanding residential loans per capita of the region in the Yamalo-Nenets and Khanty-Mansi Autonomous Districts is according to the latest data 138.2 and 124.6 thousand rubles, respectively, in the same Chechen Republic and the Republic of Ingushetia it is less than 3 thousand rubles per person.

Such imbalances in the development of mortgage lending in the regions of the Russian Federation are due to the huge geographic extent of the country, the historical and national specifics of individual regions, peculiarities of development of the economy, social and banking sectors of Russian entities.

The uneven socio-economic development of the regions amid the low level of mortgage development in the country as a whole necessitates the development of new approaches to solving the problem of mortgage inequality. It is necessary to develop a strategic program of action at the state level, aimed at solving problems in two directions. The first one is related to the development of criteria for assessing the level of mortgage development in the regions of the Russian Federation. The second one is related to the development of a program to reduce and eliminate regional mortgage inequality, based on the provision of "targeted" state support to the regions of Russia.

Fig. 2: Comparison of the indicators "The share of the region's mortgage debt in total outstanding residential loans of Russia, %" and "Mortgage loans per capita of the region, rubles" in the regional context as of November 1, 2019
(compiled by the authors based on the data of the Central Bank of the Russian Federation and Rosstat)

This study is devoted to the development of a differential indicator and the ranking of local mortgage markets for the formation of a targeted mechanism for state support of mortgage lending in the Russian Federation.

Review of literature and sources

The heterogeneity of the socio-economic development of the Russian regions dictates the need to solve the problem of increasing the efficiency of regional development management based on existing theoretical and methodological approaches in the regional economy. At different times, a large number of Russian and foreign scientists who proposed author's methods for solving the scientific problem dealt with the issues of smoothing the imbalances in the socio-economic development of the regions. At the same time, the most diverse goals have been set and continue to be set.

For example, Murias et al (2009, 2010, 2012) proposed a methodology for analyzing the economic welfare of regions and regional economic imbalances based on the calculation of the synthetic index of regional economic welfare using the DEA (Data Envelopment Analysis) methodology. Bertin et al (2016) developed a methodology for measuring quality of life at the regional level. The authors calculated the synthetic index of regional economic welfare based on the methods of the decision tree, nominal groups, as well as the method of maximizing the Choquet integral. Crescenzi (2009) proposed a methodology for analyzing the European policy for the distribution of structural funds by EU regions, based on the principal component method. Golejewska (2016) recommended an approach aimed at comparative analysis of the socio-economic potential and regional differentiations in the regions of Poland, and the research methodology is based on multivariate comparative analysis methods, namely the Hellwig's method, Spearman's rank correlation and some others. Bronisz et al (2008) assessed of the competitiveness of the regions of Poland. The authors ranked the regions of Poland on the basis of creating a general index of regional competitiveness using the approach of the Huggins

Institute (2003), based on factor analysis. Using the latter approach Zitek and Klimova built a competitiveness index of the Czech regions (2015). The proposed composite index is based on the British Huggins three-factor model (2003, 2016) and includes 14 partial indicators that are divided into three groups - input factors (for example, level of economic activity, etc.), output factors (for example, level employment, etc.) and result factors (for example, average wages, etc.).

The problem of differentiation of regions according to the level of socio-economic development on the basis of assessments based on various criteria has also been thoroughly studied by Russian scientists. Recent research in this area belong Baranov and Skufina (2008), Karelina (2016), Shabunova and Gruzdeva (2016), Nizhegorodtsev et al (2017), Rakhmangulov and Kopylova (2014), Tsapenko (2015).

The results of the review show that there are many approaches to assessing various aspects of the socio-economic development of regions, while the choice of a particular solution method is not obvious, the set of considered indicators of socio-economic development varies depending on the views of the authors and the availability of statistical data. At the same time, despite a fairly wide range of tasks to be solved on the basis of the formation of various kinds of criteria for socio-economic development, the problem of regional mortgage inequality at present has not received proper coverage in the scientific literature. At the same time, this problem is very relevant for Russia, as well as many developed and developing countries of the world, in particular the USA, England, Spain, Greece, India, China and many others. However, the analysis of foreign literature shows that most of the research is focused on regional analysis of the real estate market and a very small part of the research is focused specifically on mortgage loans, which are a key element of housing demand. The latter, in particular, is the study of Patatouka (2014), where disproportions of the development of housing and mortgage markets in the regions of Greece are identified, their simplified assessment is carried out. An interesting study is Aranaz and Marquez (2013), where the authors compare the features of retrospective development and assess regional differences in the Spanish mortgage market using the sheaf methodology. In the United States, unique to the vast role that mortgage plays in the national economy, the problem of regional inequality in the mortgage market is most often investigated to assess the impact of regional economic conditions on the level of local mortgage rates. For example, the papers of Ozdemir and Altinoz (2013), Hurst et al (2015) are devoted to this subject.

In Russia, despite the significance of the existing problem, research on the problem of regional mortgage inequality is limited to a relatively small number of publications, among which the works of Gritsenko et al (2017), Ivashkov (2011). At the same time, only in a few works, in particular in studies by Grezina (2011), the task is set not only to determine the level of development of mortgage lending in certain regions, but also to develop a differentiated policy for mortgage lending in constituent entities of the Russian Federation.

The lack of elaboration of this problem determines the theoretical and practical significance of this study, in which it is planned to develop a method of system ranking of subjects of the Russian Federation on the basis of a differential indicator that characterizes the level of development of mortgage systems in Russian regions. In turn, the appropriateness of the formation of such a criterion was proved in the early publications of the authors of this study (2014, 2018).

Data and Methods

The results of the study are based on the methods of system analysis of the features and problems of the functioning of regional systems of mortgage housing lending. Based on the results of the analysis of information about the structure and parameters of regional systems of mortgage housing lending, assumptions are made about the composition of local criteria for the effectiveness of regional mortgage markets.

It is proposed to use a system of indicators, including 23 indicators, united by 4 functional blocks.

At the same time, three of the four functional blocks responsible for assessing the economic, housing and socio-demographic subsystems of the regions are identified based on the analysis of Russian and foreign experience in forming criteria for socio-economic development. The fourth block includes indicators characterizing the development of the mortgage system in the region. The composition of the functional blocks of indicators is also due to the need to take into account the complex of interconnections of the elements of the MHL system, namely, the set of subjects and objects of mortgage lending that interact on the mortgage market and the residential real estate market.

The following variables are included in the function blocks:

1) economic indicators (5 indicators):
- Var1 - GRP per capita, rubles;
- Var2 - average per capita cash income of the population, rubles;
- Var3 - the number of economically active population, thousand people;
- Var4 – average per capita nominal accrued salary of employees of organizations, rubles;
- Var5 - the share of expenses for the purchase of real estate in the cash expenses of the population,%;

2) housing indicators (5 indicators):
- Var6 - the total area of residential premises, accounting for an average of per capita, sq. m;
- Var7 - commissioning of residential buildings per 1000 people, sq. m. total area;
- Var8 - commissioning of apartments per 1000 population, units;
- Var9 - registered housing mortgages, units;
- Var10 - housing affordability coefficient;

3) socio-demographic indicators (2 indicators):
- Var11 - the number of active social mortgage programs (by categories of recipients), %;
- Var12 - the number of births per 1000 population, persons;

4) indicators of the mortgage market (11 indicators):
- Var13 - the volume of mortgage housing loans issued according to the Central Bank of the Russian Federation (in rubles and foreign currency), thousand rubles;
- Var14 - the number of mortgage housing loans issued according to the Central Bank of the Russian Federation (in rubles and foreign currency), pcs.;
- Var15 - weighted average interest rate on mortgage housing loans granted in rubles, %;
- Var16 - total outstanding residential loans according to the Central Bank of the Russian Federation (in rubles and foreign currency), thousand rubles;
- Var17 - the number of credit organizations issuing mortgage housing loans, pcs.;
- Var18 - the number of credit organizations attracting refinancing in the secondary market of mortgage lending, pcs.;
- Var19 - refinancing of mortgage housing loans with the sale of a pool of mortgage housing loans (rights of claim for MHLs) without the formation of an additional financial instrument, million rubles;
- Var20 - refinancing of mortgage housing loans with the sale of a pool of mortgage housing loans (rights of claim for MHLs) with a further issue of mortgage-backed securities, million rubles;
- Var21 - the amount of overdue debts on MHLs, million rubles;
- Var22 - the volume of prematurely repaid mortgage housing loans in the reporting period, million rubles;
- Var23 - the percentage of families who are available to purchase a home with a mortgage, %.

The housing indicators (the second functional unit) did not include the cost per square meter of housing because the corresponding parameter is the basis for calculating the housing affordability coefficient (Var10).

The information base on a set of indicators is based on statistics from the Federal State Statistics Service and the Central Bank of the Russian Federation, materials from the RIA Rating information and analytical portal, as well as the All About Mortgage information portal. Initial data sets were formed

for 85 subjects of the Russian Federation (including the Republic of Crimea and Sevastopol) for 2014-2018.

The proposed methodology for system ranking of the regions of the Russian Federation by the level of development of the mortgage system includes the following steps:

1. Identification of the main factors in the development of regional mortgage systems based on the use of statistical methods of factor analysis.
2. Interpretation of the results and construction of a graphic model of the main factors in the development of the mortgage system in the region.
3. The formation of a differential indicator of the level of development of the regional MHL system, which determines the comparative composition of the research results, the differentiation of regions according to the identified factors.

Using methods of statistical factor analysis provides the possibility of reducing the dimension of the array of source data and eliminating the multicollinearity of primary indicators with an acceptable level of reduction in the amount of information. The result of its application is the identification of the main factors explaining 60-75% of the change in group dispersion.

The use of the method of graphical modeling is due to the need of interpreting the results of statistical factor analysis data and create structural models of the major factors in the development of a regional MHL system.

The use of multicriteria scaling methods allows us to synthesize a differential indicator based on the identified factors and a graphical model of their relationships. Its development is due to the need to classify regional MHL systems according to identified development imbalances.

Model

To conduct a comprehensive analysis of the state of mortgage lending systems in Russian entities, an indicator "The level of development of the regional system of mortgage lending" is introduced. This is a differential indicator reflecting the realized demand for a mortgage loan, as well as the size of the mortgage lending market and its characteristics. Using this indicator, we can distinguish groups of regions with similar characteristics of mortgage lending.

The differential indicator can formally be represented by the following formula:

$$k_i = \varphi\,(F1_i;\ F2_i;\ F3_i), \qquad (1)$$

where k_i–differential indicator of the development level of mortgage lending in the i-th region;
$F1_i$–the value of the first factor;;
$F2_i$–the value of the second factor;;
$F3_i$–the value of the third factor;;
i – the region number.

A graphical interpretation of the differential indicator is shown in Figure 3.

Fig. 3: A graphical model of a differential indicator

(developed by the authors)

Note that the practical use of differential indicator (1) for the system ranking of regional mortgage systems involves the subsequent development of discrete scales for each of the main components laid down in the differential indicator. The result of the implementation of the obtained model of the differential indicator (Fig. 3) in practice will be at least a three-dimensional matrix for assessing the mortgage potential of the region, including 27 or more possible combinations of coordinates in the space of alternatives. The combination of possible coordinates will allow us to create a strategic choice space for regional authorities and will become a clear tool for moving from one position to another for moving to one or another alternative, which will create conditions for the strategic management of the region's mortgage system based on the principles of continuity and operational change management.

Results

All data arrays formed over a five-year study period were processed using the ***Statistica*** software package. The results obtained are summarized in table 1.

As follows from the above results, for all periods of the study, the share of the explained group dispersion for the first three factors is higher than 70%. The factor number is determined by the fraction of the explained group variance of the source variables.

The calculation results also demonstrate the stability of the structure of primary variables in the identified factors.

Comparable results and a rather high proportion of the explained variance for the study periods justify the admissibility of the formation of a three-factor model.

Table 1: Results of processing data arrays for 2014-2018
(*Calculated by the authors using the Statistica software package)*

Factor	Eigenvalue	The share of the explained variance	Accumulated share of the explained variance
Data array 2014			
F1	9,7	48,67	48,67
F2	3,05	15,26	63,93
F3	2,25	11,27	**75,2**

Data array 2015			
F1	9,61	45,78	45,78
F2	3,19	15,2	60,99
F3	2,83	13,46	**74,45**
Data array 2016			
F1	9,47	45,10	45,10
F2	3,13	14,89	59,98
F3	2,9	13,80	**73,78**
Data array 2017			
F1	9,45	42,95	42,95
F2	3,76	17,08	60,03
F3	2,90	13,18	**73,21**
Data array 2018			
F1	9,52	48,83	48,83
F2	3,85	14,41	63,24
F3	3,06	11,47	**74,71**

The results of the study show that the first factor with a share of the explained variance of 48.8% is formed by 10 initial variables. Nine of them (Var13, Var14, Var16, Var17, Var18, Var19, Var20, Var 21, Var22) belong to the functional block of mortgage market indicators and only one, the number of economically active population (Var3), belongs to the composition of economic indicators.

The second factor (F2) with a share of the explained variance of 14.4% is formed by five initial variables, three of which (Var1, Var2 and Var4) belong to the functional block of economic indicators, and two to the blocks of housing (Var10) and mortgage indicators (Var23), respectively.

The third selected factor (F3) with a share of the explained variance of 11.5% is closely related to two initial variables belonging to the block of housing indicators, namely, the indicators - commissioning of residential buildings (Var7) and commissioning of apartments (Var8).

The given set of variables allows us to explain the meaningful meaning of the selected factors:

F1 - an indicator of the effectiveness of the functioning of the regional mortgage market;
F2 - an indicator of the availability of housing mortgage lending in the region, in turn,
F3 - an indicator of business activity in the field of housing.

Factors F1 - F3 make up the multicriteria structure of the differential indicator of the level of development of the mortgage system in the region. Each factor acts as a formally independent driver for the development of the mortgage system in the region, as the method of their selection involves reducing the statistical dependence between the selected factors to eliminate the multicollinearity of the primary variables.

To reduce the number of combinations of estimates in the classification of objects according to selected factors, it is advisable to use a discrete scale of values with an uneven step. Note that for the first factor, where the greatest scatter of the obtained values is observed, it is advisable to use a more accurate scale, for example, with a range of 10 divisions, while values from 1 and higher fall into the "high" category, and values less than -1 fall into the "low" category.

For F2 and F3, scales with a range of 5 divisions with a similar distribution of levels are selected. Other options for constructing a scale of criteria are possible.

As a result of the proposed systematization, we obtain a three-dimensional matrix for assessing the mortgage potential of the regions, including 27 coordinate combinations.

As an example, Table 2 presents the results of assessing the state of regional mortgage systems in some regions in 2018.

Table 2: The results of assessing the level of development of regional mortgage systems by differential indicator

i	Region	Differential indicator value			
		k_i	F_{1i}	F_{2i}	F_{3i}
c29	St. Petersburg	(2; 1; 2)	high	high	high
c18	Moscow	(9; 0;-2)	high	average	low
c10	Moscow region	(3; 0; 3)	high	average	high
c58	Sverdlovsk region	(1; 0; 0)	high	average	average
c32	Krasnodar region	(1;-1; 1)	high	low	high
c25	Leningrad region	(0; 0; 2)	average	average	high

Conclusion

Based on the study, the following results were obtained:

1. The need for a systematic ranking of regional mortgage markets is justified.
2. A methodology for systematic ranking of the regions of the Russian Federation by the level of development of the mortgage system based on the developed differential indicator is proposed.
3. A systematic ranking of regional mortgage markets was carried out according to the main criteria for the development of housing mortgage lending systems. The matrix for assessing the mortgage potential of the region has been formed.

In general, the study proves that the state regional mortgage policy should be targeted in nature, exerting its direct influence, first of all, on those components that received their "low" rating in the calculation of the differential indicator. State support measures should be much wider than traditionally offered to the population social mortgage programs. It should be noted that state support programs existing in Russia undoubtedly have a significant impact on the increase in demand for mortgages from certain target groups of the population, especially young families and families with children, but are not able to solve the problem of developing mortgages globally. This is evidenced by the fact that the weighted average interest rate and the number of existing social programs were not included in any of the main components for the entire five-year study period. The practical implementation of the methodology for assessing the level of development of regional systems of Mortgage Housing Lending on the basis of a differential indicator and the development of a targeted regional state mortgage policy on its basis can contribute to solving the problem at the state level. The practical implementation of the proposed approach can not only smooth out imbalances in the development of regional mortgage systems, but also raise the level of mortgage development in Russia to a qualitatively new stage in its development.

In this regard, the objectives of future research are:

- development of a model of state support for regional mortgage markets based on the differential indicator obtained by the authors. Its fundamental difference from existing analogues will be the "targeted" nature of state assistance to local mortgage markets, due to the wide range of possible values of the differential indicator (27 or more) in the space of alternatives;
- simplification of the proposed methodology for calculating the differential indicator to facilitate the procedures for its practical application.

Aroma Marketing in Business – How Fragrance Affects Customers and Employees

Abstract

The subject of the article is sensory marketing and its application in business on the example of fragrance marketing. It describes how fragrances affect the mood, well-being and behaviour of customers and employees. It also explains how olfactory stimuli affect the brain. The article is based on the literature review.

Keywords: Neuromarketing, Sensory Marketing, Aroma Marketing, Essential Oils, Behavioural Economics, Neuroeconomics

Aroma marketing constitutes one of the forms of sensory marketing, based on the use of stimuli received by an individual's sense of smell exerting the influence on the behaviour of a person, including their consumer decisions. In sensory marketing, particular messages are oriented to other senses as well, namely eyesight, hearing, taste, and touch. With the support of sensory marketing, one can increase brand awareness in the minds of patrons and develop its image (Hulten, Broweus, van Dijk, 2011). The strong impact aroma exerts on the mood and well-being of the patrons of commercial premises and hotels was established as long as over a dozen years ago (Spence, 2003). According to the researchers, about 95% of thoughts, emotions and cognitive processes occur beyond human consciousness (Zaltman, 2003). The reception of olfactory stimuli plays a special role in the process. Although the majority of sensations are based on visual and auditory stimuli, 75% of emotions that accompany us on a day-to-day basis, M. Lindstrom argues, have been triggered by smell. Thus, it is this sensual channel, strongly associated with emotions, that offers a chance to build an effective marketing strategy.

Fragrance information is decoded differently from the remaining sensations (e.g. the visual ones) and goes directly to the limbic system responsible for controlling human emotions. The nerve pathway conducting olfactory impulses is very short, which is why it is the fastest-stimulated type of sense and constitutes the oldest form of communication in nature. For the most part, the human brain responds to olfactory stimuli unconsciously (Chebet & Michon, 2005). Fragrances strongly affect one's emotions, memory, and well-being. The conditions they may cause include tachycardia (rapid heartbeat), drowsiness, tearing or nausea, as well as plenty of other sensations that affect human reactions and yet remain unperceived.

Behavioural economics is an interdisciplinary discipline bordering on psychology and economics; it has developed thanks to the commitment and work of two outstanding researchers: Daniel Kahneman and Amos Tversky. This discipline enables understanding of the irregularities occurring in market participants in the course of the decision-making process that remain unexplained based on the assumptions of the rationality of choices. In 2002, Daniel Kahneman received the Nobel Prize in Economics for his work on the theory of perspective, a notion he developed together with Amos Tversky, who had passed several years prior. The theory of perspective explains many economic

anomalies, i.e. behaviours incompatible with economically understood rationality. In their actions, people frequently follow "a bird in the hand is worth two in the bush" principle. It also turns out that they are reluctant to risk in the sphere of profits, but often a risk in the field of losses –to avoid a smaller loss, they risk incurring a larger one, for instance, when they engage in a confrontation with a police officer to avoid a ticket. The researchers also noted that sadness due to the loss of a certain amount of money, e.g. PLN 200, seems to be more than twice as strong as the joy of receiving PLN 200, a phenomenon called loss aversion. On this ground, it is known that people are reluctant to part with their money and, for example, an increase in a price may cause just such an aversion, which will translate directly into a reluctance to make a purchase (Kahneman & Tversky, 1979). This theory assumes that when making decisions, people take some point of reference and evaluate results as profit or loss. In 1979, Kahneman and Tversky conducted a study in Israel, Stockholm, and Michigan, with approximately 100 students and university staff as participants. The study consisted in choosing one of the proposals put forward in the survey, linking profit or loss with a certain probability. The results obtained in all three locations were the same. On their basis, Kahneman and Tversky distinguished the following effects:

- the certainty effect, which means that people will choose a positive profit over an uncertain benefit, even if it is greater than a positive profit;
- the rebound effect, which occurs when people given a choice solely in the sphere of losses choose the risk and reverse the certainty effect;
- the isolation effect, which occurs when there is a complicated problem, people simplify it and focus on what stands out, and omit the connecting elements. Therefore, the method of formulating the variant becomes significant as it influences decision making (Makarowski, Leszczyńska, Lozach, Makarowski, 2012).

Making choices in the circumstances of risk and uncertainty has remained within the realm of interest in neuroeconomics, a disciplinary science on the borderline of psychology, economics, and neurology. Its core interest is researching the causes and forecasting the future human behaviour in the sphere of broadly understood economics. In the research, non-invasive technologies are employed to study the activity of the human brain. Monitoring neuronal responses in the consumers' brains allows to forecast and understand how purchasing decisions are made. In one experiment, for instance, the researchers used magnetic resonance imaging (MRI) to compare the brain image while one is paying with cash with the brain image when one is experiencing an unpleasant electrical impulse. The research has shown that the parts of the brain that activate when paying in cash partially overlap those that activate responding to an electrical impulse (Mažar, Plassmann, Robitaille, Lindner, 2017). It turns out that based on observing brain activity, one can accurately predict a purchasing decision of the person examined, when the pain of paying rises, the likelihood of buying decreases.

Moreover, the predictions based on the observation of neuroimaging results overlap with the purchase intentions of the examined persons. Based on other studies, it has been established that with the increase or decrease of activity in particular brain structures, the likelihood of making a purchase increases (Zaleśkiewicz, 2011). The collected data determined that:

- an increase in activity in the nucleus accumbens area is associated with the anticipation of something pleasant;
- an increase in activity in the medial prefrontal cortex is involved in the calculation of profits and losses;
- a decrease in activation in the area of the insular cortex, which is active when experiencing something unpleasant.

These changes in the activity of particular brain areas were associated with a greater probability of purchase by the person examined. They may also be associated with the use of aroma marketing. The ingredients of essential oils affect the receptors of gamma-aminobutyric acid (GABA), a neurotransmitter that inhibits the central nervous system. Consequently, the use of most oils has a calming and anti-stress effect. The dysfunction or deficiencies in GABAergic transmission

are associated with reactions to pain and anxiety (Wang et al., 2018). As mentioned above, when reimbursing for goods or services with cash, the areas of the brain that become activated area similar to those activated while experiencing an unpleasant impulse; these are areas associated with pain processing. Then the use of aroma marketing can be associated with pleasant experiences that evoke positive feelings in the brains of patrons, thus paving the way for shopping responses.

The orbitofrontal cortex is associated with the ability to attribute emotional value to individual options, which has a significant impact on decision making. Here, the information from various brain areas, including the olfactory cortex and the reward system, is integrated (Rolls, 2004). Therefore, a scent can affect and indeed affects, for instance, the decision on how much one is willing to pay for a given product by assessing its price. An apt illustration would be an experiment in which the test persons were to review and value a pair of running shoes. Identical shoes were displayed in two separate but alike rooms. A delicate floral aroma was sprayed in one of the rooms, while the other remained without any scent modifications. It turned out that 84% of the respondents preferred trainers from a fragrant room.

What is more, they valued them at about $ 10 more than a pair from a scent untampered room. It can be assumed that these individuals were willing to spend more money on a pair of shoes, simply because they were surrounded by a pleasing smell (Lindstrom, 2009). The conclusion: the fragrant sneakers are rated as more luxurious. Correspondingly, the conclusions reached in another research indicate that people who have been affected by agreeable aromas were more extravagant. A similar situation applies to gambling. The conclusions following an experiment carried out in a casino revealed that after a nice smell was sprayed in the vicinity of the slot machines, the game stakes increased by 45% in comparison to the instances when the procedure did not occur. The first establishment to employ aromas in their casino was The Mirage, a high-class inn in Las Vegas (Dooley, 2015). In the 1990s, fragrance marketing began to be employed in the United States and Australia on a broader scale. In Poland, aroma marketing was used for the first time in movie theaters during the premiere of Jan Jakub Kolski's *Jasminum* (Lindstrom, 2009).

Aromatising the places affects the subjective sense of time as well. The customers who spent 40 minutes in a queue in the "fragrant" Lafayette shopping mall in Paris, were under the impression that the waiting time was only 25 minutes, unlike the patrons who visited the store before spraying the aroma (Lindstrom, 2009). Interestingly, the reverse effect can be observed as well; namely, the customers of stores lacking the aromatisation had the impression that the time they spent there was much longer than the period spent in the premises in which such a solution was used.

Hesitant customers are more prone to smells, and a vast majority, as many as about 80% of purchase decisions are made at the point of sale. Therefore, it is important to create such an atmosphere at the shopping spot so that a customer finds it comfortable and entertaining, which increases the chance of profit. Consistent with research, the use of fragrances in business is associated with:

- improving the positive attitude of consumers towards a product, service or spot;
- improving the feelings and mood that the patrons experience;
- increasing in the inclination towards purchases, which translates into an increase in sales;
- prolonging the time spent inside a store.

When the scent of baked bread is employed, the sales in a bakery can increase by 30% (Stasiak, 2005). According to one study, the aroma increases the time spent in a given place by 16%, which increases the efficiency of shopping. Further, the pleasant scent has a positive effect on other factors shaping the purchasing decisions, such as the assessment of staff proficiency, the quality of the presented goods or the assessment of the interior design. A store selling household goods started spraying the aroma of mown grass. It turned out that since the air indoors became scent-enhanced, as many as 49% of the surveyed patrons declared that the staff seemed to more competent (Michalska-Dudek, 2009). Dunkin' broadcast a radio commercial on Seoul buses simultaneously releasing a delicate coffee aroma. It was to remind the passengers of the experience the brand conveys. Over 350

thousand people "experienced" the radio commercial. Its outcome was a 29% increase in sales and a 16% increase in the number of visitors to Dunkin' (Skowronek, 2014).

Undoubtedly, the smell is strongly correlated with making shopping decisions, especially among indecisive people, as well as influences the willingness to spend money. The impact that particular scents have on increasing motivation and enthusiasm for work as well as minimizing faults and increasing creativity or focusing one's attention remains an extremely pertinent issue related to aromatherapy in business as well. One study examined the effect that the aroma of petitgrain (*Citrus Aurantium*) has on improving work efficiency and reducing workplace stress. The participants were divided into two groups: the experimental group was exposed to the petitgrain essential oil, while the control group was exposed to the neutral almond oil. In both groups, the participants asked to perform a computer task on a specific website. The results obtained indicate that the participants in the experimental group completed the task related to the website 2.28 minutes faster than the participants from the control group. The researchers elucidate that the results were obtained by restoring the autonomous balance of the sympathetic and parasympathetic nervous system through the unified effect of petitgrain essential oil. The outcome of exposure to this fragrance may be the improvement of the mental and emotional state by combining a decrease in the level of stress and an increase in the level of stimulation among the participants in terms of mindfulness and alertness (Huang, Capdevila, 2017).

One of the countries that promote an innovative approach to aromatherapy in business is Japan. Special places, i.e. fragrance-serving clubs, have been established there. In those places, the employees can take advantage of thirty minutes of aromatherapy. These clubs are popular among both white-collar and blue-collar workers who are happy to enjoy the served aromas, which include rosemary or lemon. Japan is also the country in which the discovery that spraying the lemon scent in office spaces by 54% reduces the number of computer errors made by employees occurred. In addition, it has been observed that jasmine stimulates the brain functions, while lavender calms the brain's electrical activity (Rudzewicz, 2010). These findings have been confirmed by the studies carried out with the participation of nurses. The use of the lavender essential oil (*Lavandula Angustifolia*) to reduce work-related stress has a positive influence on the overall assessment of the work environment and increases the satisfaction among the nurses (Johnson et al., 2017). The studies conducted on a group of healthy volunteers showed that the group exposed to the aroma of rosemary (*Rosmariunus Officinalis*) demonstrated a significant increase in the performance of overall memory quality and alertness as compared to the group exposed to the lavender aroma. Nevertheless, both scents improved the mood of the persons tested when compared to the control group that were exposed to no aroma (Moss, Cook, Wesens, Duckett, 2003).

The research indicates that not only the employees but also the patrons appreciate the enjoyable scents that contribute to the overall image of a given brand for them. As many as 90% of the respondents admitted that an unpleasant smell could prompt them to leave premises sooner or entirely abandon their plans to visit a store or hotel[1]. Agreeable aromas, in turn, encourage them to visit a store or service location. The assessment of the attractiveness and the analysis of information regarding commercial establishments and their surroundings relies predominantly on the sense of sight, followed by the sense of smell. An appealing fragrance in the surroundings is an important factor informing, for instance, about the prestige of a facility, its cleanliness, appropriate aesthetics or welcoming atmosphere (Grzybowska-Brzezińska, Rudzewicz 2013).

Where Can One Apply Fragrance Marketing?

Aromatic tones can be used wherever shopping decisions are taken, where sales or broadly understood customer service takes place. Popular locations in which fragrance marketing is employed include:

[1] Research: Aroma marketing: Impact of fragrance on business]
http://www.aromacorp.pl/wpcontent/uploads/2016/04/raport.pdf

- hotels,
- travel agencies,
- SPA & wellness centers,
- premises providing catering services (restaurants, pubs, cafes, and so forth),
- discos;
- medical and dental practices,
- waiting areas,
- galleries and shopping centers,
- stockists (e.g. offering upscale clothing; jewelry; timepieces, cosmetics; electronics/household appliance stores),
- banks.

One of the pioneers in the field of fragrance marketing was Westin Hotels & Resorts, an international hotel chain, incorporated in 1998 to Starwood, with over 120 hotels in 24 countries, which have developed and use for aromatising the hotel rooms, the letterhead as well as printed promotional materials a fragrance based on the aroma of white tea.

Singapore Airlines can serve as a case in point taken from the tourism industry. For their business activities, they use the smell of freshly cooked rice, which gives the customers a sense of security and peace. This fragrance is recognisable to the customers who define it as a light, exotically Asian, and feminine scent. This specially composed and patented bouquet, called *Stefan Floridian Waters,* is not only sprayed on the planes but also used in the form of perfume by female flight attendants. Additionally, the hot towels offered onboard at the beginning of the flight are soaked with it to generate pleasant associations and memories of a comfortable journey (Lindstrom, 2009).

Fragrance marketing has been employed successfully in the real estate industry, as well. Estate agents frequently spray the scent of vanilla, freshly brewed coffee or cake before the viewing by potential owners. The outcome evokes a positive frame of mind putting forward the affectionate family household, which can immensely facilitate making purchasing decisions. Suddenly, the estate becomes much more appealing for the eyes or rather the nose of the potential buyers.

Fragrance marketing helps the business in the following ways:

- it increases the number of visitors by encouraging the customers to visit the store;
- it extends the customer's stay in the store by improving his or her well-being and comfort, which encourages them to spend a longer time in the store and increases the likelihood of making a purchase;
- it reinforces the brand's message by stimulating the perception of customers in a pleasant, fragrant environment that triggers positive associations with the brand;
- it strengthens customer loyalty by consolidating their brand loyalty; an original fragrance is easily remembered and deepens the emotional bond between the company and its client.

How to select a fragrance for a business? While choosing a company fragrance, the following guidelines are worth considering:

- defining the target group: who they are, what they care about, what they expect from the company;
- developing the fragrances that are impeccably suited to the customer base; this requires vision and revision (for instance testing);
- taking into account the attributes of the brand;
- analysing the message one wants to convey to the patrons.

The companies that want to implement aromatherapy into business ought to clearly define the goal that the selected fragrance is to accomplish, namely whether it is to eliminate the disagreeable smells, improve the overall ambiance or consolidate the brand recognition and customer loyalty, to name but a few purposes.

Fragrance marketing has been increasingly adopted on the market. As the research brought forward illustrates, it has vast application in business, because it affects not only the purchasing decisions but also the mental functioning and well-being of both the employees and patrons. It can be assumed that fragrance marketing will play an increasingly important role in the activities oriented towards the business sector.

szynrys@interia.pl

Abstract

The purpose of the article is to analyze the authorities' competences in the field of defense - in legal acts - in regions neighboring the Republic of Poland. The comparative method was used in the assessment. The following criteria were adopted for the purpose of comparison of the competences of the authorities: understanding of the term "defense" in the different countries, directing the national defense, organization of the state defense, and planning of the state defense.

Keywords: State authority, competences in the area of defense, directing the state defense, organization of the state defense, planning of the state defense.

Introduction

Methodology

Defense is an area of national security that is aimed at countering external political and military threats using all available forces and means (Dictionary of National Security Terms 2008). This is due to one of the three functions of the state, namely the defense and compulsion function, which is related to ensuring the protection of fundamental social values. A state authority is a deliberately organized and clearly defined group of people and resources, established and operating under the applicable laws, which performs certain tasks on behalf of the state and is able to use the state's means of power and coercion to perform them. The notion of a state authority is linked to the notion of competence, function, and form of action. Competence is based on the legislation in force; it is the ability of a state authority to apply legally defined measures to carry out its tasks (The American Heritage Dictionary of the English Language 2020; Collins English Dictionary 2014). Competence is not only a power that can be exercised by an authority, but it imposes an obligation to take certain actions in situations provided for by law. The competence of a state authority cannot be presumed; it should always be based on a constitutional or statutory norm (Banaszak 2017).

In order to achieve the objective, legal acts were selected, the tasks and competences of state authorities in the field of defense were divided, and the criterion comparison was selected. The approach presented herein uses the comparative method, which is often called comparative analysis and concerns a broadly understood research perspective applied in social sciences (Tokarczyk 2008; Collier 1993; Harvey 2012-20). Taking into account the above, an informed choice of procedure was made in order to achieve the intended objective, which comprised the following stages: stage one - identification of the studied group (i.e. the authorities responsible for state defense matters); stage two - selection of the legal acts describing the state authorities' defense competences; stage three - selection of the comparison criterion; stage four - analysis of the materials and evaluation of the results of the comparison.

The research has taken into account the concept of separation of powers, where three groups of authorities were distinguished: legislative, executive, and judicial (Muszyński 2007; Banaszak 2017). Due to the significant scope and area of the subject matter covered by the study, it was limited to

legislative authorities (parliament) and executive authorities (president, council of ministers, and ministers). The condition for separation of the aforementioned groups of state authorities was their scope of competence concerning state defense.

In the second stage, the study was based on legal acts of the seven countries neighboring Poland: Republic of Belarus (Belarus), Czech Republic, Republic of Lithuania (Lithuania), Federal Republic of Germany (Germany), Republic of Ukraine (Ukraine), Russian Federation (Russia), and Slovak Republic (Slovakia). In order to achieve the desired objective, the method of examination of documents was mainly used, which enabled collection, selection, description, and scientific interpretation of legal acts applicable to the area of defense.

Due to the fact that the legislation determined the course and outcome of the research process, the methodological basis in the third stage was the choice of the comparison criterion (the concept of "defense," directing the national defense, organization of the state defense, and planning of the state defense).

Description and evaluation of the results of the comparison

The Term "Defense"

When considering the term "state defense," it should be noted that most often the translations of this term are found in the acts on defense of individual states. In countries such as Belarus, Russia, and Ukraine, the laws define this term in a similar manner. The term "defense" is translated as "a system of political, economic, social, military, scientific and technical, informational, legal, organizational, and other state measures in preparation for armed defense and protection of the state in the event of an aggression or an armed conflict" (Act of the Republic of Belarus "On Defense" 1992, Federal Act of the Russian Federation "On Defense" 1996, Act on Defense of Ukraine 1992). In two other countries, Czech Republic and Slovakia, there is a similar understanding of the term "defense": "defense of the state is a set of measures to ensure sovereignty, territorial integrity, democratic principles, and the rule of law, and to protect people's lives and property from external aggression" (Defense Act of the Czech Republic 1999) and "national defense is a set of measures by which the Slovak Republic maintains peace, security, sovereignty, territorial integrity, and inviolability of borders, and fulfils the obligations under international agreements on joint defense" (Act on Defense of the Slovak Republic 2002). However, there are some differences in the above approaches. The Defense Act of the Slovak Republic makes reference to international obligations and, later in the act, national defense is also related to cybersecurity and the fight against terrorism.

Two other approaches to the definition of the term (national) "defense" are present in the laws of the of Lithuania and Germany. The Act on National Security of Lithuania states that "defense of Lithuania is universal and total (unconditional), it is also coordinated with NATO principles of collective defense" (Act on National Security of the Republic of Lithuania 1996). The universality of defense means that Lithuania is defended by the armed forces of the state and the armed forces of NATO allies. Total defense means that both the entire nation and every citizen is obliged to oppose the aggressor, the occupant, and anyone who violates the sovereignty, territorial integrity, and constitutional order of the Lithuanian State through aggression. In the Germany, the concept of national defense has a slightly different meaning than in other countries. The term "defense" is understood to mean direct military defense carried out by the armed forces to defend the territory of the State and to protect its citizens, and the use of the armed forces results from Articles 87a and 115a of the Basic Law of the Federal Republic of Germany (Konzeption der Bundeswehr 2018). Thus, the defense of the state and its citizens is one of the basic tasks of the armed forces, and the Basic Law gives this term a constitutional status. The basic tasks of a state are to protect its population and to defend its territory against aggression. Defense (military) and civil defense (protection of the population) are organizationally autonomous (independent), but are permanently linked (Defense Policy Guidelines 2003; General Defense Guidelines 1989). It is also pointed out that the term "defense" also refers to the allied defense within the North Atlantic Treaty Alliance and stems from the Bundeswehr's tasks (Szubart 2016).

Directing the State Defense

According to the criterion of a territorial system of government, the countries neighboring Poland can be divided into two groups: federal states (Germany and Russia) and unitary states (other countries). In both cases, defense matters are given priority. In federal states, on the other hand, defense matters are the exclusive legislative competence at the federal level. With regard to the competences of the different authorities, attention should be paid to the distribution of the defense powers of the parliament, the president, and the government. The first concerns states of emergency: deciding on the imposition of martial law or approval of presidential decrees on the imposition of martial law. There are some differences in this respect. In the Czech Republic, the decision to impose martial law is made by the parliament at the request of the government, while in the Germany the decision to impose a state of defense is made by the Bundestag with the consent of the Bundesrat at the request of the Federal Government (or a determination of such state is made by the Joint Committee). In countries such as the Russia and the Ukraine, the constitution gives the president the exclusive right to impose martial law. The federal constitutional act "On martial law" provides that in the event of aggression against the Russian Federation or a direct threat of aggression, the President imposes martial law in the territory of the Russian Federation or in its individual parts and immediately notifies the Federation Council and the State Duma. Similarly, the Presidents of: Slovakia, Lithuania and Ukraine decide on defense against armed aggression, declare martial law. The competences of presidents concerning defense in the analyzed countries vary. In countries such as Russia, Belarus, and Ukraine, the president's powers related to defense are broad, while in Germany the president's powers in this matter are limited. In countries such as the Czech Republic, Slovakia and Lithuania, the presidents of these countries are commanders-in-chief of the armed forces, and their creative powers are similar.

In terms of defense, the government has a particularly important role to play, as this area of activity remains at the interface between the competences of the president and of the respective defense ministers, who often report to the president. The defense competences of individual governments are basically similar and related to the planning and implementation of the state's defense preparations to ensure its functioning in the event of an external threat to state security and during a war. In view of the issues under discussion, an important place in the government is held by the minister of defense who is responsible for directing the entire activity of the armed forces in peacetime, even though he or she acts only as an intermediary in the exercise of supreme authority over the armed forces, a function which is usually performed by the president of a given country (with the exception of the Federal Republic of Germany).

Organization of state defense

As has been mentioned earlier, in the Republic of Belarus, the powers of the President of the Republic in the area of defense are very broad and concern, among other things, defining tasks for state administration bodies in the field of organization of defense. The Council of Ministers of the Republic of Belarus organizes and develops the state defense system, equips the armed forces, other troops, and military formations with weapons, military equipment, and other materials, and determines the amount of material resources and budgetary funds for defense (act of the Republic of Belarus "On Defense" 1992). The Ministry of Defense of the Republic of Belarus is responsible for the coordination of actions of state authorities and other organizations in defense matters (the Defense Act of the Republic of Belarus 1992).

The second part of the Defense Act of the Czech Republic provides that “the management and organization of the defense of the state includes formation, preparation, and management of the armed forces, operational preparation of the territory of the state, planning of the defense of the state and measures in the national economy and in all public sectors to ensure the defense of the state.” The government of the republic is responsible for preparation and ensuring the defense of the state. The ministry of defense suggests to the government the necessary measures for the preparation and organization of national defense (Defense Act of the Czech Republic 1999). Similarly, in the Slovak

Republic, the government decides on preparations for the defense of the state and approves the concepts of the security system and the defense system of the state. To this end, it manages the activities of the ministries and other state administration bodies, the local government, and higher authorities in preparation for national defense (Constitution of the Slovak Republic 1999).

In turn, in the Republic of Lithuania, the most important issues related to the defense of the state are discussed and coordinated by the State Defense Council, composed of the President of the Republic (chairman), the Prime Minister, the Speaker of the Seimas, the Minister of National Defense, and the Head of Defense. The organization, development, and armament needs of the armed forces are determined by the Seimas. The government, the minister of defense, and the commander of the armed forces who are responsible for managing and directing the armed forces before the parliament (Act on national security of the Republic of Lithuania 1996).

In Germany, defense matters are governed by federal legislation. The Chancellor of the Federal Republic of Germany defines government policy guidelines and is responsible for them. In the event of a state of defense, the command of the armed forces is transferred to the Federal Chancellor (Basic Law of the Federal Republic of Germany 1949). At the federal level, the defense matters are entrusted to the Federal Ministry of Defense. In peacetime, the Minister of Defense settles all matters concerning the armed forces. He or she is responsible to the Parliament and the Chancellor for the achievement of military policy objectives.

The defense of Ukraine is based on the preparedness and ability of the state authorities, all elements of the security and defense sector of Ukraine, the local government authorities, the civil defense system, and the national economy to repel armed aggression (or to prevent an armed conflict). Preparation of the state for defense in time of peace includes forecasting and assessing the military threat and conducting intelligence, as well as informational and analytical activities to prepare the state for defense (Law on Defense of Ukraine 1992). In order to organize the defense of the state, the President of Ukraine, upon a request of the Cabinet of Ministers of Ukraine, approves the defense plan and the military-administrative division of the territory of Ukraine. The President of Ukraine exercises the powers of the commander-in-chief of the armed forces of Ukraine and issues decrees in the area of defense. The National Security and Defense Council of Ukraine coordinates and controls the activities of the executive authorities in the field of defense (Act on the National Security and Defense Council of Ukraine 1998). The Minister of Defense of Ukraine, as the central executive authority, ensures implementation of the state policy in the area of defense, defense and mobilization readiness, combat capability, and preparation of the armed forces to perform their functions and tasks (Act on Defense of Ukraine 1992).

The Act of the Russian Federation on defense provides that “Defense is organized and conducted in accordance with the Constitution of the Russian Federation, the federal constitutional laws, this federal law, the laws of the Russian Federation, and other statutory acts.” The Act gives the President of the Russian Federation the right to define the main directions of the Federation's military policy and leadership over the armed forces, which means that, with regard to organization of defense, the President has the right to approve decisions on the concept and development plans of the armed forces and to approve a number of undertakings in the field of state defense. In the area of defense, the Government of the Russia takes steps to ensure defense and is responsible for the state of the armed forces. Within its powers, the government organizes the equipment of and supplies to the armed forces, develops and implements the state armament program, organizes the development of mobilization plans (Federal Act “On Defense” 1992).

State Defense Planning

The defense plan of the Republic of Belarus includes a collection of mutually agreed military planning documents, the development of which takes place in accordance with the regulation on military planning, approved by the President of the Republic of Belarus and developed by the General Staff of the Belarusian Armed Forces (Act of the Republic of Belarus “On Defense” 1992). Therefore, it is the President who approves the defense plan of the Republic of Belarus, and many

other documents concerning the defense organization, which include plans for the formation, development, and use of the armed forces, the civil defense plan, and the regulations concerning territorial defense (Act on the President of the Republic of Belarus 1995). The President is also responsible for approving the mobilization plans and the plan to accumulate material reserves for mobilization purposes, which the Council of Ministers submits to the President for approval (Act on the Council of Ministers of the Republic of Belarus 2008). Proposals concerning the organization of strategic state defense planning, the use of the armed forces, are presented by the General Staff. The Ministry of Defense is a governmental body which, within the scope of its competence, participates in the development of long-term state programs in the interest of defense and the state armaments program (Presidential Decree on the Ministry of Defense 2006, Act of the Republic of Belarus "On Defense" 1992).

Defense planning in the Czech Republic means a set of forces and measures anticipated to ensure sovereignty, territorial integrity, democratic principles, and the rule of law, to protect the lives of people and their property from an external attack, and to fulfil commitments for joint defense, including the participation of the armed forces in international organizations for peace. State defense plans include defense planning, operation planning, mobilization planning, and state defense readiness planning. As in the Republic of Belarus, the President of the Czech Republic is the commander-in-chief of the armed forces; however, the planning of the state defense is the responsibility of the Government of the Czech Republic. (Constitution of the Czech Republic 1992). The government manages the process of state defense planning and defines the content of individual defense plans and the time frame (stages) for their preparation. The ministry is also responsible for planning and ensuring the operational preparation of the national territory, supplementation of the armed forces, and mobilization. To this end, it coordinates the cooperation of relevant ministries, local and regional authorities, and other administrative bodies and local government units (Act on defense of the Czech Republic 1999). The Department of Defense Capability Planning is an organizational unit of the Ministry of Defense, which is responsible for development of the Defense Strategy of the Czech Republic and managing the defense planning tasks (government regulation on state defense planning 2017).

The Act of the Russian Federation “On defense” provides that in order to plan and implement measures in the area of defense, a defense plan of the Russian Federation is developed, which contains a set of associated military planning documents. Preparation of the documents contained in the Russian Federation's defense plan is carried out in accordance with the ordinance on military planning (federal act of the Russian Federation "On defense" 1996; presidential decree "On the defense plan of the Russian Federation" 2015). The defense plan of the Russian Federation is submitted to the President by the Minister of Defense, together with other plans (and concepts) that he or she is responsible for the preparation of(presidential decree on the "Ministry of Defense of the Russian Federation" 2004). The implementation of the defense plan of the Russian Federation is approved by a presidential decree. It can be clearly concluded that the planning powers of the President of the Russian Federation are very broad, which is due to his position in the system of state authorities.

In the Republic of Lithuania, organization, development, armament needs, and division of the armed forces are approved by the Seimas. Defense planning is carried out as a part of long-term programs of foundations of national security. The Government submits to the Seimas a draft plan for the preparation of long-term programs for the foundations of national security, in agreement with the President of the Republic of Lithuania (National defense system development program 2006-07-04). National security programs are implemented through strategic planning documents and the implementation of the programs is coordinated by the government. The minister of defense is responsible for strategic planning concerning development of the defense system and the defense capabilities of the armed forces, preparation of the armed forces and other institutions of the defense system (Act on national security of the Republic of Lithuania 1996). In the ministry of defense, planning tasks are carried out by the Defense Planning Department (Act of the Republic of Lithuania on the organization of the national defense system and military service 1998; Strategic action plan 2020-2022).

Defense planning in the Slovak Republic is a set of actions through which the competent state authorities create short-term (1-2 years), medium-term (3-6 years), and long-term (10-15 years) plans (Act on defense of the Slovak Republic 2002). The government of the Slovak Republic manages the process of defense planning and approves the guidelines for defense planning, approves the concepts of the state defense system, submits to the National Council of the Slovak Republic the drafts of the state security and defense concepts (Constitutional act on state security in time of war and emergency 2002). All activities related to defense preparations are coordinated by the ministry of Defense. An important role in the defense planning process, as an advisory body, is played by the Security Council, which comprises the Defense Planning Committee and the Civil Planning Committee. (Act on the functioning of the Security Council of the Slovak Republic in peacetime 2004).

The Act "On national security of Ukraine" provides that defense planning is an integral part of the state's strategic planning system. National security and defense planning is divided into long-term (over five years), medium-term (up to five years), and short-term (up to three years) planning. The Defense plan of Ukraine is an integral part of the defense planning and contains a set of documents that specify the content of the procedure and other state measures necessary for preparation for and conduct of armed defense. The procedure for developing the defense plan for Ukraine is defined by the Cabinet of Ministers of Ukraine and the President approves the Ukrainian Defense plan. The Ministry of Defense of Ukraine is the body that ensures the creation and implementation of the state policy on national security in the military sphere. The General Staff of the Armed Forces of Ukraine is the main military body responsible for planning of state defense and for coordination and control of implementation of defense tasks by executive authorities and local government bodies (Act on defense of Ukraine 1992).

Conclusions

In conclusion, each of the countries analyzed herein pays particular attention to defense matters and the powers of the authorities in the field of defense are defined in the sources of law. However, there are noticeable differences in the powers of the legislative and executive branches of the government, with three different positions. In Russia, Belarus, and Ukraine, it is the president who has considerable powers related to the defense of the state and the armed forces. In Slovakia, the Czech Republic, and Lithuania, defense powers are divided between the parliament, the president, and the government. In Germany, on the other hand, the defense and armed forces matters fall within the competence of the parliament and the federal government.

When considering the term "national defense," it should be noted that most often the translations of this term are found in the acts on defense of individual states. Nevertheless, there are noticeable differences. In Belarus, Russia, and Ukraine, the laws define this term similarly, referring to the system of state resources in preparation for armed defense and protection of the state in the event of aggression or armed conflict. In two other countries - the Czech Republic and Slovakia - there is a similar understanding of the term "defense," as a set of measures, but referring to the assurance of certain values: the international law, the conditions of state security, and the system of government of the state. Two other approaches are present in the laws of Lithuania and of Germany. The understanding of this concept in the Lithuania - similarly - refers to the above-mentioned values, but it also defines the nature of the defense as universal and total. In Germany, the term "defense" covers more than the traditional defense against aggression. It also covers conflict and crisis prevention, crisis management, and joint actions in crisis situations.

Directing the defense of the state is understood as a process carried out in peacetime in a continuous, multidimensional way, which involves the state authorities, the armed forces, the administrative structures, and the economy. In countries, the parliaments have a scope of competences that, in principle, is limited to the adoption of legal norms and concern the defense of the state. The competences of presidents concerning defense in the analyzed countries vary. In countries such as Russia, Belarus, and Ukraine, the president's powers related to defense are broad, while in the Federal Republic of Germany the president's powers in this matter are limited. In turn, in the Czech Republic, Slovakia and Lithuania the president's powers are similar. In terms of organization and planning of

state defense, the governments of different countries have a particularly important role to play, as this area of activity remains at the interface between the competences of the president and of the respective defense ministers, who often report to the president. The defense competences of individual governments are basically similar and related to the planning and implementation of the state's defense preparations to ensure its functioning in the event of an external threat to state security and during a war.

To sum up, the powers presented herein of the authorities and the administration bodies in the area of defense in the countries neighboring Poland are aimed at ensuring efficient functioning of the defense system, and thus guaranteeing the security and effective defense of the state.

The Impact of Declaring A "State of Epidemic" On Fiscal Sustainability in Poland

Wojciech BOZEK

University of Szczecin, Szczecin, Poland

wojciech.bozek@usz.edu.pl

Abstract

Poland's current economic situation is changing dynamically which is affected i.a. by political decisions associated with the introduction of extraordinary measures and the already announced state of epidemic. In the Polish legal order constitutional extraordinary measures include martial law, a state of emergency and a state of a natural disaster. Introduction of one of the above constitutional measures affects the application of government debt brake mechanisms, but in a manner established by statute. The state of epidemic is not a constitutionally defined state. Nevertheless, announcing it measurably affects public expenditure and revenue. The impact of the state of epidemic is definitely unfavourable also from the point of view of the 60% government debt-to-GDP ratio. On the basis of statistical data, the author will demonstrate the dynamics of state public debt (SPD) and its relation to the GDP in 2015-2019. This will make it possible to establish to what degree the introduction of the state of epidemic may affect the security of the public finance sector in the context of the government debt limit in subsequent financial years. The issues analyzed carry exploratory importance and gravity. Various research methods are employed in the study: examination of applicable laws, analysis, legal comparison. Research methodology is based not only on the analysis of the Polish and EU legal order, but also on the views of legal scholars and commentators and data published in official documents of the Minister of Finance. Adopting a different research methodology would make the assessment not comprehensive.

Keywords: State of Epidemic, Extraordinary Measures, Government Debt.

Introduction

The universal proverb, allegedly coined by Hippocrates, which reads: *morbum evitare quam curare facilius est* („an ounce of prevention is worth a pound of cure") captures important principles of rational action based on thorough analysis of circumstances and assessment of possible negative consequences of belated actions. It is thus a proverb or a principle that should be in the minds of public authorities when they take financial decisions, in particular in the current, highly challenging economic and political situation. Polish public finance has been profoundly affected by the Corovid-19 pandemic. The prudential and remedial measures implemented in the Polish legal order aimed at containing the pandemic contribute to economic slowdown (GDP dynamics), the plummeting of state revenue (in particular slump in tax revenues, government levies and social security contributions), and the simultaneous increase of general government expenditure. At the moment, Poland's fiscal sustainability is being threatened, and it seems that the budget balance planned for 2020 will not be achieved for the first time in the history of free Poland, that is post-1989.

Today, when the coronavirus pandemic is sweeping the world, public authorities should do put their best efforts to use the existing public funds in a way that produces best possible outcomes. Therefore, financial and legal instruments tied with fiscal rules should be treated pragmatically. By embedding the EU debt-to-GDP ratio in the Constitution, the Polish legislator has introduced a stricter budget discipline and increased compliance with the fiscal rules of the EU legal order.

Public finance stability and sustainability is safeguarded by a constitutional provision expressed in art. 216(5) of the Constitution of the Republic of Poland (Constitution). However, the rule does not apply fully in a state of exception, i.a. when extraordinary measure are implemented in the country as

stipulated in Poland's basic law. However, a pandemic does not fall into the definition of any of the aforementioned states. Consequently, from the formal point of view, public debt brake mechanisms should not be in any way suspended. Poland's public debt exceeds 1 trillion PLN, and the biggest chunk of it is state treasury debt(Table 1). It should be noted that most actions and measures taken amidst what was declared as the state of epidemic in Poland will be financed by government budget, which will significantly affect the budget balance in 2020.

Constitutional state of exception and public finance stability

Pursuant to the rule expressed in art.216(5) of the Constitution of the Republic of Poland of 2 April 1997 (Journal of Laws 1997, No 78, item 483 as amended (Constitution)), it is not permissible to contract loans or provide financial guarantees in result of which government debt would exceed 3/5 of annual GDP. Importance of this constitutional rule is proven by the fact that the breaching of it – as an absolute, normative solution – is tantamount to violation of the basic law, which in turn shall result in a judicial investigation into the responsibility of relevant high officials whose decisions have led to violation of the threshold (Dębowska-Romanowska, 2010, p.118-119). In the case law of the Constitutional Tribunal (CT), a line of interpretation has formed which can be narrowed down to the opinion that the legislator treats the maintenance of budget balance and public finance stability as constitutionally protected values (CT judgment, 5. 1/2012; Ofiarski, 2010, p. 199-200). Counteracting excessive government debt is yet another value protected by the Constitution (CT judgment, case K. 40/2002). Each of the aforementioned ranks very high in the hierarchy of constitutional values. The state's capacity to act and solve its problems depends on the implementation of these values in public life (Chojna-Duch, 2012, p. 79; CT judgment, case K, SK 36/2007). However, this does not mean that this general rule is not subject to certain limitations embedded also in the Constitution. Art. 228(1) of the Constitution provides that in situations of particular danger, when ordinary constitutional measures are inadequate, any of the extraordinary measures may be introduced, i.e. martial law, a state of emergency or a state of natural disaster. The purpose of introducing any of the above measures is to restore the state's normal functioning as swiftly as possible. It should be mentioned here that both the rules governing the functioning of public authorities and the scope in which citizen and human freedoms and rights can be limited during any of the aforementioned states of emergency, as stipulated by the act (Ofiarski, 2010a, p. 63).

Extraordinary measures, i.e. states of exception are defined in more details in acts of ordinary legislation. These include, i.a. the Act of 29 August 2002 on the Martial Law and competence of the Commander-in-Chief and his subordination to the constitutional authorities of the Republic of Poland (Journal of Laws 2017, item 1932), Act of 21 June 2002 on the State of Emergency (Journal of Laws 2017, item 1928) and the Act of 18 April 2002 on the State of Natural Disaster (Journal of Laws 2017, item 1897).

The first state of exception enumerated in art.228(1) of the Constitution is martial law which is introduced in the event of external threat to the state. The threat may be caused by terrorist activity, any cyber attack and an armed invasion on the territory of Poland, or else, the state is obliged by international agreements to join in common defense against aggression. Martial law can be introduced in part or across the entire territory of a country. In contrast, a state of emergency should be introduced in the event of an exceptional threat to the constitutional system of the country, the safety of its citizens or the public order (including threats caused by acts of terrorism or acts of cyber war which cannot be removed by ordinary constitutional measures). The last extraordinary measure is a state of natural disaster which is introduced to remedy the impacts of natural disasters or technical breakdowns that trigger similar effects, and to remove their source.

To recapitulate, it must be emphasized that extraordinary measures are exceptional, and should be regarded as states of exception. The legislator provided for rules governing emergency declarations and their consequences, i.e. the principle of legality, purposefulness, proportionality, protection of the foundations of the legal system and protection of representative bodies (Prokop, 2005, p. 17-18). These principles are to be unconditionally followed when declaring any of the three aforementioned states of exception. In the financial and legal literature on the subject, extraordinary measures are

defined as institutions of internal law which impose limitations on the freedoms and rights of an individual and empower the government to dissent from the way power is exercised as set out in the Constitution. It is legitimized by the occurrence of exceptional threat and the necessity to counteract it (Banaszak, 2009, p. 976).

The state of epidemic from the legal and financial perspective

From the normative perspective, the „state of epidemic" as declared in Poland on 20 March 2020 should be understood as a special legal order implemented within a certain territory in response to the epidemic outbreak and with the objective to take specific preventive and anti-epidemic measures to minimize the impact of the epidemic. This state of epidemic should not be equated with the state of epidemic threat, as the latter is defined as a special legal order implemented in a certain territory in response to the risk of epidemic with the aim to take specific preventive measures.

In the event of a state of epidemic being declared, decisions that will have significant financial consequences need to be taken. The list of ways in which public funds can be spent (not only from the government budget) to contain and counteract an epidemic is long. To illustrate it, just one act, that is the Act of 5 December 2008 on preventing and combating human infections and infectious diseases (Journal of Laws 2019, item 1239) enumerates the following spending:

1) costs of programs related to the prevention and control of specific contagions or contagious diseases (art. 4(2)),
2) costs of epidemiological tests (art. 8(1)),
3) costs of verification of laboratory tests for the purposes of epidemiological supervision (art. 9(4)),
4) costs of conducting mandatory vaccinations, medical qualification examinations and specialist consultations (art. 18 (2)(3)(7)),
5) costs of purchase of medical supplies, e.g. vaccinations and other immunological medications applied in the event of epidemic threat or epidemic (art. 18a(3)),
6) costs of conducting recommended vaccinations, medical qualification examinations and specialist consultations of citizens with state health insurance coverage (art. 19(3)),
7) costs of participation in the Sentinel Surveillance System (art. 29a(3)),
8) costs of health services provided in order to combat infections and infectious diseases and costs of health services that arose in result of these infections and infectious diseases (art. 38(1)),
9) costs of safeguarding products, appliances, equipment or apparatus (art. 46d(7)),
10) costs of transportation of e.g. medications, dietary food supplies, medical goods and personal hygiene goods (art. 46e(2)),
11) costs of health benefits provided by the state in result of the epidemic (art.47(12)).

Except acts of ordinary legislation, executive acts also address various issues related to the state of epidemic (Regulation of the Minister of Health of 13 March 2020 on the state of epidemic threat, Journal of Laws 2020, item 433 as amended, Regulation of the Minister of Health of 16 September 2010 on recommended vaccinations and the manner in which vaccinations required under international medical regulations should be funded and documented, Journal of Laws 2010, No 180, item 1215). These executive acts prove that the state of epidemic needs to be approached in a comprehensive way as many of the statutory regulations have been clarified and pinpointed more precisely in executive acts, a fact that may affect total public spending related to the state of epidemic.

The condition of Poland's public finance is presented in Table 1. As the Table shows, government debt was rising over the study period (excluding 2016-2017), and the largest part of the debt was State Treasury debt. It should be borne in mind that state budget will cover spending related to the declaration of a state of epidemic as outlined hereinabove, which will definitely increase government debt in 2020. Considering the SPD to GDP ratio in 2018, it can be projected that the constitutional debt limit in 2019 will not be crossed, however, the actual effects of the poor economic situation and the SPD dynamics will be evident only in 2020.

Table 1: Public finance sector debt-to- GDP and State Treasury debt in the 2015-2019 (3rd quarter) period

year	public finance sector debt (in billion PLN)	State Treasury debt	Share of State Treasury debt in public debt	SPD/GDP (in %)
2015	877,3	834,6	95,13%	49
2016	965,2	928,7	96,22%	52,1
2017	961,8	928,5	96,54%	48,5
2018	984,3	954,3	96,95%	46,5
2019*	1001,2	987,6	98,64%	no data

** as of the end of the 3rd quarter of 2019.*

Conclusion

Rational management of public funds is a priority of public authorities since fiscal sustainability related to the revenue to expenditure ratio attracts potential investors and enhances economic stability of Poland.

Nonetheless, fiscal sustainability is not an absolute overriding good in the hierarchy of values protected by the Constitution. There is the need to "harmoniously reconcile" all constitutional values (CT judgment, case K 2/00). Therefore, although fiscal sustainability and the condition of public finance are constitutionally protected values, this protection is not absolute and it is not overriding in relation to other constitutional values (CT judgment, case K 47/01). For example, art. 88 of Act of 27 August 2009 on Public Finance (Journal of Laws 2019, item 869 as amended, PFA) provides that the prudential and remedial procedures shall not be applied in the event one of the three extraordinary measures is introduced. Implementation of the aforementioned measures is fully justified by the concern to adhere to constitutional values such as, i.a. country's autonomy, territorial integrity, human and citizen freedom and rights, citizens' safety. The provisions of art. 86 PFA are stringent and it would be difficult to reconcile them with the obligation to apply limitations imposed under each of the three extraordinary measures (Misiąg, 2019, Legalis thesis 2) since additional public funds would have to be employed. Similarly, implementation of the state of epidemic, though it has not been classified as a constitutional state of exception, will trigger increased public spending, and thus, increased foreign borrowings which in turn will translate into increased SPD level in the future, which, given the economic development slowdown, may negatively affect the debt-to-GDP ratio.

The preventive measures in form of fiscal rules implemented by the Polish legislator in Polish legal order must be deemed a wise solution. Undoubtedly, absence of cost saving measures would threaten the stability and security of public finance.

Abstract

The paper deals with the evaluation of a new type of coronavirus, called WHO as COVID-19, by means of soft computing. Specifically, the fuzzy logic supported by neural networks is chosen, which serves to create a knowledge base of rules on the basis of which the model is evaluated. For analysis, European countries have been selected, to which the coronavirus has spread from the Wuhan epicenter in China, where a further outbreak of infection has subsequently emerged. Input variables such as area, population, density and tourism are chosen for the model. The output of the model is a normalized number of infected persons. Based on the output of the fuzzy model, we can say whether the country is high, medium and low threats country.

Introduction

The new coronavirus caused an outbreak of viral pneumonia in Wuhan, China in December 2019 by Chan et al. (2020). The World Health Organization (WHO) has now named Coronavirus Disease 2019 (COVID-19). Most patients worked at the local Huanan seafood wholesale market or lived there where live animals were also sold. In the early stages of this pneumonia, severe symptoms of acute respiratory infection occurred. Patients have clinical manifestations including fever, cough, dyspnoea, muscle pain, confusion, headache, sore throat, nasal discharge, chest pain, diarrhea and nausea and vomiting according to Hui et al. (2020). On 25 March 2020, a total of 375 498 confirmed cases, 16 362 currently deaths and affected are a total of 195 countries, areas or territories reported by the WHO. Transmission risk assessment and the epidemic trend of COVID-19 are very important as they can alert vigilance policy makers, healthcare professionals and society as a whole, so that sufficient resources can be mobilized quickly and efficiently for both control and treatment.

In recent decades, two other new coronaviruses (CoVs) have emerged as major global epidemics; in 2002, severe acute respiratory syndrome coronavirus (SARS-CoV) spread to 37 countries, causing more than 8000 cases and nearly 800 deaths, and in 2012 coronavirus respiratory syndrome in the Middle East spread to 27 countries, causing 2,494 cases and 858 deaths worldwide to date. These CoVs are zoonotic and have low potential for sustained community transmission. However, larger clusters involving supernatural events were observed for SARS in 2003 and MERS in 2014-17 according to Wu et al. (2020). Symptomatic cases of both viruses usually occur with moderate to severe respiratory symptoms, which often progress to severe pneumonia. A remarkable common feature of both SARS-CoV and MERS-CoV is that they have low potential for sustained intra-community transmission. The most worrying aspect, however, is the ability of viruses to cause unusually large bursts of cases through excessive spread, which can exceed 100 individuals and is apparently deployed in a single index case.

As COVID-19 is no longer included in Wuhan, other major Chinese cities are likely to maintain localized outbreaks. Large overseas cities with close transport links with China have also become an

epicenter of the outbreak, especially Italy. An independent stand-alone epidemic in major cities around the world could become inevitable due to the considerable export of presymptomatic cases and in the absence of widespread public health interventions, as Wu et al. (2020).

Theoretical Background

Human history is full of wars and pandemics, but death and fear caused by some pandemics cannot be matched by any war. The one with the highest death rate in recent human history, the Spanish influenza caused by the H1N1 influenza A virus, infected 500 million people (nearly 1/3 of the world's population in 1918 (Taubenberger and Morens, 2006) and killed 25 to 50 million people. In the 21st century, human epidemics caused by viruses still appear in public. Among them, new infectious diseases caused by infections of wild animal coronaviruses in humans have attracted the most attention, reminding us that people should be fully prepared to respond to a larger pandemic that may occur at any time in the future.

Coronaviruses of wild animal origin have caused 3 serious infectious diseases in humans in less than 20 years. The first infectious disease was reported in November 2002 in Guangdong province in China according to Ahmad et al. (2009). Although the source of the virus has not yet been identified, the disease has spread rapidly and has infected many healthcare professionals. On 21 February 2003, an infected doctor from Guangdong traveled to Hong Kong, leading to the worldwide spread of the virus (Tsang et al., 2005). Only on 15 March, after the World Health Organization (WHO) received reports of cases from Guangdong, Hong Kong and Hanoi, was there a worldwide warning about the disease, officially named "Severe Acute Respiratory Syndrome (SARS)". The pathogen originated from bats (Wang et al., 2006) and the transient host was a masked palm tree (Hu et al., 2017). At the beginning of the epidemic, the international community had no experience of reducing this type of outbreak and the disease was not officially diagnosed. within 146 days after the first case occurred (Fouchier et al., 2003). From April to May 2003, the Chinese government set up a comprehensive prevention network, allocated 2 billion yuan to prevent epidemics, built a temporary Xiaotangshan hospital and actively treated patients. Given the low coverage of modern communication networks, there was difficulty in transmitting information. However, the epidemic response was generally satisfactory (Pang et al., 2003). the first outbreak of SARS (November 2002 to July 2003) was successfully halted thanks to worldwide cooperation (Parashar and Anderson, 2004), the worldwide spread of SARS (SARS-CoV) coronavirus still caused 8447 cases and 774 deaths in 32 countries, according to Pan et al. (2020).

The second infectious disease was MERS-CoV in 2012. It occurred in Saudi Arabia and spread to other countries including the United States, England, France and South Korea. The mortality rate was up to 34.4 %. By the end of November 2019, a total of 2468 people were infected worldwide. Research suggests that this coronavirus originates from bats and has been transmitted to humans through an intermediate host, the camel (Memish et al., 2013).

On December 31, 2019, China reported cases of unknown etiology of pneumonia (unknown cause) found in Wuhan, Hubei Province, China. A new type of coronavirus has been identified by the Chinese authorities and was isolated on 7 January 2020. Since 20 January 2020, 282 confirmed cases of 2019-nCoV have been reported from four countries including China, Thailand, Japan and the Republic of Korea. Since January 23, 2020, cases infected in China have been exported to other countries in the world. The initial 2019-nCoV source still remains unknown. WHO is proposing '2019-nCoV' as an interim name of the virus. On 12 February 2020 excluding China, there are 24 countries reporting cases of COVID-19. Among these 24 countries, 23 report cases with exposure in China. In addition, 11 of these 23 countries report cases attributed to local transmission within the reporting country. Four of the 24 countries report cases where likely exposure occurred outside the reporting country and outside China. Among these four reporting countries most likely countries where exposure occurred were France, Germany, Japan and Singapore. All transmissions occurred within known defined clusters. As of 27 February 2020, 41 States Parties have provided WHO official reports on additional health measures that significantly interfere with international traffic under Article 43 of the International Health Regulations. Most of these measures are related to the refusal of entry for travelers originating in China or from countries reporting on ongoing COVID-19 transmission. 11 March 2020 WHO therefore have made the assessment that COVID-19 can be considered as a pandemic. However,

evidence to date suggests that two groups of people are more at risk of serious COVID-19. They are older people; and those with underlying medical conditions. Europe has now become the epicenter of the pandemic, with more reported cases and deaths than the rest of the world combined, apart from China.16 March 2020 the total number of cases and deaths outside China has overtaken the total number of cases in China. More cases are now reported each day than reported in China at the height of the epidemic. (WHO, 2020)

Adaptive Neuro-Fuzzy Inference Systém

Adaptive neuro-fuzzy inference system (ANFIS) is a combination of artificial neural network (ANN) and fuzzy inference system (FIS). Thanks to its design, ANFIS can benefit from both soft computing techniques, but also overcome their shortcomings. Compared to ANN, the ANFIS model is more transparent to users and causes fewer errors in remembering. As a result, there are several advantages of ANFIS, including adaptive ability, nonlinear ability and rapid learning capability. Neural networks can easily learn from data. However, it is difficult to interpret the acquired knowledge as a meaning associated with every neuron and every mass that is quite difficult to understand. In contrast, as described by Mathur et al. (2016), fuzzy logic itself cannot learn from the data. However, fuzzy models are easy to understand because they use linguistic terms rather than numeric and IF-THEN rules structure. Language variables are defined as variables whose values are words or sentences in natural language with associated degrees of membership. The fuzzy set to which the linguistic variables belong is an extension of the crisp set where the element can have full or no membership. However, fuzzy sets also allow for partial membership, which means that an element may partially belong to more than one set see Janková (2019).

ANFIS constructs a fuzzy inference system (FIS), whose parameters of membership function are derived from training examples. The most commonly used fuzzy inference systems are Mamdani and Sugeno. The main difference between Mamdani and Sugeno is that the output function of the Sugeno membership is either linear or constant (Arkhipov et al., 2008). However, the output functions of the Mamdani membership may be triangular, Gaussian, etc. In this study, the Sugeno type fuzzy inference system was used because the Sugeno system is more computationally efficient than the Mamdani type. Mamdani is more dependent on expertise. However, the Sugeno type is trained with real data, as it adds Şahin, Erol (2017).

Fig. 1: Basic structure of ANFIS.

Mathur et al. (2016) describe the ANFIS model. In ANFIS, the crisp input signal is converted to fuzzy inputs using the membership function. The fuzzy input together with the membership function are then fed to the neural network block. A neural network block consists of a rule base that is connected to an inference engine. Back propagation algorithm is used to train the inference engine to select the right rule base. After training, appropriate rules can be generated and omitted from the neural network block

to provide optimal output. The language output from the neural network block is then converted to a crisp output by means of a decryption unit. The structure of the neuro-fuzzy model consists of different adaptive layers. Each of these layers has nodes with an associated network of transfer functions through which the fuzzy inputs are processed. The output from these nodes are then merged to give a single crisp output, since the ANFIS configuration allows only one model output. This crisp output is feedback as an input to the model and compared to the set value. If any deviation occurs, the error signal thus generated becomes an input to ANFIS, maintaining stability in the system.

Yilmaz (2003) describes the ANFIS structure as follows: A neural network consists of 5 layers in addition to the input layer (Layer 0).

Layer 0: The input layer has *n* nodes, where *n* is the number of inputs to the system.

Layer 1: A fuzzification layer in which each node represents a value of membership to a linguistic concept represented by a mean value membership function:

$$\mu Ai(x) = \frac{1}{1 + \left[\frac{x - ci}{ai}\right]^{2bi}} \tag{1}$$

where ai, bi, ci are the parameters of the membership function. These are adaptive parameters. Their values are adjusted through the back propagation algorithm during the learning phase.

Layer 2: The rule layer provides rule strength for each node using a multiplication operator. Performing min (AND) operations. Represented values of the membership $\mu Ai(x_0)$ and $\mu Bi(x_1)$ are multiplied to find the rule power, where the variable x_0 has the linguistic value Ai, and x_i has the linguistic value Bi in the antecedent portion of rule *i*. There are p^n nodes indicating the number of rules in layer 2. Each node represents an antecedent part (if part of and if-then rule) of the rule. Here *n* is the number of input variables and *p* is the number of membership functions.

$$wi = \mu Ai(x_0) * \mu Bi(x_1) \tag{2}$$

Layer 3: Is a normalization layer that normalizes the strength of all rules according to the following equation:

$$\overline{w_i} = \frac{wi}{\sum_{j=1}^{R} wj} \tag{3}$$

where wi is the force i^{th} of the rule that was calculated in layer 2. The node *i* calculates the ratio of the force of this rule to the sum of all the rules. In this layer there are nodes p^n.

Layer 4: Is a layer of adaptive nodes. Each node in this layer calculates a linear function where the coefficients are adjusted using a multi-layer feed-forward neural network.

$$\overline{w_{ifi}} = \overline{w_i}(p_0 x_0 + p_1 x_1 + p_2) \tag{4}$$

p_i's are parameters where $i = n + 1$ and *n* is the number of inputs to the system (i.e. the number of nodes in layer 0). This equation was given for two inputs. Finally $\overline{w_i}$ s output from layer 3. These parameters are updated by the learning step. The least squares approximation is used in ANFIS. In the temporal model, back-propagation algorithm is used for training.

Layer 5: Output layer whose function is the sum of the net outputs of nodes in layer 4. The output is calculated according to:

$$\sum_i \overline{w_{ifi}} = \frac{\sum_i wifi}{\sum_i wi} \tag{5}$$

where $\overline{w_{ifi}}$ is the output of node i in layer 4. This indicates the consequent part of rule i. The overall output of the neuro-fuzzy system is a summary of rule consequents.

Among the advantages of ANFIS is the robustness of the results generated by the model. ANFIS, like neural networks, is capable of generalization. Also, ANFIS is able to take crisp output and represent it in the form of membership and fuzzy rule functions, from which it generates crisp output. It is a very promising tool that needs to be explored in solving various non-linear and complex problems. However, as further described by Salleh et al. (2017) ANFIS computational costs are high due to complex structure and gradient learning. This is a significant problem especially for large input applications. In general, constraints are: a) type and number of membership functions, b) location of membership function, c) the curse of dimensionality. In addition, a compromise between interpretability and accuracy is considered a major problem with this system. In the context of ANFIS's interpretability with grid partitioning, it creates a large number of rules that model users may not understand easily and easily. Interpretability is therefore compromised, although a large number of rules contribute to improving model accuracy. As the authors further state, ANFIS works well when there are no more than five inputs.

Research Methods

The aim of this paper is to create a fuzzy model for evaluation of a new type of coronavirus called COVID-19 in European countries. The created fuzzy model is supported by neural networks, according to the procedure above, which sets the rules to evaluate the fuzzy model. Variables and parameters that can potentially detect the numbers infected in each country are chosen for the model. Specifically, input variables such as country size, population, population density - as coronavirus spreads from person to person and tourism - in particular the number of tourists per year and the number of non-European passengers per year visiting a particular country are selected. The spread of coronavirus in such a massive way is mainly attributed to the free movement of persons and easy transfer across continents.

Examined Set

A fuzzy inference system is used to evaluate a new type of WHO named coronavirus as COVID-19. The affected European countries are chosen for the fuzzy model.

Table 1: Examined Set

Country	Area (km^2 x 10^3)	Population (number x 10^6)	Density	Tourists (mil.)	Passengers (mil.)
Italy	301	58.1	193	211	153
Germany	357	82.3	231	83	222
Czech Republic	79	10.5	133	26	18
Austria	84	8.2	98	86	31
Belgium	30	10.4	347	19	34
Netherlands	41	16.7	407	44	80
France	547	62.1	114	134	162
Spain	505	40.5	80	306	220
Poland	313	38.5	123	16.7	44
Slovakia	49	5.5	112	5.3	3
Hungary	93	9.9	106	14.9	15

Specifically, 11 European countries such as Italy, Germany, Czech Republic, Austria, Belgium, Netherlands, France, Spain, Poland, Slovakia and Hungary are selected. A total of five input variables are selected for the fuzzy model, as shown in Table 1. These are the size of the country in km^2, the total population, density per km^2, the number of tourists visiting that country per year, and the number of passengers visits the country from outside Europe.

Figure 2 shows the current situation (as of March 25, 2020) of the COVID-19 infection worldwide. It is apparent that after China, which is referred to as an epicenter, the dangerous virus spread substantially to European countries where it has developed a pandemic and the epicenter has moved. To date, Italy has recorded 69,176 infected, followed by Spain with confirmed cases of 39, 673, Germany 31, 554 and France 22,025. In other European countries, the epidemic has so far not exceeded more than 6, 000 infected people.

Fig. 2: COVID-19 Confirmed Cases with 100+ cases highlighted in red.

Figure 3 shows the development of the number of infected in the analyzed countries. It is clear that Italy was first hit, followed by Spain, Germany and other countries. The enlargement between European countries was mainly due to the free movement of persons. Especially thanks to travelers and people returning from their stay skiing in mountains.

Fig. 3: COVID-19 Confirmed Cases by Country.

Proposed Model

A fuzzy inference system (FIS) type Takagi-Sugeno is created with five input variables and one output variable predicting normalized number of infected people in European countries. Gaussian membership functions are the best fit for their nature. Created FIS is divided into three attributes (LOW, MEDIUM, HIGH). The FIS is based on the above procedure using the Takagi-Sugeno type:

- Input 1 = Area
- Input 2 = Population
- Input 3 = Density

• Input 4 = Tourists
• Input 5 = Passengers

• Output = Number of infected people

From the description of the fuzzy sets we can see that the annual area in km^2 x 10^3 (input 1) of Italy belongs to the membership function with the attribute medium to high. For this reason, we can trap the linguistic term medium and high for Italy in fuzzy proximity relation. The situation is different for Czech Republic. In terms of area, this country belongs to the fuzzy set small, but also to the fuzzy medium set, as the area of the Czech Republic is, according to available information, 79 thousand km^2. Similarly, for example, density (input 3). For Italy, the population density according to the fuzzy attributes of the Gaussian function of membership is at the medium level, since the size of this variable for the country is 193 people per km^2. By contrast, Hungary shows the population density according to the fuzzy set and the set attributes small. For Spain, the number of travelers from ex-EU countries per year (input 5) is high, according to the available information, since the number of passengers per year in this country is 220 million. from countries outside the EU only 44 million a year, which means that this country belongs to the fuzzy attribute small. Fuzzy proximity relation is defined in Table 3. Now all attributes are ready to extract fuzzy functional dependencies and their language interpretation.

Table 2: Fuzzy proximity relation

Country	Area (km^2 x 10^3)	Population (number x 10^6)	Density	Tourists (mil.)	Passengers (mil.)
Italy	{medium, high}	{medium, high}	{medium}	{medium, high}	{medium, high}
Germany	{medium, high}	{high}	{medium}	{medium}	{high}
Czech Republic	{small, medium}	{small}	{small, medium}	{small}	{small}
Austria	{small, medium}	{small}	{small}	{small,medium}	{small}
Belgium	{small}	{small}	{high}	{small}	{small}
Netherlands	{small}	{small, medium}	{high}	{small,medium}	{medium}
France	{high}	{high}	{small}	{medium, high}	{medium, high}
Spain	{high}	{medium, high}	{small}	{high}	{high}
Poland	{medium, high}	{medium, high}	{small, medium}	{small}	{small, medium}
Slovakia	{small}	{small}	{small}	{small}	{small}
Hungary	{small}	{small}	{small}	{small}	{small}

The proposed model uses Takagi-Sugeno rules in the form of IF-THEN, which are generated by the adaptive neuro-fuzzy inference system. ANFIS created a total of 243 rules. Output values are represented by normalized number of infected people in selected countries.

The created ANFIS model uses the hybrid learning (training) algorithm. This learning algorithm, as reported by Loganathan, Girija (2013), combines the least-squares estimator and gradient descent method. Initially, each fuzzification neuron is assigned initial functions in the form of Gaussian distribution with certain parameters. During the training process, the training data set is presented to the ANFIS cyclically. Each cycle through all the training examples is called an epoch. In the ANFIS learning algorithm, each epoch comprises of a forward pass and a backward pass. The purpose of the forward pass is to form and adjust the consequent parameters, while that of the backward pass is to adjust the parameters of the activation functions. For this model, the number of training epochs is 30 and training error tolerance is set to zero. Setting the training error tolerance to zero is recommended in specialized literature such as Azar (2010) or Bohra, Bhatia (2012) and many others because of the uncertainty of behavioral error in training. The training process stops whenever the maximum epoch number is reached or the training error goal is achieved.

The Figure 4 shows that the ANFIS model is almost perfectly trained on the selected training data set. The crosses indicate the values generated by the ANFIS model. The circles then indicate the actual stock index values adjusted according to normalized procedures. It can be seen that most of the training values are close to or equal to the actual values.

Fig. 4: ANFIS training process.

To test the predictive capability of the model we developed, the model is first "trained" on one set of data and then "tested" on previously invisible data that we collected independently. Finally, the results are compared in terms of their accuracy. For this purpose, the RMSE is used, which compares the original data and the data obtained from the output of the model. The mathematical notation of the RMSE pointer is as follows:

$$RMSE = \sqrt{\frac{1}{n}\sum_{t=1}^{n}(y_t - \dot{y}_t)^2} \tag{6}$$

The root mean average error of the training and test data for infected people in European countries is 0.000093.

The graphs generated from the created ANFIS model are used to perform sensitivity analysis. Figure 5 shows the surface created by the number of tourists and the number of passengers. As shown in the figure, the output of the model responds very strongly to the high values of the inputs of these variables, while to the low values of the number of tourists or passengers (around 50 million) the output is almost insensitive and equal to zero.

Fig. 5: Fuzzy Surface view of tourists and number of passengers.

A different view of the relationship between the input variables is shown graphically in Fig. 6 -9. Figure 6 illustrates the relationship between area and population. Figure 7 presents the relationship between the fundamental area and density of countries. Figure 8 shows the relationship between area and number of tourists. Figure 9 illustrates the relationship between area and number of passengers.

Fig 6. Graphs of area and population.

Fig 7. Graphs of area and density.

Fig 8. Graphs of area and tourists.

Fig 9. Graphs of area and passengers.

The results of the fuzzy model defuzzification are shown in Table 3. Based on the output, we can say if the country has an area of 206,000 km^2, a population of 46,100,000, a density of 244 km^2, a number of tourists per year of 118,000,000 and a number of travelers of ex-EU countries per year 46,300,000, then the output of the model is 4.21. This value represents the normalized number of infected people. On the contrary, a country that shows the values of input variables in terms of area 63,700 km^2, population 31,700,000, density 267 per km^2, number of tourists per year 140,000,000 and number of travelers from ex-EU countries per year 101,000,000. Such a country shows the output of fuzzy model

2.28, which is a normalized number of infected persons. Other result values with different input parameters are entered in Table 3.

Table 3: Fuzzy Model Output.

Area (km^2 x 10^3)	Population (number x 10^6)	Density	Tourists (10^6)	Number of passengers (10^6)	Result
206	46.1	244	118	46.3	4.21
41.2	37.2	244	198	121	1.74
101	60.6	158	255	150	1.54
446	36.1	334	162	104	2.93
318	75.1	149	25.2	169	2.18
116	39.4	149	25.2	169	1.02
244	59.5	220	87.1	10.8	1.33
63.7	31.7	267	140	101	2.28

Conclusion

The paper deals with the evaluation of a new type of coronavirus, called WHO as COVID-19, in selected European countries. For evaluation is chosen the method of soft computing, specifically fuzzy logic supported by neural networks, which are used to set expert rules based on which the knowledge base of the fuzzy model is determined and the number of infected persons is evaluated. Input parameters such as the size of the state, population, population density - as coronavirus spreads from person to person and tourism - specifically the number of tourists per year and the number of non-European passengers per year visiting a particular country are chosen. The spread of coronavirus in such a massive way is mainly attributed to the free movement of persons and easy transfer across continents. For this reason, the authors believe that these variables can provide a more accurate fuzzy model. The output of the model is a normalized number of infected people in the country according to the set parameters. Based on the output of the fuzzy model, we can say whether the country is high, medium and low threats country.

Abstract

The ease of information in the digital age has effects on forming millennial generation. This study aims to analyze the development of youth leadership character. Qualitative methods were selected with in-depth interviews and observation of a case study of Leadership House (RK). It applies the concept of Prophetic Leadership in building the character of leaders of the millennial generation. The developed values were in the form of humbleness, open-mindedness, objectiveness, moderate, and achievement-contributing. The contemporary Islamic studies program, Tahfidz Al-Qur'an, National Leadership Camp, Community Development, and daily coaching programs, have an impact on the formation of youth leader character.

Keywords: Character Building; Leadership; Leadership House; Youth.

Introduction

In recent years, youth are one of the consumers of digital products. Their character has been influenced by the technological developments (Abbitt, 2011). The openness to access information promotes freedom for the community in creating new information (Hazell & Worthy, 2010). The ability to manage information and leverage technological advances affects the perception of youth who can change their character and role in the community (Thackeray & Hunter, 2010). According to law No. 40 of 2009, youth become a moral force, social control, and agents of change in national development (Kemenkumham RI, 2009). Youth as part of the transition from biological and social with a sturdy, strong, and productive self-image that makes the youth have many opportunities in revolutionary projects and become innovators for both society, organization, nation and country (Berzin, Singer, & Hokanson, 2014; Irwin, 2013).

Indonesia's number of youth was a quarter of the total population of Indonesia, or about 63.82 million people (BPS, 2018). History has reflected that the youth are capable to took and executed major roles in the important momentum of the Indonesian nation. In fact, nowadays, we may encounter a lot of behaviors that violate norms, values, and laws committed by leaders to be one of the indicators of the leadership crisis experienced. Indonesia Youth Development Index (YDI) is under Myanmar, Thailand, Malaysia, Brunei, and far below Singapore (ASEAN, 2017).

Researches on building characters of leadership have been widely conducted, such as the development of leadership characters in youth (Lerner, 2018), building leadership characters in the organization (Jiang, 2012; Sarti, 2014; Wu & Wang, 2012), and digital age leadership ((Dimitrov, 2018). This study seeks to elaborate on the leadership, youth, and digital age characteristics of the RK case study.

Methods

The study utilized qualitative descriptive methods through literary, observational, and interview techniques. The primary data is obtained through direct observation and interviews. Live observation and interviews were conducted to get data with direct observation of how activities being organized in the RK. Secondary Data is obtained through literary studies using the literature or documents in accordance with the research interests. Furthermore, data analysis was established that lasts continuously until complete and saturated. The activity on data analysis, namely data reduction, data display, and conclusion drawing/verification (Creswell & Creswell, 2017).

Result and Discussion

The combination of impacts arising from technological developments, with efforts made to build leadership characters, has felt like a challenge for the institution of the RK. The foundation aims to produce Indonesia's future youth leaders. Current leadership crises occur in Indonesia (Emmers, 2014; Irawanto, Ramsey, & Ryan, 2011; von Luebke, 2010). RK is an institution that is open, non-profit, non-partisan, and professional. RK was founded in 2002 with a vision to be the development center that generates the leader with integrity, acceptability, and professionalism to contribute to the transformation of Indonesia.

RK provides a scholarship program for students with two years of character development to score Indonesia's future youth leaders. These scholarship recipients are second and fourth-semester students from a selected college in Indonesia. This program designed to generates leaders with the concept of Prophetic Leadership. The prophetic leadership has been developed based on Islamic values with the prophet Muhammad as the role model (El Syam, 2017). Coaching in spiritual, mental, strengthening integrity and credibility, global competitiveness, have a soul of caring, character, and personality that mature, moderate, and efforts to build the nation into its foundation (Rumah Kepemimpinan, 2018).

Some of RK's projects became innovations in the digital era and were committed to eliminating the adverse effects of the digital era itself while utilizing digital products to mitigate the impact. The project namely:

1. POPCORN (Protect Our Peers from Consuming Pornography), the activity provides opportunities for the participants to promote anti-pornography campaigns to fellow students through talk shows and seminars. Aside from organizing seminars, the participants must also be able to become counselors to his friends who are addicted to pornography as the impact of the technology abuse in this digital era. Not only directly, but this activity also utilizes online media to reach certain areas.
2. GREACTION (Go Green in Action), is an online campaign activity to deal with waste problems and climate change. The activity provides discussions, and participatory activities are also conducted by involving community communities that exist in some areas.
3. Lembar Impian, is one of the projects promoted by the Association of RK, which utilizes social media to provide motivation and information to fellow young generation to build a dream, by doing a discredit online.
4. Other programs. Include Leadership Talks, and Inspiring Young Leadership Forum. These programs are annual agendas that also become one of the techniques of leadership character development by presenting national leaders who were discussing social and religious issues so that participants can think critically in the presence of problems. In this program, participants were forced to socialize and contribute to the community. Socialization is an important feature of leaders. Socializing leaders are friendly, polite, thoughtful, and diplomatic (Northouse, 2018). Such leaders demonstrate concern for the welfare and fulfillment of the needs of the crowd. By familiarizing the participants participating in a community and socializing in a forum or group makes participants have a good interpersonal so that it will easily create a cooperative relationship with people.

The concept of prophetic leadership as a concept in the RK becomes a spiritual source that provides insight into who they are, to find meaning in the purpose of life, the vision of creating a life that has

an impact, and significance contributions they make. As a person's leadership character is built with the ability of critical thinking and has an open mind, thinking globally to understanding the environment of the organization and its community (Caligiuri & Tarique, 2012) Interpersonal relationships with two-way communication (Resick et al., 2011).

The creation of leadership characters is not only influenced by the internal aspects of individuals but also external aspects. It is also realized by RK builders so that the programs formed to cover not only internal aspects but also external aspects. The National Leadership Camp is a supply agenda for scholarship recipients annually, where the created environment provides an opportunity to develop social potential. The agenda also becomes an introductory event for the participants. Thus, honing social skills in participants. Other programs, such as Community Development and Leadership Project, are designed to make participants more responsive to the problems that occur in the environment Around and able to provide ideas that can be implemented to be a solution to the negative impacts that occur.

RK programs are quite an answer to the challenges for the digital era leadership. Some of RK's alumni, such as Agis Aulia (agro social entrepreneur), establishing Jawara Farm that provides many benefits, one of them grows the economy and farming. Another example is Faldo Maldini as the founder of pulangkampuang.com, a digital platform initiated to be the nomads of the Minang origin to contribute to the building and prosperity of their home region. There is also Achmad Zaky as the founder and CEO of Bukalapak, which is one of the biggest e-commerce in Indonesia.

Conclusion

RK efforts to produce young people with the concept of Prophetic Leadership has been conducted by integrating a combination of prophetic values in each coaching program. Efforts to build the character of youth leadership in this digital age by conducting coaching that forms the concept of a prophetic leadership and emphasizes on humble, open mind, moderate, objective, prestigious-contributive. The programs in RK, namely; (1) Contemporary Islamic Studies, (2) Tahsin and Tahfidz Al-Qur'an, (3) Daily Coaching, (4) National Leadership Camp, (5) Community Development, (6) Leadership Project, (7) Leadership Talks, and (8) Inspiring Young Leadership programs. These RK's programs are solutions in the development of youth leadership.

The coaching programs have been produced by participants and alumni who have achievements and the ability to build community as a manifestation of their leadership character. It is also an indicator of the success of this program, although there are still some obstacles faced by the RK in running the program, including the lack of human resources, financial problems, and the impact of technological development as a cause that changes the behavior of current generations.

Abstract

Unified State Examination (USE) is a major project in Russian education. On the one part it affects the interests of millions of schoolchildren, entrants and their parents and on the other part it is an important component of continuity between school and higher education. Advancement of accessibility of the higher education is named as the main achievement of this assessment procedure as long as every school graduate, even from remote and hard-to-reach areas of Russia, can enter the best higher education institutions of the country without leaving his place of residence. The study is intended to comprehensively analyze organizing and holding of the USE as a form of the state final attestation in secondary school and of the entering examination in the higher education institutions. The research notifies achievements of the USE modernization, the experience of increasing objectivity and transparency of the examination procedure, sets out the opposing arguments of this form of assessment. A number of conclusions were made by the authors based on analysis of the USE scores and monitoring of the pathways chosen by school graduates from one of the Russian regions, the Chuvash Republic. Recommendations are made on the further improvement of legal regulation of the entering to higher education institutes with a view to extension of accessibility.

Keywords: Unified State Examination (USE), higher education, accessibility of education, format for educational assessment, pathways for school graduates, entrants.

Introduction

Standardized examinations for school graduates are a fairly common approach in the whole world. For example, the state examinations in China named “gao cao” are organizationally similar to the USE in Russia. The examination is administered centrally through the whole country under video surveillance. Examinations in the Chinese language, foreign language, mathematics and literature are obligatory for the Chinese students.

Centralized school leaving qualification in England is held in secondary education (GCSE). In order to gain entry to the higher education it is necessary to prolong the education for two more years and pass 2-3 advanced level examinations. University entrance is based on the successful pass of the advanced examinations.

Best known and most commonly held examinations in the USA are SAT (Scholastic Achievement Test) and ACT (American College Testing), which could be accepted for entering the higher education. They are elaborated by the Educational Testing Service, College Board the American College Testing Program which administers the tests. The results of SAT and ACT are part of the application for admission to four-year colleges and universities. College board and Advanced

Placement also carry out other exams such as Achievement Tests (ACH Tests) and Advanced Placement (AP) which are also accepted for entering the higher education.

In some countries, e.g. France and Germany, the examinations have a dual role and are simultaneously used for a high school graduating qualification and for defining the grade of the high school certificate which is the ground for entering a university. As a rule, public authorities control contents of the university entry exams by using various instruments (recommendations on composing the tests, discussions, expertise, etc.).

ESU in Russia has a history of almost two decades and underwent numerous changes. Nevertheless discussions upon the requirement of this form for assessment of students' knowledge still continue. Close attention to the USE is attributed to a number of causes. The examination is not only a form of the state school leaving qualification which allows to receive the high school certificate in case of successful passing, but also a form of entrance examination for baccalaureate and specialist degree programs.

According to the Federal Act №273 of 29 December 2012 "On Education in the Russian Federation" the Ministry of Education in association with the Federal Service for Supervision in Education and Science establish the standard procedure, schedule and duration of the examinations in each subject of the school curriculum. For all the regions of Russia versions of the assessment tasks are developed on the federal level and they are unified in terms of specification (layout, types and wording of tasks, thematic scope, evaluation criteria).

Accordingly, all over the country, in May and June, on the dates determined by the unified schedule high school graduates pass the examinations, which results have a direct impact on their successful graduation from school and admission to the Higher Education Institutions. Many specialists fairly name the USE an examination "with high stakes".

It should be noted that in view of its importance and magnitude the USE have a tremendous impact on the whole system of education in Russia and undoubtedly needs further development and enhancement of efficiency. On the other side the USE should not be blamed for all the problems in education. After all this evaluation procedure is only one of the measurements and gauges only certain attributes of the quality of education.

Methodological Framework

Methodological framework of the research is formed by the principles of objectivity and comprehensive study which require specific survey of public phenomena and processes in their development and change; comprehensive analysis of links and interrelationships between the elements allow to realize significant aspects as well as consider and analyze positive and negative aspects of the process.

Universal and specific scientific research methods provide the methodological basis for this research. Noteworthy among them is the method of dialectical materialism which allows to study the subject in development, interrelation of its certain displays, its interaction with related phenomena, to substantiate advantages and disadvantages of various approaches to the issue.

Such methods of formal logic as description, comparison, analysis and synthesis ensure that organizational, law, technological and other aspects of accessibility of higher education provided with introduction of ESU will be developed and thoroughly described.

Specific research methods such as comparative legal, technical, statistical, structural-functional methods ensured that the study took into consideration linkages and dependencies of the issue, revealed certain tendencies and provided generalization and conclusion.

Discussions

The issue of accessibility of higher education received significant coverage in researches. Problems of equal chances for entrants with different levels of income, as well as racial, ethnical and other aspects are highlighted by G. Psacharopoulos, G. Papakonstantinou (2005), Su-Je Cho, C. Hudley, S. Lee, L. Barry, M. Kelly (2008) and others. The matter of social inequality in the system of Russian higher education was studied in the works of D.L. Konstanntinovskiy, V.G. Nemirovskiy, V.Ya. Nechaev, I.A. Plokhova (2010), I. Prakhov, M. Yudkevich (2012) etc.
Kha Van Khoang, V.V. Fursova point out that advancement of accessibility of higher education is connected with differentiating in possibilities for various social groups when solving three following problems: choosing profession and educational institution based on developed network and organizational forms of such agencies; preparation for admission to higher education; the gap between the school curriculum and entrance examinations.

Correlation between entrance examinations (SAT and ACT in the USA) and academic productivity was analyzed in works of J.L. Kobrin, E.J. Shaw, S.M. Barbuti, B.F. Patterson, K.D. Mattern (2012), J.M. Rothstein (2004), T. Khavenson, A. Solovyeva (2014). Reformation of the procedure of entering the higher education were reflected in studies made by R.M. Blackburn, J. Jarman (1994), H. Turbatinazhod (2011), P.A. Pathak, T. Sönmez (2013), A.D. Verbitskiy, A.A. Fridman (2016), Yu.R. Vishnevskiy, S.Yu. Vishnevskiy, D.Yu. Narkhov (2018) and others.

Development prospects of the digital educational system in the context of accessibility of higher education was measured in the works of Ya.S. Mitrofanova, A.A. Sherstobitova, O.A. Filippova (2019), A.Yu. Aleksandrov, S.B. Vereshchak, O.A. Ivanova (2019). V.A. Bolotov, S.S. Kravtsov (2016), M.M. Potashkin, M.L. Agranovich, A.L. Leybovich, G.S. Kovaleva are focused on establishing a unified national Russian system to measure the quality of education. Organizational and operational issues of the USE, composing of assessment tasks are described in the works of S.S. Kravtsov, A.A. Muzaeva, O.A. Reshetnikova, Yu.S. Egorova, I.K. Kruglinskiy, Yu.S. Zahir, L.V. Karavaeva (2007) etc.

The researches of N.V. Kolacheva, N.N. Kosheleva, A.Ya Pardal (2017) fully evidently revealed that even in a region with obvious economical and socio-demographic problems the interested part of the society came to understand the USE helps to maintain the quality of education simultaneously making it more accessible.

G.V. Andrushchak, T.V. Natkhov (2012) made a research based conclusion that implementation of USE initiated significant changes in the strategies of choosing the higher education institute and preparing for the entering. At present relatively high number of families choose to apply for admission to several HSI and less of them are oriented towards one university. The results are sustainable in circumstances of various family income, demographic factors, place of residence. Moreover the most significant changes in preferences and strategy of preparation could be seen in families with low incomes. Children from such families advanced self estimation of their knowledge at school as well as in comparison with other students of USE preparation courses.

At the same time I. Prakhov, M. Yudkevich (2012) analyzed dependence of the accessibility of higher education on social and economic differentiation after implementation of USE and pointed out that this form of assessment is not able to equalize chances for admission. Entrants from wealthier families keep benefits even in conditions of standardized requirements as long as they can bear more expenses on preparation for USE.

Analysis of the findings show that problems of education accessibility, including the context of USE, need further research.

Results

Since the introduction as an ambitious experiment in 2001 to the full implementation in 2009 the USE as a format for educational assessment changed significantly. The main principles of the USE remained immutable: independent assessment of the quality of education, cumulation of school graduating and higher education entering examinations, using of unified assessment tasks and unified schedule of examinations all over the country.

We can make a conclusion that the USE made a long way from copying international experience and foreign practice to realization of the goals of Russian general education and finding its own identity (Kravtsov, 2016).

For the recent years the USE has been developing in two main directions:

1. Elaboration of assessment tasks, i.e. complex of tasks completed in standardized form, which allows to ascertain the school graduates' level acquisition of the federal educational standard. Multiple choice tasks were completely excluded (so-called "guessing game"). At present bigger part of the task consists of creative assignments, which require a full response with supporting arguments from the student, for example solving practical problems, writing a full composition or essay etc.
2. Transparency and objectivity of the examination. Unprecedented measures have been taken in the direction since 2015.

a) optimization of the examination holding venues' network. USE is only conducted in specially equipped venues, usually these are so called base schools, where graduates from several schools are assigned to come for passing the exam.

b) on-live video surveillance which covers the preparation and holding of the examination, evaluation and grading of the results, consideration of protests on grades given at USE. All the premises where any activity connected with USE is carried out are equipped with on-live video surveillance systems. Signals from all the cameras around the country are displayed at a special platform smotriege.ru. Situation and information centers were established in all the regions and the federal center with a view of live surveillance over preparation and holding of the examination and off-line reviewing of footage for revealing violations of the procedure for conducting the USE.

Particular attention is paid to this aspect of the exams organization. Thus if the broadcast is unavailable or the recording is terminated the examination could be stopped and the results canceled. Unfortunately, such measures have been practiced before.

It should be noted that not only the process of passing the examination is leave streamed, but also handling, evaluation and grading of the exam materials. The task answers given by the participants of the examination are redirected via secure communication channels from the exam holding venues to the data centers established in every region of Russia. In these regional centers the exam materials are handled, fully detailed responses checked and evaluated and later protests on grades are considered. All the procedures are conducted on line.

c) prohibition on carrying and using communication facilities, electronic, photo, audio and video gadgets, reference materials, written notes, other means of storage and transferring information for participants and administrators of the examination

d) use of metal detectors. Stationary metal detectors are installed at the entrances to the USE venues, and/or a special locations for the use of handheld detectors are set.

e) equipping of the USE venues with facilities for suppression of mobile communications.

f) application of modern information technologies, cryptographic means of information protection. Examination materials are received in the USE venues via secure communication channels 30 minutes before the examination starts. At 10.00 a.m. local time in every auditorium the materials are printed in presence of the participants. When the exam is finished paper forms with answers are scanned and forwarded to the regional data handling centers. In that way transparency and efficiency of the procedure are implemented.

It should mentioned that sorting of the participants inside the venues is also automated. Participants and administrators are provided with numbers of auditoria they will be located at only on the day the examination is held.

g) establishing the institute of public observers. Every concerned citizen may become a public observer and personally supervise adherence to objectivity on the spot in any region of the country at any USE venue.

h) cross check of the full written responses part of the USE by the regional curriculum subjects committees. The measure demanded creation of new mechanisms for developing unified approach to grading the part of USE with full responses, additional training of the subjects committees' experts. Each work is checked by two experts independently of one another. In case of wide disagreement the third expert is applied to assess the work.

The measures we mentioned are laid down in Procedure of the State Final Attestation on Secondary School Education Programs approved by joint decree number 190/1512 of the Ministry of Education and the Federal Service for Supervision in Education and Science dated 7 November 2018 (registered in the Ministry of Justice on 10 December 2018 under number 52952). Violation of the Procedure may entail cancelation of the examination results. Additionally it will be penalized in accordance with part 4 article 19.30 of the Code of Administrative Offences of Russia. The violation entails imposition of an administrative fine on citizens in the amount of 3000 to 5000 rubles, on officials in the amount of 20000 to 40000 rubles and on legal entities in the amount of 50000 to 200000 rubles.

The most important achievement of implementation of USE in recent years is a high level of objectivity. All graduates pass the examination in equal conditions in line with pre-arranged and announced rules, which strictly regulate the actions of all the participants of the procedure. All the regulations and alterations are announced before the academic year (Kravtsov, 2016). It guarantees enforcement of the constitutional right to higher education for every person applying for admission.

Nevertheless USE is still criticized. A.D. Verbetskiy, A.A. Fridman (2016) notify that standardization is a disadvantage of every test system designed to cover a considerable part of the population. Consequently there is a possibility to advance the test grade by practicing at the certain type of tasks. Therefore learning is substituted by coaching for the test and leads to reducing of the entrants' skills andabilities while admission points formally rise.

As mentioned above, the role of USE in increasing of the accessibility of higher education is questioned. Here we will analyze pathways for school graduates in the Chuvash Republic. The diagram reflecting the increasing share of graduates from the schools in Chuvashia who were admitted to higher education institutes is given in figure 1. It shows the growth from 55% in 2003 to 80 % in 2017-2019. The upward trend of choosing higher education as a pathway is evident. The index growth is also noticeable relative to 2009 level, when USE was fully implemented on regular base (the Chuvash Republic participated in the experiment since 2001).

Fig. 1: Share of the school graduates in the Chuvash Republic admitted to higher education institutes.

Addressing the geography of the pathways the graduates choose we see that in 2006 only 86% of school graduates from the Chuvash Republic who were accepted to the higher education opted for the local institutes, and by 2019 the share decreased to 54%.

Having the USE passed at school the graduate automatically becomes an entrant with wide possibilities. Nowadays there's no need to come to the university to file the documents for appliance. It is enough to send electronic copies and wait till the entrants ranking to be published at the web sites of the chosen institutes. The geographical range of higher education institutions choice made by the schools graduates in the Chuvash Republic is presented in figure 2. It should be mentioned that in 2019 20% of graduates chose to apply for metropolitan institutes and universities, 12% - to Kazan, 4% - to Saint Petersburg, 6% - other Russian cities and foreign countries. In recent years higher education institutes of the Defence Ministry, the Federal Security Service, the Ministry of Internal Affairs and The Ministry of the Russian Federation for Civil Defence, Emergencies and Elimination of Consequences of Natural Disasters situated in different parts of the country are very popular.

	2006	2009	2012	2015	2018	2019
Chuvash Republic	86%	78%	72%	62%	56%	54%
Moscow	8%	11%	13%	17%	19%	20%
Kazan	3%	4%	6%	10%	12%	12%
Saint Petersburg	1%	2%	3%	3%	4%	4%
Nizhny Novgorod	1%	3%	3%	3%	4%	4%
Other regions	1%	2%	3%	5%	5%	6%

Fig.2: Geographical range of the HEI chosen by school graduates in the Chuvash Republic

Analyzing the USE scores received by the graduates who chose to continue their education outside the Chuvash Republic we should point out the problem of the talented young population exodus. In the educational system of Russia regional higher education institution should be given a specific role of training human resources for the related entity of the Federation.

It should be noted that in some cases USE becomes a barrier to the higher education. In our opinion, the previous years' graduates are in position of inequality, they practically disabled from implementation of their constitutional right to higher education by virtue of the major modification in procedures of the state final attestation. In practice a paradoxical situation has emerged whereby people who had received their high school certificate before 1 January 2009 are compelled to undergo USE procedures in order to execute their right to education, whereas the core arrangements of the state final attestation for this category of entrants were completely different. Urgency of the problem is also attributed to the necessity of a life-long learning education. For the graduates who did not pass USE at school and received their high school certificates under different regulations applying for acceptance to the higher education through USE becomes a serious challenge (lack of information awareness, test sophistication, etc.). We believe that such graduates should be granted a possibility to enter the higher education institutes through internal examinations.

Conclusion and Recommendations

Drafters of USE suggested equal initial capacities for school graduates in applying for higher education, reduction of expenses through combining graduating and entering examinations, independent expertise, unification of tasks as main advantages of this form of assessment. In recent years significant steps have been taken to enhance the public credibility to the procedure. Sociological studies confirm the tendency. Geographical range of the school graduates' pathways widened.

Unfortunately, not all targets were met. For example, the practice of tutoring and coaching for the test was not abandoned, the graduates remain under high psychological pressure of the family and school. We should not forget that not only USE influences the accessibility of higher education. Creating appropriate social and economic conditions (scholarship, habitation, transport) is an important contributing factor.

In order to enhance accessibility of the higher education and to address the abovementioned issues the following measures could be proposed:

- creating of independent centers for assessment of the quality of education and year-round conducting of USE, providing a possibility for passing USE several times throughout a year;
- amending of part 6 article 70 the Federal Act №273 of 29 December 2012 "On Education in the Russian Federation" to grant the previous years' graduates who received their high school certificates before 1 September 2013 (when the act came into force) with a right to apply for acceptance to the higher education institutes through internal examinations;
- taking a number of steps to grant regional higher education institution with a specific role of training human resources for the related entity of the Federation;
- further changing of the assessment tasks with a view to encourage studying the school subjects with sufficient depth.

sylwia.legowik-swiacik@wz.pcz.pl

Abstract

This article constitutes a contribution to the research on the multidimensional value appropriation processes. By focusing on connecting two key indicators, profitability of the conducted activity and effectiveness of using the enterprise's intellectual capital, value appropriation processes in strategic areas of the enterprise's management, such as: profitability of the equity, profitability of assets and profitability of sales, were diagnosed. The first, theoretical part of the article presents the essence of value appropriation. The second part of the article presents results of empirical research conducted on the grounds of a case study. The publication improves the understanding of correlations between the enterprise's effectiveness and the effectiveness of using the intellectual capital. The conclusions suggest that the value appropriation processes allow assessing transmission of the value for the customer into effectiveness of the conducted activity. However, implementation of this process requires the enterprise to have the capacity to transform the intellectual capital into the proposition of new value for the customer. The article contributes to the discussion conducted by management theoreticians and practitioners on the effectiveness of enterprise management, searching for the tools of increasing the enterprise's effectiveness, as well as the ways and methods of competing.

Keywords: Management, Value Appropriation.

Introduction

In the subject literature a lot of attention is paid to the issue of creating value. The complexity of the category of value and various approaches to value management results in transferring the focus from value creation processes to value appropriation processes, which is observed in the management practice. Meanwhile, appropriation processes have not been recognised in detail and the subject literature in this scope is scattered and fragmented. The current state of knowledge is characterised with the methodological plurality and differences in theoretical bases. The research in the area of identification and diagnosis of the value appropriation process seem to be much less recognised than the value creation processes. Furthermore, competition in changing conditions of conducting business requires selection of relevant tools to assess value appropriation processes. Therefore, the information on the economic effectiveness of enterprise management should be supplemented with data regarding effectiveness of value appropriation processes with the consideration of the use of intellectual capital in the enterprise. In this context, the aim of the study is to diagnose value appropriation processes in strategic areas of enterprise management. Research methods used to achieve this aim include: literature studies, case study, Pearson linear correlation coefficient calculated in three strategic areas of enterprise management.

The essence of value appropriation

In the subject literature the appropriated value is described as the surplus generated over alternative costs, which is divided between stakeholders and the enterprise (García-Castro et al., 2013). Which means that the value appropriation processes are a mirror reflection of creation thereof (Hurmelinna-Laukkanen and Puumalainen, 2007). Value appropriation is defined in several different approaches. The first approach is based on the sector conception of M.E. Porter (2006) and assumes that value

appropriation depends on the external conditions concentrated on the bargaining power of suppliers and purchasers (Coff, 2010). The second approach is based on the resource recognition, which uses value categories as the key element (Lieberman et al., 2013).The third approach is based on the intentional formation of rules of value appropriation from the point of view of market structures (MacDonald and Ryall, 2004). The fourth approach is based on the recognition of network cooperation of enterprises (Browman and Ambrosini, 2000).

While considering the value appropriation process from the sector point of view, two main elements of competitive advantage are distinguished: value creation and appropriation processes. Therefore, threats of these processes should be recognised and defensive mechanisms, referred to as isolation mechanisms, should be implemented (Soo et al., 2002). In the area of value creation, main threats of value creation and appropriation processes include imitations and substitutes launched by innovation imitators, which leads to the destruction of value generated by the innovator. In order to protect value the innovator introduces isolation mechanisms, such as property rights control, costs reduction, establishing entry barriers or developing standards (Browman and Swart, 2007). Created value protection mechanisms only postpone the unavoidable occurrence of imitations or substitutes. Therefore, enterprises should focus not only on the value creation processes, but also on the value appropriation processes vested in them due to launching an innovation. Thus, it is important to recognise threats of value appropriation. Two strongest threats of the value appropriation process include: excessive dependence on other market participants and low quality of management (Lieberman et al., 2013), presented in picture no. 1.

Picture 1: Elements of value appropriation

Source: C. Browman, V. Ambrosini, (2000), Value Creation Versus Value capture. Towards a coherent definition of value in Strategy, British journal of Management, Vol. 11, no. 1, pp. 1-15.

Protection against dependency on other market participants is a threat of an external character and can be executed, among others, by long-term contracts including high costs of termination thereof. Dependency on other market participants can be reduced through the agency of forward and backward integration and developing cooperation networks. Personalisation of the cooperation based on trust, intellectual capital (Edvinsson and Malone, 2001) and establishing alliances and covenants also reduces the dependency on other market participants, yet, those mechanisms are burdened with high risk in case partners do not follow the rules (Harrison et al., 2010). An important mechanism of protection against dependency on other market participants constitutes decreasing the peculiarity of assets, which enables the enterprise to quickly and flexibly adjust to new types of activities, new types of products and services or cooperation with new partners (Lepak et al., 2007; Stępień, 2019). Flexible cooperation mechanisms decrease partners' proneness to appropriate "not their" part of the economic rent.

The value appropriation process should also be secured against internal threats resulting from the low quality of management. Taking wrong decisions can lead to the destruction of created value and prevent value appropriation. The high quality of management means such a configuration of the most valuable resources, which maximises use thereof and allows to protect both, the created and appropriated value (Hamel, 2002).

To sum up, it should be stated that the identification of value appropriation techniques allows grasping the dynamics of the value appropriation process. Considerations regarding value

appropriation from the sector point of view in strategic areas of enterprise management are based on the assumption that there is a positive relation between the profitability of conducted business expressed with a set of profitability indicators and the effectiveness level of using the enterprise's intellectual capital expressed with the relation between market and book value of the enterprise. Therefore, it becomes sensible to determine value appropriation indicators in strategic areas of enterprise's management.

Research Methodology

In order to diagnose the value appropriation processes in strategic areas of enterprise's management, it is necessary to purposefully and selectively choose research methodology. A comprehensive description of studied phenomena can be obtained with the use of complementary and alternative methods (Eisenhardt and Graebner, 2007).

The research procedure adjusted to the diagnosis of value appropriation processes in strategic areas of enterprise's management should include determination of value appropriation indicators. In this aspect indicators shall act as intersections providing information on important phenomena and relations connected with appropriated value protection in the enterprise. The following instruments apply to the identification of value appropriation indicators: a set of profitability indicators in the area of the enterprise's profitability (Return on equity ROE = net income/shareholder equity; Return on assets ROA = net income/total assets; Return on sales ROS = operating profit/net sales), which reflect three strategic areas in enterprise's management and Thomas Stewart ratio in the area of effectiveness of intellectual capital management in the enterprise (Thomas Stewart MV/BV ratio = market value / book value (Market-to-Book Value)). The first instrument, that is, a set of profitability indicators, allows assessment of indicators influencing the effectiveness of the surveyed enterprise's activity with the consideration of the quantity of sold products and goods' assortment structure in a specific period of time. The other, that is, Thomas Stewart ratio expressing the relation between the enterprise's market and book value (Stewart, 1999), allows to assess the intellectual capital's market value transmission process in the context of effectiveness of taking decisions in the enterprise. The diagnostic procedure in the scope of value appropriation processes identification conducted through the agency of presented instruments should allow analysis, assessment and conclusions with a consideration of relations between used instruments. Assessment of the ability to appropriate value will be conducted on the grounds of the results of the analysis of the strength and direction of the Pearson linear correlation in three areas (ROE, ROA, ROS relation to MV/BV) in compliance with the following criteria:

- between 0 and 0.30 – the enterprise does not have the capacity to appropriate value, if at least in one of the studied areas (ROE, ROA, ROS relation to MV/BV) there is a little positive correlative connection or a negative relation;
- between 0.31 and 0.50 – the enterprise has weak capacity to appropriate value, if at least in one of the studied areas (ROE, ROA, ROS relation to MV/BV) there is an average correlative connection;
- between 0.51 and 0.70 – the enterprise has the capacity to appropriate value provided that in all three research areas (ROE, ROA, ROS relation to MV/BV) there is a strong correlative connection;
- between 0.71 and 1.00 – the enterprise has significant capacity to appropriate value provided that in all three research areas (ROE, ROA, ROS relation to MV/BV) there is a very strong correlative connection.

The presented methodology enables identification and assessment of value appropriation indicators by enterprises competing for a customer in a given industry.

The Characteristics of The Surveyed Company

The surveyed company is Amica, which is included in the electro-machinery industry. Amica has been quoted on the Warsaw Stock Exchange since 1997. The surveyed enterprise generates over 65% of its profit on sales from fifty foreign markets. The countries where the brand is the most popular are: Great Britain, Germany and Scandinavia. The basic group of products include cookers, ovens, gas hobs, refrigerators, dishwashers, washing machines, microwaves, hoods and small kitchen articles. Amica employs approximately 2,500 persons. Recognition of Amica is confirmed with prestigious awards given by international institutions. The research period covers the years between 2008 and 2018.

Conducting the research process with the use of a case study allows presenting an accurate and in-depth image of studied phenomena and relations. However, one should remember the limited (probabilistic) possibility of scientific cognition with the use of the case study method (Gibbert et al., 2008). Case study limitations include: low representativeness of results, intuitiveness and subjectivity of judgements, high time consumption and high costs of conducted research.

Research Results

The research conducted in the scope of the diagnosis of value appropriation processes in strategic areas of management for the surveyed enterprise of the electro-machinery industry implies that there is a very strong positive correlation between the return on equity (ROE) and Thomas Stewart ratio (MV/BV), which reflects effectiveness of the intellectual capital management (table no. 1). On the grounds of the results obtained through the agency of Pearson linear correlation coefficient, it has been observed in the surveyed enterprise that the increase in capital profitability is accompanied by the increase in effectiveness of the intellectual capital management. While interpreting the obtained data, it can be stated that in the surveyed enterprise there are very strong correlations between effectiveness of the decision in the area of using the equity and capacity to generate profit from the invested capital as well as effectiveness of the intellectual capital management.

Table 1: Relations between effectiveness of management and intellectual capital

Correlation between the profitability indicators and Thomas Stewart ratio	
Pearson correlation coefficient between MV/BV and ROE	0.9992
Pearson correlation coefficient between MV/BV and ROA	0.9966
Pearson correlation coefficient between MV/BV and ROS	0.8691

Source: Own calculations.

While researching the relations between the level of the return on assets (ROA) and Thomas Stewart ratio (MV/BV) in a given enterprise, a strong correlation between studied variables is noticed. It means that the process of taking decisions in a given enterprise in the scope of managing assets and increasing effectiveness of administration maintains a strong relation with effectiveness of the intellectual capital management.

While considering the research results obtained through the agency of Pearson linear correlation coefficient calculated for a given enterprise, a strong correlation between the return on sales (ROS) and Thomas Stewart ratio (MV/BV) is noticed. It proves that the increase in sales profitability is accompanied with the increase in effectiveness of intellectual capital management in this enterprise.

Discussion and Conclusions

While considering the results of conducted empirical research in the scope of diagnosing value appropriation indicators in strategic areas of enterprise's management, it can be indicated that they allow presenting an accurate and in-depth image of studied phenomena and relations. On the grounds of theoretical framework and empirical research it can be concluded that the object of the analysis of

value appropriation processes consists in the enterprise and its material and non-material resources. Furthermore, various measures characterising material and non-material areas of the enterprise's strategic activity can be used to measure appropriation processes. The role of value appropriation indicators providing information on significant relations occurring in strategic areas of enterprise management is played by selected profitability indicators and intellectual capital management's effectiveness indicators. The conducted research imply that there are strong correlations between profitability indicators of equity and assets and the effectiveness indicator of intellectual capital management, which suggests that enterprises included in the research concentrate their operations on providing the required rate of return for owners of the invested capital, which provides conceptual grounds for pro-value paradigm of enterprise management. Therefore, in enterprises' practice the approach directed at creating value for owners is prevailing. The case study supports the current view that the effectiveness of value protection mechanisms should be expressed in balancing value appropriation processes between various groups of stakeholders.

The advantage of applying the presented value appropriation indicators is the fact that the presented methodology of measuring may serve as a tool of comparison with other enterprises. Another advantage thereof is the possibility of monitoring the trend of shaping studied correlations from the point of view of a specific period. Furthermore, applied measures have high cognitive value and the ease and speed of calculations and legible interpretation of obtained results increase usefulness of application thereof. However, it should be noticed that the conducted studies are burdened with certain limitations. First of all, doubts can arise with regard to the use of Thomas Stewart ratio (MV/BV) to the assessment of effectiveness of the enterprise's intellectual capital management. Diagnosis of the intellectual capital on the basis of the relation of market value to book value is related to both, taking into consideration the meaning of mood in financial markets for execution of decisions taken in the surveyed enterprise, as well as adopted accounting policy. Secondly, the use of profitability indicators, which are contractual in nature and are expressed in percentage, may generate problems in interpretation regarding the area of adopted relations between streams and resources. Thirdly, the use of the correlation informs solely of the existence of the relation and does not allow proving the causal link which provides grounds for studied relations.

Summary and Conclusions

While summarising the results of conducted empirical research in the scope of diagnosing value appropriation processes in strategic areas of enterprise management, it should be stated that describing and analysing important, current and multi-dimensional relations of value appropriation contributes to the existing literature due to connecting two key dimensions, profitability of conducted activity and effectiveness of using the enterprise's intellectual capital. Obtained results allow taking a position that both of the aforementioned dimensions are required to diagnose value appropriation processes in strategic areas of enterprise management. A clear implication from theoretical assumptions and empirical research is that the intellectual capital has particular significance in shaping value appropriation processes, since it enables creating the enterprise's value. Thus, managers of the surveyed enterprise should concentrate their activities on implementation of economic results by increasing effectiveness of the intellectual capital. Due to the fact that the subject literature in the scope of value appropriation is referred to mainly in research on: resource-related competitive advantage, transactional and relational opportunism, innovativeness and management in cross-organisational networks, it becomes sensible to conduct further research on value appropriation processes with a consideration of identification of multiple network coordination mechanisms.

Obtained data provides grounds for concluding that the surveyed enterprise concentrates its activities on providing the required return rate for the owners of invested capital, which is confirmed with strong correlations between the profitability indicators of the equity and assets and the effectiveness indicator of the intellectual capital management. This in-depth understanding of value appropriation processes can be used by managers to balance value appropriation processes between various groups of stakeholders.

Abstract

Corporate social and environmental responsibility initiatives provide benefits and competitive advantages to a company. It is still not clear, however, whether corporate social and environmental responsibility could ultimately improve a company's financial performance. The hypothesis of this paper is that there is a direct correlation between the environmental disclosure and financial performance of the Russian retailers. The authors analyzed the relationship between the environmental disclosure index and EBIT (earnings before interest and taxes), ROS (return on sales), ROE (return on equity), and ROA (return on assets) of the Russian retailers. The hypothesis was disproved for all the indicators as a result.

Keywords: Environmental Responsibility, Environmental Disclosure, Corporate Social Responsibility, Financial Performance, Retail Trade.

Introduction

Activities of businesses which focus on both social and environmental impacts have increased as an integral part of core business operations and management (Yevdokimova *et al.*, 2018; Balashov, 2019; Efimova and Rozhnova, 2019). Corporate social and environmental responsibility provides benefits for businesses. By satisfying the expectations and needs of stakeholders, the company improves its business reputation, strengthens the loyalty of the employees and customers, reduces reputational, legal, and environmental risks, establishes relationships with government agencies, public organizations, and the media, and becomes more sustainable overall. It is still not clear, however, whether corporate social responsibility could ultimately improve the company's financial performance. Cherian *et al.* (2019), Kobo and Ngwakwe (2017), Maksum and Tamba (2017), etc. have studied this in various contexts.

In this paper, we consider the relationship between disclosing environmental aspects of corporate social responsibility initiatives and financial performance of the Russian retailers. The environmental aspects are currently highly important in any business area (Semenova *et al.*, 2019; Bunakov *et al.*, 2019; Zaitseva *et al.*, 2019). Trade, including retail trade, is a leading sector of the Russian economy and performs important social functions (Bragin *et al.*, 2019; Kornilova and Karashchuk, 2017; Mayorova *et al.*, 2019). The improvement of financial performance is the aim of the implementation of most of the strategies (Zaitseva *et al.*, 2016).

The hypothesis is that there is a direct correlation between the environmental disclosure and financial performance of the Russian retailers.

Data and Methods

We used the index proposed by Bragin *et al.* (2018) to evaluate the environmental disclosure of the Russian retailers. In this paper, it is referred to as the Environmental Disclosure Index (EDI). The financial performance indicators include EBIT (earnings before interest and taxes), ROS (return on sales), ROE (return on equity), and ROA (return on assets). First, we analyzed the relationship between the Environmental Disclosure Index and financial performance indicators in the same period. Secondly, we assumed that the environmental disclosure impacts financial performance indicators in later periods rather than immediately. We used the Pearson correlation coefficient to assess the relationship between the Environmental Disclosure Index and financial performance indicators. The results were interpreted using the Cheddock scale. We constructed scatter plots for individual indicators and analyzed nonlinear dependencies. The initial data for calculating the Environmental Disclosure Index were the annual reports of six retail chains from Russia's Top 10 by revenue (see Fig. 1), which disclose their environmental responsibility initiatives. The financial indicators of the retailers were obtained from the Audit-it portal at www.audit-it.ru. The data series for each indicator included thirty values for the period from 2014 to 2018.

Fig. 1: Revenue of Russian retail chains in 2018, billion RUB.

Source: MMF (www.moneymakerfactory.ru)

Results

The correlation analysis did not confirm the hypothesized direct relationship between the environmental disclosure and the financial performance of the Russian retailers. An inverse relationship identified between individual indicators was not significant, as all correlation coefficients were less than 0.7 (Fig. 2).

Fig. 2: The correlation coefficients between the environmental disclosure index and the financial performance indicators of the Russian retailers

Source: constructed by the authors based on their own calculation results

There is no correlation between the Environmental Disclosure Index and EBIT both in the same period and after one or two years. The correlation between the Environmental Disclosure Index and ROS is either absent or weak. At the same time, there is a trend towards an increasing correlation coefficient. A noticeable inverse relationship is observed between the Environmental Disclosure Index and ROE/ROA. Over time, the inverse relationship decreases for ROE, while increasing for ROA (Table 1).

Table 1: The correlation coefficients between the environmental disclosure index and the financial performance indicators of the Russian retailers

Indicators	Financial performance indicators				
	Period	EBIT	ROS	ROE	ROA
Environmental Disclosure Index (EDI)	The same period	-0.01	-0.30	-0.60	-0.37
	+ 1 year	-0.01	-0.18	-0.54	-0.56
	+ 2 years	-0.01	0.06	-0.38	-0.67

Source: calculated by the authors according to data from Audit-it, including annual reports of retailers for 2014–2018

The calculated coefficients describe a linear relationship between the considered indicators. Fig. 3 illustrates a non-linear relationship between the Environmental Disclosure Index and the indicators for which such a relationship is most pronounced. Nonetheless, the nature of this trend also evidently does not confirm a direct dependence of financial results on the environmental disclosure.

Fig. 3: Scatter plots for the environmental disclosure index and the financial performance indicators of the Russian retailers

Source: constructed by the authors according to data from Audit-it, including annual reports of retailers for 2014–2018

Conclusion

The hypothesis was rejected. There is no direct relationship between the environmental disclosure and the financial performance of the Russian retailers in the same period or in the subsequent periods. Moreover, there is a noticeable inverse relationship between the Environmental Disclosure Index and ROE/ROA. For ROA, the inverse relationship actually strengthens in the subsequent periods. The environmental and corporate social responsibility in general is a fairly new area for Russian retailers. As a result, only limited input is available. Moreover, companies still do not have enough experience in the environmental and corporate social responsibility management. Thus they are not yet able to act as effectively as possible, including in improving financial performance.

The Influence of the Results of Neuromarketing Research on Transaction Costs in the Process of Making Purchase Decisions

Hanna WALIGORSKA

WSB University, Wroclaw, Poland, hanna.waligorska@wsb.wroclaw.pl

Ph.D. Magdalena ZUBIEL-KASPROWICZ

WSB University, Torun, Poland, magdalena.zubiel@wsb.bydgoszcz.pl

Abstract

Neuromarketing research has been gaining popularity in the recent years. Along with the development of neurosciences, trading companies are reaching for neuroimaging more and more frequently in order to find the answer to the question how to influence the purchaser to minimalize costs and maximise profits. Results of neuromarketing research point to the fact that by means of an appropriately formulated message, authors of a message are capable of reaching a potential customer efficiently and reduce the costs of sale. The EEG test described in the article indicates differences in the obtained results depending on the construction of a presented message.

Keywords: Transaction Costs, Neuromarketing, Processing

Introduction

Thanks to the latest achievements of neurosciences, more is known about the techniques of creating a marketing message, which gravitates the purchaser toward making a positive purchase decision quickly and effectively. In this context a question arises whether further development of neuroimaging techniques will contribute to the reduction of transaction costs as regards the seller with their simultaneous increase with regard to the purchaser. This article constitutes an attempt to answer the aforementioned question. In its first part, the authors present the issue of transaction costs. In the next part, the phenomenon of neuromarketing is described with particular attention drawn to a message and the depth of processing. Thereafter, the authors focus on their own research presenting the results of neuromarketing research conducted with the use of EEG. The main objective of the research was to assess how the properly formulated advertising message affects the sphere of unconscious decisions made under the influence of an impulse and the sphere of decisions subjected to deep analysis. The hypothesis was verified: the properly formulated advertising message influences the process of unconscious choice in the same way as the process of conscious choice.

Transaction Costs

Transaction costs accompany each exchange and constitute additional burden for the parties to a transaction. Aristotle noticed their presence as early as in his *Politics*, in which he discussed the issue of speculation based on a change of prices (2003). Considerations given to the conflict of interests between merchants and buyers can also be found in Adam Smith's *An Inquiry into the Nature and Causes of the Wealth of Nations.* A seller, when establishing a price which for a buyer constitutes a cost exceeding his abilities to pay, when harvest is poor, forces more careful management of resources. Smith also underlines, when discussing the issue of an export bonus, that costs incurred by population have their consequences. They among others reduce the ability to self-finance education or reduce the number of births (Smith, 2007). Together with the discussion on costs arising from concluding transactions, in sociology by works of Herbert Spencer, the concept of an Institution appeared (Stankiewicz, 2012). Institutions constitute both legal regulations and moral habits or norms binding in a society. Their objective is among others to lower transaction costs. For instance, the Act of 30th May 2014 on Consumer Rights regulates the legal issues in connection with a consumer's

rights by specifying among others the duties of an entrepreneur concluding transactions with a consumer, or specifying the rules and procedures of concluding distance contracts.

Ronald Harry Coase is considered to be the father of the theory of transaction costs (Zygan, 2014). In the article *The Nature of the Firm*, he analyses functioning of firms and the reasonableness of their existence on the market. In his considerations, he introduced the concept of costs connected with making a decision, including costs in connection with gaining information. He also highlighted the costs of negotiations characterising the moment proceeding concluding an agreement and the costs of a contract appearing at the moment of concluding an agreement and when the provisions of a contract are enforced (Coase, 1937). The term transaction costs was used in the economic literature for the first time in 1940 in the article *A Study of Interest and Capital* (Scitovsky, 1940).

The economics of transaction costs is characterised by a multidisciplinary approach to both costs and attempts to reduce them. Transaction costs are often treated as a friction phenomenon (Williamson, 1998). Friction means slowing down, and sometimes, considering high costs, preventing a transaction. Interdisciplinarity was underlined as early as by Coase, who indicated the fact that some costs were generated by external factors, that is market mechanisms, and some by internal conditioning, that is processes happening in a company (Coase, 1937). Moving away from firms, the essence of transaction costs can be examined illustrated with the example of a purchasing individual. The amount of transaction costs will be influenced on the one hand by market mechanisms, on the other hand by individual qualities of an individual. It is impossible not to mention here limitations resulting from an individual's cognitive processes, from limited rationality and from opportunistic behaviours. The latter may be connected with using by one or both parties to a transaction deceptions, fraud ad lies (Williamson, 1998). Such types of behaviour are fostered by situations in which one of the parties has a worse access to information than the other party to a transaction (Karpacz and Podkówka-Sędek, 2014).

Information asymmetry along with moral hazard and adverse selection constitute elements of Frederic Stanley Mishkin's triad. Information asymmetry, caused by unequal access to information, manifests itself when at least one party to a transaction does not have enough information to make the right decision. Following this, one of the parties gets involved in a risky situation or on the contrary – refrains from a transaction even when it is not risky. Moreover, the lack to access to information causes moral hazard (Mishkin, 1992). The triad model, which refers to the issues of world crises, explains downturn in economic activity (Ostaszewski, 2013).

Neuromarketing

The process of making purchase decisions is contingent on numerous factors. Ontogenetic conditionings, next to economic factors, play an essential role among them. Also emotions as an important element influence consumers' decisions. In the economic theory, for a long time, consumers were thought to make rational decisions. Moreover, it was believed that consumers tried to be objective when forecasting the future. In making investment decisions, the theory of rationality based on a formalised analysis and unchanging market laws, which assumed rationality of buyers' conduct, was the most useful. According to this theory, a rational consumer interprets information from the environment correctly and on its basis estimates the probability of future events. The financial theory says that a rational customer follows two principles. He is willing to take a risk, if additional benefits can be obtained thanks to it, and takes choices in order to maximise expected usefulness. It was not until a behavioural element with systems, the first one (emotional one) and the second one (rational one), was introduced that interest in the psychological aspects of making purchase decisions aroused showing one-sidedness characterised by a strictly economic approach to the issue of making purchase decisions by consumers. Recently, primarily due to the development of neurosciences together with the methods of neuroimaging of processes taking place in the brain, the certainty regarding an irrational way of making decisions by customers has been maintained and deepened (Kahneman, 2011).

The irrationality of making decisions by a consumer results primarily from marketing communication, which, through implementing the discoveries made by neurosciences in the field of marketing, manipulates purchase decisions of a customer more precisely. Looking from the angle of

specialised form of reaching a customer, it must be underlined that a customer's finances are not safe because a consumer, when making the decision to spend a specific amount of money, does not act autonomously. Therefore, what is the science which benefits from the achievements of marketing and the latest discoveries of neurosciences at the same time?

Neuromarketing constitutes a multidisciplinary approach to neurophysiological attitudes of consumers and the impact of marketing tools on behaviours and decisions of entities (Dooley, 2015). Only by using methods of brain imaging was it possible to redefine the traditional tools used in marketing, which allowed their more effective use. The idea to use the knowledge of the way a human being thinks in marketing is nothing new. The concepts like the psychology of advertising or the psychology of selling have grown in significance in the last years. Moreover, the development of contemporary neurology has significantly influenced the appearance of neurosciences, from which marketing or economics have started to take handfuls of benefits. The traditional psychology treated the brain like any other organ. More complex models of thought processes based on observations, experiments and deduction. The willingness to understand neurological processes was ignored completely. Contemporary neurology has come up with tools thanks to which it is able to have an insight into the mind. A functional nuclear magnetic resonance has enabled observing the reaction of the brain to an exorbitant price, and an electroencephalograph may be used for optimisation of advertisements and products.

Thanks to direct observations of the electrical activity of the brain (EEG), more specific information can be obtained. During an examination with the use of electrodes, the electric potentials of the brain are measured. One of the methods of using EEG is the analysis of reaction to demonstrated stimuli called an analysis of evoked potentials appearing in a split second after a stimulus is showed. In comparison with the neuroimaging techniques, it is cheap and easy to use (Lindstrom, 2009).

It is difficult to define clearly the phenomenon of neuromarketing. Some researchers use this term only with regard to the marketing analysis of magnetic resonance of the brain. Others view this concept in the wider framework, they also accept the use of biometrics (breath and pulse measurements) or following eye movements. Neuromarketing research aims at answering the question what the brain does with information about a brand, how a human really reacts to a stimulus at a level deeper than a conscious reflection, how subconsciousness can influence behaviour of a consumer, who usually behaves conversely to his declarations (Pradeep, 2011). The importance of neuromarketing is growing, because the traditional methods of marketing research are slowly becoming obsolete. Market research or focus groups say little about what consumers really think. Unreasonable human minds depend on structuring them cultural stereotypes. They are formed by tradition, the way of upbringing and by other factors. That is the reason why the results of marketing research, quantitative ones consisting in conducting surveys concerning for example a product concept or packaging, and qualitative ones – basing on focus groups, often bear no relation to real reactions of consumers to a product. Focus groups and surveys are nowhere near as good as the facts neuroimaging helps to discover.

In Martin Lindstrom's (2009) opinion, finance and economic research cannot go any further. Researchers should look inside the brain to find out why consumers make the decisions they make. Market research and economic models base on the assumption that purchasers behave in a rational, therefore predictable way. They could not be more mistaken. The discoveries of neurosciences make it possible to see what a significant influence emotions exert on a purchase decision. Thanks to neuroimaging tools, researchers have gained an insight into how emotions impact economic decisions. Martin Lindstrom (2009) concluded it accurately claiming that the brain is dominated by automatic processes and not by target thinking. Therefore, most of the processes taking place in the brain are emotional and not cognitive.

Gerald Zaltman (2008) proves that 95% of thoughts, emotions and learning processes take place outside human consciousness. Neurologists unanimously agree that the majority of thought processes occur under the surface of human consciousness (in subconsciousness, unconsciousness or in preconscious). The whole discipline of neuromarketing bases on the assumption that subconsciousness determines a significant part of consumers' behaviours. A conscious and rational cognitive process has a slight impact on purchasers' decisions. Customers' emotions and

subconscious needs constitute the main area of the interest of neuromarketing. Through the study of neuromarketing indicators, neuromarketers are able to determine precisely whether a given product or advertisement attracts recipients' attention. Moreover, researchers can specify whether a given product stirs consumers' emotions and generates memories. Further study referring to indicators of derivatives can show whether a given product is effective, that is whether it generates willingness to buy, whether it is seen as original and whether a product along with surrounding marketing strategy are perceived by a consumer's brain as clear and understandable, thus effective. Attention constitutes one of the basic forms of brain functioning and it manifest itself in the form of characteristic brainwave structures (Zurawicki, 2010). Only by using a gauge basing on brain activity is it possible to indicate the element of a message that drew a consumer's attention. Emotional involvement in turn is nothing else but the tendency of the brain and the nervous system to a stronger or weaker reaction to stimuli. It is emotions of that kind that become a motivator of consumers' intentions, decisions and actions. Apart from attention and emotions, being retained in memory constitutes one of the most crucial factors leading to a positive purchase decision. If something cannot be remembered, it will have no impact whatsoever on making the decision to buy something. Similarly to the case of attention or emotions, the processes of retaining memories generate constant and measurable brainwave structures. An emotionally involved brain will preserve memories connected with a given product under the influence of a marketing message. Originality is another indicator of derivatives. The brain prefers novelties, therefore it values originality, which is a value intensifying interest, surprise and fascination. Another indicator answers the question whether the recipients of a marketing message interpret the content of a message correctly, whether a message is clear and precise.

A Message and Processing

During the conducted research, the participants were showed two videos concerning marketing showing characteristic places of two cities, Boston and Bydgoszcz. The used videos differed significantly. The narration describing Bydgoszcz was characterised by a coherent structure with a clear beginning, development and ending. The protagonist is introduced at the very beginning. He also appeared on numerous occasions when the plot continued. However, his presence was the most visible at the beginning and at the end of the video. The narration presenting Bydgoszcz was characterised an unusual dynamics of the image and of subsequent plots. The vivid and dynamic action was intensified by a dynamic way of operating a camera as well as varied perspectives, sometimes with close-up shots, sometimes from the air. In the visual aspect, the frames offered warm colours harmonising with the dynamic image sequence showing the attractions of the city. Through introducing characters and involving them in individual frames in life situations requiring a reaction, the effect of stirring the message recipient's emotions was achieved. The message is addressed to a wide spectrum of recipients, to families with children, young people, students and mature people and business people visiting Bydgoszcz for occupational purposes.

The narration describing Boston constitutes a total contrast to the video about Bydgoszcz. The film is characterised by a lack of the leading character or supporting characters, which significantly diminished the effectiveness of the information processing. No dynamics or colours seen in the message about Bydgoszcz can be seen here. The film about Boston creates the impression of being cold and distanced. The impression is additionally underlined by the monumentality of the buildings and anonymity of the presented objects and places. The message recipient is a person strongly motivated to gain information about the centre of Boston.

Monitored with EEG stimulation or settling down of brainwaves emerging from processing the frames of the films showed that the respondents initially interested in Boston changed their minds choosing Bydgoszcz. It is highly possible that it happened in view of the construction of the two showed marketing messages, of which one met the requirements of neurosciences in terms of the effectiveness of message processing. Taking the requirements of neurosciences regarding message construction and current knowledge of the depth of processing into consideration, the fact concerning the communication of human beings should be emphasised. It is no coincidence that people use messages with a characteristic and repetitive construction. The method of constructing stories, the emotional and practical dimensions of a narration contribute to increasing recipient's efficiency of

absorbing information provided in a story. Through stories and using appropriate constructions and making use of images, unambiguously decodable in their semantic structure, it is possible to guarantee an effective exchange of information, which happens basically unnoticeably, allowing interlocutors to gain new and permanent knowledge subconsciously and discreetly. Apart from a characteristic construction of communication, it is emotions evoked by narrations in a group of recipients that have an energizing influence on relevant areas in the brain responsible for processing information. A well-constructed message is retained in memory, it activates not only peripheral consciousness, but also intellective perception, which is emphasised by dynamically developing neurosciences, which underline the importance of narration in an effectively programmed message. Only narrations possess the power to activate mirror neurons, which are responsible for among others deep processing of a message and the process of mentalization. The marketing message concerning Bydgoszcz, in addition to taking account of the key requirements of neurosciences (the protagonist on his way to reach a goal), also introduces emotional elements such as a joke, joy of fulfilment and of people-to-people relations, satisfaction, or relax. Thus depicted emotions activate mirror neurons of the recipient of the message evoking emotional states identical with those of the protagonists. Therefore, narrations have the power of involving recipients enabling them during receiving a story to engage the areas of the brain that are responsible for instance for movement. Studies show that while absorbing information which is not included into a narrative structure, only two areas of the brain, that is Broca's area and Wernicke's area, are active (Vetulani, 2014). Exactly those areas are responsible for processing language. This fact is of upmost importance for the depth of information processing. While cold facts are processed, the human brain is engaged in order to sort out the meaning of words from their collection. The situation is different in the case of processing a narration. During communicating by means of a story, the brain areas that are active are the same ones that would be active if communicating people realistically experienced the events presented in a story. All this is possible thanks to the presence of mirror neurons in the brain (Vetulani, 2014), which create a particular arrangement of neurons. This arrangement implements a motor program, which encodes observed activities slightly stimulating relevant neurons. However, it does not cause any real movement of an observer.

Emotional engagement and a coherent form of narration introducing the protagonist guarantee transmitting information to deeper levels of message processing, thus leaving a memory trace in a recipient's brain. A memory trace is a side effect of a stimulus analysis, and its durability depends on the type and depth of processing (Nęcka, Orzechowski i Szymura, 2006). If it is to be transported to a client's memory and consciousness, a message he receives needs to include information which will find its way to the deep levels of processing. The levels of processing theory, unlike the block approach to memory models, views memory as a uniform system. Craik and Lockhart in their theory divide the levels of processing into shallow processing, which is connected with an analysis of physical qualities. The other levels are called deep processing involving a more meaningful analysis, which is characterised by bigger complexity. It should be emphasised that in each of the abovementioned levels, an unspecified number of sub-levels can be found. A message is retained in a recipient's memory only when it reaches deeper levels of processing, where processing itself means searching for and assigning meanings. The deeper the level of processing of given information, the more efficient its absorption by the brain. The increase in the complexity of operations of processing information reaching the system results in the increase in the intensity of processing a message by the brain (Sikorski, 2015). From the point of view of neurosciences, the levels of information processing are consistent with the levels determined by Craik and Lockhart. The first level is the most shallow one, at which a sensory analysis of data is conducted. The results of information processing at this level are short-lasting and susceptible to disruptions. At the next level a semantic interpretation of a received signal occurs. It is through processing information at this level that the meaning of words and sentences is recognised. At the third level of information processing, an activation of previous knowledge takes place. The brain uses various kinds of associations, also at this stage knowledge is reorganised. New information can complete what was already known. Previous information can help to understand new information. It can also be transformed into new structures joining older and new information. Information processing at the deeper levels influences remembering of information. The way Bydgoszcz was presented resembles a story. The main character arrives in Bydgoszcz on business. On his way to his destination, he stops at places important for the story, which are also the attractions of Bydgoszcz. After sorting out his business, the hero leaves the city. The circle closes and

the information the marketing message provides is processed at the deep levels and is retained in memory because attention was drawn to it effectively.

Our Own Research

The research was conducted from March 2017 to March 2018.
It consisted of two stages:

I. Examination with the use of electroencephalography (EEG)
   - √ Similar conditions were provided for all respondents (the time of the day, the distance from a monitor, the seat position, the light).
   - √ A basic examination lasting about 20 minutes
   - √ An examination with the use of a presentation
   - √ An exclusion of disturbing variables

II. Surveys

The characteristics of the group in terms of socio-demographic features is presented in table 1.

Table 1: Characteristics of the examined group – socio-demographic features

variable	specification	number	%
Sex	woman	10	50
	man	10	50
Age Group	30 – 35	7	35
	36 – 40	13	65
Education	secondary or vocational education	8	40
	higher	12	60
Residence	village or town of up to 20,000	3	15
	town of 20,000 – 100,000	1	5
	town of over 100,000	16	80
Marital Status	single	7	35
	married	8	40
	divorced	3	15
	in an informal relationship	2	10

Source: own study based on the conducted surveys

Women accounted for half of the group, men accounted for the other half. The age of the respondents due to the specificity of the research (the changes in the brain occurring throughout life) was narrowed so that all the respondents were between 30 and 40 (the age span was 10 years).

Table 2 presents average amplitudes of β waves in the frontal lobe observed while the respondents were watching the film about Bydgoszcz, and table 3 while they were watching the film about Boston.

Table 2: Average results of amplitude of waves (β) in the frontal lobe (Bydgoszcz)

side	waves	N	Average	SD	Trust (-) 95.0%	Trust (+) 95.0%	min	max.	Q25	median	Q75
right (R)	B1	20	19.9	5.089	17.5	22.2	11.0	30.0	16.8	19.3	23.8
	B2	19	21.2	6.336	18.1	24.2	10.0	30.0	15.5	21.0	27.0
left (L)	B1	20	21.3	4.447	19.2	23.4	14.5	29.0	18.8	20.0	25.5
	B2	19	20.0	4.947	17.6	22.4	11.0	29.0	16.0	20.0	24.0

Source: own study based on the conducted research

A higher average amplitude of β2 waves was noted on the right side – 21.2 Uv. β1 waves on the right side were noted in the cases of all the respondents. A higher amplitude of β1 waves was noted on the left side – 21.3 Uv. β1 waves on the left side were also noted in the cases of all the respondents.

Table 3: Average results of amplitude of waves (β) in the frontal lobe (Boston)

side	waves	N	Average	SD	Trust (-) 95,0%	Trust (+) 95,0%	min	max.	Q25	median	Q75
right (R)	B1	20	19.5	3.642	17.7	21.2	14.0	26.0	17.0	19.3	22.0
	B2	20	19.3	5.777	16.6	22.0	10.5	35.0	14.5	18.3	23.0
left (L)	B1	20	19.1	3.895	17.3	20.9	13.0	28.0	15.3	20.8	21.5
	B2	18	20.4	4.949	17.9	22.8	13.5	30.5	17.0	20.0	22.0

Source: own study based on the conducted research

A higher average amplitude of β1 waves was noted on the right side – 19.5 Uv. β1 waves and β2 waves on the right side were noted in the cases of all the respondents. A higher amplitude of β2 waves was noted on the left side – 20.4 Uv. β1 waves on the left side were also noted in the cases of all the respondents.

The second part of the survey was a survey in which the respondents were to indicate the elements remembered from the viewed materials promoting the cities of Bydgoszcz and Boston and to justify their choice of the place they would like to visit. Table 4 presents the results obtained.

Table 4: The most frequently indicated terms of Bydgoszcz and Boston

Specification	The terms most frequently indicated by the respondents	
	Bydgoszcz	**Boston**
The respondents who showed a desire to visit Boston	airport, river, music, sports, university, canoeing, trams, bridge, opera	greenery, order, modernity, city I do not know, interesting city, space, university, beach, ships, Harvard, architecture
The respondents who showed a desire to visit Bydgoszcz	people (young people) and places, mill island, opera, Bydgoszcz-canal, PESA, interesting city, many attractions, Flood-fountain, library, sun, emotions, greenery	boring city, just buildings, pitch

Source: own study based on the conducted surveys

The qualitative analysis of the answers provided indicates that the respondents who decided to visit the city of Bydgoszcz used more terms in comparison to those who decided to visit Boston. Moreover, these terms were characterized by a positive emotional colouring. From the observations made while completing the questionnaires, it can be concluded that the material about Bydgoszcz aroused positive emotions in the respondents. The narration used in the description of the city of Bydgoszcz was saturated with dynamism, a changing perspective. It preserved the consistency of the story told, it had an engaging effect on the recipient of the message because it presented people as the heroes of the narrative.

The respondents who decided to visit the city of Boston used words emphasizing unknown space with interesting architecture. The message describing the city did not engage the viewer enough to arouse intense interest despite the attractiveness of the city itself. This fact should be explained by the structure of the narrative about Boston. The description of the city was factual and economical in form. It showed the city from a distance. It was focused on buildings and streets. There were no references to people in the narrative. The narrative did not have a protagonist who would show the audience the streets of Boston showing the most attractive corners of the city.

Conclusions

As can be seen from the data in Table 2 and Table 3, for the city of Bydgoszcz an average amplitude of β2 wave noted on the right side of the frontal lobe and the average amplitude of β1 wave noted on the level side of the frontal lobe were higher than for the city of Boston. The left hemisphere is responsible for logical thinking and verbal processes, the right one for holistic thinking and intuitive thinking. β1 wave characterises concentration and attention directed outside, β2 wave is characteristic for emotional agitation (Markiewicz, 2017). Although an in-depth analysis due to the statistical significance ($p>0.05$) indicated a lack of statistically important differences between the examined groups in terms of the results of the amplitude of β waves, the obtained results can indicate a bigger interest, both volitional and emotional, evoked by the presented promotional material for the city of Bydgoszcz. Additional confirmation of the obtained results and preliminary conclusions are the data obtained in the process of analysis of the respondents' statements. Both the form and the selection of words used in the descriptions by the respondents indicate the emotional reception of the city of Bydgoszcz and the lack of interest in Boston in 75% of the respondents. As a result, it could cause in unconscious choice (EEG results) and conscious choice (questionnaire) choosing Bydgoszcz as the city the respondents wanted to see. Out of 20 respondents, 15 of them chose Bydgoszcz after seeing the material, 5 people decided to visit the city of Boston.

Discussion

On the one hand, the cost of the neuromarketing research for one respondent is considerable higher than the cost of conducting a survey, on the other hand, the required number of the people examined with the use of specialised equipment is significantly smaller than in the case of the questionnaires. Moreover, the results obtained in examination with the use of an electroencephalograph or a functional nuclear magnetic resonance come from data uncontrolled by a respondent, but in the case of questionnaires intentional or unintentional data distortion can be expected. Consequently, the transaction cost incurred by an entrepreneur can be lowered. Also, assuming that as a result of neuromarketing research an entrepreneur (e.g. a trading enterprise) will gain information about the most effective stimuli bringing an expected result, that is a decision to buy, higher revenue from sale should also be expected. A customer is found on the other side of the purchasing process. In the case of using neurolinguistic knowledge by a trading company, a customer unaware of this fact can purchase uncontrollably more often, as a consequence of which a customer may be forced to pay additional costs, e.g. the costs of transport when he wants to take the purchased goods back to a shop, elongation of the stage of gaining information. However, it may also be assumed that when customers' preferences and not only stimuli provoking the willingness to buy are known, an entrepreneur (a trading company) will present an offer tailored to a customer's requirements. Consequently, transaction costs paid by a customer will be lowered.

The research discussed proves that an advertising message constructed in accordance with the guidelines of neuroscience is processed more efficiently reaching deeper levels of attention and memory, which has a direct impact on the intensity of the potential customer's interest in purchasing a given consumer good, and this significantly shortens the path from noticing the good to making a decision to buy it. What is more, the decision-maker makes a conscious decision based on the available but unconsciously obtained information. Hence, choices based on analysis often coincide with choices made emotionally. Undoubtedly, this fact has an impact on lowering transaction costs on the seller's side, while on the buyer's side it often contributes to increasing costs accompanying the purchase process.

These studies have been piloted. The aim was to verify the correctness of the test method used, including the possibility of using the EEG and the usefulness of the information obtained in the test. Due to the small size of the sample and the lack of representativeness of the results obtained, it is not possible to generalize the sample to the whole population. However, they are a valuable study for analysis and a determinant of relevant studies. With the development of neurosciences and measuring instruments, the areas accessible so far only on the way of questionnaires and introspective research gain a new quality. However, errors can be found in the process. It should be emphasised that the authors are planning further in-depth research concerning making purchase decisions through appropriately composed messages, and the above research is treated as an introduction to detailed research aiming at providing understanding how the brain buys and what has the greatest impact on it.

Abstract

Additive manufacturing (AM) or 3D printing is an industrial revolution, challenging traditional manufacturing models, but is still in the development phase after more than 30 years of discrete existence in prototyping labs. AM is an advanced manufacturing technology that fabricates parts layer by layer from one from a digital model (CAO) that manages a digital stereolithography (STL) file. From standard NF ISO 17296-2, there are 7 families of the most used processes, such as FDM (Fused Deposition Modeling) was developed by S. Scott Crump, unction by the temperature setting of the machine (around 200 ° C), necessary for the melting of the material and deposited by a thin-layer nozzle that can range from 0.08 to 3 mm thick. Due to the nature of the FDM process many benefits appear but making functional parts using FDM has proved to be a difficult task. The difficulty comes from the influence of processing parameters such as: Platform temperature, Extruder temperature, Layer thickness, Number of shells, Infill density, print speed, Infill pattern and Number of solid layers on the final characteristics of the pieces. Our work presented provides an experimental study to analyze the effect of each processing parameter on the dimensional accuracy and time of manufacture of FDM parts. In general, 18 test samples were made using various treatment parameters. In order to analyze dimensional tolerances of these samples they were measured and compared to a 3D CAD model.

Keywords: Additive manufacturing; Fused Deposition Modeling; Optimization of Processing Parameters; Taguchi method; dimensional tolerances.

Introduction

The engineering profession constantly reinvents itself through innovations and technologies so the world changes the industry also to meet the new expectations of consumers. It focuses on personalization and responsiveness. Additive manufacturing [1] is an industrial revolution that challenges traditional manufacturing models and disrupts the relationship between the manufacturer and the consumer. This process of shaping by adding material is a real economic and environmental opportunity.

Additive manufacturing or 3D printing the most popular term with the public is still in the development phase after more than 30 years of discreet existence in prototyping laboratories. The

first technology was invented in France and the patent was filed on July 16, 1984 under the name "device to realize a model of industrial part" [2], based on the same technic, the Americans also deposited theirs on August 8, 1984 [3]. So additive manufacturing is not a new technology, manufacturers have been using it for more than 30 years mainly for prototyping [4,5].

Today, the 3D printing market offers different types of machines. So not so easy to locate, especially as each device has its own technology to make the object in volume. But whatever the used method, the volume object is always a layer-by-layer succession from a numerical model (CAD) [6] which manages a digital stereolithography (STL) file [7]. Based on the standard NF ISO 17296-2 [8], there are seven families of processes to use the most. The FDM [9] " fuse deposition Modeling " is the most popular method. It builds parts layer by layer ranging from 0.08 to 3mm thick, heating a thermoplastic filament (PLA, ABS) [12]] at over 200 °C and extruding it through a small nozzle of diameters (0.4mm, 0.6mm, 0.8mm, 1.00mm and 1.20mm) by 3D CAD model usually in STL format as shown in Figure 1. The filament usually has a circular section with specific diameters for each FDM system. The most used diameters are either 3.0mm or 1.75mm. After which the platform goes down and the printer proceeds in the same way for the following layers. The second machine works a little differently SLA [2,3] or stereolithography apparatus is the first AM technique ever invented. The third method of AM is polyjet technology [10], it works on photopolymerization and looks like a lot our major conventional inkjet. In the end the SLS technology "Selective Laser Sintering" [11] placed in a tank, a thin layer of powder material will agglomerate in the heat of a powerful laser pointed at specific locations. The fused powder assembles is solidified. It is called sintering.

Figure 1: FDM process schematic.

From this revolution of the AM there are still limitations and many problems of 3D printing; the most common are problems of FDM technology.

In this paper, we will optimize one from these problems. This problem is created from the parameterization of the printing that can involve the time of the printing, the consumption of the raw material and the deviations of the dimensional tolerance of the manufactured parts. These parameters are requiring the availability of the reference to ensure that the processed additive manufacturing parts conform to the required design features, in particular geometric design features.

Material and Methods

Experimental Work

The FDM printer used to make the samples is 3DP WORKBENCH, from 3DP Platform Industries, using 1.75 mm diameter PLA filaments and a 0.6 mm diameter nozzle. This FDM printer has a print volume measuring 1000 x 1000 x 500 mm with a positioning accuracy of 0.07 mm. The components are printed in the XYZ orientation at the center of the construction platform.

The samples used in this study to evaluate print time, raw material consumption and dimensional accuracy [18-19], they are modeled on the basis of ASTM D5418-07 [13] and 35mm length width 12.5 and height 3.5 as shown in figure 2. The sample used was drawn using SolidWorks 2016 and exported as an STL file. The STL file was prepared in FDM Simplify3d [14] to define all process parameters on all samples and generate the G code that created the toolpath.

Figure 2: Created specimens' CAD model (in mm)

Experimental Design

To understand the influence of the modification of the processing parameters on the printing time, the consumption of the raw material and the dimensional accuracy of a printed part. An evaluation of optimization the control parameters that can influence the dimensional accuracy of the reference component has been completed. In this research, the treatment parameters studied are: Platform temperature, Extruder temperature, Layer thickness, Number of shells, Infill density, Print speed, Number of solid layers, and Infill pattern which was presented in Figure 3. Each of the parameters considered was assigned to only three levels Platform temperature that assigned two levels of control as shown in Table I. Some research work focuses on a single parameter, such as the building direction [20], while others focus on 3 or 4 treatment parameters at the same time. Effects as in [21], [22] and [23] where the effect of building direction, layer height, raster angle and other parameters are analyzed at the same time.

Figure 3: Infill patterns shape schematic

Table 1: Parameters and levels of varying Processing Parameters

Symbols	factors	Units	Levels
A	Platform temperature	°C	70 80
B	Extruder temperature	°C	190 200 210
C	Layer thickness	mm	0.15 0.3 0.5
D	Number of shells	--	1 2 3
E	Infill density	%	25 50 75
F	print speed mm/s	mm/s	50 65 80
G	Infill pattern 'H=1 D=2 L=3'	--	H D L
H	Number of solid layers 'U/L'	--	2 3 4

The values of the processing parameters that were used in Table 1 to establish a Taguchi's experience plan that were widely used in process optimization and product design studies [15-16] .Table 2 shows the values of treatment parameters that were used to establish a total of 18 samples. Thus, only one value was changed at a time in each printed sample.

The samples were measured using a three-dimensional measuring machine (MMT) that was programmed to perform the measurements automatically to avoid errors during the measurement process that may occur when measured manually. For the location of the samples in the MMT table were used a fixture to fix the reference components in place to allow for repeatability and ease of measurement.

Table 2: L18 Orthogonal array, Sample processing parameters specification

Results and Analysis

Experimental results for dimensional accuracy, time of printing and material consumption were recorded and analyzed

Dimensional Accuracy and Repeatability

The dimensional deviation of length L that was calculated represents the dimensional accuracy achievable by the FDM process. The average dimension, the measuring range and the deviation for each characteristic are shown in Table 3. This table shows the measurement results taken for the 18 samples.

Table 3: Samples measurements length results (in mm)

essai	LA	LB	Average	error

18	12,300	12,344	12,322	0,178

The dimensional difference of the height H that was calculated shows the dimensional accuracy achievable by the FDM process. Which have been averaged into a single height value for each sample. The results of these measurements are presented in Table 5.

Table 5: Samples measurements height results (in mm)

essai	HA	HB	Average	error
1	3,338	3,464	3,401	0,099
2	3,404	3,412	3,408	0,092
3	3,263	3,250	3,256	0,244
4	3,247	3,234	3,240	0,260
5	3,335	3,363	3,349	0,151
6	3,261	3,232	3,247	0,253
7	3,251	3,255	3,253	0,247
8	3,401	3,409	3,405	0,095
9	3,220	3,155	3,187	0,313
10	3,420	3,424	3,422	0,078
11	3,426	3,426	3,426	0,074
12	3,368	3,302	3,335	0,165
13	3,240	3,243	3,241	0,259
14	3,396	3,404	3,400	0,100
15	3,307	3,325	3,316	0,184
16	3,255	3,285	3,270	0,230
17	3,332	3,327	3,329	0,171
18	3,171	3,203	3,187	0,313

The first note for all results is that all errors have positive values, which shows that the machine tends to create larger objects than expected. Platform temperature has little or no influence on dimensional error, as shown in Figure 4-a. From Figure 4-b, it is clear that Extruder temperature has a significant effect on dimensional accuracy; when the extrusion temperature increases, the error increases for the height and the opposite for the width and length. In the figure 4-C, we can see that a more average layer height generally gives lower results. In addition to that, we can that when the layer height was 0.3 mm, the error was small in thickness even if the height of the layer is relatively large or small, which is explained by H = 3.50 mm an integer multiple of 0.3 mm. This explains the jump of error when the layer is slightly decreased to 0.15 mm or increased to 0.50 mm. All that shows the importance of the height of the layer on the dimensional accuracy [17]. Infill density and print speed has little influence on dimensional geometry in a margin of 0.05mm in length and 0.025mm in width and height, as shown in Figures 4-e and 4-f. it can be seen that when using a single shell it gives weaker results which was presented in Figure 4-d. In addition, we can see that when we increase the number of shells the error remains a little stable. The use of Infill pattern rectilinear has a significant influence on the dimensional geometer compared to Infill pattern grid which has a small dimensional error, as shown in Figure 4-g. Number of solid layers that have been shown in Figure 4-h has a great influence on length and height compared to width and when we increase the number of solid layers the error increases.

Figure 4: The dimensional error [mm] caused by (a) Platform temperature, (b) extrusion temperature, (c) layer height, (d) Number of shells, (e) infill precentage, (f) printing speed, (g) infill patterns and (h) Number of solid layers

Conclusion

This paper examines the effect of FDM processing parameters on the final geometry of printed parts, material. The study examines the influence of eight processing parameters which are: Platform temperature, Extruder temperature, Layer thickness, Number of shells, Infill density, Print speed, Infill pattern and Number of solid layers. Using Taguchi's experimental design method is a new approach developed to model and optimize print parts by FDM. The 18 reference components were constructed based on the experimental design and measurements that were made on the samples.

Generally, to improve the dimensional accuracy we need a higher Extruder temperature, higher Infill density, average Layer thickness, lower print speed, low number of shells, low number of solid layers and Infill pattern grid which less dimensional error. The dimensions may be preferable when comparing several dimensions at the same time, so that the error in the width and its changes is a little negligible compared to the errors of the other dimensions if the error has been described as a percentage error.

Future work in the field of research on the FDM process, the process of additive manufacturing shows a maximum of knowledge in making engineering applications with high quality parts, accuracy and high properties with low consumption and reduced printing time.

Abstract

Unmanned Aircraft Systems (UAS) is an emerging technology with an enormous potential to revolutionize the world and enable new technological applications. It is part of future integral applications, urban, civil and military. The technological maturity is enough to be integrated into civil society. The importance of UAS in scientific applications has been demonstrated extensively in recent years. Whatever the type of selected missions is, their number and their use will increase significantly in the future. UAS are playing a growing role in many public missions such as monitoring borders, wildlife surveys, military training, real-time monitoring and enforcement of local law. Challenges such as the lack of an onboard pilot to see and avoid other aircrafts and the large variety of missions and capabilities of unmanned aircraft must be addressed in order to fully integrate UAS operations in the context of the next generation. Drones are better suited to difficult or dangerous missions than manned aircraft. Information and monitoring services use drones primarily for intelligence, surveillance and reconnaissance, border security, the insurgency against the attack and strike, identification and target designation, the relay communication, electronic attack, mapping and meteorology.The Unmanned Aircraft (AU) which is plane without a pilot on board, can be a remote controlled aircraft (for example, controlled by a driver to a ground control station) or may fly autonomously on preprogrammed flight plans according to a path in the XY plane or in the orthonormal X, Y, Z or more complex dynamic automation systems. It can carry a lethal or non-lethal payload, which can be high- and low-resolution video cameras, day reconnaissance equipment and night, crop-spraying system, 3D scanner for mapping, weapons of war and generally any equipment necessary for the mission for whom the drone is designed.

Keywords : Drone, Innovation, System, UAS.

Aircraft System Unmanned UAS

Unmanned Aircraft Systems (UAS), also known as unmanned aerial systems, are defined as a system whose internal components work in a way that carry no human operator but that fly autonomously or remotely piloted. UAS must be considered in a systemic context including the command, control and communication and the necessary staff to control the aircraft away. The UAS has recently been used on a wider scale in both military and civilian applications. Its importance and advantages reside in search and rescue, surveillance, reconnaissance, traffic monitoring, inspection of hazardous sites and Range Extender. It is even recently used in the field of agriculture. In addition (1), UAS describes the whole system that includes civil aircraft, control stations and even links data. More profoundly, the system is much more complex in its organization based on the following elements that will prove to deploy an UAS which must provide all logistics:

- Mission Planning Station
- Launch Station and recovery.
- Connecting devices
- Ground Control Shelter
- Data Terminals ground
- Remote Video Terminals
- Payload modules
- Air Data Relay
- Miscellaneous equipment launch, recovery and ground support.

The Drone System

A drone is a system consisting of:

- **Control Station**

The control station is the operation control center, the man-machine interface. From the control station, the operator sends the drone commands via the uplink communication system to direct its flight profile and use the different types of "payload" mission it carries. Likewise, via the downlink communication, the plane returns information and operator pictures. The control station allows to find information on the state of Embedded subsystems (data management) and position information. The launch and recovery of the drone can be controlled from the main station or from a satellite control station (subsidiary). The control station can also accommodate the communication systems of payload.

- Payload
- ✓ The type and payload performance depends on the needs of the operational task. These can range from:
- ✓ Subsystems relatively simple having a non-stabilized video camera with a fixed lens with a mass as small as 200 g.
- ✓ A gyro-stabilized video system with a larger bearing capacity with probable weight of 3 to 4 kg,
- ✓ A high power radar with a mass, with its power, of up to 1 000 kg.
- ✓ etc...

Some more sophisticated drones carry a combination of different types of sensors in the payload. Data from these sensors can be processed and integrated to provide enhanced information.

- **The air vehicle**

The type and the air vehicle performance is mainly determined by the needs of the operational mission. The task of the UAV is mainly to transport the payload of the mission to its point of application, but it must also carry the subsystems necessary for its operation. The subsystems include the communication link, the stabilization and control equipment, the power plant and / or the fuel, the power supply and the basic structure of the cell and the necessary mechanisms for the launched drone to carry out its mission.

Other determinants are important in the design configuration of the drone, such as:

- ✓ the operating range.
- ✓ airspeed.
- ✓ endurance demanded by mission requirements.
- ✓ The requirement for endurance and autonomy.

The requirement of the mission (speed, endurance, altitude ...) more fundamentally determine the propulsion system and the right choice of adequate energy source for optimal configuration of the drone.

- **The Navigation System**

The system allows operators to know at any time the exact position of the drone in space in real time and enables the "back to basics" mode in case of poor performance or failures without any communication between the station and the air vehicle control with a navigation equipment called the drone. This is achieved through a radio tracking device or through the recognition of geographical features.

Today, a global positioning system (GPS) that accesses the location information of a terrestrial satellite system is available. Accuracy is further enhanced by the use of differential GPS (DGPS).

For a non autonomous operation, that is to say when the communication between the UAV and the control station is virtually continuous, or when there is a risk of blockage of GPS, other navigation options are possible as fallback options. These methods include:

- ✓ (A) radar monitoring.
- ✓ (B) Radio Monitoring.
- ✓ (C) Direct Computation of velocity vectors and the elapsed time.

- Equipment launch and recovery of the drone.
- Start the equipment. This will be necessary for aircrafts that do not have the opportunity to fly vertically or to have access to an area of track and of appropriate length for the flight. This usually takes the form of a ramp to which the aircraft is accelerated on a carriage powered by a rubber sandows system by compressed air or by rocket until the UAV reaches a given rate of acceleration to continue the flight(2).
- Recovery Equipment. This will also be required for drones that have no vertical flight capacity. It usually takes the form of a parachute, installed inside the aircraft, which is deployed at an appropriate altitude above the landing area. In addition, a way to absorb the impact energy is required as airbags or replaceable frangible material.

- **The communications**

Being the main requirement, the communication system is to provide data links between the control station and the UAV. The support of most use in the field of air transmissions is radio frequency, but today one finds other possible useful alternatives such as transmitter / 4G receiver which will be able to transmit data on the theory 4G network and therefore over the internet or a light solution in the form of a laser beam or via optical fibers.

- **Interfaces**

All these elements (subsystems) work together to achieve the optimum performance of the entire system. However, some of them can function as an “autonomous” system managed by an interface.

- **Environmental System Capacity**

From the beginning of the system design, it is important to know the impact that the environment plays on the design of all elements of the UAV system, including the provision of a working environment. A system that has been designed takes into account not only low conditions but also the necessary elements to design a anther system that respects the rules of a normalized environment. So you have to carefully examine all these aspects from the beginning of the design to the end.

Classification of unmanned aircrafts

A powered vehicle that carries no human operator can operate autonomously or remotely recoverable, and can carry a deadly and non-lethal payload.

Ballistic or semi-ballistic vehicles, cruise missiles, artillery projectiles, torpedoes, mines, satellites and unattended sensors are not considered as unmanned vehicles. *

Recently, there is a growing use of UAS in intelligence, military, civil and others for special purpose tasks. A considerable effort has been devoted to increasing endurance flight and payload of the AU, which has resulted in various UAV configurations of different sizes, the level of endurance, and capacity. Here, one can classify drones depending on their characteristics (aerodynamic configuration, size, etc.) (3.)

Fixed Wing: It refers to an unmanned aircraft with wings which requires a takeoff / landing or a catapult to launch and parachute for landing. This drone category generally has a long endurance at high cruising speeds.

Rotorcraft: It is also called UAVs (Unmanned aircraft vehicle) rotorcraft or vertical takeoff and landing (VTOL), which have the advantages of a rollover capacity and maneuverability. These capabilities are useful for many robotic missions, particularly in civil applications such as:

- ✓ Audiovisual: It remains today the sector that has the largest number of professionals of the drone. The uses are varied from picture / video private events to the live broadcast of major events.
- ✓ Industry: It is the real growth potential for the professional sector of civilian drone. Industrial applications can be divided into several categories:
- Corridor mapping - Long Distance.
- Conditional maintenance, security
- inspection work
- Repository infrastructure.

- ✓ Agriculture: Agriculture is also a rapidly expanding market for UAV industry. Mapping the treatment of cultures through their diagnosis, drones have particularly proved effective in precision agriculture.

UAV rotorcraft may have different configurations, with the main and tail rotors (conventional helicopter), coaxial rotors, tandem rotor, multi-rotor, etc.

Tethered balloons and airships: An aerostat manoeuvrable is able to propel itself into the air. Its features are lightweight, long endurance, low acceleration and large.

Flapping-wing AU: It is flexible and has morphing small wings inspired from birds and flying insects. There are also other hybrid configurations or convertible configurations, which can take off vertically and tilt their rotors or their bodies and fly like airplanes.

Tableau 1 : Current Aircraft Category and Regulatory Basis Supporting Type Certification , (Ref4)

Aircraft Category	Aircraft Use and Notable Limitations	Applicable Airworthiness Standards for Type Design
Acrobatic	Use: acrobatics Notable limitations: weight ≤ 12,500 lbs. seats ≤ 9, excluding pilot seats, (14CFR23.3)	Part 23, with regulations specific to acrobatic category airplanes No acrobatic rotorcraft
Normal	Use: Normal flying (nonutility, nonaerobatic, or noncommuter operations) Notable limitations: weight ≤ 12,500 lbs. (airplanes) ≤ 7000 lbs. (rotorcraft) seats ≤ 9, excluding pilot seats (14CFR23.3)	Part 23 for airplanes Part 27 for rotorcraft
Utility	Use: Normal + limited acrobatics allowed; e.g., spins (14 CFR 23.3) Notable limitations: weight ≤ 12,500 lbs. seats ≤ 9, excluding pilot seats	Part 23 for airplanes No utility rotorcraft
Commuter	Use: commuter operations (scheduled operation with at least 5 round trips/week on at least one route between two or more points according to the published flight schedules (14 CFR 110.2) Notable limitations: weight ≤ 19,000 lbs. seats ≤ 19, excluding pilot seats (14 CFR 23.3)	Part 23 for airplanes No commuter rotorcraft
Transport	Use: multi-engine aircraft intended for the regular public transport of passengers and/or cargo for hire or reward Notable limitations: weight: > 19,000 lbs. (jets & props), 7,000 lbs. (rotorcraft) seats ≥ 10 (jets), seats > 19 (props and rotorcraft)	Part 25 for airplanes Part 29 for rotorcraft
Restricted	Use: special purpose operations (as defined in 14CFR21.25, including agriculture and aerial surveying) Notable limitations: no operation over densely populated areas, in a congested airway, or near a busy airport (14CFR91.313)	Requirements of some other category or an aircraft meeting the requirements and accepted for use by the US military with exemptions and operating limitations specific to the special purpose (14CFR21.25)

Control Type

There are three forms of control that an operator can exert on the drone:

- Piloting the ground or remote control;
- Semi-autonomous;
- Standalone.

Ground control or remote control: AU controlled ground known as remotely piloted vehicles are radio-controlled drones that use the same basic techniques that are familiar to the lover of R / C. There are very few modern AU which are controlled remotely. In the 1980s and early 1990s, systems such as Point and Sky Owl began using both programmable guide remote control technologies and systems as an autonomous fundamental form.

Semi-autonomous: The use of the semi-autonomous flight control system assumes that the operator must take full control of the aircraft during the pre-flight, take-off, landing, and operation near the base. When the automatic steering function is activated, the drone will automatically follow the set of pre-programmed points. Yet, it prevents the operator from being constantly responsible for the mission and the drone itself throughout the operation.

Fully autonomous: The fully autonomous capability requires no human input to achieve a goal after takeoff decision. An autonomous drone is able to monitor and assess its performance, status and configuration.

The program is called allowing the drone to "fly" on the programmed flight paths without any human intervention for almost the entire mission. The operator merely monitors its systems. Control sensors are done by an onboard computer rather than a human being. This can be divided into three broad categories:

- ✓ A) Orientation;
- ✓ B) Navigation;
- ✓ C) Control.

Application of UAS (UAV)

Currently, the main applications of UAVs are related to the field of defense. The main investments are driven by future military scenarios. Most unmanned military aircrafts are mainly used for round intelligence, surveillance and reconnaissance. It is also used for detecting chemical, biological, radiological, nuclear, or just deemed too dangerous or politically difficult tasks for manned aircrafts to undertake. RSUs are preferred to manned aircrafts, not only because of the risk of downsizing, but also because unmanned vehicles have better vigilance during operation in addition to many other technological factors.

The transfer of drones to the civilian sector, which has to imagine a significant number of civil applications, opens up considerable potential growth in varied and innovative sectors. With many different aerial data capture that drones can perform, applications in the civilian sector is very diverse, with potential applications in markets.

Drones are better suited to do the following

Operational exploration: Operations requiring more than 30 or 40 flight hours are best performed using UAS with a low workload, only requiring human monitoring rather than direct and continuous control. There is a long list of tasks that could be included in this category, such as: the type of supervisory tasks on fixed sites, acting as a communications relay. However, some of these tasks can themselves generate more complex or sensitive tasks (such as the identification of a target) that may not be easily prosecuted by a simple single task platform.

Application security: UAVs are capable of performing a variety of missions in support of surveillance and military missions. The list below shows some applications:

- Monitoring the recognition and targeted acquisition.
- Marine Operations (naval fire support, targeting the horizon, missile defense, ship classification);
- Meteorological missions;
- Setting the indirect and air support fire;
- Damage Assessment;
- Radio relay and data;
- Monitoring of biological or chemical contamination;
- Electronic Intelligence;
- Designation and monitoring of targets.

Civil applications: Today, civil UAV market is still emerging. However, expectations for growth of civil and commercial UAV market are very high. Potential civilian applications drones are:

- Police Functions
- Traffic Detection
- Fisheries Protection
- Pipelines Survey
- Sporting events coverage Film
- Agricultural exploitation
- Survey on power lines
- Air Photo
- Border Patrol
- Monitoring of road traffic, etc.
- Search and rescue in disaster and crisis management.
- Environmental monitoring.
- Agriculture and Forestry.
- Fight against fires.
- Aerial mapping and meteorology.
- Search university laboratories.
- And many other applications.

Conclusion

we aim, in future scientific work, to propose a system of positive use of this innovation, in the context of health and education for example.

In this article, we tried to clarify the increasing roles of this trend and show that UAVs have an enormous potential capable of revolutionizing human life in several multipurpose sectors.

The overall architecture and the aforementioned UAS data will be useful for achieving positive results in the field of scientific and technological research at the end of the design and performance improvements. This will definitely contribute to the aerospace industry.

Abstract

The Constitution of the Russian Federation (Constitution of the Russian Federation, 2015) as well as the democratization of Russian society, which have established new development trends of the state have required fundamental changes in the structure of Executive power and other administrative and legal relations. This also implies a positive improvement in the legal regulation of relations in the field of administrative governance.Currently, the purposes of administrative and legal regulation are to improve the forms and methods of governance, establish and regulate relationships between citizens and state institutions in wich each person should be guaranteed real respect for rights and freedoms, as well as effective protection of these rights and freedoms in cases of violations.The provision of administrative (public) services by Executive authorities is a promising trend for improving public administration in the new conditions. The main advantage of this function is its multipurposeness, which contains both a regulatory and law enforcement aspect; significant potential for contractual regulation of public relations in the context of state power reform; ensuring the processes of possible convergence of public and private law principles in modern public administration; the possibility of a real guarantee of the protection of constitutional human rights of citizens, etc.It should also be taken into account that membership in many international organizations imposes to Russia certain obligations in the field of ensuring the rights of citizens and developing strategies for state policy in various spheres of public life (Vorontsov A.L., Vorontsova E.V., 2016). At the same time, the involvement of all state Executive bodies in the provision of administrative services, as well as setting tasks for them to reveal, prevent and suppress various types of violations in this area, provides for strengthening the role of these bodies as a managemental part of the state mechanism. It should be noted that providing administrative (management services) is considered by scholars as one of the main and permanent functions of the state. Therefore the importance of developing this issue requires significant efforts from both authorities and scientists who investigate managerial issues in order to improve the mechanism for providing administrative services.Thus in our opinion management services should be considered as the activity of Executive authorities to provide the necessary conditions for citizens and other subjects of administrative legal relations to fully realize their rights and freedoms in the sphere of activities of Executive authorities.During the discussion of administrative services in the field of education usually it is suggested to include in this group, for example, the creation, reorganization, liquidation, accreditation of educational institutions, registration and licensing of educational services. In this part we feel that it is more appropriate to talk about the category of state and municipal services provided directly by state authorities. Thus, we support the scientists who think that services in the sphere of activity of Executive authorities should be divided into these types mentioned above.It should also be recognized that today the problems of administrative services are constantly under the attention of both scholars and practicing lawyers, since they have not sufficiently studied in the legal literature yet .

Keywords: Administrative Services, Management Services, Public Services, Education, Educational Sphere.

Introduction

In the conditions of rapid development of the Russian Federation in all spheres of public life, it is vitally important to improve the main functions of the state. One of the leading functions is to ensure effective interaction of the interests of all subjects of law. This can be achieved by establishing the principle of the rule of law, which implies the creation of a system of public order based on the taking into account the interests of various segments of the population, their consent and compromise.

The Constitution of the Russian Federation (Constitution of the Russian Federation, 2015) says that the state recognizes the principle of the rule of law. In other words this principle is a priority one for the legal state and important way of its development. The content of this principle, first of all, means the correlation in society of law and the state (authorities, officials and other persons), i.e. the priority of law and subordination of the state and its institutions to law. Moreover, the principle of the rule of law means the correlation of law and various spheres of life such as politics, economics and others. This correlation consists in the priority of law for these spheres. The rule of law is guaranteed through the development of legislation and mechanisms for its implementation. However, besides the characterization of the process of applying legal acts adopted by the authorities, it is necessary to take a broader approach to the concept of legal regulation in the field of public relations, in terms of providing administrative services by executive authorities. First of all, this means the development of basic theoretical principles regarding the concept and legal nature of administrative (management) services as a universal tool for ensuring a democratic legal regime in the state.Nowadays, the scientific community is discussing the question of defining and adopting to the legal circulation the concept of administrative (managerial) or public services. The term was proposed as one of the functions of the Executive power to emphasize the existence of responsibilities of these authorities to individuals and legal entities.It should be noted that the term "public services" is used along with the term "administrative and management services", and in practice there is no significant boundary between them. Recently, the term "administrative services" has become more widely used, since it is rightly considered that the category of management services already has its own meaning in Economics. The adjective "administrative" is also more appropriate because it refers to the entity that provides such services – the administration, administrative authorities. In addition, the term "administrative" describes the regulatory and public nature of the activities for the provision of these services.When using the term "services", the main focus is on the legal aspects and particularly on the administrative procedure. This can be explained by the fact that first of all the main ideologists of the introduction of the theory of services are representatives of the science of administrative law.Not all administrative actions by state Executive bodies can be considered as "management services", because some types of such administrative actions do not fall under the term "services" by their nature and legal consequences. For example there are actions to take limiting or aggravating decisions against individuals, including the administrative and government measures to them. These actions cannot be qualified as "services".

The other actions can be classified as the sphere of "services" provided by authorized bodies and officials. This sphere includes a huge array of administrative actions of Executive authorities: from the issuance of a birth certificate, passport – to the consideration by the authorized body or official of any other individual's request to satisfy his or her legitimate interests on a specific issue. Taking this into account, it is proposed to define the types of activities of Executive authorities as "administrative services" because as some scholars says that the "services" provided by Executive authorities is primarily the performance of certain duties to the population (Averyanov, V.B., 2002).

There is also an opinion that it is more correct to divide services on state ones provided by Executive authorities, state institutions and organizations, and municipal ones provided by local governments and municipal institutions and organizations.

At the same time, the general criterion for state and municipal services is their public nature, i.e. they can be called public services, and them we can divide on administrative services (provided by Executive authorities, local self-government bodies) and services provided by state and municipal institutions and organizations (i.e. "non-public administrative services") (Koliushko, I., 2001).

In the scientific literature there are the following features of admenistrative services: providing only because of the request of individuals and legal entities; the need (and the opportunity) of obtaining the particular administrative services are directly provided by the law; the law gives powers to provide the administrative services to the relevant Executive authority or local authority; individuals and legal entities must meet certain requirements defined by law to get administrative services.

Consequently, administrative services are activities by the Executive authorities and local authorities (constituent territories authorized by state) aimed at providing statutory rights and interests of individuals and legal entites who took the initiative in their implementation.

Thus, the service is the result of the activities of an administrative authority, carried out at the request of an individual or legal entity, on the legal registration of conditions for the implementation of rights, freedoms and legitimate interests. Perhaps this is an even better definition of this term that draws attention to the result, and therefore to the integrity of the administrative service. However, the use of such a basis for providing administrative services as "legitimate interests" is debatable, because in this case the person does not have the right to claim (Koliushko I., 2001).

The legal regulation of the provision of administrative (management) services exist in most countries where there are codified acts devoted to the detailed regulation of procedures in the activities of the authorities in terms of their relations with individuals and legal entites.

The authors suggest the following list of administrative services to understand their essence:

- authorization (for example, engaging in certain types of individual business activities; to conduct meetings, demonstrations; for advertising; for purchase, storage, carrying and transportation of weapons; etc), including accreditation, certification (e.g. accreditation of higher education institutions, health care institutions, certification of businesses and jobs; certification of goods, works and services);
- maintenance the registers (for example, registration of acts of civil status, business entities, vehicles), including legalization of law subjects (e.g., legalization of associations of citizens);
- legalization of documents (for example, consular legalization of documents), nostrification (recognition of diplomas issued in other countries) and verification (establishing the validity of certificates of origin of goods from Russia);
- social administrative services (e.g., subsidies, pensions).

Thus, the administrative services should be considered as activities of Executive authorities in providing the necessary conditions for realization by citizens and other entities their rights and freedoms in the sphere of activities of Executive authorities.

If we consider educational services, we should include in this group the creation, reorganization, liquidation, accreditation of educational institutions, registration and licensing of educational services, in our opinion, it is more appropriate to talk about the category of state and municipal services provided directly by state authorities. Thus, we support the opinion of scientists that services in the sphere of activity of Executive authorities should be divided into these types (Raksha N.S., 2018).

Thus, licensing of educational services is a procedure for conducting a license examination, making decisions, registering them, issuing, reissuing licenses, issuing their duplicates, as well as making decisions on restricting the activities of subjects in the field of education (Lihachyov, S.V., 2015, Vorontsov, A.L., Vorontsova, E.V., 2015).

For example, the activities of the Ministry of Education and Science of the Russian Federation in licensing higher education should be classified as administrative (state services), and the activities of educational authorities of regional state administrations in licensing preschool education as municipal services.

Conclusion

Among the main directions of state reform there is the creation of a new legal framework for public administration, scientific and information support of its system. The priority of legislative regulation of the activities, functions, powers and procedures of Executive authorities, establishing the responsibility of these authorities and their officials for their decisions, actions or omissions, as well as full and high-quality provision of administrative services based on legislation, are of key importance among the fundamental principles of the functioning of the Executive power in a legal state.

During considering the essence of administrative services in the field of education, we note that it is the activity of Executive authorities on rendering educational services, which should be attributed to the category of services in connection with the presence of features common to all management services: the provision of public services is always preceded by the treatment (application) a individual or legal entity in the administrative authority; the need (and the opportunity) of receiving specific public services directly provided by the law; the law gives the power to provide each public service to the appropriate Executive or local authority; a person in accordance with the law has the right to require the authority to consider an application for the provision of services; in order to receive public services, individuals and legal entities must meet certain requirements defined by law (i.e., the established procedure for providing the relevant service must be observed.

Abstract

The annual reduction in the number of cattle, including the number of cows, actualizes the problem of providing the population with dairy products and milk. The purpose of the article is to consider the main indicators of milk production and consumption in the Sverdlovsk region. The authors highlight the main reasons for not reaching the threshold values indicated in the Doctrine of Food Security for Milk and Dairy Products. The article uses the economic and statistical method. The empirical basis of the article is a case study of the development of the dairy subcomplex of the agro-industrial complex.

Keywords: Food Security, Self-Sufficiency in Food, Agriculture, Dairy Production.

Introduction

In a rapidly changing economy, an increase in the world's population, more and more attention has been paid to the problems of providing the population with food, as well as self-sufficiency in food due to limited resources. Unfortunately, at the beginning of 2020, the Russian Federation did not reach the thresholds set by the Food Security Doctrine for self-sufficiency in milk and milk products, thus we can talk about the loss of food independence. The threshold values (target values) for the main food products are presented in Figure 1.

Provision of basic foodstuffs to the population

Milk production is one of the main directions of ensuring the «national security of the country» [9.3]. The Food Security Doctrine, approved in 2020, approved changes to the methodology for calculating food independence indicators. Namely, an indicator of self-sufficiency in food has been introduced.

Fig. 1: Target indicators of the State program for the development of agriculture and regulation of agricultural products, raw materials and food markets for 2013-2020; thresholds set by the Food Security Doctrine in 2010 and 2020.

Analyzing the indicators of the "Doctrine of Food Security" and the State Program for the Development of Agriculture and the regulation of markets for agricultural products, raw materials and food, we note that they practically coincide. Moreover, the targets of the State Program exceed the threshold values of the Doctrine of Food Security, for example, by 4.3% for grain; sugar - 5.5%; potatoes - 2.6; meat and meat products - 5.2%.

Self-sufficiency indicators for salt and milk have not been achieved. Thus, according to the Doctrine [1,2], threshold values for domestic salt are set at least 85% in the domestic market, and its only 63.6%, and milk - at least 90%, but it is produced 82.4% of the total volume of domestic consumption, i.e. below the indicator set by the Food Security Doctrine by 7.5 pp.

Table 1: Production of marketable milk in the Russian Federation, million tons for 2013 – 2018

Manufacturers of commercial milk	2013	2014	2015	2016	2017	2018	Rates of growth, %
Agricultural organizations	13,0	13,5	13,8	14,2	14,8	15,4	118,46
Peasant (farm) enterprises and individual entrepreneurs	1,2	1,3	1,4	1,5	1,7	1,8	150,00
Households	4,5	4,7	4,5	4,5	4,3	4,3	95,55
Total	18,7	19,4	19,6	20,3	21,0	21,5	114,97

Compiled by the authors on: https://agrovesti.net/lib/industries/dairy-farming/rossijskij-rynok-moloka-i-molochnykh-produktov.html

These tables reflect an increase in production of marketable milk by 114.97%, which is associated with an increase in milk productivity mainly by agricultural organizations. Moreover, the average annual growth ranged from 1.03% to 3.74%.

In recent years, there has been a decrease in the number of livestock cows due to the replacement of inefficient livestock by breeding animals. Thus, the total number of cows in the Russian Federation decreased over the same period by 5.8%, and milk production increased by 13.9%.

The level of milk consumption is also reduced from 248 kilograms per capita in 2013 «to 229 kg in 2018» [6]. At the rate recommended by the Ministry of Health of the Russian Federation - 325 kg per year per capita. Thus, «per capita consumption of milk and dairy products» [5.7] is 29.5% lower than the established norms. This is due primarily to rising prices for milk and dairy products while reducing real incomes of the population.

Consider the indicators of production and consumption of milk and dairy products in the Sverdlovsk region, table 2.

Table 2: Indicators of development of dairy cattle breeding in the Sverdlovsk region in 2015-2018

Index	**2015**	**2016**	**2017**	**2018**	**growth rate / decrease,%**
«Profit (loss) before tax» [2], thousand rubles	5344249	4604971	3847391	4764824	89,16
Net profit, thousand rubles	5238405	4451700	3784553	4613394	88,07
Total farms	264	271	245	246	93,18
Livestock, heads	192182	193033	191205	190541	99,15
including cows	82638	82304	82134	81477	98,59
Milk yield per 1 forage cow	6393	6616	7143	7473	116,42
The cost of producing 1 centner of milk, people / hour.	1,94	1,88	1,69	1,56	-0,38
«The cost of feed for the production of 1 centner of milk» [6], feed units	1,0	0,99	0,95	0,96	-0,04

Compiled by the authors at: https: //mcxso.midural.ru/

An analysis of the data in the Sverdlovsk region regarding the development of dairy cattle breeding indicates an annual decrease in the number of livestock for 1641 cattle during the four years under study, including a decrease in the number of cows for the same period - 1161 animals. “The effectiveness and efficiency of milk production is characterized by a system of natural and cost indicators” [6.8]. So the main indicators of the efficiency of the production process can be: productivity, labor intensity, level of production costs. Milk production in 2018 compared with 2017 increased by 104, 4%; the production cost of milk, over the same period, changed by 102.3%; and the increase in the commercial (full) cost of milk occurred by 101.47%; milk sales volume changed by 103.8%. At the same time, we note that the level of profitability (excluding subsidies) decreased by 11.1%; taking into account subsidies by 8.5%, which is associated with a decrease in selling prices. Every year, with the support of the regional budget, new farms are modernized, reconstructed and built. Agricultural producers, including using state support funds, in 2018 purchased more than 1,100 units of livestock equipment and machinery.

Consider the influence of factors on the «cost of one centner of milk» [4,6], table 3.

Table 3: Factors affecting the cost of milk in the Sverdlovsk region

PPeriod	«Production cost of 1 centner of milk»		«The milk yield per 1 forage cow per year»		«Labor costs per 1 cent. milk, people / hour.»	The cost of feed for the production of 1 centner of milk, feed units	Cost of feed unit, rub.
	rub.	growth relative to the previous period,%	kg	growth relative to the previous period,%			
2013	1492	-	5874	-	2,26	0,99	642,8
2014	1567	5,03	6361	8,29	2,0	0,97	705,4
2015	1761	12,38	6393	0,50	1,94	1,0	791,3
2016	1927	9,43	6616	3,49	1,88	0,99	882,5
2017	1956	1,50	7143	7,97	1,69	0,95	926,0
2018	2001	2,25	7473	4,62	1,56	0,96	945,3

The data in the table indicate an increase in the production cost of milk in the study period by 134.05%. Positive dynamics is observed in terms of «milk yield per feed cow» - 127.22%, which is associated with an increase in breeding stock; «Labor costs per centner of milk» decreased by 30.97%, which is associated with the mechanization and automation of the industry; “The cost of feed units” increased by 147.06%, which is associated with an increase in the cost of purchasing imported feed.

Description of the dairy industry of the Sverdlovsk region.

At the end of 2019, the production of raw milk increased in the Sverdlovsk region by 22.9 thousand tons. In order to increase the competitiveness of agricultural producers in the territory of the Sverdlovsk region, the state program «Five-Year Plan for the Development of the Sverdlovsk Region» is underway, within the framework of which the "Ural milk to every house" direction is being implemented.

The main producers of milk and dairy products in the Sverdlovsk Region are: Alapaevsky Dairy Plant; Serov Dairy Plant; Krasnoufimsky dairy factory; Irbit Dairy Plant; dairy factory “Milk grace; Slobodoturinsky milk factory "Hope"; dairy plants "UMMC-AGRO". For example, milk processing at the largest plants in the Sverdlovsk region has changed as follows. Alapaevsky Plant increased processing volumes from 20162 tons in 2015 to 27375 tons with a production capacity of 25,000 tons; Irbit Dairy Plant increased processing volumes from 109095 tons to 167371 tons (production capacities are calculated on 226177 tons). In table 4, we consider the dynamics of milk production.

Table 4: Milk production by organizations of the Sverdlovsk region for 2015-2019, tons (fragment)

Milk producers	2015	2016	2017	2018	2019	Rates of growth, %
Kilachevsky	28444	29569	31314	34049	34049	119,71
Kamenskoe	21415	22517	24483	24557	24557	114,67
Ural collective farm	17228	18048	18048	22116	22116	128,37
Agrofirm Irbitskaya	13212	13212	13212	17710	17710	134,04
Nekrasovo-1	9637	10792	10792	15857	15857	164,54
Collective farm named after Chapaev	н/д	12339	12339	14287	14287	115,79*
Agrofirm Patrushi	12347	11015	11700	13020	13020	105,45

** The calculation was made to the level of 2016.*
Compiled by the authors at: https://www.dairynews.ru/

The increase in milk production is increasing annually in all organizations under consideration, which is a positive trend. At the same time, the price level of agricultural producers remains low (25.3 rubles per liter in 2019 against 24.4 rubles in 2018). Retail prices are several times higher, which undoubtedly restrains the growth of milk production by both large agricultural organizations and households. Along with price disparity, there are shortcomings in building relationships between agricultural producers and retail retail chains, which have a significantly larger share in the total income from the sale of dairy products.

Abstract

Urban campuses have a role in educating future generations and empowering society to live sustainably. Campuses' gardens usually functioned as an aesthetic aspect of a campus area. Gardens have a much positive impact on society and environmentally. With the rise of environmental issues such as increased carbon gas emissions from food-producing activities, land-use change, the idea of implementing an edible garden has been around for the last decade. There are few studies about the implementation of edible gardens in Indonesia's urban campus, especially postgraduate urban campus. This paper discussed what the university thinks about the concept of the edible garden and how to manage it properly. A qualitative method was used for this research by conducting an in-depth interview and literature studies. The results of this study are that the university was interested in implementing an edible garden at the urban campus, and one of the problems in managing the gardens were lacking gardening skills and human resources. This study indicates that the concept of an edible garden is reasonable and can add the university's sustainable campus program.

Keywords: Edible garden, urban campus, sustainable society, sustainable campus program

Background

Universities have a role in educating a better generation and future leaders to create a sustainable future (Fu *et al.*, 2018; Geng *et al.*, 2013). Strong commitment and support from the academic community, which consists of the faculty members, staff, and students, can create an environmentally friendly education infrastructure for a more sustainable campus (Anis *et al.*, 2018). Urban campuses are designed differently compared to rural campuses. Rural campuses often have large green open spaces with broad spaces between each building. Some urban campuses have to reduce their open spaces to fulfill their dwellings. Some campus designs are focused on reducing energy, waste, and making a greener infrastructure. Meanwhile, there is little research about the campus garden, which is one of the identities and images of a university because it is the first area visited by campus residents or guests (Hanan, 2013; Speake *et al.,* 2013). Besides identities and images, the campus garden has a much positive impact socially and psychologically (Fu *et al.*, 2018; Lumber *et al.*, 2017; Schebella *et al.*, 2017; Soga, Gaston, & Yamaura, 2017). To achieve campus sustainability programs, some universities implemented the idea of community gardens by involving their students (Young, Scheuer, and Roush, 2016). Community gardens, as part of urban agriculture, are one of the possible solutions for urban food security and maximizing land uses in urban areas (Banderas *et al.*, 2019). According to Philips (2013), some local organizations usually provide resources and training for novice urban farmers. The initial process is assisting for the first two years with a soil test in the park to be used. Urban farmers

are encouraged to share what they have learned with family and friends and become mentors in the first year of the program.

Not all urban campus is suitable for community gardens due to the limitation of space, and postgraduates student spent a smaller amount of time in the campus garden compared to secondary and undergraduate school. Most campuses in Jakarta, Indonesia, have limited spaces and green areas. Therefore, edible landscaping or edible garden, which is a smaller scale of the community garden and an innovative concept by planting vegetables, herbs, and fruit trees with the ornamental plants, might be a solution for a more sustainable campus (Tayobong *et al.*, 2013). The plants that were chosen to be in the edible garden have an aesthetic value, such as bright-colored fruits and flowers. There has not much research focusing on managing edible gardens in postgraduate campuses in urban areas, especially in Indonesia. This article focuses on why the concept of the edible garden is suitable for urban campuses in extension to Tayobong *et al.* (2013) study and how to manage the campus edible garden. This study is necessary because there are few studies about urban campus gardens, especially in Southeast Asian countries, and edible gardens could be one of the solutions in urban areas.

In designing campuses, universities are putting many efforts in creating a comfortable environment for their dwellings. It is essential to build a comfortable environment because campus residents spend most of their time on campus area than any other place (Gulwadi *et al.*, 2019; Lee, Chou, & Huang, 2019). This intention was to decrease burnouts (Stigsdotter and Grahn, 2003) and to improve occupant's productivity (Gray and Birrell, 2014). An urban campus often imagined as a small urban ecosystem that can provide its needs socially or naturally sustainably due to its size (Lauder *et al.*, 2015). Liprini and Coetzee (2017) found that more than half of the students choose classes with garden views and prefer to spend time in the garden than rooms. Environmentally, gardens in urban areas can create a small ecosystem and act as a public space, which is a significant component of sustainable city development(Wai *et al.*, 2018).

McFarland, Waliczek, and Zajicek's (2008) study said that students who used the campus garden more often have a higher quality of life than passive users. Users will use the garden if the garden is well-maintained and appealing. Most gardens are in European style, which uses ornamental plants. The ornamental plants do not maximize the potential of land use and adjust users' needs (Uren, Dzidic and Bishop, 2015). Highly manicured gardens are perceived as unnatural and make the garden unattractive(Speake, Edmondson and Nawaz, 2013). Most campus gardens in urban areas used ornamental plants because it is easier to maintain, but ornamental plants create an unnatural look, which perceived negatively by the users. The aesthetic value and attraction of campus gardens rely on the diversity of species and how designers design the layout of the plants (Salama, 2008; Lau and Yang, 2009). The maintenance of the garden relies on garden caretaker's skill and garden management. Personal knowledge, social norms, garden rules, and security also some factors that can make an impact on the garden's condition (Preko, 2017; Sawitri *et al.*, 2015). Besides the caretaker's skill, information regarding garden rules should be socialized from the management team to garden users, which are students and other staff. In maintaining the garden, it is essential to socialize garden rules to keep the garden conditions at its prime. These external factors can influence people's behavior toward the use of space according to social cognitive theory (Sawitri, Hadiyanto, and Hadi, 2015; Preko, 2017).

When it comes to planning campus landscapes, campus residents, including students and garden caretakers, are less involved in the process. The lack of communication between the caretakers and the administrators can lead to abandonment and ungroomed landscape on campuses (Philips, 2013). The edible garden is a concept of smaller urban agriculture that is operated by a group of people from the local community, and it could be implemented in open spaces, both public and private (Conway, 2016). The local community can produce some portion of their food while engaging social participation and increase social inclusion (Scharf *et al.*, 2019). Besides social benefits, the edible garden also increases biodiversity and integrating humans with nature and their food (Philips, 2013). With the combination of edible and ornamental plants, aesthetically, the garden still looks as beautiful as a conventional garden (Sima *et al.*, 2010). In Indonesia, some primary and secondary schools have their TOGA gardens, which are herb gardens, as one of the requirements for entering the Adiwiyata Program

(Adawiah, 2019). However, there is not much research about the implementation of the edible garden in Indonesia's universities.

Universitas Indonesia (UI) is one of the oldest, prestigious, and greenest universities in Indonesia (Anis *et al.*, 2018). It has two campuses, one of them is the oldest campus in Salemba, Jakarta, the capital city of Indonesia. Campuses space in Jakarta is often limited, including Universitas Indonesia in Salemba. UI Salemba was selected for this study because UI was the founder of UI GreenMetric and had intriguing features. The campus is for postgraduate students, and located in a dense urban area with small gardens or Lau and Yang (2009) called pocket gardens. Previous research about Universitas Indonesia was conducted in Depok, not in Salemba. The first objective of this paper is to know the campus staff's opinion about current garden management. The second objective is to know their opinion about the idea of an edible garden in the campus area. This research aims to create a more sustainable campus garden management in UI Salemba.

Methods

Interview

The population of both garden management staff and garden user were unknown numerically. Snowball sampling method was used to obtain the garden caretaker and campus staff, who conduct activities in planning and manage the garden. In total, there were two categories of the interviewees, which were the university staff and the garden caretaker. Three university staff were interviewed, which consist of one staff who manage a part of UI Salemba's garden, one staff from the planning division, and one staff from Occupational Health and Safety (OHS), both located in UI Depok. There were only two garden caretakers in one of UI Salemba garden areas that were recommended by the staff.

Purposive sampling method was used to determine the number of garden users, in this case, were the postgraduate students. The criteria of this category were to have been in the campus area for more than a month, used campus garden at least more than three times per week (Holt *et al.*, 2019), spent more than 15-20 minutes on the garden (Domae, 2017; Holt *et al.*, 2019). All of the criteria means that the postgraduate students were an active garden user, by assuming they knew the condition of the garden policy and current problems. The researcher also asked what kind of garden they had in mind and what kind of activity they do in the garden. Four postgraduate students were interviewed. The researchers observed the garden users and caretakers in order to know their activities. A participative observation was done between, on average 8 a.m. to 5 p.m.

Methodology

The research study used a comparative method by using a small face-to-face semi-structured interview consisted of; the concept of current garden design, information about the university's garden policy, current garden management, current problems related to garden management, and opinion about the concept of an edible garden. The interviews lasted about 20 minutes to 30 minutes. The researchers took notes on the interviewee's answers and conduct content analysis to identify the interviewee's experiences in managing the gardens. When the answer to the interviewee was less relevant to the research goals, the researchers asked some questions to get back to the main topic. Triangulation was used to compare the answers and to strengthen the validity of the interviews.

Results and Discussions

The Concept of Current Garden Design

Based on Lau and Yang’s (2009) studies found that the campus garden users use the garden for a place to releases stress. The results of the interviews with four postgraduate students and based on the researchers’ observation, the users used the garden to gather and chat, relax, and to reconnect with

nature. Through the semi-structured interview, all postgraduate students thought that the campus garden was supposed to be a recreational area where they can release their stress. These results aligned with Salama (2008) and Domae's (2017) study about the usage of campus gardens as a social space. According to Lau and Yang's (2009) research, the garden users used the garden as a place to relax and reconnect with nature. As expected, most interviewees agree they preferred a well-maintained garden with greeneries. One of the interviewees liked a garden that has a lot of colorful flowers. Our study shows that attractiveness and aesthetic value, seating, and meeting areas are essential for the users, and they attract users to use the gardens. This finding is consistent with Lau & Yang (2009) and Salama (2008) 's studies.

Universitas Indonesia uses UI GreenMetric for its green campus program (Anis *et al.*, 2018), especially in UI Depok. The results of our interviews with one of the staff from the Management and Service Facilities Department (DPPF) there was no clear concept applied to UI Salemba yet. The OHS staff mentioned UI Depok applied forrest campus concept. The current concept was an ornamental garden. The OHS staff said that UI Salemba also applied some of the same concepts as UI Depok, but they did have some trouble on-site because of the limitation of green open space in Salemba. They were trying to create some vertical gardens to meet the criteria from UI GreenMetric. The staff in UI Salemba also said that he was still searching what kind of concept is suitable for UI Salemba, and he had an idea of planting some edible plants. All three statements mentioned by the staff were aligned.

The Information About the University's Garden Policy

When the researchers asked the staff in UI Salemba about any policy regarding the garden, he answered:

> *"Not much policy was given or known; all I knew that it is prohibited change the structure of the building and appearance of the building."*

The staff from DPPF also stated that it was unclear if the university had a policy specifically for the garden. The staff did not know precisely regarding the campus garden's policy because it came from a different department. He mentioned that the design of campus gardens was from the planning department. The researchers interviewed four postgraduate students, who were active garden users concerning the socialization of the campus garden's policy. All of them knew there were signs of smoking prohibition, but nothing more than that information. The continuity of campus care depends on the relationship between students, faculty members, designers, and staff (Fu *et al.*, 2018). Student B also proposed it for proper signage. Socialization might improve the garden's quality and user's knowledge of maintaining the garden.

Current Garden Management

The garden maintenance came from the DPPF, and they did inform how to take care of the garden to the employees at UI Salemba. According to our interview with UI Salemba's staff, there were seven janitors, and two of them were assigned to take care of the garden. The university staff, both in UI Salemba and Depok, and the caretakers said that the janitors' main job was to clean the buildings. Maintaining the garden was not a priority. All of them never been trained or educated by the university and the outsourcing for gardening. They spent two to three hours in the garden. However, sometimes, if the garden caretakers had no time to take care of the garden due to their other jobs, their colleagues would help them. Two caretakers also mentioned this statement; one of them worked in Salemba for ten years said:

> *"We did not get any training before we work on the garden area. Luckily, I'm interested in gardening, but it would be better if they give us some instructions or training. I want to grow my gardening skill."*

While the second caretaker said that he was a farmer before he worked in UI Salemba:

> *"I was a farmer; I planted corn, beans, cassava, and many more. No, we did not get any training."*

Through interviews, all interviewees mention that cleanliness was one of the main problems. The UI Salemba staff explained:

> *"It is hard to keep the garden fully clean and green because not all caretakers understand about plants. They do not have the skills to take care of the plants properly. They did try to plants some chilies and took great care of them. Unfortunately, the chief, who came from Depok, did not like the appearance of it since it looks untidy."*

The older caretaker said that they tried to keep the garden clean, but the users could not maintain the garden properly. He suggested:

> *"Someone should scold them (people who litter) face-to-face, so they are embarrassed."*

Discussion

In order to validate these statements, we conducted a participative observation and found three factors that made the garden unclean. First, the users did not maintain the garden' cleanliness, and then there was not much action taken when someone litter. Lastly, the janitors were only being seen at a certain time due to their other duty. These findings are aligned with (Sawitri *et al.* (2015) and Preko's (2017) studies on which external factors could affect other people's behavior. The communication between the garden users, staff, and caretakers need to deepen in order to aim for a more sustainable garden management.

The last part of this study was to know the interviewee's opinion about the edible garden. The idea of an edible garden was taken positively by all interviewees, mainly the caretakers and UI Salemba's staff. The caretakers were enthusiastic about the idea of the edible garden. Their background, both as farmers made them excited to plant edible plants, and the older caretaker said:

> *"We can get something for planting edible plants. I prefer edible plants more than ornamental plants. I can taste my labor."*

However, to have a sustainable edible garden, the garden caretakers need to be trained and educated so they can keep the garden's condition at its prime. The caretakers were chosen to be the ones who maintain the edible garden because it was their job to tend the plants, and the postgraduate students did not have any time to look after the garden. The university could collaborate with some local urban farmers to give the caretakers or maybe the janitors about taking care of an edible garden, as suggested by Philips (2013). There should be a dialogue between the users, staff, and garden caretakers to maximized the campus garden's condition. The image of the university will rise, and the users can enjoy the garden if the condition of it is at it is best.

Conclusion

This study aimed to know the current concept, management, problems in the campus garden, and the opinion of the concept of an edible garden. This study shows that the concept of an edible garden is reasonable in an urban campus. An edible garden could motivate the caretakers and increases the image of the university. It maximalized the usage of green space, especially in urban areas, which have some limited space. To have an edible garden, all stakeholder needs to work together. The universities can expand their relationships with local urban farmers and added a campus sustainability program for making the edible garden program. This research contributed to the ongoing development of environmental science and urban edible garden. We recommend more research done in other universities, education stages, or other building typology. However, our study has some limitations that

need to be taken carefully. Our research cannot be generalized because of the restricted research area and limited interviewees.

Acknowledgment

This research was made possible by Masters Thesis Research (*Publikasi Internasional Terindeks Mahasiswa Magister)* or PITMA B by Universitas Indonesia funding program in the 2019 fiscal year with contract number NKB-1031/UN2.R3.1/HKP.05.00/2019.

Abstract

This article deals with the theoretical and legal foundations, current status and problems of public administration in the field of environmental protection and nature management in the Russian Federation. Special attention is paid to the importance of state policy measures in the environmental sphere. The authors identify the difficulties of interaction between the Federal and regional authorities in implementing a unified environmental policy, and propose measures to improve their integration and strengthen vertical cooperation between the center and the subjects. Also, the authors pay attention to the problems of insufficient economic incentives for environmental protection. The article suggests the possibility of borrowing foreign experience of forms of economic incentives in the field of environmental protection, which have proven their effectiveness. The conclusion is made about the need to improve the legislative regulation of the environmental sphere of the Russian Federation. The authors have developed prospects for the improving of environmental policy of the Russian Federation in the coming years. During the research there were used such methods as analysis, synthesis, classification, comparison, and forecasting.

Keywords: Environment, Environmental Management, Environmental Legislation, Public Administration, Economic Incentives, Taxes, Resource Conservation, Environmental Policy.

Introduction

One of the priorities of the internal policy of the Russian Federation, which each year raises concerns both in academic and political circles and among the public, is the activity on the protection and ensuring of environmental quality. Economic changes in recent decades, is characteristic practically for all countries of the world, forced to pay special attention to the issues of nature management. An important role is played by measures of state control in the sphere of environmental protection, because the effectiveness of the policies implemented by the government in this sphere has an effect on the ecological security of not only individuals, but society as a whole (Vorontsov, A.L., Vorontsova, E.V., 2017, 2018).

In modern science the environmental management is described as the process of using the natural environment to be undertaken in order to meet the needs of the individual and society while respecting the restrictions imposed by environmental legislation (Ryzhenkov, A.YA, 2014) The

importance of clever nature management and the need for its consolidation at the legislative level are that any exploitation of natural resources of the environment requires a judicious use of natural wealth and scientifically substantiated, a thorough examination and consideration of the laws of nature.

Today, the authority for state management of environmental protection includes a range of measures for the enforcement of applicable environmental laws, which are represented by a number of normative legal acts. Among them there are codified as (Land, Water, Forest, etc. codes) and uncodified documents (Federal laws "On environmental protection", "On ecological expertise", "On specially protected natural territories", etc.). In addition, the Russian legislation also establishes the legal (administrative, criminal) liability for failure to comply with these standards. In this case, the law is one of the major preventive mechanism to alert the commission of environmental offences, which can lead to irreversible changes and cause a natural disaster.

However, in practice there are often problems with environmental law enforcement and law-abiding behavior in the field of environmental protection. Unfortunately, Russia is on the list of countries with the worst ecological situation in the world. As noted by the Chairman of the Russian environmental movement (RED) R.R. Nurgaliyev, the ecological map of Russia has more than 300 points of high environmental hazard, and the country according to international studies is recognized as one of the most polluted ones in the world.

Of course, the environmental policy of any state, including Russia, presupposes the active engagement of various participants: public authorities and institutions, law enforcement agencies, public associations and organizations, media, voluntary associations, etc. However, first and foremost, nature management is the scope of public interests, for this reason the fundamental priority role in environmental protection should be played by the state that has the greatest resources and mechanisms. The state has the powers of possession, use and disposal of natural resources, and may also establish legal restrictions in this area, therefore special attention should be focused on measures of state management in the environmental field. Today they include such areas as management of natural resources, the formation of efficient use and reproduction of natural resources, preservation and restoration of the favourable status of the environment (German, T.L., Kuruzov M.V., 2017).

In the present conditions the activity of state management of the use of natural resources and environment protection is carried out by various state authorities with relevant competence and functioning at different levels of government.According to the article 72 of the Constitution the issues related to environmental management, environmental protection and ensuring environmental security, as well as with protected areas, are joint competence of the Russian Federation and its constituent territories.

So, in Russia at the Federal level the state control in the environmental field being implemented by the Ministry of natural resources and ecology of the Russian Federation and subordinated to it of Federal services, agencies and organizations. Also, an important role is played by the Ministry of agriculture of the Russian Federation and its subordinate Federal agencies. This authorities carry out on the state level the formulation of environmental policy, normative legal regulation, control and oversight in this area.

With regards to the regional level, it should be noted that in state management of environmental protection an important role is assigned to constituent territories of the Russian Federation, which are almost completely vested with the authority of the Russian Federation in the field of water, forest resources and hunting. The regions are actively engaged in the management of subsoil areas of local importance, the protection of existing and creation of new regional protected areas (Popov, N.V. Radchenko S.YU., 2013). Laying on the subjects of a number of such important tasks due to the fact that they are experiencing the strongest negative impact from the breach of the condition of the natural environment, and also possess the necessary information to monitor the situation and take adequate management decisions.

It is logical to assume that regions by giving of timely "signals" to the Federal center, providing information about the ecological status of territories, will greatly help the implementation of the environmental policy of the Russian Federation as a whole and cause it to move in the right direction. It will facilitate the need for appropriate legal and organizational measures. At the same time, Russia still has not established the procedure for interaction between the centre and regions in the sphere of environmental protection. We believe that our country needs this mechanism in connection with the similarity of the ecological situation in a number of subjects of the Russian Federation and the need for joint protection of the environment. For example, a set of ecological problems of the Central Chernozem Region of the Russian Federation is associated with the development of the steel industry, which pollutes groundwater, while the Northern Caucasus actively fighting for the salvation of the Azov and Black sea basin and the unique recreational resources of the Black sea coast. In turn, coastal cities such as Novorossiysk, Yeysk, Tuapse suffer from severe pollution of the coastline caused by the high intensity of transportation of oil and other goods (Eliseeva, A.V., 2015).

The Federal centre and regions should strengthen vertical coordination between them that will help to develop the integration ties and to direct their joint efforts towards meeting the vital environmental needs of regions and ensuring ecological safety of the population (Vorontsov, A.L., Vorontsova, E.V., 2018). In turn, the Federal centre will carry out the summarize and analyze of information derived from regions and in addition to developing the General environmental course shall focus on particular problems of nature management of the region or group of regions.

If we speak about the practical measures it should be noted the urgent need for formation of a special coordinating authority that includes representatives of various regions of the Russian Federation. The purpose of the creation of this authority is carefully designed at the national level the concept of state policy in the field of nature, which will be implemented, taking full account of regional environmental problems and interests. One of the promising directions of work of this authority is seen to develop at the Federal level, specific regulations (for the Far East, Volga, North Caucasian and other groups of regions), which should be focused on current problems in the sphere of environmental protection. We believe that this practice will have a positive impact on the environment of the regions, will improve the quality of life and reduce the threat of environmental disaster, as relevant to each territories of the Russian Federation.

The most important problem of state environmental management in Russia, may be attributed to lack of economic incentive measures in this field. In the conditions of active development of market economy, maintaining high economic growth is impossible without carrying out of appropriate environmental measures. Otherwise, the reverse side of economic prosperity can become a huge damage caused to the environment, depletion of natural resources and the actual reduction in level of national income. In this question it is necessary to agree with I.C. Ryabokon, who claims that in the Russian Federation is currently almost no forms of economic stimulation of rational nature management. The amount of payment for negative impact on the environment and the mechanism of its charges do not stimulate enterprises to implement environmental technologies (Ryabokon, I.S., 2015).

Certainly, the increasing independence of economic activity of subjects exacerbates the problem of insufficient efficiency of existing economic and management tools capable to interest managers of various levels in addressing environmental problems of a region. It is important to note that the measures of economic stimulation of rational nature management are given priority in some foreign countries with developed legal systems. So, many European countries have adopted a range of tools and methods for motivation of resource-saving and environmental protection. In addition to the introduction of various "environmental" taxes (a tax on carbon emissions in Italy, France, the Netherlands, the tax on waste disposal in Germany, the excise tax on fuel and petroleum products in Australia) tax policy of most countries applying the active stimulation of environmental activities, provides for tax credits and incentives for manufacturers and consumers of more environmentally friendly products. The income that the government receives from "environmental" taxes, as a rule, invested in the development of technologies that increase resource efficiency and reduce

environmental pollution as well as in state support for the environment. For example, in the UK and Japan state environmental programs are financing by this income (Sedash, T.N., 2015).

The current status of financial and economic incentives in the field of environmental protection provides an opportunity to specify that a significant part of the economic instruments of environmental management set out in Russian legislation still does not apply or applies in a very limited scale. In this regard a promising direction for further development of the environmental sector of the Russian Federation is the adoption of foreign experience and implementation of ecological-economic incentives as one of the leading forms of state control in the sphere of environmental protection. The list of measures in this sphere is rather wide and includes the preferential taxation and crediting, the establishment of special pricing on the production of environmentally friendly products, accelerated depreciation, funding of environmental programmes etc.

In our opinion special attention in the environmental policy in the tax field should be given to the the concept of "double win" that uses in number of developed countries. The essence of this concept is that economic incentives for resource conservation through the establishment of "environmental" taxes should be carried out together with the proportional reduction of the tax burden associated with social benefits. This scheme brings effective results, allows to stimulate employment growth and support the competitiveness of domestic producers that is demonstrating by foreign experience (Kolotyrin, K.P., 2009).

We believe that the effectiveness of the proposed measures in the field of environmental protection will be achieved only in the case when the state will take under its control all the above mechanisms, comprehensively using existing powers. An important element of the policy considered in this article must also be suitable legal support. Unfortunately, the existing legislation, despite its variety, is characterized with insufficient detail and lack of consistency. For example, the Law of the Russian Federation "On environmental protection", sets only the basics of the state policy in the field of environmental protection to conserve biological diversity, natural resources, environmental security (Borenstein, A.L., Pozdnyakova, E.V., 2019). However, until now there is no legal act associated with the direct provision of the protection of environment and regulation economic incentive of environmental protection. We believe that the adoption of these legal instruments should be the first step towards the formation of a qualitatively new approach to the ecological policy of the Russian Federation as a whole.

Conclusion. Thus, the modern Russian state problems in the field of nature management and environmental protection and resolving them are needed a unified state policy. However, measures of the state control undertaken in this field do not reasonable and consistent. So, there are serious shortcomings in relations between the Federal center and the regions in the field of regulation of the environment protection. In addition, there are no effective economic instruments stimulating the use of natural resources. Today one of the most important directions of social - political activity of the state is the organization of nature management, which will ensure a relationship of economic and ecological well-being.

Abstract

The problem of national and public security acquires increasingly relevance in the modern world. And migration politics of the state plays an iImportant role in it it. Today this problem is an especialy accute because of the rapid development of international relations and intensity migration processes, and as a result – sharp increase in number migrants both in the Russian Federation and beyond. In this regard, there is the need of improvements of legal regulation of the migration policy of the world community. Today, along with rapid development of international relations there is a dramatically groth of the intensity migration processes, and as a result – number migrants. Because of obligations adopted by Russian Federation assotiated with compliance of human rights there is a need to ensure the rights of the individual to freedom of residence and freedom of movement. This is leading to the process of formation of updated outlook, wherein any human disorder spur him to find the best share. One of the consequences this disorder is migration which help people to find the best life for meet various levels of requirements, ranging from physiological (required for survival) to needs in self-knowledge (implementation potential opportunities). There are several main directions of migration policy. This is development of legislation in the field of migration to ensure rights of the individual to freedom of residence and movement; its adaptation of international standards; regulation of migration processes into account the interests of national security, socio-economic and demographic situation in regions and state as a whole. The authors come to the conclusion that current legal status of migrants does not full compare with the international experience and modern content of migration relations and its insufficient legal regulation leads to the illigal migration, which has a destructive impact on political, social and cultural life, as well as negative effect on the security in the country and around the world.

Keywords: Migration, Migration Policy, Legal Support, Human Rights, Improvement.

Introduction

Because of obligations adopted by Russian Federation assotiated with compliance of human rights there is a need to ensure the rights of the individual to freedom of residence and freedom of movement. This is leading to the process of formation of updated outlook, wherein any human disorder spur him to find the best share. One of the consequences this disorder is migration which help people to find the best life for meet various levels of requirements, ranging from physiological (required for survival) to needs in self recognition (Arkov, S.V., 2018, Zemskova, A.V., 2007, Tumaev, A.K., 2016, Chekhovich, S.B., 2011).

According to legislation of the Russian Federation citizens of the Russian Federation, foreigners and stateless persons who are lawfully site in Russia can leave the territory of the Russian Federation freely and citizens of Russia – to come back. The Constitution of the russian federation says that foreigners and stateless persons who are lawfully site in Russia have same rights and freedoms and also bear same responsibilities as citizens of Russia with the exceptions established by the Constitution, laws or international contracts of the Russian Federation.

Foreigners and stateless persons have the opportunity to protect their rigts by treatment in court or other state authorities, and national legislation sets that they have the same procedure rights as citizens of the Russian Federation (Alekhin, A.P., 2012).

The Constitution also secured provisions concerning the certain categories of migrants by providing the right for persons seeking for havense to get it in order established law. Legislation also provide development and implementation state return programmes of deported peoples. It should be noed that this is a significant step forward in legal recognition of this problem as problem of state importance.

This way The Constitution reflects various aspects of the migration processes, provides the foundations of their regulation, the rights of the individual to freedom of residence and freedom of movement.

Since legislative rules that governing migration processes has not codified in a separate Migration code of the Russian Federation, we need to examine the system of main laws in this area of public relations and supposed our vision of the problem situation.

Migration legislation of Russia is presented by system of several current Federal laws. The main of them are "On the order of departure from Russia and entry in Russia" 15.08.1996, No. 114-FZ; "On the legal satus of foreiners" from 25.07.2002, No. 115-FZ; "On refugees" 19.02.1993, No. 4528-1; "On citizenship Russian Federation" from 31.05.2002. No. 62-FZ etc.

It should be noted that the law, as any other legal act, has a limit to its implementation. This limit is defined in three aspects (dimensions): time; territorial applicability and the set of persons to which it applies.

The migration laws of the Russian Federation by set of persons are devided on general laws - apply to the entire population of the country; special laws - apply to a separate setof persons, namely, foreign citizens, stateless persons, and refugees.

So this differentiation allows to differ migration laws on two groups. The first one includes Federal law "On citizenship of the Russian Federation" from 31.05.2002, No. 62-FZ, "On the right of citizens of the Russian Federation to freedom of residence and freedom of movement within the Russian Federation" from 25.06.1993 No. 5242-1.

The second group of laws includes: Federal law "On the order of departure from Russia and entry in Russia" from 15.081996, No. 114-FZ, Federal law "On the legal status of foreigners" 25.07.2002, № 115-FZ, Federal law "On refugees" from 19.02.1993 No. 4528-1 etc.

According scientific literature the appropriate transformation constantly take place in Federa law "On the legal status of foreigners". On the basis of its name and the subject of legal regulation this Federal law should define various categories of foreign citizens and stateless persons in the Russian Federation. At the same time this act is a basic for the extensive entire system of migration legislation. It is dominant in this system and provides consolidation of all other regulatory legal acts in the field of migration in a single system. However, the permanent changes of its content leads to destruction of the system properties and approaches to development of migration legislation as a whole (Prudnikova, A.S., Sandugey A.N., 2018).

The right of citizenship is an essential human right. No one can be deprived of citizenship or the right to change citizenship. In Russia there is single citizenship – citizenship of the Russian Federation. For this reason, the Federal law "On citizenship of the Russian Federation" adopted in accordance with the requirements of international legal acts (ConventionsI on the reduction statelessness, August 30, 1961.).

This law consideres life conditions and interests not only immigrants but persons without the status of immigrants in the Russian Federation. Consequently it is possible to classify persons by grounds for acquiring legal status of immigrants. Some of them are connected with the Russian Federation by territorial origin or previous permanent residence on its territory, as well as their descendants. And others previously had no ties with the Russian Federation or who have been granted refugee status in the Russian Federation.

The connection between the implementation of the provisions of the Federal law "On citizenship of the Russian Federation" and migration can be traced through such an important aspect as the acquisition of Russian citizenship by territorial origin, i.e. by people who was born in the Russian Federation, including persons previously deported outside the territory (Chekhovich, S.B., 2011).

It should also be noted that the link between the institution of Russian citizenship and migration processes is also reflected in the principle of preserving Russian citizenship regardless of the place of residence of a Russian citizen. Citizenship is an important element of the constitutional and legal status of an individual. At the same time, this is one of the essential elements of the domestic and foreign policy of a country.

Federal legislation providing for the registration of individuals is designed to ensure the implementation of the constitutional right to collect, store, use information about an individual (personal information) and meet the needs of society in relation to the processing of such information, as well as in accordance with international obligations of the Russian Federation..

The legislation defines the legal and organizational basis for the implementation of the unified system of state identification, registration and accounting of individuals, aimed at introducing a system of registration of individuals at their chosen place of permanent or temporary residence; processing and use of personal information by public and local authorities, organizations, institutions and enterprises of all forms of ownership, as well as individuals who perform the relevant professional duties. This effects the settlement of migration processes and ensuring the national security of Russia (Lihachyov, S.V., 2015).

Legal documents also establish the list and requirements for documents identifying of an individual, and regulate questions about documents identifying of Russian citizens and foreigners in the Russian Federation.

Thus, registration is necessary to citizens of the Russian Federation, as well as foreign citizens and stateless persons who permanently or temporarily reside on the territory of the Russian Federation on legal grounds. It allows:

- to protect the rights of individuals to freedom of movement and residence within the Russian Federation;
- to create conditions for permanent communication between an individual permanently residing in the territory of the Russian Federation and the state for the exercise of mutual rights and performance of mutual obligations;
- to regulate relations associated with the accumulation of personal information and ensuring its intended use in the interests of protecting human rights and national security of the state.

As the primary step in the chain solve migration problems is the implementation of the Concept of migration policy of the Russian Federation for the period up to 2025 (approved by the decree of the President of the Russian Federation from June 13, 2012), as a component of the Concept of national

security of the Russian Federation, its main provisions are intended to ensure a uniform methodological approach to develop a vision of the migration process in Russia to determine the role and place of migration in socio-economic and political life of the state, identify the directions of the mechanism for regulating migration and outline the main possible positions for its implementation.

It should be noted that Russian legislation considers the state policy as a set of measures implemented by the state to regulate migration processes, create conditions for the realization of the intellectual and labor potential of migrants, build a democratic legal society, ensure proper socio-economic and demographic development, and observe the principles of protecting national interests, security and territorial integrity of the Russian Federation (Raksha, N.S., 2018, Vorontsov, A.L., Vorontsova, E.V., 2018). Legal documents define the main directions of migration policy:

- development of the legislation of the Russian Federation in the field of migration in order to ensure human rights to freedom residence and movement and adapting it to international standards;
- ensuring the regulation of migration processes taking into account the interests of national security (Lihachyov, S.V., Goncharov S.P, 2016, Sandugey, A.N., 2016) the socio-economic and demographic situation in the regions and the state as a whole, effective management of these processes and migration control by strengthening the interaction of state authorities and education;
- creation of favorable socio-economic conditions for stimulating internal labor migration as an alternative to external labor migration;
- creating conditions for the integration of migrants from among foreigners or stateless persons into Russian society, their adaptation, as well as socio-economic conditions for investment in the Russian economy of funds of Russian citizens who work abroad;
- prevention of mass unregulated migration processes, combating illegal migration and illigal labor of migrants, human trafficking and other criminal manifestations in this sphere;
- creation of effective mechanisms to support the free-will return of refugees, persons seeking or receiving asylum in the Russian Federation, forced migrants to their States, permanent residence or other safe countries;
- development of research and educational activities in the field of migration, conducting awareness-raising activities aimed at preventing discrimination and xenophobia against migrants;
- international cooperation in the field of migration.

The next fundamental law in the field of migration is the Federal law "On the legal status of foreigners" (25.07.2002 No. 115-FZ), which defines the legal status of foreign citizens and stateless persons in the Russian Federation, establishes the basic rights, freedoms and duties of foreign citizens and stateless persons who reside or in the Russian Federation, as well as the procedure for resolving issues related to their entry into or exit from the Russian Federation.

An important element of the formation of migration legislation is the definition of the conditions and procedure for immigration to the Russian Federation of foreigners and stateless persons. Immigration to the Russian Federation is carried out in accordance with certain quotas established by the Government of the Russian Federation for each calendar year. It also provides for the granting of permits for immigration outside quotas, regulates the issues of departure and expulsion from the Russian Federation of persons in connection with the cancellation of an immigration permit, appeals against decisions on immigration issues, actions or inactivity of state authorities or officials (Polyakova, N.V., 2016).

Federal law of the Russian Federation "On refugees" of 19.02.1993 No. 4528-1 establishes the procedure for granting and revoking refugee status, appealing against decisions regarding refugees, the rights and obligations of refugees, and the powers of Executive authorities that decide issues concerning persons applying for refugee status, with a view to cooperating with international organizations in the field of refugee protection.

In the legislation the term "refugee" means a person who is not a citizen of the Russian Federation and owing to well-founded fear may become a victim of persecution for racial, religion, nationality, citizenship, membership of a particular social group or political opinion. This person is outside the

country of his nationality and can not enjoy the protection of their country or unwilling to use it, or has no citizenship and is located outside the country of his previous permanent residence, is unable or unwilling to return.

Migration issues are also regulated by a number of resolutions of the State Duma of the Russian Federation, which include the main directions of state policy in the field of migration rights. For example, it is the strengthening the reality of the right to freedom of movement and residence in the Russian Federation; humanization and effective implementation of legislation on refugees and internally displaced persons; promotion of the system of non-judicial protection of human rights and freedoms; support of public organizations in the field of human rights protection.

Conclusion

The effectiveness of the state migration policy is closely related to improving the coordination of actions of authorities that are responsible for implementing the state migration policy; establishing internal and external information links that meet international standards; improving the management of migration policy in the field of forecasting, organization and control, as well as creating a modern legal framework. Today the legal support of migration processes is regulated by numerous laws, acts and international agreements, which often contradict each other.

In this regard, there is an urgent need to systematize migration legislation and adopt the Migration Code of the Russian Federation, which will contribute to the effective regulation of migration issues in Russia.

Abstract

In the process of building a democratic, social and legal state, there is a corresponding change of opinion on some fundamental political and legal values and realities of practice. Moreover, it is not only about the so-called change of accents, but about fundamental changes and absolutely new approaches and ideas about established phenomena and traditions. The search in this direction is urgently necessary within the administrative law reform, implemented not only in the Russian Federation, but also in many countries of the world. The consequences of the reform depend crucially on what kind of administrative models will be implemented, what understanding of the base principles and the goal of state management we will adhere to. For the formation of modern scientific, methodological and legal foundations of administrative reform, we need a corresponding study of the essence and features of the administrative process in modern conditions from the perspective of public administration. We can perform this task by considering this concept at the conceptual level, through the ratio and definition of categories, with the help of which it is possible to transmit the content of administrative and procedural activities. The questions of defining the essence of the administrative process, highlighting its features, its tasks and principles have always attracted the attention of scientists. So its understanding reflects the dominant ideas about the essence and purpose of administrative law. The issues of proper regulation of the conditions and procedure for the implementation of laws and bylaws, as well as comprehensive and effective protection of rights and freedoms of citizens, within the administrative and procedural activities, are becoming particularly acute in modern conditions. Currently, during the public administration reform, there are a corresponding changes in the views on a number of fundamental political and legal values and realities of practice, which include the administrative process and, accordingly, administrative and procedural activities. Therefore, for the formation of modern scientific, methodological and legal bases for reform in the administrative sphere there is the need of appropriate scientific research of a wide range of issues that cover the problems of administrative procedural activity.

Keywords: Administrative Law, Administrative Process, Public Administration, Principles, Proceeding, Stages, Legal Process.

Introduction

The process in the legal sense generates and forms a set of administrative and procedural relations, which are an independent type of legal relations. There are four elements that are necessary for the emergence of any procedural relations: the norm of substantive law, the norm of procedural law, legal personality and legal fact (Bityak, Yu.P., Zuy, V.V., 1999).

D. N. Bahrah (Bahrah, D.N., 1996) defines the essence of the legal process as the power activity of authorized entities aimed at solving specific legal cases and sufficiently fully regulated by procedural norms.

We will point out that legal processes are a kind of social processes. In the literature, the following features are distinguished: it is a conscious, purposeful activity; it is associated with the exercise of power by subjects of power; it is programmed to achieve certain legal results, aimed at solving legal cases; intermediate and final results of the process are fixed in official documents; full (or mostly) regulation of activities by legal procedural norms.

The author mentioned above defines the main features of the legal process:

1) this is an activity in which authority is exercised. Both citizens and organizations participate in relations, but the leading role belongs to the bearers of public power. Authority distinguishes the process from various procedures (conclusion of contracts, organization of press conferences, registration, etc);

2) the result of procedural activity is the resolution of legal cases (adoption of a normative act, admission to citizenship, application of sanctions, etc.). Therefore, it is issued with official documents, both interim and final);

3) procedural activity is regulated by procedural norms that define the participants in the process, their rights and obligations, jurisdiction, sequence and timing of actions, rules for processing documents, making, appealing, and executing decisions (Bahrah, D.N., 1996).

The modern administrative process in should be focused not only on the consideration of cases of violations. The main thing in the administrative process is that it is the procedure for citizens and legal entities to implement their statuses in the administrative sphere. This leads to a number of important conclusions concerning not only individual issues, but also the most essential principles of administrative law, the problems of administrative proceedings as a whole.

The concepts of formation (reform) and development of administrative procedure legislation develop from the emphasis on understanding the essence of the administrative process. It should identify sub-sectors (Executive authorities; civil service; administrative and legal regimes; administrative process and lawfulness in management, etc.), within which it is possible to consider and adopt laws that contribute to the stabilization and strengthening of the rule of law in the country.

Modern political and legal realities that are developing in the Russian Federation, cause the gradual overcoming of the old concept of administrative law. In the current conditions, administrative and legal support should be designed to implement the interests of society, the state, social communities and citizens. Therefore, the modern concept of administrative law cannot limit its horizon to issues of public administration. In this regard, the areas of administrative and legal regulation, “participation” and “protection " are expanding, as points out Yu. A. Tihomirov (Tihomirov, Yu. A., 2001).

The range of administrative and legal methods bythe degree of ensuring, expanding and narrowing the behavior of object is very wide – turnouting, regulatory, departmental, registration, licensing, administrative, contractual, prohibiting, etc.

In this regard, it is appropriate to emphasize the unique fundamental role of administrative law for the entire complex of branches of common law. It serves as the primary basis for them in the form of subjects - authorities and imperative legal norms that have both areas of independent manifestation and development, and areas in which they operate as in other branches (financial, environmental law (Vorontsov, A.L., Vorontsova, E.V. and others, 2017).

Without exaggeration, administrative law can be considered as a basic branch in the legal system with a powerful imperative and regulatory potential for the functioning of the Executive power and ensuring public interests in many areas of state and public life.

All elements of the procedural mechanism have a complex structure. So, its normative link is also complex. Of course, the objective law of any legal branch, not only procedural, but also material, consists of various legal norms and other elements. However, this is not what is meant here. In particular, the legal process arising in a certain case is not served by separate rules, which is typical for legal relations in the substantive legal branches, but in each case, almost the entire branch of procedural law comes into effect and creates a complex and integral regulatory framework for the functioning of this legal process. This specific feature of procedural law has been noted in procedural theory.

Thus, M. A. Gurvich wrote that the procedural law is applied in each case, as a rule, in full and establishes a complete abstract form for the process (Gurvich, M.A., 1972).

Administrative actions related to the implementation of permits, registration, preparation of legal acts, and execution of administrative acts of a law enforcement nature are considered procedural. Here we are talking about a variety of administrative procedures and corresponding administrative and procedural rules. In such a situation, as well as taking into account the dualistic role of the administrative process, there are sufficient grounds for considering the administrative process itself in two aspects.

In the first case (administrative and jurisdictional aspect), the activity focuses on the implementation of law enforcement functions by Executive authorities (officials) through the commission of legal actions in their traditional sense.

In the second case (administrative and procedural manifestation), the activity is represented by administrative actions of Executive authorities (officials) to implement administrative and legal procedures that are not related to jurisdiction. This is the implementation of licensing, registration, and other functions and powers.

In any understanding of administrative-procedural activity, actions performed by Executive authorities (officials) result in the issuance of non-normative (i.e. individual) legal acts, through which administrative-legal norms are applied to specific circumstances or to individuals.

This solves various cases in the field of public administration. The implementation or disposition (procedure) or sanction (jurisdiction) of the relevant rule of substantive administrative law depends on the nature of such cases.

Therefore, the subject of administrative and procedural activity is individual cases. An individual administrative case is understood as an issue related to the application of administrative and legal norms that arises in the sphere of public administration and requires administrative (operational and Executive) actions of authorized Executive authorities (officials) in order to solve it (Kolpakov, V.K., 1999).

Provisions of the legal norms almost are implemented in the individual action of certain authorities on the facts of an individual nature (for example, the fact of an administrative, disciplinary offence, upon the issuance of a permit to exercise a certain activity, upon appeals against unlawful actions of officials, etc.). The resolution of such cases is the basis of the administrative process.

The procedural status of a citizen is expressed in the fact that it has established procedural rights and obligations and the actual ability to implement them in the course of consideration and resolution of individual administrative cases. A citizen can initiate the jurisdictional process by their respective actions (for example, filing a complaint, application, etc.), demand that the authorities and officials to familiarize with the case materials, provide evidence, give explanations, etc. (Raksha, N.S., Utkina, O.V. 2016).

Traditionally, they distinguish the following specific features of the administrative process:

a) the administrative process is related to public administration and its legal forms, which are implemented in legal forms;

b) the administrative process is related to the substantive rules of administrative law; this ties is manifested in the fact that in the course of implementing the tasks of administrative law, individual cases are resolved in public administration and the rules of substantive law are effectively applied;

c) the application of substantive law is carried out in a legal order regulated by administrative and procedural rules;

d) the administrative process is not only the application of the norms of substantive law, but also the corresponding activity, as a result of which there are social relations regulated by the norms of administrative procedure law.

These features of the administrative process are successfully reflected in the following definition of its purpose. The purpose of the administrative process is pre-planned results, which can be achieved using appropriate methods and tools (Bityak Yu.P., 2000, Lihachyov, S.V. 2016).

Consequently, administrative and procedural rules are intended to regulate the exercise of jurisdictional powers in the procedural order mainly of Executive authorities (officials). This goal is achieved by establishing legal rules for administrative or judicial review of individual administrative cases of various contents.

The definition structure administrative and jurisdictional activities (for example, stage), the exercise of the relevant procedural action, order management process decision-making individual cases and their implementation are also very important.

A big role for understanding content administrative procedure norms has mechanism of procedure guarantees for citizens participants jurisdictional production. Thus, there is a legal form of protection the identity of the citizen from violations of his legal and administrative status, system legal and administrative guarantees the rights and legitimate interests.

Procedure principles of administrative rights are sustainable the basis on which is development and implementation of specific norms. Principles point to the orientation of current right, they are the embodiment of social values. The principle – fundamental theoretical knowledge that does not require evidence. It is clear that the principles are not something incomprehensible and metaphysical. They are the product and generalization of diverse social practices.

M.I. Baytin (Baytin, M.I., 2000) points out by determining the fundamental value of the principles of law, that this principles are the “base of formation and action of the right as a democratic or totalitarian. Principles of law express the main and most important in the law, trends of its development, on what right must be focused”. The principles are primary in relation to rules and more sustainable. At the same time during rapid transformations you may experience the gap existing rules from the new understanding social relations, purpose and functions of law.

Principles provide reality of law when considering and resolution of administrative cases, using of administrative measures and also in procedural production.

Among the basic principles of administrative proceedings allocate the legality, transparency, competence principle, the principle of safeguarding the interests of the state and the individual, the principle of immediacy, the principle of rapidity and efficiency of the process, the principle of the material truth, the principle of availability, the principle of responsibility of officials for the proper and efficient conduct of the process for identifying bureaucracy in the processing of complaints, etc.

Thus, the administrative process is carried out in accordance with the principles used in public administration, and in this regard, the principles are also an element of the structural and content characteristics of the administrative process. At the same time, these principles get specific features, shades, and generate new principles.

In structural terms, the administrative process consists of two parts that are equally regulated by the rules of administrative process law: firstly, the activities of public administration authorities to resolve specific cases, and, secondly, the relations between the participants of this activity. Therefore, an administrative process is an appropriate procedure that takes place within the procedural legal norms.

The structure of the administrative process, in terms of its dynamics, is relatively stable in the scientific literature. The following stages are common to the administrative process:

1) preliminary analysis of the situation (in different proceedings it may be called differently: administrative investigation, verification of a complaint, discussion of a legal act, etc.), during which information about real facts is collected and studied. This information is recorded on physical media in the form of protocols, references, diagrams, reports, etc.;

2) making a decision (order, resolution, instruction), which fixes the will of the subject of power. A decision is a conscious and volitional act of choosing one of the existing possibilities. It contains new information created by the subject of power. As an administrative act, it is usually mandatory and obliges, prohibits, authorizes, deprives or terminates something;

3) appeal against the decision and its review (optional);

4) implementation of the decision, which means the materialization of orders, their transformation into real actions, rights, relationships, processes, goods.

In law-making processes, the final stage is the publication of the act, bringing it to the attention (Tihomirov, Yu. A., 2001).

In some cases, it is advisable to complicate the procedure for the Executive power to make decisions on certain categories of cases, and to establish additional stages. So, a number of proceedings (on complaints, etc.) are supplemented with stages of initiation of the case, in the proceedings on administrative offenses, of revision of decisions (Raksha, N.S., 2016).

Most stages of proceeding can be divided into steps– a set of actions aimed at achieving a certain intermediate goal. For example, in the second stage of proceedings in cases of administrative offenses, there are such steps: preparation for consideration of the case, analysis of available data, adoption of a decision, bringing the decision to the attention of the offender, the victim, and organizations. Thus, a specific proceeding has a four-level structure: actions-steps-stages-proceeding.

From the point of view of the content, nature and specifics of individual cases, the administrative process is a set of administrative proceedings, the difference between which is determined by the subject of the proceedings (Lihachyov, S.V., Avdeeva, S., 2016).
Administrative proceeding is a legally regulated procedure for performing actions that ensure legal and objective consideration and resolution of administrative cases. The concept of administrative proceedings are covered the order of consideration of citizens complaints, the licensing and application of administrative coercive measures, etc. – all these types of administrative proceedings.

The species diversity of administrative proceedings can be reduced in accordance with the classification of administrative and procedural activities into two generalized groups:a) jurisdictional proceedings; b) procedural proceedings.

Both groups of administrative proceedings have some common features: mainly non-judicial procedure for the consideration of cases; legal and power bases; regulation of administrative procedural rules; administrative-procedural relations and principles, etc.

It should be noted that in the administrative and legal literature, the problem of understanding the structure of the administrative process, i.e. the allocation of specific proceedings, has always been debatable. Moreover, disputes are not only about the name of a particular proceeding, but also about their total number.

So, there are the following types of proceedings: for the development and adoption of normal acts; for the adoption of individual acts of governance; the application of administrative preventive measures of administrative punishment; on affairs about administrative violations; in cases of misconduct (disciplinary proceedings); registration and permitting; regulatory (made for the implementation of control and supervisory powers); on petitions; on land, pension, tax, fiscal affairs, etc.

Conclusion

Administrative-processual activity is regulated by procedural norms of administrative law and is implemented in administrative-procedural relations. Outside of legal norms, the administrative process does not exist as a phenomenon of legal reality. The boundaries of administrative-procedural activity are defined in such a way that not all cases are resolved within the administrative process, but only those that are subject to the procedural order established by administrative-procedural norms.

The administrative process can be defined as the activity of executive authorities (officials) regulated by administrative and procedural norms, the content of which is the consideration and resolution of individual administrative cases arising in the sphere of public administration, in order to implement the tasks and functions of the executive power. The qualitative essence of the administrative process is that it is a legitimate procedure for citizens and legal entities to implement their statuses in the administrative sphere.

Managers' Perception of Spaces in Organization-Qualitative Research Report

Piotr PACHURA

Częstochowa University of Technology, Faculty of Management, Department of Business Informatics and Ecosystems, Częstochowa, Poland, e-mail: piotr.pachura@pcz.pl

Abstract

The paper presented to Readers is a study reporting on a preliminary results of qualitative research conducted among a managerial staff of enterprises. The area of research was an analysis of a perception of space in organizations. The results of the research indicate a significance of an inner workspace (microspaces), its image (light in space) and an importance of a common canteen, a place of rest in a company (shared space). The results of the research are part of the stream of interpretation of space as materiality of organizational space.

Keywords: Organization, Space Model, Operationalization, Managerial Staff.

Introduction

This paper presents the results of qualitative research related to the analysis of the perception of space by managers in organizations. The presented survey report is related to the implementation of a research project devoted to the analysis of various dimensions of space in the organization's activities. In recent years, there has been a progressive interest in space, understood as a part of the analysis of the materiality of an organization (Ropo et al. 2015). This position can be traced back to the opposition to the social and constructivist approach to the analysis of an organization that has been dominant in recent decades. Space understood as distance are concepts related to economics, economic geography. In the management sciences of, it is worth pointing out, for example, the issues of designing workstations (open space, hot-desking mode of office work), theories of location, the advantages of agglomeration, logistics, new managerial roles (Pachura, 2019). At the same time, the recent period related to the rising importance of globalization and network economics and knowledge in the organization has resulted in greater interest in the issue of space. As T. Hernes notes in one of the first extensive studies devoted to the issues of space, space has not been so far the subject of systematic scientific research in connection with the functioning of the organization (2004). The aim of the article is to present the results of qualitative research performed in a group of managers of various organizations. The scientific goal was an attempt to answer the question about the way the managerial staff perceives the organization's space. The research was conducted on the basis of theoretical assumptions of the conceptual model.

Applied Methodology

Individual In-depth Interviews is one of the most widespread and elementary techniques of data collection among the set of qualitative research. This technique can be understood as form of conversation which is structured, yet at the same time, endowed with purpose, realized during interaction determinated by researcher (Pachura, 2019a). On epistemological level it is assumed that valuable knowledge about social world can be discovered, understood and interpreted during human interactions. Since the dawn of time, conversation was a method of gaining information and knowledge. In the following research project it was also decided to apply high-degree standardization interview. Also, the process of its analysis had oriented and troublesome character, as well as the procedure of meticulous encoding of full research material was dropped. Abundance of selected cases in qualitive research and its characteristics are not determinated rigidly – as in quantitative research – as well as there is lack of strictly formulated absolute procedures and rules. In source literature, pragmatic tactics of reaching optimal number of interviews is estimated by so-called theoretical

saturation of cases, which is based on observation of succeeding individuals in a way, that previous research determinates it. As a result of such a sequential action, the theorical data saturation is reached, so the situation in which incoming information in next samples duplicate those gathered so far and do not enrich already collected research data materially. Interviews took place in office space, on neutral ground, in discreet conditions, without third parties and other distracting incentives. Interviews were recorded entirely, which was agreed with interviewees (each time documented). Interviews were realized with businessmen, who worked in small and medium-sized companies with people on executive and independent positions. This article presents and analyses ten selected interviews, representative of the entire sample analyzed in the course of the research.

Operationalization of Conceptual Model of Spaces

During casual interviews respondents were evaluating aspects connected with functioning of organization in direct/physical space; glocal space, cultural, social and political space, cyberspace.

The researchers used number of methods characteristic for qualitative research. In the first place there was counterfactual measurement. The measure was connected with problem of causality, which is based on logic derived from counterfactual framework. This conception can be characterized as statement "what would happen if ?". In conducted interview's questionnaire for objective research purposes, the counterfactual measurement was applied to diagnose ideal states in all of organization's performance. Innovative and enriching procedure for research questionnaire is application of questions in form of metaphors, which were intended to characterize organization's structure and organization itself. Respondent's choice will therefore be illustration of way of thinking about organization and perception of their nearest working environment. Another procedure, which found using in organization's structure research is projective questions**,** which involve personification of various roles in organization. In research reference point for respondent were social roles in family. The metaphor of the family, as basic unit of society enables diagnosis of distance on the line managers-employees, as well as determination of the organization's hierarchization degree.

Structure of Space Model

On the basis of earlier proposed division, the preparation of conceptual research model (Fig.1) should be initiated with outlining five aspects which characterize organization's space:

1. Physical space of organization (1);
2. Glocal space (global and local space of organization), (2);
3. Cultural, social and political space (context space), (3);
4. Cyberspace (4);

Fig. 1: Elements of space model (source: autor)

Questions concerning internal space (1) of organization allowed to locate aspects of organization's functioning connected to the concept of company's arrangement and internal space. Next questions were used to assess internal space surroundings – structural aspect, transfers and dynamics of organization's development. Measurement of attitudes towards organization's external space was based on triad of questions concerning exterior objects, which were located close to the company. These questions were seemingly questions about facts. This type of questions is only assessed qualitatively. In this case counterfactual questions were applied, which allowed respondent to present their own concept of organization's structure. Global and local space (2) are two aspects, which add up to glocal space. In this case, once again the triad of counterfactual questions was used, both open and closed. During research factors connected to the structure of company's functioning were rated. Dominance of the open questions gave better field of analysis for tested individuals, as well as the possibility to take in holistically certain aspects of organization's functioning. This part of research was focused on structure of the organization and confirmation of predictor for quantitative research. Another field of research is analysis of the contextual aspects (3) of organization's functioning. In this aspect, in field of researcher's interests included cultural, social and political dimension of organization's functioning. The basic dimension of analysis in this case was employers activity, which reflects cultural level of organization. Qualitative research concerning this aspect left a lot to do for test individuals – narrative open questions and focused on establishment of the factors, which affect taking activity in above shown dimensions. In the age of widespread virtualization important aspect of organization's functioning is their presence in cyberspace (4). Rating this aspect of the organization's operation at the stage of qualitative research, the crucial part was to establish condition of the possession of the ICT devices and the terms of using them. Next examined issue during narrative interview was additional services associated with equipment and method of servicing IT. Second task connected with aspect of cyberspace applied to activity in global network. Open questions were focused in the first place on order of company's activity channels on the web (e.g. managing fanpage, micro-blog), followed by assessment of the company's innovation level in this range.

Results of Qualitative Research

Organizational Physical Inner Space

One of the crucial questions in the scenario was an application of the counterfactual measurement, which enabled respondent's concept concerning ideal arrangement of the organization. This question allowed to obtain not only knowledge about in what conditions respondents would like to work, but also in what conditions they are working currently. It can be noticed from the respondent's answers,

that they rarely analyze their everyday work surroundings. Majority of the interviewees accepted current space in their organizations. Allowing for casual conversations during research gave respondent's a second to think about the aspects, which they would like to change, but also to notice elements, which work for their company's. Counterfactual questions enabled to reach not only to arrangement of the ideal space, but also to get to know present state. It is worth noting, that asked questions created difficulties among respondents concerning determination of their needs. Majority of the questioned interviewees did not have excessive needs about arrangement of the company, as well as their own workplace. Analyzing respondent's answers of all in-depth individual interviews it can be noticed, that the most important element for interviewees in interior space of the organization was:

A) Image (perception of space around)

Almost all of the interviewees emphasized important role of the light in the space. In respondent's opinion, it is the key to good functioning in office. Big windows, not only illuminate the space, but also give the possibility to distract them from work. The view, which is supposed to be connected with natural environment, for example park or square is also important for interviewees (quotes from interviews are in italics). *Big window, I can sit backwards to the window to have a light, I can sit sideways to the window and know what is going on there after all, because you cannot stare the monitor all day. You have to be able to look further." – IDI 2*;*"Windows, for example big and possibility to look. […] Preferably on some nature. Although it can be park or forest, whatever. It would be the best if it was not some loud street" – IDI 9.*

B) Microspaces (e.g. space between desks)

Space which enables freedom of movement and gives certain "intimacy". *"First of all place for work with office space not too tight. So, I don't know how much is there – one and a half or two meters of freedom while by the desk, have a space to spread your things, of course laptop there." – IDI 8*; *"To not have those desks attached, to have some own space, so you can calmly… have ability to get away from desk, put your things." – IDI 2.*

C) Shared space (relaxation room, separate space where employees can rest)

Another important room is creating a place suitable for making and eating meals. Respondent's often said, that even though this kind of place is functioning in their company, it usually is small adapted room, not comfortable and friendly. Preferably for interviewees, it should be space, which allows several people being in the same time simultaneously with comfortable dining room away from office space. From among collected interviews respondents say that what is the most missing in their offices is space for relax and rest from office work. They have seen this space as 20-30 square meters room, arranged as living room with couches or seats. This room enables rest for example by possibility to play foosball, darts. *"I have a concept, I have seen this kind of room in one company, I liked it a lot, 20-some square meters, there was a big sofa there, foosball, I think even darts, also some peaceful space, pastel colors, big windows. Even musical instruments were there. I am not that into this, they could not be there, but only some couch and something to read. Not necessarily electronic media. This room is supposed to be place to rest." – IDI 10*; *"Place where you can sit, set up, I have heard they have this in Google headquarters, the room, where they have some cool pouffes, they can stretch themselves out, relax."- IDI 3*; *"However, I like open spaces due to greater freedom and better contact with coworkers." – IDI 1*

Perfect arrangement of workplace

Respondents did not have any special requirements concerning their place of work. Vast majority of the interviewees chose the desk with essential stuff needed for the professional purposes such as laptop and a landline phone, preferably wireless. Respondents emphasized in their statements importance of comfortable seat and ability to being mobile. Mobility is here understood as freedom

of work also in different rooms or going out to park while working. *"I think, that I wouldn't like to do the conversion, but I think that… current office should be definitely bigger when it comes to the space, because there is actually a lot of us here. The rooms are not big and yet when in such a small works 6 people, especially now when it is so hot it is not enabling environment. Oh yes, when it comes to structure of seating chart it is OK for sure"- IDI 2.* In ideal workplace space interviewees also paid attention to the use of the greenery. In majority of the interviews respondents reminded that especially flowers are good element, which causes friendly atmosphere in nearest surrounding. Also, big windows, which give natural light encourage work effectivity. After analysis of the conversations it can be concluded that, the most important aspects for employees is the need of distraction from office work and change office space into more natural and homelike. Interestingly, majority of the respondents does not have the need to bring into workspace elements from private life. *"I could have photo of my husband, but to be honest, I don't really like sharing my personal life with people I work with." – IDI 3.*

Local, Surrounding Space

In next part of scenario respondents were asked to point out the places and objects, which are located near their organization. As the analysis shows, respondents rarely paid attention to the surrounding of their organization, especially when it was located in developed area for example city center. The biggest amount of flaws, was recognized by people, whose companies where located in the suburbs without complex of shops. Questions of a metaphor character were used to characterize organization's structure and profile. Next question addressed to respondents was to determine company in local context. This question had closed character on a principle of sematic differential. Question was used to investigate local space on determined scale. Respondent rated given phenomenon on the contrast basis, defining their statement between two maximally different positions, where answer in the middle was intermediate value. Local context also interested us during interview. Respondents were also asked if their company can be important in local community in some way. Majority of the respondents thought, that their company is not meaningful in local context, does not play any important part or influence significantly residents.

Global Space

Respondents were asked how do they see their organization in global context. This question showed huge differences between small companies employing up to 50 people and huge companies especially, those which has connections with foreign businesses. Globality, in the respondent's meaning was mainly rich network of foreign connections, creation of companies' branches or sale of their products to foreign markets. Small companies had problems with perceiving their companies as global. It was connected with their lack of foreign contacts. The exception of the rule are companies, which are managing from above by foreign people. Globality in this case is understood as another approach to business. *"The fact that our boss is Belgian, already does its job. Yes, it's different work culture, considering the fact, that he is not Polish, so he came from another work culture, so he introduces otherness aspect. But what kind? First of all, integration of employees, for them to have ability to talk to each other." – IDI 2.* In contrast, big companies do not have problems with locating their organization in global context. Respondents, who work in those companies also spot the minuses. *"It is global company. Offices around the world, which are connected with involved net, various things network…The structure is powerful. I once had a chance to see whole, worldwide structure. "The firm is located in majority of countries in the world, has its own representation, offices, employ hundreds of thousands people around the world*." *– IDI 8.*

Contextual space (cultural, social space)

Closed question with sematic differential was used in this part of the quantitative research. It was a base, which showed organizational and cultural context in companies. This part of interview has enabled knowing the activity-making by coworkers, which is reflected in culture level of the organization. Analysis of interviews with respondents shows, that majority of companies, regardless

of the size of organization, has formalized rules concerning organization's culture. However, deepening of interviewees' statements shows, that those are not strict rules and in majority of positions, which respondents represented, there are informal norms and rules are determined verbally not in writing. *"I don't think so. It is all about dress code. It is pretty obvious for business meetings. In fact, I think it is the only requirement of the company." – IDI 9*; *"There is no formalized form." – IDI 10*; *"We don't have dedicated codex, the procedure code in document form. We have a collection of practice, which we are respecting, but in my opinion it is another point, yes, 'following established rules." – IDI 4.* In this part of the qualitative research respondents were asked to imagine themselves their company as forest, in which besides employees there are also other participants as deliverers, contractors, indirect clients, cooperating companies, authorities and competition. Next, they were supposed to specify what kind of forest animals listed elements were. This question had projective form *(brand part game),* involving personification of involving roles in the organization. It was often misunderstood and problematical for respondents. *"Yes, definitely. When it comes to internal work, hamster. When it comes to customer work, owl." – IDI 2.* The purpose of the interviews was also investigating the relations between coworkers and learning about their possible activities outside workplace. Majority of the relations is based solely and exclusively on the interactions in the inner space of the organization. Respondents notice that it is very rare to meet with coworkers outside workplace. It is cause mainly by lack of time and excess of work. *"Maybe some groups are forming, but all in the office. It means, that in the office over coffee, or in office space we all talk to each other willingly, outside work, sometimes there is meeting, that is to say working, which means everyone is meeting, but for individual meetings, I haven't heard about this, I don't have time and I don't know if others are meeting." – IDI 7*; *"In matters of "work-life balance". There is an issue, that everyone has their own life, it is not necessary to meet so often. There is no need for that." – IDI 10; "Oh dear, there is no need, because we don't have time. We have so much work that, there is simply no time." – IDI 2*. As demonstrated by results of research, relations in organizations are rather moderate both in organization and outside it. People, who were interviewed, because of the type of their job, have not much time for contacts with coworkers.

Cyberspace

The importance of the access to the IT infrastructure was indicated by majority of the interviewees. Almost half of them declares, that company, where they work is sufficiently modern in terms of equipment. *"I think, that we are equipped modernly. Maybe it is not hi-tech equipment, because it is well known, that computer hardware is something, what today is state-of-the-art and tomorrow is outdated. I think, that for now, we are equipped up-to-date." – IDI 7.* In some organizations huge focus on cyberspace development can be observed, especially in trade. Respondents emphasize that, it is important and nowadays necessary aspect of companies' functioning. And this space will be developing. *"Yes, we work on social media. We are on Instagram, on Facebook. We are working on launching new website, online shop. Also, we are going to reach areas like self-help books, tutorials. With some tips. So, there is planed focus on social media." – IDI 1.* Qualitative research shows, that space in the organization is seen in narrow sense. Interviews with respondents revealed that space of the organization is not the subject of reflection on the daily basis. Questions of the qualitative research, were a surprise for respondents and not every one of them was properly understood.

Discussion and Conclusion

Space as an element or dimension of materiality is also analyzed in the context of classical organizational science. However, the sources of this cognitive perspective should be sought in economics and philosophy of materialism. Research on the materiality of organizations in the context of physical space has been developing dynamically for several years, especially in British, French and Scandinavian environments. It is worth noting that this current of research is clearly related to the "materialistic turn" with its roots in Marxist concepts. For example, T. Peltonen examines the significance of materiality in the context of the perception of organizational space in terms of physical space (2012). Similar research is conducted by K. Dale and G. Burrell (2008) or H. Lefebvre (1991), placing it in the broad context of the social concept of *production of space*. The assumptions of this approach are based on an analysis of how material objects manifest themselves,

shape space and why a given space is shaped in this way and not another. It seems that similar results were achieved during the research presented in this article. Qualitative research showed that organizational space in the awareness of managerial and executive positions focuses on the nearest environment. The most important aspect for respondents is direct physical space concerning the organization of the own workplace (Fig 2). It is considered in broad categories of the principle of closed and opened space. In this dichotomous division for majority of interviewees closed space in the most comfortable one (several-people, separate room). Separate office and own desk give personal space, bigger freedom of work, intimacy and ability to focus on tasks. Closed space in preferred especially by people, who work independently. Space of organization is what the center part of the model. Only on the second level of respondent's perception the idea of the whole organization's internal space is outlined, which shows that research is accepted by the respondents, the way it is. Respondents do not have issues with adapting to the conditions in their organization. However, in the perfect type there is an idea of the open company, which offers relaxation space to their employees (Fig. 2). Important aspect, in respondents' perspective is connecting workspace with relaxation space, which is minimal in current conditions. Respondent's opinions demonstrate that the most neglected and uncomfortable interiors in companies are social spaces. It can be observed especially in small companies. The boundaries of the companies are usually agreed on frames of the inner space, which does not have particular influence on the respondents' perception. The interior is the place, where majority of interactions between employees, clients, suppliers happens.

Fig. 2: Materiality of organizational space (source: author)

One of the main conclusions of the research, worth noticing, is the shared space: relaxation and rest space – mentioned by the majority of the respondents. Interviewees referring to the ideal space of the organization put up this aspect to the foreground. It is an interesting observation, which shows that interior space of the organization, in respondents perspective, is not only workspace, but also place to rest or at least they would like it to be. The least important aspect of the space in this research turned out to be glocal space. In the interviewees' awareness it is functioning to the lesser extent. Globality is understood by respondents as well-developed collaboration with foreign clients or organization's belongingness to the foreign owner or global partner. That's why small and medium-sized firms usually do not identify with global companies. Their actions are mainly based on local and regional relations. In qualitative research context space shows, that integrational activity undertook in companies is various and not always connected to the size of the organization. However, the conversations with respondents showed, that regardless if there are team-building meetings, trainings for employees etc. it does not influence significantly the undertaking activities by coworkers outside the workplace. Informal relations, which appear among employees are rather conservative and are limited to the individual people. In conclusion, the qualitative study shows, that the most important aspect of the organization's space is interior "material" space of the company (Fig. 2), but especially assigned place of work (microspaces).

How the Change of Values Leads to a New Corporate Culture – *Post-Modernism, Generation Y and the Digital Revolution: Innovative Structures as an Answer to the Needs of Future Economy*

Oliver GLOEGGLER

Abstract

The change of values in society has been a talked about phenomenon for almost 50 years, starting in the 1970s. Its reality has never been as apparent as it is today due to a change in generations: the so-called 'Generation Y' has grown into taking over the lead in society and thus also in economy with a new set of values which on the one hand are the most defined manifestation of the process mentioned above, and on the other are interwoven in major paradigm-shifts in society as it has been moving from the Modern into the Post-Modern, both directed and driven by the Digital Revolution and the new forms of social life and economy which it has brought forth. This article sums up the meaning of these changes and their consequences for organizations; it explains why it is vital to take part in the social discourse on which they are based and shows how enterprises can use the change of values and the shift of generations to create a stable and sustainable position for themselves in future markets.

Keywords: Generation Y, Digitalization, Change of Values, Innovation

Introduction

Ethical values as a foundation of behaviour and social action determine the coexistence of people within society. Whoever had his doubts about that in the past may have changed his mind recently because of the media presence given to the 'Fridays for Future' movement and the discourse about protection of the environment and climate-change to which they have contributed substantially. Today's change of values in society which has built up momentum due to the phenomena of Digital Revolution and Globalization has an impact on society as a whole. To understand the significance of values in general and of the recent change of values in particular is the prerequisite for sustainable self-assertion within this process, which has been caused by people and can only be directed by people. That applies to every person as well as to every organization, no matter how big or small, no matter to which branch they belong. The pandemic caused by the Coronavirus and its long-term impact on the economy may (rightfully) overshadow such basic but vital truths: still, it will not change them. In fact, they may be even more important once the situation returns to normal.

Values and The Foundation of Economic Enterprises

Each enterprise grows out of an idea of producing certain goods or offering certain services. One of the first steps to reach that goal is to establish a business, which means to give it a legal form, to constitute it according to the law. There is a variety of such forms from which to choose, and whatever the choice may be in the end, it also includes a statement about this enterprise's values. For each legal form is linked to different responsibilities towards the state, society as a whole and groups of stakeholders within. The legal functioning of a co-operation differs from that of a private limited company, and thus it implies a different set of regulations, rules and expectations. Therefore, the choice of a certain legal form for an enterprise also holds a social dimension which to some extend reveals its values and thus can be seen as an act of ethical self-disclosure. This gives a foundation to

the Corporate Identity of a business or an organization, and a framework to its Normative Management which is a prerequisite to the Strategic Management[1]. The Strategic Management sets goals, standards and rules for all activities of and within an organization, and thereby shapes its Corporate Culture. But even if the management does not consciously and deliberately work on establishing common ways of communication, interaction and collaboration, a Corporate Culture will grow based on the shared values of people working together. "Values serve as a mediator between the individual and society, and work is a formative category for the relationship between these people"[2].
In modern society this is not just about 'classic' ethical values like morals, but also ideological values, such as our relation to our environment and its protection, which can manifest in different ways, e.g. recycling efforts, or the use of renewable energies or Carbon-Neutrality.[3] Ideally organizations will pick up on these issues as a part of the social discourse, to point out their own convictions reflected in their Corporate Identity. "An approvable Corporate Identity bears the potential of an extensive influence on the staff."[4] Thus, it can contribute to the creation of a Corporate Culture.

Legality and Legitimacy

The interaction of people and organizations within a society is organized by its laws in which ethical concepts are reflected. They constitute a legal system that provides citizens with security for their co-existence. The values forming the intellectual and moral background of this system derive from and remain an issue of, social discourse[5]; which means that apart from clearly defined laws there is a second level of social affairs, acting as a measurement and reflecting the recent state of social discourse: legitimacy[6]: it is the result of that discourse and it is independent of legality. An issue or an action may be legal but can be seen as illegitimate - it can be understood as legitimate without being legal[7]. Being a part of society, organizations automatically are involved in its social discourse. If enterprises decline to actively take their part in the public discussion about values, they will lose their grip on legitimacy and thus will fail to reach their target groups.

Keeping an organization's doings within the framework of the laws (i.e. on the right side of legality) is expected by the state as the guarantor of order. The expectations of the public exceed that: they not only want an organization to respect the laws given by the state, but to also conform to the ethical standards of the state's sovereign, i.e. its citizens. This attitude is reasonable. It has been nourished by growing global interdependencies of the economies, that have been creating a market, saturated with a multitude of identical products and services, in which international competitors fight for the consumers' attention and money. Since there are often no distinctions of material or quality between various offers of any kind, producers and providers must engage in different ways to position themselves. Thus, organizations portray themselves in the way that individuals do, turning into Corporate Citizens, becoming neighbours of their target groups, taking a stand in discussing important matters, accepting their role as members of social discourse.

The implementation of this role belongs to the tasks of strategic management, for that is how "[...] in general actions are called which relate to the development of potentials for success"[8].
This happens by inclusion, and under provision of all internal management tools, in co-ordination and/or collaboration with, external partners such as "[...] politics and administrations, the media, schools and research institutes, churches, non-governmental organizations […]"[9]. Thus, Strategic Management comprises both a formal as well as a content level, both of which are inseparably linked. Their common base is an organization's self-definition - the Corporate Identity; it is the foundation for the personnel's identification with their employer[10]. On the outside it keeps up the organization's reputation towards all different groups of stakeholders and thus confers faith in its actions. Ideally these tasks are embedded in a co-ordinating concept of 'Integrated Corporate Communication' – a consistent and congruent communication with all internal and external stakeholders[11].

Values and change

The connection between cherished values in society and the formation of, and orientation towards values within the economy becomes apparent whenever there is a change of values. Its effect on organization is even stronger if they haven't been positioning themselves within the process which has brought forth the latest change[12]. These changes are part of a continuous and repeating process that manifests itself in different intensities[13]. Its results are most obviously revealed when and where they cause cracks which form more or less distinct borderlines between 'before and after'.

From an economic point of view such a crack concerning the most recent change of values has appeared within the first half of the 1970s[14]. From a general socio-cultural position it happened within the 1980s[15] and regarded from a scientific position (here: Social Sciences and Economics) it has been the 1990s when this change became visible for the first time[16]. This illustrates well a central mechanism of the change of values. It is not a revolutionary act which wipes away present conditions at a stroke, but an evolution which varies its pace in different social contexts.

When in the first half of the 1970s former economic dynamics steadily came to a halt and thus the predominant paradigm of unlimited growth had to be reviewed, this has been regarded as a structural break[17]. Though this process foremost was seen as being linked to economic change[18], it had an impact on society as a whole (due to the interconnectedness which has been explained above[19]). Following the 1990s interpretation of this event, the break it had brought about had emerged from a situation of material saturation for the majority of people in Western societies and from the sudden realisation of how vulnerable material collateral can become in a crisis - both of which resulted in a return to immaterial values[20]. So much for the theory of the rise of 'post-material' values. It has been made popular by the work of American political scientist Ronald Inglehart[21]: his main hypothesis is based on the model of human needs and their hierarchy which had been depicted by the American psychologist Abraham Maslow in 1954[22]. According to him, human action is directed by the subconscious strife to satisfy certain basic needs, which he divides into those that are necessary for survival and those that grant an individual a chance of personal growth by self-expression. The latter will not manifest before people feel that their most basic demands for (material and social) survival are met.

Inglehart claimed that in Western industrial countries the majority of people had reached an amount of prosperity which had given them material and social security. Thus, they opened up to 'post-material' quests looking for personal fulfilment outside material measures. The decline of economies in the 1970s, so his reasoning went, hadn't stopped this process.

Narrowing down the focus to the economic development disregards the social evolution starting in the late 1960s, which – at least for some, especially younger people – had been formative concerning consumer expectations and behaviour as well as concerning the general attitude towards the capitalist economy[23].

Beck identifies that shift in people's perception of society as evidence for entering a new phase of 'the Modern' which he called 'Second Modern' or 'Reflexive Modern'. While the 'first' Modern had been marked by individualization, to him the 'Second Modern' is defined by pluralism and a dissolution of structures, which does not happen because of a socio-economical change but in spite of it[24].

Uniting both perspectives, the economy based on Inglehart and the socio-cultural approach of Beck, allows for a clearer and more realistic view on the causes and mechanisms of the change of values: socio-cultural aspects naturally get included into the working life and thus into the section of economy whose immanent developments effect people in both their roles as members of the workforce and as consumers, thus influencing their private-lives as well.

The Modern and the Post-Modern

In the 1980s, actuated by the beginning of the Digital Revolution in this decade which started the evolution of today's information and knowledge society, the theory of the Post-Modern as a new era with changing values had been formulated and has remained a matter of discussion ever since.

The 'Post-Modern'[25] (as a label for this period of social change) and its attributed change of paradigms and values has started at different times in different areas of social and cultural life. Its characteristics are best explained in relation to its predecessor, the 'Modern': where the Modern had been defining and substantiating, the Post-Modern has been deconstructing, fragmenting and pluralizing. This perspective coincides with Beck's theory of the 'Modernization of the Modern', a phenomenon born out of the 'Second Modern'.

The targets of post-modern deconstruction are formalities (e.g. social conventions) as well as contents. What had been understood as natural for centuries, e.g. the definition of sexes and gender-roles[26], has been redefined as issues of social construction to leave them to the discretion of deconstruction. And the same applies to the economy.

The Post-Modern's economic doctrine is Neo-Liberalism, whose core is unassailable faith in the self-regulating powers of markets that therefore have to be protected – which is the main goal of its political manifestation[27]. In order to reach this goal, the security of social backing measures by the state (acquisitions of the Modern) is deconstructed as well, becoming replaced by the requirement of people taking care of their wellbeing and personal security by themselves. Citizens in a post-modern, neo-liberal state are turned into 'managers of themselves', becoming both their own product and its marketer[28]. Individual freedom is accompanied by a need of (repeated) self-definition[29]. The downside of a multitude of choices for self-definition is the urge to use them in adaption to constant changes. The expectations and norms of peer groups, the 'chosen families' which one meets on social networks, role-models from the media and statistics provide a more or less reliable framework for facing this daily challenge. The results are 'multiple' or 'fluid identities'[30].

New mechanisms and grades of belonging have been replacing former systems and sources of reference like the class-system[31], family, religion or codes of conduct and other conventions. Everything has become fluid, social communication uses quotations and symbols (including the images of people or brands). Between variant groups and milieus the social discourse about values and assignments of meaning differentiates. The results are common values which form a conjunctive footing for the great social dialogue which – at the same time – alters them. Today's and tomorrow's consumers find themselves the focus of politics', economy's and the media's interest because of their active participation in social life, their purchasing power and their communication habits.

Right now, the population group which is in the centre of this attention are the so-called 'Generation Y' or 'Millennials', born between 1980 and the turn of the Millennium[32]. Their influence on the social discourse of values has been steadily growing with their influence on society[33]. Dietz concludes: "The assumption suggests itself that the recently stated transitions, which have been called 'Generation Y's change of values', are a continuation of the process that has been started in the 1970s"[34].

A Shift of Generations and The Change of Values

Today's younger generations have been brought up in a world in which the perception of the working life (as a factor in the construction of a person's identity) has undergone a major change compared with the last decades of the 20th century. Innovations in information/data technology and communication caused by the Digital Revolution have contributed to the fact that a value like 'plurality', which is linked to personal freedom while at the same time it is demanding of the individual to be flexible in adapting to constant changes, has been turned into a basic requirement for social survival, as which it is promoted now[35].

What distinguishes 'Generation Y' from their predecessors though is not just their socialization between information overload and digital adventure worlds, but their different attitude towards knowledge and its use[36], as well as the fact that they are the first defined generation who grew up with all the various applications of digital technology (and therefore are also called 'Digital Natives'). That grants them acceptance and expertise for this side of post-modern life, touching the corporate world as well as leisure times, and both of these fields have undergone noticeable changes due to that touch. On the one hand a stronger hedonistic streak of the younger generation manifests in the idea that their work, whatever it may be, should be fun. On the other hand, modern communication technology has been starting to wear away the borders between working and private life[37] since the same digital gadgets and tools are used in both of them, and by using them, former spatial and temporal limitations have been erased[38].

Members of ‚Generation Y' are willing to accept demands like constant accessibility and other claims of today's New Economy – provided that the job is worth it and is granting them a chance for self-determination[39]. Which means that what they are looking for, is work that just makes sense to them and their needs (including their requirements concerning communication, learning and personal growth)

> "The compatibility of private life, family and professional activities can be generally improved by flexible forms of work. Here mobile working and the so-called alternating screen-work can noticeably improve compatibility. Access to faster and mobile internet-connections and video-telephony enables more and more professions to be flexible in the choice of their working-space."[40]

A thought which had already been introduced to the discourse about the change of values in the 1990s, stating that "[...] in principal values allow for functioning in a state of cognitive uncertainty, they can 'bridge' missing knowledge and close the gap between skills, practical experience and action [...]"[41], is more relevant today than ever before. The pressure on the individual in society to act in an 'agile and fluid' way has reduced the stability of identities and has led to growing feelings of uncertainty. To compensate for that, stable values are needed. They serve as orientation guides for the task of self-definition, which on the outside is dealt with by using the means of consumerism (e.g. using labels and brands as signs in communication with peer groups). Values represent the lowest common denominator of the various groups within society and therefore allow the individual to adapt, still leaving all options for further self-expression.

At this point within the development of post-modern life, 'Generation Y' are the agents of the recent change of values. Because of their qualities, the members of this age-group have become most interesting to economy. The 'Digital Natives' visibly have gained more influence as customers, marketers and as a growing part of the workforce[42], as managers and decision makers, as innovators, as architects and engineers of future progress. Their values, attitudes and demands determine their behaviour in all social contexts, in the corporate world, in consumption, in education and culture. This includes the wish to get attention and feedback, the longing for self-development and for working in teams[43] according to the ideas and standards of 'New Work'[44] and 'Easy Economy'[45] which include an even greater need for communication and information management.

As a result of a non-representative survey including 101 managers from German banks, carried out by the author between August and November 2019, the importance of 'Generation Y' behind the change of values was confirmed for this segment of the Economy. It could be shown that the banks, being among the leaders of adapting to new standards of digital services within the German economy, have already taken measures to create and implement future-orientated, sustainable forms of organization and collaboration. However, this far efforts have mostly been focussed on singular and mostly structural areas, and have been partly in line with the younger generation's interest. But from the perspective of the 'Millennials' they haven't been sufficient, and for 'Generation X' (still being just as strong and important protagonists within the economy) they have been too far removed from their needs – thus failing to raise motivation significantly as they had been designed to do.

Comparisons with international studies have corroborated the trends and results of this national study: 'Generation Y' is ready (and in general as willing as able) to take on responsibility for the future development of economy[46] and their members are quite diverse in their needs and demands[47]. In general, they call for an agile Corporate Culture with lean management to face future challenges[48]. Its implementation will require a change of paradigms and strategies, which only can be induced and mastered based on a plausible commitment of the top management[49], investments in Human Relations and training as well as in technology.[50]

In organizations the change of value is the natural result of a shift of generations[51] which has to be balanced by the Corporate Culture. This implies transferring of all required knowledge, accepting discrepancies in perceptions and assessments, and in thinking and doing, as an expression of diversity and using them constructively. The most productive way to get there is the implementation of an innovative and creative culture, in which change is regarded as one of the basic principles of growth. This mindset allows for preventing conflicts and – when they do appear – for dealing with them in a much more positive and relaxed manner; it also allows for turning competition into collaboration. At the same time, employees of all generations will find a chance to use their unique resources and skills to contribute to common success and thus to their personal success as well. A Corporate Culture based on a congruently holistic approach[52] (including a view on individuality and diversity as major qualities) transcends the borders of generations and overcomes unwanted discriminations[53].

Therefore, one side-effect of the change of values and its effects on organizations is the need to create a sustainable Corporate Culture. What is required to get there successfully is an adequate management of knowledge. An agile culture asks for permanent education and learning[54]: i.e. learning together, from each other and/or initiated by knowledge-interventions from outside. The less tech-savvy members of staff have to be motivated to open up to the Digital Revolution and its chances. The younger generation(s) for whom this is no challenge at all have to learn why and how to appreciate the knowledge and the experience of older colleagues, how to take them onboard and make them integral parts of present and future strategies. In this context, managers are taking on the roles of relays for the transfer and transmission of knowledge - which requires the will and the chance of permanent increase of knowledge on their side as well.

Naim and Lenka point out that a Corporate Culture based on these principals is creating a positive learning environment which will support the progression of the personnel as a whole. It will add especially to their general functional skills, their decision-making and social competence, their team development, their managing skills and their professional initiative, the recognition of chances, and their sense for networking[55].

Summary

An organization's base of values is its most important strategic asset. It is the normative power behind the Corporate Identity and thus defines the principles of its strategy. It serves as an immaterial unique selling point to position an organization within the markets, and it offers identification to the staff and orientation to applicants.

Since internal as well as external stakeholders are participants in the social discourse which causes the change of values, organizations have to use their own chances for participating in these processes as well, otherwise they may risk their relation to the living environment of employees and customers, business partners and shareholders – which will result in losing the connection to the markets.

The recent change of values is linked to a shift of generations. It has been manifesting ideas and ideals which go back to the 1970s and which now – in the second and third generation – have transcended all of society. The shift between 'Generation Y' and their predecessors ushers in a socio-cultural change which therefore also affects Corporate Cultures.

Post-modern society creates fluid structures and thus demands agile organizations. Its young agents are establishing a framework for new products and services by using digital technologies, while their personal values have been altered from the material to the immaterial.

The Corporate Culture of agile, sustainable organizations which strive for identifying their resources and potentials to use them most successfully generates an understanding of management beyond classic two-dimensional definitions between tasks and relationships[56]. What is needed now is an exchange between the generations, ideally within an agile Corporate Culture of creativity and innovation with flexible conditions for teams committed to collaboration.

Acknowledgement

In particular, I would like to thank Prof. Dr. Rozalia Sulikova for her guidance and valuable support during the compilation of my publication.
This publication results as part of my PHD Studies.

[25] Apart from the concept of the ‚Post-Modern‘ there are others as well which recite on the idea of a new era but are based on a different view of its relation to the Modern (Dietz/Neuheiser 2017, p. 9).
[26] This is the origin of the gender-discussion which had been followed by Judith Butler’s theory of ‚Queer Studies’ (Babka/Posselt 2016, p. 15)
[27] Ptak 2014, p. 34
[28] The definition of citizens within a neoliberal system as a ‚managers of themselves’ is based on Michel Foucault’s theory of ‘*gouvernementalité’* in which he defines the connection between the ‘self-government’ of the individual and the state’s claim to power (Foucault 2012)

[29] The challenge of constantly re-inventing oneself as a means of social positioning and adapting to social changes leads to ‚fluid identities‘ – which proof freedom and self-determination as well as they cause insecurity and (as a result of this) fear. (Noack Napoles 2019, p. 147)
[30] Porschen-Hueck/Weihrich/Huchler 2018, p. 239
[31] These models prove to one-dimensional and rigid to allow for the dynamics of the post-modern society. Today people have the chance to define themselves by their ways of life in recourse to their habits as consumers and communicators. Thus, the term 'social milieu' has been coined to describe recent social concepts of identification and identity. (Renn 2014, pp. 292-294)
[32] Rodeck 2014, p. 3
[33] Popp points out most justly that the idea of generations as homogeneous units has to be met with caution. Without a show of a doubt each defined age cohort will show a similar social and cultural diversity, still there will be common ideals, demands and values which can be generalized and which will differ them from their predecessors and their successors (Popp 2019, p. 63)
[34] Dietz 2016, p. 21
[35] „Die Vermutung liegt nahe, dass es sich bei den aktuell konstatierten Veränderungen, die als Wertewandel der Generation Y bezeichnet werden, um eine Fortsetzung der Prozesse der 1970er Jahre handelt“ (Ibid. p. 25)
[36] Dietz 2016, p. 18
[37] ‚Work-life-balance‘, the qualitative equalization of working and private life, is replaced by 'work-life-blending' – work and leisure time melting into one (Purgal 2015, p. 28)

Abstract

Telecommunications is an important tool for the business world. This sector has a strong effect on our economic activities. The telecommunications sector represents 5.9% of Romania's GDP (in 2019). The telecommunications industry is a dynamic one, constantly developing and changing on a stable market. Thus, in order to reduce and prevent the loss of customers, most of the top companies in this sector use performance analysis that treats the churn behavior as a central topic. The purpose of this paper is to identify through an analytical method easy to visualize and interpret, the peculiarities and defining characteristics of churn clients and non-churn clients within the postpaid subscription segment. The analysis was performed on a data set of a large telecommunications company in Romania. To determine the profiles of the two types of clients we used an EDA (Exploratory Data Analysis) technique, called Violin Plot. In our study, this method identified the non-churn client's situation as defined by the lower values of the invoice and an additional cost as close to zero. A specific feature of the churn class is related to the number of national minutes received outside the network and the sum of the minutes received.

Keywords: violin plot, business, Romanian telecommunications, churn customer profile

Introduction

The telecommunications industry is an indispensable sector. This sector is the life element of our society, which has made it possible to connect people globally. The importance of telecommunications has made its mark on all spheres of life. Due to call handling techniques, businesses can easily handle incoming calls. With the help of telecommunications, employees working from home or from remote locations can communicate effectively with the rest, even when it is not possible for all team members to be physically present (web conferences), team members from around the world can participate seamlessly.

Using annual data from 192 countries from 1990-2007, the impact of mobile telecommunications on economic growth was assessed and it was found that this impact is lower for countries with lower mobile penetration. While in low-income countries, the contribution of mobile telecommunications to the annual GDP growth is 0.11%, for high-income countries it is 0.20%. Increasing returns from mobile adoption also appear when evaluating the impact on productivity growth.

Telecommunication service providers (fixed and mobile) understand that they must bring in new smart services both to attract new customers and to retain existing ones and to increase revenues. The challenges and objectives in this regard are as follows: determining the necessary services; introducing more services in a faster way and at lower costs; providing innovative services. These objectives could

not be achieved with the traditional infrastructure. New services require a much greater degree of flexibility, performance and scalability of the system, as well as open standards.

The telecommunications industry is a dynamic one, constantly developing and changing according to the needs of the client. Nowadays, telephone companies are facing increasing competition and a growing risk of churn. All these powerful trends force the telecommunications companies to respond through offers, packages and price reductions more competitively to succeed first and foremost to keep their current customers and then to increase their number.

The use of the latest analytical techniques allows telecommunications operators to apply advanced algorithms, but also predictive models. These algorithms can identify previously hidden variables and combinations of variables that predict customer behaviors. Companies can then analyze the reasons behind these behaviors to come up with solutions later.

The full value of data analytics can only be achieved when companies can customize the pricing of a specific group of customers with the greatest inclination to migrate to the competition. Such an approach requires granular micro-segmentation of the customer base, which is then adapted to a large, well-ranked library of offers. A leading operator, for example, developed a library of over 50 offers and then created a mechanism for the rapid launch and measurement of related campaigns. As a result, the company was able to reduce the churn by 10-15% over the next 18 months.

While data analytics can predict customer behavior, churn risk elimination is only performed when operators are able to change that behavior.

The problem of the churn phenomenon or the loss of a customer is a problem that is faced by almost every company in any industry. This phenomenon is a major source of financial losses, as it is generally more expensive to attract new customers than to keep existing ones. Therefore, customer management power is very important, especially in industries characterized by strong competition and saturated markets, such as the telecommunications industry. The first step in managing the phenomenon in question is to identify the particularities of customers with a high tendency for churn. There are not many published works in the field of churn modeling due to the commercially sensitive nature of the problem.

On the telecommunications market in Romania we find 2 types of telephony services, postpaid (representing customers with subscriptions) and prepaid (card users). The clients who benefit from the postpaid service have a contract that specifies a limit or an allocation of minutes, text messages, etc., and the client will be billed at a flat rate for any use equal to or lower than that quota. Any use beyond this limit incurs additional charges. Theoretically, a user in this situation has no limit to the use of mobile services and, consequently, to unlimited credit. This service is recommended for people with a constant income.

The main purpose of this paper is to identify the particularities and defining characteristics of the churn clients in the telecommunications sector through a graphical method that is easy to visualize and interpret. We will approach as I study and analyze a sample from the postpaid segment. Violin Plot is a simple method of numerical data planning. It is similar to a box plot, with the addition of a density plot of the rotated core on each side. The violin graphics are similar to the box plot, except that they show the probability density of the data.

A violin plot shows the presence of the different peaks, their position and relative amplitude. A violin type chart can have several layers. For example, the outer form represents all possible outcomes. The next layer inside may represent values that appear 95% of the time. The next layer (if any) inside may represent values that appear 50% of the time. Although violin plots are much richer in information than box plots, they are less popular. Because of their rarity, their meaning may be more difficult to understand for many readers who are not familiar with the representation of the violin type graph. Violin plots are available as extensions to a range of software packages, including R packages vioplot, wvioplot, UseR, Python libraries and more.

Literature Review

Of all the other areas, over the years telecommunications has experienced the highest annual rate of churn from 20% to 40% (JaeHyeon A. et al., 2006). This has financial implications for the company, as it costs 5 to 10 times more to add a new customer than keeping an old customer with the company (Junxiang Lu, 2003). The telecommunications field has achieved one of the most important positions in the list of fastest growing industries, covering 90% of its population (Rajanish Dass and Rumit Jain, 2011).

The risk of churn within the telecommunications companies is a major problem, the competition is extremely fierce. Abdelrahim K. A. et al. (2019), in their research, aimed at building a model that would predict the churn of the customers of the telecommunications company SyriaTel. They have developed a model that uses machine learning techniques on large data platforms. They also determined a way to select variables that help companies forecast the risk of churn. The data set used contains all the customer information over 9 months and was used to train, test and evaluate the model from SyriaTel. Some variables such as contract ID, phone number and other unique customer variables have been removed. They are not used in data processing, because they have a direct correlation with the target production.

The churn risk is an intense topic debated nowadays. Also in 2019, Yasser Khan et al. they studied this topic by building an efficient model on several attributes, such as: demographics, billing information of a telecommunications company in Pakistan. The results clearly indicate the measures needed to eliminate the risk of churn. In this article, in order to reach the presented conclusions, all variables were analyzed such as: age, duration of the call, filing of complaints, duration of the call, education, monthly incomes, low call rate and occupation.

In order to survive in a dynamic sector, it is essential to maintain an up-to-date relationship with customers through a management system. This system plays an essential role in developing customer satisfaction, loyalty and the main interface with which customers interact (Hung Chihli and Chih-Fong Tsai, 2018). The management system could revolutionize the entire system by providing real time information provision.
\
In order to survive in extreme competition in the telecommunications market, companies must adapt to external changes. Determining the determining factors in the churn problem improves the sales process, increases customer loyalty and advertising (Berry M. JA et al., 2013).

The revenue of companies facing the churn problem in the telecom industry can be increased by improving the quality of services, customer satisfaction and remedying customer problems. For all this, it is necessary to identify the variables that act as drivers in support of business decision making. In their study, Khodakarami Farnoosh and Yolande Chan (2015) used a data set based on information related to monthly income, call rates, education level, monthly invoiced amount, complaints, unpaid invoices, call duration, internet, voice services used , total calls, occupation and age.

In order to have a clearer picture of the results of the studies, the graphical methods are the most used, these being easy to interpret and understand. Tracey L. Weissgerber et al. (2017) presented in their work some of the most important graphical methods: boxplot, scatterplot, violin plot and bar graphs. According to them, the Violin poles are very effective in showing the shape of the data distribution in medium or large samples. These are the best option for very small samples, as summary statistics from other charts are significant only when sufficient data is available. These charts can also provide valuable information for larger samples. A violin plot graph includes all the data that is in a box plot with the mention that the violin plot is more informative than a box plot. While a box plot shows only summary statistics, such as mean, median, and interquartile range, the violin plot shows the complete distribution of data.

Methodology

The information in this paper focuses on identifying the specific characteristics of churn customers in the postpaid segment (clients with postpaid subscriptions). Even if this type of customer is contract-bound, which makes the task of churn prediction a little less difficult, the revenue that is typically generated in this segment is much higher than in the prepaid subscription segment. Moreover, the use of postpaid customer services is much higher compared to the prepaid segment, therefore, they would be more likely to face network issues or align with market offers, which can lead to churn.

To identify and analyze the particularities of the two classes, churn and non-churn on the postpaid segment will be used as a graphical methodology, Violin Plot. This is applied on a sample of 10.000 observations, which contains 14 indicators. The indicator found under the name of CHURN is used as the reference variable. In the graphic representations of the violin type in the figures below, the two classes are vertically aligned.

Due to the existing contractual link in the postpaid subscription sector, the data set has several categories of information. Thus, the variables studied can be classified into four major categories: demographic data, details about the customer's life cycle in the company, data regarding the financial power of each customer and information on the interaction of the subscribers with the customers of the competing networks.

As for data processing, the graphical representation with Violin Plot and non-numeric variables was tried, so for all qualitative variables, the One Hot Encoding method was applied: for each value of the non-numeric variable, a new column was created with the value of the initial column, repeating- so for each value of the initial column. For example, the Contract variable was transformed by One Hot Encoding into: Contract_ACQ = 1, where Contract = ACQ, otherwise Contract_ACQ = 0 and Contract_RET = 1 where Contract = RET, otherwise, Contract_RET = 0. This trick was made in order to use the entire dataset in the analysis. One Hot Encoding is a new data processing technique that allows the transformation of non-numeric indicators into numerical ones.

Results and Discussions

The first step in building the analysis of the client's churn and non-churn profile on the postpaid segment is the construction of the data set. In Table 1 all the indicators used are listed and described.

Table 1: Indicators from the post-paid subscriptions segment used in the comparative analysis of churn and non-churn behavior

No. of indicator	Variable name	Description	No. of figure Violin Plot
I1	Age	customer age (years)	Figure 1
I2	Tenure	represents the age of the subscriber in the company (expressed in months)	Figure 2
I3	Area_rural	shows whether the client lives (1) or not (0) in the rural area	Figure 3
I4	Area_urban	indicate information about the environment: whether the client lives (1) or not (0) in the urban environment	Figure 4
I5	Contract_acq	indicates whether the client has a purchase contract (1) or not (0)	Figure 5
I6	Contract_ret	shows whether the client has a retention contract (1) or not (0)	Figure 6

I7	Gender_F	indicates whether consumers are female (1) or not (0)	Figure 7
I8	Gender_M	shows whether consumers are male (1) or not (0)	Figure 8
I9	Extracost	represents the value of the additional cost (euros)	Figure 8
I10	Invoice	payment invoice (expressed in euros)	Figure 10
I11	MonthsC	the number of months after the customer request by telesales to modify the subscription offer for another type of service - change of the current contract	Figure 11
I12	MonthsO	the number of months since the last offer was changed on the account	Figure 12
I13	MinC	the sum of the national minutes made (outside the network)	Figure 13
I14	MinR	the sum of the national minutes received (from outside the network)	Figure 14

In the construction of the analysis of the behavior of the clients who activate in the sector of postpaid subscriptions, the particularities of the two classes (churn versus active clients) will be identified through the violin type chart, Violin Plot, as in the case of the analysis of the clients with prepaid subscriptions presented in the previous chapter. Each of the fourteen indicators are graphically represented in the figures below, divided into the 2 groups: churn and non-churn in order to remark in a visual way as easily as possible the defining particularity of the behavior of a postpaid (subscription) client who has made churn in front of a customer still active.

As can be seen from the following figures, the behavior of the customer with a postpaid subscription that did not churn is defined by the lower values of the invoice and an additional cost as close to zero, once the extra cost is equal to zero, the individuals are classified as non-churn, almost the entire class being concentrated around this value (Figure 9).

Regarding the age of the client, the graph shows a similar distribution in the two classes. In the case of the non-churn class, the representative figure (Figure 1) shows an extra limb, slightly highlighted, which shows that there is an age for which there was no churn. This extremity juggles around the range of 45-50 years and signifies that the values inside it are unlikely to churn.

We also note that among the non-churn consumer population periodic contact with customers is very important, stimulating their behavior towards stability. Most non-couriers (Figure 11) are concentrated around 0, which means that the regular telephone connection with the customers does not migrate to other competing companies.

A feature of the churn class, according to the distributions below, is related to the amount of national minutes received from outside the network (Figure 14). The churn class has a large variant and has a flat distribution, similar to the one of the non-churn class, the difference making it the values of the indicator greater than 100. In this case, if the sum of the minutes received, on average is greater than 100, then the individual is classified as a churn client. In the case of the minutes consumed we observe very similar distributions, which results that the indicator I13 cannot be considered a discriminating factor.

Another discriminating factor in the specific behavior of the churn client is the number of months since the last offer change in the account (I12). The graphic representation in the form of its Violin Plot has somewhat different oriented ends, one towards the left, the other towards the right. From here it can be concluded that churn individuals have high values, that is, the aging of the offer or the subscription causes the customers to look for new offers elsewhere (Figure 12).

Churn clients can also be characterized by their home environment, type of contract or even sex. Thus, from the images below referring to these three characteristics it can be stated that individuals with contracts or offers of retention type (Figure 6, usually in this case the offers are some very low in price compared to the market, just to convince the client to remain active in the company), from the urban area (Figure 4) and from the masculine gender (Figure 8) have a predisposition to churn greater than for the clients with purchase contracts (Figure 5), from the rural area (Figure 3), where the non-churn class or the female gender predominates (Figure 7), women show greater fidelity to the company, they tend not to make churn.

Conclusions

The telecommunications industry is a dynamic one, constantly developing and changing according to the needs of the client. Companies in this sector are facing increasing competition and a growing risk of churn. In order to determine and identify the particularities and defining characteristics of the churn clients who use the postpaid subscription service, we used an easy-to-view and interpreted graphic method, Violin Plot.

As has been shown in other studies, the use of analytical techniques allows easy identification of drivers in the analyzed action. Thus, the main discriminating factors of the class of churn customers in the studied data set are: the number of months since the last offer change in the account, the aging of the offer or the subscription causes the individuals to look for new offers elsewhere, the amount of minutes received, the average home, type of contract or even sex. In a future paper, other technical methods will be tested and analyzed, and the set of indicators will be expanded.

Abstract

Research Motivation: the energy companies' effectiveness evaluation includes a set of tools, instruments and measures to provide the acquisition and relevant interpretation of the indicators set of the energy companies condition. The practice of financial and economic activities of the various companies determines a set of criteria parameters and ranges of values, assessing the effectiveness of the various industry-specific companies. It is necessary to determine the indicators composition to assess the energy companies' effectiveness following the fundamental restructuring of the energy sector. **Research Methodology**: the analysis database of the Russian generating companies financial and economic condition for 2013 and 2014 is used, also statistical methods are used. **Main Findings**: the set of indicators and their criteria values is developed; it allows an objective comparative analysis of the generating companies. **Implications:** the developed effectiveness indicators and criteria (reference) values of these indicators allow to make informed investment decisions.

Keywords: Energy Company, Effectiveness Indicators.

Introduction

In modern Russian conditions, within the operation of such a big power engineering company as WGC, a strong analytical work at every plant acquires a particular matter connected with analyses and forecast of its financial situation. To function and develop steadily, an energy company first and foremost needs stable influx of revenues enough to pay off suppliers, creditors, employees and government. After payments and liabilities there must be sufficient volume of profit to provide expanded reproduction and self-financing of current company`s operations.

WGC`s market stability indicator is its ability to develop successfully in the changing internal and external environment which makes a compound financial analysis of WGC necessary.

The financial situation is a complex notion and characterized by the system of indicators reflecting availability and allocation of funds, their volume and structure, real and potential financial opportunities. The data for analysis of the company`s finance are included in accounting statements, which in market economy become the main source of communication and a primary element of information support of financial work.

Results and Discussion

Let`s characterize some criteria of company`s financial security. One of such measures is the probability of bankruptcy. Different indicators must be taken into account to evaluate it. Inflation rate, the period of financial cycle, the specifics of production (capitalization ratio, energy and labor intensity), workforce productivity and "tax climate" – all of them influence the dynamics of this probability. Since a company has a certain measure of financial security beyond its lower limits, the possibility of bankruptcy exists. It should be mentioned that this limit is determined by solvency, liquidity and creditworthiness of the company, since to maintain stability, the cash flows should at least provide an opportunity to meet the requirements of suppliers, creditors and government.

Solvency is considered to be a criterion and the basis for financial security. This requirement means that a company must have a capacity to pay for its industrial demands and obligations, therefore the index of stability is *regulated balance of cash flows*. It is determined primarily by the dynamic of the relation between influxes and expenses in the course of time. The necessary condition for acceptable minimum level of financial stability is the excess of inflows over costs and payments. The disequilibrium of cash flows of power engineering company (especially WGC) may become one of the main reasons for financial instability.

Factors, characterizing financial stability and solvency of a power engineering company, can be divided into internal and external ones.

The external factors include, above all, economic (economic stability in the country as a whole, industrial production in the country), political (political stability of society, legal regulation of economic activities, state tax policy), as well as the level of scientific and technical development progress (innovative technologies, the volume of capital investments in modernization and knowledge-intensive production), etc.

The solvency of a power engineering organization can be measured by means of the structure evaluation and the ratio between accounts receivable and accounts payable. Insolvency may surface up due to the impact of major factor – insolvency of energy consumers, as well as other internal and external reasons.

Internal factors of insolvency of organizations generally result from an inadequate qualification of executives and inefficient management. The stable position of a company largely depends on employees` potential and its correspondence to goals and objectives of a power engineering company. Among external factors of an emergence of insolvency there are ones which could be eliminated by successful joint work of bookkeeping and management of an energy company. They are shortage of working capital, the growth of accounts receivable and accounts payable and poor contract discipline.

Thus, solvency of a power engineering company that is ability to make payments in due periods, which depends on both inflow of money from debtors, customers and clients, and outflow to fulfill obligations to government, suppliers and other creditors, realization of investment programs – is a key factor of its financial stability. It is particularly important for the management of a company to conduct regular analysis to prevent emergence of shortage of working capital (use the calendar of payments) and a timely liquidation of crisis situation.

When estimating solvency, it is necessary first of all to evaluate how much current assets exceed the existing short-term debt (*current liquidity ratio*), and to what degree it can be paid out without involving of current assets, in other words with the help of money, short-term financial investments and cash on operating account (*intermediate liquidity ratio*), and finally how much of short-term debt can be paid out by the most liquid assets – money and , short-term financial investments (*absolute liquidity ratio*).
But financial stability does not only mean solvency. To achieve and maintain financial profit volume in relation to own capital and revenue is more important than the absolute size of profit.

The growth of revenue and earnings, which cause profitability increase, growth of financial security, decrease of bankruptcy probability, has limited efficiently until acts with raised risks provide profitability.

Detailed analysis of financial and operational activities is a substantial stage of creating and implementing a complex economic approach to providing financial stability and development of a power engineering company. It is a necessary condition of correct management, planning, forecasting and rational use of financial resources.

The aim of financial and operational activities analysis of WGC is to obtain reliable and authentic information about its financial situation, solvency and profit-making capacity, find additional money for more efficient and rational management company`s operation. The procedure of such analysis should include the following stages:

1. Analysis of business environment of the company. Collection of necessary reliable information about the impact of internal and external factors, characterizing the company`s operation: emerging tendencies of environment, features of market and stock conjuncture, financial situation of the company.
2. Express-analysis of financial accounts to reveal weaknesses in the company`s operation, assessment of their dynamic and determination of the ways for more detailed investigation
3. Analysis of financial accounts concerning liquidity, net worth sufficiency and solvency.
4. Parametric detailed analysis based on the system of financial indexes. Subsequent joining of final coefficients into generalizing indicators; implementation of experts` evaluation.
5. Analysis of business activity: return on used resources, profitability and market activity. Forecasting of financial situation with the help of estimate of bankruptcy probability and rating.
6. Determination of optimal ratio between fixed and variable costs in the structure of production costs, selection of rational composition of capital in the context of own and debt capital ratio.
7. Analysis of financial stability of a power engineering company with the help of factor model of assessment of economic stability
8. Creating the company financial statement and recommendations of activities to increase the effectiveness and financial stability of WGC.

It should be mentioned that the efficiency of such analysis increases if the company has in an organization a well-established system of financial accounting and reporting, complex automatic budgeting and conducts profound analytical work.

The analysis of financial reporting of a power engineering company helps identify interconnections and interdependencies between various indexes of its operation. The results of analysis allow stakeholders to make decisions based on current financial situation and operation of the company in previous years and its potential opportunities for future period.

WGC performance assessment its market place amidst similar companies can be done by means of horizontal, vertical and trend analyzes.

While examining of relationships between variables, both in analysis of different branches of industry and of only one branch, regression analysis can be used. The resulting equation of regression may be employed to create the sales forecast. Though a multidimensional equation of regression, including some independent variables or factors (multiple regression) is more common.

Financial ratios help to esteem the financial situation quickly and easily. Their advantage is the opportunity to eliminate the impact of inflation, which is especially significant during long-term analysis. Financial ratios are the basis for evaluation of company`s operation by interest groups, first of all shareholders and creditors.

All financial indicators can be grouped in the following way:

- liquidity ratios;
- economic activity indicators;
- solvency;
- profitability;
- market activity.

It is important to note that these indexes have some disadvantages:

1. Static character – the named indicators are calculated by specific date thus they are simultaneous and hence there is a need to analyze their dynamic for several periods (horizontal, vertical and trend analyzes)
2. There is the probability of distortion of indexes due to inclusion "dead" expense items in the composition of current asserts, for instance, surplus stock of good-material assets.
3. Incorrect accounting in terms of "illiquid" receivables that are unlikely to be recovered (it may never be repaid). In this case, the amount of customer debt increases in the balance due to low payment discipline, not because of the growing business activity of the enterprise. However, such a fictitious increase in accounts receivable will have a favorable effect on the value of the indicators under consideration.
4. Insufficient accounting of the funds turnover rate and its impact on the financial position of the company. Liquidity and solvency, directly depend on how quickly the funds invested in assets, are converted into cash. This effect is explained by the fact that the speed of assets` turnover is connected with minimum required amount of advanced capital and the associated cash payments (interest on loans, dividend payments, etc.), the need for additional sources of financing, the amount of costs, the amount of tax deductions, etc.
5. The multiplicity and diversity of indicators make it difficult to obtain definite conclusions and prediction of events

These deficiencies listed largely characterize the possible directions of improving the system of indicators for assessing the financial sustainability of an enterprise. For effective financial management it is important to have information about the availability of payment funds, optimal ratios of own and borrowed capital, a satisfactory rate of capital turnover, and finally, financial stability ratios, presented in visual and accessible form, i.e. the financial stability ratio should determine the numerical (quantitative) value of financial sustainability.
The formulated conditions clarify the requirements to areas of improvement of the system of indicators and the design of a generalized indicator of the financial sustainability of the power engineering company.

Table 1: Assessment of property potential

№	Indicator	Company				Average value	Maximum	Minimum
		WGC-2	WGC 4	WGC 5	Inter RAO			
1	The amount of funds controlled by the company, thousand rubles.	173385755	125359211	112691000	253015439	166112851	253015439	112691000
2	The value of net assets (NA), thousand rubles	113664360	120005686	68003000	210156333	127957345	210156333	68003000
3	The share of fixed assets in the assets of the company, the share	0.72	0.77	0.78	0.83	0.773	0.826	0.716
4	The share of the active part of fixed assets, share	0.57	0.41	0.00	0.13	0.279	0.572	0,000

5	The depreciation ratio of fixed assets, share	0.06	0.06	0.05	0.05	0.05592852	0.062934357	0.048685203
6	The depreciation ratio of the active part of fixed assets, share	0.08	0.09	0.00	0.02	0.048214179	0.09345649	0
7	The coefficient of renewal, share	0.05	0.05	0.05	0.05	0.05	0.05	0.05

Conclusion

The calculations allow us to draw the following conclusion: for energy companies with a similar asset structure (in particular, OGK and TGK), the volatility of indicators is much lower, i.e. it is necessary to conduct a comparative rating analysis of these enterprises within separate sets of indicators and ranges of optimal values opinions.

Interfirm Relationship Development: In Search of Relationship Life-Cycle Model for Project-Based Organizations

Janusz Marek LICHTARSKI

Wroclaw University of Economics & Business, Wroclaw, Poland
janusz.lichtarski@ue.wroc.pl

Abstract

Purpose. The goal of this paper is to present the results of literature study on interfirm relationship development and to propose the revised model of relationship life-cycle for project-based organizations. The framework helps to understand the relationship dynamics in organizations based on temporary and discontinuous cooperation. **Design/Methodology/Approach**. The method that have been used in the study is the systematic literature review. **Findings**. The review of the literature shows a variety of relationship life-cycle models with many similarities and differences among them. Studied models seems to be insufficient to examine relationship development in project-based organizations, and the revised model with two loops and six phases was developed and presented.
Research implications and directions. The paper develops a framework for examining relationship development in project-oriented organizations. The future research concern testing the model, identifying changes in the intensity of relationship features in particular phases, and searching for the ways how to increase the effectiveness of cooperation in the short-term perspective. **Originality/Value/Contribution**. The findings contribute to relationship development literature exposing the new research perspective. The study focuses on project-based organizations and short-term project partnering in contrary to previous studies which focused only on long-term perspective and strategic cooperation.

Keywords: Relationship Development, Relationship Life-Cycle, RLC Model, Project-Based Organizations, Systematic Literature Review.

Introduction

The research on interfirm relationship development (RD) resulted in the development of many interesting frameworks and models of relationship life-cycle (RLC) (e.g.: Dwyer *et al*., 1987; Ferreira *et al*., 2017; Ford, 1980; Ring & Van de Ven, 1994). The interest of relationship development results from the fact that the stable long-term interfirm relationships are seen as a source of competitive advantage for years (Dyer & Singh, 1998; Morgan & Hunt, 1999; Woodruff, 1997).

The studies on interfirm relationships development help to understand their complexity and dynamics (Dwyer *et al*., 1987; Ford, 1980; Hansen *et al*., 2013; Jap & Anderson, 2007; Palmatier *et al*., 2013), but our knowledge in this area is still limited (Biggemann, 2012). Moreover, most scholars focus attention on relationships in a long-term perspective, assuming continuous cooperation between partners (Dwyer *et al*., 1987; Sharma *et al.*, 2015), while much little attention has been paid to short-term relationships in organizations where the cooperation is temporary and discontinuous from the definition. Taking into account the specificity and temporary nature of project-oriented organizations, an interesting research gap can be observed in the field.

Consequently, the goal of this paper is to search for relationship life-cycle model for project-based organizations (PBOs). The study is based on the systematic literature review on RD and RLC. Using search criteria in three leading databases 547 papers were selected to abstract reading, of which 61 papers were selected to full reading and classified as strictly topic related. The study contributes to the inter-organizational relationship literature by comparing existing RLC models, and proposing the revised model, which combines short-term project partnering with long-term strategic cooperation.
The paper is organized as follows. In the first section the literature on relationship development and relationship life-cycles is reviewed, and the specificity of project-based organizations is presented.

The second section presents the research method. In the next sections the revised RLC model for project-based organization is presented and discussed. Finally, research limitations and directions of further research are highlighted.

Theoretical background

Relationship development – state of art

Interfirm relationships development and RLC models have been the interest of researchers for decades and many studies were conducted, examining the development of various types of interfirm relationships e.g. buyer-seller relationships (Ferreira *et al*. 2017; Restuccia & Legoux, 2019; Sharma *et al*., 2015), strategic alliances (Davis & Love, 2011; Wong *et al*., 2005), and franchising relationships (Blut *et al*. 2011; Varotto & Parente, 2016), in various sectors, e.g.: the mining industry (Baptista, 2013), construction (Davis & Love, 2011; Meng, 2010), electronic (Eng, 2009; Fynes *et al*., 2005; Lee & Johnsen, 2012; Mandják *et al*., 2015), aerospace (Ferreira *et al*., 2017), IT software (de Almeida Moraes *et al*., 2017) higher education (Heffernan & Poole 2004; Plewa *et al*. 2013; Slavtchev, 2013) or agriculture (Kam & Lai 2018). The body of research on RLC developed in marketing and strategic management provide the strong basis for theory building, however our knowledge in this area is limited in terms of the reality of project-based organizations.

2.2. A review of relationship life-cycle models

The three leading theories are the basis of existing RLC models, i.e.: the "stages" theory, the "states" theory, and the joinings approach (Batonda & Perry, 2003). The "stages" theory describes the relationship development as an orderly progression of phases over time, with predictable and sequential stages, characterized by the increase of commitment, trust and interdependence (Dwyer *et al*., 1987; Ford, 1980; Wilson, 1995). The "states" theory shows the RD as unpredictable process with the non-linear nature of relationship evolution (Abosag & Lee, 2013; Batonda & Perry, 2003; Davis & Love, 2011; Meng, 2010). The positioning theory refers to processes of entering, positioning, and repositioning within inter-organizational networks (Thorelli, 1986). As a result of taking the three mentioned perspectives, different relationship life-cycle models were developed in the literature. The most important and interesting models have been analyzed and are described in the Table 1.

Table 1: A comparison of the analyzed relationship life-cycle models

Ford (1980)	Dwyer et al. (1987)	Wilson (1995)	Ring & Van de Ven (1994)	Batonda & Perry (2003)
Linear, time-dependent, based on conceptual basics	Linear, built on conceptual foundations and corresponding theories of martial, bargaining, power	Linear, time-dependent, focused on the buyer-seller relationship	Cyclical (iterative), 3 phases, focused on the role of individuals.	Non-linear, 7 phases/states, based on literature and qualitative studies
Pre-relationship Stage -evaluation of a potential suppliers conditioned by experience, uncertainty and distance -there is no contact, exchange and commitment yet at this stage	**Awareness** -recognition of potential partners -interaction between parties has not transpired in this phase -positioning and posturing to enhance attractiveness may take place	**Search and Selection** -finding and assessing potential partners -initial contact and interactions are made	**Emergence of IOR** -congruent purposes, values, and expectations are achieved -small, informal deals are made at the beginning -transactions are repeated through time, and if they meet efficiency and equity norms, parties feel more secure in committing more of their available resources and	**Searching processes** -recognition of purpose and need -searching potential partners and finding more information about partners' competence -evaluation and selection of potential partners
Early Stage -initiation of contact between parties -negotiations of future conditions -sample delivery	**Exploration** -partners consider obligations, benefits and the possibility of exchange -dyadic interaction	**Defining Purpose** -defining mutual goals -basis for common		**Starting processes** -initial contact is made -resenting the purpose/opportunity -testing of personalities and compatibility of

- high uncertainty and distance between partners -low level of commitment	occurs, and trail purchases and tests are done -investments and commitment are low	understanding and sanctioning of the relationship are developed -limited commitment between parties yet	expectations in subsequent cycles	partners -testing of goals and compatibility
Development Stage -increasing experience due to thetincrease of deliveries - decreasing uncertainty as the partners know each other -social, cultural, and technological distance is reduced by experience -commitment is high	**Expansion** -continual increase of benefits and interdependence -commitment is high, and the motivation to maintain the relationship increases -trust and joint satisfaction lead to increased risk taking -perception of goal congruence and cooperativeness lead to increase in the scope of interaction	**Setting Boundaries** -defining informal rules concerning use of resources -commitment of resources and people to complete tasks -adaptation of process and product or services to accommodate partners	**Evolution of IOR** -institutionalization of relationships is observable in terms of personal relationships, psychological contract, and informal understandings -trust and commitment increase due to repetitive social interactions -partners' behaviours are repetitive and more and more predictable	**Development processes** -developing personal relationship and mutual trust between partners -common planning of activities, responsibilities and relationships -direct involvement, regular contacts and socialisation -little commitment to each other and business ideas, trial trading activities
Long-term Stage -mutual importance to each other due to large-scale deliveries of continuously purchased products -institutionalised cooperation occurs in terms of standards and procedures -low level of uncertainty, and increase of trust	**Commitment** -implicit or explicit pledge of relational continuity between exchange partners -most advanced phase of relationship with the high level of commitment (input, durability, and consistency), mutual trust and satisfaction	**Value Creation** -creation of value through synergistic combination of partners' resources and strengths -sharing of created value -power and influence acquire greater importance		**Maintenance processes** -increased commitment of resources to network -development of inter-organisational and member adaptations -ongoing trading activities -testing of personalities and trial small projects
The Final Stage -the stage is reached in stable markets over a long period of time -extension of the institutionalisation process to a point where the conduct of business is based on industry codes of practice	**Dissolution** -the factors affecting withdrawal or disengagement become stronger -the costs of continuation or modification outweigh the benefits -termination of relationship causes stress and problems, and strategies of leaving relationship are prepared	**Maintenance / Hybrid Stability** -increase of trust, performance, satisfaction, and commitment -stable relationships result from partners' active involvement	**Dissolution of IOR** -various exogenous and endogenous factors influence on IOR and the balance between formal and informal processes testing the strength of relationships -interpersonal sentiments, norms, and commitments among parties may lead to group thinking and inefficiency -unfulfilled needs lead to relationship termination	**Termination processes** -weighing cost and benefits of staying in or exiting -dissolution of trading relationship due to outside and inside forces -exiting through various strategies
				Dormant (and re-activation) Processes -relationship goes into inactive state due to change in business -re-activation of relationship due to the resumption of business activity

Source: based on (Ford, 1980; Dwyer et al., 1987; Wilson, 1995; Ring & Van de Ven, 1994; Batonda & Perry, 2003)

The models represent different approaches and theories, differ in terms of number of phases and terminology used, and all contribute to RD literature in a different way. However, many similarities can be observed and all the presented models treated as complementary ones, constitute the theoretical background for the development of the relationship life-cycle model for project-based organizations. Simultaneously, it is worth noting that many other interesting life-cycle models were inspiring for author's considerations and modelling processes, e.g.: Blut *et al.* (2011), Jap and

Ganesan (2000), Lee and Johnsen (2012); Plewa (2013) or Zineldin (2002). However, due to the limited volume of the paper, there is no possibility to present and discuss them all.

Project-based organizations and their specificity

It has been observed the continuous development of projects in business activities (Lundin *et al*., 2015; Maylor & Turkulainen, 2019; Sydow *et al*., 2004). When business activities are implemented and managed around temporary projects, it results in the transformation of organizations from traditional into project-based or project-oriented ones (Miterev *et al*., 2017; Stephenson, 2009). Thanks to many advantages, PBOs are widespread in different industries e.g.: aerospace, telecommunication, IT software, professional services, consulting, construction, shipbuilding, automotive or engineering, and are seen as highly effective in high velocity sectors and high value products and systems (Hobday, 2000; Sydow *et al*., 2004). The main feature distinguishing project-based organizations from the traditional ones is their temporary nature and instability (see: Stephenson, 2009; Turner & Miterev, 2019). Consequently, interfirm cooperation in project-based organizations is also temporary and discontinuous, what is challenging in terms of developing and maintaining relationships with business partners (Bygballe *et al*., 2010; Polonsky *et al*., 2010). As the time frames of projects are strictly defined, there is limited time for building cooperative relationships, gaining trust, commitment, expected outcomes, etc. Concluding, existing relationship life-cycle models are insufficient to explain relationship development in project based-organizations and the new perspective is needed.

Research Method

The research method used in the study is the systematic literature review. Using the source databases: Ebsco, JSTOR and Scopus, and search criteria: “relationship life”, “relationship development”, “relationship cycle”, “relationship dynamics”, “relationship evolution”, “relationship stages” and “relationship life-cycle” (title, abstract, key words) over ten thousand articles were identified. Taking into account the additional inclusion criteria (English language, articles and proceedings, areas: business, management, organization studies, and marketing), 547 papers were found to abstract reading, and then 108 papers were selected to the full reading process. Finally, 61 papers were classified as concerning strictly the RLC topic. The literature review was conducted by the team of four researchers using the same procedures and tools.

Results: Preposition of The Revised Model

As some researchers argue a project partnering can be the first step towards a more mature and stable strategic partnering (Ellison & Miller, 1995; Thompson & Sanders, 1998; Cheng *et al*., 2000). The revised model combines the short-term project cooperation (the small loop), and long-term strategic cooperation (the big loop) – see Figure 1.

Fig. 1: The revised model of inter-firm cooperation for project-based organizations
Source: author's own

The small loop includes two main phases: the pre-relationship phase and the exploration phase (project partnering). The first phase includes processes preceding the formal constitution of a relationship, i.e. defining needs, and searching and evaluating potential partners. Then, in the exploration phase the initial contact is made and the relationship is established in terms of formal issues (contract), and the stages of project initiation and planning take place. As the project goes through the project execution phase, the relationship between partners emerge and grow. Communication and the exchange of resources lead to the increase of interdependence, commitment, trust and satisfaction (or not if expectations are not met). Thus, the cooperation goes to the project closing stage and has been dissolved after completing a project. The small loop is closed then.

The big loop concerns strategic cooperation, including the later phases of cooperative relationship development, similar to the stages identified by Ford (1980) and Dwyer *et al*. (1998). However, the cooperation between partners conducting projects is discontinuous and iterative, and determined by a cyclical course of subsequent projects' life-cycle what is close to the approach taken by Ring and Van de Ven (1994), Polonsky *et al*. (2010), and Batonda and Perry (2003). In the models based on the "stage" theory the expansion phase is seen as a mild and smooth process of increasing the cooperation, interdependence, commitment, trust and satisfaction. However, some authors noticed tensions and conflicts at this stage (Andersen & Kumar, 2006; Lee & Johnsen, 2012), or underline the role of conflict resolution mechanisms (Claycomb & Frankwick, 2004). In the project-oriented companies tensions and conflicts are the immanent part of their functioning, and due to the vital role of social aspects also dynamic group processes described by Tuckman and Jensen (1977) come into play. Taking it into consideration the phase has been named as the "development and storming phase" in the revised model.

If the conflicts and problems are solved the relationship moves towards the maintenance phase, described by standardization of communication and exchange processes. Regardless of the distance and differences between cooperating companies, they try to develop and use common standards, procedures and routines to execute new projects, exchange knowledge, resolve problems and conflicts, etc. Then, in the line with Batonda and Perry (2003) and Polonsky *et al*. (2010) the "dormant (and re-activation)" phase was distinguished. In this phase the relationship goes into an inactive state due to project completion, and can re-activated when new projects are initiated. The last two phases are optional in the model. The processes and relationship features in particular phases are described in the Table 2.

Tab. 2: The description of phases in the revised model

Phase (processes)	Main activities and sub-stages		
1. Pre-relationship Phase (Searching processes)	-searching for potential partners to project cooperation (for single or multiple projects) -evaluation of potential project partners based on economic aspects (prices, conditions of delivery, etc.) and quality (experience, reputation) -no commitment, trust or satisfaction at this stage, as the dyad do not exist yet	The small loop of project partnering	The big loop of strategic cooperation
2. Exploration Phase / Project partnering (Starting processes / single project execution)	Sub-stage: Project Initiation/Definition -defining the project purpose, analysing conditions, identifying project stakeholders and risks -establishing rules and conditions of future cooperation among project partners, taking into account their potential, resources, project portfolio, etc.		
	Sub-stage: Project Planning -preparing feasibility study, project timeline and budget, including the tasks and constraints -synchronizing project activities taking into account partners' resources availability and conditions of exchange		
	Sub-stage: Project Execution -monitoring tasks progress and groups performance, managing project budget -communicating, exchanging knowledge, and cooperating on the implementation of the project tasks -increase of interdependence and commitment		
	Sub-stage: Project closing -conducting a final analysis, interfirm settlements and conclusion of the project -allocating remaining resources for next projects -deciding about relationship development taking into account future needs, project outcomes, lessons learned, and satisfaction		
3. Development and Storming Phase (Expanding and adjusting processes)	-increase of volume and scope of cooperation, new projects initiation and development -increase of interdependence, trust, benefits, and satisfaction through new projects -value creation due to the combination of partners' resources and unified commitment -tensions and conflicts may appear due to mixing of resources or group dynamics -cooperating organizations and individuals may fight for position and power		
4. Maintenance Phase (Stabilizing processes)	-development of inter-organisational and member adaptations through standardization -integration of operations and strategies -increase of commitment, trust, satisfaction, and conflict resolution strategies (if needed) -conceptualizing new projects, co-development of tools and techniques		
5. Dormant Phase (Inactive maintenance)	-relationship goes into inactive state due to projects completion -no commitment in terms of resources, communication is occasional to maintain the relationship -re-activation of network relationship due to the emergence of new projects		
6. Relationship Closing Phase (Termination processes)	-termination based on analysis of continuing or leaving the relationship -developing strategies to dissolve the relationship -conducting the final interfirm settlements		

Source: author's own

The revised model shows the interfirm relationship development in project-based organizations as an evolution of hardly predictable phases, and cyclical sub-stages adjusted to projects life-cycle, not an

ordered progression of stages over time. In the PBOs the process is complex, iterative and non-linear due to the temporary nature of projects and the dynamic nature of interpersonal relationships.

Discussion and conclusions

Basing on the presented study it can be stated that all the previous concepts in their "pure" form are insufficient to examine and describe interfirm relationship development in project-based organizations. The models based on the "stages" theory, e.g. Dwyer *et al*. (1987) or Ford (1980), describe the development of interfirm relationship development in relatively stable conditions, i.e. long-term goals, continuous cooperation, etc. Later concepts, e.g. Batonda and Perry (2003), Ferreira *et al*. (2017), Jap and Ganesan (2000) or Plewa *et al*. (2013), contribute to relationship literature by underlining the role of unpredictable changes and breaking events in relationship evolution. They show discontinuity of cooperation, and iterative nature of the relationship development process. The revised model adopts both mentioned perspectives, and additionally combines the small loop of project partnering with the big loop of strategic cooperation. This combination helps to understand the cyclical path, and unpredictability of relationship development in project-based organizations.

Comparing the revised model with the previous frameworks it is worth to underline its specificity. First, the model joins the short-term project partnering with the long-term strategic cooperation, as the interfirm cooperation in project-based organizations can be intentionally both temporary and long-term. Second, the model includes the dormant phase in which the relationship is inactive but still exist. The research contributes to the relationship development literature by showing a new perspective which includes intentional temporality and disruptiveness of interfirm cooperation. Presented model can be useful especially in organizations operating in high-velocity and high-technology sectors, clusters and networks, etc. The study has limitations as well, as it is based on extensive literature studies only, and there is a lack of empirical evidence concerning the model yet[1]. The model needs to be verified in the practice of project-based organizations, and exemplified by evolution of different types of cooperative (or coopetitive) dyads in PBOs. The multiple case study research design is planned as the next step in the research project conducted.

The study reveals also some new fields of exploration and shows further research directions. First, the most interesting research questions that arise are as follows: How to replace the high level of trust and commitment characteristic for the later stages in the traditional long-term approach to achieve expected quality of relationship and its outcomes? And how to increase the effectiveness of interfirm cooperation in the short-term perspective? These questions show the call for the further studies of the topic, both qualitative, and quantitative ones.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

The systematic literature review presented in the paper was conducted by a team consisting of four members: Klimas P., Lichtarski J.M., Sachpazidu-Wójcicka K., and Stańczyk S.

Strategic and Operational Marketing Mix

Roman E. NIESTROJ

WSB University, Department of Management, Dąbrowa Górnicza, Poland,
e-mail: RNiestroj@wsb.edu.pl

Abstract

The subject matter of this article is the presentation of the framework structure of a marketing mix, taking into account the strategic and operational dimension of market impact instruments. The aforementioned marketing instrument composition exhibits the complexity surrounding the issues of implementing the principle of integrated impact on the market. The basic premise behind an attempt at building such a framework structure is the often-superficial approach to the interpretation of the "marketing – mix" concept as a benchmark structural model of a set of instruments for influencing the market that is visible, in particular, in marketing literature. This is evidenced by several factors, including abstraction from the diversity of the nature of individual groups of marketing instruments from the standpoint of strategic and operational management requirements, which is particularly difficult to accept.

Keywords: Marketing – Mix, Strategic Marketing, Operational Marketing.

Introduction

Subject matter literature on marketing offers its readers a multitude of guidelines, principles and rules concerning marketing conduct, including two, which are of key importance for the identification of marketing activities. These include the principle of deliberate selection and shaping of the company's market, and the integrated market impact principle. Their essence is expressed in key marketing categories: "target market" and "marketing – mix". Their importance stems from the apparent relationships between variables determining marketing effectiveness and efficiency, where the former depends on the accuracy of identifying and defining the target market as a potential source of future revenue, while the actual efficiency of this source depends primarily on the proper use of available instruments to influence the market, as well as their proper structural composition.

Market Impact Instruments

The principle of integrated market impact dictates that a specific, tailored mix of all available tools, adapted to the situation at hand should be used, instead of using all tools separately. The idea behind this principle is to create a synergy effect thanks to the coordination of the various tools, resulting in the final effect of the total impact of the marketing composition being much greater than the sum of the effects that could be achieved through the independent use of individual instruments. The diversity and variety of marketing tools and instruments serve as natural grounds for their classification, as well as attempts at building normative models of their configurations, which may prove useful in marketing planning. Before we move on to their critical review, let us pay some attention to the marketing instruments.

In the broadest sense of the term, marketing instruments encompass all the means by which tasks and activities are performed in the subsequent stages of marketing activity – not only in the direct market impact phase, but also in the preceding preparatory activities concerning market research, analyses and marketing planning. On the other hand, in the narrower sense of the concept, it covers only means of influence used by the entrepreneur deliberately to influence the attitudes and behaviours of persons and organisations as consumers and buyers. In this narrow sense, the diverse marketing instruments constitute a set of elements, which enable building integrated compositions of tools, with the aim of exerting influence on a given target market.

To understand the essence of instruments used to influence the market, it is important to point out their deliberate use. Factors such as quality and assortment of the product, its price, place and form of sale all tend to influence the decisions made by buyers; however, we may refer to them as instruments only if they were given a deliberate shape, taking into consideration the expected reactions of buyers and users (Lehman, 2004). The aim of marketing is to ensure that this response is as controlled as possible, in line with the company's objectives – it should not be random, allowing only for recording the obtained results, without offering any opportunities for actively shaping them in any way. This can be illustrated by typical situational examples. A new product, which was developed as a result of its designer's technical innovation may only be a passive object of sale. A technical concept of a product or service becomes a product and a marketing instrument only when it undergoes a commercialisation phase, which entails shaping the characteristics of the product to increase its value for potential buyers. Likewise, when it comes to the price, it may only be considered a tool for settlement between the seller and the buyer if it is based solely on cost calculations and expected profits. It only becomes a marketing tool when it is set on the basis on the assessment of the expected market reaction when confronted with the perceived value of the product and the prices of substitute (competing) products.

Here, it is also important to point out the difference between the names of the different kinds of instruments and the specific instruments, which constitute the substance of all marketing plans and the subject of actual marketing operations. Usually, in theoretical considerations, authors tend to use generic names (such as product, price, brand), whereas marketing plans tend to include trademarks of specific product models, their proper prices, specific trademarks, logos and so on, which are used as marketing instruments.

Referring to what has been stated previously, the multitude and diversity of marketing instruments at the disposal of a marketing manager responsible for building a marketing plan suggests making their task easier by building a kind of an organiser with a certain number of compartments, in order to make it easier for them to find their way around this extensive toolbox. This, of course, requires a specific classification of the lot. The basic scheme used for classifying marketing instruments is based on the marketing-mix model suggested by E.J. McCarthy in the form of the so-called Four Ps (Product, Price, Place, Promotion) (McCarthy, 1960), also referred to as 4P. Accordingly, the classification of marketing instruments includes a number of subsets, namely:

- Product – which contains all the tools, which can be directly linked to shaping the company's offer in terms of the value offered to buyers;
- Price – which contains all the elements of the offer that the buyer takes into account as determinants of the total cost of the product;
- Place – encompasses all the tools, which enable shaping the course of transactions and logistic processes, leading up to the transfer of product and ownership from the place of manufacture to the final recipient;
- Promotion – contains various instruments, which enable the seller to get in touch with prospective buyers, communicate and try to highlight their own offer among the competition.

Marketing – Mix

This classification of marketing instruments – or the 4P model – should not be conflated with marketing-mix from the operational standpoint. As an element of a given marketing plan, the marketing-mix is a creative composition of tools, chosen deliberately from a known and available set of instruments in such a way as to obtain a synergy effect in the process of influencing the market (Gujral et al., 2016). This leads us to the need to find answers to the following key questions (Niestrój, 1998):

- What does the company intend to offer the buyer and how is it going to distinguish its product among competing offers?
- On what financial terms can the product be purchased by the buyer?

- Where and when will the product be offered to the final customer and how will it be delivered there?
- How does the company intend to inform the buyer about its offer and convince them to accept it?

Taking into account the variety of instruments classified in particular subsets, it quickly becomes necessary to shape a marketing composition characterised by a hierarchical structure, made up of four sub-compositions, in line with the presented model. These are:

- product sub-composition (basic characteristics of products and their assortment varieties, which make up a given composition, along with branding, packaging, product-related services, etc.),
- price sub-composition (basic price, discounts, rebates, payment terms, credit, etc.),
- distribution sub-composition (distribution channels, logistic solutions),
- promotion sub-composition (direct sales, advertising, sales activation measures, public relations instruments).

Depending on the scope and the diversity of specific instruments, in specific situations, the various elements of sub-compositions listed above may be developed and further expanded into lower-level sub-compositions (such as advertising media sub-composition, as well as alternative distribution channels sub-composition).

A set of marketing instruments is not closed by any means. The development of technologies and growing creativity of marketers, the marketing toolbox keeps expanding, revealing the shortcomings of the simple 4P model (Shaw, 2012), which owes its popularity mostly to its educational qualities, namely due to its effective acronym, which is easy to remember. Interestingly, the popularity of the one-letter 4P acronym gave rise to further concepts created in the same vein, including 7P, 4C and many others; However, like in the case of the original 4P, these acronyms rarely reflect the substantive nature of the presented categories. In the case of the 4P acronym, the use of the third and fourth Ps – "place" and "promotion" – leads to significant narrowing down of the meaning of these groups of instruments, compared to the actual meaning of these words, namely "distribution" and "communication." In order for the acronym to conform with the meaning, it should be "PPDC," however, 4P was deemed more effective. At the same time, one would be hard-pressed to find actual and unambiguous classification criteria in the case of the 4P model. Approaching this model from a practical point of view reveals a number of significant drawbacks and issues; chief of which are:

- artificial separation of the price and the offered product, which in reality constitutes its integral part and cannot be considered separately from product quality;
- too narrow a definition of the fourth element ("promotion"), which disregards the significance of communicating with the market in its broadest sense, thus making it difficult to distinguish the terms "promotion" (in the broad sense) and "sales promotion";
- too narrow an approach to the sales promotion instruments, which makes it difficult to explore and understand their relationships with the remaining elements of marketing-mix (such as promotional prices, promotional packaging, etc.);
- unclear stance on direct sales, which is more closely related to distribution, rather than promotion (especially in the case of door to door sales and the so-called direct marketing techniques).

Some of the various drawbacks of the 4P model were eliminated by three-part models, which gained significant popularity in German literature. Such models present the marketing-mix as a coordinated set of instruments, generated in three instrumental marketing areas (Becker, 2006):

- supply policy (product, product range, price);
- distribution policy (distribution channels, direct sales, physical distribution);
- market communication policy (advertising, sales promotion, public relations).

Thanks to this division, the offer sub-composition makes up a concise list of products offered to buyers, with full information about their performance, prices and financial terms of the transaction. The distribution sub-composition includes a complete design of distribution channels and logistics solutions, including direct sales. In turn, the communication instruments sub-composition focuses on instruments of communication and information exchange, encompassing the use of appropriately selected media.

Despite its apparent advantages, the approach presented above does not eliminate all the doubts concerning categorisation of individual sales promotion instruments – it does not provide answers to the problems of promotional packaging and price promotions, and where they should be included in that hierarchy – in the communications design or as part of the offer? In other words, a question arises whether the priority should be given to the generic or functional criteria from the point of view of marketing management. This has been a long-standing issue in the history of marketing, yet the concept for its resolution has not gained significant popularity in marketing textbooks. In 1992, W. Waterschoot and C. Van der Bulte presented a practical way of solving this issue. Starting with the classification of marketing functions, they divided all instruments as follows (Waterschoot and Van den Bulte, 1992):

- Basic mix, which encompasses:
    - basic product mix,
    - basic price mix,
    - basic distribution mix, and
    - basic communications mix, in which they distinguish: mass communications mix, personal communications mix , as well as publicity mix.
- Promotion mix, which consists of:
    - product promotion mix (e.g. economic product packaging),
    - price promotion mix (e.g. discounted goods, extended payment deadlines),
    - distribution promotion mix (e.g. occasional points of sales – fairs),
    - mass communication promotion mix (e.g. shows, presentations),
    - personal communication promotion mix (e.g. contests for sales staff),
    - publicity promotion mix (e.g. any and all sales promotion activities that create a positive company or product image).

Thus, the model outlined above eliminates all kinds of dilemmas concerning the categorisation of marketing sales promotion instruments, which make up a separate group, forming a sort of second (lower) tier of the marketing mix. This modified concept of the marketing-mix structure provokes us to ask another question – is the promotional function the best – or sufficient – criterion for distinguishing the second level of the mix?

Flexible Instruments and Inflexible Marketing Instruments

Promotional instruments serve as a typical example of operational marketing tools – they are launched as needed, depending on the current marketing policy. The basic mix, on the other hand, encompasses tools that mainly make up the important factors that determine a marketing strategy. This duality was originally pointed out by H. Meffert (1986), who distinguished diversified ranges of strategic and operational impact of specific instrument groups within the classic 4P model. Decisions concerning specific instrument groups vary in terms of significance. For example, the author indicates that the product sub-composition (with the exception of services) is subject to decisions, which are mainly strategic in nature, while sales promotion and marketing logistics are considered amongst operational decisions. However, the chart makes it difficult to establish what constitutes the criterion for distinguishing the strategic and operational scope of marketing instruments – the division, whose importance is paramount from the standpoint of marketing management organisation, in particular for the location of competences and decision-making powers at individual management levels. In this case, in addition to the scale of the resources involved, the magnitude and sustainability of the impact of the decisions taken is crucial. Decisions concerning the use of instruments involving even relatively small resources, which result in long-term impact, should be considered strategic

decisions (Drummond, 2007, Hunt, 2015). Others, regardless of cost – as long as they remain within the established marketing budget – may be considered operational decisions (Notta and Vlachvei, 2015, Kanagal, 2017).

The presented examples show that apart from a functional differentiation, another important rationale for classifying marketing instruments in a given category is their differentiation from the point of view of their susceptibility to ad-hoc modifications and the sustainability of their impact. On this basis, two types of instruments can be distinguished (Meffert, 1986). These are:

- flexible instruments, which can be modified and changed within relatively short timespans (such as sales promotion instruments, discounts, complementary services, transport routes, etc.), as well as
- inflexible instruments, whose changes require long-term planning and considerable workload (e.g. distribution channels, products).

Some instruments may seem flexible due to the fact that they might be technically easy to modify; yet in reality they might not be such, due to the slow reaction of the buyers (Kerin and Peterson, 2004, Dadzie et al., 2017, Wróblewski, 2017). The brand (company) is often cited as a typical example of such a case, as it is relatively easy to come up with a new name and logo, yet such changes are carefully considered and relatively rare. This results from the long and gruelling process of brand positioning among prospective customers. Another key element of the marketing-mix – the product (design, model) – can also be the subject of a strategic decision, in particular if it is an important source of income and has a relatively long-life cycle. Changes in the layout of distribution and supply channels are another example of such decisions. Long-term relationships and partnerships based on mutual trust make up an important component of marketing assets, a strategic asset of sorts, which significantly affects its performance and market value. In other words, low flexibility and longevity of the impact of some instruments make the related decisions strategic in nature. On the other hand, decisions concerning flexible instruments with a short-term impact belong to the realm of operational marketing.

The above considerations show that the current application of marketing mix should combine these earlier solutions, as these eliminate the limitations and inconsistencies stemming from the generic nature of the 4P model. Such conditions are met by a model that is based on a three-part classification of the various elements of the mix (Table. 1.). This framework divides the marketing composition into three functional sub mixes that are constructed on two levels – strategic and operational. These are: offer mix, communication mix and distribution mix.

A correctly constructed offer constitutes the basic component of the mix of tools used to influence the market (Varadarajan, 2015). From the standpoint of marketing, the offer encompasses a list of products offered for sale (as well as rental, leasing, etc.), addressed to a target market or a specific potential buyer identified in the marketing strategy of a given company. With the exception of cases where a single piece or instance of a given product is offered for sale, this list usually includes products defined as specific designs (models) and includes their basic characteristics (names, trademarks, quantitative data, etc.), including the price and any other relevant terms of sale (or another process), as well as terms of payment.

The comprehensive commercial offer reflects the company's offer policy, which is made up of three decision-making areas – product development policy, product programme policy, and pricing policy. At the operational level, the offer is modified as needed using various sales promotion instruments, such as promotional product sets, discounts, rebates, payment terms, product samples, and many more. The assessment of the attractiveness of the offer from the buyer's point of view is an indicator of the company's competitive standing when confronted with the assessment of the attractiveness of offers extended by competitors.

Table 1: Framework of strategic and operational marketing mixes

Sub mix		**Strategic mix**	**Operational mix**
Offer mix	Product	Utility, Quality, Brand	Additional services
	Program	Width and depth of the assortment	Promotional packages
	Prices	Level and rules differentiated prices	Discounts, Bonuses
Communication mix	Mass communication	Corporate identify, Creative and media advertising strategy	Advertising campaigns
	Public relations	PR strategy	Events, Competitions, Briefings
	Personal communication	Strategic sponsorship, Sales representatives	Personal selling
Distribution mix	Distribution channels	Main channels, Network relations	
	Operating systems	Forms of sales	Merchandising
	Delivery logistics	Delivery organization	Delivery schedules

Source: own work.

Distribution policy encompasses key decisions concerning the shape of distribution channels, concerning both their vertical section (long – short), as well as the horizontal one (wide – narrow), the course of marketing streams, the degree of integration of distribution channels and logistics solutions. They form a relatively stable distribution system, which constitutes an important component of the company's marketing assets, which impacts the assessment of its competitive position on the market. At the operational level, the distribution system is complemented by various specific solutions, depending on the needs and tasks at hand, which are used to fine-tune the capacity and efficiency of the distribution system to changing market circumstances. These include emergency deliveries, seasonally launched distribution channels, organisation of events conducive to demand activation, etc.

Communication policy encompasses decisions concerning the shape of relatively constant and unchanging elements of the marketing communication system, such as trademarks and brands, as well as other elements of corporate identity, creative and media advertising strategies, main on-line communication channels and basic instruments used to implement public relations activities. At the operational level, these include various ad-hoc promotional activities aimed at garnering the interest of buyers – some of these include bonus sales, contests, shows, tastings, etc., as well as mobilising collaborators within distribution channels using bonuses, contests, training courses, conferences, etc. (Jenkins, 2006).

Conclusion

The framework marketing mix outlined in this paper serves as an attempt to take a structured approach to the decision-making process related to the practical implementation of the integrated market impact principle. Given the onslaught of the never-ending variety of new marketing concepts, it may seem that classical marketing principles are becoming a thing of the past; however, this is not the case. Regardless of the currently promoted marketing concepts, no reasonable marketer would disregard the analyses and decisions concerning the identification of the target market, nor will they refrain from agreeing on the applicable marketing instruments from the point of view of the

consistency of their impact on the market. It seems that the framework structure for the composition of marketing instruments proposed above may bring us closer to better understanding of the complexity of this issue and thus facilitate finding the best solution in a given situation.

Abstract

The main goal of this paper is to analyse how digitalization affects performance of 100 largest companies that operated during the 2014 – 2018 period in Croatia. For this purpose, a regression analysis is employed. Various firm-specific variables including digitalization, size of the firm, leverage, age and liquidity serve as independent variables whereas net profit margin (NPM) is employed as dependent variable. The results of the analysis revealed that performance of Croatian largest firms is influenced by digitalization, leverage and liquidity. Specifically, digitalization positively impacts performance as well as liquidity whereas leverage of the firm has negative impact on performance.

Keywords: Digitalization; Firm's Success; Croatian Largest Companies

Introduction

Despite the fact that there are numerous papers dealing with the issue of determining factors that influence firm's success, this field of research continues to occupy scientists with regard to the ever-changing environment in which businesses operate and the challenges they face. Digitalization, which is often described as the increasing use of ICT technologies in every area of life (Vuori, Helander, and Okkonen, 2019), has become an emerging trend. Therefore, we want to find out whether the use of digital technologies changes firms' businesses in a way of enhancing their performance. Since the existing literature that empirically investigates this topic is scarce or almost non-existent, the authors want to fill the gap by providing new evidence on effects of digitalization on firm's performance on the sample of largest Croatian non-financial cross-sector companies. In that sense, the primary aim of the authors is to analyse the influence of digitalization on performance of 100 largest Croatian companies that operated in 2014 – 2018 period. These are selected based on total assets, total sales and number of employees, criteria defined by Accounting Act (Official Gazette 78/15, 134/15, 120/16 and 116/18) using Infobiz database available through FINA (Croatian Financial Agency). However, after adjusting for companies with incomplete data the final sample consists of 70 companies that operated in at least two consecutive years making a total of 299 observations. For the purpose of this analysis performance is measured with accounting–based measure of performance, i.e. net profit margin. Besides digitalization that serves as independent variable, several control variables are introduced in the research in order to capture some other aspects of firm's performance. These are size of the company, leverage, age and liquidity.

The rest of the paper is structured as follows. After introductory part giving the background on the topic, investigated literature review follows. Description of variables is provided in the third part of the manuscript. In this part a rationale for potential influence of firm-specific variables on performance is given. The fourth section provides results of the empirical analysis while the fifth part concludes.

Literature Review

Although digitalization and its effects have been quite popular in research papers in recent years, most of them deal with this issue from the theoretical perspective whereas literature on quantitative research papers is relatively scarce.

Wroblewski (2018) analyses how digitalization affects firm performance. The author employs the portfolio analysis and risk factor models to find out the influence of digitalization on stock returns as well as the dynamic panel model in order to see how digital maturity affects operating performance. The proxy for digital maturity comprises digital marketing, product experience, e-commerce, e-customer relationship management and social media. The analysis is conducted on the sample of 24 Swedish companies belonging to different sectors that were listed in the period 2010 – 2016. The author does not find support for the hypothesis that digitally mature companies perform better.

On the other hand, Bughin, Catlin, Hall, and Zeebroeck (2017) use the sample of about 250 companies across the world and industries to see how digital intelligence influences financial performance. Their findings reveal that digital intelligence is positively correlated with revenues, earnings before interest and taxes as well as on company's growth.

Falentina, Resosudarmo, Darmawan, and Sulistyaningrum (2019) investigate how digitalization seen as internet utilization affects corporate performance on the sample of 576 micro and small firms in Indonesia in 2018. Results reveal that internet usage has enhanced labour productivity as well as exports.

It is also worth citing Abbasi and Weigand (2017) who present literature review on papers dealing with the influence of digital financial services on company's performance in the banking sector. This literature review covers 39 papers with majority of studies, specifically 82% of them, finding positive influence of digital financial services on bank's performance.

Tohanean, Sorin-George, and Dumitru (2018) support the view that digitalization enhances corporate performance on the case of German company. Furthermore, on the sample of 452 companies that operated in the period 1998 – 2003 Mithas, Tafti, Bardhan, and Goh (2012) find that IT investments positively affect revenues. Van Ark (2015) explores effects of digital economy on economic growth of European and US economy finding its positive effects on productivity. In paper by Eremina, Lace, and Bistrova (2019) the authors apply specially developed assessment methodology relating to a digital maturity. Using the sample of listed Baltic companies, the authors find positive relationship between digital maturity and financial performance measured with sales growth and ROE.

On the other hand, theoretical papers consistently emphasize the benefits of digitalization. For instance, Kotarba (2017) analyses metrics that are being used to quantify digitalization activities while Neumeier, Wolf, and Oesterle (2017) list digital benefits and emphasize its value drivers. Lenka, Parida, and Wincent (2017) describe how three subcomponents of digitalization capabilities facilitate value co-creation in a B2B setting with customers through perceptive and responsive mechanisms.

Description of Variables

In order of analysing how digitalization influences performance of Croatian largest firms, a number of company-specific variables are used in the research. As a dependent variable an accounting-based performance measure, calculated as net profit to total sales i.e. net profit margin (**NPM)** is used. A large number of studies dealing with determinants of firm's performance use NPM as a performance measure (e.g. Liargovas and Skandalis, 2010; Waelchli and Zeller, 2013).

Since the main goal of this research is to see how digitalization observed as investments in ICT technologies influences on firm's profitability, we employ digitalization as an independent variable (**DIG**). Unfortunately, companies' balance sheet lacks the precise data on ICT investments. Although

the notes to financial statements of the companies should indicate what items and amounts are involved, this is rarely done. Thus, we proxy it with logarithmic value of intangible assets item named "concessions, patents, licences, trademarks, software and other rights" which refers to a large extent to the software the companies use. Similar approach is employed by papers whose object of analysis are insurance companies. Specifically, Łyskawa, Kędra, Klapkiv, and Klapkiv (2019) obtain the data on ICT expenses from notes to financial statements whereas Pavic Kramaric (2020) proxies this variable by using "other intangible assets" or "software etc." while investigating its impact on performance of listed companies in Croatia. Positive impact of digitalization on corporate performance is expected based on the rationale that digitalization observed as investments in ITC technology enhances quality of products or services offered as well as firm's business operations, decision making processes, strategic positioning etc. leading to better performance.

Size variable is chosen based on the existing literature which regularly uses this variable as a potential determinant of firm's success. This variable is calculated as a logarithm value of firm's total assets (**SIZE**). The findings of numerous studies suggest that the impact of company size on performance could be positive or negative. The rationale for positive effect of firm size on performance can be found in Serrasqueiro and Nunes (2008) stating that larger companies may exploit scale economies, have greater strategic diversification as well as better position to negotiate with customers and suppliers. On the other hand, smaller companies may take advantage of easily modified organizational structures and greater possibility to detect profitable investments easily as compared to larger companies as stated in Pattitoni, Petracci, and Spisni (2014).

Leverage variable (**LEV**) is included in the analysis as a control variable and it is calculated as total liabilities to total assets ratio. Since higher indebtedness implies interest rate payments resulting in reduced levels of profits, a negative influence of this variable might be expected. However, as stated in Agiomirgianakis, Magoutas, and Sfakianakis (2013), sometimes companies need additional financial funds in order to finance new profitable investments. The same authors also cite the value-maximization theory according to which there is an optimal level of indebtedness defined by the trade-offs between the advantages of borrowing funds and the associated risks. Therefore, the influence of this variable is also unclear.

Another control variable is liquidity ratio (**LIQ**) which is calculated as current assets to short-term liabilities. It is often employed in empirical literature on determinants of company's profitability (e.g. Goddard, Tavakoli, and Wilson, 2005; Serrasqueiro and Nunes 2008; Škuflić, Mlinarić and Družić, 2016). It represents current ratio indicating the speed at which a company reacts to sudden changes in its business environment as stated in Goddard, Tavakoli, and Wilson (2005). Higher levels of liquidity reduce exposure to the risk of not being able to repay short-term liabilities. In this sense positive influence of liquidity on performance is expected as found by Goddard, Tavakoli, and Wilson (2005) who investigate factors determining performance on the sample of Belgian, French, Italian and UK manufacturers and service sector firms. However, some authors confirm negative impact of liquidity on firm's performance such as in Škuflić, Mlinarić, and Družić (2016) and Eljelly (2004), whereas some find no statistically significant influence of liquidity on performance (e.g. Pratheepan, 2014 and Pervan, Pervan, and Ćurak, 2019). Having in mind all stated above, the effect of liquidity on firm's performance is ambiguous.

We employ variable age of the firm (**AGE**) in order to see how it affects performance of the Croatian largest firms. This variable is calculated following Yasuda (2005) approach who investigates factors that determine firm growth on the sample of Japanese manufacturing firms. Specifically, we subtract the year when the company is established from the year of the analysis, and add 1. Regarding the influence of firm's age on its performance there are mixed results in the empirical literature. Durand and Coeurderoy (2001) use the sample of 582 French manufacturing firms in order to investigate how age, order of entry, strategic orientations and industry conditions affect firm's performance and find that younger firms perform better. They explain the negative influence of firm age on performance stating that "older firms suffer from ossification of their routines, non-learning processes, blindness, and conservatism, which cause poor performance and decline". Negative influence of this variable on performance is also found in Majumdar (1997) while investigating productivity and profitability of

1020 Indian firms, Pervan, Pervan, and Ćurak (2017) and in Akben-Selcuk (2016) to name a few. On the other hand, some research papers suggest that older firms exhibit superior performance (e.g. Ghafoorifard, Sheykh, Shakibaee, and Joshaghan, 2014; Osunsan, Nowak, Mabonga, Pule, Kibirige, and Baliruno, 2015). Positive influence of age on company's performance may be found in the fact that age enhances experience or, as stated in Das (1995), a firm's reputation increases with age. Moreover, Boeker (1997) finds no significant effect of firm age on performance. Therefore, the expected sign of this variable is unclear.

Results of the Regression Analysis

Descriptive statistics of variables that are used in the analysis is presented in Table 1 from which can be perceived quite variation in variables. The largest standard deviations are found in variables leverage and NPM, indicating quite dispersion of the data. According to the data, average value of NPM is 2.9%, while a mean value of variable age shows that, on average, firms operate 24 years in the market. Average size of the firm (measured in terms of total assets) amounts 2 billions of HRK (cca. 266 millions of euro), while the mean value of liquidity amounts 1.5%. The span of logarithm value for the variable digitalization lies between 9.1 and 22.1.

Table 1: Descriptive Statistics

	Minimum	***Maximum***	***Mean***	***Standard Deviation***
NPM	-63.544	42.253	2.850	11.667
DIG	9.067	22.112	15.859	2.352
SIZE	18.042	24.690	21.416	1.151
LEV	4.544	96.624	47.061	20.302
AGE	4	48	23.95	9.294
LIQ	0.0487	14.540	1.5263	1.430

Source: Author's calculations

In order to preliminary detect the relationship between analysed variables, a correlation analysis is performed. According to Table 2 the strongest relationship is identified between digitalization and firm's size. At the same time, firm's performance, presented with NPM, is most closely related to liquidity.

Table 2: Correlation Analysis

	NPM	***DIG***	***SIZE***	***LEV***	***AGE***	***LIQ***
NPM	1					
DIG	0.180**	1				
SIZE	0.174**	0.605**	1			
LEV	-0.287**	-0.174**	-0.273**	1		
AGE	0.004	0.034	-0.163**	0.066	1	
LIQ	0.370**	0.106	0.058	-0.373**	0.211**	1

*** Correlation is significant at the 0.01 level (2-tailed)*
Source: Author's calculations

However, since the influence of one variable (independent) on the other variable (dependent) can be enhanced when several independent variables are combined and observed together, we decide to examine the influence of digitalization on firm's profitability with the application of the regression analysis. As a dependent variable, a NPM is applied, while all other variables i.e. digitalization, size, leverage, age and liquidity are used as independent variables.

In order to be sure that multiple regression analysis provided valid results, we test for the presence of autocorrelation in the residuals with a Durbin–Watson (DW) test. The obtained value of DW test is around 2 (i.e. 1.96) indicating that residuals are free of autocorrelation. In addition, the test for

multicollinearity shows that VIF (variance inflation factor) factors are lower than 5, verifying no presence of multicollinearity.

Table 3 provides the R^2 and adjusted R^2 which show us how well a regression model fits the data. Value of 0.460 indicates satisfactory level of prediction. At the same time, from the value of 0.197 (coefficient of determination) we can conclude that independent variables (digitalization, size, leverage, age and liquidity) explain 19.7% of the variability of firm's profitability.

Table 3: Model Summary

R	*R Square*	*Adjusted R Square*	*Std. Error of the Estimate*	*Durbin-Watson*
0.460[a]	0.211	0.197	10.5926	1.963

[a]*Predictors: (Constant), Liquidity, Digitalization, Leverage, Age, Size*
Dependent Variable: NPM
Source: Author's calculations

In Table 4, the F-ratio is presented and according to its value and significance ($p<0.001$) it is possible to conclude that overall regression model is a good fit for the data.

Table 4: ANOVA[a]

Model		*Sum of Squares*	*df*	*Mean Square*	*F*	Sig.
1	Regression	8080.881	5	1616.176	14.404	0.000[b]

Conducted analysis reveals that digitalization, leverage and liquidity play significant role in determining corporate performance of Croatian largest companies. Specifically, positive influence of digitalization suggests that Croatian largest companies take advantage of benefits offered by digitalization. Our study confirms the assumption that digitalization enhances quality of products or services offered as well as firm's business operations, decision making processes, strategic positioning etc. leading to improved performance.

The obtained results are similar to those of Chen and Srinivasan (2019) who find positive impact of digital activity (identified as digital term in the companies' disclosures) on the firm's performance measured with assets turnover. Likewise, Łyskawa, Kędra, Klapkiv, and Klapkiv (2019) show strong and positive correlation between software and gross written premiums in the case of two European insurance groups. Moreover, on the sample consisting of non-publicly traded hospitals Kohli, Devaraj and Ow (2012) find that IT investments positively influence performance when it is measured with market values. Chen, Lin, and Liu (2018) report that software and database expenses positively influence performance when it is measured with profit and revenue to cost ratio while Scott, Van Reenen, and Zachariadis (2017) find positive relationship of digital innovation observed as adoption of swift on bank's performance.

According to the obtained results, leverage has statistically significant and negative influence on firm's profitability measured with NPM implying that the costs of borrowing are higher than the potential advantages of debt. Negative influence of this variable can be explained by the fact that higher levels of profitability increase the possibility of accumulating adequate levels of earnings reducing in that way the need for debt (González, 2013). Statistically significant and negative influence of leverage on performance is also found by Asimakopoulos, Samitas, and Papadogonas (2009); Agiomirgianakis, Magoutas, and Sfakianakis (2013) and Al-Jafari, and Samman (2015).

Firm's liquidity significantly influences on firm's success. Positive influence of current ratio on performance is also found in Goddard, Tavakoli, and Wilson (2005). This positive influence can be explained through the fact that higher levels of liquidity allow firms to take greater advantage of good investment opportunities as stated in Goddard, Tavakoli, and Wilson (2005).

Variables age and firm's size have no statistical influence on firm's performance.

Conclusion

With this research the authors want to shed a light on the role that digitalization plays in determining corporate performance. For this purpose, a sample of 70 largest non-financial cross-sector Croatian companies that operated in 2014 - 2018 is chosen for the analysis. After conducting regression analysis, the results suggest significant influence of digitalization, liquidity and leverage on performance whereas age as well as the size of the company show no statistically significant influence on performance.

The fact that this research confirms the significant role of digitalization in corporate performance reinforces its importance and it is definitely becoming an integral part of business activities in many corporations. However, in the future research it might be useful to encompass other performance measures as well as introduce new control variables in order to see in which direction they influence firm's performance.

The Phenomenon of Digital Influencers in Light of Empirical Research on Heavy Internet Users Belonging to Generation Z

Janusz Wielki

Opole University of Technology, Opole, Poland
Janusz@Wielki.pl

Abstract

The aim of this paper is to determine the function, position and significance of digital influencers in the entire online advertising and promotion system, and to state how the concept of influencer marketing fosters its further development. For the purpose of this paper, the literature was reviewed regarding the following: the origin, scale and causes of the phenomenon of digital influencers and its influence on the digital advertising and promotion system. Following this stage, surveys were conducted on the group of Internet users to obtain primary data. The results clearly indicate a high potential of activities involving the participation of digital influencers. This is mainly due to the following factors: information on the product or service is communicated effectively, brand awareness is increase d and the level of sales of products and services offered by companies is raised. Based on the research results, initial recommendations along with the statement of risks arising from the concept were formulated.

Keywords: Influencer Marketing, Social Media, Digital Promotion, Electronic Space.

Introduction

Expenditure on online advertising and promotional activities is growing rapidly. This is, inter alia, because of a steady increase in expenditure on digital advertising and a decline in expenditure on traditional media. According to the Statista portal, in 2020, expenditure will amount to more than USD 365 billion (Statista, 2020). eMarketer's forecasts are even more optimistic. According to its report, expenditure is expected to reach 384.96 billion USD in 2020. At the same time, digital advertising expenditure accounted for 50.1% of global advertising expenditure in 2019, and in 2023, it is expected to reach 60.5% (eMarketer, 2019). In this respect, the increase in spending on social media advertising is a clear trend. In 2017, it amounted to over 62 billion USD, and in 2023, it is expected to reach a level twice as high, i.e. 125 billion USD (Statista, 2020).

However, with the increasing expenditure on broadly understood digital advertising and promotion goes the decreasing effectiveness of activities in e-space (Wielki, 2007; Wielki and Grabara, 2018). This is because a number of reasons. What is clearly visible is that consumers are less and less vulnerable to online advertising and promotional activities used so far. They are dissatisfied with the way organizations communicate with them, e.g. various forms of digital advertising. They feel that digital advertising is excessive and increasingly intrusive. As a result, they more and more often ignore (TapInfluence, 2019a) or block digital advertising, the scale of the latter rapidly growing (Bhat, 2017; Essex, 2017; Wielki and Grabara, 2018).

The changes happening on the market are largely reflected by the growing voice of Generation Z which constitutes an expanding group of consumers. Members of Generation Z behave completely different and focus on completely different issues compared to other generations of consumers (Cone Communications, 2017). For them, organizations have to adopt a completely different marketing approach. They spend a lot of time in social media (GlobalWebIndex, 2019) and like to observe and follow some people present in social media who seem interesting to them for various reasons and whom they trust (Fromm, 2018).

In a dynamically changing market situation, where advertising and promoting products, services or brands are more difficult than ever before, organizations started to look for alternative ways of

influencing consumers. In this regard, the concept of digital influencers and influencer marketing in the processes of communication between organizations and their customers became the main course of action (Forbes Communications Council, 2018; Roose, 2019). This approach is the fastest growing trend in the field which changes the way specific industries work (Chief Marketer, 2019; Finley, 2016).

Given the growing importance of digital influencers in the processes of communication between organizations and their consumers, the main aim of this paper is to determine the function, position and significance of digital influencers with respect to the entire online advertising and promotion system and related changes. The paper is based on data from reports on digital influencers and own research conducted on individual Internet users.

Digital influencers: definition, scale and reasons for the development of the concept of influencer marketing

Definition and typology of a digital influencer

Contrary to appearances, the idea of using various types of well-known characters for the purpose of broadly understood recommendation marketing activities is not new as it dates back to the 18th century (Górecka-Butora, Strykowski, and Biegun, 2019). Its modern version is closely related to the development of social media and the use of social media in the processes of online marketing communication in organizations. With a growing popularity of social media, some people started to use them to gather around groups of followers, in some cases amounting to even more than one hundred million people (Hopper, 2019).

Handayani et al. provide the following definition of digital influencers: "The digital influencers are influential social media users with a large follower base" (Handayani et al., 2019). According to Górecka-Butora et al., "the influencer is an opinion leader, popular in a wider or higher group of regular recipients, who with their credible actions, currently conducted increasingly often on the Internet, inspires trust, engages and convinces their recipients to make specific choices, e.g. on shopping, nutrition or worldview" (Górecka-Butora, Strykowski, and Biegun, 2019). Due to their use of social media, they are often also called social media influencers. According to Influencer Marketing Hub, social media influencers "are people who have built a reputation for their knowledge and expertise on a specific topic. They make regular posts about that topic on their preferred social media channels and generate large followings of enthusiastic, engaged people who pay close attention to their views" (Influencer Marketing Hub, 2020). According to Pixlee's marketing platform, "a social media influencer is a user on social media who has established credibility in a specific industry. A social media influencer has access to a large audience and can persuade others by virtue of their authenticity and reach" (Pixlee, 2020).

The taxonomy of digital influencers can base on a number of distinguishing features. The number of followers is the most obvious criterion. In this respect, the following categories can be distinguished: celebrities (more than 5 million followers), mega-influencers (1–5 million), top influencers (more than 500 thousand), macro-influencers (100–500 thousand), medium influencers (20–100 thousand), micro-influencers (less than 20 thousand) and nano-influencers (1–10 thousand) (Mediakix Team, 2017; Mediakix Team, 2019; Górecka-Butora, Strykowski, and Biegun, 2019). Another criterion is the motivation to act. This includes the following categories: idols, experts, lifestylers, activists and artists. Idols are people who are widely recognized and hugely popular. In their message, they focus primarily on themselves with some reference to political or social issues and current events. Experts are people considered to be authorities in a given field due to their knowledge or skills. This category includes industry specialists, advisors, reviewers and testers. Lifestylers raise issues around lifestyle and leisure activities. They often focus on the following areas: fashion, beauty, interior design, health, cooking and travel. Activists pay much attention to their worldview. They often concentrate on minority rights, environmental matters and feminism. Artists focus on high aesthetics and visual appeal of the content they create when they use the Internet. They usually run various photoblogs and

Instagram profiles. They address issues around nature, travel, people and architecture (Górecka-Butora, Strykowski, and Biegun, 2019; Jones, 2016; TapInfluence, 2019a). The third criterion is a communication platform used by digital influencers. This category includes bloggers, YouTubers, Facebookers, Instagrammers, Twiterrers and Snapchaters (Górecka-Butora, Strykowski, and Biegun, 2019).

Key benefits from the participation of digital influencers in advertising and promotional activities

The literature shows a number of benefits from the participation of digital influencers in the marketing activities of organizations. Key benefits are as follows:

- The message is not anonymous;
- The message reaches out to precisely selected groups of recipients;
- Digital influencers have an impact on product sales;
- The costs are highly efficient.

Lack of anonymity of the message and the link between the message and a specific person is the most common point raised in studies on the participation of digital influencers in the marketing activities. It inspires trust and helps establish relations with recipients (Chief Marketer, 2019; Górecka-Butora, Strykowski, and Biegun, 2019; TapInfluence, 2019). In today's market conditions with a clear decline in trust in intrusive and anonymous digital advertising this factor is extremely important (TapInfluence, 2018). Activities of influencers result in brand humanization (Huff, 2017). The fact that the message reaches out to precisely selected groups of recipients is another important factor. The message is addressed to a specific group of Internet users who follow a person with clearly defined interests or beliefs (Chief Marketer, 2019; Górecka-Butora, Strykowski, and Biegun, 2019).

The impact of digital influencers on the product sales is another important factor as evidenced in a number of studies. According to a study by Nielsen Catalina Solutions, people affected by digital influencers bought significantly more than the control group (TapInfluence, 2017a). These results are also confirmed by global consumer research carried out by Rakuten Marketing at the turn of 2018 and 2019. The research shows that 80% of the respondents purchased a product recommended by the influencer "by clicking on the link or image" (Rakuten Marketing, 2019).

High cost efficiency of digital influencers is the fourth key benefit. The results of the research show different levels of cost efficiency. Nevertheless, this factor is undoubtedly very favorable to organizations. According to the "Influencer Marketing Benchmarking Report: 2019," a return in the range from 5.20 to even 18 USD for each dollar spent on digital influencer activities may be expected (Influencer Marketing Hub, 2019a). The research conducted by TapInfluence and Nielsen Catalina Solutions indicate even higher level of return, i.e. 23 USD. It is not possible to attain this level with banner ads as the return from banner ads amounts to 2.15–4.30 USD (TapInfluence, 2017).

Prospects for the use of influencer marketing and related expenditure

With respect to the prospects for the use of digital influencers in organizations, the reports of companies which examine this phenomenon clearly indicate a growing interest in this form of marketing activities. The "Influencer Marketing Benchmarking Report: 2019" shows that 86% of the surveyed companies intended to allocate part of their budgets for digital influencer activities in 2019 (as compared to 37% in 2017). In addition, more than 60% of the surveyed organizations declared an increase in expenditure on influencer marketing activities in the following year (Influencer Marketing Hub, 2019a).

This tendency is also confirmed by the results of eMarketer's global research conducted among the Chief Marketing Officers. In this research, more than 30% of respondents indicated on "increasing their focus on influencer marketing as an element of the advertising media mix" (eMarketer, 2019a).

Due to the growing interest in the participation of digital influencers in marketing activities of organizations, the value of the entire influencer marketing industry obviously keeps growing. Influencer Marketing Hub forecasts a rapid increase in the value of this industry between 2016 and 2019 from USD 1.7 billion to USD 6.5 billion (Fig. 1).

Fig. 1: Growth of the value of the influencer marketing industry between 2016 and 2019 *(source: Influencer Marketing Hub, 2019a).*

The report of Business Insider Intelligence predicts even more dynamic growth, i.e. from 8 billion USD (2019) to 15 billion USD (2022) (Fig. 2).

Fig. 2: Expected growth of the value of the influencer marketing industry between 2019 and 2023 (source: Business Insider, 2019).

The phenomenon of digital influencers in light of author's own research

Based on the broadly understood literature review on digital influencers and influencer marketing tendencies, the primary research on a specific group of Internet users was conducted. The selection of the group was based on two criteria. Firstly, respondents had to be intensive Internet users with the extensive use of social media. Literature and previous own research clearly indicate that students fall within this criterion (Wielki, 2017, Wielki, 2018). Secondly, respondents had to be members of Generation Z. To meet those two criteria, first and second cycle full-time students were selected.

The survey was conducted between January and May 2019 with the use of Google Forms. The survey was attended by 612 students covering all six local faculties of the Opole University of Technology. First cycle students accounted for 77% of the total number of students while second cycle students 23%.

The survey focused on the following issues:

1. Intensity of Internet use;
2. Use of social media;
3. Knowledge of the concept of a digital influencer;
4. Evaluation and criteria of the effectiveness of digital influencer activities;
5. Evaluation of the effects of activities taken by digital influencers;
6. Evaluation of the prospects for the digital influencer activities.

As regards the intensity of Internet use, the assumptions have been confirmed. Respondents are very intensive Internet users. More than two thirds of respondents are permanently connected to the Internet (always-on) (Fig. 3 and 4).

Fig. 3: Intensity of Internet use (source: own source).

Fig. 4: Respondents permanently connected to the Internet (source: own source).

Social media are used by most respondents, with Facebook (92.9%), YouTube (90.6%) and Instagram (56.3%) being most popular. The vast majority of the respondents are familiar with the concept of a digital influencer (Fig. 5).

Fig. 5: Knowledge of the concept of a digital influencer (source: own source).

The vast majority of respondents claim that digital influencer activities are much more effective than digital advertising, including the best personalized advertising activities (Fig. 6).

Fig. 6: Evaluation of the effectiveness of digital influencer activities (source: own source).

The key criteria of effectiveness are trust in the influencer being an authority (33.9%), credibility of the message (27.6%) and link between the message and a specific person (23.3%). According to the respondents, the key effects of digital influencer activities include providing information about the product/service, increasing brand awareness and convincing one to make a purchase (Fig. 7).

Fig. 7: Key effects of digital influencer activities (source: own source).

In the last point of the survey, the respondents were asked to evaluate the prospects for the development of digital influencer activities. As shown in Fig. 8, the vast majority of respondents agree with the statement that digital influencer activities will develop in the near future at the expense of digital advertising.

Fig. 8: Evaluation of the prospects for the development of digital influencer activities (source: own source).

Challenges arising from the participation of digital influencers in the marketing activities of organizations

As evidenced by the primary and secondary research, the idea of participation of digital influencers in e-space advertising and promotional activities of organizations has a huge potential, more and more widely recognized in organizations. However, there are also, more clearly visible, challenges and threats arising from the use of the concept of influencer marketing in companies. Such challenges may be:

- internal (related to the organization),
- external (related to the organization's environment).

The managers responsible for the adoption of the concept of influencer marketing who attended "2019 Influencer Marketing Survey" identified the eleven key challenges are related to digital influencer activities. The first six are as follows (Mediakix, 2019):

1. Spotting fake followers (50%);
2. Social algorithm changes (49%);
3. Building an always-on strategy (41%);
4. Rising influencer costs (38%);
5. Keeping up with social media trends to stay relevant (33%);
6. Building a strong creative strategy (33%).

Influencer fraud is regarded as the key challenge. Some accounts or profiles following influencers do not belong to real people as they are fake bot accounts (Influencer Marketing Hub, 2019). As a result, some funds spent on influencer marketing activities are wasted (O'Malley, 2019). Social algorithm changes constitute the second key challenge. Algorithms "control" the content sent to users on social platforms and make the influencer's message less visible for target groups. The third key challenge refers to building an always-on strategy. This refers to the ability to create an influencer marketing strategy that does not turn off, instead of launching sporadic, short-term campaigns. Another challenge is the rising influencer costs. This results directly from to the growing interest in the concept of influencer marketing. The fifth challenge refers to the rapidly changing dynamics of interest in particular social media and the ability to choose the right social media for specific target groups. The last challenge is the ability to build a creative strategy to stand out from hundreds or thousands of others (Mediakix, 2019).

Of the analyzed points, the first, second and fourth challenges are external in nature, while the remaining three internal.

Conclusion

In recent years, growing expenditures of organizations on advertising and promotional online activities are observed. On the other hand, consumers are more and more dissatisfied with the ways used by companies to communicate with them in e-space. This is mainly because online advertising is excessive and increasingly intrusive. As a result, ad-blocking and similar phenomena occur and this significantly reduces the effectiveness of advertising and promotional activities. This is why organizations search for alternative ways of influencing consumers. The concept of influencer marketing is one of the most important trends in this respect.

The secondary and primary data analyzed in this paper clearly show a high potential of digital influencer activities. This is extremely important for organizations in view of a significant decrease in effectiveness of online advertising and promotional activities used so far. There are several factors that determine the growing popularity of influencer marketing activities. They include the continuous development of social media along with the increased activity of Internet users in social media, high effectiveness of digital influencer activities, and the increasingly common tendency to ignore digital advertising, including those best personalized. The potential of advertising and promotional activities results mainly from the following factors: information on the product or service is communicated effectively, brand awareness is increased and the level of sales of products and services offered by companies is raised.

However, to make digital influencer campaigns truly effective and to use their potential, one has to review and prepare them properly taking into account the character of the organization, its industry and potential challenges mentioned above. It is extremely important that the right influencers are selected and properly managed, ROI (return on investment) of the influencer marketing program is clearly defined and digital influencer activities are properly incorporated into the advertising media mix of the organization. Such a rational approach will significantly help organizations to achieve success in influencer marketing activities and meet their goals.

Abstract

The paper is aimed at considering tractor transport to be an important component of agricultural logistics. It has been established that expediency of using tractors in transport operations is determined by features adversely affecting transportation of goods in agriculture, in particular, field conditions; characteristics of agricultural production technology, for example, the need to carry out transport and technological operations along with transportation; organizational and economic reasons (a large volume of on farm transportation with short distances of goods movement and a large proportion of down time during loading and unloading); the need for more complete utilization of tractors throughout the year, reducing the cost of tractor operations due to redistribution of the annual amount of amortization expenses. Requirements for tractor transport in the agriculture have been defined including the performance of goods transportation on scheduled time; compliance of tractor trailers with characteristics of goods; prevention of goods losses during loading and unloading as well as transportation; optimal performance of tractor transport units; ensuring cost effectiveness of transportation; technical excellence of tractors and trailers. The level of tractor provision with trailers in agricultural enterprises of Ukraine has been analyzed. It has been established that medium-power tractors (having engine power from 60 to 100 kilowatts) and more powerful tractors (having engine power over 100 kilowatts) are most in demand in the agriculture. It has been determined that the growth trend of average engine power is typical for agricultural enterprises, which positively affects the increase in tractor transport productivity. The system of operational and economic indicators of tractors utilization for agricultural goods transportation has been improved. It has been proposed to introduce to the estimated performance indicators of tractor transport as follows: the index of free time for tractor-transport operations, the index of tractor application in transport operations, the productivity of tractor transport units per one ton of carrying capacity of tractor trailers. The methodological basis for determining the standard of tractor utilization in transport operations has been given scientific credence.

Keywords: Agrarian Logistics, Tractor Transport.

Introduction

Under the current economic conditions, the logistical activity of economic entities is one of the important components of successful doing business, including agrarian. This has already become a mandatory practice in developing business strategies in developed countries.

In a broad sense, we consider that any processes related to transportation, storage and sale of products are logistical. It should be noted that in the agrarian sphere, logistic activities are rather complicated, since it combines the processes of harvesting, inventory planning, storage, warehousing operations, provision of resources, transportation, order planning, supply and sale, creating new production, economic and commercial connections as well as receiving and collecting data, communication and more. A prominent place here is occupied by transport logistics, which is a set of processes for organization of delivery, namely, movement of material objects and substances (machinery, spare parts, protection products, fertilizers, agricultural products) and others from one point to another on the optimal route. Therefore, it is crucial to examine and search for possible ways to develop transport logistics in the agricultural business of Ukraine.

A brief over view of publications on the topic

As a science, logistics studies management of material flows and those which are related to them in the procurement of material resources, their processing and sale of products. These processes are closely linked to transportation of goods. In general, a transport and logistics systems are a set of objects and entities of transport and logistics infrastructure, combined with material, financial and information flows between them, which performs the functions of transportation, storage, distribution of goods, as well as information and legal support of goods flows.

Given the economic and social role of the industry in the national economy of the country, agrarian logistics, which studies the material flows and stocks in the production and marketing of agricultural raw materials and food, is an important component of logistics.

Issues of the researched topics have been under consideration in the works of such scientists as: Lyson Kenneth, Gillingham, Michael, 2003; Leenders, Michiel, Fearon, Harold E., Flynn Anna, Johnson P. Fraser, 2001; Stock, James, Lambert, Douglas, 2000; Waters, Donald, 2009, Hoskinson R.E., 2009, Moller C., 2004; Velychko O., 2014, 2017; Velychko O.,Velychko L., Butko M. and Khalatur S., 2019.

In the book “Sustainable Logistics – An Introduction to the Concept and Case Studies from Germany. Deutsche Gesellschaftfür Internationale Zusammenarbeit (GIZ) GmbH”, emphasis is made on the relevance of development of sustainable logistics, namely, of transport and transport infrastructure (Roth, J.-J., Bernecker, T., Lohre, D., Grandjot, H.-H., &Poerschke, V., 2015).

Topical issues of agricultural transport logistics have been considered by such researchers as Wampfler, B., 2004., Szpon, I., 2005; Perebyynis V..I., Perebyynis O.V., 2005; Perebyynis V.I., Pomaz O.M., 2011; Gutorov O.I., Prozorova N.V., 2011; Velychko O., 2015; Kolodiichuk V., 2016, 2017; Kravtsiv V., Kolodiichuk V., Kolodiichuk I., 2018; Kolodiichuk V., Dubnevych Y., 2019.
The need to improve the efficiency of tractor utilization in agriculture determines expediency of clarifying the corresponding system of operational and economic indicators, resource support for goods transportation, etc., which has been highlighted in the published works by Wampfler, B., 2004; Szpon, I., 2005; Perebyynis V.I., Perebyynis O.V., 2005; Perebyynis V.I., Pomaz O.M., 2011; Gutorov O.I., Prozorova N.V., 2011;Yermakov O.Yu., Trush N.I., 2012 and others.

Thus, the Encyclopedia of Transportation (2014) draws attention to the need of taking into account the specific conditions of tractor transport utilization in different sectors of the economy. Tractors with trailers are widely used for agricultural machinery transportation within certain regions, which is important for timely field work in the crops industry. Information on tractor transport is provided on

websites as follows: in the United Kingdom (Tractor transport services, 2020), in the USA (Specializing in Agriculture and Farming Machinery & Equipment. Tractor transport, 2020), in Australia (Tractor and Mobile Machinery Transport Quotes, 2020).

The economic issues of goods transportation by tractors with trailers are described in the work by Perebyynis V.I., Malysh M.N., 1999.

The need to improve the efficiency of tractor utilization agriculture as a constituent of agrarian logistics determines expediency of:

a) substantiation of the organizational and economic reasons of tractor utilization in transport operations;
b) clarification of requirements for goods transportation by tractor transport;
c) improvement of the corresponding system of operational and economic indicators of tractor utilization for agricultural goods transportation;
d) development of methods for planning tractor utilization in transport operations.

Purpose of the paper is analysis of scientific and practical principles of agrarian logistics development in Ukraine in the context of economically feasible use of tractor transport by agricultural enterprises.

Materials and Methods

In the course of the study, general scientific and special economic methods have been used, namely: the dialectical method, the methods of analysis and synthesis, the method of historical-logical analysis and the method of system analysis.

The Main Material Presenting

As a science, agrarian logistics studies movement of material flows in agriculture. In transport logistics (as a component of general logistics), material flows take a form of goods flows. In agricultural enterprises, goods movement is carried out, as a rule, by road and tractor transport.

Research results of the enhancement of economic efficiency of goods transportation by tractors with trailers have been described in the work by Perebyynis V.I. and Malysh M.N. (1999). The scientists Janulevičius A. and Pupinis G. (2013) have found that the efficiency of the utilization of tractors with trailers depends on the level of use of engine power, which is influenced by a number of features of the tractor design.

Tractors used for the carriage of goods are subject to specific requirements. In particular, a number of regulatory requirements have been in force in the UK since 2017(Guidance Tractors and regulatory requirements: a brief guide, September 2017). Thus, a ‘tractor’ (or a ‘category T tractor’) is defined in EU Regulation 167/2013. It essentially covers vehicles that a layman would think of as a tractor, being a motor vehicle designed to ‘pull, push, carry and actuate’ equipment to perform agricultural or forestry work. An ‘agricultural trailer’ is trailer used only for agriculture, horticulture or forestry. The mentioned requirements imply that the majority of tractors may travel at up to 40 km/h (approximately 25 mph). However, some tractors built to higher specifications are permitted to be driven at up to 40 mph (around 65 km/h). The higher speed limit applies to tractors that have (among other requirements) all-wheel suspension, braking efficiency of 50%, pneumatic tires, a speedometer and a horn. The exact requirements are contained in the Construction and Use Regulations 1986 (as amended) (The Road Vehicles (Construction and Use) (Amendment) Regulations, 1986).

Moreover, some tractors, for instance, if used for commercial non-agricultural haulage, may require use of a tachograph and have maximum limits on driving time and minimum requirements for breaks and rest periods, set out in EU drivers’ hours rules (Regulation (EC) 561/2006) (Drivers' hours, 2020). Tractors require a tachograph if they are used to haul goods on the road, the maximum

authorized mass exceeds 3.5 tones and they do not fit one (or more) of the available exemptions. According to the information (Agricultural vehicles, 2020), operators or drivers of agricultural vehicles, or operators transporting agricultural vehicles, in South Australia are required to comply with the applicable exemption (permit or notice) available from the NHVR's website (Notices and permit-based schemes, 2020). In particular, this applies to the requirements for the dimensions (width) of tractor vehicles.

The main reasons determining the expediency of using tractors in transport operations can be divided into several groups. Firstly, these are reasons caused by features adversely affecting goods transportation in terms of agriculture. They include difficult road conditions (especially during winter impassability of roads as well as autumn and spring thaws) when transportation on natural roads and across fields is difficult and often impossible. When driving in such conditions, the main advantage of a motor vehicle - its high speed on direct gear - is not used.

Secondly, the expediency of using tractors for goods transportation is determined by peculiarities of the agricultural production technology. Along with transport operations, it is also necessary to carry out transport and technological operations. They include maintenance of various harvesting machines, transportation and dosed distribution of feed, transportation and application of mineral and organic fertilizers, etc.

Thirdly, the need to use transport arises from reasons of organizational and economic character. They include a large amount of on-farm traffic characterized with a short distance of goods movement, a large proportion of downtime during loading and unloading operations, inability to develop a high speed of movement of vehicles. As a rule, here tractor transport is more efficient than road transport. It is important to load the tractor fleet more fully throughout the year, reduce the production cost of tractor operations due to redistribution of an annual amount of depreciation deductions.

Fourthly, the expediency of using tractor vehicles for goods transportation can be attributed to technical reasons. Wheeled tractors with trailers are more adapted for field work than cars. A number of tractor trailer models matches with low bulk goods transportation.

Agriculture places demands on goods transportation by tractor transport within the time limits set, on compliance of tractor trailers with characteristics of goods, on prevention of goods losses during loading and unloading operations as well as transportation, on performance of tractor transport units, on ensuring economic efficiency of transportation, on technical excellence of tractors and trailers.

An indicator of a number of trailers per tractor is important to assess the performance potential of tractors in transportation (Table 1).

According to the data in Table 1, the number of trailers per tractor in the study period has been reduced. It derives from both reducing the number of trailers and increasing the number of tractors. In particular, for the studied three years the number of roller tractors increased by 2,768units and the number of tractor trailers decreased by 3,138units at the agricultural enterprises of Ukraine.

Table 1: Endowment of tractor trailers at agricultural enterprises in Ukraine in 2016-2018(at the beginning of year)

Index	2016	2017	2018	2018 in % on 2016
Roller tractors	118,178	123,439	120,939	102,3
Tractor trailers	49,004	48,546	45,866	93,6
Number of tractor trailers per roller tractor	0.41	0.39	0.38	92,7

(Source: own elaboration based on: [www 1])

Despite the increase in their domestic production of tractor trailers– respectively, in 2016, 2.700agriculturaltrailersandsemi-trailersweremanufacturedbyUkrainianplants, in 2017 – 3,800andin 2018 – 4,500), as well as the purchase of imported trailers.

Universal mono-trailers and mono-semitrailers are especially popular. This type of trailers for transportation of various agricultural bulk materials are produced by such enterprises as Umanfermmash, Rivnesilmash (Ukraine), Bobruiskselmash (Belarus), Strjco-agro (Denmark), Dezeure (Belgium), etc. (Yasenetskyi, Derevianko, Chornoshkur, Kovpak and Paniotova, 2016).

Tractor transport units carry a significant amount of straw, hay, silage and hay mass, green fodder and other goods belonging to classes III and IV. At the same time, the load-carrying capacity of universal tractor trailers due to their insufficient adaptability to the above-mentioned goods transportation is not fully utilized which causes the need for specialized trailers. Currently, in the market of transport equipment, there are, in particular, tractor trailers for transporting bales and rolls of straw and hay produced by ZavodKobzarenko (Ukraine), Bobruiskselmash (Belarus), ZDT, STS (the Czech Republic), Fliegl (Germany) etc. In agriculture, tractor trailers and semitrailers used for transporting animals (cattle, horses, sheep, swine, poultry) are produced by ZDT (Czech Republic), etc. (Yasenetskyi, Derevianko, Chornoshkur, Kovpak and Paniotova, 2016).

Crops and feed production processes are characterized by the presence of harvesting, mixing and distribution operations performed simultaneously with transport processes by the same technical means. Along with tractor transport units of general use, this makes it necessary to have special purpose rolling stock - trailers equipped with working tools to perform certain technological operations.

Among them, there are tractor trailers and semitrailers with interchangeable extensions and non-removable chassis. For example, semitrailers of the Mega series produced by ZDT (the Czech Republic) consist of an irremovable chassis and interchangeable extensions (a body, manure spreader, tanks for liquid materials, grain reloaders). Tractor trailers and semitrailers produced by Fliegl (Germany) consist of a universal chassis and interchangeable extensions (a body for bulk materials and grain loader). Annaburger (Germany) manufactures Multiland Plus trailers containing a universal chassis and interchangeable superstructures (tanks for liquid fertilizers, a body for crushed grass, organic fertilizer spreader, dump truck superstructure) (Yasenetskyi, Derevianko, Chornoshkur, Kovpak and Paniotova, 2016).

The proliferation of progressive harvesting technologies for agricultural crops leads to a significant increase in a number of goods loaded into tractor trailers using harvesting machines. Therefore, pick-up trailers are of interest. In particular, in Ukraine, such companies as Pottinger (Austria), Knore, Straumann (Germany) are represented on the markets of such equipment.

Management decisions to improve the operation of technical equipment in agriculture should be made taking into account the results of the analysis. The indicators for assessing tractor application used at enterprises take into account factors affecting the machines productivity, degree of use of the tractor fleet operation time, its load, level of operating costs. They include as follows: tractor utilization, shift factor, availability factor, shift, daily and annual output, production costs of a conventional reference hectare of mechanized operations.

The specific features of tractor application in transport operations make it necessary to substantiate the relevant indicators. In particular, in the estimated performance of tractor transport, it is necessary to enter: the index of free time for performance of tractor and transport operations; the index of tractor application in transport operations; the performance of tractor transport units per ton of tractor trailer capacity and some others.

Theentiresetofoperationalandeconomicindicatorsoftractorapplicationintransportoperations can be at tri but the following groups.

Into the first group, it is expedient to include tractor unit utilization indicators: the shift index, the tractor utilization index, the index of free time for performance of tractor and transport operations, the index of tractor application in transport operations.

The shift index α_s characterizes duration of tractor fleet application during a working day.

The tractor utilization index α_i is usually determined as the ratio of the operating time of tractors T_e to the inventory time T_i (hereinafter, work time, downtime, etc. is determined in machine-shifts).
If tractors are constantly on the farm, then

$$T_i = 365 \cdot \alpha_s \qquad (1)$$

then

$$\alpha_i = \frac{T_e}{365\alpha_s}. \qquad (2)$$

The index of free time for performance of tractor and transport operationsα_p is determined by the formula (3):

$$\alpha_P = \frac{T_{TT}}{T_I-(T_1+T_2+T_3+T_4)}, \qquad (3)$$

where T_{TT} – is operation time of tractors during transport operations; T_1 – is tractor application time during field and stationary operations; T_2 – is the time spent on maintenance and repairs; T_3 – is downtime due to technical faults, meteorological conditions, organizational and other reasons; T_4 – is downtime of a tractor due to a tractor driver's rest on weekends, public holidays and during vacations, illnesses, etc.

Substituting the value of T_i from the formula (1) into the formula (3) and taking $T_4 = 0$ (which means a possibility of replacing the main tractor driver at the time of his absence with another), we obtain the value of α_P:

$$\alpha_P = \frac{T_{TT}}{365\alpha_s-(T_1+T_2+T_3)}, \qquad (4)$$

The index of tractor application in transport operations α_{TT} is determined by the formula (5):

$$\alpha_{TT} = \frac{T_{TT}}{T_e}, \qquad (5)$$

The second group of indicators reflecting tractor trailer train application is represented by the index of utilization of the mileage β, the index of utilization of the carrying capacity of tractor trailers γ, the average transportation distance l_s, the average operating speed V_e.

Indicators of the production of tractor vehicles characterizing the amount of transport operations performed by them are included in the third group. This may comprise performance of tractor transport units in tons of P_T and ton-kilometers of $P_{T\text{KM}}$ per 1 ton of capacity of a tractor trailer per year (a tractor trailer train performance per load capacity), which are determined by the formulas (6, 7):

$$P_T = \frac{8T_e\beta\gamma\alpha_s V_e}{l_s}, \qquad (6)$$

$$P_T = 8T_e\beta\gamma\alpha_s V_e, \qquad (7)$$

where 8 – is duration of a work shift, hour.

The fourth group which includes operating cost indicators revealing the cost-effectiveness of using tractor vehicles is represented by indicators such as lab our costs for performing one ton-kilometer of transport operations, the production cost of one ton-kilometer.

The cost-effectiveness of using vehicles is also characterized by the amount of goods transported per unit of time, specific investments and reduced costs.

When planning tractor application for goods transportation, there is a need to know the standard for the expedient tractor utilization in transport operations T_{TTn}. This indicator can be determined by the formula (8):

$$T_{mmn} = \alpha_{mmn} \cdot T_e, \quad (8)$$

where α_{TTn} – is the standard value of the index of tractor application in transport operations, determined by the formula (9)

$$\alpha_{TTn} = \frac{T_e - T_1}{T_e}. \quad (9)$$

We should also note that:

$$T_e = T_i - T_2 - T_3, \quad (10)$$

The time spent on maintenance and repairs T_2 is equal to:

$$T_2 = K_2 \cdot T_e, \quad (11)$$

where K_2 – is the index of time spent on maintenance and repairs.

Downtime T_3 consists of downtime by fault T_5, due to weather conditions T_6, organizational and other downtime T_7:

$$T_3 = T_5 + T_6 + T_7; \quad (12)$$

$$T_3 = K_3 \cdot T_e + K_4 \cdot T_i + K_5 \cdot T_e \quad (13)$$

where K_3, K_4, K_5arethe indexes taking into account, respectively, downtime by fault, due to weather conditions, organizational and other reasons.

Substituting the corresponding values from the formulas (11) and (13) into the formula (10) and performing transformations, we obtain:

$$T_e = \frac{T_5(1-K_4)}{1+K_2+K_3+K_5}. \quad (14)$$

Substituting the value of $T_э$ from the formula (1.14) into the formula (1.9), we obtain:

$$\alpha_{TTN} = 1 - \frac{T_1}{T_i}\left(\frac{1+K_2+K_3+K_5}{1-K_4}\right). \quad (15)$$

Since the index of time spent by a tractor to perform field and stationary operationsK_1can be determined as

$$K_1 = \frac{T_1}{T_i} \quad (16)$$

Taking $K_5 = 0$, then

$$\alpha_{TTN} = 1 - K_1\left(\frac{1+K_2+K_3}{1-K_4}\right). \quad (17)$$

The index K_4 is determined by the formula (18):

$$K_4 = 1 - K_4^1, \quad (18)$$

where K_4^1 – ss the index of time use based on weather conditions.

For Poltava region (Ukraine), annual average $K_4^1 = 0.91$ (Grigorieva, A.S., Kogan, Y.A. and Vostryakov, N.A., 1975, p. 66).

Then, the formula takes the form:

$$\alpha_{mmn} = 1 - 1{,}1\, K_1(1+K_2+K_3) \quad (19)$$

The valuesof K_2 and $K_3$are presented in Table 2.

Table 2: The values of the indexes $K_н$ and $K_{то}$ for roller tractors

Tractor capacity, kilowatt	K_2	K_3
200-250	0.42	0.16
100-150	0.32	0.10
50-75	0.23	0.05
30-35	0.22	0.04
15-20	0.17	0.02

Substituting the values of K_2 and K_3into the formula (19), we obtain the values α_{TTn} shown in Table3.

Table 3: The standard value of tractor utilization in transport operations α_{TTn}

Tractor capacity, kilowatt	Value of K_1						
	0.1	0.2	0.3	0.4	0.5	0.6	0.7
200-250	0.83	0.65	0.48	0.30	0.13	-	-
100-150	0.84	0.69	0.53	0.38	0.22	0.06	-
50-75	0.86	0.72	0.56	0.44	0.30	0.15	0.01
30-35	0.86	0.72	0.59	0.45	0.31	0.17	0.03
15-20	0.87	0.74	0.61	0.48	0.35	0.21	0.08

(Source: author's own work)

The operating time of tractors throughout the year is determined by the formula (20) which is derived from the value of T_e (the formula 14) and the fact that K_5 is assumed to be zero:

$$T_e = 365\alpha_s \frac{1-K_4}{1+K_2+K_3}. \qquad (20)$$

Substituting the values of the indexes into the formula (20), we obtain the value of T_e (Table4).

Table4: Values of tractor operating time throughout the year T_e

Tractor capacity, Kilowatt	Shift index α_s						
	1.0	1.1	1.2	1.3	1.4	1.5	1.6
200-250	210	231	252	273	294	315	336
100-150	234	257	281	304	328	351	374
50-75	259	285	311	337	362	388	414
30-35	264	291	317	344	370	397	423
15-20	279	306	334	362	390	418	446

(Source: author's ownwork)

To determine the tractor utilization rate in transport operations, it is necessary:

1. Based on the specific tractor utilization in field and stationary operations T_1 and the shift index α_s according to the formula (21), it is necessary to determine the value of K_1:

$$K_1 = \frac{T_1}{365\alpha_s}. \qquad (21)$$

2. Using the found value of the index K_1 in table 1.2, it is necessary to determine the value of the index α_{TTn}.

3. For a given value of the index α_s in Table 5, we should determine the value of T_e.

4. The required value of the expedient tractor utilization standard in transport operations is determined by multiplying α_{TTn} by T_e according to the formula (8).
In the case, when the index α_s is the same for all types of tractor operations, the value of T_{TTn} can be calculated as the difference of the value of T_e (which can be determined from Table 6) and the specified T_1.

Conclusion

It has been established that the expediency of tractor utilization in transport operations is determined by the following main reasons: features of agriculture adversely affecting motor-traction; features of agricultural production technologies; the need for more complete tractor utilization throughout the year. It has been substantiated that agriculture places demands on goods transportation by tractor transport within the time limits set, on compliance of tractor trailers with goods characteristics, on

prevention of goods losses during loading, on transportation and unloading. Requirements for productivity of tractor transport units, ensuring cost effectiveness of transportation, technical excellence of tractors and trailers have also been defined. The scientific novelty of the research results is as follows: the improvement of operational and economic indicators of tractor utilization for agricultural goods transportation, as well as the development of methodological basis for determining the standard of tractor utilization in transport operations.

Abstract

The article deals with the analysis of a number of guests and a number of overnight lodgings in four- and five-star hotels in the Czech Republic, sorted by residents and non-residents within the time series 2012 – 2018. Further it studies a dependence of a gross domestic product on a number of guests and a number of overnight lodgings. Through the regression and correlation analysis there were find out high values of correlation coefficients of the studied dependences; correlation coefficient value was 0.995 for a number of guests and gross domestic product, and 0.986 for a number of overnight lodgings and gross domestic product, which shows an evidence of almost perfect dependence. Furthermore, using the triple classification analysis of variance at the significance level $\alpha = 0.05$ there were found statistically conclusive differences for the variable "number of guests" in all classification criteria (year, hotel category, type of guest). For the variable "number of overnight lodgings" the F-test was provable only for the criterion "hotel category". Detailed evaluation of the analysis of variance by the Tukey's method shows statistically conclusive difference between a number of guests and a numbers of overnight lodgings in respect of the hotel category. Both the number of guests and number of overnight lodgings in the four-star hotels provably differs from those in the five-star hotels.

Keywords: Tourist Industry, Time Series, Regression and Correlation, Analysis of Variance

Introduction

The tourist industry in the Czech Republic represents an intensively developing branch of the national economy. This process is related immediately to the development in demand for accommodation services in the Czech Republic, both by non-residents and residents, as domestic tourist industry is also experiencing unprecedented development.

The tourist industry belongs among important component parts of any national economy as it brings financial sources not only from the domestic tourists, but mostly from the foreign visitors in the Czech Republic. Among the best crowd-pullers of the Czech tourist industry belong the historical monuments, monuments signed up in the UNESCO cultural heritage list, spas, winter sport activities centres and natural monuments. The tourist industry as itself governs further branches of industry, such as accommodation and catering services, culture, sports and commerce. And of course, accommodation immediately relates to the statistics on the mass accommodation facilities, where the research of a number of guests and a number of overnight lodgings in the time series 2012 – 2018 offers a new context relating to the economic development of the state, especially to the growth of the gross domestic product.

According to the Global Peace Index (GPI), published by the British Institute for Economics and Peace (IEP) the Czech Republic is ranked amongst the most peaceful and safe countries in the world. It is the seventh best from among 163 countries assessed. The index reflects the crime rate, ease of access to weapons, army size and armament, contributions to the OSN peace missions, relations to

the neighbouring countries, peacefulness of demonstrations, rate of enforcement of the political system towards the citizens, or involvement in foreign conflicts.

In terms of incomes from the international tourist industry (in milliards USD, without the traffic), where the Czech Republic ranks the 36th place and it also shows an above-average increase of a number of nights spent by guests in accommodation facilities.

V the time series 2012 – 2018 there were studied numbers of guests and numbers of overnight lodgings in the four- and five-star hotels, where the data unambiguously result that the demand for accommodation services in these categories of the mass accommodation facilities in the Czech Republic systematically grows, both in the light of non-residents and residents. The article deals with an economic impact of the studied factors in hotel-keeping in the Czech Republic on the gross domestic product.

With usage of the triple classification analysis of variance there were identified conclusive differences of variables "number of guests" and "number of overnight lodgings" in light of three classification criteria – year (2012 – 2019), hotel category (four- and five-star hotel) and type of guest (resident, non-resident).

Methodology

For the analysis of the time series of the number of guests and number of overnight lodgings there were used the data of the Czech Statistical Bureau (ČSÚ, 2020). For the data concerning the gross domestic product there was used the portal Kurzy.cz (Kurzy.cz, 2020).

For processing the data there was used a linear regression and correlation analysis. There was used a classical linear trend of the time series $T_t = \beta_0 + \beta_1.t$. For calculation of the parameters of the trend function there was used the method of least squares offering the best non-deviated estimations (Hindls, 2007). The close dependence was rated by the correlation coefficient (Novák, 2015). Further, there was applied the method of the triple classification analysis of variance, based in evaluation of the F-test (Sanderson E. et Windmeijer, 2016). Significance level was set on $\alpha = 0.05$. For more detailed evaluation there was chosen the Tukey's method (Svatošová, 2004; Joong, 2006). The data were processed with usage of the computer program Statgraphics 4.0.

Methodology of the time series analyses is taken into account by for example Arlt et Arltová (2009), where the economic time series are characteristic by the trend reflecting the changes in the average conduct of the time series. Ordinary visualisation of the indicator conduct is enabled especially by graphs, as a graphical representation enables to recognise a long-term tendency in the course of the time series or another periodically repeated development change (Marek, 2007; Perugia, Hsu, 1993).

The analysis has been carried out for the four-star hotels which are – regarding a number of guests – the most visited in the Czech Republic (ČSÚ, 2019) and for the five-star hotels which are considered as the most luxurious

Results

In the last 7 years there occurs a linear increase in a number of guests and a number of overnight lodgings in four- and five-star hotels (graphs in Figures 1 and 2).

Fig. 1: Trend of Number of Guests in Four- and Five-Star Hotels (Source: ČSÚ 2019, self-processed)

Fig. 2: Trend of Number of Overnight Lodgings in Four- and Five-Star Hotels (*Source: ČSÚ 2019, self-processed)*

Reliability of all the assessed linear trends was represented by the determination index R^2 higher than 93% which shows very quality regression models. Thus it can be claimed that interest in accommodation in the Czech Republic in the time series 2012 – 2018 shows a linearly raising trend; this increase of number of guests and overnight lodgings in both hotel categories evidently projected in the gross domestic product. In the time series there was found very strong correlation, almost perfect dependence between the GDP increase and both variables (correlation coefficient for the number of guests and gross domestic product was 0.995 and for the number of overnight lodgings and GDP was 0.986.

In the time series 2012 – 2019 the increase of the gross domestic product is shown in the graph in the Figure 3.

Fig. 3: Increase of Gross Domestic Product in 2012 – 2018 (Source: ČSÚ 2019, self-processed)

Thus it is unambiguous that the steadily developing Czech tourist industry, accompanied by the linear increase of a number of guest and a number of overnight lodgings, projects itself in strengthening the whole economy of our country. The whole spectrum of influences over domestic economy is described e.g. by Petříček (2015), but it is sure that the tourist industry increase projects itself in the GDP increase as well. This fact is also confirmed by almost stable proportion of the tourist industry in GDP, ranging between 2.7% and 2.9% in 2012 – 2019; standard deviation was 0.082%, also in despite of a quite intensive increase of GDP (e.g. 4.5% in 2017).

All the F-tests of the classification criteria (year, type of guest, hotel category) for the variable „number of guest“, were conclusive at the significance level $\alpha = 0.05$ (Figure 4).

Type of Guest	Average	Homogeneous Groups
Residents	764303.3	*
Non-Residents	2552246.6	*

Source: self-processed

As for a number of guests there is a statistically conclusive difference between residents and non-residents, as well as a number of guests accommodated in four-star hotels differs from a number of those in five-star hotels. The source data show there are – of course – less domestic guests that foreigners. Furthermore, that the guests prefer four-star hotels where the reason can be more favourable proportion of price and quality, in contrast to the luxurious five-star hotels which assumedly only smaller yet wealthier clientele can afford. Differences between years are not crucial but we can claim that at the significance level α = 0.05 in the last year of the time series – the year 2018 – statistically conclusively differs from 2016 – 2012.

The analysis of variance for the classification criterion "number of overnight lodgings" shows that only the category of four-star hotels conclusively differs from the five-stars, where the F-test was conclusive at the significance level $\alpha = 0.05$ (Figure 5).

Four-Stars	8274448.1	*

Source: self-processed

There were not found any inter-annual differences for this variable, as well as there was not found any statistically conclusive difference for the classification criterion "type of guest". Such a result for "overnight lodging" can relate to decreasing trend of a length of overnight lodging in four-star hotels, as confirmed also by the Czech Statistical Bureau data (ČSÚ, 2019-1). Five-star hotels noted an increase of overnight lodgings in the last year, however, the trend cannot be described (Figure 5).

Fig. 5: Number of Overnight Lodgings in Four- and Five-Star Hotels (Source: Self-processed ČSÚ, 2019: Návštěvnost HUZ podle kategorie-územní srovnání)

On the grounds of the above stated statistical analyses we can claim that the development of an efficiency of accommodation services largely reflects the overall development of the economy in the Czech Republic in the monitored period. Tourist industry as a whole almost precisely copied the increase of efficiency of the national economy. Characteristic for the monitored period is a stable proportion of the tourist industry in the gross domestic product of the country. In 2012 – 2017 the proportion of the tourist industry in GDP oscillated between 2.7% (2012) and 2.9% (2017) the standard deviation was only 0.082% which can be considered as very low moderate oscillation around an arithmetical average, namely in condition of the increase of GDP almost in the whole monitored period (excepting 2012 and 2013 where an inter-annual decrease was 0.8%, resp. 0.9%). It moved from 2% (2014) to 4.6% (2017). The increase of efficiency of the tourist industry had to correspond with the GDP growth rate in individual years.

Within the branch of accommodation services there is an evident increase of a number of guests either in four- and five-star hotels. More intensive increase of a number of the accommodated can be seen within the four-star hotels. The reason is probably a higher elasticity of demand for services of this hotel category.

Further years development of a length of overnight lodgings in both monitored categories can be problematic. In the monitored period the trend of previous years continued, when the length of an overnight lodging continuously shortens (Máče, 2012). Again, this trend is more distinctive in the category of four-star hotels. The probable reason is again higher sensibility of a demand in a branch of four-star hotels. This long-term negative trend is being corrected to a certain extent. Despite decreasing number of days spent overnight this value does not have any negative impact on the main indicators of the tourist industry at present. The reason is continuously increasing both a visit rate and a number of guest in accommodation facilities.

Conclusion

The tourist industry represents a stable part of the economy of the Czech Republic. Its proportion in total efficiency of the national economy is well-balanced in the long term. In the branch of accommodation services in four- and five-star hotels there occurs an increase of both a number of accommodated persons and a number of overnight lodgings. This trend is more significant in four-

star hotel category. Together with it there is an evident long-term trend of decrease of duration of accommodation. Also this trend is more significant in four-star hotel category. It can be a reason of significant problems at the moment, when a current increase of the national economy turns and the economy falls in recession. We can assume that in such a case there would occur a total decrease of demand for accommodation services, as it happened between 2008 and 2012, and subsequently a decrease of both a number of guests and a number of overnight lodgings. Together with decreasing length of the stay duration it can lead to significant problems of the entire branch of accommodation services. However, it is probable that the category of four-star hotels, displaying a higher correlation of demand with the economic development, would be affected more perceivably.

Abstract

Today's organizations face the necessity of dealing with a growing number of various tension and risk factors-generators. As stressed many researchers, management studies referring to paradox theory offer new and important sights on an array of organizational tensionsand management issues. The authors took into account the wide range of international scientific literature in which paradoxes in various areas of the economy are widely studied. The aim of this paper is to indication and theoretically refer to the problems of paradoxes in selected areas of management. The paper indicated the contradictions emerging in the areas such as: risk management, demography, real estate market and innovation,

Keywords: Demographic Processes, Innovation, Real Estate Market, Management Problems, Paradoxes, Risk Management.

Introduction

At the end of the 1980s, the first research appeared on the problems of organizational tensions and accompanying paradoxes of various areas of the economy (Quinn, Cameron, 1988). There are many different types of paradoxes found in the literature and that may be found at different levels within an organisation. For example, the following paradoxes can be pointed out: namely, the paradoxes of organizing, performing, belonging and learning (Jarzabkowski et al., 2013; Lewis, 2000; Lim et al. 2017). They contribute to the creation of innovation, both at the time of the release of tensions and of limiting them. They may relate to conflicting purposes may apply to the conflicting objectives, activities and processes, as well as to the significant restrictions. The settlement and the decision require a prior solution that would help maintain the balance between the contradictions and the intention of achieving an objective.

In the field of strategic management, the need to shape the tension between two opposites is indicated.(De Wit, Meyer 2010). These opposites include: logic and creativity, deliberateness and spontaneity, revolution and evolution, markets and resources, reflex and synergy, competition and cooperation, subordination and free choice, control and chaos, globalization and regionalization, as well as profitability and accountability. Those behaviors and features that maximize the likelihood of a company's major success also maximize the likelihood of a total disaster. Raynor (2007) points out that this peculiar paradox of strategy can be resolved by separating the management of permanent choices from the uncertainty management.

The phenomena are occurring in the enterprises environment are very important, especially in the context of aging and shrinking of potential labour force. The demographic paradox refers to the proposition that there is an inverse relation between the number of children that people in the

developed countries, but also the in the developing and emerging countries, actually have and could afford to have in view of their constantly rising real income. The term paradox results from the notion that greater means would necessitate the production of more offspring as pointed out by Thomas Malthus (Wail, 2009).The conclusion is that nations or subpopulations with higher GDP per capita are observed to have fewer children, even though a richer population can support more children.

In the real estate sector, however, it is still possible to see contradictions and paradoxes in adopted strategies and management (Sitek 2015). They concern government strategies and decisions, e.g. within the framework of housing programmers', prices, mortgages, financial resources, and even in terms of meeting the needs of the purchasers i.e. family (Tosics 2018; Donner 2000; Holmans et al. 2002). The threats and paradoxes in the real estate market point to the need to search for new strategies and management methods and ways of analyzing this market using new tools.

Criticism of risk management as a result the global financial crisis and contradictions in this area (by academics and practitioners point of view) became the foundation of research from the paradox theory perspective (Power 2011, Mikes 2009).

The aim of the paper was to theoretically refer to the problems of paradoxes in selected areas of management. The authors indicated the contradictions emerging in the areas such as: innovation, risk management, demography and real estate market (fig. 1).

Figure 1: Number of academic literature in paradoxes

Source: own study based on Web of Science and Scopus databased

The remainder of this paper is organised as follows. Building on the existing literature, in first section we illustrate current trends in risk management research from the tension perspective. The next sections reviews the literature on paradox in innovations, demography and on the real estate market. Discussion of our key findings and a conclusion complete the paper.

Methodology of Research

The inspiration for the analysis of organizational problems is the need to counteract the growing number of factors that generate tension and risk in organizations. The aim of the study is, by referring to the problems of paradoxes in different areas, to indication and theoretically refer to the problems of paradoxes in selected areas of management.

National and international literature (covering the period since the 1990s), related to this problem and secondary data, was used to achieve the purpose of the work. Therefor in the paper the analysis of national and international literature as well as the Web of Science and Scopus data base in the context of paradoxes were conducted. The methodology and literature research adopted in the work enabled the presentation of the most common contradictions and paradoxes increasing the effectiveness of undertaken actions and indicated the need for continuous control selected management areas.

Same Management Problems from Paradox Perspective

Management of risk from paradox perspective

The issues of paradoxes in management of risk is a study subject addressed by many researchers (Power 2011; Mikes 2009; Gorzeń-Mitka 2015, 2016, 2017 and others). Most of researchers define paradox as contradictory yet interrelated elements that exist simultaneously and persist over time (Lewis, 2000; Smith and Lewis, 2011; Jarzabkowski et al. 2013). Describing the concept of paradoxes in risk management, researchers highlight its specificity and complexity, which are inherent characteristics of the process itself (e.g. Gorzeń-Mitka, 2016, 2017; Lim et al. 2017). Studies of the nature of paradoxes pay attention, among others, on organising paradox, performing paradox, belonging paradox, and learning paradox. It is important to stress that all four forms of paradox may coexist, interact and cascade down through an organisation - from the organisational level, through to functional and individual levels (Smith, Lewis 2011; Jarzabkowski et al. 2013).

Although various aspects of paradoxes have been analysed in recent years, nowadays research on contradiction in management is one of intensively developed area. It is confirmed by, among other things, the number of scientific works that analyse problems in this area. In leading databases covering management literature (Web of Science, SCOPUS, Emerald, Elsevier, Google Scholar) there is an increase in the number of publications addressing issues concerning management and risk in tension context. For instance, the number of papers on the subject discussed included in the Scopus and Web of Science database increased almost fivefold between 2000 and 2019 (Figure 2).

Figure 2: Number of academic research on risk and management in paradox context
Source: own work based on Science Direct journal database

Analysis (Figure 2) showed dissection of the number of publications depending on the adopted combination analysed words. According to the search words "paradox + risk" an almost twofold the number of publications than in the case of search "paradox + management". The last combination provides the lowest number of publications. This indicates, on the one hand, considerable interest in the issues of paradox and risk in other areas than management, on the other hand, this matter on the basis of management science is in the initial phase of the interest of researchers.

It should be stressed that in the period there has been a fivefold increase in the number of publications in the analysed area. Paradox perspective in the risk management occurs most often in conjunction with the analysis of problems in economics, business and social sciences. Leading issues identifying paradoxes regarding risk and management context discussed in the scientific literature include e.g. paradoxical nature of risk management systems in the banking sector, corporate social responsibility, contextual variability of risk management practice, organizational stretch goals, relational network approach to partner selections and network behaviour and others.

Lim, Woods Humprey and Seow (2017) examine the operational dynamics and paradoxical nature of risk management systems in the banking sector. They postulate viewing the risk management systems as a series of connected paradoxes not as a set of assured, robust practices. They indicate that risk management requires a fundamental switch in emphasis away from a normative, standards-based approach to one which gives greater recognition to its behavioural dimensions.

In turn, work by Kingma (2015) points toward a paradox of risk management and corporate social responsibility (CSR). He draws special attention to the role of knowledge production and science play in the construction and evaluation of gambling risks and indicate that despite all the efforts put in the risk-management strategies, a significant part of the problem CSR cannot be addressed at all.

Important comments on the nature of paradoxes in risk management are presented by Besner and Hobbs (2012). They investigate the interplay between risk management and uncertainty and the contextual variability of risk management practice (relation between the extent of use of risk management and the level of project uncertainty) and show that the use of risk management practices and tools is negatively related to the degree of project uncertainty.

In turn, Sitkin, See, Miller, Lawless, and Carton (2011) investigate the organizational pursuit of seemingly impossible goals (knows as stretch goals). They conclude that stretch goals are, paradoxically, most seductive for organizations that can least afford the risks associated with them.

In summaries, it can be said that the context of paradoxes in management of risk most often appears in connection with the analysis of such problems as an organizational culture especially risk culture (Gorzeń-Mitka 2015, 2017), heterogeneity of management system or environment.

Paradoxes in Demographic Processes

The widespread opinion that demography is lacking in theory is based in part on a particular view of the nature of scientific theory, generally known as logical empiricism or positivism (Burch 2003).

Theories that explain the shaping of demographic processes, for example: the fertility decline theory by Caldwell, Easterlin's theory and hypothesis and the economic theory of human behavior by G.S. Becker or numerous theories of migration have become the inspiration for researches (Bodvarsson et al. 2015). Therefore, the paradoxes in demographic processes can be found innumerous scientific researches in this scope (Skibiński 2018, Bloom et al. 2010). Figure 3 is included the number of scientific publications on the paradoxes in demography estimated based on the leading database.

The data from Fig. 3 indicate that the number of publications related to paradoxes in demography has been steadily increasing over the years. The results of the study support the existence of the demographic and economic paradox, which is described that nations or subpopulations with higher GDP per capita are observed to have fewer children, even though a richer population can support more children (Balan, 2015).There are many ways in which fertility inversely impacts economic outcomes. In the international literature Brander and Dowrick (1994) exanimated the effects of population growth and fertility on economic growth for 107 countries covering 1960-1985 periods. They concluded, that high birth rates cause the reduction of economic growth by means of investment effects and capital dilution.

In turn Li and Zhang (2007) examined the impact of birth rate on economic growth using a panel data set of 28 provinces in China for the period 1978-1998.Using the generalized method of moments estimator, the empirical findings of Li and Zhang (2007)'s study showed that the birth rate has a negative impact on economic growth. This finding is interpreted by the authors in the waythat it supports the view of Malthus and China`s birth control policy is indeed growth enhancing. According

Figure 3: Number of scientific studies including paradoxes in demography

Source: own study based on: Science Direct journals database

to Luci and Thevenon (2010) investigated whether there is a convex relationship between economic development and fertility for 30 OECD countries over the period 1960-2007. They found an inverse J-shaped pattern of fertility along the process of economic development. They concluded that there is a clear shift in the relationship between the two variables from negative to positive. Whereas Somayeh et al. (2013) examined the effects of total fertility rate, life expectancy at birth, mortality rate and capital stock on the economic growth in 16 developed countries and 14 developing countries using panel data analysis over the period 1990-2010. Their researches show that capital stock and life expectancy have a statistically significant positive effect on economic growth, while mortality rate has a statistically significant negative effect on economic growth in both groups of countries. The influence of fertility rate on economic growth differs for developing and developed countries. For example, to developed countries, fertility rate has a statistically positive effect on economic growth, while it has a statistically negative effect for developing countries. Social and economical transformations have recently stimulated political debates and policies on the integration of migrants in most Western and East European countries. While transnational migration studies have documented migrants' cross-border activities there have been few empirically grounded efforts to theories these developments in the framework of integration and status theory. Nieswand (2011) indicates based on a case study of Ghanaian migrants, integration processes and develops a theorem of the status paradox of migration, which explores the interaction between migrants' integration into the receiving country and the maintained inclusion into the sending society. It describes a characteristic problem for a large class of labour migrants from the global south who gain status in the sending countries by simultaneously losing it in the receiving countries of migration. This transnational dynamic of status attainment, which goes along with specifically national forms of status inconsistency, is what is called the status paradox of migration. By bringing together two modes of national status incorporation within one framework, the status paradox provides an innovative perspective on migration processes and demonstrates the usefulness of a trans nationalist integration theory (Nieswand 2011). Silva et al. (2006) discuss the so-called paradox of ageing process, with respect to the members of the age group 55-64 years of age. This generation is currently too young to retire, despite the length of their working lives for some in excess of forty years and high earnings, yet is too old to continue working, since employers prefer to hire younger, more flexible and less expensive workers. Furthermore, official statistics show that the longevity of this

generation is higher than its predecessors, an evolution that would apparently call for a gradual increase in the retirement age. To sum up, it can be concluded that the knowledge about paradoxes in demographic processes are becoming more important for each organization especially in the face of population ageing.

Paradoxes in the Real Estate Market

To date, contradictions and paradoxes in the real estate market can still be observed in the management of resources in this market and in the strategies adopted for its requirements and the implementation of government housing programmes. However, the topic of paradoxes on the real estate market is rarely chosen by the authors. As shown by the Web of Science and Scopus databases, the number of scientific articles on this subject is not significant but is systematically growing from year to year. This is shown in Figure 4.

The situation of the price paradox concerning enormous differences in property prices reflecting uneven the level of development of individual regions of the country is well-known.

In Poland, in 2019, a package of government declarations of social transfers appeared, combined with a strategy of the minimum wage growth path which means the achievement of gross PLN 4,000

Figure 4: Number of academic research on real estate market in paradox context
Source: own study based on: Science Direct journals database

by 2024. Since the demand for real estate is sensitive to changes in incomes, a significant increase in incomes has resulted in a large rise in demand for already expensive apartments, with a significant increase in their prices observed especially in large urban agglomerations.

The housing paradox was discussed by Ivan Tosics (2018). Financing of housing investments fosters the gentrification of parts of the cities (most often a residential district) into a zone dominated by residents with a relatively high material status, causing resettlement and evictions on an unprecedented scale (United States, Spain, Portugal). To counteract this, governments are introducing progressive legislation to confirm the social function of housing and to facilitate the temporary expropriation of vacant housing units, while prohibiting mortgage foreclosure and evictions leading to homelessness and limiting the opportunities for foreign investors to purchase residential property. The state supports the development of social housing not only with its own housing programmes but also by promoting market mechanisms (Donner 2001, p. 29; Sitek 2015).

With the current housing situation in Poland, a credit paradox, i.e. "higher own contribution may mean more expensive credit", represents quite important information. In some banks, the credit recipients with 45% own contribution pay a higher margin than those who borrow 80% of the value of the property. The reasons for this paradox should be seen in the design of bank margins. With a large own contribution, the interest rates will be higher, although the risk for the bank will be lower (BiuroPrasowe Bankier.pl 2017).

Paradoxes related to the purchase of real estate and housing loans are perceived in a fairly similar way. Stopka (2009) enumerated such paradoxes as buying real estate and loans in banks. This author noted that when real estate prices rise sharply, the highest number of transactions to buy them is observed. However, after the collapse of real estate prices, the number of buyers is relatively low. In the case of a credit paradox, banks are very keen to lend at very low margins at a time of optimistic GDP forecasts. In a period of economic slowdown and at very high margins, banks are wary of granting new loans. This represents a mortgage loan paradox.

The analysis of the presented paradoxes in the real estate market shows the necessity of constant monitoring of three aspects: access to flats, the level of housing expenditure and allocation of financial resources which is strictly related to this expenditure (Holmans et al. 2002; Sitek, 2015).

Management of Innovation from Paradox Perspective

Paradoxes also appear in the area of innovation management and result mainly from the complexity of reality (Hall and Smith). Interest in these issues is seen, among others, in the growing number of scientific publications addressing this topic, especially in recent years. They analyses the Scopus and Web of Science databases, a significant increase in the number of publications in the field of innovation management can be seen since year 2000 (nine-fold and eight-fold increase). In the case of publications also taking into account the problem of paradoxes, the numbers are definitely smaller. In the analyzed period, there are 444 publications in the Scopus database and only 24 publications in the WoS database. This may indicate the initial phase of researchers' interest in contradictions in the area of innovation management. (Figure 5)

Figure 5: Number of academic research on innovation management in paradox context
Source: own study based on Science Direct journals database

In the case of innovation management, paradoxes can be found in various areas and on many levels. According to Deloitte (2005), the innovation paradox is the reluctance (inability) of manufacturing firms to take actions that build the operational capabilities (as part of a strategy) necessary to create innovation. It has been noticed that in the manufacturing industry there is a significant profit barrier resulting from the failure of introducing most new products and services to the market. This paradox

is the result of several important reasons, including: the capabilities of suppliers; insufficient information on customer needs; inconsistent approach to innovation in the area of activities related to products, customers and the supply chain, as well as unwillingness to allocate additional expenses for research and development activities.

Francisco (2010) also notes the contradiction between present-day innovations and the innovation process. He uses the term "innovation paradox" to define the negative looping of phenomena related to the non-reflective pursuit of digitization, streamlining, increasing the efficiency and consumption that contribute to less interest in the development of knowledge and creativity. As a result, we can see the process of going away from human experiences, behaviors and values that are a source of innovation. Innovations are a result of “a feedback between the technical capabilities and needs, as well as the interaction between technology, science and the implementation actions within a company”.

Innovation management is associated with long-term planning, high costs and a high risk of failure (Kay 1996, p. 26-30; Gorzeń-Mitka2007, p. 15). The paradox in innovation management is particularly seen when managers perform many tasks to introduce innovations, some of which seem to conflict with each other or with the leadership style adopted by them. A contradiction appears here in terms of priorities important for the development of a company and for the stakeholders, who most often expect immediate effects–that look forward no further than 2 years (Davidson 2011,Wang et al. 2019) Unfortunately, the effects of efforts made in this area are not immediately visible. To be stressed that just having a formulated innovation strategy is not a guarantee of success. Successful implementation is greatly dependent on the degree of business preparedness, and in particular, on the appropriate engagement of the management team (entrepreneurism, managers) (Sipa, Skibiński, 2015; Brondoni, 2013).

Referring to the problems of contemporary organization structures and leadership styles, Buekens (2013) points to such paradoxes of innovation as: flexibility paradox; the paradox of failure; the paradox of business success; knowledge paradox; the paradox of strategic alignment.

In the conditions of globalization, introducing groundbreaking innovations that give a long-lasting advantage over competitors seems to be more and more difficult to achieve. Therefore we should also mention the paradox related to imitation and innovation. According to Krzakiewicz and Cyfert (2016), imitation and innovation are not mutually exclusive phenomena, but they create an integrated system related to mutually complementing features and a synergistic effect, which means that imitation should not be seen as an obstacle, but as a driver of a properly organized innovation process. Tremendous technological leaps and using newer technology, allow imitators to outdistance innovators. Creative imitations focus on generating imitative products, but with new functions. These imitative products include benchmarking, strategic alliances and significant investment in research and development. Drucker (2001) emphasizes that the benefits of increased productivity are related not to the original innovations, but rather to the improvements that follow them. Imitators can provide the recipients with both an improved product and a product which is much cheaper.

Contradictions can also be seen when we look at the issue of encouraging employees by managers to be open to new and unknown things; motivating for the efficient flow of knowledge and rewarding the best ideas; providing employees with the freedom of creativity while maintaining control in this regard. They also have to promote innovation, while not exposing a company to loss in profitability and losing the position on the market. (Hall, Smith; Leonardbarton 1992).

Conclusion

Paradoxes may be found in various fields and they have become the subject of descriptions and discussions in terms of many scientific research and by learning and researching various types of paradoxes, we may better understand the behaviours of various business entities.

Undoubtedly, paradox in risk management context is a notion that resists clear classification. With respect to the conducted analyses, one should emphasize the fact that this problem has not been sufficiently explored in management sciences but we observe a growth of interest in this concept.
In the area of real estate market for a high attention deserves the fact that the government programs of subsidies of mortgage loans for young people paradoxically were more expensive in the whole period of the credit, which directs very important need of changing the management of subsidising this type of activity.

The results of research presented in this study may provide a basis for further work in this area.
Contemporary organizations may be efficiently managed when managers understand the dynamics of social-cultural processes in terms of business. Also solve problems in accordance with the algorithm: identification of paradoxes – analysis of conflict, and consistently searching for synthesis – a new paradigm – new goals and strategies – new ways of solving problems.

Therefore, identifying and getting to know these paradoxes helps to manage them, increasing the efficiency of the undertaken actions, and the need to control selected management areas.

Resumen

Este estudio analiza los factores que afectan la configuración y consolidación de los puertos verdes en Colombia. Para este propósito, se realiza un estudio de caso de los puertos de carga marítima de Cartagena, Barranquilla y Santa Marta abordando entrevistas semiestructuradas para identificar los factores que contribuyen a la consolidación de los puertos verdes y los factores que guían la gestión de la sostenibilidad en los puertos que no se han certificado aún como puertos verdes. Los resultados muestran que las regulaciones ambientales son un punto de partida, pero no son el factor clave para consolidarse como un puerto verde. Factores como la inversión en tecnologías limpias, la integración con grupos de interés, y la evaluación y monitoreo de indicadores ambientales relevantes se han convertido en los factores diferenciales que permiten que el puerto de Santa Marta haya sido certificado y reconocido como un puerto verde. Como conclusión, la conversión de los puertos colombianos a puertos verdes no debe limitarse al logro de certificaciones, como la certificación EcoPorts, sino que debe garantizar la contribución al desarrollo sostenible a través de dimensiones económicas, sociales y ambientales, y a través del logro de los ODS.

Palabras clave: Puertos verdes, regulación ambiental, puerto de carga marítima, desarrollo sostenible, certificación EcoPorts

Introducción

Un puerto verde de define como un puerto que desempeña sus actividades causando daños mínimos al medio ambiente y a la sociedad, proporcionando medidas de mejora y control de calidad del aire, el agua, el ruido y los desechos (Chen et al., 2019; Fahdi, Elkhechafi, & Hachimi, 2019; Zis, 2019). Esto alinea la iniciativa de puertos verdes con la agenda de política internacional sobre desarrollo sostenible, contribuyendo al logro de varios objetivos de desarrollo sostenible (ODS), expresados en la Agenda 2030 de la ONU (Londoño, 2015; Londoño & Baena, 2017; Londoño & Cruz, 2019).

La designación de puerto verde se otorga a través de una certificación otorgada por la Organización Europea de Puertos Marítimos (*European Sea Ports Organization* - ESPO) que a su vez promueve el estándar de Sistemas de Revisión Ambiental Portuaria (*Port Environmental Review Systems* - PERS), que es el único estándar de gestión ambiental específico para el sector portuario, cuyo cumplimiento está certificado a través de la firma *Lloyd's Register Quality Assurance* (EcoPorts, 2019). Entre las ventajas generadas por EcoPorts está la promoción del comercio seguro y la eficiencia en las operaciones portuarias, la entrada a la cadena logística de compañías que solo invierten y hacen negocios con puertos certificados, la atracción de nuevos clientes, la minimización de los impactos adversos en la comunidad y el medio ambiente, y la mejora de la imagen corporativa en la sociedad (Serna et al., 2020; Akgul, 2017; Satir & Doğan-Sağlamtimur, 2018).

Colombia fue el primer país fuera de la Unión Europea en tener un EcoPort, que se otorgó al puerto de Santa Marta por primera vez en 2013, debido principalmente al transporte de carbón, ya que la actividad

minera no puede concebirse sin tener una obligación y responsabilidad con la comunidad y el medio ambiente (Moore, 2008; Todd, 2000; Zeng, Liu, He, Ma, & Wu, 2018). Este logro se debe, en gran medida, a las capacidades de emprendimiento internacional del equipo directivo de la Sociedad Portuaria de Santa Marta en relación con la orientación al cliente, la proactividad y la creación de valor para las partes interesadas o *stakeholders* (Causado & Londoño, 2015; Londoño, 2014; Tabares, Alvarez, & Urbano, 2015), quienes han contribuido a reflejar en su misión y visión el compromiso con la sostenibilidad.

Igualmente, debe tenerse en cuenta que las políticas ambientales tienen un impacto directo en la regulación ambiental establecida por los puertos (Tsai et al., 2018; Woo, Moon, & Lam, 2018), y estas políticas deben explicar las sanciones, los incentivos fiscales y recompensas para aquellos puertos que promuevan prácticas sostenibles a nivel ambiental (Arbelaez, 2015; Sheu, Hu, & Lin, 2013; Londoño, 2018). Por lo tanto, se requiere un equilibrio entre las demandas de los puertos hacia los operadores marítimos y los incentivos que permiten a dichos operadores mantener la rentabilidad de las operaciones, asegurando la armonización entre la regulación ambiental y el apalancamiento económico (Tseng & Pilcher, 2019; Wan, Zhang, Yan, & Yang, 2018; Vargas & Díaz, 2016). Todo esto traerá una alta competitividad y mejorará la sostenibilidad de las cadenas de suministro que utilicen puertos verdes, y a su vez incrementará la ventaja competitiva de los productos finales de dichas cadenas (Cano et al., 2015).

Caso de Estudio

En esta investigación, se sigue un estudio de caso de estudio múltiple integrado (Yin, 2013), ya que las unidades de análisis son los tres principales puertos de la costa atlántica colombiana (Cartagena, Barranquilla y Santa Marta), y las variables a analizar son institucionales, asociadas con la política ambiental y la actitud del equipo de gestión del puerto hacia el emprendimiento. La información del estudio se recopiló a través de una entrevista semiestructurada aplicada a los gerentes estratégicos de los puertos, cuyas preguntas se presentan en la Tabla 1.

Tabla 1: Preguntas de la entrevista semiestructurada aplicadas a los gerentes de los puertos

Factores	Preguntas
Factores legislativos	¿Cuál es el impacto de la política ambiental y la legislación ambiental en Colombia en el logro de la certificación EcoPorts?
	¿Cómo afectan la política ambiental y la legislación ambiental en Colombia a la configuración de un puerto verde?
Factores internos	¿Cómo han influido los factores asociados con la capacidad del equipo de gestión en la obtención de la certificación EcoPorts?
	¿Cómo contribuyen los factores asociados con la capacidad del equipo de gestión a la configuración de un puerto verde?
Certificación EcoPorts	¿El puerto tiene certificación EcoPorts?

En los estudios de caso abordados en esta investigación, prevalece la relevancia de los casos en lugar de un criterio de representatividad estadística (Gibbert & Ruigrok, 2010; Yin, 2013), que se asocia con la importancia de las unidades de análisis seleccionadas. Por lo tanto, los puertos seleccionados son los más importantes de la costa atlántica de Colombia en términos de infraestructura, tránsito, volumen de mercancías y capacidad de almacenamiento.

Resultados

A continuación se presenta la síntesis de las respuestas obtenidas para cada puerto.

Puerto de Cartagena

La política ambiental y la legislación ambiental sirven como guía para que los puertos sean sostenibles a nivel ambiental. Este puerto cumple con las obligaciones legales ambientales y avanza hacia la gestión ambiental, y esto se corrobora con la disminución en el consumo de diésel y energía, lo que resulta en menores emisiones de CO2 por año. Incluso, el puerto de Cartagena ha sido nominado por la ESPO como la instalación portuaria que más ha salvaguardado y contribuido a la naturaleza y al ecosistema en su área de influencia. Por lo tanto, este puerto no está lejos de convertirse en un puerto verde, ya que existen prácticas ambientales que incluso van más allá del cumplimiento de la ley, sin embargo, es necesario seguir las fases de esta nueva iniciativa, y especialmente involucrar a los diferentes interesados en este proceso.

Puerto de Barranquilla

Las obligaciones legales indicadas en las políticas ambientales representan el punto de partida tomado por el puerto, sin embargo, requiere una gestión ambiental centrada en la configuración de un puerto verde. Aunque el puerto de Barranquilla no está certificado como puerto verde, realiza acciones dirigidas a la gestión ambiental, tales como tener un permiso de emisiones al aire otorgado por la autoridad ambiental local, lo que implica la realización de estudios anuales de calidad del aire. Además, los vehículos que ingresan al puerto deben tener certificaciones técnico-mecánicas vigentes. Del mismo modo, el puerto tiene permisos de vertimiento de líquidos, cuenta con un programa de gestión de residuos sólidos que se difunde a todo el grupo empresarial y a los contratistas que ingresan a las instalaciones del puerto. Se han intervenido diferentes aspectos ambientales en el puerto, pero se requieren altas inversiones en tecnologías limpias para lograr una transformación efectiva hacia un puerto verde.

Puerto de Santa Marta

La legislación ambiental es el punto de partida para una certificación de puerto verde y el proceso de planificación ambiental se coordina con el Sistema Nacional Ambiental (SINA), además, el decreto 3083 de 2007 de Colombia proporciona algunas pautas con respecto a la carga directa de carbón en los puertos que exportan este mineral. Sin embargo, no existe una legislación específica en Colombia respecto a los puertos verdes, ya que la ESPO promueve el único estándar de gestión ambiental específico para el sector portuario (PERS). Sin embargo, la legislación ambiental en Colombia promueve buenas prácticas ambientales, lo que resulta en la obtención de este tipo de certificación. Algunos de los factores que se evalúan, supervisan y han sido cruciales para que el puerto de Santa Marta obtenga una certificación EcoPorts son: la eficiencia en el uso del agua para los procesos portuarios, iniciativas como la carga directa de carbón, el control de la calidad del aire, la sustitución de equipos de gasolina por equipos eléctricos, la presencia y protección del último relicto de coral sobre la bahía de Santa Marta en los muelles de operación, así como el trabajo social realizado por la Fundación de la Sociedad Portuaria de Santa Marta. Por lo tanto, la certificación de puertos verdes no está limitada al cumplimiento de los requisitos legislativos, sino que también requiere de inversión financiera para la gestión ambiental, y especialmente requiere del trabajo integrador de los *stakeholders* afectados por la operación del puerto y de la capacitación continua del personal del puerto.

En resumen, el puerto de Cartagena está enfocado en la integración de los *stakeholders*, el puerto de Barranquilla está enfocado en altas inversiones en tecnologías limpias, y el puerto de Santa Marta destaca que los factores que contribuyen a obtener la certificación EcoPorts están relacionados con la inversión en tecnología, orientación hacia los *stakeholders*, capacitación del personal del puerto en sostenibilidad, y monitoreo estricto de los indicadores ambientales.

Conclusión

En los puertos abordados en este estudio, se destaca la importancia de las regulaciones y políticas ambientales para crear un marco institucional que promueva la protección ambiental y la sostenibilidad, sin embargo, si no hay compromiso y actitud proactiva por parte del equipo de gestión de las sociedades portuarias, el marco regulatorio será insuficiente. Debido a que no existe una política específica para los puertos verdes en Colombia, es necesario centrarse en factores más importantes, como la integración de los *stakeholders*, las inversiones en tecnologías limpias, la capacitación del personal del puerto en sostenibilidad, y el monitoreo de los indicadores ambientales. Como consecuencia, estos factores permitieron certificar algunos puertos como puertos verdes y recibir nominaciones y permisos que demuestran buenas prácticas ambientales.

Jose Alejandro CANO
Universidad de Medellin, Medellin, Colombia, jacano@udem.edu.co

Resumen

El requisito de fabricar nuevos buques de carga utilizando nuevas tecnologías de reducción de emisiones de azufre es una de las implicaciones del Anexo VI del Convenio Internacional para la Prevención de la Contaminación por los Buques (MARPOL). Por lo tanto, el propósito de este artículo es analizar a través de una búsqueda especializada en la literatura, los desafíos para la adopción de depuradores y combustibles con bajo contenido de azufre en los fabricantes de barcos y compañías navieras. Los principales hallazgos muestran que los fabricantes de buques, bajo un escenario de sanción y penalización derivado de las regulaciones internacionales de transporte marítimo, deben financiar su capital de trabajo y sus costos operativos, lo que implica un aumento en los precios de los buques que aplican estas nuevas tecnologías. Por otro lado, las compañías navieras deben elegir qué tecnología es la más apropiada de acuerdo con las áreas donde navegan los barcos, las economías de escala de las rutas comerciales, y el análisis de costo-beneficio de la modernización de los barcos.

Palabras clave: Reducción de emisiones de azufre, depuradores, combustibles con bajo contenido de azufre, fabricantes de barcos, navieras

Introducción

El transporte marítimo es aquel que genera menos emisiones de CO2 por tonelada-milla en comparación con otros medios de transporte tales como el transporte ferroviario, terrestre y aéreo (Lister, Poulsen, & Ponte, 2015). Sin embargo, desde la década de 1960, los efectos ambientales negativos generados por factores operativos y accidentales en el transporte marítimo han aumentado junto con el rápido crecimiento y el movimiento anual de mercancías (Ochoa, 2015)(Grant & Elliott, 2018). Algunos de estos efectos negativos se relacionan con las emisiones de óxidos de azufre (SOx) y óxidos de nitrógeno (NOx), contaminación del aire, contaminación de los mares, muertes de especies acuáticas y plancton debido a derrames de petróleo y productos químicos, basura y sedimentos (House, 2004; Koski, Stedmon, & Trapp, 2017; Sato, 2018; Winther et al., 2014; Woodyard, 2004).

Esta situación condujo a la adopción de la Convención Internacional para la Prevención de la Contaminación por Buques (MARPOL) en 1973. Esta es la principal convención relacionada con la protección del medio ambiente relacionada con el transporte marítimo y desde entonces ha sido modificada continuamente de acuerdo con el realidades del comercio internacional y el impacto en el medio ambiente (Lister et al., 2015; Walker et al., 2019). Por esta razón, el Anexo VI de MARPOL limitó el contenido máximo de azufre de los combustibles marinos en las Áreas de Control de Emisiones de Azufre (Sulfur Emission Control Areas - SECA) a 0.1% desde 2015 y 0.5% en 2020 para aquellas áreas fuera del SECA (Antturi et al., 2016; Nikopoulou, 2017; Olaniyi, Atari, & Prause, 2018; van Hassel, Meersman, de Voorde, & Vanelslander, 2016). El SECA comprende el Mar del Norte, el

Mar Báltico, el Mar Caribe alrededor de Puerto Rico, las Islas Vírgenes y algunas millas náuticas de Canadá y los Estados Unidos.

Esta situación implica un compromiso ambiental y una inversión en tecnologías para reducir las emisiones de azufre de los buques basadas en sistemas de limpieza de gases de escape (depuradores o scrubbers) y/o la incorporación de combustibles con bajo contenido de azufre (Endres et al., 2018; Gu & Wallace, 2017; Han, 2010; Scott, 2017; Zheng & Chen, 2018), lo que lleva a una serie de efectos financieros para los fabricantes de barcos y las compañías navieras que alquilan dichos barcos (Allal, Mansouri, Youssfi, & Qbadou, 2019; Solakivi, Laari, Kiiski, Töyli, & Ojala, 2019). De esta forma, se espera aumentar la competitividad y sostenibildiad de cadenas de suministro que empleen buques equipados con depuradores o que funciones a base de combustibles bajos en azufre (Cano et al., 2015).

Metodología

Para la revisión de la literatura, se consultaron las bases de datos de Scopus, Wos y Science Direct utilizando la ecuación de búsqueda *("Shipowners" or "Shipping Companies") and ("Scrubbers" or "Low Sulfur Fuel")*. Esta búsqueda proporcionó 43 documentos que abordan los métodos de reducción de emisiones de azufre en el sector marítimo, que consisten en 34 artículos de revistas, 5 *conference proceedings* y 4 capítulos de libros. La Figura 1 muestra el número de documentos publicados por año, identificando que el 79% de los documentos fueron publicados entre 2015 y 2019, indicando que las tecnologías y soluciones que permiten el cumplimiento de las propuestas en el capítulo VI de MARPOL por parte de compañías navieras, dueños de barcos y fabricantes de barcos son un tema actual en la literatura.

Figura 1: Documentos por año

También se identifica que la revista *Transportation Research Part D: Transport and Environment* concentra el mayor número de documentos publicados sobre el tema de este estudio, publicando el 18% de los documentos analizados (8 documentos). Los autores con el mayor número de publicaciones sobre este tema son Thierry Vanelslander, Christa Sys, Kevin Cullinane y Edwin van Hassel.

Resultados

Los estudios de (Armellini, Daniotti, Pinamonti, & Reini, 2018; Solakivi et al., 2019; Stevens, Sys, Vanelslander, & van Hassel, 2015; Zhu, Li, Shi, & Lam, 2017) argumentan que el uso de depuradores y filtros de partículas diésel representa la mejor forma de reducir las emisiones de azufre en los barcos, especialmente para las compañías navieras que presentan mucho tráfico a través de la SECA, ya que los combustibles con bajo contenido de azufre suelen ser más caros (Gu & Wallace, 2017; Han, 2010; van Biert, Godjevac, Visser, & Aravind, 2016; Zheng & Chen, 2018). Por otro lado, el uso de combustibles con bajo contenido de azufre es más adecuado para las compañías navieras que operan en un número reducido de puertos en la SECA o que operan fuera de la SECA (Acciaro, 2014; Calderón, Illing, & Veiga, 2016; Halff, Younes, & Boersma, 2019; Rehmatulla, Calleya, & Smith,

2017; Svanberg, Ellis, Lundgren, & Landälv, 2018; Theocharis, Rodrigues, Pettit, & Haider, 2019; Vierth, Karlsson, & Mellin, 2015). Otros factores como el consumo anual de combustible, los precios del combustible y la regulación ambiental también influyen en la decisión de elegir la mejor alternativa para reducir las emisiones de azufre (Rehn, Haugsdal, & Erikstad, 2016).

Del mismo modo, los fabricantes de barcos enfrentan grandes desafíos asociados con los altos costos de capital y la falta de leyes integrales sobre la contaminación del aire, ya que requieren el compromiso de actores como puertos, gobiernos, mercados financieros y compradores, vendedores y arrendatarios de barcos (Animah, Addy-Lamptey, Korsah, & Sackey, 2018; Cullinane & Bergqvist, 2014; Schinas & Stefanakos, 2012). Además, se destaca la necesidad de mejorar la infraestructura portuaria, especialmente para la aplicación de tecnologías basadas en combustibles con bajo contenido de azufre, ya que hay muy pocos puertos en el mundo que tengan la infraestructura adecuada para proporcionar este servicio (Cullinane & Cullinane, 2019; Holmgren, Nikopoulou, Ramstedt, & Woxenius, 2014; Kim & Seo, 2019; Notteboom & Vernimmen, 2009; Sheng, Meng, & Li, 2019) (Sanabria, Acosta, & Rodríguez, 2015).

Respecto a la viabilidad económica de los depuradores y los combustibles con bajo contenido de azufre, varios análisis de los flujos de caja a largo plazo muestran que los costos de ambos tipos de tecnologías superan los beneficios bajo la regulación marítima actual (Panasiuk and Turkina, 2015) (Antturi et al., 2016), lo que significa que el Anexo VI de MARPOL corre el riesgo de incumplimiento. Como consecuencia, la literatura muestra la necesidad de proporcionar soluciones que trasciendan la naturaleza coercitiva (representada en multas, sanciones), ya que esto puede afectar tanto los costos de transporte como el dinamismo del comercio internacional; y por otro lado, se requieren acuerdos y compromisos entre los diferentes miembros de la cadena de comercio marítimo para reducir conjuntamente las emisiones de azufre y contribuir a la sostenibilidad del transporte marítimo (Adland, Fonnes, Jia, Lampe, & Strandenes, 2017; Lähteenmäki-Uutela, Repka, Haukioja, & Pohjola, 2017; Zis, 2019).

Conclusión

La principal preocupación de los fabricantes de barcos está relacionada con las sanciones que se les pueden imponer si no adoptan tecnologías para reducir las emisiones de azufre, lo que les obliga a realizar grandes inversiones para cumplir con los requisitos normativos, e implica un aumento en el precio de venta de embarcaciones equipadas con nuevas tecnologías. En las compañías navieras se destaca el uso de análisis de costos de oportunidad relacionados con la compra o alquiler de barcos con depuradores o combustibles con bajo contenido de azufre. Estas decisiones dependen principalmente de factores como las áreas de navegación de los buques, las economías de escala de las rutas comerciales y el análisis de costo-beneficio de la modernización de los buques. Futuras investigaciones pueden enfocarse en proponer diferentes formas de mejorar la relación y los acuerdos entre los propietarios y los arrendatarios de buques para reducir las emisiones de azufre de manera rentable y económica.

Resumen

Este artículo tiene como objetivo presentar un método de ponderación de indicadores para la construcción de índices compuestos con el fin de evaluar el desarrollo sostenible a nivel subnacional. Para ello, se utiliza un proceso analítico jerárquico (AHP) de comparaciones por pares, que se considera relevante para este tema ya que permite establecer vínculos entre los indicadores que conforman los diferentes objetivos de desarrollo sostenible (ODS). Este estudio, se basa en 28 indicadores definidos por un grupo de expertos para evaluar el progreso hacia el desarrollo sostenible de la subregión del Valle de Aburrá, ubicada en Antioquia, Colombia. Los resultados muestran que los indicadores relacionados con la salud, el empleo, y la educación obtuvieron mayores ponderaciones, mientras que los indicadores relacionados con asuntos ambientales presentaron las ponderaciones más bajas. Del mismo modo, se demuestra que el modelo es consistente utilizando un índice de consistencia, lo cual genera la posibilidad de replicar este modelo en diferentes niveles subnacionales.

Palabras clave: Ponderación de indicadores, proceso analítico jerárquico, marco de referencia intertemático, objetivos de desarrollo sostenible

Introducción

Trabajos recientes utilizan los objetivos de desarrollo sostenible (ODS) como una guía para evaluar el desarrollo sostenible debido a que la Agenda de los ODS sigue en vigencia hasta el año 2030, y desde allí una línea de base de 17 ODS, 169 metas y 232 indicadores sirven como guía para evaluación del desarrollo sostenible (Londoño & Cruz, 2019; Londoño, 2015). En consecuencia, el método más común para evaluar el desarrollo sostenible ha sido el de la construcción de índices agregados o compuestos (Boggia & Cortina, 2010) debido a que apoya la evaluación de fenómenos complejos y facilita los procesos de toma de decisiones cuando se formulan políticas públicas (Becker, Saisana, Paruolo, & Vandecasteele, 2017; KEI, 2005). Asimismo, los índices agregados o compuestos parten de un modelo conceptual y resumen un concepto multidimensional en un índice unidimensional (Baena, Cano, & Campo, 2018; Cano, Campo, & Gómez, 2017; Cano, Vergara, & Puerta, 2017; Londoño, 2014).

Por lo tanto, la evaluación del desarrollo sostenible por medio de índices agregados requiere, en general, las siguientes etapas: desarrollo de un marco conceptual, selección de indicadores, imputación de datos faltantes, análisis multivariado, estandarización de datos, ponderación y agregación de indicadores, y análisis de sensibilidad (Ciommi, Gigliarano, Emili, Taralli, & Chelli, 2017). En este sentido, el AHP se usa para priorizar o determinar los pesos de varios factores y subfactores, considerando múltiples criterios y múltiples grupos de partes interesadas (*stakeholders*) para problemas complejos, y capturando medidas de evaluación subjetivas y objetivas que son fáciles de usar y son escalables (Zhang, Chen, & Sun, 2019; Causado & Londoño, 2015). Actualmente, los estudios de sostenibilidad en diferentes niveles territoriales están aumentando, incluidas las regiones

subnacionales, ciudades, municipios, microrregiones e incluso grupos de vecindarios (Londoño & Cruz, 2019; Schneider, Jenny, & Longet, 2018; Londoño & Baena, 2017), lo que demuestra la necesidad de evaluar el desarrollo sostenible en las diferentes unidades de planificación y gestión (Londoño, 2018; Serna, Czerny, Pineda, & Rojas, 2015). Por lo tanto, este documento presenta un método de ponderación de indicadores para construir índices agregados con el fin de evaluar el desarrollo sostenible a nivel subnacional, utilizando el AHP y una técnica de comparación por pares.

Ponderación de indicadores para el desarrollo sostenible

Para aplicar un método de ponderación de indicadores con el fin de evaluar el desarrollo sostenible a nivel subnacional, este estudio se centra en la subregión del Valle de Aburrá que pertenece al departamento de Antioquia (Colombia). El Valle de Aburrá es una subregión que representa la entidad político-administrativa del departamento de Antioquia, y tiene un centro de información llamado Observatorio Metropolitano de Información (OMI) que se encarga de presentar el análisis, el procesamiento y la interpretación de los indicadores que respaldan la gestión institucional y la planificación regional, centrándose en temas como planificación y territorio, medio ambiente, movilidad, calidad de vida e instituciones (Área Metropolitana del Valle de Aburrá, 2019). Por lo tanto, estas condiciones facilitan el diseño y la implementación de métodos de evaluación del desarrollo sostenible a nivel subnacional.

Dado que la Agenda 2030 propone 232 indicadores para evaluar el desarrollo sostenible, es muy difícil encontrar esta amplia información disponible a nivel de país, y mucho más difícil a nivel de subregión. Por lo tanto, la selección de indicadores para evaluar el desarrollo sostenible se basa en la información del MIO y las directrices de la Agenda 2030. Los objetivos e indicadores que se podrían utilizar para evaluar el desarrollo sostenible se tomaron de la Agenda 2030, y en el OMI se enumeran los indicadores disponibles que pueden medir los ODS. Luego, a través de criterios expertos, se seleccionaron indicadores del OMI que miden efectivamente cada uno de los ODS establecidos en la Agenda 2030. Como resultado del criterio de expertos, la Tabla 1 muestra los 28 indicadores seleccionados para evaluar el desarrollo sostenible en el Valle de Aburrá. Debe tenerse en cuenta que los indicadores para los ODS 9, 13 y 14 no se muestran en la Tabla 1 porque los indicadores propuestos para estos ODS no están disponibles en el OMI para el Valle de Aburrá.

Tabla 1: Indicadores para la evaluación del desarrollo sostenible

ODS	Indicadores	Código	ODS	Indicadores	Código
ODS_1	Porcentaje de hogares con al menos una necesidad básica insatisfecha (Pobreza)	X_1	ODS_7	Cobertura energética	X_{15}
	Porcentaje de hogares con dos o más necesidades básicas insatisfechas (Miseria)	X_2		Cobertura de la conexión de gas	X_{16}
ODS_2	Porcentaje de hogares con inseguridad alimentaria.	X_3	ODS_8	Tasa de desempleo	X_{17}
	Índice de mortalidad materna	X_4		Tasa de subempleo	X_{18}
ODS_3	Tasa de mortalidad en menores de 5 años.	X_5		coeficiente de solvencia	X_{19}
	Tasa de mortalidad por VIH-SIDA	X_6	ODS_{10}	Índice de endeudamiento	X_{20}
	Tasa de asistencia escolar en primaria	X_7		Cobertura de internet	X_{21}
	Tasa de asistencia a la escuela secundaria	X_8	ODS_{11}	Porcentaje de tierra rural	X_{22}
ODS_4	Tasa de escolaridad en educación superior	X_9		Concentración de material particulado PM2,5	X_{23}
	Tasa de analfabetismo de 10 a 14 años	X_{10}	ODS_{12}	Porcentaje de protección del suelo.	X_{24}
	Tasa de analfabetismo en mayores de 15 años	X_{11}	ODS_{15}	Percentage of soil protection	X_{25}
ODS_5	Porcentaje de mujeres en los consejos municipales	X_{12}	ODS_{16}	Tasa de homicidios	X_{26}

ODS_6	Cobertura de acueducto	X_{13}		Tarifas de secuestros	X_{27}
	Cobertura de alcantarillado	X_{14}	ODS_{17}	Tasa de penetración de internet	X_{28}

Los resultados de la encuesta de percepción ciudadana (EPC) realizada por la empresa encuestadora Ipsos Napoleón Franco se utilizaron para apoyar el proceso de asignación de preferencias (Medellín Cómo Vamos, 2017). De acuerdo con los resultados de la EPC, se priorizaron los problemas de calidad de vida más importantes para los ciudadanos del Valle de Aburrá, indicando que los temas más importantes son salud, empleo, educación, vivienda, seguridad, alimentación y otros (igualdad de género, medio ambiente, e ingresos). Una vez que se obtiene la priorización de los indicadores de CPS y el desempeño de los indicadores del MIO, a través del criterio de expertos se define la importancia de los indicadores utilizando la escala de preferencias original de Saatty (Saaty, 1980) que tiene 9 calificaciones y ha sido ampliamente utilizada por varios autores (Kamaruzzaman, Lou, Wong, Wood, & Che-Ani, 2018; Kurka, 2013). Esta escala de preferencias permite indicar qué indicador es más importante que otro, y así asignar pesos a cada indicador a través del AHP.

Cuando se realizan comparaciones pareadas para N variables, se forma la matriz de juicio (A), en la que cada entrada a_{ij} en la matriz se crea comparando los elementos de la fila A_i con los elementos correspondientes de la columna A_j (Kamaruzzaman et al., 2018; Kurka, 2013), de modo que A = (a_{ij}), donde $i = 1, 2, \ldots, N$ y $j = 1, 2, \ldots, N$ representan el número de criterios. Al comparar la misma variable, la calificación será 1, por lo que la diagonal principal de A es igual a 1 ($a_{ii}=1$ o $a_{jj}=1$). Debajo de la diagonal principal están las calificaciones inversas de las que aparecen encima, y en este caso, la matriz de juicio contiene valores del 1 al 9 y sus valores inversos correspondientes. Para obtener los pesos para cada indicador, se debe normalizar primero la matriz de juicio. Para hacer esto, cada valor de la matriz se divide sobre el total de la columna a la que pertenece. Luego, las filas de todos los valores estandarizados (sa_{ij}) se suman y se dividen por el número de indicadores (en este caso 28), obteniendo la ponderación de cada indicador.

Para verificar la consistencia del AHP, es necesario calcular el radio de consistencia (CR) propuesto por (Saaty, 1990), que se basa en un índice de consistencia (IC) y un índice aleatorio (RI). Si CR<0.10, la consistencia es razonable; mientras que si el CR>0.10 el modelo de análisis jerárquico es inconsistente, y la asignación de preferencias y comparaciones por pares debe hacerse nuevamente para obtener un modelo de ponderación de indicadores confiable.

Resultados

Como resultado del método AHP, la Figura 1 muestra las ponderaciones de los 28 indicadores analizados y las ponderaciones agregadas de los ODS que conforman el modelo de evaluación del desarrollo sostenible para el Valle de Aburrá. Por su parte, el índice de consistencia es de 0.033 y el índice aleatorio es de 1.838, obteniendo un radio de consistencia de 0.018. Como CR<0.10, el modelo de ponderación de indicadores propuesto es consistente y confiable.

Figura 1: Índice de desarrollo sostenible basado en ponderación de indicadores

La Figura 1 también indica que los indicadores asociados con las dimensiones de salud (X_4, X_5 y X_6), empleo (X_{17} y X_{18}) y educación (X X_7, X_8, X_9, X_{10}, X_{11}) fueron los que obtuvieron mayores pesos, mientras que los indicadores relacionados con las dimensiones ambientales y los que pertenecen al ODS_{11}, ODS_{12}, y ODS_{15} (X_{22}, X_{24}, X_{25}) presentaron los pesos más bajos. La única excepción fue el indicador X_{23} (concentración de material particulado - PM 2.5), cuyo peso fue mayor porque en los últimos años el Valle de Aburrá ha presentado varias contingencias ambientales, y esta afecta directamente la salud humana. Por lo tanto, debido a las características de la subregión del Valle de Aburrá, los indicadores más importantes fueron los relacionados con la salud, el empleo y la educación.

Conclusión

Este estudio presentó un método de ponderación de indicadores para evaluar el desarrollo sostenible a nivel subnacional, utilizando un AHP respaldado por criterios expertos. Un grupo de expertos asignó preferencias basadas en comparaciones por pares respaldadas por la Agenda 2030, la información local del Observatorio Metropolitano de Información, y la encuesta de percepción ciudadana del Valle de Aburrá. Las comparaciones por pares se definieron de acuerdo con los problemas de la subregión del Valle de Aburrá, por lo tanto, es coherente que se obtuvieran los mayores pesos para los indicadores asociados con la salud, el empleo y la educación. Asimismo, el modelo de ponderación de indicadores propuesto para el Valle de Aburrá es consistente, lo que genera la posibilidad de replicar dicho modelo en diferentes niveles subnacionales.
