The more various constraints on the decision-maker, the greater the probability of failure. These constraints may be related to factors such as: time pressure, limited financial or other necessary resources, lack of courage to go beyond confirmation or routine. In addition, there is a phenomenon known as 'decision-maker narcissism' – the decision-makers become attached to the first decision and instead of entering the obligatory research mode they only seek confirmation that "their" decision is correct.

Therefore, special attention should be paid to whether the research mode is used in the approach to wicked problems, whether the first phase of data collection and analysis is carried out with due diligence, moreover, it should be a continuous process. In the open date era, there are almost unlimited possibilities for such analyses.

An interesting, although controversial example may be the way the Chinese have approached the elimination of COVID-19 coronavirus infection. According to Polish Press Agency (2020), the Chinese media indicate that thanks to the use of information-gathering technologies, the fight against the coronavirus has been managed. The scope of such automated activities as: automated body temperature measurement devices, robots that help doctors with some duties, helmets that detect people with fever and artificial intelligence systems that help in medical diagnostics or analysis of epidemiological data, applications for mobile phones were also developed to check if an individual was not taking a train or flying with someone with a confirmed infection. Interactive city plans are also available, showing where the diagnosed patients lived. Hangzhou was also the first city to introduce the so-called health code in Alipay, a popular mobile payment application. The system assigns users with a code – green, yellow or red – which indicates whether and for how long they should be isolated from society, or if they can, for example, use the subway and enter shopping malls.

Summary

The above considerations lead to the following conclusions:

1. The English phrase *wicked problems* is translated into Polish in several ways. There are at least several equivalents of the word "wicked" in the Polish dictionary. In Polish literature the most popular translations are those that describe wicked problems as problems that are vile or intricate.
2. However, taking into account not only Webber and Rittel's but also Simon's original approach, it is worthwhile to propose, besides the above Polish translations, some chronic problems, which reflect the essence of wicked problems well.
3. Chronic problems are those that cannot be solved in the long run. They consist of many factors that derive from different areas. Among them the most important are: social, scientific and methodological areas.

4. Characterising the first social area, it should be stressed that they concern individuals, social groups or entire societies. Depending on the number of people affected, they have a local, national, international or global reach.
5. Characteristics of chronic problems resulting from the social area are the existence of many stakeholders, either overt or hidden. This is one of the main reasons why chronic problems cannot be solved. The people (stakeholders) affected often have different value systems, may come from different cultures, define success in different ways, and therefore may have divergent goals. How chronic problems are managed is often determined by the economic and political power of the stakeholders, or by the quantitative power of the people involved (e.g. due to the climate strikes in many European cities, the problem could not go unnoticed by municipal and national authorities).
6. The second important area of chronic problems is the scientific area. Depending on the level of development of science and knowledge, as well as the availability of information, opportunities or barriers related to managing chronic problems exist or are being removed. In this area it is also important to select the right people to manage the problem taking into account the key disciplines of science, and to deepen cooperation between them.
7. The last, third area concerns the methodology of chronic problem management. Creative methods such as design thinking or mind mapping are needed to manage chronic problems. On the one hand, it is worth using structured methods to manage them. On the other hand, however, chronic problems require constant search for new methods, innovative, unconventional approaches, and the constant improvement of applied methods.
8. It is not possible to find a complete solution to chronic problems, because by definition, it is impossible to do so. What is more important is managing them. In the approach to chronic problems, continuous activity is needed, consisting in monitoring the problem: its intensity, proposing selected solutions (the most important aspects in the opinion of managers) and implementing them. Then, the chronic problem should be re-evaluated, key aspects for preparing solution in a new situation should be found, implemented, etc. This is a continuous and ongoing process, as is the process of social and economic development.
9. The art of managing chronic problems is based on skilfully formulating them. Many times activities are carried out "in the dark", because it is not fully known what is the cause and effect of an unwanted situation. It turns out that the most difficult part of the process, is to correctly identify the problem and name it (and often it is not entirely possible).
10. Wicked problem management errors can result from many factors. One of the key factors is the process of selection and analysis of information, as well as limitations resulting from the conscious (or unconscious) omission of the key information – treated as petty or uncomfortable – and other limitations resulting from the attitude of the decision maker. Decisions relating to the management of wicked problems should be made in a research mode.

Hackathons as a Public-Private Collaboration Platform

Mariusz CZUPICH

Department of Economic Policy and Regional Studies, Toruń, Poland
czupich@umk.pl

Abstract

The article is an analysis of hackathons as a new trend in the field of cooperation between public authorities and private entities. These are events initiated by the government to solve significant problems for society. As statistics show, hackathons are a rather unpopular instrument for implementing public policy. The purpose of the paper is to identify the mechanism of creating new public solutions through public-private partnership in the form of hackathons. The growing role of ICT in social and economic life creates new opportunities to use open data and applications to solve social problems. New ideas and solutions created during civic hackathons are not the only benefits of this form of cooperation between government and non-governmental actors. Other benefits include increasing the transparency of public activities, improving the democratisation of the government as well as meeting social needs more accurately and building trust between partners.

Keywords: Civic Hackathons, Public-Private Collaboration, Open Data, Public Policy

Introduction

The public sector has been evolving for several decades from a bureaucratic model of governance towards a broad cooperation of many stakeholders. It is reflected in such management models as New Public Management, Government 3.0. In the process of co-creating public services, the authorities are looking for new opportunities to engage private entities (citizens, enterprises) in new roles that they could have when cooperating. It means a transformation towards more inclusive, open innovation governance structures (Jäske and Ertiö, 2019, p. 23). Implementing policies under the open system has significant consequences. On the one hand, it means that public agencies are ready for external influences, including critical ones in the form of opposite views. On the other hand, however, it causes the government starts to intensively cooperate with its environment and thus strengthens the problem-solving capacity. This capacity can be used to develop and implement new public solutions. Numerous examples of cooperation confirm the growing position and role of non-governmental actors in public policy. It is emphasised that society is perceived as competent and capable of pursuing its interests and co-creating public services. Building a new type of civic engagement through conscious and active participation is able to initiate the hidden wealth of society (Torfing, 2016, p. 136).

In recent years, civic hackathons have been an increasingly popular way to solve development problems using open data related to citizens' lives. These events are organised by the government for programmers, enterprises and hacker environments in order to generate benefits for the public and private parties (Sieber and Johnson, 2015). Research and analyses included in the literature mostly focus on the outcomes of social solutions, and thus, describe what they are and what new products and initiatives they cover. Very little attention is paid to the two most essential aspects that allow their understanding: the processes of their formation and the organisations that create them (Borzaga and Bodini, 2012, p. 416).

The article aims to identify the mechanism of creating new public solutions through hackathons. The article focuses on civic hackathons using open data as an effective public-private collaboration platform intended to solve social problems.

The article uses two research methods. The first one is literature studies to determine the essence of the collaborative governance process. Theoretical analysis was also used to identify the hackathon idea as a platform for cooperation between public and private entities to solve social problems. The second research method used is case studies, which were used to examine hackathons from several cities around the world. They were considered in terms of mechanisms for solving public challenges and effects. The analyses conducted made it possible to draw some conclusions.

The article is composed of three parts. After the introduction, the essence of the collaborative governance process was presented. This process is based on open policy and civic participation to meet social needs better and improve the quality of life of citizens. In the next part, the essence, features and types of hackathons were analysed. Particular emphasis was laid on hackathons initiated by public authorities with the involvement of private partners that bring specific benefits to all stakeholders. The last part of the article is a collection of case studies presenting the experience of public authorities in the organisation of hackathons from various parts of the world (New York, Dublin, Taipei). Detailed public solutions resulting from individual collaborative actions were also presented.

Involvement Of Non-Governmental Actors In Public Policy Implementation

Social participation is a significant element of many socio-economic development concepts. For many years, it has been postulated, also in public policy, to include residents, enterprises, non-profit organisations both in planning works focused on socio-economic development and the entire public management process. According to A. Sen, people must be actively involved to shape their destiny, and not just be passive recipients of the effects of implemented development programs (Sen, 1999, p. 53). Therefore, it is crucial to create institutional and organisational foundations for the resident's participation in the exercise of power. Social inclusion consists in removing institutional barriers and strengthening incentives to increase the access of the whole society to development opportunities (Ali and Son, 2007, p. 2). A unique role is played by authorities, which should create the proper conditions and take initiative to ensure that society adopts an active attitude and takes responsibility for development in a given area. In this way, public authorities at the central or regional and local level can pay more attention to the quality of residents' life in terms of living conditions, access to health and educational services, security level, *etc*. The participation of a broad group of stakeholders favours connecting public policy with real social needs. In this way, the inclusive government makes its policy more effective and public services more user friendly and user-driven. Thus, inclusiveness becomes a key dimension of effectiveness (OECD, 2015, p. 26). Openness to citizens is noticeable in the shape of public policy.

The new public management models such as New Public Management, Government 3.0 are based on the collaborative governance process. This term refers to agreements in which public agencies engage non-state stakeholders in a collective decision-making process that is formalised, consensus-oriented and oriented towards the implementation of public policy or managing public programs or assets (Ansell and Gash, 2007, p. 543). Therefore, these are the public policy implementation processes that take place in the formula of public-private collaboration. Cooperation processes in such a system should be characterised by appropriate dynamics characterised by the following three key elements (Emerson *et al.*, 2011, pp. 10-17):

- principled engagement (discovery, definition, deliberation, determination);
- shared motivation (trust, mutual understanding, legitimacy);
- capacity for joint action (procedural and institutional arrangements, leadership, knowledge, resources).

Collaborative governance can be treated as a platform in the form of organisations or programs with dedicated competences and resources for facilitating the creation, adaptation and success of multiple or ongoing collaborative projects or networks (Ansell and Gash, 2018, pp. 16, 29). It facilitates multilateral relations between officials, entrepreneurs, citizens, NGOs, business support institutions, *etc*. It also provides a stable organisational framework on which both short-term and more specialised projects can be implemented. One problem may be the fact that the effectiveness of such a network depends on trust between its members (Keast *et al*., 2004, p. 365). It turns out that in political activities, building such relationships can be difficult. Therefore, to overcome this limitation, it is necessary to understand that the individual goals of each network members cannot always be achieved, since all activities are interdependent.

The cooperation may take place at various levels of public authority. There are also many views that collaborative governance is a local process that coordinates resources, expertise and energy of a wide range of actors. The effectiveness of this process is based on the possibility of cooperation in usually difficult circumstances in the region, namely: conflict of interest, mutual dependence, dispersion of power (Rich and Stoker, 2014, pp. 41-42). It is emphasised that divergent interests bring regional partners to some extent, who make an effort to implement common goals (Torfing *et al.,* 2012, p. 2). Therefore, as part of collaborative governance, there is interaction through 'conflict-ridden negotiations that take place within an institutionalised framework of rules, norms, shared knowledge and social imaginaries' (Sørensen and Torfing, 2009, p. 236). A correctly implemented collaborative approach allows public goals to be achieved more effectively than the government can on its own. Moreover, it can be a powerful lever for creating public value (Donahue and Zeckhauser, 2011, p. 4). Unfortunately, this approach is often mistaken for conventional contracting or charity, or public-private partnership.

Due to cooperation, private and public entities jointly strive to implement development programs for a given spatial unit. These programs do not rely on the direct delivery of goods and services but are orientated towards achieving specific benefits. An additional profit is that the involvement of the local community helps in creative problem-solving thanks to the knowledge of its members. This way, it is possible to avoid more professionalised views of public problems and possible solutions.

Hackathons – the idea and benefits

Hackathon is a combination of 'hack' and 'marathon'. Sometimes terms such as 'hackfest' (from the words: 'hack' and 'festival'), 'hackday' (if it lasts one day), 'code camp' or 'jam' are used (Komssi *et al*., 2015, pp. 60, 62). Hackathons are limited in time meetings of programmers, interface designers, graphic designers, entities interested in software development as well as citizens and organisations focused on creating new solutions. The effect of these events can be software applications that meet the expectations set by sponsors (Almirall *et al*., 2014, p. 393). Even though the organisation of hackathons can differ significantly from each other, there can be found some common attributes (Rosell *et al.,* 2014, pp. 1-2):

- focused intensity - these events are limited in time and space. They usually last 1-3 days and are located in one building. It allows participants to focus on specific problems to be solved;
- novelty - through contact with new technology, participants can feel the excitement that will trigger their commitment to new solutions;
- collaborative - teamwork is the key to success here. Each team develops its own work organisation, which is based on an exchange of ideas;
- incentive-based - every hackathon has its own set of rules and rewards. The catalogue of incentives is very wide – it ranges from financial rewards to the opportunity to interact with interesting people, learn from others. In fact, the most substantial incentive to participate is to create something new. In many hackathons, participants retain the intellectual property rights to their inventions. This allows them to continue the development of their solutions.

The degree of their formalisation may vary. They often take place in a loose form, which attracts young people, hacker groups and other communities. Hackathons promote entrepreneurship and trigger the creativity of participants. Most often, they are organised in the form of competitions, and

their organisers are enterprises, social organisations, research networks, cultural institutions, and public authorities. The form of competition means that there is competition between small groups of programmers. Also, they receive external support and encouragement. Moreover, competing teams often help each other. It means that during hackathons there is the so-called 'coopetition'. These are paradoxical (simultaneously competitive and cooperative) multi-level relationships between entities that are aimed at creating shared values and new competencies (Shvindina, 2019, p. 3). However, there are opinions that hackathon organisers should direct the hackathon formula towards either competing or collaborating (Pe-Than *et al.*, 2019, p. 17). The appropriate set of incentives for participants is used for this end.

Hackathons can be divided into two groups: tech-centric and focus-centric (Briscoe and Mulligan, 2014, pp. 5-6). In the first group, the events focus on software development using specific technology or applications. This group includes hackathons, the purpose of which is: (1) Single application - application development, *e.g.*, new programming language, (2) Application type - specific platform development (genre), *e.g.*, mobile apps, video game development, (3) Technology-Specific - developing applications that use specific language, framework (HTML5) or Application Programming Interface. However, the second group of hackathons, the so-called focus-centric ones, are focused on a social issue or a business objective. The following three types of them can be distinguished: (1) Socially-oriented - their subject is a social concern, *e.g.*, public services, (2) Demographic-specific - intended for specific demographic groups, *e.g.*, women, teenagers, (3) Company-Internal – company's employees are developing a new product innovation.
Hackathon initiators often include companies that use tech-centric in addition to company-internal hackathons. However, in recent years, socially-oriented hackathons initiated by public authorities, usually at the local level, have been gaining popularity.

The added value of civic hackathons is the opportunity for private entities to interact with public authorities through modern techniques. Hackathons are a type of event that can be described as idea competition. They are based on the principle of the competition leading to open innovation processes. The competition is about designing and implementing a digital service prototype for a specific purpose based on open data (Hjalmarsson and Rudmark, 2012, p. 10). Governments publish data from various areas, while participants transpose their interests and skills into the public good (Thoreson, 2013, p. 28). In this way, the benefits are reached through the engagement of both parties. For the authorities, this means greater transparency of activities, establishing communication with citizens and the opportunity to use innovative ideas (Brown, 2007). Moreover, applications resulting from the open data contest affect inclusiveness, deliberation, influence, publicity, mobilisation, and knowledge production, which translates into more democratic governance (Jäske and Ertiö, 2019). In turn, for citizens, this is a way to develop their skills and interests and implement solutions that reduce their problems. Furthermore, they develop their soft skills through teamwork, joint problem solving and conflict resolution. In this way, new relationships are created. Benefits also apply to sponsors, *i.e.*, mainly software and hardware companies. For them, hackathons give the opportunity to (1) discover the potential or new applications of their existing products, (2) build a group of users of their products, (3) advertise and promote their brand (4) beta test new products, (5) identify and recruit talented programmers (Lara and Lockwood, 2016, p. 486).

The HackerEarth organisation conducted an analysis of 849 hackathons taking place in 2015-2016. It turned out that only 22 of them (2.6% of all) were initiated by governments or public companies (HackerEarth, 2017). Social welfare (ten events) and multi-themed (five events) were the dominant themes of government hackathons. These studies show that hackathons organised by public institutions are in the early stages of development. Therefore, it can be stated that their organisation, duration, awards and nature of cooperation differ from each other. Over time, when more events of this type occur, the result will be the availability and dissemination of good practices. It will allow to avoid errors and barriers and increase the efficiency of public hackathons.

Hackathons as an Instrument for Creating New Public Solutions

Urban Hackathons - NYC Big Apps

An example of cooperation between city authorities and local entities is the NYC Big Apps project. It is a platform for cooperation between organisational units of city authorities and the academic community, entrepreneurs, developers, designers (Nycbigapps, 2020). The result of joint actions are innovations that are supposed to facilitate functioning in the city, improve the quality of life and improve urban services (New York City Economic Development Corporation, 2020). In addition, the organisers intend to support entrepreneurship and improve the transparency of municipal authorities. The works take place in the mode of annual hackathons. From several dozen to over 100 teams participate in them, which, based on urban databases (open data), prepare solutions, usually in the form of applications for New Yorkers. The city has over 1,000 databases regarding, among others, traffic, real estate transactions, events in the city and the location of schools or constituencies. The competitions are preceded by workshops with representatives of the city's organisational units. They discuss the biggest challenges facing the city authorities. The result of the discussion is determining the areas that will be the point of reference for the participants of the competition. These are, for instance, jobs and economic mobility, lifelong learning, healthy living, energy, environment, and resilience. The competition in 2019 was orientated at applications for blockchain technology for city residents within three spheres: identity, energy and real estate asset management. The culmination of the competition is the so-called 'Demo Day', during which the finalists present their applications. The jury consists of representatives of city authorities and technical experts (Nycbigapps, 2019). During the presentation, residents, potential investors and representatives of ICT companies are present.

In addition to the cash prize, the winners are offered marketing, IT and legal opportunities to develop their ideas. It often happens that they are noticed by investment funds and receive support under venture capital funding. One of the winning projects in 2019 is MyCity.ID. The blockchain-based application is a stand-alone digital identifier that will improve the verification of identity-related information (Milligan Partners, 2020). The advantage of this solution is the security of personal data. The ultimate goal is to streamline the process of applying for social services and benefits by using pre-verified information, making this process faster and easier for residents and service providers.

Smart City Hackathons - Smart Dublin

Smart Dublin is an initiative of four local Dublin authorities (Dublin City Council, South Dublin County Council, Dún Laoghaire-Rathdown County Council and Fingal County Council), which work with intelligent technology providers, scientists and citizens to solve problems and improve city life. The goal of Smart Dublin is to use open data to implement the smart city concept in the areas of mobility, environment, energy, waste and crisis management (Smart Dublin 2020a). The program is being implemented by creating solutions based on new technologies and public data that meet the development needs of the city.

Collaboration and engagement within Smart Dublin are based on the Innovation Quadruple Helix Model. The agreement covers various stakeholders, for example (Smart Dublin 2020b):

- Multinationals & Tech Companies (Google, Intel, AT&T, Microsoft),
- SMEs & Start-ups,
- Research Institutions & Universities (ICHC, Maynooth University, Trinity College Dublin),
- City and State Agencies (Enterprise Ireland, IDA Ireland),
- Citizen/Community Groups.

Since 2016, Smart Dublin has been a co-organizer of hackathons that are focused on solving urban challenges. In 2017, the second place in the competition was taken by the C-Park project (Smart Dublin, 2017). The project assumes the possibility of planning a city trip for people with disabilities. The created application informs about the availability of parking spaces in real-time. Moreover, it

introduces a digital authentication system that eliminated the risk of fraudulent use of disabled parking permits.

In 2018, the problem to be solved during the hackathon was congestion in Dublin city transport. The winner of the main prize was Jump'On solution (Hack Access, 2018). The project involves the monitoring of bus capacities, levels of congestion and any failures using cameras. Information is provided to users through the application and information boards located on the bus route. In this way, they can plan their trip and avoid problems related to the lack of space on buses. In the future, this system can be developed and used to check valid travel permits and detect crimes in public transport.

In 2019, Smart Dublin together with the City Council of Dublin and other members of the consortium, including the Grangegorman Development Agency and Science Foundation Ireland, organised the first 3D Data Hackathon in Ireland (Smart Dublin, 2019). Competition projects were evaluated for the novelty of ideas, adaptation to challenging areas, viability and commercial/social impact. The awards included financial support for developing a winning solution, mentoring and access to the work and exhibition space as well as media coverage of the project (Smart Docklands, 2019). The winner was the Place Engage project, which is based on an augmented reality app which would help citizens of Dublin city understand new developments in the city while in conception phase and help to understand and visualise these ideas in real-time (Maynooth University 2019).

Presidential Hackathons – Taipei

Another initiative organised at the governmental level is in Taiwan. It is called Presidential Hackathon and is focused on the innovative use of open data to meet social and development needs arising from the development of the country (Presidential Hackathon, 2020). The event was initiated in 2018 by the President of Taiwan Tsai Ing-Wen as a forum for the exchange of ideas between sectors, hackers, and public officials. Its goal is to optimise public services through innovation. Teams from different countries can participate in the competition because the impact of the innovations developed can go beyond Taiwan. The main prize, unlike most hackathons in the world, is not a financial prize but a guarantee of implementing the proposals of the five winning teams as part of public service. In addition, the winners attend a special dinner with celebrities from the government sector.

In 2019, the leading theme of the hackathon was 'Enabling Sustainable Infrastructure'. Its participants had to design, build and operate fundamental infrastructures in a sustainable and inclusive way.

This means taking social, economic, and ecological processes into account. The proposed solutions were subjected to the following perspectives (Presidential Hackathon, 2019a):

1. Strengthen transparency and trust,
2. Evaluate and deliver value for money,
3. Improve decision support, risk mitigation and project/asset lifecycle management,
4. Promote cross-domain/cross-border partnerships.

The organisation of the competition was carried out in a strictly defined way. Applications from teams were accepted in April and May. Then, at the beginning of June, a list of some of the best teams was announced, which were invited to Taipei for a three-day hackathon in July. The final of the competition was the presentation of solutions in the Presidential Office Building and the awards ceremony with the participation of the president.

The five winning projects included the Rounding Team. A group of palliative care specialists designed an intelligent platform for the Ministry of Health and Social Welfare. It allows the exchange of experiences, support in difficult times as well as medical and other resources to terminal patients

who remain at home. The solution provides families or people hospitalised at home with a secure knowledge-sharing platform (Business Insider, 2019).

The top five winners also included The Angels of the Aged. It uses big data from the Ministry of Internal Affairs and the Ministry of Health and Welfare to identify seniors living in isolated locations. The program aims to effectively allocate government resources for the most deprived to improve home safety and convenience for senior citizens (Presidential Hackathon, 2019b).

Conclusions

In recent years, interest in public hackathons has increased. They are analyzed in terms of their effectiveness (Johnson, Robinson, 2014), the benefits of cooperation with local partners (Robinson, Johnson, 2016), the possibilities of using them in creating urban space (De Winne *et al*. 2020) or the motivation of participants (Antikainen *et al*., 2010).

The analysis carried out in this article has led to several conclusions.

Firstly, social involvement in the process of planning and implementing public policy is one of the conditions for improving the quality of life. Moreover, broad social inclusion is one of the foundations of new public management processes successively implemented in the last several years. It also resulted in greater exposure of citizens' participation in the decision-making process.

Secondly, public-private cooperation brings new opportunities to create new public solutions aimed at satisfying social needs. New solutions of this type are an example of user-driven innovations, where recipients of innovations become their authors at the same time. It brings tangible benefits to both parties. Public authorities increase the transparency of their activities, improve the level of democratisation of activities and reduce costs, whereas the private party meets their own needs more effectively.

Thirdly, collective solving of social problems using ICT is increasingly taking the form of hackathons. These events can be transferred from business practice to public policy. The examples of good practices presented in the article confirm that non-governmental actors can find the use of open data to solve several social challenges. Creating new knowledge through collective action exceeds the potential and abilities of individual entities.

Abstract

The development of the economy has also negative effects on the environment and society. The concept of corporate social responsibility is the tool for mitigating the negative effects of enterprises' activity. Its main idea is to implement good practices in business what will have a positive impact on the local environment and societies. The article describes the social aspect of corporate social responsibility in relation to employed people. The article has literature and empirical character. Statistical analysis was used to measure regional and sector differentiation among groups of enterprises in terms of worker-related indicators. Some statistically significant differences were found.

Keywords: CSR, Working Conditions, Forced Labour, Diversity.

Introduction

Analysis of the impact of business operations on the environment and the society is an important process that is forced not only by government authorities, but above all by consumers. The emergence of the concept of corporate social responsibility (CSR) results from building the brand of a socially responsible enterprise, and on the other hand, minimizing and paying attention to the negative effects of business operations. The concept of CSR aims to draw attention to the company's activities in the context of the environment, corporate governance, but also the local environment and internal stakeholders including employees. The approach of the management to its workers is very important in the context of work efficiency, organizational culture and ethics. Nevertheless, it happens that in many enterprises this aspect is overlooked. Some companies do not pay attention to CSR at all, other concentrate on supporting external stakeholders like foundations, schools, local societies, and in the same time does not offer a decent workplace for its employees.

The aim of the article is to analyze the companies' approach to human resources as one of the areas of the concept of CSR. There were regional and sector classifications used in the research. The article has literature and empirical character and has been developed based on literature and statistical data studies.

Performing in-depth statistical analysis about worker-related indicators must be preceded by characterizing the social aspect of CSR.

Social aspect of Corporate Social Responsibility

In recent years, a new concept of CSR has gained popularity. The development of this concept is undoubtedly developing with increasing awareness of people – buyers, users and members of society. They constitute the target group of enterprises as recipients of their products and services. The

consequence of this phenomenon is greater attention devoted by management staff to corporate image, manifested through the positive impact on the environment and stakeholder groups. It also affects the actions taken in the field of ethics and charity. According to Friedman (1970): "*there is one and only one social responsibility of business to use its resources and engage in activities designed to increase its profits so long as it stays in the rules of the game, which is to say, engages in open and free competition, without deception or fraud*". Friedman focuses only on economic and legal dimension of business operations. Young (2005) describes CSR as: "*strategic and long-term approach, available on the basis of social dialogue, transparent relationships and searching for solutions used for everyone; it also achieved a lasting connection while wisely shaping relationships with specific stakeholders (...). It is also possible to apply in business in a way that takes into account ethical values, law, respect for employees, society and the natural environment, as well as enabling joining the development plan by working with them to improve the quality of life for all*".

According to Sokołowska (2009) enterprises are not only the subjects of rights and obligations, but also responsibility in the economic, legal and social dimensions. Gableta (2010) states that the processes leading to the integration of employees with the enterprise should be part of building a competitive advantage. This can be seen more broadly at the interface between broadly understood stakeholders and the company. The goal of CSR is therefore to alleviate the age-old conflict between business and society. In addition, it should be noted that direct translation of CSR performance into financial benefits is questionable. When e.g. Johansson Karlsson and Hagberg (2015) state that there is no significant relation between CSR and financial performance, research made by Samy, Halabi and Bampton (2011) shows it exists. Regardless of its direct financial impact CSR helps to build trust which is crucial in times of crisis.

Adamiak and Nowicki (2012) wrote: "*the concept of corporate social responsibility comes down to special skills with its social and natural environment*". Carroll distinguishes four levels of corporate responsibility: economic, legal, ethical and philanthropic. This author notes that the foundation of business activity according to the concept of CSR is its financial stability and bringing profits. The next levels are legal and ethical aspects, i.e. compliance with all established and generally accepted laws and ethical norms. Only then one can undertake philanthropic activity, which is the top of the A.B. Carroll's pyramid. It is implemented by active support and helping others in need. Consistency and implementation of individual actions in the indicated areas is an evidence of the social responsibility level. It should be pointed out, that the sequence of actions taken (from economic aspects to philanthropic activities) is also important and related to the level of development of the organization. There are many approaches to distinct areas of CSR. One of them was presented by Garriga and Melé (2004) who divided CSR theories into instrumental, political, integrational and ethical. Jones (1980) postulate that important issue of corporate governance can also be improved by realization of the concept of CSR.

Social responsibility focuses basically on fulfilling economic demand of shareholders and stakeholders. Above that there are important aspects concerning environment and the community, as internal stakeholders, but also local people. Therefore, it can be determined that activities in the light of CSR focus on the social, economic, environmental and ethical areas. Their synthetic approach is shown in the Fig. 1.

Fig. 1 : Areas of CSR

Source: K. Huk, Logistyka miejska a społeczna odpowiedzialność biznesu – wspólne obszary zainteresowania, „Studia Ekonomiczne. Zeszyty Naukowe Uniwersytetu Ekonomicznego w Katowicach" 2015, nr 249, p. 159.

For effective operation, each organization should consider achieving its primary goals and the ability to bring specific added value. Providing the capabilities and the basis for functioning is important and affects the overall activities, including in the field of CSR. Through functioning and economic stability, entrepreneurs provide jobs, and by reaching a higher level of financial and CSR performance they are able to support society. According to Huk (2015) the social aspect is broadly understood, because it concerns various types of external stakeholders, but primarily the group of employees.

Griffin (2004) defines social responsibility as: "*set of organizational commitments to protect and strengthen the social context in which it operates*". Taking into consideration the multiple count and the complex character of company–workers relation, the most important task in strengthening the social context is to provide a decent workplace for employees, and after then support outside parties. If internal social issues are not fulfilled there it is impossible to continue market presence in long term.

Research Methodology

Data for the needs of this analysis were obtained from the company GES Investment Services. They come from corporate social responsibility ratings. 1096 enterprises from 29 countries, representing 52 industries, were divided into groups according to two classifications: regional, taking into account geographical and cultural proximity and sectoral, according to the Global Industry Classification Standard (2008) (Table 1).

Table 1: Regional and sector classifications of assessed companies

no.	Regions	n	no.	Sectors	n
1.	North America (Bermuda, Jamaica, Cayman Islands, Canada, Panama, USA)	479	1.	Telecommunication Services (TS)	44
2.	Western Europe (Austria, France, Ireland, Germany, Switzerland, United Kingdom)	189	2.	Health care (health)	118
3.	Southern Europe (Spain, Portugal, Italy)	32	3.	Information technology (IT)	79
4.	Australia and Oceania (Australia, New Zealand, Papua New Gwinea)	52	4.	Materials	131
5.	Northern Europe (Denmark, Finland, Norway, Sweden)	50	5.	Industrials (industry)	225
6.	Japan (Japan)	233	6.	Consumer discretionary (CD)	206
7.	China (China, Hong Kong, Singapore)	31	7.	Consumer staples (CS)	118
8.	Benelux (Belgium, Netherlands, Luxembourg)	30	8.	Energy	95
			9.	Utilities	80

Source: own work.

Based on the two classifications presented above, a comparative statistical analysis of groups was carried out in terms of corporate social responsibility towards employees. The overall rating in this area could reach a value from 0 to 10 and was the sum of five indicators:

- management systems and policies regarding occupational health and safety (OHS),
- approach to workplace diversity and discrimination (diversity),
- freedom of association and collective agreements (FOA),
- regulations on working time and remuneration (w. conditions),

- approach to forced labor (forced labor).

The score for each indicator was in the range of [0; 2]. Lack of points meant not taking specific actions in a given scope or their non-compliance with legal regulations, international agreements and guidelines of social responsibility. Points are awarded for: having appropriate policies consistent with or exceeding legal provisions, responsible practices ensuring the practical implementation of policies, raising employees' awareness of applicable internal regulations, the functioning of an anonymous complaint system, risk identification, and social reporting.

Approach to human resources in the context of CSR – statistical data analysis

The human factor is critical for every enterprise's performance. Generated economic an non-financial results depend on people employed in organization. Appreciated people are able to significantly contribute to the increase of the company's profit. However, the basic factor that should be preserved in every enterprise is ensuring human rights and decent work conditions. This study presents statistical analysis of indicators characterizing the human factor in accordance with the concept of CSR. This analysis was carried out divided into 3 dimensions: general, regional and sector.

General analysis

Zero grades were noted in all analyzed indicators. They accounted for from 6.11% in the case of OHS, to 44.53% for forced labor (Table 2). 3.38% of entities obtained zero grades in all, and 52.46% in at least one indicator.

Table 2 : Basic statistics of grades achieved in indicators

	OHS	diversity	FOA	w. conditions	forced labour	overall
minimum	0.00	0.00	0.00	0.00	0.00	0.00
maximum	2.00	2.00	2.00	2.00	2.00	10.00
mean	1.26	1.16	0.66	0.60	0.45	4.12
median	1.67	1.25	0.67	0.50	0.50	4.34
standard deviation	0.56	0.41	0.53	0.51	0.46	1.94
coefficient of variation [%]	44	36	80	84	102	47
0 grades [n]	67	80	313	264	488	37
0 grades [%]	6.11	7.30	28.56	24.09	44.53	3.38

Source: own work

In each indicator, maximum ratings were also recorded, with 1 enterprise obtaining the maximum overall rating. Considering both median and average values, the order of indicators starting from the highest grades is as follows: occupational health and safety, diversity, freedom of association, working conditions and forced labor.

The standard deviation achieved values in the range [0.41; 0.56], however, due to the large variation in central measures, the coefficient of variation better reflects the heterogeneity of the groups. The most similar grades were obtained in the diversity indicator, the east in forced labor.

Regional Analysis

The distribution of general ratings in regional groups is presented in Fig. 2.

Fig. 2: The distribution of overall grades in regions

Source: own work.

3 regional groups achieved a higher median of overall rating than the entire population. They were: North America, Western Europe and Southern Europe. The lowest median, but also the first and third quartile results were recorded for Japan, China and Benelux. Regarding extreme values, only the Southern European group did not have an entity with an overall zero rating. The only company with a maximum number of points represented the North American group.

The differences seen in the above chart required statistical confirmation. The number of groups above 3, the distribution not close to normal and the uneven number of observations indicated that the statistical significance of the differences was verified using the non-parametric Kruskal-Wallis test. The results of the test indicated that at least one of the groups came from a different population. At a later stage, in *post hoc* analysis pairs were tested using the Mann-Whitney method. The results are shown in Table 3. Results are rounded to 3 decimal places.

Table 3 : Statistical significance of differences between regions for α= 0,05, Bonferroni corrected \ incorrected

	N. America	W. Europe	S. Europe	Australia	N. Europe	Japan	China	Benelux
N. America		0.614	0.638	0.333	0.281	0.000	0.006	0.003
W. Europe	1		0.470	0.532	0.472	0.000	0.012	0.009
S. Europe	1	1		0.257	0.258	0.001	0.011	0.010
Australia	1	1	1		0.997	0.044	0.121	0.084
N. Europe	1	1	1	1		0.054	0.126	0.033
Japan	0.000	0.000	0.031	1	1		0.807	0.237
China	0.169	0.033	0.295	1	1	1		0.484
Benelux	0.086	0.266	0.266	1	0.934	1	1	

Source: own work.

The table above shows that only some of the differences were statistically significant. They occurred in each case between 3 regions with the highest and 3 with the lowest grades, and in pairs Japan–Australia and Benelux–Northern Europe. However, for multiple comparisons Bonferroni corrected results are more reliable. They show that Japan achieved significantly lower results than North America, Western Europe and Southern Europe. No other statistically significant differences were found.

The most homogeneous group in terms of obtained ratings was Southern Europe, whose coefficient of variation was 34%. The highest diversity was observed in Benelux with V = 72%.

The overall scores consisted of 5 partial grades. The values of their medians achieved by specific regions are presented in Table 4.

Table 4 : Partial grades' medians among regions

	OHS	diversity	FOA	w. conditions	forced labour
N. America	1.67	1.25	0.67	0.50	0.50
W. Europe	1.67	1.25	0.67	0.50	0.50
S. Europe	1.67	1.25	0.67	0.67	0.50
Australia	1.67	1.25	0.67	0.50	0.50
N. Europe	1.33	1.25	0.67	0.50	0.00
Japan	1.00	1.25	0.33	0.33	0.00
China	1.67	1.25	0.33	0.33	0.00
Benelux	1.00	1.25	0.00	0.33	0.00

Source: own work.

While it is difficult to clearly identify the group with the highest scores, Benelux obtained the lowest results. Among the indicators examined, the highest scores were given in the field of OHS and diversity, whose medians for all groups were equal. The lowest grades were recorded in the case of forced labor. This situation can be caused by the fact that occupational health and safety issues are regulated and required by law and the diversity issues has been strongly highlighted by some groups of stakeholders in public debates. The problems with freedom of association, working conditions and especially forced labour concerns mostly suppliers of global enterprises. Entities' results in this area can be improved with the extending of the range of responsibility outside organizational borders into the supply chain.

Disproportion between grades obtained in assessed indicators is confirmed also by mean values what is clearly illustrated in Fig. 3.

Fig. 2 : Mean values of grades obtained by regions in assessed indicators

Source: own work.

The most homogeneous group in terms of obtained ratings was Southern Europe, whose coefficient of variation was 34%. The highest diversity was observed in Benelux – V = 72%.

Sector Analysis

Regarding the sector classification, it should be noted that the median of overall grades in 3 sectors: consumer staples, energy and utilities reached lower values than the median for all surveyed entities (Fig. 4).

Fig. 3 :The distribution of overall grades in sectors

Source: own work.

The telecommunication services sector achieved clearly the highest median value. In this group no observation was also recorded with an overall rating of 0. The values of the first and third quartiles

were the highest in the IT sector and the lowest in energy and utilities. The Kruskal-Wallis test also in this case indicated that at least one of the groups came from a different population. Table 5 presents the results of *post hoc* analysis carried out using Mann-Whitney tests. Results are rounded to 3 decimal places.

Table 5: Statistical significance of differences between sectors for α= 0,05, Bonferroni corrected \ incorrected

	TS	health	IT	materials	industry	CD	CS	energy	utilities
TS		0.934	0.906	0.958	0.336	0.509	0.220	0.037	0.004
health	1		0.873	0.938	0.231	0.397	0.098	0.008	0.000
IT	1	1		0.968	0.293	0.385	0.119	0.016	0.001
materials	1	1	1		0.175	0.332	0.091	0.006	0.000
industry	1	1	1	1		0.637	0.654	0.077	0.009
CD	1	1	1	1	1		0.399	0.031	0.002
CS	1	1	1	1	1	1		0.187	0.028
energy	1	0.287	0.579	0.223	1	1	1		0.504
utilities	0.141	0.008	0.025	0.009	0.318	0.080	1	1	

Source: own work.

According to unadjusted test values, the utilities sector achieved significantly lower marks than all other groups except energy. This one was significantly worse than telecommunication services, health care, IT, materials, consumer discretionary. Bonferroni corrected test values indicate that the sector utilities achieved significantly lower marks than health care, IT and materials. No other statistically significant differences were found.

The coefficient of variation of the overall ratings obtained in the sectors was in the range of: [35%; 61%]. The smallest diversity of grades occurred in health care and telecommunication services, the largest in energy sector.

As in the case of geographical analysis, the highest partial grades were obtained in the case of OHS and diversity, which also in this case adopted equal median values for all groups (Table 6). The lowest grades were obtained for forced labor.

Table 6 : Partial grades' medians among regions

	OHS	diversity	FOA	w. conditions	forced labour
TS	1.67	1.25	0.67	0.50	0.50
health	1.67	1.25	0.67	0.50	0.50
IT	1.67	1.25	0.67	0.50	0.50
materials	1.67	1.25	1.00	0.50	0.50
industry	1.67	1.25	0.67	0.50	0.50
CD	1.33	1.25	0.67	0.50	0.50
CS	1.33	1.25	0.67	0.50	0.25

energy	1.33	1.25	0.33	0.50	0.00
utilities	1.00	1.25	0.33	0.33	0.00

Source: own work.

Fig. 5 shows mean values of grades obtained by sectors and illustrates the same situation as in regional classification. There is a clear distinction for 2 low and 3 high-rated indicators.

Fig. 4 : Mean values of grades obtained by sectors in assessed indicators
Source: own work.

Summary

CSR is a desirable trend in the development of organization and business, but only when its main goal is pro-social and pro-environmental activity, and not maximizing profit through improved corporate image. One of the most important moral responsibility is to enforce human rights and ensure proper working conditions for the people employed in the organization. The aim of the article was to present and analyze the approach of companies to social aspects in accordance with the concept of CSR.

One of the conclusions that arises after the statistical analysis is the fact that companies achieved significantly higher grades in occupational health and safety and diversity indicators than in the right of association working condition and forced labor. More than a half of assessed entities did not demonstrate any meaningful activities in at least one indicator, and 3.38% were passive in all parameters.

Of the 8 regions studied, North America and Western Europe received the highest overall grades. Companies from Benelux achieved the lowest results. Sectors were less diverse in terms of distribution of grades. The highest scores were recorded in the telecommunication services group, the lowest in utilities.

Statistical analysis showed statistically significant differences between several groups only. For regions, Japan scores worse than North America, Western Europe and Southern Europe. In the sector classification, the utilities group received lower marks than health care, IT and materials.

Benelux was the most internally diversified region in terms of obtained ratings, the least Southern Europe. For the sectors, these groups were respectively: telecommunication services and health care.

Abstract

The aim of this study was to detach the evolutions of the macroeconomic variables that characterize the energy sector at the level of EU countries in the period 2014-2017. The statistical analysis performed in the study was based on secondary data provided by the Eurostat Database. The results of the study considered the combination of research methods and statistical techniques used for time series, in order to measure the existing interdependencies between the macroeconomic variables that characterize the energy system at European level. As macroeconomic variables were used in the study: the price of electricity according to the type of user, export, final energy consumption, gross domestic product. The panel-type analysis and model built in the study using the multifactorial regression and correlation method as well as the validity test were performed using the database management and analysis programs (Excel, EViews).

Keywords: energy field, regression and correlation method, macroeconomic variables, renewable energy, carbon dioxide emissions

Introductory Aspects

Energy is a product of great economic, political, social but also strategic value. This is necessary for the entire economy of a country, both in the industrial and service sectors as well as in social activities. The lack of access to the energy field has significant consequences, and the strategic and political role of the energy field has been clearly highlighted in the last 30-40 years by the various oil or energy crises, regional conflicts, which have degenerated into wars, serious energy damage, social tensions or errors in a country's energy policy.

We can see that, the energy field has a major impact on people's lives, representing both economically and socially, a true force at European level. The specific features of this field of activity can be characterized as follows:

→ this domain is characterized by a large inertia, with a significant period of time between decision and achievement;
→ the energy field contributes significantly to the degree of environmental pollution and climate change;
→ in order to develop and grow sustainably the energy field requires massive investments;
→ in this area it is necessary to implement an adequate legislative and institutional framework, as well as an energy strategy in the medium and long term. All these actions must be accompanied by national energy policies and instruments specific to the market economy.

Because, the EU's energy policy envisages a range of measures, which aim to achieve an integrated energy market and to ensure the security of energy supply and the sustainability of the energy sector. According to the European Commission (2015), the energy policy of the U.E. has the following five main objectives: ensuring the functioning of the internal energy market and interconnecting energy networks; ensuring the security of energy supply in the EU; promoting energy efficiency and energy conservation; decarbonisation of the economy and the transition to a low carbon economy, in accordance with the Paris Agreement promoting the development of new forms of renewable energy for better alignment and integration of climate change objectives within the new market organization; promoting research, innovation and competitiveness.

Over the last decades, this field of activity has been in continuous development, especially from a sustainable point of view. This is because, for a long time, the energy field has acted and developed without considering the environmental norms and a development compatible with the environment. Thus, energy has become a polluting industry in some European countries (especially those with a lower level of development) but which is currently undergoing continuous sustainable remodeling. In this context, the European Commission said that more needs to be done to combat energy poverty, which still affects almost 50 million people across the EU. One way to do this is to promote investment in energy efficiency in households, thus improving living conditions and reducing energy bills. Thus, according to the European Commission, almost EUR 5 billion of the European Structural and Investment Funds for the period 2014-2020 have been allocated to help renovate homes for around 840 000 households. (The European Commission, 2019)

This is because Europe enjoys one of the most comprehensive and reliable networks in the world for electricity and gas. The main objective of the European Commission was to strengthen this network where it was needed to address the remaining security issues of supply, to connect energy islands and to address the challenges arising from the ongoing transition to a low-emission economy carbon. A main objective of the European Commission was to eliminate the energy isolation of the disconnected regions. A success in this endeavor has been registered in the Baltic countries.

Although maintaining low oil prices could affect the competitiveness of renewable energy costs, the long-term prospects for renewable energy are excellent. Renewable energy technologies have become increasingly cost-effective.

Literature Review

Concerns about the creation of a European energy market and the gradual development of an EU-wide energy policy took place together with the Treaty on the European Coal and Steel Community (1951) and the Euratom Treaty on the Establishment of a European Atomic Energy Community (1957). The two treaties focused on coal and nuclear energy as primary energy sources. Much later, with the Lisbon Treaty (2007), the field of energy is given a legal basis and EU policy in this vital area of life considers the following main aspects: to ensure security of energy supply; to promote energy efficiency and energy saving; to ensure the functioning of the energy market as well as the development of new energy sources and renewable energies.

With the discovery of unconventional gas reserves in various EU countries, a process of assessing the effects of the exploitation of this resource on the environment and human and natural habitats has begun at Union level. Along with the European Commission's initiatives addressed at the regular

meetings of energy ministers in EU Member States, the Europeanization of energy policy was complemented by the organization of European Councils on energy among the topics covered (February 2011, May 2013, March 2014, June 2014, October 2014, December 2014, March 2015, December 2015, March 2016, June 2016).

The Communication on the Energy Union launched by the European Commission in 2015 sets out five main targets such as: energy security; solidarity and trust; the internal energy market; energy efficiency, seen as a contribution to moderating energy demand; decarburization of the economy; research, innovation and competitiveness. In 2016, the European Commission adopted the package of measures in the field of energy security which considers the following aspects: legislative proposal to revise Regulation 994/2010 on security of gas supply, legislative proposal to revise the Decision on the transparency of intergovernmental agreements concluded by Member States with third countries in the field of energy, EU Strategy on LNG and storage, Heating and cooling strategy.

The transition to a modern, low-carbon and energy-efficient economy is still in full swing in Europe. This process of transition to a sustainable economy and in terms of energy and the environment has been accelerated with the signing of the commitments made under the Paris Agreement of 2016 ratified by the European Union. Renewable energy has now become a necessity for all EU countries, and waste must be reduced or even eliminated. Renewable energy sources include wind energy, solar energy (thermal, photovoltaic and concentrated), hydroelectric energy, tidal energy, geothermal energy, ambient heat captured by heat pumps, biofuels and the renewable part of waste. One of the positive effects of the use of renewable energy is the reduction of carbon dioxide emissions, having a significant impact on the health of the population, but also on environmental protection. The use of renewable energy is ensured, in accordance with the Kyoto Treaty and in close correlation with the EU energy policy set out in the Lisbon Strategy, environmental protection, reduction of fossil fuel consumption.

In accordance with the energy policy of the European Union, the European level of renewable energy differs according to the sector of activity, namely: 30.8% in the electricity sector, 19.5% in the heating and cooling sector and 7.6% in the transport sector. (Matteo Ciucci, 2020) But due to the lower price, there are still EU countries who choose to use oil as their main source of energy and not renewable energy that requires high implementation costs. In this context, according with Eurostat, countries such as Luxembourg, the Netherlands, Malta, Belgium and Cyprus are among the most dependent on the use of electricity from sources that cause great damage to health and the environment. The consequences of non-compliance by some European countries with the targets proposed by the European Council have led to increased greenhouse gas emissions. (see figure 1).

In 2017 according with Eurostat, energy from renewable sources accounted for 19.5% of total energy consumption for heating and cooling in the EU-28. This represents a significant increase from 10.4% in 2004. Growth in the industrial, services and household consumption sectors (construction sector) contributed to this increase.

Figure 1: Greenhouse gas emissions (in CO2 equivalent), base year 1990

Source: Eurostat -Data Explorer (sdg_13_10)

According to the European Commission's (2019) Report to the European Parliament and the Council, compared to 2016, final energy consumption increased in 24 Member States in 2017, with the largest increases in Slovakia (+ 7%), Malta (+ 6.7%) and Poland (+ 6.5%). The largest decreases were recorded in Belgium (-1.2%), the United Kingdom (-0.8%) and Italy (-0.6%). However, in 2017, primary energy consumption increased in 20 Member States compared to the previous year, with the largest increases being in Malta (+ 12.9%), Romania (+ 5.7%) and Spain (+ 5.4%). Estonia recorded the largest year-on-year decrease (-4.2%) compared to 2016, followed by the United Kingdom (-1.6%) and Ireland (-1.4%). This is due to the decrease in primary energy intensity in all Member States, with six exceptions Belgium, Greece, Italy, Hungary, Austria and Portugal.

The first legally binding and universal agreement on climate change in Paris, as mentioned earlier in the study, set out a comprehensive action plan to combat climate change. This agreement was also known as the "Clean Energy for All Europeans" package. Under this agreement, the European Union agreed to reduce greenhouse gas emissions by at least 40% by 2030 compared to 1990. At the same time, the Paris Agreement on Climate Change - the Clean Energy for All Europeans package aims to develop the concept of clean energy (a different way of producing and consuming energy) in interdependence with combating climate change.

In this context, in the field of energy, the European Union has made significant progress in terms of unjustified consumption and air pollution. In addition to monitoring the competent European institutions such as the Energy Union, the European Council has proposed in the Europe 2020 Strategy targets for all Member States such as:

- 20% reduction in greenhouse gas emissions (CO2 equivalent) compared to 1990,
- reduction by 20% of the final energy consumption compared to 2005,

increasing energy efficiency and increasing the share of renewable sources in the total energy mix to at least 20%. (Matteo Ciucci, 2020)

One of the main objectives of the Europe 2020 strategy in the field of energy is to increase energy efficiency and increase the share of renewable sources in the total energy mix to a minimum, setting a 20% increase over 2005 for each EU-Member State.

The European countries that encountered difficulties in meeting the target set by the European Commission were the Netherlands, France, the United Kingdom, Ireland and Belgium. The main reasons for not achieving the set goal were: overdevelopment of traditional geographical and energy systems. Although at the bottom of the rankings, France has made progress in the field of renewable energy. Thus, according to Eurostat-European Statistics, from 2010 to 2017, the top 5 countries of the European Union that recorded the best results in order to achieve the objectives of the Europe 2020 Strategy were (see table 1):

Table 1: Top of the first European countries on achieving the objectives of the Europe 2020 Strategy

EU/Member State	**Greenhouse gas emissions**	**Share of renewable energy**	**Energy efficiency**
	Reducing greenhouse gas emissions by at least 20% compared to 1990 levels	**Increasing the share of renewable energy in final energy consumption to 20%,**	**Moving towards a 20% increase in energy efficiency**
Germany	0.14	0.18	276.6
France	0.14	0.23	219.9
United Kingdom	0.16	0.15	177.6
Italy	0.13	0.17	158
Spain	0.10	0.20	119.8

Source: (2017), *Europe 2020 Targets*
https://ec.europa.eu/eurostat/documents/4411192/4411431/Europe_2020_Targets.pdf)

These EU-Member States have achieved or even exceeded their targets in different ways in each country. Measures to reduce coal use, energy efficiency measures to replace inefficient heating equipment and the development of more sustainable means of transport have led to the creation of sustainable energy induction. Also, according to Eurostat-European Statistics, from 2010 to 2017 the last 5 countries of the European Union that have registered the weakest results in order to achieve the objectives were (see table 2):

Table 2: Top of the last European countries on achieving the objectives of the Europe 2020 Strategy

EU/Member State	**Greenhouse gas emissions**	**Share of renewable energy**	**Energy efficiency**
	Reducing greenhouse gas emissions by at least 20% compared to 1990 levels	**Increasing the share of renewable energy in final energy consumption to 20%,**	**Moving towards a 20% increase in energy efficiency**
Malta	0.05	0.10	0.7
Latvia	0.17	0.40	5.4
Estonia	0.11	0.25	6.5
Lithuania	0.15	0.23	6.5
Slovenia	0.04	0.25	7.3

Source ((2017), *Europe 2020 Targets*
https://ec.europa.eu/eurostat/documents/4411192/4411431/Europe_2020_Targets.pdf)

For 10 EU-Member States (Malta, Latvia, Estonia Lithuania, Slovenia, Croatia, Slovakia, Bulgaria, Portugal, Hungary) policies that are currently planned or implemented for the promotion of energy from renewable sources are currently insufficient. Thus, these countries have major deficits in reaching the targets for 2020. The lack of funds was the main cause for which these countries failed to make progress towards achieving the goals, as well as the failure to attract investors and money from the European Commission (2019). The European Union has significantly increased its ambition by setting new targets for 2030, namely: reducing greenhouse gas emissions by at least 40% compared to 1990 levels, reaching at least 32 % of energy from renewable sources (Directive 2018/2001 EU of the European Parliament and of the Council of 11 December 2018), and the increase with the little 32.5% of energy efficiency (Directive 2018/2002 EU of the European Parliament and of the Council of 11 December 2018).(see table 3)

Table 3: Climate and energy framework for 2030- Agreed Objectives

Year	Emissions by gases with effect evening	Energy this sources renewable	Efficiency energy	Interconnection	Issues climate in programs financed by EU	Emissions of CO2 From
2020	-20%	20%	20%	10%	2014-2020 (20%)	
2030	≤ -40%	≤ 32%	≤ 32.5%	15%	2021-2027 (25%)	Cars:-37.5% Vans:-31% Trucking:-30%

Source: https://www.consilium.europa.eu/ro/policies/climate-change/2030-climate-and-energy-framework/

Climate change and environmental degradation are an existential threat to Europe and the world. To find solutions to this threat, Europe needs a new growth strategy that will transform the Union into a modern, competitive and resource-efficient economy, in which:

• by 2050, we will stop emitting greenhouse gases;
• economic growth will be decoupled from the use of resources;
• no person and no place will be left behind. (European Commission, 2019)

The European Green Pact is the EU's roadmap for achieving a sustainable economy. The European Green Pact aims to transform the bloc of EU-28 countries into a low-carbon economy without reducing prosperity and improving people's quality of life through cleaner air and water, better health and a thriving natural world. The development of renewable energy sources can also have the potential to stimulate employment in the EU, by creating jobs in the sector of new "green" technologies.

Research Methodology

The study aimed at measuring the interdependencies of the main macroeconomic variables that characterize the energy field in EU-28 countries in the period 2014-2017. The research methodology was based on secondary data taken from the Eurostat Database. In the study we used simple methods for analyzing the energy domain (the graphical method) and simple methods for analyzing the statistical distributions in order to characterize the evolution of the macroeconomic indicators of the energy field based on the descriptive indicators for the period 2014-2017. We chose this period because the value of the macroeconomic indicators included in the analysis were more efficient that is, they recorded with higher values in terms of sustainable growth according to European Green Pact. The analysis of macroeconomic variables in the energy field is presented in the study independently and in correlation with influencing factors. (Cristache at all, 2019).

To analyze the final energy consumption in interdependence with the macroeconomic variables that characterize the energy field at European level, we used a multifactorial regression model with panel data. Thus, panel data models allow the verification of country-specific macroeconomic variables, which cannot be analyzed or quantified and which do not vary over time. Thus, we analyzed the evolution of final energy consumption as an endogenous variable according to the evolution of exogenous variables: the price of electricity according to the type of users and exports in current prices (market factors) and gross domestic product at current prices (factor economic). The data we have taken into account have been obtained from the official websites of the Statistical Office of the European Union Eurostat for a number of 28 European countries (Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, the Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and the United Kingdom).

Of these countries, a number of 27 countries are members of the European Union and the United Kingdom has recently left the EU, but it represents one of the main partners of the European Union, partner with important bilateral trade treaties concluded. That is why we considered including in this database also this European country, which was in the first places regarding the energy field during the analyzed period. Data analyzed aimed at describing trends as close to the present time, and the most recent available data for the macroeconomic variables that characterize the energy field considered were those of 2017.

Results and Discussions

The study started by analyzing the statistical distributions of the macroeconomic variables that characterize the energy field in order to derive their descriptive characteristics.

In the period 2014-2017, the macroeconomic variables included in the study did not show significant fluctuations at the level of each country. Thus, in the case of the endogenous variable Cons_final_en, out of the 28 countries analyzed, a number of 7 countries (Germany, Italy, Holland, Poland, France, Great Britain, Spain) had values above the sample mean, and the remaining 21 countries (Austria, Belgium, Bulgaria, Cyprus, Croatia, Denmark, Estonia, Czech Republic, Finland, Romania, Latvia,

Table 4: Descriptive characteristics of the macroeconomic variables that characterize the energy field

	Cons_final_en Million tonnes of oil equivalent (TOE)	**Export (current prices mil. euros)**	**GDP (current prices mil. euros)**	**Price_energ_ el (EUR pe kwh)**
Mean	39.09	159194.2	529920.48	0.18
Maximum	0.55	1256279	3244990	0.96
Minimum	218.71	197.82	8508.3	0.08
Std. Dev.	52.02	240142.5	808151.69	0.09

Lithuania, Greece, Hungary, Ireland, Luxembourg, Malta, Slovakia, Slovenia, Portugal, Sweden) were below the EU-28 average. In the case of the exogenous variable Price_energ_el, 12 EU countries (Austria, Belgium, Cyprus, Denmark, Germany, Italy, Sweden, Italy, United Kingdom, Netherlands, Portugal, Spain) recorded values above the average of 0.1854 (representing an average annual change in energy prices 18.54%), while 16 EU countries (Bulgaria, Finland, France, Greece, Hungary, Norway, Romania, Slovenia, Latvia, Lithuania, Czech Republic, Croatia, Estonia, Ireland, Luxembourg, Slovakia) below this value. Regarding the exogenous variable Export, a number of 8 EU countries (Germany, Belgium, Italy, France, the Netherlands, Great Britain, Italy, Spain) record

an export value above the EU-28 average, while the other 20 European countries below this value. Also, in the case of the exogenous GDP variable, 6 EU countries (Germany, France, Spain, Italy, Great Britain and the Netherlands) recorded a higher average level than the average of the sample, while 22 EU countries (Cyprus, Austria, Czech Republic, Finland, Greece, Ireland, Malta, Norway, Poland, Portugal, Romania, Slovenia, Bulgaria, Hungary, Latvia, Lithuania, Croatia, Estonia, Luxembourg, Slovakia, Belgium, Denmark) lower. At the same time, it should be noted that the data on macroeconomic variables that characterize the energy field at European level, included in the paper had a high degree of heterogeneity. This high degree is a consequence of the disparities existing in the level of sustainable development of the EU countries and the differences existing in the way of energy production and distribution. Next to estimate the existence/non-existence of a relationship between the indicators mentioned earlier in the study we used the econometric concepts associated with the panel data regression models. (Simionescu and Dumitrescu 2017)

Within the panel-type multifactorial regression model that explains in proportion of 97.44% the evolution of the endogenous variable Cons_final_en using the three exogenous variables, the existence of a positive link between the final energy consumption trend and the exogenous variables that characterize the energy field stated above is highlighted. (See table 5) Specifically, Table 5 indicates the existence of a positive relationship between final energy consumption at the level of the EU countries and the exogenous variables included in the regression model using the EViews software package.

Table 5: Estimation results between Cons_final_en and the trend of the energy field (Export, GDP, Price_energ_ el) as exogenous variables at European level in the period 2014-2017

Dependent Variable: CONS_FINAL_EN
Method: Panel Least Squares
Sample: 2014-2017
Total panel (balanced) observations: 112
CONS_FINAL_EN_=C(1) +C(2)*EXPORT +C(3)*
PRICE_ENERG_ EL+C(4)*GDP

	Coefficient	Std. Error	t-Statistic	Prob.
C(1)	7,297921	1.824145	4,007463	0.0009
C(2)	0.000049	0.000005	6.382086	0.0000
C(3)	-14.967436	9.139350	-1.437995	0.5049
C(4)	0.000050	0.00001	22.22225	0.0001

R-squared	0.974467	Mean dependent var	39.09678
Adjusted R-squared	0.973785	S.D. dependent var	52.02569
F-statistic	1375.468	Durbin-Watson stat	1.568676
Prob(F-statistic)	0.000000		

From Table 5 we can conclude that, with an increase of one million euros in Exports, an increase of 0.000049 million tons of final energy consumption will be obtained, a positive relationship that is statistically significant because (Prob. <5%) . Similarly, it can be observed that a similar impact is generated by GDP, respectively the increase by one million euros of this indicator will determine the increase by 0.000050 million tons of the final energy consumption at the level of the sample of studied countries. The coefficient related to the GDP variable is positive and significant because (Prob. <5%). Also, the coefficient of the variable Price_energ_el registered a negative value and indicates that it is not quite statistically significant. One argument that this coefficient is statistically insignificant could be that the price of energy in the European Union it depends on a number of different supply and demand conditions, including the geopolitical situation, the national energy mix, import diversification, network costs, environmental protection costs, extremely unfavorable weather conditions or levels of excise and taxation. However, this coefficient slightly exceeds the significance

threshold of 5%. According to the data presented in Table 5, the estimated form of the regression equation, using the panel data, is given by:

Cons_final_en= 7,297921+ 0.000049*Export- 14.967436* Price_energ_el +0.000050*GDP

In order to use this equation, it is necessary to consider the limits of the econometric models, such as the restrictive assumptions needed to be met by the independent variables. Regarding the testing of the significance of the panel-type multifactorial regression model and the multiple correlation report based on the "Fisher" criterion, the following conclusion was reached in the study: because the probability of Sig. F is less than 0.05, the multifactorial regression model is valid, as is the multiple correlation ratios for a significance threshold of 0.05. To reconfirm that the multifactorial regression model developed in the study is linear, we further used the graphical method to see if there is an interdependence link between the variables and if its shape is linear.

So, to analyze to what extent each exogenous variable influences the final energy consumption at European level in from 2014-2017 we used the scatter diagram using Excel software packages. (See figure 2) Based on the correlation graph, we appreciated that the points in the graph network are evenly distributed, without disparities between them, so we can conclude that the connection between exogenous variables that characterize the energy level European Union (Export, GDP, Price_energ_el) and Cons_final_en as endogenous variable is linear, direct. So we can appreciate that the exogenous variables included in the model have a significant influence on the variation of the endogenous variable (final energy consumption) contributing to its average annual growth.

Figure 2: Correlation between Price_energ_el, GDP, Export and Cons_Final_en

Source: Eurostat –European Statistics

The value of the coefficient of determination in the case of the unifactorial linear correlation panel type between the GDP and the final energy consumption of 0.984 shows that 98.4% represents the

significant influence of the exogenous variable on the final energy consumption, the rest of 1.6% coming from other random, random factors, not included in the model as for example: energy productivity, energy efficiency, electricity production, etc. The value of the coefficient of determination of 0.926 in the case of the unifactorial linear correlation panel type between the export and the final energy consumption suggests that 92.6% represent the influence of the export on the final energy consumption the rest of 7.4% coming from other random factors, such as: energy imports, energy intensity, etc. The value of the coefficient of determination in the case of the unifactorial linear correlation panel type between Price_energ_el and the final energy consumption of 0.227 shows us that 22.7% represents the reduced influence of the exogenous variable on the final energy consumption, the rest of 77.3% coming from other random, random factors, not included in the model as for example: energy taxes and taxes, final consumption expenses of households and institutions. This is because there are significant discrepancies in energy prices at European level, there is no uniformity and equalization of these prices. This situation can also be attributed to the uneven development of the economies of European countries mainly due to the different methods and tools applied by them in terms of sustainable economic growth in line with the Europe 2020 Strategy.

Because the time period used in the study was quite short 2014-2017, we did not consider the construction of a VAR model. In the future, in order to deepen the analysis, we plan to extend the time period to develop such an econometric model. OLS hypotheses are tested for the same level of significance, except for the error autocorrelation hypothesis, tested using the Durbin-Watson test. Statistically, DW recorded a calculated value (DW = 1.56), a value that we compared with the critical statistical values for α = 0.05, k = 3 and n = 112; d1 = 1.63 and d2 = 1.72 suggest that the errors are positively correlated. Regarding the verification of the error normality hypothesis, it turned out that the calculated value of the Jarque-Berra test: $JB\,(123.62) > \chi^2_{0,05;4}\,(9.49)$ we appreciate that the hypothesis of normality of errors cannot be accepted. The verification of the multicolinearity hypothesis of the exogenous variables was based on the analysis of the correlation matrix from table 6.

Table 6: Correlation Matrix

	CONS_FINAL_EN	EXPORT	PRICE_ENERG_EL	GDP
CONS_FINAL_EN	1			
EXPORT	0.926818	1		
PRICE_ENERG_EL	0.227657	0.269016	1	
GDP	0.984714	0.900010	0.232288	1

Following the application of the Klein Criterion for verifying multicollinearity, it resulted that $r^2_{(x_1;x_3)} = 0.90 < R^2 = 0.97$ *and* $r^2_{(x_1;x_2)} = 0.26 < R^2 = 0.97$ exogenous variables are not collinear.

Conclusions

The challenges facing the EU in the field of energy include issues such as increased import dependency, limited diversification, high levels of energy prices and their volatility, increased energy demand globally, security risks affecting producing countries and those involved of transit, the increasing threats posed by climate change, the slow progress in energy efficiency, the challenges arising from the increasing share of renewable energy, and the need for greater transparency and better integration and interconnection in the energy markets.

According to the European Environmental Agency (2016) the use of energy from renewable sources has many potential benefits, including a reduction of greenhouse gas emissions, diversification of energy supply and reduction of dependence on fossil fuel markets (in particular, the oil and gas market). The development of renewable energy sources can also have the potential to stimulate employment in the EU, by creating jobs in the sector of new "green" technologies.

At European level, the completion of the internal market of the European Union has since the establishment, among other desires, the elimination of trade barriers, the similarity of policies practiced by each European state individually, as well as the practice of free mechanisms of price formation, based on demand and of the offer. But from an energy point of view, the establishment of appropriate measures for each state in particular has made it difficult for specialists in the field, because each state sizes its electricity production according to the available resources. That is why the significant discrepancies existing in the energy field at European level are still present with all the measures that the EU has taken and is trying to take. There are countries where pollution is still high and there are no modern technologies to reduce it. This is because the standard of living of the European population is not at the same level in all EU countries as well as the unemployment rate and the degree of education.

That is why the significant discrepancies existing in the energy field at European level are still present with all the measures that the European Union has taken and tries to continue to take. However, Europe has much strength, such as: the talent and creativity of its citizens, a strong industrial base, a strong service sector, a prosperous and high quality agricultural sector, a strong maritime tradition, the single market and the common currency, the position of the largest trading bloc in the world and the main destination of foreign direct investment. One of the main objectives of the energy field, existing at present but also estimated in the future, is the use of renewable energy. According to the European Environmental Agency (2016) renewable energies will inevitably dominate the long-term global and European energy system, due in particular to limited fossil fuel resources. The argument, perhaps the strongest one, is that of global warming and the alteration of climate and biological balances, a process that has been accelerated almost 10 times in the last 30 years. According to the European Environmental Agency (2016) the use of systems that exploit renewable energy such as: geothermal energy, biomass, solar energy (HVAC) or: wind, bioenergy, photovoltaic energy, hydropower, tide (electricity production) is a very broad subject of study case ensures better coherence in terms of energy policy as a whole. This can be achieved by integrating the energy policy of the Member States into the definition of the European energy strategy and through coordinated actions at Community level.

The Use of Artificial Intelligence in Identifying the Quality Costs in Service Companies

Wojciech SADKOWSKI

Jagiellonian University, Cracow, Poland
wojciech.sadkowski@uj.edu.pl

Abstract

The purpose of the hereby paper is to present the possibilities of using artificial intelligence to identify the quality costs in service companies. The quality costs and the use of artificial intelligence in accounting systems are the subjects of the research. Analysis of available literature sources showed substantial gaps in the area of identifying quality costs using artificial intelligence. The author made the attempt to create a tool for identifying quality costs based on artificial intelligence. The work involved a critical analysis of scientific literature on accounting, quality management and IT as well as to selected journals. The present paper forms a body of theory to develop own tool enabling the implementation of quality costs calculation in service companies.

Keywords : artificial intelligence, quality costs, quality costs calculation, service company.

Introduction

Artificial intelligence is an area of science that brings together fields, methods, tools and techniques designed to create and develop a complete computer program that accurately reflects the model of human and his mind functioning, Warszycki (2019). This science has its roots in computer science, philosophy, mathematics, psychology, cognitive science, as well as in many other disciplines, Dignum (2019). It is used more and more widely in all areas of human life. It is used in the modern economy, e.g. in banking, retail, industrial production, Sylpaczuk and Żynda (2019), to predict consumer emotions, Warszycki (2019), as well as in counteracting tax avoidance, Kuźniacki (2019).

Griffin (2016) mentioned that nowadays, artificial intelligence is also practically used in accounting: in all aspects of business operations accounting (implementation of automatic accounting), payment of invoices (automatic payments) and analysis of financial data.

Quality costs are an important cost group in service companies. Particular difficulties arise in their proper identification. The use of artificial intelligence will allow to prepare a solution enabling their correct verification and registration in the company's accounting system.

The article was organized in the following order. In the first part, the author refers to the state of knowledge in the field of quality costs and the impact of artificial intelligence on their identification. The second part presents a mechanism enabling the identification of quality costs in service companies. The third part attempts to critically evaluate the proposed tool. The article ends with the conclusions of the conducted considerations in the summary.

Quality costs and Artificial Intelligence

The first definition of the term *quality costs* appeared as early as 1951. In the opinion Juran (1951), the author of the definition, quality costs is an instrument to measure quality. This interpretation of the term was followed by numerous other specifications in subsequent years. The most important of these are definitions by A.V. Feigenbaum, F. Nixon, W.A. Nowak and K. Szczepańska.

Feigenbaum (1961) believes that these costs are related to pro-quality efforts. For Nixon (1974), these are costs of obtaining certainty that consumer receives only products manufactured according to the requirements. In Nowak's (1997) opinion these are costs of client's needs and expectations embracing prevention and evaluation, as well as costs resulting from inadequate quality. Szczepańska (2017) defines quality costs as costs of failing to meet unidentified requirements of company's clients. The various specifications of quality costs prove lack of one, universal definition of this term.

Service activities is the backbone of modern economies and is increasingly supported by technology, but just like any other economic activity is associated with costs. A large part of the costs allocated to the implementation of the service relates to quality, which from the client's point of view is of fundamental importance in the receipt of the service rendered. Therefore, the estimation and disclosure of quality costs, which "hide" in implemented processes, gains significant value in a company. Sorting out costs related to quality allows an individual to be more aware of the problem of quality and process efficiency.

The first work on artificial intelligence was conducted by W. McCulloch and W. Pitts in 1943, who studied the model of artificial neurons. In their research, they showed that neuron activity is an "all-or-none" process, McCulloch and Pitts (1943). In 1950, M. Minsky and D. Edmonds built the first neural network computer, Akst (2019). The most significant event of this period was the work of A.M. Turing (1950) with his introduction to the Turing Test. The period from the mid-1950s to the early 1980s was about to formulate new hypotheses about programming languages and microcosms, but there was a lack of sufficient technology at the time. Industry investment in artificial intelligence and the construction of useful systems based on it began to become more significant after 1980 and continues to this day. The state-of-the-art examples of technologies using artificial intelligence are robotic vehicles, speech recognition, autonomous planning and machine translation. In the service sector, such examples are virtual assistants (chatbots), robotic service providers, as well as intelligent agents, Ferreira et al. (2020), Makridakis (2017), Burgess (2018). Ferreira et al. (2020) indicate that artificial intelligence has a very significant impact on the provision of services and provides breakthrough technological innovations whose consequences for services are yet unforeseen.

The presented applications of artificial intelligence in services and the economy allow to formulate the claim that the use of artificial intelligence can facilitate the proper identification of quality costs in service companies. For this to happen, it is necessary to develop appropriate software that will help to achieve the set goal. To build this tool, it will be necessary to use the theory of artificial intelligence, which indicates that its main components are in order: data set, computational operations and management module, Nilsson (2014). The data set is one of the most important elements of computer systems, as well as individual computer programs, which is responsible for maintaining and storing all data related to the unit's work, tasks performed, ways of making decisions. Their implementation depends on the wide range of information collected. The management module has a defined strategy and control of the operations of the entire computer system that are implemented by computing operations. As part of the article, work on artificial intelligence has been narrowed to the quality costs in the accounting systems of service companies.

Tool of Identifying the Quality Costs

The main assumptions adopted in the construction of the mechanism for identifying quality costs are: using the existing accounting system in the company, having an integrated management system and quality team, which is responsible for verification of quality costs in implemented processes, and also classifies them into appropriate cost groups. The created program should be based on the components of artificial intelligence: data set, computational operations and management module**,** Akerkar (2019).

Improving the operations of the Quality Team will be possible thanks to the introduction of a computer program called QC, whose task will be to identify the quality cost on the basis of information collected by the accounting system (invoices, other financial documents) and the integrated management system (complaint registers, error reports, information about processes) and

classifying it in the appropriate group of quality costs, The program will automatically assign the following data to each of the estimated costs: name of the process (in which it was created), name of the cost, type of cost, its amount, as well as the source document and will generate a collective quality cost estimation form, which is shown in Table 1.

Table 1: Quality costs estimation form

Name of the process	Name of the cost	Type of cost	The amount of the cost	The source document	Additional information
process No. 1	Cost No. 1				
	Cost No. 2				
	Cost No. n				
process No. 2	Cost No. 1				
	Cost No. 2				
	Cost No. n				
process No. n	Cost No. 1				
	Cost No. 2				
	Cost No. n				

Note: own elaboration.

A periodic summary statement of quality costs prepared on the basis of the quality cost estimation form will be forwarded by the QC program to the quality team for verification. A positively verified and approved document by the quality team will be the basis for preparing a comprehensive quality costs report, which should include quality costs analysis (size, structure, change dynamics, errors, indicators analysis, identification of places where quality costs arise and the processes most burdened by these costs). A periodic quality costs report should be forwarded to the accounting department. The proposed course of the quality costs identification process is presented in Figure 1.

Fig. 1: Proposed process of identifying of quality costs using artificial intelligence
Note: own elaboration.

Results and Discussion

The creation of a computer program QC for identifying quality costs will have a positive impact on "shell" these costs from processes carried out in service companies and will provide an additional source of information for decision makers managing these organizations. The author of the publication recommends the creation of an interdisciplinary research team consisting of specialists in accounting, IT and artificial intelligence, whose goal will be to prepare and implement the QC program.

Automating the identification of quality costs using special computer software that complements the accounting system used will allow to: increase the efficiency of hidden quality costs detection in processes, reduce human errors, save the work time of the quality team and incurred costs, as well as improve business decision making in service companies and will contribute to increasing the quality of services provided and increasing the quality awareness of employees responsible for individual processes. An investment in artificial intelligence to estimate quality costs will help optimize processes in service.

The process of identifying quality costs proposed by the author is based on the use of the accounting system and integrated management system implemented in the service companies. Lack of possession of these two systems will forbid the use of the proposed QC program.

Summary

To sum up, it should be stated that the preparation of a computer program identifying quality costs will require cooperation with specialists in the IT sector, because only in this way will it be possible to fill the existing gap between accounting and artificial intelligence, Stancheva-Todorova (2018).

An efficient program that identifies quality costs should support the work of the quality team, the accounting department and the head of integrated management systems. The next step in extending the use of this tool should be its use to create a computer program for quality costs calculation, Sadkowski (2019).

The process of identifying quality costs using artificial intelligence proposed by the author is an innovative accounting solution that bridges the gap in recognizing and estimating quality costs in services. Creating this program will allow to take the next technological step in the development of IT accounting systems and automate the process of identifying costs related to quality.

The presented article may be an introduction to in-depth research in the field of the effectiveness of the use of artificial intelligence in identifying the quality costs of service companies. It is recommended to continue research in the field of verification of the use of the QC computer program by service companies and preparation of a tool for quality cost calculation based on artificial intelligence.

Abstract

This paper aimed to examine workplace relations a panacea for job performance in a manufacturing company in Ota, Ogun State, Nigeria. It investigated the factors such interpersonal relations vis-à-vis mentoring that affect job satisfaction. The population for this study, comprised of organizational employees in the food & pharmaceutical manufacturing company in Ota, comprised of 200 respondents. To reach the objectives for this study, the researcher developed and distributed and collected questionnaires, and analyzed the data obtained from the questionnaires using SPSS. An overall analysis was conducted based on the descriptive and correlation analysis. The findings of this study revealed that interpersonal relations and mentoring have significant effect on job satisfaction. The paper provided recommendations for fostering interpersonal relations and mentoring in the manufacturing organization in Nigeria.

Keywords: Interpersonal Relations, Job Satisfaction, Mentoring and Job Performance.

Introduction

In the business world, there are two categories of organizations and this includes the profit-making organization and the non-profit organization. Both of these organizations were created in order to attain organizational objectives. Objectives are measurable, specific and have a definite time of completion (Abdulla, 2018), which ultimately leads to job performance (Mundia & Iravo, 2014; Abdulla, 2018). Hence, no organization can exist or achieve its specific set of objectives on its own without the availability, use, association, and involvement of human resource and their skills (Fulmer & Ployhart, 2013; Omur & Derya, 2013). In relation, understanding the human resource aspect of an organization

considering that they are the most essential factor in the workplace is vital to attaining workplace objectives (Xesha, Iwu, Slabbert & Ndunai, 2014; Sequeira & Dhriti, 2015). Thus, in essence, can bring about enhanced job performance.

According to Thushel (2015) job performance is characterized as behaviors or actions that are performed to achieve the workplace's objectives. Himanshu (2015), added that job performance is as a result of positive relationship behaviors between employer and employee as well as colleagues in the organization. In support, it was argued that employees perform well through good relationship management existing among individuals or groups of people working together, and are willing to get things done in harmony and peacefully (Emily & Jacob, 2014; Onwu, 2012). Iqbal, Ijaz, Latif, and Mushtaq (2015) opined that different factors at the workplace affect job performance (job satisfaction) of workers and this includes workplace relationship practices. Therefore, in gaining enhanced level of job performance, satisfaction and engagement, it is essential to have effective workplace relationship practices. These practices involve mentoring, interpersonal relations and other positive interactions between employees that are behaving in a properly responsive manner thereby affecting job performance level (Osibanjo, Abiodun & Obamiro, 2011; Deme & Worlu, 2017). Bajaj, Sinha, and Tiwari (2013) revealed that increased trust and interpersonal relations reduce working environment issues. Hence this study believes that workplace relations will drive job performance in the workplace.

Workplace relations, therefore, can be referred to as the formal or informal interaction that exists between overall employees. It also involves employee relations practices. Employee relations practices are key concepts which involve positive interpersonal relations and mentoring practices for enhancing overall job performance in an organization. High performing employees translate their organizations into successful organizations through positive workplace relations. In addition, Sulaimon, Muhammed, Raji, Omede, and Sulaiman, (2016) added that it is a form of social relationship that is part of human beings' characteristics. Elnaga and Imran (2013) drew opinions from many research work and Hawthorne studies that the effectiveness and efficiency of employees is a pointer to the fact that employees are enthusiastic about their job as a result of existing positive workplace relationships. Healthier employee relationships existing within an organization provides a better chance for employees to perform better within a competitive business environment (Dele, 2013).

Moreover, in a highly competitive and turbulent environment faced by firms today, firms depend mainly on the quality of its employees and the relationship developed with them to attain success and sustenance (Worlu, Osibanjo, Ogunnaike, Salau, & Igbinoba, 2016).

Therefore, in undertaking this study, the researcher developed some research objectives, research questions and hypothesis, and made use of extensive literature in relation to this study. Answers to the research questions were provided by the researcher through analyzed questionnaires from respondents in the manufacturing sector suitable for this study.

Objectives of the Study

Examining workplace relations as a panacea for job performance is the main objective of this study.

The primary objectives therefore are broken down into specific objectives which are to:

i. determine the effect of interpersonal relations on job satisfaction.

ii. investigate the influence of mentoring on job satisfaction

Research Questions

i. to what extent can interpersonal relations affect job satisfaction?

ii. in what way has mentoring influenced job satisfaction?

Research Hypotheses

HYPOTHESIS 1

H_0: interpersonal relation has no significant effect on job satisfaction.

HYPOTHESIS 2

H_0: mentoring has no significant influence on job satisfaction.

Literature Review

Interpersonal Relations

In today's workplace, an interpersonal relationship is an important factor. Interpersonal relationship can be referred to as a form of social communication existing among workers at all levels either working together as a team or working together in a work unit.

In addition, workplace interpersonal relations play a vital role as well as a critical precondition for effective business (Olannye, 2014). It is an employees' repeated interactions and participation in the building of relationships through soft skills and organizational communication is a part of interpersonal relations (Adesubomi, 2015). Interpersonal relationships can be referred to as that association existing between individuals at work such as between employees and colleagues at all levels. Employees at levels as well as employers engage in interpersonal relations which takes the form of networking, being assertive, handling emotional behavior and conflict, communication, working in teams or groups, negotiating, handling politics, liaising with customers, performing in a politically smart and moral way to secure the objectives of the HR (Armstrong, 2016). There is a need for long-term beneficial social relationships in the work environment as it represents a stabilizing factor that promotes emotional and cognitive involvement in the work environment as well as promoting employees' attachment to the organization (Zenobia, 2015).

Singh (2012) as cited in the work of Ombayo, Shiamwama and Egessa (2014) affirms that the benefits of a firm's level of outcomes, among others, is as a result of the investment in training employees in issues around interpersonal relations according to research indications.

Mentoring

Mentoring is an employee developmental activity that happens formally and informally in the workplace. Organizations that have mentoring programs experience enhanced success and retains satisfied employees (Tewari & Sharma, 2014; Washington, 2010).

In addition, among other strategies for managing human resources in the workplace mentoring is one of the most essential. It is used to strengthen employee relations, sustain the firms' competitive advantage, build firms' knowledge and provides a one on one basis whereby the younger employees have the opportunity to gain experience and wisdom from the matured and more experienced individuals in the firm (Rollins, Rutherford & Nickell, 2014; Ofobruku & Nwakoby, 2015). In other words, mentoring brings opportunity for the formulation of close relationship between one or more persons.

Tewari et al (2014), opined that mentoring can be referred to as one of the top strategies for advancing and developing a career. Similarly, the researchers defined it as a form of the relationship existing between a more experienced organizational member of with a less experienced organizational individual which provides employees the opportunity to share their personal and professional skills as well as experiences, and in the process leading to growth and development. However, Rollins, et al (2014); Arogundade (2011) asserted that a mentor can be defined as the individual that provides insight and knowledge sharing that have been learned through the years to facilitates or enhance the professional and personal growth of an individual. Maintaining and improving an organization's competitive advantage and employee development through mentoring encompasses the activities encouraged and designed by management (Abomeh & Mohammed, 2016).

Job Satisfaction

A very vital component of an organizations' checklist is job satisfaction. It brings a positive effect in the workplace and it's vital to the organization's employees across all levels (Saad, Muhammad & Rafi, 2012). Satisfaction can be referred to as a mental state of a person in a job. Furthermore, job satisfaction gives an understanding of knowing the reason people work, the level at their job satisfy them and how they get satisfied (Rahman, Gupta & Moudud-Ul-Huq, 2012).

Moreover, there are expectations needed from the organization by employees in other to be satisfied among others (Bakotic & Babic, 2013, Adeniji & Osibanjo, 2012). Job satisfaction is the appraisal of one's job experiences that leads to an emotional state that is both pleasurable and positive (Malik, Danish & Munir, 2012; Singh & Mini, 2013). As employees become contented with their job, job satisfaction is enhanced. Satisfied wants of employees lead to a contentment experience which forms the overall attitude of employees towards work (Chetna & Rajnie, 2012).

Additionally, Shahab and Nisa (2014) opined that job satisfaction is seen as the workplace employees' overall beliefs and collection of feelings regarding their current jobs. In additionally, the job satisfaction level of a worker can range from a very high satisfaction to a very high dissatisfaction (Mohammed & Eleswed, 2013). Job satisfaction is defined as when the employee fulfills their desire at the workplace as a result of their full commitment and happiness with their work (Saad, et al., 2012).

In particular, among many other factors employee performances can be enhanced by satisfied a worker who continuously achieve the goal in line with his or her job (Solanki, 2013). From the standpoint of employees, managers and scientists job satisfaction is an interesting issue.

Empirical Review

Olannye (2014) pointed out in his study on interpersonal relationship that the findings revealed that good interactions that are friendly in nature showed a vast positive effect on the retention of customers. Thus, depicting in a long run the level at which employees are satisfied as a result of friendly interactions which affects the retention of customers. Furthermore, with the findings the study concluded that interpersonal relationship is a vital weapon for competitive advantage in the hotel industry due to its possibilities in

provoking interaction that are friendly, which fosters satisfaction, loyalty, and emotional attachment among others, to the service providers.

Mohammed, Asombo and Daniel (2018) indicated from their study on interpersonal relationship and job performance that from the hypotheses tested, it indicated that there was a significant relationship between interpersonal relationship and job performance among employees. Therefore, the findings shows that there is a relationship between interpersonal relationship and job satisfaction that translates into job performance because there cannot be performance without some level of satisfaction.

Yang, George and Yaojiang (2014) in their study on mentoring found out that the mentees math score was not improved through the program but rather their learning stress increased. In addition, math scores of mentors were improved significantly by 0.57 standard deviations through the program and with no significant change in their mental health scores lowering their dropout rate by 3%.

An empirical work by Rhay-Hung, Ching-Yuan, Wen-Chen, Li-Yu, Syr-En, and Mei-Ying (2010) in their study on the impact of mentoring on job satisfaction and commitment. Their findings showed that between employee mentoring and job satisfaction, employee mentoring has a positive effect. Sebastian and Zacharias (2015) carried out a study on employee mentoring and affective commitment: a study among new generation private sector bank employees in Kerala. However, 36 employees working ICICI bank, HDFC bank and Axis bank were selected using convenience. The findings proved that there exists a positive effect of employee mentoring on employee commitment.

Furthermore, in the work of Shagufta and James (2013) a total of 110 respondents at two private organizations were administered through a constructed questionnaire. These questionnaires were also tested. Out of the administered questionnaires analyzed with Microsoft excel to test the hypotheses of the study were a total of 104 usable surveys. Positive job satisfaction of employees was induced by rewards as shown by findings. Moreover, revealed through findings was that employees' loyalty to the organization was stimulated by their job satisfaction. However, employee pay and the amount of work they do record a very high level of employee dissatisfaction in it.

Research Methods

Basically, the primary method of data collection was adopted in this study. This study also adopted a descriptive survey research design. A sample of 200 respondents was contacted in the manufacturing sector in Ota, Ogun State, Nigeria to obtain responses of the questionnaire. sThe questionnaire was divided into three parts: section A contained the biodata of the respondents, it was made up of the respondents' sex, age, marital status, religion, educational qualification, and length of service while section B (independent variable) and C (dependent variable) consists of questions that relate to this study and would be able to answer the researchers' questions. In addition, Likert scale was used for section B and C with the calibration of Strongly-Agree (SA), Agree (A), Undecided (U), Disagree (D) and strongly-Disagree (SD). Cronbach's Alpha was used to check reliability. All in all, responses were analyzed with the use of Statistical Package for Social Sciences (SPSS) and simple linear regression was used to indicate significant effect of interpersonal relations on job satisfaction, as well as indicating significant influence of mentoring on job satisfaction.

Data Presentation, Analysis and Interpretation

Table 1: Analysis of Response Rate

RESPONSE	NUMBER OF RESPONDENTS	PERCENTAGE (%)
RETURENED	146	73
NOT RETURNED	54	27
TOTAL DISTRIBUTED	200	100

From the analysis above Table 1, 146 respondents which represent 73% of the total retrieved questionnaire will be analyzed in this work while a total of 54 respondents which consist of 27% could not be retrieved. The analysis and findings will be based on the 73% responses retrieved from the employees consisting of 146 respondents.

Test of Hypotheses

In the course of this study two (2) hypotheses have been posed and checked using regression analysis. In regression analysis, we consider the alternative hypothesis and reject the null hypothesis and vice versa when the relevant (sig) value is less than 0.05 for 95 percent confidence level or less than 0.01 for 99 percent confidence level.

In order to test the hypotheses, linear regression analysis and correlation were used.

Test of Hypothesis 1

***Research Objective 1*:** Determine the effect of interpersonal relations on job satisfaction.
***Research Question 1*:** To what extent can interpersonal relations significant effect job satisfaction?
***Hypothesis 1*:**
H_0**:** Interpersonal relations have no significant effect on job satisfaction.

Table 2: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.783[a]	.614	.611	.43765

a. Predictors: (Constant), Interpersonal relations

b. Dependent variable: Job Satisfaction

Interpretation of Results

The model summary Table 2 reveals how much the independent variance in the outcome (job satisfaction) is explained by the predictor variable (interpersonal relations). In this case the R square is 0.614 when indicated by percentage it will be 61.4%. This means that the model explains 61.4% of the variance in the levels of job satisfaction can be predicted from interpersonal relations, which suggest that interpersonal relations is a very good predictor.

Table 3: ANOVA

Model		Sum of Squares	Df.	Mean Square	F	Sig.
1	**Regression**	43.849	1	43.849	228.930	.000[a]
	Residual	27.582	144	.192		
	Total	71.431	145			

a. Dependent Variable: Satisfaction

b. Predictors: (Constant), Interpersonal Relations

Interpretation of Result

Table 3 reveals the valuation of the statistical significance of the result. However, In order to know if the null hypothesis is statistically significant the ANOVA table test is carried out. From the result, the model in this table is statistically significant as the F value is 228.930 at 0.000[b]. Implication is that interpersonal relations as a predictor was significantly better than the prediction without interpersonal relation. Hence, interpersonal relation has a significant influence on job satisfaction.

***Decision*:** The null hypothesis H_0 is rejected. Therefore, there is a significant effect of interpersonal relations on job performance.

Table 4: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	**Std. Error**	**Beta**		
1	(Constant)	.552	.135		4.081	.000
	Interpersonal Relations	.784	.052	.783	15.130	.000

a. Dependent Variable: Job Satisfaction

Interpretation of Result

The coefficients Table 4 indicates the extent to which interpersonal relations has effect on job satisfaction. In this table, the beta coefficient is 0.784 and this implies that holding other variable constant, for every one unit increase in interpersonal relations would result in 78.4% increase in job satisfaction level.

From the above table, it can be concluded that interpersonal relations has a significant effect on job satisfaction. Therefore the null hypothesis H_0 is rejected.

Test of Hypothesis 2

***Research Objective 2*:** Investigate the influence of mentoring on job satisfaction?
***Research Question 2*:** In what way has mentoring influence on job satisfaction?
Hypothesis 2:
H_0**:** Mentoring has no significant influence on job satisfaction

Table 5: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.768[a]	.590	.587	.45107

a. *Predictors: (Constant), Mentoring*

Interpretation of Results

The model summary Table 5 reveals how much the independent variable (mentoring) explains the level of variance of the dependent variable (job satisfaction). In this case the R square is 0.590 if indicated by percentage will be 59.0%. This means that the model explains 59.0% of the variance in the levels of job satisfaction was predicted from the level of mentoring which suggest that mentoring is a good predictor.

Table 6: ANOVA

Model		**Sum of Squares**	**Df**	**Mean Square**	**F**	**Sig.**
1	**Regression**	42.132	1	42.132	207.075	.000[a]
	Residual	29.299	144	.203		
	Total	71.431	145			

a. *Dependent Variable: Job Satisfaction*
b. *Predictors: (Constant), Mentoring*

Interpretation of Result

Table 6 shows the valuation of the statistical significance of the result. More so, in order to know if the null hypothesis is statistically significant the ANOVA table test is carried out. From the result, the model in this table is statistically significant showing the F value to be 207.075 at 0.000[a]. This implication is that mentoring as a predictor was significantly better than the prediction without mentoring. Hence, mentoring has a significant influence on job satisfaction.

Decision: The null hypothesis H_0 was rejected. Therefore, there is a significant influence of mentoring on job satisfaction.

Table 7: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.460	.148		3.103	.002
	Mentoring	.836	.058	.768	14.390	.000

a. Dependent Variable: Job Satisfaction

Interpretation of Result

The coefficients Table 7 indicates the extent to which mentoring has influence on job satisfaction. In this table, the beta coefficient is 0.836 and this implies that holding other variable constant, for every one-unit increase in mentoring, it would result in 83.6% increase in job satisfaction level.

From Table 7, it can be concluded that mentoring has a significant influence on job satisfaction. The null hypothesis H_0 was rejected.

Discussion of Objectives

In the course of this study, two (2) hypotheses were drawn and tested using the simple linear regression analysis. Based on the analyses, findings were presented below in line with the objectives of the study;

Objective 1: to determine the effect of interpersonal relations on job satisfaction.

The findings of this study were based on the statistical data analyzed and hypotheses tested. The analysis of data collected showed that interpersonal relations is a significant predictor of job satisfaction. This finding is supported the work of other scholars such as (Olannye, 2014; Mohammed, *et al*., 2018). Olannye (2014); Mohammed, et al (2018) have been able to determine the effect of interpersonal relations on other relating variable such as customers retention and job performance (dependent variables) respectively that depicted a positive relationship. For instance, in the work of Olannye (2014) it revealed that interpersonal relations had a positive effect on the retention of customers. Thus, revealing there is a relationship between interpersonal relationship and job satisfaction because as employees are satisfied as a result of friendly interactions, this will translate to also affect the retention of customers. All in all, the

null hypothesis one (1) for this study was rejected as findings reveals that there was a significant effect of interpersonal relations on the level of job satisfaction.

Objective 2: To investigate the influence of mentoring on job satisfaction.

The findings from the retrieved analysis of data indicated that mentoring is a significant predictor of job satisfaction. The finding is support by other scholars which includes (Rhay-Hung *et al.,* 2014; Shagufta & James, 2013; Sebastian & Zacharias, 2015). However, even though these scholars used other dependent variables for their work, their work showed that interpersonal relation has some form of influence on job satisfaction. On the other hand, Yang *et al* (2014) was not able to clearly investigate and unveil the influence of mentoring on job satisfaction while using a different dependent variable like the aforementioned scholars. For example, Rhay-Hung et al (2014) was able to reveal that mentoring has a positive effect on employees' commitment. Hence, indicating that since mentoring has a positive effect on employees' commitment then there is some form of positive influence of mentoring on the satisfaction of employees. Thus, this study considered mentoring to be vital and having a positive effect on job satisfaction within an organization. The null hypothesis was rejected being that findings from this study indicate that there was a significant influence of mentoring on the level of job satisfaction.

Contribution to Knowledge

This study has contributed to knowledge by providing through its empirical review valuable collection of ideas, facts and figures that are essential to employers, entrepreneurs, lecturers, students and other scholars in understanding significance of workplace relations as a panacea for job performance within the organization.

Also, this study has contributed to knowledge by providing findings that can be applied, compared and observed respectively with other findings from related studies conducted in business institutions and organizations in Nigeria as well as in the globe. Furthermore, this study has provided more basis for further studies to be conducted in this area of workplace relations a panacea for job performance in other manufacturing organizations

Finally, another contribution to knowledge is that the study has been able to further establish the importance of interpersonal relations and mentoring within the organization in facilitating job satisfaction.

Conclusion

The focus of this study was on workplace relations a panacea for job performance: a case study of manufacturing company in Ota, Ogun State, Nigeria. It was observed that even though through the responses of respondent that employee relations was fairly satisfactory in the selected manufacturing company, the results still shows that employee relations has a significant effect on job performance and is capable of affecting the overall success of an organization. However, it can be safely concluded that the success of an organization may be jeopardized if there is low job satisfaction of employees. Negative trend of low job satisfaction can however be reversed if interpersonal relations and mentoring are improved upon within an organization.

Recommendation

Based on the empirical findings from the objective for this study, indicating that interpersonal relations is a significant predictor of job satisfaction and has a significant effect on job satisfaction. The researcher recommends that management of the organization should ensure that they increase the level of attention and actions necessary to foster interpersonal relations within the organization.

Again, the researcher recommends that since the empirical finding based on the objective for this study indicates that there is a significant influence of mentoring on the level of job performance. Management of the organization should encourage mentoring within the organization as much as possible. Allowing mentoring within the organization will improve the attention to personal problems, encourage fair employee treatment, shared personal knowledge and experiences for good employee relations and ultimately increase the level of job performance between employees at all levels.

Suggestions for Further Studies

This study focused on employees within Nigeria. The employees were respondents based in a manufacturing company in Ota, Ogun state, Nigeria. Moreover, the following suggestions will be beneficial for future research. Studies in line with this subject area workplace relations a panacea for job performance should be carried out in other manufacturing organizations within and outside Nigeria by interested researchers so as to ascertain whether the findings in this study is similar to other context. In addition, studies should be done by studying and comparing more organizations at the same time. In addition, scholars carrying out further studies in this area should indicate and clearly state the variables used in their undertaken studies.

Acknowledgements

Through this medium, we give thanks to God for granting us the strength, wisdom, privilege and opportunity to undertake this study. In addition, we thank Covenant University's management team for their tremendous assistance and support in funding this paper, moving us once again toward excellence. Furthermore, we appreciate the Business Management Department, Covenant University for providing consistent support through the cause of carrying out this study. To Professor Vincent Efeovbokhan, we say thank you and God bless you for all your contributions towards the success of this study.

maciej.nowak@zut.edu.pl

Abstract

Key issues in this context include spatial order protection, the role of spatial planning in integrated development planning, adaptation of space management to the ever-changing role of cities (and urban policy principles), or the way to reconcile different - even from the perspective of scientific disciplines - perspectives related to the perception of priorities and directions of spatial policy. The analysis would then have to take into account the diverse context (economic, political, spatial, etc.) of these countries. Conclusions - relating to the thematic areas presented above - can generally be reduced to:

- assessment of actions taken (both on a national, regional and perhaps primarily local scale);
- developing short-term and long-term recommendations for further actions.

The invitation to implement this research project is addressed to all authors dealing with broadly understood issues of spatial policy in various countries.

Keywords: Covid-19, Pandemic, Space Management

Introduction

Issues related to space management (also recognized as spatial policy) translate into a number of attractive research issues. Key issues in this context include spatial order protection, the role of spatial planning in integrated development planning, adaptation of space management to the ever-changing role of cities (and urban policy principles), or the way to reconcile different - even from the perspective of scientific disciplines - perspectives related to the perception of priorities and directions of spatial policy. The COVID-19 pandemic, however, generates additional problems that also need to be included in the spatial context.

Space Management and Malfunction of Public Authorities

In the literature on the subject of various countries, the priorities and directions of space management are discussed in various ways. The following issues may be considered as particularly interesting (in terms of research, also in the sphere of international discussion):

- the optimal scope of state intervention in the economy and translating related conclusions into a range of possible activities regarding space management (Mickiewicz, Nowak, 2013; Olbrysz, Zachariasz, 2015);
- protection and shaping of spatial order and the optimal scope of limiting the rights of property owners associated with it (Sleszynski, 2018; Gibas, Majorek, 2020; Heffner, Czarnecki, 2015);
- environmental protection in space management (Degorska, Deregowska, 2008);

- social and economic effects of urban spatial development (including the problem of so-called *suburbia*, also in the field of urban sprawl) (Shucksmith, 2010; Sleszynski, 2018);
- integrated development planning, also in the dimension related to regional policy (Maibach et al. 2008).

These kinds of topics can be multiplied. Nevertheless, even their brief presentation will allow to signal the scale of problems and dilemmas related to the space management. In each of the above-mentioned issues, it is possible to distinguish the conflict between conflicting (at least after initial analysis) reasons and directions. In each of these cases, there is also the issue of possible malfunction of public authorities.

This context should be carefully considered when describing another research problem. There is no doubt that the current pandemic causes a number of long-term changes that should also be associated with the sphere of space management. Generally speaking, it can be pointed out that in the analyzed context, the following planes can be distinguished:

- assessment of the authorities' actions - both in the first stage of pandemic, in conditions of relative calming of the pandemic, but also in relation to the economic crisis. Of course, this is the context related to the spatial management system, which boils down to determining whether and to what extent the national authorities change the spatial management system (even temporarily) in relation to the indicated situation, and as in the individual periods identified above, local authorities use direct spatial policy tools: how the frequency of actions changes and what it looks like - a conflict that occurs on such occasions: the speed of planning procedures versus maintaining optimal values for the spatial management system;
- assessment of the possibilities and institutional framework for implementing the social distance project. There is no doubt that at least in the next several months, the so-called *project of social distance* will be incorporated. The spatial framework related to this issue was included, among others, by Richard Florida. It will boil down to imposing a different form of development of numerous facilities, as well as (with a broader understanding of the terms "space management" and "spatial policy") linking to this specific support activities for specific business entities and non-profit organizations. However, it should be stipulated that guidelines and recommendations at the national level are not enough. Analyses and actions at a local level are necessary. Therefore, the possibilities (including institutional ones in this respect) should be verified, followed by the accepted practice;
- assessment of the impact of the economic crisis caused by the pandemic on space management. There is no doubt that also spatial policy entities (also at the local level) must monitor the changes taking place in the socio-economic sphere and, if possible, adapt to them. Sometimes, such a reaction will be reduced to the modification of the applied spatial policy tools, and at other times, to more subdued actions. The systemic problem will be the categorization of these activities and adaptation to specific needs and challenges.

These assumptions will be specified as data on specific activities in municipalities are available and knowledge about the time frame of the pandemic, its economic effects and necessary spatial restrictions is expanded. There is no doubt, however, that an optimal approach to this problem would be covering several countries at least. The analysis would then have to take into account the diverse context (economic, political, spatial, etc.) of these countries, but the authors are convinced that it is possible to make reliable comparisons and draw, at least in part, joint conclusions. These conclusions - relating to the thematic areas presented above - can generally be reduced to:

- assessment of actions taken (both on a national, regional and perhaps primarily local scale);
- developing short-term and long-term recommendations for further actions.

Therefore, the invitation to implement this research project is addressed to all authors dealing with broadly understood issues of spatial policy in various countries. Regardless of the holistic approach to the problem, more detailed analyses relating to selected issues are also possible.

Fast actions are not Necessarily Functional Actions

To clarify the possible way of addressing this issue, it is possible to signal a part of the indicated conditions (currently possible to present and initial diagnosis) occurring in Poland. At this stage, they come down to the activities of public authorities translating directly into the sphere of space management.

First of all, it is necessary to signal the immediately noticeable dilemma regarding the speed of implementation of planning procedures in relation to the preservation of key values in the spatial management system. The example can be the pressure to quickly adopt (in some municipalities) both strategic and regulatory spatial planning acts, at the cost of even broadly limiting the social participation. These dilemmas have expanded after the adoption of the Act of March 2, 2020 on special solutions related to the prevention and control of COVID-19, other infectious diseases and emergencies caused by them (Journal of Laws 2020, item 374 as amended - legal status for April 2020). In the original wording, the following provisions could be associated with the issues of preparing the spatial policy tools:

- Art. 12 of the Act pursuant to which, among others, the provisions of the Act on spatial planning and development shall not apply in the design, construction, reconstruction, renovation, maintenance and demolition of buildings, including changes in use, in connection with the prevention of COVID-19;
- Art. 15zzs. 1, according to which, during the period of the state of epidemic threat or the state of epidemic, constitutive bodies of local government units and collegial bodies: executive bodies in local government units, in associations of local government units, in a metropolitan association, in regional accounting chambers and self-government appeal boards, may convene and hold deliberations, sessions, meetings, assemblies or other forms of action appropriate for these bodies, as well as make decisions, including resolutions, using means of distance communication or by correspondence (remote mode of meeting);
- Art. 15zzs. 8, according to which the time limit for tacit settlement of the case and in another case in which the authority does not express an objection, issue a decision, order or other resolution, entitles the party or participant of the proceedings to take action, perform actions or affects the scope of the participant's rights and obligations - does not start and the started one is suspended.

However, after passing the so-called II of the anti-crisis shield (mid-April 2020), changes were introduced according to which the suspension of deadlines does not apply, among others, to:

- dealing with strategic and regulatory spatial policy tools to the extent that they agree on their projects;
- issuing decisions on development conditions considered as the most disintegrating spatial order of solutions.

These changes were aimed at enabling the planning activities also during a pandemic (to an extent other than the one agreed above). The legislator's reference to the arrangements and opinions was linked to previous practice, under which opinion giving and agreeing bodies very often did not express their opinions on specific planning acts within the required time limit and was considered their tacit agreement. The provisions of previous wording of the "anti-crisis shield" prevented from the continuation of such practice (the lack of authority response, in principle, cannot be considered tacit agreement during a pandemic, unless a specific exception is provided for in this respect). At this stage, the speed of implementation of planning procedures does not seem to be the most important goal – especially since the current planning practice carried out in ordinary conditions raised a number of huge doubts (an important issue still arises in this context: the relation of planning procedures to values in the spatial management system). On the other hand nothing should be done in haste but gripping a flea. As part of the anti-crisis shield, can also be observed the introduction of various solutions that are highly debatable in terms of their impact on mitigating the effects of the impending crisis. An example of such activities may be facilitating the construction of 5G masts by

removing the need to obtain building permits and only notification. It is also worth noting that on the one hand, the government suspends the deadlines for administrative proceedings (e.g. public participation), which extends the deadline for obtaining a construction decision, on the other hand it alleviates the restrictions, as in the case of the 5G masts mentioned above.

Conclusion

The authors intend to develop these issues in their further research. Especially that the polish government announces work on the 3.0 anti-crisis shield. Similar approaches would in depth cover the perspective of other countries. At this stage, the goal of this type of research is to diagnose new conditions and propose optimal solutions in the field of space management problems caused by the COVID-19 pandemic and their socio-economic consequences.

Abstract

The purpose of the study is to examine the impact of politicians' and public servants' statements on changes in the oil price. In the research, the authors used the technique for time series study that combines the consistent application of fractal and regression analysis with the use of dummy variables. The study shows that various politicians' and public servants' statements (especially foreign ones) are a real tool for influencing the oil price. The results suggest that if the oil price declines during a period of time, it will soon start to increase and this process will take about 18 days. All factors, except the one that characterizes politicians' and public servants' statements, affect the oil price, and it decreases by 0.02 USD. The above mentioned statements lead to an increase in the oil price by an average of 10.04 USD.

Keywords: fractal analysis, regression, politico-economic statements, oil price.

Introduction

According to Bouri and Demirer (2019), the world oil market is developing continuously, yet chaotically, therefore, there is a need to explore the causes of its fluctuations. Research by Elian, Kisswani (2018), Muradov et al. (2019) shows that the key factors affecting the oil price are the reduction of commercial crude oil inventories, weakening dollar, natural disasters, political and military tension in production countries and actions of oil speculators. However, the main factors of the oil market cannot affect the oil price, which changes monthly or even daily. Recent developments in the oil market only confirm the previous statement. A drop in crude oil demand caused by the coronavirus pandemic and oil-producing countries struggling to agree on production cuts resulted in the oil price crashing after the leaders of Saudi Arabia claimed they would increase output.

After President Donald Trump tweeted about his conversation on the oil price with the Crown Prince of Saudi Arabia Mohammed bin Salman, the oil price went up. Brent crude rose 23.36% to finish at

$30.52 a barrel. There also were cases when Brent crude rose 40% to $35.99 per barrel. The above-mentioned statements are often used to manipulate the oil price, which poses a serious problem for oil market participants.

A lot of politicians, deputies and members of the parliament seem to be unaware of the seriousness of their statements or simply do not understand how their words influence the state of the stock market, exchange rates or the oil price. On the other hand, there is another group of people that knowingly makes certain political, economic and other statements to influence the trading in financial instruments, dollar exchange rate or the oil price and cause fluctuations that probably wouldn't take place without those statements.

Therefore, statements made via mass media including electronic media, information and telecommunication networks (including the Internet), are not only a way of competing and playing the market, due to the fact that many politicians and public servants own securities, stocks and shares in the authorized capitals of companies, but also massive leverage over the political and socio-economic situation in countries.

According to Pirrong (1996), if we analyze the studies on this issue, most of them are devoted to various legal problems related to the deliberate spread of false information via mass media, i.e. market manipulation. In this paper, we will not determine the legal essence of those statements (besides, they do not always contain false information), but will try to understand how they influence the oil price. Note that there are not enough studies devoted to mechanisms of statements and construction of econometric models to evaluate the impact of statements on econometric indicators.

Methods of Research

In the research, we used the time series technique. Based on the data provided by the World Bank, the initial information base was created for daily prices of Brent crude from 29.04.2016 to 15.04.2020. We also created a database for statements made by politicians and public servants via electronic media, information and telecommunication networks (including the Internet). The oil price (*Y*) is an endogenous variable, and politicians' and public servants' statements (*X*) - an exogenous variable.

In accordance with the purpose of the study and the research by Sottinen (2001), we carried out a fractal analysis based on the relationship between future prices and their previous changes to determine the length of the forecast period. In order to conduct a fractal or R/S analysis to determine the time interval and politicians' and public servants' statements that influence the oil price, we need to converse the series and proceed with the determined price increment:

$$\Delta y_i = \ln\left(\frac{y_{i+1}}{y_i}\right),$$

which can be considered as the impact of a certain statement. Next, we normalize and center the values:

$$\Delta Y_i = \frac{\Delta y_i - \overline{\Delta}}{\sqrt{\mathrm{var}}},$$

where $\overline{\Delta}$ is an average value for Δyi, var is the Δyi dispersion. The next step is to calculate the average accumulated values:

$$M_t = \frac{1}{t+1}\sum_{u=0}^{t}\Delta Y_u ,$$

at t=0, 1, ..., n-2, and the cumulative deviation:

$$X_t = \sum_{u=0}^{t} (\Delta Y_u - M_u).$$

The following step is to determine the cumulative deviation range, which is $R_t = \max(M_t) - \min(M_t)$, the standard deviation is:

$$S_t = \sqrt{\frac{\sum_{u=0}^{t} (\Delta Y_u - M_u)^2}{t+1}},$$

and the standardized range of the cumulative deviation for *n* periods is:

$$R/S_t = \frac{R_t}{S_t}.$$

The obtained function should be compared to the Hurst exponent:

$$R/S = aN^H,$$

which shows the deviation of the process from the random walk H=0.5. If H differs from 0.5, the observations are independent. Each observation contains memories about all previous events, such dependence is called long-range and it theoretically persists, unlike the short-range (or Markov) dependence. The impact of present on future can be expressed by a correlation ratio:

$$C = 2^{2H-1} - 1,$$

where C is the measure of correlation, H is the Hurst exponent. The Hurst exponent can be determined by the following equation:

$$H = \frac{\ln(R/S)}{\ln(n/2)}.$$

If H-0.5, the series is random and the events are uncorrelated, C=0 and present does not affect the future. If 0<H<0.5, such series is called ergodic, i.e. if the system was showing an increase over the previous period, then there will probably be a drop in the next period. The stability of behaviour depends on how close H is to 0: the closer H is to 0, the closer C is to (-0.5), i.e. the negative correlation. If 0.5<H<1, the series is persistent, which means that it sustains the trend in the future. The closer H is to 1 (C to 1), the stronger the trend is expressed.

To characterize the impact of statements made by politicians and public servants of economically developed countries via mass media, we constructed a regression equation with a dummy variable:

$$\tilde{Y}_t = a + bt + cx,$$

where t is time,

$$x = \begin{cases} 1, \textit{the statement} \\ 0, \textit{other} \end{cases}.$$

Research and discussion

The fractal analysis is based on the dependence of future prices on previous change. The purpose of the analysis is to determine the length of the forecast period. The cumulative deviation range in our case is $R_t = 0{,}2665$, the standard deviation is $S_t = 1{,}002$ and the standardized range of the cumulative deviation for *n* periods is: $R / S_t = 0{,}2671$, the Hurst exponent H=0.1788 an the measure of correlation C=0.609.

Since 0<H<0.5, the series is ergodic. In other words, the result indicates that, firstly, if the oil price is decreasing continuously, then soon it will start to rise and this process will take about 18 days.

Secondly, since the Hurst exponent did not reach 0.5, we cannot discard the fact that the oil price is influenced by previous statements made by politicians and public servants. We believe that this can be explained by the data considered in the *x* variable (most statements were related to sanctions imposed on Russia, Iran and China).

To evaluate the impact of statements on Brent crude price dynamics, we assessed the relationship between the oil price and statements made by politicians and public servants via mass media, including electronic media, information and telecommunication networks (including the Internet), using the STATISTICA package. The results are presented in table 1.

Table 1: parameters of the regression equation, impact of factors on the oil price

Indicators	Regression equation coefficient	Standard error of the regression coefficient	Student's *t*-test	*p*-significance level
The intercept	78.45	0.950	82.60	0.0000
t	-0.02	0.001	-21.95	0.0000
X	10.04	1.437	6.98	0.0000

Calculated by authors based on the author data base using the STATISTICA package. $R^2=0.274$; $F_{(0.05;2;1536)}=293.29$; $p=0.0000$

The F-test exceeds the table value, which indicates the significance of the equation. All coefficients of the equation are statistically significant at the 5% significance level.

Politicians' and public servants' statements result in the oil price increase. The model parameter *t* indicates that all factors, except the information factor, affect the oil price and it decreases by 0.02 USD. The above mentioned statements lead to an increase in the oil price by an average of 10.04 USD.

The decrease in the oil price is of technical nature due to the futures mechanism and lack of storage places. The feature of futures is that the trader who cannot close the contract on time is expected to make an actual delivery of crude oil. Oil is commonly delivered to the Cushing terminal in Oklahoma. However, as demand for oil sinks, the storage capacity is getting closer to its upper limits due to the economic slump and coronavirus pandemic. To avoid the physical delivery of oil, the traders try to sell oil by the end of the trading day and send prices down. Hence, prices crash at the moment of contract execution.

The main condition for recovery of oil market is gradual removal of restrictions and quarantine. Only after that the demand and oil prices could recover.

According to Carmalt (2017) and Li et al. (2020), if we consider the long-term oil price change, we can see that the decrease in the oil price is due to the qualitative transformation in the world economy related to changes in consumer preferences, regulators' and investors' policies influenced by the moral and ethical transition to low-carbon energy systems and sustainable development. In their research Renne and Fields (2013) note that the growth of decentralization of energy consumption along with digital technologies increases the interest of consumers in stand-alone power systems, and the politics of decarbonization of energy in its turn increases the interest in achieving self-supply based on nonhydrocarbon energy resources. According to Zhichkin (2020), the new generation of consumers, so-called "millennials", are strongly inclined to pursue the goal of rejection of hydrocarbons and goods produced using it. Greta Thunberg is an outstanding representative of this generation. At the end of 2016, one of the world's largest IT-corporations Google (2016) announced that its data centres and the offices would be powered entirely by renewable energy from 2017. Companies such as Facebook, Amazon, Apple and Microsoft have also entered long-term renewable energy agreements.

Therefore, according to Yoshino and Taghizadeh-Hesary (2016), the decline in demand for oil is due to policies of governments of the world's leading countries aimed at the restriction of climate policy and regulation of the hydrocarbons market. As stated by Li et al. (2020), this results in the decline in demand for oil and the development of electrification and low-carbon energy technologies, especially in the sphere of renewable energy sources.

Oil prices plummeting to their current level is very unprofitable for the US slate industry. Median break-even prices for slate producers in the USA is 45-47 dollars/barrel. Therefore, at the current oil price, there is no incentive for the US slate industry to develop, which affects the increase in the oil price, as well as political and militaristic statements made by US politicians. Moreover, the President of the USA Donald Trump, in addition to his tweets, with support from oil companies started to eliminate energy regulations adopted during the Obama years aimed at the development of "green" energy and climate policy.

Conclusions

To sum up, we can safely assume that the global economy will gradually phase out oil consumption. The prospects for the future developments of the global oil market are linked to energy and climate policies of developed countries, demographic changes, technological development and the global economic upturn. The political environment has a great influence on pricing in the global oil market as oil production plays an important role in many countries' economies. Therefore, the oil price is always a primary focus for political leaders.

The research provided new analytic solutions given the analysis of oil market prices, based on the synthesis of the fractal and regression analysis with the use of dummy variables. The result shows that the oil price declines during a period of time, however in 18 days it starts to rise. Moreover, all factors, except the one that characterizes politicians' and public servants' statements, affect the oil price, and it decreases by 0.02 USD. The above mentioned statements lead to an increase in the oil price by an average of 10.04 USD.

One of the main problems of innovation activities is the shortage of highly qualified personnel, or rather, managers and teams capable of solving complex tasks effectively. To get out of this situation, it is advisable to use targeted team training, which at low costs significantly reduces the time and risks of developing and introducing innovations. The article discusses the sources of staffing for innovative activities, clarifies the conceptual framework used to indicate the processes of changing a profession and ways to return to it, substantiates the feasibility of wide implementation of the method of multidisciplinary project training, develops tools for measuring the integral level synergistic effect of educational and professional groups.

Keywords: Innovations, Innovation of Production Processes, Multidisciplinary Project Training, Synergistic Effect, Reprofessionalization.

Introduction

Innovative development of the regions and the country as a whole, modernization of the economy, improvement of production processes at enterprises are impossible without creating a regional system for training highly qualified personnel and involving staff in the implementation of strategic plans for innovating production processes. In tackling the problem of staffing the innovation activities, the role of the lower level (enterprises) is particularly prominent. It is at this level that the mechanism of involving personnel in the implementation of strategic plans for the innovation of production processes should be created and function.

The quality of human resources employed to an enterprise primarily depends on the system of training highly qualified personnel. In planning the parameters of this system, it is necessary to take into account both the requirements for the level of professional education and the identity of employees, who should be motivated, first of all, for creativity, initiative and perseverance in the introduction of innovations. Not the least among these criteria is the ability of an employee to

effectively interact with labor process colleagues with a different profession, in order to persuade them to find comprehensive solutions to all aspects of urgent problems.

One of the main problems of innovative activity in production enterprises and increasing their value is the shortage of highly qualified personnel, or rather, managers and teams capable of solving complex problems effectively. To overcome this situation, it is advisable to use targeted team training, which at low costs significantly reduces time and risks of developing and introducing innovations. Recovery of the relatively small costs of targeted training is provided by an increase in turnover and profits, if at least some of the planned innovative projects were effectively implemented.

Analysis of the publications shows that at present there is practically no scientifically based holistic system of staffing for the management of innovative activities of enterprises that meets dynamically changing requirements, which determines the relevance of the research topic.

The study of the mechanism of involving personnel in the implementation of strategic plans for the innovation of production processes and the sources of the formation of a staffing system for innovative activities revealed that one of the sources of satisfying the need for human resources for implementing innovative projects can be a fairly large social group, whose subjects have higher technical education, don't work in their degree related field, but wish to return to it, provided that they receive certain additional training that actualizes the knowledge and skills they once received.

The purpose of this article is to consider the sources of staffing of innovative activity, to clarify the conceptual apparatus used to refer to processes of change of profession and return to it as a source of staffing, to justify the expediency of wide application of the method multidisciplinary project training (MPT) in the practice of educational activities of technical universities, to develop tools to measure the integral level of the synergetic effect of learning and professional groups.

Research Methodology

The following methods were used in the research: analysis of normative documents, questionnaire survey, systematization and generalization of facts and concepts.

Review of special literature

The term "human resources" was first invented by Tom De Marco and Timothy Lister, who considered the problem of the human factor in terms of its impact on the development of software products [1]. In this context, the characteristics of the software being developed depend not only on what hardware and firmware it is being created for, but also on the team developing the software.

Thus, the concept of "personnel support" has become a term that links the conceptual apparatus of the inanimate component of the process of ensuring the operation of computer equipment with the animate component into a single system [2]. This Association has now become a classic. Its relevance is growing in the digital economy.

Various approaches (program-target, resource, system and functional) to the formulation of the concept of "human resources " are considered in detail in the work of S. M. Korostelev[2].The issues of staffing innovative activities are considered in the works of Torrington D, Hall. L., Tailor S., Parker G, among the Russian authors we can highlight the works of Davankov A.Y., Sokolov K.O., Mingaleeva G.F, Shpilberg S A, Irikova V.A., Gavrilova A, Prikhach A.Y. and other authors.

Almost all authors note that while the methods of innovative personnel management are followed, a properly organized HR management system contributes to the creation of innovative thinking among employees, which turns human resources into an actor of innovation and competitiveness.

Quality of the employed human resources depends not only on the system of training highly qualified personnel, but also on sources of formation of the regional system of staffing the innovation activities (Table 1), which is considered in the work of Davankov A.Y., Sokolov K.O.

Table 1: Classification of sources of formation of the regional system of personnel support for

№	Classification criteria	Classification groups of innovations	Sources of formation of the regional system for staffing innovation
1	Original location of human resources	Internal	Training of specialists. Retraining specialists. Employing qualified specialists, who have gone to other sectors of the regional economy.
		External	Leasing (renting) specialists. Migration and relocation of specialists.
2	Responsiveness of employment	Employing in a short time	Training of specialists. Retraining of specialists. Employing qualified specialists, who have gone to other sectors of the regional economy. Leasing (renting) specialists. Migration and relocation of specialists.
		Over a long period of time	Training of specialists.
3	Duration of employment	Temporary	Retraining of specialists. Employing qualified specialists, who have gone to other sectors of the regional economy. Leasing (renting) specialists. Migration and relocation of specialists.
		Continual	Training of specialists. Relocating specialists.
4	Form of employment	Collective	Leasing (renting) specialists. Relocating specialists. Retraining of specialists.
		Individual	Training of specialists. Retraining of specialists. Employing qualified specialists, who have gone to other sectors of the regional economy. Migration and relocation of specialists. Leasing (renting) specialists.
5	Skill level of human resources	High	Employing qualified specialists, who have gone to other sectors of the regional economy. Leasing (renting) specialists. Migration and relocation of specialists.
		Low	Training of specialists. Retraining of specialists.

innovation [1]

Sokolov K.O. notes the increasing importance of innovation in the development of modern organizations and the increasing role of team methods of managing innovative projects [10].

Many authors pay attention to such a problem as the shortage of highly qualified personnel, more precisely, managers and teams that are able to effectively solve complex tasks for the implementation of innovative activities.

Results

The research allowed us to formulate the following hypothesis: one of the sources for satisfying the need for human resources for the implementation of innovative projects in conditions of shortage of highly qualified personnel can be a rather large social group, the subjects of which have a higher technical education; they are employed in jobs other than their specialties, but they want to return to the specialty they studied for, provided they receive certain additional training that updates their knowledge and skills. One of the forms of such updating can be multidisciplinary educational project teams (EPT). Needless to say, the project form of training as such in this case is highly relevant, because the innovative activity itself has a quite obvious project nature. At the same time, the obviousness of this fact does not negate the need for a qualified discussion of the advantages of a multidisciplinary approach to organizing such training and the obstacles arising along this path.

However, before proceeding to discussing the causes and consequences of changing professions, developing specific recommendations for improving the efficiency of utilizing working potential of workers who have changed their profession and describing the appropriate mechanism for their retraining in educational project teams, it is necessary to remove the difficulties associated with lack of clarity and consistency in terminology. In other words, the discussion should begin with a review of the conceptual apparatus, with the terms that are commonly used to denote the process of changing profession and ways of returning to it. One of these terms is reprofessionalization.

Some researchers understand reprofessionalization as the process of changing occupation, which is accompanied by acquisition of new professional knowledge and skills.

Another option to eliminate confusion would be to introduce the concepts of primary and secondary reprofessionalization — in its connection with primary and secondary professionalization.
Primary professionalization is the process of becoming a specialist. It includes acquisition of professional skills required for a successful start of a professional activity, namely, acquisition of a specialty. An indicator of successful completion of the primary professionalization stage is completion of professional education and obtaining professional qualifications.

Analogically, primary reprofessionalization could intend a change in profession immediately after graduating from professional education and obtaining professional qualifications, which is not only a very common phenomenon nowadays and therefore requires research, but also an indispensable prerequisite for secondary reprofessionalization.

Secondary professionalization is generally accepted to be a transformation of a specialist into a highly qualified professional, formation of a special professional skill, development of a creative approach to a professional activity, and not necessarily within a framework of an initially acquired profession. This is the formation and development of professionalism directly through work experience on the basis of accumulation and use of practical and activity-oriented knowledge. In this case, it would be logical to call the employee's return to the previous profession after the secondary professionalization as the secondary reprofessionalization.

However, in our opinion, in order to simplify the vocabulary and to avoid excessive formalization of the conceptual apparatus to refer to the primary reprofessionalization, it is preferable to use the traditional term "retraining". And by reprofessionalization we mean only the process of returning to the previous profession, obtained as a result of primary or secondary professionalization, through "recovery" training and additional training, which updates their knowledge and skills [3].

The second key term in the framework of the declared topic is the multidisciplinary project preparation. Etymological aspect of the term seems quite clear ("multi" — many), but his understanding is not as straightforward and apparently requires a few comments. It is our submission, that multidisciplinary project training (MPT) within the framework of primary professionalization is a method of reinforcing and developing the main and related professional competences by senior students of technical Universities in the process of joint development of primary project

documentation (design, technological, marketing, organizational and productive, financial and economic, legal, etc.), then preparing a business plan of an innovative project commissioned by an enterprise.

In both conceptual and scientific and applied respects, the MPT method is most thoroughly justified as a tool of primary professionalization. The methodology of project training has been practiced in technical higher education for many decades and has proved its effectiveness in practice as an indispensable tool for the formation of professional competencies of a future engineer [4]. At the same time, collective implementation of educational projects by groups of students, with more or less success imitating the activities of a design or technology agency, is also widely spread. There is seemingly nothing new to expect in this field, but with the granting of the status of technical universities to large technical colleges, one of the goals of which was proclaimed the "humanitarization" of engineering education, a new powerful potential of project training was formed. It has become possible for project groups to include not only engineers and technologists, aerodynamicists and structural analysts but also economists, marketers, environmentalists, lawyers, PR-managers and other specialists, whose training was mastered in the Humanities department. The foundation, ensuring the efficiency of such a student team, is a technical task of the employer to develop a full-fledged innovative project under the guidance of academic staff of specialized departments and mentoring consultants from the enterprise. The practical successes achieved in the course of numerous experiments conducted at the initiative of our Department, including at the interuniversity level, evidences not only to the expediency of widespread introduction of the MPT method in the practice of educational activities of technical universities, but also make us think about its expansion beyond the process of primary professionalization, in particular – about the adaptation of this method to the problems of reprofessionalization.

In developing an investment project able to attract the attention of a real investor with participation of students or participants of courses for professional development, an integrated approach to a set of tasks is maintained, which, outside the framework of the MPT methodology, is perceived as aimed at achieving individual, autonomously existing goals. However, before proceeding to discuss its benefits and issues on the possible extent and ways of using the method of MPT in the process of reprofessionalisation, let us refer to the statistics. The study of Higher school of Economics and Russian Federal State Statistics Service provides information that only half of Russians with diplomas of higher education work in their specialty. And engineers are the least of all who work in the specialty. Among them, only 35% are arranged to work in the specialty, about 30% are employed in areas that do not require higher education.

The study used data from a survey of 270 thousand people aged 15-72 years, while the authors of the study argue that after the economic crisis, the structure of employment in the professions will not change. The statement is quite controversial, but not directly contradicting our reasoning.

The reason for the current shortage of engineering personnel is well known — many universities could not recruit students even for state-funded places and were forced to admit school graduates with poor grades. Interestingly, the reluctance to work in the profession until recently was demonstrated by all age groups of engineers. The engineers of the Soviet formation in the 90s retrained into shuttle traders, drivers, some of them became managers and do not want to return to their previous activities. Many of those engineers who received a diploma in the 2000s became workers — so low was the level of their training even when entering the University. With such assumptions, full-scale reprofessionalization, in our view, is not advisable. At the same time, we can talk about the policy of targeted reprofessionalization, which is possible under at least two conditions.

The first condition is the need for using human resources for innovation in the short term.

The second condition is the desire of an employee to return to the previously obtained profession.

Let us consider in more detail the cases that may encourage such a desire. One of the cases is related to the fact that the main part of university graduates is under the influence of the "gre y" labor

market, i.e. they get a job on their own, focusing on the economic benefits of the proposals, for example, the first salary of a university graduate in the trading network is bigger than the first salary of an engineer at an enterprise. Often the specialty obtained in self-employment is not considered. Employers (mostly companies with private ownership) are willing to pay a worker a higher salary for unskilled labor than a state enterprise for a qualified one. But the employer chooses an employee from a larger number of applicants and generally tend to set the high requirements. When filling any vacant position, preference is given to persons with higher education. This is beneficial to the enterprise: without spending a ruble (the education in a state university is state-funded), it has a sufficiently competent specialist in the prime of his intellectual and physical strength, which expands the potential of the enterprise. As for the employee, it takes 2-3 years of low-skilled labor or labor in a field different from his specialty to lose the skills and knowledge obtained in the university, gradually losing the capacity to work independently and creatively. For a creative person it usually causes a feeling of dissatisfaction with the current situation and awakens the desire to work in the former profession, which causes mainly positive emotions. In addition, he notices that his university colleagues in about a year after acquiring relevant experience in an enterprise start to have the same wage and begin to surpass the salary of a manager in a trading network. No less important is the fact that an employee of an enterprise can also make a managerial career in engineering or manufacturing, or even change the scope of activity when desired, going to the supply, sales, HR, economy, which greatly expands the possibilities of self-realization of a specialist with engineering education at the manufacturing plant.

Another situation may arise due to the fact that an employee cannot work at the previous job due to any force majeure: unsuitability (for example, loss of voice at work related to communication on the phone), staff reductions, etc.

The desire to return to the former profession usually arises in some subjects after communicating with their former colleagues who have successfully realized themselves in the profession. A survey conducted in Kazan National Research Technical University named after A.N. Tupolev showed that on average 10-15% of graduates who are not employed in the specialty obtained at the university would like to practice their specialty, provided that they will get an appropriate additional training.
The next important issue is the required volumes and possible sources of financial resources attracted for reprofessionalization as a part of the multidisciplinary project teams. Turning to this issue, it should be noted that business opportunities are reduced in times of crisis. At the same time, we believe that the costs of such reprofessionalization will be feasible for the region, since it is not a matter of mass retraining of graduates in traditional educational technology, but of reprofessionalization, and not large-scale, but targeted. In addition, the costs of reprofessionalization can be partially funded by the Federal budget via transfers to the budget of the Republic of Tatarstan, which is similar to the financing of the costs of advanced training.

The kind of professionalization and a well-formed educational project team will significantly affect the magnitude of cost [5]. If there is secondary professionalization and subsequent reprofessionalization in an educational project team, the cost of additional training will be significantly lower compared to the cost of the same training for workers who have received only traditional primary professionalization.

The practical significance of the proposals and the results of the implementation

The positive side of reprofessionalization of the workers who have received secondary professionalization may be the possible synergetic effect – when the primary specialty, for example, a heat power engineering graduate returns to his specialty after becoming "secondary professionalized" in the field of computer technology, and therefore already able to more effectively interact with computer technology professionals in educational project teams (EPT).

After all, the main distinctive feature of a specialist who has participated in a project training in multidisciplinary educational project teams is the ability to effectively interact with specialists of other professions in all spheres of economic activity of an enterprise and thus provide system

solutions to their professional objectives in the development and implementation of large-scale innovative production projects.

As the first attempt to develop a tool for measuring the integrated level of synergetic effect of EPT, it is proposed to use a simple additive model, in which the components are relative (normalized) levels of reducing the time for solving typical project problems and the number of proposed erroneous interdisciplinary solutions. For example, we present the calculation of the level of integrated synergetic effect (LISE) of EPT for one of the student educational and research projects, which is presented in table 2.

Table 2: Initial data for calculating the level of integrated synergetic effect of EPT.

Indicators	Classification criteria.	Values
Time frame for the implementation (workdays)	Traditional educational project engineering team with outsourcing of marketing, design, estimate and other non-engineering tasks	56
	Multidisciplinary EPT	44
The number of rejected (incorrect) solutions	Traditional educational project engineering team with outsourcing of marketing, design, estimate and other non-engineering tasks	8
	Multidisciplinary EPT	3

LISE = [(56-44)/56 + (8-3)/8]/2 = [0,27+0,62]/2 = 0,49.
The maximum value of the LISE can be 1 (or 100%).

In more general terms, it is about the possibility of saving on modernization of the university's organizational infrastructure, the need for which is justified due to development of the MPT methodology, for example, in work [13]. The problem of reconstructing the organizational and methodological bases of educational process under the MPT technology has a fundamental character, because it provides for the formation of the matrix organizational structure of the University in accordance with the project approach to the management of educational process, its intensification by shifting from a semester structure the academic year to bimestrial with a training schedule without examinations as well as the development of the Institute of real academic freedom of younger students as part of their pre-training [4].

As already noted, the peculiarity of reprofessionalization through the MPT technology is also the need for more careful selection of candidates for additional training groups, which requires developing and using appropriate tools. Thus, it is needed to comply with another condition. It is about a certain level of residual knowledge of a graduate and his skills. It can be assumed that the value of this level will vary depending on the specific tasks that the people wishing to return to the profession will solve in the future.

In particular, it is necessary to say about the problem of discreteness – qualitative changes in the primary qualification of an employee, which occur at certain intervals. All other things being equal, it is clear that the longer these periods of time between professionalization and reprofessionalization are, the lower the level of residual knowledge and the more difficult reprofessionalization are. Perhaps for some professions it makes sense to define specific values of critical time intervals, and then the problem of selection in additional training groups for certain categories of candidates will be solved almost automatically.

Conclusions

One of the main problems of innovation is the lack of highly qualified personnel, more precisely, managers and teams that can effectively solve complex tasks. To get out of this situation, it is advisable to use targeted team training, which at a low cost significantly reduces the time and risks of developing and implementing innovations. One of the sources of meeting the need for human resources for implementing innovative projects can be a fairly large social group, whose subjects have higher technical education, don't work in their degree related field, but wish to return to it, provided that they receive certain additional training that actualizes the knowledge and skills they once received. In our opinion, multidisciplinary educational project teams are an effective form of

staff reprofessionalization. The positive side of reprofessionalization of employees who have received secondary professionalization may be the appearance of a synergistic effect in some cases. To measure the integral level of the synergetic effect of EPT, the authors propose a simple additive model, in which the terms are relative (normalized) levels of reducing the time for solving typical project tasks and the number of proposed erroneous interdisciplinary solutions.

The work in such teams, in addition to formation and development of professional qualities, with appropriate organization and environment will contribute to formation and development of innovative abilities of managers and specialists also from the standpoint of their personal qualities. For managers, it is the ability to create a creative atmosphere in his team, the ability to motivate employees, high competence; for executives is support of innovations, providing staff with the necessary information, demonstration of a positive attitude to people, etc. With an appropriate organization of interaction between the University and an enterprise, a multidisciplinary educational project team can be a ready innovative team and become a base for supporters of transformation in the organization. An important condition is that the members of the group must be psychologically compatible with each other.

The main application of specialists who have received project reprofessionalization will be found in the aircraft industry, engineering, petrochemical complexes, as well as in other areas of national economy of the Republic of Tatarstan.

The final result of implementing the concept of additional project training of specialists in multidisciplinary educational project teams will be staffing of enterprises and organizations in the form of project-oriented teams of specialists with secondary and higher special education from various disciplines, who are able to solve the whole complex of tasks related to the development, production and promotion of innovative products in close cooperation with each other.

Mutual Fund Performance on The Polish Capital Market

Radoslaw PIETRZYK

Wroclaw University of Economics and Business, Department of Financial Investments and Risk Management, Komandorska 118/120, 53-345 Wroclaw, Poland
radoslaw.pietrzyk@ue.wroc.pl

Abstract

Analysing the performance of mutual funds is a significant theoretical and practical issue. There is currently no consensus on the market regarding which methods of assessing investment performance should be used. This study examines the performance of Polish mutual funds between 2004 and 2020. The mutual fund data set contains the returns of Polish equity funds with at least 80% of the fund capital invested in domestic equity. The main purpose of this article is to compare different methods of evaluating fund abilities in the area of market timing and security selection. Regression-based Treynor-Mazuy and Henriksson-Merton models were employed to assess the market timing and stock selection abilities of fund managers. The estimated parameters of the models used in the research were statistically significant and the models were well fitted to the data. However, no evidence of any market timing ability in the selected group of funds was found. The results thus indicate that managers of Polish mutual funds exhibit no selectivity ability or timing ability.

Keywords: Mutual fund performance; market timing; selectivity.

Introduction

The main purpose of this article is to examine the abilities of mutual fund managers in Poland. The performance of mutual funds is assessed through measures of selectivity and market timing abilities. These measures make it possible to assess whether portfolio managers can forecast changes in market trends, adapt their investment strategies to these changes, and apply proper portfolio selection techniques to outperform other participants in the market. This provides a tool for comparing actively managed portfolios with passive ones as well as providing benchmarks for the funds. The use of market timing models also facilitates testing of the hypothesis that, on average, a mutual fund obtains returns that are above average for the market indices. Comparing returns yielded by mutual funds with returns on stock market indices implies that only funds that allocate a large part of their assets in the stock market are taken into consideration. For the purposes of this research, an 80% minimum threshold of stock investments was assumed. An analysis was then conducted of eleven mutual funds operating in Poland from 2004-2020.

Evaluation of Portfolio Performance

Evaluation of the ability to use market trend forecasts, as well as pick up stocks, is based on a linear single-index model in which the portfolio return in period t is influenced by an aggregated risk factor (market factor). One of the simplest and most popular models is that proposed by Sharpe (1963). In this model, the relationship is given by the following formula:

$$R_{pt} = \alpha_p + \beta_p R_{mt} + e_{pt} \tag{1}$$

where

R_{pt} – portfolio rate of return in period t,
R_{mt} – market portfolio rate of return in period t,

β_p – measure of the sensitivity of portfolio return to an aggregated market risk factor (manifested in this model by changes in return on market portfolio),
e_{pt} – random residual in period t.

In this model, the market portfolio is treated as a natural benchmark for stock portfolio managers. It can be applied to the analysis of deviations of realised rates of returns from theoretical returns derived from the model. If the average difference between realised and theoretical returns is positive, this can be treated as an excess rate of return resulting from the over-average skills of portfolio managers. This was the concept underlying Jensen's (1968) α measure:

$$R_{pt} - R_{ft} = \alpha_p + \beta_p \left(R_{mt} - R_{ft} \right) + e_{pt} \tag{2}$$

where:
R_{ft} – the risk-free rate of return in period t,
α_p – selectivity measure.

This measure can be interpreted as the difference between the realised rate of return of the managed portfolio and the rate of return of a passive portfolio with the same level of risk.

The model does not, however, identify the source of the excess return and attribute it to the particular skills of a portfolio manager. Jensen's α only provides synthetic information about these skills. Based on the CAPM model, other original models exist that are included among the so-called market timing models. Measures based on these can be divided into security-selection and market timing measures. Such models are also based on regression equations; however, unlike the Sharpe model, it is assumed that portfolio composition may change over time. This generalisation allows pieces of information to be isolated that are needed to assess the particular market-timing skills of portfolio managers. This includes, among others, an assessment of how excellent the trend-predicting skills of managers are and how elastic their strategy is in reacting to changing situations.

One of the first propositions of this type was a quadratic regression model developed by Treynor and Mazuy (1966). This model is based on the assumption that if managers can predict market trend reversals, they will also adjust portfolio composition to align with these changes. This should result in the overweighting of risky assets (market portfolio) when price increases are expected and underweighting when decreases are expected. Treynor and Mazuy proposed augmenting the model by a squared component, which made the relationship between the rate of return on the analysis and market portfolio nonlinear:

$$R_{pt} - R_{ft} = \alpha_p + \beta_p \left(R_{mt} - R_{ft} \right) + \gamma_p \left(R_{mt} - R_{ft} \right)^2 + e_{pt} \tag{3}$$

where: γ_p – market timing coefficient.

A positive value for this coefficient means that the portfolio yields an extra return as a result of adjusting portfolio composition to changes in general stock market trends.

An alternative solution was developed by Henriksson and Merton (1981) and Merton (1981), whose model is based on two regressions. The first corresponds to periods of lower trend (negative excess returns) and the second to periods of upper trends (positive excess returns). A model constructed in this way can be employed to evaluate a manager's skill in adjusting portfolio composition to short-term trends in the market. The ability to adjust involves increasing the risk exposure (higher beta) in periods of growing prices and reducing risk (lower beta) in periods of falling prices. This model can also be expressed in a compact version using the following equation:

$$R_{pt} - R_{ft} = \alpha_p + \beta_p \left(R_{mt} - R_{ft}\right) + \gamma_P \max\left(0, \left(R_{mt} - R_{ft}\right)\right) + e_{pt} . \quad (4)$$

The value of $\beta - \gamma$ expression can be interpreted as a beta coefficient analogue for a downturn in the market. A positive value of the γ parameter means that the manager can predict market trends and adjust portfolio composition in line with these predictions.

Data and Methodology

Analysis of portfolio performance in the area of market timing and security selection was performed for all mutual funds operating in the Polish capital market from 1 January 2004 until 31 March 2020. This choice enabled the research to cover a long period and a relatively large number of mutual funds. Using a large sample (12 mutual funds and 195 monthly periods) also helps to marginalise the influence of outliers on the results of the evaluation. The funds were selected for the analysis based on their allocation strategy. Most of their assets were invested in risky securities, primarily in shares. Inevitably, investment strategies changed during the observation period. However, market-timing models are able to assess such active strategies and the skills exhibited by mutual fund managers in security selection and forecasting trends.

It was assumed that the funds taken into consideration use benchmarks that contain at least 80% of one of the Polish stock market indices. These benchmarks comprise two main indices of the Warsaw Stock Exchange: the Warsaw Stock Exchange Index (WIG) and Warsaw Stock Exchange Large-Cap Index of the 20 major and most liquid companies in the WSE Main List (WIG20). The remaining part of the benchmark comprises the interest rate for deposits in the interbank market (WIBID). For most mutual funds, the benchmarks are corrected by an asset management fee (expressed in percentage terms). In this research, the WIG index was treated as a benchmark for all stock mutual funds as it can be a risk factor for the entire Polish stock market.

Table 1: Rates of returns of mutual funds and equity index WIG

Fund	*R* 2004- I Q20	R_{log} monthly	st. dev. monthly
Aviva	90.36%	0.330%	5.35%
Esaliens	83.86%	0.312%	5.01%
Generali	96.70%	0.347%	5.04%
NN1	84.19%	0.313%	4.84%
NN2	47.68%	0.200%	5.12%
Pekao	-40.84%	-0.269%	6.00%
PZU	-17.12%	-0.096%	5.19%
Santander	51.19%	0.212%	5.58%
Skarbiec	46.44%	0.196%	5.08%
Millenium	9.01%	0.044%	4.94%
Investor1	129.84%	0.427%	5.29%
Inwestor2	73.01%	0.281%	5.05%
WIG index	99.93%	0.355%	5.68%
WIBID	80.12%	0.302%	0.14%

The analysis spanned the period from 1 January 2004 to 31 March 2020. Samples of monthly logarithmic rates of returns were used. The risk-free rate was taken to be the three-month bid rate of the Polish

interbank market (WIBID), adjusted to monthly capitalisation periods. Two of the models discussed previously, Henriksson-Merton and Treynor-Mazuy, were employed in the analysis.

During the period concerned, ten funds yielded a positive return; however, only one had a return higher than that of the benchmark (WIG index). Two funds had rates of return below 0 and five had a positive return but below the risk-free rate. Table 1 presents the rates of returns of mutual funds across the whole period, as well as monthly mean log-returns and their risks (measured in standard deviations).

As shown, 7 of the 12 mutual funds during this period realised lower monthly average returns than the risk-free rate. From a theoretical and practical point of view, the results for monthly horizons are more important as adjusting an investment strategy typically takes time. For this reason, the results are presented for monthly rates of return.

Empirical Results

The results following the application of the Treynor-Mazuy model and Henriksson-Merton models are presented in Tables 2 and 3.

Table 2: Estimates for the Treynor-Mazuy model – monthly rate of returns

Estimates of model parameters (Table 2 and Table 3 contain results for monthly returns) show that the models are well fitted to the data. All coefficients of determination R^2 are above 0.8, and 10 are above 0.9. F-statistics also indicate a satisfactory level of significance. The analysis for particular coefficients in the models indicates that β parameter estimates are significant in all cases (for both models). The values of these parameters indicate a strong connection between the portfolios and the market index. Beta coefficients for monthly data are 0.673-0.958 for the Henriksson-Merton model and 0.81-1.014 for the Treynor-Mazuy model.

In 4 cases for the Treynor-Mazuy model and 5 cases for the Henriksson-Merton model, there are no premises demanding rejection of the hypothesis that the γ coefficient equals zero (p-values > 0.1). The values of the γ coefficient estimator show that it is difficult to demonstrate any additional skills exhibited by portfolio managers in market timing based on predicted general market trends. In the Treynor-Mazuy model, the γ coefficient is negative in 6 cases and positive in two cases γ (p-values < 0.1). In the Henriksson-Merton model, there are no mutual funds in which gammas are positive and significantly different from zero. Thus, no evidence is found to suggest that managers try to time the market, nor is there any evidence supporting the hypothesis that they have the skills to do so.

	α	0.0028	0.0019	1.467	0.144			

In terms of selectivity, the estimators of the respective parameter are somewhat different than for market timing. The parameter is statistically significant in only five cases, both for the Henriksson-Merton and Treynor-Mazuy model. In cases in which the parameter is significant, its value is negative, except for one case in the Treynor-Mazuy model. It can therefore be concluded that almost all funds are unable to generate excess returns as a result of skills in security selection.

Conclusions

Evaluation of mutual fund portfolio management is important from a practical point of view. The results obtained in this research support the hypothesis that, on average, portfolio managers in mutual funds do not achieve excess returns from market timing and security selection activity in comparison to returns from a passive strategy (index investing). These conclusions align with research study by Pietrzyk (2012) based on several other market timing models. Performance analysis on the Polish market has been conducted by, amongst others, Zamojska (2009). The results, however, are not comparable as different time ranges were used.

Analysis of the selectivity indicator also provides little evidence to indicate that above-average advantages from picking up securities are based on particular pricing or forecasting skills. A small number of cases of a significant positive α show that only a few portfolio managers can make active bets when successfully selecting assets to the portfolios.

Acknowledgements

"The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 – 2022. The project number is 015/RID/2018/19 and the total amount of funding is 10 721 040,00 PLN"

Abstract

This article reviews some conclusions of the issue of the project activities initiation in elementary school. The authors analyze the experience of participants of a network educational workshop held by "Prosveshenie" Publishing House. The junior schoolchildren's projects on traditional (folk) culture created with the help of ICT are a focus of attention. The authors analyze the stages and the forms of these activities, describe their methodological basis, in particular, the "unity in diversity" principle which provides the use of the elements of cultures of all the ethnoses represented in a given educational institution during the work with the traditional culture phenomena.
The article includes the description of the most successful projects created by the junior schoolchildren from several educational institutions of the Mari El Republic ("From Kids to Kids" and "Children's Urban Mythology"). The range of digital instruments used by the children in the process of designing and publishing their projects in the Internet is indicated.
The authors of the article come to the conclusion that the materials prepared by the Primary school students and published in the Internet are examples of useful and qualitative sources of information on traditional (folk) culture. At the same time, they motivate children to learn and popularize their own unique individual and group creative work.

Keywords: Project Activities, ICT, Elementary School, A Network Educational Workshop Of The Mari El Republic, Traditional (Folk) Culture.

Introduction

Nowadays, children and teenagers devote a significant part of their leisure time to communication on the Internet: (social networks, video games) and instant messengers (WhatsApp, Viber, Telegram, SMS, etc.) (Messengers in Russia 2019). A certain style is formed in the process of exchanging information, its signs include new genres of modern culture (memes) and attempts to graphically express various kinds of emotions (emojis, stickers, emoticons and so on), etc. Special studies have been devoted to these issues recently (see, for example, Internet and folklore 2009; Efimova, Zolotova 2013). At the same time, there is a certain gap between the information that is offered to teachers in various kinds of research and the rapid mastering of ICT by children and teenagers. This article summarizes some of the results of creating the activities for Primary school students in the field of IC technology in the process of implementing the content of teaching materials "Perspectives" (based on the material of traditional (folk) culture).

Goals and objectives

In 2018, an agreement was signed between LC "Enlightenment Publishing House" and a number of RME educational organizations on the creation of a network of pedagogical workshop on the topic "Project activities of a primary school student in the field of IC technologies to implement the content of "Enlightenment" teaching materials". Its goal is the formation of the technological component of ICT – the competence of primary school students to determine the optimal conditions for the formation and development of independent learning activities in primary school students (using the traditional (folklore) culture of the peoples of the RME as an example). The theme of the pedagogical workshop is directly related to the research activities of this team within the network of the experimental platform of the Federal Institute for the Development of Education in the RME to determine the principles of interaction at the lesson and extracurricular activities of Primary school students with materials of Russian traditional and other national cultures of the Volga region. Wonderful folklorist and teacher M. Yu. Novitskaya headed it. The necessity for the organization of experimental work was also caused by the necessity for a bigger use of the cultural values of the Russian, Mari, and other peoples of the Mari El Republic in the training, development and upbringing of the younger generation. This work started in 2011; MarSU, gymnasium "The Blue Bird", secondary school # 6 of Yoshkar-Ola, and the Yurinsky Secondary School named after A. I. Loseva (Zolotova, Novitskaya 2013) took part in it. Gymnasium # 26 named after Andre Malraux and Korkatovsky Lyceum joined the experiment in 2015. Each educational institution had a specific field of work: 1) development of methodological and theoretical principles of research, providing the participants of the experiment with the necessary material (Mari State University); development of lessons of the subject "Social, environmental and scientific education" (SESE) with a dominant ethnocultural component (Gymnasium # 26 of Yoshkar-Ola); 2) development of lessons on the basis of interdisciplinary connections with all the disciplines of elementary school on the basis of ethnocultural issues embedded in SESE (Gymnasium # 26 named after Andre Malro, Yoshkar-Ola); 3) organization of extracurricular activities of a teacher on the basis of interdisciplinary relations in cooperation with parents and family (Republican Gymnasium "The Blue Bird" named after Ishtrikova T. V.); 4) organization and provision of cooperation with social partners and the nearest socio-cultural infrastructure (museums, studios, higher educational institutions, etc. (Korkatovsky Lyceum and Yurinskaya Secondary School). It should be noted that the participants in the experimental study were not limited to a strictly specific aspect in their activities, but tried to synthesize them.

Methodological and theoretical principles of the research

A lot of material was accumulated in the sphere of our interest in Russian science. The search for the national identity of Russians, the specifics of Russian culture in general made the greatest Russian scientists A. N. Veselovsky (1882), V. M. Zhirmunsky (1979), B. N. Putilov (1983, 1994), N. I. Tolstoy (1983), V. M. Gatsak (1993) and others realize the need to solve it based on the comparison with other cultures.

Russian science formulated the principle of *"unity in diversity"*, which is the most important for our work. This principle was formulated in XIX by remarkable Russian philosopher K. Leontyev (1993) and his followers N. Danilevsky and L. Gumilev. Currently, this principle has already been used a lot, for example, by specialists from the Department of Sociology of Art Life at the State Institute of Art Studies (SPB) in a project that claims to create a new model that regulates the relationships between art and society at the present stage (Artistic Life of Contemporary Society 1996; Sokolov 2000).

Thus, the implementation of this principle in relation to our problem involves the usage of the values (elements) of the national culture of representatives of all ethnic groups of this educational community/team in the process of spiritual, moral and civil-patriotic education of youth. In other words, if Russians, Mari, Tatars, Chuvash, Ukrainians, Chechens and others are studying at the same time in a particular educational institution, it is necessary to take into account the components of each culture of these peoples in building educational activities on the basis of the value potential of the folk culture. It is not a simple joining/listing of forms of culture, belonging, for example, to a certain

rite, but the identification of their common core and demonstration of the diversity of national forms on this basis.

The results of the activity of the experimental sites were the development and publication of teaching aids and programs, cycles of lessons and educational events, including the online format (Traditional Culture 2016). Databases and virtual museum of folklore (Folklore of the Vyatka immigrants RME 2020; Virtual Museum of Folklore of the Gornomariysky District 2020; Virtual Museum of Folklore of the Yurinsky District 2020) were created and posted on the website of MarSU to provide participants of the experimental sites with the necessary materials on traditional (folklore) culture (ritual descriptions and comments on it, texts of works of various genres of audio and video recordings).

The project participants understood the importance of participation of schoolchildren in the development at any stage in the process of working on databases and virtual folklore museums (interviewing prominent artists of the region, organizing material, creating collections of genres). The results of the experiment were the subject of special discussion at the All-Russian school-seminar, which took place at the MarSU base in April, 2016. The participants of the school-seminar saw the high level of organization of the event in general, as well as the prospects of such studies and expressed their desire to join the experiment.

As for the principles of using ICT technologies, now there are different approaches to use them in education. Our team was primarily focused on the SAMR model, developed by the consulting company Hippasus (Massachusetts) under the leadership of Ruben Puentedura (2014), a graduate of Harvard University, the founder and president of the consulting company Hippasus, in particular on its third and fourth levels:

– level of modification; that is the technology that significantly changes the educational task: this task is impossible without a program or gadget. For example, when working with some text, pupils can choose pictures, musical fragments, write their own or select someone else's comments to the terms. A teacher must give pupils a list of resources to take information from. Also, pupils can record their monologues, dialogues on the phone/computer to work on mistakes or mutual evaluation. Similar tasks include leaving posts on the Internet on a specific topic;
– level of rethinking/redivision; a task can be created, which was impossible earlier. So, children themselves can create a crossword (Hot Potatoes resource), a survey (Surveymonkey resource), city tours (google maps), animations (Voki resource) for each other on a topic.

The Results of The Research, Discussion

The following projects can be called the most interesting decisions of our team.

"From Kids to Kids": Creation by primary school pupils of copyright collective and individual electronic educational resources (based on traditional culture). The project of gymnasium "Blue Bird" named after Ishtrikova T.V."

One of the areas of the project activity of the SBEI of the Republic of Mari El "Humanitarian Gymnasium "Blue Bird" named after Ishtrikova T. V." is the study of traditional culture in a multi-ethnic region using information and communication technologies. The goal of the work of the gymnasium team in this direction is the formation of pupils' ideas about the traditions of the peoples inhabiting the Republic of Mari El, the study of culture as a single and diverse process, familiarization with the national and universal values, mastering and acknowledgment of the country's cultural diversity.

As the joint experience of teachers and pupils of the gymnasium shows, the usage of ICTs in the field of primary general education is one of the most interesting, visual and accessible elements of the instruction for primary school children. It corresponds with their aesthetic and technological selectivity and has a positive effect on the process of knowledge assimilation. The main thing is that

the usage of ICT allows you to bring the learning process to a higher level from the initial stage of training. Children are happy to work with training programs and electronic manuals; they model, design, develop electronic educational resources and are interested in doing tasks and exercises using technologies.

Thanks to ICT, children also have an opportunity to study certain topics online, not only in general education institutions, but also at home at any convenient time.

The result of the activities of the gymnasium within the network of the pedagogical site was the development and testing of a set of electronic educational resources in traditional (folklore) culture, aimed at spiritual, moral, civil and patriotic education of younger schoolchildren.

For sure, one of the popular ways of presenting information on traditional culture was the presentation. Grammar school pupils of the "Blue Bird" learn to create them in PowerPoint from the first grade and use them in almost all subjects and extracurricular activities as illustrative material. The resources created by children in the SMART Notebook program (2020) were also interesting. This software makes learning effective and interactive, it includes tools that make electronic educational materials more vivid. So, the experience of creating various video projects by children turned out to be impressive. For example, video excursions – a productive and accessible way of giving information that is clear and emotional. The first-graders conducted video interviews among gymnasium pupils in the folklore genre as a part of the research of folklore genres in the special course "Fundamentals of Literary Analysis" SESE. Another interesting type of ELR is video master classes for the manufacture of decorative and applied arts products.

However, the most popular of the varieties of project activities tested by the pupils was blogging. Children explained it this way: a presentation is a very familiar, ordinary and traditional way of presenting materials, but SMART Notebook programs are complex, not always possible for Primary school students, and also not installed on every computer. High-quality recording, editing video materials for excursions require special skills but preparation of educational video materials for the blog format turned out to be interesting and affordable for pupils. At the same time, this way of presenting information is already quite popular among modern pupils, many of them have already mastered it. Creating a video and possibly posting it to a social network or channel is a great opportunity for creative self-realization.

The skills required for blogging are creating a blog concept, creating a content on a specific topic, modeling material, developing a unified, individual style, scripting and recording videos, editing video material. Responsibility for the quality of the posted information is also necessary for blogging. Blogs are a part of a learning tool as a personal educational environment in the work of the gymnasium team. Its creation, placement on the Internet and, accordingly, its usage contribute to the individualization, personification and personalization of the educational process.

Starting to work on the projects, the children identified a range of topics in traditional culture which interest them (they are partially represented in the textbooks of the teaching materials "Perspectives" on SESE) and divided them into five blogs in accordance with the content. Each of them was given a name. The project leaders have become bloggers. However, it should be noted that the educational videos were prepared not only by them, but also by other pupils. Teachers, educators and parents were involved in the creation of blogs, which was very significant and valuable for children. Grammar school pupils coped with the tasks. Materials on traditional culture were studied, recorded and presented, the programs for creating video materials were mastered.

Video blogs created by children can be used as a part of the study of topics in literary reading, technology, computer science, SESE during extracurricular activities and independent preparation. At the same time, a blog is an excellent way to create a community of like-minded people as a part of the study of traditional culture.

The first blog *"According to old recipes"*, developed by the pupils of the 2nd and 4th grades, was about cooking traditional dishes of Mari and Tatar cuisine. Its material became part of the project devoted to the study of the national cuisine of the peoples inhabiting the Republic of Mari El and can also be used to study the following topics on the discipline SESE: "About bread and porridge, about tea and coffee", "We are the family of the peoples of Russia" (1st grade); "The house is not big, but it doesn't tell you to stand", "House as an economy", "Bread and salt on the table" (3rd grade).

The second blog was a video tutorial "Learning by playing". Pupils of the 1st and 3rd grades talked about the folk toy and traditional performance with dolls-nativity in an understandable way for the Primary school students. These materials can be used at the lessons of SESE in the 1st grade when studying the topics "My collection", "Nature in human creativity", in the 2nd grade at the literary reading lessons "Museum of Folk Art", in the 3rd grade – "Images of animals in folk art", "Folk toy – good soul". Material about the Christmas nativity scene can be presented in the 2nd grade at the lessons of SESE "In the Red Corner", "Winter Holidays. Christmas holiday in Russia", in the 4th grade – "The Bright Soul of Russia".

The videos of the third blog *"The Old Workshop"* resemble those presented on DIY channels ("do it yourself"). The materials of the gymnasium pupils contain step-by-step instructions for the manufacture of decorative and applied arts products: the Zhostovo tray in an unusual technique, beregini dolls and horse toys. The material can be used at the lessons of SESE in the 1st grade when studying the topics "People are creators of culture", in the 3rd grade – "Folk toy – good soul", "Images of animals in folk art", "In an old house", at technology lessons during extracurricular activities.

The fourth blog, *"What about you?"* is a brief overview of the folklore genres prepared by the pupils of the 2nd grade. The second-graders talked about the genres of riddles and counters of the peoples of the Republic of Mari El as a part of the study of folklore genres in the special course "Fundamentals of Literary Analysis". The material can be used at the lessons of Literary reading in the 1st and 2nd classes when studying the topics "Riddles", at the lessons of SESE in the 1st grade – "Cause – time, fun – hour", "Nature in human creativity", "What kind of animals are there?", "Wild and domestic animals", in the 3rd grade – "Images of animals in folk art".

The fifth blog *"Clearly about antiquity"* had information about the modern life of ancient rites. Pupils of the 3rd and 4th grades talked about the holy divination. Despite the fact that viewers will not see traditional dresses, absolute accuracy in reproducing all the ritual actions, a complete list of the characteristic attributes of the rites on this blog, in general this is an original attempt to popularize traditional culture by children. The material can be used at the lessons of SESE in the 3rd grade "Winter Holidays. Christmas holiday in Russia" during extracurricular activities.

2. "Children's urban mythology": Creation of copyright collective and individual electronic educational resources by primary school pupils (based on traditional culture). The project of gymnasium #26 named after Andre Malraux

Another original project *"Children's urban mythology"* was developed by the teachers and pupils of Humanitarian Gymnasium # 26 named after André Malraux. It is interesting primarily for its content. The teachers of the gymnasium "Blue Bird" named after Ishtrikova T.V. selected recognizable elements of traditional culture (food, ceremonies, folk crafts, etc.) for the development of projects by Primary school students. The staff of the gymnasium # 26 named after André Malraux paid specific attention to one of the areas of modern folklore – children's urban mythology, and in particular, the area of the terrible (creepypasta). This area is extremely popular among children and teenagers, but maybe not well known among parents and schoolteachers. It should be noted that the teachers of the gymnasium had to turn to the study of the works of scientists who became classics in this field (Vinogradov 1986, Osorina 1986, Toporkov 1992, 1998, Trykova 1997, Loyter 2001, Novitskaya 2002, Cherednikova 2002), articles by beginning folklorists (Mirvoda 2016, 2018 a, b, c), as well as numerous sites with texts of cryptipasta genres (Cryptipasta (scary stories) 2019a, Cripipasta (scary stories) 2019b, Cripipasta (legends and horrors of the Internet) 2019). As a result, it was concluded

that modern childhood mythology (referring to the first decades of the 21st century) has its own specifics: 1) it moved to the field of the Internet; 2) its characters became the heroes of numerous computer games.

A questionnaire was developed and conducted among students [see application], which allowed to get a fairly complete picture of how often schoolchildren play games on gadgets, what games and characters are most popular among them, etc. At the same time, processing the questionnaire materials allowed us to formulate and offer pupils the topics for creating their own projects ("My favorite game", "My favorite cartoon hero", "My favorite game hero", "Funny stories about game heroes", "Horror stories of our school", "Horror stories of our class", "Horror stories of our yard ", etc.).

Individual projects developed by pupils, on the one hand, reflect the specifics of the game, cartoons, and cryptipasta stories, on the other hand, they are an attempt to fix and analyze modern children's urban folklore, presenting this material in the form of a research paper.

It should be noted that pupils were unusually interested in this topic. Many elementary classes began to have groups of children, firstly, who knew the field of culture well, secondly, who were prepared to work in its space, thirdly, who were ready to share their knowledge about a particular game with their peers. So that's how the projects about their favorite computer games and heroes, folklore genres that arose on the basis of a game (for example, jokes and aphorisms) and their own stories (for example, about the reasons for the heroes of their favorite game to have special energy) appeared. At the same time, the pupils not only prepared the texts, developed characters' dialogues, provided the texts with their own illustrations, but also created characters (for example, robots).

Conclusion

The use of ICT in the pupils' project activities forms the key competencies, develops the ability to work with various programs, information sources, improves information literacy and information culture in general, and develops a sense of responsibility for the information provided. Children and teenagers learn to find, verify, select, analyze, process and correctly use the necessary material. In this regard, education becomes multi-faceted, interactive and creative.

Materials prepared by students for the digital educational environment on the Internet may be available to many users, and especially for peers. They should make the network very useful, fill it with qualitative information on traditional culture, help to motivate learning activities, promote unique children's individual and cooperative creativity. Preparing visual materials on traditional culture will be a great way for the pupils to do the work on their own, and not to choose the ready-made material from the Internet, which deprives children of personal creative work.

The creation of projects for children by children is also important and significant for teachers and educators. They allow you to diversify any activity, turn it from traditional to innovative.

In the future, it seems possible to continue the work on the preparation of ELR on traditional culture within the framework of the project "Children to Children" and "City Urban Mythology"; another project, "Epic Creativity of the People of the RME. National Hero" (Secondary School # 6), is planned to be prepared for the centennial of the Republic of Mari El. The result may be the placement of materials as an educational content on the sites of the educational organizations – the project participants as examples of a virtual electronic information and educational environment.

Acknowledgements

The reported study was funded and conducted as a part of the research work of the grant awarded President of Russian Federation for support of young Russian scientists — candidates of science (MK–2019).

Appendix 1

Hi!

We adults are eager to know more about the things kids love to play nowadays. Unfortunately, we know very little about them. That's why we're asking you to fill in our questionnaire! This will help us learn more about your interests!

This is not a test or control work, so any answer you give is correct!

Your age: _____ (example: 10 y.o.).

Your school (you can shorten the name):
_____

Don't write your name or surname on this paper!

Questionnaire

Circle one option:

Do you play games on gadgets (a computer, a smartphone, a laptop)?

A) Yes, often.
B) Yes, sometimes.
C) Rarely or almost never.

Do you play or have you ever played “Minecraft”?
A) Yes, I play it often.
B) Yes, I play it sometimes. / Yes, I used to play it in the past.
C) I’ve heard of this game, but I’ve never played it.
D) I’ve never heard of this game.

Which of these Minecraft characters do you know? (You can circle more than one option).
A) Herobrine
B) Entity 303
C) Null
D) Write down another character if you want: _____

Have you heard any weird or creepy stories about these characters?
A) Yes.
B) No.

Where did you hear these stories? Answer this question if you answered “Yes” to question 4.
A) I read them in the Internet.
B) I heard them in a YouTube video.
C) My friends or classmates told me about them.
D) My elder brothers or sisters told me about them.
E) Other option: _____

Do you tell such stories to others?
A) Yes.
B) No.
C) I tell creepy stories, but not about these characters.

Have you ever tried to act out scenes with these characters (or any other Minecraft-themed scenes) with your friends in real life (without using a computer)?
A) Yes.
B) No.

Do you know what creepypasta is?
A) Yes.
B) No.
C) I’ve heard about it but I don’t know what it is.

Have you ever heard of Slenderman?
A) Yes.
B) No.

What other creepypasta characters do you know?
Write their names down: _____

Have you ever heard of SCP?
A) Yes.
B) No.

How did you find out about SCP? Answer this question if you answered “Yes” to question 10.
A) I read about it in the Internet.
B) My friends told me about it.
C) Other option: _____ .

Have you ever tried to tell or write your own SCP stories?

A) Yes.
B) No.

Do you know any characters from Marvel or DC universe?
A) Yes.
B) No.

If you do, name your favorite and the most interesting ones.

What's your favorite computer or mobile game, if any? Name two if you want.

What's your favorite real-life (not computer or mobile) game?

What's your favorite movie or cartoon? You can name both if you want.

Thanks for filling in our questionnaire!

Legal and Organizational Aspects of Preparing the State to Act In Crisis Situations

Abstract

Crisis management begins already during the normal state of monitoring the situation and detecting threats by preparing to counteract them when they occur, including removal of effects and recovery. The system covers all levels of public administration, it has an organizational structure that allows the execution of tasks according to the specific purpose and the phases of crisis management. Particular important in the fight against extraordinary risks to the security of the State is the legal system, which makes it possible to take specific actions in the event of a risk. Hence, the objective of this study is to present the legal and organizational aspects of crisis management in Poland, drawing attention to the role of extraordinary states in, because, as the results of the research shown, there are discrepancies in this area.

Keywords: Crisis Management, State of Natural Disaster, Natural Disaster, Technical Failure.

Introduction

The human being strives to be safe and feel secure. This is one of the most important human needs, following the physiological needs. Ensuring security has been one of the main driving forces in the social evolution of people. The state of security is not evenly distributed across the globe, in various parts of the world, or even among the citizens of one State. This, however, is notwithstanding the fact that each of the civilizations existing in the contemporary world ensures, in its essence, the security of the societies that comprise it.

The complexity of the category of security is manifested by the multiple types of security identified in different typologies. In general, it may be assumed that they all group the different types of security under its three major dimensions: subjective, objective and procedural.

In the subjective dimension, security concerns the members of a society, whose numbers are growing. Accordingly, state-centric understanding of security is no longer valid and it is necessary to extend the catalogue of protected values. It is worth mentioning the supporter of the school of "World Community", Ken Booth, who altogether dismisses the State as the most important subject of research on security, focusing instead on the individual. The way he sees it, security is based on the emancipation of individuals (Booth, 1991). However, in Martin Shaw's opinion, the security of individuals should not be so radically juxtaposed to the State. A complex analysis is needed of the security of respective subjects as if side by side. According to him, the most appropriate level of the conceptualization of security is the society as an intermediate level between the state and individuals (Shaw, 1993; Polak, 2019; Lu, Gozgor, Huang, Lau, 2020). There is also the interesting concept of human security referring to an individual person. This special kind of human security is currently the most comprehensive and

advanced conceptualization of the security of an individual as a subject. The core is the quality of human life in the society and in the State (Thakur, 1997; Danišauskas, 2017).

By contrast, in the objective dimension, security concerns its various aspects (areas). Meanwhile, the procedural dimension reflects its changeability in time. Security should be treated not only as a state but also as a process. This dimension fully demonstrates its dynamics, which results from scientific and technological progress, sociopolitical thought and conceptualization in science and everyday life. People experience numerous socioeconomic transformations in various aspects of life. According to forecasts, these will be gradually accelerating in the years to come. These transformations bring with them an increased risk to the security of citizens, mainly associated with the development of civilization and the laws of nature, such a flood, fire, technological, chemical and environmental disasters or infectious human or animal diseases.

It is not possible to completely control and predict human behavior, but it is possible to try and limit the situations that cause a crisis and minimize its consequences. It should be noted that crisis is a specific phenomenon that follows a larger, sometimes very long process of changes. It requires readiness to change and accept new challenges and tasks (Ciekanowski et al., 2017; Belas, et al., 2018).

The basic principles of crisis management include:

- The principle of territorial primacy – the leading structure in this model is considered to be the territorial arrangement of the state and the industry arrangement is reduced to the auxiliary function;
- The principle of individual management – one person makes decisions and is accountable for them;
- The principle of the accountability of public authorities – certain authorities become competent and responsible for decision making in crisis situations;
- The principle of unification – administrative authorities receive general competencies that guarantee their performance of duties;
- The principle of categorization of risks – it involves grouping risks by type and size and associating them with specific legal, organizational and financial solutions;
- The principle of universality – crisis management is provided by public authorities in cooperation with existing specialist institutions and organizations and the general society.

New circumstances demand a new approach to the problem of crisis management. The multiple challenges and risks existing at the threshold of the third decade of the 21st century require constant improvements to the crisis management system (Wiśniewski et al., 2017; Valaskova, Kliestik, Kovacova, 2018).

Legal aspects of responding to a crisis

The basic legal regulation that identifies the competent authorities in matters of crisis management and specifies their tasks and principles of operation in this area as well as the principles of financing crisis management tasks is the *Crisis Management Act* of 26 April 2007 (Journal of Laws of 2019, item 1398) amended by the *Act Amending the Crisis Management Act* of 17 July 2009 (Journal of Laws of 2009, no. 131, item 1076).

The Crisis Management Act establishes an integrated crisis management system that covers central and local government administration authorities, the Armed Forces of the Republic of Poland and selected private operators and it defines such concepts as: crisis management; crisis situation; critical infrastructure or civil planning.

According to that Act, crisis management is the responsibility of public administration authorities constituting an element of national security management, which involves preventing crisis situations, preparing to control such situations through planned measures, responding in the event of crisis

situations, removing their consequences and restoring resources and critical infrastructure.
When it comes to the concept of crisis situation, many experts agree that the approach presented in the Act of 2009 grasps its essence and implements the postulates of both the central government and local governments, in particular in terms of facilitating the classification of an event as a crisis situation. According to the definition contained in the Act of 2007, such event occurred, if there existed a risk that triggered jointly the following three effect factors:

- Broken or significantly disturbed social bonds;
- Seriously disturbed functioning of public institutions;
- Use of necessary means to ensure or restore security to an extent that does not justify the need to introduce one of the states of emergency referred to in Article 228.1 of the *Constitution of the Republic of Poland* (Journal of Laws no. 78, item 483).

Meanwhile, the current approach to crisis situation conditions the occurrence of a crisis situation only on the existence of a risk that negatively affects the security of people or the environment to such a degree that it limits the operation of competent public administration authorities, when the resources and procedures of operation of those authorities prove to be insufficient.

An important aspect of crisis management is civil planning, which should be understood as the total of organizational projects that are supposed to prepare public administration for crisis management as well as planning the support of the Armed Forces of the Republic of Poland, should they be used, and planning to use the Armed Forces of the Republic of Poland to implement crisis management tasks. Tasks in the area of civil planning include, among other things: preparing crisis management plans, structures to be activated in crisis situations and resources necessary to perform the tasks provided for in a crisis management plan. In the contemporary world, it is also vital to maintain the infrastructure needed to ensure the functioning of a society, especially in the event of a crisis situation.
The solutions adopted in Poland in the area of the security of the State and its citizens make it possible to declare, in the event of specific risks, if regular constitutional measures are not sufficient, the adequate extraordinary state: the martial law, the state of emergency or the state of natural disaster (Socha, 2013).

The issues concerning extraordinary states are governed in Chapter XI of the *Constitution of the Republic of* Poland of 1997 and discussed in more detail in the following acts: the *Martial Law Act* of 29 August 2002 (Journal of Laws of 2017, item 1932, as amended), the *State of Emergency Act* of 21 June 2002 (Journal of Laws of 2017, item 1928, as amended) ant the *State of Natural Disaster Act* of 18 April 2002 (Journal of Laws of 2017, item 1897, as amended). Pursuant to Article 228, in the event of specific risks, if regular constitutional measures are not sufficient, it is possible to declare the adequate extraordinary state: the martial law, the state of emergency or the state of natural disaster. They can only be imposed on the basis of an act of law, through a resolution that needs to be published. The measures taken as a result of declaring the above states must correspond to the degree of risk and should aim at restoring the normal functioning of the State as soon as possible.

In the event of an external risk to the State, including one caused by terrorist or cyberspace operations, an armed attack on the territory of the Republic of Poland or, if an international treaty requires joint defense against aggression, the President of the Republic of Poland may, at the request of the Council of Ministers, declare the martial law. Meanwhile, in the event of a specific threat to the constitutional system of the State, security of the citizens or public order, including one caused by terrorist or cyberspace operations, the President of the Republic of Poland may declare the state of emergency for a fixed period of time. The state of emergency may only be declared if the above risk actually happens and if it was unexpected. The Constitution does not require simultaneous occurrence of all the circumstances justifying the declaration of the state of emergency.

The President submits a regulation declaring the martial law or state of emergency to the Sejm (lower house of the Polish Parliament) within 48 hours of its signing. The Sejm promptly reviews the regulation, which it may repeal by the absolute majority of votes in the presence of at least half of the

statutory number of the Members of the Sejm. The state of emergency may only be extended once, subject to the consent of the Sejm, for the maximum of 60 days.

Meanwhile, in order to prevent the consequences of natural disasters or technological failures that have the features of a natural disaster and for the purpose of their removal, the Council of Ministers may declare, for a fixed period, no longer than 30 days, the state of natural disaster in a part of or in the whole State. This state may be prolonged subject to the consent of the Sejm.

The structure of crisis management

The structure of crisis management in Poland is based on four levels: central, regional (voivodship), sub-regional (poviat) and local (gmina). Crisis management covering the territory of the country is controlled by the Council of Ministers. In urgent cases, crisis management is controlled by the minister of home affairs. The Council of Ministers has established the Government Team for Crisis Management. It is an evaluation and advisory body competent to initiate and coordinate measures within the scope of crisis management. The Government Center for Security has also been established. It reports to the Prime Minister and provides crisis management related services to the Council of Ministers, the Prime Minister, the Government Team for Crisis Management and the minister of home affairs, and it serves the function of the national center for crisis management (Journal of Laws of 2015, item 508).

Also, the ministers and central administration authorities competent for matters associated with ensuring national security, including protection of the population or economic foundations of the security of the State, were obligated to establish crisis management centers, whose duties include, among other things, serving round-the-clock on-call duty to ensure the flow of information for the purpose of crisis management, cooperating with crisis management centres of public administration authorities, supervising the operation of the system of detection, alert and early warning of the population, cooperating with services engaged in rescue, search and humanitarian operations, and serving continuous on-call duty to increase the defense preparedness of the State.

On the regional level, the competent authority in matters of crisis management is the head of the region (voivode), who performs his duties in collaboration with the regional team for crisis management. Also, regional crisis management centers are established, operated by organizational units competent for the matters of crisis management in regional offices.

The duties of the voivode as the representative of central administration in the region include, in particular:

- To supervise the functioning of the civil preparedness and management system in the region, including to issue orders, to the extent necessary, to public administration authorities to ensure proper performance of their tasks within that system;
- To approve regional plans and programs within the scope of civil planning, including response plans to risks that directly trigger a crisis or risks that lead to a crisis;
- To determine crisis management procedures in the region;
- To verify sub-regional (poviat) plans and programs within the scope of civil planning, including response plans to risks that directly trigger a crisis or risks that lead to a crisis;
- To determine specific tasks within the scope of civil preparedness for public and private operators in the region and to inform them of the need to perform specific activities;
- To verify regional programs and projects for their compliance with the civil preparedness and crisis management system and plans;
- To coordinate management and alert systems and to monitor risks in the region;
- To invest in civil readiness and crisis management in the region, in particular to expand and modernize coordinating, monitoring and warning systems;

- To coordinate activities at times of risk or crisis in the region or a major part of the region, including: to distribute the share of the state reserves allocated to the region and to provide updated information;
- To assist the head of a poviat (starosta) in performing his duties at a time of risk or crisis in the poviat, i.e. to provide logistics, materials, devices, human resources, including special forces, military reserves and the army, however, without overtaking control over the operations at a time of risk or crisis;
- To organize cooperation between poviats or regions or across the country at a time of risk or crisis that covers one or more than one poviats;
- To verify poviat projects and programs, including investment projects and projects involving reconstruction of specific areas, for their compliance with the existing plans, principles and standards of civil preparedness and crisis management;
- To support local civil preparedness and crisis management bodies in acquiring the funds required for reconstruction;
- To organize training and drills verifying the condition of civil preparedness and crisis management.

The competent authority in matters of crisis management in a poviat is the head of the poviat (starosta) who, as the chair of the poviat board, performs crisis management operations in cooperation with the poviat team for crisis management. Poviats also establish their centers for crisis management. On the lowest level of the local government, i.e. in gminas, the authority competent for matters of crisis management is the mayor of the gmina, town or city. The mayor of a gmina, town or city is assisted in the performance of crisis management operations by the gmina team for crisis management. In order to implement those operations, he may establish gmina (municipal) centers for crisis management.

Phases of Crisis Management

Crisis management operations should include:

- Prevention and preparation measures;
- Information collection and situation evaluation process;
- Setting the goals to be implemented;
- Developing various options of action plans and comparing them; and
- Analyzing response methods.

When implementing the above assumptions, it is reasonable to identify four stages of crisis management: preparation, prevention, response and reconstruction.

At the preparation stage, action plans should be developed and the actors responsible for specific operations as well as the scope of work to be performed should be identified. The entire procedure is based on the evaluation of the probability of occurrence of potential risks and on determining the specificity of their occurrence. In order to verify whether plans will work in practice, the personnel engaged in performing the operations contained in the plans should undergo trainings and drills. The crisis response plan identifies the organizational structure of crisis management as well as reporting and cooperation lines. It determines the forces and means that are necessary and that may be used in potential actions and specifies how to protect people and their possessions during crisis. The measures taken at this stage do not involve technologies which – if properly applied – could significantly reduce the consequences of an event, minimize loss and accelerate restoration of the conditions needed for normal functioning (Maciejewski, 1998).

Prevention is an incessant process the goal of which is to eliminate the probability of the occurrence of a risk or to limit the risk and to minimize the loss caused by a disaster. Here, it is important to have a strategy of action that contains the following elements: analysis of risks and evaluation of social vulnerability; promoting applied research and technology transfer; increasing social awareness and popular education in risk prevention; developing a system of financial incentives and restrictions and

proper utilization of resources; ensuring leadership and coordination of activities. It seems that many crisis events would not take place if more attention was paid to the implementation of specific plans, recommendations or guidelines, which could prevent the occurrence and consequences of a disaster (Maciejewski, 1998).
In the third stage – the response stage – the planned recommendations are implemented and the work of competent actors focusing on the provision of assistance to the victims and limiting the loss is coordinated. The key elements of the response stage include, among other things:

- Situation monitoring – it is based on routine collection of data and information on potential and actual circumstances or events that threaten the security of the local community and the environment. The monitoring should be continuous, as it constitutes a substantial basis for the evaluation of a situation, and thus for decision making;
- Risk identification – it means using monitoring information to analyse events and forecast the development of a situation. The type, range and duration of a given stimulus of phenomenon is a prerequisite to evaluate the risk and adequately use the forces and means that enable rescue activities;
- Warning and notification – it concerns the obligation to provide information about a danger, which should reach both the population and the institutions predisposed to appropriately respond to a hazardous event;
- Rescuing people – all the activities undertaken to help victims, involving search and rescue actions, evacuation of people and property from the region of a disaster and provision of medical and psychological assistance.
- Securing property – involves protecting property from damage and looting;
- Social care and assessment of damage – these are two different activities, but they are performed simultaneously. Social care involves measures that are supposed to provide victims with any assistance they may need in order to return to as normal functioning as possible. The main purpose of the assessment of the consequences of a disaster is to apply to management authorities of higher levels for help;
- Restoration – involves, among other things, removal of debris from the site of a disaster, decontamination of an area, restoration of public services, enabling return to normal life. Restoration is an early stage of the phase of reconstruction (Maciejewski, 1998).

The main goal of this stage is to restore, as quickly as possible, minimum living conditions for people and the operation of municipal systems and administrative structures in a given area. Reconstruction is done in such a way as to make the area struck by a disaster more resistant to that disaster in the future. At that time, damage is assessed, debris is removed and disinfection and anti-epidemic measures are performed.

During reconstruction, it is possible to prevent future disasters. The four stages constitute a closed cycle, because the stage of reconstruction should be implemented in such a way as to make it an element of the prevention stage, i.e. new solutions should not only restore the structures from before a disaster but also modernize them and, based on the lessons learned, increase resilience to new risks.

It is worth noting that the literature mentions the fifth phase of crisis management called “learning a lesson”, i.e. accumulating experiences gained in the course of a disaster situation and assimilating this knowledge so that it may be used to combat future risks (Mitroff, Pearson, 1998; Szczepańska-Woszczyna, 2013). The above cycle was developed on the basis of the experiences of economic sciences, but it can well be transposed to the level of ensuring general security.
Accordingly, crisis management involves:

- Acquisition, distribution and evaluation of information – permanent information authorities;
- Situation analysis – headquarters, dedicated, permanent authorities;
- Identifying the goals to be achieved – in normal times, the governing authorities, at times of a disaster – their representations;
- Selecting and implementing action options – top representation – committee and coordinating minister;
- Analyzing the effects of response and reconstruction.

Summary

Over the last years the concept of resilience, or disaster risk reduction, has emerged into public debate, and it is a sign that at long last people in authority are taking seriously the idea of preparing for adverse events, not merely reacting to them. As Timothy Coombs and Daniel Laufer note "Despite the importance of this topic, the state of the literature in the area of global crisis management has yet to be explored" (Coombs, Laufer, 2018).

Presenting a list of existing Polish legal regulations governing crisis management is a more complex task than it is generally believed. There are two schools that can be mentioned here. The representatives of the first believe that the crisis situation referred to in the *Crisis Management Act* exists by the time one of the extraordinary states is declared and continues after it is cancelled, until the State returns to normality. Meanwhile, the representatives of the other school believe that a crisis situation ends once the climax has been passed and the risk drops to a stable, low and acceptable level. Thus, crisis management does not end once one of the extraordinary states is declared, but rather it lasts until the State once again functions normally.

Considering the above, for some, legal regulations governing crisis management include, apart from the *Crisis Management Act*, all the three acts on extraordinary states, i.e. on martial law, state of emergency and state of natural disasters, while others omit the *Martial Law Act* and still others disregard all those acts. Yet others mention more legal regulations, e.g. the *Act on Protecting Persons and Property* or the *Act on the Security of Mass Events.*

Nonetheless, the *Crisis Management Act* guarantees, at least in the legal sense, a harmonious transition of the State management system from a normal state to an extraordinary state. Also, continuous improvement of a specific system makes it more efficient (Pawłowski, 2004), which means that improving the existing solutions concerning the operation of public administration in crisis situations will make them effective and help them avoid mistakes, and at the same time it will enable, if need be, seamless transition of structures from operation in "peace" conditions to operation in a situation of threat (Socha et al., 2015). As David Alexander indicates in his research "The study and management of disasters should involve a mixture of theory and experience. We learn the former in the classroom and the latter in the field. Lack of either perspective is unhelpful or downright dangerous. Theory is the roadmap that enables us to deal with disasters, and experience needs it to be able to make sense of complex and chaotic realities. The field of disasters is unusual, in that the test of theory is its ability to help solve pressing, practical problems right away, not in 50 years' time" (Alexander, 2012). Furthermore, L. Baird's at al. research shows that „A critical component for learning is the application of post-crisis reviews because the process has been found to facilitate organizational learning" (Baird et al., 2000).

It may also be claimed that if operators are prepared to act in a crisis situation, they will also be more effective in implementing their statutory duties in normal conditions. Accordingly, crisis management is a very complex problem, even though it may not seem so, and there still remains a lot to be done in this area both for academics and for practitioners.

With the increased interest in crisis management over the years, including special issues in mainstream business journals – as D. Laufer notes in his research (Laufer, 2015) – hopefully more attention will focus on global issues in situations of non-military threats in the future.

Abstract

Frente a otras formas de relaciones laborales, la modalidad de empleo con apoyo fomenta la inserción laboral de personas con discapacidad intelectual en la empresa ordinaria. En este estudio, a través de un grupo focal, se analizan los beneficios de esta modalidad de inserción sociolaboral desde la perspectiva de los trabajadores/as con discapacidad intelectual. Los resultados muestran que el empleo con apoyo fomenta su desarrollo personal y profesional, autonomía y bienestar social.

Keywords: empleo con apoyo, discapacidad intelectual, inserción laboral, calidad de vida.

Introducción

El empleo es un medio valioso para las personas, más que una fuente de ingresos, el empleo aporta identidad personal, fomenta el desarrollo personal e incrementa las interacciones sociales entre las personas (Subirats et al., 2004). Para las personas con discapacidad intelectual (DI) el empleo es todavía más significativo, les proporciona un rol social, incrementa sus niveles de calidad de vida y les conduce a disfrutar de mayores niveles de autonomía y participación social, fomentado sus posibilidades de inclusión (Akkerman, Jassen y Meininger, 2016; Jahoda, Kemp, Riddell y Banks, 2008; Verdugo, Martín-Ingelmo, Jordán de Urríes, Vicent y Sánchez, 2009). Asimismo, se establece una relación positiva entre calidad de vida, empleo y salud mental (Dean, Shogren, Hagiwara y Wehmeyer, 2017).

La CRPD (2006) y la directiva para el empleo 78/2000/CE garantizan el derecho a la participación plena en el empleo de las personas con discapacidad en igualdad de condiciones y no-discriminación, en entornos laborales ordinarios, abiertos y accesibles. Sin embargo, todavía hoy nos encontramos lejos de alcanzar esta realidad (CRPD, 2006). Es amplia la literatura que reivindica la situación de desventaja social de las personas con discapacidad en relación al empleo, tasas de empleo inferiores al 50% en toda Europa y altas tasas de desempleo e inactividad (Greve, 2009; Parmenter, 2011; Sharle y Csillag, 2016; Shima, Zóloyomi y Zaidi, 2008). Así como, las barreras que impiden su acceso siendo estas individuales (dificultades para la interacción social, habilidades sociales, cambios de rutina, etc.) (Khayatzadeh-Mahani, Wittevrongel, Nicholas y Zwicker, 2019) y contextuales (estigma y prejucios, bajas expectativas sobre su productividad, desconocimiento de la discapacidad, costes percibidos para los soportes y las adaptaciones y las características propias del lugar de trabajo (Ellenkamp, Brouwers, Embregts, Jossen y Weeghel, 2016).

La orientación de política pública se ha orientado a incrementar los niveles de participación de personas con discapacidad en el empleo. Sin embargo, se continúan invirtiendo recursos en estructuras de empleo segregado (Greve, 2009; Jordán de Urríes y Verdugo, 2012; Wheman, 2012). En los últimos treinta años se ha transitado hacia la aplicación de políticas activas de empleo, que movilizan a las personas con discapacidad a trabajar en entornos ordinarios. Una de estas estrategias para la inclusión laboral de personas con discapacidad es proporcionar apoyos individualizados en entornos laborales ordinarios, también conocido como Empleo con Apoyo (EcA) (Wheman, 2012). En la actualidad, los

mercados *flexiseguros*, definidos como aquellos que combinan mercados laborales flexibles, sistemas potentes de seguridad social y una alta aplicación de las políticas activas de empleo, son los que ofrecen mayores oportunidades de inclusión para las personas con discapacidad (European Comission, 2012; Sharle y Csillag, 2016).

Considerando la importancia del empleo con apoyo para las personas con discapacidad (Akkerman et al, 2016; Jahoda et al, 2008; Evans, 2010; Verdugo et al., 2009; Subirats et al., 2004; Wheman, 2012) , este estudio analiza el empleo con apoyo desde la perspectiva de los trabajadores con DI. Para ello se analiza el caso de una empresa que incorpora por primera vez a trabajadores con discapacidad. El siguente apartado analiza el empleo con apoyo como herramienta de inserción laboral. A continuación se detalla la metodología de la investigación y se analizan y discuten los resultados. El análisis realizado permite comprender los beneficios de esta modalidad de inseción laboral desde la perspectiva de los trabajadores con discapacidad.

La Situación Actual Del Empleo Con Apoyo

El Empleo con Apoyo (EcA) nace en los Estados Unidos y Canadá, entra con fuerza en Europa a finales de los años ochenta. El EcA supone un avance respecto al *Customized Employment* (Inge, 2012). El EcA se considera más que una simple metodología de inserción laboral, esta se acompaña de una filosofía, unos principios (Evans, 2010) y unos valores (Wheman, 2012). El empleo debe ser significativo para el individuo, le debe proporcionar calidad de vida, oportunidades de crecimiento personal y un mayor desarrollo de sus relaciones sociales (Wheman, Inge, Revell y Broke, 2007).

El EcA se ha extendido por todo el mundo, con mayor o menor intensidad. Se dispone de una serie de evidencias científicas que demuestran su impacto sobre la calidad de vida de las personas con DI y su eficiencia respecto de otras metodologias de inclusión laboral (Cimera, 2012). Sin embargo, disponemos de más evidencias para *Indivudual Placement Support* (IPS), una metodología de inserción laboral con apoyo orientada a personas con problemas de salud mental (Luciano, Drake, Bond y Becker, 2014).

Verdugo et al (2012) avalúan el impacto del programa EcA Caja Madrid sobre la calidad de vida de las personas con discapacidad y qué factores influyen en la misma. En relación con los resultados, las personas con DI maifiestan altos niveles de competencia/productividad, niveles intermedios de satisfacción, autodeterminación/independencia y menores niveles de pertinencia social/integración en la comunidad. Concluyen que los trabajadores que participan en el programa EcA mejoran su calidad de vida. Así mismo, Jahoda et al (2008) encontraron que el EcA tenía un impacto positivo sobre la calidad de vida, bienestar y niveles de autonomía de las personas con DI, mientras que se percibían menores niveles de aceptación social. Para Schalok y Verdugo (2007) el concepto de calidad de vida es multidimensional y está influenciado por factores personales y ambientales. Establecen ocho dimensiones para medir los niveles de calidad de vida (desarrollo personal, autodeterminación, relaciones interpersonales, inclusión social, derechos y bienestar emocional, físico y material) y ejemplos de apoyos para fomentarlas.

En relación a los niveles de satisfacción de las personas con discapacidad Verdugo et al (2009) afirman que el EcA tiene un impacto positivo sobre los niveles de calidad de vida, traduciéndose en mayores niveles de autodeterminación, empoderamiento y autoconocimiento. Sin embargo, se muestran menores niveles de satisfacción en relación a su integración en la comunidad. Tanto los factores ambientales, como las características propias del lugar de trabajo y los compañeros influyen en los niveles de autodeterminación de las personas con discapacidad. Por último, demostraron los trabajadores con discapacidad disfrutaban, se sentían satisfechos con su trabajo y mostraban interés por aprender más.

Las personas con discapacidad prefieren trabajar en entornos ordinadarios y muestran mayores niveles de satisfacion laboral que los que trabajan en entornos segregados (Migliore, Mank, Grossini y Rogan, 2007). Para Akkerman et al (2016) los factores que influyen para obtener mayores niveles de satisfacción laboral son: las características del trabajador, las características del lugar de trabajo, las relaciones sociales y apoyos y la adecuación entre la persona y el entorno. En esta línea Págan y Malo (2009) añaden que los mayores niveles de satisfacción de las personas con discapacidad respecto de

las personas sin discapacidad se pueden deber a las bajas expectativas en relación al empleo de los primeros.

Otros estudios han ido más orientados a evaluar cuales han sido los niveles de implementación del programa EcA en los diferentes países europeos. En general, se observa un desarrollo lento, pero progresivo, principalmente porqué la posición del EcA no está suficientemente clarificada y se aplican metodologías diferenciadas (Jordán de Urríes y Verdugo. 2010), así mismo, los recursos que se destinan a los programas son inestables (Beyer, Jordán de Urríes y Verdugo, 2010; European Comission, 2012; Verdugo et al., 2009). En España, el proyecto INCO de Caja Madrid en España, supuso un avance importante para el desarrollo del programa EcA, otorgando una fuente de financiación estable. En 2008 se habían desarrollado 202 iniciativas que ofrecían EcA a 23.342 personas (Jordán de Urríes y Verdugo, 2010).

También se han llevado a cabo estudios cualitativos relevantes como el realizado por Spjelkavik y Evans (2007) con la finalidad de conocer el estado general del EcA en Noruega, comparándolo con iniciativas de otros países como España, o el estudio realizado por Cramm, Finkenflügel, Kujstein y Exel (2009) quienes analizan la perspectiva de los trabajadores con DI sobre los programas EcA. En este estudio, los participantes otorgaron mayor valor a la participación, a la variedad de tareas y al sentimiento de pertinencia. Así mismo, se valoró positivamente el hecho de poder trabajar independientemente, acuerdos laborales claros y compañeros de trabajo amigables, concluyendo que la relación entre el EcA y la integración social es positiva.

A pesar de que se pueden encontrar evidencias interesantes, todavía se requieren de más estudios que sustenten la efectividad de la metodología EcA como un servicio que garantiza un empleo competitivo para las personas con DI (Waghorn, Collister, Killackey y Sherring, 2007). También se requieren más investigaciones que ofrezcan resultados sobre el impacto del EcA sobre los niveles de calidad de vida y niveles de autodeterminación de sus trabajadores (Verdugo *et al.,* 2009).

Metodología

Este estudio se fundamenta en una metodología cualitativa a través de un grupo focal compuesto por cinco trabajadores con discapacidad. Según Verdugo, Jordán de Urríes y Vicent (2009) para evaluar programas de EcA es necesario realizar grupos de discusión con los usuarios del programa y sus famílias, estas últimas no son analizadas en este estudio. Los grupos focales facilitan altos niveles de discusión entre los participantes, útiles para captar la variedad de experiencias personales en relación a la experiencia de EcA en un periodo corto de tiempo (Hamui-Sutton y Varela-Ruiz, 2013). Más concretamente, los grupos de discusión permiten evaluar como impacta el programa EcA en la calidad de vida de los trabajadores con discapacidad, así como, detectar los aspectos positivos y negativos del programa según la percepción de los usuarios para intentar mejorarlos (Verdugo et al., 2009).

El grupo focal constó de un total de cinco trabajadores/as con discapacidad intelectual de entre 18 y 30 años que que desempeñaban las funciones de auxiliar de bibliotecario/a. En los resultados se identifican con la P de participante, P1, P3 y P5 son hombres mientras que P2 y P4 son mujeres. Todos ellos habían participado previamente en un programa formativo en competencias y habilidades para trabajar en empresa ordinaria. En relación con la experiencia laboral previa P1 y P4 habían trabajado previamente en un centro especial de empleo, P2 en un centro ocupacional, mientras que P2 y P5 no tenían experiencia laboral previa.

Para el desarrollo del grupo focal se elaboró un cuestionario de preguntas semi-estructuradas fundamentado en cuatro de las ocho dimensiones del modelo de calidad de vida de Schalok y Verdugo (2007): desarrollo personal, autodeterminación, relaciones interpersonales y bienestar material. Así mismo, se añadieron otras cuestiones relacionadas con el nivel de satisfacción con los apoyos y con las tareas asignadas.

Resultados

En el siguiente apartado se exponen cuáles han sido los principales resultados. En primer lugar, se debe identificar si los participantes consideran que el EcA ha tenido un impacto positivo en sus niveles de

calidad de vida en relación a las siguientes cuestiones: desarrollo personal, autodeterminación, relaciones interpersonales, integración social y bienestar material.

Por otro lado, se analiza la percepción que tienen los trabajadores con discapacidad en relación con los apoyos y a su disposición hacia el empleo: motivación, iniciativa, productividad.

Tabla 1: Variables de análisis para el grupo focal

	Percepción en relación a:	Indicadores
Calidad de vida	1. Desarrollo personal	Progreso , habilidades
	2. Autodeterminación	Autonomia, autoestima empoderamiento
	3. Relaciones interpersonales	Relaciones de amistad, interacciones
	4. Integración social	Aceptación, ambiente de trabajo,
	5. Bienestar Material	Ingresos
Empleo ordinario con apoyo	6. Apoyos	Apoyos naturales y entrenadores laborales
	7. Tareas	Motivación, iniciativa, productividad

Fuente: Elaboració propia

Calidad de vida percibida por los trabajadores con DI en un programa EcA

En general los usuarios del programa EcA valoran positivamente la experiencia de empleo ordinario. Manifiestan que el EcA les ha ofrecido oportunidades para progresar y desarrollarse personal y profesionalmente.

> "*Para mí ha sido una cosa magistral"* [P3].
>
> "*Valoro que he crecido claro, en comparación al trabajo que hacía antes pues claro, años vista"* [P1]

Aquellos que habían desempeñado empleos en entornos protegidos valoran muy positivamente la transición a empresa ordinaria.

> *"He crecido más, he hecho tareas nuevas, he aprendido cosas, he notado un gran cambio con el centro especial de empleo"* [P4].
>
> "*Me ha encantado la experiencia ha sido muy positiva, también me ha gustado esa transición del centro especial de empleo hacia la empresa ordinaria"* [P1]

Así mismo, todos manifestaron el deseo de poder seguir formandose para desempeñar tareas más complejas .

> "S*i porqué hay tareas como el préstamo que solo pueden ellos, me han dicho que aún no puedo hacerlo"* [P3],

En cuanto a la autodeterminación, los participantes reconocen mayores niveles de autonomía personal y en el desarrollo de las tareas.

> "*He aprendido a hacer un mejor uso del transporte público y a ser más responsable con los horarios para no perderlo"* [P1]".
>
> *"Están muy contentos conmigo, lo hacía todo solo, era una persona autónoma"* [P2].

En este sentido, la mayoría de los participantes consideran que el empleo ordinario ha mejorado sus niveles autoestima y habilidades sociales, se sienten más empoderados y tienen una mejor visión de sí mismos.

> *"[…] he aprendido muchas cosas, he perdido bastante la vergüenza, he podido confiar en mí misma"* [P2].
>
> *"He crecido más, he hecho tareas nuevas, he aprendido cosas, he notado un gran cambio con el centro especial de empleo"* [P4].
>
> *"[…] ahora me siento, bueno después de haber hecho esto me siento más seguro de mí mismo, y decir puedo hacer esto"* [P3].

Otro aspecto importante para el análisis es determinar si el programa EcA ha mejorado sus relaciones interpersonales. En general, todos valoran muy positivamente el compañerismo proporcionado por sus compañeros de trabajo, sobretodo que se preocuparan por ellos y los hicieran sentirse cómodos.

> "S*on todos muy majos, son personas que han sabido que éramos personas con discapacidad y han sabido tener una mirada hacía...* [P1].
>
> *"Siempre que entraba me preguntaban cómo estaba, si quería café, me preguntaban si me cansaba, se preocupaban por mí"* [P4].

Consideraron que la relación con los compañeros de empleo debía ser diferente a la amistad y fundamentarse en la confianza y el respeto. En este aspecto, todos los participantes expresaron que confiaban en sus compañeros de trabajo.

> "*Amistad no, pero ir tranquilo al trabajo, estar bien con todos los compañeros"* [P1],
>
> "*Confianza y confiar en mí misma, sé que no puedo hacer amigos"* [P2].
>
> *"En mi caso la confianza…"* [P3].
>
> "*Agradable, cordial con respeto"* [P4].
>
> *"Estar cómodo"* [P5],

Sin embargo, en dos de los participantes se observan menores niveles de interacción social con los compañeros de trabajo.

> *"Les digo hola y poca cosa más […] no soy mucho de hablar, si sale alguna cosa, pero soy más de responder que de preguntar"* [P5].
>
> "*Iba a desayunar solo al bar, cada uno iba a su aire, tampoco buscaba ir con nadie* [P1].

En cuanto a la integración social en general los participantes se sienten aceptados por sus compañeros de trabajo y manifestan que el ambiente laboral es adecuado.

En relación al bienestar material todos los participantes se mostraban satisfechos de disponer de un salario equiparable al resto de trabajadores y se sienten satisfechos de tener cierta autonomía económica para satisfacer algunas de sus necesidades.

> *"Yo he hecho más cosas, o guardármelo, me he comprado ropa"* [P2].
>
> *"He comprado unas figuras de juego de tronos y he gastado porqué es navidad y reyes, he gastado también porqué es el cumple de mi mentora, le he comprado un libro"* [P3].
>
> *"Me compré un par de cosas que quería, un juego para mi cumpleaños, antes pensaba más lo que gastaba porqué tenía ingresos más limitados, me gustaría seguir trabajando"* [P5].

Perspectiva de los trabajadores con discapacidad en relación con los apoyos y el empleo

Por lo que respecta a los apoyos proporcionados, distinguimos entre: apoyos naturales, disponibles en el lugar de trabajo y los apoyos proporcionados por los entrenadores laborales externos.

Los participantes consideran que los apoyos que se les han proporcionado han sido suficientes. En cuanto a los apoyos naturales, los particpantes manifiestan que siempre les han ofrecido ayuda cuando la han necesitado, así mismo valoran muy favorablemente el hecho que se les ofrecieran instrucciones por escrito.

> "E*l primer día estaba un poco perdida, pero me lo trajeron todo por escrito, por pasos, con flechas y después ya sabía hacerlo, siempre que he necesitado apoyo me lo han dado"* [P4].
>
> "*Me dieron una hoja por escrito, pero ahora ya no la necesito, sin que me digan nada se perfectamente que debo hacer, si tenía dudas preguntaba y me ayudaban"* [P4].
>
> *"Al principio no lo tenía claro pero mi compañera de trabajo, se ha puesto a mi lado y me ha ayudado en muchas cosas"* [P1].

En cuanto a los apoyos externos expresan que estuvieron poco tiempo porqué tanto los empleadores como ellos mismos consideraban que ya no eran tan necesarios. Es decir, la intensidad de sus apoyos externos se vio reducido desde las primeras semanas.

> "A *mí también me dieron soporte, el tercer día ya no vinieron, después venían una vez por semana a ver cómo estaba"* [P2].
>
> "*La chica estuvo allí una semana y después de una semana le dijeron que ya se podía ir que no necesitaba a nadie al lado"* [P1].
>
> "*Vinieron el primer día y al segundo ya les dijeron que no vinieran más, que ya sabía todo, venían a visitarme y se iban, me dijeron me voy, no tengo nada que hacer aquí, lo sabes hacer tú sola"* [P4].

En un caso se observó que el participante no podía valorar si el apoyo por parte del profesional externo había sido suficiente.

> *"Hace como dos meses que no la veo, vino la primera semana y ya está, que yo recuerde, tampoco sé si me hubiera ido bien que viniera, no lo sé realmente"* [P5].

Así mismo, todos coincidieron en que los apoyos habían sido claves para ayudarles a gestionar momentos puntuales de estrés laboral.

> *"A veces vienen todos de golpe, mi compañera me dijo que no me preocupara que ella me iba a ayudar, que cuando hubiera mucha faena la haríamos poco a poco"* [P3].
>
> *"Yo con las revistas, es un trabajo que no me gusta, y ya… se tiene que respetar […] en ese momento estaba la Ruth (soporte externo) y dejemos la tarea, …me perdía, una parte la sabía hacer, la otra era mucho más complicada* [P1].
>
> *"Me estrese una vez y vino el compañero […] y él me dijo tu hazlo aquí y yo te ayudo por allí, a veces el sistema se colapsaba y teníamos que cerrar el ordenador"* [P4].

Un último aspecto a analizar es como valoran las tareas, si se sentían motivados para realizarlas, si tenían iniciativa y si consideraban que habían sido lo suficientemente productivos.

En general todos los participantes valoran que las tareas se han adecuado a sus capacidades. Valoraron sus capacidades respecto de las tareas que tenían que hacer del siguiente modo: *"yo un 7"* [P1], *"bastante bien"* [P3], *"bien"* [P2], *"yo muy bien"* [P4].

Así mismo, consideraron que las tareas que hacían mejor fueron:

> *"yo lo que hacía mejor era codificar libros, poner etiquetas, sellar…*[P1].

> "*A mi me gustaba la parte de las bolsas azules, es lo que hago mejor, lo se hacer y también estar allí para cuando alguien viene a pedir un portátil y se lo das"* [P3].
>
> *"En mi caso son muchas las cosas que hago bien, hacer las bolsas azules, dejarlas en el almacén, subir los carros, coger los portátiles que la gente devuelve"* [P2].
>
> *"Pues no lo sé, las tareas son bastante simples para decir que unas me han costado más que otras*" [P5].

Sin embargo, consideraron que tareas como la codificación y ordenacion de libros según la clasificación decimal universal eran más complejas. Aun así, se mostraron dispuestos recibir formación para realizarlas mejor.

En relación con la motivación y compromiso con el empleo, en general todos manifestaron que habían dado lo mejor de ellos, que eran más responsables y hacían un trabajo de calidad.

> "*Muy buena, he dedicado el tiempo a las tareas, además me decían que, hacia muy poco tiempo de descanso, me decían ¿ya estás aquí?* [P1].
>
> *"Yo estaba pendiente del trabajo que tenía que hacer, comprometida, con calidad, sellaba y cuando terminaba lo revisaba"* [P2].

Asimismo, se sintieron productivos y reconocidos por sus responsables, el hecho de terminar tareas que consideraban costosas en poco tiempo les hacía sentirse reconocidos.

> *"A mi un día me trajeron una caja para revisar y me dicen ¿ya está? ¡qué rápido! es que no damos abasto"* [P4].
>
> *"Me gusta poder decir que he terminado una faena que era costosa"* [P1].
>
> *"A mi me gusta empezar tareas y terminarlas, se ponían contentos porqué las hacia deprisa* [P3].

Para finalizar, un dato interesante es el significado que el empleo tiene un sus, vidas. Algunos de los participantes se sentían más motivados a trabajar en una biblioteca porqué se sentían vinculados con los libros.

> "[…] *mi familia viene de libros, todos venimos de libros y ver libros que no has visto nunca, verlos y tocarlos en directo, claro esto para una persona a la que le gusta leer es bonito […]* [P1].

Discusión Y Conclusión

Este estudio tiene como objetivo comprender los cambios que han percibido los trabajadores con DI que han participado en un programa de EcA. Los resultados indican que el EcA ofrece oportunidades desarrollo personal y profesional de los trabajadores con DI. Estos resultados son coherentes con las investigaciones realizadas por Verdugo et al (2009) y Subirats et al (2004). De igual forma, el EcA ofrece mayores niveles de autodeterminación para las personas con DI que se traducen en mayores niveles de autonomía, autoestima y empoderamiento. Este aspecto coincide con los resultados de los estudios desarrollados por Akkerman et al (2016), Jahoda et al (2008) y Verdugo et al (2009).

Asimismo, según los resultados de este estudio el EcA mejora parcialmente las relaciones interpersonales de los trabajadores con DI y sus niveles de integración social, en este mismo sentido, el estudio realizado por Verdugo et al, (2009) concluye que los participantes del programa EcA mostraron inferiores niveles de satisfacción en relación a su integración en la comunidad. Por lo que respecta al bienestar material, el programa EcA garantiza un empleo competitivo integrado en la comunidad, con salarios equiparables al resto de los trabajadores, este aspecto sigue la definición de EcA desarrollada por Wheman (2012).

En cuanto a los apoyos se considera que son fundamentales para alcanzar resultados exitosos en relación a la consecución de objectivos de inserción laboral, sobretodo los apoyos integrados en el lugar

de trabajo. Por lo que respecta a los apoyos proporcionados por los preparadores laborales se observaron diferencias en la intensidad y en la calidad de los soportes puediendo estas derivar de la metodología empleada por cada organización. En general, durante la primera semana se dejaron de prestar soportes intesivos, pasando a un rol de soporte puntual. Estos resultados coinciden con las aportaciones de la European Union en (2012) y Spjelkavik y Evans (2007).

A pesar de que continúan existiendo barreras en relación al empleo como las bajas expectativas en productividad, motivación y iniciativa de las personas con DI, los resultados señalan que las personas con DI son productivas y realizan sus tareas con compromiso y motivación. Estos resultados siguen la línea de las aportaciones realizadas por Lysaght, Petner-Arrey, Howell-Moneta y Cobigo (2017). Por lo que respecta a la iniciativa, en algunos casos las caracteristicas del lugar de trabajo no la han permitido, además, la falta de formación para desempeñar algunas tareas han impedido que las pudieran realizar. Asimismo, los resultados apuntan que las personas que se sienten vinculadas con la tareas se sienten más motivados en su trabajo, este hallazgo también fue puntualizado por Arsuaga y Santiso (2018).

En conclusión, el EcA es una metodología de inclusión laboral efectiva para que las personas con DI puedan ocupar puestos de trabajo integrados en la comunidad y así incrementar sus niveles de calidad de vida y su participación social. Sin embargo, se requiere de más prácticas basadas en evidencias que permitan sustentar todavía más estas afirmaciones. Asimismo, se requieren de más investigaciones en relación a como se pueden fomentar las relaciones sociales de las personas con DI e incrementar la calidad de los apoyos en entornos laborales integrados.

Abstract

The dynamics of globalisation have created an opportunity for African economies, especially Nigeria, to promote public relations. Decree Number 16 of 1990 includes numerous guidelines and by-laws stated by Nigerian Institute of Public Relations. Given the presence of the constitutional guidelines, there remain several issues. Such problems vary from unethical attitudes, lack of sufficient knowledge about the code of profession and institute functions. The aim of this article is to provide a summary of public relations ethics. The principles of public relations, the current state of practice and ethical dilemma. It will provide definitions and discuss key areas of ethical dilemma and controversy from the theoretical points of view. The authors used desk research, also called secondary research, to collect data for the analysis. We collected past NIPR publications via desk study, including policy charter, NIPR News, PRs Journal and workshop papers, PR news releases, etc. Relevant information was sourced from articles indexed in scholars and Scopus. Consequences for practitioners were explored, including research that shows a strong sense of ethics and how ethical decisions will improve public relations professionals' career prospects. Recommendations are proffered for public relations professionals.

Keywords: Ethics, Dilemma, Public Relation Practice, Management

Introduction

Presently, public relations is a crucial marketing tool and powerful communication force which helps business and non-commercial organisations to sell product or services, credibility, and ideas through the information channel. Public relations has taken an essential and challenging shape in a modern society characterised by the growth of industrialisation, competitive business corporations (Kim & Ki, 2014; Yang & Taylor, 2014) and non-government organisations (Taylor & Yang, 2015). The importance of public relations is based on the need to convey the messages of an institution or organisation to a wide range of people both within and outside. The essence of this is to establish and sustain its position in society by managing the relationship with stakeholders. This profession has the responsibility to act as the spokesperson and mediator, to reach target people and to manage the public

perception of organisational crises through appropriate communication (Browning, 2018). This requires an art of communicating messages through proper channels with integrity and ethical values to maintain a cordial relationship with stakeholders.

In the developed world, the public relations profession has received greater importance (Commission on Public Relations, 2009), and however, negative attitudes persist and create misunderstandings about the role of public relations which ultimately (Sterne, 2010; Quinn-Allan, 2010; Genilo, Akther & Chowdhury, 2011), degrade the status of this job in the eyes of employers and other professionals. This is of exemption to developing countries. According to Oyero, Tayo-Adigboluja, Odiboh & Egharevba (2018), Nigerian laws do not allow anyone to practice public relations without licensing or being a professional public relations person by any other name. And such individuals cannot be professionals without being licensed by the Nigerian Institute of Public Relations (NIPR). The institute is an entity entrusted with the responsibility of managing reputation, friendship, relationships and regulating public relations activities in the country.

The Nigeria Institute of Public Relations (NIPR) was founded to perform the following objectives: build a credible and dynamic professional institution with efficient and responsive structures to promote the advocacy of good image and reputation management; promote professionalism and excellence through a high standard of practice by members, in accordance with its established Code of Ethics and Professional Conduct; and ensure a reputation sensitive society built on the core values of mutual respect, dignity, patriotism and communal pride among others. This article argues that following reforms including the federal government conferment of chartered status on the NIPR, the institute's adoption of a code of ethics and the creation of a qualified public relations certificate, the practice of public relations faces some important challenges in Nigeria. However, it is important for professional communicators in public relations to observe a certain degree of ethics during the persuasion process to prevent the very image they hope to build from being tarnished by disseminating verified information to the public. While most regulations do not explicitly regulate business ethics, they do provide the establishment of company-specific codes of conduct or persons that the corporate partnership will comply with. Ratification of codes of conduct helps a party to seek legal action if the parties involved violate the code of conduct. This is not the case in Nigeria.

In recent times, the Nigeria Institute for Public Relations (NIPR) has witnessed many dramatic changes that have elevated serious ethical issues, including the performance challenge. It is against this problem statement that the authors raised specific objectives to guide this study. Decree No. 16 of 1990 includes numerous guidelines and by-laws declared by the Nigerian Institute of Public Relations. Given the presence of these constitutional guidelines, there remain several issues. Such problems vary from unethical attitudes, lack of sufficient knowledge about the code of ethics. The specific objectives raised for this study were to:

(i) review the inevitability of public relations from the theoretical points of view;
(ii) examine various ethical dilemma among practitioners of Public relations; and
(iii) provide pragmatic approach to preventing unethical practices among PR practitioners.

Methodology

The authors used desk research, also called secondary research, to collect data for the analysis. We collected past NIPR publications via desk study, including policy charter, NIPR News, PRs Journal and workshop papers, PR news releases, etc. Relevant information were sourced from articles indexed in EbscoHost, ProQuest, DOAJ, Google scholars and Scopus. The selected articles targeted issues relating to various ethical dilemma in the practice of public relations.

Literature Review

Public Relations defined

Public Relations are the board of an organisation and its public contact (Grunig & Hunt, 1984). Ledingham and Bruning (1998) describe public Relations as the management of a system that recognises, develops and sustains mutual benefit relationship with the public. PR is designed to build and sustain goodwill and a better understanding between an entity and its target audience (Skandari, 2004).

Ethics defined

Ethics means knowing what is right or wrong and then doing the right thing. This definition has meant different things to different individuals. However, it is important to note that the basic principles by which we live our lives are governed by ethics. Ethics guides have been provided by philosophers such as Socrates and Plato. Moral values like integrity, fairness, equality and accountability help to drive how we will act. Ethical deliberation is the mechanism to know what is right and what is wrong and offer defensible reasons for acts well beyond one's original moral intuition.

Ethics in Public Relations

Ethics is a vital concept in people's lives. The term 'ethics' varies from society to society.. Ethics was formed from a Greek word 'ethos' (Solomon, 1999, p.4). According to American Heritage Dictionary, ethics has to do with the study of general nature of morality, specific moral choices, moral philosophy; and ethical guidelines governing the actions of profession members" (Sterne, 2010; Quinn-Allan, 2010). Pearson (1989b) described ethics as applying knowledge, experience, and logic of professional practice to public relations (p.9). This involves principles such as fairness, transparency, commitment, fair-mindedness, reverence, dignity, and direct communication (Bowen, 2016). These opinions seemingly include a defined area of ethical guidelines for the public relations profession with an adequate impression that public relations ethics has gone beyond the thought of generating a persuasive message.

The inevitability of Professionalism and Ethics in Public Relations

Public relations profession offers a great challenge for stimulating professional individuality and socialisation in the field. Though, public relations has been practised in Nigeria for four decades or more; however, it is still important to strengthen the practice in response to the dynamics of globalisation. Public relations is also one of the profession that suffers mostly from a negative reputation based on the following reasons: lack of maintenance of professional ethics and standards; individuals within the society misunderstand public relations and do not use it; people often use public relations interchangeably with press relations and publicity; and it can also be categorised into little executive office tasks (Badran & Ayish, 1996; Kirat, 2005, 2006, 2016).

Apart from the limitations stated above, others are; top managers do not have depth understanding of PR functions, mix-up of prerogatives and tasks, inadequate studies or research, and poor experiences and qualification of PR practitioners (Kirat, 2006, p. 258; Al Khaja, 2009). Despite the problems, public relations agency in developing countries, especially Nigeria, is one of the most vibrant in Africa. Currently, Nigeria has about 100 public relations agencies that focused on education and training to ensure professionalism within the field (Kirat, 2016; Prasad, 2011).

Proposition Development

Research Objective 1: Public Relations from Theoretical Points of View

Genilo, Akther and Chowdhury (2011) defined public relations as the art and science of forming associations, monitoring and evaluating attitudes of public, and ensuring mutual understanding between an organisation and its stakeholders. The mass media are tools for establishing and managing the relationship with the public. In modern terms, public relations is an indispensable aspect of mass communication processes. In this process, a public relations practitioner needs an understanding of media techniques, of communication processes and of public opinion, which can be seen as a combination of feelings, reason, consciousness and temporal experiences (Quinn-Allan, 2010).

In the age of globalisation and influential media, an organisation does not operate in a vacuum: it depends and is affected by external influences to varying degrees (Browning, 2018). A public relations practitioner bridges the gap between an organisation and its stakeholders while scanning the horizon and formulating appropriate policies. Interestingly, the role of a public relations professional has shifted far from media relations to crisis and risk management through to maintaining professional leadership, ethics and organisational policy (Bowen, 2000; Bowen, 2016).

The recent scholarly emphasis on public relations has focused on the relationship management perspective which ensure the balances of interests between the organisation and publics or society through managing the organisations-public relationships (Barić, 2017). From this perspective, public relations includes how to manage crisis, issues, media relations and public affairs (Ledingham, 2003; Browning, 2018). Later approaches to public relations have focused on strategic management. The role of public relations has also been understood in relation to its contribution to national identity and rebuilding communities (Taylor & Yang, 2015). It focuses on how communication efforts are used to establish, maintain or change relationships between organisations and the public. Public relations work through the communication facilities in modern society, bridging the gap among opinion leaders to form social unity and setting a link between people and development processes of a country. An example is the use of development communication through local, community and dialogical tools of communication such as folk media, community radio, posters, and group discussion to enhance the development activities.

Research Objective 2: Ethical Dilemma and Public Relations

Ethics has been found to be central to the multiple, varying and often conflicting responsibilities practitioners face on daily basis (Browning, 2018). The societal perception of public relations is decadent. Public relations is regarded as an unethical profession exhibiting immoral vices such as lying dishonesty, manipulation. To many, ethics cannot exist in public relations as a profession because the practice itself evolved around propaganda, manipulation and distortion of the truth (Genilo, Akther & Chowdhury, 2011).

Critics, such as political makers, journalists and some others believe that in practicing public relations, ethics is a dream and unreal, a means of hiding deception. Also, practicing public relations is an oxymoron (Parson, 2004 p.4). This is the view of Genilo, Akther & Chowdhury (2011) who argues that public relation is lacking in discipline, integrity, loyalty, honesty, forthright communication, openness and respect (Oyero, Tayo-Adigboluja, Odiboh, & Egharevba, 2018). As the saying goes, there is no smoke without fire; perhaps the action of some practitioners in deliberately lying and withholding information from the general public (Amodu, Agedah, Oyero & Okorie, 2018). As a result, ethical rules and codes of conduct were set up to guide public relations practice.

Deirdre Breakenridge (CEO of Pure Performance Communications) (2016) stated that technology has increase the speed of communication among public; hence, it is crucial for PR professionals to be more diligence with the information they share. He further stated that, when time is not taken to review details of information carefully and confirming the accuracy of communication in this age of social

conversations, there will be tremendous challenge. It is therefore the responsibility of the ethical communicators to ensure that the information shared are authentic and be in best interest of all parties involved as stated below:

> *Nicole Spears, who is the social media manager of Geben Communications opined that inadequate education surrounding individual roles in media is a fundamental dilemma that PR are facing presently. She also asserted that nothing can be done to change it. Nicole further added that setting clear expectations with clients and giving can help earn respect with people we work with. Megan Wagner, the founder of MW MarCom asserted that prioritising our message's truth over its connection power felt is one of the challenges facing PR today is prioritising our message's truth over its connection power. According to John Kageorge, who is a strategist for Vital Communications, PR pros should not be afraid of delivering bad news to colleagues.*

Some codes of ethics are not written appropriately and others espouse a set of ethical principles that should be followed. For example, The International Public Relations Association based on United States of America Code of Ethics adopted several Code of Conducts for the public relations professionals in 2010 (Consolidated "IPRA Code of Conduct", 2010, pp.1-2). Endorsed in 2011, the IPRA Code of Conduct is an affirmation of professional and ethical conduct and it is recommended to public relations practitioners universally. Similarly, the Nigerian Institute of Public Relations (NIPR), Public Relations Institute of Australia (PRIA) and the Canadian Public Relations Society (CPRS) require their members to adhere strictly to the ethical practice standards and professional competence (Individual code of ethics, 2010, Code of Ethics, 2011). "The code of ethics says 'you cannot practise public relations by whatever means, if you are not licensed by this institute and this institute, does not just license people as they come, there are certain criteria, there are certain qualifications, there are certain requirements that you have to actually qualify for before that is done'; surprisingly, so many of the people that are asked to manage some of these agencies and uphold the principles are not well-groomed in the Art of Public Relations.

Public relation is a field fraught with ethical dilemmas (Bowen 2001; 2016). Ethical issues comforting public relations practice are multifaceted. The codes of conduct prohibit PR practitioners/professionals from damaging their counterpart's reputation. The code of conduct says that it is unethical for a practitioner to damage the reputation of a fellow practitioner, and it also gives a great opportunity to practitioner to report any unethical conduct of the fellow practitioner. Kirat (2006) and Al khaja (2009) argue that poor qualification, the inexperience of public relations practitioners, confusion of task and prerogatives, lack of understanding of public relations function by managers, absence of research and lack of studies of opinion polls are the major limitations to public relations practice.

Another problem found by Parson is the tension between the personal sense of morality and codified organisational expectations of codes of conduct. Depending on the social background, prevailing conditions and their understanding of codes of conduct, different levels of morality exist among different individuals. If the firm and the client turn out to have conflicting views on the morality of withholding information or the course of action appropriate to the situation, they may need to seek legal assistance to resolve the stalemate. Parson (2010) suggests an analysis of each case on an individual basis when making decisions as each case thrives on different merits, involves different individuals, and different circumstances. Although cases regarding ethics sometimes bear certain similarities, some details in the cases vary and in the same case, circumstances differ, often requiring a change in approach. Even with cases bearing identical facts, a PR practitioner should look at the entire situation, including external circumstances such as the political atmosphere. Trevino and Nelson (2014) suggest that weighing the costs and benefits of disseminating information to the public assist practitioners in making objective decisions in chaotic situations. Ethical issues also arise from unskilled and untrained people parading themselves as PR practitioners. Osho (2017) observed that unskilled practitioners usurp PR practices and engage in unethical activities, creating a nuisance and given the profession bad image that has generated a great cause for concern and setback for professional development and excellence.

Research Objective 3: Way Forward

For NIPR as an established statutory governing body to move forward and for public relations practitioners to uphold ethical practices in their professional conduct, attention must be paid to the enforcement of policies and adherence to the established policies which are meant to guide and instil good attitudes to advance the profession. NIPR needs repositioning to take up the ethical challenges confronting the profession through adequate compliance with the code of conduct. Offenders and defaulters of ethics should be punished to prevent others from following the trend. Firms should be compelled to, "distribute right information and quickly correct any invalid communication for which they might be held responsible and also obeying laws and policies governing their professional activities and, if any law or policy is violated, [they] should act promptly to correct the situation". Public relations profession should go beyond advisory role and should regard themselves as the conscience of their organisation (Judd's 2009, and Ajala 2005).

Presenting the truth to the public would also exonerate the PR firm from blame and possible ruin of its reputation in the future. The second possible solution involves the use of another form of media announcement other than a press conference by the firm. The benefit of this move is that it allows the firm to present the truth in an appropriate manner that does not result in an attack on its efficiency in carrying out its responsibility. Some of the questions that may arise in a press conference situation involve matters of due diligence, which require the firm to investigate the truth of information before sharing the same with the public. Preparing a well-thought announcement would allow the firm to explain its viewpoint without distortion of information famous with press conferences.

Thirdly, the firm may choose to settle the matter with the client and request its management to make the announcement to the public as a damage control measure that allows the client to defend its credibility. Although presenting the information may result in an attack on some of the drug company's policies, it also gives the company the opportunity to explain its position to the public. In addition, this option exonerates the PR Company from blame and situations that cause dilemmas in deciding which information is appropriate for the public to know. Lastly, the firm may choose to institute legal proceedings against the client for misrepresentation. However, this decision should be the last resort as court cases sometimes drag on for years, thus costing the client and the firm valuable time and money. It may also cause negative or dark PR for the firm.

Finally, professionalism should be encouraged through the development of curriculum that includes comprehensive academic, theory-building, social science and management courses. Such courses will provide rich academic skills to their students and help them build an academic reputation that will allow them to gain respect from the general public. The more rigorous the education in professional public relations, the greater the probability that education will improve professionalism. The NIPR is required to play a central role in accrediting public relations practitioners. Accreditation of practitioners is necessary for quality assurance, to guard against unethical behaviour, to prevent penetration of non-professionals. The charter of the NIPR makes accreditation of public relations professionals mandatory until they can practice. That is, someone who works without NIPR is deemed to be a non-professional and risks prosecution (NIPR Bye-Law No. 1, 1992).

Conclusion

Checks and controls are indispensable for curtailing bad practitioners ' activities. It can be recommended that NIPR must consistently ensure that there are effective control and oversight of Public Relations Practitioners ' activities in the country in order to maintain and uphold the principles of the profession. Nevertheless, it is advisable for PR practitioners to look at situations in their entirety when making decisions and making decisions that seem most favourable to all parties without compromising the firm's credibility, dignity and goals. For this purpose, it is advisable that public relations practice pay apt attention to ethical issues and promptly adhere to the established code of conducts. This paper demonstrated that PR is an ethical profession guided by a set of codes of ethics and the public relations professional are expected to follow a code of ethics to promote transparency and accountability in order to make stable their profession. Since the profession is at the growing stage

in Nigeria, it can be said that the job of public relations professionals is to uphold the image of the profession by using analytical, truthful and ethical behaviour so that the final impression about the organisation and a public relations professional himself is established positively.

Abstract

In the contemporary economy, the success of enterprises is increasingly decided by intangible values. One of these is that of social networks that are based on the mutual ties of the management with the employees. The herein paper constitutes a theoretical discourse on the subject of social networks in an organization, as well as an empirical presentation of the role of a manager in the functioning of social networks in enterprises and the impact of social networks on the level of competitiveness of enterprises. The principal aim of the herein paper is to search for answers to the following research questions: Are there differences in the degree of occurrence of the social network with regard to the magnitude of enterprises? To what extent do the features of the manager, influence the level of social network in enterprises? The established aim was executed thanks to the application of the method of critical analysis of literary sources associated with social network, as well as the analysis of the results of empirical research on the social network. As a result of the research, significant statistical relations were discovered between the attributes social network and the managerial features.

Keywords: Social Networks, Enterprise, Manager, Features of A Manager.

Introduction

In times of interest in social capital, which is acknowledged to be an important factor in having an impact on the success of an organization (Lehtimaki and Karintaus, 2013), it is worth reanalysing the significance of social networks that constitute its significant social resource. The characteristic feature of social capital is the fact that, by combining people in social networks, this leads to the fact whereby they reap the benefits of belonging to them. People who are interconnected with each other by means of network ties, trust each other and are mutually obliged to provide support and thanks to this fact, they have access to common resources and thus, achieve success more rapidly. The basis of the functioning of social networks constitutes interpersonal cooperation within employee groups and organizations. The quality of this cooperation depends on the degree in which the given organization acknowledges and shares the set of social norms and values. Sharing this favours the development of social networks, which have an increasing impact on the functioning of enterprises. The developed social networks connected by social ties facilitate the survival of employees in the most difficult moments in an enterprise and may become the foundation for conducting corrective action. That is why it is necessary to build social networks in a conscious manner. A significant role in this process is played by managers who hold a central place in social networks and the efficiency of social networks depends on their actions. The author determined the subject matter to be the impact of a manager on the functioning of social networks in an enterprise. The choice of this research problem was the effect of meta-analysis of the research on social networks in enterprises. By adopting the assumption that a head has a significant impact on the functioning of social networks, three research questions have been formulated as follows: Are there differences in the degree of occurrence of the social network with regard to the magnitude of enterprises? To what extent do the features of the manager, influence the level of social network in enterprises? The search for answers to these questions became the main aim of this paper.

Social Networks in an Enterprise - Theoretical Background

In the analysis of social networks, it is possible to distinguish several approaches. One of the most important ones is the resource approach. P. Bourdieu (1986) noted the importance of social networks in creating the resources of an organization. He writes that the resources of an organization are associated with the possession of constant social networks that are more or less institutionalized relations, mutual familiarity or cognition. In turn, J. Nahapiet and S. Ghoshal (1988) perceive the significance of networks in the creation and transfer of the resources of the organization to the particular members. They are of the opinion that the sum of the actual and potential resources within the organization is available by means of the network of ties. Participation in the network facilitates reaping various benefits on the part of the individuals, albeit only in the situation whereby they are constant and geared towards mutual cooperation. Attention is drawn to this fact by A. Portes (1998, p. 6) who opines that the feature of social capital is the ability of the entities to ensure benefits from the membership of social networks or other social structures. Subbian et al. (2014) claim that actors with a high individual social capital are very frequently key people of influence on a social network. Hence, the significance of the network is the result of the positive effects for the employees participating in them, as well as its impact on the development of the organization. In the theories of networks, it is indicated that the value of enterprises is derived from the ability to create networks of organizations and the right to avail of the knowledge capital created by the network participants (Burt, 2000).

Social networks in an organization may have both external and internal dimensions. In the former, this refers to the network of relations of an organization with its environment, namely with its clients, suppliers, competitors and other entities. In the theory of networks, it is indicated that the value of an enterprise is derivative of the ability to create the network of the organization and the right to avail of the knowledge capital created by the network participants (Burt, 2000, p. 24). The external social networks are sometimes created by the managers of various enterprises. Ch. J. Collins and K.D. Clark (2003) in analysing the strategic practices of human resources in the scope of creating competitive advantage for enterprises from the sector of high technology claimed that the strength and range of the external connections between the managers of the highest levels of high technology firms are important indicators of sales growth in firms.

In the case of internal networks, this refers to social relations which connect employees and managers that have an impact on the creation of the vibe of cooperation and facilitate the achievement of common aims of the employees and the enterprise itself. When an individual is connected with the "appropriate" relations with other people, then these ties are the way to attain important goods from the viewpoint of the individual (Matiaske, 1999, p. 182). Simultaneously, resources and experience which are embedded in social networks are not freely available for everyone in a given organization. Only thanks to participation in the network and ties with others does an individual gain access to specific knowledge and resources basing on the norms and values that are binding in the network (Penuel et al., 2009, p. 129).

The participation of an employee in social networks with other members of an organization creates the situation in which cooperative ties are formed on the basis of mutual trust and cooperation (Bylok et al, 2017). Reciprocity and transitivity are the two most important structural mechanisms underlying a social network (Block, 2015). Other significant factors determining networks are consistency and predictability of a partner in a network. The factors determining these relations are constancy and predictability of the partner in the network. Thanks to this, they enter into long term cooperative ties in the organization. The ownership of these relations may be defined by a range of parameters, such as for instance, their scope of occurrence, range, stability and quality. In terms of ownership, interpersonal relations hold a prominent position which may be identified by means of such indicators as the following: dimension of cooperation of the members of the employee teams, efficiency of communication between the members of the organization, scale of readiness to help others, as well as the awareness of belonging to a group.

In the analysis of social networks in an organization, it is worth focusing attention on the structure of ties between the network members. S. Wasserman and K. Faust (1998, p. 4) perceive the structure of networks in the context of individual actions and patterns of ties between the actors participating in the network. The networks in which the members have a mutual impact on each other are featured by cooperation and the exchange of information (Oh et al, 2004). A significant element of the network is that of nodes (Yang and Xie, 2015) that define its spatial structure. Nodes may be created by people, social positions, or other entities including collective entities (Skolik and Kukowska, 2017, p. 385). They may also be of a positive nature which bring something useful such as friendship, advice or social support; a neutral nature that signifies interactions, yet not necessarily benefits, such as being in a department of a company, or participating in formal communication, or a negative nature that brings something harmful, e.g. harm or animosity (Harrigan et al., 2020).

In the analysis of the network structure the type of relations between the participants is important, which is characterized by the flow of resources of three types as follows: 1) tangible material (physical buildings); 2) symbols (including values, norms); 3) feelings, such as compassion, approval or pleasure (Turner, 2004, p. 606). Likewise, the impact of the three network processes is important: resource and information transfer, status signalling and certification, and social influence. Different mixes of these mechanisms characterize disparate networks because the obligations imposed by ties and the capacities of partners result in situations where mechanisms amplify or diminish one another (Owen-Smith et al., 2015).

It is possible to distinguish three types of networks as follows: 1) bonds occurring between the members of the project team, employees of the department, small organizational units), employees. In these groups of members, there are strong emotional ties, common values, convictions, norms, 2) bridges which form within the organization between the employees belonging to various work teams. The employees that create this are guided by their own benefits. These networks are characterized by weaker bonds; 3) linkage occurring in hierarchical organizations, connecting people that hold various positions in the structure of the firm (Jędrych, 2012, p. 41). Another division of networks was presented by Burt (2000) who by adopting the criteria of the density of the network and the position of the manager in its structure distinguished two extreme hierarchical and egalitarian models. In sum, social networks in an organization may take on a new form and their efficiency to a large extent is dependent on the ties and channels for the flow of information and knowledge between the network participants.

Impact of Features of a Managers on Social Networks in Enterprises in Light of Research

Method and Sample

The intention of the author was to analyse the degree of occurrence of social networks in enterprises with regard to their magnitude, while also defining the level of impact of the manager on their attributes of social networks. The assumed aims were achieved thanks to the application of the survey method with the questionnaire technique. Research on the opinions of entrepreneurs, managers and workers HRM on social network in issue of the enterprises was executed in February of 2018, which was participated in by 149 enterprises, including 63 small enterprises (10–49 employees) and 46 medium-sized enterprises (50–249 employees) and 40 large enterprises (250 workers and more).

Results

With the aim of defining the degree of occurrence of social networks in the analysed enterprises, indicators were built on the basis of the frequency of formal and informal ties between the employees and between the heads and the employees. Research illustrates that the general indicator of networking for the analysed enterprises amounted to 5.73 on a scale from 1 to 10 (in which 1 signifies a lack, whereas 10 signifies high frequency, or closeness of ties) (Fig.1). Detailed analysis of this indicator with regard to the magnitude of enterprises indicates that social networks occur in large

enterprises to the greatest extent (5.91), a relatively lower level in medium-sized firms (5.68) and in small firms (5.67). This results in among others, the specifics of the organization of enterprises, in large enterprises employee teams are created based on cooperation and co-working with the aim of executing the tasks commissioned. They are featured by cohesion that is the result of frequent contact and cooperation during the course of executing the tasks commissioned. Social networks in employee teams and between employee teams provide support for the execution of the aims set out.

Scale: Scale of values from 1 to 10, in which 1 signifies a lack, whereas 10 signifies great frequency, or closeness of ties.

Fig. 1: General indicator of social networks with regard to magnitude of enterprises

Social networks in enterprises function on the basis of formal and informal ties.

Analysis of the indicators of networks in the analysed enterprises indicates the advantage of formal ties over informal ties (Table 1). The indicators of formal ties achieved a relatively high value, namely, the indicator of the frequency of contacts between an employee and other employees with whom he has cooperated with over the past year had a value of 7.59, whereas the indicator of the frequency of contacts between an employee and other employees with regard to professional issues achieved a value of 7.17. Thus, it is possible to state that in the analysed enterprises, employees contact each other relatively often, whereas these ties are of a formal nature at the workplace. By comparison with the formal ties between employees, informal ties between them are at a lower level. Research shows that the frequency of the contacts between an employee and other employees after work, e.g. common outings to a restaurant or pub is at a low level (4.49), while there are differences between the magnitude of enterprises in that the greatest frequency of informal ties occurs in large enterprises and the lowest frequency in small enterprises. Employees enter informal relations at work with relatively few employees. The average number of employees with whom an individual maintains informal contact amounted to 4.36. In small sized enterprises employees enter informal ties with employees, whereas with 4,37 employees in medium-sized firms and with 4.84 employees in large firms.

Formal and informal contacts have an impact on the closeness of ties between employees. Analysis of the indicator of the closeness of ties between employees illustrates the significant differences between enterprises. A relatively higher value was achieved in large firms (5.70), whereas the lowest value in small enterprises (4.23). The closeness of ties between employees is associated with direct communication “face to face”, which is spontaneous by nature, based on a relatively small number of communication nodes. Interpersonal communication by means of universality and mutuality of the flow of information is the fundamental prerequisite of the efficiency of the social networks. Networks

of high intensity of relations and low internal centralization are featured by a relatively high level of efficiency as a team (Mora-Cantallops 2019).

Table 1: Values of indicators of social networks with regard to magnitude of enterprises

Indicators of social networks	Total	Small firms	Medium-sized firms	Large firms
Frequency of contacts of an employee with other employees, with whom he has cooperated over the past year	7.59	5.54	7.75	7.87
Frequency of contacts of an employee with other employees, who made contact for professional issues	7.17	5.15	7.17	7.59
Frequency of contacts of an employee with other employees after work (common outings to restaurants for dinner, supper, or to a pub)	4.49	4.21	4.40	4.68
Closeness of ties with other employees	4.91	4.23	4.47	5.35
Frequency of contacts with a manager, who may be approached for help or advice	6.49	5.27	6.78	6.02
Closeness of ties between employees and a manager	5.08	5.43	4.73	4.89
Number of employees with whom the respondent keeps informal contacts at work	4.36	4.00	4.37	4.84

Scale: Scale of values from 1 to 10, in which 1 signifies a lack, whereas 10 signifies high frequency or closeness of ties.
Source: Self-analysis.

Manager play a significant role in social networks. The central position of a manager in internal networks favours the achievement of good results at work on the part of employees (Mehra et al, 2006). In research, it was accepted that the significant indicators of the role of managers are as follows: the frequency of contacts with heads who may be approached for help or advice, while also the closeness of ties of employees with the head (Table 1). It is worth noting that among the analysed enterprises, this frequency was lower than the frequency of contacts of an employee with other employees with whom he has cooperated over the past year. Simultaneously, the highest level was noted in medium-sized enterprises (6.78), while the lowest in small enterprises (5.27). Another situation took place in the case of the indicator of the closeness of ties of an employee with the manager, in which the strongest ties occurred between them in large firms (5.43), while the weakest was noted in medium-sized firms (4.73). In sum, social networks are becoming an important factor in terms of executing tasks when there is a high frequency of contacts between the employees and the head, while also close ties between the employees and the manager.

The functioning of the social networks depends to a large extent on the features possessed by the managers who have an impact on the quality of ties between them and the subordinates. Research shows that the heads have the following features to the greatest extent: enhancement of their knowledge, respect for norms and values, keeping secrets, acknowledgement that trust is an important source of competitive advantage, being guided by ethical values in terms of ties with subordinates, interest in the enhancement of qualifications by the subordinates and the thinking that the majority of people are open and have an impact on the functioning of the social networks (Table 2).

Table 2: Degree of occurrence of features of managers in analysed enterprises

Features of a manager	Total	Small firms	Medium-sized firms	Large firms
Self-improvement of knowledge	3.64	3.65	3.63	3.35
Keeping secrets	3.49	3.50	3.59	2.94
Reduction of security with regard to long-serving employees	3.07	3.06	3.18	3.00
Tendency to trust others	3.19	3.28	3.27	3.25
Keeping your word	3.36	3.51	3.22	3.51
Thinking that the majority of people are open	3.38	3.40	3.38	3.35
Respect for norms and values	3.62	3.64	3.56	3.64
Acknowledgement that trust is important source of competitive advantage	3.48	3.49	3.50	3.46
Thinking that trust is significant source of innovativeness	3.35	3.41	3.34	3.25
Entering informal ties with employees	2.88	2.65	3.02	3.07
Restricting contacts to closest co-workers	2.78	3.04	2.90	2.76
Interest in increasing qualifications on part of subordinates	3.42	3.37	3.51	3.41
Being guided by ethical values in relations with subordinates	3.47	3.45	3.52	3.43

Scale: Scale of values from 1 to 5, in which 1 signifies very low, 2 – low, 3- average, 4 - high, 5- very high.
Source: Self-analysis.

What is significant from the perspective of the formulated research questions is the analysis of the impact of the features of the manager on the attributes of social networks in enterprises. The Gamma correlation was utilized to analyse this impact. The Gamma correlation indicator defines the strength of the impact of the features of the manager on the elements of the social networks (Table 3). Research illustrates that the strongest statistical relation was indicated in the case of the number of employees with whom the respondent maintains informal contacts, while also keeping your word, respect for the norms and values, as well as being guided by ethical values in terms of relations with subordinates. Likewise, the strong impact on a further attribute of the network, namely, the frequency of the contacts of an employee with other employees with whom he has cooperated over the past year had such features of a manager as respect for norms and values, while also being guided by ethical values in terms of relations with subordinates. In turn, the frequency of the contacts of an employee with other employees with whom he has made contact relating to professional issues was influenced the most by keeping your word and thinking that the majority of people are open, while also being guided by ethical values in terms of relations with subordinates. This correlation also appeared in the case of the frequency of contacts with heads to whom it is possible to approach for help or advice, while also in the case of keeping your word, tendency to trust others and being guided by ethical values in terms of relations with subordinates. A further attribute of the network in terms of the frequency of contacts of an employee with other employees after working hours (common outing to a restaurant for dinner, supper or to a pub) was relatively more weakly influenced by keeping your word and thinking that the majority of people are open. Likewise, the closeness of ties between the employees and the manager was relatively more weakly influenced by keeping your word. Similarly, the closeness of ties of employees with other employees was weakly influenced by the feature associated with keeping your word. By way of conclusion, the greatest significance in terms of the functioning of social networks is exerted by the features of a head associated with values, trust and support of employees in terms of enhancing qualifications.

Table 3: Gamma correlation between characteristics of managers and attributes of social networks

Characteri-stics of managers	Type of attribute of social networks						
	Frequency of contacts of an employee with other employees, with whom he has cooperated over the past year	Frequency of contacts of an employee with other employees, who made contact for profession-al issues	Frequency of contacts of an employee with other employees after work (common outings to restaurants for dinner, supper, or to a pub)	Closeness of ties with other employees	Number of employees with whom the respondent keeps informal contacts at work	Frequency of contacts with manager, who may be approached for help or advice	Closeness of ties between employees and manager
Self-improvement of knowledge	0,221127 p=0,001983	0,267656 p=0,000145	X	0,185055 p=0,008076	0,266872 0,000128	0,247645 p=0,000358	X

Thinking that trust is significant source of innovative-ness	X	0,179696 p=0,010628	0,219555 p=0,001538	0,001538 p=0,004423	0,227300 p=0,001132	0,234389 p=0,000702	0,232516 p=0,000917
Interest in increasing qualifications on part of subordinates	0,211681 p=0,002760	0,271870 p=0,000095	0,205760 p=0,002688	0,171506 p=0,012515	0,307813 p=0,000007	0,279093 p=0,000044	0,196581 p=0,004519
Being guided by ethical values in relations with subordinates	0,261019 p=0,000291	0,291039 p=0,000041	0,194871 p=0,005364	0,196700 p=0,004798	0,361424 p=0,000000	0,308851 p=0,000009	0,148334 p=0,035414

Source: Self-analysis.

These features had the strongest impact on first and foremost the frequency of contacts with managers to whom it is possible to approach for help or advice, the frequency of contacts of an employee with other employees with whom he has made contact referring to professional issues, while also the number of employees whom the respondent maintains informal contacts with at work. Hence, it is possible to draw the conclusion that the functioning of social networks is dependent on the features of a head associated with values in a significant way.

Discussion and Conclusions

Social networks are an important factor that have an impact on the success of an enterprise on a competitive market. Treating social networks as a resource, both in terms of an individual dimension, as well as a group dimension, in terms of which unit gains by participating in differentiated social networks and exchanges with other resources that are appreciated by people (Lin 2001) facilitates the observation of the potential of its significance. The results of the research conducted enabled the definition of the scope of occurrence of social networks in the analysed enterprises. Analysis of the results of empirical research illustrates that in the analysed enterprises the general level of occurrence of social networks is at an average level, while there are differences in terms of its level with regard to the magnitude of the enterprise. Its highest level occurs in large firms, while the lowest level is at large enterprises.

A significant role in the functioning of social networks is fulfilled by managers, who possess the features that favour its development. Research illustrates that the highest rated features are as follows: self-improvement of knowledge, showing respect to norms and values, keeping secrets, acknowledgement that trust is a significant source of competitive advantage, being guided by ethical values in terms of relations of an employee with employees, showing interest in enhancing qualifications on the part of the subordinates. The enumerated features of managers had a positive impact on the frequency of contacts with heads, to whom it was possible to approach for help or advice, while the frequency of the relations of an employee with other employees with whom he had been in contact relating to professional matters, while also the number of employees with whom the respondent maintains informal contacts at work. Thus, it is possible to come to the conclusion that the functioning of the social networks is significantly influenced by the features of the head that are associated with trust and the axionormative system. The research conducted facilitated the formulation of the conclusion that managers should participate in social networks in an enterprise on a bigger scale, which would enable them to stimulate employees to execute more effective work. Knowledge relating to the nature of social networks may help managers in terms of stimulating the pro-innovative activities of employees, which increases the competitiveness of enterprises on the market. With relation to this fact, greater attention should be paid to its formation.

Social networks are beneficial for employees as they gain access to important resources such as knowledge, information, security or prestige. For instance, thanks to belonging to a network, new employees may count on assistance from experienced employees who usually offer knowledge without receiving gratification in the form of presents (Panitz, Glückler, 2020).

The author of this paper wishes to indicate the restrictions of availing of the research results on social networks in enterprises arising from the size of the research sample and the research methods applied. The research conducted with the use of the survey method with the questionnaire technique was aimed at outlining the intricate problematic issues of social networks in organizations and constitute a starting point in the broader research on their function in contemporary enterprises.

Impact of the 5th Anti-Money Laundering Directive on EU's financial market

Marek KOT

Wroclaw University of Economics and Business, Wroclaw, Poland,
Marek.Kot@ue.wroc.pl

Abstract

This paper gives a general overview of the grounds and needs of implementing 5th Anti-Money Laundering Directive. Events of past years have shown weaknesses of the global anti-money laundering system. This is an important issue of security and trust in financial transaction markets. Preventing such crimes is crucial for stability of the global and European financial market. The actual acts of European law have been briefly described as well as impact of the previous, 4th Anti-Money Laundering Directive. Main purpose of the paper is to focus on the changes that will follow implementation of the new directive that has been in force since January 2020. Its provisions will affect many sectors and institutions of both European and Member States financial markets.

Keywords: Money Laundering, Directive, AML, Impact

Introduction

On 19th April 2018, the European Commission, the European Parliament and the Council of the European Union agreed adopted, in plenary, the amendment of the Fourth EU Anti Money Laundering Directive, which was the initial version of the EU Fifth Anti-Money Laundering Directive (EU) 2018/843 (AMLD V). Revised directive concludes almost two year of negotiations between several stakeholders. Its purpose is to strengthen and improve effectiveness of AML framework in the European Union to prevent and fight illegal financial dealing like those uncovered in the "Panama Papers" during 2016.

The scope of the AMLD V will be extended to include custodian wallet providers, estate agents and rental intermediary, art dealers and, what's seems to be the most important, virtual currency exchanges. New Directive is on the immediate horizon, as it requires Member States to implement these rules into their national laws by 10 January, 2020. It will definitely bring wide changes to both global and European financial market. Next months will be crucial for all entities defined in the directive. Final outcome of new directive will depend on their understanding and implementing directive's provisions of the directive to their own business.

Research background

The 5th Anti-Money Laundering Directive provides for certain amendments to the risk-based approach of the Directive 2015/849 (or 4th EU AML Directive) by mandating that certain situations are exposed to high risk and defined a list of measures, which must be taken in mitigating risk of money laundering process. While EU Member States must give effect to the provisions AMLD V into their national laws by 10 January 2020, it is expected that United Kingdom will bring these provisions into force under its law despite Brexit.

The entities, which are being regulated by AMLD V are expected to examine the background and purpose of a wider range of financial transactions, encompassing those which are at least one of the following: complex, unusually large, without apparent lawful or economic purpose or conducted in an unusual pattern (Bergstrom 2018). Previously, entities were obliged to apply additional scrutiny to transactions with no apparent economic or legal purpose, which either: were complex and unusually or demonstrated unusual patterns (Burrell and Thorne, 2019).

Going further, AMLD V prescribes the following specific enhances due diligence measures for transactions involving third countries, which are said to be high-risk and also for business relationships:

- obtaining information on the source of funds, wealth of the customer and reasons for the intended or performed transactions;
- obtaining approval of senior management for continuing or establishing the business relationships;
- obtaining additional information on the customer, ultimate beneficial owner (UBO) and the intended nature of the business relationship;
- conducting enhanced monitoring of the relationships by increasing the number and timing of controls, which are being applied as well as selecting patterns of transactions that need further examination.

Banks are expected to conduct constant monitoring and investigating the effects of anti-money laundering prevention, especially in area of financial transactions (Laszlo Gal 2018). Number of researchers focuses on data delivered by banks in order to prepare detailed reports in mentioned area. Such reports include information on on-site inspections by authorities and follow-up actions and the quantity along with quality of suspicious transactions reports being filed by banks before and after inspections (for a complete overview of filed reports see Gara, Manaresi, Marchetti and Marinucci 2019).

Simone Wong focuses on the impact of AMLD V on trusts. New directive proposes widening of both the recording of and access to beneficial ownership information in central registers. This expansion of financial transparency raises many concerns about how the processing of more financial information and the wider access to such information about trusts is to be reconciled with right s to privacy and confidentiality (Wong 2017).

Important part of money laundering prevention and combating the financing of terrorism is Financial Action Task Force (FATF). It has become a prime example of a norm-building process that transcends the traditional avenues of public international law, while compelling a high level of compliance and assuring quick adaptation to norms and practices that better address money laundering and the financing of terrorism in their evolving form (Pavlidis 2020).

Leigh-Alexandra Basha describes what recent legislative and regulatory developments on anti-money laundering will change from the US perspective. Paper includes researches relating to beneficial ownership rule, geographic targeting orders, the American Bar Association position and the impact of the AMLD V. It also looks at the impact on the legal profession (Basha 2018).

Virtual currencies pose a serious threat to be used for money laundering, weakening European Union's financial system. Recent directive intends to mitigate these risks by introducing a definition of virtual currencies within EU law. Some financial service providers connected to virtual currencies are made subject to anti-money laundering law. It is important that Member States transpose it proper way. Otherwise, they will create legal uncertainty and loopholes for specific entities (Haffke, Fromberger and Zimmermann 2019).

Future will bring the 6th Anti-Money Laundering Directive (AMLD VI), which came into force at the EU level on 2 December 2018 and which Member States are required to implement by 3 December 2020. It mainly focuses on standardising the approach of European Union Member Stater to the offence of money laundering. Moreover it aims to expand the scope for potential liability for money laundering and sanctions that EU Member States are required to impose under local law (for a complete overview of supposed changes of AMLD VI and its provisions especially in the UK see Burrell and Thorne 2019).

General impact of the 4th Anti-Money Laundering Directive

Flows of illicit money can damage the integrity, reputation and stability of the financial sector, and threaten the internal market of the European Union as well as global financial market. Terrorism financing, money laundering and organized crime remain significant problems which should be addressed at EU level.

Former global enforcement actions against financial institutions highlight the importance of compliance with anti-money laundering and combating the financing of terrorism regulations Such enforcement actions were clear in spite of the fact that the considerable progress made in mitigating risks posed by money laundering and rooting our prior wrongdoing, financial institutions are still falling short of regulators expectations (Mula 2016).

Changes caused by AMLD IV brought significant effects for smaller institutions. Directive which was enacted June 2015 outlines number modification to the previous version (Boszormenyi, Schweighofer 2015). One of the main differences between Third and Fourth Directive were requirements of the risk-based approach. New requirements have been put in place, whereby Member States were later required to evidence that they at least have taken the necessary steps to identify, asses, understand and reduce AML risks. The AMLD IV required enhanced due diligence measures for cases that present a higher money laundering risk (Sefora 2017).

What will change?

The European Union's 5th Anti-Money Laundering Directive which comes into the force on 10 January 2020 addressing its provisions and tightens regulatory controls mainly across following areas: custodian wallet providers, virtual currencies, estate agents and rental intermediaries, and art dealers. AMLD V places greater emphasis on the transparency around ultimate beneficial ownership in an attempt to prevent and fight financial criminals who hide behind complex corporate structures. Relevant approach to new regulations includes ensuring access to trusted data as well as having the right tools to streamline risk mitigation processes. The global efforts to establish an efficient framework for the prevent and fight against money laundering and terrorism financing (ML/TF) required a new approach, which could enable a connection between private sector with the structures enforcing criminal legislation. In a result, countries adopted initiatives to set up a new type of state authority, which was called Financial Intelligence Unit (FIU). Its core function is the receipt, analysis and transmitting reports of suspicions, which were identified and filed by participants of private sector. The Units therefore functions as an intermediary among the private institutions, subject to AML/CFT obligations, and also law enforcement agencies. According to the Standards issued by FATF, all countries should have established an authority which function will be to act as an FIU (Council of Europe).

Among the key amendments to the AMLD IV, listed in Table 1 are due to have a significant impact on the operational workflows of financial institutions.

Table 1: Crucial changes caused by EU's 5th Anti-Money Laundering Directive

Area	AMLD V	Impact
Controls	▪ Self-regulating organisations must report on suspicious transaction reports, violations of the Anti-Money Laundering Directive, suspicious transaction report forwarded to the Financial Intelligence Unit and sanctions imposed. ▪ Protection of whistleblowers who report money laundering from any	▪ As Member States Financial Intelligence Unit will have to request information from each and every entity. Obligated institutions must ensure that they have effective mechanisms to coordinate information gathering and sending in a timely manner.

	kind of the discrimination in the workplace as well as protection of their identity.	
Data collection and processing	▪ Public authorities must have an access to all required information on real estate ownership. The Comission will assess the necessity of interconnecting these across national registrars by the end of 2021. ▪ Public access to national registers of beneficial owners of companies, which are operating within European Union, including subsequent interconnection of national registers. ▪ Separate registries for bank accounts must be created as well, although these will be accessible only by authorities. ▪ Ultimate beneficial ownership regulations will extend also to trust. ▪ AMLD V obliges Member States to prepare functional Politically Exposed Person (PEP) lists that include all titles, functions or roles that are deemed to be politically exposed.	▪ Formalised processes to obtain, update and records beneficial ownership information should be developed. ▪ Obliged institutions will have to reassess the information available in KYC records. They will also need to ensure there are no gaps in collected and recorded data. ▪ Greater emphasis on transparency will help to fight back against financial criminals who often hide behind complex and opaque corporate structures.
Risk assessment and mitigation	▪ AMLD V drops the limit of monthly transactions of prepaid cards from EUR250 to EUR150, with a EUR50 online limit applicable. ▪ Going further, only cards issued within the EU will be allowed, unless they were issued in a specific country with legislation that is deemed on par with European AML standards. ▪ Tougher criteria for estimating third countries with an increased risk of money laundering, i.e. possibility of sanctions against violations of money laundering regulations, obligation to report suspicious transactions. ▪ New directive also focuses on high value goods, which are being used in order to storing and moving funds. AMLD V extends the range of goods that will be subject to regulatory enforcement and reporting requirements.	▪ Risk methodologies may require amending and updating. Also may necessitate assessment and modifications to reflect more detailed checks on prepaid cards. ▪ Obliged institutions should review and be prepared to adopt revised list of the European Union's high risk third countries into KYC processes. ▪ High value goods are: oil, art, arms, tobacco, precious metals, cultural, historical and archaeological artefacts.
Customer Due Diligence	▪ If only the managing director is known and it is impossible to identify the actual beneficial owner	▪ Any provider of exchange services between custodian wallets, fiat currencies and

	of a company, this must be indicated in the special beneficial ownership register. ▪ Virtual currencies will face more stringent controls with exchanges being registered with the respective authorities in their jurisdictions, conduct full customer due diligence, as well as prepare suspicious activity reports when necessary. ▪ Extending the coper of AMLD to cover all existing forms of tax advisory services, freeports, letting agents, electronic wallet providers, art dealers and virtual currency exchange service providers.	virtual currencies will needs to implement internal AMLD processes. ▪ FIUs will be required to keep records, including names and addresses, of those purchasing virtual currency.

Source: Own research

Highlighted are four main areas impacted by AMLD V: Control, Data Collection and Processing, Risk Assessment and Mitigation, and Customer Due Diligence. Each contains widely described sectors and institutions, which need to adhere to new provisions. These seems to be core areas and changes brought to their scope will surely have an impact. Regulators are supposed to deliver proper tools for all institutions and Member States for sufficient understanding and implementations of AMLD V provisions. It is crucial to adhere to new law, so the goals of new directive can be achieved and entities can avoid bearing financial consequences.

The timetable for the AMLD V transposition is as follows:

1. 19 June 2018 – publication in the Official Journal of the EU;
2. 10 January 2020 – new directive is expected to enter into force (18 months after publication);
3. National registrars of business owners along with national registrars of trust owners to persons with the legitimate interest are due to be available for the public during early 2020 (20 months after publication);
4. Interconnection of national registers across the borders within the EU is due to go live during early 2021 (32 months after publication).

Conclusion

Financial crime remains a persistent scourge across the globe, and it is therefore unsurprising that 2019 has seen increased regulatory pressure on the financial institutions and banks to crack down corruption. Ongoing illicit activity, as outlined by the relevant 2018 European Parliament Directive, was a significant catalyst for the new anti-money laundering directive.

While the revised provisions will be improving the existing rules, effectively fighting financial crime will require relevant implementation amongst several market participant along with proper-acting coordination. This is not only a fighting, but also preventing from bigger loss. Total aggregated loss of turnover from financial kind of crimes is estimated at around USD1.45 trillion (Thomson Reuters 2018). It shows how much can be gained.

Notes

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 – 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Application of Strategic Planning and Performance in Nigerian Flour Mills: A Conceptual Review

Egwuirebe Godwin, Osibanjo, A.O.; Adeniji, A.A. and Salau, O.P.

Department of Business Management
Covenant University, Ota, Nigeria

Abstract

Organizations do not operate in isolation but with interactions with various facets in the environment and have to tackle challenges of fierce competition, change in taste of customers, performance shortfalls, obsolescence of product, technological change, shortages of resource and culture change. This study examined how strategic planning can be applied to the process of sustaining performance using focusing on flour mills in Lagos. A conceptual review of the literature was done with the conceptual framework and models therefrom. Propositions were made, and efforts were made to obtain conclusions from the literature reviewed assessing the subjective and objective aspects of corporate performance. Relevant information was extracted from journals, articles, annual flour industry report, and bulletins presented by corporate strategists and policy planners. The inferences from the propositions revealed that strategic planning could be applied to sustain performance. Based on the finding, it can be concluded that strategic planning important in achieving organisational goals and it was recommended that more organisations should engage in strategic planning to enhance their performance.

Keywords: Strategy, Strategic Planning, Organisation, Performance.

Introduction

Organizations do not operate in isolation but with interactions by various facets in the environment and have to tackle challenges of fierce competition, change in taste of customers, performance shortfalls, obsolescence of product, technological change, shortages of resource and culture change (Nzewi and Orjiagu, 2015; Kolade, Olanipon and Olumuyiwa 2018; Bergstrom, Tran and Lundell, 2013; Shahin, 2011). Despite all these, organizations still strive to achieve their goals and objective with optimal utilization of as possible to satisfy the varied stakeholders of customers, employees, investors and others. Yoshikuni and Albertin (2018) emphasized that earlier studies present that firm performance is distorted by the unfriendly and turbulent environment in addition to other variables.

Bergström, Tran and Lundell (2013) discourses that some organizations achieve their goals and objectives by adapting to flow with the changes and others have various plans simulating possible scenarios and how they should be tackled in the event of a possible occurrence of one of the scenarios. These plans could be strategic plans or long-range plans. Strategic plans guide the organization to where they want it to be stating how it should be done. Thompson, Strickland and Gamble (2012) and Aremu (2010) established that strategic planning standardizes objective setting, implementation and assessment processes that allow an organization to achieve its goals (Agha, Alrubaiee and Jamhour, 2011; Tapinos, 2015; Agwu, 2018).

Dyson (2010); McAdam and Bailie (2012) also highlighted in their studies that organizations must align their strategies and performance measurement systems together. Ansoff (1970) argues that in companies that are strategically managed, planning produces better alignment and results than those that are not. Strategic planning is a challenging process that requires the thinking individual. Management uses a strategic planning process to set goals, schedule activities and measure progress within the organisation (Mostaghel, Oghazi & Hultman, 2015; Monday, 2015). It is strongly believed that every organization is accountable for the outcome of their performance (Akpabot & Khan, 2015; Mohamud, Mohamud & Mohamed, 2015).

Falshaw, Glaister and Tatoglum (2016) posit that the ability to wade to turbulent times and perform well is a function of strategic planning and preparedness of the organization (Lee, 2010). Hence, shareholder satisfaction is changing approaches to corporate decision making. As a result, marketing strategies are evaluated by their capacity to increase shareholders' value and not by traditional yardsticks like market share, sales growth or return on investment. Wijetunge and Pushpakumari (2016) asserted that strategic planning and financial performance relationship might be looked at from four variables which include size, age, planning history and levels of strategic planning. Hence, the objective of this research was to determine the connection between strategy implementation and job effectiveness; appraise the association between strategy evaluation and market share; and assess the association between strategy determination and employee /stakeholder satisfaction.

Literature Review

Strategic Planning

There exist so many definitions of strategy with a few general agreements (O'Regan and Ghobadian, 2007). The strategy is the board and senior management proactive measures towards opportunities and constraints that firms need to grapple with (Falilat, 2013). Planning is currently used in different senses that it risks degenerating into an emotional noise. For the most part, definitions of strategic planning are varied but in many ways, remarkably the same. According to Viljoen (1994), strategic planning is the process of selecting and implementing activities that will improve an organization's long-term performance. Aremu (2010) sees strategy as that utilized to ensure a firms actualization of its goals and objectives. Adeleke, Ogundele and Oyenuga (2008) defines strategic planning as entailing the assessment of internal and external constraints of a firm and formulation of ways and means of reaching the firms objective by optimizing the opportunities and watering down the threats (Thompson et al. 2012; Bergstrom et al. 2013; Knies, Jacobsen and Tummers, 2016). Above all, strategic planning is one of the management function that emphases an organization's growth and sustained future well-being.

Factors Influencing Strategic Planning

Strategic plans are developed by organizations all over the world. They ensure the creation of vision and put in place necessary strategies to achieve it. However, many are still faced with challenges of realizing their vision and delivering the strategic outcomes expected. Unfortunately, the reasons for this dilemma cannot be identified by executive teams, so they keep repeating the strategic planning cycle all over again, hoping to get a better result.

Many factors have been adduced by researchers to influence strategic planning. One very significant one is environmental, and another is uncertainties (Ikoro and Nwosu, 2017; Bergstrom et al., 2013; Makinde, Akinlabi and Ajike,2015). Resource availability, legal forces and well as legislative changes bring in new dynamics that should be taken into cognizance also. Size and complexity of a firm is also another factor as it is believed by Ikoro and Nwosu that as the organization increases so does the need and degree of formulating of policies and strategic planning activities. However, over time it becomes apparent that the strategic goal given to them will not be realized by this team and that the strategy itself will be considered a failure. Managing the strategy that leads to failure is the lack of an Innovation Process. Top management came up with strategies for achieving them that required innovation. They do not have a clear innovation strategy but have new product development strategies. This position is also corroborated by Ufartiene, 2014); Falsaw et al., 2006); Hummelbrunner and Jones, 2013); Thompson *et al.,* 2012; Nimfa and Godwin, 2014). Other factors they also identify are:

i. The level of involvement in operational concerns: strategic planning will need a good knowledge of the operations and those that will implement will also need to grasp the strategic focus and rationale for the development of the strategy.

ii. The implementation gap: a lot of questions have to be answered here. What is the service level agreement between departments in the value chain? Will the implementation be in phases, pilot or abrupt? What are the equipment and facilities needed to implement the strategy?
iii. The competitive environment changes: the strategy formulators will have to take into cognizance the opportunities and threats from competitors and substitutes and how they can as well use their resources to get an advantage over and above their competitors.
iv. Stage in the life cycle of the product or service: in the product or service in the introduction, growth, or decline stage? The product life cycle stage determines their efforts at innovation, rebranding, process change, diversification and other measures.
v. Lack of commitment: the commitment of the management and employees need to be obtained to achieve the desire of the strategy formulators properly. The senior management and board of the need to ensure that the key personnel in the organization are committed and work towards the overall achievement of the strategic focus.
vi. Inadequate instruction to employees: it is one thing to formulate a strategy and another to map out the details and step by step instructions to be followed by employees to attain the desire of the strategy.

Strategic Planning focus of Flour Mills Industry

Strategic planning processes are positive or successful when a communication approach is taken from the bottom-up and top-down. It begins with communication with all staff at various levels notifying them that a process of strategic planning will be taken place. It includes their participation as individuals in this process. This involves communication from the top to the bottom. Employees will also be engaged in the strategic planning process through feedback surveys, focus groups, meetings, etc. on their organizational direction ideas.

Businesses use strategic tools such as a SWOT analysis to investigate strengths, weaknesses, opportunities and threats and also to modify current strategies. Hence, below are some of the characteristics of the flour mills industry that strategic planning needs to take into cognizance:

i. Stiff Competition: competition there is very keen as they have substitute products. Success is mostly hinged on market share and volume and capacity. Also, prices are fixed by the Flour Millers Association.
ii. High Volumes: high volumes will result in a possible reduction in per-unit costs to absorb high overheads, cost, increase margins.
iii. Substantial Cost Outlay: most of their inputs are imported (wheat) and with the heavy import duty and embargo of some goods they need to plan adequately.
iv. Seasonality: their inputs are often from agricultural products and thus are seasonal. Demand is, however often much. How do they take care of this?
v. Price Sensitive Demand: their products have a high elasticity of demand and a major upsurge in prices will lead to a change to substitute. How will this be surmounted?

Challenges of Strategic Planning

For the modern company, strategic changes come in many ways. Based on the report from Harvard Business School, ninety percent of organizations have difficulty in the implementation of their strategic plans (Park, Lee and Chae, 2017; Quigley and Graffin, 2017). When the strategy is not adequately implemented, it can lead to lack of employee goals (Rigby and Bilodeau, 2009), improper allocation of resources (Shahin, 2011; Thompson, Strickland, and Gamble, 2012), inadequate structure and leadership (Wijetunge and Pushpakumari, 2016), and weak communication lines (Yoshikuni, Favaretto, Albertin and Meirelles, 2018. According to Ikoro and Nwosu (2017), the following are the challenges of strategic planning:

i. Lack of commitment: plans should not only be developed, but the buy-in of all stakeholders should be obtained. More notably, management, employees and unions that are key to the effective implementation for results. There is often very difficult because the above mention

stakeholders have opposing interests, and their commitment level will differ depending on what is brought to the fore (Bergström & Lundell. 2013).

ii. Lack of accountability: how easy will it be? Individuals responsible for various aspects of the strategy implementation may not have the requisite resolve to be accountable in their span of control, and these may also be interwoven with others (Agwu, 2018).

iii. Inadequate instructions to employees: plans should be broken down into tactics and bits of instructions that employees understand and can follow through. These will need expertise and understanding by key stakeholders (Caliskan, 2010; Akinyele, 2010).

iv. Power and Influence: authority and power should be warehoused in those that need to wield the necessary influence to get things done. These may be done through the organogram and structure (Bagire & Namada, 2013; Chavunduka, Chimunhu & Sifile, 2015)

v. Culture: strategy planning and implementation may result in culture shock, and the management should ensure they put in adequate change management measures to handhold employees and other key stakeholders. The organization culture may need to be altered to enable the smooth operation of the intended strategy Dubilihla and Sandada, 2014; Gomera, Chinyamurindi and Mishi, 2018)

Firm Performance

The process or action of embarking on or achieving a task, function or an action is referred to as performance (Nzewi and Ojiagu, 2015). The performance comprises of behavioural and outcome aspect. They further emphasize that performance multi-dimensional and dynamic concept that entails outcomes aspects as well as behavioural features. The performance further ensures that given tasks achieved speedily, accurately, wholly and cost-effectively with value creation as ultimate goal and objective (Okpara, 2014; Nzewi and Ojiagu, 2015; Monday and Aladeraji, 2015). Performance in organizations could be looked at from the objective and subjective measures such as profits, sales, return on assets, and return on investment, while non-financial measures emphasis on issues like delivery time, referral rates, customer`s satisfaction and referral rates (Okpara, 2014; Nzewi & Ojiagu, 2015; Falshaw, Glaister & Tatoglu, 2006; Bergstrom et al., 2013).

Flour Mills Manufacturing Firms in Lagos

There are currently 21 flour milling companies in Nigeria. 80% of the market share is controlled by 6 of the 21 firms (NSE 2018 Report). This has resulted in a difference between the 'big players' and others. The six players by market share include Flour Mills of Nigeria Plc, Dangote Flour Mills Plc, Ideal Flour Mills Ltd, Honeywell Flour Mills Ltd, Standard Flour Mills Ltd and Crown Flour Mills Ltd. Due to the stronghold of the market by these 'big 6', other aspiring and prospective flour millers would have 'invisible entry barriers' (Leadway capital, 2018). There is a wide gap between the big six and other firms in this sector. Nigeria's Flour Milling industry has a total capacity of more than 22,000 metric tonnes with Flour Mills Nigeria Ltd. controlling about 38%. Other market shares are 18%, 7%, 14% and 8% for Dangote Flour Mills, Honeywell, Ideal Group and Crown Flour respectively (NSE Report 2018).

The flour mills industry in Nigeria generates more than 10 million jobs according to Anurag Shukla, the Managing Director of Crown Flour Mills Nigeria. This is because their product is used in bakeries, noodles, biscuits, pasta, restaurants and fast foods. According to Akhidenor (2018), Regional Agriculture Counsellor to USDA on Nigeria's Grain and Feed Annual report MY2018/19 wheat consumption by Nigerians is projected at 5.0 million tons, a 5 percent increase over the year 2017. Also, rising domestic demand for animal feeds by Nigerians and accumulative foreign investment in the milling sector are expected to boost corn and cassava usage by 550,000 tons, nearly 40 percent increase 2017. Hence, consumer prices continue to rise mostly as a result of increases in the prices of yam, bread, other cereals, potatoes, and cassava and other tubers which are either inputs or output from the milling industry (Akhidenor, 2018).

Critical Strategic Success Factors in the Flour Mills industry

NSE 2018 report states the following strategic performance-related critical factors:

i. Capacity: this is a critical factor in the Flour Mills industry because it is a volume-driven market. A firm's capability to continuously increase its production abilities distinguishes it from others and makes it a more successful player. Ability to increase capacity in the short and long run.
ii. Marketing: Aggressive marketing is another substantial strategic performance success factor for flour millers. The competition among players makes them deploy considerable resources towards advertisement, promotions, advertisements and general publicity aimed at increasing patronage.
iii. An adequate distribution network is a necessity of flour millers in Nigeria. Flour is consumed in almost all areas and eating lifestyles Nigeria. It is relevant that the product gets to the final consumer as at when needed.
iv. Proper strategic management: quality of management cannot be ruled out in any industry, and this is not an exception. Experience, track record, and competence of top management is essential for the growth of volumes and margins.
v. Adequate Storage Facilities: most of their inputs are perishable goods such as wheat, sorghum, maize, rice and others. With adequate storage in place, spoilages and wastages, as well as deterioration, are mitigated.
vi. Pricing: Flour Millers Association regulates the pricing of products. However, big players often set prices higher than the fixed price for increased margins and profits.

Methodology

Literature survey research design was adopted for this study. Articles and thesis on strategic planning, Strategic management, and long term planning, performance and performance measure were looked up. Besides, textbooks, journals, unpublished thesis, online resources and databases relevant to the study such as Covenant University repository and Leadway Capital annual flour industry report, NSE annual sector reports were reviewed. Secondary material was gotten from relevant textbooks, journal, articles, bulletins and documents by corporate strategists and policy planners.

Model Propositions and Discussions

Proposition 1: Proper strategy implementation has a positive impact on job effectiveness.

The execution phase is an operations-oriented phase that executives have to accomplish. It is probably the most challenging and time-consuming component of the method of strategic leadership (Gomera et al., 2018; Gumel, 2019; Hakimpoor, 2014). This strategy implementation involves the preparation of a strategic plan that sets annual goals, creates an efficient organisational framework, creates a budget, creates a feasible data scheme and usually creates a work schedule for the implementation of jobs. It also includes motivating staff, establishing a culture of support, allocating funds and connecting compensation for staff to the organisation, and so on (Thompson, 2014).

Pressman and Wildavsky (1984) noted that implementation is a method of evolution, not a revolutionary process. Gomera, Chinyamurindi and Mishi (2018) indicated that the key to effective job performance is through alignment of measures, complete and active managerial assistance. The various fragments of the strategy should be outlined by the company and drawn out in manual of operations to guide the employees and the management of firms to ensure and sustain job effectiveness

Proposition 2: Strategy evaluation will help to increase firms' market share over time.

Evaluation of the strategy includes organizing the company's funds and motivating employees to attain goals (Hakimpoor, 2014; Hummelbrunner and Jones, 2013). The competitive worldwide climate of today is complicated, vibrant, and mainly unpredictable. A lot of thinking has fallen into the question of how best to formulate policies to cope with this unprecedented stage of transition and expand market

share. The market share-profit interaction remains a critical study problem in the world's strategic company leadership. There is increasing pressure to make the correct choices rapidly, and one of the difficulties that executives face is how to boost earnings in today's dynamic company environment. To do this, managers need to understand the factors that increase profitability. Studies (Ikoro, and Nwosu, 2017; Knies, Jacobsen and Tummers, 2016; Kolade, Olanipon and Olumuyiwa, 2018) have shown that firms can achieve a substantial market share only when they engage in appropriate strategy evaluation.

Strategy evaluation as done in the flour mills industry through price structuring, capacity expansion and volume increase with ensuring an upsurge in the market share. Strategy evaluation allows room for review to ensure that the target market share aimed at by organizations, causes of shortfalls and actions needed may be initiated. This study concludes that the evaluation and control method aims at ensuring that the company achieves what it intends to accomplish by comparing output with required outcomes, identifying the efficiency status and offering reviews needed for the leadership to make the right intervention (Yabs, 2007).

Proposition 3: Adequate strategy determination is necessary for stakeholder satisfaction.

Strategic choices determine the organisational relationship to its internal setting, cover the full organisation, rely on feedback from all functional fields of the organisation, have a direct impact on the administrative and operational operations, and are vital to an organization's long-term safety (Shirley, 1982). According to Schermerhorn (1989), to achieve shareholders' satisfaction, policies must be well developed and enforced. Therefore, the strategic capacity to guide a company to performance achievement begins well before execution; during formulation. Determination is a significant element of the strategy, according to Pride and Ferrell (2003).

Issues related to the satisfying the expectations of the shareholders include choosing which new company to join, which company to leave, how to allocate funds, whether to grow or diversify activities, whether to join global markets, whether to combine or form a joint venture and how to prevent a hostile business environment (Kim et al. 2011; Gomera et al., 2018; Bagire and Namada, 2013). Strategy determination and formulation enables firms to assess where they want to be and how they want to get there. This is evident in the flour mills industry where capacity and volume of sale as well as distributors targeted at bringing the goods close to the distributors' chain. This is done through the evaluation of the external environment in which operation is done.

Conclusion and Managerial Implications

The study magnified the knowledge, information and understanding of the relationship between strategic planning and organisational performance. It also stresses the overall importance of strategic planning and its ability in the creation of innovative ideas and throughput in the performance process in an organization.

Based on the review and conclusion, the following recommendations are made:

i. The top management of organizations in Nigeria should continuously make an effort at being informed about trends and better business strategies and process to improve their efficiency and effectiveness.
ii. The top management of organizations should not be formulating policies and strategies. Still, it should also endeavour to get them implemented, watching out for feedback and deviations with control measures put in place.

The study revealed that most organizations focus only on strategy plan formulation of and not implementation. Strategic plan utilization ensures competitive advantage, organizational profitability and increment in company market share and therefore recommend that strategic planning should be embraced by organizations.

Management of Third-Party Logistics in Supply Chain – Aspect of Customer Service

Beata SKOWRON-GRABOWSKA

Czestochowa University of Technology, Management Faculty, Czestochowa, Poland,
E-mail: beata.skowron-grabowska@wz.pcz.pl

Abstract

The aim of the herein paper is to characterize the logistics projects in the process of purchasing services from TPL logistics operators (Third Part Logistics). Logistics service providers implement activities within the framework of the supply chain which they will develop in terms of the scale and scope of their activities that also have an impact on customer service at the same time. The activities of logistics operators facilitate the attainment of profits for all participants of the supply chain, as well as matching individual needs arising from the unique nature of a particular order in an appropriate manner. Thanks to this fact, suppliers gain financial profit, clients are well-served, while in the case of manufacturing and service companies it is possible to bring forward future orders. The existing literature depicts the basic elements of third party logistics (TPL). The practical section of the herein paper presents the results of survey research relating to the evaluation of customer service provided by a logistics operator functioning in a supply chain. The findings imply that the level of customer service in practice extends beyond both pretransaction and transaction phases as well as positive verification of introduced hypothesis. The results produce some propositions for future research.

Keywords: TPL, supply chains, customer service.

Introduction

An effective supply chain should have an integrated approach where all the elements of logistics have to be considered to get a balanced customer service level that includes transit time, reliability and cost. The basis of the orientation towards the client and the achievement of success for a firm is the ability to acquire and maintain clients that bring in profits. One of the significant ways of achieving this aim is the skill of effective management in terms of relations with clients. The process of their service transcends the general functional limits of the particular departments of the organization. This is not only the sales department, but the departments of service, marketing, logistics and controlling also take part in the full cycle of contacts with clients, as the relations with a client which have been made in one department have an impact on the type and content of contacts in the other sections or departments in a particular firm. In a competitive environment, in which customer satisfaction is of key importance for the long-term success, it is significant that the logistics operators are able to create such services that fully satisfy the needs of their clients. The functioning of the logistics operators in supply chains requires concentration on clients/partners within the framework of the chain with the aim of intensifying the level of cooperation, while also shortening the timescale of taking decisions and execution of activities, reducing the costs and increasing profits. The elimination of unnecessary activities and shortening the timescale of rendering services shall aid the physical processes. The issue of the lack of the appropriate customer service in terms of logistics services such as the following: storage and planning of distribution, stock management may lead to discrepancies and distortion in the functioning of enterprises in the supply chain.

Literature Review

Such terms as "logistics outsourcing" "logistics allies" "third party logistics", "contract logistics" and " contract distribution" were used interchangeably in order to describe the organizational practice of commissioning part, or all of the logistics operations that had been previously conducted in the firm (Aljohan, Thompson, 2016). Various definitions emphasize various aspects with regard to the

commissioning of tasks for execution, such as an offer of services, the nature and duration of services of interpersonal relations, performance results, the scope of liability of the third party with relation to the logistics process, as well as the position and role in the supply chain.

A logistics operator is usually associated with an offer of multiple service packages rather than merely singular functions, such as transport or storage (Jayaram, Tan, 2010). Modern-day contracts with logistics operators are based on formal (both short-term and long-term) contract relations, as opposed to immediate purchases of logistics services.

The supply chain is defined as a system of organization, people, operations, information and resources engaged in the transfer of a product or service from the supplier/provider to a client. Activities associated with the supply chain encompass the transformation of the natural resources, raw materials and components into a ready-made product, which is delivered to the final client. This is a network of organizations that are involved via ties upwards and downwards, as well as various processes and operations that create value in the form of products and services delivered to the final consumer (Kaina, Verma, 2018). The supply chain may be defined as a set of firms moving the materials forward which launch products and services on the market, including the final clients within the framework of the supply chain (Verm, Seth, 2011).

Logistics operators in the supply chain may lead to the shortening of the timescale of taking decisions and the execution of activities, while also reduce costs and increase profits. It is necessary to choose such operators that will eliminate the unnecessary activities and shorten the timescale of execution, thus supporting the physical processes. Redundancies are a particular issue that should be undertaken as enterprises base their fundamental activities around this, while simultaneously outsourcing the remaining operations of the supply chain for their trading partners.

The evaluation of TPL logistics operators must commence with establishing the criteria of choice. The most frequent criteria relate to such aspects as costs, quality of service and the possibilities of providing services (how vast the range of services of the provider is, what the geographical range is, whether it has a specialized staff of employees). However, the criteria may be intensified if the implementation of long-term projects and close ties are expected. In such a case, other factors are adopted, such as adjustment in terms of culture, flexibility and liability, as well as creative solutions to problems in the case of unforeseen situations. (Nu´n˜ez-Carballosa, Guitart-Tarre´s, 2011)

Logistics operators functioning in supply chains and conducting their activities illustrate that their activities are first and foremost concentrated on the clients. In analysing customer satisfaction, it is necessary to emphasize that it is actually they who constitute the principal aim of the activities of the operator, namely, they concentrate on the fact that it is not service users and clients who are dependent on a firm, but rather its profitability depends on current clients. It is also necessary to note that customer satisfaction is becoming a key element in the concentration of a logistics operator in terms of the pursuit of promoting the repetitive and long-term business relations. In the present competitive environment, it is dangerous to be a firm that is unattached to a client. The majority of firms are competitive and in order to remain on the market they must provide high quality services that make clients satisfied. And in logistics customer orientation and satisfaction usually means perfect order. (McFarlane, Giannikas, Lu, 2016)

Likewise, it is also necessary to acknowledge that firms which render logistics services should know their clients. An operator who has great knowledge about his/her clients, has more possibilities in terms of taking the appropriate decisions relating to the needs of a client, which in turn facilitates the development of new services, among others, by means of projects that contribute to the increased value for clients, while also evaluation of the values desired by the clients. (Meidutė-Kavaliauskienė, Aranskis, Litvinenko, 2014) The problem of evaluating the values is also perceived in the context of the relationship matrix that determines the decision-making level. On this basis, a multitude of alternative solutions to varying spatial and time spheres are formulated. Likewise, the magnitude of the enterprise and the risk of its activities are taken into account from the viewpoint of values. (Heizer, Render, Munson, 2017)

Together with the development of logistics services, multiple logistics operators decide to create supply chains of logistics services by means of ties and integration. Supply chains in the provision of logistics services enable enterprises to fulfil the individualized requirements of clients and the achievement of the necessary abilities to offer services.

In logistics services, a key factor in individualization which ensures competitiveness in the supply chain is the fact that it may offer individualized services at the lowest costs for mass services thanks to the work schedule stipulated in projects. (Liu, Wu, Liang, Zhu, 2018).

A logistics operator is a multi-entity organization of a high degree of intricacy (Skowron-Grabowska, 2010). The specialized nature of TPL enables it to render comprehensive logistics services. Logistics services in terms of earnings encompass the execution of forwarding, transport, storage, while also associated services and the supporting process of the flow of goods between the links of the supply chain. (Dakhli, Lafhaj, 2017). Jeszka (2009) claims: "The areas of the logistics activities undertaken by TPL in supply chains are as follows: supplies, production and distribution". Logistics services are organized and provided by a specialized firm, which manages the logistics system of another enterprise (Golembska, 2010). Logistics services are the response to the demand and expectation of a client associated with providing him/her with the appropriate product within the appropriate timescale, at a suitable price, while preserving the appropriate level of quality of these services and featured by the following properties: (Golembska 2010)

- departure from the typical secondary demand for this service, whereas transportation services are rendered as a result of the formation of secondary demand for this service,
- price of logistics services is the function of the prices of storage, transport and the process of customer service,
- logistics services not only increases the value of goods, but also increases the competitiveness on international markets.

Logistics services management may be divided up into five groups in accordance with their characteristics. The tasks and sets of factors included in them consist of comprehensive logistics services that are rendered by specialized organizations, logistics operators, which is illustrated in Fig. 1.

Fig .1: Elements of logistics management

Source: D. M. Z. Islam, J. F. Meier, P. T. Aditjandra, T. H. Zunder, G. Pace, Logistics and supply chain management, Research in Transportation Economics 41 2013, p. 5

In the figure 1 the following types of logistics management distinguished: transport, storage and inventory, packaging with unitisation as well as information processing, which as a common denominator is the organization of the flow of goods and information. According to Gołembska (2010), the development of the forms of logistics services and their range is determined with the aid of four elements:

- storage and handling stocks,
- transportation and handling loads,
- market research and creating a marketing system of information,
- financing transactions, banking and insurance servicing of contracts.

These elements relate to not only the storage and transportation of goods, but also the key areas such as the management of information and financial services. (Gupta, Goh, Desouza, Garg, 2011). The core of logistics services are activities and actions such as the following: transport, storage, market research and financing activities on which the level of the comprehensive logistics services depend (Rydzkowski, 2011). In Table 1, the subjective scope of logistics services has been presented.

Table 1: Subjective scope of logistics services

LOGISTICS SERVICES			
Storage and handling stocks	**Transportation and handling of loads**	**Market research and creating a marketing system of information**	**Financing transactions, banking and insurance servicing of contracts**
1. Stockpiling goods 2. Operating loading ramp 3. Distribution in row of racks 4. Location of warehouse bases 5. Decompletion of loads 6. Creating load units 7. Packing 8. Planning surface size 9. Operating cold storage 10. Operating open and semi-open warehouses	1. Transportation of loads 2. Intermodal transport 3. Multimodal transport 4. Bimodal transport 5. Securing the load in transport 6. Marking the load in transport 7. Operating reloading points 8. Planning transportation routes 9. Planning load space for fleet vehicle 10. Operating close distance transport, lift trucks, cranes etc.	1. Market research, share in profit 2. Creating MIS 3. Prognosis of demand 4. Sales reports, bar codes 5. Planning of magnitude of sales 6. Analysing environs of competition 7. Public relations 8. Promotion 9. Advertising 10. Statistical quality control	1. Leasing agreements 2. Credit agreements 3. Table 1 illustrates that according to Mindur (2008) logistics services encompass all the activities that are essential for the execution of the logistics processes. A logistics operator facilitates the execution of all the enumerated tasks with regard to the subjective nature and high degree of specialization of the executed operations. TPL has the task of facilitating the execution of the specific logistics processes thanks to the defined infrastructure and good organization. The wide range of possibilities offered by a TPL means that clients and trading partners are willing to avail of its services, which in turn makes it competitive among enterprises providing logistics services. Inside the supply chain, TPL performance is positively impacted by supply chain management strategy; consequently,

improving the TPL activity can even more improve the performance of the entire supply chain. (Liu, Yuan, Hafeez, Yuan, 2018)

Methods

Third party logistics (TPL) companies are the chosen context of this study for two reasons: (1) customer service policies in TPL are likely to be constantly improving as the customers' requirements are changing quickly and (2) many TPL companies are increasingly adopting new management practices.

Survey

Based on a literature review, a questionnaire was prepared with two researchers who had extensive experience in the TPL functioning. Then, the questionnaire was pretested with a survey to 20 students attending a part-time postgraduate program at a local university. Finally, undertook a quantitative study to test hypotheses. A representative proportion from TPL sector was desirable, and their customers were carefully checked. In order to satisfy quantitative criteria, a list of 36 firms was prepared from the database of statistical office. A stratified sample of 16 firms and 5 customers for each company was selected from these companies. This gives a group of 80 customers for all 16 TPL.

A formal covering letter was then sent to the personal e-mail of the participant, providing an introduction and a general explanation of the study. From the questionnaires that were sent, 55 questionnaires were returned, but 5 were dropped because of incomplete data. Thus, 50 usable questionnaires represented a 62,5% response rate.

Multi-item measures with a 5-point Likert scale (1=very bad (completely unimportant), 5=very good (very important)) were used to evaluate all constructs. The construct captures the essential actions relating to the level of customers service in TPL and criteria of choosing given TPL by a customer.

Empirical Research

Ciesielski (2006) claims, logistics services for clients are defined as providing them with the appropriate product within the appropriate timescale and at the appropriate location. Another definition characterizes logistics services for clients as "the ability of the logistics system of an enterprise to secure/satisfy the needs of clients from the viewpoint of time, reliability, communication and convenience" (Kozlowski R., Sikorski, 2009). It is possible to add that they satisfy these requirements by availing of various forms of *logistics activity, including transport, storage, stock management, information and packing.* (Kempny, 2001). In practice, logistics operators rendering services to clients may be perceived in a different way of determining the subjective and functional scope of the applied approach (Szumilak, 2007).

1. Service as a specified activity – a set of associated actions to be performed in the cycle of ordering (service as a process),
2. Service as that of offering and maintaining the level of service - standards (norms) of the execution of the basic elements in accordance with the requirements of the clients,
3. Service as a philosophy of the activities and mission of the given firm, this ensuring it has a high position on the market.

Service as a specified activity may be described as a multitude of coupled logistics activities that occur in a specified order, which decide on the level of customer satisfaction following the purchase of a product. The second approach is aimed at providing services for a client in accordance with high standards in order to fulfil the requirements of a client. However, customer service as a philosophy is to "ensure that such relations between the time of submitting an order and the time in which the product is delivered to the client are to fully satisfy and maintain that level of satisfaction for as long as possible"(Szumilak, 2007). Activities aimed at acquiring effectively functioning systems of services must be thought out precisely. Stachowicz-Stanusch (2007) claims, In planning customer

service, it is necessary to recognize and analyze clients and their needs, while subsequently establish service packages and standards of services.

A key element in logistics services for clients is that of planning and organization with the aim of creating a well-functioning system of the distribution of services. Therefore, there must be optimization of the entire supply chain network as well as customer value creation. (Grazia Speranz· 2018) Hence, the research conducted facilitated the analysis of how the effects of the work of logistics operators are evaluated by the clients availing of the aforesaid services. And the hypothesis is formulated as:

H: The better chosen criteria when choosing a logistics operator, the higher will be the customer level satisfaction of logistics service quality offered by the TPL, which in turn, in the end improves the level of transaction service.

In order to assess the services for clients in a TPL, it is necessary to analyze what elements the clients of a TPL pay attention to when choosing a firm. This data has been illustrated in Table 2.

Table 2: Elements taken into account when choosing a logistics operator

What was your criteria of choosing a logistics operator?					
	Responses				
Responses	Very important	Important	Of medium importance	Of little importance	Completely unimportant
Price of services	70%	18%	8%	4%	0%
Timescale of execution of order	80%	12%	8%	0%	0%
Communication with firm	88%	6%	6%	0%	0%
Reliability in provision of services	92%	6%	2%	0%	0%
Opinions on image and position of firm on the market	10%	6%	12%	38%	34%
Safety of provision of services	86%	14%	0%	0%	0%
Professional service	82%	12%	4%	2%	0%
Large choice of services offered	24%	70%	6%	0%	0%
Conditions of making complaints about services rendered	18	34	26	16	6

Source: Prepared on the basis of self-analysis of personal survey research

Table 2 indicates that the elements that are taken into account the most at the moment of choosing a logistics operator are reliability in the execution of an order, communication with the firm, safety in terms of the provision of services, professional service, while also the timescale of the execution of orders. Only after these elements do the clients of a TPL enumerate customer convenience and the price of services rendered. However, the least important is that of the image and market position of the firm. Table 3 presents how the clients of a logistics operators assess service during the course of the execution of orders.

Table 3: Evaluation of logistics customer service of logistics operators

Please conduct an evaluation of customer service provided by logistics operators					
	Responses				
Responses	Very good	Good	Medium	Bad	Very bad
Price of services	18%	58%	22%	2%	0%
Timescale of execution of order	40%	38%	16%	6%	0%
Communication with firm	34%	46%	14%	2%	4%
Reliability in provision of services	6%	30%	64%	0%	0%
Safety of provision of services	48%	40%	10%	2%	0%
Professional service	24%	68%	8%	0%	0%
Large choice of services offered	76%	10%	8%	4%	2%
Conditions of making complaints about services rendered	18%	38%	26%	18%	0%

Source: Prepared on the basis of self-analysis

The clients of a TPL evaluated this as very good (76%), while professional service and the price of services were evaluated as 68% and 58% respectively among those surveyed. Elements such as the large choice of services on offer, the safety of the provision of services, the timescale of the provision of services were evaluated at a very high level, reaching 76%, 48% and 40% respectively among those under analysis.

According to Krawczyk (2000) the logistics services for clients consist of a multitude of mutually connected activities. These may be divided into groups which create the elements as follows:

- pre-transaction,
- transaction,
- post- transaction.

The elements of the logistics services for clients may be divided into 3 groups, in which those surveyed evaluated the level of service provided by the logistics operators. This data has been presented in Table 4.

Table 4: Evaluation of logistics services for clients in three phases: before concluding a transaction, during the course of concluding a transaction and after concluding a transaction

	Responses				
Responses	Very good	Good	Medium	Bad	Very bad
Pre-transaction phase	44%	36%	18%	4%	2%
Transaction phase	38%	52%	10%	0%	0%
Post-transaction phase	28%	38%	18%	16%	4%

Source: Prepared on the basis of self-analysis

Table 4 illustrates that the clients of logistics operators evaluate service rendered in the transaction phase and the pre-transaction phase the best. The low assessment of the transaction phase in terms of customer service may result from the time of expectation for the final evaluation of a complaint about services rendered and other inconveniences arising from the associated procedures. (Render , Stair, Hanna, Hale, 2018) The research results point that the most significant part of the logistics services for clients are the elements of the transaction phase. And this shows the positive verification of the

hypothesis. They constitute the level of customer service and may have an impact on the perception of a logistics operator in the supply chain, while simultaneously constitute the decisive factor in the functioning of the supply chain.

Theoretical and Practical Implications

The results from research offer two main propositions for theoretical advancement. First, study extends the findings of earlier studies with regards to the drivers of customer service in TPL. Findings support an approach which is crucial to achieve competitive success on difficult logistics service market

In their desire to attract the potential users of their service, the logistics operators operating in the supply chain must first of all correctly understand the expectations of consumers and subsequently prepare the provision of these services well. The research conducted on a group of clients of logistics operators indicated that this has a direct impact on customer satisfaction. The high quality of services rendered enhances the competitive advantage of the service providers, as well as the loyalty of the consumers with regard to the operator. The research has indicated that clients assess an operator well that provides high quality services by offering them both in the pre-transaction phase, as well as in the post-transaction phase. Customer satisfaction in terms of the activities of the operator actually creates its capital. Simultaneously, the lack of satisfaction causes a drop in the competitiveness of the logistics operator.

According to the results achieved in the study, in a competitive environment, good knowledge about customer service would help a TPL to enhance its logistics service quality and develop satisfactory relationships with its customer.

A TPL''s general logistics efforts in maintaining sufficient customer service level and in keeping prices flat, accurately may constitute an adequate response to dynamic demand from customers side.

Future Research

Future studies could investigate how criteria are employed in TPLs in other research settings, such as business-to-consumer TPLs. It would be interesting to study the interaction between different customers and the development of the TPL. Moreover, future research could be conducted in international TPL's . Large-scale quantitative studies are needed to develop wide criteria of customer service. Furthermore, although this study has shed some light customers' service evaluation future research might advance the conceptualization stronger relationship between TPL and customers.

Social Reasons in The Theory and Practice of Economic Safety of Poland

Mieczyslaw PAWLISIAK

Military University of Technology, Warsaw, Poland
mieczyslaw.pawlisiak@wat.edu.pl

Abstract

Safety as a state is one of the most important needs of every person. It is perceived in an individualised way, but a person functioning in a particular community cannot separate his or her own feelings from the general social situation. Economic security is one of the types of safety that affect the functioning of society. When presenting content related to the perception of the economic security of Polish society, attention is drawn to the three most important issues in the author's opinion. The first is the social conditions currently prevailing in Poland. These include areas such as life expectancy, professional activity, income per family member, as well as the size of Gross Domestic Product. The second area is the conditions in which social policy is pursued. In this regard, attention is paid to the unemployment rate, which in pandemic conditions may increase sharply, a decrease in the total population and a reduced fertility rate for women in Poland. Given the above, it is proposed in the article to conduct social policy taking into account three main areas, namely health care, educational activities and providing housing for each family. Such an investment in the future may in the future allow for a more effective social policy and increase in the economic security of people in Poland.

Keywords: Safety, Economic Security, Social Policy, Person, Society

Introduction

Safety as a very general concept is considered by the general public as the absence of any noticeable threat. However, it has its own specificity, as there are many spheres and areas that society considers to be safe - without any threats or where the threat is felt subjectively or objectively. Its scale may be different and may concern whole countries, social groups or an individual person. In order to assess the impact of social premises on the theory and practice of economic security in Poland, it is necessary to conduct research in accordance with the accepted and frequently applied sequence of events understood as the process of scientific research. Starting from this assumption, the problem situation should first be identified. The next step is to define the research objective and research problems. On this basis, activities related to the selection of research methods and techniques are undertaken, the use of which will allow obtaining reliable results in the research process.

Considering the above theoretical content, it is advisable to consider that the problem situation examined is social premises in Poland, which have an impact on the state of economic security. These premises are assumed to be perceived in many aspects, starting from the economic situation, through the population, and ending with health and education. Thus understanding the content of the problem situation, it is scientifically justified to specify the purpose of the study, with the following content **to present the impact of social policy on the sense of economic security of society in Poland.**

Literature Review

Literature on safety issues in general as well as economic security is rich, although there are many controversial opinions in this field. There are also many myths and the resulting misunderstandings about defining what is meant by the essence of economic security. These misunderstandings are a consequence of the lack of a clear understanding of the meaning of the term economic security.

An extremely helpful literature on general issues related to economic security is the study by Victor George of 2018 entitled "Social security and society" (Vol. 3), Routledge from the content of this study it can be concluded that ensuring social security is not a manifestation of concern for the poor, but care for the preservation of the status of guo, so that rich people will continue to live at the appropriate level and will support the poor. It is also interesting to say that long-term unemployment is not beneficial when looking for employment. Collective elaboration by Bilan Yurij, Mishchuk Halyna, Samoliuk Natalia, Yurchyk Halyna Impact of Income Distribution on Social and Economic Well-Being of the State proved to be helpful in the aspect of assessing the volume of gross domestic product in the context of conducting social policy. This study indicates the relationship between the volume of gross domestic product and the implementation of tasks under social policy and ensuring social security and shows Poland's place against the background of other Central and Eastern European countries. Another interesting item is the 2019 article titled "Measuring social justice in the light of effectiveness of public distributive policy" by Mishchuk, H., Samoliuk, N. and Bilan, Y. Its content is to show problems regarding the distribution policy of goods and the feeling whether these actions are perceived as fair or not. Luttmer, E. F. & Samwick, A. A. present a different point of view on economic security in an article from 2018 entitled "The welfare cost of perceived policy uncertainty: evidence from social security". On the basis of research, they believe that in order to avoid risk, it is expedient to accumulate funds to ensure economic security in old age.

The discussed papers present a different point of view, but the common denominator is economic security, which as a category is extremely important for the proper functioning of an individual and the whole society.

Research Questions

Taking as a starting point the understanding and interpretation of the fundamental concepts related to the economic security of the Polish society, and at the same time striving to achieve the previously defined objective of the study, it is necessary to adopt the following fundamental research problem defined in the form of the question - ***whether and to what extent social policy in Poland has an impact on economic security?***

In order to attempt to answer such a general question, it seems legitimate to clarify its substance by taking the following specific research problems as a starting point:

- what are the objectives of social policy in Poland and according to what principles are these objectives achieved?
- in what conditions is social policy implemented in Poland?
- what is the subject matter of social policy in Poland?

The research problems specified this way show the complexity of the issue of economic security of the Polish society and at the same time allow to realize the assumed objective of this publication.

Research Methods

In the process of solving partial research tasks, it is necessary to perform subsequent actions also called the research procedure. In its course, research tools, appropriate to the issues under consideration, are used.

First of all, using the method of analysis and synthesis, an attempt was made to determine the basic components such as life expectancy, professional activity, income per family member or unemployment rate. mainly data from the Central Statistical Office were used in this regard. The method of analysis was then used to determine the conditions for conducting social policy in Poland. Particular attention has been focused on content related to the unemployment rate, population, fertility rate and the shift in female fertility age in Poland. On this basis, using the deduction method, areas have been identified where social policy in Poland should focus its attention in the coming years. This applies to health care, broadly understood education, and to providing every family with independent housing.

Bearing in mind the pursuit of the adopted goal and the solution of previously indicated research problems, it is justified to use the theoretical research methods described above. This methodological approach guarantees the achievement of the goal of developing and obtaining reliable results regarding the impact of social premises on the economic security of society in Poland.

Results of Research

Objectives and principles of social policy in Poland

The concept of social policy is sometimes defined in very different, sometimes original ways. However, it seems that it is possible, and even necessary, to assume that social policy is understood as public activity, usually directed at all social groups, in order to provide material and non-material conditions to function at an appropriate level. It is also important that the main target of social policy measures is families as the basic social unit. This does not mean, however, that other communities that are part of the entire Polish society are excluded (Auleytner 2004, p.14 - 23).

It should be noted that there is a gradual evolution of their content as a result of changes taking place in our society. Also, technological progress, economic development and the change of the society's awareness have an impact on the content of the objectives which are implemented in the framework of social policy in Poland in the first half of the 21st century. First of all, it is important to mention the desire to provide all citizens with decent living, learning and even playing conditions in case of children. Achieving this objective is important, as it offers the chance that the main conditions of start will be the same for all citizens. The statement that the start conditions may be the same is, in part, an overstatement. This is due to the fact that even the richest country is not able to equalise living and starting conditions, taking the richest members of society as its point of reference. Despite such an approach, the essence of this goal is that everyone has a chance, and whether he or she takes this chance is already an individual achievement of an individual person. The second objective of social policy should be and is to protect from poverty the part of the population that has been unable and continues to be unable to function in a market economy.

An important objective of social policy in Poland is to ensure that citizens can spend their last years in a peaceful and dignified manner. It is justified to emphasise the importance of this objective given that the life expectancy of Poles is steadily increasing while the number of working citizens is decreasing. In the second quarter of 2019 the population of working persons amounted to 16,484 thousand (of which the vast majority were people of the working age - 96.1%, i.e. 15,833 thousand employed) and increased compared to the previous quarter (by 1.3%), but decreased compared to the previous year (by 0.5%)**Error! Reference source not found.**.

An important social policy objective is to ensure the right of everyone to decent and freely negotiated work. This objective also includes the provision of safe work conditions and a time frame, in which the worker is able to participate in family life, recover and, where possible, participate in leisure activities. It is as if another, higher stage in specifying the objective to be achieved by social policy. An extremely important and, in part, controversial objective is to strive to ensure the right of all citizens to health protection and living conditions in an environment free from threats to human life.

The implementation of sub-tasks to achieve the objectives requires adherence to certain principles. Their content is not always made available to the public as certain content may not appear to be fully popular and accepted by the general public for policy-makers at state level. Nevertheless, in the public space there are usually five principles which should be applied in social policy in the name of the primary objective of reducing poverty while ensuring the economic security of the state.

The first and seemingly basic principle is ***to respect the revenue criterion***. This means that all social assistance activities should be based on a documented revenue per person in the family or other basic social unit. This means that social assistance should be directed only to the poorest people. It is unreasonable to allocate funds to the wealthy, middle-heavy or financially viable.

The second principle in conducting social policy as understood by the author should be ***equal opportunities for everyone***. It is nothing less than a philosophy of thinking and acting, which should be the guiding principle of the bodies dealing with social policy in the state. It is unfair and not understood by everyone to favour certain social or professional groups at the expense of the rest of society. The objective should therefore be to eliminate such cases by treating society as a whole equally.

The third principle relates to ***compliance with the subsidiarity criterion***. Its essence is that state's social assistance should be activated only when other activities related to providing aid have not brought the assumed positive effects. Social assistance should be applied in practice when other ways of solving social problems are less effective or cannot be applied in practice.

The content of the fourth social policy principle is ***compliance with the efficiency criterion***. Currently, there are situations in Poland where unjustified spending of financial resources takes place. Sometimes they are apparent or even fictitious actions. Therefore, there should be a principle forcing officially operating entities to make effective use of the funds allocated to social policy. This can be achieved by introducing statutory provisions introducing an obligation to evaluate to what extent the assistance provided has been effective in a given place and time. It seems appropriate to carry out ex-ante and ex-post evaluations while monitoring the effectiveness of the policy on an ongoing basis using quantitative indicators. The presented proposal is the result of the analysis of the results of activities carried out by the Supreme Chamber of Control in twenty-one county labour offices in Poland. This audit showed that over the long term, this effectiveness has decreased significantly. After two years from the beginning of the activation period, public works proved to be the least effective form of activation (the permanence of employment calculated by county labour offices decreased from 76.5% - after three months - to 9.5% - after two years) and internships (a decrease from almost 78% to less than 27%). The permanence of employment remained at a high, almost unchanged level in the case of subsidies for business activity (a drop from over 93% to about 87%)[1].

The fifth and, in the opinion of the Author, the last principle to be taken into account in the process of conducting social policy is ***respecting the development criterion***. It means that social policy should be geared to helping people go out of poverty, not to preserving in poverty. Such an assumption has huge consequences in the way social policy is distributed.

When assessing the content of the principles of social policy one cannot fail to notice their importance for the economic security of the state. It is based on the fact that the application of the rules may reduce unnecessary spending of the state budget funds and at the same time lead to professional activation of part of the society, which may translate into an increase, although in part of the Gross Domestic Product.

Principles as a kind of dogma and a certain framework are necessary from a state perspective. However, it seems worthwhile to supplement the content of the rules with postulates or requirements articulated by the Association of Entrepreneurs and Employers and the Warsaw Enterprise Institute Foundation. Thesetwoorganisationsbelievethatsocial policy should be:

- predictable, so that citizens can feel secure in the long term;
- flexible, which should be understood as being able to respond to a changing situation;
- coherent across the state without division of tasks into individual ministries, which should result in more efficient management of funds allocated for social assistance;
- activating, understood as activities supporting citizens in solving their problems at an early stage;
- accessible, in terms of information on where, when and how to get help in difficult life situations;

[1]Report by the Supreme Audit Office Efficiency of labour market services The Supreme Audit Office, Warsaw, November 2018 [pol. Efektywność świadczenia usług rynku pracy Najwyższa Izba Kontroli Warszawa, listopad 2018]

- effective, in financial terms, allowing to achieve greater effects in relation to the expenditure on the social assistance administrative system;
- open - being a place where it is possible to exchange information, receive data about the foundations, health services or other data of interest to individual providers;
- modern, through the use of the latest IT systems to collect information and use it online;
- open, i.e. able to cooperate both with state and local government institutions and all kinds of non-governmental organisations.

Expectations concerning the functioning of social policy presented in the form of postulates are not only a set of so-called pious wishes. According to the author, it is necessary to consider their sense and, as far as possible, adapt today's system to the requirements of the 21st century. This may, on the one hand, increase the effectiveness of social assistance, and on the other hand, it will not be dangerous for the state budget.

Conditions for conducting social policy in Poland

Social policy in Poland is conducted under specific conditions here and now. It is therefore appropriate to consider what conditions and why affect the shape and a way to conduct the social policy. The analysis of the current state of implementation of tasks resulting from the state's obligation to conduct social policy shows that it is at least partly dependent on a number of various conditions. Among these, internal and external factors can be distinguished. The internal factors include, in the first place, those resulting from the political system in force in Poland and political activity. They materialize primarily through the functioning of parliamentary democracy and the participation of local governments in the implementation of a number of tasks in the local market. Not without significance in this area is the centralization of activities related to social assistance and the quantitative and qualitative status of the institutions assigned for this purpose in Poland.

An important internal factor determining the conduct of social policy is the economic level of Poland. It is the amount of GDP, the unemployment rate and the amount of social security contributions that influence the shape and quality of social policy. Adding to this the low qualifications of a part of the society, the existing social infrastructure, underdeveloped housing and the existing labour market, there is an under-efficient and under-effective social policy system in Poland.

The important factor determining the functioning of social policy in Poland is the human factor. The first place in this respect is the ageing of the population, which is the result of several factors. First of all, the decreasing number of birthdays should be mentioned as the cause of the ageing population in Poland. Meanwhile, Poland has been experiencing a systematic decline in the number of births for several years, which in a straight line leads to the so-called birth depression (Głowacka, Jarosz, Włoszczak-Szubzda, Dzierżek, 2011, p. 89). In the second decade of the 21st century, the number of births is almost half of the size recorded in the mid 1980s, the last baby boom. For example, in 2013 the total fertility rate was 1.26, which means that for every 100 women aged 15-49 there were only 126 children born. Demographers estimate that the stability of demographic development is only guaranteed by a factor of 2.10-2.15[2]. Another factor causing the ageing of the population in Poland is the extension of the population's life span. This applies first of all to people classified as the oldest category, which clearly accelerates the phenomenon of population ageing (Szukalski, 2008, p. 33). The last thirty years have seen a systematic increase in life span in Poland, which has increased by more than seven years for men and by about six years for women[3]. It is also important from the point of view of the ageing of the Polish society to increase the age at which women decide to give birth to their first child. The reason for this is a number of determinants, such as a longer period of study or greater professional activity of women. This has led to a shift in the fertility of women from the 20-24 age group to the 25-29 age group with a significant increase in fertility in the 30-34 age group. As a

[2]Podstawowe informacje o rozwoju demograficznym Polski do 2014 r., GUS, Warsaw, January 27, 2015, p. 4.

[3]Ludność. Stan i struktura oraz ruch naturalny w przekroju terytorialnym w 2018 r. GUS, Warsaw, 2019, p. 16

consequence of these trends, the last 10-15 years have seen a 4-year increase in the median age of women who gave birth under 30 to a child. The average age of women giving birth in Poland is currently around 28 years[4].

A decrease in the number of marriages is also noticeable. At the end of 2010, there were almost 9 million marriages in Poland, and already since 2018 it has been noted that their number is decreasing, which means that each year the number of newly concluded marriages is lower than the number of marriages dissolved (by death or divorce). For example, in 2010, new marriages were more than 8,000 fewer than those that were dissolved, but already in 2017 and 2018 the difference is more than 30,000[5]. This means that the overall number of marriages in Poland is decreasing and this is a noticeable trend in recent years.

Another factor determining social policy is the fact that people living in informal relationships are increasingly choosing to have children. Such an approach may lead in the near future to a further decline in the birth rate, with the consequent deepening of the demographic crisis. Statistical data show that for several years the share of extramarital births has been systematically increasing. At the beginning of the 1990s, about 6-7% of the children were born in extramarital relationships. In 2000 it was already about 12% of children. In the 21st century, there has even been a leap forward and in 2013, more than 23% of children were born outside of formal marriages[6].

The presented selected conditions of conducting social policy in Poland, in a straight way leading to the phenomenon of demographic ageing, are the consequence of, among others, the processes taking place. They are conditioned by a tangle of changes taking place in the contemporary world. All this makes it necessary to take a new look at the approach and implementation of social policy in Poland in the first half of the 21st century as an element of economic security.

Scope of the subject matter of social policy in Poland

The social policy realized (conducted) in Poland is perceived as an important element ensuring the sense of security of the whole society. This activity can be seen as a narrow or wide undertaking. It is usually mentioned from the theoretical point of view that the subject of social policy is labour, health, education and upbringing (culture) and also housing (Szarfenberg 2003, p. 73).

Labour, as creating conditions for the professional activity of individual members of society, is mentioned in the first place. Labour, also understood as an employment opportunity, can be seen in two aspects - economic and political. From the point of view of an individual person, it is usually seen as an opportunity to obtain a livelihood. At the same time, given the essence of social policy as an activity of "public management of social risks", it is important for the effective management of these risks to ensure that citizens can earn an income by providing jobs (Esping-Andersen, 2010, p. 52). Such activities allow for the provision of services related to the activation of people and shielding activities addressed to the society.

Health as a subject of social policy is one of the most important components of the public good, also called national wealth. A healthy society generates national income and does not require state budget expenditure. In this understanding of health as a subject of state policy, there should be not only verbal but real concern about ensuring adequate health standards of the society. This concern should rest on the shoulders of the state, local governments, NGOs, public and private organisations. Every person - a member of society - should also participate in this activity (Nosko 2005, p. 135). In order to maintain the proportion of responsibility, it should be noted that, on an individual - personal level, good health should be seen as one of the key factors determining quality of life.
Education and upbringing, sometimes with the additional term "culture", are another component of the concerned perception of social policy in Poland. It should be noted that at the beginning of the

[4]Sytuacja demograficzna Polski do 2017 r. Urodzenia i dzietność, GUS, Warsaw, 2018, p. 12
[5]Rocznik Demograficzny 2018, GUS, Warsaw, 2019 p. 221
[6]Małżeństwa oraz dzietność w Polsce, GUS, Warsaw, 2016, p. 12

21st century, it is education and competences that are an important determinant of every person's life chances. Such an understanding of education and the competences possessed results in the fact that education is treated in Poland as one of the basic instruments for increasing chances on the labour market and counteracting the phenomenon of social exclusion of people[7].The universal right of citizens to education is nowadays treated as one of the fundamental social and economic rights that should be guaranteed by the state. It is widely accepted that it is not the most important thing to have a diploma itself, but it is important to acquire and have the knowledge, skills and ability to perform specific tasks. It is obvious that the range of human skills should be based on qualitatively correct education. Today we have an agreed list of key competences in the European Union, which includes, among other things, the need to communicate not only in one's mother tongue but also in foreign languages, mathematical competence together with basic competences in science and technology, digital competence, learning to learn, social and civic competences, sense of initiative and entrepreneurship, and cultural awareness and expression.

Today's view of the education system should enable people to achieve objectives that are articulated by the state but are intended to provide conditions for individual development. This requires care to ensure that each person's individual chances for a good education do not depend on their personal, social or economic situation. These assumptions are not always met, but it is the duty of the state to ensure that the possibility of access to good education is not limited. It is also expected that the state and educational institutions will be aimed at improving social integration, especially of marginalised groups and persons, and additionally they will receive support adequate to the reported needs and capabilities of the state.

Housing as a commonly used term when dealing with the issue of this perception of social policy is nothing more than housing as a whole implemented in a town, region or country. From the point of view of every person it is extremely important because having a roof over one's head is one of the basic human needs (Szelągowska 2011 p. 22 - 31). It is decent housing conditions that are an important prerequisite for the proper functioning of individuals, families and entire social groups. However, it should be remembered that part of the Polish society does not have sufficient income to meet its housing needs independently, at an appropriate level and in a stable way.

Another point of view on the problem of housing is presented by the “Habitat for Humanity Poland” Foundation. The Foundation shows that in Poland there are only 366 dwellings per 1000 inhabitants with an average of 460 in Europe. It is also true that there are more and more apartments on the market, but they are difficult to access because today's average earnings allow you to buy less than one square meter of flats at best.

Conclusions

Economic security is a kind of foundation for the proper functioning of all, every society, including Polish society. This sense of security is a derivative of many factors and events not always fully dependent on man. One should strive to know them in every situation and on this basis take action to ensure a sense of security for all people. Considering the economic and population situation in Poland, it is advisable to focus the efforts of the authorities and the entire society on several key issues that have a significant impact on the sense of social security. The research shows that these issues are:

- conducting effective activities ensuring proper medical care and prevention for every person;
- organizing the education system in such a way that it enables the removal of inequalities and allows an equal start for every child;
- conducting effective housing policy, thanks to which each family will have its own apartment.

The aforementioned areas of the state's activity related to ensuring economic security are not a simple task for them, but without trying to resolve them, it may turn out that the economic security of Polish women and Poles may deteriorate in the future.

Modelling logistics services in the supply chain

Tomasz SZCZEPANIK

Politechnika Częstochowska, Częstochowa, Poland

tomasz.szczepanik@wz.pcz.pl

Abstract

The article addresses cooperation and business relationships in the supply chain between logistics centres and courier companies using the CL offer. It presents a model of functioning of courier companies in logistics centres, a model of providing courier services with the use of infrastructure, IT systems, modern technologies and coordinators of logistics processes offered by logistics centres. The analysis concerns the impact of IT systems offered by logistics centres on the execution of courier services and business relationships in the supply chain.

Keywords: Modelling, Supply Chain, Logistics Services, Business Relationships

Supply chain relationships between business partners

The concept of the supply chain has changed the perception of business cooperation in meeting customer needs from an inward to an outward orientation. Perceiving solely own benefits and basing cooperation on the above does not determine the maintenance of beneficial business relationships and achievement of desired results [1]. It is crucial to be outwardly oriented and understand that the final form of a product or service is not the result of the work of one organisation but a network of interdependent entities [4]. A supply chain can be viewed as activities related to the transport and processing of goods, from sourcing all kinds of raw materials to delivering the product to consumers. The concept also includes the flow of information which is relevant during the entire process [5].

In the supply chain, relationships between its links, which may be following: tangible – related to the movement of goods, and intangible - involving the exchange of information, communication, and services can be observed [29]. It can be assumed that in the supply chain, customers are the entities that give rise to decisions made in the supply chain, as they create the demand that drives the supply chain [8]. Thus, the supply chain is to ensure a fast and efficient flow of goods while minimising its costs. It is worth mentioning that the main goals of the supply chain include: [10]

- Market adaptation - understood as the readiness to adapt supply chain design to changes in market structures and adapt supply networks to the company's strategy, products and technologies,
- Flexibility - expressed in the ability to respond to changes in demand and supply as well as quickly identify and remove internal disturbances,
- Taking account of the interests of business partners on both sides - by developing an incentive system for greater efficiency and identifying success factors.

Developing cooperation relationships with suppliers, using intermediaries to acquire new suppliers and new logistics infrastructure, creating flexible designs of logistics products and services, achieving a free information exchange with suppliers and customers, and a customer needs assessment are among the various methods employed to achieve those goals.
Building relationships between its partners, which can result in mutual benefits, constitutes a significant part of the supply chain. Not only the offered product or service is the final effect of the flows in the supply chain, but also the impact of the interaction between the cooperating parties on

their development and functioning. That is not a form of independence from the business partner but interdependence resulting from close cooperation and adjustment of the offer to the environment [16]. The cooperation of courier companies with logistics centres consists in using the potential of logistics centres in the execution of courier services.

A logistics centre can be described as "a spatial object with its own organisation and infrastructure enabling various independent companies to implement activities on goods in connection with their storage and transfer between the consignor and consignee including handling intermodal transport and performing activities on resources used for this purpose" [14]. Its infrastructure consists of warehouses, storage yards, railway container terminals and buildings such as employee hotels, petrol stations, vehicle service stations or food courts, customs services, insurance companies - i.e. places where additional services are provided [17]. It should be stressed that the logistics centre is an independent enterprise whose task is to "coordinate logistic, storage and transport services along with the information flow, as well as control activities" [26]. A logistics centre can also be defined as "a spatially functional facility with its infrastructure and organisation, in which all types of logistics services related to the receipt, storage, distribution and release of goods, as well as support services delivered by economic entities independent of the consignor and consignee, are performed" [7]. It can be noted that the logistics centre is a multi-entity organisation of a high degree of complexity [22]. The multi-faceted nature of a logistics centre allows it to provide comprehensive logistics services. The logistic centre is supposed to enable the performance of specific logistic processes due to its extensive infrastructure and good organisation [20]. The wide range of possibilities offered by the logistics centre makes customers and contractors willing to use its services. Thereby, it becomes competitive among companies delivering logistics services.

Courier companies are operators providing courier services, the essence of which is to "collect a shipment from the consignor by courier and deliver it directly to the consignee". [19]. It should be mentioned that its essential element is the quality standards of provided services, offers of courier companies, and technologies used in the processes of order execution. The reason is that the contemporary courier market, both domestic and international, offers customers solutions tailored to their needs and expectations [13]. Today, Delivery of consignment is a comprehensive service, realized following the principles of logistics, whose priority is customer satisfaction [6].

Courier companies using external logistics services are provided with specialist and reliable service without the maintenance costs they would have to face in case they were to organise their own logistics services and maintain the necessary logistics infrastructure for this purpose. The time and resources saved in this way can be channelled into developing the core business, thereby increasing efficiency. An undoubted advantage lies in the increase in the satisfaction of contractors cooperating with logistic centres and customers thanks to professional service that is a sign of improving the level of customer service [2]. The positive aspects of the application of this method have contributed to the development of the courier transport industry and the establishment of courier companies offering a range of additional services as well as dedicated solutions for companies. Courier companies increasingly see their development and effectiveness in the efficient management, IT systems [18] and modern logistics infrastructure, all of which can be provided when located in a logistics centre [25]. The offer of the logistics centre is extensive and diversified, which makes companies perceive the logistics centre in terms of expected benefits in the form of professional and efficient customer and contractor service, as well as gaining a competitive advantage over other companies offering courier services.

Organisation of Logistics Services in the Supply Chain

Logistics services include commercially performed forwarding, transport, warehousing, as well as related ones and those supporting the process of flow of goods between the links of the supply chain [11]. The areas of undertaken logistics activities by logistics service providers in an enterprise comprise supply, production and distribution [12]. Logistics service is organised and provided by a specialist company that manages the logistics system of another company [9].

As indicated above: "logistic services include commercially performed forwarding, transport and storage services" [12] which include courier services. Their task is to "take over the consignment from the consignor by a courier and deliver it directly to the consignee" [19]. "The areas of logistic activities undertaken by logistics service providers in an enterprise are procurement, production and distribution" [12], where courier services can be used in both procurement and distribution, thus supporting the flow of goods between the links of the supply chain [23]. Figure 1 displays a proposed model of the operation of courier companies in logistics centres.

Figure 1: Model of operation of courier companies in logistics centres
Source: Study based on [22]

IT systems in the logistics centre are employed to plan, coordinate, and control activities both inside and outside the organisation (*business partners*), including customisation to the customer needs [3]. The logistic structure includes companies cooperating with the centre and using the provided infrastructure. Logistics processes focus on customer service, building relationships, order fulfilment, demand management, and integrating and coordinating activities taking place in the centre. The courier company cooperating with the logistics centre uses each of the three areas of the centre's operation in the implementation of courier services [21]. The proposed model of courier services in the logistics centre is presented below.

Figure 2: Model of courier services in a logistics centre
Source: Study based on [6], [8]

When providing courier services, the courier company applies the IT systems available in the logistics centre to enable efficient information flow and uses the logistics infrastructure to ensure an uninterrupted shipment flow. Logistics process coordinators, who supervise the course of courier services from the forwarding point through the activities carried out in the centre to the transport to the reception centre, assure synergy of logistics processes in a courier company.

The impact of IT systems on Supply Chain Relationships

A logistics centre that intends to provide logistic services at the highest possible level, taking advantage of modern solutions, is forced to employ an IT system. The use of such modern technologies is inextricably linked to the possession of suitable computer hardware and software. Due to the high level of specialisation and complexity of services, logistic centres offer comprehensive service to their customers. It includes transport, storage, formal and legal services, and other additional ones. Therefore, it is necessary to use an IT system to provide full service efficiently. The logistics centre that has implemented the IT system is positively perceived, which improves its image. The research hypothesis is to study the influence of IT systems in the centres on the functioning of courier companies and relationships in the supply chain. The research task was executed by constructing two survey questionnaires addressed to courier companies and logistics centres. The surveys covered some of the European Union Member States. The questionnaire was sent to 90 logistic centres where courier companies operate and 90 courier companies located in these logistic centres. Completed questionnaires were received back from 58 logistic centres and 53 courier companies. The survey aimed to examine pairs formed by the logistics centre cooperating with the courier company; therefore, from among the received completed questionnaires those without pairs were rejected. Hence, 44 logistics centres and 44 courier companies constitute the surveyed sample. The survey was conducted from September 2019 to January 2020 through a questionnaire.

The survey directed to courier companies allowed for a detailed analysis of their activities, determining, among other things, the effectiveness of courier deliveries, "understood as the degree to which the courier company's objectives are achieved" [28]. As the courier company assumes the aim

of delivering consignments to customers: [27]

- executed within the deadlines set,
- implemented without errors,
- realised in the full specification of the products ordered and
- carried out flexibly, adjusting the delivery time to the customer [1]

these elements were examined by determining the level of their effectiveness based on the respondents' answers [15]. Table 1 presents the execution of courier deliveries considering the set delivery dates.

Table 1. Execution of courier deliveries within the set deadlines

Are courier deliveries executed within the set deadlines?	Frequency	Percentage
often (60% of deliveries)	*4*	*9,09%*
very often (80% of deliveries)	*34*	*77,27%*
always (100% of deliveries)	*6*	*13,64%*
Total	*44*	*100%*

Source: Own study based on survey results.

Table 1. shows that 34 of the surveyed courier companies (77.27%) state that they very often, 6 entities (13.64%) always, while 4 respondents (9.09%) frequently deliver shipments on time. It proves that 6 courier companies are 100% effective in delivering consignments on time, 34 entities are effective in this respect in 80% and 4 respondents in 60% of deliveries.

Assuming that the limit of satisfactory effectiveness is at the level of 80%, 40 courier companies are effective in courier deliveries on time, which constitutes 90.91% of the surveyed companies. The surveyed courier companies were asked about the frequency of errors in courier deliveries. Table 2 presents the results obtained.

Table 2: Execution of courier deliveries without errors

Are courier deliveries executed without errors?	Frequency	Percentage
very often (80% of deliveries)	*30*	*68,2*
always (100% of deliveries)	*14*	*31,8*
Total	*44*	*100,0*

Source: Own study based on survey results.

Table 2 shows that 30 of the surveyed courier companies very often deliver shipments without errors, while the remaining 14 respondents always do so. Therefore, 30 courier companies (68.18%) are 80% effective in delivering consignments without errors, whereas 14 respondents (31.82%) are 100% effective in this aspect. It follows that, with the assumed limit of satisfactory effectiveness at the level of 80%, all the surveyed courier companies are effective in delivering shipments without errors. Moreover, the survey questionnaire allowed examining how often courier deliveries are carried out in full product specification. This issue is presented in Table 3.

Table 3: Execution of courier deliveries in the full specification of ordered products

Are courier deliveries executed in the full specification of ordered products?	Frequency	Percentage
often (60% of deliveries)	*1*	*2,27%*
very often (80% of deliveries)	*36*	*81,82%*
always (100% of deliveries)	*7*	*15,91%*
Total	*44*	*100%*

Source: Own study based on survey results.

As Table 3 shows, one surveyed courier company (2.27%) declares that it often delivers shipments in the full specification of ordered products, while 36 entities (81.82%) do so very often, and 7 (15.91%) always. Among the surveyed courier companies, 97.73% of them perform deliveries effectively. Given the limit of satisfactory effectiveness at the level of 80%, 43 courier companies are effective in delivering consignments in the full specification of ordered products, which constitutes 97.73% of the research sample. The survey also allowed to identify whether courier companies adjust the time of delivery to customers, which is displayed in Table 4.

Table 4: Execution of courier deliveries by adjusting the time of delivery to the customer

Are courier shipments delivered flexibly, with the delivery time adjusted to the customer?	Frequency	Percentage
often (60% of deliveries)	*13*	*29,55%*
very often (80% of deliveries)	*31*	*70,45%*
Total	*44*	*100%*

Source: Own study based on survey results.

Table 4 shows that 13 courier companies (29.55%) often adjust the time of delivery to the customer during the service implementation, while 31 entities (70.45%) admit that they do so very often. It means that 70.45% of courier companies appears effective in taking account of the time of shipment delivery to the customer.

The data collected enabled the assessment of the impact of using IT systems on the logistics centre management. The information obtained from the study allowed the determination of the IT systems class used by logistics centres. Table 5 presents the percentage division of logistics centres according to the use of specific classes of information systems (from the survey directed to logistics centres).

Table 5: Information system class used in logistics centres

		Answers	
IT system class used		N	Percentage
	12_2 – ERP	*44*	*100,0%*
	12_4 – CRM	*44*	*100,0%*
	12_6 – ERP II	*14*	*31,8%*
	12_8 - WMS	*35*	*79,5%*

Source: Own study based on survey results.

Table 5 shows that ERP and CRM systems were used in all surveyed logistics centres. 79.5% of the respondents applied WMS, while 31.8% ERP II class system. The survey questionnaire made it possible to examine whether logistic centres provide courier companies with an IT system (from the

survey directed to logistic centres). The collected results are presented in Table 6.

Table 6: Making the IT system available to courier companies by logistics centres

Does the logistics centre allow courier companies to use its IT system?	Frequency	Percentage
Yes	*44*	*100,0*

Source: Own study based on survey results.

Table 6 presents the findings of the survey, which identified that all surveyed logistics centres allow courier companies to use their IT systems. It means that logistics centres provide courier companies with both logistics infrastructure and IT systems to ensure proper handling of logistics processes. Table 7 presents data on the possibility of using the logistics centres' IT system by courier companies (from the survey addressed to courier companies).

Table 7: Possibility of using the infrastructure of logistics centres by courier companies

Does the logistics centre allow courier companies to use its IT system?	Frequency	Percentage
Yes	*44*	*100,0*

Source: Own study based on survey results.

Table 7 shows that all surveyed courier companies have the possibility to use the IT system employed in logistics centres. The survey identified how many systems offered by logistics centres courier companies apply (from the survey directed to courier companies). Table 8 displays the obtained and developed data.

Table 8: The number of IT systems offered courier companies to use by logistics centres

How many IT systems offered by the logistics centre are used by the courier company?	Frequency
1	*14*
2	*22*
3	*8*
Total	*44*

Source: Own study based on survey results.

As can be seen in Table 8, 14 courier companies (31.82%) use one, 22 respondents (50%) two and 8 (18.18%) three IT systems from the offer of logistics centres. The questionnaire allowed the examination of the impact of the IT system employed in logistics centres on the efficiency of information flow of the courier company (from the survey among courier companies), which is presented in Table 9.

Table 9: The extent to which the use of the IT system of logistics centres affects the efficiency of courier company's information flow.

To what extent does the use of the logistics centre's IT system affect the efficiency of the courier company's information flow?	Frequency
Average	*32*
Large	*14*
Total	*44*

Source: Own study based on survey results.

As shown in Table 9, 32 courier companies (72.7%) state that the use of the IT system offered by logistics centres to the average extent determines the efficiency of information flow in their companies, while 14 surveyed entities (27.3%) describe this impact as high. As a further step, the possibility of using the logistics centre's IT system by a courier company (from the survey directed to courier companies) and the class of IT systems used in the logistics centre (from the survey addressed to logistics centres) were examined. Cross-table 10 was drawn up for this purpose.

Table 10: Does the logistics centre allow courier companies to use its IT system? * What class of information systems is used in the logistics centre?

Cross - table							
			Class of systems from logistics centres' offer				Total
			MRP II	ERP II	ECR	WMS	
Does the logistics centre allow courier companies to use its IT system?	Yes	Number	*44*	*44*	*14*	*35*	*44*
Total		Number	*44*	*44*	*14*	*35*	*44*

Source: Own study based on survey results.

Due to the constancy of answers provided by logistics centres, the Chi-square test was not performed in the question of enabling the IT system to courier companies (Table 10). However, it can be noted that courier companies can use IT systems of all logistics centres, regardless of the class of systems applied. All logistics centres allow the use of their respective system classes, which has an impact on the efficiency of courier deliveries. It can, therefore, be concluded that the smooth information flow resulting from the use of the logistics centres' IT system by the courier companies affects the level of the courier services provided, which is reflected in the efficient delivery of courier services. The following step was the assessment of the impact of IT systems on improving the functioning of the centre (from the survey received back from courier companies) and the possibility of using the logistics centre's IT system by the courier company (from the survey to courier companies). To this end, Cross-table 11 was created.

Table 11: What is the impact of IT systems on improving the functioning of the centre? * Does the logistics centre allow courier companies to use its IT system?

Cross - table				
			Does the logistics centre allow courier companies to use its IT system?	Total
			Yes

Total		Number	*44*	*44*
		% in column	*100,0%*	*100,0%*

Source: Own study based on survey results.

Table 11 shows that the test was not performed since all surveyed logistics centres answered in the

affirmative when asked about the possibility of using the logistics centre's IT system by a courier company. However, it can be noted that among courier companies using the logistics centres' IT system, the influence of IT systems on improving the functioning of a logistics centre is noted as average by 22.7% of the respondents, and as a large and very large respectively by 61.4% and 15.9% of the surveyed courier companies. It follows that courier companies highly evaluate the influence of IT systems used by logistics centres on the improvement of the functioning of logistics centres, which they use to deliver shipments and obtain the support of logistics process coordinators. That proves that the efficient flow of information affects the high level of courier services provided. It translates into good relations and confirms the research hypothesis. Then the number of IT systems used by the courier company (from the survey directed to courier companies) and the class of IT systems used in the logistics centre (from the survey addressed to logistics centres) were investigated. For this purpose, Cross-table 12 and Table 13 showing the Chi-square test were created.

Table 12: How many IT systems offered by the logistics centre are used by the courier company? * What class of IT systems is used in the logistics centre?

N important observations	*44*		

P = 0,05
Source: Own study based on survey results.

Table 13 shows no statistically significant relationships between the variables (p = 0.999). The distribution of the number of IT systems used by a courier company is similar among logistics centres offering specific IT system classes. Almost 50% of courier companies applied two, about 33% of the respondents one, and nearly 17% three IT systems offered by logistics centres. The effectiveness of courier deliveries is possible due to the efficient flow of information provided by IT systems in the logistics centre. Therefore, it can be concluded that efficient information flow influences the high level of provided courier services, which has an impact on positive business relationships.

The dynamics analysis of the phenomena by evaluating relationships between variables, and showing differences in the distribution of response rates between the groups indicates that the main objective of the work has been achieved. It was to examine the effectiveness of courier services in logistics centres as determinants of relationships in the logistics centre. The tests and calculations made it possible to positively verify the hypothesis that the impact of using the centres' IT systems on the functioning of courier companies and relationships in the supply chain exists.

Conclusion

Courier companies need an increasingly advanced IT system to support their management processes. The use of an IT system in logistics centres contributes positively to the improvement of business processes of courier companies. Equipping logistics centres with modern IT systems, RFID technology, and offering logistics process coordinators are the main elements considered when choosing the location of a courier company. That is why logistics centres, with courier companies in mind, endeavour to prepare their offer for their needs. Hence the logistic centres are becoming increasingly crucial for the development of courier services. The relationship that occurs in cooperation between the logistics centre and the courier company consists in the effective execution of logistics services. This refers to both current activities improving the flow of goods and information streams, and the implementation of strategies for financing logistics processes in the supply chain. Although the courier company is a business entity that operates based on logistics, the cooperation with the logistics centre is not a category of outsourcing logistics service, but a well-thought-out strategy that brings chances and opportunities to provide courier services at a higher level in dynamically developing supply chains.

Abstract

Issues related to the supply chain management are currently being given more and more attention. Supply chain consists of enterprises cooperating in various functional areas, and their customers, among which the flows of material, information and finance are visible. It is worth noting, yet rarely emphasized in the relevant literature, that apart from the indicated flows of materials, information and finance, there is a need to identify and examine the human flows (or people flows) in the supply chain. The research approach adopted by the authors was intended to answer the initial research questions: (a) What are the situations and rules for human flows in the supply chain? (b) Who is set for a secondment to the other links in the supply chain? The empirical results have been obtained during a three-stage research process. The nomothetic approach has been adopted in order to present an overall picture of the analysed problem. The role of the prepared survey was to identify human flows in the supply chain from the enterprises that are the leaders of that supply chain.

Keywords: human flows, supply chain, supply chain management, employee, secondment.

Introduction

Issues related to the supply chain management (SCM) are currently being given more and more attention. Supply chain (SC) consists of mining, production, commercial and service enterprises cooperating in various functional areas, and their customers, among which the flows of material, information and finance are visible. The function of such a network system is related primarily to the integration and coordination of network participants' activities through developing a coopetition strategy. It means the integration and coordination of material, information and financial flows, beginning from raw material acquisition to consumption. This creates a competitive advantage of the SC links and their customers. It is worth noting, yet rarely emphasized in the relevant literature, that apart from the indicated flows of materials, information and finance, there is a need to identify and examine the human flows (or people flows) in the SC.

According to S.T. Menon (2012) research in SCM has predominantly been the purview of research in the areas of operation management, logistics and information technology systems, with limited reference to human resources. The people dimension has been under-represented both in research and in practice (Sweeney 2013). However, according to Fawcett et al. (2008) people are the key bridge to successful collaborative innovation, and therefore, should not be overlooked. We agree with Sweeney (2013) that supply chains are about people: customers and suppliers. People are those who design, manage and execute SC operations.

Human flows in the Supply Chain

Issues related to the SC are of the upmost importance for suppliers, manufacturers and distributors. None of the SC's links can ignore any kind of flows in the SC: material, financial, informational and human. However, the last type, human flows, are not widely recognized by researchers and practitioners. The literature focusses mainly on the hard aspects of SCM (Stadtler and Kigler, 2011), while the soft aspects (including human flows) are not the main field of researchers' interest. Therefore, the authors of the article found it necessary to focus on existing literature gap.

There is even a lack of SC and/or SCM definitions that include people in the understood as human flows. They have been recognized by the working group of the Scientific Advisory Board of German Logistics Association – BVL through understanding logistics as an application-oriented scientific discipline (Delfamnn et al., 2010): "*the nature of logistics as a scientific discipline […], its interpretation of economic processes as flows of good, information, people, moneys and other objects and its multiperspectival approach to research on these networks*". The working group of researchers has underlined the flows of objects through time and space. Those objects are: goods, information, money and people.

However, in the relevant literature there is a wide scope of issues related to human activities in the SC. The observed lack of consistency in the terminology results in the necessity to identify commonly used terms. Some of the authors examine the so-called HR and SCM (Floethmann, Hoberg and Gammelgaard, 2017; Madani and Wajeetongratana, 2019) that is an integrated system that allows enterprises to develop unique and inter-organizational strategies. Other researchers analyse human capital in the SC (Zacharakis and Meyer, 2000; Kiessling, Harvey and Moeller, 2012; Gonzalez-Loureiro, Dabić and Puig, 2014) that should be understood as an important resource in the enterprise and the SC, especially in terms of people's working experiences. Furthermore, the theory of employee flow that refers to the flows of staff, both internal – intraflows, and external – inflows and outflows, has been presented by Lee (2010).

Although the flows of material, finance and information are widely accepted, the flows of human (or people) are rather unrecognized. The flows of people may be understood in two ways (Delfamnn et al., 2010):

1. From the technical perspective where people operate in any kind of logistics activities such as pickers, forklift operators, truck drivers, etc.
2. From the social perspective where people are actors with a certain level of freedom for the utilization of their actions.

Moreover, three assumptions of human role in logistics can be distinguished (Delfamnn et al., 2010). Firstly, the human as a production factor and/or market actor, whose behaviour may be anticipated likewise material, financial and informational flows. Secondly, the human as an actor with limited rationality and thirdly, the human as a *homo oeconomicus*.

Human flows in the SC have been also noticed by Yun (2017). Based on them the researcher noticed "HRM of the SC" and "human resource SC". The first approach suggests that employees of one enterprise may be transferred to another one in order to increase the production effectiveness. The situation is strongly related to the HRM even if allocation and optimization of HR is in a wider range. The main goal is to maximize the benefits of the SC. Therefore, HR are considered similarly to other resources such as machines, raw materials or energy inputs. Its allocation is only an aspect of resource dispatching. Material flows are the main activity in the SC, while HR activities are supplementary involving inter-organizational sharing, exchanging and cooperation such as: HR expatriating, technological supports providing, cross-organizational team-working, etc. The second approach suggests that enterprises form alliances that acquire HR from their partners. These HR start to be one of the flows in the SC where partners cooperate on the basis of their demand and supply as well as utilization. Therefore, human flows are of the upmost importance and core consideration of all SC's links. The topics related to the above mentioned issues usually refer to the: cooperating alliance

constructing, HR demand forecasting and supply analyzing, members' HR strategy formulating, the alliance's HR inventory policy optimizing, members' and the alliance's HR risks managing, etc. (Yun, 2017).

Nevertheless, despite noticing the essence of human flows in the SC, it seems that the term "human resource supply chain" appearing in the relevant literature illustrates the analogy of HR flows in the enterprise to the material flows in the SC. It can be defined as incorporating the structure and delivery channels of the HR function, the flow of HRM practices across the organization, and the management or governance techniques applied to ensure both structure and flow are operating effectively to reduce uncertainty and achieve organizational goals (Ferndale and al. 2010). Similar understanding is presented by Allen et al. (2013) who identified the concept of human SC with managing the flow of people through an organization as managing the flow of materials through a traditional SC. Other analogies of transferring the SCM methodology to the HR sphere can be found in Kumar (2003), who applied SC thinking to recruitment and Capelli (2008) who considered SC implication for internal talent development system.

This article does not present human activities understood in the perspective of HRM. The authors of the article focus on the SCM's perspective that categorize activities related to people as human flows, as it is with material, financial and information flows. The most suitable term that fits the author's understanding can be found in the theory of employee flow. It suggests that flows are a consequence of a high-performance workplace (Heskett, Sasser and Schlesinger, 1997). These require a high level of trust and integration with customers as well as suppliers. However, the role of the B2B relations cannot be overestimated. The deeper one relationship is more likely with a main supplier's employees (Lee, 2010). The competencies of various SCM employees in various SCs has been widely analysed in the relevant literature (Myers et al., 2004; Christopher, 2005; Kovacs, Tatham and Larson, 2012; Floethmann, Hoberg and Wieland, 2018). The theory of employee flow only partially explains the human flows in the SC. Issues related to that flows has been initially analysed by Lee (2010). The researcher examined people who were: promoted upwards, transferred to another account/division, left the supplier, transferred/promoted from elsewhere within the supplier.

Research Methodology

The research approach adopted by the authors was intended to answer the initial research questions:

1. What are the situations and rules for human flows in the SC?
2. Who is set for a secondment to the other links in the SC?

The empirical results have been obtained during a three-stage research process. The nomothetic approach has been adopted in order to present an overall picture of the analysed problem. The role of the prepared survey was to identify human flows in the SC from the enterprises that are the leaders of that SC. The SC leader is the coordinator of SC activities whose economic strength and position in SC are decisive. Accordingly, the SC leader ensures meeting the goals set for the SC.

The first stage of the research was an initial stage intended to identify the literature gap of the analysed problem as well as the research sample.

The second stage of the research process was a proper research conducted in fall 2019. The authors have thoroughly investigated the relevant literature from worldwide online databases such as World of Science and Scopus as well as industry and branch reports from Poland in order to distinguish types of enterprises selected for the analysis and situations for human flows in the SC. Therefore, the branches representing those types of enterprises are as follows: home appliances, construction, chemical, wood industry, electrical machinery industry, metal industry, electrotechnical, energy, retail, wholesale trade, medical/pharmaceutical, oil and gas, clothing/textile, food, telecommunications, transport/rail/logistics, armaments and other enterprises. Considering the size of the enterprise, authors of the article decided to examine medium and large enterprises. The minimum employment size was assumed for medium-sized enterprises over 100 employees. This choice resulted from the authors'

belief that in smaller business entities situations related to the human flows in SCs are not frequent. The situations when human flows occur are as follows: quality control, IT systems integration, audit, training, supplying the supplier's workforce in case of insufficient production capacity, replacement, accident, joint tasks/projects.

The spatial range of the research was limited to Poland. The structured interview tool has been applied in the research with the computer-assisted telephone interviewing (CATI) method. The research sample consists of 2469 enterprises. 1232 respondent (sampling frame) were included in the research process, where 500 respondents declared the occurrence of human flows in the SC, while 732 enterprises denied. The respondent was a HR manager of a particular enterprise that is a leader of the SC. The obtained results, after comparing them with the relevant literature, constitute a fundamental for diagnosing the role of the human flows in the SC. This stage gave the authors a relevant statistical data that helped to answer both research questions.

Therefore, the third stage of the research process was an analysis of the research data obtained from the stage two. It should be emphasised that the results of the interviews answered the questions from the following fields:

1. Duration of the human flows in the SC.
2. Rules and legal forms of the human flows in the SC.
3. Type of employees set for secondment.
4. Identification of the initiator of human flows in the SC.

Empirical Results

In the structured interview 500 enterprises declared the occurrence of human flows in the SC. In terms of the employment size there was 366 enterprises between 100 and 249 employees (see Table 1) as well as 134 enterprises over 249 employees (see Table 2). The most common situation when human flows in the SC occur is joint tasks/projects and then the audit. Human flows are not so popular in replacement and supplying the supplier's workforce in case of insufficient production capacity. The distribution of the number of situation for both groups of enterprises is similar.

Table 1: Human flows in the SC – period (from 100 to 249 employees)

Frequency	Quality control	IT systems integration	Audit	Training	Supplier' s workforce	Replacement	Accident	Joint tasks/ projects	Percentage
Up to several days at a time	30	35	75	96	20	8	31	273	78%
Once to several weeks	11	6	7	14	0	0	0	79	16%
Once to several months	4	1	0	2	0	0	1	2	1%
Cyclically every week	1	0	0	0	0	0	0	1	0%
Cyclically every month for several days	1	1	3	0	0	0	0	3	1%
Cyclically every year for several days	0	1	13	1	0	0	0	2	2%
Cyclically every year for several months	0	0	0	1	0	0	0	1	0%

Source: own calculations.

Considering the frequency and period for which human flows in the SC exist (see Table 1 and Table 2), both in the group of enterprises with up to 249 employees and in the group of larger enterprises, one-off, short-term (up to several days) flows dominate. This applies to all of the analysed situations. Importantly however, in the group of larger enterprises, the situations regarding cyclical human flows are more often observed. While in the group of smaller enterprises cyclical human flows constitute only 4% of the total flows, in the group of larger enterprises it is already 25%. Thus, it can be seen that in larger enterprises the tendency to build lasting relationships is increasing due to the repetition of human flows. This tendency is most evident when the recipient and supplier enterprises implement joint tasks/projects.

Table 2: Human flows in the SC – period (over 249 employees)

Frequency	Quality control	IT systems integration	Audit	Training	Supplier' s workforce	Replacement	Accident	Joint tasks/ projects	Percentage
Up to several days at a time	22	27	42	44	13	1	33	61	61%
Once to several weeks	14	4	7	0	0	0	0	16	10%
Once to several months	3	5	4	4	1	0	0	0	4%
Cyclically every week	2	2	1	0	0	0	0	9	3%
Cyclically every month for several days	0	4	1	2	1	2	2	23	9%
Cyclically every year for several days	2	5	16	5	2	0	1	14	11%
Cyclically every year for several months	0	0	2	1	1	1	0	1	1%

Source: own calculations.

Empirical studies (see Table 3) also identified the type of contract that forms the basis for the human flows between recipient and supplier enterprises. At the same time, two of the most popular solutions in business practice were considered, i.e. a contract between two business entities and an employee loan agreement, giving the respondents the opportunity to indicate other solutions. The research shows that the dominant form of the contract is the contract between the supplier and the recipient (63% of indications in the group of enterprises up to 249 employees and 55% in larger enterprises). However, it is worth taking a closer look at the results of the research, in situations of accident, replacement and the supply of the supplier's workforce, where employee loan agreement is dominant or at least comparable. This situation is observed in both groups of enterprises. It is also worth developing the thread of other agreements that involve the human flows in the SC. This indication was chosen by 25% of respondents in the smaller group and 30% in the group of larger enterprises. The analysis of their responses shows that these flows often take place without companies signing any contracts. This may indicate a high degree of trust and well-established, continuous cooperation between the SC links analyzed in the survey.

The research also identified the subjects of human flows (see Table 4). Respondents were asked about who are the people flowing between enterprises, considering the place in the hierarchy in the enterprise and the type of work performed. It constituted the criterion for separating such groups as: production and administrative employees as well as lower and senior management. The results of the research show that most often we observe the flow of direct production employees (39% of indications in the group of enterprises up to 249 employees and 4% in the case of larger enterprises) between enterprises.

Secondly, these flows concern administrative employees (34% and 33% respectively). They are much less often related to the management staff, with lower-level management staff flowing more often between enterprises (21% and 18%). And relatively rarely top-level staff (6% of flows in smaller enterprises and 3% of all flows in enterprises larger than 250 employees).

Table 3: Human flows in the SC – type of contract

Number of employees	From 100 to 249 employees			Over 249 employees		
Type of flow	**Employee loan agreement**	**Contract with supplier/recipient**	**Other**	**Employee loan agreement**	**Contract with supplier/recipient**	**Other**
Quality control	11	18	18	4	23	16
IT systems integration	9	19	16	9	21	17
Audit	24	49	25	17	27	29
Training	16	59	39	6	23	27
Supplying the supplier's workforce	10	9	1	3	8	7
Replacement	5	2	1	2	1	1

Percentage	39%	34%	21%	6%	46%	33%	18%	3%

Source: own elaboration.

Looking at the specific situations in which human flows occur, it can be seen that their subjects are production employees in the cases of joint tasks/projects, audits, quality control, supplying the supplier's workforce and accidents. In turn, administrative employees flow to supplier enterprises in situations such as the implementation of joint tasks/projects, conducting or participating in supplier training, integration of IT systems and accidents. Managing staff is most often a subject in the human flows in the SC in cases of joint tasks/projects and training activities.

Research shows that none of the parties to cooperation is the dominant initiator of human flows in the SC (see Table 5). Respondents indicated that SC leader initiate human flows in 41% in the group of smaller enterprises and in 47% of cases in the group of larger enterprises. This is especially the case in the situations such as audit, training, accident, supplying the supplier's workforce and replacement. In turn, suppliers are the initiators of human flows in 41% in the group of smaller enterprises and in 40% of cases in the group of larger enterprises. This most often applies to the implementation of joint tasks/projects, quality control, integration of IT systems and training. The research shows that the customer are the least frequent initiators of cooperation in the SC through the human flows between its links enterprises (respectively 18% in the group of smaller enterprises and in 13% cases in the group of larger enterprises). Analyzing this situation, it is worth noting that training is such an area of human flows, whose initiator in a relatively proportional distribution are all the analyzed entities, i.e. both companies that are SC leaders, as well as their suppliers and recipients.

Table 5: Human flows in the SC – the initiator

Number of employees	**From 100 to 249 employees**			**Over 249 employees**		
Type of flow	**My enterprise**	**Supplier**	**Recipient**	**My enterprise**	**Supplier**	**Recipient**
Quality control	7	31	9	11	26	6
IT systems integration	17	22	5	22	19	6
Audit	62	35	1	54	19	0
Training	45	32	37	26	15	15
Supplying the supplier's workforce	14	6	0	10	7	1
Replacement	7	1	0	4	0	0
Accident	31	1	0	26	10	0
Joint tasks/ projects	114	168	79	36	64	24
Percentage	41%	41%	18%	47%	40%	13%

The variables present in the study are measured on a nominal scale. In order to examine the relationship between these variables, the following correlations were determined: contingency coefficient[i], phi measure and Cramer V[ii]. Firstly, the type of situation was taken into account in the correlation, and then the number of situations. Based on these correlations (Table 6), it can be concluded that there is a very weak or weak[iii], significant relationship between the occurrence of individual situations in the period of human flows and the size of employment. The largest – moderate relationship exists between

the implementation of joint tasks/projects and the size of employment. Similarly, within type of contract, management level and initiator of human flows, there is a very weak or weak, significant relationship between the number of situations that occur and the amount of employment. Only in three situations correlations are not statistically significant, these correlations in tables 6 are marked with an asterisk.

Table 6: The correlations of situations in which there are flows of people with the size of employment in the surveyed company for the management level, initiator, situation and the period, and type of contract

Conclusions

The analysis of the research results allows to indicate several important conclusions:

1. Human flows are not identified in all SCs. Among the surveyed companies, 41% of entities indicated human flows.
2. The most common type of human flows in the SC is the implementation of joint tasks/projects.
3. Human flows in the SC are usually one-off and short-term (up to several days) in nature. However, in a quarter of cases, cyclical human flows are observed in the group of larger enterprises (over 249 employees).
4. The dominant form of the agreement regulating the human flows in the SC is the agreement between the supplier and the recipient. In selected situations (accident, replacement and supply of workforce), the employee loan agreement is used. Human flows also occur without formal contracts signed by enterprises.
5. Most often, there is a direct flow of production employees between the links of the SC. Secondly, these flows concern administrative employees (34% and 33% respectively). Definitely less often they concern managers.
6. No link in the SC is the dominant initiator of the human flows.

To conclude, human flows in the SC are important factor of every supply chain. Ipso facto, the cooperation of enterprises that is based on human flows tends to the efficient SCM. Nevertheless, authors of the articles are fully aware of the necessity of the further research that should include: the role of human flows in the SC integration, the determinants of the one-off and cyclical human flows as well as the role of the top-level management in operational issues within SC. The comprehensive mathematical models and regression methods are expected to be applied in the further research.

Abstract

State regulation of the housing sector based on achieving a balanced housing policy by the development and implementation of an assessment of the quality and comfort of living in new buildings is considered in this article. The proposed methodology for assessing the quality and comfort of living offers the possibility to determine the targets and indicators for the urban environment and the rating of residential complexes at the global level. The methodology is also used for improving quality levels of housing construction in general. The implementation of this methodology is possible using the functioning of the digital platform of scenario planning and forecasting.

Keywords: Regulation of The Housing Sector, Assessment System, Digital Platform of Scenario Planning and Forecasting.

Introduction

The housing market depends on two components: demand and supply. Destructive changes like stagnation with a consequent crisis of the entire industry can occur in the event of an imbalance of these components. The priority task of state policy is to regulate and stimulate the growth of supply and demand in the housing market and the construction industry.

Problem Statement

The theory and practice in the housing market research indicate its diversity as a segment of the economy. The complexity of the structure, as well as the interaction and mutual influence of all its stakeholders are taken into account when studying the housing market, in particular, economic and statistical analysis. Moreover, scientists from various countries are engaged in solving systemic problems and studying the patterns of residential mobility and the changing structure of the housing market. Delft University of Technology (Netherlands), the department of Housing Systems devotes considerable attention to the study and analysis of the supply and demand of the housing sector as well as the regulation of this relation using housing policy by the government management at the national and international levels.

Professor Bolhuver's research contains the analysis of the housing policy instruments used in seven European countries - the Netherlands, Belgium, Germany, Denmark, France, England, and Sweden. According to the results of the research, the author has identified three groups of housing policy instruments: regulation, subsidies, and direct budget investments.

In the Russian Federation, the research of the forms and methods of housing regulation has been described in several works written by scientists and practitioners of the Institute for Urban Economics Foundation — N.B.Kosareva, A.S.Puzanova, T.D. Polidi, I.K. Trutneva, and others.

A significant contribution to the development of theoretical approaches to the solution of the problems of investment activity management in the housing sector was made by O.K.Meshcheryakova, V.Ya. Mishchenko, E.Yu.Okolelova, S.A. Gryaznova, L.G. Dikman, I. A. Liberman, I.A.Rakhman, V.I.Resin, I.S.Stepanov, L.M.Chistov, V.G.Shabalin and others.

With a large number of scientific approaches, the effectiveness of the implementation of the housing policy of the state can be estimated through the universal indicator "Annual volume of housing commissioning, mln sq. meters ". Figure 1 shows these dynamics.

Figure 1: Residential commissioning process in the Russian Federation, mln. meters of the total residential area

The presented figure shows that the record number of square meters was put into operation in the Russian Federation in 2014-2015. In 2016-2018, the level of commissioning has annually decreased by a few percent. However, the supply on the housing market remains substantial. It is confirmed by the residential commissioning in 2019.

It is necessary to note the number of square meters that were put into operation by developers - Figure 2.

Figure 2: The volume of commissioning of apartment buildings by developers, mln sq. meters of the total residential area

According to this figure, in 2018-2021, a slowdown in the growth rate of real estate commissioning is expected due to the necessary adaptation of developers to changes in industry regulation due to the transition to the use of escrow accounts. Some projects will be delayed or reformatted due to the expected transfer of all projects to a new financing mechanism, including those that received building permits until July 1, 2018. This will lead to a redistribution of housing commissioning volumes in 2020-2021.

According to the analysis of Table 1, there is a conclusion that the difference between the square meters which were put into operation by developers and its sales has significantly increased in 2014-2016. Currently, there is a market balance between the volume of construction projects and the volume of sales. This allows predicting a decrease in the number of "problem" objects in housing construction. Additional measures are required to solve the problems associated with the imbalance in the housing market with projected volumes of residential commissioning by 2025 in the amount of 120 million square meters annually.

Table 1: The ratio of residential commissioning by developers and sales in the Russian Federation

Name of indicator (years)	2014	2015	2016	2017	2018
Sales under equity participation agreement, mln. meters	42,2	23,1	25,3	43,0	40,4
Residential commissioning by developers, mln. Sq. meters	48,0	38,9	41,7	46,2	42,4
Difference, million square meters	-5,8	-15,8	-16,4	-3,2	-2,0
Difference, %	12,1%	40,6%	39,3%	6,9%	4,7%

An increase in the demand level of citizens on the environment is a significant factor in influencing the state and development of the housing market. Perhaps this factor may complicate the activities of average developers. Today, environmental quality indicators such as safety, environmental friendliness, overall visual attractiveness, the convenience of domestic areas, the presence or even a variety of social infrastructure near the place of residence, transport accessibility of all urban areas are no longer underestimated, and its priority is not only dictated by global trends but also becomes a tangible argument in the competition of developers.

Research Questions

A strategic analysis of the state of the balanced development of the housing sector has made it possible to diagnose the following key problems:

- Low involvement of financial institutions in the housing sector;
- The growth of economic imbalances in the structure of expenditures on the production of housing goods: investing in an increase in housing assets;
- The rate of increase in the housing stock is constantly outdistancing the rate of increase in the amount of investments;
- The pace of housing construction is outdistancing the pace of providing new housing estates with social and engineering infrastructure;
- Low competition in housing construction;
- Application of unified approaches to the implementation of housing policy without taking into account its territorial differentiation based on the prospects for socio-economic, spatial and demographic development of regions, cities and other settlements.

Taking into account the above key problems, a large supply on the market and the transformation of citizens' approaches to housing choices, it is necessary to develop a system for assessing the quality

and comfort of living in new buildings and residential complexes under construction based on global quality standards adopted in the urban environment. This might allow developers and residents - potential buyers - to create approaches in housing construction that will help stabilize demand and supply as well as further development of the real estate market.

The functioning of this assessment system in the housing market of the Russian Federation will contribute to increasing market activity in terms of demand for residential real estate, as well as the formation of a healthy competitive environment among developers. Also, the functioning of this assessment system will be able to catalyze the development of advertising and marketing technologies which can positively affect regional macroeconomics.

Purpose of the Study

However, it is worth noting that the methodology is put in the first place by the development and implementation of such systems. The key efficiency factors and the basis for developing a methodology for assessing the quality and comfort of living for a balanced development of housing policy are the objectivity of the parameters and evaluation criteria, as well as the transparency of the formation and the results transmission.

Research Methods

The results of a strategic analysis of the housing sector became the basis for the development of a methodology for assessing the quality and comfort of living for a balanced development of housing policy in two areas:

• general criteria and indicators of the quality of the urban environment for all constituent entities of the Russian Federation (the urban environmental quality index that was introduced by Decree of the President of the Russian Federation No. 510 dated March 23, 2019, providing the assessment approach of cities by 36 indicators).
Indicators of the urban environment index are distributed in six areas: housing, social and business infrastructure and surrounding areas, social and leisure infrastructure and surrounding areas, green areas, embankments, street infrastructure, and citywide space, as well as environmental factors - safety, comfort, environmental friendliness, identity, and diversity, modern environment and management

Table 2: shows the assessment of specific residential complexes and surrounding areas by the levels and categories.

Level	Category	Characteristics of assessment
№ 1 «BUILDING»	«Architectural and design solutions»	• architectural aspect of the object; • architectural planning solution; • building density
	«Accessible environment»	• provision with ramps, lifts; • entrance without a barrier; • elevator equipment; • storage space for strollers
№ 2 «BUILDING - YARD»	«Security»	• fenced territory; • video control system; • security; • lighting of the yard
	«Infrastructure»	• utility rooms (basements, pantries); • built-in attached premises; • public premises
	«Improvement»	• planting • playgrounds for different age groups of children; • pedestrian paths, sports grounds,

		public areas, design objects, and small architectural forms
	«Transport»	• driving navigation; • parking; • markings and measures that impede the rapid movement on the territory of the residential complex; • implementation of the concept “yard without cars"
№ 3 «BUILDING - CITY»	«Social infrastructure»	• distance to the nearest kindergarten and school, hospital, park, square, supermarket, and other social infrastructure
	«Transport accessibility»	• distance to the nearest public transport stop; • safe road intersection; • number of public transport routes; • level of traffic flow to the object
№ 4 «BUILDING MANAGEMENT»	«Management company or homeowners partnership»	• ensuring compliance with obligations established by the contract, • organization of events for residents “Meet the neighbors” • planting events, organization of community cleanup

Findings

Thus, the proposed methodology for assessing the quality and comfort of living allows us to determine the targets and indicators for the urban environment at the global level, and for individual subsystems for rating residential complexes. The methodology is also used for improving quality levels of housing construction in general.

The advantage of this approach is to apply the set of targets, indicators, criteria, and parameters for assessing the spatial and economic development of the region. This allows studying the dynamics of indicative characteristics of various areas of housing policy in the region and diagnosing the indicators that impede the balanced development of the region by determining the direction of regional development for the long term.

The use of the digital platform of scenario planning and forecasting of the balanced development of housing construction is necessary for the successful application of this methodology. The platform simulates key indicators of quality and comfort and applies methods of regression and correlation analysis which allows obtaining various scenarios of the development of housing construction (inertial, basic and target), differentiated depending on the degree of the attainability of forecast values. Their application contributes to the adoption of certain state measures to stimulate housing construction by executive authorities in the future.

The model of such a platform implies the availability of a central processor. The processing of data, input and output subsystems and the creation of the database are applied in this processor. This model provides the creation of underlying layer of information (OpenStreetMap). The residential complexes that are in the construction or commissioning process will be graphically placed on the underlying layer. The ability to simulate the state of the housing sector will be available using specialized software and the above indicators, as well as a database of government support measures.

The software packages designed for modeling at the macro level that have been tested in developed countries of the world include the following packages: TransCad® (Caliper Corp., USA); EMME / 2

™ (Montreal University); TRIPS (MVA UK); CUBE SATURN (Leeds University, VISSUM (a component of the PTV Vision package, PTV AG, Karlsruhe, Germany).

A rather wide range of tools for modeling at the micro-level is presented on the market of simulation packages. For example, there are the packages which are widely used in European countries: AIMSUN2; DRACULA; Paramics SISTM; VISSIM.

The practical functioning of this methodology using the model involves:

- creation of a platform that combines information flows into the software on the assessment of indicators which are coming in real time with the ability of its interpretation;
- creation of a single control center with an appropriate support team and with the ability to continuously enter and update data in it, since such a system involves the dynamic change of information about an object;
- development of a subsystem for monitoring the implementation of the amendment regulations, which guarantees timely and complete processing by event operators of the assessment of the impact of state support measures.

Conclusion

This methodology for assessing the quality and comfort of living in new buildings will contribute to solving the following problems in the housing sector of the Russian Federation:

- stabilization of supply and demand in the housing market by encouraging developers to create a comfortable living environment in residential complexes and by increasing the importance of citizens' requests in the housing market;
- increasing the efficiency and competitiveness of regional developers and crowding out unscrupulous construction companies from the housing market;
- increasing the transparency of the provision of real estate services, including the provision of services of sales departments in the system of activities of developers in the construction of a residential complex;
- stimulation of management companies serving a particular housing complex to improve the quality of living during its operation focusing on the best indicators of a comfortable environment;
- balanced development of housing in the regions of the Russian Federation.

Abstract

Since Poland's accession to NATO, the Polish Armed Forces have been operationally aware that one of the determinants for improvement of the military security of the country is to have efficient and effective military logistics. From the perspective of the efficiency of the military logistics system, it is crucial to implement and operate an IT system that would support efficient management of logistic information and ensure real-time visibility of resources. The paper discusses the LOGFAS IT system supporting logistic security during national and multinational missions and operations, in the planning and implementation of logistic processes, exchange of logistic information both in the period of preparation and operation. The article also contains the results of research that represent basis for checking, verification and evaluation of LOGFAS functional units. Moreover, the directions for development and the progress of LOGFAS implementation works in the Polish Armed Forces were presented.

Keywords: Military Security, Management of The Military Logistics System, Logistic Information Systems.

Introduction

One of the basic features of ensuring the military security of the country is the ability to acquire, collect and exchange logistic information during peace, crisis and war. This has a significant impact on the end result of each measure taken: whether it be national, international, allied or coalition, military or non-military measure. In NATO, based on long-term experience of the Alliance since the 1990s, a system for the exchange of logistical information for the purposes of the alliance's military operations has been consistently built. Among other things, standards for the exchange of logistical information have been developed and implemented, covering both the transmission method and specifying the types of reports required along with their structure.

The volume of logistic data to be provided during the preparation and conduct of missions and operations is so large that it becomes necessary to implement increasingly advanced ICT solutions in order to manage it effectively. NATO has already drawn attention to this aspect of military logistics management many years ago, and therefore the relevant normative documents have been developed and a specialist IT system has been commissioned to support logistics system management in military missions and operations.

From the very beginning, Poland, as a NATO member, has committed itself to adapting its logistics system to the format supported by the LOGFAS (Logistics Functional Area Services) IT system. Its aim is to unify the information transferred and thus streamline the logistic processes in the phases of both the preparation and conduct of missions and military operations. For many years now, the Ministry of National Defence (MOD) has been building and developing an integrated multi-level IT system (ZWSI RON), and the logistics module is one of its components. In the next phase of implementation

of the LOGFAS system in the Polish Armed Forces the integration of the Integrated multi-level IT system (ZWSI RON) with LOGFAS logistics system is planned.
The subject of the research provided for in the study is a logistic IT system used in military missions and operations, including allied, coalition and national operations. Ignorance of this issue has led to the creation of a specific problematic situation, resulting in the need to carry out research on the IT system used in NATO to support the management of logistics resources and the operations of logistics units. Above all, however, it is a tool to assist the operation commander in ensuring the visibility of the resources committed under his command for operations.

The general objective of this publication, which is to examine and evaluate the LOGFAS IT system in terms of the system's capacity to reflect the planning and monitoring of resources within the individual functional subsystems of logistics, is subordinated to the problematic situation. Another objective of this article is to check the viability of implementing the system in the Armed Forces. The cognitive objective of this article is to broaden theoretically knowledge about LOGFAS system and the scope of its implementation at the Ministry of National Defence (RON).

The implementation of the objectives of the article thus defined required answers to the following research questions: what are the needs of the army in terms of safeguarding the visibility of logistic resources in terms of registering supplies and exchanging information about the logistic capacity? What capabilities does the allied IT system have to support the management of logistic resources of the armed forces? Furthermore, what functional modules does LOGFAS system have?

Due to the research problems formulated in this way, the following research methods were applied: analysis and criticism of the literature of the subject of research, examination of military instruction documents and a diagnostic survey using a surveying technique.

General characteristics of the LOGFAS IT system

The LOGFAS IT system is an allied system used during NATO missions, operations and exercises, supporting the management of logistic resources in all phases of allied operations, including within and outside Article 5 of the North Atlantic Treaty (MOD, 2017). As a basic tool for logistical planning, the system is designed, *inter alia*, for the preparation and exchange of logistic information. It mainly supports allied operations, although the Alliance makes the software available free of charge also the members of the Partnership for Peace (PfP) programme.

The use of the LOGFAS IT system is dedicated to the strategic and operational level commanders in NATO and European Union operations, including NATO Response Forces (NRF) and European Union Battle Groups (GB EU), units declared according to NATO Force Table, Polish Military Contingents (PMC) and units participating in international exercises. The users of the LOGFAS system in the Polish Armed Forces are the General Command of the Polish Armed Forces, the Operational Command of the Polish Armed Forces, the General Command of the Military Police, the Headquarters of the Inspectorate of Support for the Polish Armed Forces and the Command of the missions and operations carried out within the framework of the NATO Response Forces, the European Union Battle Groups and the Polish Military Contingents abroad (MOD, 2017, p. 27).

SI LOGFAS is a multi-unit system that takes into account the following aspects: strategic displacement planning of ADAMS forces and resources, EVE transport planning and monitoring, reception planning, deployment and onward movement of CORSOM troops, logistic reporting on the state of resources for LOGREP operations, material consumption planning and replenishment of SPM and SDM supplies and ACROSS combat assets consumption planning (MOD 2014, pp. 150-151). LOGFAS can be functionally divided into three basic module groups, with some modules being common to all module groups (LOGFAS: 2009a; 2009b; 2010, 2011; 2014a; 2014b; 2014 c):

- The group of logistic reporting system modules LOGREP (Logistic Reporting System) is a software enabling the timely transmission of reports and information and updating the database on the status of tasks in the functional areas of NATO logistics. LOGREP includes applications

used to prepare and send basic logistic reports, i.e. the Logistic Assessment Report (LOGASSESSREP) and the Logistic Update (LOGUPDATE). LOGREP consists of the following common modules: LOGBASE (Logistic Database), SPM (Sustainment Planning Module), LDM (Logistic Data Management Module), GEOMAN (Geo Manager Module) and SDM (Supply Distribution Module);

- A group of modules supporting M&T (Movement and Transportation) planning and execution processes, which includes ADAMS (Allied Deployment and Movement System), EVE (Effective Visible Execution) planning and coordination, CORSOM (Coalition Reception, Staging and Onward Movement) and shared modules: LOGBASE, SPM, LDM and GEOMAN;
- a group of modules supporting ACROSS (Allied Commands Resource Optimisation Software System) resource planning processes to support NATO strategic commanders and member states in the process of planning combat assets critical to the battlefield. ACROSS consists of the following modules: ADMEM (Air Defence Munitions Expenditure Module), AGMEM (Air to Ground Munitions Expenditure Module), LEMEMEM (Land Forces Munitions Expenditure Module), MARMEM (Maritime Munitions Expenditure Module) and LOGBASE, SPM, LDM and GEOMAN (Joint Module).

The dependencies of the individual functional modules are shown in Figure 1.

Fig. 1: Functional modules of the LOGFAS system

Identification of conditions determining implementation of the LOGFAS IT system in the Polish Armed Forces

The Polish Armed Forces, despite enormous development efforts taken to implement an IT system supporting the management of the logistics system, do not have the capacity to ensure full logistical interoperability within NATO in terms of planning and monitoring resources for operations. To this extent, in order to ensure the highest possible level of interoperability of the Polish Armed Forces within NATO, it has become necessary, *inter alia*, to fully implement the LOGFAS system in all functional areas of military logistics, which, as a technologically advanced IT system supporting resource planning and monitoring processes, will be used in allied and national missions, operations and exercises. Figure 2 shows the considerations for the implementation of LOGFAS in the Polish Armed Forces.

Fig. 2: Factors determining the implementation of the LOGFAS logistics planning system
Source: own analyses

Implementation requirements for the LOGFAS system in the Polish Armed Forces

In compliance with the current NATO arrangements (MOD, 2008), the security and logistic support of the allied forces in the area of operations may be implemented using the logistic options listed below: use of MILU (Multinational Integrated Logistic Units) and MIMU (Multinational Integrated Medical Units) logistics; support of forces by the National Logistics Security Systems of States participating in NSE (National Support Element) Operation; support by the Host Nation Support (HNS); support by the Logistic Lead Nation (LLN); support by the Logistic Role Specialist Nation (LRSN); support by external contractors to CSOs (Contractors Support to Operations); support by NATO agencies responsible for supporting the operations of allied forces and mutual support to States participating in the operation on the basis of international MoUs concluded.

The multiplicity and multidimensionality of allied security and logistic support necessitates to have in place a logistic resource management system capable of identifying, collecting and transferring logistic information both at the MON and NATO level. Currently, the logistic IT systems in the possession of MON do not have such capabilities. For instance, the logistic security system of the Polish Military Contingents in most cases is based on three components, using separate IT systems, i.e. the national supply system based on the integrated multi-level IT system (ZWSI RON), implemented through the NSE; multinational logistics using LOGFAS IT system; and logistics of coalition countries using national logistics systems.

Based on conclusions drawn from the carried out operations, in response to the operation commander's information gaps on the held resources, the Alliance has developed a concept (MOD, 2015b), containing a range of undertakings necessary to ensure the operation commander's adequate visibility of resources, aimed at enhancing efficiency and improving the effectiveness of logistic processes. The document formulates, *inter alia*, requirements for the national IT systems supporting automated tracking of resources allocated to operations. It is assumed that the time interval in which the operation commander should have knowledge of the assets held is the period from the transfer of assets to the operation commander in theatre of operations (assets landing area) until the assets are taken over from the operation commander (assets loading area).

The analysis of the provisions of the national doctrine document (MOD, 2015b, p. 19), a conclusion was drawn that the visibility of resources should support the operation commander in the decision-making process, ensuring that he can make optimal decisions. On the other hand, in accordance with the allied requirements, several important factors must be met. Among other things, account should be

taken of the fact that the resources earmarked for securing tactical operations are not visible in operational-level systems. Therefore, the visibility of resources at this level of command should be taken into account in the systems of the tactical level, which are operated by other IT systems supporting command and control processes at tactical levels.

The general structure of information about logistical resources (MOD, 2015b, p. 11) shows that information about resources is divided into two parts, the first one deals with the visibility of resources subject to relocation and the second one with the visibility of resources under acquisition, stored and used. In order to obtain adequate visibility of the resources being relocated, modern technologies are used, such as: GPRS (General Packet Radio Service); GSM (Global System for Mobile Communications) and GPS (Global Positioning System) satellite navigation system (MOD, 2015b, p. 13). The State, being the owner of the consignment, is responsible for collecting and processing information about the consignment in the national system, whereas information required by the operation commander is made available through the allied LOGFAS (Logistic Functional Services) IT system (Kupiec 2013, pp. 88–96). When a consignment passes through a consignment monitoring node, owned by another country, it is identified in the tracking system. The relevant information about the shipment is then made available to the country of ownership in the NATO Data Exchange Service (MOD, 2015b).

Implementation capacities for the LOGFAS IT system in the Polish Armed Forces

For the purposes of tracking the resources held by the armed forces, a concept of a national resource tracking system has been developed, which defines the assumptions, conditions and principles of operational use of the system in the Polish Armed Forces. The concept sets forth three capacity levels (MON, 2015b, p. 32): basic level - consignment monitoring; extended level - visibility of resources during relocation and full level - total visibility of resources. In accordance with the adopted implementation schedule for the national resource tracking system, it is necessary, in the first place, to ensure the ability to monitor consignments in the territory of Poland and consignments directed to (from) the Polish military contingents (PKW) (Nyszk, 2009; Kurasiński, Pawlisiak, 2013), as well as providing the allied forces, staying in the territory of Poland, with an option of monitoring their consignments.

In the longer term, the National Asset Tracking System will be expanded to enhance its usefulness and to ensure the visibility (MON, 2012), including the ability to track consignments and to integrate the control of relocation of personnel and resources deployed for operations outside national borders, while making available the information required to provide Common Operational Picture (COP).

The system safeguarding the visibility of military resources, improving decision-making processes and the management of logistic processes, should be assessed through the prism of having the ability to: unambiguously marking and identifying resources; collecting and processing information about resources in the national system; making available information about resources relocated, acquired, stored and used in the allied LOGFAS system; automatic identification and tracking identifiers, in accordance with the relevant NATO standardisation agreements; making available in the NATO data exchange service information about other countries' consignments passing through their own consignment monitoring nodes.

In the area of compatibility with the LOGFAS logistics IT system, the national integrated multi-level logistics system (ZWSI RON) is to achieve and ensure the capability of importing data from the national database into the logistics modules of the automated command system interoperable with LOGFAS and IT support for the planning and management of logistics capabilities for NATO (MOD, 2017). To sum up, as far as monitoring the movement of their resources is concerned, the Polish Armed Forces have not yet attained the capacity to track them. Work is currently underway to achieve a minimum traceability of resources, i.e. tracking of consignments.

The functionality of LOGFAS IT system is based on the design of databases with resources and tasks performed by armed forces and means in their geographical arrangement. This applies to the stocks of supplies, equipment, material and technical supplies. It describes the consumption rate depending on the type of operation and the terrain and climate conditions in which the operation will be carried out. For the purposes of LOGFAS IT system, databases are created with data on the size of resources and their location. In addition, the system can be used to assess to what extent needs for required supplies for task implementation under different scenarios for operations or military exercises are being secured have been secured.

The system has the ability to carry out the calculation of the forecast consumption of supplies, using Consumption Rates (CR) and manoeuvring and tactical factors (MF - Modification Factors). For the automatic identification of resources, the LOGFAS IT system uses a uniform data format and uniform methods for the identification, description and classification of military equipment used in an allied operation by means of the Reportable Item Code (RIC). The system also enables the import and export of data and uniform procedures for managing the LOGBASE database (LOGFAS 2011).

A breakthrough for the implementation of LOGFAS IT system for operation in the Polish Armed Forces was the signing of an agreement on the LOGFAS software by the Polish side in 2016. Under this agreement, the Polish Armed Forces may make full use of FAS software and support from the NATO Communication and Information Agency (NCIA), in the field of user training at LOGFAS courses at the NATO School of Communication and Information Technology in Oeiras (Portugal). Under the above-mentioned agreement, since 2019, Polish representatives have also participated in training courses at the NATO Academy in Portugal.

In adherence to the allied obligations assumed by Poland, many components of the LOGFAS logistics IT system have been implemented in the Polish Armed Forces over a span of consecutive years. The milestones and scope of implementation of LOGFAS IT system at MOD are presented in Table 1.

Table 1: Implementation milestones of LOGFAS IT system in the Polish Armed Forces

Item	Objective of Polish Armed Forces	Edition	Name of project
1.	Armed Forces Objective TG 4149	1,998	Implementation of NATO logistic reporting system
2.	Armed Forces Objective EG 4051	2,000	Implementation of NATO's logistic reporting system for automatic processing of logistic data
3.	Armed Forces Objective EG 4100	2,000	Ensure coordination of the transport and relocation system of the Polish Armed Forces with the NATO system by integrating the National Centre for Coordination of Military Movement (CKRW) with the ADAMS system
4.	Armed Forces Objective EG 4100	2,002	Ensuring coordination of transport and relocation of troops between the Polish Armed Forces and NATO
5.	Armed Forces Objective EG 4051	2,002	Application of automatic processing of logistic data of the Polish Armed Forces by establishing a connection for the logistic reporting system with the NATO's LOGFAS IT System
6.	Armed Forces Objective EG 4051	2,004	Providing secure links for automatic data processing between national and NATO-based logistic IT systems
7.	Armed Forces Objective EG 4051	2,006	Providing secure links for automatic data processing between national and NATO-based logistic IT systems

Item	Objective of Polish Armed Forces	Edition	Name of project
8.	Armed Forces Objective EG 2860	2,008	Implementation of network centric IT systems
9.	Armed Forces Objective EG 5023	2,013	Implementation of static networks for LOGFAS IT system in the Polish Armed Forces
10.	Armed Forces Objective EG 5301	2017	Development of communication and logistic information access systems for the LOGFAS IT system in the Polish Armed Forces

Source: Own compilation on the basis of (MOD, 2017, p. 23).

The analysis of source documents (MOD 2017, p. 25) shows that the basic undertakings carried out over twenty years of presence in NATO, MOD during that time included the implementation of NATO normative documents, the launch of a system of training of LOGFAS system operators in the country and the participation of representatives of the Polish Armed Forces in foreign courses. Moreover, it was extremely important from the perspective of IT architecture development for the purposes of LOGFAS IT system to establish ICT links for the exchange of logistic information, to ensure secure data processing through the preparation of the national ICT platform called PMN (Polish Misssion Network) platform, which provides support for the command process during missions and operations on the territory of the country and abroad, including launching a reporting system between the relevant units of the Polish Armed Forces and components separated within the NATO Response Forces.

In the Military University of Technology, as part of the training of LOGFAS system operators, almost 600 soldiers were trained during LOGFAS courses in 2001-2019 to operate the LOGREP module (logistical reporting system) and to operate LOGFAS software modules. Moreover, at the Logistics Training Centre of the Polish Armed Forces of the Republic of Poland, almost 400 soldiers were trained in LOGREP logistic planning and reporting and management of logistic resources using the LOGFAS IT system. (MOD 2017, p. 27).

In addition to the above mentioned undertakings, to implement the LOGFAS IT system in the Polish Armed Forces MOD is obliged to cooperate in the implementation of allied tasks. In the international environment, inter alia, a database (LOGBASE) is maintained and updated, and in the reporting module (LOGREP) update reports (LOGUPDATE) are generated together with reports on planned consumption and recovery of supplies (SPM) for the needs of the forces and resources allocated from the Polish Armed Forces to the NATO Response Forces.

Furthermore, during the preparation of international exercises, the National Centre for the Coordination of Military Movement (NCKRW) prepares a National Detailed Deployment Plan (NDDP) each time in the ADAMS module. On the basis of the NDDP Plan, sent by individual states to the allied Centre for the Coordination of Military Movement within the framework of information exchange, a single relocation plan is created, the so-called Multinational Detailed Deployment Plan (MNDDP) (MOD, 2017, p. 26).

Another example of MOD's implementation of the LOGFAS IT system is the EVE (visibility of means of transport) and CORSOM (planning the acceptance, centring and onward movement of troops) modules, used by Polish Military Contingent in Afghanistan to illustrate the movement of troops in the framework of the reduction of NATO forces in ISAF operation. At the same time, one of the tasks resulting from Poland's accession to NATO was the use of the module for planning warfare agents (ACROSS) and the calculation of stock levels for forces declared to NATO. In this area of information exchange, since March 1999, the representatives of the Ministry of Defence have participated in projects related to planning the stockpile of warfare agents of NATO countries. The results of the calculations were included in the Defence Planning Questionnaire (2008 edition). In this manner, the

NATO standards for calculating the stockpile of warfare agents for forces declared to NATO have been achieved. Currently, ACROSS is maintained by NATO's Communications and IT Agency (MON, 2017) due to lack of development needs.

Checking, verification and evaluation of the LOGFAS IT system based on survey results

Due to the issues raised and the methodology adopted in the study, it was decided to obtain data by means of a diagnostic survey carried out by means of a survey technique. The survey covered the trainees attending the LOGFAS IT system training course. The survey was run and the Military University of Technology in two forms: one was carried out during training course and the other one was carried out in the population of cadets as part of the teaching process. The survey was attended by 80 respondents, of which 85% were men (68 people) and 15% women (12 people). According to the division into age groups, most people (68.8%) were under 25 years of age. Fig. 3 shows a breakdown of respondents by gender and age.

Fig. 3: Breakdown of respondents by gender and age

Source: own analyses.

More than 87% of those surveyed serve in the land forces (Question 17). The most numerous functional division among the respondents (Question 18) were cadets (33.8%), soldiers of the staff division (17.5%), support (13.8%) and commanding officers (10%). According to the breakdown of the respondents into the personnel corps (Question 19), the vast majority (92.5%) were soldiers of the communications and IT troops. According to the breakdown by time in the occupied position (Question 20), the respondents mostly worked for one to three years (77.5%) and below one year (12.5%).

Figure 4 shows a breakdown of respondents by the place where they became familiar with the LOGFAS IT system.

Fig. 4: Breakdown of the respondents by the place of getting familiar with the LOGFAS IT system

Source: own analyses.

The graph in Figure 3 shows that military units and universities are the main contact points with the LOGFAS IT system. Apart from the 12 category-specific questions concerning the surveyed population, the survey also defined 12 subject matter questions. They are presented in Table 2.

Table 2: Specification of subject matter questions concerning the evaluation of the LOGFAS IT system

Question No.	Question	Expanded question
1.	Please evaluate the impact of LOGFAS IT System on the quality of logistic information management at the Ministry of Defence (MOD).	Is it going to have positive impact on the improvement of logistic information management in the armed forces.
2.	Please evaluate LOGFAS IT System's capability to safeguard data security the LOGFAS IT System.	It is concerned with database protection, availability of system resources, network, shared information, certificates, etc.).
3.	Please evaluate the user-friendliness of data entry into the LOGFAS IT System.	Does the LOGFAS IT System have sufficient and clear instructions and manuals for operating and entering data into the system?
4.	Please make an overall assessment of the LOGFAS IT System.	Assessments of the degree of usefulness of the LOGFAS IT System in managing logistic information in the armed forces?
5.	Please evaluate the reliability of the LOGFAS IT System.	Is the System characterized by high failure rate? Does the system allow for assistance with regard to reported errors?
6.	Please evaluate the performance of LOGFAS IT System.	Refers to the response time of the system to an entered command, data transfer, labour consumption by data entry and validation).
7.	Please evaluate the usefulness of the LOGFAS IT system.	It refers to ease of use, ease of navigation in the system, speed of switching to other options, comprehensibility of entered data, etc.
8.	Please evaluate the functionality of the LOGFAS IT system.	Are all real subsystems and functional areas of military logistics represented in the system?
9.	Please evaluate the simplicity of the LOGFAS IT system.	It refers to ability of using the system after a short training, on-the-job training.
10.	Please evaluate the integrity of the LOGFAS IT System.	It refers to an option of eliminating the resultant data entry errors.
11.	Please evaluate the flexibility of the LOGFAS IT System.	It refers to the capability of automatic transformation of the entered data from a tabular form into another one - visualization, graphs, map display, etc.
12.	Please evaluate the interaction of the LOGFAS IT System.	It refers to an option of interaction and data exchange with other national IT systems.

Source: own analyses.

The survey form was developed using closed and semi-open questions. The first type is characterized by the fact that the respondent made the right choice from specified answers. The questions are aimed at answering the questions concerning the main issues covered by the survey. In addition, some of them have been supplemented with an option of own response of the respondent. Such questions have an option of presenting own evaluations, owing to no possibility to list all possible solutions. It was decided to develop design survey form in such way owing to the complexity of the surveyed issues. It was not possible to create an easy to understand form containing all possible options at once. Thanks to such design, the survey is universal by nature and each respondent could be treated individually. The

intention of such design of survey form was to obtain information on the evaluation of the implementation and operation of the LOGFAS IT System used at the MOD.

The answers presented in the figure (Fig. 5) show that the respondents evaluate positively the implementation of the system and its impact on the management of logistic information (45% YES, 40% RATHER YES).

Fig. 5: Evaluation of the impact of the implementation of the LOGFAS IT system on the management of logistic information in the armed forces.
Source: own analyses

Another surveyed area was the search for an answer to the question whether the system has adequate capacity to ensure data security (Figure 6).

Fig. 6: Evaluation of the LOGFAS IT System capacity to ensure data security
Source: own analyses.

The analysis of the respondents' answers contained in the question in Figure 5, a high percentage of "I don't have an opinion" answers is noted. (35%), which indicates low knowledge about the subject, although the system operates in the "Milnet-Z" classified network. The next question was about the suitability of the system for managing logistic information at the MOD (Fig. 7).

Fig. 7: Overall evaluation of the usefulness of the LOGFAS IT System in the armed forces
Source: own analyses.

The survey showed that more than 81% of the respondents evaluated positively the usefulness of the LOGFAS IT System in the management of logistic information in the armed forces, which is evidence of supporting MOD initiatives in the implementation of information technology, integrating to a large extent the logistic activities of the armed forces. The System functionality was evaluated at a similar manner (Fig. 8).

Fig. 8: Evaluation of functionality of the LOGFAS IT System in the armed forces.
Source: own analyses

Analysing the survey findings in the evaluation of other aspects of the System's usefulness, one can also see a high percentage of negative answers (sufficient/not enough/not relevant) to the remaining questions, especially those concerning the area of reliability (50%), efficiency (47%), usability (45%), simplicity (54%), integrity (45%) and the System's capability of interacting with other systems implemented at the MOD (53%).

Negative aspects shown by the analysis of respondents' responses to the LOGFAS IT System evaluation

The majority of respondents evaluated positively the MOD decision to implement in the Polish Armed Forces an allied system of logistic planning of missions and operations, not only NATO, but above all the full implementation of the System in the Polish environment. Among the answers to closed questions, the survey form offered an option of making free statements and presenting evaluations in answers to open questions. The respondents most often paid attention to the following aspects:

1. The number of trained operators at different levels of command is not high enough.
2. Databases are saved to a file on a hard drive, which is accessible to everyone using a certain workstation.
3. There is a lack of consistency and uniform procedures in the development of databases and profiles (sons, databases for a uniform training background).
4. The main problem is the difficulty in software upgrade to higher versions and RIC updates.
5. There are a lot of errors at this stage and often the data export writes are not compatible even though the software version and RIC are the same.
6. The compulsory application of capital letters makes it difficult to enter data such as units' abbreviations.
7. The correctness of data entry is determined by details that may be overlooked easily.
8. Unclear reporting procedures (including reports in the reporting system during the exercises, for example the logistic LOGASSESREP report).
9. The basic activities can be done after a brief instruction, but calculations and other more complex activities require constant practice.
10. The software is not intuitive, the trained person in the short term is not able to cope with all the capabilities offered by the software.
11. The format of the exported profiles (xml) could be more transparent so that data could be freely entered by e.g. using a MS Excel spreadsheet.

Of course, it is impossible to disagree with the above evaluations, bearing in mind the necessity of entering into the LOGBASE database of the LOGFAS system all resources held by the Polish armed forces. According to the entries in the allied documents, this is the responsibility of each NATO Member State, and this requires higher resources for data entry, which means that the number of people trained to use the LOGFAS IT system has to be enhanced.

ICT systems used for information exchange in the LOGFAS IT system

The analysis of the normative document (MOD, 2013a) shows that the communication between the LOGFAS system components is based on the classified ICT system of the MOD (MILNET-Z) and the classified NATO office workflow automation network in Poland (PMN). The hardware and software resources that make the LOGFAS IT system comprise (MOD, 2017):

- ST MILNET-Z servers (virtual instances separated from hardware resources of the servers of the IT Inspectorate working in the MILNET-Z ICT system);
- ST MILNET-Z client stations (workstations of the MILNET-Z ICT system selected for software installation);
- NOAN national network client station (PL_NS NOAN system workstation, selected for software installation, i.e. PL_NS NOAN terminal installed in IWsp SZ);
- LOGFAS server software and client software installed at workstations.

According to the MOD decisions, the LOGFAS IT System operates in the MILET-Z and PL_NS NOAN networks, as well as in the PMN (Polish Mission NATO) network in land forces. The PL_NS NOAN IT network shall be designed for the processing, storage and transmission of information up to and including the "Secret" classification clause. The LOGFAS IT system operates on the basis of a central database in the ST MILNET-Z ICT system, administered by the Head of Logistics Planning of the Inspectorate of Support for the Polish Armed Forces (SPL IWsp SZ). The central NATO database is located at the NATO SHAPE headquarters and is fed by XML files via e-mail in the PL_NS NOAN network (MOD, 2017).

Access to the database (LOGBASE) of the LOGFAS system is via MILNET-Z using a remote connection (client-server), which can be established from any place in the country, after obtaining the appropriate access authorisations. Access to the PL_NS NOAN network is possible under the conditions specified in the system security documentation.

The information exchange through the LOGFAS module in the alliance system is shown in Figure 9.

Fig. 9: Exchange of logistic information through the LOGFAS module in the allied system
Source: Own compilation on the basis of (MOD, 2017, p. 37).

Data transfer in the LOGFAS IT system takes place in three ways:

- client (user) - server (remote link to the database);
- by means of a communication protocol controlling data transfer using e-mail services;

- manually, via data carriers such as USB memory stick or CD-ROM.

Meanwhile data exchange in the LOGFAS IT System takes place in two ways:

- Data files generated on the local PC are transferred manually from the local LOGFAS database;
- direct data input using a local PC, which serves as a connection terminal with the LOGFAS database located on the server.

The exchange of information in the LOGFAS IT system for national system operations is shown in Figure 10.

Fig. 10: Exchange of logistic information in the LOGFAS IT System for operations

Source: Own compilation on the basis of (MOD, 2017, p. 38).

The presented diagram shows that in the case of the Polish Military Contingents' mission, the LOGFAS IT system operates on the basis of a local database in the MILNET-Z ICT system, administered by the Polish Military Contingents. Local databases of particular PKW elements are supplied by XML files using MILNET-Z network e-mail. For the needs of the PKW Afghanistan in 2012-2015 the WEN (White Eagle Network) was developed in the area of operations and in Poland as an extension of the NATO AMN (Afghanistan Mission Network) coalition network, which was the first national ICT network capable of processing NATO classified information in the coalition system.

LOGFAS as a tool to achieve interoperability of the Polish Armed Forces in operations

The concept of developing logistic chain management in NATO military operations assumes a parallel process of improving the current logistic chain under the direction of the Allied Command Operations (ACO) and building from scratch new operational logistic chain management capabilities by the Allied Command Transformation (ACT). The assumption of both directions of work is to reach a common concept of Operations Logistics Chain Management (OLCM) providing an integrated view of the logistics situation in the Common Operational Picture. The work is scheduled for completion in 2019 (MON, 2017).

Currently the NATO experts are working on the preparation and development of a new logistics information environment LOG FS (Logistics Functional Services), which will replace the existing LOGFAS system. To this extent, it is necessary to take a number of measures that would provide the

LOG FS with the functionality needed to command and direct all logistic components in allied operations, including in particular the provision of logistic information to the Common Operational Picture. Through delivery of this function, the LOG FS system will reach full operational capability. Through the implement ion of the LOG FS system, the Alliance seeks to optimise the utilisation of existing resources. For this purpose, for instance, the LOGFAS system tools must be equipped with additional functions, including those that meet operational requirements not currently supported. This should improve overall integration, ensure interoperable solutions using new technologies and improve the life cycle of resources, in particular through elimination of duplication and centralisation of shared functions.

It follows from the assumptions developed (MOD 2017) that the new LOG FS environment will be developed on the basis of Logistics Intelligence and Support Services (LOGBIDS), as part of an agreed capability packet. At the same time, NATO is carrying out a comprehensive review of the Alliance's capability packets and projects to determine their importance in the current security environment and their relevance to the new NATO defence planning process. This will allow for a gradual allocation of resources and ensure a pragmatic approach to their implementation.

Data exchange concept between the Integrated Multi-Level National logistics system (ZWSI RON) and the Alliance's LOGFAS IT system

In order to ensure fast and flawless data update in LOGFAS system at the national and, consequently, allied levels, dedicated interfaces for data acquisition from the RON Integrated Multi-level IT system (ZWSI RON) are planned to be developed. Figure 11 shows a diagram of transferring information about logistic resources to the central LOGFAS database by a dedicated ZWSI RON module.

Fig. 11: Logistical data exchange between ZWSI RON and LOGFAS systems

Source: Own compilation on the basis of (MOD, 2017, p. 37).

It follows from the diagram presented hereinabove that a separate module is to be set up in the Integrated Multi-Level ZWSI RON system for the exchange of information with the LOGFAS IT system, that will be used to transfer data from the ZWSI RON system to the central database (LOGBASE) of the LOGFAS IT system. This will allow to feed the LOGFAS system on an ongoing basis with MOD's logistic resources data in order to use it for the purposes of the Polish Military Contingents separated from the Polish Armed Forces to participate in a military operation.

The ZWSI RON system is assumed to feed the LOGFAS system with the following data:

- concerning the National Identity Number (NIC) and the Uniform Material Index (JIM) assigned in the LOGFAS modules to the appropriate NATO's reporting code (RIC);
- concerning military equipment (tactical and technical data);
- about the stock of supplies in the subdivision (their echelons and classification);

- describing the status of equipment concerning its working order (category, place of operation or repair, availability for use, allocation to a military unit).

Discussions and Conclusions

In order to enhance the national military security, the Polish Armed Forces are part of the allied trend of creating multinational logistics security management centres in combined operations. Consequently, there is an urgent need to prepare national logistics authorities for cooperation with such centres. It is assessed that the coordination of logistical tasks and services in an operation requires the logistic governance bodies at both tactical (component headquarters) and operational (operation headquarters) levels to be equipped with IT systems enabling them to: have visibility of logistic resources, exchange of information and enter into logistic interaction with the military components of other States participating in the operation.

The concept based on the integration of multinational logistics in NATO missions and operations requires that the logistic security processes be covered by a uniform management system. The enormous amount of resources to be delivered to the troops under a multinational operation leads to the conclusion that the planning methods must be harmonised within the framework of allied logistics. The aim of these operations is to enable the NATO Commander to provide the most complete data on logistic resources at this disposal.

NATO strives at designing logistic capabilities in operations so as to reduce the level of duplication of national resources committed to the operations, to simplify and streamline the flow of logistic information, and to ensure the visibility of resources to meet operational requirements. This requires logistic support for missions and operations in terms of timeliness and accuracy of logistic information, which will allow to have larger influence on the implementation of logistic support. The Allied or Coalition Operation Commander and the National Component Commanders participating in the operation must receive such information as soon as possible and be kept updated on developments in the theatre of military operations. Their aim is to ensure the proper exercise of their powers to coordinate and prioritise logistic support.

In the Polish Armed Forces, a wide range of tasks to support and secure missions and operations, faced by the military logistic authorities cannot be properly and effectively implemented without an IT system supporting the management of military logistics. The analysis of the experience of participation in missions and operations outside the country allows to conclude that during the preparation and carrying out of operations it is necessary to use an effective and flexible tool supporting the management of logistic resources in each phase of the operation. In the Alliance such a role is performed successfully by the functional modules of the LOGFAS system, which provide the operation commander with full, accurate and current logistic information about the possessed resources, presented in the form of the so called Logistic and Operational Situation Pictures.

The evaluations collected in the article allow us to state Poland's accession to NATO was followed by an increase in interest of the Ministry of Defence management in the issues of computerization of military logistics. The studies carried out confirmed that the experience gained in order to transform the Polish Armed Forces into a fully professional army, prompted the Ministry of Defence to change its approach to computerization of military logistics, in relation to the support of logistic processes with modern information and communication technologies (ICT).

The analyses presented in the article indicate that the essence of the implementation of the LOGFAS IT system in the Polish Armed Forces is as follows:

- to gain an advantage in accessing logistic information during operations;
- to improve the management of military logistics during operations;
- to have real time information about logistic resources, their quantity and location;
- to ensure coherence between national and allied IT logistics systems;

- to ensure the integration and security of the flow of logistic information in a national and multinational operation;
- to manage logistic resources within the national integrated IT system, operating in a network-centric environment, compatible with the allied logistics systems;
- to enable the identification, collection and transfer of information about logistical resources and the tracking of their movements to ensure the visibility of the operation commander's resources.

As of 2020 the weaknesses of the RON IT system supporting the management of the logistics support system of the Polish Armed Forces are as follows:

- The Polish Armed Forces do not have a departmental IT system supporting the implementation of logistic processes in national missions and operations in terms of logistic planning in the period of operation preparation, monitoring of logistic resources allocated to the operation and exchange of information during the operation;
- operational IT systems supporting the management of logistics of the Polish Armed Forces' during peacetime do not satisfy the needs of IT logistics subsystems in all areas of logistic support during the period of preparation and conduct of operations; the first IT system - under a code name of ZWSI RON is an inventory system, which is only used in military budget units; the second IT system under a code name of KONWÓJ is an ICT system for monitoring the position of troops, used by the authorities of troops transport and movement for the purpose of developing and issuing permits for travel and current monitoring of movement of dangerous vehicles, oversized vehicles and columns carried out by the Ministry of Defence;
- no option to exchange logistical information in an automated command and control support systems in the national operations in accordance with NATO standards; in the land component headquarters the command and control support systems (C2 Wierzba system) and special (C2 Spartan system) are in the process of being acquired, whereas the maritime (C2 MCCIS Łeba) and air component headquarters (ICC) do not have the capacity to exchange information not only with the LOGAS IT system, but even with Integrated, Multi-Level IT System (ZWSI RON).

To sum up, the basic directions of implementation and development of the LOGFAS IT system should take into account the use of the latest technologies in the field of ICT equipment, software, networks, servers and ensure security of logistic information flows. To conclude, the full implementation of the LOGFAS IT system, which belongs to the most advanced class of IT systems, on subject matter and technological grounds, supporting the process of logistics management, will enable the Polish Armed Forces to optimize the processes in both multinational and national missions, operations and military exercises.

Safety Culture of Citizens in Selected Eu Regions and Ways to Deal with The Covid-19 Pandemic

Prof. dr hab. Marian Cieślarczyk

Safety, Logistics and Management Faculty, Military University of Technology in Warsaw,
ORCID 0000-0002-3382-9168

Abstract

Based on the current systemically related results and experiences collected during the covid-19 pandemic in several cities in different EU countries, the author of analyzes of situation analyzes and behavioral analyzes, actions and interactions of various functions and limitations struggling with the covid-19 pandemic. The composition is characterized by the cultural impact on the effectiveness, efficiency and effectiveness of coping with this challenge by individuals, relationships and institutions. In analyzing problems that arise then, we use organizational and safety models of the organization, developed, perfected and used by the author and his team for almost twenty decades. These models, as research tools, were available, among others in national empirical research at the beginning of the second decade of the 21st century. Research and analysis of clear relationships between safety and culture analyzes, administrative organizations of local administration, services and "ordinary" bodies with the efficiency and effectiveness of several cities and counties in crisis situations. In the author's letter, he justified the thesis that cultural conditions, and specifically - the level and nature of safety culture and organizational cultures, covering various types of risk and legal - in terms of overall impact on the effectiveness of dealing with crisis situations, as well as all, such as the coronovirus pandemic. Joint research and teaching practice includes that a safety culture can be improved.

Keywords: Pandemic, Transdisciplinary Studies, Safety Culture.

Introduction

Pandemic covid-19 is a fact, but also a process with unpredictable consequences and timescale. It is also a relatively poorly recognised phenomenon, which most countries and societies did not manage satisfactorily in March 2020. This pandemic is difficult to compare with other similar phenomena in human history. This difficulty stems not only from the specific properties of coronavirus, but also from the character of the hitherto existing globalised and “pursued” world, and in it “pursued” people. The eloquent title of the work of the Polish Nobel Prize winner, Olga Tokarczuk, "Bieguni" (Warsaw 2019), signals this problem in a convincing way. The protagonists of her book, the title “Bieguni”, were aware of the importance of such values in human life as the ability to reflect (Giddens, 2002), knowledge and **wisdom**. However, the latter value in the 21st century seems to be covered with patina and maybe even “dust of forgottenness”. For many people undertaking higher education, the main goal was often a diploma or certificate, not wisdom. The question remains open whether this value as an objective can be found in the curricula and syllabuses of lecturers, as well as the question whether a "virus", marked with the 3Z symbol (Chuck, Pass, Forget it. [pol. Zakuj, Zdaj Zapomnij]) has nested in some university. However, the extent of its occurrence and the damage it does vary. This is because the destructive effects of this "virus" reveal themselves only after years, and especially when they meet their twin "brother", e.g. the coronavirus.

The education crisis has been discussed in the world for a long time. The Club of Rome reports and the resulting recommendations remained largely theoretical. This has been clearly demonstrated by the covid pandemic19 and the recent financial and economic crisis, as well as by the highly controversial discussions about climate change, its causes and effects. Without going into details about e.g. economic education, the advantages and disadvantages of which can be seen almost every

day, in this article I would like to deal with a wider type of Human competencies, which is his safety culture. The importance of these competencies was realized only after the catastrophe of the Chernobyl nuclear reactor on the territory of the former Soviet Union, which was tragic in its far-reaching consequences. However, for many years the knowledge about the essence and significance of the safety culture and the functions it performs has hardly "penetrated" the social consciousness. Despite this, a group of scientists, also in Poland, continued their research by presenting their results in scientific publications (Pidgeon, 1991, 1998; Carnini, Weiman, 1995; Studenski, 2000; Cieślarczyk, 2001, 2006, 2011, 2019, Filipek, 2007, 2013, 2017; Sadłowska-Wrzesińska, 2018 and others). It is optimistic that in recent years there has been a clear increase in interest in safety culture, especially among young people.

This article attempts to explain the importance of a safety culture for *the persistence, survival and development* of physical and legal entities experiencing various types of crisis situations in connection with the covid -19 pandemic. The basic question is *whether the experience to date of scientific diagnosis and improvement of the safety culture of physical and legal entities can be useful during a coronavirus pandemic, but also after its expiry*?

To begin with, a Few Facts and Related Phenomena

While this article was under development, i.e. in the second half of March 2020, the covid-19 pandemic was spreading dynamically in the world. Only in China, where the first outbreak was detected a few weeks ago, in the third decade of March there was no increase in the disease. The greatest dynamics of the disease was in Europe at that time. The following section shows the increase in the number of cases and deaths in several major European countries.

Let's start with Italy, which was most affected by the pandemic in March. For example, within four days 21-24 March, the number of illnesses in this country increased from 47,021 to over 60 thousand and the number of deaths increased from 4,032 to over 6,800. In Lombardy, over 400 infected people died in just one day. In the following days of March these numbers grew exponentially. At the end of the month, official announcements said that around 1,000 infected people in Italy lost their lives during the day...

Spain was also in a difficult situation. In the analogous period of 21-24.03. the number of coronovirus cases increased from 21,571 to 39,700 people and the number of deaths from 1,093 to 2,696. Also in France at that time the number of cases increased from 12,612 to 22,000 and the number of deaths from 562 to 1,100. In Germany at that time, there was an increase in the number of infections from 19,848 to about 35,000 and the number of deaths increased from 68 to 206.

Due to the high dynamics of changes in the situation, the above data should be treated as indicative. When analysing them, it is also worth remembering that the timing of detection of the first infections and the rate of their spread varied from country to country. Already at this point, one conclusion seems quite obvious. In similar situations to these, the skills to manage space-time and the associated risk are difficult to overestimate. Individual cultures attach different importance to this type of human competence. This is an important part of the organizational and safety culture. Also, individual and institutional decisions and the associated behaviour, actions and interaction of physical and legal entities differed considerably from one country to another.

Let's stop with the situation in Italy and its conditionality. According to Dr Piotr Podemski, an Italianist from the University of Warsaw, from the very beginning a long list of mistakes was made in Italy, which contributed to the rapid spread of the disease. The first case of Covid-19 infection in this country was officially confirmed on the 20th of February in the town of Codogno in Lombardy. According to this scientist, the doctors of Codogno have been wondering for quite a long time that there has been a mysterious increase in the number of cases of strange, persistent pneumonia, which could not be treated with anything. There were more

and more patients, some were dying, but most of them were elderly people. The illnesses and deaths were thus explained by age and the co-occurrence of other diseases. Infected persons were basically not isolated. They've spread out all over northern Italy. As the situation became more serious, the country began to introduce closed or restricted zones. However, the restrictions did not help, and the coronavirus continued to take its toll. Among those who died in Italy, women infected with coronavirus were half as many as men, as reported by the National Health Institute. The situation is becoming more and more difficult in hospitals in Italian Lombardy, especially in intensive care and resuscitation wards - doctors and representatives of local authorities informed about it in the media. “This is a tsunami.”

I quote - “hospitals are full, also places in the Lombardy region are running out” - a doctor named Riva signalled in the media. He was explaining: “In the intensive care ward, we intubate even more than seven people a day and work non-stop, with an average of 14 days off.” “We are close to the moment when we will have no more room for reanimation” said Lombardy Regional President Attilio Fontana on SkyTg24 television. He also reported that one of the most serious problems in the local health service is the lack of a sufficient number of respirators. Efforts are being made to provide additional space for the infected in hospitals. Patients die completely alone and beg to be able to say goodbye to their children and grandchildren," Dr Francesca Cortellaro informed in one of her interviews. In connection with this situation, there were suggestions to place tabletson coronavirus wards, through which dying patients could say goodbye to their relatives for the last time.

Meanwhile, the Mayor of Bari in Apulia, in the south of Italy, Antono Decaro personally "rushed" to the home of undisciplined residents who did not comply with the rules on the ban on leaving without good reason. “This is a national crisis. This is not fun. The images coming in from Milan or Bergamo are not a film, it's really happening, people are dying there,” called out Decaro walking the streets of the city. Also in the historical centre of Bari Decaro, he spoke with a firm voice to the people sitting on the benches to go home. "You can't be on the street. How can I explain this to you?" Luckily, this group of previously carefree Bari residents immediately got up and went home. There was a recording of that intervention on TV. It is worth noting that the media at that time showed similar behaviours of people in many other European countries as in Italy. Among those who died in Italy, women infected with coronavirus were then half as many as men. Research conducted in Poland in 2011 showed a higher level of safety culture for women than for men (Safety Culture, 2015). It cannot be ruled out, however, that in crisis situations women can make better use of their intuition than men (Moir, Jessel, 2002).

Coming back to Italy, it is worth reminding that on 20.03.2020, new coronavirus outbreaks appeared there. "There are still too many infections, and the situation in the north is disastrous." This is how the next day of the epidemic in the country was described by the head of the Department of Infectious Diseases at the National Health Institute Giovanni Rezza. He stressed *that everything should be done to ensure that the rules of fighting the epidemic are respected throughout the country.* And I don't think so." - said this high-ranking official. Commenting on the growing number of infections among medical staff, the representative of the Health Institute stressed: "This is a big problem, a consequence of the fact that we have probably not taken their protection seriously and rigorously enough. It is also true that our medical staff lacked personal protective equipment and that our European neighbours were not helpful. The current coronavirus balance in Italy is 3,405 deaths, more than in China, and over 41,000 confirmed cases of infection". However, he did not point out that almost every country in Europe was already clearly affected by the effects of the pandemic, affecting not only the health security sphere.

In a report titled "Responsible Actions of Managers in the COVID-19 era", the Kearney consultancy wrote that “...industries based on the movement of people and services, as well as those that were already struggling with problems when the new global threat emerged, are particularly vulnerable to the virus. There are industries that will not be so badly affected by the pandemic". However, according to the authors of the report, the global extent of the epidemic and the restrictions and limitations introduced have led to imbalances in world trade and have severely damaged supply chains. The final scale of the crisis is still unknown.

Experts from various industries stress that "COVID-19 clearly has an impact on supply chains. Starting with industrial production, which has clearly slowed down (especially in China, which is the 'factory of the world'). It is suffering from staff shortages caused, among other things, by insufficient number of protective masks required for work and forced quarantine of workers. In addition, travel restrictions have resulted in a drastic drop in demand (and thus in prices) for land and air transport, paralysing them," said Kearney consultant Jakub Dudzic.

The Kearney report shows that the key to ensuring business continuity is to effectively support remote working. In this respect, technology that provides many tools and channels for use in ongoing communication is helpful. "Among our clients are those who almost overnight and without compromising efficiency, have switched most of their office staff to remote working and those who prefer to minimise remote working because it is unusual for their organisation. The same goes for customer relations. Those companies that have invested in multi-channeling and sell their products and services today both at physical points and in mobile applications and online shops are relatively less affected by today's extraordinary situation," - said Kearney Director Krystian Kamyk.

For some time the atmosphere of panic on the stock exchanges grew as the number of coronavirus cases increased. In Europe, the rate of infection was at its highest, and in the USA it started to accelerate. The Fed's decision, instead of improving the situation, only "added fuel to the fire" of market fears. The Wall Street stock exchange was stopped for 15 minutes immediately after the session opened. This is the third such case in the last six days. The reason was that the S&P500 index fell by 8%, which automatically suspended the session to calm investors' emotions. In just a few minutes, the stock market value of S&P500 companies fell by 2 trillion dollars, Reuters calculated. The Fed's decision to cut feet to zero instead of encouraging shopping was a panic-stricken mood. "The fear indicator jumped off the roof this morning," comments Reuters Peter Cardillo, chief market economist at Spartan Capital Securities in New York. The markets are terrified of the situation where central banks are entering and adding billions of dollars of liquidity," he added. Traders also fear that when traffic between countries closes the world's supply networks will be paralysed, which will hit companies' finances. And traders treat the interest rate decision as confirmation that the financial world is in serious trouble. Apple, Amazon and Microsoft reportedly lost about $300 billion of market value together.

Due to the limited framework of the article, only certain problems and phenomena, as well as links and relations between the health and economic security sectors will be highlighted. However, it may be worthwhile to use the models presented in the text of the article in the analyses carried out in relation to the other areas of safety in question, several of which are presented in Figure 1. It was also used to present in a synthetic way the research method adopted for the purposes of the article, as well as basic theoretical assumptions.

Theoretical and Methodological Assumptions Made

In order to better understand the essence of *the problem* signalled in the title of the article and its determinants, as well as while trying to formulate conclusions, the analysis was based on the assumption that in a crisis situation caused by the covid -19 pandemic, elements of the safety theory may prove useful, especially those concerning the safety culture (Pitgeon, 1991; Carnino, A., Weiman, G., 1995); Cieślarczyk, 2001, 2006, 2011); Filipek 2017). For the article, a holistic (Cieślarczyk 1997), systemic (Sienkiewicz 1994) and transdisciplinary (Bremer, 2016) research approach was also used. The adopted research perspective is presented in a synthetic way in Figure 1.

Figure 1: A holistic and transdisciplinary perspective on the study of safety problems in the 21st century (Cieślarczyk 1997, p.110).

Using the achievements of the safety sciences and several other scientific disciplines, our further deliberations will begin by approximating two ways of understanding the term *safety* (Stańczyk, 1996). This knowledge can be used successfully in relation to health security and the pandemic covit-19, which is of interest to us, and its impact on the economic and financial dimension of safety. The first, so called narrow and negative understanding of safety, treats safety as 'no threats'. This understanding is mainly encountered in the common thinking of most citizens, also in Poland. *Such understanding of safety* is often accompanied by treating it as *a state*. In the second thought safety model, the safety is understood as a process that takes place in *time and space* (see elements 6 and 7 in Figure 2). This way of thinking about security, including health and economic security, is not yet commonplace. This is evidenced not only by the results of empirical research (Safety Culture 2015), but also by the behaviour of many people in various difficult situations, also during the covid pandemic - 19. This is also indicated by the specific attitude to the health of some people when nothing ails them. This is particularly evident among young people. In many countries, the ways in which a certain proportion of the young people in the localities affected by the coronavirus pandemic were preserved did not bear witness to a satisfactory level of their safety culture.

The *safety* category, in its broadest sense, also takes into account *challenges, opportunities and risks* in addition to the *"threat"* term. The place of these terms in the structure of the so-called "safety alphabet" has been attempted to be presented in Figure 2 (elements 3.1 - 3.4). Unfortunately, it has to be said that even in scientific activity these terms are not widely known and rationally used. Let us recall that the *challenge* is the broadest concept in relation to the above-mentioned terms (Cieślarczyk 2006, pp. 118-119). It includes the *threats and opportunities* and *risk* terms. *A challenge is understood as a situation or information about that situation. If a challenge is properly identified and the related actions have been taken in a timely manner and in a manner appropriate to the situation, it usually becomes an opportunity. Otherwise, it becomes a threat.*

Skilful use of these terms in the description and evaluation of situations preceding a crisis, but also during and after the crisis, proves to be practically useful. This includes a better understanding of what *risk* is and how to handle it effectively in practice, including in business. Experienced businessmen know that there are no changes without risk. Without changes, there is no *development* as a condition for safety in the long run. However, *the development* is too rarely remembered to be *sustainable*. It is worth noting that the level and nature of the safety culture of the entities, assessed for example on the basis of their behaviour, actions and cooperation in crisis situations, correlates with their understanding of the *safety* term. Safety can be understood "point by point" - as *a state (fact, event)*, or "linearly" - as a process. The understanding of safety as *a spherical phenomenon* occurring in *space-time* (elements 6 and 7 in Figure 2) is much less common in practice. This was quite evident in many countries in the early stages of the coronavirus epidemic, which was not conducive to effective management of this threat. It is worth adding that the "owners" of the first ("point") and second ("linear") *way of thinking* about safety are less likely to use the previously discussed package of concepts: *challenges, threats, opportunities and risks*.

They usually focus on "threats" only. This is not conducive to effective crisis management. This is because it is difficult to *predict and prevent*. This is usually followed by inadequate and usually late *preparations*. This makes *the reaction* ineffective and very expensive, not only in material terms. It would be difficult to say that such situations were not observed in many countries, not only European ones, in the initial phase of the covid epidemic - 19. This was also noticeable during the economic crisis at the end of the first decade of the 21st century.

Based on the above mentioned observations and results of empirical research conducted by the author and his collaborators in Poland in the years 2011-2013 (*Safety Culture, 2015*), the theoretical assumptions adopted for the purposes of the article may be useful at various *stages of crisis management*, also in relation to various types of epidemics, of which probably covid - 19 is not the last one. A higher level of safety culture then proves to be particularly useful in the *prediction and prevention* phase. Then the stage of *preparation* for potential crises is conducted more carefully, which makes the response stage much more operational, effective and efficient. And the way the "reconstruction" phase, i.e. the return to “normal state", is carried out is at a higher level of development thanks to the experience gained during the crisis. These observations can be applied to various crisis situations, including those concerning the health and life of citizens, but also the "health" of the economy.

Knowledge of crisis management has great potential, but unfortunately it is still too little used in practice, as well as knowledge and experience of safety culture. In many countries, it can be seen that crisis management structures at different administrative levels are not always able to "find their way" in large scale crises. This is also visible during the covid pandemic - 19. In the last stage of crisis management, which is *reconstruction*, two different ways of action taken by physical and legal entities are observed depending on the level and nature of the safety culture. One of these ways is to restore the pre-crisis situation. The second one is a kind of activity, when using the experience of crisis, actions are taken to improve the existing organizational, technological and procedural structures, but also "thought structures", i.e. the ways of thinking of employees of a company or institution.

This reduces the risk of further crises, also on a large scale, and if they do occur, it will be easier to deal with them. The actions taken then are more operational, effective, economical and efficient, and the organisation or institution becomes a "learning organisation" (Senge, 1998). Probably "already" in a few months we will know more about how it went during the covid-19 pandemic. It seems that when describing and explaining many processes and phenomena that appear at that time, it may turn out to be useful to see the model called "safety alphabet" in Figure 2.

Figure 2: "Safety alphabet" as the element of the safety culture.

The analysis of some events related to the coronavirus pandemic using this model will allow, among others, to better understand the importance of the challenge category in combination with other factors affecting the level of safety of natural and legal entities.

In various life situations and research, the term usually appears in *the relationships* (factor 3 in Figure 2) between the subject (factor 1) and the surroundings (factor 2), and in it with various types of environments. The dynamic analysis of the elements of this model in relation to crisis situations allows us to observe that in relations between actors and with different types of environments there are also crises (factor 3.5.), and among them, "grown up" like the "Siamese brothers" crises in the sphere of health and economic security (Cieślarczyk, Filipek, Ważniewska, Świderski 2011). That is why people have been designing and installing various types of *systems* in relation to their surroundings for centuries (factor 4 in Figure 2).

As already mentioned, systems are located between the *subject* (man, family, institution and organisation, state, nation or community, e.g. the EU) and their closer and further surroundings. It is worth remembering that in the 21st century safety environments are becoming increasingly turbulent and difficult to predict. This was pointed out years ago by U. Beck (2002) when he wrote about "a society of risk".

Both scientific studies and practical experience suggest that in a broad sense of the surroundings term, there are various types of environments necessary for the life and development of homo sapiens. Among the basic environments there are: natural, economic, social, cultural environment - and within the cultural environment there is information environment, etc. They are located in element 2 in Figure 2. As already mentioned, these environments are essential for physical and legal entities to live and develop. Experience to date shows that it is too rarely the sustainable development. There is a growing body of talk that this may be one of the main causes of past and future crises on a global scale. The following years will show how the situation will change in this

respect in the world and in individual countries. In this sense, we can treat the covid-19 pandemic as a *challenge*.

While still following the “safety alphabet” model, it is worth recalling the quite obvious fact that various physical and legal entities live and function in *the social environment* (element 1 in Figure 2). They are characterised, among others, by dynamically increasing *needs* (factor 1.1.) and *interests* (factor 1.2.) over the last decades, which, however, have not been kept up with the pace of improvement of their safety culture (factor 1.3) and its level is not adequate to the needs. In order to satisfy the dynamically expanding range of needs, entities use different types of *matter, energy and information* (factors 2.2 - 2.4). In the information civilisation this order is reversed, which is particularly evident during the covid-19 pandemic. Thus, the question arises: can this global crisis, understood as a *challenge, contribute to the civilisational solstice and accelerate the transition of most countries and societies from the stage of industrial civilisation to the information civilisation, and perhaps even to the civilisation of knowledge and wisdom*? The importance of the latter value, which is *wisdom*, is particularly evident in crisis situations (Cieślarczyk, Kołodziejczyk, 2019), also such as the coronovirus pandemic.

In recent years, there has been a growing awareness that information and knowledge, but also the related *information and communication culture*, will become increasingly important in the coming decades. However, it would be difficult to say that the current level of *information and communication culture* of citizens in many countries has kept pace with the challenges of civilisation, including the pace of changes in modern technologies. This fear is confirmed not only by numerous facts which prove the susceptibility of a significant part of citizens to "wars" and informational struggles since years. The deficit of *the information and communication culture* and the related reduced efficiency, effectiveness, cost-effectiveness and effectiveness in the "fight" against the coronavirus is visible in many countries. Using the “safety alphabet” model it is worth noting that the weave of most of the factors shown in Figure 2 creates *the situations*, marked with symbols 2.5 and 7.

These elements, together with the *safety culture* (symbol 1.4.), can form *a system of operation* (Crozier, Friedberg, 1982) when the level of safety culture of the operators is at least satisfactory. The experience of the covid pandemic - 19 shows that most societies still have a lot to do in this respect. In order to learn more about the essence and importance of *safety culture*, it is worth to use the empirically proven model presented in Figure 3. Let us recall that in the simplest sense, *the safety culture is understood as a universal type of competence of a psychosocial and praxis nature. It is sometimes assumed to be a system (“package”) of competences, useful to natural and legal entities in various situations, especially in crisis situations.* This "Package" consists of: *a) knowledge and thinking about security, b) perception of security and threats, c) way/who to respond to objectively or subjectively emerging threats or perceived security deficits* (Frei, 1997)*, d) for the safety of oneself and others, e) for the closer and further dimension of space-time*. This simplified understanding of security culture is worth enriching (developing) with the use of successive models of this hardly noticeable, as it were, ethereal phenomenon, which becomes more evident during crises. Let's start its next approximation from Figure 3.

Figure 3: Safety culture - an ideal model (Cieślarczyk 2006, p.212, VIII)

It resembles a section of a tree trunk. Its core (axis) is a *value system* characteristic of a given natural or legal entity, marked in yellow. In the ideal model, the relative balance between the importance the subject attaches to the different sectors of life and safety as shown in Figure 3 and their place in the value system contributes to the fact that the model takes the shape of a circle as the ideal form. This is also achieved by the green colouring of internalised and practical *standards* for different spheres of life and safety. They are particularly important in difficult, crisis situations. And the third - looking from the inside - "tree jar" corresponds to the category of attitudes that can be more or less "rooted" in values. From pedagogical literature (Mika 1981 et al.) we learn that the attitude category consists of three elements, conventionally treated as "layers". These are: knowledge and "technology of the intellect" (M.Marody, 1987), a sphere of emotions ("good or bad"), and an "outer layer", symbolizing the subject's willingness to act, or to give up activity. In Figure 3 we can see that the category of "action" reaches its "roots" to the core of the safety culture, i.e. in *the values* which, combined with *norms*, form *the axio-normative system* of the subject, called *rules* or *patterns* by sociologists (Sztompka 2002, pp. 257-258, Sumner 1927). It would be difficult to say that in recent decades most schools and universities in the world have devoted much attention to these issues. And it is mainly they that determine the quality of human attitudes, which - as in a lens - are more clearly visible in difficult, crisis situations. Then, however, in most cases, the *behaviour* category manifests itself more often than the *actions* category, the formation of which is not supported by the deficit of *reflectiveness* mentioned at the beginning of the article.

It is worth adding that the "golden vectors" presented in Figure 3, symbolising *actions in* the ideal model, in the real model take on a red colour corresponding to behavioural *behaviours*. This is particularly evident in crisis situations. These vectors, symbolizing *relationships*, are then not "rooted" in the system of values, but rather in the emotional layer of attitudes. In difficult, crisis situations, this turns out to be insufficient even when such *behaviours* are motivated by "positive emotions". For example, groups of young people dancing on an Italian beach or in other public

places, "strengthening" themselves with shouts: "we're not afraid of the virus", pointed out on the one hand that these young people "can't be afraid". On the other hand, they gave evidence of a not necessarily high level of their safety culture. Analysing one of the models of *safety culture* presented in Figure 3, it is worth noting that in its "core", i.e. in the system of values, the already mentioned, although not always appreciated at home, in schools and universities, the *wisdom* category plays an important role. It can be understood most easily as *the ability of an entity to use information, knowledge*

and other types of resources to achieve worthy objectives. The objectives, seen not only "here and now" but also "somewhere and someday". These are important elements of *a strategic culture* as an important part of a broadly defined safety culture. It can be assumed with great probability that *wisdom fulfils the role of an operational regulatory centre, which is difficult to overestimate, in relation to the other elements of the safety culture, and within it in relation to the organizational, legal and strategic culture*. The latter category was of particular interest to the European Commission several years ago. However, the campaign launched at that time did not hit the vulnerable ground. This was probably not supported by the level of safety culture of natural and legal entities in most EU countries. More on this subject in the next article, entitled *"The expected impact of the covid-19 pandemic on the basic spheres of life and security of states and societies"*.

Summary

Knowledge of the coronavirus and the effects of the covid-19 pandemic, as well as information available in March 2020 on the behaviour, actions and interaction of physical and legal entities during the build-up of the pandemic, is still fragmented and unstructured. However, even in this situation one can risk saying that significant elements of knowledge on *the safety theory* can be useful *to describe and explain* processes and phenomena related to *the covid-19 pandemic* and its potential consequences. *Safety culture models*, developed by the research team on the basis of many years of experience gathered during other crisis situations, can be particularly useful. Empirical research conducted several years ago in Poland has shown, among other things, a clear link between the level and nature of safety culture of physical and legal entities experiencing crisis situations and the efficiency, effectiveness, economy and effectiveness of dealing with these situations. Although their scope and nature cannot be compared with the covid pandemic - 19, according to the author, many of those experiences may prove useful "here and now", but also in predicting the effects of the pandemic on various spheres of life and human safety. Several years of didactic experience of this research team also allows us to conclude that the culture of safety of individuals and social groups can be diagnosed and improved. The best results are achieved when you start at a younger school age.

Railway Component of The Central Transport Port as A Determinant of The Transport Security of Military Units

Mieczyslaw PAWLISIAK

Military University of Technology, Warsaw, Poland
mieczyslaw.pawlisiak@wat.edu.pl

Abstract

Safety is, inter alia, defined as a condition in which no risks are perceived. These risks may affect different areas, including the meeting of transport needs. For military units and institutions, one of the key needs in the broadly understood logistics is the need for transport tasks. In the 21st century, this need can be met with different modes of transport. When planning to expand the Central Transport Port /CPK/ it is necessary to see the possibility of meeting the transport need using a railway component built and upgraded under the CPK. Whether and as far as possible depends on the transport relationship and the planned course of the new railway line system. Analysis of the planned routes indicates that, in addition to the CPK railway component, other lines should be taken into account, the modernisation of which will create conditions for a fuller meeting of the transport needs of military units and institutions.

Keywords: Central Transport Port, railway component, transport need, security, railway line, modernization, construction.

Introduction

The decision regarding the construction of the Central Transport Port (the CPK) in Poland should be and actually is perceived from different perspectives. The creation of such a facility will affect the economy in two ways. In the short term, it will affect demand in areas such as the production of materials and the acquisition of raw materials necessary for the construction of the airport and the accompanying transport infrastructure, as well as demand for construction and assembly services. When considering investment activities over a longer period of time, one should also notice the impact of the construction of the airport together with the accompanying infrastructure as a factor that drives the entire economy, boosts other investments and conditions the development of international trade. However, it is advisable to consider the construction of the CPK not only from an economic point of view. An attempt should also be made to assess its impact on meeting the transport needs of military units, especially in the context of their involvement in activities ensuring the security of the Republic of Poland. In order for the assessment to be fairly comprehensive, it should be noted that the CPK project is often equated with the construction of the airport, which is not complete information. The airport itself and the infrastructure associated with it are only part of the investment. Accompanying infrastructure such as, among others, modernized and newly built railway lines will have a significant contribution to the subsequent proper functioning of the CPK. From the point of view of military transport, they are the main component that arouses interest in terms of their use in the interest of national security.

Given the above scope and understanding the importance of transport for ensuring the security of virtually all military units, it is justified to assume the ***purpose of the article which is to determine whether and to what extent the CPK railway component affects the performance of transport tasks for the needs of military units to ensure their transport security***.

In order to achieve this goal, it is necessary to specify the research problem as follows: ***does the CPK railway component have an impact on ensuring transport security of military units?*** Solving the main research problem requires solving ***three specific research problems***.

1. Is transport security important from the point of view of a military unit and how is it understood?
2. What are the main routes of military transport services carried out by rail?
3. Does the selected route of railway lines under the CPK meet the expectations related to satisfying the needs of military units?

In an attempt to solve the listed research problems, basic research methods such as ***analysis, synthesis and inference have been used***. ***Surveys*** conducted among soldiers serving in various military units complemented the research process. It was a deliberate selection as it involved participants of courses conducted at the university and, additionally, these were officers actively carrying out tasks related to satisfying transport needs in military units. According to the author, the methodological approach presented allows to obtain reliable data and solve the above-specified research problem.

Transport Security - Theoretical Approach

Transport is a kind of business or service activity that focuses its efforts in the first place on the implementation of tasks related to the movement of various types of cargo /goods/ from the place of loading to the destination (place of consumption or use) [Rydzykowski, Wojewódzka - Król 2010, pp. 35-57]. With regard to persons, transport tasks relate to ensuring the conditions for moving passengers to the place indicated by them. It can be a place of work, recreation or place of residence. In every situation, means of transport which are adequate to the intended transport task as well as infrastructure enabling the safe movement thereof must be provided.

From an economic point of view, transport is nothing more than a paid performance of various transportation tasks. The result of those operations is meeting the needs of individual or institutional clients, and at the same time generating profit by the transport company [Koźlak 2008, p. 11]. When analysing the realization of transport tasks, it is possible to distinguish additional services accompanying the transport service. These can be services that cover a wide range of activities providing added value to the transport service itself. These may include, inter alia, various forms of consulting, storage of goods, their palletization, consolidation, de-consolidation, conditioning, wrapping, binding, repackaging, labelling and other activities ordered by individual clients [Jeszka 2009, pp. 78-122].

Transport system understood as a deliberately complex set of elements, also called subsystems, forming a specific whole designed to meet the needs associated with the movement of people and goods in space. Its internal structure can be divided into technical, organizational, procedural /regulatory/ or financial subsystems. From the point of view of security being the essence of the article, the key element – subsystem is the stationary transport infrastructure, which, when combined with means of transport and supported by organization and legal regulations, will be able to ensure the security of military units and institutions. It is the stationary, linear and point, transport infrastructure that determines the availability and thus the quality of transport services provided. This is important because the institution of the Polish Armed Forces does not have a separate transport infrastructure (with small exceptions such as, e.g. military railway sidings or roads in military training grounds). Therefore, it is the railway infrastructure located on the territory of the country and being at the disposal of specific state institutions that should meet the needs of military units and institutions both in times of peace as well as in crisis or war. Considering the general and only key points about transport, one should consider whether any correlations between transport and security can be found. It seems that since transport as a whole is to meet the needs generated by specific entities, there should be no doubt that satisfying them has a direct impact on the sense of security of these entities [Kośmider, Kitler 2017]. This position of the author results from the fact that security is commonly understood as a state in which the considered entity does not feel a threat in relation to its functioning [Rokiciński, Mikołajczak, Oszowska, 2016 pp. 125-144]. The above statement does not exhaust all possible interpretations of the term security. Polish and foreign authors define the commonly used word “security” in different ways, as shown in the following compilation.

Table 1: List of selected definitions and terms of security

No.	Content – interpretation of the word security	Author / Publication
1.	"Security is like peace, it is not given to people once and for all, without any conditions"	Huzarski M., Variable foundations of state security and defense, AON, Warszawa 2009, pp. 11-14
2.	"Security is nothing more than the ability to resist various threats caused by human action or a natural event /e.g. flood/"	Pokruszyński W., Theoretical aspects of security, University of Regional Economy, Józefów 2010, p. 8
3.	security is virtually identical with certainty /*safety*/ and it means no physical threat /*danger*/ or protection against it	definition by Daniel Lerner included in the UNESCO Dictionary of Social Sciences Zięba R., The institutionalization of European security: concepts - structures - functioning. Warsaw: "Scholar" 1999. p. 27
4.	"Security is the opposite of danger" the view of Professor Charles Manning specialist in international relations at Oxford University	Stańczyk J., Contemporary understanding of security, ISP PAN, Warszawa 1996, p. 16
6.	"Security is freedom of action, which is not accompanied by a sense of danger, and therefore a state of mind that is determined by a specific form of international order" - Roy Edwin Jones, English Professor specializing in problems of international relations	Grader S., The English School of International relations: evidence and evaluation. Review of International Studies, (1998) 14 pp. 29–44, Cambridge University Press 1988
7.	"Security is the only goal and motive of the state's activity and this goal should be achieved by means of applicable legal rules" - the view was expressed by the German philosopher Friedrich Wilhelm Christian Karl Ferdinand von Humboldt	Maneli M., History of political and legal doctrines of the 19th century, p. I, PWN, Warsaw, 1964, pp. 198–207
8.	"Each time when an entity's security is not ensured, it results in damage to a single person or to a larger group of people. This usually results in the destabilization of the entity's functioning and identity."	Kukułka J., New conditions and dimensions of Poland's international security, "Countryside and State", 1995, no. 1, pp. 198–199
9.	"Recognizing security as the primary need of a human being and specific social groups is an important stimulus to act in the name of achieving specific goals"	Zięba R., General theory of state security in international relations, International relations in the 21st century. Jubilee book on the occasion of the 30th anniversary of the Institute of International Relations at the University of Warsaw, Scholar, Warsaw, 2006, pp. 939–950
10.	"Logistic security of military units and institutions is nothing more than providing conditions for maintaining combat capability, among others, by satisfying transport needs – ensuring transport security"	Pawlisiak M., System logistycznydeterminantembezpieczeństwaSiłZbrojnychRzeczypospolitejPolskiej, WAT Warszawa 2017, pp. 64–66

The presented views show only partially how security is perceived and defined. It seems that to further develop and discuss the issues of security in a broader perspective, it is justified to undertake an analysis of the problem presented by Professor Huzarski. He believes that in the process of consider-

ing threats, considering among others the satisfaction of transport needs, it is necessary to recognize the dynamics of change and the variety of factors posing a threat in this area. Sometimes threats and the resulting insecurity (sense of danger) go beyond the military sphere and may take the form of cyberattacks, economic pressures or variations of hybrid wars, which can currently be observed during the conflict in eastern Ukraine. Such situations require actions aimed at limiting threats and thus ensuring security with regard to the functioning of transport.

An equally interesting proposition referring to an attempt at a correct definition of the term threat is the view presented by the Swiss political scientist Daniel Freia, who, based on an analysis of subjective and objective aspects of threats, built a synthetic model that allows to explain the essence of an observable threat. The result of this analysis is the formulation of the following four theses:

- the state of insecurity occurs when a real external threat is correctly and objectively perceived;
- the state of obsession, panic and incapacitation arises in the event of an unjustified exaggeration of an unknown or not fully identified threat;
- the state of false security is the result of unjustified minimization or marginalization of a perceived external threat;
- The state of security occurs only when there is a slight and at the same time correctly diagnosed threat [Frei 1977].

It is also obvious that the state of the art, the tools used and the range of threats have changed dramatically since the 1970s. At the beginning of the twenty-first century, one should be inclined to take a wider look at the series of events determining security. This means that it is advisable to consider theoretical issues of security while expanding the area of interest to include the next stages involving various challenges. It is quite commonly proposed to perceive security as a specific process in which there are certain cause and effect relationships between individual components such as the subject and object of security, the possibility of counteracting threats and the manner of ensuring the security of specific entities [Zięba 2012]. Only such an approach creates premises for the correct perception of security in a specific place and time.

Military Transport Routes by Rail

During peace, units of the Polish Army operate and are quartered in barracks located throughout Poland. The present location of military bases is a legacy of earlier historical events. Until 1918, there was no Polish State, and then the decisions regarding the location of military facilities such as barracks, fortresses or storage facilities were taken by the partitioning countries. When making such decisions they were guided by two premises. First, they sought to ensure their security by placing military facilities in a place where they would protect the territory of partitioning forces against external threats. Secondly, they were to allow peace and security in the occupied territory. After regaining independence in 1918, the shape of Polish territory deviated from today's borders. Investments in infrastructure of that period were also guided by ensuring safety and the results of these activities do not fully correspond to today's reality. In addition, it should be noted that part of today's Polish territory in the interwar period was within the German Reich, which as a state pursued an expansion-oriented policy and attached great importance to the construction of barracks and other facilities for the needs of its armed forces. After the end of World War II, Poland operated within the structures of the Warsaw Pact. Its policy and the opponent's location in the west did not require the construction of new military facilities. At that time, facilities already existing in Poland were used.

The Prime Minister of the Republic of Poland is responsible in the Polish legal system for the overall functioning of the national economy as well as issues related to national defense. In this respect, its decision periodically clarifies the route of railway lines of national importance. These lines perform economic functions as well as are used for military transport just like other transport infrastructure facilities, as the Polish Armed Forces do not have their own national facilities. Although they have, for example, military training grounds or military railway sidings, national railways of defense significance are used for domestic transport.

The above-discussed historical conditions have led to a situation in which the location of chief barracks and storage facilities does not fully correspond to today's political and military situation. Military units use existing facilities; however, there is a need to take action to ensure the possibility of their relocation along routes adequate to the situation.

Fig. 1: Location of chief military units and facilities on the territory of Poland[1]

The schematic distribution of the main military units of the Polish Armed Forces only signals a problem. It should be remembered that units such as the 11th Armored Cavalry Division, which is the main striking force, has its subordinate brigades in Świętoszów, Międzyrzecz, Wędrzyn and Żagań, while any military threat can rather be seen in the east. Unfavourable distribution can also be observed in relation to warehouses, which, according to the earlier concept of the Warsaw Pact, are dispersed unevenly in Poland. Some of them are located in the west of Poland (Potok, Duninów, Jastrzębie, Krapkowice, NowogródBobrzański) and at least to this day no redeployment has been planned. There are also warehouses located a short distance from the eastern border. These are depots in Hajnówka, Osowiec and Bezwola.[2]

To indicate the importance of military transport by rail with regard to particular routes***, the author's own surveys have been carried out***. Respondents were required to answer a number of detailed questions related to the need and possibilities of using rail in military transport. The results of these surveys are presented in the table below.

[1] Own study

[2] The ability to accurately indicate locations of military units and warehouses results from the experience of the author who served in the logistics division of the Polish Army. He was, among others, Commander of the 1st Pomeranian Logistics Brigade

Table 2: The extent of using rail in military transport

No.	Type of transport/freight	The importance of carrying out transport to ensure the transport security of the military unit and institution (%)			
		low	average	high	very high
1.	Operational transport – military equipment:				
	a/ during peace;	13	41	29	17
	b/ during crisis /threat/;	8	21	34	37
	c/ during war;	57	25	13	5
2.	Supply transport - combat and material supplies:				
	a/ during peace;	47	33	12	8
	b/ during crisis /threat/;	13	22	41	24
	c/ during war;	48	25	18	9

Cumulative survey results included in the table show some regularities. In relation to operational transport, rail transport is perceived as significant during peace as well as during crisis, also referred to as the period of threat. At the time before the outbreak of a possible war this type of transport plays an important role in ensuring transport security, as estimated by 55 to 70 percent of the surveyed persons. However, during war its significance decreases and this view is expressed by over 80 percent of the respondents. The results regarding the transport of supplies are slightly different. In the respondents' opinion, rail transport plays an important role especially in times of crisis or threat. This view is expressed by over 60 percent of respondents. During that time, tasks related to supplying troops should be carried out with simultaneous operations related to stocks redeployment. This period allows the use of rail transport as it enables the performance of extensive transport operations with the involvement of a smaller number of transport means. To sum up, it can be stated that the scope of use of rail will be greater during a period of peace and threat while its significance in time of war will decrease. The respondents justify this claim by the fact that the destruction of the railway network will not allow mass use of this type of transport and, additionally, during war it is necessary to carry out transport tasks in a short time, which is what rail transport is unable to provide.

The second main problem studied by the author by means of surveys is the routes along which rail transport is and should be implemented to ensure the transport security of military units and institutions. The results obtained in the course of the research are presented in the table below.

Table 3: Routes in military transportation by rail

No.	Military transportation routes	Importance of routes in military transports (%)			
		Low	Average	High	Very high
1.	Location of the 11DKPanc /Żagań/ – north east of Poland:	11			
	a/ during peace;	3	23	44	22
	b/ during threat;	49	14	35	48
	c/ during war.		35	11	5
2.	Location of the 11DKPanc /Żagań/ – east of Poland:				
	a/ during peace;	12	22	47	19
	b/ during threat;	5	15	34	46
	c/ during war.	51	36	8	5

4.	Location of warehouses (Masuria, Warmia, Podlachia) – west and south west of Poland:				
	a/ during peace;	23	22	34	21
	b/ during threat;	4	6	44	46
	c/ during war.	23	19	25	33
5.	Location of warehouses (Lower Silesia, Opolian Silesia, Lubusz Province) – east of Poland:				
	a/ during peace;	29	24	22	23
	b/ during threat;	11	15	34	40
	c/ during war.	23	23	28	26

The overall survey results in the table show some regularities and trends. They consist in the fact that less significance is perceived during peace and war, while during the period of threat of war, rail transport along the indicated routes can play a very important role. It is an indication that this type of transport should be considered as necessary in the process of delivering supplies as well as the evacuation or redistribution of accumulated stocks of combat and material supplies. Research results also indicate that respondents understood the importance of rail for the effective operation of mass supply transport.

A possible continuation of the presented observations and conclusions resulting from the analysis of the results of the surveys is the need to look at the fact that, in accordance with the current training concept in the Polish Armed Forces [DD 7 (A) 2010], each military unit is required to provide training in field conditions twice in year. This means the necessity to transfer forces and supplies from their place of permanent stationing to training grounds using available means of transport. In the Armed Forces of the Republic of Poland there is a rule according to which military vehicles on tracked chassis are transported on low-loader outfits or using rail transport. Considering the economic factor and the limited availability of low-loader outfits, mainly rail transport is used. Thus, during training in times of peace, military equipment can be transported along the following routes:

- Żagań/Świętoszów – OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Międzyrzecz - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Szczecin - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Złocieniec - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Słupsk - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Warszawa Wesoła - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Rzeszów - OSPWL DrawskoPomorskie/OSPWL Orzysz;
- Lublin - OSPWL DrawskoPomorskie/OSPWL Orzysz.

The presented routes do not exhaust the topic, but only show the main directions of transport of military units. The resulting conclusions should be considered as one of the determinants of the design of the CPK railway component.

To sum up the presented results regarding possible routes in operational military transport using rail, it can be observed that their course ends mainly in the north-eastern or eastern part of Poland. Starting—loading—points are located in different parts of the country and this is due to the deployment of military units during peace. In turn, the starting point of each supply transport is usually located in the warehouse, while the destination point is determined by the recipient or the person making the decision regarding the evacuation or redistribution of stocks.

The routes of the Central Transport Port's railway lines and the needs of military units

According to the decision of the central authorities, the modernization and construction of new railway lines is an integral part of the construction of the Central Transport Port. The investment is planned to include as its part a railway network the shape of which resembles a cobweb. In order to

meet this goal, routes to ten important destinations, currently called spokes, have been selected. Additionally, to ensure the possibility of collision-free re-routing of train sets between the "spokes", the construction and modernization of sections, known as "clips" in the draft, has been planned. The entire railway investment will include the construction of approximately 1,600 kilometres of lines, where trains will be able to travel at speeds of 160 to 250 kilometres per hour. Not very optimistic news in this area is the fact that the completion of rail investments is expected by 2040.

Map of modernized and newly built railway lines as part of the construction of the Central Transport Port[3] – source "kronika 24.pl accessed 25 November 2019

In the author's opinion, several basic railway lines modernized as part of the construction of the Central Transport Port are particularly important for ensuring the transport security of military units. First of all, one should mention the railway line running from the border crossing in Lubawka through Wrocław, Sieradz, and Łódź to the Warsaw junction, from where transport can be carried out along two routes:

- Ostrołęka, Łomża, Pisz, and Giżycko through Orzysz;
- Małkinia, Białystok, Suwałki.

In order to ensure the conditions for the full use of these lines for military transport, it appears necessary to make additional investments in railway lines of lesser importance for the CPK. This applies in particular to railway line No. 283 connecting, among others, Świętoszów with Żagań and railway line 275 connecting Żagań with Wrocław.[4] In this way, convenient transfer of forces and resources from Lower Silesia to the north-east will be enabled. In addition, such a course of the railway lines will allow the evacuation and redistribution of supplies stored in this area.

[3]kronika 24.pl accessed 25.11.2019
[4]https://www.rynek-kolejowy.pl/ accessed 28 November 2019

The second important railway line from the point of view of transport security is the one running from Słubice, through Zbąszynek, Poznań, and Kutno to Warsaw, where there is a possibility of transport in two main directions. The first one leads to Giżycko via Ostrołęka, Łomża, Pisz, and Orzysz while the latter goes via Małkinia and Białystok to Suwałki. In order for this line to meet the requirements, it is reasonable to modernize route number 375 on the Międzyrzecz – Zbąszynek section.[5]

Such rail investments in the Dolnośląskie and LubuskieVoivodeships (Provinces) will ensure favourable conditions for the use of rail transport on essential routes, i.e. a place of permanent deployment of a military unit—a training ground or an area of operational destination.

To enable manoeuvres between individual railway lines already existing as well as those modernized in the future, it is necessary to have other railway lines that are not part of the CPK railway component. This solution can be observed in the modernization of railway line number 219 running from Olsztyn to Ełk.[6] On the one hand, it boosts the development of areas in its vicinity, and from a security point of view it can constitute a viable alternative for military transport in this region.

Assessing the location of military units in the western part of Poland, one can observe a certain dissonance between the CPK railway component and the area of West Pomerania. Military units relevant to Poland's security are also located there. In turn, the primary bearing of the railway lines focuses on the central part of the country. It can therefore be said that for the units of the 12th Mechanized Division, the CPK railway component is not critical in ensuring their transport security. Therefore, it will be necessary to take into account the transport needs of military units located in the northwestern part of the country in other projects related to rail investments. This may include, inter alia, the modernization of railway line No. 210 connecting Chojnice with Runowo Pomorskie through Szczecinek, Złocieniec and Drawsko Pomorskie.

When making a comprehensive assessment of the impact of the railway component on satisfying the transport needs of military units and institutions, it is legitimate to state that the construction of the CPK can improve the conditions of military transport using rail. It should be remembered that the primary role of the CPK is to meet the country's overall transport needs, taking into account the conditions and requirements of the 21st century. In this situation, the transport security of military units and institutions is only one of the factors that have been taken into account when planning and implementing investments. It is also reasonable to recognize the investment needs not only in relation to rail infrastructure. It is also necessary not to neglect the means of transport, i.e. rolling stock as a necessary element in the effective realization of transport tasks. This issue can and should be the area of interest for subsequent theoretical studies.

Conclusion

The construction of the Central Transport Port is a complex undertaking requiring reconciliation of social, economic and security interests of the Republic of Poland. As a result, there might occur situations in which meeting all expectations may prove difficult, and sometimes even impossible. This is also partly applicable to military units and institutions. However, a possible solution should be sought, which has been discussed as feasible modernization of certain railway lines. It also seems that current plans may be subject to modification after taking into account changing political, economic or military conditions. Each time, however, the transport needs of military units and institutions should be taken into account as the factor which translates into the military security of the Republic of Poland.

Supporting the Operations of a Transport Undertaking in Uncertain Conditions

Sławomir BARTOSIEWICZ

Military University of Technology, Warsaw, Poland
slawomir.bartosiewicz@wat.edu.pl

Abstract

An IT tool has been designed to support the operational activities of a transport company under conditions of uncertainty. The main component of this tool is a developed random timetable generator for rail transport vehicles, which allows preparing input data on the basis of which can be forecast their departure schedule. The tool allows generating both random schedules and manually enter actual quantity data. The idea of such a solution was based on the Excel spreadsheet of Microsoft Office, in which the built-in functions were used to model random timetables of transport means in a railway company.

Keywords: Supporting the operational activities of a transport company, conditions of uncertainty, tool, data, transport, forecast, analysis.

Introduction

The management of a transport undertaking involves taking decisions in a state of uncertainty, in which certain management decisions have different effects, depending on which state of affairs occurs. In such a situation, the manager of the transport company most often knows the probability distribution of the occurrence of certain states of affairs, and the most common solution to the problem of acting in such conditions is to maximize the expected value, i.e. to choose the action with the highest expected value. Therefore, quick decision making has a huge impact on the situation of the company because delaying it often causes significant losses Raczkowski Noga and Klepacki (2015). Moreover, supporting operational activities in conditions of uncertainty protects and enhances the value of the company as it contributes to the achievement of its objectives.

One of the effective ways to deal with the uncertainty associated with the timely departure of rail transport in this company will be to develop this tool.

Adopted Research Procedures

The goal that the author wants to achieve is to design an innovative analytic and prognostic tool that will facilitate management decisions supporting operational activities in a transport company.

The research problem is the answer to the question: How to design an innovative analytic and prognostic tool that will effectively support the operational activities of a transport company under conditions of uncertainty?

A research hypothesis was adopted: The designed tool will effectively support the decision-making process in a transport company.

The subject of research is designing an innovative analytic and forecasting tool; the audited organization is a railway undertaking.
The testing period is from 2012 to 2014.
Spatial coverage is a railway company operating on the Polish market.

The data used for the research calculations were hypothetical and their scope was limited to one railway line, assuming that the vehicle (train) leaves daily at a specified time.

The following research methods and tools are discussed in the article:

- analysis of the literature on the subject;
- analysis of the structure of statistical population;
- MS Excel spreadsheet;
- forecasting.

The hardcore of the tool is a properly designed random numbers generator which, based on normal distribution in the range from minimum to maximum, generates random departure timetables for the means of rail transport in a railway undertaking. The framework of the study is the following:

- assumptions made for the research process;
- design of a generator of random timetables for means of rail transport;
- building a forecasting model for train departures timetable in a railway undertaking.

Assumptions made for the research process

According to Rowntree (2018), the core of the developed IT tool is the generator of random train timetables in a railway undertaking which allows, in a relatively simple way, the preparation of input data for the forecasting of train departure times with the following options:

1. Setting any time periods for generating results. Data range can be easily changed by adding or removing subsequent days. With Excel functions, data can be grouped using a pivot table in monthly or yearly periods.
2. Creating and modulating delays using various types of distributions. Owing to the Excel functions embedded in the spreadsheet, which reflect probability distributions, different types of distributions can be used in an easy and intuitive way that best present the course of the studied phenomenon. In addition, these distributions can be modulated by specifying measures such as: mean, standard deviation, etc.
3. Thanks to the trigonometric functions available in the spreadsheet, periodic fluctuations of the studied phenomenon can be simulated. In the studied case, a modified sine function was used; if the phenomenon occurs differently, other trigonometric functions can be employed and their parameters can be adjusted.
4. The obtained data can be easily presented using graphical data presentation methods, e.g. in an Excel spreadsheet which offers a full range of ready-made graphic solutions, such as: pie chart, line chart, column chart, bar chart, and histogram.

To make the designed IT tool more transparent, it is possible to collapse the calculation cells to leave the most important information, such as date, planned departure time, actual departure time and the difference between them (Table 1).

Table 1: An example of a timetable sheet after collapsing calculation cells

Date	Planned departure	Actual departure	Delay
01.01.2012	11:00	11:51	00:51
01.02.2012	11:00	12:51	01:51
01.03.2012	11:00	11:16	00:16
01.04.2012	11:00	11:15	00:15
01.05.2012	11:00	11:25	00:25
01.06.2012	11:00	11:19	00:19
01.07.2012	11:00	11:17	00:17

01.08.2012	11:00	11:15	00:15
01.09.2012	11:00	11:16	00:16
01.10.2012	11:00	11:18	00:18
01.11.2012	11:00	11:18	00:18
01.12.2012	11:00	11:18	00:18
01.13.2012	11:00	11:53	00:53
01.14.2012	11:00	11:36	00:36
01.15.2012	11:00	11:18	00:18
01.16.2012	11:00	11:16	00:16
01.17.2012	11:00	11:19	00:19

This form of data structure permits the use of time series analysis methods. The IT tool generates practical random timetables and, based on them, performs analyses and allows conclusions to be drawn. It also helps analyze and forecast a train timetable in a railway undertaking. When designing the tool, the structure of the studied phenomenon was studied using descriptive analysis methods and statistical formulas which allowed calculations in the MS Excel spreadsheet. Some of the statistical functions are embedded Excel spreadsheets while the remaining part was developed independently. The application is integrated with the random timetable generator, which allows the generation of data for the study and then the analysis of obtained results.

Results

The entire generator is contained in one spreadsheet and consists of the following columns: date, planned departure time, random departure delay, degrees to periodicity, radians to periodicity, periodic fluctuations, random factor, unknown component, actual departure time, and delay. The first three rows contain the following fields: years, average, deviation, etc. (Table 2).

Table 2: A spreadsheet of random train departure timetables generator

	A	B	C	D	E	F	G	H	I	J

Legend:

- “Date" column - this column contains individual dates for which the timetable is tested;
- "Planned departure" column - this column contains the time of planned departure of a freight train. 11:00 was adopted for the study;
- "Random departure delay" column - this field contains a random delay based on normal distribution. The full function is as follows:”= ABS(TRUNC(NORMINV (RAND();C$2;C$3)))/24/60”. It is assumed that in real departure times there is a delay in line with the statistical normal distribution (over the whole studied period, there are several major delays; next, there are more average delays and, correspondingly, many small or no delays). To modulate the function of normal distribution, the values corresponding to the mean and standard deviation are used (fields C2 and C3 in the spreadsheet). The whole algorithm works as follows: The normal distribution function for the given mean, standard deviation and probability of occurrence (the RAND() function which returns a random value from 0 to 1), returns a value consistent with these parameters. Then, it is rounded to integers and, thanks to the number module function, only a non-negative value is returned. In the last step, the function divides the obtained result by 24 (24 hours in a day) and 60 (60 minutes in an hour). The fields of these columns in the spreadsheet have the "time" format set. As a result, the delay value is returned as 00:00:00 (hours, minutes, seconds);
- Degrees to periodicity - this column contains angular degree values in the range from 0 to 365; they are used in further calculations of periodic fluctuations (seasonality);
- Radians to periodicity - column E contains the degrees of plane angle from column D converted into arc measurement, i.e. radians:

$$\boldsymbol{\alpha(rad) = \frac{\alpha(^\circ) * \pi}{180^\circ}\, rad} \qquad \textbf{(1)}$$

  Degrees are converted into radians. While in the spreadsheet, the above formula should be replaced with the function below to make the program understand it. Function "= 2*PI()/360*D8" works according to the algorithm given above using the values from column D;
- Periodic fluctuations - data obtained for this column show the seasonality of the studied phenomenon. In the presented example, assumptions were made that delays are greater in autumn and winter while declining in the spring and summer season. For this purpose, the following function was used: “=((TRUNC((8*SIN(E7)))+8)/24/60)”. This function uses the course of the trigonometric sine function which shows annual variations of delays. The algorithm is as follows: depending on the value in column E (where successive degrees are converted to radians), the sine function returns a specific value consistent with its course. Then, multiplying by 8 and adding 8 ensures that the function is only positive and oscillates between 0 and 15 minutes. Divided by 24 and 60, it allows the function to be written as a time value in the 00:00:00 format. The course of periodic delays in the consecutive days of one year is shown in Fig. 1;

Fig. 1: The course of periodic fluctuations in days of the same year

- Random factor - the column contains random values created using the function RAND() and existing in the range from 0 to 1 inclusive;
- Unknown component - column H fields contain delays not related to periodicity. These are accidental delays that can be caused, for example, by train failure, damage to control devices or an accident. This function is: "=TRUNC((0,07*G7)*24*60)/24/60". After converting the cell format to the "time," values ranging from 00:00:00 to 01:40:00 can be obtained;
- Real departure time - the actual train departure time is returned taking into account all delays generated earlier.
- Delay - the difference between the real train departure time and planned departure time.
-

Fig. 2 presents the procedures for random distributions.

Fig. 2: Operation of random timetable generator

Table 3 summarizes the functions used in the random timetable generator.

Table 3: Summary of functions used in timetable generator

Function	Purpose
ABS()	Returns the absolute value of number
TRUNC()	Rounds number down to the nearest integer
NORMINV()	Returns the inverse of cumulative normal distribution
RAND()	Returns a pseudo-random number between 0 and 1
PI()	Returns number value π
SIN()	Returns the sine of the given angle

The Excel spreadsheet employed in various practical areas was prepared to assist in the performance of large amounts of demanding and repetitive calculations. Computer memory stores quantitative data, texts and completed calculations entered in the table fields. In addition to performing basic functions, such as data entry and simple arithmetic operations, the program offers various tools and functionalities. Additional options include graphic tools, mathematical, statistical and financial functions, let alone mechanism that allow the generation of charts, lists and complex analyzes. The tools offered by MS Excel are worth using to a greater extent in order to collect and process data from many systems. The most popular spreadsheet tool is MS Excel (supplied with the Microsoft Office suite).

The spreadsheet containing the tool is called Data Analysis. It includes instructions on how to generate data and perform analyses and forecasts. Table 4 shows a fragment of the analysis and forecasting tool.

Table 4: Selected fragment of the analysis and forecasting tool

A	B	C	D
Routine procedure		**Measure (Gauge)**	**Result**
1.Refresh the data in the ”Decomposition generator” sheet		Weighted arithmetic mean	0:08
2.Copy the entire content of the “Decomposition generator” sheet		Median	0:11
3.Paste into the “Test data” sheet as values		First quartile	0:06
4.Sort a column "Delay" (column J)		Third quartile	0:17
5.Refresh the pivot table on the “Data analysis” sheet		Variance	509,80
6. Drag the formulas in columns I and J		Standard deviation	0:22
7. Refresh the graphs on a sheet “Graphical presentation of data"		Quartile coefficient of skewness	0:12

Next, a manual was developed that allows the performance of the entire process: from data generation to the calculation of values describing the structure of timetable and its graphic representation. The cells visible to the right of the manual contain descriptions of functions that calculate individual values of the timetable structure. The following values are discussed in the article:

- weighted arithmetic mean;
- median;
- quartiles: first and third;
- variance;
- standard deviation;
- quartile coefficient of skewness.

1. The weighted arithmetic mean was calculated based on its own function (MS Excel does not have such am integrated function). For the purpose of this article, the following combination of functions was calculated: “SUMPRODUCT(G:G;H:H)/SUM(H:H)”. It refers to the columns that will be shown below and which contain a pivot table showing the course of the distribution and point statistical series created on the basis of the generated timetable. It is an ordered series of values along with their frequency of occurrence.
2. The median was calculated on the basis of serial base data, i.e. a simple (calculating) frequency distribution. The function “MEDIAN(“Test Data”!J:J)” is left to be calculated. It is a function embedded in the spreadsheet.

3. The first and third quartiles were also calculated with the embedded function "QUARTILE("Test Data"!J:J;1)." The structure of the function differs only by a parameter which indicates the use of the first or third quartile. The calculations are based on serial data from the "Test data" sheet.
4. Variance as a function is the basis for calculating standard deviation. In order to calculate variance, the time format (00:00:00) was changed into a numerical value showing the number of minutes of delay. This step was necessary because it was not possible to calculate variance when the delay time was below the weighted arithmetic mean (negative time cannot be used). Next, because of the absence of the function of calculating variance for a distribution series, further calculations included in variance were performed: a square from the difference between the statistical unit and the mean multiplied by the frequency of the phenomenon, adding up the total results and dividing by the total statistical population. Table 5 contains a fragment of the spreadsheet with a pivot table constituting a distribution and point series, delay converter into minutes and functions calculating data necessary for variance step-by-step.

	G	H	I	J	K
2	**Delay**	**Number of delays**	**Number of minutes of delay**	$(x_i - \overline{x})^2 * n_i$	$\sum_{i=1}^{N}(x_i - \overline{x}) * n_i$
3	0:00	13	0	841,8024262	558739,7402
4	0:01	50	1	2483,002734	
5	0:02	47	2	1718,605599	
6	0:03	62	3	1579,270106	
7	0:04	47	4	769,7716578	
8	0:05	48	5	445,6388293	
9	0:06	56	6	234,6491938	
10	0:07	46	7	50,424455936	
11	0:08	45	8	0,0993558692	
12	0:09	47	9	42,68680383	
13	0:10	49	10	186,8983366	
14	0:11	50	11	436,0136832	
15	0:12	43	12	671,9307092	
16	0:13	45	13	1103,954286	
17	0:14	53	14	1878,231986	
18	0:15	58	15	2803,972953	
19	0:16	62	16	3921,523756	

Fig. 6: Fragment of the analysis and forecasting model

5. Standard deviation is one of the most important values describing the studied phenomenon, calculated as the root of variance. In addition, the time format was restored (variance is shown in minutes in numeric format).
6. The quartile coefficient of skewness is: the total of the first and third quartiles minus the median calculated before.

In addition, the tool also has the function of graphic presentation of the studied phenomenon. The "Graphic data presentation" sheet contains a graph showing delays in the time function and a delay distribution histogram showing how often specific delays occurred. To illustrate the phenomenon, a linear trend is presented showing the behavior of the generalized function (Figs 3 and 4).

Fig. 3: Graphic representation of delays in time in the years 2012÷2014

Fig. 4: Delay distribution histogram

Interpretation of study results

The design and development of the timetable generator and the analytical and forecasting tool was aimed to obtain model results for departure timetables along with their analysis. As a result, a number of values and parameters were obtained that can be subject to analysis based on returned results and their graphic representations. Table 6 shows test results in minutes obtained for the selected sample.

Table 6: Test results obtained for the selected sample in minutes

Measure (Gauge)	Results
Weighted arithmetic mean	0:08
Median	0:11
First quartile	0:06
Third quartile	0:17
Variance	509,80
Standard deviation	0:22
Quartile coefficient of skewness	0:12

The research sampling showed that:

1. The weighted arithmetic mean indicates the approximate value in the general population. The study yielded the result of eight minutes. This shows that over four years (the period of study of the phenomenon) each of 1096 train departures was delayed by eight minutes. This value is sensitive to extremes that may blur the clarity of results, therefore further values should be used.
2. Median or a value that divides a series into two equal parts where half of the units have values lower than or equal to the median, and the other half have values greater than or equal to the median. A median of 11 minutes was obtained in the study. This value is the center of totality of all statistical

units of the population. It is worth noting that the median does not respond to changes in the value of extreme features, i.e. unusual and accidental observations.

3. The first quartile was 6 minutes and the third one 17 minutes. Based on these results, it appeared that 25% of the results have values lower than or equal to 6 minutes and 25% of the results have a value greater than or equal to 17 minutes. Half of the results obtained are in the middle range, i.e. between 6 and 17 minutes of delay. This observation helps determine the quantitative distribution of delays.
4. Variance as a measure of dispersion is the basis for calculating standard deviation; as such, it is not used to describe the studied phenomenon.
5. Standard deviation is a measure of diversity and determines the average deviation of individual feature values from the arithmetic mean. The analysis returned the result of 22 minutes, which indicates that the average value of the statistical unit differs by 22 minutes from the arithmetic mean. The result leads to a conclusion that the distribution of the studied feature shows a firm presence around the average (expected) value.
6. The quartile coefficient of skewness is a measure of asymmetry and provides information on how units are distributed in relation to feature distribution. It illustrates in what part of the variability range most of the unit features are gathered. During the analysis, the result of 12 minutes was obtained, i.e. greater than 0, which indicates right-sided (positive) asymmetry where the average value is greater than the median.
7. A graphic representation of delay in a function of time (prepared based on departure timetable database) shows how a given population behaves in consecutive units of time. Based on this representation, several regularities can be identified such as:
   - strong seasonality of the phenomenon;
   - there is a high increase in total delays in the winter season; additionally, there are frequent and single delays with very high values;
   - in the summer season the situation gets stabilized, and there are only a few major delays;
   - looking at the trend line, a downward trend can be discerned, which testifies to a decrease in the number of delays in subsequent periods (Fig. 5).

Fig. 5: Graphic representation of linear delays in time in the years 2012-2014

8. Delay distribution histogram is a column chart that shows the frequency of occurrence of individual delays. This form of data clearly shows which values are most common. It can be seen that the largest number of delays fall within 0 to 18 minutes. Greater delays than those given above are rare and get reduced as the value of the delay increases. To illustrate these conclusions, Fig. 6 again shows this delay distribution histogram.

Fig. 6: Delay distribution histogram

Summary and Conclusions

The research shows that the occurrence of large delays of no more than 18 minutes may be caused by bad weather conditions. The trend behavior indicates the right company management strategy which reduces the number of delays across all rendered services. In addition, by analyzing the delays data on a regular basis and comparing it with the management response, it is possible to check the course of the phenomenon thoroughly when making specific decisions. Consequently, it becomes clear which decisions have a positive impact on reducing delays and, ultimately, on improving the quality of services rendered by the railway undertaking.

The adopted research goal was achieved, and the research hypothesis was verified as viable. To achieve that, the procedures and methodology for developing an analytical and forecasting IT tool were designed and its practical application in the company were demonstrated.

Based on the conducted study, the following conclusions were drawn:

1. The designed analytical and forecasting tool allows quick analysis of obtained delay distribution, assists in the forecasting of further phenomena by a decision maker and facilitates drawing final conclusions.
2. The departures timetable generator easily generates data that the user can model to various parameters. This solution allows various courses of delays to be plotted along with making predictions.
3. The data discussed in this article is not real since there author was not authorized to use such data, however it is similar and the application can be implemented for use within the enterprise.
4. The developed tool can be employed at many decision-making levels of the enterprise where the analysis and imaging of the behavior of function help draw conclusions for the future. In addition, the periodicity of the function enables the company to take action to prevent delays; the monitoring of the trend of the phenomenon allows the management to continue such action to reduce the number and size of delays of the means of rail transport. Next, determining the average size of delays and standard deviation can be used to prepare procedures to limit initial delays.
5. As part of further research, the tool can be enhanced through the use of other measures for descriptive analysis of the structure of the phenomenon, also investigating delays from different angles and across different layers. On top of that, it is worth considering external factors in the structure of delays, such as the quality of services provided by competitive railway undertakings, the condition of the railway infrastructure and other factors likely to affect the level of studied delays.
6. The developed innovative IT tool supports decision-making at the managerial level of a railway undertaking, and, thanks to the analysis and forecasting capacity, the entity is able to predict upcoming changes.
7. Such activities are an integral part of the management process and help predict the size of various types of obstructions accurately.
8. Such a good analytical and forecasting tool will contribute to the company's growth while inaccurate and imprecise mechanisms may lead to loss of liquidity and ultimate bankruptcy.

Abstract

The purpose of this article is to propose a model for implementing design strategies in enterprises in the SME sector. The developed model is the result of observation, experience and research of nearly 80 Polish enterprises in the SME sector. Design strategy in such enterprises is one of the key tools of innovation and product development. Thanks to dedicated subsidies e.g. from national agencies, Polish SME enterprises are increasingly trying to improve their maturity in the field of design by implementing design strategies. Due to the fact that knowledge of strategic management principles in SME companies is often moderate and often there is a lack of competence in formalizing development goals, the use of models for building and implementing strategies seems reasonable. Therefore, the developed model is an attempt to standardize activities related to building and implementing a specific type of functional strategies, which are design strategies. For the purposes of presenting the model and the legitimacy of its use, the article is divided into four main parts. The first one discusses the specifics of design strategies as a form of strategic management in SME enterprises, then the specifics of these enterprises are discussed, indicating problems and competence gaps hindering the implementation of design strategies. The next part presents the strategy implementation model that responds to the identified problems of enterprises in the SME sector and then discusses the example of strategic changes resulting from the application of the model.

Keywords: Design, Strategic Management, Design Strategies, SMEs.

Introduction

The design strategy is a set of actions leading to the launch of new products on the market, often with unique or innovative features. In its assumptions, it bases on good practices in industrial design and as an element of strategic management is not a new phenomenon. The first definitions of design strategies appeared in the 70s and 80s [13] where they were directly related to the company's offer and marketing development. However, in the authors' opinion, the role of industrial design and thus design strategies in the era of Industry 4.0 has increased significantly and thanks to available technologies, it goes beyond the scope of the product itself and implies a number of strategic changes in the area of processes, projects or technologies used in companies. The role of industrial design and product designers is increasing due to the use of the Internet of Things, especially various types of sensors and ever better use of data. Product designers have more knowledge (and what is more important, they get it much faster) about the utility needs, they also have the ability to give products new features by information technology.

Design Strategy as an Element of Strategic Management

As a result of the dynamics of the environment, there is an increase in the importance of the design process, which nowadays is required to design products tailored to the needs of customers. On the one hand, new forms of obtaining and gathering information about usage requirements facilitate product design processes, but on the other hand, they require appropriate preparation of the organization (its maturity or readiness) in the resource or process dimension, which is the heart of modern design strategies.

Market, social and ecological trends are the second group of reasons for the increase of the importance of industrial design. Growing expectations for tailor-made products or products developed according to the principles of the "zero waste" philosophy impose searching for new ways of design and production on the producers.

Premises resulting from technological progress or i.a. ecological trends imply the growing importance of industrial design when designing new products. Thus, the importance of design strategies in the functioning of companies is growing. Design strategy as an element of strategic management is a part of the classic functional strategies of enterprises according to the classification of i.a. J. Penc [6], who distinguished the three classes of strategy:

– enterprise level strategy (shaped by the top management that oversees the activities of an organization that deals with more than one type of economic activity),
– an operational unit level strategy (SBU) is used to control the interests and activities of a particular, individual business unit,
– the functional level strategy creates a framework for managing functions such as products, finances, research and development, marketing, ecology, in accordance with the strategy of the operational unit.

In addition, design strategies can be found in a number of references in [4, 5], where a functional strategy at the implementation level requires the definition of the target market, range and width of the assortment, and product brand policy.

In the authors' opinion, contemporary design strategies are expanding beyond the scope of product change and will force a number of changes in other areas, which will be presented in the last part of the article in the form of a catalog of potential areas for changes in the functioning of the company. Therefore, in this article DESIGN and design strategies do not ONLY refer to the appearance of products, but above all to a set of management, organizational and design activities leading to the delivery of USE VALUE to end users.

The importance of design strategies for the modern economy should also be emphasized. At the turn of 2018 and 2019, regional and national development agencies in Poland awarded funding to several hundred companies from the SMEs sector in the field of design development. In 2019 only, Polish development agencies (including PARP - Polish Agency for Enterprise Development and regional agencies) allocated nearly 300,000,000 to grants for development projects, including the development of product innovation through the implementation of design strategies and design projects ("Design dla Przedsiębiorców" and "Wzór na konkurencję" competitions). Authors deal with strategic analyzes of enterprises of the SME sector in Poland as part of research and consulting work and observe a number of problems in the field of strategic management arising. Among others: due to the lack of formalization of strategies in SME companies, it was considered reasonable to develop a model for implementing design strategies for the needs of this sector. To develop the model, it was necessary to analyze the needs in the area of implementing design strategies and to understand the specificity of SME enterprises.

The specific of SMEs in the context of Building Design Strategies

Design strategy is an example of a development strategy that can be used in a company of any size. The authors' focus on the SME sector and emphasizing the role of this strategy for the development of small and medium-sized enterprises results from two reasons. Firstly, the design strategy refers directly

to the offer (products), which is the core of SME operations, and allows to increase the competitiveness of the current offer. Secondly, it allows the management maturity to increase through the basic formalization of plans and visions, which were often implemented ad hoc and without control in these companies.

Companies from the SMEs sector are often family companies that have built their position through organic development and improvement of the offer. Very often they experimented on their own with the manufacturing and later the improvement of products. Sometimes the success achieved 20-30 years ago was determined by fortuity (e.g. purchase of a machine that enabled mass production of given product). As a result, product development has often been unstructured and not methodical, without knowledge of product design principles, project methodologies, or good R&D practices.

SMEs sector companies are often characterized by high flexibility and the ability to adapt to customer needs, they can modify their products, adapt processes to orders and carry out transactions on a large scale. However, they treat operational processes as a basic propulsion mechanism and often do not plan development in new areas of activity. Most often the investment outlays of these companies are focused on the development of machinery, production improvement, development of halls and warehouses, sometimes new product distribution channels. However, the strategies of these companies, or rather plans, do not refer to vertical integration, buying new companies, taking over market shares or incurring high investment expenses encouraging to develop in new industries (which is typical for large holding companies). Thus, SME enterprises do not build long-term development strategies based on capital but on a product (they do not invest e.g. in acquisitions of other companies).

The problem in building design strategies is to seek the answer to the question HOW to build such a strategy and implement it in organization. While high-level strategies typical of large enterprises, often containing complexly named qualitative or capital goals, are built regularly, small enterprises lack adequate competence to create strategic plans. Therefore, a very important role of the design strategy in SMEs is the role of organizing and formalizing existing visions and imprecise development plans. The authors' experience shows that most of the surveyed companies did not have a defined development strategy and development plans depended mostly on the owner's vision. Observations from 79 SMEs (mainly manufacturing) over the 2017-2019 period indicated that nearly 90% of enterprises did not have any strategy or defined goals.

Table 1: Level of strategy formalization in the surveyed companies

Level of strategy formalization	Number of observations	Comments
Formalized strategy	**2**	In the analyzed companies strategic documents were operating; development goals and plans were defined. The companies had a clearly defined vision and mission as well as defined innovative and development projects.
Informal strategy	**37**	In the analyzed companies the owners had clearly defined development directions that were never written down. The company has no defined vision or mission and product development takes place in an organic way.

Lack of strategy	**30**	In the analyzed companies the owners were focused on product improvement, plant development and ensuring business continuity, however, there was no strategy. Often, companies were in the process of succession, where the owner handed over management to their children expecting them to develop a strategy and continue to achieve the results achieved over 20-30 years.

The above considerations were aimed at presenting a general outline of design strategies and their impact on the functioning of SMEs. The development, implementation and realization of recommendations within the framework of design strategies is of wide importance in the area of product and innovation development, as well as ensuring the survival of companies from the SMEs sector. The table below synthetically presents the advantages of design strategies as a tool for managing the development of SMEs and ensuring their survival. The table indicates the weaknesses of entrepreneurs that are challenges during the implementation of the strategy.

Table 2: Benefits and challenges of design strategies

BENEFITS OF DESIGN STRATEGIES	CHALLENGES FOR ENTREPRENEURS
• Easily noticeable effects of the strategy in the form of visible product changes • Low investment risk • Easy to understand for all employees • Easy to adapt to a smaller company • Low level of complexity (targeted towards the product)	• The need to know the principles of pattern design and analysis of user needs • Knowledge of project management principles • The need to improve design and management competences in many departments at the same time • The need to improve design maturity in order to keep up with the market

The model of implementing design strategies in SMEs

Based on the identified problems in the lack of competence to methodically define design strategies in companies, the authors propose a strategy implementation model based on the best practices of strategic management as well as project management. To develop the model, it was necessary to isolate two states, typical for building and implementing each strategy, i.e. the current state (AS IS analysis - as it is) and the future state (TO BE) also including the way to reach the desired state (strategic change).

The sequence of actions presented in the model allows to learn the conditions of the company's functioning both in micro and macro environment and then to develop recommendations (assumptions for design strategy) and their implementation in the project mode. Design projects are a kind of tool for implementing the strategy or even realization of its assumptions. Due to the fact that the design strategy leads to changes in products, the project form of work is justified (the project is a unique activity that brings a legitimate business change). The biggest challenge is to measure your achievement

level after the change. The authors propose two classes of measures of strategic change (apart from the observed changes in the functioning of the company as a whole).

In the presented model, 2 key areas were distinguished, i.e. audit area, project area. Within each of the areas, a set of actions and tools necessary for the successful implementation of the design strategy in the company and achieving the assumed results in the form of new or improved products of high market importance was proposed. In the following, the model was decomposed and its key elements discussed in detail.

Fig. 1: Model of design strategy management

Design audit (AS IS)

Design audit is a basic tool for determining the current state of the company (AS IS) and assessing the company in the context of the closer and distant environment. The audit covers the analysis of all key areas of the company's operation as well as the development of assessments and identification of problems that should be solved by implementing (realization of) a design strategy.

Within the audit activities, the authors try to go beyond the framework of classic strategic analysis which covers a set of basic activities by developing audit analysis with elements of design maturity assessment. Therefore, as part of the audit being a way of analyzing the company before implementing the strategy, two analytical activities were distinguished:

- basic analysis – a typical strategic analysis, consistent with good management practices,
- analysis of design maturity and readiness to implement the strategy – a design-specific analysis determining the level of knowledge and application of good design practices in the company.

Basic Analysis

The basic analysis for the needs of the model implementation strategy is based on the analysis of the company in its surroundings and its inside. The concept of Griffin's environment [5] and the scope of strategic analyzes in [7] comes down to three key areas - the inside, the closer surroundings and the distant surroundings. It should be emphasized that the scope of analyses in the concept in [5] is holistic, in the case of design strategy it should be adapted to key aspects of design. The table below contains the basic areas of analysis for the purposes of diagnosing the company's condition.

Table 3: Areas of basic analysis in design strategy

Area	Type of analysis	Details
Company inside analysis	Product analysis	Includes design analysis and evaluation of the current product offer design. Aesthetic, functional and utility aspects as well as the degree of meeting the needs of users by the products offered by the company are analyzed.
	Process and technology analysis	Includes the analysis of the methods and technologies used in the production of existing products as well as the process of designing new products, its course and efficiency.
	Organizational structure analysis	The purpose of the analysis is to verify to what extent the management structure is conducive to offer development, who is responsible for the processes of implementing new products and to what extent the crew's competences are sufficient to manage design projects.
Close surroundings analysis	Channel and audience analysis	Analyses verifying ways of reaching the recipients of the current offer and the level of their satisfaction with existing products.
	Competitor's product analysis	Comparative analysis presenting the company's current products in comparison with close and distant competitors as well as producers of substitutes and complementary goods.
Distant surroundings analysis	Industry trends analysis	It covers the analysis of trends within a given industry and is used to assess how the industry will change in the coming years in order to best match the company's strategy.
	Social trends analysis	It covers the analysis of habits, behaviors, demographic structure and changing user needs.
	Technological trends analysis	It covers the analysis of machines, devices and technological innovations in relation to the market on which the company operates and to the global market (e.g. in terms of IT trends).

Analysis of Design Maturity and Readiness to Implement A Design Strategy

The analyses of organizational maturity and readiness for change are more and more focused on, as evidenced by numerous studies, including [2,14]. Maturity is often something difficult to measure and yet recognizable intuitively by managers.

It should be noted that so far one key positioning model has been created in design management depending on its design maturity and the share of pattern design processes in the company. This model, called the Design Ladder, is presented below [12].

Fig. 2: Design ladder

It seems reasonable to base company's assessment on the design ladder model. The model organizes issues crucial for design very well. However, it does not define tools that allow to unambiguously decide on the level at which the company is located or define transition processes. The goal of the design strategy should be to move to the highest possible level, but there is no clear methodology for implementing the transition process. According to the authors, the implementation of the design strategy that is to ensure the transition to the desired level.

It is worth noting that a similar approach to maturity can be observed in process maturity assessment models such as CMMI [3]. The CMMI model is much more formalized than the Design Ladder model. Assessment questionnaires, such as SCAMPI [11], have already been developed for the CMMI model, which allow, based on observations and responses to a set of questions, to assess the level of company process maturity.

Due to the lack of similar solutions for the needs of design maturity assessment, the authors proposed their own tool for measuring readiness to implement design strategy. The tool does not directly assess design maturity, but complements the Design Ladder model and is an attempt to measure maturity and readiness to deploy strategy.

SECTION: **PRODUCTS**	0/12
QUESTION	ANSWER
R1. How many new products (services) have been introduced to the market during the lat 12 months?	3 options
How many innovative design ideas for new products have been created in the company in the last 12 months?	3 options
How many of these ideas have been implemented in the last 12 months?	3 options
How many design improvements (compared to products / services) have been made in the last 12 months?	3 options
Please select which activities have occurred in your organization during the last 12 months:	X
Top management submitting ideas for new products	YES/NO
Middle management submitting ideas for new products	YES/NO
Submission of ideas for new products by direct production employees	YES/NO
Are people experienced in design working on product development?	YES/NO

SECTION: **PROCESSES**	0/12
QUESTION	ANSWER
Z1. Are the design projects for implementing new products formalized?	YES/NO
Is there a defined process in the organization for building prototypes of new products (the defined process has its own description, the owner of the process – the person responsible and is repeatable)?	YES/NO
Are existing products being improved continuously? (new technologies / new production methods)	YES/NO
Which of the processes necessary for design development were carried out in the company?	X
• Competition anlysis	YES/NO
• Benchmarking new products	YES/NO
• Using creative techniques to define new products (brainstorming, design thinking)	YES/NO
• Ordering expertise / expert consultations with designers	YES/NO
• Initiating cooperation with research units (institutes / universities)	YES/NO
• Feasibility study before launching a new product on the market	YES/NO
• Profitability analysis for new products	YES/NO
• Creating product data sheets for new products	YES/NO
• Purchases of new devices / technologies / licenses to improve production processes	YES/NO

SECTION: **PROJECTS**	0/9
QUESTION	ANSWER
P1. Are new products created in design mode?	YES/NO
How many such design projects have been initiated in the last 2-3 years?	3 options
Have the project cards been developed (project charter - a formal document for all major project work)?	YES/NO
How many projects ended with the implementation of the new product?	3 options
Have dedicated budgets for design projects been allocated?	YES/NO
Were teams appointed to carry out design projects?	YES/NO
Was the risk of design projects managed methodically? (agile projects, design thinking, service design)	YES/NO

SECTION: **PEOPLE AND ORGANIZATION CULTURE**	6/11
QUESTION	ANSWER
L1. Is there a dedicated department responsible for generating ideas for new products and / or their implementation?	YES/NO
Is there a department responsible for market analysis in the field of business?	YES/NO
How many people were involved in the work on new products?	3 options
How many people in your organization have submitted ideas for improving products or production processes?	3 options
How many people were involved in improving production processes?	3 options
How many people participated in industry conferences and / or exhibitions, fairs where own and competition products are presented?	3 options
Did the employees willingly get involved in work on new products or improving existing ones?	YES/NO

Fig. 3: The readiness for design strategy implementation assessment sheet

Depending on the answers received, points are allocated in accordance with the adopted rules:

- • YES / NO questions - 1 point for a “YES” answer, 0 points for a “NO” answer,
- Questions with 3 options to choose from - 2 points for option three, 1 point for option 2, 0 points for option 1.

The maximum possible number of points to be achieved is 44, and depending on the ratio of the number of points to the maximum, the company is classified in one of three levels of readiness:

- From 0 to 14 - low readiness, high risk of failure,

- From 15 to 30 – moderate readiness,
- From 21 to 44 – high readiness.

The developed tool can also be a permanent element of assessing design maturity (not only at the audit stage).

Project Portfolio Management

Design projects are the basic form of implementation of strategic recommendations necessary to achieve the expected state of change (TO BE). The developed model assumes that the implementation of the design strategy should be based primarily on project activities, due to the need to obtain a new or improved product. As a rule, design projects fulfill the classic definition of projects (in accordance with PMBoK [9]) and are temporary, multifunctional activities (involving employees from various departments), unique with a clearly defined result leading to business change in the company. On the other hand, building a portfolio of strategic projects focused on design development is part of the standardization of actions necessary to increase the level (maturity) of design at the SME.

It is worth emphasizing that in the implementation layer, design projects require specialist methodological knowledge and experience of a designer. These projects include a synthesis and analysis stage, which aims to develop the substantive and theoretical foundations necessary to prepare the concept of a new product. In turn, at the stage of conceptualization, it is necessary to develop a new product in terms of shapes, aesthetics, utility functions and initial visualization (e.g. in the form of 3-D models, conceptual sketches, etc.). After validation and approval of the concept for implementation, you can begin to build prototypes or models from substitute materials and assess the technological feasibility of the project.

Fig. 4: Design project management hybrid model

As for the very manufacturing level of the design process, work at each stage of the design project should proceed in an iterative and incremental manner. A new product should not be produced without further loops providing feedback from potential recipients and major project stakeholders (e.g. management). Therefore, in the authors' opinion, at the design stage of the design project, agile approaches should be used to ensure "early feedback" and incremental product development.

Therefore, the diagram on the picture no.2 presents the method of implementing design projects within the design portfolio of the design strategy (DESIGN PROJECT MANAGEMENT HYBRID MODEL). The developed scheme assumes a hybrid of good practices in classic project management where the main stages in accordance with good practices in the design project and PRINCE 2 [8] management methods and elements of agile approaches at the level of SCRUM [10] implementation are distinguished.

The biggest challenge for the success of design projects in SME enterprises is to understand the idea of design work in the field of design projects and to ensure design competence. In many companies, the function of an expert can be performed by experienced employees or dedicated product designers, but this is not a common phenomenon. Small businesses focused on ensuring business continuity cannot always hire a full-time product designer or do not need a full-time designer.

Examples of strategic changes that appear as a result of implementing design strategies

In the case of SME enterprises, the implementation of the design strategy as one of the basic or (as indicated earlier) the only strategic activity causes changes in many areas. These changes may be typical for the Kotter model. The natural area is the change in products, however it is not the only area of change caused by the implementation of the strategy. The record of the company's experience based on the observation of nearly 80 companies over 2 years of research has allowed us to identify 7 main areas of change.

Table 4: Areas of SMEs strategic change

Area of change for SME	Specification and examples
Product changes	They constitute a key, fundamental area of change. They refer directly to the current offer and focus on refreshing, modifying, improving or introducing a completely new product that the company has not produced so far. Product changes can mean adding new functions to existing products (e.g. development of an electric bicycle on the basis of a classic one) and may be associated with entering new markets (e.g. vertical integration - production of boats instead of previous production of only the equipment for these boats)
Changes in the recipient structure / segment	These changes are often derived from product changes. The development of new or improved products is preceded by an analysis of the market and the needs of specific groups of users (recipients). As a result of product changes, the company reaches new customer groups or new market segments. An example would be a line of new furniture dedicated to a specific group (e.g. seniors or people with mobility impairments).
Resource changes	Changes in resources are a typical change that occurs in every SME, often regardless of strategy. However, as a consequence of implementing the strategy, there is a need for significant changes in the structure of resources, especially fixed assets. Typical changes in resources include changes in infrastructure or equipment (e.g. new warehouse, new machine park, new production line, development of additional functions in machines).
Changes in the organizational structure	These changes are a consequence of the need to reorganize the company due to the implementation of the strategy through dedicated design projects. The company must include new roles in its structure (e.g. project leaders) as well as sometimes entire departments responsible for the development of the offer.

	An example of such a change is, for example, establishing a research and development department that develops concepts for new products or works in the field of materials (e.g. in terms of the hydrophobicity of the surface of bathroom equipment products).
Changes in the supply chain / logistics chain	As a result of design strategies, there are often changes in the logistics chain and even the entire value chain in the company. This is due to the fact that companies that have been focused mainly on the product for many years, perfectly understand its properties, the owners often improved the products themselves and thus they know the properties of the components they use to manufacture their products. Having deep knowledge of the processes of producing complementary elements, it is easier for them to enter the role of the producer of such an element. An example would be the launch of its own integrated circuit production line at a company that assembles electronic devices (which previously bought integrated circuit boards).
Technological changes	This is one of the key changes resulting from the implementation of the design strategy. Technological changes may relate to changes in production technology (and this is the most common change) as well as, which seems crucial in the era of industry 4.0, changes in the use of IT systems in current functioning. The authors' observations indicate that thanks to the strategic team composed of company representatives and experts from the consulting company, it is possible to accelerate the digital transformation of companies from the SME sector. Companies with a low level of computerization based mostly on basic spreadsheets, thanks to the synergy of the strategic team can go to a higher level of technology use. An example is the implementation of distance sensors for measuring material cutting and data synchronization with an internal production control system.
Process changes	Changes are often a consequence of technological and resource changes. New machines and devices or the reorganization of production lines allowing the use of work automation technologies often implies changes in processes. Some processes are redesigned (e.g. production process) and some cease to be justified. An example of such changes is the redefinition of the quality control process of material cutting and the elimination of manual operation by using a distance sensor that checks whether the material has been evenly cut.

Summary

To sum up the above considerations, it is worth paying attention to the clear benefits achieved by SME enterprises due to the implementation of design strategies. In addition to obvious changes in revenues due to the extension of the offer with new or improved products or more innovative services, according to the authors, changes in the use of information technologies deserve special attention. The natural evolution assumes that companies are moving from analog and manual production to automated and then to controlled with the use of information systems (e.g. ERP). They finally operate in accordance with the paradigm of industry 4.0 where there is an increased share of intelligent technologies and the use of modern solutions, e.g. the Internet of Things in processes operational and strategic decisions. It should be added that the costs of implementing the design strategy are tied with some investment outlays. In the case of the surveyed enterprises, often at the level of several million Polish zlotys, which was in some cases the equivalent of annual income.

The second very important issue arising from the implementation of design strategies is greater organization synergy. Entrepreneurs in the SME sector, who often built their own companies from scratch by acquiring contractors or presenting their products at fairs, fulfilled all key functions

personally - both marketing and controlling production and even controlling this production. Implementation of design strategies in which changes occur in the organizational structure or in the entire resource structure of the company is an opportunity for decentralization of management, which results in greater synergy of many people involved in the company's development activities.

The use of elements of the developed model allows organizing work in the field of implementing design strategies. The presented model has an ordering function and can be a starting point for further development, both in the area of analysis and the area of implementation (based on dedicated design projects). The authors, presenting the current state of research on the model, are aware of its imperfections and the need for modification. Undoubtedly, it is necessary to take into account the aspects of measuring the effects of the strategy, therefore the next steps in the model's development will relate to modeling KPIs of the strategy's implementation performance.

Structural Analysis of The Connection Network of The W2 Variant of The Metropolitan Rail of The Silesian Voivodeship In Poland

Pawel SOBCZAK

WSB University, Dąbrowa Górnicza, Poland
psobczak@wsb.edu.pl (10 pt – times new Roman)

Abstract

The article presents simulation research, the purpose of which was to assess the parameters of the proposed, modeled by the team of variant W2 authors (the author of this publication was not a member of this team), concept of a new transport network, which goal is to improve public transport in the Silesian agglomeration. The analysis made it possible to assess the network parameters and its assessment in terms of both functionality and resistance to possible interference.

Keywords: Silesian Voivodeship Metropolitan Rail, Structural Analysis, Graph Theory

Introduction

Transport networks have a number of goals to fulfill. These goals are even more demanding in the area of public transport networks. Currently, the most important goals of public transport include [1]:

- enabling the movement of large passenger streams as part of public transport
- enabling the movement from less urban areas to more urbanized areas, and vice versa within the public transport
- reducing the number of individual vehicles in the overall stream of means of transport
- reducing the number of harmful substances emitted to the environment
- reducing the likelihood of accidents and associated negative effects (public transport is characterized by a high safety rate)

The abovementioned environmental factor (reduction of harmful emissions and accidents) is one of the most important elements and tasks set for public transport in accordance with the assumptions of sustainable transport. Obviously, organized public transport must be attractive to users also in terms of a number of elements such as (Sobczak 2017):

- fare
- travel time (especially compared with private transport)
- transport comfort

- the number of necessary transfers

The fulfillment of these criteria is very difficult and at the same time crucial for the implementation of efficient and effective transport. Thus, it is one of the elements and challenges that carriers providing public transport must meet - as well as planned metropolitan railway line in Silesia (Poland).

The concept of the Metropolitan Railway

The metropolitan railway is planned for implementation in the Silesian Voivodeship in Poland. It is significant that the Silesian Voivodeship is one of the most densely populated and urbanized areas of Poland. For this reason, in this area it is particularly important that the applied and proposed public transport solutions meet the abovementioned requirements. Currently, both road and rail public transport (tramway in selected cities and railways throughout the whole province) are carried out in this area, however, it is also an area with very high individual transport. In order to increase the region's transport attractiveness, increase the availability of public transport, and reduce the intensity of individual transport, also taking into account the forecast of growing transport needs in the region, actions have been taken to develop the concept of metropolitan rail (as mentioned in the abstract, the author of this publication was not a member of this team). The concept includes several variants of railway expansion due to the need to take into account both a number of different needs to be met and the required time and financial resources to implement it. The concept developed by its authors allowed for a whole range of very important factors, including factors of the demographic structure of the region, the structure of current passenger flows distribution, current and planned transport needs, as well as, its impact on the overall development of the region. The analyses carried out are a very important element of the created concept. According to the author of this publication, it is worth extending it by structural analysis of planned and proposed connection networks using graph theory.

Graph theory in the analysis of transport networks

The article describes research carried out using the computer simulation method. However, the applied technique was a stimulation technique by using graph theory. The tool that was used to conduct the research was the Gephi software, which is widely known and used for network analysis software. Graph theory in scientific work is used to analyze, among others, social networks (Amaral, Scala, Barthelemy, Stanley, 2000, p. 11149–11152; Newman, Watts, Strogatz, 2002, p. 2566–2572; Arenas, Danon, Diaz-Guilera, Gleiser, Guimera, 2003, p. 373–380), computer networks (Valverde, Solé 2003), or biological networks (Sporns 2002, p. 56 – 60; Stam, Reijneveld, 2007, p. 1–19). Graph theory is also used to analyze transport networks (Newman 2010; Wilkinson, Dunn, Ma, 2012, p. 1027–1036; Li, Guo, Xu, Hu, 2014; Ouyang, Pan, Hong, He, 2015, p. 142, 248; Tarapata, 2015, p. 55-65; Dunn, Wilkinson, 2017, p. 1–12; Stawiarska, Sobczak, 2018; Sobczak, Stawiarska, Buchwald 2020). An important element of the analysis of network connections using graph theory is the ability to perform both functional and organizational analysis (Amaral, Scala, Barthelemy, Stanley, 2000, p. 11149–11152; Newman, Watts, Strogatz, 2002, p. 2566–2572; Sporns 2002, p. 56 – 60; Arenas, Danon, Diaz-Guilera, Gleiser, Guimera, 2003, p. 373–380; Valverde, Solé 2003; Stam, Reijneveld, 2007, p. 1–19; Newman 2010; Wilkinson, Dunn, Ma, 2012, p. 1027–1036; Li, Guo, Xu, Hu, 2014; Ouyang, Pan, Hong, He, 2015, p. 142, 248; Tarapata, 2015, p. 55-65; Dunn, Wilkinson, 2017, p. 1–12; Stawiarska, Sobczak, 2018; Sobczak, Stawiarska, Buchwald 2020). As part of the analysis, coefficients are calculated which allow the assessment of individual network nodes (train stops), but also allow the analysis of the network as a whole. The analysis allows obtaining information about the role of individual nodes in the network (whether it is a local role or the role of a node

constituting the center of the network) as well as enables obtaining estimated information on the network's resistance to possible interference (unintentional in the form of e.g. failure or network accidents) and intentional (e.g. sabotage or terrorist attack) (Amaral, Scala, Barthelemy, Stanley, 2000, p. 11149–11152; Newman, Watts, Strogatz, 2002, p. 2566–2572; Sporns 2002, p. 56 – 60; Arenas, Danon, Diaz-Guilera, Gleiser, Guimera, 2003, p. 373–380; Valverde, Solé 2003; Stam, Reijneveld, 2007, p. 1–19; Newman 2010; Wilkinson, Dunn, Ma, 2012, p. 1027–1036; Li, Guo, Xu, Hu, 2014; Ouyang, Pan, Hong, He, 2015, p. 142, 248; Tarapata, 2015, p. 55-65; Dunn, Wilkinson, 2017, p. 1–12; Stawiarska, Sobczak, 2018; Sobczak, Stawiarska, Oláh, Popp, Kliestik, 2018; Stawiarska, Sobczak, 2018; Sobczak, Stawiarska, Buchwald 2020; Sobczak, 2018a; Sobczak, 2018b; Sobczak, 2018c; Bukowski, Sobczak, 2019; Sobczak, Stawiarska, Buchwald 2020). As part of the research, a structural analysis of the network connection for variant W2 of the Metropolitan Railway concept was carried out. This selection is caused by the author's conducting analogous analyzes for the W1 variant currently recommended by the team of authors. The results of the analysis are presented in the publication (Sobczak, Stawiarska, Buchwald 2020). Variant W2 was analyzed because it is a natural development of the planned transport network. Variant W2 of the planned network is shown in Figure 1.

Fig. 1: Concept of Variant W2 of the planned Metropolitan Railway network
Source: Own work based on (Joint publication, 2020)

Results

As a result of the analysis, a number of parameters were obtained that allow the assessment of the properties of the parameters of individual network nodes and their role in the analyzed network, as well as, enables its analysis as a whole. The analyses were carried out for 2 (sub-) variants (network variant with the so-called Mono-rail line and a variant without this line).

Below there are results for the W2 variant without Mono-rail network.

Table 1: Results for the W2 variant without Mono-rail network

Conclusions from conducted analyzes

Based on the analyses, it can be concluded that the obtained network (both with and without a Monorail line) is a Scale-Free network. This type of network is characterized by quite high resistance to events and random disturbances such as failures. Unfortunately, they are very sensitive to deliberate actions that disrupt their functioning (e.g. terrorist attacks). The analyses made it possible to obtain information that the nodes Gliwice Sośnica, Mikołów, Sosnowiec Główny and Tychy are very important nodes for the functioning of the network. Importantly, these are completely different nodes than the nodes indicated as key for the W1 variant (Katowice Node and Świętochłowice Mijanka Node)[16], which of course still play an important role in the network, but no longer constitute key elements for the network.

A very important element of network analysis is also the assessment of its parameters as a whole. Table 5 compares the network parameters for variants W1 and W2 (for both sub-options).

Table 5: Comparison of parameters of individual variants of the Metropolitan Railway network concept

Variant	*The average length of the shortest pathL*	*Diemeter D*	*Radious R*
W1	13. 733212341197822	35	18
W2 without Monorail	13.417525773195877	34	19
W2 with Monorail	11.840202020202021	30	17

Source: Own study based on Tables 2, 4 and (Sobczak, Stawiarska, Buchwald 2020)

According to the literature, the lower the values are for the presented parameters, the better the network parameters. The comparison presented in Table 5 clearly indicates that the W2 network concept with Monorail has the best network parameters compared. Importantly, the W2 variant with the Monorail line is also designed to enable efficient public transport between individual agglomeration regions and the Pyrzowice Airport, which is currently a hub not only for the region but also for the whole country (third airport in Poland due to the number of transported passengers and the key airport Cargo), so this is the most suggested variant to consider for the target version of the Metropolitan Railway network.

According to the author, the analysis results presented in the article and the key nodes presented (depending on the variant adopted) are an additional valuable source of information about the role of individual nodes in terms of network structure and can be used during work on the creation of the Metropolitan Railway to better fit its needs and specifics of the region in which it is created.

Mobile Health Apps Use in The Group of Young Poles – Comparative Analysis

Magdalena SOBON

University of Szczecin, Szczecin, Poland, magdalena.sobon@usz.edu.pl

Abstract

Mobile technology is useful not only in communication, but also as a support for many other activities. Is also rapidly expanding field in the health sector, assisting our life. The purpose of the paper is to discuss smartphones as a platform for m-health delivery for young people in Szczecin. The aim is not only to study the popularity of various health and medicine apps but to analyse changes over time and to examine the association between the installation, use of health-related apps and some socio demographic qualities in this age group. To achieve the purpose, primary research was done. The survey let author collect data from the pre-defined sample of 225 respondents in June 2013 and 212 respondents in June 2019 aged 18-34 years. The questionnaire contained closed ended questions generally in the form of dichotomous questions. Statistical analysis was done using Pearson's chi-square test of independence, coefficient φ and Cramer's coefficient V. According to the results smartphones are increasingly used for health-related purposes by young people in Szczecin. The growing, although relatively small, part of young people uses health or medical applications. Apps are much more often installed than used and their users are usually in good or very good health condition. Mobile technologies have the potential to revolutionize interaction with health services. Observed changes let formulate thesis that health apps will be more and more popular in the group aged 18-34 because of digitalisation and conscious health management trends. M-health increases access to health information and services, as well as promotes positive changes in health behaviours.

Keywords: M-Health, Applications, Smartphones, Young Smartphone Users

Introduction

Increasing interest in health-related issues, commonly implemented health promoting programs plus a rising trend to keep fit, along with advancements in information and communication technologies lead to the question of how mobile technology is utilized in the area of health. It is worth looking into smartphones, popular with young people using various phone functionalities day in and day out, including the software dedicated to health. This study aims to examine how smartphone owners aged 18-34 years use available health applications, how their behaviour in this respect changes in time and what determines such changes. The author focuses on the use of smartphone applications supporting health management and treatment process among young consumers.

The article consists of five parts. It discusses major issues concerning smartphones, their popularity, areas of application and users, research methodology, results of questionnaire survey conducted in a group of 18-34 year old Szczecin residents in 2013 and 2019, comments and conclusions.

Health Apps as A Part Of M-Health

Mobile health (m-health) defined as “medical and public health practice supported by mobile devices, such as mobile phones, patient monitoring devices, personal digital assistants and other wireless devices” (WHO, 2011) in combination with global penetration of mobile phones creates new opportunities for people’s health and wellbeing (Patrick et al., 2008; Becker et al., 2014; Ersting et al., 2017). This system, which unfortunately is emerging in large part as a patchwork of incompatible elements (Estrin & Sim, 2010; van Heerden et al., 2012), also includes health applications with self-monitoring as the most common method of engagement approach (Sama et al., 2014).

Via apps can be addressed health-related needs, broadly in two main areas: changing consumer/patient behavior and improving the implementations of prescribed treatment (Becker et al., 2014). In practice applications have the potential to aid a wide range of health-related issues like improving contraceptive knowledge of women (Moglia et al., 2016; Rousseau et al., 2019), physical activity (Coughlin et al., 2016; Jee, 2017), medication management (Stawarz et al., 2014; Ahmed et al., 2018) or disease prevention (Buller et al., 2015; Coughlin et al., 2017). They also serve in a variety of medical problems such as obesity and weight loss (Chen et al., 2015; Rivera et al., 2016), smoking cessation (Iacoviello et al., 2017; Powell et al., 2016), pain management (Lalloo et al., 2015, Reynoldson et al., 2014), diabetes (Arnhold et al., 2014; Wu et al., 2017), alcohol abuse (Crane et al., 2015; Meredith et al., 2015), cardiology (Plante et al., 2016; Martínez-Pérez et al., 2013) or mental health (Larsen et al., 2016; Goodwin et al., 2016).

Despite the researchers interest of the uptake in health-related mobile phone apps in Poland (Bujnowska-Fedak et al., 2016; Kuska & Żukowska, 2017; Kajzer & Szlachetka, 2017) as well as their potential for improving health (Caroll et al., 2017; Krebs & Duncan, 2015), there is the lack of information concerning differences between installation and use in practice of health-related applications and changes over time. Moreover although studies have described the sociodemographic factors associated with mobile health apps use (Kajzer & Szlachetka, 2017; Waligóra & Bujnowska-Fedak, 2019) also among young people (Baranek et al., 2017), so rapid changes force to verify recent published analyses.

Therefore, the aim for this study was 3-fold: (1) to describe the sociodemographic characteristics associated with health apps installation and use (2) to examine differences between apps installation and use and (3) to analyse changes over time.

Smartphone Users

The cellular telephony in Poland started over 25 years ago. The cell phone, initially associated with high social status and luxury, soon became a common, obvious element of everyday life. Over time the mobile cel phone has undergone an enormous transformation into a high tech device called a smartphone. A modern smartphone, more powerful than some computers, apart from phone calls and text messages, allows its owner to enjoy all the benefits of applications (apps) available through the mobile Internet. Apart from access to websites or email services, mobile phone apps allow users to chat via messenger type apps, and offer functions of a number of portable devices, such as satellite navigation, game consoles, MP3 players and digital cameras; it also enables editing texts, images, films and music.

Smartphone markets have been expanding rapidly. In the first quarter of 2013, the number of smartphones sold exceeded the number of stationary phones (IDC, 2014). However, the rising trend in the subsequent years decelerated in 2018 when the sales of new mobile phones dropped from a level of 1.455 billion in 2017 to 1.388 billion. The trend continues, as the year 2019 is expected to end with year-on-year sales drop by 3.1% (Canalys, 2019). This results from the market saturation that might be overcome by promoting 5G technology.

In Poland, the growing trend also slowed down. It is estimated that compared to the record level of 9.5 million pieces in 2018 (GfK Polonia, 2019) the figure will be lower by approximately 5%. Interestingly, even though the sales of smartphones drop, the revenues remain at a similar level. This implies slow progress towards saturation, while demand shifts toward more expensive models. Poles increasingly choose the latest phone models. 21 million smartphones (Jestem.mobi, 2018) were used by 63% of Polish adults in 2018 (Fig 1).

Fig. 1: Smartphone ownership in advanced economies (% of adults) in 2018

Source: Based on Pew Research Center (2019), Smartphone Ownership Is Growing Rapidly Around the World, but Not Always Equally, p.3.

According to global data, among smartphone owners going in for new technologies the leading categories are young men, those with higher incomes and better educated (Pew Research Center, 2019). In Poland, the highest smartphone penetration characterizes the same groups, reaching the smallest differences in gender (males 65%, females 62%), education (better educated 82%, worse educated 57%), income (the rich 74%, the poor 48%) and age (18-34 years old - 93%, 35-49 y.o. - 87% , 50+ y.o. - 35%). However, visible differences gradually diminish, especially in age groups, where acceptance of high tech devices is noticeable among the oldest group of users (Pew Research Center, 2019).

An observable trend of changing from cell phones to smartphones noted for the last few years relates to the functionality offered by the latter. Equipped with a touch screen or qwerty keypad, smartphones have an operating system, and a capacity for installing a wide variety of applications [1]. Personalization is a feature that can make the smartphone the most personal product in the history of electronics, allowing the user to match the parameters and applications suited with their needs.* Practically, every smartphone subscriber uses their device in a unique way.

Use of Smartphones

An analysis of smartphone holders' behaviour shows that a relatively large group does not make use of available functions. Some Poles are not aware of what functions their smartphone offers or use them unaware (Kantar Poland, 2019). Of all the devices with Internet access, the smartphone - always at hand - is used most frequently (GUS, 2019), but 1/3 of the subscribers use it rarely or never. For this group, smartphone use is limited to the functions closely related with making phone calls. The

[1] The definition of a smartphone based on technical parameters.

reasons for this include being unaware of phone capabilities, no need or cost concerns. However, if smartphone holders decide on online activity, which increasingly more users do year by year, their areas of interest include mainly maps, email and some specific applications (IAB Polska, 2018) (Fig 2).

Fig. 2: The most common online activities on smartphones in 2014 and 2017 (in %)

Source: Based on IAB Polska (2018). Mobile 2018, p.15.

Adjusting smartphones to their own needs, smartphone holders may choose from a countless set of applications made available by software firms. Research confirms their popularity and increasing interest. In a report prepared by App Annie an average user in the world uses 10 different apps daily and 30 apps per month (App Annie, 2017). This generally accounts for approximately half or a third of all applications installed on the mobile device. Using applications is a daily habit of an increasing part of the global community. As of the first quarter of 2019, these active app users could choose to download between 2.6 million Android, and 2.2 million iOS apps. And they are choosing: App Annie sets the volume of they in 2018 at 194 million; up to 178 billion in 2017 (App Annie, 2019).

In Poland, the number of people who download smartphone apps is also increasing significantly, but there is a large group of Poles who do not distinguish using the Internet through a browser from using phone apps, as in their understanding an application is something installed in the phone by its manufacturer (Kantar Polska, 2019). Along with the increase in the percentage of users using factory applications, the corresponding number of people downloading free apps is doubled, and there is a slight increase in the number of people downloading paid programs (IAB Polska, 2018). Although the scale of the phenomenon is not large, the users extend their usage of apps installed in brand new phones and seek tools they actually need (IAB Polska, 2018).

The application is considered as a 'life facilitator' and Poles admit that app solutions exist 'for everything', although they usually use only the basic ones. These include satellite navigation and maps (74%) , weather forecasts (64%) and email service apps (63%) (IAB Polska, 2018). The category 'health and medicine' is usually absent in primary selections, but shops with applications offer a wide choice. Both Google Play and Apple App Store under 'health and fitness' and 'medicine'

offer hundreds of free and paid programs. The former category accounts for 3.33% of the available items, 11th in the ranking of categories (Statista, 2019) , the latter - 3.31% and 9th place in the ranking (Statista, 2019a). An analysis of the phenomenon by spending on applications in 2018, the category 'health and fitness' ranks higher: eighth in Google Play, seventh in Apple App Store; in both cases one place up compared to the previous year (App Annie, 2019).

Research Methodology

To examine the use of health applications and compare the results in time, measurements performed in June 2019 were compared to those in June 2013. In the former study 212 randomly selected Szczecin residents aged 18-34 were surveyed, in the latter - 225, with males and females in equal proportion. The study focused on young people as they are the most numerous and most active smartphone users (this is also indicated by research of various institutions, e.g. TNS Polska, NoNoobs and Antyweb, Ericsson), and no other age group reached such high market penetration by uptodate smartphones (Pew Research Center, 2019). Besides, as research shows (Jestem.mobi, 2015), applications are also more popular in this age group than among older users.

The study used a direct questionnaire created on the basis of an American study of Mobile Health implemented by Pew Research Center (Pew Research Center, 2012). Six closed questions asked about the possession and manners of using cell phones, with a special emphasis on health activity using apps; besides, two socio demographic questions about gender and health status. Nominal alternative and ordinal scales were used. Health assessment was built on a five-stage scale of the perceived health status adopted for the OECD Health Statistics 2019 (OECD, 2019).

An analysis of variable relationships was conducted for 2019 data, and the year 2013 was used for demonstrating the emerging changes in the area under survey.

In view of the nature of measurement scales, contingency tables were used to determine the significance and strength of the relationship between the independent variables: gender and health status, and dependent variables: possession and use of health related applications. Significance was examined by Pearson's chi-square test of independence χ^2, wherein Yates correction was used in cases of smaller sample size in particular cells of 2x2 contingency tables. For variables, for which associations were statistically significant, the strength of correlation in the relationship was calculated. For 2x2 tables the coefficient φ and Cramer's coefficient V were applied. The calculations were made by means of the Statistica package v. 13.3.

The results of the survey

Characteristics of the Respondents

In 2013 and 2019, respectively, 225 and 212 people were tested, but the test sample decreased with each subsequent question due to a small number of those who declared installing and using health applications (Fig 3). A question about the use of specific programs in 2013 was affirmatively answered by only eight people, in 2019 – 25.

Fig. 3: Flowcharts of respondents through the survey instrument in 2013 and 2019

The test sample of 50/50 division by gender was characterised for health status. The largest group included people with very good and good health, then good/bad, bad and very bad (Table 1).

Table 1: Health status of the sample in the year 2019

	Women	**Men**	**All**
Very good	30 14,15%	58 27,36%	88 41,51%
Good	26 12,26%	47 22,17%	73 34,43%
Fair	5 2,36%	35 16,51%	40 18,87%
Bed	0 0,00%	9 4,25%	9 4,25%
Very bed	0 0,00%	2 0,94%	2 0,94%
All	61 28,77%	151 71,23%	212 100,00%

Ownership of Mobile Phones

Of 225 respondents in 2013 only six persons (2.7%) did not have a cell phone, while in 2019 the group decreased below 1% (2 out of 212). In both cases, men were those who had no phone. As for

the type of mobile phone, in both examined years new generation phones prevailed, and their popularity increased substantially from 62.1% in 2013 to 97.% in 2019. Among smartphone owners, percentage of men was higher than that of women – 66.4% (71 men) versus 58.1% (65 women) in the first period, while in 2019 103 men accounted for 99%, 101 women - 95.3%. The dynamic indicator was 1.55, different for men: 1.49, and for women: 1.62. In 2013, approximately 6.5% of the women were unable to tell whether their phone was a smartphone, at present all owners know what they possess (Fig 4).

Fig. 4: Ownership of mobile phones and smartphones in 2013 and 2019 (in %)

Mobile phones and health-related activities

Young Szczecin residents have been eager to use various functions of their phones. In most cases, it was sending short text and multimedia messages. Regardless of gender, 100% of phone owners use this way of communication.

The other surveyed areas of activity required access to the Internet. In 2013, 70% of the subscribers made use of the mobile Internet, downloading graphics, using email and e-banking services. In 2019 the internet popularity significantly increased to over 95%, an increase in mobile Internet users by more than 1/3 (Fig 5).

Fig. 5: Looking for health-related information and access to the Internet (in %)

In 2013, 28.87% of the surveyed mobile phone users, more women (32.26%) than men (21.43%) browsed the Internet seeking health related information. In 2019 the figure rose by 21% as more than 35% of the respondents admitted that they used the phone to search for information about health. The figure for women in this respect slightly decreased, with 38% versus 32% for men.

In 2013, applications for health tracking or management were installed by 17 female users (over 25%) and nine men (12.7% of all male users), while in 2019 the corresponding figures were as follows – 42 women (39.6%) and 19 men (17.9%) (Fig 6). This means an increase by 14% for women and 111% for men.

Fig. 6: Installation and usage of health and medicine apps in the studied group

In 2013, one female smartphone owner in ten and one man in fifty admitted using health applications, accounting for only 6% of all surveyed smartphone users. In 2019 the results improved. Although the phenomenon refers to 18.8% of female owners (19) and only 5.8% of males (6) (Fig.6), the dynamic of the change is significant. In both groups, men and women, the increase in the number of health application users was over threefold: men - 1.8% in 2013, 5.7% in 2019; women - 5.4% in 2013, 17.9% in 2019.

Various applications installed in smartphones by young users included workout and fitness, diet and food, weight, menstrual cycle, medicines, sleep (Fig 7).

Fig. 7: The popularity of health and medicine apps in the studied group (in % of smartphone users)

The most popular applications come under the workout and fitness category, representing the largest group of programs installed in 2013 by half of health app users, while in 2019 the figure rose to 58%. These applications assist the users in taking care of their physical condition and getting slim, consequently guaranteeing well-being and good health. Endomondo Sports Tracker was the program most frequently used in both surveyed periods, although another app, Samsung Health, emerged as another leader.

Sleep related applications rank second in popularity, including those tracking sleep depth, helping to get asleep or get up as planned. They comprised about 20% of the programmes installed by 25% of health application holders in 2013 and 26% in 2019. An example of these apps is Sleep as Android.

Apps for medicines in 2013 attracted 15% of health applications users, dropping to 12% in 2019. This category includes programs for medicament administration and lexicons. In 2013, the most popular in this group was "Budzik lek" (Alarm clock medicine), while in 2019 „Przypomnienia o lekach i dziennik zdrowia. My Therapy" (Medicine reminder and health log My Therapy).

Diet and food apps had 12.5% share among health apps in 2013, increasing to 18% in 2019. These mobile guides inform users about food they eat, and provide databases on chemicals in food, calory calculators and recipes.

Besides, in 2013 10% of smartphone owners declared using programs for monitoring the menstrual cycle, supporting pregnancy planning, while in 2019 5% of the respondents showed interest in apps for body weight control.

Health status of health app users

Since health related applications should support health maintenance and management, the survey asked respondents using health apps about their health status. In 2013 and 2019 these programmes were mainly used by those in very good and good health (Fig 8), in 2013 half of each group, in 2019 the health status of almost 50% was very good, 42.6% - good, and 8.2% was neither good nor bad. Although there were cases of bad and very bad health status, none of those persons had any of the health apps.

Fig. 8: Health status of health and medicine apps users in 2013 and 2019

Analysis of The Relationships

An analysis of the relationship between gender and installation and use of health supporting programs found out that both relationships were statistically significant. At the assumed level of significance $\alpha = 0.05$ in the former case the value of parameter $p<0.001$, in the latter case $p<0.01$ (with Yates

correction). The strength of the relationship between gender and program installation, measured by the coefficient φ was moderate, between gender and application use - low (Table 2).

Table 2: The relationship between gender and installation and use of health supporting programs

Sex	Instalation of health apps		Use of health apps	
Female	42	p=0,00031 φ=0,2526759	19	p=0,00893 φ=0,1980065
Male	19		6	

An analysis of the relationship between the health status and installation and use of health supporting applications shows that the former relationship (installation) is statistically significant, while in the case of use it is not. At the assumed level of significance α=0.05, the relationship between health status and installation of the programs, the value of parameter p<0.02, for the relationship between the health status and application use the parameter p>0.05. The strength of the relationship between health status and application use is moderate (Table 3).

Table 3: The relationship between health status and installation and use of health supporting programs

Health status	Instalation of health apps		Use of health apps	
Very good	30	p=0,01237 V Cramera = 0,2503472	15	p=0,05365
Good	26		10	
Neither good or bed	5		0	
Bad	0		0	
Very bad	0		0	

Discussion

The conducted research shows that in line with data for Poland (TNS Polska, 2014) and the world (We are social, 2019a) on the popularity of cell phones, including smartphones, possessing of a mobile communication device has been common. Almost all young people have smartphones, the number of which has increased substantially since 2013. The difference between the number of male and female users tends to decrease as women increasingly find multifunction phones attractive, and the corresponding market segments witness similar smartphone penetration.

Apart from phone calls, the smartphone is mostly used for sending text and/or multimedia messages. With time, MMS messages are getting more frequent, while sending short text messages is partly done by means of communicators such as Messenger or WhatsApp (UKE, 2019). The Internet services on the phone gain increasingly more users. This results from wider access and popularity of mobile solutions. Demand for mobile phone Internet is growing, and its cost is dropping (UKE, 2018).

Although the Internet use continues to be an important, even inseparable area of phone holders activity (UKE, 2019), an interest in health related topics was not and still is not particularly large in terms of browsing online or using dedicated apps. Potentially, the age group of 18-34 years old users should be reaching for health and medical programs, as they demonstrate a large, increasingly growing involvement in Internet use, interest in mobile applications (App Annie, 2017) and, resulting from the 'be fit' trend (Deloitte, 2019), considerable interest in a wide range of health issues. However, as the survey results show, the young use such programs occasionally. Significantly more respondents who installed health software in their smartphones did not use them. Consequently, the question arises why many people installed, but did not use health related apps. This may result from

the lack of conviction that such programs help in health care or health recovery or the fact that the applications installed in the past are not useful or not useful enough to use them (Jestem mobi, 2015).

A majority of those who install and use health and medicine applications are healthy. On the one hand, it seems to logically result from the fact that physical activity requires at least good health (the most common applications), while certain afflictions make it impossible to do physical exercises. On the other hand, some of the applications, such as drug reminders or chronic illness monitoring should arouse interest of people with health problems.

Differences in popularity of specific health applications indicate the user profile and factors determining the installation and use. App installation depends on gender and health status, and the use is dependent on gender. These relationships partly result from the predomination of software relating to keeping fit.

Despite relatively small interest in health applications, there is a visible dynamic increase in the number of their users. The number of people who download health applications increased more than twofold, and the number of users tripled. Taking into account the rising trend of apps popularity (We are social, 2019) and e-health solutions (Ministerstwo Zdrowia, 2019) we can predict that in the years to come the interest of smartphone owners in using health management programs will grow substantially. Health and medical applications have a great potential that software providers may exploit, although these programs need to be promoted in preventive and therapeutic medicine. Regardless of their purpose (Zhao & Freeman, 2016), they need to be trustworthy, safe, and their user interface must allow efficient use (Becker et al., 2014).

Research value and research limitation

A strength of this study is research repeated on the same sample stratified by sex and health status six years apart from first survey. This allowed the author not only to know popularity of health apps, but also changes in the behaviour of young residents of Szczecin in this field. Finally, research supplied novel information, contributing to the research field, by linking health status with installation and use of health apps. It provided an information about disparity in apps installation and use, showing a gap between them and relatively small usefulness of health apps.

This study has some limitations. It focuses on young people – the most numerous and most active smartphone users. No other age group has been studied. Consequently mainly healthy people were examined – mobile technology and apps users with a relatively small need to use applications dedicated to various health problems. It means excluded groups could be better sample for analysis. Despite surveying a good-sized group, just a small part of it was interested in health apps. Excluding workout and fitness applications there were only few examples of health apps. Due to small quantity of applications deep analysis wasn't possible. Because the situation on the health apps market is dynamic and continuously evolving, conclusions could be quickly outdated by new developments.

Implications for future research and practice

The use of applications should be constantly monitored due to the dynamic of changes in this area in all age and health status groups. To know more about this phenomenon it is very important to extend analysis to more specialized applications dedicated to specific medical problems. They could be seen as a potential low-cost and effective way to deliver health interventions to populations worldwide. The gap between installation and use of health apps, between apps delivery and real impact on behaviour changes and health status requires deeper analysis, especially if it goes about causes and effects of this phenomenon.

Conclusions

The aim of this paper was to discuss smartphones as a platform for m-health delivery for young people in Szczecin, to study the popularity of various health and medicine apps, to analyse changes over time and to examine the association between the installation, use of health-related apps, sex and health status.

Young Szczecin residents commonly use modern technological solutions for mobile communications, using smartphones for various activities. While the mobile Internet use continues to grow to an impressively high level, online interest in health related topics is significantly lower, although keeps rising, and refers more to women than men.

Health applications have a small share that is dynamically growing, with a disparity between installers and users. Prevailing programs are dedicated to fitness and health maintenance, while those for solving medical issues are of marginal importance. To date, smartphone health apps seem to be chosen by healthy people, and the typical user of these applications is a woman with good or very good health.

Mobile technologies have the potential to revolutionize interaction with health services. M-health increases access to health information and services, as well as promotes positive changes in health behaviours.

Acknowledgment

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019-2022, project number 001/RID/2018/19, the amount of financing PLN 10,684,000.00.

Abstract

Investment decision-supporting computer systems operate mainly on the basis of technical analysis. Fundamental and behavioral analysis is also aided with computer tools, but the integration of data remains at the discretion of the user since the market lacks a holistic system that automatically integrates the results of technical, fundamental, and behavioral analysis. The main aim of the paper is to develop a conceptual framework of investment decision support systems using cognitive technologies, including deep learning. The study of subject literature by authors has revealed a lack of both papers with a comprehensive presentation of methods to build an automated investment strategy building system and a lack of works about automated systems used in the Polish stock market. The main contribution is to develop a holistic approach based on integration by using collective intelligence methods. The article also fills the gap in using deep learning methods in the Polish stock market.

Keywords: Deep Learning, Artificial Intelligence, Investment Strategies, Financial Decisions

Introduction

Making investment decisions is a complicated and challenging problem, always connected with a certain risk. Current investment decision-supporting computer systems operate mainly on the basis of technical analysis. Fundamental and behavioral analysis is also aided with computer tools, but the integration of data remains at the discretion of the user since the market lacks a holistic system that automatically integrates the results of technical, fundamental, and behavioral analysis. The main aim of the paper is to develop a conceptual framework of investment decision support systems using cognitive technologies, including deep learning.

The study of subject literature by authors has revealed a lack of both papers with a comprehensive presentation of methods to build an automated investment strategy system and a lack of works about automated systems used in the Polish stock market.

The main contribution is to develop a holistic approach based on taking into consideration many groups of factors and their integration using collective intelligence methods. The article also fills the gap in using deep learning methods in the Polish stock market.

Related Works

During the study of the subject literature, no works have been found to contain a comprehensive collection and comparison of methods for developing an automated investment strategy building system. Such works exist mainly in the scope of the FOREX investment market Korczak, Hernes (2017). An additional reason for conducting the studies is the will to use machine learning methods that find more and more purposes of use. Subject literature usually refers to well-developed markets, mainly the USA (Renault 2017, Ziemba et al. 2019). The works focus on particular and specialized aspects, markets, and indexes, such as:

a) the method based on Bollinger bands (Bollinger 2001);
b) predicting the shifting of gold prices with investor psychology (Kumar et al. 2012);
c) the influence of stock market deregulation as globalization factor, replacing traditional trade and the development of algorithmic trade (Klaus et al. 2016);
d) the impact of financial reports and interest rates on the assessment of companies (Nowak, Olbrys 2016, Przekota, Szczepanska-Przekota 2010);
e) evaluation of recommendations made with the DCF method (Behr et al. 2018);
f) formation search study, i.e., using technical analysis as support in selecting companies (Szandula 2018);
g) using moving averages to study profitability on the stock market (Barber, Huang 2016);
h) stock market crises and the ability to predict them (Barber, Huang 2016);
i) study of market liquidity and the influence of liquidity on the profitability of transactions (Kewei et al. 2006);
j) study of Emerging Markets (Kewei et al. 2006);

A very significant aspect of the subject is the use of artificial intelligence and deep learning for the purpose of formulating an investment strategy and proper knowledge flow (Owoc, Weichbroth, 2015 Weichbroth, Brodnicki 2017, Hernes, Sobieska-Karpinska 2016). The analysis of financial trends is an important field of study in Financial Technology (FinTech). The study of turn point forecasting models which can consider international markets together, using multi-modal deep learning, reveals that common consideration of international stock markets may improve the accuracy of forecasts, and deep neural networks effectively support the process of solving such problems (Lee, Yoo, 2019, Shiao et al. 2019)). The deep learning method may also be used to forecast the stock market based on events (Ding et al. 2015), extracted from message text and represented as dense vectors tested with a new neural network of a tensor. Deep learning can also improve the accuracy of market forecasts (Singh, Srivastava 2017). Comprehensive and objective evaluation of both the pros and cons of using deep learning algorithms for analyses and market forecasts (Lee et al. 2019) indicates a general ability of neural networks to predict future behavior and market phenomena. The innovative approach of using deep learning models with vector paragraph and long short-term memory (LSTM) (Takeuchi, Lee 2013) to forecast time series allows to convert press articles into their dispersed representations with a Vector and perform the modeling of the tidal influence of past events on stock rates.

Deep learning is also applicable in formulating quantitative strategy in the option exchange market (Fang et al. 2019). Investment decision strategy (IDS) may be expressed on the basis of deep learning (Hu et al. 2018). In this case, for the purpose of building a portfolio, a deep-learned optimization of representation and modularity was used for grouping stocks and identifying various sectors and selecting stocks in each sector according to their Sharpe ratio. Using artificial intelligence systems in forecasting financial markets requires a reliable and straightforward model that provides profitable growth.

A review of deep learning issues reveals that they are pointed out explicitly in the context of predicting the value of stocks and the financial market (Henrique et al. 2019). Research is also conducted (Yang et al. 2019) of using deep learning on the Yu'e Bao transaction database to maximize profits with deceased investment risk. For the purpose of forming investment strategies on global stock market, financial indexes can be indicated which, when used with deep learning, allow to construct two strategies based on stock rate indexes (Lee et al. 2019): global strategy for forecasting the stock market and regional strategy for allocating the developed/emerging market. Using auto-coder (Takeuchi, Lee 2013) composed of accumulated limited Boltzmann machines allows to extract individual stock rates from the past. Designing Hybrid Attention Networks (HAN) (Hu et al. 2018) allows to predict market trend based on related news. Deep learning methods also allowed to forecast Standard & Poor's 500 index (Vargas et al. 2017) based on financial news headlines and a set of technical data. The methodology of deep learning (Tsantekidis et al. 2017) based on Convolutional Neural Networks (CNN), which uses large-scale high-frequency time series from financial markets' order book, also allows predicting the changes of stock rates. The existing methods of forecasting use both linear algorithms (AR, MA, ARIMA), and non-linear algorithms (ARCH, GARCH, neural networks) and focus on predicting changes in stock index or forecasting prices for a given company upon closing of markings. An innovative end-to-end model (Long et al. 2019) called multi-filter neural network (MFNN) built on the CSI 300 Chinese market index allows extracting features from samples of financial time series in order to predict price change. Both convolutional and recurrent neurons are integrated to build a multi-filter structure to provide information from different areas of market functions and views.

Study of literature has revealed the existence of a research gap in the following aspects:

1. No work has been found that approaches the market in a holistic manner, contains the influence of foreign markets on Polish markets, investment sentiment followed by a selection of strategy to choose the best companies at a given moment. No works about automated systems used on the Polish stock market;
2. Automatic strategies focus mainly on the FOREX or American market;
3. No works about the application of deep learning methods in the Polish stock market.

Research Methodology

In our researches, we use the Design Science Research Process (DSRP) methodology (Vaishnavi et al. 2017). This methodology involves the realization of research works as process-dependent steps responsible for the implementation of basic tasks and the delivery of basic work artifacts. This methodology is based on five basic steps. The first, "Awareness of the problem," focuses on the preparation of a preliminary proposal for a new research topic, which usually results from the analysis of already available achievements and results in related discipline or disciplines, as well as in industry. The second, development of the proposal ("Suggestion"), follows the initial proposal and is a creative step aimed at defining new models, methods, functionalities based on new configurations of existing or new elements. The third, development of the proposal ("Development"), is the stage where the initial research is developed and extended. The fourth, "Evaluation" is the stage where the prepared artifacts are evaluated according to the adopted criteria. The fifth, "Conclusion" can be the end of a given research cycle or is the end of the entire research undertaking. As outlined, each stage ends with a specific result, which then forms the basis and allows for the next step in the process. Also, this methodology assumes that it is possible to return to the previous steps under the observed restrictions. The concept of using the DSRP methodology in this paper is presented in Figure 1.

We mainly use the literature of subject analysis as a research method in the Awareness of the problem and the Suggestion stages. In the development stage, we use such research methods as modeling, design, and implementation and observation of phenomena.

The Evaluation stage uses a research experiment method. The concluding phase is based on synthesis, analysis, induction, and deduction research methods.

Fig. 1: Stages of research methodology.

Factors Affecting Investment Decisions

A large number of factors that may influence the final evaluation of stock price make it difficult to make an investment decision. Each investor selects their strategy based on a small section of the market and sticks to it. This is the only way a human can cope with the barrage of information, indexes, and speculation. The application of information systems allows detecting patterns and trends in all this. That is why the stock market environment should be a perfect proving ground for the latest artificial intelligence technologies, including deep neural networks. Factors influencing share price are presented in Figure 2.

Fig. 2: Factors affecting the share price.

Information from companies is the most important and fundamental. It includes: paid dividends (Sirignano, Cont 2019), company profits (balance, profit, and loss account) (Fang et al. 2019), information on takeovers, share sales, etc. (Hu et al. 2018), announcements of important events for the company, contracts, resolutions, new projects, investments (Maknickienė, Maknickas 2013), changes in company ownership, reduction or increase in the number of shares of a given shareholder (Qian, Rasheed 2007), reduction or increase in the number of shares of a given institutional investor (a trust fund, retirement fund, etc.), the announcement of the purchase of shares, stability and transparency of company operation (Hu et al. 2018).

Another significant factor that influences share prices is information that appears during the session day. It involves in particular: volume of sales, statements appearing on the formation graphs, unpredictable events, such as speeches, geopolitical uncertainties, terrorist attacks, disasters (Maknickienė, Maknickas 2013).

Another equally significant element is macroeconomic data, especially (Henrique et al. 2019, Yang et al. 2019)): interest rates, GDP, inflation, credit, deficit, development of country and individual sectors, taxes introduced, new regulations or changes in laws.

Another group of factors influencing share prices is world news. It may apply to the following: trade wars, new international regulations, decline/boom on world markets, rate of unemployment in the USA etc., income and consumption, housing development (Maknickienė, Maknickas 2013, Fang et al. 2019). Another important factor is the sentiment of a given enterprise. In such a case, the share price mainly depends on the influence of human emotions (Qian, Rasheed 2007).

The last group of factors presented in Figure 2 is 'other' that include (Pradeepkumar, Ravi, 2018; Munkhdalai et al. 2019),:

a) recommendations from brokerage houses, bloggers, fund managers, etc.
b) changes in currency markets,
c) changes in raw material prices on world markets,
d) speculation – from small stock exchange gamblers to enormous hedging funds,
e) seasonality/changing market liquidity – some companies operate in seasonal trend,
f) a number of shares – if a company has a small number of shares issued, their price is higher, but they can also be 'watered down' at any moment,
g) bubbles, fashion, crisis – fashion for a given industry, in which many inexperienced investors invest their money at a given moment,

h) results of similar companies – sector correlation, for instance: rate increase for one gaming company causes increase for another company from the same industry,
i) different classes of assets attract more investors at a given moment – for instance: bonds or deposits are attractive enough for the capital to come their way.

The number of factors influencing the share price is large, and their analysis is very complicated and time-consuming. It has been decided to select a certain range of factors to base on. It has been decided to divide the analysis of investment strategy building issues into several stages where groups of selected factors are analyzed. A number of comparison methods will be applied at each stage in the field of accounting, statistics, and machine learning. On this basis, one of the methods will be selected at each stage to yield satisfactory results. The method must be quick and easily automated.

Deep Learning Framework for Investment Decision Support

Based on the study of subject literature and practical experience of authors of the paper, the deep learning model should consist of the following cascade deep neural networks (Fig. 3):

Fig. 3: Deep learning holistic approach.

1. Global situation – at this stage, the general global sentiment should be considered. Is the market outlook good at the moment, or is there a crisis? What is the best target of investment (shares/bonds/raw materials)? How does the current situation influence the capital flow between world markets? This stage should provide an answer whether or not it is a good idea to invest in, for example, Polish Stock Market. However, this stage should be universal enough to answer the question: how and where should money be

invested at the moment? In this section, the main emphasis will be put on the analysis of literature and world economy indexes.

2. Influence of markets on one another – examination of the influence of world markets on one another and their influence on market outlook on the Polish Stock Market.
3. Analysis of the situation on the Polish Stock Market. Checking current trends, investor sentiment, duration of decline or boom, business cycles, and their effect on the upcoming years.
4. Division of companies from the Polish Stock Market on sectors/industries. Applying several methods to check which one yields the best results when selecting the most successful industry or company group (e.g., according to liquidity, WIGs, industries). Creating a ranking of sectors (Fischer, Krauss 2017).
5. A more detailed analysis of a selected industry or sector. Methods used to determine whether a given sector gives perspectives, the study of competition in the sector (Porter's Five Forces Network).
6. A closer look at specific companies upon selecting the sector. Methods such as feature importance (e.g., decision trees), binary classification, DCF, indexes, reports, covariance, correlation (Fang et al. 2019). Creating a ranking of companies based on machine learning methods and fundamental analysis (Fischer, Krauss 2017).
7. Upon selection, the choice of investment strategy, risk approach, and methods for creating a portfolio must be considered.

The outputs of every deep neural network are connected to the inputs of the next neural network. The output of the last neural network represents the ranking of companies – each output represents the value (the range: [0..1]) of the given company's evaluation.

Discussion

The deep learning framework presented above considers the influence of economic news on the Polish Stock Market, therefore it is fundamental data, but with global reach. It is a large group of numerical data, generally available indexes that appear at various time intervals. The question is: what is the influence of fundamental data on the final share price and its movement? The framework allows checking the situation on global markets, the market outlook of world stock markets, and then the Polish Stock Market. Then, the influence of external factors on the situation of the Polish stock market is analyzed along with the fundamental situation of companies selected while creating the tool.

The proposed approach is interdisciplinary. Typically financial factors must be analyzed, being the fundaments of a given company. It is also necessary to consider the correlation and causality of individual information – these are typically statistical aspects. Technical analysis, indexes such as RSI MACD, CCI, oscillators, moving averages, etc. will be used as input and output moment signals. Also, the effects of introducing the processed data into the machine learning system must be examined, and that is a programming issue. Naturally, it is impossible to check the influence of all the listed factors; it is necessary to select the aspect to begin the research with and to check the relations that exist in this field.

Conclusions

Investment decisions are burdened with high risk, and making such decisions is a complicated and incredibly complex task. Predicting share prices is the basic and most challenging element of investment in a stock market. For years, investors have been using various IT tools to optimize their financial decisions and to adopt a strategy of conduct. As pointed out in the article, current computer investment decision-making support systems are mainly based on elements of technical analysis. The market also offers IT tools that use the assumptions of fundamental or behavioral analysis. However,

no system operates in a holistic, complex manner, one that integrates all results from technical, fundamental, and behavioral analysis automatically.

Such a holistic approach, based on the integration of the approaches mentioned above using collective intelligence, was the main aim of this article. The proposed interdisciplinary approach supported by deep learning should consider such factors as global situation analysis of the influence of markets on one another, analysis of the situation on the Polish Stock Market, selection and analysis of industries, followed by a selection of specific companies. Have made the selection, one must consider the investment strategy, approach to risk, and method of creating the portfolio.

Abstract

The Polish gas stations lack labour because of the good economic situation in Poland and the migration of workers to other EU countries, especially those with vocational education. This makes entrepreneurs face the challenge to change their processes to be less dependent on the workforce. It leads to improvements based on technological innovations, e.g. self-service payment for fuel with the use of touchscreens. **Purpose of the Paper:** The aim of this paper is to present an innovative approach - The Smart Payment Terminal (SPT) as an answer to labour problems and as both product and process innovation in the fuel selling process at gas stations in Poland. **Methodology**: Basic function and technical information of SPT are presented. The work has R&D character. **Findings**: The main contribution is developing the innovative Smart Payment Terminal that allows payment with cash, credit cards or fleet cards, or using a special code worth the rest of the money remaining in advance cash payments, as the machine does not give change. It prints receipts or invoices, depending on the customer's choice. **Conclusions**: This innovation will make the selling process more fluent and user-friendly. Moreover, it will allow the company to reduce costs and be more independent from the lack of labour.

Keywords: Payment Terminal, Gas Station, Self-Service Technology, Product Innovation, Process Management

Introduction

The good economic situation in Poland and the connected low unemployment rate (5.2% according to the Central Statistical Office at the end of December 2019 (Główny Urząd Statystyczny, 2020), and 3.3% according to Eurostat, while the average unemployment rate for the European Union member countries at the end of December 2019 amounted to 6.2% (Eurostat, 2020) causes entrepreneurs to face multidimensional challenges (Kotlorz, 2011; Makuch, 2014). One of them is the labour deficit. Results of the research conducted among Polish entrepreneurs show that a serious barrier to the development of companies is becoming, as one might suppose, not the lack of capital, but the lack of employees. This problem is particularly visible in the segment of low-skilled employees and is a

strong barrier to the development of key sectors of the Polish economy (DNB Bank Polska S.A. and Deloittle, 2016; Przemyślańska-Włosek, 2019).

The main factors conditioning the growing shortages in the area of lower-qualified labour supply include the mismatch of the education structure to the needs of the labour market and migration processes.

The high level of enrolment rate (Lewandowski *et al.*, 2017), caused by the easy access to higher education in the late 1990s, led to an increase in the overall level of education of labour resources and significant changes in the structure of labour supply. The number of employees with higher education in Poland in 2005–2014 increased by two-thirds, while in the entire European Union it increased by one-third (Arendt and Gajdos, 2018). This, in turn, translated into an increase in the professional and life aspirations of university graduates who are not willing (understandably) to work below the qualifications obtained.

Migration processes also affected the shortage of employees in the Polish labour market. The economic emigration in Poland intensified after accession to the European Union and the opening of most western labour markets (Kaczmarczyk and Okólski, 2008; Kaczmarczyk, 2012). One of the most important motives for these migrations is the economic aspect, which is manifested in particular in the possibility of obtaining a higher salary. Although the opening of European labour markets for Poles has significantly increased the level of migration of people with higher education, the largest group of migrants are still people with vocational education, which directly translates into the problems of Polish entrepreneurs with finding lower-level employees (Nowak and Kulik-Nowak, 2018).

Because of the problems with labour in Poland described above, many companies, including the trading ones, seek for solutions which make them more independent from the lack of workers. They need to organize their processes in such a way that will not need workers in such quantity as before or not need them at all. It leads to some technological solutions in customers' service which can be applied in trade.

Technology is ubiquitous as never before. In 2017 the top five public companies by market capitalization were tech companies: Apple, Alphabet, Microsoft, Amazon, and Facebook (Klarin, 2019). It shows that people globally use technological solution and have already got used to them. Nowadays, innovation is one of the basic requirements of the company's success. It is innovation rather than efficiency regarded as the key driver of market competitiveness, company's growth, and business success (Tajeddini *et al.*, 2020). According to the Oslo Manual and the OECD experts, the innovation is "a new or improved product or process (or a combination thereof) that differs significantly from the unit's previous products or processes and that has been made available to potential users (product) or brought into use by the unit (process)" (OECD, 2018). There are two main types of innovations indicated above. Product innovation refers to a new or significantly improved good or service and includes significant improvements to characteristics or performance specifications, such as quality, technical specifications, user-friendliness or usability. Business process innovation means a new or significantly improved business process for business functions, including production, distribution and logistics, marketing and sales, information and communication systems, and administration and management. According to the OECD Innovation Indicators Report (OECD, 2020), only 21% of Polish firms are innovative, and they employ 51% of workers in the country.

The aim of this paper is to present an innovative approach - The Smart Payment Terminal (SPT) as an answer to labour problems and as both product and process innovation in the fuel selling process at gas stations in Poland. The possibilities and the advantages of its use in such a specific place of trade are presented. The work has R&D character. The main contribution is developing the innovative Smart Payment Terminal that allows payment with cash, credit cards or fleet cards, or using a special code worth the rest of the money remaining in advance cash payments, as the machine

does not give change. This section should follow keywords. This section should provide background of the study and highlight research motivation.

Related Works

Selling fuel at gas stations in Poland is based on self-service. At the beginning of selling fuels back in the early 20th century, the gas station attendant pumped the gas, cleaned the windshield, and even checked tire pressure while the customer sat in the car. Now, the customers pump the fuel by themselves, may wash the windows, check the tire pressure, or even vacuum-clean the inside of the car, all by themselves. The only thing that is done with the exploitation of employees is the payment process. The driver has to close the car and go to pay to the convenience store which is located in most of the gas stations, buying some food and drinks by the way. It takes a few minutes to go there and back to the car and during that time the refuelling station is blocked by the car.

Increasing customisation of services and lack of labour to work at gas stations, especially at nights, force the companies to improve the selling process. One of the innovations used worldwide in improving products and processes is the use of touchscreen in self-service technology. Many of us use it in everyday life, e.g. cash machines, self-service cash registers in a supermarket, or self-service check-ins at the airport. Self-service technology is becoming more and more popular and increasing in importance because while using it the customer feels empowered to conduct even complex operation by himself in a convenient time and way for him, and has the ability to customize a product or service for him-self. The companies also want to use this technology, because they gain the potential to serve more customers with fewer resources, and thus reduce costs. Also, they want to increase customers' satisfaction, so they would return to the service and not seek alternatives from competitors (Hsieh, 2005; Jokisuu *et al.*, 2015).

To introduce self-service technology in the payment process at the gas station, the pay-at-the-pump service with on-line technology is necessary (Hsieh, 2005). The system of payment at the pump was first used in 1982 in Europe and 1986 in the US. The dispenser with a built-in credit/debit card reader system was available, but only 13% of convenience stores used that technology by 1994, while in 2002, 80% of them had it already implemented. In 2004, Sheetz, an American chain of stores that also sell gasoline, was the first to use touch-screen kiosks at the pump where customers could pay for the fuel and order in-store foodservice items that they picked up after fuelling. Eight years later, in 2012, the touch screens were placed directly on the pump (NACS Online, 2011). Nowadays, such solutions are used in many countries, e.g. in the UK, the US, Australia, Singapore, Ireland, Iceland, Italy etc. In some countries, e.g. Brazil, Egypt, or some states in the US, such a system is illegal, because the government wants to keep fuel attendant jobs in the country to decrease the unemployment rate.

In Poland, all gas stations are self-service, which means that there is no standard service to pump the fuel by an attendant, but you can ask for help. The payment is always done after filling up at the cash desk, mostly placed inside the gas station convenience store, which offers also some fast food. The gas stations are open 24/7, despite the prohibition of trade on Sundays because they perform works or sell goods necessary to the every-day life of the society.

The self-payment service on the gas station has been slowly introducing for the last few years, some small gas stations have been being equipped with self-service payment terminals. However, they are located only near big shopping centres and do not support printing invoices as on-site service as a standard ("eMila," 2020). These stations make about 1% of all gas stations in Poland.

Smart Payment Terminal

The Smart Payment Terminal (SPT) is an intelligent answer to problems with labour at Polish gas stations, being at the same time both product and process innovation in the fuel selling process. As product innovation it uses touchscreen technology to self-service of the payment and is a completely

new product compared to the cash desk, it is user-friendly and its usability is much higher than standard self-service at the gas station. It is also a business process innovation because of the new payment service in the selling process. The process is more fluent and the customer feels more comfortable while using the well-known touchscreen. The company is seen as innovative.

Basic Functions of SPT

Smart Payment Terminal has following functions:

- 24-hour self-service retail sale of fuels and gas,
- payment with a card or an own fleet card services,
- handling cash payments,
- editing and printing invoices,
- checking the discount system for groups or selected users,
- service of own fleet cards,
- use of limits and restrictions related to drivers and vehicles, groups of recipients, groups of vehicles,
- archiving transactions along with the information about the user, transaction time, quantity and value of issued fuel,
- data transfer in real-time,
- integration with any IT system,
- cooperation with management control systems.

Technical Specification

Smart Payment Terminal (SPT) is built in a special anti-burglary housing made of stainless steel, in which the necessary devices and protections required for correct operation have been installed. Construction of SPT is shown on Fig. 1 and Fig. 2.

Fig. 1: SPT – front view

Fig. 2: SPT – inside view

Using the SPT

After turning on the terminal, the main screen of the application indicating available payment methods appears on the touch screen. SPT allows payment (Fig. 3):

- in cash with 10, 20, 50, 100, 200 PLN or 5,10,20,50 € banknotes and their combinations,
- by credit card - a selection of refuelling amount,
- fleet card for regular customers - choosing the amount of refuelling,
- using a special code worth the rest of the money remaining in advance cash payments, as the machine does not give change.

Fig. 3: SPT – payment methods

After accepting payment by the SPT, the user may start refuelling. Due to safety reason the user must start refuelling in 120 seconds. If this time is exceeded, the SPT will print the change code. SPT also allows opting out of buying fuel. After refuelling, the user may choose a refuelling confirmation in

the form of a receipt or invoice, where the company's tax identification number needs to be provided by the user. The remaining customer data are automatically downloaded by the system.

The STP also includes an IT management system (Fig. 4). The system is available after logging in to the appropriate Internet address provided by the SPT supplier. The management system consists of 10 tabs:

- Sales - summary of financial analysis and transactions,
- Fleet cards - card configuration,
- Companies - entering data for companies using SPT,
- Tanks - a preview of the fuel level in the tanks,
- Stations - configuring SPT for fuels, refuelling stations, filling stations,
- Settings - entering basic data related to sales through SPT,
- Service,
- Invoices - issuing invoices,
- Users - granting rights to users,
- Change codes - accounting for unused change codes.

Fig. 2: SPT – management system

Discussion

The presented solution supports the gas refueling process in a complex way. The main advantages are as follows:

- full automation of gas sale process,
- presenting, collecting and processing information regarding the implementation of the purchase / sale process,
- making payments using all available channels,
- compliance with legal standards (e.g. by using fiscal printing),
- printing all necessary documents needed for accounting and fiscal offices,
- integration with gas pump,
- management by dedicated software,

- performing quantitative and qualitative process analysis using the dedicated software,
- possibility of integration of the software with the management information systems (e.g. ERP system).

The main disadvantage of Smart Payment Terminal is a costs of implementation, which is higher, than, for example, mobile applications. On the other hand, the presented solution with SPT is more flexible than mobile applications. For instance, the mobile application offers less payment channels (it is impossible to make payment by cash). Also not everybody has the access to the internet and the use of mobile applications is impossible (e.g. many of seniors). Also lack of a mobile application for customers is a disadvantage of SPT.

Conclusion

The Smart Payment Terminal is a solution to the problems of lack of workers at gas stations in Poland, which begun a few years ago and was caused by the good economic situation in the country, the easy access to higher education and the economic emigration of workers to EU countries. SPT is a terminal which can be used at every gas station in Poland. It allows conducting a self-service payment for fuel with the use of a touch screen. It ensures meeting all possible needs of the customer, as it allows payments by cash, credit cards, fleet cards and special codes that were given in advanced payments. It may print a receipt or an invoice. The last one is not possible at self-service payment terminals at the moment. Printing invoices at a gas station is operated only by an attendant. SPT will change that, the customer will be able to serve himself completely. Such innovation will allow to reduce costs and to make the selling process more fluent. The company will be seen as innovative.
The further research works can be related, for example, to using artificial intelligence tools (e.g. neural networks or cognitive tools) for fuel sales forecasting and to implementation of mobile applications for customers.

Acknowledgment

The research is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN – scientific part and by The European Regional Development Fund under: Priority Axis 1 "Innovative and competitive economy", Actions 1.2 "Strengthening the innovation potential of Wielkopolska" of the Wielkopolska Regional Operational Program for 2014-2020 the project entitled "Carrying out research and development works in order to develop a prototype terminal for the self-service sale of fuels and gas" No. RPWP.01.02.00-30-0101 / 16-00. – development part.

Abstract

The paper is devoted to the credit system of China, the most significant of which is the segment of the banking system led by the central bank. China's credit system's condition was analyzed taking into account the influence of globalization and the current external shocks on the economies of emerging market. In this context, China's credit system is of particular interest to identify trends in the development of credit and financial-intermediation in emerging markets. It was noted that the central bank in the classic definition - is the bank of banks. Such a definition of an adequate retained its meaning in the middle of the XX century. However, due to the development of the banking periphery, the central bank in modern terms appears as a bank of the system of credit and financial organizations, which includes not only banks. Not all credit and financial institutions in the PRC are controlled by the central bank and therefore do not belong to the second level of the country's banking system. The role of tax instruments to support China's financial and credit system was shown. Exemption of bank deposits interest from the personal income tax stimulates the involvement of public funds in the form of bank deposits. The necessity to revise the role of the credit system of the countries with emerging economies in the face of global external shocks was proved. It was concluded that central banks from the bank the banks develop into megacenter for financial intermediation institutions. At the same time, central banks are not able to become regulators of the national credit system. This conclusion is extremely important for the search engines display the national economies, including emerging markets, the global crisis.

Keywords: credit system, banking system, central bank, emerging markets, globalization of financial markets, tax regulation, tax conditions.

Introduction

We would like to preface our study with the phrase William Rogers: 'From the beginning of time there have been three great inventions: fire, wheel and *central banking system*."

Usually, a study of a national credit system comes down to a review of the banking system, which is led by a central bank. The central bank in the classical definition is a bank of banks (of course, along with other functions). Such a definition retained its adequate meaning back in the middle of the 20th century. However, due to the development of the banking periphery, the formation of several levels in it, in the modern view, the central bank is the center of the system of credit and financial organizations, which includes not only banks. As a result, central banks from a bank of banks develop

into mega-centers (mega-regulators) of financial intermediation institutions. This conceptual setting is also characteristic of the central bank of China. Over the past forty years, financial markets have developed at a rapid pace in the country, which may be evidenced by the entry (according to Fortune Rating) at the end of 2019 of 26 companies directly related to the financial sector (banking, life insurance, the stock market) into the TOP-500 companies the world with the highest financial turnover (table 1).

Table 1: The largest companies in the financial sector of China in 2019

Rank in global rating	Company	Revenue, billion dollars USA	Profit, billion dollars USA	Assets, billion dollars USA	Employees, thousand people
26	Industrial & Commercial Bank of China	$168,979.00	$45,002.30	$4,034,481.60	449,296
36	Agricultural Bank of China	$139,523.60	$30,656.50	$3,293,105.00	477,526
31	China Construction Bank	$151,110.80	$38,498.40	$3,382,421.70	366,996
29	Ping An Insurance	$163,597.40	$16,237.20	$1,040,383.40	376,9
51	China Life Insurance	$116,171.50	$2,566.90	$580,331.60	175,077
44	Bank of China	$127,714.10	$27,225.20	$3,097,612.00	310,119
67	China Development Bank	$103,072.90	$16,744.30	$2,356,616.20	9,507
121	People's Insurance Co. of China	$75,377.30	$1,952.00	$150,259.30	198,457
138	China Evergrande Group	$70,478.90	$5,652.60	$273,829.00	131,694
137	CITIC Group	$70,659.00	$4,566.00	$986,297.00	287,5
150	Bank of Communications	$65,644.80	$11,131.30	$1,388,230.00	92,714

Boundaries of subordination of financial institutions to the central bank in different countries of the world are not uniform, they are predetermined by economic and political expediency.

The purpose of this paper is to show the structural differences between the "credit system" and the "banking system", to reveal the diverse structure of credit and financial organizations in the emerging financial market of China, to characterize China's experience in creating the conditions for the successful development of the credit system. To achieve the goal, a complete description of the system of credit and financial organizations of the PRC is provided, adequate to reality, the special provisions of the Central Bank of China are analyzed, tax incentives for the formation of the country's credit system resources are evaluated.

At the heart of any science is a description of the facts. Only on a factual basis can we draw practical conclusions and forecasts, which make up the deep essence and purpose of economic and financial science. If the body of knowledge does not describe the facts, if it is not able to logically lead to comparisons (factors, dynamic models or static samples), and from them to practical conclusions and forecasts, then such a body of knowledge cannot pretend to be scientific.

Of particular interest in researching the characteristics and development trends of the PRC credit system is due to the fact that China remains an emerging market country. Significantly ahead of the rest of the transforming countries in terms of capital turnover in domestic financial markets and in terms of economic growth, China, nevertheless, remains a reference point in terms of the dynamics and trends of structural changes, primarily in the financial and credit sphere. Moreover, emerging markets depend on growth in China and the stability of the Chinese economy. Moving from early to intermediate and further to an advanced stage of development, countries with emerging markets are going through a stage requiring restructuring of the entire economy, the most important component of which is the formation and development of credit and financial infrastructure. In this context, a study of the evolution, current status and prospects of the PRC credit system allows us to identify the most important trends in the development of credit and financial intermediation in countries with emerging markets. The identified trends will allow accelerating infrastructural transformations in emerging markets, which becomes critically important in the face of external shocks in 2020.

Literature Overview

The characteristics of China's financial and credit system are largely determined by the emerging financial market (Lvova, 2016). Many institutions of emerging financial markets have significant specificities (Mischenko et al., 2019; Ivanov et al., 2019; Naumenkova et al., 2020), and the tools applied to developed markets require adjustments for emerging markets (Voronov et al., 2016; Bubnov and Bubnova, 2018; Lukasevich et al., 2018).

Certain aspects of the PRC credit system have been repeatedly considered, firstly, fragmentarily, and secondly, from the point of view of the banking reforms being carried out in the country. Here we can note the work of Zhou and Zlra, 1987; Yk, 1999; Lardy, 2000; Li and Mehta, 2001; Subal and Dan, 2007; Wang, 2018; Xiaochi and Yi, 2019.

The results of previous studies substantiated the importance of tax regulation for economic development in general (Pokrovskaia et al., 2016; Karpova and Mayburov, 2017), and for the credit system (Sokolov and Sokolova, 2016; Ivanova et al., 2019) in particular.

However, the extent to which reforms are large-scale, progressive and consistent can only be grounded after a holistic reflection of the object of reform. Only by understanding the scope of the facility, one can understand the progressiveness or limitations of the reforms. In this regard, the noted publications are narrow in nature and require additional studies, which are the subject of this work.

The structure of the credit system of China

The credit system of China can be divided into several groups of institutions (Fig. 1).

Fig. 1: Credit system of People Republic of China

Source: made by authors.

The first group: a two-tier banking system. It includes:

– The People's Bank of China (PBC) is the country's central bank, representing the first level of the banking system (Sokolov and Nazarov, 2018; Ivanov, 2019);
– a complex of organizations engaged in banking operations, the activities of which are regulated and controlled by PBC. This complex constitutes the periphery of the country's central bank as the center of banking and non-banking organizations, the second level of the banking system.

It should be noted that within this group there are no such organizations between which subordination has developed; therefore, the allocation of a three-tier banking system is fundamentally wrong. For example, it makes no sense to treat banking and non-bank credit organizations as two independent levels. This statement is true not only in relation to the banking system of China, but also in relation to the banking system of Russia.

The second level of the PRC banking system includes:
– the four largest state-owned commercial banks, representing transnational banking corporations;
– commercial banks;
– rural financial institutions;
– branches and representative offices of foreign banks;
– non-bank financial institutions;

The second group: credit organizations that are not controlled by the People's Bank of China, respectively, are not included in the two-tier banking system:

- national political development banks;
- multinational banking corporations.

The third group: organizations that make up the infrastructure of the credit system. These include:

- non-profit self-regulatory organization;
- credit and financial information institutions:
- deposit insurance agency. The practice of reorganization in the banking sector of any country requires the creation of a deposit insurance agency in order to prevent panic among depositors during periods of banking crises. The decision on deposit insurance in the PRC was adopted on May 1, 2015. In accordance with the Decree, the People's Bank of China implements a program of deposit insurance of the population in commercial banks by opening accounts in the Deposit Insurance Fund. The PBC invests the money of this fund in bonds and other financial instruments;
- debt agencies. The prevailing practice of collecting overdue debts consists of going to court, but court procedures are often protracted. Therefore, debt collection agencies began to be created, specializing in extra-judicial collection of overdue receivables and bad debts;
- and others.

First level banking system of China

The center of the banking system of China is the People’s Bank of China. It was formed in 1947 as a result of the merger and nationalization of the three largest commercial financial organizations: Huabei Bank, Beihai Bank and Sibey Agricultural Bank (Sokolov and Nazarov, 2018). In 1949, the headquarters of the bank moved to Beijing.

It should be noted that without the periphery there is no center; accordingly, a single bank cannot be central. As a result of the 1980 reform, four independent banks appeared in the country for settlements, which belonged to the state. And by decision of the State Council of the People's Republic of China since 1983, the People's Bank of China gradually began to be vested with the functions of the central bank.

In 1998, an extensive reform was carried out to reorganize the management system of the People's Bank of China, aimed at forming a credit and financial center and its periphery. If earlier in each province, autonomous region and cities of central subordination there were branches of the People’s Bank of China, there were more than 2000 of them, then after the reform they were reorganized into 9 branches, which covered all administrative units of the country.

Under the PBC, a system of party committees was created to carry out vertical management, as well as the appointment of cadre personnel. Currently, China has branches of the People's Bank of China in Nanjing, Guangzhou, Shanghai, Tianjin, Shenyang, Xiani, Jinan, Wuhan, Chengdu. The objectives of this reform were:

1. independence of the branches of the People's Bank of China from administrative units;
2. Creation of PBC branches in more preferable, from the point of view of economic development, places, since after the reform, the branches began to cover several administrative units of the country;
3. Independence of appointment to senior positions of PBC branches from local authorities.

Thus, the ground was prepared for securing the functions of the country's central bank for the People’s Bank of China. The PBC itself is controlled by the PRC State Council, the highest executive body, and is one of its 25 departments. The activities of the Central Bank of China are regulated by the Law on the People’s Bank of China, which entered into force after the amendments on February 1, 2004.

In 2005, a special regional headquarters of the PBC was opened in Shanghai. He was granted the same rights as the main headquarters in Beijing. In addition, the main headquarters in Shanghai was entrusted with the management of the China Currency Trading Center, the Shanghai Gold Exchange, as well as control over the Chinese payment system ChinaUnionPay.

In addition, on July 10, 2008, the PRC State Council issued an additional provision "On the Basic Functions, Internal Structure and Employees of the People's Bank of China," according to which the powers of the People's Bank of China were expanded and the internal structure of the bank was amended.

In accordance with the People's Bank of China Law, the ultimate goal of the People's Bank of China is to maintain a stable purchasing power of money in order to promote the country's economic growth, which includes stability of the value of the currency, full employment, economic development, maintaining the balance of international payments, and also maintaining the country's financial stability.

The intermediate goal of the activities of the People's Bank of China is indicated in the form of regulation of the money supply in the country, as well as the total lending associated with it.

The most important globalization goals of the PBC's external activities are to strengthen the position of the Chinese yuan (Sokolov and Jiang, 2017) and promote Chinese companies in global commodity markets.

The implementation of these goals is subject to the accumulation of foreign exchange reserves. According to this indicator, the PBC is the leader in the world (Table 2).

China Banking and Insurance Regulatory Commission and Nonprofit Self-Regulatory Organization

Regulation and control of the credit sector in the national credit and financial system can be external and internal. External regulation and control in the PRC is carried out by the China Banking and Insurance Regulatory Commission (CBIRC), and internal regulation is carried out by a non-profit self-regulatory organization.

The separation of the functions of regulation and control of the credit market from the People's Bank of China took place on April 25, 2003. The transfer of authority to regulate and control banking activities enabled the PBC to concentrate on pursuing a monetary policy.

Currently, the regulation of the credit market is carried out by the China Banking and Insurance Regulatory Commission, which is an agency of the People's Republic of China directly reporting to the State Council. CBIRC was established on April 8, 2018 through the merger of banking and insurance regulators, namely, the China Banking Regulatory Commission (CBRC) and the China Insurance Regulatory Commission (CIRC).

CBIRC is essentially above the banking system. Its main functions are to control the current activities of banking and insurance organizations, develop a legislative framework for the banking and insurance sectors and, if necessary, take measures against violators of regulatory acts. It also conducts audits and supervision of banks and insurers, collects and publishes statistics on the banking system, approves the creation or expansion of banks, and solves potential liquidity, solvency, or other problems that may arise in individual banks.

The Commission monitors the activities of banks and portfolio capital management companies, investment trust companies and other financial institutions that accept deposits, and also protects the rule of law and the “healthy functioning” of the banking sector.

A non-profit self-regulatory organization - the China Banking Association (CBA) - is not a credit institution, but should be included in the credit system as an organization that constitutes its infrastructure, as it expresses and defends the interests of the banking community.

The China Banking Association is a self-regulatory organization created by the Ministry of Civil Administration of the PRC, whose main area of activity is the registration of national non-profit public organizations. The CBA includes the following major committees: a legal working committee, a committee on the legal recognition of qualifications of employees in the banking sector, and a working committee on foreign banks.

National Political Development Banks

Political banks in China are specialized development banks that provide support for state economic policy. Unlike commercial banks, they do not set their main goal of making a profit, although they provide loans on terms of repayment, maturity and payment.

The establishment of development banks in the PRC aimed at creating an effective mechanism for investing in key sectors such as energy, transport, communications, in the implementation of government procurement of agricultural products to ensure reserves and government stimulation of exports, taking into account market principles.

The system of political development banks includes: China Development Bank, Agricultural Development Bank of China, Export-Import Bank of China.

The China Development Bank was established on March 17, 1994. The main functions of the bank include supporting basic industries, implementing policies aimed at the development of individual territories. The Bank is expanding ties with Europe, Africa and Latin America.

The Agricultural Development Bank of China was established on November 18, 1994 to support the country's agriculture. The bank is under the direct supervision of the State Council of the PRC.

The rise of agriculture requires significant funds, loan repayment is slow, therefore, commercial banks consider such loans as high-risk. The Agricultural Development Bank of China provides loans for the general development of agriculture, the state-planned small capital construction in the field of agriculture, forestry, livestock and water management.

The *Export-Import Bank of China* was officially established on July 1, 1994. The Bank is directly subordinate to the State Council of the PRC and is a foreign economic state bank that implements the foreign economic policy of the government.

The purpose of the Export-Import Bank is to provide monetary resources for foreign trade operations. His direct functions include the provision of export and import loans for the purchase of capital goods, primarily for mechanical engineering and electronics products, as well as complete equipment.

Transnational State Banking Corporations

According to the definition of the World Bank, a transnational bank is an organization having divisions or subsidiary banks with one hundred percent foreign capital in more than five countries. Four major transnational banking corporations are distinguished by the volume of capital and scale of activity: the Bank of China, the Agricultural Bank of China, the Industrial and Commercial Bank of China, the China Construction Bank, which are also systemically important banks in the PRC. The authorized capital of these banks is fully formed by the state.

In the past, these banks specialized in one particular area of activity, as their name suggests. However, it cannot be concluded on this basis that the entire Chinese banking system is specialized. At present, these multinational banking corporations are striving to become modern universal banks with a global field of activity, not to mention medium and small banking organizations.

The Bank of China was founded on January 24, 1912 by the decree of President Sun Zhongshan, and on February 5, 1912, it officially began its activities. Its functions were to streamline the monetary system, issue money, manage the treasury. The Bank of China at that time acted as the central bank of China, an international exchange bank and a special foreign trade bank. Currently, the bank has a controlling stake in financial institutions such as the Bank of China (Hong Kong), Bank of China (International), Bank of China (Insurance). In a global context, the Bank of China provides comprehensive and first-class credit and financial services for private clients and companies.

The Agricultural Bank of China, founded in 1951, became the first state-owned commercial bank after the formation of the PRC. On January 15, 2009, the Agricultural Bank of China was transformed into a joint-stock commercial bank, and since 2010 its shares have been traded on the Shanghai and Hong Kong stock exchanges. Agricultural Bank of China A + H shares issued worldwide raised $ 21 billion, becoming historically the largest IPO in world banking history. By the

end of 2009, total assets were estimated at about 9 billion yuan, which amounted to 11.3% of the total assets of the financial sector of banks throughout the country.

The Industrial and Commercial Bank of China has one of the largest financial assets among Chinese commercial banks. By the end of 2003, the total assets of the bank reached almost 53 billion yuan, which amounted to about 20% of the total assets of financial institutions in the banking sector of mainland China.

The China Construction Bank was founded on October 1, 1954. A prerequisite for the creation of the China Construction Bank was the need to manage large-scale investment funds. The implementation of 156 key projects has become a major economic construction in the implementation of the first five-year plan for the development of the national economy of China. China Construction Bank is a state-owned commercial bank.

In addition to multinational banking corporations, the second level in the system regulated and controlled by the PBC includes several hundred credit and financial organizations: joint-stock commercial banks, city commercial banks, banks with foreign capital, branches and representative offices of foreign banks, the Postal Savings Bank of China, rural credit organizations, financial leasing automobile company, etc.

Non-bank credit organizations also belong to the second level of the banking system. These organizations have the right to perform certain banking operations, the list of which is established by the central bank of the country. In the PRC, non-bank credit organizations include cash collection organizations; settlement organizations; portfolio management companies; companies providing financial leasing services; trust companies; currency brokers, etc.

Tax regulation of savings on bank deposits in China

The effectiveness of the credit system, among other things, is determined by the coordination of monetary and tax policies. The most important supplier of financial resources is individuals. It is they who, in the framework of making the most effective investment decisions, ensure the mobilization of national savings and their transformation into investments. During periods of financial instability, the importance of savings increases significantly both for the economy as a whole and for the stability of the banking system in particular.

The World Bank, as part of the Global Financial Development Assessment, calculates the ratio of bank deposits to GDP. The corresponding indicator allows you to compare the importance of bank deposits as a way of saving, as well as the scale of the banking system, taking into account the economic development of the country. The ranked values of bank deposits to GDP by countries with developed and emerging financial markets are presented in Fig. 2 and 3.

Fig. 2: Bank deposits to GDP in 2017, Emerging markets

Source: author's calculation on Global Financial Development Database.

Fig. 3: Bank deposits to GDP in 2017, Developed markets

Source: author's calculation on Global Financial Development Database.

Despite the fact that total bank deposits account for about half of world GDP, the values for individual regions and countries vary significantly. Although the ratio of bank deposits to GDP is similar in some countries with developed and emerging markets (for example, Norway and Brazil, Portugal and the UAE, Thailand and the Republic of Korea), the average values for the groups differs. In countries with emerging markets the average value of bank deposits in 2017 is about 60% of GDP, in countries with developed markets this value is twice as high - 121% of GDP. At the same time, when comparing countries according to the corresponding indicator, it is important to take into

account both differences in the value of GDP and the desire of some countries to actively attract bank deposits of non-residents (for example, in Luxembourg, Hong Kong, Cyprus, Switzerland, etc.).

Deposits to GDP in China approximately correspond to the average value for emerging financial markets, however, when analyzing the dynamics of this indicator (Fig. 4), it is important to take into account the value of GDP and its change.

Fig. 4: The dynamics of bank deposits in relation to GDP in China
Source: author's calculation on Global financial development Database.

The tax conditions for income on bank deposits (Table 3) reflect the degree of financial development. The tax rate in emerging market is lower than in developed market. At the same time, significant differences are also observed within the groups. Taxation conditions may reflect a desire to avoid tax evasion (Kireenko and Nevzorova, 2019; Bykov et al., 2015), as is the case, for example, in Russia; a digitalization level (Victorova et al., 2018; Sinenko et al., 2017; Sinenko et al., 2018), national-cultural characteristics (L'vova et al., 2017); fiscal federalism (Salina, 2011; Pokrovskaia and Belov, 2020); other economic parameters.

Table 3: Taxation of bank deposits in developed and emerging markets

Country	Tax rate for bank deposit interest income
1. Emerging markets

Source: compiled by author's on EY, 2019.

In China, income from bank deposits is exempt from the personal income tax. Previously, they were taxed at a rate of 5%, and until August 15, 2007 - at a rate of 20%. Thus, the attraction of private investments in the country's credit system is successfully stimulated.

Conclusion

The powerful economic boom that China has demonstrated over the past 35 years shows that it was ensured by the adequate development of the country's credit system, which now has a fully developed structure. It is important that the positive inertia of a prolonged recovery currently allows the PRC to unusually quickly compensate for the significant losses from the crisis caused by the pandemic of the COVID-19. The China Manufacturing Purchasing Managers Index (PMI), which outstripped the indices of Russia and the euro zone in October 2019 by almost ten points and fell by ten points in February, almost completely recovered by early April 2020. In this regard, it should be emphasized that the PRC credit system, effectively fulfilling the role of the "circulatory system" of the Chinese economy in times of crisis, includes: a two-tier banking system, off-tier credit organizations, as well as organizations that make up the infrastructure of the modern credit system.

An analysis of the role and functions of the People's Bank of China as a center of financial intermediation allows us to predict the most important directions for the further quite natural evolution of credit and financial institutions. Compared to the banking and life insurance sectors, property insurance and pensions are still underdeveloped. It is in these areas that one should expect the greatest progress in the growth of the Chinese financial market. There is no doubt that these trends will manifest in one way or another in all emerging financial markets, and this will affect the investment potential of economies in the process of transformation.

In the foreseeable future, with the further development of globalization, with an increase in the turnover of transnational and multinational banking corporations, the concept of the banking center and the credit and financial periphery will change, which will lead to radical changes in the system of credit and financial intermediation, and will allow economies with emerging markets overcome the consequences of powerful global challenges ahead of relatively developed countries.

The Outlook for Argentine-Russian Cooperation in Science and Technology

Tatiana CHECHENKINA

Russian Institute of Economics, Politics and Law in Science and Technology, Moscow, Russia
chechenkina@riep.ru

Abstract

The paper discusses benefits of international cooperation in science and technology between the countries with different challenges and tasks of S&T development. It provides feasibility analysis of strengthening S&T cooperation between the Russian Federation and the Argentine Republic. Each of the national R&D systems has own strengths, which can offset weaknesses of the other's. While Argentinean researchers can benefit from access to capital and advanced infrastructure, the Russian science can attenuate the lack of highly qualified human resources. The study of joint projects and publications has identified the most promising areas for cooperation, including physics, medicine, space research, biotechnology, climate and ecology. At the moment intensity of bilateral scientific cooperation is quite low. The Russia's national 'Science' project must be seen as a unique window of opportunity to push mutually advantageous cooperation in the 5 coming years.

Keywords: International Cooperation in Science and Technology, Science Policy, S&T Priorities, Research Infrastructure, Russia-Argentina Cooperation, Co-Publication Analysis.

Introduction

International cooperation in science and technology is an increasingly important part of public policy since global challenges need to be addressed by pooling resources of multiple institutions and nations. Specific forms and objectives of S&T cooperation depend heavily on the economic and political situation in the country. This tool helps world's scientific leaders to strengthen competitiveness by attracting talents and skills and enables researchers from countries with lower scientific capacity to get access to world-class research infrastructures, advanced research methods, and to publish co-authored papers in top journals. In some cases scientific collaboration may help to steer a country out of its international isolation and to mitigate the impacts of economic and technological sanctions. In light of the recent global disasters, the need for teaming up researchers across national boundaries has become ever more apparent. The role of science and technology in tackling the challenges faced by mankind can't be underestimated. The exchange of research results becomes a matter of survival for our civilization.

Russia's S&T internationalization policy is codified in the Strategy for the Scientific and Technological Development of the Russian Federation. In 2019 the Ministry of Science and Higher Education of the Russian Federation published the Russia's Concept of International Cooperation in Science and Technology (ICST). The document outlines the ICST strategic vision, objectives, principles, and priorities of national policy in the field. The Concept considers the international cooperation in science and technology as a means of integrating Russian science into the global science with regard to the national interests of the Russian Federation.

Currently, most of international projects of Russian research teams are performed in collaboration with European and US partners. Researchers from the United States, Germany, France and the United Kingdom have the largest share among international co-authors of Russian researchers. However, Russia's science is far from exploiting ICST's full potential and still there is plenty of room for expanding geographical scope of S&T cooperation.

This paper provides feasibility analysis of strengthening S&T cooperation between the Russian Federation and the Argentine Republic. It proposes mutually beneficial ways of collaboration with respect to the major challenges and tasks of science and technology development in both countries.

Methods

The analysis of the trends in the Russian-Argentine S&T cooperation is based on screening bilateral and multilateral projects with participation of researchers from both countries and on more in-depth study of the use of Russia's research infrastructure by Argentine scientists. This information was obtained by the authors in the course of the survey conducted by the Russian Institute of Economics, Politics and Law in S&T (RIEPL) for the Ministry of Science and Higher Education of the Russian Federation. The survey reached out 343 Core facilities and 198 Large-scale research facilities recorded in the Russian registry of research infrastructures. The full registry is available via the internet portal en.ckp-rf.ru, which is maintained and updated by RIEPL.

Additional information was drawn from co-authored articles published by Argentinean and Russian researchers between 2015 and 2019 in Web of Science indexed journals. The InCites Benchmarking & Analytics tool, by Clarivate, was applied for evaluation of co-publication intensity.

The desk-research of S&T capacities and objectives was used to assess the potential of bilateral collaborations. The analysis of national S&T policy documents provided information for evaluation of the governments' commitment to science and research. The underlying data sources for the analysis of the countries' financial, material and human resources are the OECD's Main Science and Technology Indicators and national R&D statistics.

Results

Identification of entry points for bilateral cooperation starts with mapping the scientific landscape of Argentina and Russia.

Both countries belong to the group of upper-middle economies in the classification of the World Bank Data Team (2019) and occupy neighbouring places (48th and 49th) in the Human Development Index ranking published by the United Nations Development Programme (2019).

According to OECD (2019), the science-intensive gross domestic product of Argentina in 2017 (the latest available data) was 0.54% lower than in Russia (1.1%) and in OECD countries (2.37%). Just as in the Russian Federation, R&D system of Argentina is largely dependent on public funding. The government share reaches 72.6% of the domestic expenditures for R&D, while in OECD countries budgetary funds account for about a quarter of gross expenditures for research and development. In Russia this indicator has stayed stable at around two-thirds.

The 10-year increase in the number of researchers in Argentina was interrupted in 2017, when it decreased from 54.0 thousand to 52.4 thousand within one year.

Argentine academic R&D output, measured by patents and publications, must be regarded as less than satisfactory.

According to the World Intellectual Property Organization statistics, in 2017 Argentina ranked 49th in terms of patent activity (at this period Russia ranked in position 12) with 354 patents for inventions, and 42 patents for utility models granted. Only 766 patent applications for inventions and 216 for utility models were filed by Argentine residents worldwide.

Data analysis for 2013–2017 shows that Argentina falls behind 26 OECD countries in the number of publications in journals indexed in Scopus database, and behind 27 OECD countries in the number of publications in journals indexed in Web of Science. Nevertheless, during the indicated period the average citation of Argentine publications in Web of Science journals (5.58) was higher than that of

Russian papers (3.38). As indicated by Gokhberg et al. (2019), Argentinean papers in Scopus indexed journals were cited on average 6.81 times, Russian papers - 3.57 times.

By no means spectacular but stable, values of R&D output are rooted in S&T policy pursued by the Argentine government in 2003–2015. During this period there was a 20-fold increase in the budgets of research organizations and universities and a 5-fold increase in the salaries of scientists. Trager (2016) reports that a number of programs were launched to develop research infrastructure, to form international collaborations, and to return scientific diaspora members from abroad.

Taking office in 2015, President Mauricio Macri declared a two-fold increase in spending on science and technology. However, just a year later the budget deficit and high inflation forced him to announce 32 per cent cuts in public funding of science and universities. Under pressure from the scientific community, the Congress approved a 16 per cent reduction in funding.

All the research funding agencies were affected by the budget cuts, among them the National Scientific and Technical Research Council (CONICET) and the National Agency for Scientific and Technological Promotion (ANPCyT). Argentina suspended its contributions to a number of international research projects. Grants, scholarships, equipment purchase suffered the greatest reduction. The latter was hit by the double blow, as drastic devaluation of domestic currency (566% in four years) reduced availability of imported research equipment and supplies.

Funding cuts had a particularly negative impact on young people's engagement in science. Some researchers, e.g. Pellettieri L. (2019), say they can't afford to pay publishing fees charged by scientific journals. Consequently, this reduces the likelihood of receiving further grant funding.

Reduction of jobs, erosions of real wages and labour standards have exacerbated the brain drain.

In the context of a deep worldwide crisis, even a dramatic change in political course after the 2019 presidential election will not be able to provide a fast solution to the problems of the Argentine R&D sector, which include:

- underfunding of scientific research;
- imbalance of R&D sending across sectors;
- lack of commercial demand for R&D from business;
- a downward trend in the number of R&D personnel;
- low level of scientific productivity, as measured by bibliometric and patent indicators.

Against that backdrop, international scientific and technological cooperation may help to prevent the outflow of scientists to other countries and to other areas of activity. Argentina has a large number of bilateral agreements with the countries of EU, Latin America, Asia and the US. The year 2019 marked the 20th anniversary of the entry into force of the Agreement between the Government of the Russian Federation and the Government of the Argentine Republic on scientific and technical cooperation. The annual meetings of the Intergovernmental Russian-Argentine Commission on Trade, Economic, Scientific and Technical Cooperation are held in Russia and Argentina in rotation. The possibilities of Russian-Argentine cooperation in agricultural sciences, biotechnology, genetics, medicine, pharmaceuticals, space exploration, and alternative energy were the subject of discussions between officials in different years.

The Russian leaders formulated ambitious goals in the development of science and technology. Thus, in accordance with the national 'Science' project, by 2024 Russia shall be taken into the top five countries ranked by the level of R&D development in the priority areas, become an attractive destination for the leading foreign scientists, and ensure increasing R&D intensity.

As a result of the 'Science' project implementation, Russia shall occupy the place among the world's leading countries ranked by the following indicators:

- number of researchers (top-4);
- number of scientific papers in the priority areas of S&T (top-5);
- number of patent applications in the priority areas of S&T (top-5).

In 2018, the number of researchers in Russia was about 348 thousand people. Over the coming years, it is planned to attract and develop 35 thousand researchers with a focus on young talented scientists. By 2024 young researchers (aged under 39 years) shall account for more than half of all researchers in the Russian Federation.

Implementation of the 'Science' project requires significant financial and human resources. Over 300 billion roubles has been allocated for the implementation of this national project form the federal budget.

The 'Science' national project provides for the active involvement of researchers from overseas.

By 2024, it is planned to create 16 world-class scientific centres, which employ prominent Russian and foreign scientists. In 2019 four mathematical centres and three centres for genomic research were established. On March 20, 2020, the Ministry of Science and Higher Education of the Russian Federation announced a new call for proposals. Grants will be provided for the establishment of at least 3 world-class scientific centres specializing in priority S&T areas:

- advanced digital technologies, artificial intelligence, robotic systems, new materials;
- eco-friendly energy, sustainable use of energy, mineral, biological resources;
- personalized medicine, high-tech medicine and healthcare models;
- high yield and environmentally friendly agriculture and aquaculture, production of safe, high-quality, nutritional food;
- national security (prevention of manmade disasters, biological hazards, social and cultural threats, terrorism, extremism, cyber threats and other sources of danger for society and the economy);
- smart transport and telecommunication systems, research and development of the local Universe and the Earth's geosphere, atmosphere, hydrosphere (Arctic and Antarctica, oceans, airspace, and outer space);
- humanitarian and social issues of the interactions between Man and Nature, Man and Machine.

One of evaluation criteria is the degree of integration of an applicant organization into the global science (participation in international conferences, projects, publications and patents in collaboration with foreign authors). When established, the centres shall attract a certain number of foreign researchers and graduate students.

Another focus of the 'Science' national project is the development of advanced research infrastructure in the Russian Federation. By 2024 Russia's leading scientific institutions shall have 50% of their instrumentation upgraded or replaced.

Special attention is given to large-scale research facilities. Russia actively participates in financing and implementation of experiments at international megascience facilities (CERN, ITER, XFEL, FAIR etc.). Its share in funding these projects ranges from 3% to 26%. At the same time Russia is building a national synchrotron and neutron network, including:

- International centre for neutron research on the basis of the high flux research reactor PIK in Leningrad oblast;
- Nuclotron-based Ion Collier facility (NICA) in Moscow oblast;
- prototype of a spallation neutron source in Moscow oblast;
- 4th generation synchrotron X-ray source in Novosibirsk oblast;
- synchrotron on Russky Island in the Far East.

These facilities shall be open for overseas researchers specializing in the condensed matter physics, materials physics, superconductivity, magnetic systems, biology, medicine and others areas.

Today a wide network of shared research facilities is already available for local and overseas scientists. Information about 615 core facilities and 351 large-scale research facilities (accelerators, reactors, telescopes etc.) is available via ckp-rf.ru portal. More than 1000 foreign institutions are among consumers of their services. Among them are organizations from Argentina, Brazil, Mexico, and Chile.

Comparison of analytical equipment in the core facilities of Russian and Argentinean scientific organizations and universities demonstrated that they used to work with the same manufacturers and brands. The lists of top suppliers of scientific equipment in both countries include US companies (Bruker, Agilent, Perkin Elmer, Thermo Fischer Scientific), Japanese companies (Jeol, Shimadzu, Olympus) and German Carl Zeiss. Generally, researchers from Russia and Argentina use measuring and analytical instrumentation of the same generation, often of the same series, which creates favourable conditions for scientific exchanges. Russian organizations are interested in increasing the share of external users, since this indicator is taken into account when allocating public funding.

Among the examples of successful cooperation on the basis of Russia's research infrastructure is the study of explosive processes of the Universe conducted by the Astrophysical Center of Irkutsk State University in the Tunka Valley for the Institute of Earth and Space Astronomical Science (ICATE) and the Felix Aguilar Astronomical Observatory (OAFA) of the National University of San Juan (UNSJ).

UNSJ Observatory is a part of the Mobile Astronomical System of TElescope Robots network (MASTER) of Lomonosov Moscow State University. The MASTER network brings together eight observatories from Russia, South Africa, Spain, and Argentina. Robotic telescopes enable the detection of gamma-ray bursts, supernovae, comets, asteroids and other optical transients of different nature. Due to the MASTER-OAFA auto-detection system located in Argentina, a nova in the Small Magellanic Cloud was discovered in 2016.

The results of joint scientific research are published in reputable journals. Using the InCites tool, by Clarivate Analytics, we identified 1018 co-authored articles by Russian and Argentine researchers, which were published in 2015–2019 in WoS indexed journals.

Most of the articles deal with subjects of physics, medicine, astronomy, space science and astrophysics. The main subjects of these publications are listed in the Table 1.

Table 1: Number of co-authored articles by Russian and Argentine researchers, published in 2015–2019 in WoS indexed journals, by branches of science

Branch of science	Number of Articles
Physics	454
Medicine	340
Astronomy & astrophysics	56
Biology	41
Genetics	34
Earth sciences	30
Chemistry	24
Environmental sciences	20
Social sciences	11
Materials science	5

Mathematics	2
Agricultural sciences	1

However, the number of co-authored publications is lower if the works of major international research collaborations are not taken into account. Thus, 403 of 452 articles in physics co-authored by Russian and Argentinean authors are the fruits of collaborations' collective efforts. For instance, one of the papers reporting results of the ATLAS Experiment at the CERN Large Hadron Collider includes 659 co-authors. Of the 340 multi-author papers in medicine, 297 describe the results of clinical trials of drugs conducted by medical practitioners in many countries. Collective authorship is also typical for astrophysics. These papers have up to 1940 authors and make up about two thirds of the joint Russian-Argentinean articles: 39 of 58. Excluding the works of scientific collaborations reduces the list of articles by Russian and Argentinean co-authors from 1018 to 196. The main subjects of these publications are presented in the Table 2.

Table 2: The main research areas of co-authored articles by Russian and Argentine researchers, published in 2015–2019 in WoS indexed journals

Branch of science	Areas of research
Physics	nuclear energy, nuclear physics, high-energy physics, nanophysics and nanoelectronics (e.g. nanocrystalline thin films, quantum size effects)
Medicine	treatment of diabetes, oncology, cardiovascular diseases, hematology problems, immunology, and mental disorders
Astronomy & astrophysics	astrophysics and stellar astronomy, high energy astrophysics (cosmic rays, neutrinos, gravitational waves), theoretical physics (dark matter problem)
Biology	molecular biology, biophysics (magnetobiology), microbiology (virology), parasitology, paleontology, zoology
Genetics and evolutionary biology	biodiversity and systematics (phylogenetic taxonomy), molecular genetics of cancer
Earth Sciences	climatology, oceanology, glaciology, hydrology, soil science, volcanology, historical geology
Chemistry	physical chemistry, electrochemistry, nanochemistry, nanophotonics, functional materials, chemical analysis of food products

Diversified collaborative works are devoted to research in the Antarctic: solar observations, the study of the Earth's magnetic field, the Antarctic ice sheet, climate, and fauna.

200 years ago the sixth continent was discovered by the Russian naval expedition led by Faddey Bellingshausen and Mikhail Lazarev. Russia and Argentina were among the original 12 countries that signed the Antarctic Treaty. The Treaty promotes international cooperation in scientific investigation in Antarctica, including exchange of information on scientific programs in the area, exchange of scientific personnel, and exchange of scientific observations and results. The two countries have experience of practical cooperation in the region. In 2002, the Argentinean icebreaker Almirante Irizar participated in an operation to free the Russian polar vessel stranded behind a massive ice sheet. In turn, from 2007 to 2017 Argentina used Russian ships and helicopters to supply the Antarctic stations, as its icebreaker was being repaired. The Argentine Republic has 13 Antarctic stations – more than any other nation. Russia is in the top-3 countries in the number of stations on the continent, however, it lags behind 'newcomers in Antarctica' (primarily China) in technological advancement.

Taking into account that Antarctic Treaty System's Mining Ban prohibiting mineral resource activities (other than scientific research) is valid till 2048, it is important for every party to approach this date with a clear strategy and reliable allies.

The Argentine Republic is a potentially important partner for Russia in bioeconomics. Both countries have favourable conditions for its development, including a vast territory, diversification of climate and bioresources, well-developed agriculture, scientific achievements in the field of cellular and genomic technologies. For Argentina it is also a matter of food security.

Recently the Federal Research Programme for Genetic Technologies Development for 2019–2027 was launched by the Government of the Russian Federation (2019). It is admitted in the Programme that there is high demand for the skilled genetic engineers and genome researchers in the country. In 2016-2017 Russian authors published only 395 articles in the field in scientific journals indexed in WoS Core Collection.

Argentina is a pioneer in gene-editing in Latin America. Gene-editing techniques allow scientists to breed plants and animals with desired characteristics. This is especially important for the country specializing in agriculture. The interest in the development of gene technologies in both countries create favourable conditions for bilateral cooperation and the use of resources of the new world-class genomic research centres created in Russia. The national 'Science' project should give a new impetus to international scientific and technical cooperation in the Russian Federation.

In December 2018 in Buenos Aires, the Russian Federation and Republic of Argentina signed a number of strategic documents, which formed a framework for mutually beneficial economic, scientific and technological cooperation. Among the others, the parties signed the Agreement for the development of mutually beneficial and equal cooperation in the field of fisheries and aquaculture. The parties agreed on sustainable use and conservation of marine living resources, prevention of illegal, unreported and unregulated fishing, cooperation in S&T, and professional training. The first session of the Russian-Argentine Fisheries Commission took part in March 2020. Representatives of the National Institute for Research and Development of Fisheries of Argentina (INIDEP) and the Russian Federal Research Institute of Fisheries and Oceanography (VNIRO) presented the main areas of their scientific research to shape the agenda for cooperation. For example, the Russian party is ready to share its methods for crab stock assessment and new technologies of chitosan and chitin production from crustaceans wastes. Russia and Argentina are determined to implement joint projects, including with a focus on improving the quality and safety of food products.

Apart from the expression of the political will, both governments have to work hard to take full advantage of the opportunities provided by cooperation.

It might be difficult to plan international research projects in post-pandemic era.

With few exceptions, Russia's research institutions and universities cannot afford to pay attractive salaries for foreign researchers on their own. In most cases they use earmarked funds of national programmes for this purpose.

This year Russia has faced a significant budget shortfall due to lower oil and gas revenues. Although the Russian government declares it has no plans for sequestration in 2020, there is still risk of government funding cuts to certain research and development programmes.

Political stability is another vital factor in ISTC promoting. The tension in relations of the Russian Federation with the EU and North America has some impact on Russia's attractiveness for academic staff from other countries.

According to our survey of the leading Russian research institutions, which implement experimental research, more than a quarter of them were affected by sanctions banning supply of consumables. Nevertheless, sanctions are not in the top tier of barriers to successful research. Among the main factors hindering the research the respondents mentioned legal regulation of public procurement and customs proceedings. Time-consuming bureaucracy negatively affects research efficiency. Half of respondents say that procurement – from preparation of specifications to product delivery – takes 4-6

months on average. The other half of those polled evaluates the average procurement timeframe as 2-3 months.

Not many universities and research institutes have well-established procedures to host foreign visitors and to solve the problems of accommodation, medical care etc. Foreign researchers in Russia experience difficulties in their daily life. For instance, limited English proficiency is a problem both in academic community and in society as a whole.

To sum up, we can conclude that success of bilateral cooperation heavily depends on:

- economical environment,
- political environment,
- legal framework,
- administrative framework and
- social environment.

Conclusion

Russia's and Argentina's economies are heavily reliant on exports of natural resources. Both countries recognize the role of science in promoting progressive structural changes. However, the economic downturn, devaluation, and one of the highest inflation rates in the world would hardly allow Argentina to reverse the negative trends in science funding and staffing in the short term. Russia, in contrast, plans to increase R&D financing and the number of scientific personnel over the next 5 years. At the same time the Russia's government has endorsed the expansion of scientific and technological cooperation with overseas countries. The Russian Federation is interested in attracting foreign students, graduate students, and researchers to make maximum possible use of research infrastructure. For the Argentine Republic it is important to retain the human resources in a crisis period.

Russia and Argentina should expand collaboration in physics, space research, medicine, biotechnology, agriculture and aquaculture, and Earth sciences with a focus on Antarctic research. Bilateral interaction shall be initiated both "bottom-up", by individual researchers and organizations, and "top-down", by government agencies and scientific foundations in the form of targeted grants for collaborations. The recent initiatives of the Ministry of Science and Higher Education of the Russian Federation shall reduce administrative difficulties inherent to international cooperation.

Pandemic diseases and environmental catastrophes respect no borders. To meet these and other challenges we need a broad network for sharing ideas, findings and expertise. When borders are closed for people, they remain open for ideas.

Acknowledgements

The study was funded in 2020 by the Ministry of Science and Higher Education of the Russian Federation, as part of the public order for public institutions (Organizational and Technical Support for the Development of Research and Innovation Infrastructure in the Russian Federation project).

Abstract

This paper starts a large research aiming to build up econometric models applicable in mining industry that may be useful for managers working in this economic activities. Being the first one, this article deals mainly with building a dynamic model for resource utilization in mining industry. In his first part, the paper assesses sustainability and the thermodynamic constraints on optimal mining ores depletion in this respect. Starting from these findings, in the second part, a dynamic model of change and substitution techniques for resource utilization in mining industry has been developed. This model will be a useful tool for decision makers for an optimal management in mining industry.

Keywords: Mining Industry, Dynamic Model, Sustainability, Energy, Raw Materials, Technologies, Thermodynamics.

Introduction

The supply of minerals and energy is critical to global society. However, this supply is associated with social and environmental impacts, leading to concerns of generational and intergenerational equity [Moran *et al.*, 2014]. And such, the sustained development of production and the increase of its economic efficiency implies the rational use and capitalization of raw materials and energy resources. The increase of capitalization degree of raw materials and energy resources is a major coordinate of an economic growth, of a more intense increase of the economic efficiency [Brown *et al.*, 2015].

Dealing with the use of material resources, a complex system of elements is assumed, which involves the norms of consumption, the specific consumption of materials, raw materials and energy, the degree of use of raw materials and materials (technological losses), the actual weight of the products made, the specific weight of one unit of main characteristic of the products (machines, machineries), the recovery and capitalization of reusable resources, the use of materials for the substitution of raw materials and scarce materials [Segura-Salazar *et al.*, 2018]. Regarding the norming of raw materials, energy and materials consumption, the following aspects are frequently used: the degree of extension of consumption norms, the evolution of consumption norms, and the degree of meeting consumption norms.

Establishing the technically and economically consumption norms in the design phase of the new products and redesigning the products currently in production, and the fulfillment of the consumption norms and regulations are important requirements of the rational use of material resources to reduce the actual specified consumption of exhaustible raw materials and materials [Azapagic, 2004].

Reducing the actual specific consumption by assimilating new products with superior characteristics and reduced materials and energy consumption, redesigning the products, introducing advanced technologies and improving the existing technologies, respecting the production process of the established technologies, strictly adhering to the consumption norms and regulations, reducing the waste, improving the conditions of transport and storage of materials represent the most important ways to save material resources and to increase the relative base of raw materials and energy, to reduce imports and increase the degree of valorization of material and energy resources, thus increasing the sustainable way of resource management [Fonseca *et al.*, 2013].

Thermodynamic Constraints on Optimal Mining Ores Depletion

The economic process, instead of being a mechanical analogue as traditionally represented in mathematical economics, is an entropic process. In the ultimate analysis man struggles for low entropy, and economic scarcity is the reflection of the Entropy Law, which is the most economical in nature of all natural laws. Thermodynamics itself is the physics of economic value and man's economic activity as analogous (though not identical) to that of the purposive sorting of the famous Maxwellian demon. Economic activity is in fact an extension and a complement of man's biological evolution [Georgescu-Roegen, 1971].

One can argue that the more general use of the term "evolution" employed by physicists and applied to non-living systems connects directly to the narrow biological meaning. Physical evolution is best understood as a thermodynamic phenomenon, and this perspective comfortably includes all of biological evolution. A particular level of evolution can underpin the emergence of higher levels, but evolutionary processes persist at each level in the hierarchy [Tessera and Hoelzer, 2013]. It can be also argued that particular evolutionary processes can occur at any level of the hierarchy where they are not obstructed by material constraints. This theoretical framework provides an extensive basis for understanding natural selection as a multilevel process. The extensive literature on thermodynamics in turn provides an important advantage to this perspective on the evolution of higher levels of organization, such as the evolution of altruism that can accompany the emergence of social organization.

Comparatively speaking, thermodynamics is a young science but has been shown to apply to all work and energy systems including the classic temperature-volume-pressure systems, chemical kinetic systems, electromagnetic and quantum systems [Hatsopoulos and Keenan, 1965; Kestin, 1966; Carathéodory, 1976]; as a result, they have recast the second law of thermodynamics from the old statement of "entropy increase" into a statement that describes systems undergoing processes so that they will reach a unique state of equilibrium. In this respect, we may argue that a reformulated second law of thermodynamics [Schneider and Kay, 1994] to conceptualize the relation between evolution, complexity and ecosystems can also be applied to economic systems. Therefore, we focus on the applications of these thermodynamic principles to the science of ecology as we view ecosystems as open thermodynamic systems with a large gradient impressed on them by the sun.

The thermodynamic imperative of the restated second law is that these systems will strive to reduce this gradient by all physical and chemical processes available to them [Martyushev and Seleznev, 2014]. Thus, ecosystems will develop structures and functions selected to most effectively dissipate the gradients imposed on them while allowing for the continued existence of the ecosystem. Utilizing thermos-economic principles, this enables us to formalize the concept of economic evolution as the development of structural complexity to harness available energy from the environment to avert degradation gradients. We may therefore conclude, speculatively, that as much as life is an inevitable consequence of the reformulated entropy law [Kauffman, 1993; Schneider and Kay, 1994], then this is also true of market economies for the same equilibrium seeking reasons.

Market economies have experimentally proven themselves, more than any other known institutional arrangements, to abet the production of new knowledge and structural complexity, and therefore energy degradation. As a direct extension of the Schneider and Kay hypothesis (already mentioned), market economies are evolutionary stable because of their efficacy in growing knowledge and increasing structural complexity; a consequence, we argue, that follows from the reformulated second law of thermodynamics. The enormous energy transformations typical of market economies, consequent on their ability to induce and harness new transformations, are ultimately the reason they are selected.

Hence, the comparative analysis of the specific consumption of raw materials and materials made by different companies with similar production is meant to highlight the results obtained in reducing the specific consumption as well as the reserves of reducing these specific consumption. Comparisons can also be made regarding the level of specific consumption achieved on the same product and in the member companies worldwide, thus enriching the conclusions regarding the reserves of reducing specific consumption. Thus, a significant aspect in this respect is given by the analysis of the contribution of the increase of capitalization degree of material and energy resources to enhance the marketable production and the net production.

For these purposes, the centralized data processing system must provide data on:

- The value and physical volume of potential secondary resources (inventories) on the economy as a whole and by types of secondary resources.
- The value and physical volume of secondary resources used throughout the economy and by types of secondary resources.
- The degree of exploitation of the potential secondary resources expressed by the weight of secondary resources used in the total volume of the potential secondary resources, on the economy as a whole and by types of secondary resources.
- The degree of meeting the need of raw materials and energy resources with secondary resources, expressed by the weight of the volume of secondary resources used in the total volume of material and energy resources used throughout the economy as a whole and by types of secondary resources.
- The volume of secondary energy resources recycled and their share in the potential energy resources and in the global energy consumption.
- Quantities and values of raw materials and materials resulting from the processing of secondary resources.
- The volume of primary resources saved by capitalizing on secondary resources.
- Reduction of imports as a result of the recycling and reuse of secondary resources.
- The value of the products obtained per ton of secondary resources used.
- The increase in national income obtained by capitalizing on reusable secondary resources.

One of the criteria followed is that of balancing the markets for exhaustible resources by introducing what has been called secondary resources. One of the main problems that arise is related to the structure of the cost of production and to what extent the constituent elements of the cost for exhaustible resources can be translated to the new ones. Depending on the type of resource used, then the basic costs, the auxiliary production costs or the expenses related to the sale of the obtained goods can be analyzed.

The recovery, capitalization, respectively the superior use of secondary resources can also be stimulated by a program that considers the modification of taxes in the total expenses to determine the unit cost of the product. Thus, in the segment containing the royalties, a value r of its level can be assumed with a value:

$$R = \sum p_i r_i ; \sum p_i = 1 \qquad (1\text{-}3.1)$$

where: p_i - represents the share of the resource taken in the analysis;

r_i – is the corresponding royalty.

The extrapolated analysis of consumption and spending on other products can be done in comparison with the existing equilibrium models for which - for example - prices and processing options provide sufficient information. Thus, particularities corresponding to endogenous processes in relation to those in development, which are generally exogenous, can be taken into account [Georgescu-Roegen, 1971].

At national and international level, a wide variety of policies and initiatives are emerging to improve the balance between natural capital (the supply of natural resources and services offered by ecological systems such as waste assimilation) and the needs and wishes of citizens [Lebre *et al.*, 2015]. These large-scale initiatives include pollutant emissions taxes to create a link between the costs of pollution and the one that causes the pollution, with the aim of absolving the company as a whole to bear these costs. Other initiatives related to the water saving process are loss recovery schemes at the consumer level [Gunson, 2013]. Even more, consumers are starting to demand products and services that are more environmentally friendly, noting that the sustainable dimension of the economy is no longer so compelling and manifests itself through innovative initiatives and designs [Sequeira, 2010].

The dynamic model of change and substitution techniques in mining industry

The evaluation of resources used in the economic processes ideally requires a dynamic analysis of the multitude of stimuli fed before the relationship between the economy and the environment. Such a model is simulated with empirical, aggregated data.

Suppose a mining operation to extract the ore from a mine, separated into ore and sterile rock in a series of milling, crushing and flotation processes, which then proceeds to metal, through processing, smelting and refining.

In each stage of production, the extracted minerals are present in increasing concentration. This type of mineral material is accompanied by the use of other materials, such as water and chemicals in the process of milling, and electricity used in electric mining and milling equipment, or heat of furnaces for smelting of waste, and residual heat.

Finally, they are released into the environment, while the desired product is passed on to additional processing or final consumption. Of high quality part (low entropy), the energy entering these processes is irreversibly degraded and released into the environment, and a part of the process is released by the high chemical energy, being incorporated into the material outputs. The use of energy generates an opportunity cost for mining companies and society as a whole, which must be reflected in the company's long-term decision and whether such a decision is optimal.

Suppose we maximize the value of the function of the following mining units:

$$W = \int_0^T \left(\frac{Y(t)}{Y_0} - \frac{E(t)}{E_0} \right) e^{-rt}\, dt \qquad (2\text{-}3.7)$$

where: $Y(t)$ – represents the physical quantity of the production;
$E(t)$ – is the physical quantity of the input energy quality;
Y_0, E_0 - indicate the basic quantities used to normalize the inputs and outputs;
e^r - is the reduction factor.

An increase in output contributes positively to the value function, while an increase in energy quality decreases the value of W. The flow of values generated for each time period is summarized over the life of the mine and extends from the present $(t = 0)$ until a certain future date (T).

For the correct analysis of the changes in the combined economy-environment system, one can investigate, based on simplified hypotheses, the implications of an optimal use of resources over the range from $t = 0$ to $t = T$. To this end, one can maximize (2-3.7) with the help of a set of constraints that represent important features of reality, and to gather information regarding the feasible limits of the future mineral exploitation and processing activity.

A minimum set of such constraints is given as follows: maximizing the value generated by mining is subject to constraint, so that at each point *(J)* of extraction at time *(t)* is non-negative:

$$J(t) \geq 0 \tag{3-3.8}$$

The cumulative extraction from the mine may not exceed *X*, the initial stock *(t = 0)*:

$$Q(T) = \int_0^T j(t)dt \leq X(t=0) \tag{4-3.9}$$

For simplicity, it is assumed that there is no recycling, no new discoveries, and no other type of reserves, other than those obtained by the current extraction, i.e.:

$$X(t) = -J(t) \tag{5-3.10}$$

signifying the constraints imposed by the reduced availability of high quality energy sources.

For example purposes, Ruth [1995] studied the interdependencies between the effects of ore extraction and fuel processing (the evaluation had been detailed for copper and aluminum).

Thus, the material extracted from the mining operations is separated into ore and sterile rocks, making abstraction of raw materials consumption, other than those extracted from the mine and in common of possible products, while the separation process can be described by the following production function:

$$\frac{Y(t)}{Y_0} = \left(\frac{J(t) - J^*(t)}{J_0 - J_0{}^*}\right)^{\gamma_1} - \left(\frac{E(t) - E^*(t)}{E_0 - E_0{}^*}\right)^{\gamma_2}, \tag{6-3.11}$$

where $J^*(t)$ and $E^*(t)$ are thermodynamically determined as limits for material and, respectively, energy use in mining exploitations.

Bearing in mind these findings, we now can move on with our analysis to the next stage. In doing this, the main characteristic of isoquants is that the asymptotic approach has determined thermodynamic limits between the material and energy use. Hence, the use of resources is usually accompanied by two distinct tendencies: firstly, the quality of the superior resources that can be extracted over time, generating a low level of ore extraction in the future; and secondly, the extraction of lower ores may require an increase in energy consumption per ton of ore produced. At the same time, the technical changes take place, thus reducing the energy requirements per ton of ore.

In the model, the quantity of ore *g(t)* is assumed to decrease with the extraction:

$$g(t) = \beta_1 Q(t)^{\beta_2} \tag{7-3.12}$$

with β_1 and β_2 constant.

Similarly, the energy required per output unit *f(t)* may decrease with the experience gained in mining industry. However, there are physically determined limits for lower energy consumption per ore unit, which cannot be exceeded with the help of extractive experience.

In the case of a mining operation, *e(t)* is the minimum energy required to sort component mixtures, calculated here in the case of an ideal mix, as follows:

$$e^{*}(t) = \frac{1}{g(t)} k(g(t)\ln g(t) + (1-g(t))\ln(1-g(t)))\frac{M_1}{M_2}T \qquad (8\text{-}3.13)$$

where: k - Boltzmann's constant ($k = 1.38 \bullet 10^{-23}$ Joule per degree Kelvin);
M_1 - Avogadro's constant ($M_1 = 6{,}022 \bullet 10^{-23}$ mole-L);
M_2 - molecular mass of the extracted mineral;
T - a reference temperature, set here at T = 98.15 K [as proposed by Chapman and Roberts, 1983].

The minimum energy requirements for smelting and refining are determined by the chemical reactions of the substances used. Given $e^{*}(t)$, it is possible to define a learning curve for energy use:

$$e(t) - e^{*}(t) = mQ(t)^{n} \qquad (9\text{-}3.14)$$

where m and n are parameters.

However, learning curves are meant to effectively introduce the technique of changing endogenous variables into a dynamic model of resource use. As a result, not only the production functions at each time point respect the limits of thermodynamics, but also the technical changes are explicitly specified, so that it cannot exceed these limits. With the decline of ore grades, technological improvements may counteract the temporary trend of increasing energy demand. In the long term, however, the effects of depletion on energy use may prevail.

Based on these assessments, Chapman and Roberts [1983] developed a theoretical model for metallic ores, energy costs and energy saving technical change that support energy costs per ton of metal. They developed a framework for assessing the future availability of metals by first reviewing the activities associated with the production of metals. These can be divided into four broad categories: exploration and establishment, mining, concentrating, and smelting and refining.

They then examined factors such as energy economics, forecasting issues, resources and reserves estimation, and trends in technical efficiency. In this respect, subsequent analysis dealt with the evaluation of fuel use in metals production; the secondary production of metals from scrap and other waste materials; non-technical issues that are potential sources of short-term crises; and other applications of energy data. The findings confirm a downward trend, followed by a sharp increase in mineral prices.

In our own analysis, considering the production function (6-3.11), the changes in the quality of resources expressed in (7-3.12), the changes in technology from (9-3.14), the dynamic optimization of the function value (2-3.7), which are subject to constraints (3-3.8) - (4-3.9), then the model indicates the optimal time yields for extracting ores from the mine.

To conclude, now we can argue that an assessment of the use of resources is considered incomplete if the production and consumption processes are neglected. The ore resulting from the extraction is further treated in chemical, thermal and other mechanical processes at the stage at which the desired result is available as a pure metal [van Berkel, 2007].

Anyhow, to simplify the model, the processes of manufacture and consumption from the perspective of the end use by the consumer were not included in this model.

Finally, all these materials are released into the atmosphere, discharged into the ecosystem, stored in lakes and oceans. The evaluation of the resource utilization degree, strictly from the perspective of its physical wear, can be realized by calculating the net energy loss due to the dispersion of materials and the generation of waste heat (as wastes), on one hand, and by evaluating the degree of natural mining ore processing, on the other hand [Bulearca, 2010; Bulearca *et al.*, 2011]. This net loss can be expressed as the irreversibility generated by mining, smelting and refining per ton of finished product metal [Telukdariea *et al.*, 2006].

Conclusions

All the evidence offered in this paper suggest that societies address environmental problems involving external effects sequentially: addressing those with the most immediate costs first, and those whose costs are displaced in time and space later. That evidence is, however, limited by the fact that existing analysis typically test a partial equilibrium hypothesis about emissions of single pollutants, and have little to say about general equilibrium or whole-system impacts. The core of the environmental problem in growing economies is in fact the lack of effective signals of the indirect environmental effects on economic growth. The problem is not with resources whose scarcity is signaled by markets, or whose effects are both local and immediate. The problem lies with effects that are external to the market, that are not clearly visible to consumers, or that are displaced in space and time. It lies with effects that are cumulative, uncertain and potentially irreversible.

It has been argued in the paper, that the economic process, instead of being a mechanical analogue as traditionally represented in mathematical economics, is an entropic process. In the ultimate analysis man struggles for low entropy, and economic scarcity is the reflection of the Entropy Law, which is the most economical in nature of all natural laws. In doing this, market economies have experimentally proven themselves, more than any other known institutional arrangements, to abet the production of new knowledge and structural complexity, and therefore energy degradation. As a direct extension of such hypothesis analyzed in the paper, market economies are evolutionary stable because of their efficacy in growing knowledge and increasing structural complexity; a consequence, we argue, that follows from the reformulated second law of thermodynamics. The enormous energy transformations typical of market economies, consequent on their ability to induce and harness new transformations, are ultimately the reason they are selected.

This are the reasons why we developed in this paper a methodology to integrate concepts from thermodynamics into economic models of optimal natural resource use and to empirically determine relationships between changes in thermos-dynamic states of materials and the use of high-quality energy sources. The integration is aimed at an assessment of technologies, substitution and technical change based on economic concepts that do justice to fundamental physical constraints. And such, a model of natural resource use and production has been developed, by combining econometric time series analysis with dynamic modeling techniques.

Hence, the model explicitly includes thermodynamic constraints on the process of separating minerals from crude ore, the smelting processes, the substitution among inputs, and the endogenous technical change in mining, smelting and refining operations. Based on empirical information and simplifications, the model has been simulated to assess outer limits of feasible resource savings in mining operations, smelting and refining processes. Therefore, conclusions are drawn for the evaluation of products and effluents from mining, smelting and refining operations with regard to changes in the physical resource base and environmental quality.

As a result, through high Government pressures, increasing expectations from society and changing regulations have led to the implementation by many extraction units of ecological production practices and the replacement of traditional equipment with environmentally-friendly equipment and technologies.

Abstract

The Industrial Revolution 4.0 fundamentally changed the way humans think, live, and connect. This era will disrupt the various human activities in various fields, not only in the field of technology, but also in other fields such as economics, social, and politics. The public has indeed experienced some of these changes, but concern for the challenges in the era of digitization and automation today is fairly minimal. Therefore, the state must take part in the support of the elements of Industry 4.0. By providing a more complete and in-depth understanding, the community will naturally be compelled to prepare and respond to the changes that are supported. Even more important is to encourage the national education sector - basic education to tertiary education - adjusting the education curriculum to the challenges and needs of today. A curriculum that opens access for generations to gain knowledge and training to become competitive and productive workers. Organization as a non-formal institution in the education system is an important factor in increasing soft skills and hard skills that are not obtained in schools. One place to sharpen the knowledge of students who have been obtained at school. Through the organization as well, students can free up the creativity of those who are asked to stay within the limits of the organization's Basic Rules / Domestic Rules

Keywords*:* Management; Organization, Change, Students, Industrial Revolution 4.0.

Background

In the economic sector, it has been seen how the transportation service sector arises from the presence of online taxis and motorcycle taxis. The same thing also happened in the social and political fields. Social interaction becomes unlimited, because of the ease of internet access and technology. The same thing also happened in the political field. Through digital ease of access, people's behavior also shifts. Political action can now be collected through social media-based movements by carrying out certain political ideologies.

But behind the convenience offered, the Industrial Revolution 4.0 kept a variety of negative impacts, including the threat of unemployment due to automation, natural damage due to industrial exploitation, and the rise of hoaxes due to easy dissemination of information. Therefore, the key to dealing with the Industrial Revolution 4.0 is in addition to preparing technological advances, on the other hand, it is necessary to develop human resources from the humanities side so that the negative impacts of technological development can be reduced

The role and existence of student organizations are also part of the strength of civil society, which cannot be underestimated. Its existence is the spearhead of the nation's cadre formation because it is realized that to guarantee the continuity of the nation, future cadres of the nation are needed. And students are the foundation of a nation's future, and they are an important component in every change. (Qibtiyah, 2012).

Changes for the changes that occur in global and Indonesian society can certainly involve young people as the main actors, Widhyharto & Adiputra, (2014) in Azca, Widhyharto, & Sutopo, (2014). Furthermore, Naaf and White (2012) discuss young people can be divided into three perspectives, namely young people as a generation, young people as a transition, and young people as creators and consumers of culture. First, young people in the generation approach remind us that each young generation has its historical side and context. Then Parker and Nilan (2013) in Azca, Widhyharto, & Sutopo (2014) stated that the construction of young people is not the same from time to time, this condition makes the meaning of these young people change. For example,

Second, young people as a transition, are considered as a deterministic approach that believes that young people experience stages of life that are permanent and universal (Sutopo, 2014). This view is in line with the concept of functionalism which asserts the sharing of roles to create balance. This view has created the argument that the transition of youth that emphasizes biological and psychosocial assumptions to development then results in the dependence of legitimacy and intervention of adults to ensure that young people pass the path by the construction and definition that has been exceeded before by adults.

Third, young people as creators and consumers of culture. Luvaas (2009) explains the internalization of young people towards the value of globalization, for example, the phenomenon of doing it yourself culture in the world of young people, so that it raises distros, indie music, zinc, etc. Another study, Nilan (2006) explains the intersection between local and global culture, thus creating a hybrid culture among young Muslims in Indonesia (Luvass, 2009 & Nilan, 2006 in Widhyharto, 2014). This is also part of the strategy of young people to deal with the swift currents of globalization, as well as to show that they can become a cultural agency that sorts and chooses critically. All three views emphasize the dynamics of young people in responding to change.

Then why are young people, not young people, the younger generation or other terms? Young people are considered to represent a large quantity or amount, the autonomous subject (able to make decisions and do it alone or together), they also represent the values and culture (the creator and the model of the values themselves). Responding to the definition, then young people have an incision with various issues of change, young people face a struggle for social, economic, cultural and political values. At the same time, there is a demand for a new lifestyle-culture and political freedom, considering that socially young people are constructed and constructed by various kinds of knowledge, values, status-roles from a dynamic social environment (Pilan 2006, in Nilan & Feixa, 2006).

Then when young people enter the arena of globalization, young people are faced with a more massive structure of externalities, across national borders, and economic, political, and cultural barriers become thinner (Giddens in Ritzer, 2003). This then places young people in an ambiguous position, on the one hand, they are producers and main consumers, but on the other hand, they are the new proletariat class of globalization as explained by Bayat and Herrera (2011) in Azca, Widhyharto, Sutopo, (2014).

Globalization has entered a new era called the Industrial Revolution 4.0. Klaus (Shwab, 2016) through The Fourth Industrial Revolution states that the world has experienced four stages of the revolution, namely: 1) Industrial Revolution 1.0 occurred in the 18th century through the invention of steam engines, so that goods could be mass-produced, 2) Industrial Revolution 2.0 occurred in the 19-20 century through the use of electricity which made production costs cheap, 3) the Industrial Revolution 3.0 occurred in the 1970s through the use of computerization, and 4) the Industrial Revolution 4.0 itself occurred around the 2010s through intelligence engineering and the internet of things as the backbone of the movement and connectivity of humans and machines.

Methods

This study uses a descriptive qualitative approach with in-depth interviews of the informants who have been selected by researchers and processes data obtained in the field and has analyzed its results and concluded by researchers. According to Saeful (2009) Research Methods a decade ago there was an

error in society that the so-called research activities were surveyed. Besides, there is another understanding that research is correct if it uses a list of questions or develops due to the strong influence of positivistic flow.

In this study using a qualitative method that is analyzing field research, the object of research is the Nahdlatul Ulama Student Association and the Muhammadiyah Student Association which is in the form of descriptive. The theoretical foundation is used as a guide so that researchers focus on utilizing the theory of the Organization and the concept of state defense by the facts on the ground. Besides, the theoretical basis is also useful to provide a general description of the research background and as a material for discussion of research results. Case study research or field study (field study) is intended to study intensively about the background of the problem situation and position of an event that is taking place at this time, as well as the interaction of certain social units that are (given). Research subjects can be individuals, groups, institution or society. Case study research is an in-depth study of certain social units and the results of these studies provide a broad and in-depth overview of certain social units. The subjects studied were relatively limited, but the variables and focus under study were very broad in their dimensions (Suryana, 2010).

Results And Discussions

The development of technology gave birth to an interesting phenomenon in the life of today's society, namely the rise of global culture and an instant lifestyle. This phenomenon occurs as a result of the current globalization which can no longer be dammed. Globalization is often interpreted as the hegemony of developed countries (the West) against underdeveloped countries or developing nations. Starting from the style of dress to lifestyle, and consume instant food to absorb news instantly without critical reasoning. One important phenomenon of the globalization process has given birth to the generation of gadgets, a term used to mark the emergence of the millennial generation. The current millennial generation is those aged 17-36 years, those who now act as students, early jobbers, and young parents.

Millennial was born between 1981-2000. (Ali & Lilik Purwandi, 2017) Gadgets are more fitting to be interpreted as equipment so that the generation of gadgets is intended to be the generation that in life has always been in contact with equipment whose name contains elements of information technology. So, as if the various equipment has become an inseparable part of their lives. Connecting gadgets to the internet, resulting in community connections with each other to cross regions, countries, and even continents.

Thus, the development of IT has blurred geographical boundaries. Mc Luhan calls it Global Village because humans can explore distant territories even if they only sit in a confined space. In this context too, the time limit also becomes meaningless. It was also mentioned by Paul Virilio with the theory of Dromology. According to him, technology has destroyed the boundaries of space and time/speed. (Istriyani & Widiana, 2016).

The Industrial Revolution Era 4.0 provides opportunities and challenges for young people. The role of humans is gradually taken over by automatic machines. As a result, the number of unemployed has increased. This, of course, will add to the burden of local and national problems. Therefore, to take advantage of opportunities and respond to the challenges of the industrial revolution 4.0, student organizations must have data, technology, and human literacy abilities.

Technology literacy shows the ability to utilize digital technology to process data and information. Whereas human literacy must be mastered because it shows the element of soft skill or individual character development to be able to collaborate, be adaptive and be wise in the era of "flood" of information.

The term Industry 4.0 was born from the idea of the fourth industrial revolution. European Parliamentary Research Service in Davies (2015) said that the industrial revolution happened four times. The first industrial revolution took place in England in 1784 where the invention of steam

engines and mechanization began to replace human work. The second revolution occurred at the end of the 19th century in which production machines powered by electricity were used for mass production activities. The use of computer technology for manufacturing automation starting in 1970 marked the third industrial revolution. At present, the rapid development of sensor technology, interconnection, and data analysis has led to the idea of integrating all of these technologies into various fields of industry. This idea is predicted to be the next industrial revolution. The number four in the term Industry 4.0 refers to the fourth revolution. Industry 4.0 is a unique phenomenon compared to the three industrial revolutions that preceded it. Industry 4.0 was announced a priori because real events had not yet taken place and were still in the form of ideas (Drath and Horch, 2014). The term Industry 4.0 itself was officially born in Germany precisely when the Hannover Fair was held in 2011 (Kagermann et al, 2011). Germany has a great interest in this matter because Industry 4.0 is part of its development plan policy called the High-Tech Strategy 2020. The policy aims to keep Germany at the forefront of manufacturing (Heng, 2013). Several other countries also participated in realizing the concept of Industry 4. 0 but use different terms like Smart Factories, Industrial Internet of Things, Smart Industry, or Advanced Manufacturing. Even though they have different terms, they all have the same goal, which is to increase the industrial competitiveness of each country in the face of a very dynamic global market. This condition is caused by the rapid development of the utilization of digital technology in various fields.

IPNU realizes that students are an important element of changing times, especially in the industrial revolution 4.0. Collaboration and synergy in realizing big ideas is an inevitability of the organization. A response that is swift and responsive in adapting change is a skill that is internalized in the cadre's mindset early on. IPNU with its resources is committed to bringing forth a variety of creativity and innovation. For example, in the field of information technology, digital economy, ecopreneurs, and creative economics. Empowerment and innovation assistance is indeed one of the focuses of IPNU today.

Then the 4.0 Industrial Revolution and the digitalization era were responded by the HDI, Article 10 Points 2 and 3 of the HDI Article of Association stated, IPM members are Muslim students aged from twelve years to twenty-four years. Current IPM members are filled by Millennials and are dominated by Generation Z according to APJII data, are many internet users.

Conclusion

There are several impacts of the industrial revolution 4.0 process among students. First, Students are more comfortable learning by using the internet. From searching for the process of receiving knowledge to finding a source for a task, everything is done using a device and using internet access. Secondly, social media is a place for student expression, students are currently expressing more things on social media, whether it is heartfelt, complaints, anger or creativity all loaded in social media with a variety of content that attracts the attention of others. Third, the lack of student social interaction, reduced student social interaction because, most students focus on the device, not even a few students are more concerned with looking good on social media than the real world.

Abstract

The article reveals the problem of digitalization of the higher education system and its consequences. It gives a comprehensive analysis of the essence and ambivalent nature of this process. The author consistently studies the positive aspects of introducing digital technologies in the learning process, which are connected with the prospects for the development of online and remote education. Particular attention is paid to the consideration of risks associated with the digitalization of education, the study of a possible negative impact of these processes on the social development and the future of mankind.

Keywords: Digitalization, Digitalization of Education, Educational Innovations, E-Learning, Online Learning

Introduction

The information revolution has sweepingly rushed into the life of modern society, considerably changing the functioning of its various spheres. Digitalization as one of the main components of the information revolution has not only gained a strong footing in the mechanism of the education system, but also has substantially transformed this mechanism, as well as the essence and nature of education. This process gained particular importance during the coronavirus pandemic, when many national education systems had to switch completely to online learning, as it happened in Russia. It helped discover in more detail both the new possibilities and shortcomings of such learning process.

If we speak about the classical understanding of the category of education, it means a system of knowledge, abilities, skills and qualifications that a student should master, as well as gaining the experience in creative activity and a values-based attitude to the world. Education precedes other activities and is an important factor in both the socialization of an individual and the development of society, its progress. Therefore, the importance of an educational institution in the life of modern society continues increasing.

However, the content and forms of education have a concrete-historical character, and they reflect the worldview and specific features of society at a certain stage of development. Today's society can be described as informational and postmodern. Professor Peter Weill, a well-known expert in management, compared such a society with a boiler of constantly boiling water. This creates a feeling of constant uncertainty, confusion and chaos. The essence of the postmodernity information era consists exactly in this unpredictability and dynamism, when social dominants are constantly changing, and the information flow collapses as an avalanche on the human mind. Thinkers call it a “liquid” world (as defined by Z. Bauman), “runaway” world (A. Giddens), “ground in motion” (F. Emery).

Any person today as well as any expert should be able to navigate well in such a rapidly changing world in order to make the right decisions. The mission of modern education is to teach this using

modern information technology. These processes are related to the concept of digitalization, which has recently become obviously popular and is often used in the scientific and professional communities: "digital economy", "digitalization in management", etc.

The concept and essence of digitalization

Let us review in more detail the concept of digitalization, which, even though it seems obvious, is, in fact, ambiguous. On the one hand, digitalization in the narrow sense of the word often implies the introduction of digital technologies into various spheres, the transformation of information into a digital form. An example from the education sphere is the replacement of "analog" paper reports of an instructor and various services with electronic personal accounts or a shift of an instructor/student/employee from educational documents on paper (or in simple files) to keeping data with special computer software that integrates an array of information. In this case, the concept of digitalization in the narrow sense, as a rule, is associated with the simplification and acceleration of processes, cost reduction.

At the same time, digitalization is closely interconnected with informatization. At the first stage, digitalization often consists in widespread systematic use of information and computer technologies. We can consider informatization, which is mainly associated with a change in the information channels, the nature and quality of information infrastructure, part of a more complex digitalization process, that has a systemic-functional nature. Digitalization in different fields helps effectively solve tasks set by a person, while forecasting the result.

However, digital methods, like any new methods, require that users are digitally savvy. They include not only the mastery of information technologies, but also knowledge about the specific features of digital systems, skills and abilities to take advantage of such systems, and even the emotional component of the attitude to the digitalization process. Otherwise, if there are no skills of using the new digital functionality, the effect may be the opposite. Digital expertise helps an expert achieve a new level of using modern technology.

In the broad sense of the word, digitalization is a global process characterized by a change in the social, economic, cultural environment, science and education, the penetration of digitalization in all spheres of social and personal life. At the same time, in a "digital" society, people not only have skills of using digital tools, but also use them constantly, they are inextricably linked with their daily life and work. In crisis or difficult periods (for example, the spread of the coronavirus epidemic), digitalization is designed to respond fast to unexpected social problems. The digital world should make any activity more flexible and adaptable to extremely dynamic systems, and, therefore, more competitive. Thus, digitalization today is not just the introduction of digital technologies in life, but a trend in the social development, actively influencing the nature of social relations. And this phenomenon is ambivalent. This is most vividly manifested in the field of education.

The benefits of digital transformation

It is obvious that digital transformation provides a lot of opportunities in the educational sphere. Let us review them. Firstly, new possibilities relate, primarily, to the content of education and training, and ways of mastering it. The development of the Internet provides opens access for instructors and students to the information space, including for self-education purposes. Open access appeared as an alternative to the monopoly of scientific publishers in the late 20th century. Open access means unrestricted free of charge access to the complete texts of scientific publications and educational literature for all users. This means that for a consumer of information there are no technical, financial or legal restrictions on the reading, copying, distribution of research information and its use for other purposes prescribed by law. This process was initiated in 1991 by Paul Ginsparg with the creation of the arXiv open depository, which even today remains the largest free archive of scientific publications in the field of natural sciences (physics, mathematics, computer science, biology, astronomy). All the three articles of Perelman, in which he consistently proved the Poincaré theory, were published on this site.[1] Following Ginsparg, archives were opened by: CogPrints (archive of psychology, linguistics and neuroscience); NetworkedComputerScienceTechnicalReferenceLibrary (Networked reference library for computer

science); RePEc (library on economics); NetworkedDigitalLibraryofThesesandDissertations (Networked library of theses and dissertations). This provided new opportunities for creative activities and for the implementation of projects; expanded the theoretical base of research, making it flexible and relevant; gave unlimited opportunities for communication and sharing of best practices. But at the same time, these processes required the organizational consolidation of the latest approaches to the use of information and research literature, which was undertaken by the Budapest Open Access Initiative (BOAI) in December 2001.[2] Then, in 2002, the methodological and theoretical foundations of open access were formulated at the Budapest Open Access Initiative Conference,[3] and in 2003, in the Berlin Declaration on Open Access to Knowledge, which was signed by almost all leading scientific organizations in the world. Respected systems such as the Public Library of Science-PLoS, the Open Archives Initiative (OAI), which supports interoperability between networks, and others have joined this movement. The open publication of scientific materials and research papers in a virtual space allows not only to make them available to students and instructors, but also to serve as a certain guarantee of protection against plagiarism and other kinds of unfair competition in scientific activity.

New technologies facilitate the development of electronic textbooks, electronic educational resources posted on the websites of educational institutions, and educational software that are not only presented in digital form, but also make it possible to master the content of a certain discipline step-by-step, which is controlled automatically: for example, you cannot move to the next section without having studied the material of the previous one at a sufficient level. Such electronic disciplinary courses have ample opportunity to diversify and make the material easier to understand with the help of instructional videos, as well as to introduce listeners to the video lectures by famous scientists.

As a result of digitalization, electronic educational resources become not just an accessible flow of educational information, but also a system of interactive and multimedia experiences, online dialogues. Teaching aids in this digital format are still not widespread in Russia, their quality is often far from perfect, since the development and implementation of such electronic materials is a meticulous task that requires time, methodological knowledge, a creative approach and digital expertise.

The introduction of innovative technologies necessarily requires, on the one hand, changes in the methodology of teaching and learning, and, on the other hand, many social practices and humanitarian-democratic initiatives can be supported by digital transformation processes. The latter is the most valuable "acquisition" of digitalization. Thus, the opportunities for inclusive education are increasing in satisfying the diverse, including special educational, needs and taking into account the individual capabilities of students. The new virtual educational space facilitates the implementation of the multi-purpose Russian state program entitled "Accessible Environment" and can be aimed at supporting students with physical disabilities or other challenges in adaptation to the educational process, as it can adapt to the lifestyle, needs, psychological characteristics and interests of a particular individual, by giving free equal access to educational resources.

To solve the same problems of increasing the flexibility and mobility of the educational process for different target audiences, the number of open universities and e-learning departments across the world is steadily growing. They implement the relevant methods, including work with open electronic libraries and repositories, the study of specially designed electronic textbooks and workshops, online courses in disciplines from the curriculum, conducting webinars, online tests, discussion of certain issues on the forum, in chat rooms and etc. At the same time, all the information with instructions is compactly placed in virtual classes and students' personal accounts, easily controlled by both parties (students and instructors) and also includes feedback. "Education should be a right, not a privilege," is a slogan put forward by Daphne Koller and Andrew Ng[4], the founders of the first online learning platform Coursera.

The official date for the introduction of online learning in Russia is May 30, 1997. On this day the Ministry of Education of the Russian Federation issued an order which authorized conducting an experiment on online learning in the field of education. Over the recent years, due to the digital transformation, the space of online education has expanded significantly thanks to EdTech (i.e., online learning), the placement of ELR (electronic learning resources); we observe mass introduction of online learning methods (video lectures, online testing and etc.) in ordinary departments. In 2016, the Russian online education market grew by 30%, which is 2 times faster than the global indicator.[5] Higher School

of Economics is at the forefront of promoting online learning in the Russian Federation. Indeed, such learning process has its advantages[6] – cost-saving for students and educational institutions, flexibility and mobility of the learning process, accessibility (can be implemented outside a certain time and space).

EdTechXGlobal believes that the global market volume for EdTech will reach $252 billion by 2020. Global Market Insights has more modest but still significant forecasts – $240 billion by 2023. However, Russia is lagging behind by the volume of online education introduced: now Russia accounts for about 0.5% of this market. Nevertheless, the volume of the Russian market may grow to 53.3 billion rubles by 2021. It is gaining pace faster than anyone in Eastern Europe.[7] Indeed, Russian education, especially higher education, seeks to follow global trends that were defined in 2015 by the United Nations General Assembly in the resolution entitled "Transforming our World: The 2030 Agenda for Sustainable Development", in which education plays a special role . "Ensuring inclusive and equitable quality education and promoting lifelong learning opportunities for all" implies a comprehensive digitalization of the educational institution. Today, the Russian Federation pays great attention to the digital transformation processes, which is reflected in the national draft document published in February 2020, "Key Areas for the Development of Russian Education to Achieve the Sustainable Development Goals and Objectives in the Education System until 2035", in which universal digitalization is among the basic global drivers that control the development of civilization and directly affect the institution of education, which must manage to adapt to global changes.[8]

The introduction of digital technologies drastically influences not only the mastery of content and teaching methods, but the entire educational organization. Digitalization should promote the development of a more flexible education system – a personal educational and career "road map", as well as to make management procedures more transparent and susceptible to reengineering. New management technologies in education are based on the values of network culture, based on extreme information transparency, Big Data processing methods, and a regulatory and instructional base. Such digitalization of the education system in the broad sense intends to: on the one hand, contribute to an objective assessment of the current processes and scientific and educational activities, systematize the mechanisms of interaction between the entities, and, on the other hand, promote a comprehensive analysis of current situation at various levels from the whole system in general, up to departments and individuals (instructors and students), make accurate forecasts for long-term planning based on them. Thus, the effectiveness of controlling and the speed of making optimal decisions should increase. The system itself, based on various regulations, should become more clear, organized and predictable. Such a mechanism is introduced through the creation of online rooms for instructors and students, where all information about their activities is collected, through online monitoring mechanisms, business communication, workflow management and reporting, the functioning of rating systems, etc.

It would seem that, thanks to digitalization, the education system is becoming harmonious, unbiased and predictable. The digital future of education is joyous, as in the past we really had to deal with misrepresentation of fact in reports that were difficult to double-check, as well as subjectivity in evaluating activities. But the duality, the ambivalent nature of the digitalization process, which contains hidden and obvious threats and risks, is too obvious. Let us review them.

Threats and risks of digitalization

Considering the reverse side of the coin, we will start again with mastering the content of training courses amid universal digitalization, which has made this process, as mentioned above, open and accessible. However, is every young person able to benefit from it effectively and independently? For example, only the number of articles on the brain exceeds 10 million and it is simply not possible to read them. Moreover, every day at least ten article are published.[9] Without an experienced instructor, it is difficult for a student to navigate in a huge information flow, which is sometimes outdated, sometimes false, or has become junk information. But such information is most easily accessible, and young people often go the shortest way. Moreover, not all publications have become accessible. The most famous and reputable resources do not give public access to the articles immediately, so as not to lose their subscribers. Contradictions between the commercial interests of such publishers and the public movement toward scientific openness sometimes lead to litigation and lawsuits: for example,

the lawsuit of the famous Springer Nature, which was joined by 13 other scientific publishers, against the pirated websites, Sci-Hub and LibGen, that provide open access to research papers.[10]

Another problem is that sometimes students download materials without any critical assessment, without additional processing, without identifying the essence and main ideas. At the same time, students have a syndrome of illusory possession of knowledge ("Internet expert" syndrome), which they aren't actually able to use, since they have not assimilated this information. Indeed, the concept of information is not synonymous with the concept of "knowledge": knowledge is acquired through active and purposeful work with information, the semantic blocks should become convincing for its consumer and take a certain place in the worldview system. This information becomes true knowledge only after joint discussion with other students guided by instructors and the application of this information. Moreover, in different audiences the ways to achieve the truth will be different. During live communication the instructor is sensitive to the specific features of the audience, their needs and capabilities.

Only an instructor who personally (and not virtually) manages the learning process can cope with such tasks. The initial assumptions of EdTech supporters (for example, founder and CEO of Knowledgemotion David Bainbridge) that education can be significantly reduced in price because it can do without instructors did not prove to be right. In Western education, the attempts to replace a real instructor with a virtual one failed. Therefore, today the "profession of the future", a tutor, has started to be introduced into the field of education. This is the organizer of the learning process, a consultant and a personal mentor for a student, who remotely helps navigate the educational virtual space and develop an individual pathway to knowledge.

Nevertheless, the role of a real instructor working directly with students cannot be even slightly compared with an online tutor. Men are social beings, this is key manifestation of their ancestral essence and development. Without the "participation effect" of an instructor and fellow students, not only communicative abilities, teamwork skills, social intelligence weaken and gradually disappear, but the level of cognitive abilities deteriorates. The Wall Street Journal showed that 89% of managers are already struggling to select candidates with the required set of soft skills such as teamwork, communication skills, and social adaptability.[11] What then to expect considering further dominance of online education? Genuine education can only take place in the context of real relationships.

One cannot but recall the dialogic theory of the Russian philosopher M.Bakhtin, which can be considered in this case as the methodological basis of the learning process. His dialogic pedagogy sets a goal of achieving, through communication, a creative understanding,[12] which exists on the border between the "I" and the "Other" and at the same time includes the intentions of the "I" and the intentions of the "Other", and, therefore, new semantic discoveries, and internal convincing discourses.

American sociologist, Ph.D. Randall Collins in his work "The Sociology of Philosophy: A Global Theory of Intellectual Change" highlights a drastic role of personal contacts for intellectual creativity, the social conditioning of cognition in general.[13] The results of a person's spiritual activity live only in social systems of live discussions, dialogue with opponents, like-minded people, etc., and not in computer software and artificial intelligence. By seeing the reflection of his ideas in the thoughts of another, a person begins to understand something new about himself and his position. An expert in neurolinguistics and experimental psychology, Doctor of Philological and Biological Sciences, Corresponding Member of the Russian Academy of Sciences and the Norwegian Academy of Science and Letters T.V. Chernigovskaya sees the deprivation of social communication as a great misfortune: "Such people do not develop the thing that is now considered one of the last (disappearing) privileges of a person compared with all other neighbors on the planet, which is the ability to build a model of another person's psyche. There is no good term for this action in Russian, but in English it is called the theory of mind... This is the ability to look at a situation not with your own eyes (brain), but with the eyes of another person. This is the basis of communication, *the basis of training*, the basis of sympathy, empathy, etc."[14]

At the same time, a student through live interaction not only finds himself as an active actor in the educational process, but also through a dialogue involving discursive polyphony, identifies his stance, personal attitude to information, and deepens knowledge. It is necessary to also consider the transfer

of implicit knowledge, values and implicit skills of intellectual work, experimental experience in direct communication with an instructor – a personality and a well-respected figure. The scientist and philosopher M. Polanyi insisted on this, developing the theory of tacit knowledge after a long observation of chemical and medical students.[15]

The student's social environment in the learning process plays a motivating and organizing role. Not every student is able to discipline himself and independently control the academic process. It is clearly demonstrated by the example of Coursera online learning platform, the most famous one in Russia, which entered the market in 2012. Its launch was very optimistic, and almost in a year, a staggering 2 million number of users was registered there. By 2017, Coursera already had 24 million students. But, despite the huge interest, an unexpected decline came afterwards, and the percentage of students who completed the full training course was extremely small. According to the forecasts of Ambient Insight, people will be less likely to study online on their own over the next five years.[16] Indeed, online courses are not able to control "how people study": "Maybe they turned on the webinars and are watching them attentively, or maybe they are watching them on the background while cleaning their house. It's hard to track when and why they drop the course, and without this data it's impossible to understand how to find gaps and improve content."[17]

Furthermore, the use of new digital technology in education has a negative impact on the development of human cognitive abilities. No need to take notes, availability of the Internet where you can find answers to any questions, fragmentation (mosaic structure) and visualization of information, etc. result in a sharp deterioration of students' ability to draw a border line between scientific and unscientific facts, to single out the key information, to capture the essence of content and problems, to think systematically and critically analyze information, which could allow using it to make adequate decisions. At the beginning of computerization process in the 20th century, the United States was the first country to face the problem of "pseudo professionalism," when employees who were tech-savvy could not effectively use and systematize the information they found. Today, a similar problem is observed in the educational sphere and it was even dubbed "digital dementia".

On the other hand, an instructor in a digital environment is forced to master a huge number of information and digital skills, which is extremely time consuming and results in emotional burnout and stress. At the same time, the creative learning process often fades into the background, turning into a number of strict standards, a set of requirements and instructions, which emasculates an emotional lively atmosphere, especially in the social and humanitarian sphere. If a highly qualified instructor is incapable of or unwilling to master digital skills, he automatically becomes uncompetitive. Thus, even talented instructors who do not want to spend time on "digital accounting" are definitely left behind the new education system.

There is a disturbing trend in higher education, which manifested itself vividly in the 21st century in the Western countries and is trying to come into the spotlight in Russia – not to consider higher education as a certain "privilege", which gives students often abstract, fundamental or humanities knowledge – spiritual capital, which may not be needed for them in their specific professional activities, but which increases the cost of education. Clayton Christensen, professor at Harvard Business School, formulated the Theory of Jobs to Be Done. It says that universities should consider, first of all, the tasks that enrollees set for themselves. In his book *Competing Against Luck: The Story of Innovation and Customer Choice* he writes, "When we buy a product, we essentially 'hire' something to get a job done", that is, we strive to achieve a result in a certain life situation.[18] And low-cost online learning is quite enough to acquire specific skills.

This trend in the education will lead to the simplification of the learning and thinking processes of consumers – students, the incomplete realization of their capabilities, the decrease in the creative potential of future professionals and the absence of the social qualities that are necessary today for an expert who will have to make responsible and important social decisions in the future. A businessman, doctor, economist or engineer should be included in a specific cultural and historical context of their time, its spiritual problems, universal values, and, thus, be able to comprehend their professional problems through cultural and ethical categories.

It is necessary to remember that higher education is, first of all, the development of higher intellectual and cultural values, the spiritual enrichment, necessary for any expert amid the exacerbation of global problems. And this general cultural expertise is again beginning to be appreciated. Thus, according to Catherine Weinberger, an economist from the University of California, Santa Barbara, in western countries, experts with a balanced (including general cultural component) set of competencies today receive 10% more than their "field specific" colleagues.[19]

The conditions in a digital society require a flexible approach to this situation in the education sphere. At our university, Plekhanov Russian University of Economics, each instructor generates Electronic Educational Resources, which turned out to be extremely helpful during the coronavirus pandemic, and are regularly used in other difficult situations when a student is geographically remote or has certain physical challenges, as well as to master the basics of theoretical knowledge (electronic textbook, thesaurus, tests, etc.). However, mastering practical professional (including communicative, social) skills and values requires the “magic” of direct interaction and going out of the comfort zone.

Conclusion

Considering this, we can agree with the current position of the Russian Ministry of Science and Higher Education and its new Head, Valery Falkov, who said, “Online courses should be a mandatory part of the educational process at any university, but they cannot completely replace traditional education ... Online education works best for receiving the second graduate degree and further higher education”.[20] It is encouraging that this opinion coincides with the position of the majority of Russian instructors and students.

At the end of 2018, researchers of the “Modern Digital Environment in the Russian Federation” project presented the results of a sociological survey conducted among employers, instructors and students of higher and secondary specialized educational institutions. More than half of the surveyed instructors and almost 90% of students highly appreciate the opportunities offered by online learning platforms, however, traditional higher education remains a priority for students.[21]

Digital technologies have certainly greatly transformed the educational sphere and require new socialization forms in the educational space. They bring new opportunities for learning, at the same time making the society face new challenges, without which the country will not be able to remain competitive on the world stage.

Furniture Industry - Managing the Polish Industry's Sustainable Development

Anna WISNIEWSKA-SALEK

Czestochowa University of Technology, Czestochowa, Poland
anna.wisniewska-salek@wz.pcz.pl

Abstract

National economy is based on activities taken up by market participants. Domestic economy is viewed globally through the lens of products/services it offers. Therefore, market image building depends on what the given country is associated or identified with. Currently, the Polish economy (according to the Polish Development Fund's data) is valued at 11 billion [Euro] in terms of furniture export. Among industries belonging to the industrial processing sector, the furniture discipline is second in terms of net export. It is therefore very important to sufficiently invest in this sector of the Polish economy. The paper presents an analysis of the furniture industry in terms of own and government research. All of the analyses are embedded in the topic of sustainable development, which constitutes the foundation for fulfilling the basic assumptions of "Industry 4.0". This direction of action is required for industry management. Then, it will be possible to participate in a global, but "digitalised" and "smart" chain of a relations network that satisfies consumer needs. An analysis of the study results allowed for defining the key factors in development planning, i.e. "education" and "house brand". Their participation is required in managing sustainable development in the furniture industry to consciously shape the domestic economy.

Keywords: Furniture industry, sustainable development, Industry 4.0.

Introduction

Competitive advantage is one of an enterprise's priority objectives and is of major strategic significance in the company's development process. Gaining an advantage is related to many activities, which as result allows for achieving success in the economy. An in-depth market analysis constitutes one of many valuable information on the sector in which the enterprise is functioning. On the other hand, an analysis of specific market segments allows for allocating a specific product and/or service in adequate purchasers, thereby enabling the satisfaction of the customer's individual needs.
An analysis of the furniture industry in terms of sustainable development should mostly be focused on the following:

1. Studying the social potential mainly in terms of education, i.e. focused education in the scope of designing in areas in which the furniture industry and wood processing are significantly large (they stand out among other industries).
2. Studying the economic benefits resulting from building strategic network alliances supporting the industry's development. Promoting local brands by striving to strengthen the competitive advantage in foreign markets.
3. Studying the ecological economics, i.e. economic estimates affecting the environment and related to the quotation of natural resources. Focusing mostly on limiting the degradation of the natural tree population and on using state-of-the-art processing lines that reduce, among others, the quantity of wastes or optimise the raw material's consumption.

Analysis of Most Recent Studies and Publications

The modern times are a period of adapting production/service solutions to global solutions aimed mostly at environmental protection. Sustainable development is development that meets the needs of

the present without compromising the ability of future generations to meet their own needs (Gudukeya *et al.*, 2019; Ministerstwo Rozwoju, 2018). The quoted term (UN Report of the World Commission on Environment and Development) is the most commonly used explanation for what sustainable development is. The term is equally often characterised in the manner specified by David Altwegg, et al (2004). The impact on the environment, economy and society constitutes three pillars of sustainable development. Sustainable development is achieved completely by accomplishing all of its three pillars.

Sustainable environmental development refers to: maintaining renewable resources, minimising pollution, limiting the consumption of non-renewable resources. Broader explanations on environmental impact are present, among others, in the following publications (Ijaz *et al.*, 2020; Mikulčić *et al.*, 2020, Vesal *et al.*, 2020).

Sustainable economic development is focused mainly on maintaining a specific level of economic production. Roberto Cervelló-Royo et al (2019) presents an interesting view in which he identifies the factors of a country's economic and sustainable development in relation to capability-based entrepreneurship. On the other hand, a general view on the sustainable economic development as a method of facilitating effective policy designing is presented by Arsenio M. Balisacan et al (2015).

A country's sustainable social development should enable a specific level of social welfare among its residents. The diversity in the approach to social development can be deliberated on in terms of adaptive management of social and economic systems (SES) (Castro-Arce and Vanclay, 2020) and as sustainability referring to the end (often ideal) state, which is constant over time (Segerstedt and Abrahamsson, 2019).

In maintaining social balance, it is necessary to consider how it is affected by economic and environmental balance. On the other hand, economic growth is limited by the society and the society's development largely depends on available natural resources. The significance of the sustainable development concept can be found in many publications. In terms of the production process, the phenomenon is described by Mahdi Naderi et al (2019), while in terms of production systems – by Melissa Demartini et al (2019). The significance of sustainable development among small and medium companies is described by Erik Steinhöfel et al (2019) following the example of companies acting in Germany or for the furniture industry enterprises (Wiśniewska-Sałek, 2018).

In terms of defining the concept of the fourth industrial revolution, scientific literature describes this notion very broadly (Weking *et al.*, 2019; Pacchini *et al.*, 2019; Alaloul *et al.,* 2020; Shatrevich and Strautmane, 2015; Amaral *et al.,* 2019) by analysing them in many areas and relations (Büchi *et al.,* 2020; Müller *et al.,* 2020; Rauch *et al.,* 2020; Rajput *et al.,* 2019; Villa and Taurino, 2019) or doubts concerning the enterprises' readiness to implement them (Ślusarczyk, 2018). It is possible to question the knowledge possessed by enterprises about the Industry 4.0 ideology. The knowledge is required for the company's correct restructuring. The resources in the form of the human factor can also raise doubts. Whether they have skills to analyse the data generated by using advanced technologies, modern and digitalised economy (Wiśniewska-Sałek, 2019; Wiśniewska-Sałek *et al.*, 2019).

Paper's Objective

The main objective of a country is to support entrepreneurs in the process of building the strength of its economy. An analysis of the results of the bottom-up administrative division (i.e. poviat) in relation to the country makes it possible to find factors that are equally important for the functioning of companies at the lowest and highest territorial levels. The factors resulting from the decision made, in terms of economic changes, i.e. the fourth industrial revolution, should be balanced. This also concerns single companies from the SME sector as well as large national manufacturers. The management of the industry's sustainable development requires adapting the unit's business model to the model of managing the country's sustainable industry. The expediency of the furniture industry's study was justified by the high position of Polish furniture in global rankings in terms of export size and the large number of manufacturers often focused in very small areas. The industry's specificity,

i.e. production based on natural resources constitutes a very important element of environmental care, which justifies the expediency of sustainable development. The paper's main objective is to find factors that will constitute a starting point for the furniture industry's development in an environment of sustainable development.

Materials and Methods

The paper utilises two prominent sources. The first source was own research, i.e. a survey conducted on a group of entrepreneurs in the furniture industry. The second source was an analysis of the Polish furniture manufacturers conducted based on the commission on the Polish government (PARP, 2020). The analysis was also supplemented with current information derived from the data published by Statistics Poland (Statistics Poland, 2019a; 2019b; 2019c) and the Polish Chamber of Commerce of Furniture Manufacturers (OIGPM, 2020) and State Forests in Poland (Portal Leśno-Drzewny, 2020; State Forests, 2015).

The survey was conducted on a sample group of 150 randomly selected enterprises with economic activity registered in the Kępno poviat, Wielkopolskie voivodeship. Companies classified acc. to the Polish Classification of Activity (PKD, 2007) and the surveyed entities belong to section C - Industrial processing: Section 31: Furniture production: kitchen furniture, office and shop furniture (the sub-class includes: production of chairs and seats for offices, production rooms, hotels, restaurants and public buildings; production of cinema and theatre, etc. chairs and seats; production of special shop furniture: counters, display cabinets, shelves, etc.; production of office buildings; production of laboratory tables, chairs and other seats used in laboratories, other laboratory furniture, e.g. cabinets; production of furniture used in furniture, schools or restaurants; production of decorative trolleys used in restaurants) and other furniture (the sub-class includes: production of sofas, folding sofas and seat couches; production of garden chairs and furniture; production of furniture for bedrooms, living rooms, gardens, etc.; production of cabinets for sewing machines, TVs, etc.; finishing of chairs and seats, such as upholstery; finishing of furniture, such as: painting (including spray painting), varnishing and upholstering). The survey's questionnaire featured 10 multiple-choice questions and metrics. The questions characterised the furniture industry in terms of its financial, production and resource capabilities. They also referred to the business-related environment, including the education field. The survey was conducted with own resources allocated for the performance of activities as part of the subsidy granted for the funding of scientific research and developmental works as well as related tasks aimed at developing young scientists. The survey was conducted in the period of October-December 2019, contractor: BIOSTAT sp. z o.o., CATI method.

The country-wide analysis was conducted with participation of: European Union – European Structural and Investment Funds as well as the Republic of Poland – Polish Enterprise for Enterprise Development (PARP, PRF group). The studies were conducted as part of the project titled "Development of the furniture industry's Polish brand strategy 2018-2021", which is one of the elements of the "Polish Furniture" Flagship Programme. The project's main assumption was to develop a system strengthening the global position of the Polish furniture industry.

Results

Nearly 50% of the random sample representing the furniture industry's statistical population in the Wielkopolskie voivodeship are companies belonging to the group of micro-enterprises (hiring up to 9 employees), while 37% hires no more than 49 employees. Nearly ¾ of the surveyed enterprises state that they are selling their products abroad under their own brand (however the companies' size raises doubt whether the surveyor and respondent understand the "own brand" term the same way) and only 17% of the surveyed entities acts in the domestic market for over 20 years. Most entrepreneurs established their activity between 1998 and 2008.

Sustainable development of the furniture industry according to own survey research.

The statistically studied enterprise confirms the furniture industry-related educational capabilities in their business-related environment. The results are presented in figure 1.

Fig. 1: Share of education institutions providing vocational education on furniture production in 2018.

Source: own research (survey)

The enterprises themselves declare co-operation with institutions, such as (order according to most frequent selection): financial institutions (25%), local government, science and research centers, universities and science institutes (1%). The co-operation results include, among others, access to European structural and investment fund subsidies as well as specific subsidies, financial resources obtained through credits or employment office subsidies. The survey's results have also shown that co-operation with the environment mostly comes down to institutions related to increasing financial resources, not material or information resources.

The economic pillar's analysis shows that the value of production sold amounts to just over or below PLN 100,000 for 26.5% of the surveyed population and the entities forecast that it will increase by 3-5% (for 16% of respondents) and over 5% (for 24% of respondents) in the next 2 years. It is necessary to note that enterprises very reluctantly provide information about their finances. The answers provided may not be completely objective and real, if only due to the fact that 70% of respondents declared export under their own brand.

A production process based on natural resources constitutes a big challenge for the process of managing their sustainable development. The strategic resource consumption planning assumptions should include environmental protection on one hand and support the industrial discipline's development on the other. A resource analysis allows for stating that the estimated annual wood demand for furniture production is distributed relatively evenly. Nearly 30-40% of respondents use pine, beech and oak to produce furniture in general. 70% of respondents produce furniture from birch wood, catalogued in the "other" item, including: chairs, upholstered furniture for the bedroom or gardens. The estimated annual demand for this wood for furniture production does not exceed 10 thousand m^3 per annum. Oak wood is most commonly used in the production process. Its

consumption differs depending on the enterprise. Over 50% of the analysed companies consume less than 10 thousand m^3 of this raw material per annum and over a dozen enterprises requires an estimated million m^3 per annum. Due to its hardness grade (Brinell's wood hardness class III: BNH 3.1-4)), oak wood is dominant in the production of office furniture. Furniture production also includes the use of wood-based materials which enable reducing the degree of forest degradation. The share of wood-based materials amounts to 30-50% in the overall furniture production among the surveyed enterprises. Unfortunately, these are products with lower utility quality, which substantially affects the industry's economic dimension. The detailed statistics are presented in figure 2.

Fig. 2: Share of semi-finished products used in furniture production in 2018.
Source: own research (survey)

The increased applicability (70% of respondents) is visible mainly in the production of upholstered furniture, while veneer is the least popular. It is also concurrently used in kitchen furniture production and its applicability reaches even 10 million m^2.

Sustainable development of the furniture industry according to country-wide research.

The Polish population reached 38,411.1 thousand people in 2018, 60.6% of which are persons of working age. In comparison to 2014, it is a drop in the number of working age persons by 2.4% at the expense of increased number of retirement age persons. The population of educational age (the country's economic future) according to the age groups demonstrates a drop in the last 4 years by 250 thousand of children at the age of 3-6 and 16-18 as well as by 500 thousand for the age of 19-24. A relatively even level – slightly over a million persons – applies to children at the age of 13-15 and an increase by 250 thousand of children at the age of 7-12. (Statistics Poland, 2019c)

Population statistics, specifically the distribution of educational competencies translate substantially into the occupational spectrum. In 2018, the employment in the furniture industry amounted to 161 thousand, including 25% of foreigners from Ukraine, China or India. The average monthly remuneration in the industry is equal to (gross) PLN 3,607.7 and in comparison to 2017 and 2019, it is possible to observe a rising trend of nearly 8% on average. (OIGPM, 2020)

In the 2018/2019 academic year, preparation for work directly in the furniture industry was possible, among others, in I degree industry schools, production and processing studies. The offer was utilised by 20 thousand young people. The same studies in basic vocational schools feature slightly over 1.5 thousand spots. Technical schools with engineering and technical profiles include nearly 120 thousand students and slightly over 18 thousand of them has vocational competencies (passed the exam confirming the competencies). The furniture industry is not only production, but also designing. In the studied academic year, 9,992 persons took up artistic education of the I degree and 12.9 thousand students took up second degree education. (Statistics Poland, 2019a) In addition, 691 qualification vocational courses were organised and featured active participation of 19.1 thousand auditors. On the other hand, higher education in the 2018/2019 academic year featured 235.1 thousand students in technical universities and 16.8 thousand students in artistic universities. Studies correlated with the industry, i.e. engineering and technical constitute nearly 10% of all education profiles. On the other hand, processing and production are studies chosen by 34 thousand persons from 1,230.3 thousand students in the country (most took up studies related to business and administration). At the end of 2018, students studying forestry sciences in Poland included 5,090 persons, 1,231 of which were ready to enter the labour market, i.e. attended the last year of the studies. (Statistics Poland, 2019b)

The furniture industry's economic aspect is measured by its production. In 2018, the furniture production in Poland achieved the value of over PLN 49 billion. The most wooden furniture produced was intended for living rooms and dining rooms (22,991.14 thousand pieces), wooden furniture intended for sitting (13,572.56 thousand pieces) as well as 4,932.09, 3,324.69 and 2,744.46 [thousand pieces] of wooden furniture intended for bedrooms, kitchen and convertible for sleeping purposes. The biggest increase in comparison to 2017 was recorded for wooden furniture intended for living rooms and dining rooms, i.e. by 18.7% and the lowest – for furniture intended for sitting (0.3%). In comparison to 2019, sitting furniture convertible for sleeping purposes featured the highest drops by 6.8% and 23.3% while sleeping furniture featured the highest increase by 23.7%. The Polish furniture industry is mainly the export of products. In 2018, furniture of the value of EUR 10.8 billion was exported from the country. This gives Poland the third position in the global exporter ranking. Within 10 years, furniture export has nearly double in value. The main recipients of Polish furniture are customers from: Germany, the Czech Republic, Great Britain, France, Netherlands, Sweden and USA. (OIGPM, 2020)

The furniture industry's global aspect obviously includes wood and wood-based semi-products. In 2018, the Polish forest inspectorate sold the most medium-sized wood used in the industry and for general use from coniferous trees (13.5 million m^3) and deciduous trees (4 million m^3). (Portal Leśno-Drzewny, 2020) The detailed distribution is presented in figure 3.

(* W0 – large-size wood: logs (no wood: WA1, WB1, WC1); WK – large-size wood: logs; WB1 – plywood large-size wood; S2A - medium-sized wood: applied in industrial and general purpose; S2B - medium-sized wood: applied for mechanical processing)

Fig. 3: Polish forest inspectorate's wood sale volumes in the product group in 2018 [million m^3].
Source: based on data from Portal Leśno-Drzewny (2020)

The wood sales dynamics featured an overall increase from 2014 among coniferous trees to approx. 31 million m^3 and deciduous trees at a stable 6 million m^3 for all tree types and product groups. According to the notification of the forest inspectorate of 14 January 2020, in 2019 Poland recorded a drop to 28 million m^3 of wood from coniferous trees (including [million m^3]: 11.9 - S2A; 6.9 - W0; 5.9 – WK; 3.3 - S2B) and a further stable state for deciduous tree wood (approx. 6 million m^3). The volume of semi-products used for producing furniture in Poland for 2018 comes down to the following values:

— fibreboards from wood or wood-based materials: 5,430,648.65 [thousand m^2] (increase by +1.3% in 2018 when compared to 2017 and a decrease by -0.1% in 2019 when compared to 2018)
— veneers: 16,173.62 [thousand m^2] (-5%: 2017 and -11.3%: 2019)
— plywood, veneer panels and similar 8,306.42 [dam^3] (+2.3%: 2017 and +2.8%: 2019)
— chipboards and similar wooden boards 4,287.06 [dam^3] (+2.7%: 2017 and +5.9%: 2019)
— total lumber: 2,472.08 [dam^3] (+6.5%: 2017 and -1.5%: 2019).

Conclusions

Managing the industry's sustainable development requires managing the country's sustainable economy, so that the activities taken up by the entrepreneur are compatible with the country's development strategy.

According to the macroeconomic trends developed by the Polish government, the furniture market's activities should take into consideration the impact of urbanisation on the product consumers' life style. These factors include the following: increased number of single people, late parenthood, most middle-class society, facilitated access to education, constant connectivity (Internet), high costs of small apartments' upkeep, focus on infrastructure and services, reduced physical activity resulting from lack of time for relaxation, environmental pollution being the cause of health deterioration.

Furniture designs should therefore be multi-functional and ergonomic. In addition, the increasing participation of the ageing society in the market shared with the millennials generation generates the need to design furniture meeting specific and often peculiar customer requirements. On one hand, it results from the health and financial circumstances, as well as the "mass" personalisation or I-designers on the other. This means furniture without compromise, delivered quickly from the early adopters' zone. (PARP, 2020)

The analysis of the Polish furniture industry's needs and expectations, according to the Polish government's report, comes down to export. The economic dimension of this form of expansion to foreign markets is very favorable for the economy. The source for the Polish exporters' success, among others, is their flexibility, technology and resources, trust, price competitiveness and geo-economic situation. Nevertheless, the cause for the entrepreneur's success can mean the sale of the production capacity instead of the product for the entire industry. The lack of a sales network and brand generally leads to a brand-less industry. Taking into consideration that approx. 80% of all furniture manufacturers in Poland are small companies (hiring up to 49 employees), the lack of financial resources for investing into, for example, a marketing department promoting the brand, deepens the problem of brand recognition. (PARP, 2020)

The environment, specifically forest resources constitute the basis for the furniture industry's functioning. Sustainable forest management around the world, including Poland, comes down to establishing institutions that will manage the possessed resources in a conscious and organised manner. It is necessary to introduce instruments that would allow for certification that the given product is derived from controlled forest areas – FSC or, for example, PEFC. A certificate confirming that the product is made from material not acquired, among others, at the cost of limiting biological diversity. Sustainable management also features supporting the governments of the global south in actions taken to protect forests. The detailed initiatives are presented in fig. 4.

Fig. 4: Initiatives for the protection of forest resources.
Source: State Forests, 2015, p. 48

From the State Forests' point of view, sustainable forestry should be take into account absolute economic superiority. A forest performs different roles: waterproofing, soil-protecting or protection reservations. The economic function constitutes 48.8% of all forest functions. Nevertheless, society is the most import factor for the effective sustainable forest management. Conscious consumption

leading to the elimination of the excess of poor quality, uncertified wood products, will reduce deforestation, thereby favorably affecting the ecosystem and climate. (State Forests, 2015)

The analysis of the data deriving from own and nationwide research allows for the conclusion that the industry's sustainable development management requires the following key aspects:

1. Education:
   1.1. Social dimension – high demand for employees (design, production, knowledge about the material);
   1.2. Economic dimension – balance of supply and demand (conscious consumption);
   1.3. Environmental dimension – climate and ecosystem (forest functions);
2. Product's brand:
   2.1. Social dimension – creating national value (identifying the product/company with the country of origin);
   2.2. Economic dimension – share in the global economy and/or global delivery chain;
   2.3. Environmental dimension – quality certified products (produced in harmony with the natural environment).

Sustainable management means taking into consideration the social, environmental and economic needs. According to the author, the balance in exploiting natural resources in the furniture industry constitutes a starting point for the efficient and sustainable management of the industry's development. However, the balance will be possible to achieve thanks to adequate and comprehensive education, but also production designated with brand associated with quality and a production site that is in harmony with nature.

Abstract

The purpose of the paper is to analyze the economic performance of the agricultural products obtained in conventional system and in organic farming with emphasis on the direct payment schemes, on the incentives that affect the decision of the farmers to adopt the transition from one production system to another, as well as the analysis comparative of the economic performances of agricultural products in accordance with the practices of ecological and conventional management. This study was based on research on the economic calculation and more precisely on the calculation and management of costs at system level, in general, and at agricultural product level in particular, to estimate the effects of the target subsidy reform act of Romania, in particular of payments on income inequality. The research was conducted for the year of production 2020 and offers an overview of the income structure at the level of agricultural product as well as the degree of influence of the direct payment schemes in obtaining the income, the crops of soy, rice, hemp, and sugar beet. The results of the study revealed that there is a considerable differentiation not only in terms of the economic performance of organic agriculture (average production, production costs, revenues) compared to the conventional system, but also the existence of a financial incentive of 218 euros/ha, granted through National Rural Development Program 2014-2020 - sMeasure 11.2 Support for the maintenance of organic farming practices, which differentiates the two production systems.

Keywords: Conventional System, Ecological Agriculture, Subsidies, Incomes.

Introduction

The objectives of the organic production policy are an integral part of the CAP objectives, by guaranteeing that farmers receive a fair profit in exchange for complying with the rules on organic production. (Regulation (EU) 2018/848 of the European Parliament and of the Council of 30 May 2018 on organic production and labeling of organic products and repealing Council Regulation (EC) No 834/2007).

Starting with the year 2021 the new regulations on organic production are meant to ensure fair competition for farmers and maintain consumer confidence.

Why do farmers need support? Because agriculture is a risky and often expensive activity. If the weather conditions are unpredictable, the crops can be destroyed, and the production and income of the farm can be significantly affected. The negative impact generated affects both farmers and consumers. To compensate for lower prices, farmers cannot rely on the idea that they can sell more products. In addition, fluctuations in demand and supply intensify price volatility on the agricultural market. Price volatility eliminates the safety of farmers with respect to the expected income and reduces the productivity and efficiency with effect on the supply of food for consumers. (A. Volkov, T. Balezentis, M. Morkunas, D. Streimikiene, 2019)

With what indicators can we easily and accurately measure the economic performance level of an agricultural crop? Usually, we have to compare the economic level of a crop from one production system to another production system, in order to assess the impact of a support program. The economic performance of agricultural products will be measured by the profitability rates of the products that could add value in the economy of a farm. But the problem is that we are not sure that for the moment we can indicate exact measures for the indicators. (F. Sgroi, M. Candela, A. M. Di Trapani, M. Foderà, R. Squatrito, Ri. Testa and S. Tudisca, 2015)

The study contributes to the knowledge of the two farming systems, in general, and to the knowledge of the economy of organic farming compared to the economy of conventional agriculture, in particular. There is very little information available on yields, costs, and incomes, given the attention paid to organic farming in recent years.

Material and method

In order to carry out the analysis, technological quotations were developed for soybean, hemp, rice and sugar beet crops, in different calculation variants, specific to the conventional system of production and organic farming, as well as a system of technical-economic indicators that surprise in detail. all elements related to: value of production, intermediate consumption (total expenses), cost of production, taxable income, net income as well as income rates.

Production value (A) is determined on the basis of the average production per ha and the estimated prices on the internal market for the main production (A1 = Val. P.p.) and the value of the secondary production.

Subsidies (B) constitutes the value of the direct support of the state in the harvest year for agricultural producers in the vegetable sector, funds oriented to support competitive agricultural products;

The gross product (C) results from summing the value of the production with the subsidies granted on the product or on the surface unit.

Intermediate consumption (D) sums up the value of the inputs and services consumed in the agricultural production process and includes: seed, fertilizers and amendments, pesticides, mechanical works, irrigation, supplies, general expenses, interest on loans, insurance, depreciation and other expenses for plant production.

Intermediate consumption for the main production (D_1) does not include expenses incurred in obtaining secondary production. Intermediate consumption comprises two groups of expenses:

- variable expenses
- fixed expenses

Gross income (E) is obtained by reducing the intermediate consumption for the main production from the value of the main production.

Net income results from the deduction of taxable income with the value of the related taxes and the addition of allocations and subsidies granted by the state according to the legislation in force.

Rate of gross income (G) is calculated as a percentage by reporting the taxable income on consumption for the main production.

Net income rate + subsidies (H) is calculated as a percentage by reporting net income + consumption subsidies for the main production.

Cost of production represents the expense ratio for the main product and the main production of the respective crop.

Predictable domestic market price is the price of recovery at which the production obtained in the harvest year for which the calculations are made will be sold. (*ICEADR calculation methodology*)

The estimated revenues to be realized in the year of production 2020 were analyzed in two variants: the version with subsidies and the version without subsidies. In variant *income without subsidies* the hypothesis is verified if an agricultural producer could remain competitive in the context in which they would no longer benefit from subsidies. Analysis variant *income with subsidies* aims to highlight the contribution of each payment to the income.

On the basis of research results, to establish production yields for the two types of agriculture, were used statistical data of the National Statistics Institute (INS) and Order 619/2015 on "approving the eligibility criteria for approval payment schemes that apply in agriculture in the period 2015-2020 ". For the calculation of the "income with subsidies" variant, the amounts established and announced by the Agency for Payments and Interventions in Agriculture (APIA) for the production year 2019 were used.

Other research methods used in the paper:

- *Documentation*, which aims at theoretical documentation through the analysis of the specialized literature, in this sense being studied national and international articles;
- *The method of interdisciplinary research*, based on knowledge from other fields, such as those of phytotechnics, culture technologies, statistics, economics, legislation in force;
- *Comparative analysis* used in comparing technical-economic indicators specific to ecological and conventional products.

Results and Discussion

In addition to basic subsidies for agricultural producers, organic producers receive more subsidies than conventional enterprises, in particular support for organic farming. The subsidies granted to organic farmers are intended to offset the greater positive externalities induced by organic farming compared to conventional agriculture and to pay for the internalization of negative externalities (D. Crowder, J . Reganold, 2015).

Soybean

Table 1: Payment schemes for soybean cultivation

Current number	**Direct payment schemes**	**Conventional soybean** (euro/ha)	**Organic soybean** (euro/ha)
1	Single Area Payment Scheme (SAPS)	102,5697	102,5697
2	Redistributive payment	5	5
3	Payment for climate-friendly agricultural practices	58,2361	58,2361
4	Support scheme coupled	206	206
5	Transitional National Aid 1 (ANT 1)	14,7033	14,7033
6	SubMeasure 11.2 - Support for maintaining organic farming practices	x	218
Total subsidies		**386,5091**	**604,5091**

Source: Agricultural Payments and Intervention Agency, 2019

The cultivation of organic cultivated soy is different from the cultivated soy in the conventional system, by the following indicators: subsidies (table no. 1), by the production yield that is less than 40% (1990 kg / ha compared to 3300 kg / ha) , but also through the results the incomes obtained (table no. 2).

Coupled support is a direct payment that is granted to farmers for some crops considered important for Romania, for economic, social and environmental reasons.

Table 2: Comparative analysis of economic performance of soybean culture - ecological system vs conventional system

Nr. crt	INDICATORS	U.M	VALUES

Source: Own calculations, ADER (Agriculture and Rural Development) 23.1.1 Project

Incomes without subsidies: the analysis of the gross income obtained from the cultivation of soybeans grown in the ecological system (-660 euros / ha), reveals differences with 87% smaller compared to the soybeans grown in the conventional system (-353 euros / ha, (table no. 2, row 9) . For the two levels of production, 3.3 t / ha and 1,990 t / ha, there is a negative rate of gross income, between 26.4% and 45.1% (table no. 2, column 7, row 16), the difference between the income rates for the two levels of production (ecological / conventional) being 18.7 percentage points (table no. 2, row 16). The correct explanation and appreciation of the action of the physical volume of the soybean production on the gross income can be considered as economically negative, given that the efficiency correlation between the expenditure index as effort and the index of physical production as effect, the income ratio has not been respected. / expenses being 1: 0.55 (table no. 2, column 7, lines 1 and 5).

Incomes with subsidies - in soybean cultivation the income losses are covered by granting subsidies. In absolute values, the income obtained from soybeans grown in the organic system is 58 euros / ha less than the income obtained from soybeans grown in the conventional system (11 euros / ha compared to 69 euros / ha) (table no. 2, row 12).

The influence of the subsidies on the incomes is appreciated, both in absolute values and in relative values, (table no. 2, lines 9 - 23), depending on the contribution of the direct payment schemes to the

realization of the incomes, and the analysis reveals the degree of influence expressed by ***rates of return of culture*** of soy, thus:

- *Net income rate + total subsidies:* the rates of return are positive and are between 5.1% (conventional system) and 0.7% (ecological system), the eco / conventional difference being 4.4 percentage points (table no. 2, row 18). The share of total subsidies (386,509 euro / ha conv and 604,509 eur / ha eco) in the gross product (between 1424 euro / ha and 1408 euro / ha) is between 27.1% for the production of 3.3 t / ha and of 42.9% for the production of 1,990 t / ha (table no. 2, rows 3 and 4);
- *Net income rate + coupled support:* the coupled support contributes to the income, but for the production year 2020 does not have a positive influence on the income. It is estimated a negative rate of return, between 8.3% and 26.5%, the difference between the two production systems, ecological / conventional, being 18.2 percentage points (table no. 2, col. 7, row 19). The weight of the support (960.7428 lei / 206 euros / ha) in the gross product being of 14.5% for both levels of production (table no. 2, rows 3 and 4).
- *Net income rate + sM 11.2:* the amount of 218 euro / ha is granted to certified organic farmers to cover the income losses caused by the lower production yields. In this case, the estimates show a negative rate of return, of 25.7% (table no. 2, row 20). The share of the amount granted by sM 11.2 in the gross product is 15.5%;
- *Net income rate + direct payments:* a negative rate of return between 10.2% and 28.2% is estimated, the difference between the two production systems (ecological / conventional) being 18 percentage points (table no. 2, row 21). The share of direct payments (841,8583 lei / ha / 180,5091 euros / ha) in the gross product being 12.7% for both levels of production;

Conclusion

If the subsidies are not taken into account, the soybean crop registers income losses for both levels of production. From this point of view, soy culture is not economically profitable. If the total subsidies (coupled support, direct payments, etc.) are taken into account, soybean cultivation becomes profitable, the difference between ecological / conventional being 4.4% (58 euros / ha).

Hemp

Ecologically grown hemp culture differs from conventional cultivated hemp by the following indicators: subsidies (table no. 3), through the production yield which is lower by 37.4% (3.460 t / ha eco compared to 5.530 t / ha, conv, but also by income (Table no. 4).

Table 3: Payment schemes for hemp culture

Current number	Direct payment schemes	Conventional hemp (euro/ha)	Ecological hemp (euro/ha)

Source: Own calculations, ADER (Agriculture and Rural Development) 23.1.1 Project

Incomes without subsidies: analysis of the gross income obtained from the cultivation of hemp grown in ecological system (-421 euros / ha), reveals differences 4 times smaller compared to hemp grown in conventional system (142 euros / ha), (table no. 4, row 9). For the two levels of production, of 5,530 t / ha and of 3,460 t / ha, a gross income rate is registered, between 6.9% and -18.4% (table no. 4, column 7, row 17). The difference between the income rates (ecological / conventional) is 25.3 percentage points (table no. 4, row 17). The correct explanation and appreciation of the action of the physical volume of the production of hemp grown in the ecological system on the gross income can be considered as negative from an economic point of view, since the efficiency correlation between the expenditure index as effort and the index of physical production as effect, the income / expenditure ratio being 1: 0.82 (table no.4, col. 7, rows 1 and 5).

Incomes with subsidies - in the cultivation of hemp grown in the ecological system the income losses are covered by granting subsidies. In absolute values, the income obtained from soybeans grown in the organic system is 66% lower than the income obtained from soybeans grown in the conventional system (136 euros / ha compared to 404 euros / ha) (table no. 4, row 12).

The influence of the subsidies on the incomes is appreciated, both in absolute values and in relative values, (table no. 4, lines 9-25) according to the contribution of the direct payment schemes to the realization of the incomes, and the analysis reveals the degree of influence expressed by the ***rates of profitability of hemp*** culture, as follows:

- *Net income rate + total subsidies:* the rates of return are positive and are between 19.6% (conventional system) and 6% (ecological system), the ecological / conventional difference being 13.6 percentage points (table no. 4, row 19). The share of total subsidies (275.7 euro / ha conv and 514.9 eur / ha eco) in the gross product (in the amount of 2481 euro / conventional ha and 2378 euro / ha organic) is between 11.1% for the production of 5,530 t / ha and 21.7% for the production of 3,460 t / ha (table no. 4, rows 3 and 4);
- *Net income rate + sM 11.2:* the amount of 218 euro / ha is granted to certified organic farmers to cover the income losses caused by the lower production yields. In this case, the estimates show a negative rate of return of 11.7% (loss of 161 euros / ha) (table no. 4, row 20). The share of the amount granted by sM 11.2 in the gross product is 42.8%;
- *Net income rate + coupled support:* coupled support does not have a positive influence on revenue. It is estimated a rate of return between 10.4% and -12.8%, the difference between the two production systems, ecological / conventional, being 23.2 percentage points (table no. 4, col. 7, row 21). The weight of the support (408.1 lei / 87.5100 euros / ha) in the gross product being of 14.5% for both levels of production (table no. 4, rows 3 and 4).
- *Net income rate + direct payments:* a negative rate of return between 10.2% and 28.2% is estimated, the difference between the two production systems (ecological / conventional) being 18 percentage points (table no. 4, row 21). The share of direct payments (841,8583 lei / ha / 180,5091 euros / ha) in the gross product being 16.4% for the production of 5,530 t / ha and 17.2% for the production level of 3,460 t / ha;
- *Net income rate + ANT 3:* the transitional national aid for 2020 for hemp cultivation amounts to 7.6474 euros / ha. The degree of influence of this support scheme on income, expressed through the rates of return varies between 6.6% and -15.3%. In this case, the estimates show differences of 21.9% percentage points between the two production systems (loss of 485 euros / ha) (table no. 4, col. 7, rows 16 and 23). The share of ANT 3 in the gross product varies between 0.3% conventional system and 1.2% ecological ecological system;

Conclusion

The cultivation of hemp in the conventional system brings valuable benefits to the agricultural producer compared to the one cultivated in the ecological system. The losses of income from organic hemp, due to the differences in yield and the costs regarding certification are covered by the amount granted by sM 11.2. From this point of view, the hemp hemp culture is economically profitable, the ecological / conventional difference (of 268 euros / ha) being 13.6 percentage points.

Rice

The ecological rice culture differs from the rice grown in the conventional system, by the level of subsidies (table no. 5), by the level of production that is lower by 24.6% (3.415 t / ha eco compared to 4.530 t / ha, conv) and through the income obtained.

Table 5: Payment schemes for rice cultivation

***Incomes without subsidies*:** analysis of the gross income obtained from rice cultivation in an ecological system (-1084 euros / ha), reveals differences by 49.7% smaller than the rice grown in conventional system (-724 euros / ha, (table no. 6, row 9 For the two levels of production, 4,530 t / ha and 3,415 t / ha, there is a negative rate of gross income, between 33.6% and 42.7% (table no. 6, column 7, row 16), the difference between the income rates for the two levels of production (ecological / conventional) being of 9.1 percentage points (table no. 6, row 16). the gross income can be considered as economically negative as long as the efficiency correlation between the expenditure index as effort and the index of physical production as effect has not been respected, the income / expense ratio being 1: 0.67 for conventional rice and of 1: 0.57 for organic rice (t abel no. 6, rows 1 and 5).

Incomes with subsidies - in rice culture, the income losses are covered by granting subsidies. In absolute terms, the income obtained from rice grown in the organic system is 105 euros / ha less than the income obtained from the rice grown in the conventional system (83 euros / ha compared to 188 euros / ha) (table no. 6, row 12).

The influence of the subsidies on the incomes is appreciated, both in absolute values and in relative values, (table no. 6, lines 9 - 23) according to the contribution of the direct payment schemes to the realization of the incomes, and the analysis reveals the degree of influence expressed by the ***rates of profitability of rice culture***, as follows:

- *Net income rate + total subsidies:* the rates of return are positive and are between 8.7% (conventional system) and 3.3% (ecological system), the ecological / conventional difference being 5.4 percentage points (table no. 6, row 18). The share of total subsidies (840.5 euros / ha - conventional and 1058.5 euros / ha organic) in the gross product (which ranges from 2272 euros / ha to 2516 euros / ha) is between 37% for the production of 4,530 t / ha and 42.1% for the production of 3,415 t / ha (table no. 6, rows 3 and 4);
- *Net income rate + coupled support:* the coupled support contributes to covering the income losses. It is estimated a rate of return of 0.4% and -12.4 %%, the difference between the two production systems, ecological / conventional, being 12.8 percentage points (table no. 6, column 7, row 19). The coupled support (3078.1 lei / 840.5 euro / ha) in the gross product occupies weights of 29% for conventional rice and 26.2% for organic rice (table no. 6, rows 3 and 4);
- *Net income rate + sM 11.2:* The amount of 218 euros / ha is granted to certified organic producers to cover the income losses caused by the lower production yields. In this case, the estimates show a negative rate of return of 35.5% (table no. 6, row 20). The share of the amount granted by sM 11.2 in the crude product to the ecological rice is 8.7%;
- *Net income rate + direct payments:* a negative rate of return between 21.9% and 31.3% is estimated, the difference between the two production systems (ecological / conventional) being 9.4 percentage points, (table no. 6, row 21). The direct payments (841,8583 lei / ha / 180,5091 euros / ha) in the gross product occupy 7.9% weights on conventional rice and 7.2% on organic rice.

Conclusion

it is appreciated that for both production systems, the profitability of the rice crop is ensured by granting subsidies. The difference between the two ecological / conventional systems is given by both the technical characteristics of production (yield with 1,115 t / ha less than conventional rice) and the economic ones (the cost of production by 56.3%). The advantage of organic rice is given by the recovery price which is 35% higher than the conventional rice. (table no. 6, row 22 and 23).

Sugar beet

The cultivation of organically grown sugar beet differs from the sugar beet cultivated in the conventional system, through subsidies (table no. 7), the level of production that is 63% lower (57,100 t / ha eco compared to 21,100 t / ha, conv) and also through the income obtained.

Table 7: Payment schemes for sugar beet culture

Source: Own calculations, ADER (Agriculture and Rural Development) 23.1.1 Project

Incomes without subsidies: analysis of the gross income obtained from the cultivation of sugar beet grown in ecological system (-1060 euros / ha), reveals differences 1.7 times smaller compared to sugar beet grown in conventional system (-387 euros / ha), (table no. 8, row 9). For the two levels of production, 57,100 t / ha and 21,100 t / ha, a negative gross income rate is recorded, between 17.4% and 53.7% (table no. 8, col. 7, row 17). The difference in income between the two ecological / conventional systems is 36.3 percentage points (table no. 8, row 17). The correct explanation and appreciation of the action of the physical volume of sugar beet production on the gross income can be regarded as negative from an economic point of view, as long as the efficiency correlation between the expenditure index as effort and the index of physical production as effect was not respected, the income / expenditure ratio being 1: 0.82 for conventional sugar beet and 1: 0.46 for organic sugar beet (table no. 8, column 7, lines 1 and 5).

Incomes with subsidies - at the sugar beet crop grown in the ecological system the income losses are covered by granting subsidies. In absolute terms, the income obtained from sugar beet grown in the organic system is 51% lower than the income obtained from sugar beet grown in the conventional system (360 euros / ha compared to 735 euros / ha) (table no. 8, row 12).

The influence of the subsidies on the incomes is appreciated, both in absolute values and in relative values, (table no. 8, lines 9 to 25), depending on the contribution of the direct payment schemes to the realization of the incomes, and the analysis reveals the degree of influence expressed by the interest ***rates. profitability of sugar beet culture***, as follows:

- *Net income rate + total subsidies:* the rates of return are positive and are between 33.1% (conventional system) and 17.6% (ecological system), the ecological / conventional difference being of 15.5 percentage points (table no. 8, col. 7, row 19) . The share of total subsidies (1083,318 euro / ha conv and 1301.3 eur / ha eco) in the gross product (in the amount of 2916 euro / ha conventional and 2229 euro / ha organic) is between 37.1% for the production of 57,100 t / ha and 58.7% for the production of 21,100 t / ha (table no. 8, rows 3 and 4);
- *Net income rate + coupled support:* It is estimated a rate of return between 21.5% and -6.6%, the difference between the two production systems, ecological / conventional, being 28.1 percentage points (table no. 8, column 7, row 20) . The weight of the support (3847.5884 lei / 824.99 euros / ha) in the gross product being 28.3% (conventional system) and 37.2% (ecological system) (table no. 8, rows 3 and 4);
- *Net income rate + sM 11.2:* while the sugar beet farmers are beneficiaries of sM 11.2, the estimates show a negative rate of return of 37.3% (loss of 736 euros / ha) (table no. 8, col. 6, row 15). The share of the amount granted by sM 11.2 in the gross product is 9.8%;
- *Net income rate + direct payments:* a negative rate of return between 7.6% and 39.2% is estimated, the difference between the two production systems (ecological / conventional) being 31.6 percentage points, (table no. 8, row 22). The share of direct payments (841,8583 lei / ha / 180,5091 euros / ha) in the gross product being 6.1% for the production of 57,100 t / ha and 8.1% for the production level of 21,100 t / ha;
- *Net income rate + ANT 6:* the transitional national aid for the year 2020 for sugar beet cultivation amounts to 77,819 euros / ha. The degree of influence of this income support scheme, expressed through the rates of return, varies between -12.2% and -44.4%. In this case, the estimates show differences of 32.2% percentage points between the two production systems (592 euros / ha) (table no. 8, col. 7, rows 16 and 23). The share of ANT 6 in the gross product varies between 2.7% conventional system and 3.5% ecological ecological system;

Conclusion

it is appreciated that in the case of both production systems, the profitability of the sugar beet crop is ensured by granting subsidies. The difference between the two ecological / conventional systems is given by both the technical characteristics of production (yield 36.0 t / ha less than conventional sugar beet) and economic ones (production cost higher by 141%). The advantage of organic sugar

beet culture is given by the predictable price of recovery which is 34.4% higher than the conventional sugar beet. (table no. 8, rows 22 and 23).

Conclusions

The economic performance indicators of the studied agricultural products represent a key tool in the economic analysis and a fundamental requirement for the efficient elaboration of the agricultural policies. Among these indicators, the calculation of production cost and revenue were some of the most useful indicators. In this context, we offer all interested parties access to information that can contribute to the efficiency of agricultural product markets.

These guidelines also serve as a useful reference tool for agricultural producers to compare their farm results and for analysts to understand the basics for cost and income estimates.

In addition to describing the methodology, this study also provides practical guidance for calculating revenue and expenditure budgets at the agricultural product level, and the estimated indicators may be internationally comparable.

The performance of the analyzed organic products differs significantly from those of the conventional products, being considered less economically efficient. The expenses exceed the revenues, and the products record losses, despite the fact that they receive higher subsidies. Conventional agricultural products obtain higher values of the input and output indicators. Organic products obtain lower values of the income indicators for the analyzed products, due to lower production yields but also high costs for organic control products.

If the income indicators are lower than the conventional ones, the ecological products have higher prices on the market than the conventional products.

In both systems the economic performance is obtained by the dependence on subsidies. The statement remains to be verified in the next 3 years of research in this direction, thus contributing to the improvement of the information base related to the conventional system and to organic farming.

Management of Receivables in The Aspect of Universities and Business Units in Poland

Renata BIADACZ

Czestochowa University of Technology, Faculty of Management, Department of Finance, Banking and Accounting, Armii Krajowej 19b, Czestochowa, Poland
renata.biadacz@pcz.pl

Abstract

Development of a rational receivables management policy in an enterprise is necessary in the face of payment gridlocks occurring on the market. Policy of granting trade credit, debt collection, concluding factoring or forfaiting agreements guarantee control over company's financial liquidity. Often, receivables management requires the management to make difficult decisions, especially financial ones, but it is necessary in order to escalate the market share of a business unit and acquire new customers. It is a process that requires knowledge, experience and thorough market analysis.
Research problem can be summarized as an attempt to approximate importance of receivables management in organizations in Poland. A university was chosen as a research entity in order to demonstrate a specificity of this type of organization in the field of receivables management compared to enterprises. The methodology used explains, through references to literature and legal acts in force in Poland, the receivable management policy and the recovery process in organizations. The article also presents the aspect of the functioning of universities in Poland and the responsibility for violating public finance discipline in the light of applicable law. The general scope of receivables management is presented on the example of a selected university. Conducted research indicates significant differences that occur in the scope of managing receivables at universities and private sector entities resulting from the specificity of the operation of the university as a public sector unit.

Keywords: Management, Receivables, University, Business Unit.

Introduction

Higher education has a very rich history. Education institutions are one of the oldest and at the same time most complex man-made organizations whose goal is to achieve often contradictory goals in research, education and social impact. They are currently organizations full of tension (Geppert and Hollinshead 2017), "suspended" between tradition and modernity (Leja 2013; Kwiek, 2015; Antonowicz 2015; Sułkowski 2016), facing many challenges. These challenges include reduction of public funds for financing, changing requirements of recipients (students, business, government and others), intensive development of new technologies that fundamentally change methods of education, conducting research and shaping relations with environment, focusing on effectiveness and efficiency of activity ("value for money"), pressure on excellence in education and research; putting emphasis on strengthening so-called social impact (Maciąg 2018). Above-mentioned factors rapidly change internal and external context of university management. Given a need to maintain financial stability of the university, readiness for changes is becoming one of the most important tasks faced by managers of these units. As a result, there is a significant increase in demand for financial and non-financial information about university management processes.

Effective and efficient management of organization's receivables is one of important instruments for influencing maintenance of an appropriate level of financial liquidity. Phenomenon of delaying or avoiding settling liabilities is becoming a common practice in current economic environment, as a result

of which it is necessary for enterprises to monitor their receivables on an ongoing basis, as well as to create a policy for managing and recovering them.

Research problem can be summarized as an attempt to approximate importance of receivables management in organizations in Poland. A university was chosen as a research entity in order to demonstrate a specificity of this type of organization in the field of receivables management compared to enterprises. The methodology used explains, through references to literature and legal acts in force in Poland, the receivable management policy and the recovery process in organizations. The article also presents the aspect of the functioning of universities in Poland and the responsibility for violating public finance discipline in the light of applicable law. The general scope of receivables management is presented on the example of a selected university. Conducted research indicates significant differences that occur in the scope of managing receivables at universities and private sector entities resulting from the specificity of the operation of the university as a public sector unit.

Receivables Management Policy

Receivable, as a result of business activity, is an obligation for provision by a debtor towards a creditor, which should be met within a specified period and in a due amount. It is usually identified with the entity's entitlement to receive a cash benefit from another entity. A receivable is a financial term, and in particular - an accounting category. In financial terms, receivables are sales with deferred payment terms (Kreczmańska-Gigol, 2013). This is a very general understanding, because it means that any form of sale in which release of product or provision of service is separated from the moment the customer executes the payment for them leads to receivable. This form may be monetary or non-monetary, for example a barter transaction where "payment" is a transfer of another item. Since this definition refers to sales, it excludes claims arising from other titles, including due to taxes (e.g. VAT refund) or undeclared work (e.g. by an employee) (Wędzki 2018).

Effective supervision over repayment of receivables is very important because freezing organization's funds in receivables may become the reason for a need to obtain external financing by taking loans on current account or even factoring, which leads to additional costs. Use of trade credit in current economic conditions is almost a necessity (more see for exemple Wysłocka 2013). Often extending the payment deadlines is associated with a need to maintain the company at a competitive level in a given industry, however, it becomes a reason for increase in the level of receivables in company's assets. Therefore, ongoing monitoring of the level of receivables in the enterprise becomes extremely important in order to reduce possibility of overdue payments (see also: Cwynar et all, 2018; Bussoli and Marino 2018; European Payment Report 2019, Intrum).

Receivables management process is a set of activities related to forecasting and assessing their level, developing credit policy applied by a given organization, coordinating collateral in relation to the amount of credit risk, as well as ongoing monitoring of payment settlement. It should be noted, however, that receivables management is not only activities aimed at controlling timeliness of cash receipts, debt collection in the event of delays, disciplining debtors, but also preventive actions, which, unfortunately, are often underestimated. Their goal should be to determine degree of risk associated with a given transaction already at the stage preceding signing of the contract, and then, depending on results achieved, differentiate commercial terms offered to clients. An important element of receivables management process should also be adaptation of hedging measures to previously estimated risk in order to minimize incurred expenses and losses.

Developing a receivables management policy requires great skills and market knowledge. Due to complexity of the problem, there are no universal methods of managing receivables, verified and recognized as effective for all business entities. There are still no economically beneficial and effective

methods of collecting debts (Brigham and Ehrhardt 2014; Paul and Boden 2011). Each enterprise should have an adopted credit policy strategy.

The receivables management strategy should therefore identify issues such as:

- conditions for deferring payment terms, with particular regard to the level of risk, periods of deferred payments, as well as methods of verifying solvency of contractors,
- criteria for assessing profitability of deferring the date of payment, indication of expected profits and costs resulting from granting a trade credit,
- indicating conditions for the use of any price discounts,
- setting general rules for debt collection,
- developing possible solutions regarding ways of obtaining additional sources of receivables financing (Cieplińska and Grzywacz 2018).

Receivables management policy should be formulated in a universal way, but it is important that each transaction with deferred payment is considered individually, while analyzing full cooperation with the recipient. Precision and caution especially in case of transactions for large amounts is extremely important. In that case, any financial benefits connected with deferring payments should necessarily be compared with estimation of maintaining financial liquidity. Maintaining financial liquidity is a prerequisite for maintaining business continuity. In a crisis situation, when it is difficult to forecast future financial situation and solvency, care for liquidity takes on special significance. In the event of a breakdown in company's liquidity, expected future benefits for services rendered or goods or products delivered will not secure the company (Maćkwiak 2018; European Payment Report 2019, Intrum).

Development of a rational receivables management policy in an enterprise is necessary in the face of payment gridlocks occurring on the market. Policy of granting trade credit, debt collection, concluding factoring or forfaiting agreements guarantee control over company's financial liquidity. Often, receivables management requires the management to make difficult decisions, especially financial ones, but it is necessary in order to escalate the market share of a business unit and acquire new customers. It is a process that requires knowledge, experience and thorough market analysis.

Performance of The Recovery Process

A claim is a legal term used in legal doctrine but not specified in a specific legal act. Namely, it is the right to demand (claim) fulfillment of a benefit from a specific obligation relationship that the creditor is entitled to against the debtor. Indirectly, a claim results from art. 353 § 1 of the Civil Code, according to which the obligation consists in the fact that a creditor may demand benefit from a debtor, and debtor should fulfill the benefit (Act of 23.04.1964 Civil Code...). Therefore, two entities are necessary to create a claim: a creditor and a debtor, where liability constitutes rights of a creditor. As a result of concluding relevant legal transactions, these rights may be transferred between business entities.

Debt collection process is a set of procedures used to recover outstanding claims from a debtor. This process is extremely complex, and its course is largely determined by actions taken by entity before receivable arise. Problem of debt collection exists in all companies and has a very large impact on economic situation of a company (for more see Łada and Wejer-Kudełko 2018, Patterson and Wejer-Kudełko 2018). An enterprise may recover one of three methods to recover a claim:

- independent debt collection by competent departments organized within the unit,
- debt collection outsourcing, transferring all activities to an external company,
- mixed model, supporting debt collection activities within the organization by specific external services (Wodyńska 2017).

Number and variety of provisions that should be considered during recovery process constitute a significant impediment for original creditor. Larger organizations delegate a separate employee to debt collection process, or if they have capabilities, they create departments specializing in amicable debt collection. Regardless of which of the above-mentioned recovery models entity chooses, the process itself is the same. There are three stages of debt collection: amicable debt collection, referral to court and debt enforcement proceedings.

The aim of the first stage of recovery process - amicable recovery - is to take effort to recover debt individually, without going to court.
Such debt often leads to a settlement or agreement that is favorable to both debtor and creditor, and that it can be repaid in installments, for example. Benefit of using this type of debt recovery is not only low costs, but also maintaining good relations with contractor (Bekas 2013). Building positive commercial bonds is the basis for an effective debt collection process at the pre-court stage (Mei 2008; Hendley 2004).

In a situation where abovementioned actions prove to be ineffective and will not be finalized by settlement of receivables or settlement, it is necessary to refer the case to court, which is second stage of recovery process. This is a very formal stage, it is necessary to maintain appropriate order of actions, which include initiation of proceedings, obtaining an enforcement order and enforce the enforcement order (Podel 2014).
Legal proceedings in the aspect of debt collection are often inevitable, however, this is a lengthy process and generates significant costs related to stamp duties, court fees and legal representation costs. Decision to file a claim should be preceded by an in-depth analysis of the situation.

In the current culture of business environment, it is a common practice for a creditor to call a debtor for repayment once again after obtaining a judgment enforcement clause, informing contractor of any costs related to debt collection that can be avoided by voluntarily paying a debt. This is a tendency related to understanding difficult situation of recipients, resulting from health problems, family problems or being result of erroneous business decisions, and awareness that a debtor entity may prove to be a lucrative customer in the future (Jamroży 2011).

The last stage of recovery is debt enforcement proceedings, which literature on the subject often treats as an element directly related to judicial recovery. Due to uniqueness characterizing activities undertaken in the enforcement proceedings as well as freedom in choosing the entity conducting an enforcement, it is reasonable to treat this stage separately to court proceedings (Kreczmańska-Gigol 2013).

In a situation where primary creditor, for various reasons, is not able to wait for solution and enforcement of receivables, the sale of receivables is becoming a more and more popular practice. Assignment procedure, otherwise known as a claim transfer agreement, is a fee-based transfer of a given claim to the transferee, i.e. the assignee. This type of procedure can only include uncontested transactions, free from legal defects and other encumbrances (Jurkiewicz 2013). Opinions on assignment of claims in business practice are divided. Its undoubted advantage is an improvement of original creditor's financial liquidity, however, each situation should be considered individually, as creditor's loss of influence on the relationship with debtor recipient is not insignificant.

In order to undertake appropriate and well-coordinated debt collection activities, it is necessary to correctly systematize various claims. Size of claims is also an important aspect. For recovery of lower amounts, less work will be required and its costs will be lower. With high amounts, a creditor should be aware of higher costs and longer recovery time.

From an economic point of view, in the short term, debt collection has a significant impact on the level of receivables and payables, i.e. cash flow, while in the long term, irrecoverable debts affect the overall economic situation of the company (Celczyńska 2012; Filipoviča 2009).

Operation of universities in Poland and responsibility for violation of public finance discipline in the light of law

Activity and operations of higher education in Poland are defined by many legal norms. With regard to university operations, most important document is the Law on Higher Education and Science. The idea behind implementation of this document, commonly referred to as the Constitution for Science, is reorganization of legal acts through their organization and unification, as well as exclusion of provisions imposing unnecessary obligations on universities (this aspect is broadly discussed in, among others, Dziedziczak-Foltyn, 2018). Adoption of Law on Higher Education and Science reduced the number of laws regulating activity of this area from four to one, and the number of regulations by half. Legislator defines the framework issues, leaving them more precise at university's disposal, which increases its autonomy.

Pursuant to provisions of the Act, public universities receive a subsidy from state budget for their activities. Effect of this is necessity of managing assets and managing finances using provisions of the Public Finance Act. This is particularly important in the aspect of university's operation in the field of commercialization of research, supporting manifestations of entrepreneurship in academic circles, as well as implementation of tasks that are on the border of scientific and economic activity (Kapuścińska, Matejun 2013). Process of supervising and managing public finances is subject to special restrictions and regulations.

Article 40 of the Public Finance Act imposes on public universities, as units of the public finance sector, obligation to conduct financial and property management of universities in accordance with provisions of the Accounting Act. Due to management of state budget funds, proper functioning of accounting system at a university is extremely important. As part of their accounting, universities apply the principles and concepts arising from the Accounting Act, but also the National Accounting Standards and International Accounting Standards.

Financial management of an entity of public finance sector requires taking actions characterized by thoroughness, reliability and transparency. Creation of receivables in public finance sector units takes place by virtue of law and is a result of concluded contracts issued by the authority of administrative decisions or other legal actions.
University's receivables and liabilities constitute an important element of managing university's financial management, and any oversight and neglect of obligations result in a threat to violation of public finance discipline.

In connection with implementation of tasks of a public nature by universities, a significant part of funds from which higher education is financed comes from the state budget, which results in a need to comply with applicable legal standards in the field of disposing of public finances in accordance with principles such as transparency, purposefulness and rational disposing of these funds.

In the aspect of spending public funds, public finance discipline is an extremely important concept. There is no consistent definition of budgetary discipline in applicable legal order. Literature on the subject, however, defines it as a need to comply with provisions of all legal standards regarding functioning and operating principles of public sector entities, in particular in terms of ensuring rationality and regularity of business operations carried out, as well as ensuring their compliance with all principles of economy (Piotrowska-Marczak 2011).

Legislator body included precise regulations on ensuring compliance with budgetary discipline in the Act of 17 December 2004 on liability for violation of public finance discipline (Journal of Laws of 2019, item 1440). The document contains the scope of responsibility incurred in the event of violation of mentioned discipline, size of any penalties, rules for appointment and functioning of judicial authorities, procedures, notifications and required checking activities.

In the applicable legal order, concept of responsibility is defined as negative consequences applied to an individual or entity, resulting from a state of affairs that is assessed as not complying with applicable rules and violating standards (Banaszczyk 2015). A consequence of management and disposal of state budget funds is a factual state related to liability for any violations of public finance discipline. The moment of occurrence of a possible violation of discipline is determined by the time in which an entity undertook actions contrary to applicable rules or omitted activities to which it was obliged. Omission can be acknowledged on a day following the date when particular activity is due (Herman 2018).

Receivables Management in Higher Education Entity

Receivables management requires knowledge of the applicable legal order. It is necessary to verify and monitor receivables on an ongoing basis in order to apply a debt recovery procedure in appropriate periods preventing prescription.

In the context of units such as universities, university's management staff is obliged, under pain of violating public finance discipline, among others to:

- ensure compliance of activities undertaken with activity-and-finance plan,
- take measures to ensure that university receivables are properly calculated,
- apply the rules regarding distribution of payments into installments or their cancellation, resulting from separate provisions,
- ensure that the university's receivables are not time-barred,
- ensure that funds allocated by the state budget are spent in a manner consistent with their purpose,
- conduct internal audit of university organizational units.

Management of receivables owned by the university, their monitoring and application of receivables collection procedures has an extremely significant impact on its functioning. Effective debt collection can be defined as receivables recovery consisting of recovering claims, with minimized costs of activities undertaken, while maintaining generally accepted principles affecting maintenance of positive contacts with the contractor. This type of strategy guarantees maintaining financial liquidity at an appropriate level, safe for future operations of the university. In addition, it guarantees that existing public finance discipline rules will be fulfilled. It should be emphasized that overall management of receivables and the process of their possible recovery requires an interdisciplinary approach, and consequently involvement of personnel with knowledge in the fields of management, accounting, finance, as well as law and sociology. It is vital to ensure effective monitoring of receivables and necessary to develop principles and strategies of operation applied in the unit that comprehensively take into account all of the above areas.

Due to specifics of operations of public finance sector, university's monitoring and recovery of receivables is caused not only by care for maintaining financial liquidity, but also by implementation of tasks resulting from a need to apply public finance discipline.

Among the most common university settlements are student settlements. The Law on Higher Education and Science guarantees universities the possibility of charging fees to persons attending classes in the field of additional educational services. Within the scope allowed by the Act, university introduces the amount of payment for provision of services to the legal framework pursuant to the disposition of the

university Rector, at the same time publishing the document on the proper page of the University's Public Information Bulletin.

Therefore, universities introduce unified rules for monitoring student receivables and introduce procedures for collecting receivables from students for fees related to education in studies.

Activities implemented in the field of receivables management are carried out at universities in two stages, as part of pre-recovery proceedings and debt collection.

Pre-collection activities are carried out by employees of dean's offices who have responsibility of monitoring students' duties. In this case, it is necessary to cooperate with central administration departments in order to verify receivables booked and payments recorded. As part of pre-collection activities, dean's office employees conduct a personal (telephone) conversation, in the absence of such an option they send e-mails to a debtor, prepare documentation of activities carried out, as well as in the event of failure to settle amounts, they send requests for payment.

If, despite pre-collection measures taken, there is no payment, administrative procedure is initiated, which involves removal of a debtor from the list of students and recovery proceedings, usually by University's Legal Office. After analyzing submitted documents, the University Legal Office directs the case to court, or decides not to pursue the claim, explaining reasons for not taking debt collection actions and sending a letter to the Rector of university. Debt collection proceedings are conducted before the competent court. Lack of payment of receivables in the event of obtaining a final court judgment is a basis for referring the case to enforcement proceedings.

In special cases, based on application of the person concerned, Rector of university may issue a settlement agreement with a debtor and set detailed payment terms. The settlement should take place in writing and result in suspension of the recovery procedure.

In a situation where the value of claim is low i.e. not exceeding the cost of sending two registered letters with a return receipt, the university does not institute debt collection proceedings against the debtor, whose costs would exceed the value of claim. In this case, only pre-collection measures are taken.

If debt collection actions undertaken do not bring effective satisfaction of claims, the Rector is entitled to make a decision on the use of alternative debt recovery actions, or write-off the value of claim against costs of the university.

Final Conclusions

Public finance sector is made up of extremely diverse entities performing specific tasks whose main purpose is to provide public services. Responsibility of these units, unlike private sector entities, is not to maximize profits achieved, but to achieve public and social goals in an effective, rational and effective way. Current legislation on disposal of public funds is the foundation for compliance with principles of transparency, openness of actions taken, and is also a reason for a need to use numerous procedures in units. For entities subject to provisions of the Act on public finance, this involves a need to perform additional obligations, often extremely labor-intensive, especially in the aspect of preparing various statements and reports. Violation of rules and standards related to disposal of public finances, both in terms of taking actions that are inconsistent with applicable regulations, and possible omission of the required activities, constitute the basis for a decision on violation of the public finance discipline.

University receivables management is a big challenge due to their specificity. Due to non-productive nature of activities, receivables are largely unpaid payments by students for education-related services. The need to collect debts at universities is obviously due to applicable law, and failure to monitor and

enforce debt will become the reason for a violation of public finance discipline. In private sector units, debt collection results from the care for maintaining financial liquidity of the company and not abusing trade credits granted by contractors. Business entities may also be more flexible in negotiating repayment terms with debtors. In the case of enterprises, it may be more beneficial to divide debt of the debtor into installments, defer its payment, or enable it to offset it by exchanging it for products or services, instead of judicial recovery. Maintaining a long-term partnership with contractor, based on this type of interaction, proves to be more advantageous in the long run, because it does not become a reason for termination of cooperation, and any problems with timeliness of customer payments can be temporary. Therefore, before undertaking debt collection measures, a thorough analysis of receivables is necessary. They should be subject to constant and systematic assessment. Receivables management depends on many factors that determine effective operation of business entities. In the case of a public finance sector unit, deferment of payment, dividing it into installments or cancellation is connected with a need to maintain numerous procedures related to disposal of state budget funds. Division of receivables into installments will result in a reduction of interest on late payment, which in turn will reduce the value of funds due to universities, while the write-off of receivables requires comprehensive documentation of a particular social interest. Therefore, rational management of receivables in the aspect of universities is not an easy task, especially if the social aspect is involved.

It should be emphasized that in the current difficult market situation there is an increase in interest in receivables management tools. In connection with the above, an important aspect is also education of entrepreneurs and awareness of existence of financial instruments, which translates directly into the ability to use them. Undertaking activities aimed at disseminating and expanding the knowledge of management regarding available options for ensuring security of transactions with deferred payment is one of the most desirable changes in order to improve activity in the analyzed area. In the fight against unreliable debtors and delaying payments, support is a comprehensive package of mechanisms (civil law, administrative solutions and tax changes) contained in the Act of 19 July 2019 on the amendment of certain acts to reduce payment gridlocks (Journal of Laws item 1649). They entered into force on January 1, 2020 and are intended to discourage lengthening payment deadlines in commercial transactions and strike those debtors who exceed the statutory deadlines more severely.

Institutional Stability and Its Impact Upon Country-Level Indicators of Innovation in Selected EU Member States

Jakub SUKIENNIK

Wroclaw University of Economics and Business, Wroclaw, Poland,
jakub.sukiennik@ue.wroc.pl

Abstract

Innovation and Research&Development (R&D) investment represent key aspects of development policies in the European Union. In modern economies, R&D involvement plays an important role in the process of building competitive advantage and innovation at national, regional, and enterprise level. The outstanding significance of R&D activities is not only clearly emphasized in EU strategies of development (Lisbon Strategy, Europe 2020), but also reflected in the ongoing project of the Sustainable Europe 2030 strategy. All of the above documents seem to emphasize perception of R&D activities as sources for the development of Europe as an area integrating highly competitive economies built on the fundament of knowledge. In Poland, country-level indicators of innovation (regardless of the adopted methods and indices, and also in terms of national levels of R&D expenditure) place the economy at the decidedly lower end of scale among the EU Member States. This poor ranking may be the effect of disturbances in the national institutional system, defined here as a combination of varied formal institutions subject to intergenerational pace of development and informal structures characterized by a more intragenerational pace of change (Williamson, 2000). Poland's poor performance in the studied dimension may also be related to some other systemic disturbances, both internal and external, including high pace of change and institutional volatility, lack of institutional clarity, or the lack of complementarity between institutions (both in national and international perspective) which may affect the stability of the institutional system or produce disturbances in its operation, and ultimately produce disincentives and obstacles barring the effective development of R&D initiatives. The main objective of this paper is to present evidence for correlation between country-level indicators of innovation and the stability of national institutional systems. The study was conducted using public information on state-level indicators of innovation, R&D expenditure, and institutional stability from selected EU Member States.

Keywords: NIE, Innovation, Institutional Stability

Introduction

The modern concept of institutional systems and identification of factors of potential impact upon the dynamic structures of socio-economic order clearly belong in the realm of New Institutional Economics – NIE (Kapp, 1976; Eggertsson, 2009). Proponents of this school of academic thought place emphasis on the fundamental role of institutions as vehicles of economic development, with their motto of institutions do matter (Williamson, 2000). NIE researchers also emphasize the correlation between innovation (particularly the R&D involvement) and economic development. Hence, this postulate received key significance in the EU strategies of development, as R&D involvement is deemed to play an important role in building the competitive advantage of the EU, defined here as potential for assuming the lead position in relation to other market competitors (Sołoducho-Pelc, 2016). The significance of R&D expenditures has been emphasized both in the Lisbon strategy[1], the "Europe 2020 Strategy of Development"[2], and the "Sustainable Europe 2030" strategy. This view has also been reflected in formal institutional support for R&D activities, as this type of investment is believed to stimulate the increase of innovation at national, regional, and enterprise level (Tebaldi, Elmslie, 2008).

[1] https://www.europarl.europa.eu/summits/lis1_en.htm

[2] https://ec.europa.eu/eu2020/pdf/COMPLET%20EN%20BARROSO%20%20%20007%20-%20Europe%202020%20-%20EN%20version.pdf

The effective realization of the above postulates is believed to improve the conditions of R&D involvement among the EU Member States, for instance: by ensuring that 3% of GDP be assigned in support of research and development investments with the intended effect of improving the level of innovation and catalysing the formation of the so-called "Innovation Union" [3]. The R&D, on the other hand, is defined in terms of creative involvement in the effective generation of new knowledge and/or new ways to employ the existing knowledge (Schot, Steinmueller, 2018). As such, the R&D activities include three categories of research (Stępniak-Kucharska, 2015):

- fundamental research – experimental or theoretical research designed primarily to discover new knowledge,
- applied – planned research or critical evaluations designed to discover new knowledge and skills for practical development of new products, processes and services or the improvement of existing ones,
- technical development research – this type of research involves the use of existing knowledge for practical development of new products, processes and services or the improvement of existing ones.

Furthermore, it seems rational to assume that institutions play a significant role not only in the development of business environment and the entire economy, but also in the improvement of country-level innovation (Silve, Plekhanov, 2015). Also, some of the changes introduced in the area of legislative regulations are designed to stimulate the effectiveness of the institutional system, defined here as a combination of both formal and informal institutions (Williamson, 2000). In other words, changes in legislation should stimulate the increase of system effectiveness and ensure a dynamic state of institutional equilibrium (Chang, 2011), i.e. proper synchronization between institutions and their reciprocal complementarity (Leković, 2011; Pejovich, 1999). At this point, it may be worth noting that any given set of legislative regulations may produce different effects, depending on the degree of conformance or synchronization between various regulations and informal institutions (North, 1990; Chang, 2011). Thus, it may be wrong to assume that a direct replication of solutions designed for a country characterized by a different institutional structure – with no regard for the specificity of the intrasystemic institutional correlations and culture (defined as a set of informal institutions) may bring the desired effect in another setting. It must be remembered that institutional systems are not modular structures; one cannot assume that a change of a single module (such as a formal regulation) of a structure of this type can be introduced without proper evaluation of its potential effects on other modules (regulations) and on the entire system, due to the nature of correlations between various formal regulations and those between formal and informal regulations. In view of the above, it may be advisable (for cognitive and utility purposes) to ensure proper identification and evaluation of any relations between the stability of the institutional system and the associated country-level indicators of innovation or R&D expenditure.

For the purpose at hand, i.e. for the determination of relations between the three elements described above, it may be useful to employ research methods postulated by the New Institutional Economics. The next section of this paper presents key definitions and some of the most important concepts of the NIE, including: the institutional system, formal and informal institutions, transaction costs, and other factors influencing the stability, flexibility, and effectiveness of the system. This will be followed by evaluations of the role of institutions and of the institutional system in economic growth processes, R&D expenditures, and state-level indicators of innovation. State-level indicator of innovation and R&D expenditures will also be analysed for Poland, in relation to other EU Member States. The last section presents an attempt to determine the character of relations between state-level indicators of innovation, R&D expenditure, and the stability of the institutional system.

Institutions and Economic Processes

Professional literature provides many interpretations of terms employed in this study, including those of institutions, transaction costs, and norms and regulations (Kingston, Caballero, 2009; J. Godłów-

[3] https://www.consilium.europa.eu/media/30776/qc3210249enc.pdf

Legiędź, 2010). For the purpose at hand, the author employed the definition by D. C. North (1990), which describes institutions as rules of play or, more formally, limitations imposed by humans with the view of shaping the activities of whole groups. In effect, institutions serve to construe a structure of stimuli in the sphere of human exchanges of interpersonal, political, social, and economic character (North, 1990). According to North, formal institutions represent written rules, such as the constitution, legal provisions, or rights of ownership, while informal institutions are expressed in the form of sanctions, taboos, customs, traditions, religions, rules of conduct, and other constructs formed on the basis of the group's cultural inheritance. Ultimately, institutions represent not only formal and informal limitations, but also means of enforcing them (North, 1991). Lastly, transaction costs are defined here as the cost of market mechanism utilization, borne by individuals and enterprises (Allen, 2000).

Proponents of the New Institutional Economics clam that there can be no true understanding of the economic reality without due consideration for the institutional environment of the studied market and its practical significance. R.H. Coase (1998) argues that the effectiveness of economies is ruled by institutional solutions. In other words, the institutional system serves to constitute the legal, political, social, and economic order and to shape the course of economic processes. Consequently, it may also affect the state-level indicator of innovation as well as the level of R&D expenditure. Many authors seem to subscribe to the view that effective institutional systems and equally effective enforcement methods serve to improve interpersonal relations, reduce the uncertainty inherent in any exchange process, limit the transaction costs, and stimulate the economic growth and level of innovation (North, 1991; Leković, 2011; Milgrom, North, Weingast, 1990; Greif 1994). In other words, a stable institutional system offers potential to increase the competitive advantage of entire economies and, in effect, produce sizeable increase of state-level indices of both R&D expenditure and innovation.

The system of institutional equilibrium and institutional transformations and their impact upon economic growth and state-level indicators of innovation

The institutional system represents a combination of varied formal institutions (than may change within the span of a single generation) and informal institutions (of a more durable character) (Williamson, 2000). However, the concept itself may also be defined as a network of reciprocal correlations between the main streams of economic activities, namely: consumption, production, and exchange; or alternatively as a system of rules, beliefs, norms, and regulations designed to ensure regularity in all activities undertaken by economic entities (Sukiennik, Dokurno, Fiedor, 2017).

It must be noted, however, that every society is characterized by their own set of institutional structures consisting of formal and informal institutions. In addition, legislative provisions imposed by states constitute an important element of their institutional systems, and their significance may grow in direct proportion to the pace of knowledge dissemination over the course of their gradual transformation into information economies based on human capital and innovation (Woźniak, 2008). Assuming the full harmonization of an institutional system, i.e. its capacity to maintain accord between all its constituent elements, the efficiency of institutions serves to increase the predictability of interpersonal relations, thus reducing the uncertainty of economic processes and forming incentives for investments in new technologies. In effect, the so-called high quality institutions[4], i.e. the most effective ones, may also reduce the transaction costs inherent in many economic processes, such as exchange. In effect, the long-term stability offered by efficient institutional systems results in a sizeable increase of state-level

[4] Measures of institutional quality may be expressed in relation to the level of transaction cost, the institutional capacity in adapting to new phenomena, the observance and clarity of laws, the indices of investment risk, competitiveness, economic freedom, and corruption, to name a few. The above indices can also be used to provide information on the degree of cohesion between formal and informal institutions. On the other hand, the effectiveness of selected fragments of the institutional system can be studied in laboratory conditions, based on stimulation of responses from selected institutions on statistically representative respondent samples and designed to determine the best (most effective) approach to change. It may be worth noting that economic experiments of this type may also be employed for the evaluation of spontaneously formed institutions of a non-informal character, (Jakubowski, Kuśmierczyk, 2009; Camacho-Cuena, Requate, 2012; Ahn, Ostrom, Walker, 2011)

economic effectiveness, and provides incentives for R&D investment. It may be worth emphasizing that the economic development as such may also influence the effective development of many institutional changes. Firstly, the economic growth stimulates public demand for high quality institutions and increases their public appeal. Secondly, the economic growth seems to encourage the involvement of groups interested in the capture and/or formulation of new regulations (Chang, 2011). Thirdly, the economic growth results in technological advancements which, in turn, favour or enforce changes of the so-called rules of play (Kingston, Caballero, 2009).

With respect to the operation of institutional systems, one may also encounter cases where such accord is no longer present. These may serve to assume that the affected system is:

- destabilized, i.e. with no prospect of unassisted return to the former state of equilibrium – either by incorporating new norms of legal interpretation or by negotiating reciprocal adjustments with the existing structures,
- unbalanced, i.e. with some prospect of unassisted return to the former state of institutional equilibrium.

The above forms of disturbance may be caused by factors belonging to one of the following categories:

- internal, caused by the lack of accord or complementarity between constituents of the national institutional system,
- external, caused by the lack of accord or complementarity between institutional systems at national and international level (such as the European Community regulations).

Destabilizations of institutional systems are typically remedied through governmental agency and their cost is borne by the public. In addition, they also produce extra cost associated with implementation of new institutions or modification of the existing ones. Thus, the operating cost of the entire system is far from optimal, and persistent at least up to the point when former balance is ultimately reinstated (Eggertsson, 2009; Colomer, 2014; Greif, Kingston, 2011). A balanced system serves as evidence of continued and effective economic growth, with transaction costs kept at a minimal level even in the face of short-term imbalances on individual markets. Thus, the state of institutional equilibrium should not be perceived as a construct based on a static point of reference, but rather as a realization of specific criteria in a highly dynamic environment. These criteria may include the following (Wilkin, 2011):

- balancing of requirements and needs of individuals and groups,
- enforcing public observance of the rules of order deemed as socially beneficial, while preserving the freedom of choice in all matters within the bounds of the existing institutions,
- ensuring the continuity of regulations and other mechanisms of the institutional system,
- safeguarding the predictability of behaviours between individuals and groups.

Another element with potential to directly affect the state-level increase of innovation is the flexibility of the institutional system, i.e. the capacity of institutions for adapting to changes in the turbulent economic, social, and political environment and vice versa (Safarzyńska, 2013). In such scenarios, the effectiveness of the institutional system may be associated with the relatively low cost of adapting to such changes (Scrieciu, Barker, Ackerman, 2013). Preservation of institutional equilibrium requires involvement of many institutions responsible for keeping the actions of individuals within the specific bounds of local culture, time period, and society (Czetwertyński, 2019). In addition, due to the fact that informal institutions are more resilient to rapid change (Williamson, 2000), the preservation of institutional equilibrium should focus on such legislative changes that offer best prospect of producing the synergy effect in the form of a complete and balanced institutional matrix (North 1991).

Ultimately, the complexity of the system, particularly the multitude of elements, costs, and objectives affected by institutional changes, the optimization of the entire institutional structure may not always be possible to control in an efficient manner (Woźniak, 2008). This observation seems to emphasize the notion of frequency in performing the required changes in formal institutions. As instruments designed to formulate the shape of cooperation between economic actors, these changes should be in good adjustment with the pertinent needs. They should also provide warranty of maximum stabilization in all economic relations. In practice, however, institutions of this type are often shaped under pressure

from various interest groups – this is clearly not the best warranty of their effectiveness. In addition, frequent changes in national legislation – an important element of the institutional system – may produce systemic disturbances and eventually serve as disincentives for long-term B&R involvement. Similarly, poor flexibility of a national institutional structure results in a sizeable increase of operation cost – this is particularly evident in the case of institutional changes introduced at the Community level which are in disaccord with or not complementary with the existing national regulations or informal institutions. Such scenarios will typically raise the expectation of imminent cuts in R&D investments and the decreased inflow of innovation. In this context, it may be useful to attempt a proper identification of criteria deemed of impact upon the effectiveness of the institutional change process. These may include the following (Sukiennik, Dokurno, Fiedor, 2017):

- participation of actors directly affected by the change in the design of new rules and methods of implementation,
- financial involvement from those actors who expect to receive the bulk of benefits from the planned change, to ensure effective coverage of transaction costs related to the design, negotiation, and evaluation of the best possible approaches to institutional transformations,
- potential for tracking historic developments of similar or analogous approaches to institutional change, e.g. those introduced in other countries, to ensure effective replication of model solutions,
- accord between institutional change, path of its historic development, and the associated value system, introduced with the intention of reducing the cost of institutional implementations or modifications,
- complementarity, completeness, transparency, specificity, and clarity of the implemented change, to ensure proper synchronization and equilibrium between institutions, both at national and international level,
- creation of incentives for enterprises in support of their involvement in long-term R&D investment and innovation.

To sum up, processes of institutional change require considerable expenses, due to the steep cost of design, implementation, enforcement, and continued maintenance and adjustment of institutions, norms, and regulations, as well as the cost involved in adjustment of human capital to the planned change. Despite this cost, a stable institutional system will ultimately hasten the pace of economic growth, reduce uncertainty inherent in all transaction processes, limit the cost of such transactions, and build competitive advantages through long-term R&D involvement.

The state-level stability of an Institutional System

For the purpose of this study, the author decided to employ a state-level measure of institutional stability developed on the basis of the Rule of Law Index formulated by the World Justice Project (WJP) and applicable both to formal and informal institutions. Measurements are taken regularly based on surveys designed to collate experiences and opinions from general public and from expert researchers, globally. The WJP index takes account of the following variables:

- Limitations of governmental empowerments:
  - governmental powers are effectively regulated by the legislator,
  - the judiciary imposes effective limitations of governmental powers,
  - governmental empowerments are effectively limited by independent audit,
  - state officials and representatives of the state may be held accountable before proper courts for any misconduct in their duties,
  - governmental empowerments are subject to non-governmental control,
  - transition of powers and delegation of empowerments are regulated by the law.
- Elimination of corruption:
  - state officials and representatives shall not use their public office for personal benefit,
  - state officials holding judicial positions shall not entertain their powers for private benefit,
  - members of military and law enforcement services shall not entertain their powers for private benefit,

- o state representatives employed in legislative departments shall not use their office for private benefit.
- Transparency of governmental activities:
  - o publication of laws,
  - o publication of data and reports,
  - o the right of individuals to be informed,
  - o civic participation (engagement),
  - o provision of effective complaint mechanisms.
- Fundamental laws:
  - o equal treatment and lack of discrimination,
  - o the right to live and prosper in security,
  - o the right to a judicial process and the benefit of counsel,
  - o freedom of opinion and freedom of speech,
  - o freedom of religion and conscience,
  - o the right to privacy coupled with limitation of state paternalism,
  - o the right of assembly and association,
  - o the rights of employment.
- Order and security:
  - o limitation and control of criminal behaviours,
  - o limitation of civic conflicts,
  - o limitation of violence and of its use in resolving personal grievance.
- Regulations:
  - o effective execution of governmental regulations,
  - o prompt and effective enforcement of any breach in public observance of state regulations,
  - o prompt realization of administrative proceedings,
  - o lawful realization of administrative proceedings,
  - o elimination of expropriation without due compensation or without the right of judicial process.
- Judiciary proceedings in civil law (code):
  - o unrestrained access to judiciary services in all matters related to civil code,
  - o the judiciary for civil code is free from discrimination,
  - o the judiciary for civil code is free from corruption,
  - o the judiciary for civil code is resilient to any form of unlawful governmental influence or misappropriation of governmental powers,
  - o the judiciary for civil code is prompt in their responses to claims,
  - o civil code verdicts are effectively enforced,
  - o the state provides alternative, unbiased and effective mechanisms for the resolution of civil code disputes.
- Judiciary proceedings in the sphere of criminal law:
  - o effectiveness of criminal investigations,
  - o effectiveness and timeliness of criminal law adjudications,
  - o effectiveness of the penitentiary system, with the main objective of limiting the incidence of criminal behaviours after discharge,
  - o impartiality of any judgement passed in relation to criminal law,
  - o the judiciary for criminal law is free from corruption,
  - o the judiciary for criminal law is resilient to any form of unlawful governmental influence or misappropriation of governmental powers,
  - o defendants are unrestrained in their right to a judicial process and the benefit of counsel.

Stability of an institutional system is closely correlated to the effective rule of law, as a mechanism designed to limit corruption, poverty, disorders and injustice among the public. All of the above elements constitute a fundament for effective provision of justice, peace, development, responsible governance and observation of laws. The WJP Rule of Law Index is also characterized by other

properties which emphasize its role of a determinant or indicator of stability offered by the institutional system, namely:

- the index measures the observance of the rule of law by means of analytical evaluations of surveys designed to study such aspects as the freedom of access to judiciary services or the system's capacity to effectively control crime incidence,
- in contrast to other instruments of similar application, the index can be described as comprehensive and multi-dimensional,
- the index presents the perspective of ordinary citizens and relates to public perception of rule of law observance; it presents public opinions formed in the course of practical exchanges between governmental authorities and other actors,
- the index is subject to regular updates, and the comprehensive reports are produced annually, based on responses from citizens (1000 respondents per country) and local expert researchers; the effects can therefore be deemed as good approximations of the real conditions observed in societies under study,
- the index is produced in a holistic fashion, meaning that it may safely be applied for any country and any scenario, regardless of the observed practical differences in cultural, social, economic or political patterns.

Table 1: The Rule of Law Index (WJP - World Justice Project)

Source: own research based on WJP - World Justice Project reports for the years 2009-2019

Results of institutional stability measurements (Tab.1) suggest that, in the years 2009 – 2019, the institutional system in Poland was fairly stable. As the same time, the reported measures of stability for Poland (0.66) can be seen as evidence of a poor level of stability – clearly in the lower spectrum of the findings for the EU area. The highest scores were reported for: Denmark (0.9), Norway (0.89), Finland (0.87), Sweden (0.85), the Netherlands (0.84), Germany (0.84), and Austria (0.82); for decades now, these countries typically receive the highest scores with respect to their rule of law or, in another perspective, with respect to the stability of their institutional systems.

Levels of R&D involvement and state-level indicators of innovation in selected EU Member States

Developed economies are typically characterized by their strong emphasis on new technologies and innovative solutions, in tandem with the more general trends of rapid globalization of economies and facilitated access to global market outlets. Innovations of processes, products and organizational methods exert a direct impact upon markets and economies. For production enterprises, particularly for providers of highly processed products, innovation is closely correlated with R&D involvement. This type of involvement, in turn, is directly translated into innovative products, processes and technologies. Naturally, innovation of processes and organization methods is equally important, as these elements seem to determine the practical operation of enterprises and entire economies. However, this study places emphasis on R&D involvement and product innovation. One of the most popular measures of R&D involvement is the so-called GERD index designed to illustrate the country-level indicators of R&D expenditure (cf. Tab. 2).

Source: own research based on Eurostat data: https://appsso.eurostat.ec.europa.eu/nui/show.do?dataset=rd_e_gerdfund&lang=en

As shown above, the GERD index value for Poland, expressing the state-level R&D expenditure as percentage of GDP, represents one of the lowest scores among the selected EU Member States. The GERD level for Poland (e.g. the 1.21 score for the year 2018), is significantly lower compared to the Old Europe average of 2.17 or the EU average of 2.03. Similarly to the recorded levels of institutional system stability, the highest GERD scores were reported for such countries as: Denmark (3.03), Sweden (3.31), Finland (2.75), Austria (3.17), Germany (3.13), and Belgium (2.76).

State-level indicators of innovation for Poland were, again, in the lower range of those recorded for the EU Member States. Poland places at the rear in many international rankings of innovation:

Innovation Union Scoreboard (2018 – 25th in Europe), Global Innovation Index(2019 – 26th in Europe), and Global Creativity Index (2015 –46th, globally). For instance, the Innovation Union Scoreboard examines various state-level determinants of innovation in such aspects as:

- human resources,
- attractive research systems,
- innovation-friendly environment,
- public support and investment in innovative projects,
- private investment in research and innovation,
- others.

Table 3 : State- level indicators of innovation – the Innovation Union Scoreboard results for selected EU Member States in the years 2011-2018

Source: own research based on reports published athttps://ec.europa.eu/growth/industry/innovation/facts-figures/scoreboards_pl

As seen in Tab. 3, the level of Innovation Union Scoreboard index for Polish economy (61 the year 2018) represents one of the lower scores for those EU Member States which were included in its calculation. The top positions, on the other hand, were invariably associated with such countries as: Denmark (141), Finland (146), Germany (127), the Netherlands (135), Norway (128), Great Britain (128), Belgium (128), and Austria (125). Therefore, it seems reasonable to assume that institutional stability may indeed be seen as a potential determinant of both the state level of R&D expenditure and the state-level indicators of innovation. Effective institutional solutions in a flexible and stable institutional system may provide enterprises and individual with greater incentives to commit in long-term R&D investments and innovations. At the same time, it must be noted that the above correlation is only postulated, and may in fact be a product of a cause-effect type of relation, but this postulate requires further examination in the form of detailed studies.

Conclusions

Analytical evaluations presented herein provide arguments for the assumption that an effective institutional system does act in favour of the economic development and seems to stimulate the increase of R&D involvement among companies. It also seems valid to assume any disturbance within the bounds of such institutional system may be harmful in terms of the state-level economic development. It may also act in detriment of long-term R&D investment, as this particular condition is often associated with elevated levels of corruption and bureaucracy (Brol, 2013). Lastly, it should be noted that no institutional development can be introduced without prior and clearly stated demand from the public for high quality institutions. Hence, the ubiquitous presence of various strong and competitive interest groups can be perceived as highly desirable (Czetwertyński, Brol 2013). In the opinion of F. Fukuyama, failures in effective response to internal demand for institutional changes (or lack of such demand) can be seen as one of the fundamental barriers to economic development of countries (Fukuyama, 2004).

Ultimately, it seems that one of the major tasks in the implementation of institutional changes is to ensure that the new or modified formal institutions are in good accord with the existing structure of local norms and rules. This accord should also be maintained in relation to any formal institutions introduced at the Community level. In other words, the prime responsibility is to preserve the complementarity of institutions and to place proper emphasis on the historic paths of their development. Failure to satisfy these requirements (i.e. the lack of proper synchronization) will result in competing rules or even in utter disregard for selected rules. In such scenarios, the affected institutional system will be bound to operate in a non-optimal fashion, and the resulting state-level indicator of innovation will (at best) remain static, if not lower than expected. Similar outcome can be concluded with reference to the levels of R&D involvement. In light of the above, the true nature of the observed correlation between these three factors may be purely causal, but this assumption may require further examination, with focus on statistical analyses.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme “Regional Initiative of Excellence” 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN

The Influence of Knowledge Creation Tools on Innovation Teams in Learning Organisations

Areej ALQAHTANI
King Faisal University, Al-Ahsa, Saudi Arabia, afalqahtani@kfu.edu.sa

Prof. Igor HAWRYSZIEWYCZ
University of Technology Sydney, Sydney, Australia, igor.hawrysziewycz@uts.edu.au

Abstract

Innovation is an important part of any organisation. Nowadays, organisations are keen to learn to improve themselves by creating knowledge. Using knowledge creation tools are another aspect for assessing innovation inside an organisation. However, it is not obvious whether using knowledge creation tools in a learning organisation can lead to successful innovation inside an organisation. Previous studies have focused on the knowledge creation process and not the tools. The main purpose of this study is to investigate whether the knowledge creation tools used in learning organisations successfully promote organisation innovation, more specifically improving the innovation team. This in-progress research will conduct questionnaires at learning organisations. It will investigate the use of knowledge creation tools and better understand their contribution to a successful innovation team. The results will assist management to assure best practices for innovation teams that use knowledge creation tools in learning organisations.

Keywords: Knowledge creation tools, learning organisation, innovation team.

Introduction

This section should follow keywords. This section should provide background of the study and Most organisations want to improve their performance and do this by including best practices. One area organisations need to be aware of is organisational learning. According to Lopez, Peón and Ordás (2005) the organisational learning in any organisation refers to 'a dynamic process of creation, acquisition and integration of knowledge aimed at the development of resources and capabilities that allow the organisations a better performance'. Thus, organisational learning is linked to knowledge. Therefore, the organisation will need to apply a knowledge creation concept if they want to become a learning organisation.

Knowledge creation process can be applied by using knowledge creation tools. These tools can be IT-based or non-IT-based. Using the appropriate tools will significantly enhance the organisational learning process. The application of knowledge creation tools to improve organisational learning can subsequently support innovation within the organisation. Innovation is another concept that one must take into consideration when discussing organisational learning.

According to Liao and Wu (2009) there is a relationship between the three concepts of knowledge management, organisational learning, and innovation. The previous study has two limitations: 1) The organisational learning that had been studied was simply a mediator between knowledge management and innovation; 2) The study focused only on knowledge management, in general, not knowledge creation tools, in particular. However, this study will focus specifically on knowledge creation, and how its tools can be applied in the context of learning organisations building a successful innovation team. Moreover, this study will not use organisational learning as a mediator but as an environment to apply the knowledge creation process.

The main objective of this research is to investigate knowledge creation tools in an organisation. It will then test to see whether or not these tools support innovation inside an organisation, in the

context of organisational learning. This research will primarily answer the following questions: 1) What are the knowledge creation tools are used inside the organisation? 2) How do knowledge creation tools lead to successful innovation team performance in a learning organisation?

Literature Review

Knowledge creation and its tools

Knowledge management has many processes that can be applied to any type of organisation. It includes knowledge creation, knowledge sharing, acquiring, and capturing (Jimenez-Jimenez and Sanz-Valle, 2013). Knowledge life cycle begin with knowledge creation (Bhatt, 2000). The knowledge itself can be divided into tacit and explicit knowledge (Nonaka and Konno, 1998). The explicit knowledge is the knowledge that can be found in the likes of books and articles. On the other hand, tacit knowledge is the knowledge that people hold onto in their brain and cannot be available physically (Nonaka and Konno, 1998). Accessing this type of knowledge becomes a challenge for many organisations. There is therefore a need for a combination of both types of knowledge, in order to create valuable knowledge.

The focus on knowledge creation is becoming very important, as knowledge is a vital asset within an organisation. However, if this knowledge is not well created, critical issues will emerge inside the organisation (Štorga, Mostashari and Stanković, 2013). According to Kaba and Ramaiah (2020) knowledge creation is 'the ability to search and identify new knowledge, apply existing knowledge to new contexts, understand and absorb unfamiliar knowledge and integrate different bodies of knowledge'. According to Salisbury (2008), knowledge creation happens when an organisation is trying to solve new problems. Many organisations allocate funds for knowledge creation tools (Roth, 2003).

Knowledge management can be applied by using many tools and techniques (Tyndale, 2002). However, this research focusses only on those knowledge creation tools that facilitate the process of knowledge generation in an organisation. Researchers have divided knowledge management tools into many categories. For example, Dalkir (2011) categorises them into a 'knowledge creation and codification phase; 2. knowledge sharing and dissemination phase; and 3. knowledge acquisition and application phase', with every phase including specific tools. The knowledge creation tools are: 'authoring tools, templates, annotations, data mining, expert profiling, blogs, mashups' (Dalkir, 2011; Kaba and Ramaiah, 2017). Some researchers such as Burkhard, Schneider and Meier (2009) and Tyagi *et al.* (2015) have introduced their own knowledge creation tools. Moreover, social media, such as Twitter and Facebook, can be used as knowledge creation tools (Wagner, Vollmar and Wagner, 2014). Wikis and data mining are also used as knowledge creation tools (Brohman, 2006; Watson and Harper, 2007).

Learning Organisation

A learning organisation is 'a form of organisation where processes of learning in some way or another are important' (Mohanty and Kar, 2012). The organisational learning is the process that most of studies link it with the knowledge management process. It is about preparing the organisation community to manage their knowledge effectively (Jain and Moreno, 2015). Previous studies have investigated the two terms 'knowledge creation' and 'organisational learning' as separate issues (Argote, McEvily and Reagans, 2003; Meier, 2011; Lyles, 2014). It can therefore be inferred that knowledge creation is just one of the many knowledge management processes, but has rarely been linked with organisational learning.

Using knowledge creation tools is one of the ways that can be used to create new knowledge to support organisational innovation. Some recent studies have shown a relationship between knowledge management practices and organisational learning, however, it is not known how the knowledge creation tools specifically can be employed in order to achieve organisational innovation. According to Mohanty and Kar (2012) innovative learning organisation should have 'personal mastery, mental models, shared vision, team learning, and system thinking'.

Innovation

Innovation is 'as an idea, practice, behaviour, or artefact that is perceived as being new by the adopting unit' (Eseryel, 2014, p. 806). One way for organisations to retain a competitive advantage over others is through innovation. Moreover, to assure that innovation is continual, organisations need to apply a well of knowledge creation process (Popadiuk and Choo, 2006). Merx-Chermin and Nijhof (2005) studied the factors affecting innovation inside learning organisations. First, they asked through interviews how organisations apply the innovation spiral. Then, they conducted a survey about the factors that affect the use of an innovation spiral.

In order to determine whether a specific organisation practices innovation process successfully, critical success factors should be tested. According to Kim and Wilemon (2002); (Gunasekaran, Patel and McGaughey, 2004; Harmancioglu *et al.*, 2007; Kam Sing Wong and Tong, 2012; Kannan, 2014) the innovation success factors gain 'support from top management, committed team leaders, crossfunctional departments, organisational infrastructure, organisational planning and strategy, incentives and rewards, training, client-customer involvement, supplier-vendor involvement, and knowledge management' (Abu and Mansor, 2019). However, there is a limit to measuring innovation performance inside an organisation (Trantopoulos *et al.*, 2017). Innovation performance is a result of utilising a new knowledge, Moreover, organisational learning can play an essential role in innovation performance (Curado, Muñoz-Pascual and Galende, 2018). Further, Wang and Ellinger Andrea (2011) emphasised that 'the term innovation performance is connected with organisational learning practices'. Figure 1 shows the conceptual framework of the study. Three levels of learning organisation characteristics: individual, team, and organisational. The learning organisation can use one or more knowledge creation tools. The question is whether the combination of using knowledge creation tools and learning organisation can lead to successful team innovation performance. From previous discussion, some innovation factors are chosen and others are deleted depending on factors related to team concept. For example, 'supplier-vendor involvement' is not associated with innovation team factors.

Figure 1: Conceptual framework

Research Methodology

A quantitative method will be used in this research. It offers the most appropriate method for answering the research questions. A questionnaire is designed for organisations' employees who are using knowledge creation tools. First, an investigation of the tools that the organisation uses in order to create new knowledge. Then, testing if the learning organisation characteristics and this tool can lead to a successful innovation team. This can be applied at one of mobile telecommunications organisations, since these organisations need to be up to date in offering new services to their customers. This process (creating new services) needs to quickly achieve a competitive advantage.

Conclusion

This study will contribute to the body of knowledge examining the use of knowledge creation tools in learning organisations for enhancing successful innovation performance. Previous literature has studied organisational learning in the area of knowledge management but not knowledge creation.

Moreover, the focus on the use of knowledge creation tools in learning organisations is missing in the literature. Thus, the relationship between the learning organisation, knowledge creation tools, and innovation, particularly on innovation teams. needs to be more fully explored.

Abstract

The competency-based approach requires the adoption of a training system with teaching strategies centered on an active learner, in order to introduce him/her to professionalization. After the implementation of the LMD (License, Master, and Doctorate) system, the Higher Institutes of Nursing and Health Techniques (ISPITS) in Tetouan in Morocco should align themselves with this approach by training competent health professionals, capable of acting in complex and unpredictable situations. This vision could only succeed by having a pedagogical alignment between the curriculum and the didactic tools of teaching/learning and evaluation. In this context, our study is combining nominal group technique and Mind map as teaching/learning and assessment tools to diagnose barriers to learning of midwives students at ISPITS in Tetouan, Morocco, towards the course of "sexually transmitted infections". The results of the combination of these tools highlighted some conceptions of future midwives and allowed us as teachers to adjust our practices according to the level of acquisition of our learners.

Keywords: Health Education, teaching, learning tools, student, midwife, NGT, Mindmap, barriers to learning.

Introduction

The underdeveloped countries suffer from a marked lack of scientific achievements. This has been confirmed by various surveys (Abouzaj, 2019; Frey, 2018; Labe, 2011; Legendre, 2012).

This observation, which has revealed shortcomings in teaching, has been reinforced by various studies in several disciplinary fields such as didactics, sciences, etc. (Giordan and de Vecchi, 1987).

Among others, in science didactics, researchers have been irritated by this problem and have tried to identify the causes. Among the causes of the failure of learning outcomes in the learning process, research has evoked learners' conceptions (Astolfi, 2010; Clément, 2010; Delacote and Tiberghien, 2010; Giordan and de Vecchi, 1987).

In fact, it has been shown that these conceptions constitute a real obstacle for the learner and teaching that does not take these conceptions into account will not lead to a satisfactory outcome in the quality of learners' learning (Bachelard, 1934; Giordan and de Vecchi, 1994; Pizon *et al*., 2010).

In addition, as a teacher in the Higher Institutes of Nursing and Health Techniques (ISPITS) in Tetouan in Morocco, we have to help train a competent health professional, capable of acting in complex and unpredictable situations (Abouzaj, 2019).

This vision could only succeed by having a pedagogical alignment between the curriculum and the didactic tools of teaching/learning and evaluation (Biggs, 1996, 2003, 2014; Roegiers, 2010) by taking into consideration the obstacles to the learning of our learners.

Thus, since we are in charge of teaching the Sexually Transmitted Infections "STI" course for midwifery students in semester4, we have combined two didactic tools: the Nominal Group Technique "NGT" and the Mindmap to diagnose the barriers to learning for these students in relation to this course. We used this work as a diagnostic assessment to identify the barriers that hinder the learning of our learners towards the "STI" course prior to any teaching of this course. In addition, it would allow us to adjust our teaching according to the level of acquisition of the learners.

This is a first study to our knowledge where we combined two didactic tools, which are the nominal group technique and the mind map tools in order to diagnose the obstacles to learning with regard to the course of sexually transmitted infections "STI", but before describing the approach, we will first make a presentation of the two techniques used.

The Nominal Group Technique

The Nominal Group Technique "NGT" is an evaluative method that emerged from the work of Delbecq and Van (1971) to address group decision-making processes.

We have used this technique because health professionals and educators have demonstrated its ability to extract "collective knowledge" from the profession (Lennon, Glasper and Carpenter, 2012) and formalize it, even though it is often considered operational knowledge that is difficult to verbalize (Foth *et al*., 2016).

The technique was described in 6 steps in the work of the El Hassouny team (2016).

The Mind Map Technique

The Mindmap or Heuristic map is an active learning strategy that facilitates the learning process and helps the learner's brain to develop associations from a central concept (Buzan and Buzan, 1996).

It also allows the student to use existing knowledge or prerequisites (Buzan and Buzan, 1996; Spencer, Anderson, and Ellis, 2013) and is little used in nursing.

Students' conceptions are a barrier to their learning and without considering them; the teacher would not be able to succeed in his or her teaching/educational assignments (André Giordan and de Vecchi, 1987).

We used this tool to diagnose the students' conceptions of the "STI" course before teaching the course, which will enable us subsequently to adjust our teaching practices with the level of the learners.

Methodology

It is a qualitative, exploratory, diagnostic study of barriers to learning. Our study sample consisted of a class of 20 midwifery students from semester 4 of the bachelor class at "ISPITS" in Tetouan in Morocco, during the 2018/2019 school year.In order to conduct this study we had the authorization of administration and the consent of all participants in our sample.

Educational Scripting

In this study, we have used the didactic tools used in the "STI" course that we are responsible for delivering. The choice of this course in the present study was imposed since it represents a major element in the training of the midwifery option.

- ✓ As a first step, before any teaching of the said course, during the 1st session, we facilitated a discussion using the nominal group technique "TGN" to diagnose learning difficulties vis-à-vis the same course (diagnostic group assessment).
- ✓ Then, based on the results found by the NGT, we asked students to develop Mindmaps after having introduced them to this technique, in order to diagnose their misconceptions about concepts related to the same course (individual diagnostic assessment).

Procedure for diagnosing learning disabilities by nominal group technique

- ✓ At the 1st session and before starting the "STI" course and in order to conduct a diagnostic evaluation, we gathered a class of 20 midwifery students from the bachelor's class semester 4 and asked them the following nominal question: "What are the difficulties and problems you have encountered in your previous studies on STI? ».
- ✓ After having put in confidence the 20 learners of the sample, we encouraged and encouraged them to express themselves freely and without constraints on one of the two sheets that we distributed to them.
- ✓ The data collection revealed 12 responses that we wrote on the board.
- ✓ -We eliminated redundant proposals and those that seemed irrelevant to us, such as answers that made sense only in the respondents' logic. Thus, the number of successful responses was reduced to 9 responses.
- ✓ In the next step, we asked students to choose 6 from this pool and prioritize them by assigning a weight of 8 to the top answer, 7 to the second, and so on down to the last.
- ✓ Once the data was collected, we drew up Table 1 (see page below) where the responses are ranked according to a descending Σpi.

Procedure for diagnosing students' conceptions of "STI" concepts

We introduced the students to the Mindmap technique by brainstorming, with the participation of the whole class, some Mindmaps, and then we distributed empty Mindmaps and invited each student to fill them in spontaneously.

The question in the mindmap was as follows:

Hang on to each branch a word (or short phrase) that comes to mind spontaneously when you hear the concept of the Sexually Transmitted Infections "STI":

Results and Discussion

Results of student responses obtained by the nominal group technique:

Table 1: Results of student responses obtained by the nominal group technique

Responses on Difficulties Hindering Learning for Students in the STI Course	Σpi	Order
Difficulty and forgetfulness of the Sexually Transmitted Infections concepts	160	1
The course is covered in an incomprehensible way in the textbook	140	2
The language barrier	120	3
Lack of tutorials and practical work in high school	100	4
The time allotted to the course is very insufficient	80	5
It is a taboo subject; students don't dare to interact in class...	60	6

This table reveals that midwives students attribute their difficulties in assimilating the Sexually Transmitted Infections “STI” mainly to the fact that they are not able to assimilate “STI”:

- ✓ To the difficulty and forgetfulness of “STI” notions and concepts seen in the school curriculum.
- ✓ To the content of the textbook stated as "difficult".
- ✓ To the language barrier since they do not master the French language well enough.
- ✓ The lack of the use of practical work and tutorials related to the theme in high school.
- ✓ The insufficient time allocated to the teaching of the sequences of this discipline.
- ✓ Finally to the characteristic of the content whichcame as a "taboo subject".

In fact, the answer that comes at the top of the list with the highest weight (Σpi = 160) refers to the forgetfulness and difficulty of the concepts, this observation is more argued with the answer n2. These answers match the observations of the course of didacticians who confirm with a certain regularity that scientific knowledge is poorly understood, poorly integrated or quickly forgotten by the learner (Giordan and de Vecchi, 1987; ROMAINVILLE, 2000 ; TIBERGHIEN, 1988).

Students' results obtained by Mindmap reported in the table below:

Table 2: Student results obtained by Mindmap

Misconceptions of midwives students approached by the Mind map tool regarding Sexually Transmitted Infections (STIs)
-STI = "incapable", "Sex life destroyed", "Sexual impotence"...
-STI = "Stigmatization", "Excluded from society" ...
-STI = "Human Immunodeficiency Virus" (HIV)
-STI = "Taboo", "Illicit sexual relations", "relations outside marriage"

Using the mindmap tool, we were able to explore some of the misconceptions that students had reported about “STI” concepts, among those misconceptions:

That STIs cause sexual impotence, that those affected are stigmatized by society, that "STI" are synonymous with the Human Immunodeficiency Virus, and that they are a taboo subject reflecting illicit sex outside of marriage.

The results found by the Mindmap are consistent with those found by TGN and are similar to those found by other researchers (Pourmarzi and Sharami, 2017; Rochigneux, 2012; Sabah *et al.,* 2010; Vieira *et al*., 2017). Indeed, midwives students find it difficult to assimilate the prerequisites taught previously.

Consequently, the existence of students' misconceptions that have not been taken into consideration by the education system hampers their learning process. This finding matches other studies at the national or international level (Chakour *et al*., 2019; Pourmarzi and Sharami, 2017) that prove that knowledge is not passed on.

Conclusion

The use of these tools allowed us to identify some of the barriers that hinder the learning process for midwives students. Indeed, the combination of these two techniques can be used as an evaluation to allow the teacher to adjust his/her teaching according to a cyclical and permanent process at any time with the level of the prerequisites of his students.

Finally, we suggest using this approach to diagnose the misconceptions of learners in other disciplines.

Digital Transformation in Accounting: Systematic Review

Gisleise, AGUIAR

Universidade Fernando Pessoal, Porto – Portugal
gisleise@hotmail.com

Luis, GOUVEIA

Universidade Fernando Pessoa, Porto – Portugal
lmbg@ufp.edu.pt

Abstract

Although the subject of digital transformation in Accounting has been widely discussed in the media, there is still a considerable absence of studies on the key research topics in the scientific literature, as well as the trends and impacts on professionals working in this area. Aiming to narrow this gap, the objective of this research is to investigate academic studies on digital transformations in the area of Accounting, map the literature and point out research opportunities. For this purpose, a Systematic Literature Review (SLR) was performed, selecting the publications made up to December 2019, propose a categorization of articles, as well as point out the evolution and scope of the scientific studies published. The results found on about digital transformation in Accounting, in the Scopus and Web of Science databases, is still reduced, but show an increasing curve in the last three years. Moreover, the literature points to the effects on the education of accounting professionals, which is directly complementary to the need for technical skills and knowledge to be developed in the training of professionals. Innovations in digital base technologies, such as blockchain, artificial intelligence, big data, among others, appear with great emphasis this work. Finally, subjects related to the impacts on accounting professionals are still limited and represent the most sensitive aspects, which allows to assess the effects of digital transformation as the focus on future opportunities and also major challenges for the profession.

Keywords: Systematic Review, Scientific Production, Digital Transformation in Accounting

Introduction

Technologies have shaped society over time, so contemporaneously, innovations in Information and Communication Technologies (ICT) have boosted a new and intense transformation called digital transformation (Weiss. M, 2019). It is a fact that this transformation is not limited to improving the quality of human life but includes the remodeling of several areas and the continuous development of new technologies.

Accounting, as an area of knowledge integrated into the social and business environment, also suffer the effects of digital transformation. The truth is that the emergence of the term *Digital Transformation* (DT) fundamentally impacted the discourse on business practices, and thus, it is considered the process that companies use as the most innovative in technology to productivity enhancement and improve their results. Also found spelled, DT consists of a broad process, in which technology becomes central to the organization and companies making use of technological data analysis tools and methodology - such as Robotization, Big Data, Business Intelligence, Artificial Intelligence, Blockchain among others - to increase your performance and create more value. Tomelin et al (2011) mentioned that a strategic alliance between accounting and new information technologies provides safer conditions for decision-making organizations.

Information technologies have changed the way information is managed by "producers" as well as accountants and auditors to "consumers" - as investors, creditors and other users of information (Elliott, RK, 2002). Digital Transformation provides the impetus to reconsider the very nature of accounting information (AIS) in their purpose to manage data and information to be used by decision-makers in

accounting and finance functions, and to contribute to strategy implementation and internal control of the enterprise (Quinn, Martin et al, 2017). In other words, information technology solutions are part of the processes in the accounting area and data security has become vital for business continuity.

It is also important to highlight that other aspects of the accounting profession, such as occupations, activities, the job market, professional education, skills, and competences to be developed and are being largely affected by the digital transformation.

In view of the relevance of this theme, this work aims maps the literature on the subject, and proposes a categorization for it, highlighting the main questions which have been dealt with to date in the research contained in the indexed databases, recognized as important to the scientific community.

In view of the relevance of this theme, the work describes the digital transformation in Accounting, maps the literature on the subject, and proposes a categorization for it, highlighting the main questions which have been dealt with to date in the research contained in the indexed databases, recognized as important to the scientific community. Moreover, based on a critical review of the subjects found, new research questions are proposed that capable of increasing the quality and the relevance of future studies on the subject. The research approach selected was a Systematic Literature Review (SLR), applying bibliometric and network analysis. This Systematic Literature Review (SLR) provides researchers and practitioners with a structured, categorized view of what has been produced in the literature on digital transformation in Accounting to the present (December 2019).

Research Method

This study consists of a Systematic Literature Review (SLR) scientific on digital transformation in Accounting. The systematic review of the literature, generally referred to as a systematic review, is a means of identifying, evaluating and interpreting all available research relevant to a research question or thematic area or phenomenon of interest (Kitchenham et al, 2013). In addition to requires an understanding of the existing literature, including gaps and uncertainties, clarification of definitions related to the research question and an understanding of how they are conceptualized in the existing literature (Armstrong et al, 2011).

SLR is a less demanding scientific investigation, it is a research article with pre-defined systematic methods to systematically identify all relevant published and unpublished documents for a research question, it evaluates the quality of these articles, extracts the data and synthesizes the results (Siddaway AP et al, 2019).

In addition to the RSL should be followed by a rigorous methodology in which to define the research question, write a protocol, search the literature, collect and perform the screening and analysis of the literature. It is important mentioning that all process must also be carefully documented. For this study, the review protocol was developed in the planning phase.

The protocol is an essential component in the RSL process and helps to ensure consistency, transparency, and integrity (Donato et al, 2019). This review protocol includes detailing of the questions, definition of the research terms, study selection, data extraction and data analysis. Fig. 1 is highlighting the five steps of the review protocol to be use this study.

Fig. 1: Review protocol steps

Research Questions

For the study to achieve its objectives, that is, to provide researchers and practitioners with a structured categorized view of what has been produced in the digital transformation in Accounting literature, here are the two proposed research questions. The first concerns the presentation of a global amount of work on the subject, described below:

RQ1. How has the literature on digital transformation in accounting evolved over time?

Seeking answers of a more quantitative nature, this question has been broken down into the following:

RQ1.1. How has the number of publications on this subject evolved over time?

RQ 1.2 What are the main journals for this subject?

RQ1.3. Which countries contribute the most in terms of publications (considering the number of publications)?

The systematic review answers a well-defined research question and is characterized by being methodologically comprehensive, transparent and replicable (Donato H, et al, 2019). In this work of identifying the existing literature to create and develop new studies, a grouping of the major subjects and research questions was taken from the digital transformation in Accounting activities found in the publications from the sample in categories. Thus, the second question of this work is:

RQ2. What are the main issues in the scientific literature on digital transformation in Accounting?

The next section describes the process carried out to perform this systematic literature review.

The Sampling Process

The initial sample was taken from the indexed databases of the Scopus® portal by Elsevier B.V and the Web of Science Core ™ Collection (WOS) accessed through the ISI Web of Knowledge ™ portal. These databases were selected, because they provide interfaces that make it possible to carry out research from different sources through a common set of research chains. In a broad way, that is, without restriction of journals, periods or areas of knowledge, were selected and identified sources studies from 1974 to December 2019, such as: Journal of Corporate Accounting And Finance, Journal of Applied Accounting Research, Pacific Business Review International , focused on the area of Accounting and sources, such as, Journal of Information Technology, Advances in Intelligent Systems and Computing, Journal of Information Technology, as well as ACM and IEEE studies aimed at research in the area of Technology and Systems Engineering.

The initial sample was taken from the indexed databases only publications classified as "Article" and "Conference", which include the principles of these studies, were selected because they have undergone a rigorous peer review process prior to publication. Moreover, these works also contain all the information necessary (metadata) to undertake bibliometric analysis, with authors, references, number of citations and date of publication. Works that did not meet the above requirements were rejected under the quality criterion (Kitchenham and Charters, 2007).

Fig. 2 is a schematic presentation of the process for identifying and selecting the sample for the study. In the publication identification phase, with the use of preliminary definitions for the search strings, carried out on the databases indexed in Web of Science and Scopus. Then, the identical "scripts" of Search 1 and Search 2 were applied in databases used, restricting the search to "Summary", "Job Title" and " Keywords".

Fig. 2: Search and selection process - search phase – keyword

In Search 3 (Fig. 2), language verification was also inserted, restricting the materials to only the English and Portuguese languages for the authors' appreciation. The refined data from Survey 3 was inserted in the online tool ***Parsifal***[i], which allows researchers to carry out systematic analyzes of the literature, in the application of the review protocol, management of conduct and research documentation.

During the processing phase at Parsifal, this tool performs the identification of duplicate studies between the two sources of data Scopus and WOS, resulting in 232 relevant ones, demonstrated in the demonstrated in the transition from Phase 1 to Phase 2 in Fig. 3.

As Carvalho et al. (2013) suggested, during the triage process the authors of the present study read the titles and abstracts publication. And finally, they kept in the sample only those publications that everyone agreed met the inclusion criteria, that is, they fit the scope of the digital transformation in Accounting had the necessary metadata for the following stages of analysis. The authors created inclusion criteria, which provide potential data to answer the research questions, and exclusion criteria, as shown in Table 1.

Table 1: Search Classification Criteria

EXCLUSION	INCLUSION
No access	Study on Digital Transformation in Accounting Education
Unrelated to the research theme	Study on Digital Transformation and Impacts on Accounting Professionals
Addresses the subject superficially	Study on Digitally Based Technologies in Accounting (blockchain, big data, among others)
Duplicated	Study on Artificial Intelligence in Accounting

Among the 232 publications, 112 were rejected, through the analysis of title and abstract, and classified by the exclusion criteria, therefore, they were excluded from the bibliometric analysis and content phases (extraction). Thus, 110 publications were accepted and were analyzed in this study.

Figure 3: Phase selection

After the selection, it was also identified that in the selection we have articles from the Web of Science Core ™ Collection, the studies were transferred to *Parfisal* with the characteristics of "inprocessing", that is, a study that has not yet been granted full access, thus the publications approved for Phase 2 "C" were from 88 publications.

As shown in Fig. 1, the first activity in the selection and extraction ended the planning phase. Once the research protocol was completed, the practice of separating the sample was established excluding publications that did not meet the inclusion criteria.

Data Analysis

In the data analysis, bibliometric analysis and content analysis were used in order to identify the variety of scientific literature on digital transformation in Accounting, describing trends and identifying patterns.

Bibliometric Analysis

Bibliometric analysis aims is answer the questions related to the evolution of literature, making it possible to identify the most productive authors, journals and periods in which publications were produced, the evolution of publications over time (Ikpaahindi, 1985).

This subsection contains the results of the process of collecting quantitative data related to periods, publications, authors, citations and other information involving the journals that are part of the sample in order to answer questions RQ1.1, RQ1.2 and RQ1.3 of study.

Publications / year / period

The sample covers the period from 1974 to December 2019 and contains 88 publications during and selected works written in English and Portuguese. Only 13 articles (11%) were published between 1974 and 2000, between 2016 and 2017 there was an increase from 5 to 14 studies, and only in 2019 we had 23 (21%) of the total number of publications. It should be noted that 51% of the publications are from the last three years, clearly showing the intensity and growing interest of researchers in the subject.

Fig. 3: Publications by Year

Publications / journals / periods

The 88 works in the sample were published in 50 different journals. Table 1 shows only the 5 main journals with the highest number of publications about this study. Moreover, 12% of the selected publications are concentrated in two journals: Journal of Accounting Education and Accounting Education.

Table 2: Number of publications by Periodicals

Rank	Journals	Num. Publications
1	Journal of Accounting Education	6
2	Accounting Education	5
3	Journal of Information Systems	3
4	Journal of Corporate Accounting and Finance	3
5	Accounting Information Systems	3

Countries / Publications

Finally, a location analysis of the main references on the digital transformation of Accounting was made Fig. 4. Of the 88 articles considered, the United States has more publications (35), followed by China (12); Australia (7); United Kingdom (6); Romania (5), Iran and Singapore (3), Malaysia and Turkey (2) and the other countries with only one publication.

Fig. 4: Publications by country

Content Analysis

During the study, content analysis was used to search for main topics, approaches and methods, most important of the subject in question. For this study, was used the *VosView tool*, which allows organizing the data generated in a "cluster" from the most frequent words and building relationships between them, as shown in Figure 5. The cluster analysis included a variety of methods to classify data multivariate in subgroups, which can help to reveal the characteristics of any structure or pattern present (BS Everitt, 2011).

Fig. 5: Grouping by Frequency of Terms

One can see in Fig. 5 there is no direct mention of the term “Digital Transformation in Accounting”, but a grouping of related terms related to the study. However, by performing an analysis of the contents classified for inclusion criteria (Table 1), it is possible to identify synergy between the collected works.

During the analysis and classification of the contents of the collected articles, 44 articles (50%) were identified, highlighting the dynamic nature of information technologies, analyzing their impacts and the need to redefine new skills and competences for the accounting profession (Ku Bahador et al, 2013 and Wilson, et al, 1992) that were highlighted by the cluster in red in Fig. 5.

The second major aspect of the articles is aimed at studies on the impacts of Digital Transformation with a look at the Education and Training of Professionals, 19 (22%) were identified that present ways of identifying whether aspiring professional accountants acquire sufficient knowledge and develop necessary IT skills through empirical research analyzing university curricula, (Stanciu, V.et al, 2015).

Regarding the cluster highlighted in blue (fig. 6) with the theme Artificial Intelligence applied to Accounting, 6 articles were identified, with the main objective to demonstrate how Artificial Intelligence works in an innovative way with the internal control systems to help managers to produce information high quality accounting, reducing the risk of information (Askary, S. et al, 2008)

Finally, the remaining articles 22 are focused on digitally based technologies, such as Blockchain, Big Data, XBRL, among others that seek to identify barriers, group them as related to technology, as well as investigate current practice with regard to the use of these for these innovations, as cited by Perkhofer, Lisa Maria et al (2019) and Tan, BS et al (2019).

Conclusions

This article shows that, among the 88 selected studies, 2019 was the year with the largest number of studies on Digital Transformation in Accounting, and there is a growing trend of publications on this subject. In relation to the journals that published the most on the topic, the Journal of Accounting Education and Accounting Education stand out.

Among the countries, the country with the most publications is the United States, followed by China and few publications in Brazil on this subject; and the studies mainly address the relationship with Digital Transformation in Accounting and the impacts on Accounting professionals (50%), their activities and skills. Followed by the second focus is the impact of digital transformation in the educational structure, which is directly complementary to the need for IT skills and technical knowledge to be developed in your professional accounting training.

The low number of scientific studies on the impacts of digital transformation in Accounting shows that there are gaps and questions to be answered. Future studies can be carried out in the area, comparing and validating the results presented here, especially with the expanded search criteria and databases. In addition, other analysis techniques, such as the example of semantic analysis, can be used in the search for new concepts, definitions or common terms that would best characterize the works, as well as validating the results of this systematic review. Another interesting insight for future research is the relationship between topical research that appears in the network analysis as the strong relationship to the development of new skills and competences to be expected in the training of accounting professionals in technologies and what activities and functions of accounting professionals can be impacted by digital transformation.

Abstract

The purpose of this study is to establish the mediation of financial return between innovation and sustainability of small social entrepreneurship. Earlier research is limited in this perspective, and therefore this study focuses on filling the gap as far as the relationship between innovation and sustainability of social entrepreneurship is concerned. The research data for this study comes from Nigeria by adopting a Likert Scale questionnaire through a convenience sampling approach. In the data analysis, this research utilized SPSS ver. 25 and SmartPLS ver. 3.2.8 for descriptive statistics, structural equation modeling, and mediation analysis. At the end of the study, the findings show that there is a direct relationship between entrepreneurial innovation and its sustainability, which is mediated by financial return in the developing countries' settings. While this study has successfully established the clarity concerning the relationship between the chosen variables including, innovation, financial returns, and sustainability of social entrepreneurship in the developing countries, there is the need for further research due to the global significance of social entrepreneurship. The research discusses the limitation of the study and recommends future research to focus on comparative study between countries, gender divergence study, culture, and technological effects in social entrepreneurship**.**

Keywords: Social Entrepreneurship, Innovation, Financial Return, Sustainability

Introduction

There is a need for an increase in call and commitment to social entrepreneurship in Africa due to perennial problems and inconsistent policies. One of the engines of economic growth and prosperity in a country is entrepreneurship (Cornwall, 1998; Roundy, 2013). The entrepreneur is the vector of change since its fulfills a certain number of functions (Vries, 1977). Among these functions are the obligation to “undertake”, the recognition and creation of opportunities through innovation and creativity (Dees, 1998; Kings and Roberts, 1987). This opportunity indicates, the displacement of resources from places with low productivity, to qualified areas with high productivity (Kirzner, 1979). Thus, whatever the

role and the place of the entrepreneur, entrepreneurship is a catalyst of economic and social growth for the states which aspire to the emergence for the simple reason that they can influence the economic atmosphere, upset the business climate, and above all, sharpen wealth (Weerawardena and Mort, 2006; Sanusi, Olaleye and Atjonen, 2017).

Several Governments, from Africa, Europe, America and Asia are becoming more and more interested in entrepreneurship by considering it as a revolution which thus responds to the problems of society which are sometimes considered as complex. In Africa, several states have emerged as leaders in the field of social entrepreneurship and social openness in view of the opportunities it abounds in the efficient reduction of poverty, the improvement of the health system, access to educational opportunities and especially the improvement of several social problems for poor communities in disadvantaged countries. Social entrepreneurship, therefore, takes its foundations from the main desire to create wealth, unlike the generation of wealth as conceptualized for companies whose goal is to generate economic wealth (Drayton, 2002; Stevens, Moray, Bruneel and Practice, 2015). Similarly, businesses with an entrepreneurial vocation and carrying out entrepreneurial activities are increasingly known as a strong economic and social indicator in today's society (Mair and Martí, 2006; Urbano et al., 2017).

This study is very important because of the gap in the intervention of financial return between innovative social entrepreneurship and sustainability. This study explains the direct and indirect relationship of innovation and sustainability of small social entrepreneurship in a developing country setting. This result shows a significant direct relationship between innovation and sustainability and the mediation of financial return. This paper is therefore structured as follows: the next section presents a state of the art of the environment of social entrepreneurship in developing countries. Next, we will highlight the variables that make up our research model. The methodology of the study will then be approached in part 4. It will also provide information on the distribution of the questionnaire, the method of analysis of the data collected, the instruments of measurement of the model as well as the structural model of the study. The following section will be reserved for results and interpretation according to the research objectives of the study. The next two sections will be reserved for stating the various theoretical and managerial implications. Finally, we will discuss the different limits of our study as well as the various suggestions for the next studies.

Social Entrepreneurship in Developing Countries' Settings

The various researches on social entrepreneurship for decades have turned more towards a desire to differentiate social entrepreneurs with philanthropic vocation from traditional social entrepreneurs (Austin, Stevenson and Wei-Skillern, 2017; Dhesi, 2010). This research has therefore drawn from the roots by analyzing each entrepreneurial life cycle, from the moment a person is motivated to become an entrepreneur until the moment when he structures and organizes his business. Also, research has focused on financing mechanisms and obtaining financial resources by social entrepreneurs. (Roundy, 2013), for example, analyzed the different speeches and communication methodologies used by social entrepreneurs to attract investors, the media and even business incubators. Social entrepreneurs play a unique role in the social economy through their ability to generate positive gains that impact unrelated individuals not involved in the supply chain (Roundy, 2017; Santos, 2012). The mission of the social entrepreneur is central, detailed and clear. It significantly influences how he assesses an opportunity and explores market trends. Therefore, the impact of mission emerges as a fundamental criterion to the detriment of the creation of wealth, which is only one of the many means of achieving its ends. The creation of value pawns the creation of wealth for a social entrepreneur (Dees, 2018).

As a social service, social entrepreneurship in Africa is a concrete path to positive social change to improve living conditions, and above all to restructure ecosystems. To achieve positive social change with a significant impact on several social strata, several channels should be considered, such as awareness campaigns, advocacy, policy documents, lobbying with appropriate organizations, research, education, and strong legislative restructuring. Africa, the cradle of humanity, regarding social disparities and economic opportunities, presents unique characteristics for researchers in social entrepreneurship. When we consider the enormous economic and social challenges, it is ambitious to

say that the needs that emerge can be transformed into opportunities for companies with a social vision. In this scenario, companies can broaden their fields of intervention by moving from an open economic model to one that responds to specific social challenges such as extreme poverty, marginalized communities and institutional voids. It is then that the mesh between the specificities and social, economic and cultural realities of Africa and social entrepreneurship can lead to a good perspective.

Social Entrepreneurship Atmosphere in Africa

Sub-Saharan Africa is the poorest part of the African continent according to the social- economic indices of the World Bank (Beegle and Christiaensen, 2019) ; It is therefore a mesh of very high social and economic inequality and a high level of poverty that radically changes the vision and the social objective of entrepreneurship. Social entrepreneurship is born when expectations are far from the realities shown by the private sector and governments. It also emerges when expectations can lead to a positive external impact. Huge social problems are also seen in low-income countries in Sub-Saharan Africa, which is a huge breach for the myriad of opportunities for social enterprise creation. Recent discoveries by (Santos, 2012) state that in view of the multitude of social problems existing in Africa, the emergence of social entrepreneurship is therefore important for the strengthening of attributes unique to Africa, and the consolidation of the specificities observed. Indeed, the current African context is therefore favorable for poor and disadvantaged communities in terms of the inclusive aspect, and in terms of difficulties in understanding their external needs (Nega and Schneider, 2014; Pless, 2012). Regardless of the social aspect on the ground, a climate characterized by an extremely high poverty rate will therefore tarnish the social vision associated with businesses. In view of this, the trends would therefore tilt towards the higher the level of poverty, the greater the self-perception as a social enterprise and therefore a choice of activity sector with a strong social dimension. In Africa, the economic, social and cultural environment is strongly influenced by ethnic and tribal groupings, higher than the rest of the world (Berman, 1998). These cultural and ethnic groupings come in several cases to complement the national institutional framework recognized by the states. (Michalopoulos and Papaioannou, 2012) found that several well-known ethnic and cultural groups can help influence social entrepreneurship since they already greatly influence the economy.

The Colonial Legacy

It is undeniable that colonization had a strong consequence on the economic and social life of several African states, and the traces of this colonization are up to the present day visible on several dimensions. It has also tainted the economic, political, social and even cultural fields of several African states with serious consequences, which are felt even fifty years later. Several researchers have conducted comparative studies in several areas of Africa according to whether they were colonized by the British or other parts of the world. At the end of this investigation, the observation is the same: the countries which had British colonizers tend to be more developed than the countries which had French, Portuguese, German, and even Belgian colonizers. This development gap therefore has a significantly large impact and modifies the structure and conception of what social entrepreneurship is in several countries and following colonial history.

Figure 1: Study one hypotheses conceptual framework

Fig. 2: Study two hypotheses conceptual framework

Social Entrepreneurship Variables

Innovation

Innovation is an important aspect of social entrepreneurship. For the entrepreneur, it is not a question of limiting himself to the resolution of a trivial problem, but to an innovative proposal of lasting and effective solutions which go to the root of the problem and deal with it effectively. To get there, therefore, it would take a lot of creativity and innovation because creativity figures in all the reflections and actions of the social entrepreneur. Even if there is no question of devising a new solution in a situation, the social entrepreneur must be innovative, creative and imaginative in how to go about it in order to maximize reflection in production. Subsequently, it was discovered that social entrepreneurship gives the possibility of bringing together different actors of social change which contributes to carrying out concrete and practical investigations that go beyond borders.

H1: Innovative social entrepreneurship is a direct predictor of small entrepreneurship sustainability.

H2: Innovative social entrepreneurship directly predicts financial return of small entrepreneurship and financial return mediates between innovation and sustainability of small entrepreneurship.

Financial Return

The entrepreneurial economic vision is based on the premise that the mission of a social entrepreneur incorporates maximum profitability of financial income. Concretely, social entrepreneurship has a mission to complete the shortcomings observed in government actions in the production of public goods and the social satisfaction of citizens (Hartigan, 2006) . It is a mix of business models integrating a non-profit, hybrid, and social enterprise architecture. Hybrid businesses flourish partially thanks to the profits generated by goods and services, but also through various grants and donations from governments and organizations (Prahalad, 2009). In addition, the social enterprise differs in that it accentuates efforts, activities and visions on social and financial returns and impacts (Meador, 2014). This means that in this case, a shareholder of a social enterprise receives a return on investment but does not receive dividends because the profits generated are reinvested in the light of the vision and the social objectives set.

H3: Financial return directly predicts sustainability of small entrepreneurship and mediates between innovation and sustainability of small entrepreneurship.

Methodology for Social Entrepreneurship Study

Questionnaire Formulation and Administration

This study reviewed relevant literature on social entrepreneurship innovation, financial return, and sustainability. It adapts Likert Scales questions from the extant studies ranging from 5=strongly agree to 1=disagree. The study designed demographics questions on gender, age, marital status and education levels of a social entrepreneurs in Nigeria's emerging economy. This study targets the social entrepreneurs in Nigeria because of its precarious economic conditions. The study adopts quantitative methodology and administered questionnaires online through Qualtrics to social entrepreneurs. The study considers the participant's privacy and creates an opportunity for the respondents' consent of participation. The social entrepreneurs that participated in this study account for 37 (Peng and Lai, 2012) based on convenience sampling and the data was collected less than two months between the second and third quarters of 2019. The study utilized SPSS ver. 25 for descriptive statistics, and SmartPLS ver. 3.2.8 for measurement, structural analysis and Bootstrapping to test the formulated hypotheses.

Table 2: Demography Descriptive Statistics

Descriptive Variable	Frequency	Percent
Gender		
Male	34	91.9
Female	3	8.1
Age		
Under 25	1	2.7
25 - 34	15	40.5
35 - 44	14	37.8
45 - 54	5	13.5
55 and above	2	5.4
Marital Status		
Single	10	27
Married	27	73
Education		
High School/Diploma	5	13.5
Bachelor	18	48.6
Masters	12	32.4
Doctoral	2	5.4

Information about Descriptive Statistics and Insights

Descriptive statistics analysis and interpretation are important for the simpler interpretation of the data. The result of the descriptive statistics (Table 2) shows that male social entrepreneurs 34 (91.9%) participated in this study and accounts for the greater participants than the female that only accounts for 3 (8.1%). This low turnout of female social entrepreneurs in Nigeria shows that male social entrepreneurs are more interested in issue that pertains to innovation, financial return, and sustainability than their female counterparts. Regarding the age brackets of the social entrepreneurs that participated in this study, ages 25 – 34, which accounts for 15 (40.5%) had the highest frequency followed by ages 35 – 44 with 14 frequency (37.8%). Ages 45 – 54 and 55 and above records are sparing frequency of 5 (13.5%) and 2 (5.4%), respectively. For marital status, the married social entrepreneurs 27 (73%) are more than single social entrepreneurs 10 (27%), and it shows that the majority of the social entrepreneurs that participated in this study are matured based on their marital status. Education-wise, the social entrepreneurs had 18 bachelor holders (48.6%), 12 Masters holders (32.4%), 5 High

School/Diploma holders (13.5%) and 2 academic doctors (5.4%). The descriptive shows that the social entrepreneurs involved in this study are well educated.

Measurement Model of the Study

This study checks the quality criteria of the proposed model before proceeding to the stage of structural equation modelling and founds that all the items loaded well under each factor based on (Fornell and Larcker, 1981) postulation. In Table 3, Innovation had a minimum of (0.873 and a maximum of 0.920). Also, Financial Returns had minimum of (0.886 and maximum of 0.899) while Sustainability had minimum of (0.738 and maximum of 0.928). Table 4 shows the quality criteria of the utilized variables and the Composite Reliability results were all above the thresholds of 0.7 (Bagozzi and Yi, 1988) in the literature and Average Variance Extracted (AVE) also above the boundary of 0.5 (Anderson, Anderson and Hurst, 2010) and the values were strong between the minimum of 0.728 and maximum of 0.805. The model is discriminant valid with diagonal values of Financial Return (0.894), Innovation (0.897) and Sustainability (0.854) and the variables are strongly correlated.

Table 3: Items loadings of Innovation, Financial Return and Sustainability

	IN	FR	SU	ITEMS QUESTIONS
IN1	0.873			…identifying social opportunities
IN2	0.920			…deliver sustainable advantage through innovative goods and services
FR1		0.886		Survival through profits is my aim
FR2		0.897		Making profits a means to achieve a social goal
FR3		0.899		Maximizing the wealth of their investors
SU1			0.738	Environmentally friendly
SU2			0.922	Improve quality of life in the long run
SU3			0.814	Promotes solutions that are ethical
SU4			0.928	…social and environmental concerns

Note: Weak items loading dropped from the study
IN: Innovation, FR: Financial Return, SU: Sustainability

Structural and Mediation Model Result

This section shows the SmartPLS algorithms and bootstrapping results. It also shows the hypothesized variables and the outcome of their relationships (Figures 1, 2, and Table 4). This study hypothesized (H1) that innovative social entrepreneurship directly predicts small entrepreneurship sustainability, that is, Innovation->Sustainability ($\beta = 0.73, t = 7.32, p < 0.05$).

Additionally, the study hypothesized that innovative social entrepreneurship directly predicts the financial return of small entrepreneurship (H2) and financial return mediates between innovation and sustainability of small entrepreneurship, that is, Innovation -> Financial Return ($\beta = 0.60, t = 6.02, p < 0.05$) and also hypothesized that financial return directly predicts sustainability of small entrepreneurship (H3) and mediates between innovation and sustainability of small entrepreneurship, that is, Financial Return->Sustainability ($\beta = 0.65, t = 3.73, p < 0.05$). Innovation as a direct predictor of sustainability has the highest predictor value than other path-coefficients. Besides, the R^2 for Financial Return explained 34.3% variance while Sustainability explained 40.6% variance. Besides, the effect sizes of the variables are extreme. Innovation had f^2 (0.57) while Sustainability had f^2 (0.73). According to (Hair et al., 2016), this is an indication of a strong effect size. In all, sustainability of social entrepreneurship in the context of a developing country had the highest R^2 and f^2 (Table 4). This study established the mediation of financial return based on the three research questions established in the study of (Sarstedt et al., 2014) . First, the study excluded financial return from the path model and embarked on bootstrapping. The bootstrapping result shows that the direct effect between innovation and sustainability is 0.733 and significant at $p \leq 0.01$. Second, the study re-estimating the full model

by including the mediator variable and tests the indirect effect significance. The bootstrapping results indicate that the indirect effect yields 0.391, and it is significant at $p \leq 0.01$. Third, the study computes the Variance Accounted For (VAF) with the below formula:

$$VAF = \frac{indirect\ effect}{total\ effect}$$

The final analysis results for VAF is 0.533 which indicates that there is a partial financial return mediation effect between innovation and sustainability (Sarstedt et al., 2014) .

Table 4: Values of quality criteria of the variables

	FR	IN	SU	CR	(AVE)	R^2	f^2
Financial Return	**0.894**			0.923	0.799	0.343	
Innovation	0.601	**0.897**		0.892	0.805		0.566
Sustainability	0.650	0.731	**0.854**	0.914	0.728	0.406	0.733

Figure 3: Social entrepreneurship result of tested hypotheses of study 1

Fig. 4: Social entrepreneurship result of tested hypotheses of study 2

Table 5: Result of tested hypotheses for social entrepreneurship

Hypotheses	Variable Path Coefficient	OS	SD	T. Values	P. Values
H1	Innovation -> Sustainability	0.73	0.10	7.32	0.000
H2	Innovation -> Financial Return	0.60	0.16	6.02	0.000
H3	Financial Return -> Sustainability	0.65	0.11	3.73	0.000

Note: OS: Original Sample, SD: Standard Deviation

Result Discussion

The social entrepreneurs are world changers, especially in developing countries, as they engaged in poverty alleviation through economic and humanitarian intervention to lift people out of poverty. Social entrepreneurship is crucial in the developing nations because poverty has different ripple effects of increases health, economic, and political risks. This study probes the direct and indirect relationship of innovation, financial return, and sustainability as an integral part of social entrepreneurship dimensions based on the earlier recommendation of (Valle et al., 2018) . The findings of this study show the direct relationship of innovation and sustainability as the most significant part of social entrepreneurship in a developing country context. This result indicates that the higher the innovative social entrepreneurship, the higher the sustainability of social entrepreneurship. It indicates that the social entrepreneur that is not innovative will find it challenging to be sustainable. Eleven years ago, the earlier authors stated that there was no sustainable pressure in developing countries than in developed countries. However, today, things are different as sustainability has become a global issue, and there are more focus on the developing countries because they are the epicenter of sustainability needs (Nidumolu, Prahalad and Rangaswami, 2009) . It is possible for a social entrepreneur that considers resource conservation in their product or service life cycles and the supply chains with a core sustainable strategy to have a financial return. Inculcating innovation in a social entrepreneur's sustainable plan helps to get rid of harmful impacts on ecological systems and human health and facilitates healthy communities. There is a strong affinity between innovation and financial return, and in current research, building social capital and persistence innovative role was recommended to the social entrepreneurs (Olaleye, Mogaji, Watat and Ukpabi, 2020). On the other, (Sołtysik, Urbaniec and Wojnarowska, 2019) described sustainable development as an entrepreneurial opportunity to solve social and environmental challenges while (Leal-Millan, Peris-Ortiz and Leal-Rodríguez, 2018) advocate for green innovation and actions that promotes strategies, policies, and practices that curb negative human activities in the environment. The thoughts from the current studies support the significance of direct and indirect intervention of innovation, financial return, and sustainability in the context of social entrepreneurship in a developing setting.

Theoretical Inputs

The direct and indirect relationship between innovation and sustainability in the context of social entrepreneurship in a developing country theoretically contributes as follows. This study sheds more light on the importance of social entrepreneurship dimensions and underscores the structural relationship of innovation and sustainability with high effect size. Second, it shows the mediation effects of financial return and how it transfers the effect from innovation to sustainability. This study established the focal role of financial return as a means of promoting social activities in developing countries with a focus on sustainability. The results of this study are in tandem with earlier studies of (Nidumolu, Prahalad and Rangaswami, 2009; Leal-Millan, Peris-Ortiz, and Leal-Rodríguez, 2018; Sołtysik, Urbaniec and Wojnarowska, 2019; Olaleye, Mogaji, Watat and Ukpabi, 2020). All these studies contribute to the positive direct or indirect relationship of innovation and sustainability, but only a few pay attention to the mediation of financial return. It is clearer that financial return is an essential variable of consideration for social entrepreneurship.

Managerial Inputs

Managerially, this study identifies the direct relationship of social entrepreneurship innovation with its sustainability and the mediation of financial return between innovation and sustainability and offers implications for social entrepreneur managers. First, for existing social entrepreneurs and incoming managers to harness ways of having financial returns to be able to solve complex social needs in the developing countries. Though their objectives are not profit-making, they should look beyond the funders to identify other means of generating income to reduce poverty in society through social missions. Second, change and imbibing innovative ideas are crucial for the development and advancement of social entrepreneurship. The social entrepreneurs should not be satisfied with their present breakthroughs, and they need to innovate more to promote sustainable environmental practices that can foster a healthy community. Third, the social entrepreneurs' managers should implement an innovative sustainability policy and ethics that is robust as a guide and preventer from deviating from sustainable practices.

Limitations of the study and future suggestions

Social entrepreneurship is a growing trend in the developing countries, and this study paved the way for future extension of this research. Despite this study's contribution, there is still a limitation that gives insight to the academic community. This study used three variables from social entrepreneurship dimensions due to its focus, but the future study should look beyond these dimensions and investigate the interplay of culture and emerging technology with the established social entrepreneurship dimensions. Social entrepreneurship is a global issue, and the results of this study should trigger a comparative study between emerging and established economies. The female social entrepreneurs participated less in this study, and this gap should give birth to gender study in the context of social entrepreneurship and its dimensionality. Future researchers should examine the gender divergence of male and female social entrepreneurship as a comparative study of developed and developing nations.

Abstract

This research examines the strength of agreement of students' academic performances for their first and graduating year in the University using Cohen's kappa. Academic records of 710 students which consist of students Grade Point Average (GPA) and Cumulative Grade Point Average (CGPA) for their first and graduating year. This paper is to examine the final academic performances of students in the University based on specific information regarding their academic performances during their first year at the University. This study reveals that a strong agreement exists between the students' first and graduating year academic performance in their result. This work will serve as a useful counseling guide to prospective admission seekers and all stakeholders at enhancing students' academic performances in the University system. This study is divided into five sections: introduction, literature, methodology, discussion while the study limitation and future study forms the part of the conclusion.

Keywords: Academic performance, Intra-class kappa, Cohen's kappa, Cumulative grade point average

Introduction

Academic performance is the outcome of student-teacher efforts, and it depicts the student's preparation and how well the students respond to the material presented to them in the class by the teacher. Research on academic performance is growing, and many authors have contributed positively to the research domain of academic performance, theoretically and methodologically. Some of the recent studies by (Mensink and King, 2020) focused on student online feedback based on the assessment marks, gender and academic performance with educational data mining and discovered gender divergence in how students get feedback through the Learning Management Systems (LMS). Besides, (Baert et al., 2020) explore the correlation or causal relationship of Smartphone use and academic performance with samples from two Belgian Universities with instrumental variable estimation techniques, and their results show that a standard-deviation increase in daily use of Smartphone by the students yields a decrease in their average examination scores. (Donovan et al., 2020) digressed to the environmental impact on student's academic performance based on individual-level standardized mathematics and reading test scores.

They found that an I-SD upward shift in road density within 100 m of a student's home associates with advancing from the 50th percentile to the 47th percentile on reading tests. Consistent with (Mensink and King, 2020) study, (Fernandes et al., 2019) also used data mining to predict the academic performance of students in the central part of Brazil within school terms of two years, and their study found that the attributes of student grades and absences are the most relevant variables to predict the year academic outcomes of student performance. Recent studies by (HemaMalini, Suresh and Kushal,

2020) applied three machine learning techniques for performance analysis of the students and determined the factors affecting their performance. The result shows that Random Forest is the best technique in terms of accuracy, and the factors that contribute to student's performance are parent's education, attention from the faculty members to perform better, number of backlogs, and admission quota while (Mallikarjun Rao and Ramana Murthy, 2020) predicted and examined factors affecting student's performance using the XGBoost classifier.

The result identified parent education, the medium of instruction, style of learning as some of the factors that influence students' performance. (Yaacob et al., 2019) also used supervised data mining to predict student performance using some selected universities in Malaysia. The result shows that Naive Bayes performed better than the other methods. It also reveals some factors contributing to the students' performance. The authors focused on students' performance in different perspectives with different data analysis techniques but the aspect of strength of agreement of students' academic performances as a counseling guide for the University prospective admission seekers is insufficiently researched.

This research, therefore, considers the influences of the student's academic performances during their first year in the University and on their final academic performances and the main objective of this paper is to examine the final academic performances of students in the University based on specific information regarding their academic performances at their first year in the University. Results from this study would enable students to efficiently prioritize their social engagements vis-à-vis their academic activities during their first year in the University as build-up steps towards attaining academic excellence at the end of their studies at the University. This study is divided into five sections: introduction, literature, methodology, discussion while the study limitation and future study forms the part of the conclusion.

Exegesis of Performance Literature

Research is progressive in the research domain of students' academic performance and several researchers have examined the phenomenon. For instance, (Sadiq and Ahmed, 2019) classified and predicted student's performance using Decision Tree C4.5, Random Forest, Support Vector Machine, and Naïve Bayes. The authors also came up with an improved Decision Tree and compared it with the traditional Decision Tree C4.5. The result shows that the improved Decision Tree performed better than the traditional one when applied to three Universities in Iraq. (Sawant et al., 2019) employed Decision Tree in predicting student's performance by including some other factors that may affect their performance in the dataset used.

Still on the use of Decision Tree, (Adebayo and Chaubey, 2019) employed it in classifying and predicting student's performance in high school during a quiz. The authors reveal that the result will help teachers and students predict future performance based on the previous score in the quiz. Moreso, (Sitepu et al., 2019) compared the performance of the Decision Tree and Support Vector Machine method in classifying and predicting the student's performance in getting a scholarship. The result reveals that Decision Tree outperformed the Support Vector machine method in terms of accuracy to predict student's performance in getting a scholarship.

Differentiating from Decision Tree, (Alkadhwi and Adebayo, 2019) used the K-means algorithm to predict the student's performance. The authors reveal that the information from the result can be used by the Universities and Education sector to prevent drawbacks and failures in student's results in the future while (Salal, Abdullaev and Kumar, 2019) implemented nine algorithms to predict and classify the student's performance. The result shows that the school and the study time of the students play a significant role in affecting the student's performance, and three algorithms performed better in terms of accuracy in predicting the students' performance.

Besides, (Sasikala, Rajesh and Sreevidya, 2020) classified and predicted the academic performance of Alcoholic students using a classification model that uses Naïve Bayes and ID3. The authors compared the accuracy of R and Weka in terms of Naïve Bayes. The result shows that Naïve Bayes implemented in R performs better in terms of accuracy than Weka. The accuracy is the same when all the attributes and some of the attributes implemented in R and Weka for ID3 and (Mavani et al., 2020) employed Naïve Bayes classification, which is implemented in R, Weka, Python, and Orange to predict student's performance in S.S.C. and H.S.C. examinations. The result reveals that the Naïve Bayes implemented in Weka performs better in terms of accuracy. The authors suggest that future work will be able to identify the student that needs special attention and guidance to increase their likelihood placement.

Machine learning is now a groundbreaking data analysis technique and (Sana, Siddiqui and Arain, 2019) employed three different classifiers such as Naive Bayes, Decision Tree, and Artificial Neural Network, to examine the effect of some factors on student's performance. In terms of accuracy the result reveals that Artificial Neural Network is the best. Also, the result shows that student's punctuality and parents participating in the learning process are some of the factors that influence students' performance.

Also, (Adejo and Connolly, 2018) predicted student academic performance using multi-data sources with a multi-model different ensemble approach and founds that the approach used command efficiency and accuracy in predicting student performance and helps to identify the student risk of attrition. Also, (de Boer et al., 2018) carried out a meta-analysis review of the effects of metacognitive strategy instruction on student academic performance. Their study discovers the positive small increase effects of long-term strategy, but some specific strategies employed such as metacognitive, cognitive, management, and motivation failed to moderate the overall positive long-term effect of metacognitive strategy instruction. All the studies mentioned above show that one data analysis technique is not sufficient to evaluate and predict student academic performance. Applied linear regression and correlation analysis characterize the study of (Balogun, Oyelere and Atsa'am, 2019) as they determine the relationship between computing students' initial and final academic performance to support decision making in higher education institutions. Their study shows that there is a strong relationship between their first GPAs and graduating CGPA.

Education is defined as an efficient technique for the exchange and change of culture, through formal or informal training of people in a society (Oghuvbu, 2007) . It is a procedure that prompts mental, physical, psychological, and social development of a person in a given society. The prime target of getting educated throughout the world geared towards labor improvement that would encourage national development and advancement. As an instrument for the advancement of man and the general public, the way towards acquiring formal education can be compartmentalized into different categorized stages starting from primary (kindergarten) to higher (tertiary) levels (Ebong, 1996). This various categorized structure of education varies, starting with one nation then onto the next. Presently, there are 165 government-endorsed Universities in Nigeria, 43 of which built up and supported by the Federal Government of Nigeria, and the State Governments own 47 in Nigeria while private entities also own 43. These universities admit several students into their various programs and graduated a reasonable number of them with a different class of degrees annually.

The employability of graduates after University, to a great extent, relies upon the class of degrees they had at the end of their programme. Consequently, it is essential to analyze and assess the procedures that decide the final academic performances of the students while they are still in the Universities. The first year of students in the University is usually portrayed by a long list of activities such as orientation programme, students' union activities, traveling show, having sideshows, sightseeing and rides, engaging in games of skill and the like, all in a bid to get themselves adapt to the new school environment not quite the same as their origination. While these activities would enhance the social status of the students in the school, regrettably, they are similarly equipped for diverting the students from their genuine academic pursuit for their admission into the school.

Cohen's kappa coefficient (k) is a statistic that uses to measure inter-rater reliability (and intra-rater reliability) for qualitative (categorical) items. Kappa statistic is an excellent tool to test the level of agreement between two raters. Relevant studies such as (Banjoko et al., 2015) used kappa statistics to examine the strength of agreement between students' academic performance after their first and graduating year and also examine the factors that influence the students' academic performances at graduation by fitting a Multiple regression model. Also, (Elepo and Balogun, 2016) used Cohen's kappa and Intra-class kappa statistics to examine students' academic performance using their GPA and CGPA in their first and final year.

There are similarities in student's performance studies. (Oguntunde et al., 2018) and (Popoola et al., 2018) used comparable data in their work to study the trend of students' performance in the tertiary institution using multiple regression and correlation analysis for the students first, second, third, fourth-year GPA and final CGPA. They found out there is a strong relationship between the students' GPA and their CGPA. In the current study, we will be using Kappa statistics to reveal the strong agreement that exists between the students' first and graduating year academic performance. The study also shows the percentage of students who improve, maintained, or drop in their academic performance using the same dataset.

Material and Methods

Data Description: Data on results of academic performances of programs in three engineering departments (Information communication engineering, Mechanical engineering, and Petroleum engineering department), Covenant University, Nigeria, during the 2005/2006 academic session were followed-up to their year of graduation in 2010. The academic performance of the students in various courses offered in a session recorded in percentage scores with possible marks obtainable by the student ranged from 0% to 100%. We convert these percentage scores to weighted grade point (WGP), which were after that converted to grade point average (the term used for student's academic performance point average, the term used for student's academic performance point at the end of their second year and beyond in the university).

At the end of the session, the class of degree of a student determines the GPA or CGPA point obtained. Also, the performance of students during the first session of the programme recorded as the GPA, which is a function of courses' credit units and grade points. For two or more sessions, the performance of the student recorded as the CGPA. The dispersion of the scope of GPA or CGPA points attainable by students and their respective classes of degree as appropriate by National University Commission (NUC), the body is responsible for the regulation of University education in Nigeria, as presented in Table 1. Any student that produces a GPA or CGPA point between 0.00 and 0.99 would be withdrawn from the programme or placed on probation (repeat the academic level) depending on whether the student is in their first year or second year and higher of his/her academic programme respectively.

Table 1: Table of possible GPAs or CGPAs

Obtainable GPA or CGPA	Class of degree
$4.50 - 5.00$	First class (honours) -1st Class
$3.50 - 4.49$	Second class (honours) upper division – 2nd class upper
$2.40 - 3.49$	Second class (honours) lower division – 2nd class lower
$1.50 - 2.39$	Third class (honours) – 3rd class
$1.00 - 1.49$	Pass
$0.00 - 0.99$	Fail

Methodology

To set up an agreement between the initial classes of degrees of students at the end of their first year in the university estimated by their GPAs and final class of degrees they attained at the end of their study equally estimated by their CGPAs, a measure of agreement using Cohen's kappa and intra-class kappa statistic (Scott, 1955; Banerjee et al., 1999; Lawal, 2003; Dou et al., 2007; Bloch and Kraemer, 1989). Cohen's Kappa statistic is a correlation-like coefficient that measures the pairwise agreement between two raters in order to decide whether the observed agreement attained by chance or not (Donner and Eliasziw, 1992). (Fleiss, Cohen and Everitt, 1969) extended this idea to come up with a weighted Kappa statistic to evaluate the ordinal scale degrees of agreement or disagreement.

By and large, two possible uses of kappa are (i) to test raters' independence, that is, as a test statistic for testing the null hypothesis that there is no agreement between the two raters than might occur by chance given random guessing and (ii) to quantify the level of agreement (effect-size measure), which is of more worry in this work.

For any typical square $r \times c$ contingency table (with $r = c$) as given by Table 2 ($for\ r = c = 5$), the Kappa statistic k_a definition is:

$$k_a = \frac{(\pi_0 - \pi_e)}{(1 - \pi_e)} \tag{1}$$

Where; $\pi_0 = \sum_{i=1}^{r} \pi_{ii}$ with $\pi_{ii} = \frac{n_{ii}}{n_{..}}$; $\pi_e = \pi_{i.}\pi_{.j} = \frac{1}{n_{..}^2}\sum_{i=1}^{r}\sum_{j=1}^{r}\frac{n_{i.} \times n_{.j}}{n_{..}}$ (2)

The Intra-class Kappa defines as data comprising of blind dichotomous ratings on each of n subjects by two fixed raters. The presumption that the ratings on a subject are interchangeable that is, in the population of subjects; the two ratings for each subject have a distribution that is invariant under permutations of the raters to guarantee that there is no rater bias (Donner and Eliasziw, 1992; Bloch and Kraemer, 1989; Scott, 1955). The Intra-class Kappa k_i defined as:

$$\frac{(\pi_0^* - \pi_e^*)}{(1 - \pi_e^*)} \tag{3}$$

Where $\pi_0^* = \sum_{i=1}^{r} n_{ii}$ and $\pi_e^* = \sum \left[\frac{n_{i.} + n_{.j}}{n_{..}} \Big/ 2 \right]^2$ (4)

Table 2: A typical 5×5 contingency table used for computation of Cohen's Kappa and Intra-class Kappa coefficients and for raters agreement between two independent raters

Class of Degree		Final Class of Degree (j)					Total
		1st	2¹	2²	3rd	Pass	
Initial Class of Degree (i)	1st	(n_{11})	(n_{12})	(n_{13})	(n_{14})	(n_{15})	$(n_{1.})$
	2¹	(n_{21})	(n_{22})	(n_{23})	(n_{24})	(n_{25})	$(n_{2.})$
	2²	(n_{31})	(n_{32})	(n_{33})	(n_{34})	(n_{35})	$(n_{3.})$
	3rd	(n_{41})	(n_{42})	(n_{43})	(n_{44})	(n_{45})	$(n_{4.})$
	Pass	(n_{51})	(n_{52})	(n_{53})	(n_{54})	(n_{55})	$(n_{5.})$
Total		$(n_{.1})$	$(n_{.2})$	$(n_{.3})$	$(n_{.4})$	$(n_{.5})$	$(n_{..})$

Table 3: Table of the interpretation of the estimates of Cohen's Kappa k_a and Intra-class Kappa k_i statistic

Interval of Kappa Estimate	Strength of agreement
< 0.00	Poor
$0.01 - 0.20$	Slight
$0.21 - 0.40$	Fair
$0.41 - 0.60$	Moderate
$0.61 - 0.80$	Substantial
$0.81 - 1.00$	Almost perfect

There is a diverse opinion of scholars' interpretations concerning the right level of agreement using the computed Cohen's Kappa statistic k_a. Traditionally, values of k_a between $-1\ and + 1$ are used to interpret the inter-rater reliability agreement between two raters (McHugh, 2012). However, interpretations of values k_a between 0 and 1 have been a common choice in the literature (Altman, 1991; Viera and Garrett, 2005). Relatedly, Table 3 presents the interpretations of values of k_a as reported by (Altman, 1991; Viera and Garrett, 2005) for values of $k_a = 0.00$ and 1.00 indicate poor agreement and perfect agreement, respectively.

Finally, based on the observed counts in the contingency Table 2, this study determines the proportions of students that:

P_1 = the proportion of students that maintained what they started with, that is, the diagonal entries
P_2 = the proportion of students that improved on their performance, that is, those below the diagonal entries
P_3 = the proportion of students that dropped from the class of grade point they started with, that is, those above the diagonal entries from table 2 using the formula as follows:

$P_1 = \frac{1}{n_{..}} \sum_{i=1}^{4} \sum_{j=1}^{5} n_{ij}$, for $i < j$, $i = 1,2,3,4; j = 1,2,3,4,5$
$P_2 = \frac{1}{n_{..}} \sum_{i=1}^{5} \sum_{j=1}^{5} n_{ij}$, for $i = j$, $i = 1,2,3,4,5; j = 1,2,3,4,5$
$P_3 = \frac{1}{n_{..}} \sum_{i=1}^{5} \sum_{j=1}^{4} n_{ij}$, for $i > j$, $i = 1,2,3,4,5; j = 1,2,3,4$

Thus, P_1, P_2, P_3 are computed by taking the sum counts above the diagonal entries, along with the main diagonal entries, and below the main diagonal entries in Table 2 over the sample. This study utilized IBM SPSS 25 version and Microsoft Excel package for all the data analyses.

Analysis and Result

This study presents the analysis and result of the data collected from the three engineering departments on the students' performances at the end of their first and final academic sessions in this section. Table 4 presents the summary of the academic performances of students in the three engineering departments at the end of their first and final year in the University.

Table 4: showing the proportion of students that maintained their initial classes of degree, improved on their initial class of degree they started with and dropped from their initial class of degree

Discussion

The main objective of this paper is to examine the final academic performances of students in the University based on specific information regarding their academic performances in their first year at the University. However, this study emphasizes the possible relationship between the initial academic performances of the students at the end of their first year and measured by their GPAs and their final academic performances. Both of these converted into possible classes of degrees that are obtainable within the University system, as provided in Table 1.

Data on academic performances of students in three departments from Covenant University, Nigeria, were collected on 710 students. This study depicts a longitudinal study in which the academic progress of these 710 students followed up until graduation.

Based on the available information on all the academic performances of 710 students in all the three departments from Covenant University as detailed in Table 8. This study discovers that a total of 14 (1.97%) graduates improved on the classes of degrees they had in the first year of their study. Also, 572 (80.56%) of students maintained their classes of degrees they had in their first year till graduation, while 124 (17.46%) of the students dropped from the classes of degrees they started with in the first year of their study at graduation.

Surprisingly, of the 77 students that started with first-class in their first year, 53 (68.83%) of them maintained this class of degree while the remaining 24 (31.17%) dropped to (2^1) class at graduation. Specifically, out of a total of 380 students that had second upper (2^1) at the end of their first year in their departments, only 4 (1.05%) of them improved to first class ((1st)), 284 (74.74%) of them maintained this class of degree till graduation while 92 (24.21%) of them dropped to a second class lower (2^2).

Also, out of 209 students that started with second class lower (2^2)from their first year in the University, only 5 (2.39%) of them improved to second class upper. 196 (93.78%) of them maintained this class of degree till graduation while only 8 (3.83%) of them dropped to third class (3rd) degree status at graduation. Similarly, of the 43 students that had a third-class degree (3rd) in their first year, only 4 (9.30%) improved (the four students had (2^2) while 39 (90.70%) maintained this class of degree till graduation. Only one student started with a pass degree in their first year, and 1 (100%) improved to a second class lower.

The distribution of the classes of degrees obtained by 349, 166 and 195 students that graduated from Information Communication Engineering, Mechanical Engineering and Petroleum Engineering department respectively cross-classified by their classes of degrees they had at the end of their first and final years in the University is presented by the confusion matrices in Table 5, 6 and 7. The pattern of academic performance of students replicates for the three departments in this study, and the results are as follows:

Based on observation, the data in Table 5 for the 349 graduates of Information Communication Engineering department that just 1 (0.29%) student improved on its initial classes of degrees. Whereas

347 (99.43%) students maintained their initial classes of degrees till graduation (main diagonal entries) and while only 1 (0.29%) student dropped from its classes of degrees it started with at graduation.

To further examine the association between the initial and final classes of academic performance of students at the end of their first and final years in the University, the Kappa statistics were computed separately for all the three departments for which the data used is collected from Covenant University using the information provided in Tables 5, 6 and 7. The results of the Cohens Kappa and Intra-class Kappa agreement using statistic (1) and (3) as presented in Table 9 where reasonable agreement observed between the students' initial and final classes of degrees they had at the end of their first and final years of study in the University in all the departments. This result was supported by the results of the Chi-square test of association in which the p-values for each department were significant ($p < 0.05$).

Conclusion

This work examines the impact of the performances of students in higher institutions of learning, especially in the University, during their first year on their final academic achievement at graduation. Emphasis is more on determining the relationship between the initial GPAs and final CGPAs of students at their first and final years in the University system. The follow-up study on the performance of students from three Engineering departments, Covenant University, Nigeria, between 2005 and 2010, determines this development.

These results show that, generally, about 81% of the students in the University do maintain the classes of degrees they had in the first year of their program till graduation. Whereas, about 2% of the students improved on their first classes of degrees during their first year at graduation while only about 17% of them had their academic performances dropped from what they had during their first year.
Results from this study have provided vital information that is useful for prospective students of the University regarding the need to work hard during their first year on their academic programs since the outcome of such efforts would greatly determine their final academic performance on graduation from the University.

Besides, the different results from this work would serve as useful counseling resources to stakeholders in the education sector within and outside the University system towards improving the academic performances of students in the system. This study would equally benefit the parents and guardians to be able to put in place necessary measures that would assist in improving the academic performances of their children and wards in the University.

Information Communication Engineering department had the highest number of students that maintained their grade point, Petroleum Engineering department had the highest number of students who improved on their performance, and Mechanical Engineering department had the number of students that dropped. Also, the strength of agreement that exists between the first year and their final grade of the students is on the average is fair. This study is limited by secondary data and the future research should employ big data with machine learning to advance the results of this study.

Abstract

Today, young entrepreneurs who begin their "adventure" with business and are in the initial startup stage, the so-called preseed stage, have problems describing their business plan in terms of its vision, strategy and innovation. They tend to follow the usual patterns and often make too hasty decisions about the final establishment of their business. Then, what becomes the most difficult is the fact that the control group formed by the companies that have already left startups (the so-called post-startup stage) and are building their brand, is not relevant, because their development paths were also poorly thought out and even very often resembled someone else's idea adapted to the demand and economic conditions of the day. This article presents the results of research on Wrocław enterprises (startups) concerning the analysis of the company's mission and vision along with the identification of innovation sources, resources and elements of the Lean Canvas strategy. The original research assumption was to identify the extent of use of creative problem-solving techniques in the context of open innovation. However, in the course of research it turned out that Wrocław startups know very little about the problem being studied, which resulted in a change in the research objective.

Keywords: Innovation, Startups, Creativity, Entrepreneurship

Introduction

J.A. Schumpeter was a pioneer in research on enterprise innovation. Contemporary theorists and practitioners are still discussing the categories he introduced. The classic combinations of production factors in the form of new products, production methods, raw materials, markets and industry organization (Schumpeter, 1960) are currently taking completely different forms, because they take into account the soft social sphere, which the Schumpeter school has ignored, focusing rather on the technical aspects of innovation. Schumpeter's theory arose during the capitalist economy of the early 20th century, which was based on a large concentrated mass industry, and the most important resources were land, labor and capital. The dynamic imbalance caused by entrepreneurs, which is the backbone of the market economy to a greater extent than balance and optimization (Bielski, 2000), has remained unchanged. The analysis of changes that have taken place in recent years in the generally understood organization management process allows us to see important trends in creative destruction. They concern not only the emphasis on introducing technological innovations as the main direction of company renewal, but also changes in the perception of the sources of these innovations. The environment of modern organizations is becoming a new source of innovation, which results in the emergence of open innovations.

The purpose of the article is to present the results of research carried out in the third quarter of 2015 on a group of startups which is the foundation of planned empirical research in the so-called post-startup

stage. The research was initially intended to identify the extent to which creative problem-solving techniques were used in the context of open innovation. However, while conducting research, the research team decided to change its objective due to the fact that the respondents knew so little about creative techniques of project management that it did not make much sense to study it. Therefore, the research focused on mission and vision analysis, identification of innovation sources, resources as well as planned strategies and elements of the Lean Canvas business model. The presented research should be treated as preliminary research for further empirical procedure.

The study consists of three parts. The first part presents the research methodology and description of the target group. Part two presents the results of research carried out in 2015 on the basis of SWOT methodology, and part three presents elements of the Lean Canvas methodology. The conclusion presents the questions of the planned research, which was decided to be carried out among the respondents from 2015. The form of research will thus be longitudinal, although as it turns out - the objectives of current research will be significantly expanded.

Research methodology and description of the group of respondents

The concept that has changed the approach to innovative activity of companies and which can become the foundation of value innovation is open innovation. It is a relatively new concept and not fully recognized in the world of management (Huizingh, 2001). This concept was introduced in 2003 by H. Chesbrough. Open innovation is the antithesis of a traditional, vertical innovation model in which internal innovation activities lead to the internal development of products or services. The author calls this model closed innovation and describes open innovation as *the deliberate use of inflows and outflows of knowledge to accelerate internal innovation and the expansion to external markets* (Chesbrough, 2012). Shifting focus from the center of the organization to its environment does not mean giving up creating innovations inside the company, which in turn leads to the creation of two types of open innovations: outside-in and inside-out. The first one makes use of external sources of knowledge - users, competitors, suppliers, partners, local communities (crowdsourcing). The second one is about sharing the existing internal knowledge with other entities that can use it in their activities. This model is much less recognized and understood, both in academic environments and in business practice *(*Chesbrough*, 2012*). The research problem identified in 2015 was based on observations of organizations developing in the business incubator ecosystem: of the Wrocław University of Economics and the WSB University. Observation showed that entrepreneurs were not able to creatively work on their projects, and they were unable to identify their needs for the range of methods they could use. At that time there were no well-established methodologies in Poland to lead a team during the implementation of creative projects (e.g. brainstorming). There was also a gap in the area of open innovation (the approach, in which the most important is the belief that companies can and should use both external and internal ideas in their innovation processes), which eliminated the possibility of proper assessment of the work of project teams. Due to the need to redefine this goal in 2015 the analysis covered the mission and vision, sources of innovation, resources as well as planned strategies and elements of the Lean Canvas business model.

Research work was carried out in the following stages:

a) Analysis of selected literature - comparison of foreign techniques, their degree of effectiveness and impact on individual stages of solution design.
b) In-depth interviews with representatives of 20 startups operating in Wrocław business incubators - based on a detailed scenario developed on the basis of the applicant's experience and conclusions from the literature - qualitative research
c) Conducting research using a questionnaire among entrepreneurs (40 startup companies) operating in Wrocław - quantitative research

The first research stage of the project was a systematic analysis of the literature on the subject in the field of open innovations, design thinking, brainstorming and tools used in the blue ocean strategy as well as purchase of access to databases (Harvard Business Review, Stanford University case studies database - Graduate School of Business - areas: leadership, human resources, entrepreneurship,

innovation in developing economies). This allowed to systematize the knowledge of commonly used methods and tools in the processes of creative problem-solving, as well as to select research issues that were implemented as practical applications for contemporary entrepreneurs.

The next stage of research involved selecting and conducting meetings with representatives of 20 companies (Startup) based in Wrocław, working on innovative projects. In-depth interviews were conducted on the basis of an in-depth interview scenario. The choice of individual in-depth interviews in the proposed project was supported, among others, by the need to analyze individual opinions and experiences, business specificity and the limited time availability of the respondents. Survey questionnaires made it possible to conduct a quantitative analysis of entities operating in Wrocław incubators, which enabled a comparative analysis.

The study covered the circles of Wrocław enterprises that started their operations at the Academic Business Incubators. The research was carried out on a group of 30 people up to 30 years old, 21 men and 9 women. The group included active students (27%), previous year's graduates (13%) and university graduates from 2009-2012 (60%), including 2 persons with doctoral degrees. For 9 people, the analyzed idea was their next initiative.

Most of the respondents (70%) decided to work individually and independently implement their ideas. 6 ideas were implemented in a group of 2 people, others in teams of more than 3 people, including one in a team of 6 people. Having analyzed the education profile of respondents, it was observed that 18 of the analyzed ideas belonged to industries consistent with the originators' education profile. 50% of the respondents have economic education (students and graduates - including post-graduate studies - of the University of Economics, Wrocław University of Technology, the WSB University, and the Univeristy of Business in Wrocław). 11 people have technical education, of which 8 are educated in IT.

Researchers were aware of the disadvantages of the developed scenarios, used for structured in-depth interviews (SSI), such as the researcher's subjectivity, but the choice of this method in the present study was supported by:

- the need to analyze individual opinions and experiences,
- specifics of the business and
- limited time availability of the respondents.

According to the authors of the study, the group of respondents (young originators) had to be contacted directly to avoid inconsistencies that could be easily clarified during the interview (directly or by referring to other issues). All interviews were conducted according to the assumed plan.

Research results: strengths and weaknesses, opportunities and threats - perspective of entrepreneurs

Initially, the project assumed to analyze the environment of Wrocław enterprises starting their operation at the Academic Business Incubator. According to the researchers' knowledge, the level of research on creative techniques for conducting project teamwork (startups) was very low. This was mainly due to the lack of even basic and, what is worth emphasizing, practical knowledge about creative techniques, which negatively affects the operation of project teams or the behavior of leaders. In the course of project work and analysis of business ideas, it turned out that the level of knowledge of creative techniques of project management is so low that the goal of the project should be redefined. Therefore, the research focused on mission and vision analysis, identification of innovation sources, resources as well as planned strategies and elements of the Lean Canvas business model.

In all the analyzed cases, the respondents had a clear vision of the purpose of the business, they were able to determine the exact needs of consumers addressed by the startup. The respondents had no trouble determining the business profile, which confirmed their awareness and allowed them to conclude on the successful implementation of the adopted strategy. Only 4 out of 30 respondents claim that at the time they applied to the incubator their product / service offer had to be refined and could

not have been placed on the market yet. Others said their product / offer was ready to be placed on at least local market. 14 respondents defined the scope of their activity as nationwide, and 4 respondents indicated that their product / service was ready for the global market. Others (50%) were in the initial stage of operation on the local market, of which 5 people planned to expand the offer to the nationwide market.

Together with the respondents, analyses of the strengths and weaknesses of implemented projects, as well as their opportunities and threats were carried out. Figure 1 presents the results of the research.

Strengths	Weaknesses
- motivation - goal-directing - flexibility (understood as openness to new, unconventional solutions and openness to customer needs) - innovative perspective and positive attitude	- inexperience - lack of time - lack of financial resources - lack of brand recognition - the need to employ unknown subcontractors for larger orders
Opportunities	**Threats**
- innovation of the idea - continuous technical progress - the possibility of receiving financial support for startups (EU Funds, regional competitions, finding and support from investors), perspective of cooperation with other startups, - developed business model, - growing customer demand for a given service / product - help from institutions supporting startup activities: Academic Business Incubators	- distrust of young entrepreneurs, growing customer requirements - "people outflow" to other, more stable jobs, - highly qualified competition, transient trends (in the case of startups focused on nutritional counselling and physical activity) - increasing costs associated with subcontracting (in the case of sole proprietorships)

Figure 1: SWOT matrix for conducted empirical research - preliminary research results
Source: Own study.

Strengths and weaknesses in the study concerned present factors, while opportunities and threats, due to the timing of idea implementation, pointed out future discriminants that could but did not necessarily have to appear. Identification of factors by means of a significantly shortened SWOT analysis allowed the respondents to rationalize the idea, and gave them opportunity to learn about the market from the perspective of objective observers, not emotionally connected with the idea or the originator. In this way, the respondents obtained added value from the research, namely: verification of project assumptions and discovery of so far unnoticed development opportunities.

Research Results - Elements of The Lean Canvas Methodology

As the need arose to change empirical assumptions, the research employed the assumptions of the Lean Canvas methodology. This model was developed for startup companies operating in conditions of extreme uncertainty. The first discussed elements of the model were:

- knowledge of customer segments understood as target groups whose problems are solved by the offered service / product,
- value suggestions, i.e. understanding and determining the solution to customers' needs,
- main competitive advantage,
- solutions and protection of intellectual property,
- subjective feelings about the business risk of running a startup,
- concept of brand and branding,
- revenue streams and knowledge of cost structures.

Only 9 (30%) respondents affirmatively answered the question about having developed a full business model and stated that in their opinion it would allow for stable startup development. In 27 cases the respondents conducted demand analyses for the products offered. As sources of knowledge about market needs they indicated their own previous experience in the industry, virtual resources (internet forums, blogs, industry websites) and the knowledge of other people from their contact network. Two respondents indicated trade press and scientific journals as their main source of knowledge (both had experience of working at a university). The replies also included reports from competing companies that commissioned studies from consulting and advisory companies. In order to verify the value proposition, an expert assessment was made which awarded points (maximum 1) for defining in response to open questions the mission understood as the role of the company on the market, the vision, i.e. image in the distant future and the strategy, i.e. awareness and preparation for action in a changing environment . All respondents were able to clearly assess at least 2 out of 3 points, which indicates their understanding of the proposed solution as a response to customer needs and / or awareness in shaping the market for the needs of startups, as is the case with innovative solutions. Only 2 respondents used tools protecting intellectual property, enabling the protection of know-how and solutions. The responses listed confidentiality agreements, patents and trademark protection. It is worth emphasizing that in 3 cases protection was defined as "keeping the idea for yourself" and "not sharing it with others", which may indicate no willingness to cooperate with other entities. 25 respondents replied that they did not protect their knowledge in any way, of which 60% thought that this problem did not concern them. The results confirm the information published in many reports about the lack of basic knowledge among young entrepreneurs concerning the protection of intellectual property, tools for protecting an idea and / or a solution or even the ability to see innovations and the need to protect them.

In published reports on young entrepreneurs and startups, great attention is paid to risk and overestimating their opportunities on the market. 10 respondents considered the business risk associated with launching a product / service to be low or negligible. 6 of them operate in the IT area, which is characterized by high flexibility and volatility, employee turnover and rapid development. The remaining 4 are companies which are about to start their activity in the artistic or consulting industry (dance school, nutrition counselling), which depend largely on the trends prevailing on the market. In 3 out of 10 cases, respondents, assessing the risk as low, did not carry out a market needs analysis, the next 3 are not sure if their product / service has a chance to achieve a competitive advantage, and 2 people do not have a clear development strategy. Failure to analyze the needs of the market or the lack of strategy can cause significant overestimation of your capabilities, distorting the vision of a startup and, as a consequence, delaying the start of business and entering the market.

According to experts' opinions, small companies entering the market need at least basic knowledge about cost control and cost settlement. It is worth emphasizing that 77% of respondents control the flow of money, and by entering the structures of the incubator they can use the services of a qualified accountant.

Together with the respondents, the following categories of innovation were assigned to their business ideas: technological (product, process), organizational or marketing. Although precise qualification is virtually impossible at the initial stage of development, 15 respondents considered their idea to be a technological - product innovation, understood as significant modifications in products, related to new functional features of the product, tailored to the needs of a new group of service clients. 3 people said that they introduce innovations at the organizational level, and 3 more introduce significant changes in the field of distribution, marketing or product design (marketing innovation). Other people were unable to clearly identify areas of innovation and indicated the vision of a startup. Importantly, the indicated source of innovation in 60% of the analyzed cases was colleagues (their potential) as well as own competences and experience.

Based on the results of the research, it can be concluded that the awareness of cognitive processes that improve creative thinking in project teams is very low.

Conclusion

Contemporary organizations are actively looking for sources of innovation, going beyond the industries in which they previously operated, and thus obtaining tangible intangible benefits (Lichtenthaler, 2011; Grindley, 1997). However, the most important benefit arising from the implementation of an open approach to innovation is the elimination of the NIH syndrome (not invented here), which is the negative attitude among employees of the organization towards a novel that has not arisen within their structures (Laursen , 2006). Other positive consequences are reduction of risk by spreading it over several entities, saving time and money, and creating new networks of relationships based on coopetition and synergistic relationships. The literature on open innovation focuses mostly on three issues: a) how to measure them, b) interaction between an organization's strategy based on open innovations and company choices, c) the growing integration of open integrations with existing theories of innovation, management and economics (West, 2014). However, as it turns out, along with the degree of popularization of information about the imperative use of creative techniques for solving problems in Western literature - in practice it looked quite different in Poland. Researchers' opinions were deliberately used in those years - to show how huge the difference is between what happened in Western countries and what happened in Poland. The question is: what is the same situation like today? Therefore, the presented empirical research is preliminary studies to the main research, in which the following empirical research was set:

1. Do Polish startups use creative problem-solving techniques? If so, to what extent? If not - what are the barriers associated with using such solutions?
2. Do Polish startups use the opportunities associated with open innovations? If so, to what extent? If not - what are the barriers related to the use of such solutions?

In addition, it is planned to conduct longitudinal studies among respondents who participated in the research in 2015. The main goal of the research is the same as the objectives realized in the presented research, and the specific goal is to identify discrepancies and determine the level of maturity of an innovative organization in the analyzed contexts. As part of this research group, decision was made to conduct qualitative research and identify the moments that appeared in the period 2015-2020 which significantly affected the business (barriers, opportunities, crises and their distinguishing features in the area of conducting innovative activities).

Abstract

Public organizations are in a state of crisis at the moment of significant institutional changes in their structures (Boin, t'Hart, in: Wagnedaar, 2000, pp. 9-31), and the greater the number of people affected - the more the crisis in the organization is felt. In connection with the ordinance of the Minister of Health of 13 March 2020 (Journal of Laws of 2020, item 433), announcing the state of epidemic threat in the territory of the Republic of Poland, common units of the prosecutor's office faced a new challenge regarding quick and effective response to crimes arising in connection with the use of the state of emergency for unlawful purpose. Certainly, for people who act against the law this is a typical opportunity, a situation that can be used to generate spectacular profits. On the other hand, for law-enforcing organizations the state of epidemic threat is, if not a crisis, certainly an emergency situation. Apart from the specific dichotomy that emerged as part of the analysis carried out for this article (the relationship between opportunity and crisis), it is worth presenting the actions taken in the public entity during the crisis caused by COVID-19. What is the purpose of this study? The study analyses the actions taken by the Polish Public Prosecutor's office in reaction to the crisis which aim to minimize the spread of not only the virus, but also criminal activity in Poland. The study consists of 4 parts. The first part is theoretical and describes the issues from management and quality sciences related both to crisis and emergency situation. The second part describes strategic and operational actions taken by organizations in crisis environment. Parts three and four are practical and describe the activities of the Polish public prosecutor's office in the face of the crisis caused by the emergence of COVID-19 in Poland.

Keywords: Crisis, Crisis Management, Polish Public Prosecutor's Office, COVID_19.

The Essence of Crisis and Emergency Situations

Crises can be defined as unexpected, difficult to solve and predict[1] situations that have a significant impact on organizations and stakeholders (Tokakis, Polychroniou, Boustras, 2019, p. 37). As crisis we understand a state in which the organization loses the ability to properly respond to stimuli and, as a consequence, to perform its basic functions. The crisis is a special condition in the life of an organization, constituting either a deadly threat or a source of growth and development opportunities (Skalik, 2003, p. 145). In the literature on the subject, the notion of crisis permanently coexists with

[1] Although, as practice shows, economic crises appear in 10-year cycles, and the economic crisis of 2020 should have happened accordingly in 2018 (the last one took place in 2008-2009), the situation in Poland has been shifted due to a huge bull market in the automotive and real estate markets. However, as it turned out, the global factor, which is the COVID-19 virus, caused a global crisis that could not have been stopped by the accelerating economy. Therefore, a bizarre situation emerges and a new element of the further environment model influencing the enterprise emerge appears, namely: biological factors.

the phenomenon of an emergency situation, and the terms are often wrongly used interchangeably. The difference between these concepts lies mainly in their final effect. Namely, an emergency situation does not directly threaten the existence of an individual, unlike a crisis. One can venture to say that the emergency situation is the sum of specific crisis-forming events. Therefore, it is a state in which the organization deviates from a certain adopted state, and may consequently lead to a crisis. Chronologically speaking, first are crisis events, followed by an emergency situation, the direct consequence of which may be a crisis (Skalik, 2003, p. 146). The current situation related to the economic crisis caused by COVID-19 questions the current knowledge of organization management, according to which the most common causes of crises are external factors of a macroeconomic nature related to a competitive environment (Urbanowska-Sojkin, 1999, p. 21). The appearance of a new element in the model of the further environment of both business and non-profit entities - a biological factor - will forever change the way organizations operate around the world.

The crisis and changes at strategic and operational levels

Managing an organization in crisis is a difficult task, especially considering stress experienced by employees at all levels of management. Under crisis conditions, management shifts attention and focus from implementing strategies to responding to turbulence in the environment, which may implicate a change in the relationship between strategy and structure. In a bull market, you first work on a strategy that determines the structure, while the crisis creates the need to reverse these actions. This results in structural changes, consisting in adapting structures to the existing conditions, which in practice may entail dismissals of employees. The natural effects are savings and promoting flexibility of structures (Nogalski, Marcinkiewicz, 2004, p. 230), but also a decrease in employee morale and an increase in opportunistic behavior.

From the perspective of strategic changes in the conditions of crisis, the implementation of the organization’s mission is losing significance, because completely different goals become important. The pursuit of growth and development is marginalized for survival.

At operational level, in crisis conditions the recommended actions cover seven elements (Slatter, Lovett, 2001) of restructuring. One of them is crisis stabilization - in case of COVID-19 this factor is beyond control, and the only activities are those based on the attempts to minimize the impact of entities building the business ecosystem on organizational reality. Another factor is leadership, which is particularly meaningful in times of crisis. The role of the leader changes towards initiating creative thinking, undertaking and implying risky actions to negate the status quo of the crisis, tolerating diversification of strategic options and promoting various solutions to similar problems in the organization. Leaders become influencers of change to the extent that is possible in the environment in which they make decisions (Paglis, Green, 2002, p. 220) (e.g. top management, or the resources at their disposal). Other activities include supporting interest groups (e.g. obtaining a loan, implementation of the anti-crisis shield by the government), focusing on strategic issues (strong product orientation on industries affected by the crisis to a lesser extent, cost reductions), and thus identifying existing resources and specifying those that are fundamental to the survival of the organization, implementing organizational changes, as well as improving key processes and financial restructuring. The sources of the crisis can be perceived both inside and outside the organization. In the case of the analyzed economic crisis caused by COVID-19, the source is outside the entities, causing consequences inside both enterprises and public entities. Nevertheless, the crisis resulting from the changes taking place in the environment makes it necessary to reformulate the existing ways of functioning, including the structural solutions used, the method of resource allocation (Cyfert, 2004, p. 72) and the architecture of processes.

Practical actions during the crisis: structural changes

The strategic activities of public prosecutors' offices, i.e. public entities who are realizing investigation and public prosecution in criminal proceedings (Act of 28 January 2016. Law on the Public Prosecutor's Office. Journal of Laws of 2016, item 177), in the face of the COVID-19 pandemic, have not changed. Prosecutors continue to carry out activities in cases brought before the courts and perform tasks in the

prosecution of criminals and upholding the law. In turn, operational activities[2] in the case of the Polish public prosecutor's office acquired the features of crisis management, thus determining structural and procedural changes.

On 16 March 2020, according to the Ordinance No. 28/20 of the National Public Prosecutor (Ordinance No. 28/20 of the National Public Prosecutor from 16 March 2020), a team of prosecutors was appointed in the National Public Prosecutor's Office to coordinate the fight against economic crime in connection with the state of epidemic threat. The creation of the team was a reaction to the registered increase in crimes which employed the panic of part of society and information chaos in the face of a pandemic, including, e.g., access to protection measures against COVID-19, supplying necessary products, including groceries, medical articles and disinfectants, disposing of accumulated funds and financial instruments.

The team's main goal is to coordinate fraud-related proceedings related to:

- economically unjustified trade in goods, in particular food products, medicines, medical articles, disinfectants, related to the resale of purchased goods with excessive profit without economic basis, which is a harm for the transaction party;
- causing people to dispose of their property to their disadvantage by misleading them as to the quantity, quality, suitability, actual value of purchased goods, in particular food products, medicines, medical products, disinfectants;
- causing people to dispose of their property to their disadvantage via the Internet by misleading them as to the need to dispose of their accumulated financial resources and financial instruments;
- causing people to dispose of their property to their disadvantage by misleading them as to the operation of sanitary, control and public order services of the country;
- concluding contracts in the conditions of exploiting the forced position of natural persons, imposing the obligation of disproportionate consideration.

The team's tasks include:

- collecting and analyzing information on ongoing proceedings that are the subject of the team's activities in order to assess the nature, growth dynamics and scale of this type of crime;
- ongoing coordination and supervision of such proceedings carried out in individual organizational units of the public prosecutor's office;
- as well as the assessment of the legitimacy of procedural actions taken in the most serious proceedings, including adopted legal qualifications and applied preventive measures, in order to standardize the practice of proceedings and increase their effectiveness.

In addition, due to the state of epidemic threat, the management of common prosecutor's offices were obliged to take steps to ensure the safety of prosecutors, other employees of the prosecutor's office in the performance of their duties, as well as parties and participants in proceedings, when carrying out procedural activities with their participation in the offices of individual prosecutor's offices. For example, the Regional Prosecutor's Office in Wrocław, by letter of 31 March 2002. ref. RP III 013.42.2016, ordered that if necessary to leave the place of residence to the place of the incident, the prosecutor would use, with the consent of the Regional Prosecutor, a private car in order to avoid contact with other people present at the place of the incident.

Practical Actions During Crisis: Procedural Changes

From the point of view of procedural changes, it is important to provide guidelines for examining the corpses at the place of their disclosure, in the event of obtaining information about a sudden death

[2] From the perspective of management and quality sciences - operational activities concern implementation at the lowest levels of management, in contrast to the activities of prosecutors, which mean activities undertaken as part of control over the reconnaissance activities of authorized services.

covered by the order of §169 of the Regulation of the Minister of Justice of 7 April 2016. Regulations of the internal office of common organizational units of the prosecutor's office (Journal of Laws 2017.0.1206) i.e. in cases of murder, communication and construction disaster, and an accident at work with fatal outcome, as well as in other more serious cases which result in death of a person. In particular, prosecutors carrying out activities at the scene of the above-mentioned events were obliged to determine information on the potential threat of coronavirus at the site of inspection, and in the event of such a threat, to immediately notify the competent sanitary inspector. The prosecutor performing on-site inspections of activities should also use individual protection measures adequate to the conditions at the place of the incident and the needs of the procedural step. Recommendations were also made regarding the examination and opening of the corpse of a person who may have been a carrier of the coronavirus. In this case, the body was ordered to be transported to a facility enabling operations to be carried out in conditions ensuring protection against threats, giving the prosecutor the opportunity to perform activities from a room behind the glass or using audio-video transmission. If it is necessary for the prosecutor to be personally present in the room in which the autopsy is performed, the prosecutor should absolutely use personal protective equipment.

In addition, in order to continue the on-call duty, decisions were made to provide protective packages containing the suits, the so-called helmets, protective masks and disposable gloves. A position was also prepared at the Regional Prosecutor's Office in Wrocław to enable interrogation without personal contact with participants of the activities.

By letter of 1 April 2020. ref. PK I BP 024.8.2020 The First Public Prosecutor General's Deputy, The National Public Prosecutor issued guidelines applicable to all public prosecutor's offices. In particular, the National Public Prosecutor recommended taking actions adapted to the location, organizational and technical capabilities of common prosecutor's offices, limiting the spread of the SARS-CoV-2 coronavirus. This resulted in the decision to use the method of conducting procedural activities remotely via videoconferencing, if it was established that the person who was to participate in the activity was an infected person or suspected of being infected with coronavirus. If it is necessary to directly interrogate procedural activities involving a person suspected of being infected with coronavirus, the activities are to be carried out in a specially designated and secured room, while equipping the persons participating in the activities with adequate personal protective equipment and maintaining all sanitary services recommendations (including maintaining the recommended distance, disinfecting rooms, etc.). Emphasis was also placed on directing employees to work remotely, minimizing the number of people performing work in prosecutor's office buildings. To this end, it was pointed out that the number of people rendering work in prosecutor's office buildings should not exceed 30% of employees. Exceptionally, employees may stay at the prosecutor's office beyond the assumed percentage of employees in the case of performing activities in which remote work does not guarantee the possibility of performing key duties.

The heads of organizational units of the prosecutor's office were also obliged to organize the work of prosecutors and other employees so as to limit the spread of the SARS-CoV-2 coronavirus. In particular, it was recommended to organize working places in a way that would allow a distance of not less than 1.5 meters between them. It was also indicated that it is possible to direct employees to overdue holiday leaves, which are to be granted in not less than a weekly period and within a time limit, as far as possible, agreed with the employee. Employees were required to use gloves and were to be given access to disinfectant fluids. It was recommended to secure appropriate individual protection measures for prosecutors carrying out emergency duties, participating in autopsies and performing other potentially dangerous procedural activities, and to determine the area at the premises of individual prosecutor's offices, Departments of Forensic Medicine or other facilities where it would be possible to safely conduct a visual inspection and autopsy It was also recommended to use maximum electronic correspondence, also in internal contacts and to secure employees who have contact with incoming correspondence in paper form.

In addition, a permanent cooperation with competent court presidents, commanders of police units, sanitary inspectors and other services was required. To this end, the need for ongoing contact and regular meetings with representatives of the above services were pointed out, in order to implement

organizational actions allowing for efficient performance of activities, while minimizing the risk of COVID-19 transmission.

The activities described are aimed, despite the spread of the SARS-CoV-2 coronavirus, to ensure continuity in the implementation of tasks of common prosecutor's offices as organs appointed to uphold the law and prosecute crimes, as well as to perform ongoing tasks specified in legal regulations and to fulfil the official duties incumbent on prosecutors.

Conclusion

According to the literature on the subject, organization's problems begin with a strategy crisis that has a negative impact on day-to-day operations (Wawrzyniak, 1999). In the case of public organizations, here: the analyzed case of the Polish public prosecutor's office, the emergence of an economic crisis caused by the COVID-19 coronavirus pandemic did not interrupt or even disrupt the implementation of its strategic goals. The top management implemented a set of conservative actions to secure the functioning of the employees of prosecutor's offices. The organization operates steadily, has not lost control or business continuity, and the implemented procedures and structural changes have secured both employees and recipients of this public organization.

Towards Semantic Improvement of Marketing Recommendation Systems

Ilona PAWEŁOSZEK

Czestochowa University of Technology, Czestochowa, Poland
ilona.paweloszek@pcz.pl

Abstract

The functioning of recommendation systems traditionally involves the analysis of transactional data and customer behaviour. However, raw data, in many cases is not enough to make valuable recommendations. The article proposes the use of taxonomies to extend the perspectives of data analysis and interpretation for the needs of recommendation systems. In particular, semantic models (such as taxonomies or ontologies) may be a response to the deficiencies of recommendation systems due to a lack of data interpretation. It has also been proposed to use external, semantically related data sources to expand the analysis perspectives. Many valuable features can be obtained by semantic interpretation of transactional data and combining them with other data sets. The article presents the Author's suggestions for extending the scope of data analysis that has been made available by the lingerie retail chain. The analyzes aimed at expanding the possibilities of acquiring knowledge about customers and products. This knowledge can be useful to create better recommendations and targeted marketing campaigns.

Keywords: Recommendation System, Marketing, Semantics, Taxonomy

Introduction

In the era of globalization and the development of information technology, knowledge about the market is dynamic. New products are continually appearing, which may interest various groups of recipients. Advanced information technology also creates new opportunities to acquire and analyze data about customers, their shopping habits and behaviour. These changes require managers to be creative in their ongoing pursuit of current market knowledge and forecasting.

Because currently, the information resources obtained from various sales channels have a heterogeneous structure, and their number increases every day, recommendation systems are becoming more and more popular. Their main goal is to provide clients and managers with the most adequate and personalized information. This problem is becoming more and more important because non-expert customers are overwhelmed by the amount of information available. On the other hand, enterprises strive to attract new customers and increase the pool of loyal customers through efficient and personalized service.

In recent years, recommendation systems (RS) have become an important research area combining achievements in behavioural sciences (Celdrán et al. 2016), marketing (Mocean, Marcel 2012), artificial intelligence (Gabrani, Sabharwal, Singh 2017), and user experience (Nguyen 2016). Recommendation systems are a particular class of decision support systems. The customer is a passive recipient of information. He has no direct impact on the operation of the recommendation system. From a manager's point of view, a key issue is how to discover customer interests effectively, and to decide what data will be taken into account when creating recommendations.

This article proposes extending the hybrid recommendation model with semantic aspects that significantly enrich the analysis perspectives, thus enabling the discovery of new useful relationships and features in transactional data sets. The use of semantic models allows for combining various data sets related contextually to the analyzed area of activity.

The considerations presented here are limited to the problem of applying semantics in response to shortcomings of existing systems, lack of knowledge and inference in RS. The purpose of the research work was to develop taxonomies that allow extracting from the data set additional features useful for enriching the recommendation system and targeted marketing campaigns. Data used in the study were made available to the Author by a network of lingerie retail stores located in major cities in Poland. The data was in the form of a flat table exported from a data warehouse containing a list of transactions from two consecutive years.

Many studies are currently focusing on analyzing the behaviour of online store customers. However, the group of customers preferring stationery stores is a particular challenge, as determining their preferences may be more difficult due to the lack of data on their behaviour. Generating useful recommendations for a group of retail store customers requires the interpretation of transaction data and loyalty programs. Data on the preferences of retail store customers can be valuable in creating an Omnichannel strategy. This strategy allows the acquisition and integration of customer knowledge from many communication channels, and retail stores are one of them.

Related Works

Recommender systems, their mechanisms and the data mining algorithms are extensively described in the literature. Recommendation systems are used in many areas (Itmazi, Megias 2006). In general, the RS can be defined as a system that helps Internet users browse Internet resources, providing suggestions for items that may be of interest to them (Shrivastava, Rajawat 2013). In the field of trade, the recommendation system is a particular class of personalized systems that are designed to predict the potential customer's interest in available products and services, based on previously assessed elements or attributes (Lekakos, Giaglis 2006), customer behaviour in the past and the preferences they specify. Conventional recommender systems are known to work well for the case where customers show their preferences for specific products explicitly (e.g., rating the products) (Kim 2013).

In the literature, recommendation systems are considered from three main perspectives (Korczak, Pondel 2018). From the management point of view, the recommendation system is a decision support system that uses large sets of heterogeneous data and inference mechanisms to generate useful knowledge in creating sales strategies and the promotion of products offered. From the customer's point of view, this is an advisory system that facilitates the selection of products following interests, needs and preferences. From the information technology perspective, the recommendation system is an interactive computer platform containing many models of data analysis and exploration, and visualization, integrated with the online store's transaction systems.

The methods used in recommendation systems include:

- integrated collaborative filtering (Goldberg 1992),
- content-based filtering (Pazzani, Billsus 2007),
- constraint-based recommendation (Felfering et al. 2010),

- critiquing-based recommendation (Chen, Pu 2012),
- expert-based recommendation (Amatrian et al. 2009),
- hybrid recommendation (combining two or more recommendation methods) (Burke 2007).

The selection of the filtering method appropriate for a given recommendation system depends on the type of information about customers and products (e.g. purchase history, product evaluation). Literature studies (Beel et al. 2016) show that solutions based on product features (content-based recommendation) and integrated filtering of information are the most popular. The methods mentioned above have their pros and cons.

The essential thing in collaborative filtering recommendation is how to select the most valuable neighbours. Integrated collaborative filtering systems encounter a problem when there are no opinions of other users, in particular when recommendations are to apply to a new product that has not yet been rated, or ratings are sparse. The same problem occurs with new users who have made very few reviews so far. In some areas, the number of products is so large that users are not able to evaluate all, which means that the number of ratings for each product is too small to create a forecast. In the case of a vast quantity of products and the lack of a sufficient number of reviews, semantic categorization based on the domain knowledge of the product can be helpful.

In the case of content-based filtering, the main problems are the form of description and the ability to extract data from it. Problems can occur in particular if the description is in a multimedia form. Another problem is excessive specialization - systems based on content analysis can only extract information from those resources that the user has previously viewed, so they are unable to provide suggestions that go beyond a specific thematic scope. Their weakness is, therefore, the lack of a semantic model of knowledge to allow inference. The advantage of content-based recommendation systems is that they can provide recommendations for “cold-start” items. It is the situation when there is little or no training data available, but typically have lower accuracy than collaborative filtering systems (Gunawardana, Meek 2009).

In the discussed solutions, recommendation systems consist of a recommendation engine, and their programming can be categorized as machine learning algorithms. These types of algorithms are evolving through learning from a training data set. However, an expert system-based approach can also be used to generate recommendations. These types of recommendation systems are a sub-category of expert systems that accumulate domain-specific knowledge provided by human-expert. If the recommendation prediction algorithms work solely based on information about the transaction history or customer ratings, ignoring domain knowledge, the recommendations may turn out to be wrong (Li et al. 2014).

Difficulties in establishing a satisfactory recommendation also occur in the case of people who differ in preferences from the rest of the customers and show inconsistent interests (choosing products from entirely different categories) (Sharma, Singh 2016), or intentionally give product evaluations other than most people (Płoński 2011). In such a situation, there is a problem of assigning a person to a group whose opinion could be used. Data on transactions of such clients cannot also constitute the basis for mechanisms using common filtration and grouping (Bieńkowski 2012). Hybrid systems are to address these problems. They combine many filtering techniques, using both content/product analysis and similarities between users.

The basis for creating recommendations are analytical systems with a large number of algorithms and data on which they could work. However, the multidimensionality of data, which would allow for analyzes at different levels of abstraction, is also of great importance for the accuracy of

recommendations. For example, different levels of product categorization and their semantic combination into groups belonging to one field, as well as complementary and substitution domains, can be helpful.

The semantic knowledge representation in the form of ontology or taxonomy defines the relevant basic concepts and a structure of the modelled domain. Relationships between the concepts represent the structure of the domain. Also, ontologies may contain rules enabling deriving implicit knowledge as well as checking the consistency of knowledge (Lommatzsch 2015). Ontologies and taxonomies can, therefore, be an appropriate formalism in knowledge representation in modern recommendation systems.

Taxonomy of Products

Product categorization is an important issue when creating marketing campaigns and recommendations for online store customers. Detailed knowledge of product specifics can also help in customer segmentation due to interest in specific products.

Taxonomies are the most commonly used semantic models in recommendation systems, mainly because their construction is less time-consuming and does not require such in-depth expert knowledge, as is the case with ontology. The taxonomy is a collection of concepts and relations between them, forming the hierarchy of generalization and specialization.

Many ready taxonomies can be used in recommendation systems in popular areas of e-commerce. Examples of such taxonomies are WordNet, Amazon classification, IPTC NewsCodes or the Open Directory Project. Taxonomies have a twofold use. On the one hand, they help customers of online stores find desired products; on the other, they are useful in data mining and creating marketing strategies by managers. Taxonomies generally have a hierarchical structure - they start with general or broadly understood concepts and gradually reduce the level of detail to exact classifications, such as product name. Despite a large number of taxonomies available, adjusting them to individual needs is often not easy, especially for lower levels of taxonomies describing products in detail. The names of product models in the transaction databases, unequivocally identify individual goods, but they cannot be the basis for some analyzes. The main problem is a large number of different types of goods from many manufacturers. Trade names are to identify a product uniquely, but they usually say little about its features and purpose.

In the case of lingerie stores, the database may contain hundreds of thousands of similar names of goods, so assigning categories to each of them would take too much time (would require checking the manufacturer's website for the type of product and its features). Automating product categorization can, therefore, be very helpful and significantly speed up the work.

Product classification helps managers in choosing strategies and methods for product or service promotion. Categorization also facilitates the appropriate design of the e-commerce store interface, and thus - offering customers a convenient tool to find exciting offers.

Automated product categorization requires a dictionary that allows for interpreting the trade names, for identifying the product category, and more advanced semantic models to determine product usability features. The data table must, therefore, be expanded with additional attributes by adding columns with the appropriate meaning. Adding new attributes to the data set is known as feature engineering. Feature engineering requires analytical skills and in-depth domain knowledge. There are many possibilities to categorize products due to their various characteristics, for example, durability, frequency of use, price range, target audience (age, gender). The more features can be distinguished, the higher will be the ability to assess customer preferences and forecast their future purchases correctly.

Semantic categorization of products can be done in different ways, depending on what data is available. The methods presented here support the automation of this process. Lexical analysis of product model names can identify categories by extracting fragments of names indicating a specific affiliation of the product. Categorization of products can also be carried out based on their descriptions. In addition to the product, the seller receives a lot of information about it. This information is usually in textual form, and it is possible to extract some key features from it. For example, in the case of clothing, it can be size, type of fabric, type of product, group of users (men, women, children), style (sports, casual, elegant). Parameters can also take continuous values representing the intensity of a particular feature (e.g. elegance and comfort). This method of categorizing footwear is implemented by Zalando (https://www.zalando.pl/rodzaje-butow/).

An analysis of product trade names was carried out to automate the categorization. The product names created by manufacturers are usually composed of alphanumeric strings that identify a particular product and some usability features. In the case of the analyzed data set, the Author attempted to categorize the data by extracting strings of characters identifying product features. It should be emphasized that such an approach is not possible and effective in every case. In this study, it was possible to categorize women's bras, according to their functional features—such taxonomy developed by the Author based on product markings presented in figure 1.

Fig. 1: A fragment of product taxonomy based on functional features

Extraction of significant character strings denoting the product category should be based on previously determined taxonomy. Its creation is a time-consuming process and iterative. For this purpose, a spreadsheet with text functions and the ability to write macros (MS Excel) was used in this research experiment.

The macro algorithm involves checking product names for specific strings. For the correct operation of the algorithm, the order of checking is essential. For example, in the analyzed case finding the "WHU" string does not determine the category, because in the next iteration the WHUM string can be found, similarly in the case of searching for WD and WDP strings. Therefore, the analysis started with shorter sequences (one or two letters), and then the longer sequences were checked. During the construction of the hierarchy, the inheritance principle was applied. The child class has all the attributes of the parent class. So, for example, a WHU category product will have all the features of the WH and W categories. In

this case, there are also multiple specializations, which describe the situation when a given class inherits directly from more than one superclass.

Taxonomy can be useful to calculate product similarity (Poncelet et al. 2019), which is of great importance for recommendation systems. You can easily designate products similar to the one chosen by the customer and recommend them. Two products can be marked as similar if they have the same leaf category in the taxonomy tree.

More than one product taxonomy can be created, taking into account different characteristics. In the case of clothing, it can be style (sports, casual, elegant, sexy, vintage, seamless), age group (children, teenagers, adults), gender (male, female, unisex). It should be noted that the above categories can be flexibly defined based on transaction analysis. Such analysis allows isolating types of products willingly bought by various customer groups. Merging different taxonomies is an effective way to build a complete product taxonomy (Jiang, Lin, Li 2018).

If we have a broad range of products, automation of category creation is essential (Aanen, Vandic, Frasincar 2015). Both the creation of a taxonomy and categorization algorithms require expert knowledge including knowledge of products and their use. The algorithm must be improved as new models appear. The key is to extract data from disordered or semi-structured information and convert it into a structured format, according to a pre-set semantic model. Having a data set supplemented with additional features, you can use any of several grouping (clustering) methods. Clustering (also known as cluster analysis) is an unattended data mining technique whose task is to detect groups (clusters) of objects with similar characteristics in a data set. The method requires defining a measure of proximity of objects demonstrating the degree of their similarity. Objects with a certain degree of similarity are combined into groups.

For sales data analysis, clustering can be performed to find out, for example, which products categories the customers choose most often. With a wide assortment, grouping only by trade name does not give satisfactory results, because the number of generated groups is vast. In this case, the effects of analysis are of little use in making decisions. A much better approach is to group products by a category designated due to its functional characteristics. The research problem in the discussed case is to identify the possibility of extending the data set of the recommendation system with new dimensions of analysis. In particular, the ability to dynamically define product categories. In practice, this means the ability to define multi-level rules that create an interface to the database.

Taxonomy of customer behaviour

Success in marketing and sales depends on the degree of understanding of customer needs and the factors that guide them when making purchasing decisions. Knowledge of their behaviour and relationship that connects them with the company allows you to create the right marketing message. Customer segmentation provides the necessary tool to describe customers in a significant way for price and market strategy. Segmentation can use various criteria, e.g. demographic, geographical, behavioural, psychographic. Based on the results of segmentation, you can create detailed customer profiles that are the basis of knowledge for building marketing strategies.

Psychographic criteria are the most difficult to determine and the most analytically demanding. Psychographic segmentation takes into account factors such as motives, attitudes, opinions, values, lifestyles, interests and personality, and thus features that are hard to measure. After identifying one or more psychographic segments, they can be combined with demographic, geographical or behavioural segmentation to create fully developed consumer profiles (Ferrel, Hartline 2010, p. 177).

Customer characteristics can be determined by direct or indirect methods. In the first case, data can be collected through a questionnaire. However, this method may be affected by mistake due to many factors, such as the way the questions are formulated, the respondent's misunderstanding of the issues, unwillingness to answer, deliberately giving false answers, etc. Indirect methods of extracting knowledge from transactional data sets contribute to a better understanding of the habits and preferences of the client based on the collected facts and allow for establishing similarities between customer groups.

In this study, the Author only had a detailed transaction database along with customer IDs. The challenge was to extract customer knowledge from this database. Therefore, it was proposed to identify additional features based on the semantic interpretation of existing attributes and semantically related data sources. As research shows (Rawski 2015, Sobczyk 2016), enterprises mainly use data obtained from internal sources for analytical purposes. Most enterprises consider this data to be the most valuable. It can, therefore, be argued that breaking this stereotype and focusing analyzes towards greater use of external data sets may create added value for business resulting from expanding the scope of analyzes by discovering semantic relationships.

Figure 2 shows a set of fields in the data table, new features that can be obtained through semantic interpretation, and additional external data sets. The lines in the figure represent semantic links. This way, many new features have been identified that can potentially be useful when constructing recommendations for clients.

Name of the field in the database	Meaning
ProductID	A unique number assigned to each product item
ProductName	Trade name given by the manufacturer
Model	A unique number that identifies the product model
Color	The code that identifies the color of the product
Cup	The letters - like A, B, C, D - stand for cup sizes of the item
Size	Standard code identifying the size of the clothing
Store	The code that identifies the store in the data warehouse
City	The name of the town where the store is located
Voivodeship	Name of the voivodship in which the store is located
SalesmanID	A unique number identifying the seller
SalesmanName	The unique name of the seller containing the first and first letter of the surname
Quantity	Number of items of a given assortment on a receipt
GrossPrice	Catalog price in PLN
GrossPriceWithDiscount	Price paid by the customer in PLN
VAT	The percentage of VAT for a given inventory item
TransactionDate	Date of purchase
ReceiptID	A number that identifies the receipt within the entire data warehouse
ItemID	A number identifying the item on the receipt
Promotion	Promotion name
ProductGroup	The name identifying the product group adopting one of two values: Triumph, Other
AssortmentGroup	The name of the assortment group that adopts one of four values: daywear, nightwear, swimwear, accessories
CustomerID	Number that identifies the customer if he has a loyalty card
CustomerName	Name that identifies the customer if he has a loyalty card
Gender	F or M value identifying the gender of the customer (loyalty card details)
BirthDate	date of birth of the customer (loyalty card details)
PostalCode	postal code of the place of residence of the customer (loyalty card details)
CustomerCity	Place of residence of the customer with a loyalty card
CupSize	The letters - like A, B, C, D - stand for cup sizes, customer size (loyalty card details)
UnderBust	Under-bust Circumference – customer size (loyalty card details)
ClothingSize	The standard size designation applies to a customer who has a loyalty card (inconsistent data - no explicit understanding has been adopted)
CardEstablishmentDate	Date of loyalty card establishment

Fig. 2: New features in the data set extracted based on semantic interpretation

An interesting issue from the marketing point of view are customer behaviour patterns. Behaviour patterns are customer activities that recur at a particular frequency that can be considered statistically significant. However, the semantic interpretation of these patterns is crucial, i.e. understanding the

reasons the customers are guided by during purchasing decisions when choosing a brand, product category and moment of transaction.

In the case of stores with a large transaction base, valuable information is sequential patterns. Sequential patterns should be distinguished from association rules used in so-called basket analysis that tells you which products customers buy most often in one transaction. On the other hand, sequential patterns inform about what products are purchased by customers in subsequent transactions. This information is vital for the operation of recommendation systems. Information about several transactions of the customer lets us forecast which product he will probably purchase in the next deal and when it may occur. These rules can be extracted from a database containing the transaction history of regular or occasional customers. For comparison, we choose customers who bought the same product or who are somehow similar to the person for whom the recommendation is created.

It should be mentioned that performing sequence analysis requires that for a given customer, there are two or more transactions made on different days in the database. Sequence analysis provides the most common patterns in the form of pairs of predecessors and successors. The predecessor is the product bought earlier, while the successor is the product purchased in the next transaction. You can decide if the pattern is correct based on its frequency of occurrence in the examined data set.

Product categorization, combined with multi-level sequence analysis makes the recommender system operate more flexibly. In particular, it may be important to extract information about substitutability or complementarity of products from the customer's point of view. The recommendation can be created not only based on product features but also taking into account its brand or price range.

Another important information resulting from the sequence rules is the seasonality of specific products. Seasonality can be determined for a given customer (e.g. buying a product of a particular category every two years, or buying related to holidays)by using data mining techniques. The semantics of customer behaviour according to various parameters extracted using the classification are presented in Figure 3.

Fig. 3: Taxonomy of customer behaviour

Summing up the analyzes carried out based on an experimental data set, it is possible to extract a customer behaviour profile, consisting of many attributes, such as shopping propensity, seasonality, categories and product usability features preferred by the customer. Such a profile allows extracting rules that can be useful to generate recommendations and create marketing campaigns.

Semantic models such as ontologies and taxonomies enable the formalization of knowledge necessary to make marketing decisions. In particular, this is product and customer knowledge. Formalization of knowledge is nowadays a significant issue of decision support, as it allows automation of inference processes and significantly speeds up the whole process.

Conclusions

Knowledge can be created directly based on a data set by using data mining, in particular, clustering algorithms that group the examined objects according to many features. However, for the results of the clustering algorithms to be useful, they require semantic interpretation.

The hierarchical representation of knowledge in the form of taxonomy enables the categorization of products, which is very helpful for analytical purposes. The article indicates that the use of taxonomy allows flexible creation of analysis perspectives, in particular, adding new variables to the data set obtained by generalization or specialization of existing variables. The semantic model will enable you to create new variables by reasoning and combining different data sets. Thus, in the process of data analysis, new useful knowledge is created that can be used to make decisions.

Limitations of the study and future research

The experimental study presented in this paper shows that new variables are not always significant. During research experiments using data mining, it can be checked whether the new features are useful (e.g. the age of the customer at the time of the transaction, information about the weather on the day of purchase or the distance from the customer's home). A new feature can be is useful if it allows grouping the examined objects (products, transactions, customers), and the division into groups is of practical significance and contributes to the generation of better recommendations.

Future research will include identifying existing taxonomies that can be adapted and used in recommendation systems. The study will also focus on finding and evaluation of external, open data sources that, through a semantic linking, can enrich the results of analyzes and the effectiveness of recommendation systems.

Abstract

One of the basic aspects of modern logistics is the system approach, one of its subsystems is logistics distribution centres /LDC/. LDCs are complex facilities, consisting of storage areas, transport infrastructure for various transport branches, transhipment and storage equipment. They must have access to a land and/or sea long-distance transport route operated by means of local origins. They therefore include elements of the goods distribution system as well as transport network routes. These facilities deal with the coordination of logistics services (including transport) integrated with the flow of information, the quality control system and the provision of logistics services packages. The creation of logistics centres takes place as part of the development of new-generation seaports, by creating port logistic platforms, which become centres of comprehensive distribution of logistic services and economic growth poles in the development of regions. Ports of the whole of Europe, including Polish ones, such as: Gdańsk, Gdynia, Szczecin and Świnoujście aspire to such a role. Within them the logistic centres will satisfy needs of business entities.

Keywords: Logistics, Distribution Centers, Logistics System

Introduction

One of the basic aspects of modern logistics is the system approach, one of its subsystems are distribution centers / LDC /. Country logistics is: warehouse areas, transport infrastructure for various modes of transport, transhipment and storage devices, etc. They must have access to a land and / or sea long-distance transport route operated by the local origin of the country. They therefore cover elements of the goods distribution system as well as transport network routes. These facilities coordinate logistics services (including transport) integrated with the flow of information, the quality control system and the provision of logistics services packages. The creation of logistics centers takes place as part of the development of new generation seaports by creating port logistics platforms that become centers of comprehensive distribution of logistics services and poles of economic growth in the development of regions. Ports throughout Europe, including Poland, such as Gdańsk, Gdynia, Szczecin and Świnoujście, aspire to such a role. In them, logistics centers meet the needs of business entities.

Currently, it is increasingly discussed that there is a need to build logistics distribution centers in Poland, i.e. centers dealing with the coordination of logistics services and short- and long-distance transport, ensuring an integrated transport connection along with the flow of information between producers, distributors and consumers, and a control system.
The article introduces the goals and tasks of logistics centers in market economy conditions, as well as presents the existing structure of these facilities and presents solutions for the creation and operation

of logistics centers and assessment of their impact on location solutions and operations of logistics centers in Poland.

Problem Situation

With the above in mind, logistics distribution centers are the subject of research and analysis of various scientific disciplines. Striving to solve the problems of transport, including sea, the synthesis of knowledge in these areas is made, setting goals and hypotheses, adopting the right course of research to prove or deny them. Problems of transport economics focus, among others, on the principles of transport economic calculus, shaping prices for transport and reloading, programming, as well as planning the development of transport networks and shaping transport financing systems, generalizing the functioning of LDC. In the above topic, RESEARCH OBJECTIVE focused on LDC over a set time horizon and changing demand for transport services, taking into account their IT needs, against the backdrop of global political and economic conditions. The main RESEARCH PROBLEM concerned finding the answer to the question: In what logistic environment are LDC functioning processes carried out, and to what extent are LDC forces and resources prepared for the implementation of electronic systems?

The solution to the main research problem was possible thanks to the verification of HYPOTHESIS, which adopted the following wording: due to the growing role in transport logistics, there is a need for changes in its management system, through the leading role of solutions based on the construction of LDCs and their computerization.

The implementation of the research objective and problem contributed to fill the gap in the literature related to transport management, including maritime transport, in the context of the operation of computerized logistics centers.

The main hypothesis, research problem as well as specific problems require defining adequate methods needs and specifying research techniques and tools necessary to carry out tasks and verify accepted hypotheses. Systematic theoretical and empirical methods were used to achieve the objectives of verifying the adopted hypotheses. Theoretical research methods included literature analysis, comparative analysis, generalization, synthesis and inference etc.

Analysis of the literature allowed to obtain the theoretical foundations of empirical research, also conditioned synthesis. It made it possible to determine the current state of knowledge and factors affecting the quality of logistic system security management. The comparison method helped to indicate common features and differences between logistic systems of various entities functioning in the systems, which gave the basis to predict the further direction of development of the studied phenomenon and future possible changes and states.

The synthesis made it possible to determine the relationships and dependencies of the tests carried out and was helpful in the correct interpretation of the test results obtained. In addition, she contributed to the recognition of the overall research problem by linking specific facts with simultaneous partial rejection some of them and with generalization of others, as well as for precise formulation of conclusions.

The research problem in the presented approach touches only some of the problems resulting from determining the place and role of LDC in transport logistics, as well as the impact on its functioning of IT systems, one should be aware of constant changes in the subject of research, the appearance of new technologies, means of transport, etc., this emergence new research areas. Therefore, there is a need to systematically repeat and develop research on the presented problem.

One of the basic aspects of modern logistics is the system approach based on the general theory of systems. According to the assumptions of the system approach, the whole creating a certain system is the most important, while the parts that make it up (elements) play a secondary role. The role of individual parts is determined by the purpose for which the whole exists.

A logistics system. It can be defined as a set of logistics elements whose connections are made concrete through transformation processes in the temporal-spatial, quantitative and qualitative sense in the sphere of the flow of goods and information (Blaik, 1997), or as intentionally organized and integrated (within a given economic system) flows of materials and products and corresponding information enabling optimization in supply chain management (Abt, 1998, Kot et al., 2018, Akhtar, 2019) is the platform for the implementation of logistics processes. It is described, considering many possible components and relationships, as a multi-structural and multifaceted problem. There are many attempts to distinguish and classify various logistics systems and subsystems in the literature on the subject, which indicates that logistics is a specific way of managing procurement, production and distribution as an integrated whole.

The key role of the transport subsystem in the logistics system should be emphasized. Transport plays the function of integrating (binding) the logistics process, and its reliable and stable operation is a condition for the functioning of the entire system. Transport performs its functions by servicing the supply, production and sales spheres, and its main objective is to ensure the highest efficiency of transferring goods from the seller to the buyer. It is indispensable in all phases of the production sphere, starting from moving raw materials, materials and semi-finished products to production positions, by moving these elements during their processing (so-called technological transport), and ending with exporting the finished final product from the place of its production. Therefore, transport is a factor integrating the transformation of raw materials and semi-finished products into a new product. In the sphere of exchange, transport ensures delivery of previously manufactured products to the sales network and ultimately to consumers (Behun et al., 2018). Thus, thanks to transport, the supply, production and distribution phases can be seen as one process. Management techniques applied in transportation increasing the effectiveness of the transportation system, and protecting the natural environment with all its resources (Stawiarska, Sobczak, 2018).

The ongoing globalization of the economy increases the importance of international logistics, whose special features result from the fact that delivery and collection points are located in different countries. Therefore, logistics is facing new tasks related to the implementation of deliveries in cross-border conditions (Kurowska-Pysz et al., 2018, Witkowski et al., 2017). According to H.Ch. Pfohl we can talk about international logistics systems which are more complex than national systems, because the general and specific conditions for the creation of such systems are different (Pfohl, 1998). The economic practice of many developed countries indicates the important role of logistics in all economic enterprises. Logistics has become a decisive factor in the efficiency and effectiveness of individual enterprises and entire economies as systems (through the creation of national logistic systems). Copious evidence from the practice of market economy countries indicates that competitive struggle is being transferred to the sphere of distribution, and more broadly - to the sphere of logistics (Krzyżaniak, 1997). Not only the products themselves, nor their producers, compete but the whole supply chains, because today it is logistics that decides about the real level of customer service, and therefore about the level of income of enterprises providing specific products to the market. At the same time, these activities are the source of specific costs (related to transport, storage and inventory), therefore the logistics sphere has a significant impact on profit. One of the elements of the logistics infrastructure subsystem is logistics distribution centers (Krzyżaniak, 1997). They are very important links in the logistics process of supply chains and are an indispensable condition for fully applying the rules of logistics in the transport of loads.

It should be emphasized, as research shows, that in addition to the basic advantage of creating logistics centers, which is the reduction of costs of warehouse and transport operations, one should also cite their other very important advantages:

- high speed and completeness of supplying city trading points,
- creating an architecturally beneficial urban-forming element - ecological,
- reducing the harmful effects of large delivery motor vehicles on the urban environment, especially its historic buildings,
- creating good working conditions that minimize the accident rate and eliminate the nuisance of physical work,

- the possibility of providing storage services for seasonal products,
- the possibility of organizing specialized repair workshops in the warehouse district and many others, which are an expression of ecological development of the economy.

According to the authors of this article, due to the limited financial capabilities of the state and transport companies, it should be assumed that the process of creating these facilities will be a long-term process, even in the case of cooperation in their financing by external sources.

Logistics Distribution Centres /LDC/

Logistics centers play the role of organizational nodes in the national logistic system, streamlining flows in distribution channels, rationalizing the choice of transport means and communication routes, creating a platform for the operation of logistics, production and service companies, strengthening the trends of economic development (Krzyżaniak, 1997). Thanks to well-functioning centres, the organization of the shipment process can be carried out in all conditions, regardless of the type of market (Kordel, 1999). In practice, LDCs provide, to a lesser or greater extent, services that make up the so-called package of logistic services (Krystek et al., 2008; Chruzik, Mindur, 2015; Bukowski, Feliks, 2012; Loucanová et al., 2019; Korenkova, Zavadsky, Lis, 2019). In general, the following services are included in the package of logistic services: organization of physical movement, and hence transport; storage; distribution; transshipment; sorting; customs services; information services; financial services; insurance services; maintenance services; warranty services. In large centers, offered packages of logistic services contain up to several dozen items. The packages currently offered by logistics operators are becoming the standard on the transport market. Of course, their scope depends on the requirements, needs and expectations of individual clients.

The main tasks of logistics distribution centres (LDC) cover three areas of activity (Mendyk, 1998; Urzúa et al., 2019):

- distribution of goods, including: ordering goods, management of stocks, quality control, accepting returns, short and long-term storage of goods, their packaging, marking;
- transport of goods, including: formation of integrated cargo units, provision of appropriate transport technology for particular types and volumes of cargo, application of appropriate transshipment technology;
- other accompanying services, e.g.: legal and administrative support, forwarding, information, financial, insurance, or other logistic services, including advisory services.

Thus, LDCs can fulfil various functions resulting from the need of efficient handling of logistics chains. Their activities can significantly facilitate the rational control of supply chains, contributing to the increase of the efficiency of the flow of goods.

A characteristic feature of each logistics centre is the fact that all its elements ensuring the service of the goods, from acceptance to its dispatch, should be linked by means of an integrated information and telematics system and data exchange networks with other logistic centres in Poland and abroad and all participants of the exchange of goods. The main effect of the operation of such a centre and its cooperation in the field of handling freight with interested participants in the exchange of goods is to shorten the duration of delivery within logistic chains (Klimek, 2000).

It seems that without virtual connections with participants of the exchange of goods and entities servicing this exchange, the existence of LDCs would cease to be required.

The main effect of their functioning is shortening the delivery time within logistic chains, which contributes to minimizing the costs of goods distribution and transport. In addition, LDCs enable:

- 24-hour distribution of goods and completeness of deliveries;
- increase in the speed of delivery of goods (which can sometimes be a decisive factor in their purchase);
- improving the level of customer service;

- creation of new jobs;
- elimination of arduous physical work;
- increase in work safety;
- reduction of truck traffic on urban arteries (as centers are generally located near agglomerations, due to the requirement of a large free area for development);
- taking care of the cleanliness of the natural environment of the agglomeration;
- creation of synergy effects.

LCDs' operation in Western European countries and their continuous development, also near the borders with Poland, confirm that these entities are undoubtedly one of the most important links in logistics systems and their development in Poland is indispensable.

The construction of a logistics distribution centre from scratch is extremely costly, which is why logistics operators sometimes use existing technical infrastructure, e.g. in seaports or inland ports, or in duty free zones, for the provision of logistic services. Then the expenditures that they incur may concern the modernization of the telecommunications infrastructure, or the purchase of specialized equipment for handling goods in accordance with the client's wishes. In the case of seaports, it is also important that they can handle multimodal transport.

The occurrence of seaports as land-sea transport nodes particularly predestines them to accept the functions of a logistics centre, where various types of cargo and means of transport meet with an extensive camera for their service The attractiveness of seaports for using them as LCDs results from the fact that they generally have the appropriate infrastructure and superstructure, i.e. an appropriate area, a large storage area, devices and mechanized equipment for handling various types of goods, the possibility of high storage of goods, a telephone and computer network, and in port cities - a network of banks, financial and insurance institutions, customs offices (Klimek, 1998). Application of a logistics concept The logistics concept in transport (integrally associated with the operation of the land and sea transport chain) is defined as "the process of planning, implementing and controlling efficient, cost-effective flow and storage of raw materials, production stocks, finished products and related information from the starting point to the point consumption to meet customer needs. (Szwankowski, 1994; Lis & Szczepanska-Woszczyna, 2015; Janoskova & Kral, 2019) focuses its attention on factors shaping transportation needs, and not only on the quantitative aspect of these needs. This concept makes it possible to improve the land and sea transport chain (by increasing the quality of services provided in it) and taking over from its users activities related to physical cargo handling (Paprocki, 1989). These include goods handling operations, auxiliary transport operations, storage, physical distribution services, confectioning, marking, merging into larger units, inventory management, commercial services, final services (e.g. assembly and control), logistics support services and others. These types of services are realized in LDCs that are being built in or near the seaports, in the back of big urban and industrial agglomerations or large railway junctions.

The location of LDCs in ports is also the result of fundamental changes that have occurred in their functioning in recent decades. We are dealing here with the transformation of the traditional role of ports, which from passive participation in maritime trade turned into active and very important participants in global trade and transport system, adopting commercial orientation of their activities in the face of constantly growing international competition, as well as becoming an integrating element in logistic chains through the implementation of the logistics function (Ferrari, Parola, Morchio, 2006; Szwankowski, 2000). The expansion of port operations has even resulted in the extension of the concept of a seaport (Kuźma, Szczepaniak, 1971). Currently, it is defined as a "logistics and economic node in the global transport system, with a strong maritime character, in which the functional and spatially diverse activities are concentrated, directly or indirectly connected with logistics chains [The logistics chain (supply chain) is an activity related to the flow of goods from its original source, through all intermediate forms, to the form in which it is consumed by the final customer. It can also be defined as a "model-designed logistics process (resource flow process), integrated in terms of time, costs, spatial distance and customer service level, using infrastructural factors and organizational capabilities of a given channel or logistics channels. (Chaberek, 2000). However, it should be remembered that traditional supply chains, based on inventories and independence of their participants and oriented at

reducing costs, in the future will give way to supply chains which will be based on virtual information and networks and will be value oriented (this will be the effect of the market situation, necessity to meet individual customer needs, and use of direct marketing), (Augustyniak, 2003)], parts of land and sea transport chains are part of it" (Szwankowski, 2000).

In this way, you can define the leading sea ports of the world and Europe. They are said to be third generation ports. Operation of these ports, in addition to providing traditional port services (transshipment, storage, ship services) supported by modern technology, organization and management, high-performance technical equipment and "infostructure", industrial and environmental services [Generating the added value and associated with the operation of environmentally-friendly devices] and administrative and commercial services [Including procedures related to documentation and port regulations, as well as banking, insurance and legal services]. It is also connected with the creation in their logistics areas of distribution and information centres for international trade and the integration of the port with other links of transport chains (Szwankowski, 2000).

The fact is, however, that many seaports in the world are still in the phase of functioning of the 1st or 2nd generation ports. This is proof of the large diversity of the role and importance of ports on a global scale. All the more so because the largest and most modern ports are entering the fourth generation phase, resulting from the intensive development of their logistics function, manifested by taking over management and supervision over entire logistics chains (Notteboom, Rodrigue, 2008; Szwankowski, 2000). It should be emphasized that the growing competition in the market of port and transport services is the main reason for the diversification of seaport economic activity. It turns out that running only traditional activities (handling, storage) disqualifies seaports in the fight for the client. Therefore, a way to improve the competitive position of the port, the possibility of obtaining additional revenues (including value added), and the increase in the degree of use of owned production assets is diversification of economic activity. It consists not only in offering the widest possible range of services to clients, but also in creating numerous capital connections (with forwarders, sea or land carriers), or undertaking activities not directly related to port and sea trade. The use of electronic systems is also a supporting element, which is necessary today in the functioning of transport economy. Therefore, in order to implement the logistics concept it is necessary to combine human resources, fixed assets, information and goods in the supply chains and apply the basic logistics rule Just in Time /JIT/ but also Electronic Data Interchange /EDI/, which, acting as an information bridge between production and demand, plays a vital role in implementing the JIT principle. The combination of the goods stream and the information stream leads to integrated logistics.

Electronic Data Interchange /EDI/

The smooth functioning of modern supply chains requires the speed of communication of all their participants, their integration (as a result of which individual enterprises are increasingly intertwined), which can be achieved by using EDI, as well as the so-called value-added partnerships to optimize the flow of goods along the entire chain. Therefore, since the modern market requires fast deliveries of goods precisely tailored to the customers' expectations, fast communication and fast automated information processing become necessary, so EDI is the right solution, which allows quick response to market demand, while reducing inventory and shortening the time preceding execution of orders.

The enormous development of EDI in the world has led to an increase in understanding in Poland of the indispensability and inevitability of its use, with the simultaneous resignation of traditional paper documents for electronic documents. Although, for now, the process of introducing EDI by Polish participants of logistics chains is quite slow, in the future one should expect its dynamic development in all sectors of the economy and public administration (Kondratowicz, 1999). Meanwhile, the Internet is gaining more and more importance as a cheap, fast and easily accessible medium of information transmission. It should be emphasized that when introducing EDI, important role may be played by sea ports as LCDs (and LCD located at their back), which freight, transport, commercial, insurance, shipping agencies and other companies have to deal with, and hence their special role in the implementation of modern telematics solutions.

In connection with the significant role of ports in land and sea transport chains, a huge amount of various information is generated, which requires processing and transfer between all participants of port and sea trade. The carriers of this information are documents, the exchange of which using traditional methods involves many tedious, time-consuming formalities and significant costs.

Application of Electronic Data Interchange

The implemented EDI gives additional bonuses related to strengthening the organization's brand and is a signal of its readiness to cooperate with global companies. Almost all global companies use electronic data interchange and often require the use of this technology from their partners. In the European Union, the phenomenon of forcing the implementation of electronic data exchange in the entire logistics chain (by producers of final products at their sub-suppliers) has been observed. EDI is a strategic technology for large organizations that allows you to significantly increase the efficiency of exchanging huge amounts of information and reduce the costs associated with maintaining staff involved in handling paper documents.

EDI is closest to classic systems, allowing for full automation of processes, on the other hand, it uses Internet technologies, including the World Wide Web. This allows EDI to be implemented into the company's information system without the need to incur major investments - assuming that it uses web applications. Lowering the threshold of costs necessary for the implementation of EDI allows for the dissemination of this technology among smaller subcontractors, which will lead to an increase in economies of scale and improvement of business processes in the entire branches of the economy.

This paper highlights the problem of using EDI in international goods exchange. Particular attention was paid to the use of EDI in transport, including sea transport, in the light of the development of the logistics center. One of the important elements conditioning the development of a logistics center is to provide its entities with the possibility of exchanging electronic data within the port environment and with its surroundings. It should be remembered that at present, the strength of logistics is no longer due to extensive infrastructure (including telecommunications and ICT infrastructure), but in particular the effective flow of information made possible by the implementation and development of information services. The basic facts indicating the effectiveness of implementation are:

1. EDI is an abbreviation derived from the English name Electronic Data Interchange which means in direct translation Electronic Data Exchange.
2. EDI is the exchange of data in formats described by international standards, between IT systems of trading partners, with minimal human intervention.
3. EDI combines the possibilities of IT and telecommunications. It enables the elimination of paper documents, increasing the efficiency of all trade-related activities. EDI is the easiest way to carry out commercial transactions, avoiding the laborious work of creating, copying and sending paper documents. EDI creates a bridge that directly connects IT systems of cooperating companies.
4. EDI enables immediate transmission of information that is contained in typical commercial documents. The use of standard and globally accepted data formats ensures that all exchange participants use the same language. The EDI document is the equivalent of a paper commercial document of an established international form that has been adapted for the purposes of electronic data transmission.
5. EDI works regardless of the type of user software. The use of EDI is not limited by the differences in software that business partners use in their enterprises.
6. EDI is not a type of electronic mail. EDI involves the exchange of data in a fixed format between information systems, not between people. These data can be automatically processed by the computer.

EDI lies at the heart of the Electronic Market - the technology underlying strategies such as Continuous Replenishment in the retail sector, JIT (Just-In-Time) in the manufacturing sector, transport tracking in distribution, and electronic payments in all market environments .

The Electronic Market can be seen as both a short-term tactic and as a long-term strategy. No matter how you look at him, you mustn't ignore him, especially because of the benefits it brings:

- Improvements in the design cycle, enabling faster product launch
- Time and cost savings in production processes
- Reduction of general administration costs due to the elimination of manual processes

So how can EDI help? EDI is a strategic economic "catalyst" that unites customers, suppliers, banks and logistics companies, resulting in the creation of more effective partnership relations, based on streamlined working procedures, closer information exchange, increased productivity and stronger trade links. The idea of EDI is to exchange data between information systems, not between people (as it happens in the case of electronic mail). EDI enables immediate transfer of information that is contained in typical commercial documents.

The implementation of EDI requires integration of communication between partner's computer systems, but above all - a well-thought-out strategy. The EDI operator, apart from all technical issues, also deals with the analysis of business goals and the selection of the best solution tailored to the needs. The implementation of EDI brings measurable benefits - saving up to 80%!

The benefits of using EDI are: time saving, elimination of errors and mistakes related to manual data entry, automation of business processes, process transparency, care for the natural environment (saving of paper and energy).

It is an application that provides: sending and receiving electronic documents, creating invoices and WZ documents based on the local catalog, tracking the status of sent documents, built-in archive of received and sent documents, serial printout of received orders, monitoring of event history.

Today, electronic data exchange is the basis of economies around the world, and we are part of the international EDITEL group - a leading provider of EDI solutions in Central and Eastern Europe. The international experience of companies in the whole group allows us to quickly and efficiently connect business partners around the world. We also help in finding local legal regulations.

More and more entrepreneurs are choosing EDI communication. By introducing electronic data interchange - including in the field of orders, invoices, logistic documents - you ensure efficient business processes. Regardless of the scale of operation, EDI communication works in every company. Full control of the processes taking place directly supports the company's effectiveness and, consequently, the implementation of the adopted strategic goals. EDI allows you to instantly transfer information between a company and its suppliers and recipients. Smooth information exchange ensures precise traceability. Global Location Number assigned by the GS1 organization provides such solutions. By deciding on electronic documents, you streamline the process of delivery and production, and reduce the waiting time for the final product, which in turn translates into the company's position on the international market.

Conclusions

The expansion of business activity means that, as part of the logistics concept in transport, modern seaports (regardless of their size) can perform alongside traditional functions: transport, industrial, commercial, passenger and tourist traffic, as well as logistics and distribution functions. The key importance shall be attributed to ensuring that the whole creates a certain logistics system, while the parts that make it up play a secondary role. The role of individual parts is determined by the purpose for which the whole exists.
The research problem in the presented approach touches only some of the problems resulting from determining the place and role of LDC in transport logistics, as well as the impact on its functioning of IT systems, one should be aware of constant changes in the subject of research, the emergence of new technologies, means of transport, etc., this emergence new research areas. Therefore, there is a need to systematically repeat and develop research on the presented problem.

The changes taking place on the Polish transport and forwarding market clearly show the direction in which it is evolving. It is developing in the direction of logistics, which means that companies getting rid of cars and warehouses are increasingly willing to use external operators to manage goods and inventory. Enterprises, in search of cost reduction and building competitive advantage, transfer logistics functions outside. Therefore, there has been a development of enterprises providing comprehensive logistics services. The scope of logistics services rendered is usually very wide and includes activities that go beyond traditionally understood transport or forwarding. Usually these include supply services, distribution, transport, storage, inventory management, packaging, order processing. Therefore, the construction of logistics centers from the point of view of logistics service of the market is a particularly important task. Of course, the implementation of the logistics center location project requires long preparation. The experience of Western European countries indicates that they are necessary. Trade development, improvement of road infrastructure, density of the railway network, and above all new jobs - these are the main and most frequently mentioned advantages. Logistics centers are also an element of state policy, as they will significantly support the development of exports. These are also problems of future scientific research.

Leadership, Conflict Management Traits and Teachers' Satisfaction

Sophia Anastasiou

Faculty of Social Sciences, University of Ioannina, Ioannina, Greece
anastasiou@yahoo.com

Abstract

Leadership traits can have a significant effect on the success of an organization and leaders face a range of challenging roles required to lead and inspire their workforce. Personality traits, experience and training are contributing factors of successful leaders. For example, succefull conflict management resolution at work is contributing parameters for job satisfaction and productivity of the workforce. Conflict at work can be and indication of issues which require managerial intervention but managers may feel ill at ease and unprepared to handle conflicts at work. The purpose of this article is to present evidence which support the interaction between leadership traits and the satisfaction of employees. Evidence of a correlation between leadership styles, conflict management style is presented and the interaction between leadership traits and Teachers' satisfaction is illustrated with examples of the interaction between school conflict and school leadership. It would be interesting to investigate this phenomenon in other professions. Further research in this field can elucidate the interaction among different variables including leadership traits and work conflicts, which can affect the level job satisfaction and the effiency of an organization.

Keywords: Leadership, School Conflict, Transformational, Laisezz-faire leadership style

Introduction

Personality traits, experience and training are contributing factors of successful leaders (Leithwood, 2014; Yukl, 2012). There is some evidence to suggest a significant effect of leadership traits on the performance of an organization. Leadership style (You et al., 2015) and conflict management style (Ahmed, 2015; Chen et al., 2012; Lu and Wang, 2017) can have a significant effect on job satisfaction of employees. Job satisfaction can be a reliable indicator of successful management and efficiency of an organization (Aldridge & Fraser, 2016; Banerjee et al., 2016). Conflict at work can be and indication of issues which require managerial intervention but managers may feel ill at ease and unprepared to handle conflicts at work. Conflict management resolution at work is contributing parameters for job satisfaction, efficiency and productivity of the workforce (Chen et al., 2012; Kunaviktikul et al., 2000; Howell & Avolio, 2013; Vestal and Torres, 2016).

The purpose of this article is to present evidence which support a link between leadership and conflict management traits with the satisfaction of employees.

The relationship between the School Leadership and Conflict Management traits.

School leaders are expected to exhibit traits which will encourage the communication between school, students, teachers, parents and other stakeholders (Sosik et al., 2016). A successful school leadership can motivates teachers and students in achieving their goals in academics (Howell, & Avolio, 2013). There is evidence to suggest a significant correlation between leadership styles, conflict management style and job satisfaction of teachers. School leaders may adopt different styles according their personality traits, experience and management skills. There is a range of leadership traits which can be grouped according to their characteristics in different types of leadership styles. According to Bass et al. (2003), different leadership styles are transformational leadership, transactional leadership, and passive leadership, or Laisezz-faire leadership style.

School leaders are faced with challenging issues in a range of their jobs. A particular issue which leaders may face, is work conflict. There is a need for the school leaders and the manager to understand the approaches used in managing conflict by developing high competence in all the conflict resolution areas for the effective running of the schools (Wanjiru, 2019). The various leadership levels of the schools should ensure that they use the best conflict management strategies in defining and determining nature in the conflicts as they try solving it. Besides, the school heads can use various conflict resolution mechanisms to resolve the differences that exist between the members of the school community. The effectiveness of the leaders to use the conflict resolution approaches enhances their awareness of highlighting various conflicting situations that, in turn, lead to the best way of ending the differences among the people (Wanjiru, 2019). The school leaders can comprehend the structure of conflict management strategies so that they understand the root causes of the conflict in schools and select the best approach that will give them an amicable solution. Again, various disputes in schools at a personal level may involve teachers-teachers or learners-teachers (Wanjiru, 2019). These conflicts can be managed by the school heads who embrace the five conflict management strategies to bring them to an end and create peaceful co-existence in school.

Figure 1: Level of school conflict and level of Teachers' satisfaction with (a) Transformational and (b) Laisezz-faire leadership style. Redrawn from Chandolia & Anastasiou, (2020).

Different leadership styles and conflict management styles may be adopted by school leaders (Saiti, 2015). The effectiveness of school conflict management may vary according different *leadership style* and *conflict management style*. There is some evidence to suggest a negative correlation between successful school conflict and job satisfaction. High levels of school conflict can be associated with lower level of job satisfaction, whereas moderate levels of school conflict can create conditions which attract the attention of the school leader who may exhibit creativity, leadership and conflict management traits which can successfully resolve conflicts. For example, a correlation between school conflict and the effectiveness of school leaders has been reflected on a negative correlation between conflict level and teachers' satisaction (Hareesol et al., 2019). Furthermote, Chandolia & Anastasiou (2020) reported that compared to the *Laissez-faire* school leadership style, *Transactional* leadership style was associated with low level of school conflict.

In the same manner, the effect of different conflict management styles was reflected on the satisfaction of teachers. In their study, Chandolia & Anastasiou (2020) concluded that in most cases, leadership traits have a significant effect on teachers. This is illustrated graphically in Figure 1. The correlation between conflict and Teachers' satisfaction is modified according to different leadership styles (Figure 1). School conflict correlates with teachers' satisfaction. This was a negative correlation when leaders exhibited Transformational leadership style but the reverse was exhibited in school units with a Transactional style adopted by school leaders.

Conclusion

In conclusion, there some evidence to suggest that leadership and conflict management traits can be correlated with the level of school conflict and job satisfaction of teachers. The interaction of all these variables may be modulated by a variety of parameters such as human resources, school resources and several other school parameters (Anastasiou, & Papakonstantinou, 2015; Aldridge & Fraser, 2016; Bass et al., 2003; Anastasiou & Papagianni, 2020). Further investigation is required to elucidate the interaction among different variables including leadership traits, which can affect the level job satisfaction of teacher as well the educational outcome of a school unit. It would be interesting to investigate this phenomenon in other professions.

Determinants of The Economic Value of Investment Activity as A Factor of Sustainable Business Development

Svetlana DROBYAZKO

Doctor of Economics, Professor, European academy of sciences, United Kingdom
svetlana.drobyazko@yahoo.com

Abstract

The economic value of investment activity of a telecommunications provider as an internal characteristic of its economic activity is studied through characteristics of the state and efficiency of the investment activity implementation, estimated by indicators of development of the results of economic activity of a telecommunications provider in the value chain. Characteristics of the economic value of an investment activity for a telecommunications provider are mostly reflected in value indicators such as net investments, share of capital investment in net income, capital efficiency, return on invested capital. Results of economic development of a telecommunications provider are characterized by an increase in ARPU, net income and efficiency, growth in assets, formation of net cash flow and economic value added. The specifics of a telecommunications provider are reflected in such operational indicators of development as an increase of subscriber base, an increase of Internet traffic or voice traffic, changes in the structure of traffic characterizing changes which have occurred due to improvement in quality of rendering services, expansion of their scope, etc.

Keywords: return on invested capital, operational indicators of development, quality of services, investment activity, economic value.

Introduction

The concept of sustainable information and communication development, active use of information and communication technologies (hereinafter ICT) underlies national projects of the leading countries of the world, systematically making transition to the digital economy.

Resolution of this contradiction lies in application of a set of innovative approaches in the economy and management of investment activity of a telecommunications provider, the synthesis of which in practice will allow to carry out investment activity of a telecommunications provider at a new qualitative level, which will provide both technical and economic development of the telecommunications provider in accordance with the new socio-economic requirements.

Therefore, the scientific problem resides in the lack of accumulated scientific knowledge on generation of new scientific and applied approaches in the economy and investment management of a telecommunications provider, which create opportunities for sustainable development of investment activity of a telecommunications provider, which should be based on modern approaches to managing the economic activity of a business, experience in using investment financing instruments that are new to businesses, as well as considering current conditions of functioning and specifics of activity of telecommunications providers, related to the specifics of its organization and the product created.

The purpose is to develop theoretical and methodological bases and applied provisions for managing the investment activity of a telecommunications provider on the basis of economic value.

Literature Survey

Interdisciplinary links between enterprise economics and financial management, which are traced to the provided concepts, directly impact on substantiation of methods and tools of analysis, planning

and organization of the investment activity of a business, which largely determine its successful implementation (Eckert, J., & Gatzert, N. (2018)).

However, the existing studies of investment activity focus on individual aspects without providing a unified view of the role, objectives and results of investment activity of a company.

So far, the issues of studying investment activity as a part of economic activity of a company, where it is considered as a holistic phenomenon, which is the primary reason for achieving current and future results of activity, the carrier of economic value, which is the source of generating economic activity of a company on the market and an information driver that supports and develops it, remain insufficiently considered and researched (Cordes, J. J. (2017)).

Considering the important role of the investment activity of a company, it becomes clear that it is appropriate and necessary to apply the appropriate technologies and strategic management tools, which are introduced within the overall approach to managing the economic activity of a company (Badri, H., Ghomi, SF, & Hejazi, TH (2017)). It should be noted that the methods, structure, functions and targets of a company management have undergone considerable changes as a result of the evolution of views and changes in management approaches.

The subject area of the investment activity of a company reveals the interdisciplinary links of its study based on integration of theory and practice of enterprise economics, financial, investment and strategic management, anticipating its further study in the context of such areas as (Grimm, M., Hartwig, R., & Lay , J. (2017)): application of value-oriented management and stakeholder theory, balanced scorecard; development of information and analytical support of a company's economic activity; application of methods of economic analysis, financial planning and budgeting technologies; development of new and improvement of the existing tools for managing the investment activity of a company, taking into account its peculiarities and the role in shaping the result of economic activity.

Within the framework of a value-oriented management and the stakeholder theory (Drobyazko, S., et al. (2019a), Drobyazko, S., et al. (2019b)), a theoretical foundation of value-based management has been formed.

Study of theoretical and methodological aspects of investment activity in the context of value-oriented management will help to investigate its further development in a more meaningful way. Therefore, value-oriented management and stakeholder theory are those promising areas which, in this study, are defined as the basis for economic growth and investment management of a company (Firk, S., Schmidt, T., & Wolff, M. (2019)).

The theory of value-oriented management puts forward the statement on increasing the value of business for its owners and external investors, who, only in case of satisfaction with owning a business, will invest and expand investment resources for its further development. (Vercellini, P., et al. (2018)).

The owners' satisfaction is based on two components. The first is the ability of a business to accumulate in the result of operations of a sufficient and, where possible, regular cash flow that the owner receives from owning it (Zerfass, A., & Viertmann, C. (2017)). The second, equally important component, is the gradual increase of the value of business, which ensures an increase in the well-being of owners in future (Srinivasan, R., & Parlikad, A. K. (2020)).

Simultaneously with the value-oriented management develops the stakeholder theory, which considers the purpose of business as creation and growth of its value for all parties interested in the activities of the business (internal and external agents), called stakeholders. Among the benefits of applying the stakeholder theory are the following:

ensuring importance of the environment research (Franchetti, J., & Page, S. J. (2017));
increasing the level of trust and loyalty of the company's customers (Langner, A., et al. (2017));

opportunities to prevent the risk of damage to the publicity;
development of interaction and communication with society provides potential growth of social importance of a business (Trianni, A., Cagno, E., Marchesani, F., & Spallina, G. (2017)).

In turn, among the shortcomings of the theory of stakeholders stand out the following (Blendinger, G., & Michalski, G. (2018)):

stakeholders are focused on their own needs and do not pay attention to business matters (Töytäri, P., Keränen, J., & Rajala, R. (2017));
taking into account the interests of all stakeholder groups transforms the purpose of a business into a certain list in which some provisions may conflict with each other (Narula, R., & Pineli, A. (2017));
certain areas of a company's progress may be blocked, especially those that conflict with the interests of some stakeholders (Rossi, M., Festa, G., Solima, L., & Popa, S. (2017)).

Harmonization of provisions of the value-oriented management and the stakeholder theory is possible within a balanced scorecard system that provides tools to develop and implement a strategy for a given value (Drobyazko, S., et al. (2020)). BSC provides for consistent implementation of a development strategy, company goals and control of their achievement through the so-called key performance indicators.

Methods

The methodological basis of the work is a set of methods and techniques of scientific cognition, including: dialectical and systematic approaches to the subject of research, as well as theoretical and empirical methods, the main of which are analogies, analysis, synthesis, used in determining the subject plane of the investment activity of a company and its place in the economic activity; abstracting and specifying in formulating definitions of key concepts of the value of investment activity, carrying out decomposition of connection between them, developing a structural and logical scheme of influence of investment activity on the value of economic activity of a company for stakeholders; method of distance from the model, expert methods - measuring the economic value of investment activity.

The information base of the research is analytical reports, data of annual reports of telecommunications providers, monographic researches and publications in periodicals on the researched subject, Internet resources, results of own researches of the autho.

Results

The investment activity of a company usually involves a simultaneous implementation of a certain set of investment decisions, which have different objectives for development of a company’s activity, require different scopes of investments, differentiate by the level and terms of implementation. Such a wide range of characteristics requires agreement of the level of effectiveness of investment decisions in the framework of targeted management units based on economic value.

Proceeding from understanding of the concept of efficiency, the essence of assessing efficiency of investment activity of a telecommunications provider is to compare the result (effect) of its implementation with the cost of its achievement. To evaluate effectiveness of investment activity as a holistic object in the theory of economics and management, we use models, which include formation and planning of a company investment program.

In such circumstances, defining methodological provisions for development of a value based investment program is a task that needs to be addressed in the scientific and practical fields.

Determinants of the investment activity of a telecommunications provider are those decisive levers that, when applied together, provide economic value, allowing for simultaneous growth of the economic effect of each invested hryvna and value characteristics of the activity for the stakeholders.

According to the results of the conducted researches with such determinants it was found that investments in creation of additional services for consumers, which determine directions of diversification of operating activity; capital investment facilities that produce technological leadership; formation of financial support of investment activity from alternative value-oriented sources; justification of investment decisions taking into account the value characteristics of stakeholders.

Logical relationships between the results and objects of a company's investment activity in relation to changes occurring in the economic activity of a company and manifested in certain indicators are presented in the form of a scheme of influence of investment activity on the value of economic activity of a company for the stakeholders, where the objects of investment as investment drivers of generating new added value form specific characteristics for different telecommunications stakeholder groups.

Research of an investment driver of introduction of 3G technologies by Ukrainian telecommunications providers has identified the following trends: acceleration of revenue growth for telecommunications providers due to a significant (over 100%) increase in mobile traffic usage, which influenced growth of mobile data revenue and ARPU, growing the number of subscribers in two of Ukraine's three largest mobile operators. In particular, the results show that the investment driver "3G Implementation" allowed PJSC "VF Ukraine" to move to a new development stage, to increase the value of its activity on the market as a result of a positive impact of the investment decision on the main value characteristics by stakeholder groups.

The consolidated results of determining the integral indicator of economic value of investment activity of telecommunications providers in Ukraine in 2019 and the expert estimates for 2020 are presented in Table 1

Table 1. The summarized results of the integrated evaluation of the economic value of investment activity of telecommunications providers in Ukraine (author's analysis on the basis of financial statements)

Company	2019 standard value	Value considering the weight in 2019	Expert estimation for 2020	Estimated value considering the weight in 2020
PJSC “Kyivstar”	12.75	0.84	14.75	0.92
PJSC “VF Ukraine”	7.46	0.51	11.65	0.71
PJSC “Ukrtelecom”	7.73	0.50	8.15	0.52

The obtained results show that the highest integral indicator of economic value belongs to PJSC Kyivstar and is expected to further improve in 2020. PJSC “VF Ukraine” received a low level of economic value due to the impact of negative economic added value in 2019 and a significant outflow of subscribers, but the experts’ expectations are optimistic-positive. PJSC “Ukrtelecom” has the lowest level of economic value and the worst estimate, which remained positive due to the active technical development and the place occupied by the enterprise on the market. Consistency of experts' opinions is estimated by the coefficient of variation, the value of which varies within the interval [7.5% ... 30%]. The highest consensus of experts' opinions was obtained by the value characteristics of the owners, and the lowest - by the state indicators.

The content and essence of the developed theoretical and methodological bases and applied provisions are aimed at creating opportunities for sustainable development of investment activity of a telecommunications provider on the basis of economic value, taking into account current conditions of accelerated spread of ICT and digitization of economy.

Discussion

Investments of Ukrainian telecommunications providers in 3G technology have had a positive impact both on the value of the economic activities of the companies that have implemented them and on the spread of ICT in Ukraine, since introduction of 3G contributed to reducing digital divide between urban and rural settlements. The value of investment decisions of a telecommunications provider, whose activity is carried out throughout the country, manifests itself in the internal environment of the company, creating the basis for improvement and further development of economic activity and the external one, changing the telecommunication service user habits and preferences, business conditions, level of ICT development, etc.

An increase in the economic added value of a telecommunications provider is possible on condition that a subscriber base is created with the number of subscribers larger than necessary to obtain its minimum size. Therefore, an important aspect for a telecommunications provider is to determine the threshold volume of the subscriber base, the excess of which provides an increase in economic value added without additional capital and operating costs of the network maintenance, since the main cost activity, in this case, becomes marketing, which provides creation of a subscriber base of telecommunications provider, under similar operational and technological conditions, on the basis of effective pricing policy applying modern means of services promotion.

Further development of the model of formation of the investment program of a company allowed to formulate an improved model, which, unlike the existing one, assumes consideration of the value aspects of the investment activity of a company and is based on the following main provisions: projects that on condition of joint implementation generate a net cash flow that ensures creation of economic added value at the maximum permissible level of risk are included into the investment program of a company with a certain implementation period; the cost of the investment program by the amount of investment should not exceed the amount of financial resources available to the company during implementation of the program. The amount of available financial resources depends on the financial condition of the company during implementation of the investment program.

Conclusion

The model improvement is based on the synthesis of key indicators of the concepts of value for money in time and value-oriented management.

As a result, the formulated model of the value based investment program of a company allows to implement investment decisions that have high priority, but not able to provide added value in the first years after implementation, to determine the total amount of annual economic value added from the investment activity of a company, the total level of efficiency of the capital invested in the company.

The results of the integrated assessment of the economic value of the investment activity of Ukrainian telecommunications providers make it possible to determine that the integral indicator is the highest for PJSC Kyivstar. PJSC “VF Ukraine” received a low level of economic value due to the impact of negative economic added value in 2019 and a significant outflow of subscribers, but the experts’ expectations are optimistic-positive. PJSC “Ukrtelecom” has the lowest level of economic value and the worst expectations, which remained positive due to the active technical development and the place occupied by the company on the market. Consistency of experts' opinions is estimated by the coefficient of variation, the value of which varies in the interval [7.5% ... 30%]. The overall positive tendency in the forecast of economic value of investment activity of telecommunications providers is emphasized, where the leading components of its formation are orientation to technological leadership and efficiency, formation of value characteristics of business owners and users of services.

Introduction of a balanced scorecard to determine the value of the investment activity characteristics will enable to develop a strategic map of the investment activity of a telecommunications provider. The developed map is a model that generalizes cause and effect relationships between four strategic

zones of economic activity of a company, forms the basis for investment management through characteristics and indicators that directly or indirectly reflect the economic impact and effectiveness of implementing investment decisions, focusing on the process and result of value adding of economic activity of a telecommunications provider for the stakeholders.

Abstract

The SWOT analysis identifies and highlights the advantages and disadvantages of country's sustainable development, as well as the external and internal threats and opportunities in this area. It was confirmed that the strategic goal of economic transformation in country is innovative development, which foresees the rejection of traditional scientific and technical solutions in favor of fundamentally new advanced technologies. The analysis of qualitative methods that build alternatives to the scenarios of a desirable future is represented.

Keywords: Sustainable Development, Security, SWOT-Analysis, Matrix, Innovative Development, Cognitive Modeling.

Introduction

Sustainable development provides the refusal from traditional scientific and technical solutions in favor of fundamentally new advanced technologies, as well as ensuring the release of high-tech products and the implementation of new organizational forms, such as: technoparks, technopoles, as well as the implementation of resource policy and energy conservation.

The urgent need for qualitatively new, systematically agreed principles, approaches, methods for identifying opportunities for assessing trends and prospects for the development of both civilization with its economy in general, and of a particular country, occurs.
The research is relevant because of the identification of new trends, strategic scientific directions, technological advances, which in the long term, will be able to make a significant impact on economic and social development. To this end, in the process of generating alternative scenarios in solving prediction problems, there is a need to involve methods of expert evaluation, the following are the main methods: SWOT analysis, Delphi methods and morphological analysis.

Cognitive modeling is used to construct the scenarios for the selected alternatives, enabling, on the basis of the proposed mathematical apparatus, to get a sound scenario for practical decision making.

The goal of the study is to create a strategy for the development of socio-economic systems based on the mathematical provision of simultaneous application of prediction methodologies for creating

alternative scenarios and cognitive modeling, in order to build scenarios for the desired future and ways of their implementation.

Literature Survey

When designing a strategy for innovative development of large socio-economic systems at the level of the metropolis, large enterprise, region or even the country as a whole, the prediction methodology has proven its advantages in many high-status countries.
According to the foresight methodology, 3-4 alternatives to the scenarios are proposed in the final stage of the decision-making process, which, in the general case, are complex, badly structured problems (Gault, F. (2018)).

Today, within the framework of the prediction methodology, a number of qualitative methods of analysis have been formalized (SWOT-analysis, analytic hierarchy process (AHP) and its modifications, Delphi methods, cross-analysis, morphological analysis, etc.), which became the basis of the toolkit for building script alternatives (Drobyazko, S., et al. (2019a), Drobyazko, S., et al. (2019b), Drobyazko, S., et al. (2019c)).

Experience in the use of foresight in the world has shown that this methodology helps to build strong connection between industry, science, government, non-governmental organizations, etc. (Szopik-Depczyńska, K., et al. (2018)).

This allows to carry a thorough analysis of existing problems and to create special scenarios for the industry under consideration, also to implement the selected project in future, paying necessary attention to the increasing complexity of risk analysis and decision-making in such systems.(Wang, M. X., et al. (2018)).
In order to solve prediction tasks, a wide range of methods can be used, some designed especially for the analysis of the future, others borrowed from management and planning (Skrynnyk, Z., et al. (2019)).

In particular, research (descriptive) methods are distinguished (Manuela, T., & Kristina, R. (2017)), which are based on extrapolations of past trends or causal dynamics (trend analysis, cross-impact analysis, etc.), and normative methods that based on a preliminary consideration of a desirable scenario for future development (trees of importance, morphological analysis methods, Delphi, different scenarios, etc.) (Wang, W., Hou, R., & Qiao, W. (2017, April)).
Another classification is the distinction between quantitative (based on quantitative data input) (Smol, M., Kulczycka, J., & Avdiushchenko, A. (2017)) and qualitative (allow to make conclusions based on subjective expert judgment) methods (Zhao, H., Guo, S., & Zhao, H. (2018)).

In the context of solving prediction problems, methods of Bayesian models, trend analysis and simulation are considered as quantitative. (Ghaffari, S., Arab, A., Nafari, J., & Manteghi, M. (2017)).

Qualitative methods include brainstorming, SWOT and STEEP analysis (Kusi-Sarpong, S., Gupta, H., & Sarkis, J. (2019)), scanning, expert panels, hierarchy, Delphi analysis, morphological analysis, technological "roadmap" (Roadmapping) (Stec, M., & Grzebyk, M. (2018)), as well as, critical technologies, cross-impacts, scenarios, and more.
The problem with solving prediction problems is to determine the proper role of each of these methods, as well as to effectively combine these methods into a single methodology. (Żelazny, R., & Pietrucha, J. (2017)).

These groups of methods represent different approaches, their combination depends on the following factors: the time required for their implementation, financial resources, the nature of the problem under study, the purpose of the task, the ability to organize appropriate expertise (Kasych, A., et al. (2019)).

Predictability tasks are innovative because of this, they are fundamentally unformalized, so they contain fundamentally informal procedures, such as the selection of criteria, the choice of conditions for rational compromise, etc. (Song, M. L., Fisher, R., Wang, J. L., & Cui, L. B. (2018)).
When solving problems that require decision-making in conditions of conceptual uncertainty, often the only possible way of application is the method of expert evaluation. (Tetiana, H., et al. (2019)).

This is due to the fact that, regarding the issue of overcoming the shortage or the fundamental inability to obtain the necessary statistics for solving the tasks set, the only source of information can be the experience and knowledge of people, experts in this field (Kusi-Sarpong, S., Gupta, H., & Sarkis, J. (2019)).

In particular, there is a concept of "subjective probabilities" which, compared to statistical ones, have another origin and is defined by competent experts through specially organized procedures (Hilorme, T., et al. (2019a), Hilorme, T., et al. (2019b), Hilorme, T., et al. (2019c)).

Methods

The computational algorithm is designed to carry out an SWOT analysis of an object, that is, an analysis of its Strengths, Weaknesses, Opportunities, and Threats. The computational algorithm supports all the procedures, models and methods necessary for SWOT analysis. The SWOT Matrix contains 4 sectors that contain options for describing strengths, weaknesses, opportunities, and threats. While creating a model, you can make a list of parameters for describing the internal and external environment.

The structure of the created model consists of the following levels: loading and processing of data; data analysis; construction of SWOT model; prediction.

The first level provides the ability to enter data manually and then edit them to eliminate redundancy or, even, add new data. The next step is preparing the data for analysis. It is possible to use different software products at this level. In our opinion, MS Excel is the most convenient and affordable;
The second level provides an opportunity for mutual analysis of pairs of the following indicators: Strengths-Opportunities (S-O); Strengths-Threats (S-T); Weaknesses- Opportunities (W-O); Weaknesses-Threats (W-T);
The third level provides the tools for building a SWOT- model;
The fourth level implements the prediction based on the created SWOT- model.

Results

The usage of SWOT-analysis provides an opportunity to determine the impact of the external and internal business environment, taking into account the peculiarities of innovative development of the country, on the basis of energy component management in the national security system.

After the study, according to our opinion, the most significant characteristics were identified, and then they were represented in Table. 1.

Table 1:Identification of strengths in the innovative development of the country, based on the management of energy component in the national security system (author's research)

STRENGHTS	
S1	The level of the enterprise provision with its own energy resources
S2	Building a decent foundation for a competitive economy
S3	Achieving of the energy self-sufficiency
S4	NPP network developed
S5	Implementation of internal reforms in the context of network integration with the EU
S6	Change of energy (alternative) and supplier
S7	Creating an energy efficient society
S8	Creating an opportunity to re-equip both the energy industry and the industry as a whole
S9	Improving the security of the economy, energy and the environment
S10	Development of scientific potential
S11	Workplace creation
S12	Convenient geographical location for the development of the electricity industry
S13	Large reserves of natural resources for various industries
S14	Favorable trading geographical location

However, unfortunately, the weaknesses, of the modern economy as a whole and of its individual branches, were even more (Table 2).

Table 2: Identification of weaknesses in the innovative development of the country, based on the management of energy component in the national security system (author's research)

WEAKNESS	
W1	Monopoly dependence on particular supplier or route of energy supply
W2	Insufficient search for alternative sources of electricity, ways for reducing their volumes
W3	High dependence on imports of natural gas and oil
W4	Outdated production facilities and a significant amount of non-usable fixed assets of enterprises
W5	Installation of appropriate tariffs, coefficients for enterprises
W6	Low level of investment and innovation activity in the complex of enterprises of the fuel and energy sector
W7	Need for modernization, re-equipment and restructuring of production with continuation of technological resource of production facilities at the enterprises
W8	Low level of the labor resources skills
W9	High level of corruption
W10	Political and social instability
W11	Increase of tariffs for development of gas fields, up to 5 km deep
W12	Migration of labor resources for permanent residence abroad
W13	Complex implementation of EU standards in the energy sector

W14	Complexity of strategic goals achievement in the energy sphere
W15	Openness of production cycles of most industries
W16	Irrational usage of natural resources
W17	Irrational privatization
W18	Deprofessionalization of energy sector
W19	Low level of industry orientation in the sphere of education
W20	False statements of certain legal acts
W21	Complexity of the certain economic transformations
W22	Increased costs on energy

These characteristics can be eliminated. If the strengths are used rationally and all the existing opportunities are realized (Table 3), over time it is possible not only to compensate all the weaknesses, but also to turn them from disadvantages into advantages.

Table 3: Identification of opportunities for innovative development of the country on the basis of energy component management in the national security system (author's research)

OPPORTUNITIES	
O1	Significant potential of non-conventional natural gas reserves (methane from coal deposits, shale, biogas from landfills, etc.)
O2	The oil and gas pipeline systems are branched and developed
O3	Auction system for the sale of condensate, oil, and liquefied gas
O4	Integration into European standards of the energy system
O5	Significant potential for reducing greenhouse gas emissions
O6	Branched system of centralized heating
O7	Auctions of permits and licenses for the development of hydrocarbon fields
O8	Development of renewable energy sources
O9	High quality and compliance with international standards of Ukrainian scientific developments in the progressive sphere of alternative energy
O10	Introduction of tax motivation
O11	Significant potential for energy savings in industry, transport, budget and consumer sectors
O12	Strengthening of global connection
O13	Increasing energy savings and energy efficiency
O14	Diversification of energy imports
O15	Creation of strategic reserves of fuel and energy resources
O16	Reform of the power system
O17	Innovative renewal in accordance to world standards
O18	Attraction of investments and development of business with foreign capital
O19	Reduction of administrative barriers to entry the market and free investment
O20	Reorientation and renewal of old enterprises, modernization of technological processes
O21	Expanding international relations
O22	Developing mechanisms to counteract corruption
O23	Ability to diversify nuclear fuel supplies

Undoubtedly, there is a range of factors that hinder the development of the economy in the country, and some even cause its decline. We identify a number of threats (Table 4), which, in our opinion, are the most urgent nowadays.

Table 4: Threat detection in innovative development of the country, based on energy component management in the national security system (author's research)

THREATS	
T1	Investment capital withdrawal
T2	The threat of terrorism in energy facilities, as well as in the territories of countries that transit energy resources
T3	Ecological (large-scale crashes, global greenhouse gas emissions, threatening the entire planet)
T4	Speculation in the media, which is a negative manifestation of today's globalized world (artificially created panic, which leads to the destabilization of energy markets)
T5	Social threat (high accident of production, strikes and other possible protests, etc.)
T6	The threat of nuclear terrorism, the problem of non-proliferation of nuclear materials
T7	Energy poverty (lack of access to the sufficient amounts)
T8	External aggression of the energy supplier
T9	Neglect of the rules of “decarbonisation”
T10	The importance of ensuring the stability of energy transportation
T11	Dependence on foreign energy resources
T12	Transit status may be lost
T13	Self-isolation after EU rules were not observed or inadequately implemented
T14	Existence of seismic geological zones in the Carpathian region

We have selected 10 officials from different levels of management of seven energy companies of Dnipropetrovsk region, as experts.The consistency of experts' opinions was calculated by the Kendel rank correlation coefficient, which was 0.67.
The results obtained by implementing the computational algorithm of the SWOT-analysis method are presented in Table. 5.

Table 5. Results obtained from SWOT-analysis (author's calculations)

STRENGHTS		WEAKNESS		OPPORTUNITIES		THREATS	
S_j	F_j	W_k	H_k	O_n	G_n	T_i	B_i
S13	19,7	W10	19,4	O17	5,5	T8	-9,8
S14	18,4	W9	17,7	O1	4,8	T1	-7,8
S6	17,3	W12	16,4	O4	4,1	T5	-6,5
S5	15,1	W5	15,7	O10	3,7	T12	-4,2
S12	14,8	W22	14,4	O8	3,5	T11	-2,2
S3	14,8	W16	13,5	O12	2,3	T2	-1,7
S8	12,4	W17	12,5	O14	2,3	T3	1,0
S11	12,3	W1	12,3	O15	1,9	T6	0,2
S10	10,9	W4	11,3	O21	1,8	T9	0,5
S4	10,7	W3	11,1	O22	1,3	T4	1,2
S9	10,6	W7	10,3	O19	1,2	T10	1,5
S7	10,6	W8	9,0	O18	0,9	T7	3,1

S2	8,3	W20	8,3	O9	0,8	T13	3,7
S1	7,5	W21	8,0	O16	0,7	T14	4,7
		W18	6,2	O2	0,3		
		W13	5,1	O6	0,3		
		W6	4,8	O13	0,1		
		W2	4,7	O7	-0,2		
		W11	4,6	O3	-0,5		
		W15	3,7	O20	-1,1		
		W19	3,6	O5	-1,2		
		W14	3,5	O23	-3,9		
				O11	-3,9		

From the results in table 6, it is advisable to highlight the following.

The strongest characteristics. From the obtained values of the coefficient F it can be seen that it reaches the maximum for the characteristics S13 and S14 (F = 19,7 and F = 18,4 respectively). The S6 characteristic is much smaller than F = 17,3. The other characteristics are also close to those, which were mentioned, their F values are slowly decreasing. There are five strong characteristics with the highest F.

S13 Large reserves of natural resources for various industries;
S14 Favorable trading geographical location;
S6 Change of energy (alternative) and supplier;
S5 Implementation of internal reforms in the context of network integration with the EU;
S12 Convenient geographical location for the development of the electricity industry.

The weakest characteristics. Based on the values of the H coefficients, we can make relevant conclusion about the weak characteristics. For the most important characteristics, these values differ slightly (from 19,4 to 11,1), however, allow them to be prioritized. The values of the coefficient H for the other characteristics gradually fall into the interval [10,3; 3,5]. So the weakest features are the following:

W10 Political and social instability;
W9 High level of corruption;
W12 Migration of labor resources for permanent residence abroad;
W5 Installation of appropriate tariffs, coefficients for enterprises;
W22 Increased costs on energy.

Opportunities with the greatest chance of implementation. The highest value of the coefficient G has the ability O17 (G = 5,5). In second place is O1 with value of G = 4,8. O10 and O8 opportunities are close in value. Thus, the most likely opportunities are the following:

O17 Innovative renewal in accordance to world standards;
O1 Significant potential of non-conventional natural gas reserves (methane from coal deposits, shale, biogas from landfills, etc);
O10 Introduction of tax motivation;
O8 Development of renewable energy sources.

The most dangerous threats. When calculating the coefficient B, we can observe that the most urgent and dangerous threat is T8, for which B = -9,8. Furthermore, nearly equal values of B have T1 i T5 (-7,8 and -6,5 respectively). The range of B values for the rest of the threats starts at -4.2, that means that, the level of these threats is relatively lower. Thus, the most dangerous threats are:

T8 External aggression of the energy supplier;
T1 Investment capital withdrawal;

T5 Social threat (high accident of production, strikes and other possible protests, etc).

Discussion

The development of industries depends on the introduction of critical technologies, in particular, high-priority technologies, the usage of which is crucial for creating or exceeding world-class products. The usage of critical technologies should help to meet national needs in the social, military, economic and other spheres of the economy.

Economic analysis of the factors influencing the definition of priority directions of technological development, shows that the following indicators of the critical technologies introduction may be used in the country's industries:

volumes of budget financing of scientific and technical works, concerning development of perspective technologies and determination of priority directions of science and technology development;
volumes of innovative costs;
introduction of new technologies;
development of new product types;
specific volumes of innovative costs for the introduction of new technological processes.

However, the issues of introducing scientific and technological developments into production remain unresolved. The financial situation of most industries prevents them from introducing new technologies and paying for highly qualified specialists.

Conclusion

Thus, the current priority directions in the development of the strategy and policy of the development of scientific technologies in the country are:

concentration of resources for engineering research in those areas, where country has significant scientific, technological and industrial potential;
the usage of a targeted program approach to finance all sectors of the scientific field;
introduction of market mechanisms to support the development of new technologies, in order to expand the participation of small and medium businesses in scientific and technological development;
bringing the system of intellectual property legal protection in accordance with international norms and introduction of intellectual property into the economic return;
development and implementation of innovative information technologies.

The strategic goal of economic transformation in country is innovative development, which can be realized only in the context of structural restructuring of economic sectors, technological renewal of industry and agrarian sector with the widespread use of perspective technologies.

Selection of critical technologies, creation of rational scenarios for development of strategically important enterprises, determination of priority industries and industrial sector of the state, are advisable to perform on the basis of carrying out a set of works concerning technological prediction.

The perspective research directions in this area are the construction of a cognitive of country's innovative development, based on the energy component management in the national security system, using the factors identified in the results of the SWOT-analysis. Cognitive modeling technology is based on identifying possible and rational ways of managing the situation in order to move from the initial states to the positive ones, using cognitive models. Cognitive modeling technologies do not allow to make rational decisions for the benefit of subjects.

Information and Communication Technologies (ICT) Usage in Public Administration – Example of Poland

Patrycja KRAWCZYK

Czestochowa University of Technology, Czestochowa, Poland
patrycja.krawczyk@wz.pcz.pl

Abstract

Today's information and communication technologies (ICT) have revolutionized the way of working, transformed the economy and irreversible affected human activity in the information society. Poland is increasingly embracing ICTs as a key enabler of social and economic development. It is important for governments to improve the management of ICT-driven approaches to guarantee continuity of online services as well as to safeguard people's data and privacy. E-government has been growing rapidly over the past years. The purpose of this article is to analyse the use of information and communication technologies (ICT) in public administration in Poland. This issue will be analysed taking into account the structure of central administration and local government units. The method of literature analysis in terms of ICT as well as report analysis and own observations will be used.

Keywords: Information and Communication Technologies (ICT), E-Government, Public Administration, State Administration, Self-Government

Introduction

Information and communication theories became a major driver of the economic development of countries in a global world. Information component plays a key role in the building of competitive potential of countries and the development of international relations (Petkova, Ryabokon and Vdovychenko. 2019). The worldwide rapid progress of ICT in the last three decades has attracted increasing attention among many economists and researchers who have focused on studying the impact of ICT diffusion (Bahrini, Qaffas 2019). The usage of ICT systems provides administration with many diverse advantages. A fundamental one is more efficient achievement, systemic solutions in operations and more efficient reactions in case of emergence of various crises. Many ICT tools can be efficiently used by all unites of public administration.

Information and communications technology (ICT) is a very broad term, analyzed from the standpoint of many areas of science. These technologies are used in all sectors of the economy, and issues related to ICT are the focus of interests of both economists as well as politicians dealing with the economy and business – both in developed as well as in developing countries. The term ICT includes all communication media, media allowing the storage of information and equipment allowing information processing. In addition, ICT also encompass a range of digital applications and complex IT systems allowing the actual implementation of higher abstraction level data processing and storage than the hardware level. It is thus correct to state that ICT are the circulatory system of the knowledge-based economy, in which the information society is of dominant significance. This significance is confirmed by relevant numbers (ITU, 2019):

- It is estimated that 4.1 billion people are using the Internet in 2019, reflecting a 5.3% increase compared with 2018. The global penetration rate increased from nearly 17% in 2005 to over 53% in 2019

- Between 2005 and 2019, the number of Internet users grew on average by 10% every year.

- In developed countries, most people are online, with close to 87% of individuals using the Internet. In the least developed countries (LDCs), on the other hand, only 19% of individuals

are online in 2019. Europe is the region with the highest Internet usage rates, Africa the region with the lowest Internet usage rates.

- In all regions of the world, more men than women are using the Internet.
- The percentage of households with Internet access at home is generally correlated with a region´s level of development. In all regions of the world, households are more likely to have Internet access at home than to have a computer because Internet access is also possible through other devices. In 2019 years, more households in many countries have had Internet access than computers.
- An important barrier in the uptake and effective use of the Internet is a lack of ICT skills.
- European countries lead e-government development globally; the Americas and Asia share almost equal standing in high and middle e-government levels, and many African countries continue to struggle to improve their e-government standing.

Public administration is work of the state implementing its objectives. In other words, it is the entirety of activity conducted by diverse entities, bodies and institutions for the purpose of implementation of the public interest. Two groups can be discerned between: State administration and local government administration. State administration may be further subdivided by its area of activity, into central administration (Chairman of the Cabinet of Ministers, the Cabinet of Ministers, the ministers and central state administration bodies) and field administration (the voivodes and services operating regionally). Central state administration bodies handle the entire territory of the country, with field state administration bodies only operating within a strictly defined area. The local government is and will be one of the main entities controlling the development of the country. Local communities were deemed to be one of the basis for the democratic system – the key component of which is the citizens' right to participate in the control and management of public affairs. Local government authorities are of particular importance for the functioning of the entire system of democratic structures within a state. In order to enable must direct exercising of this right, the Republic of Poland includes since January 1st, 1999, a three-level structure of local government, made up of: the local commune government, the local county government, the local voivodeship government.

As of January 1st, 2020, the administrative subdivisions of Poland spanned: 16 voivodeships 314 counties and 66 cities with county rights, 2477 communes (including 302 urban communes, 638 urban-rural communes and 1537 rural communes). A series of acts of law governs the operation of local government entities; these describe the scope of affairs transferred for control of local governments and the resources that they may make use of. The constitution of Poland establishes rights of local governments, art. 15 section 1 states: „The territorial system of Poland ensures the decentralisation of government". Art. 16 section 2 states in turn: „The local government participates in exercising power. The significant part of public affairs that it is to handle is handled under own name and responsibility".

Digitalisation of economic and social dimensions has become an unavoidable subject in political and social debates, which are based on current technological, social and economic tendencies (Muravska, Stacenko, Zeibote 2019). Intensive development of new ICT technologies has forced a creation of a new type of communication of citizens with the state (authority), and new solutions are defined as: e-administration or e-government. To a narrower extent, e-administration refers to creation of government websites to improve the quality of public services provided to citizens or work organization in an office that is using an electronic document flow (E-administration digital services in Poland).

These conclusions suggest the leading question, which is: What is the level of usage of ICT by public administration in Poland? The presented issue shall be verified through the following detailed research inquiries:

- What is the level of use of ICT in Poland compared to other countries?
- Is the level of use of ICT dependent on the unites of administration?
- In which areas does the implementation of ICT proceed satisfactorily, and which areas require improvements?

The following issues related to information and communication technologies will be analysed in detail:

- access to the Internet,
- providing of mobile devices to public administration employees,
- Intranet usage,
- ICT training for employees of public administration,
- EDMS usage,
- implementation of the ISO system,
- use of Business Intelligence tools,
- level of websites,
- e-service for citizens,
- expenditure on selected ICT equipment (IT equipment, telecommunications equipment).

The analysis shall be based upon a critical analysis of literature, specific reports as well as observations of practice, own experience and thoughts.

Literature Review

Development of a concept of the social investment and innovation is a core element in digitalisation public services (Muravska, Stacenko, Zeibote 2019). The authors suggest to stress in social research a distinct understanding of the co-creation as local, regional, and national governments rely on digital provision of government services.

In recent years, we have seen an increase in interest in topics of ICT. Many scientists from diverse fields of social sciences have been undertaking research in this area. Information and communication technologies (ICT) are a tool used in many areas, including scientific research. Most scientists treat them as basic equipment and use them without even wondering about their significance for their work. Many discuss the topic of the significance of ICT from the point of view of their field of research, e. g. engineering, medicine or economy. Regarding the growing importance of ICT and the way it is transforming the world, many academicians and researchers have focused on studying the impact of ICT on economic growth at the industry level, at the national level, and at the cross-country level (Bahrini, Qaffas 2019).

The evolution of ICT has been shaped by both innovational complementarities and the sequential appearance of imbalances that has focused innovation activity in discrete phases of industrial development (Taalbi 2019). Digital governance structures provides one-to-one link between micro and macro, between individual and government (Erkut 2019).

The successful implementation of the desired e-services depends on the level of e-skills of all entities involved in the planned project. It was concluded that in order to be able to achieve a higher level of e-administration development, we need an efficient, effective, transparent and open model of its development, which will contribute to the increase of accessibility and the level of advancement of public services over the Internet Information and Communication Technology (ICT) can make public administration capable of capturing future challenges. Studies show how the use of ICT affects social live (Tomaszewicz 2018).

According to Carlo Thomsen, two factors have been crucial for digitalisation in the Norwegian public sector and administration. First, the development of technology has made possible a more effective task performance and a better distribution of resources across sectors and levels. Increasing budget limitations has led to a demand for more effective solutions, and hence investement in new technology to facilitate such needs. Second, the expectations of citizens and private businesses have evolved alongside these technological developments. Many services – for example banking services – have become more user-friendly. Users expect rapid problem-solving and direct feedback (Danielsen, Førde and Rykkja 2018). It is worth mentioning that new technologies are not always an effective instrument for improving public services or the quality of life of residents. Such a situation may occur when there is no social acceptance of new solutions or the level of complexity of their application, for example: cities with an aging society, where most residents prefer more traditional solutions (Czupich 2019)

At the national level, the development of innovative technologies enables a country to take higher ranking positions by the level of information and communication technology development. The assessment is carried out using a number of indicators, calculated with the respective index system and applied for analysis of problem areas in politics, as well as for monitoring of progress in the field of innovative technologies introduction (Petkova, Ryabokon, Vdovychenko 2019). Factors indicating the development level in terms of ICT are: the E-Government Development Index (EGDI) the ICT Development Index (IDI), the Web Index and the Networked Readiness Index (NRI).

The United Nations has generated the United Nations E-government Development Index (EGDI). The EGDI is a composite indicator that consists of three indices (online service index, telecommunication index and human capital index) that are equally weighted. In view of the steady growth in technological capabilities and the fact that the UN aims to reflect these developments in their indices. In the most recent summary for the year 2018 Poland is ranked 33rd; compared to the previous period – 2016 – it improved its rank by three and found its place among states classified as very well developed in this regard. The ranking leader is Denmark, which rose in the list as compared to the previous year by a staggering eight levels (https://publicadministration.un.org/en/databases).

The ICT Development Index (IDI), has been published annually since 2009, is used to monitor and compare developments in information and communication technology (ICT) between countries and over time. In the 2017 report, Poland took 49th place (out of 176 ranked states) rising by one level as compared to the year 2016. It was, however, one of the lowest ranked European states (https://www.itu.int).

The Web Index is the first measure of the web's contribution to social, economic and political progress, studying countries across the world. Since its launch, the Web Index has become established as a reference point for governments and policymakers around the world, holding governments accountable and driving public debate. In the last full list, Poland was ranked 34th out of 85 states (https://thewebindex.org).

The World Economic Forum's Networked Readiness Index (NRI), measures the propensity for countries to exploit the opportunities offered by information and communications technology (ICT). It is published in collaboration with INSEAD, as part of their annual Global Information Technology Report (GITR). The report is regarded as the most authoritative and comprehensive assessment of how ICT impacts the competitiveness and well-being of nations. Liderami ranking są Finlandia i Singapur. The list is led by Finland and Singapore. According to this report, Poland took 42th place out of 139 (WEF 2016 report). Poland's neighbours rank better: Germany – 15, Lithuania – 29, the Czech Republic – 36 (https://reports.weforum.org).

On the basis of data from the indicated reports, it must be concluded that Poland still has a lot to do in terms of information and communication technologies. A necessary condition of improved ICT development levels in Poland is support by the public administration entailing bringing legal provisions to order and designating innovative technologies as a priority within state policy.

Data Analysis

The connection of individual bodies with the world digital network is the basic condition of existence of efficient e-administration. In Poland in the year 2018, the most commonly used mode of access to the Internet among public government entities were connections using DSL and broadband connections. The highest level of DSL technology availability was declared by commune offices (75.1%). The lowest level is provided by marshal offices (37.5%), which were in turn characterised by the highest level of availability of broadband mobile connections (at least 3G), even higher than in case of state administration.

Table 1: Public administration units with Internet access by type of access and type of unit (in %)

	state administration		self-government		municipal offices		district offices		marshal offices	
	2017	2018	2017	2018	2017	2018	2017	2018	2017	2018
DSL connection	33,0	42,0	76,8	72,2	79,5	75,1	62,4	55,4	25,0	37,5
Other broadband exed connection	91,2	91,1	46,3	55,3	41,0	50,0	77,2	86,8	100,0	100,0
Broadband mobile connection (at least 3G)	98,9	95,5	68,3	69,5	65,2	66,4	86,4	87,6	100,0	100,0
Narrowband mobile connection	36,3	46,4	11,0	13,4	10,4	12,3	14,2	18,8	18,8	50,0

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

Mobile Internet access encompasses equipping employees with suitable devices. In the year 2018, as compared to the year 2017, the share of employees equipped by offices with mobile devices with Internet access rose by 3.5% and amounted to 20.5%. Within state administration the use of such devices is over twice as high than in local government bodies. Marshal offices rank best in this area.

Fig. 1: Employees of public administration units equipped in mobile devices with Internet access by type of units

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

For the purpose of efficient operation of public administration bodies, employees must continually improve their competences, the area of ICT included. It is thus necessary to arrange training seminars both for ICT specialists as well as for the remaining employees. In the year 2018, 90% of state administration and almost half of local government bodies organised such training seminars. All (100%) of marshal offices did this.

Table 2: Information and communication technologies (ICT) - use in management within administration (in %)

	state administration		self-government		municipal offices		district offices		marshal offices	
	2017	2018	2017	2018	2017	2018	2017	2018	2017	2018
Public administration using EDMS	72,5	78,6	59,0	64,7	56,8	62,6	71,3	77,2	81,3	87,5
Public administration using EDMS as a primary mode of documentation of handling and settling official issues mode of documentation (in % of units using EDMS)	60,6	71,6	17,2	26,3	16,9	26,2	17,8	26,5	38,5	35,7
Public administration units having a policy or strategy to share open public data	16,5	40,2	4,4	14,6	4,1	13,4	6,2	22,3	12,5	25
Public administration units that implemented the ISO system	22,0	26,8	10,6	15,2	7,9	12,8	24,3	28,5	68,8	68,8
Public administration units that used Business Intelligence tools	28,6	31,1	1,8	2,3	1,4	1,7	3,6	4,6	18,8	37,5

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

An Electronic Document Management System (EDMS) supports units in management. The share of bodies using an EDMS rose in the year 2018 across all levels of administration. Local government entities use such systems less frequently (2017 - 59%, 2018 – 64.7%) than state-level administration (2017 – 72.5%, 2018 – 78.6%). It is most frequently used at marshal offices (87.5% – 2018). The usage of an EDMS as the basic mode of documentation of the course of handling and resolving issues varies greatly between state and local government entities – the figures for the year 2018 are 71.6% and 26.3%, respectively. Many modern products and services are developed on the basis of open-access public data in the world. They are the source of real savings of financial resources and time. Recipients may utilise public data resources in implementing their own objectives, developing business and social activity and conducting research. In the year 2018, as compared to the year 2017, the share of public administration entities using open data policies of strategies increased. An analysis of available results shows strong differentiation in terms of the participation of the individual levels of administration in terms of provision of open public data. All levels noted significant increases in the year 2018 as compared to 2017. The disparity in the implementation of policies or strategies of provision of public information between state and local government entities in the year 2018 amounted to 25.6 percentage points to the advantage of the former. The highest share of public administration bodies that operate policies or strategies of provision of public information was found for marshal offices (25.0%), and the lowest – for commune offices (13.4%).

The ISO system is a set of standards that helps organizations ensure they meet customers' and other stakeholder needs within statutory and regulatory requirements related to a product or service. In the year 2018 the share of public administration bodies that implemented ISO quality management systems rose – 15.7%. State administration entities possessed implemented ISO quality management systems more frequently than local government entities, they also declared seeking to implement such systems in the relevant year). The share of local government bodies with implemented ISO quality systems is varied; in the year 2018 it was used by 12.8% of commune offices, 28.5% county offices and 68.8% marshal offices. Another very useful concept are Business Intelligence (BI) tools. In the year 2018 they were used by 31.3% of state administration entities and only just over 2% of local government entities. The highest share of local government entities that utilised such tools is found for marshal offices (37.5%). In commune offices this share is very low, and amounted to 1.7%.

Fig. 2: Public administration units having an Intranet by type of unit

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

Intranets are one of the basic modes of provision of resources to employees as well as for the purpose of communication within an entity. In state government bodies, intranet systems were used twice as frequently than in local government bodies. In case of the former, the share of entities with internal networks in the year 2018 amounted to 86.6%, whereby among local governments it was 40.1%. It was lowest in municipal offices (2017 – 33.2%, 2018 – 36.9%), however within marshal offices it was even higher than in case of state administration (2017 – 87.5%, 2018 – 93.8%).

Fig. 3: Public administration units providing training for employees in the field of ICT by type of unit

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

In the year 2018, the share of public administration entities providing downloadable applications for mobile devices offering e-services rose over the year by 8.5% and amounted to 19.8%. In the year 2018, the share of state administration bodies offering downloadable applications for mobile devices offering e-services amounted to 17.9%, whereby it was higher for local government bodies and amounted to 19.9%. The highest share was found for marshal offices (43.8%); it was significantly lower in county (21.8%) and commune offices (19.4%).

Table 3: Information and communication technologies (ICT) - selected solutions offered to clients (in %0

	state administration		self-government		municipal offices		district offices		marshal offices	
	2017	2018	2017	2018	2017	2018	2017	2018	2017	2018
Public administration units providing applications that can be downloaded to mobile devices offering e-services	16,5	17,9	11,1	19,9	10,4	19,4	13,9	21,8	37,5	43,8
Public administration units providing citizens services via Internet	91,2	89,3	86,4	96,9	84,7	96,7	95,9	98,4	100	100
Public administration units using Electronic Platform of Public Administration Services (ePUAP)	-	88,4	-	96,8	-	96,5	-	98,4	-	100

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

Citizens expect to be able to handle as many official affairs on-line as possible. In the year 2018, on-line processing of official affairs was offered by 96.6% of bodies. In state administration this share amounted to 89.3% and improved by 1.9 p. p. over the year, in local governments – this was – 96.9% (an increase of 10.5 p. p.). As in the previous year, electronic services were offered by all marshal offices.

In the year 2018, in the process of implementation of electronic services, 96.5% administration bodies utilised the electronic mail box system offered by the Polish ePUAP platform. The usage of the electronic mail box system was more commonly used by local government bodies (96.8%) than by state bodies (88.4%), whereby this type of service was offered by all marshal offices.

Table 4: Websites of public administration units (in%)

	state administration		self-government		municipal offices		district offices		marshal offices	
	2017	2018	2017	2018	2017	2018	2017	2018	2017	2018
Public administration units having a website adapted to be operated by mobile devices (in % of units having a website)	89,0	91,1	65,9	74,8	65,0	74,0	70,4	79,3	87,5	93,8
Public administration units having a website that meets the criteria of WCAG 2.0 at the level of the AA (in % of units having a website) in 2018	-	81,3	-	74,8	-	73,8	-	80,4	-	93,8
Public administration units having a bilingual website (in % of units having a website)	73,6	71,4	27,4	30,5	24,5	27,9	44,1	45,7	62,5	56,3

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

Web Content Accessibility Guidelines (WCAG) 2.0 covers a wide range of recommendations for making Web content more accessible. Following these guidelines will make content accessible to a wider range of people with disabilities, including blindness and low vision, deafness and hearing loss, learning disabilities, cognitive limitations, limited movement, speech disabilities, photosensitivity and combinations of these. Following these guidelines will also often make your Web content more usable to users in general (https://www.w3.org). Level AA is commonly considered to be optimum; websites at this level conform to specific conditions that allow them to be accessed by a broad group of users. In the year 2018, WCAG-compliant websites were operated by 75.1% of public administration bodies. The share was decidedly higher for state administration – 81.3%, in local government administration this indicator is highest for marshal offices (93.8%).

Ubiquitous access to the Internet and the rising popularity of usage of mobile devices forces administration bodies to change their approach towards processing visitor affairs. More and more offices have website versions adapted for mobile devices. In the year 2018, operation of such websites was declared by 75.4% administration bodies, and was higher by 8.7 p. p. than in the preceding year. A similar value and an increase of this factor was found for local government institutions (74.8% and 8.9 p. p. respectively). In state administration in the year 2018, the share of entities having mobile versions of their websites improved over the year by 2.1 p. p. and amounted to 91.1%.

More and more public administration bodies have websites available in foreign languages. In the year 2018 this option was offered by 32.1% of entities (3.1 p. p. more than in the preceding year), in state administration – 71.4%, and in local governments – 30.5% (the numbers for the year 2017 are 73.6% and 27.4%, respectively).

Fig. 4: Expenditure incurred by public administration units on selected ICT equipment in 2018 (in thousand PLN)

Source: own study based on Information society in Poland. Results of statistical surveys in the years 2015–2019.

In the year 2018 over 95% public administration bodies made ICT expenses, including computer equipment – 94.4%, and telecommunications equipment – 61.6%. The total expenditure borne by public administration entities for the purchase of ICT equipment was PLN 948 million. State administration is responsible for over 63% of this amount.

Conclusions

The presented data allows answers to the questions posed in the introduction. What is the level of usage of ICT by public administration in Poland? What is the level of use of ICT in Poland compared to other countries? Is the level of use of ICT dependent on the unites of administration? In which areas does the implementation of ICT proceed satisfactorily, and which areas require improvements? Analyses of public administration in Poland from perspective of Information and communications technologies (ICT) allow the following conclusions:

- Considering the presented world indicators of ICT implementation, it must be stated that Poland is not the leader in these rankings (E-Government Development Index – EGDI 2018 – 33rd position, ICT Development Index – IDI – 49th , Web Index – 34th; Networked Readiness Index – NRI – 42). Regrettably, it is currently difficult to estimate, when Poland will reach the level of development of Western Europe in terms of digitalisation of administration. The objective should be continued development of public services provided electronically and approaching world standards.

- The presented results of research of the state of ICT in Polish administration entities indicate that continued intense development work is needed. Particular attention should be turned towards the lowest level of local government administration – communes. Marshal offices may be presented as prime examples in many areas.

- Most frequently used Internet connections among public administration units were fixed DSL connections and wireless broadband connections (71.0% and 70.5%, respectively).

State administration units usually declared using wireless broadband connections (95.5%) and other fixed broadband connections (91.1%), while local self-government units – DSL connections (42.0%).

- The share of employees equipped by public authorities with mobile devices with Internet access increased but it still is low.

- Most of public administration units had a website meeting WCAG 2.0 criteria. A significantly higher share occurred among state administration, in which 81.3% units declared conformity of a website with these criteria, than in local self-government (74.8%). The highest value of this indicator was reported in Marshal Offices.

- All Marshal Offices provided electronic services. In 2018, in order to perform electronic services 96.5% of public administration units used an incoming correspondence box available on the ePUAP platform.

The study has certain limitations due to the data that was analysed. It is based on results of studies conducted by Statistics Poland and presented within Information society in Poland Results of statistical surveys in the years 2017–2018. Intense and dynamic changes, in particular in terms of new information and communication technologies, require continued verification of data. The analysis should be expanded to include information from the following years 2019 and 2020. This could also be the vantage point for own research by the author.

Management Perspective of The Eco-Innovation Scientific Landscape – A Bibliometric Analysis

Adam RYSZKO

Silesian University of Technology, Gliwice, Poland
adam.ryszko@polsl.pl

Abstract

This paper presents the results of a comprehensive bibliometric analysis aiming to describe and evaluate the management perspective of eco-innovation research. The analysis was based on the Web of Science Core Collection database. The VOSviewer software tool was selected to visualize the scientific landscape and determine diverse networks in the analyzed field. Using quantity and quality indicators, the descriptive bibliometric analysis enabled identification of the most prolific authors, sources, organizations and countries in the literature. Moreover, network analyses were performed to visualize and assess the level of multi-faceted scientific collaboration. This made it possible to determine the most influential research channels and impact from sources, countries and research topics, as well as major clusters of publications covering the management perspective of eco-innovation research.

Keywords: Eco-Innovation, Management Perspective, Bibliometric Analysis

Introduction

Innovations aiming at minimizing the negative effect on the environment have gained increased attention among researchers, policymakers and practitioners during last years. This resulted in a significant growth in the number of publications, conferences and workshops on this issue. However, different terms are used to explain this kind of innovation, such as 'eco', 'environmental', 'green' or 'sustainable'. According to Kemp and Pearson (2008), 'eco-innovation' is the production, assimilation or exploitation of a product, production process, service, management or business method that is novel to the organization (developing or adopting it) and which results, throughout its life cycle, in a reduction of environmental risk, pollution and other negative impacts of resources use (including energy use) compared to relevant alternatives. 'Environmental innovation' comprises a set of techniques, systems, products and/or new or modified processes that serve to prevent or reduce environmental damage (Kemp et al., 2001). 'Green innovation' is defined as hardware or software innovation that is related to green products or processes, including the innovation in technologies that are involved in energy-saving, pollution-prevention, waste recycling, green product designs, or corporate environmental management (Chen et al., 2006). In fact, 'sustainable innovation' should be defined as innovation that improves sustainability performance, where such performance includes ecological, economic, and social criteria (Boons et al., 2013). Nevertheless, the vast majority of publications on sustainable innovation refer to definitions that focus on ecological sustainability only. Despite differences in wording, definitions of 'eco-innovation', 'environmental innovation', 'green innovation' or 'sustainable innovation' embrace the environmental component and reflect the two main consequences of this kind of innovation: fewer adverse effects on the environment and more efficient use of resources which might be realized in many forms (e.g., product, process, organizational and/or marketing methods). In fact, 'environmental innovation' was the predominant notion, however the term 'eco-innovation' has had an upsurge in the last years (Díaz-García et al., 2015). Therefore, in this paper the term "eco-innovation" is used to describe any innovation that aims at minimizing the negative effect on the environment and improves environmental performance.

Carrillo-Hermosilla et al. (2010) identified the key dimensions of eco-innovation (i.e. design, user, product service and governance) to explore specific characteristics and analyze variety of studies in

this area. However, research on eco-innovation comprise various categories. Based on path analysis Barbieri et al. (2016) revealed that eco-innovation literature revolves around (1) determinants of eco-innovation, (2) economic effects of eco-innovation, (3) environmental effects of eco-innovation, and (4) policy inducement of eco-innovation. Albort-Morant et al. (2017) distinguished the following main categories of publications on eco-innovation:

- Performance – articles focusing on the results and outcomes of eco-innovation;
- Drivers – articles focusing on finding the antecedents of eco-innovation;
- Types – articles focusing on classifying the different types of eco-innovation;
- Process – articles focusing on the process of the development of eco-innovations;
- Context – articles focusing on showing the context of a study such as a specific region or country, transition economies, etc.;
- Policy – articles focusing on policy evaluation, transition management, and the diffusion of eco-innovation through policies.

With regard to this classification and trends in eco-innovation research field, Albort-Morant et al. (2017) indicated that 'performance' and 'drivers' are the most recurrent categories. Moreover, Díaz-García et al. (2015) observed that there is a clear increase in the relevance of this issue within academia and several thematic trends arise in eco-innovation research, with drivers of eco-innovation being the most popular. Although various publications reviewing the eco-innovation research field have been published in recent years, the papers carrying out a bibliometric analysis in this area still rarely occur in the literature (Albort-Morant et al., 2017; Turkeli and Kemp, 2018). In addition, they focus on general results which undoubtedly requires expansion and updating due to the substantial dynamism of publication activity. Moreover, specific areas of eco-innovation research (i.e. management perspective, technological perspective etc.) seem to be very interesting and needs to be further investigated.

This paper presents a comprehensive bibliometric analysis of scientific literature covering specific area of eco-innovation. It was decided to investigate management perspective of this research field because it is extremally important. This concerns, in particular, conditions, concepts and methods to manage complex processes of eco-innovation development and adoption. The detailed and longitudinal assessment was based on the Web of Science (WoS) Core Collection database. Three types of bibliometric indicators were used: quantity indicators (for measuring productivity), quality indicators (for measuring the impact), and structural indicators (for measuring the connections) (Durieux and Gevenois, 2010). In particular, a network analysis (i.e., co-keyword analysis, co-authorship analysis, and co-citation analysis) was also performed and major clusters of the eco-innovation research were determined.

The results achieved in the analyzed domain are expected to enable researchers and practitioners:

- to identify the most prolific authors, sources, organizations, and countries in the analyzed scientific field,
- to determine the most influential research channels and impact from sources, countries, and research topics in management perspective of eco-innovation research,
- to analyze how the eco-innovation publications covering management perspective are clustered,
- to provide information for further investigation.

Materials and Methods

Management perspective of eco-innovation research was determined and investigated using bibliometric analysis. The analysis covered scientific publications on eco-innovation and concepts related to this notion. The study was carried out in the following phases (Janik et al., 2020): (1) study

design, (2) data collection, (3) descriptive bibliometric analysis, (4) network analysis, and (5) composing the conclusions.

In the first phase of the analysis, online bibliographic database – the Web of Science (WoS) Core Collection – was selected for the research purposes. All types of scientific papers collected in the WoS were chosen for the investigation. In addition, VOSviewer was selected as a software tool for the bibliometric and network analyses. In the next step, a list of the search query wordings and the Boolean operators were identified. Aiming to conduct an in-depth analysis of the extensive scientific field of eco-innovation and to determine management perspective of this research area, the relevant query wordings presented in Table 1 were selected. This set of query wordings encompassed various variants of such wordings as eco-innovation, environmental innovation, green innovation, sustainable innovation, low-carbon innovation and notions similar to these terms (using Boolean operator 'OR'). It was also decided to use query wordings "manag*" and "strateg*" to determine papers comprising management perspective of eco-innovation research (using Boolean operator 'AND'). Due to the fact that the first publication in the analyzed scientific field appeared in the WoS in 1991, the study timespan was determined to 1991–2020.

In the second phase of the analysis, the input data was collected. The analyzed items were retrieved on 16 March 2020 from the WoS database. All relevant query wordings in the publication title (TI) and the publication subject (TS) were used to identify publications in the extensive scientific field of the eco-innovation as well as to determine publications comprising management perspective of eco-innovation research. The obtained results are presented in Table 1.

Table 1: Results of initial bibliometric analysis – searching by different query wordings

No.	Query wording (QW)	QW appearance in title of publication	QW appearance as topic of publication
#1	"eco-innovation"	387	1,116
#2	"eco-innovative"	53	173
#3	"eco-innov*" OR "ecoinnov*" OR "eco innov*"	539	1,331
#4	#3 AND "manag*"	20	596

#24	"low carbon innovation"	27	75
#25	"lowcarbon innov*" OR "low carbon innov*"	33	91
#26	#25 AND "manag*"	0	17

#27	#25 AND "strateg*"	0	25
Extensive scientific field of eco-innovation research (#3 OR #9 OR #14 OR #21 OR #25)		1,785	3,956
Publications covering management perspective of eco-innovation research (#4 OR #5 OR #10 OR #11 OR #15 OR #16 OR #22 OR #23 OR #26 OR #27)		185	2,090

The third phase of the study covered descriptive bibliometric analysis. This included the determination of the number of publications and the total number of citations, the main research areas and research categories, the most productive authors, sources, countries, and organizations publishing scientific publications on eco-innovation.

In the fourth phase a network analysis was performed. This analysis was conducted using the VOSviewer software tool (version 1.6.14). The networks (i.e. nodes and lines) were created based on clustering technique developed by Waltman, Van Eck, and Noyons (2010). The nodes were represented by relevant keywords, sources or countries. The lines represented the relationships between them, e.g., co-occurrence, citation. The network analysis covered author keywords co-occurrence and scientific collaboration mapping. Author keywords analysis visualized the structure of scientific fields of publications covering management perspective of eco-innovation research. The scientific collaboration was mapped and analyzed using the results of the co-authorship network of countries and the citation network of countries and sources.

The final phase of the analysis included composing and presentation of conclusions.

Results and Discussion

Descriptive bibliometric analysis of publications covering management perspective of eco-innovation research

The performed analysis resulted in 3,956 publications indexed in the WoS covering the extensive scientific field of eco-innovation research (Table 1). The further detailed analysis was focused on publications covering management perspective of eco-innovation research. This analysis revealed 2,090 publications, including four main document types: 1,545 articles (73.92% of all relevant identified publications), 447 proceedings papers (21.39%), 106 reviews (5.07%), and 78 book chapters 3.73%). The vast majority of identified publications was written in English (2,043 items). The other publications were published in Portuguese (15), Spanish (14), Russian (7 items), German (3), Chinese (2), Czech (2), French (2) and Polish (2) language.

Table 2 presents indicators of publication activity related to management perspective of eco-innovation research based on records included in the WoS database. It covers the number of publications (i.e., annual and cumulative) for the period of 1991–2020 and the number of citations that these items received. The obtained data indicated that from 2014 to 2019, the number of publications on management perspective of eco-innovation and of relevant citations increased considerably.

Table 2: The number of publications and total citations related to management perspective of eco-innovation research

Year	Number of publications	% of all publications	Cumulative number of publications	Total citations
1991	1	0.05	1	0
1992	1	0.05	2	0
1993	0	0.00	2	0
1994	3	0.14	5	1
1995	0	0.00	5	3
1996	2	0.10	7	3
1997	2	0.10	9	1
1998	6	0.29	15	1
1999	3	0.14	18	5
2000	5	0.24	23	14
2001	6	0.29	29	23
2002	10	0.48	39	12
2003	13	0.62	52	19
2004	10	0.48	62	36
2005	11	0.53	73	52
2006	20	0.96	93	92
2007	23	1.10	116	146
2008	35	1.68	151	223
2009	45	2.15	196	283
2010	55	2.63	251	414
2011	73	3.49	324	605
2012	82	3.92	406	1,006
2013	97	4.64	503	1,285
2014	114	5.46	617	1,815
2015	174	8.33	791	2,663
2016	231	11.05	1,022	3,777
2017	279	13.35	1,301	5,207
2018	326	15.60	1,627	7,421
2019	397	19.00	2,024	9,869
2020	66	3.16	2,090	2,025

The search for publications related to management perspective of eco-innovation research literature in the WoS returned the first reference to it in 1991 (Edwards, 1991). The most cited article in the analyzed research field indexed in the WoS database, with 834 citations, is 'Sustainability transitions: An emerging field of research and its prospects' written by Markard et al. (2012). The authors focused on sustainability oriented innovation and sustainability transitions, They identified the intellectual contours of this emerging field by conducting a review of basic conceptual frameworks in the field paving the way for new conceptual developments and serve as stepping-stones in the maturation of sustainability transition studies, by linking with the scholarly literatures of management studies, sociology, policy studies, economic geography, and modeling (Markard et al., 2012). In the second place is 'Strategic niche management and sustainable innovation journeys: theory, findings, research agenda, and policy' written by Schot and Geels (2008), cited 631 times. This paper discusses empirical findings and conceptual elaborations in strategic niche management research. The empirical findings showed that the analysis of niche-internal dimensions needed to be complemented with attention to niche external processes with regard to the dynamics of sustainable innovation journeys (Schot and Geels, 2008). The study by Horbach (2008) 'Determinants of environmental innovation - New evidence from German panel data sources' appears in third place with 492 citations. This article explored determinants of environmental innovations based on two German panel databases, the establishment panel of the Institute for Employment Research (IAB) and the Mannheim innovation panel (MIP) of the Centre for European Economic Research (ZEW). The

econometric estimations show that the improvement of the technological capabilities (knowledge capital) by R&D triggers environmental innovations. Environmental regulation, environmental management tools and general organizational changes also encourage environmental innovation, a result that has also been postulated by the Porter-hypothesis (Horbach, 2008).

Table 3 shows the most cited publications related to management perspective of eco-innovation research in the WoS database. It should be noted that most studies on the lists with the highest number of citations are from the period of 2008–2012.

Table 3: The most cited publications covering management perspective of eco-innovation research

In the next step, the main research areas and categories of studies in the analyzed scientific field were identified, together with sources and authors with the most substantive contributions to the literature. Moreover, the most productive countries and organizations in the field were indicated. The analysis results showed that:

- Studies on management perspective of eco-innovation research cover diverse research areas. According to the WoS database, these areas include, in particular, Business Economics (874 records with 41.82% of all identified publications in the analyzed scientific field), Environmental Sciences Ecology (867, 41.48%), Science Technology other topics (587,

28.09%), Engineering (553, 26.46%), Public Administration (109, 5.22%), Operations Research Management Science (107, 5.12%), Social Sciences other topics (103, 4.93%), Computer Science (89, 4.26%), Energy Fuels (66, 3.16%), and Education Educational Research (49, 2.34%).

- Considering the WoS categories, the most popular are Environmental Sciences (643 records in the WoS with 30.77% of all publications), Management (569, 27.23%), Green Sustainable Science Technology (540, 25.84%), Environmental Studies (452, 21.63%), Business (441, 21.10%), Engineering Environmental (329, 15.74%), Economics (224, 10.72%), Operations Research Management Science (107, 5.12%), Engineering Industrial (97, 4.64%), and Regional Urban Planning (91, 4.35%).
- Most publications related to management perspective of eco-innovation research indexed in the WoS database appeared in Journal of Cleaner Production (273, 13.06%), Sustainability (157, 7.51%), Business Strategy and the Environment (96, 4.59%), Technological Forecasting and Social Change (37, 1.77%), Corporate Social Responsibility and Environmental Management (31, 1.48%), Ecological Economics (28, 1.34%), Research Policy (23, 1.10%), Technology Analysis Strategic Management (18, 0.86%), Energy Policy (17, 0.81%), Journal of Business Ethics (16, 0.77%), and Procedia Social and Behavioral Sciences (16, 0.77%).
- The most prolific authors with the most frequent contributions to the analyzed research field in the WoS database are Massimiliano Mazzanti (16 publications), Sabina Scarpellini (16), Angel Peiro-Signes (15), Francisco J Saez-Martinez (12), Ming-Lang Tseng (12), Pablo Del Rio (11), Valentina De Marchi (10), Charbel Jose Chiappetta Jabbour (10), Yu-Shan Chen (9), Zhongju Liao (9), Klaus Rennings (9), and Suhaiza Zailani (9).
- The most productive countries in the analyzed literature field indexed in the WoS database are China (324 WoS-indexed publications), Spain (212), England (207), Italy (199), the United States (198), the Netherlands (151), Germany (136), France (105), Brazil (94), and Taiwan (90).
- The most active organizations are Delft University of Technology (27 WoS-indexed publications), University of Sussex (23), Wageningen University Research (23), Universidad de Castilla La Mancha (22), University of London (22), Universitat Politecnica de Valencia (21), University of Ferrara (21), and University of Padua (18).

In the last step of this analysis phase reference literature which is cited most frequently by publications covering management perspective of eco-innovation research in the WoS database was identified. The results of this analysis are presented in Table 4. The intention behind this analysis was to determine the most significant literature background for the scientific field under consideration. The performed research revealed that 2,090 publications covering management perspective of eco-innovation research cited 73,335 references. The most cited reference, with 314 citations, is article titled 'Redefining innovation – eco-innovation research and the contribution from ecological economics' written by Rennings (2000). This paper specified connections between eco-innovation and three kinds of changes towards sustainable development: technological, social and institutional innovation. Moreover, three peculiarities of eco-innovation were identified: the double externality problem, the regulatory push/pull effect and the increasing importance of social and institutional innovation (Rennings, 2000). The study by Porter and van der Linde (1995) 'Toward a New Conception of the Environment-Competitiveness Relationship' appears in second place with 273 citations. The authors investigated trade-off between environmental regulation and competitiveness. They suggested that properly crafted environmental standards can trigger innovation offsets, allowing companies to improve their resource productivity. In addition, the debate shifting from pollution control to pollution prevention was proposed as a step forward in focusing on resource productivity (Porter and van der Linde, 1995). In the third place is 'Determinants of environmental innovation - New evidence from German panel data sources' written by Horbach (2008), cited 270 times.

Network Analyses

Co-Keyword Analysis

Based on VOSviewer tool for the visualization of scientific landscapes, in particular large networks, the author keywords co-occurrence in the analyzed research field was explored. The obtained keyword co-occurrence network is presented in Figure 1. The size of the circles corresponds to the number of occurrences of relevant keywords. This means that the larger the circle, the more the author keyword was co-selected in the eco-innovation literature focused on management perspective. The links between particular keywords indicate the number of publications in which the keywords co-occurred. Moreover, the keyword similarity are demonstrated by the distance between the elements of individual pairs. The obtained network consists of 12 distinct clusters (i.e. different colors of the circles are assigned to individual keyword clusters), representing individual subfields of the analyzed research field.

Figure 1: Co-occurrence network of author keywords in the analyzed scientific field

The obtained co-occurrence network of author keywords revealed that:

- The core topics in literature covering management perspective of eco-innovation research with the highest total link strength are: 'eco-innovation', 'sustainability', 'innovation', 'sustainable development', 'green innovation', 'sustainable innovation', 'environmental innovation', and 'circular economy'.
- Twelve subfields (i.e. clusters of author keywords) were identified in the analyzed scientific field, and the main subfields are as follows:
  - Orange cluster grouping together such keywords as 'eco-innovation', 'environment', 'environmental sustainability', 'green economy', 'industrial ecology', 'green marketing', 'green practices', 'sustainable manufacturing', 'green management', and 'sustainable production'.
  - Red cluster grouping together such keywords as 'sustainability', 'climate change', 'strategy', 'social innovation', 'sustainability transitions', 'environmental innovations', 'Porter hypothesis', 'innovation policy', 'transition management', 'product development', and 'sustainable consumption'.
  - Green cluster grouping together such keywords as 'sustainable innovation', 'circular economy', 'business model', 'corporate sustainability', 'resource efficiency', 'business model innovation', 'governance', ;sustainable entrepreneurship', 'sustainable supply chain management', and 'sustainability innovation'.
  - Blue cluster grouping together such keywords as 'innovation', 'knowledge management', 'innovation management', 'open innovation', 'absorptive capacity', 'environmental strategy', 'eco-efficiency', 'green innovation performance', 'new product development', 'proactive environmental strategy', 'green product innovation performance', and 'service innovation'.
  - Purple cluster grouping together such keywords as 'green innovation', 'green product innovation', 'green process innovation', 'ecodesign', 'environmental management system', 'green entrepreneurship', 'innovation strategy', and 'innovation system'.

- Dark pink cluster grouping together such keywords as ‘environmental innovation’, ‘environmental policy’, ‘environmental regulation’, ‘environmental management systems’, ‘determinants’, ‘eco-innovation drivers’, and ‘green technology innovation’.

Mapping Scientific Collaboration

In the first step of mapping scientific collaboration co-authorship occurrences of countries were analyzed and visualized. The network illustrating collaboration between countries in the analyzed scientific field is presented in Figure 2. The size of the circles represents the number of documents and the collaboration strength is demonstrated by the distance between circles in individual pairs. In addition, the total link strength of a country indicates the number of papers in which the authors of a given publication represent the two countries involved.

The obtained co-authorship occurrences of countries network revealed that:

- There are 92 countries represented by authors collaborating in the management perspective of eco-innovation literature.
- China and Spain have the highest number of publications written in collaboration.
- England, the United States and the Netherlands are the countries with the greatest total link strength when it comes to an international collaboration of authors.

Figure 2: Co-authorship network of countries in the analyzed scientific field

The next step of this research phase concerned the country-by-country citation analysis. The citation network of countries, illustrating mutual international citations in the management perspective of eco-innovation literature is presented in Figure 3. The size of the relevant circles depends on the number of publications in a given country. The distance between circles representing different countries reflects the number of mutual citations of authors coming from them. The more often authors from one country cited authors from another, the shorter is the distance between circles representing relevant countries in the obtained network.

Figure 3: Citation network of countries in the analyzed scientific field

The obtained citation network of countries revealed that:

- There are 92 countries whose publications in the management perspective of eco-innovation literature were cited by foreign authors.
- There are two big scientific communities that have publications in the analyzed literature, comprising, inter alia, the following groups of countries: (1) Spain, Italy, Germany, England, France, the Netherlands, Brazil, Canada, Sweden, Denmark, and Switzerland and (2) China, Taiwan, the United States, Malaysia, Australia, South Korea, and India.

In the last step of this research phase the significance of individual sources in the creation of the management perspective of eco-innovation research field was determined based on the source-citation analysis**.** The source was understood as a journal, a book, or proceedings indexed in the WoS database. The network of mutual citations of different sources of the management perspective of eco-innovation research literature is presented in Figure 4. The size of the circles in this figure depends on the number of publications of a given source. The distance between circles representing different sources reflected the number of their mutual citations. The more often the publications of a given source cited the other source publications, the shorter was the distance between the two sources in the network presented in Figure 4.

Figure 6: Citation network of sources in the analyzed scientific field

The obtained citation network of sources revealed that:

- There are 919 sources whose publications covering management perspective of eco-innovation research were cited by another source.
- There are three groups of significant sources with strong mutual relations: (1) Journal of Cleaner Production, Business Strategy and the Environment, Sustainability, Journal of Business Ethics, Corporate Social Responsibility and Environmental Management, R&D Management, Technovation, International Journal of Production Economics, International Journal of Operations & Production Management, (2) Ecological Economics, Research Policy, Technological Forecasting and Social Change, Industry and Innovation, Innovation-Organization & Management, Technological and Economic Development of Economy, Sustainable Production and Consumption, Environmental Engineering and Management Journal, International Journal of Environmental Research and Public Health, (3) Technology Analysis & Strategic Management, Environmental Innovation and Societal Transitions, Energy Policy, Renewable & Sustainable Energy Reviews, Energy Research & Social Science.
- There are dominating top sources with the highest value of the total link strength, including Journal of Cleaner Production (total link strength: 1,833), Business Strategy and the Environment (1,037), Ecological Economics (822), Sustainability (803), Research Policy (740), and Journal of Business Ethics (424).

Conclusions

This paper presented the management perspective of eco-innovation research based on a bibliometric analysis of 1991–2020 publications indexed in the WoS database. Three types of bibliometric indicators were used for the purpose of measurement of scientific activities, including quantity indicators (for measuring productivity), quality indicators (for measuring the impact), and structural indicators (for measuring the connections).

The bibliometric analysis results proved that the number of publications covering analyzed scientific field have increased year by year. In particular, this concerns period from 2014 to 2019 when the number of publications and of relevant citations enlarged considerably.

The descriptive bibliometric analysis indicated that publications covering management perspective of eco-innovation encompass diverse research areas such as Business Economics, Environmental Sciences Ecology, Science Technology other topics, Engineering, Public Administration, Operations Research Management Science, and Social Sciences other topics. Considering the WoS categories, the most popular are Environmental Sciences, Management, Green Sustainable Science Technology, Environmental Studies, Business, Engineering Environmental, Economics, and Operations Research Management Science. The most productive sources of publications in the analyzed scientific field include Journal of Cleaner Production, Sustainability, Business Strategy and the Environment, Technological Forecasting and Social Change, Corporate Social Responsibility and Environmental Management, Ecological Economics, and Research Policy. The most prolific authors with the most frequent contributions to the analyzed research area in the WoS database are Massimiliano Mazzanti, Sabina Scarpellini, and Angel Peiro-Signes. However, this scientific field is mainly shaped by authors from the countries, such as China, Spain, England, Italy, the United States, the Netherlands, and Germany. Moreover, considering the affiliations of scientists publishing in the analyzed literature, the following most active organizations should be distinguished: Delft University of Technology, University of Sussex, Wageningen University Research, Universidad de Castilla La Mancha, University of London, Universitat Politecnica de Valencia, and University of Ferrara.

The network analysis revealed interesting findings. The co-occurrence network of author keywords indicated that the core topics in literature covering management perspective of eco-innovation research are: ‘eco-innovation’, ‘sustainability’, ‘innovation’, ‘sustainable development’, ‘green innovation’, ‘sustainable innovation’, ‘environmental innovation’ and ‘circular economy’. Nevertheless, the clusters obtained from the network analysis of author keywords demonstrated a considerable diversity of the co-occurrence of various topics. For example, the keyword ‘eco-innovation’ co-occurs, in particular, with such other keywords as ‘environmental sustainability’, ‘green economy’, ‘industrial ecology’, ‘green marketing’, ‘green practices’, ‘sustainable manufacturing’, and ‘green management’. The ‘green innovation’ keyword co-occurs with such topics as ‘green product innovation’, ‘green process innovation’, ‘ecodesign’, ‘environmental management system’, ‘green entrepreneurship’, ‘innovation strategy’, and ‘innovation system’. In contrast, ‘environmental innovation’ co-occurs with ‘environmental policy’, ‘environmental regulation’, ‘environmental management systems’, and ‘eco-innovation drivers’. This means that the analyzed scientific field must be characterized using multi-faceted and multi-dimensional features. The analysis of the countries’ cooperation network indicated that China and Spain, with the highest number of publications written in international collaboration, are definite leaders in the field of co-authorship. However, England, the United States and the Netherlands are the countries with the greatest total link strength when it comes to the closest international collaboration of authors. The citation network of sources revealed that there are three groups of significant sources with strong mutual relations. In particular, this concerns: (1) Journal of Cleaner Production, Business Strategy and the Environment, Sustainability, Journal of Business Ethics, and Corporate Social Responsibility and Environmental Management, and (2) Ecological Economics, Research Policy, and Technological Forecasting and Social Change, and (3) Technology Analysis & Strategic Management and Environmental Innovation and Societal Transitions.

Eco-innovation is still a young research domain, however, it has gained increasing concern for policy makers, academics and practitioners (Díaz-García et al., 2015). Nevertheless, some areas in the analyzed scientific field appear to be extremely important. For example, this concerns management perspective of eco-innovation research focusing on, in particular, engagement of companies in eco-innovation development and adoption. Determination of factors facilitating the successful inclusion of eco-innovation into business models and creation of value makes it possible to enable companies to gain and maintain competitive advantage. However, it should be noted that effective eco-innovation activity resulting in new or significantly improved products or processes requires comprehensive utilization of specific quantitative and qualitative tools applied both on the strategic

and operational level of the company (Brodny et al., 2016; Janik, 2016; Loska and Paszkowski, 2018; Matusek, 2015; Szafraniec, 2015). In addition, this activity involves the need to develop diverse innovative initiatives (Szmal, 2015) and suitable forms of internal and interorganizational cooperation (Brzóska et al., 2016). These issues seem to be very interesting and need to be further investigated in the future.

The performed analysis made it possible to determine the most frequent topics, the most popular research areas, and also the most active and influential authors, sources, countries, and organizations in the literature covering management perspective of eco-innovation research. This knowledge might be used by future authors of eco-innovation publications to implement efficient publication strategy and become the valuable basis for searching and establishing future collaboration. However, although an effort has been made to perform this research in the most accurate manner, the results presented in this paper are subject to some limitations. The analysis was based on WoS-indexed publications only, which means that it could not be assumed as entirely complete as there might be other important publications in the analyzed scientific field. In order to gather more information and obtain a wider understanding of the management perspective of eco-innovation research, further research should take account of analyses based on other databases (e.g., Scopus or Google Scholar). In addition, the numbers of the publications and total citations were used to measure the quality and quantity of papers regardless of their actual scientific merit. It is worth noting that the number of publications exploring analyzed research field increases dynamically. Therefore, the obtained results ought to be treated with caution because they might become obsolete rather fast. Nevertheless, it should be emphasized that the aim of this study was comprehensive quantitative up-to-date determination and evaluation of management perspective of eco-innovation scientific field based on bibliometric analysis.

Abstract

In this mini bibliometric review, we explore and report on the contributions made in the field of Artificial Neural Networks (ANN) over more than three decades of research endeavors. The review covers the period from 1986 to 2018 with a total of 380,086 documents extracted from Scopus database. The extracted bibliometric information was thoroughly pre-processed while the analysis of authorship was performed using the VOSviewer (www.vosviewer.com). The result of the bibliometric analysis unearths the types of publications, the languages used for the publications, the evolution of the scientific outputs, the distribution of publications by regions and institutions, the distribution of outputs in subject categories and the networks of authorship. The results presented in this paper could help researchers seeking for collaborations in the field of ANN to promptly locate reputable scholars. Funding agencies could also leverage on the results in this study to properly disburse grants for ground-breaking work and measure impact and accountability of investment to support further research in artificial intelligence.

Keywords: Artificial Neural Networks; ANN; Neurofuzzy; Kohonen; Hopfield; Bibliometrics

Introduction

The idea of Artificial Neural Network (ANN) came from the concept of biological neurons in the human nervous system consisting of several processing units that are highly interconnected for the purpose of interaction. Much like the human brains, ANNs are capable of learning by examples. This is why ANN has drawn the attention of a lot of researchers and has become one of the most important tools for pattern recognition and classification (Sivagaminathan and Ramakrishnan, 2007).

ANN is basically a network of nodes or neurons which are highly interconnected. Each neuron is able to receive inputs from external sources or nodes, carry out some processing according to some set of rules and send an output to the environment or other nodes and thus are able to perceive certain features in data. Each input to a neuron has its associated weights, which are manipulated during training of the system. The nodes or neurons are grouped into layers and these layers can fall into any of three groups, namely; the input, hidden and output layer. The input layer accepts independent data, the hidden layer is sandwiched between the input and output layers and is where the data is majorly processed while the neurons in the output layer produces the final result.

The use of ANN offers a number of advantages. Its inherent nonlinearity requires no underlying assumptions for handling nonlinear systems. Other vital advantages of ANN include - adaptability of its weights in real-time, fault tolerance, reliability in decision making, parallel processing ability and capacity to learn as well as adapt itself to its environment.

ANN can be classified into four main groups in terms of their general characteristics. Group one only accepts inputs from the layer before it and send outputs to the layer after but they do not connect to nodes in their own layer. They consist of the Feedforward Networks (FFNs), multilayer perceptron (MLP) and the Radial Basic Function (RBF) (Bildirici et al., 2010). Group two have dynamic connections and store information for future use. They have nodes that connect not only to other nodes but also to themselves. They consist of the Recurrent Networks (RCNs), Elman Network (ELN) and Partially Recurrent Networks (PRN) (Pérez-Rodríguez et al., 2005). Group three are also referred to as the Polynomial Networks. They efficiently process inputs which are polynomial variables. They consist of the Function Link Network (FLN) and Ridge Polynomial Networks (RPN) (Hussain et al., 2008). Group four have the characteristic of being able to work independently in separate modules and then combine their answers in a logical manner with the Modular Networks (MNs) as a major example (Adeodato et al., 2011).

ANN finds applications in different fields that model physical phenomena. For instance, in the finance world, the behavior of stock market prices can be predicted using ANN and it helps investors to better deal with the volatile nature of the market. There are a number of research papers, which have successfully shown the possibilities of stock market prices forecast using ANN. For example, in Chen and Du, (2009), ANN and data mining algorithms were adopted to build a financial distress estimation system. The first phase was the preprocessing, which extracted relevant information from the huge input data thereby improving the quality of the data by filtering inconsistencies and discrepancies. The next phase was to analyze the data by applying the neural network model to find the rules and estimate the financial distress levels. In Codicil, ANNs have been compared with traditional financial models and successfully applied in areas like decision making in investment portfolios, mortgage risks, price analysis, bankruptcy and assessment of risks. In order to predict the financial distress levels of various companies, ANN has also been found very useful in assisting with sending signals to investors before the year-end report of the company is made available or to check report falsifications (Rada, 2008).

ANN is used in the medical fields to intelligently diagnose and determine the nature and types of diseases thus helping physicians to get more accurate results (Lin, 2010) (Adetiba et al, 2011a) (Adetiba et al, 2011b) (Adetiba et al, 2015a) (Adetiba et al, 2015b) (Adetiba et al, 2015c) (Adetiba et al, 2016) (Adetiba et al, 2017a) (Adetiba et al, 2017b) (Adetiba et al, 2017c) (Adetiba et al, 2017d) . For instance, Chou et al (2004). achieved diagnosis accuracy of 98% by the application of multivariate adaptive regression splines (MARS) and ANN for the detection of breast cancer.

A lot of studies have adopted ANN to resolve the complexity and fluctuations in tourism forecasting because ANN has the advantage of capturing subtle relationships in data, even if the relationships are not previously known (Palmer et al., 2006). In Chun-Fun et al. (2012a) were able to accurately predict demands in tourism by developing a forecasting system which made use of Empirical Model Decomposition (EMD) to first break down the complicated raw input data and ANN's Back-propagation Neural Network (BPN) for the forecasting.

ANN found usefulness in the prediction of fracture density of well logs and reservoirs (Reda, 2008). In Zazoun (2013) an experiment was carried out on 170 cores by making use of conventional well log data from 17 unoriented wells using 7 different training algorithms and 8 network architectures to arrive at an optimal 4 layer ANN architecture.

In order to explore relationships in performance between Research and Development (R&D) projects, Yu-Shan et al. (2012) applied a three-layered ANN using Self-Organizing Map (SOM) for classification. The hidden layer nodes employed sigmoid transfer function while the output nodes made use of linear transfer function. The inputs to the network were the skills of project managers, quality of project environment and the effectiveness of teamwork. Applying ANN, they discovered how these inputs have an inverse U-shaped impact on R&D project performances. Their results show that at a certain point, continuous investment in the quality of project environment begins to have a negative effect on project performance while continuous investment in project manager's skill and teamwork always yielded better performance. This provides valuable insights on how companies could improve the performance of R&D projects.

ANN techniques are also popularly being used in the transportation industries. One example is the two ANN-based models in conjunction with data fusion techniques used by Chien-Hung and Ying (2007) to estimate how long it takes to resolve traffic accidents so as to minimize the uncertainty of travel time. The first model provides an initial forecast using traffic data representing the traffic situation prior to the incident, while the second model provides periodic forecasts till the incident is resolved. The research gave good and stable results such that the differences between the estimated duration and the actual were within the range of 200 seconds to 800 seconds and ANN was able to smoothen out the noisy data in the model.

This paper is a bibliometric analysis with statistics highlighting research endeavors in ANN over more than three decades (i.e. 1986 to 2018). The extracted publications on ANN within these periods were analyzed based on countries, institutions, educational fields as well as authorship networks. This bibliometric analysis is important because, at a glance, it shows the relevance of ANN applications, its potentials and thus encourages further research especially in subject areas yet untapped.

Materials and Methods

In order to perform this analysis, a deep search of the Scopus database was carried out using the Title, Abstract and Keyword subfields. The search was carried out using the following search terms: "neural net*", "neural-net*", neurofuzzy, neuro-fuzzy, Kohonen, Perceptron, "Radial Basis Function Network", Hopfield as used in Robert et al. (2004). The ast(erisk was used as a wild card to accommodate for any word prolongation. The search was carried out on 13th April 2018 and year range from 1986 to 2018. The extracted records have been pre-processed using google sheets (https://docs.google.com/spreadsheets/). Google sheets is a spreadsheet web-based software suite provided by Google. The various search queries are presented in Table 1.

Results and Discussions

Type of Publications and Languages of Publications

A total of 380,086 documents have been published in this research area from 1986 – 2018. The publication output is majorly spread across *Journal Articles* and *Conference Papers* with 187,160 (49.2%) and 169,904 (44.7%) respectively. Other publication types are Journal Reviews; 6,648 (1.75%), Conference Reviews; 6,647 (1.75%), Book Chapters; 3,429 (0.9%), Articles in Press; 3,049 (0.8%). Other documents with less weight are Editorials, Letters, Notes, Books, Short Surveys, Erratum, Reports, Abstract Reports and Business articles made up 3,243 (0.85%) documents as shown in Fig. 1. Also, 6 (0.0016%) documents have been retracted in the history of this research area. The Top 10 languages for publications in this research area are English (354,181), Chinese (21,560), Japanese (876), Russian (638), Spanish (624), Turkish (599), German (471), French (412), Portuguese (389) and Polish (355).

Fig. 1: Pie Chart representation of document type distribution from 1986 – 2018 for Artificial Neural Network

Characteristics of Scientific Outputs

In Fig. 2, the time trend of published papers for artificial neural networks between 1986 and April 13, 2018 is given. A steady increase in the number of publications can be noticed from 1986 to 2009, a negligible decrease in the number of publication output was experienced in 2009 to 2011, followed by a sharp increase in the number of publications from 2011 to 2017. Already in 2018, a total of 7,644 documents have been published. Fig. 3 shows the publication output from 1986 to 2018 on the logarithmic scale, to give an idea of the publication growth rate. The correlation coefficient is given as $R^2 = 0.811$.

Fig. 2: Evolution of Publication Output for Artificial Neural Network from 1986 – 2018

Fig. 3: Evolution of Publication Output for Artificial Network from 1986 – 2018 (Number of Publications – y axis on logarithmic scale)

Publication Distribution by Regions and Institutions

Between 1986 and 2018, a total of 89,548 documents have been published from China on ANN giving it the first place. Next, 64,349 documents have been published from the United States. Following in the publication trend, India is third place with 21,353 documents, United Kingdom (21,168), Japan (19,430), Germany (14,215), Iran (12,376), Canada (12,326), Italy (12,246) and Spain (10, 727). This result agrees with the current trends in Artificial Intelligence resurgence in which groundbreaking strides in research relating to ANN are currently taking place in China, United States and etc. It is noteworthy to point out that it was only until 2002 that China's publication output exceeded 1,000 documents. Whereas, publication output exceeded 1,000 documents in the year 1992 for the United States. Interestingly, India's publication output exceeded 1,000 documents in 2009 and has been on the increase ever since. However, according to the data extraction from Scopus, there were 21,939 documents categorized as *Undefined*. These are indexed documents with no identifiable national affiliation. Figure 4 shows a world map of publication outputs based on countries and regions with respect to ANN. An evolution of research publications for the Top published countries is given in Fig. 5. It was noticed that Iran's publications indexed in Scopus started off in 1991, since then they have continued to gain more publication volume, making them the sixth highest country in terms of publication volume for ANN. Also, 16 out of the Top 20 institutions in ANN research are located in China alone; other Countries in the Top 20 are USA, France, Singapore and Iran as seen in Table 2.

Fig. 4: World Map Showing ANN Publication Distributions

19	Dalian University of Technology	1,466	China
20	Chongqing University	1,464	China

Distribution of Outputs in Subject Categories and Journals

The Top 5 subject areas for ANN research based on the number of documents published in the areas as compiled from Scopus is Computer Science (190,107), Engineering (169,104), Mathematics (66,577), Physics and Astronomy (32,664) and Neuroscience (23,127). The Top 20 subject areas are classified in Table 3. Table 4 lists the Top 20 journals and conference proceedings where researchers in the ANN have published between 1986 and 2018. Where Lecture Notes In Computer Science Including Subseries Lecture Notes In Artificial Intelligence and Lecture Notes In Bioinformatics, Proceedings of the International Joint Conference on Neural Networks, Proceedings of SPIE, Neurocomputing and IEEE International Conference On Neural Networks Conference Proceedings makes the top of the list.

It should be noted that three out of the top five publishing outlets are International conference proceedings, which are organized by the United States. Table 4 further gives the comparative ranking of the outlets according to the number of published documents, position held according to the Scimago Journal Rank (SJR) and Source Normalized Impact per Paper (SNIP) computed by Elsevier, type of publication, publisher and status of publishing outlet.

Table 3: Top 20 Subject Categories for Artificial Neural Network

S/N	Subject Areas	Number of documents	S/N	Subject Areas	Number of documents
1	Computer Science	190,107	11	Environmental Science	13,096
2	Engineering	169,104	12	Chemistry Engineering	11,743

Analysis of Authorship

An analysis of authorship was performed using bibliometric information extracted from 39,912 documents from the SCOPUS database. Of the 380,086 documents only 39,912 unique documents were synthesized for this analysis. The VOSviewer software tool (Van Eck and Waltman, 2010, van Eck and Waltman, 2014) which was developed by Van Eck was used for visualizing the bibliometric network. This is freely available at www.vosviewer.com. Furthermore, in the visualization of co-authorship network, the size of the symbol representing the authors is determined by the number of co-authored publications. In order to have a high quality visualization, the attraction and repulsion parameters of the layout technique used by the VOSviewer was set to 1 and -1. Also, the resolution parameter was set to a default value of 1. The location of authors in the visualization is set in such a way that authors who have co-authored together are located closer to each other in the visualization. Figure 6 shows the visualization of the number of documents by the Top 1000 authors while Figure 7 shows the visualization of the citation count by the Top 1000 authors. Figure 8-10 shows the authorship links in cluster 1, 2 and 3.

Conclusion

In this paper, a bibliometric review of publications on ANN published between 1986 and 2018 have been highlighted. A total of 380,086 documents were retrieved which met the search criteria detailed in Table 1. After analysis of the retrieved data, it was discovered that 49.2% of the publications in this research area are Journal articles while 44.7% of the documents are conference papers. Similarly, the top languages favored by researchers in this field are English, Chinese and Japanese. Based on the scientific outputs over the years under study, there has been a steady increase in the number of publications with a correlation coefficient of 0.811. The analysis showed that China, Unites States and India have published the largest number of documents in this area. Also, 16 out of the Top 20 institutions publishing in this research area are institutions located in China. Based on subject area, the top subject areas are Computer science, Engineering, Mathematics, Physics and astronomy and Neuroscience. Also, using the VOS viewer; a co-authorship mapping was performed. A map of the first 1000 authors is presented.

Corporate Leveraged Buyout Market Development Trends

Yulia Y. FINOGENOVA

Plekhanov Russian University of Economics, Moscow, Russia
Finogenova.YY@rea.ru

Abstract

The article is devoted to the peculiarities of international financing transactions on large corporate private equity acquisitions, including M&A deals using borrowed funds. The main emphasis is made on the study of the international leveraged buyout market and the requirements for the values of debt to EBITDA ratios. We made some conclusions concerning the term of loan within the LBO: in the USA and most EU countries the buyer can expect a loan of up to five years, while in Russia it is possible to attract borrowed funds for two or three years. The problems of performing LBO transactions by Russian companies today connected to limited number of banks that are willing to take on non-traditional risks. However, LBO has great prospects in Russia, as knowledge of transactions spreads, and banks become more active in dealing with them, gaining experience, there will be an understanding of the structure of transactions. Gradually, investors will begin to offer more interesting conditions that can contribute to the growth of interest in these mechanisms in a business environment. In the article there were also investigated the results of multiple regression analysis bases on US statistics. A model with three factors, making impact on LBO deals number was built. These factors: industrial PMI, GDP, and bankruptcy of individuals. In the result we found, that business activity index for manufacturing companies and the level of bankruptcy of individuals have the greatest impact on the number of LBO.

Keywords: leveraged buyout (LBO) investors, covenant-light deals, pro forma leverage.

JEL Classification: G32, G35, H25.

Introduction

As a rule, the expectations of investors who actively use leverage (hereinafter referred to as LBO-investors) are that the profit of the acquired company in the future will exceed the obligations on debt interest. The use of borrowed funds increases the expected return of joint-stock companies. By investing as little of their own money as possible, successful firms, can achieve greater return on capital (ROE) and internal rate of return (IRR).

However, along with the potential return on equity growth, risks also increase, since only companies with stable revenue can decide to link debt payments to operating profit. Therefore, it is necessary to estimate several parameters of the target company: the ability to generate free cash flows the target company; to estimate the schedule and the amount of loan payments along with the amount of cash flows that will spent to cover obligations; the dynamics of a company's internal rate of return; sensitivity analysis of the financial model to changes in the external factors.

Financing the purchase of a business with the help of LBO has both advantages and disadvantages. The advantages include a low need for own funds for these purposes (banks are ready to finance up to 50% of the target company's value), a reduction in the tax burden on the company (interest on the use of a loan is the taxable base for income tax). In addition, there is no need for additional liquid collateral or guarantees. Note that the repayment of interest on the loan can be made not only through the receipt of funds from the operating activities of the target company, but also using the money received as a result of the non-core asset's sale.
In addition, it is companies acquired that are undervalued by the market are using the LBO mechanism. As a result, when the loan is paid off and the management has decided to sell the business, the cost of sale is significantly higher than the amount for which these assets were purchased.

Literature Review

In the international publications, there were described a range of leveraged buyout's pros and cons. Some authors (Ayash,et.2017) suggests, that "among successful LBOs, LBOs that enhance operating efficiencies produce the highest "exit" returns; however, LBO sponsors commonly fail to monetize these returns due to delays associated with liquidating portfolio positions". While (Kamoto, 2017) believes, that "management buyouts improve the innovation intensity, even if managers gain no excess value from the buyouts in collaboration with private equity firms".

The idea of concentration of investor's buyout fund commitments in the large fund groups were mentioned by (Hooke and Yook, 2016). The authors suggest, that "many investors consider the large fund families to be the "winners" in the buyout industry". And "

In the USA and Europe, the LBO market reached $1,3 trillion in 2018 against $734 billion in 2007, according to (S&P Global, 2018). The surge was caused by three major transactions (40% of the loan volume for LBO): the first is a $ 17 billion buyout of the controlling stake in Thomson Reuters Financial & Risk Unit, now called Refinitiv, and the second is a $ 11,7 billion LBO (Carlyle and GIC) to acquire Akzo Nobel Specialty Chemicals, as well as a deal to acquire Envision Healthcare.

High geopolitical uncertainty has hampered deal-making processes and contributed to a 30% annual decline in institutional new money, which at the end of the year was $239 billion. Looking at the drivers of institutional new money, it can be seen, that the volume of LBO decreased by 18% in 2019 to $ 107 billion, while other m & a activities decreased by 48% to less than $ 80 billion. In Russia, LBO is still rare.

An increase in the number of such transactions will be observed if the following conditions are met:

- a large number of companies entering the public market through IPOs;
- the end of the period of growth of stock indexes and the emergence of undervalued companies. As a rule, during the period of market growth, the main assets are overvalued and companies prefer to raise funds through IPOs. The LBO is in some sense the reverse process, and its economic validity arises in the event of a fall in the market and the appearance of undervalued assets;
- development of the legal framework in the field of mergers and acquisitions.

Despite the risk associated with increasing debt load, there are a number of notable advantages of LBO transactions for buyers. First, there is a low need for equity. Second, the high return on invested funds. In addition, a significant debt burden usually disciplines managers and concentrates their efforts on making effective management decisions (see Osipov etc., 2017).

Hypotheses

Considering international experience, when making LBO transactions in Russia, it is necessary to:

(1) correctly assess the assets and prospects for the development of the acquired business, the probability of its bankruptcy in the event of a financial crisis;

(2) correctly structure transactions that occur with the participation of an investment bank;

(3) assess the costs of consulting services (legal and financial consulting) as clearly as possible at the stage of registration of the transaction.

Assuming the Russian specifics, the first problem is the most difficult, since the information transparency of Russian companies is not enough. Therefore, it is important to have highly qualified appraisers who are familiar with the specifics of the industry (to which the target company belongs) and can accurately assess the assets (based on the available information). The buyer should also assume the discounts in the transaction price due to insufficient transparency of the target company's risks.

The most significant risk when buying a business using the LBO mechanism is a risk of financial distress and default. Since the interest on the loan is repaid from the target company's cash flows, any failures in its operation can lead to the fact that the funds to pay the loan simply will not be enough.

There are also significant costs for consulting services (legal and financial consulting) at the initial stage of transaction's registration. In addition, if the company acquires a 75% stake, the transfer of property as collateral can be regarded as a transaction with an interest. In this case, it must be approved by most minority shareholders, who can block the decision to transfer the company's property as collateral.

In the process of acquiring a ready-made business with borrowed funds, you can conditionally identify several main steps:

1. The choice of the target company.
2. Search for a lender.
3. Determination of sources of financing and the moment of transfer of rights.
4. Payment for the purchased business and completion of the transaction.

Step 1. Selecting a target company. At the first stage, the buyer chooses the company to purchase and starts building the relationships with the future creditors. The main difficulty is related to the search for such a company that, on the one hand, would meet the business development strategy, and on the other — the requirements imposed by banks to the target company. Ideally, the following conditions should be met for the target company:

– the company's cash flows must be sufficient to repay the interest on the loan for the purchase of the business;

– the company should work in a well-established market and offer customers a fairly simple product line. For example, businesses with a noticeable growth rate, but offering high-tech products are generally not suitable for acquisitions using LBO. Maintaining the growth rate will require additional investment in accounts receivable and inventory (i.e., in net working capital), as well as additional investment in production capacity. In addition, high-tech products are subject to rapid obsolescence, which requires constant significant R&D costs for the introduction of new technologies, while the increase in the debt burden of the acquired company limits its investment opportunities;

- low ratio of own and borrowed funds in the company's balance sheet structure;

– the asset structure is dominated by fixed assets that can serve as collateral for new loans;

- the book value of the target company's assets is lower than the market value.

When selecting a target company, the company's buyer together with the financial adviser performs a SWOT analysis of the business, determines industry trends and business growth potential. In addition, accounting reports are audited, current accounts, liabilities, and tax arrears are checked, and the ownership structure is evaluated.

Step 2. Search for a lender. After the target company is selected, the buyer company makes a presentation of the transaction, the so-called :"bank book", which is sent to potential creditors (banks). The bank book briefly describes the target company and the essence of the transaction, justifies the sufficiency of cash flows for debt service. In case of interest in the project, the lenders inform the buyer about the amount of the loan that they are ready to provide. After that, they are sent a business plan for five years, detailed in terms of forecasting future cash flows.

At the same time, bankers will put forward a number of significant restrictions:

- mandatory target use of the borrowed funds;
- managing the acquired business strictly in accordance with the approved business plan, significant restriction on dividends payments and capital expenditures;
- ban on M&A transactions involving the target company;
- mandatory provision of information to the bank by the buyer company about events that may negatively affect the acquired business;

- the property of the target company cannot be pledged.

Step 3. Determination of financing sources and the moment of rights transfer. Bank - investor is ready to provide up to 40-50% of the funds needed to purchase a business. This is the so-called "senior duty". The buyer's own funds account for 30-40% of the transaction amount. The remaining part of the funds (mezzanine financing) is usually raised by issuing high-yield bonds. Since the bond issue takes from three to four months, an interim bank loan is used, which is then repaid using the funds raised as a result of the bond loan. The moment of transfer of ownership of shares is stipulated in the contract of sale between the seller and the buyer.

After the financing structure of the business purchase transaction is determined, the moment of transfer of ownership rights to the company's assets to the new owner is also defined. Depending on the agreement, shares can be transferred to the new owner either at the time of signing the agreement or after payment.

Step 4. Payment for the purchased business and completion of the transaction.

After all contracts are signed, payment is made. In practice, there are two payment options: first, the entire amount of the contract for the purchase of shares is paid immediately; the second option involves partial payment. Partial payment means that after signing the contract, only a percentage of the total amount of payment under the contract is paid, the repayment of the remaining part depends on the performance of the target company. For example, when a transaction is done, the controlling stake is paid in full, and the balance is paid within the specified period with a coefficient linked to the annual financial results.

The next steps that the new business owner should take: the sale of non-core assets, improving the quality of management and, as a result, the company's financial results. Part of the funds from operating activities and the sale of non-core assets is used to repay the loan debt and pay interest.

The result of the transaction and the fate of the target company will depend on the type of buyer: whether it acts as a strategic investor or a financial one. If the strategic investor is interested in creating an integrated holding company and developing the acquired business, the financial investor will sell the acquired company at a better price in three to five years.

Methodology and Data

In this study, we also investigated the correlation and regression dependence of changes in the number of LBO transactions on various macroeconomic indicators. The source for statistical information for the study was USA market.

First, we investigated, what factors affect the USA annual leveraged loan issues. There were built multiple regression model. As a result, the following multiple regression equation was obtained:

$$Y\ model=-696{,}603+38{,}311*X1-55{,}869*X2-0{,}002*X3 \qquad [1]$$

The resulting equation shows the relationship between the indicators of US Annual Leveraged loan issues, PMI manufacturing, GDP, and US Bankrupts in non-production business.

From the equation it follows that with the growth of PMI (manufacturing companies) by one unit leads to the increase the number of LBOs by 38,311 units; with a growth of this index by one point - the number of LBO to be reduced by 55,869 units; with the increasing level of individuals' bankruptcy by one unit - the number of LBO to decrease by 0,002 units.

Based on the regression coefficients, we calculate standardized coefficients using the formula:

$$\beta_i = b_i \cdot \frac{\sigma_{x_i}}{\sigma_y}.$$

Table of standardized coefficients is given below:
Factor 1 (b1), PMI manufacturing equal to 0, 668339;
Factor 2 (b2), GDP equal to -0,30303;
Factor 3 (b3), US Bankruptcies non-business equal to -0,66547.

Then, equation in standardized form can be presented as:

Y model (standardized) = 0,668* Tx1-0,303* Tx2-0,665* Tx3 [2]

Since the standardized regression coefficients can be compared with each other, we can say that the business activity index (PMI manufacturing) and the level of bankruptcy of individuals have the greatest impact on the number of LBOs, since their coefficients are approximately the same in modulus and significantly exceed the values of the standardized coefficients for other factors.

We also investigated, if there any relationship between M&A Leveraged loan issue and Average equity contribution (we considered two groups of middle market and large corporations).

The correlation coefficient between M&A Leveraged loan issue and Average equity contribution (middle market) is -0.13616 and between M&A Leveraged loan issue and Average equity contribution (large corporations) is -0.06089 (that indicates a weak inverse relationship).

The final problem was identifying, which of the given factors: (1) the number of bankruptcies of individuals and business entities, (2) the business activity index (PMI) for both manufacturing and non-manufacturing companies, and (3) the dynamics of GDP growth has the most significant correlation with the number of LBO transactions.

We found that the number of bankruptcies of individuals and business entities has a weak correlation with LBO numbers (large capitalization): the correlation coefficient for the level of bankruptcy of individuals is equal to -0,1603; and with the level of business entities' bankruptcy, the correlation is equal to -0, 2554. However, the relationship is more negative relationship between LBO number (middle market capitalization) and individuals and business entities bankruptcy (consequently -0, 4425 and -0,5259). The business activity indicator for industrial companies has a moderate direct impact (the correlation coefficient is 0,3702); the business activity indicator for non-industrial enterprises has a moderate direct impact (the correlation coefficient is 0,2407). The business activity indicator (PMI) for manufacturing companies has a weak direct impact (the correlation coefficient is 0,0101); the business activity indicator for non-industrial enterprises has a moderate direct impact (the correlation coefficient is 0,33). The dynamics of GDP growth has a moderate direct impact (the correlation coefficient is 0,53).

Results and conclusion

In the multiple regression equation were made a number of changes (USA market) as far as the number of factors was reduced, since PMI industrial and PMI non-industrial strongly correlate, the same situation with the bankruptcy of physical and legal entities. A model was built with the higher coefficients of determination. As a result, it turned out to be a model with three factors: industrial PMI, GDP, and bankruptcy of individuals.

Since the standardized regression coefficients can be compared with each other, we can say that the business activity index for manufacturing companies and the level of bankruptcy of individuals have the greatest impact on the number of LBO, since their coefficients are approximately the same in modulus and significantly exceed the values of the standardized coefficients for other factors.
The prospect of an LBO as an effective instrument for financing the business' purchase is largely due to the enough funds that banks are willing to offer at a relatively low interest rate and for the long time.

Russian banks are legally restricted in providing leverage for redemption purposes. When lending to buy back shares, a reserve of 21% must be created. Well-structured LBO transactions (for example, through SPV lending for transparent target projects and with a smaller reserve) do not become public. One of the conditions for attracting borrowed funds for a transaction where the object of collateral for the loan is the purchased enterprise itself is a clear justification by the buyer of the debt repayment mechanism. The acquired company must generate enough funds to return the money on time, or it must have some assets that could be used to refinance the debt.

Sometimes refinancing can be done by selling part of the purchased asset. For example, a buyer may agree with an international investor to sell part of the target company before making a transaction. Due to the proceeds from the sale of assets, as well as operating cash flows of the target company, the buyer will be able to repay the loan.

If we mean a large company, it is possible to return the loan through a bond loan or IPO.

As for the repayment of the loan due to the generated cash flow of the target company, there are few such cases in Russian practice, unlike the US market.

Investors make demands not only on the target company, but also on the buyer's company itself. After evaluating the business of the buyer company, you can draw conclusions about how successful the LBO transaction will be, and how it will be able to dispose of the purchase. Sometimes investors require additional guarantees from the buyer. For example, in the Russian market, a deal was made to buy a pipe plant. The buyer was a pipe trader. Even though the buyer's business was profitable, the investor demanded in addition to the pledge of shares, the buyer's guarantee on the loan.

Discussion

Global economic growth is expected to slow in 2020. However, collateral credit obligations (CLOs) currently circulating on the market also contribute to maintaining a stable demand for loans. Interestingly, lenders that provide the main share of financing are now more exposed to risk than they were a decade ago, since their share of loans is higher and their degree of control is lower than in the previous business cycle.

Previously, companies that are at risk of financial insolvency had to follow the agreed values of the ratio of own and borrowed funds (covenant) and, if they are reduced, pay additional risk rewards to creditors. Now the situation has changed, and most deals do not provide for such a covenant. Debt documents give companies more freedom to take risks and use assets as they see fit. Private equity companies can also sell assets without paying off debt and pay themselves dividends.

Covenant-lite loans mean that loans are issued to borrowers with fewer restrictions on collateral, payment terms, and income levels, so this process has historically been integrated with leveraged acquisitions. On the one hand, purchasing shares using borrowed funds requires a high level of financing compared to equity capital, but on the other hand, they can have a huge return for a private equity company and its investors. This latter fact has led to the fact that in recent years, LBO investors have begun to dictate their terms to banks and financial groups. They were not only able to get easing of credit restrictions, but also favorable conditions for the schedule and size of loan repayment, which led to an expansion of their market share.

LBO investors who conduct large M&A transactions are allowed to add expenses incurred back to operating profit (EBITDA adjustments), which significantly improves their financial performance. The largest part of these adjustments is due to the synergy effect or potential cost savings resulting from the merger of the two companies.
With such adjustments, the actual risk is masked, since the borrower's leverage will be underestimated over time if the projected revenue of the company being acquired does not actually meet expectations.

A logical question arises: if the value of the debt-to-EBITDA covenant indicator for a transaction became higher only based on adjusted EBITDA, how much riskier would the transaction be if no EBITDA adjustments were made? The answer is a significant amount. For example, 8% of us LBO's for M&A transactions had a debt-to-EBITDA ratio of 7 or higher in 2018. However, if the expected synergy is not achieved, the share of M&A transactions with seven times the leverage will double, which will almost match the pre-crisis "record" of 2007. Loans that have a Debt-to-EBITDA ratio of six or more times may cause additional risks to the market.

Leverage on loans that support LBO has gradually increased over the past few years all over the world. For example, in the USA approximately 53% of LBO investments for large corporate borrowers in 2018 had a formal leverage of 6 times or higher. For reference, the record continues to hold in 2007, when 61% of LBO fell into this category, and in 2014 the level of loans with a similar leverage was 52% of all transactions. High valuations and geopolitical uncertainty delayed the deal-making process and contributed to an annual 30% decrease in institutional new money volume, which at the end of the year amounted to $239 billion. Refinancing also continued and decreased by 59% year to year indicators in 2019 to $167 billion. If we look at borrowed funds, we can see, that the volume of mergers and acquisitions decreased by a third in 2019 and amounted to $ 253 billion (including acquisitions by 44% below the previous year date). The amount of funds raised decreased by 41% for a year to $ 364 billion in 2019. 74% of the 2019 LBO's were aligned to debt-to-EBITDA ratio at 6x or higher, while 37% were aligned - 7x or higher.

The return on borrowed funds jumped to 8,6% in 2019, it was the highest annual return since 2016.

In the European market in 2018, M&A transactions also became a driving force for the development of lending, including transactions of LBO investors. The total volume of loans issued for them exceeded 80%. To date, the volume of leveraged loans in Europe intended for institutional investors is 41 billion euros.

Conclusions

In the coming years, the growth of LBO deals is closely linked to the growth of the following factors:

– general economic recovery and return of capital to the economy;
– access to borrowed capital in the market ("long-term" money);
– improvement of market and legislative mechanisms, that will greatly simplify procedures and protect the interests of investors and creditors in LBO transactions;
– the Emergence of experienced managers and proven transaction schemes;
– more precise regulation of mergers in terms of the tender offer procedure and guarantees of compliance with the rights of minority shareholders;
– removal of restrictions on initial placement of shares (the period of pre-emptive acquisition, registration of the report on the results of the issue, etc.);
– improvement the companies' bankruptcy procedure.

LBO investors, in the current market situation, may find themselves "in the line of fire". This is due to higher interest rates and reduced opportunities for generating profits against the background of the general economic downturn. Interestingly, it is not even the LBO investors themselves who are at a disadvantage, but their creditors, among whom there has been a boom in risk financing in recent years.

Abstract

The city as an independent territorial and social unit is a system in which economic, political, environmental and social processes proceed that have their own specific characteristics. Sustainable development of the city entails the implementation of measures that contribute to solving problems of improving the quality of life of the population, the optimal use of resource potential, the development of industrial infrastructure with minimization of environmental damage. The purpose of the study is to conduct a qualitative and quantitative assessment of the sustainable development of Kaliningrad. This requires: to consider the concept of the initiative "Sustainable urban development" and its main provisions; to analyze the process of implementing the concept of sustainable development of Kaliningrad at present; based on the proposed methodology, assess the level of sustainable development of Kaliningrad; to conduct a comparative analysis of the level of sustainable development of Kaliningrad with the average level for the Russian Federation; assess the prospects for the implementation of the concept of sustainable development in this region.

Keywords: Kaliningrad, sustainable development**,** Sustainable Cities Initiative, Fuzzy logic

Introduction

Currently, there are many points of view regarding the concept of sustainable development, which in general terms can be considered as a balanced socio-economic development of territories in the framework of environmental conservation (Denevyuk, 2012; Skhvediani and Kudryavtseva, 2018; Bell and Morse, 2012; Hassan, 2008) With proper planning and development, cities can contribute to the development of an economically, socially and environmentally sustainable society. However, inadequate planning, lack of effective governance and legal frameworks, unsustainable public institutions, low capacity of local authorities and the lack of a reliable monitoring mechanism undermine the capacity for long-term sustainable urban development, justifying the need for a global monitoring mechanism adapted to national and local conditions.

The Sustainable Cities Initiative (SCI) is a multi-year program to assist cities and national government programs to address the challenges of urban sustainability in various countries of the Europe and Central Asia (ECA) region (World Bank; UN,2019)

1. Preservation and restoration of the historical city. Preservation of historical places (including energy-efficient street lighting, adaptive reuse of built assets and reduction of water consumption due to improved construction standards and urban design, etc.).

2. Energy Efficiency and Climate Change. Cities worldwide account for more than 70% of greenhouse-gas emissions; on the other hand, cities consume 60-80% of the country's electricity. Consequently, the way in which cities are planned, financed and managed has a decisive impact on the results of sustainable development, as well as on the lives and livelihoods of urban dwellers.

3. Development of contaminated sites. Contaminated areas are abandoned or underutilized sites with real or perceived pollution problems that pose an obstacle to their development potential, posing a threat to people and the environment. On the other hand, reconstructed brown deposits can become engines of economic development and improve the quality of life of the cities in which they are located.

4. Municipal finance. Decentralization in most parts of ECA has given municipalities greater autonomy as well as more responsibilities and resources for local authorities in managing large and important infrastructure assets, which requires adequate funding for the operation, maintenance and renewal of capital.

5. Solid waste management. Municipalities can increase the economic sustainability and financial viability of solid waste management by reducing the environmental impact of waste generation. Integrated solid waste management systems encourage municipalities to collaborate at the regional level to reduce waste disposal and recycling costs, optimize collection and transportation services, and maximize resource recovery through sorting and recycling.

6. Water and waste water Urban centers in ECA are in the process of rapid modernization, which requires adequate response in the provision of urban infrastructure and services, including water and sanitation.

7. Urban transport The constant deterioration of public transport infrastructure is a major challenge in solving the problems of increasing the social accessibility of cities.

8. Social integration. In this case, the focus is on inclusive urban development: 1) marginalization of socially excluded groups and inequality; and 2) social responsibility and participation. Specific marginalized groups in ECA, such as Roma communities, often live in informal settlements with or without access to sanitation, water, electricity and other basic public services. Cities provide better services to the poor when social responsibility mechanisms linking communities, service providers, and politicians exist.

Thus, the sustainable development of cities makes them resilient, adaptable, mitigating adverse effects, and stimulating positive socio-economic and environmental changes. SD covers all aspects of the healthy development of the city and should provide a solution to financial, economic, social and environmental problems. The Sustainable Cities Initiative provides support to cities and government programs in addressing the challenges of increasing the sustainability of cities in the European and Central Asian region (UN Global Compact).

The main idea of this initiative is that the cities of the ECA region can learn a lot from their neighbors - the cities of Western Europe, which can provide practical examples of how policy changes and investments can be promoted that will enable the ECA region's cities to better prepare for the future of urban development.

The Strategy for Sustainable Urban Development as a socio-Economic System implies the achievement Of Goal 11 (Ensuring the openness, security, resilience and environmental sustainability of cities and human settlements), as set out in Agenda 2015. The United Nations has set the main Objectives for sustainable development in order to achieve them. (World Bank) It can be noted that these tasks are primarily aimed at improving the ecology of cities, accessibility and safety of housing and infrastructure. In turn, these areas affect all areas of sustainable urban development: environmental, socio-economic and infrastructural. In the face of the challenges posed by rapid urbanization, the authorities are forced to rethink and determine how urban infrastructure will be built, how public services will be provided, how citizens will be involved in urban development management, and how all these subsystems will be linked.

The implementation of the sustainable development strategy of the city Kaliningrad

The main document containing the goals of sustainable development for Kaliningrad is the Strategy for socio-economic development of the Kaliningrad region for the long term.

The Strategy was designed to create an effective system of public administration of regional development processes, dynamically developing, competitive and balanced regional economy, conditions for improving the standard and quality of life of the population.

The strategy, developed taking into account the strategic documents of the socio-economic development of the Russian Federation (Figure 1), is based on the following provisions:

1) social orientation (improving the level and quality of life of the population of the Kaliningrad region);

2) the creation of a dynamically developing, competitive and balanced economy, ensuring employment of the population mainly in sectors with high potential for sustainable growth and labor productivity;

3) cooperation providing a combination of regional, interregional and national interests in solving strategic problems of economic, social and territorial development.

Figure 1: Documents of socio-economic development of Kaliningrad and the Kaliningrad region

Implementation of the Initiative areas of Sustainable Cities Initiative:

1. Protection and revival of historical cities and districts. To create a unified system for the implementation of cultural policy in the Kaliningrad region and conditions for the innovative development of the cultural sphere, to ensure the right of Kaliningrad Oblast residents to participate in cultural life, such targeted programs of the Kaliningrad region were developed and implemented, as follows:

- "Cultural Development of the Kaliningrad region (2007-2013)",
- the subprogram "Development of the State Institution of Culture "Kaliningrad Regional Museum of Amber" and the cultural and educational sector of the amber industry for 2007-2011",
- Regional Program "Amber industry Development" and other (The Ministry of Economics).

In order to familiarize children and youth with Russian cultural and historical values, to develop and strengthen a sense of patriotism and pride in their country in their minds, the target program "We Are Russians" has been implemented since 2007. During the program, more than 70,000 young Kaliningrad people took part in excursion and educational trips to the cities of Russia.

The main directions of urban development, providing conditions and prerequisites for the development of the construction complex of the Kaliningrad region for the period until 2020, are:

1) implementation of the territorial planning scheme of the Kaliningrad region;

2) the development and improvement of regional urban planning legislation and regulatory technical support of urban development activities;

3) the development of architecture and design (the implementation of measures to protect the cultural and architectural and construction heritage, restoration of historical, cultural and architectural monuments, the restoration of the historical part of cities and rural settlements, as well as by creating means accessible to people with disabilities and other means of architecture and urban planning people with limited mobility of the living environment);

4) the development of scientific and technological progress in the field of technology and the organization of construction production (including the development of new technologies and equipment for the disposal of dismantling products of obsolete designs of residential buildings);

5) ensuring environmental safety and applying measures to reduce the negative impact of the construction complex on the environment and the development of protection of the Baltic Sea coast, the Kaliningrad and Curonian lagoons within the Kaliningrad region.

2. Energy efficiency and climate change. The geographical situation of the Kaliningrad region (enclave and involvement in the pan-European system of environmental relations) requires an integrated approach to waste management. To date, the concept of the target program of the Kaliningrad region "Improvement of the waste management system of production and consumption in the Kaliningrad region for 2012-2016" has been implemented (Sauskan and Umansky, 2010)

The solution to the problem of creating infrastructure facilities that will increase the share of waste used as secondary resources and reduce the volumes exported to landfills will be carried out by designing and constructing landfills for household and industrial waste, waste sorting complexes, garbage transfer stations, and creating recycling centers waste intended for additional central collection of valuable components and harmful substances of various kinds from the population and the authority organizations, the systems of reception of temporary storage and disposal of various kinds of industrial wastes.

In order to work more effectively on the creation of a waste management system for production and consumption in the Kaliningrad region, it is necessary to increase the level of environmental protection of society through the development of an environmental education system, education and public education.

3. Development of contaminated sites. The presence of contaminated territories in Kaliningrad is considered as a development potential of the region, which is reflected in one of the main activities in the field of environmental safety (The Ministry of Economics):

The implementation of the target Program of the Kaliningrad Region "Ecological Improvement of the Territory of the Kaliningrad Region for 2008-2013 also contributed to the solution of the tasks set to improve the environmental situation in the Kaliningrad Region, restore, prevent degradation and preserve natural complexes.

The main objectives of the Program were:

- construction and reconstruction of thermal networks and heat supply facilities; construction and reconstruction of water intake facilities and water supply facilities;
- coastal protection of the Baltic Sea and other water basins of the Kaliningrad region;
- construction and reconstruction of sewage facilities and treatment facilities of the Kaliningrad region;
- construction of a waste sorting complex, etc.

4. Financial opportunities of municipalities. In connection with the decentralization processes, the authorities of the Kaliningrad region make decisions in the direction of forming their own regional reports on budget spending, as well as its revenues.

5. Solid waste management. With regard to the disposal of solid waste, the Kaliningrad Region Program "Improving the System of Management of Production and Consumption Wastes in the Kaliningrad Region for 2012-2016" was introduced and implemented.

To reduce waste disposal, the following objectives were set: organize separate collection of waste, which will allow to remove from them the waste fractions, reduce transportation costs, burial costs, extend the life of landfills, and to reduce anthropogenic burden on the environment (Agency for Regional Economic).

Further use of the raw materials collected during separate collection is more environmentally safe, acceptable, energy- and resource-saving production.

Figure 2: Directions of reforming housing and communal services (The Ministry of Economics)

6. Water supply and sewage systems. Important areas of reforming the housing and communal services of the Kaliningrad region are presented in Figure 2.

7. City transport. As measures aimed at improving urban transport, and subsequently at increasing the social accessibility of cities, only federal targeted programs are formed, for example, "Development of the transport system of Russia."

8. Social integration. The formation of social responsibility among the population of Kaliningrad in the field of sustainable development is implemented through the creation of the portal “Active Citizen. Kaliningrad region". This portal is an online platform for voting on a wide range of issues related to the life of cities and towns, including planning, arrangement and development of the urban environment.

Its purpose is to promote the involvement of citizens in the decision-making processes of state authorities and local self-government on a wide range of city and settlement issues, to facilitate the implementation by civil society institutions and citizens in the implementation of public control.

Based on the data of the process of implementation Of The Sustainable Development Initiative of the city on the example of Kaliningrad, we will form a table reflecting the implementation of the initiative of the city SD in the directions Of The Initiative (table 1)

Table 1: Implementation of the SD initiative in Kaliningrad in the areas of the SD Urban Initiative

Initiative Direction	Kaliningrad
Preservation and restoration of a historic city	+
Energy Efficiency and Climate Change	+
Development of contaminated sites	-
Municipal Finance	-
Solid waste management	+\-
Water and wastewater	+
Urban transport	-
Social integration	-

In Kaliningrad, regulatory documents were adopted containing goals in the field of socio-economic development and sustainable development in general. Regarding the instruments of economic development, special economic zones have been created in the city. Moreover, in Kaliningrad, the special economic zone has specific features and cannot be attributed to any of the four types of SEZs operating in the Russian Federation.

In Kaliningrad, all directions Of The Sustainable Development Initiative are implemented through ministerial decisions or as the goal of the Strategy for Social and Economic Development. Kaliningrad does not fully implement measures to eliminate the problem with solid waste, which is an all-Russian trend. Such areas as the development of contaminated sites, municipal finance, urban transport and social integration are very weak or not at all taken into account in achieving sustainable development.

The study presents an approach to assessing progress toward achieving the Sustainable Cities Goals in the areas Of Initiative.

Materials and Methods

Measuring progress towards achieving the SDGs is a very important tool for cities, as it allows each municipality to have a benchmark for its progress both in relation to the Sustainable Development Goals and in relation to other similar cities (in the same country or globally).

In turn, these areas affect all areas of sustainable urban development: Environmental, socio-economic and infrastructural. In order to assess the sustainability of cities as socio-economic systems, factors should be selected for all four areas.

SDSN has a developed methodology for assessing compliance with sustainable development goals in US cities and Italy (Espey, J., Dahmm, H., & Manderino, L. (2018).). In Spain, REDS has also adapted this methodology for its cities. (Mirando Hacia el Futuro: Ciudades Sostenibles)

Along with the methodology of SDSN, the World Bank and others, there are some domestic methods developed both at the level of large organizations and by individual authors. Unfortunately, all of the above methods have a complex system of calculations or a large number of indicators for which either there are no data at all or there is no data in the public domain, therefore, they cannot be called universal and apply to any country or city.

The Spanish organization REDS has experience in adapting indicators for assessing the level of sustainable urban development, and also includes assessing sustainability across all the SDGs. The REDS report methodology is based on the methodology developed by the SDSN for US cities

(REDS), which, in turn, is based on the methodology developed by the Bertelsmann Stiftung Foundation and SDSN for the Global SDG Index (Sachs et al., 2017; SDSN,2018).

The indicators used to assess the sustainable development of cities in Russia and the world vary. Moreover, in the methodologies considered there are some common features that can be adapted and used to further build the author's model for assessing the sustainability of socio-economic systems (cities).

To assess the level of sustainable development of Kaliningrad, we will use indicators characterizing three areas of sustainable development - economic, environmental, and social. Based on the values of individual indicators, it is rather difficult to draw conclusions about the current level of the city's SD, but based on the available indicators using the fuzzy logic method., it is possible to calculate an indicator that reflects the level of SD of Kaliningrad. For this purpose, we introduce the linguistic variable "Level of sustainable development", describing it as a set of proposed indicators. (Rudskaya and Rodionov, 2018; Gutman Svetlana, Rytova Elena and Kravchenko Valentina, 2018; Kichigin et al., 2018; Leksin and Profiryev, 2017).

After analyzing studies in the field of assessing the level of sustainable development of territorial socio-economic systems, a system was formed of the most frequently used and available for research qualitative and quantitative indicators in three areas of SD: social, economic and environmental (Zaborovskaya, Kudryavtseva and Zhogova, 2019; Kharlamov and Kharlamova, 2019; Shabunina, Shchelkina and Rodionov, 2017; Bogolyubov et al., 2019; Shvetsov et al., 2019; van Zeijl-Rozema, Ferraguto and Caratti, 2011) (Fig. 3).

Figure 3: Social, economic and environmental indicators of sustainable development of the city

Each of the indicators has its own scope of definition. In accordance with the basic provisions of the theory of fuzzy sets, if each factor is assigned to the degree of its belonging to an odd set A, then this accessory is expressed by the number μA (x) - the function of an accessory in the interval [0;1].

Further, each value of a linguistic variable (which in its construction is an unclear subset of the values of the interval [0;1]) is compared with the function of belonging to an integral indicator to an odd subset.

Thus, the value of function Y will characterize the level of sustainable development of the city depending on a number of selected factors. This function will be called the parameter that evaluates this element. As a result, the fuzzy scale represents a comparison table between the numerical value of the assessment of sustainable development of the city and its verbal description.

Results

We build a scale of unclear values for the level of sustainable development of the city (Table 2.)

Table 2: Scale of unclear values for sustainable development

Set of values	Level of SD	Description of the level
0 – 0,333	Low	Socio-economic crisis
0,167 – 0,5	Below average	Risk zone, sustainable development of the city is characterized by a precrisis state
0,333 – 0, 667	Average	Negative trends in socio-economic development, indicates a violation of stability in some components of SD
0,5 – 0, 833	Above average	Sustainable socio-economic situation of the city
0,667 - 1	High	Sustainability in all three components of SD cities, factors contributing to the rapid reduction of SD level may appear

Next, we proceed to the selection of indicators we have proposed, factors affecting the level of sustainable development of the city Kaliningrad. We have chosen indicators such as per capita GRP and unemployment as economic factors. Social factors are the average salary and the proportion of graduates to the total population. The Air Quality Index is an environmental factor. It is also a qualitative variable for our method of research.

The air quality index is used by government agencies to inform the public how polluted air is currently or how polluted it is projected to become. Health risks increase with increasing AQI.

The more air is polluted , the higher this indicator, the greater the proportion of the population that may experience the negative effects of pollution - whether it be short-term or long-term health effects.

0-20 Low pollution. Pollution levels are below the recommended exposure limits set by the World Health Organization (WHO) for one year of exposure to pollution.

21-50 Moderate pollution. Air quality is considered acceptable, although it exceeds the WHO recommended threshold of one year. This means that if such values are not year-round, then there should be no adverse health effects.

51-100 Heavy pollution. The air is heavily polluted - World Health Organization recommendations exceeding 24 hours a day.

101+ Very high pollution. Prolonged exposure poses a real health risk. Levels exceeded the recommended WHO exposure threshold by one hour (AQI Index).

In connection with the description of SD levels, we understand that the indicators are multidirectional, therefore, when normalizing, it is necessary to change the signs of the values on such indicators as the Air Quality Index and the unemployment rate.

Table 3 presents the values of the selected indicators of Kaliningrad, as well as their normalized values for 2018.

Table 3: Indicators of sustainable development of Kaliningrad in 2018 (ROSSTAT; EMISS; Eurostat; statdata.ru)

Indicator	Kaliningrad		
	Indicator value	The average value in Russia	Normalized value
Air quality index (AQI), points	21	36	0,417
GRP per capita, rubles	421 479,2	510 253,1	-0,174
Unemployment rate, %	4,7	4,8	0,021
Average salary, rubles	32445	37100	-0,125
The proportion of the number of university graduates,%	0,54	0,85	-0,365

Based on the interval of values of a particular function of an accessory, we calculate the value that characterizes the level in the scale of subsets. Based on the interval of values of a particular function of an accessory, we calculate the value characterizing the level of SD of Kaliningrad in 2018. (table 4)

Table 4: Calculation of the level of SD of Kaliningrad for 2018

Indicator	Subset scale					Significance level
	Low	Below average	Average	Above average	High	
Air quality index (AQI), points				0,375	0,625	0,18
GRP per capita, rubles		0,261	0,739			0,26
Unemployment rate, %			0,468	0,532		0,15
Average salary, rubles		0,187	0,813			0,32
The proportion of the number of university graduates,%	0,048	0,952				0,09
Total, taking into account the weights of indicators	0,00432	0,21338	0,5225	0,1473	0,1125	1
Nodal points	0,165	0,332	0,499	0,666	0,833	
Total	0,0007	0,0708	0,2607	0,0981	0,0937	0,5241

We get the level of sustainability of Kaliningrad development equal to 0.5241. According to the table, this value corresponds to the level of SD above the average. The values of sustainable development levels for Kaliningrad on a subset scale show in what percentage the level of SD refers to a particular term set according to the classification in table 2.

In 2018, we can conclude that relative to Russia as a whole, Kaliningrad has a level of sustainable development of medium-above average, which indicates the existence of problems in some areas of SD.

Conclusion

At the end of the research, we can conclude about the level of sustainable development of Kaliningrad. Based on the study of activities within the framework of the Sustainable Development Initiative, Kaliningrad is not sufficiently implementing various kinds of projects, actions and events. So, for example, to improve the situation with contaminated territories in Kaliningrad, subsidies should be introduced for entrepreneurs introducing special equipment (technologies) a in their enterprises that contribute to reducing environmental damage. Garbage sorting in Russia is becoming increasingly popular, but the pace of the spread of the environmental movement is greatly inhibited due to the lack of competent authorities. The introduction of fines for incorrect or completely absent sorting, for scattering rubbish in public places, and rejection of plastic from large companies would significantly improve the ecological situation in the city. The urban transport project for Russia is the only project of this type in Kaliningrad. There is a significant infrastructure problem, especially in large cities. For the solution it is necessary to draw up new plans of urban arrangement with involvement of designers and urbanists for comfortable movement of citizens. The «Active Citizen» portal operates in almost every city in the country. This is not enough for the successful direction of the population's forces towards sustainable development. The Kaliningrad government should provide better support to people below the poverty line, people with disabilities and older people. Organizations can solve the problem of gender inequality by establishing a satisfactory percentage for men and women working in it. Municipal finance management should be at the same level as regional for more efficient work. You might also consider hosting a major international event in Kaliningrad. In addition to updating the "physical" infrastructure, an event of this level provides a unique opportunity to draw the attention of the world community to the city, showing its openness and willingness to perform the most difficult tasks.

Thus, the joint efforts of both the City Government and the organizations operating in the territory of Kaliningrad and its citizens will allow the city to achieve a higher level of social development.

Abstract

The retail market mainly depends on the purchasing power of the population. The industry situation worsened significantly after the macroeconomic events of 2014, sharp ruble weakening and food embargo introduction. In 2018, real cash incomes of the population again showed a reduction, and the model of consumer behavior changed from saving to lean consumption. In addition, convenience and time saving have become one of the consumer`s priorities, which stimulates the development of e-Commerce (delivery services) and negatively affects traffic and sales in hypermarkets. On the Food Retail market, the largest development is gained by retail chains selling goods at a price close to the wholesale, namely, discounters, with federal chains having the highest rates. Thus, discounters are the most dynamically growing format. The ongoing reconstruction programs can improve the perceived quality of the service provided. Moreover, the market has a high level of retail chain consolidation. It significantly increases the threshold for entering the industry, leads to large-scale promotional activities, and, as a result, negatively affects the profitability of retailers and suppliers. In order to understand what the pace of retail market recovery is and what to expect in the future, we conducted a study of the industry. So the purpose of this study is to analyze the stage of structural development of the retail industry to justify the priority strategic decisions for individual industry participants.

Keywords: Food Retail, Russian Federation, Strategic Analysis, Industry Structure, Competition

Introduction

The retailing is one of the most important sectors of the economy, ensuring the functioning of other industries and the state as a whole. The retailing is the most dynamically developing sector of the Russian economy (Kalinushkin, 2016). The rapid development of international and federal retail chains, the creation of impressive retail complexes that own all the modern technologies for conducting and organizing business, causes the absorption or self-liquidation of uncompetitive Russian organizations by larger enterprises.

Retail is one of the youngest and most dynamic sectors of the Russian economy (Kondratieva, 2018; Ivanova & Titova, 2018). Together with transport and industry, retail is the top three in terms of tax payments to the budget. Moreover, the retail is a leader in the number of jobs - almost a third of all employed in Russia falls on it. Investments in the retail sector stimulate the growth of related industries: real estate, advertising, logistics and more (Grigorievna, Sharnopolskaja & Pogorgelskaja, 2017).

Currently, there are chains and independent trading enterprises in the Russian food retail market. The modern development of retail trade in Russia in many respects follows the path that this industry has already passed in countries with developed economies; one of the characteristic features is the

creation and widespread distribution of chains and chain products. It is the chain organization of retail trade that makes it the most important economic and social tool that directly affects the quality of life of millions of people. A chained organization managed from a single center has the ability to centralize procurement activities, develop a strategy for placing stores, and create its own brand, which creates the prerequisites for lowering costs, more convenient location of a trading company, increasing its recognition with effective positioning and strong associative ties.

The purpose of this study is to analyze the stage of structural development of the retail industry to justify the priority strategic decisions for individual industry participants.

To achieve this goal it is necessary to solve a number of problems:

1) to analyze the retail industry of the Russian Federation, to determine the stage of its life cycle;
2) identify the main strategic groups and their participants;
3) justify the most acceptable strategic decisions of individual companies in the industry, taking into account their competitive positions and the stage of the life cycle of the industry.

Materials and Methods

One of the main indicators of efficiency of retail trade in the economy is the total retail turnover. Figure 1 shows the values of the index of physical volume of retail turnover for the period 2000-2018 according to the Federal State Statistics Service (Official website of Rosstat).

Fig. 1: Index of retail turnover, % to the previous year

For a complete analysis of the retailing of the Russian Federation, we need to consider its structure. Based on the data of the Federal State Statistics Service, a gradual reduction in the number of retail markets and individual entrepreneurs can be observed. Among large trading organizations retail chains stand out. Figure 2 shows a graph of the increase in the share of retail chains in the formation of retail turnover from 2009 to 2018 (Official website of Rosstat), respectively with the gradual crowding out of markets, fairs and individual entrepreneurs.

Fig. 2 : The share of retail chains in the formation of retail turnover, in percent

In 2018, there were some shifts in the ranking of the largest retailers in Russia. The rating was compiled by the INFOLine information agency (Official website Information agency «INFOLine»). The top 5 ranking of the largest retail chains in Russia by revenue to the end of 2018 is shown in table 1.

Table 1 - Rating of the largest retail chains in Russia for 2018 (Source: Official website Information agency «INFOLine»)

Position in rating	Chain	Revenue, 2018, billion rub.	Revenue, 2017, billion rub.	The growth rate of revenue to 2017, %
1	X5 Retail Group	1525	1295	17,76
2	Magnit	1237	1143,3	8,20
3	Lenta	413,5	365,2	13,23
4	Auchan Retail Russia	306,4	294,38	4,08
5	Red & white	301	215	40,00

Thus, retail trade remains a fairly stable industry. Current trends in are reducing the number of small players, strengthening the position of large retail chains (fig. 3), a gradual increase in turnover, growth in entrepreneurial confidence. In these conditions, in order to keep pace with all the trends in the market and compete with other market participants, a trading company must have sufficient financial resources. One way to solve this problem is to create an optimal capital structure that provides a balance between liquidity risk and the target return on equity and maximizes the market value of the company (Mednikov et al, 2018, Demidenko et al, 2018) .

Fig. 3 – Grocery retail Russia Market

Findings and Results

A competitive analysis of the industry according to the model of 5 forces of M. Porter (Porter, 1998) showed that the most significant force influencing the level of competition in the industry is pressure from consumers (Fig. 4).

Fig. 4 - Model of five forces of M. Porter for the retailing

The determination of the stage of structural development of the industry was carried out on the basis of the theory of consolidation A.T. Kearny. This model is used by managers of organizations to solve the problem of choosing the type of acceptable strategic decisions and the time of their implementation (Dinz, Kruger & Zaizel, 2004).

The model distinguishes 4 stages of the industry life cycle (consolidation, Fig. 5). The first stage is characterized by low competition within the industry, but there is competition between industries producing substitutes. The number of participants is constantly growing, and their share is decreasing. This stage lasts up to achieving the equilibrium of supply and demand.

The second stage is growth. All organizations are divided into three groups that differ in their strategies. The first group consists of companies that have chosen a growth strategy and are actively using effectively implemented management. The second group is also companies with a growth strategy, but the activity has not been completely reformed, as a result of which they lag behind the leaders. The third group includes new market participants, small organizations that in the long run have a development trend, as well as organizations that have not begun to apply reforms, but they are aimed at a specific market segment.

The third stage is specialization. Here, the groups described above are retained, but the number of participants in the second group is reduced due to a lack of resources to counteract the merger or acquisition. Therefore, small companies have a fairly stable position compared to the second group because of their small size and, therefore, profitability.

The fourth stage is balance. This stage is characterized by a stable state. Leading companies and niche players remain on the market. Leaders occupy 80% of the industry's share, customer growth is almost ceasing, taking a market share of niche participants is contrary to antitrust laws. So, leaders practically lose their strategic perspective. Therefore, for their development, they are trying to penetrate into other industries.

In order to understand the stage of industry consolidation, it is necessary to determine the concentration coefficient at the current time and several years ago. To do this, it is necessary to know the market share of leading industry participants. Industry data are shown in table 2.

Table 2 - The share of users of retail chains in Russia

	Chain	Sales share on 2018, %	Sales share on 2016, %
1	X5 Retail Group	10,7	8
2	Magnit	7,5	7,7
3	Lenta	2,8	2,2
4	Auchan Retail Russia	2	2,6
5	Red & white	2	
	Dixy		2,3
CR3		21	18,3

The industry position is calculated by setting the CR3 concentration coefficient at the current moment and is refined by measuring CR3 in retrospect to determine the industry development vector δ.

CR3 = s1+s2+s3 (1)

Where s1, s2 и s3 – market share of the three leading market participants at a given time.

2018 г.: CR3 = 10,7 + 7,5 + 2,8 = 21,0 (2)

2016 г.: CR3 = 8,0 + 7,7 + 2,6 = 18,3 (3)

Industry Development Vector:

δ (CR3 2018 – CR3 2016) = 21,0 – 18,3 = 2,7 (4)

The consolidation rate can be calculated using the formula:

$\tau = | \delta | / n$ (5)

Where τ – consolidation rate, δ – Industry Development Vector, n – number of years.

$\tau = 2{,}7 / 2 = 1{,}35$ (6)

So, on average, the industry consolidation rate at this stage is 1.35% per year (Fig.4).

Fig. 5: Stages of consolidation of the retailing in 2016 and 2018

The retail sector of the Russian Federation is in the second stage - "growth", and approaching the third stage. The consumer market is still young, not mature enough, and not enough consolidated and balanced. It is in this uneven development of individual segments of the consumer market that lies the main causes of conflicts that regularly arise between suppliers and trade.

In the second stage, growth goals should be higher than the indus-try average: it is necessary to constantly strengthen the culture of organization, comparing it with the culture of other major players and developing a global vision (Abushova et al, 2018; Bogdanova, 2019).

. Attention should gradually switch from external expansion to internal optimization. It is necessary to adapt the organization to its further growth: improving IT systems, processes and structures in such a way as to create reference methods for knowledge management in this industry (Dubgorn et al, 2019; Lyamin et al, 2019).

The presence of a sufficiently large number of large and at the same time comparable players requires the development of a sound strategy. This is due to the fact that on the next stage with a correctly selected and implemented development strategy that will reveal the clear industry leaders [15, 16, 17, Petrov, 2005).

Strategic groups are a combination of several industry competitors that are united on the basis of long-term similarity (ADL matrix for determining the vector of company development; Assortment analysis using a matrix McKinsey – General Electric). These signs may be different depending on the industry: assortment, quality of goods and services, number of brands, use of technology, etc.

Mapping strategic groups of competitors allows you to identify mobility barriers, identify marginal groups, determine the direction of strategic changes, analyze trends and predict the reaction of players (Domnin, Makarova & Martynenko, 2019; Ilin et al, 2019).

The procedure for graphical strategic analysis of competitors consisted of building maps of strategic groups of competitors (Aaker, 2002), which are a two-dimensional matrix of selected pairs of barriers of strategic grouping, and included:

1. Identification of the competitive characteristics of barriers to strategic grouping of competitors in food retail.

2. Classification of retail enterprises in accordance with the selected competitive characteristics.
3. The union of retail enterprises with similar values of competitive characteristics in strategic groups.

The construction of strategic maps was carried out taking into account the following requirements (Markides & Geroski, 2006):

- The variables used to build the maps should reflect the significant differences between competitors;
- The variables of strategic maps must be separate in nature;
- The variables must not correlate with each other.

Based on the results of processing the survey data, competing cost-effective characteristics of the barriers of strategic grouping of food retail enterprises were determined (Table 3).

Table 3: Barriers of strategic grouping of competitors

Name of the barrier to strategic grouping of competitors	Description of the barrier to strategic grouping of competitors
Product price	Low prices Average prices High prices
The breadth and complexity of the range	Everyday demand (simple) Complex rational Elite (mixed)
Chain affiliation	Chain Non-chain
Level of specialization	Universal Specialized Highly specialized
Additional services	Availability Lack of
Retail Enterprise Size	Microenterprise Small business Medium-sized enterprise Large enterprise
Service form	Self catering Through the counter Advisory

Figure 6 shows a map of the strategic groups of food retail enterprises in relation to the barriers “product price - breadth and complexity of the assortment”.

The classification results of retail enterprises with distinguished competitive characteristics made it possible to unite enterprises into strategic groups and determine their share (Tompson & Strickland, 2003). Figure 6 illustrates the concentration of enterprises in eight squares.

The first group (the square “medium and high prices - everyday demand”) represents enterprises selling food products of daily consumption (bakery products, dairy products, sausages, drinks, etc.). The share of these enterprises is 54% of the sample.

The second group is in the square of the complex assortment and average price, which indicates that the enterprises of this group trade in one or two commodity groups of food products. The assortment of such stores is complex, and the goods are offered to customers at average market prices. These enterprises account for 5% of the market.

The third, clearly traceable, group makes up 5% of the total number of the sample and represents discount stores, as it is located in the square "low price - daily demand". This group of trading enterprises offers goods of a certain category to low-income customers.

Fig. 6 - Map of food retail enterprises with barriers "price - assortment"

The fourth group is the trading enterprises of food producers operating in the middle market segment. It is one of the small segment, it accounts for 10% of the market.

The fifth group is represented by trade enterprises located in the square "high price - an elite assortment". In the assortment of stores in this group there are premium quality products. Such stores offer a large number of additional services and use modern electronic technologies in customer service. The group is small and makes up 3% of the market.

The sixth group of retail enterprises is located in the "low and medium prices - every day and complex range" zone, offering a wide range of food products, as well as related non-food products. Prices in these trade enterprises are higher than in chain stores. The group is small and makes up 3% of the market.

The seventh group is the trading enterprises united in chains. These enterprises occupy the sector of "low, medium, high prices - a complex (rational) assortment". This group has all the products that can be purchased in the premium class. The share of the total number of sample constitutes 20% of the market.

According to the results of research, strategic segmentation of food and beverage retailers was carried out. The analysis revealed typical strategic groups of competitors:

1. Convenient shops
2. Mono-shops (highly specialized).
3. Discount stores.
4. Branded stores of food and beverage manufacturers.
5. Shops with VIP products.
6. Supermarkets.
7. Trading chains.

The features of the 7th group include:

- convenient location;
- coverage of all areas of the city;
- coverage of a large number of buyers;
- a wide range of food products;
- self-service and trade "through the counter";
- providing discount cards to regular customers.

Trading enterprises of the 7th strategic group have a stable financial position, a high level of logistics, the ability to dictate terms to suppliers.

The disadvantages are:

- the availability of goods of different quality levels;
- products of unknown manufacturers;
- the absence of certain product groups due to the lack of systematic supply of goods.

This group includes the TOP-5 retail chains in the retail(Fig. 7): “X5 Retail Group”, “Magnit”, “Lenta”, “Auchan Retail Russia”, “Red & White”, “O`key "," Dixy "," Pyaterochka and others. (PricewaterhouseCoopers Advisor, 2018; The development strategy of the chain "Magnet").

Activities and projects in the food retail sector

Buying or selling	• X5 Retail Group, Lenta and Azbuka Vkusa has acquired Sedmoy Kontinent's rental rights to retail premises. • Lenta has reached an agreement with the Holiday Group to purchase 22 supermarkets in Siberia. • X5 Retail Group is selling Perekrestok Express and acquiring the O'Key supermarket chain.
E-commerce	• Auchan has started selling products online in Russia.
Innovative technologies	• Perekrestok has launched a new system that identifies customers on their stores' Wi-Fi networks and provides them with personalised offers. • The Pyaterochka supermarket chain has begun using a bot to recruit prospective employees. • Auchan has opened an innovative flagship store in the centre of Moscow with electronic price labels and digital information panels. • X5 Retail Group is developing self-service technology and testing a mobile app that scans and pays for goods automatically.
New opportunities for business development	• O'Key plans to optimize the retail space of hypermarkets (decrease store size from 1,100 – 12,000 sq m to 3,000 – 7,500 sq m) and to reduce a number of retail formats (from 51 to 6). • Magnit has started to test wholesale stores. • Dixy and Megapolis have launched the wholesale distribution of fast-moving consumer goods to small retailers. • Lenta has launched wholesale trade for small businesses.
Strategic partnerships	• O'Key is providing space in their hypermarkets for the fashion retailer Familia. Their partnership includes marketing campaigns and sales promotions. • X5 Retail Group and Danone are planning to sell unique dairy products in X5 Retail Group stores.

Fig 7. Activities and projects in the food retail sector (Source: PwC analysis, *PricewaterhouseCoopers Advisor*)

Conclusion

Thus, the retail industry is at the 2nd stage of its life cycle: the industry concentration indicator corresponds to the “growth” stage; according to the “price - assortment” criteria 7 strategic groups are identified that can be identified by A.T. Kearny's model as three significant strategic groups: “leaders” (group 7), “second tier” (individual players from group 7 with a relatively low market share, as well as strategic groups 2, 4 and 6) and “niche players” (strategic groups 1, 3, 5).

To develop the company competitiveness at this stage of development, it is necessary to focus on a number of the most significant strategic decisions.

For a group of leaders at the corporate strategy level, it is necessary to implement of a diversification strategy on a territorial basis both through the creation of their own business units and through the sale of franchises.

The priority areas for development for the group of leaders include (Konnikov, Konnikova et al, 2018; Konnikov, Yuldasheva et al, 2018)

- further expansion of the chain of stores due to an increase in the density of coverage of key markets of presence, as well as organic development in the least developed regions of Russia;
- maintaining focus on chain efficiency;
- retaining existing customers and attracting new ones, improving the overall brand image, including through redesign of stores;
- creation of a unique value proposition for customers in each format;
- organization and development of new sales channels;
- building effective marketing that meets consumer expectations;
- development of digital channels of communication with customers (Zaitseva et al, 2017).

At the same time, it makes sense for companies belonging to the “second tier” group to preserve their business through the implementation of various forms of strategic intercompany interactions up to mergers and associations.

In order to further strengthen the competitive position of “niche players” in the retail industry, it is necessary:

- Adhere to the strategy of strengthening the uniqueness of the product and concentrate on such a target market for which unique characteristics are important (adhere to a leadership strategy in a specific market niche).
- The company should focus its main efforts on building a high level of product knowledge and on building awareness of the unique features of the product.
- To maintain competitiveness, it is necessary to constantly monitor the proposals of competitors and the emergence of new players.
- Reduce the impact of price competition on the company's sales.
- Concentrate campaign activity on building long-term relationships with the buyer, apply special programs for VIP-clients and economy programs for price-sensitive consumers.

Abstract

This paper builds on already existing theoretical and empirical research on the economic factors used in explaining tax compliance. The likelihood that personal income taxpayers in Nigeria will be tax non-compliant, low tax compliant or tax compliant for economic factors are evaluated using the Generalised ordered logistic regression. The findings in this paper provide extra information on the mixed results that have been obtained by empirical research on the subject matter of tax compliance by revealing how economic factors have different likelihood values for individuals to fall into the tax compliant category. This paper recommends that a proper analysis of the peculiar traits of the Nigerian tax system be conducted before decisions are made on the combination of economic factors to be employed to move personal income taxpayers to the tax compliant category.

Keywords: Tax compliance, Personal income tax, Generalised ordered logistic regression, Economic factors

Introduction

Since the global financial and economic crises of 2007/2008, strengthening tax compliance has over time become a core development objective in improving tax revenue generation and in aiding a better Domestic Revenue Mobilisation (DRM), in both advanced and developing countries (International Monetary Fund-IMF, 2015; Keen, Toro, Baer, Perry, Norregaard, Ueda, Rojas, Brondolo, Cleary, Hutton, Luca, Thackray, Wingender, Kapoor, Narasimhan, Ruzvidzo, Venon and Prado, 2015). In developing countries, Nigeria inclusive, the achievement of the Sustainable Development Goals (SDGs) in 2030 requires tax revenue to Gross Domestic Products (GDP) ratio to grow by at least 5 percent annually and be at least 15-20 percent to effectively finance health, education, power, transportation, and sanitation; which are key targets of the SDGs (Matthew, Miebaka-Ogan, Popoola, Olawande, Osabuohien, Urhie, Adediran and Ogunbiyi, 2019; Gasper, Amaglobeli, Escribaro, Prady and Soto, 2019; Gupta and Plant, 2019; Prichard, Lustig, Gupta, Krafchik, Gary and Coulibaly, 2019; World Bank, 2015; United Nations, 2017). However, among Sub- Saharan African (SSA) countries, Nigeria has one of the lowest tax revenue to GDP ratio of about 6.5 percent (Okorie, Osabuohien and Oaikhenan, 2020; Umar, Derashid, Ibrahim and Bidin, 2019; IMF fiscal monitor, 2018).

In Nigeria, the issue of tax non-compliance is present in both the formal and informal sectors, among the wealthy and the poor, among corporate bodies as well as Entrepreneurs. Income taxes are paid mainly by persons who are formally employed, and large corporations (Kangave, Nakato, Waiswa, Nalukwago and Zzimbe, 2018). Out of the 200 million Nigerians and the 65 million economically active persons; all the states and the Federal Capital Territory inclusive, only about 10 percent pay taxes (Oyedele and Erikume, 2019). There are also about 130,000 high net worth individuals and companies in Nigeria; however, taxing these individuals has been very challenging (Andersen tax, 2018). In a survey carried out by the Nigerian Economic Summit Group (NESG) in 2018, out of the

16,228 households that were interviewed, 13,066, that is about 81 percent of the respondents did not pay income taxes in the previous year. While for the few that paid, more than 70 percent paid for one month, out of 12 months (International Centre for Tax and Development-ICTD, 2019).

Empirical and theoretical efforts have identified the determinants of tax compliance as either belonging to the economic school of thought or the psychological school of thought. The economic factors are tax rates, tax penalties, and the probability of being detected for tax non-compliance (Oladele, Aribaba, Ahmodu and Yusuff, 2019; Alkahtib, Abdul-jabbar and Marimutu, 2018; Alm, Jackson and Mckee, 1992; Allingham and Sandmo, 1972). While the psychological factors include taxpayers' perception of the government, tax morale, age, sex, tax education and knowledge, personal values and beliefs, social norms, peer effects, trust in the government, provision of public goods as well as eliciting taxpayers' preferences (Umar et al., 2019; Da silva, Gurrereio and Flores, 2019; Alasfour, 2019; Bird and Nozemack 2018; Adeleye, Osabuhoien, Bowale, Matthew and Oduntan, 2018; Gobena and Dijke, 2017). According to the study on tax compliance carried out by Feld and Frey (2007), these factors need to be properly combined and utilised on a country-specific basis to bring about an improved tax compliance rate.

The search for a sustainable solution to tax non-compliance has remained a paramount agenda for the Nigerian government and the tax authorities. To improve personal income tax compliance rate in Nigeria, the Nigerian government, as well as the tax authorities, have employed some economic factors like reduction or increase in tax rates, carrying out tax audits to detect non-compliant persons, as well as meting out penalties to tax offenders (Oladele et al., 2019). Also, Psychological factors like a reduction of tax burdens, provision of tax incentives, tax amnesties, as well as rewards for compliant citizens have been implemented (Oladele et al., 2019). Although the number of taxable adults in Nigeria increased from about 10 million to about 20 million people in 2018, tax compliance rate is still less than 20 percent, and comprises 4 percent of people whose taxes are not deducted at source and 96 percent of persons whose taxes are deducted at source (Osibanjo, 2018; Pricewaterhousecoopers-PWC, 2017).

Some of the recent empirical research on economic factors for tax compliance in developing countries and Nigeria have found significant positive or negative relationships (Oladele, Aribaba, Ahmodu and Yusuff, 2019; Olaoye and Ekundayo, 2019; Umar, Derashid, and Popoola, 2018; Alkahtib, Abdul-Jabbar and Marimutu, 2018; Modugu and Anyaduba, 2014). However, these studies just made conclusions about the extent to which these factors explain tax compliance, with no breakdown of the extent to which these factors move tax non-compliant citizens to become tax compliant. Perhaps, the findings from these empirical researches on tax compliance have not provided full details on how economic factors explain tax compliance in Nigeria and as such, the focus has been on less likely factors or less likely combination of factors.

In trying to understand why personal income tax compliance has been low in Nigeria, this paper employs the Generalised ordered logistic regression to evaluate the likelihood of Nigerians to be either tax non-compliant, low tax compliant or tax compliant when economic factors are put in place. In evaluating tax compliance, this methodology allows for the relaxation of the assumption of equal odds for falling into either tax non-compliant, low tax compliant or tax compliant categories as the explanatory variables increases. Best to the knowledge and review of literature by the researchers, only a few studies have used this methodology in explaining tax compliance in developing countries, with no study conducted for Nigeria (Radulovic, 2019; Ozdemir, Celik and Kara, 2019). This paper also contributes to the existing literature by ascertaining the economic factor with the most impact on personal income tax compliance in Nigeria based on the findings from the Generalised ordered logistic regression analysis.

Insights from Extant Studies

Tax compliance is deciding to pay taxes for the benefit of society and at the expense of personal benefits (Djike, Gobena and Verboon, 2019). It is the will of the taxpayer to act according to the spirit and letter of tax rules and regulations and tax administration without the use of coercion (Newman, Mwandambira, Charity and Ongayi, 2018).

Theoretical Review

Economic Deterrence Theory

This theory was propagated by Allingham and Sandmo (1972) and it explains tax compliance with respect to tax rates, the probability of being detected for evasion, and the penalties and threats of punishments (Ali, Fjelstad and Sjursen, 2013). The theory is based on tackling tax compliance challenges as this challenge is commonplace in almost all countries (Ortega and Sanguinetti, 2013; Alm, 2013). This theory tries to make predictions on compliance with tax laws based on the taxpayers' abilities. Those with the capacity to pay taxes, but fail to do so, incur some consequences under the deterrence theory (Ortega and Sanguinetti, 2013; Chigbu, Eze and Ebimobowei, 2012; Bird and Zolt, 2003). According to John and John (2015) at the core of the deterrence theory, unlawful behaviours can be curtailed by ensuring that repercussions in the form of punishments are in place. The three principles of this theory are certainty; which represents a surety, severity; which represents the weight of punishment, and celerity; which means how fast these punishments would be given to defaulters.

Bringing the theory down to economics and taxation, this is what influences tax authorities to establish tax auditing, tax penalties and other structures for defaulters (Oladele, Aribaba, Ahmodu and Yusuff, 2019). Economic deterrence theory to taxation however only gives one aspect of tax compliance. (Tyler, 2006; Feld and Frey, 2003). This is because when tax rates are imposed, the citizens measure the benefits of evading, they check for the probability of being detected by the auditors and the strength of the penalties and punishments for tax non-compliance.

Theory of Planned Behavior

In the field of psychology, according to Anwar (1995), the theory that explains the relationship between beliefs and behaviours is known as the Theory of Planned Behaviour (TPB). It explains the depth of human behaviour and asserts that attitudes, subjective norms, and perceived behavioural controls are the factors that shape human behaviour (Ameyaw, Abruquah and Ashalley, 2016). This theory is an extension of the Theory of Reasoned Action (TRA) which was specifically based on human voluntary behaviour and behavioural control. TPB explains human behaviour as being deliberate and calculated and that whether or not a behaviour will be performed is best predicted by the intention of coming out with a planned behaviour (Ajzen, 1991).

Empirical and Methodological Review

Studies on economic factors and tax compliance

Akhatib, Abdul-Jabbar and Marimutu (2018) examined deterrence factors in relation to income tax evasion in lieu of small businesses in Palestine. Using partial least square regression analysis, the factors tax penalty and the probability of being detected for tax evasion were statistically significant in explaining tax compliance but were negatively related to tax compliance. On the other hand, Olaleye and Ekundayo (2019) studied the effects of tax audit on tax compliance in Nigeria, using Ekiti as a case study. The result of the Multinomial logistic regression analysis revealed that tax audit was not statistically significant in explaining tax compliance in Nigeria. It was therefore concluded that the effect of tax audit on tax compliance in Nigeria is not concrete.

Using the Taro Yamane formula and judgment sampling technique Oladele, Aribaba, Olamide Ahmodu, Yusuff, and Alade, (2019) assessed the effectiveness of tax enforcement tools for improving tax compliance and overall tax income in the Ondo State, Nigeria. From the Ordinary Least Square regression analysis, tax audit and tax penalty indicated a positive and significant relationship with tax compliance in Ondo State, however, no meaningful association exists between tax amnesty and tax compliance based on the finding of this study. While, Umar, Derashid and

Popoola (2019) asserted that tax audits in developing countries must be done as a three-dimensional process consisting of audit probability, detection and sanction rather than a holistic audit probability. The study argued that these three aspects are distinct and must all work together to ensure an effective audit before the audit process can serve as a deterrent. They also proposed that practitioners should measure tax audit effectiveness based on the three dimensions as put forward in the study.

Methodology

Theoretical Framework

This study adapts the economic deterrence theory by Alingham and Sandmo (1972). Economic deterrence explains tax compliance with respect to tax rates, probability of being detected for evasion, and the penalties and threats of punishments (Ali, Fjelstad and Sjursen, 2013). The three principles of this theory are certainty; which represents a surety, severity; which represents the weight of punishment, and celerity; which means how fast these punishments would be given to defaulters.

The conceptual framework for this study is obtained through the modification of the recommended framework in the tax compliance studies carried out by Oladele, Aribaba, Ahmodu and Yusuff (2019). They explained tax compliance in Ondo state, Nigeria as being determined by the interactions between tax audits and tax penalties. The conceptual framework of this study is such that personal income tax compliance in Nigeria would be explained by:

i. **Tax rates:** It is the rate at which individuals or businesses are taxed.
ii. **Tax penalty:** It refers to punishments for violations of tax laws.
iii. **Probability of no detection for tax non-compliance:** This is likelihood of not getting caught for the violation of tax laws and regulations.

Figure 1.1: Schematic framework for personal income tax compliance in Nigeria

The schematic framework in figure 3.1 depicts the path flow from economic factors to personal income tax compliance and from economic factors to personal income tax compliance in Nigeria.

Method of Analysis

Model Specification

To achieve the research objectives of this study, the model for this research is specified in line with the adapted conceptual framework presented in Section 3.2.
To assess the likelihood of being either tax non-compliant, low tax compliant or tax compliant in Nigeria when economic factors are utilised, the implicit form of the model is thus:

$$TC = f\ (TP_i, PD_i, TR_i) \ldots\ldots\ldots\

TC: Tax compliance

TP_i: Tax penalty

PD_i: Probability of detection

TR_i: Tax penalty

When equation (1) is rewritten in its linear form, it becomes:

$$Y_i = \alpha_0 + \alpha_1 TP_i + \alpha_2 PD_i + \alpha_3 TR_i + \varepsilon_i \quad \ldots\ldots(2)$$

Where:

Y_i: Tax compliance
α_1, α_2 $and \alpha_3$ are slope coefficients
All explanatory variables are as previously defined

A Priori Expectations

Variable	Expected signs
Tax rate	+/-
Tax penalty	+
Probability of detection	+

Source: Authors' computation

Data Description

This research utilised the 2018 Nigerian Economic Summit Group (NESG) quantitative survey dataset on households' attitudes and perceptions towards tax compliance in Nigeria. The survey was created to be very representative at the national level, geopolitical zones, urban/rural areas, and gender. It included a sample total of 16228 respondents. The basic methodology for data collection was in-home and face to face personal interviews using clustered, stratified, and multistage random selection method to achieve a representative sample. The respondents' selection process was based on a random selection of sampling start points, a random selection of households, and stratified random selection of eligible respondents. Households were sampled from all states (proportionate to their populations), there was a 50:50 gender balance, and respondents from urban areas made up 70 percent while those from rural areas made up 30 percent. To further make the dataset robust, extensive qualitative research was also conducted including FGDs and In-Depth Interviews (IDIs) with tax officials in selected states. The survey excluded non-Nigerian citizens, people aged less than 18 years, and people living in institutionalised settings. This study therefore selected indicators from this household survey data, relating to each research objective. For this study however, all the 16228 respondents in the NESG household survey data were utilised to ensure that this study remains representative of the perception of directly assessed personal income taxpayers in Nigeria.

Data Availability Statement

The data that support the findings of this study are openly available in [International Center for Tax and Development] at [https://www.ictd.ac/dataset/nesg-nigeria-tax-subsidy-perception-dataset/].

Estimation Technique

The review of the literature revealed different methodologies used in explaining the determinants of tax compliance. These techniques include descriptive and logistic regression analysis, ordered logistic regression, probit regression, fixed-effect analysis, as well as weighted least squares. In this study, however, the evaluation of the likelihood of Nigerians to be either tax non-compliant, low tax compliant or tax compliant when economic factors, psychological factors and a combination of both factors are employed is conducted using the Generalised ordered logistic regression. This technique is appropriate for this study because of the ranked ordinal nature of the dependent variable employed as well as the relaxation of the assumption of proportional odds between the different tax compliance categories.

This technique has greater advantages over the other types because most times, in reality, the proportional odds assumption is violated that one or more of the regression coefficients may differ across the categories of the dependent variable (Williams, 2006). It is a simpler method and does not need to estimate several parameters like other non-ordinal estimation techniques that relax the proportional odds assumption. The generalised ordered logistic regression model for this study was estimated using the gologit2 command, which is a Stata user-written command. It was created in line with the gologit command created by Vincent Fu in 1998. However, gologit2 has more strength as it can also be used to estimate logistic regression, partial proportional odds models as well as proportional odds models.

The Generalised Ordered Logistic regression model for this study is specified according to Fullerton and Xu (2016). It can thus be written as:

$$P_r(y = z|X) = \begin{Bmatrix} F(\omega_1 - X\alpha_1) \\ F(\omega_z - X\alpha_z) - F(\omega_{z-1} - X\alpha_{z-1}) \\ 1 - F(\omega_{z-1} - X\alpha_{z-1}) \end{Bmatrix} \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (11)$$

Given that $z = 1$,

$1 < z \leq Z - 1$,

$z = Z$

Where F is the logistic Cumulative Density Function (CDF);

α is a vector of logit coefficients that varies freely across logit equation;

X is a vector of independent variables;

ω is a cut-off point;

z is the logit

Criteria for Interpretation of Results

The criteria for the interpretation of the generalised ordered logistic regression results are as follows:

i. The generalised ordered logistic regression presents its results in two sets, namely: reporting coefficients, and reporting odds ratio. The coefficients represent the log odds and it is the signs of these log-odds that are interpreted and not the magnitude. The odds ratio, on the other hand, refers to the comparison between people in a group that is greater than T against people that are less or equal to T (where T represents the levels of the dependent variable). It thus depicts the odds of a situation occurring against the non-occurrence by dividing the probability of the occurrence by the probability of the non-occurrence (Williams, 2006).

ii. For a model whose dependent variable has three response categories (1, 2, and 3), the first panel of coefficients is interpreted like a binary logistic regression in which the dependent variable is recoded as 1 versus 2+3. While the second panel is interpreted like a binary logistic regression in which the dependent variable is recoded as 1+2 versus 3. A positive coefficient, therefore, means that a greater value on the explanatory variables makes greater values of the dependent variable more likely.

iii. Predicted probabilities are used to forecast the likelihood values of an outcome variable as it moves from one point of its category response to another. It can also be used to forecast probabilities of specific points in the dependent variable, based on specific points in the independent variable.

Results and Discussions

Results

Table 4.1: Generalised ordered logistic regression

Variables	Coefficient	Odds ratio	P-value
1. Not wrong at all:			
Tax rate	0.069	1.071	0.065
Tax penalty	0.948	2.580	0.000
Probability of detection	-0.163	0.849	0.000
2. Wrong and understandable:			
Tax rate	0.176	1.191	0.000
Tax penalty	1.044	2.839	0.000
Probability of detection	-0.191	0.826	0.000
LR Chi-square	2054.82		
P-value of chi-square	0.0000		
Pseudo R-Square	0.1044		

Source: Authors' computation

The null hypothesis states that there is no significant relationship between being either tax non-compliant, low tax compliant or tax compliant and economic factors in Nigeria. The first panel of Table 4.1 reveals a non-statistically significant and positive relationship between tax rates and moving an individual from being tax non-compliant to becoming low tax compliant or tax compliant. In the second panel also, tax rate is statistically significant and positive when explaining the shift in an individual from being tax non-compliant or low tax compliant to becoming tax compliant. The odds ratio when tax rate is employed as a tax compliance determinant shows that the odds of a person becoming tax compliant increases when tax non-compliant and low tax compliant individuals are being pushed to a higher category. Tax penalty as well reveals the same result as tax rates. The difference, however, is the value of the odds ratio for tax compliance; with tax penalty having higher odds.

For the probability of no detection for tax non-compliance, the statistically significant and negative regression coefficient in the first panel and second panel shows that an individual will not move to a higher category of tax compliance when there is no probability of being detected. The odds ratio also depicts a continuous reduction in the odds for tax compliance when there is no detection of tax non-compliance.

The explanatory variables were tested for multicollinearity and the correlation matrix in section 2 of the appendices revealed that there is no presence of a strong positive correlation between the explanatory variables. Also, the P-value of the LR chi-square of 0.0000 shows that all the variables combined in this model are relevant and statistically significant in explaining tax compliance.

Table 4.2: Predicted probabilities

TC level	High TR	Low TR	Small TP	Big TP	Low PD	High PD
Non-compliant	45%	9%	22%	4%	24%	18%
Low compliant	50%	62%	65%	45%	64%	66%
Compliant	5%	28%	13%	50%	12%	16%

Source: Author's computation (2020)

The specific points of the explanatory variables in each column used to predict the different categories of tax compliance are defined as high tax rates, low tax rates, small tax penalty, and big tax penalty, high probability of not being detected and low probability of not being detected, respectively. The first column named TC level represents the different tax compliance levels.

From Table 4.2, it can be observed that when tax rates are high or low, the likelihood of falling into the low tax compliance level has the highest percentage. However, low tax rates see an increase in the likelihood of falling into the compliant category of about 23 percent; from the 5 percent of high tax rates. While the likelihood of falling into the tax non-compliant category decreases by about 36 percent when tax rates are lower.

In addition, the likelihood of falling into the low tax compliant category has the highest percentage for both small and big tax penalties. There is however a decrease in the likelihood to be tax non-compliant when tax penalties are considered as big. Also, big tax penalties increase the likelihood of being tax compliant by 37 percent from 13 percent when small penalties are employed.

Furthermore, low tax compliance category has the most likelihood when the probability of not being detected for tax non-compliance is low and high. For the non-compliant category, the likelihood of being in this category reduces when the probability of not being detected is low. The same can also be said for the tax compliant category which reveals a 4 percent increase in the likelihood of being tax compliant when there is a low probability of not being detected.

In Table 4.1, the likelihood of directly falling into the tax compliant category without any other option for increases in the explanatory variables is presented in the second panel. From the second panel, the factor with the highest odds ratio for tax compliance and which is positive and statistically significant is the tax penalty. The predicted probability results in Table 4.2 further buttressed the impact level of tax penalty on tax compliance. Howbeit, it is large tax penalties that have the most impact of about 50 percent, personal income tax compliance in Nigeria.

Discussions

This study found that tax rates, tax penalties, and the probability of not being detected are relevant in the model of the personal income tax compliance in Nigeria. Tax rates and tax penalties were found to positively explain the likelihood of a Nigerian being either tax non-compliant, low tax compliant, and tax compliant. While the probability of not being detected for tax non-compliance negatively

relates to the likelihood of being in a higher tax compliance category. These findings negate the conclusions made by Alkhatib, Abdul-Jabbar and Marimuthu (2018) in their empirical research which posit that tax rates and tax penalties play no role in tax compliance among non-members of the formal economy. Meanwhile, these outcomes corroborate the postulations of Olamide, Ahmodu, Yusuf and Alade (2019) which found positive relationships between tax compliance in Nigeria and tax rates, tax penalties, and tax audits. Also, the findings of this study support the postulations of the empirical research of Ozdemir, Celik and Kara (2019) which also employed the generalised ordered logistic regression and found significant a negative relationship between the probabilities of not being detected for tax non-compliance in Turkey.

Perhaps, the mixed result from the existing literature is because the actual effects of economic factors on tax compliance have not been revealed. The findings of this research disclose two points which a tax non-compliant Nigerian can be. The first point is where he/she has a choice to be either low tax compliant or tax compliant. The second point is to be tax compliant. As far as tax rates are in Nigeria are concerned, the finding from the results presented in Table 4.1 depicts that there are greater odds of being in point two, that is, being tax compliant. Table 4.2 however provided a detailed explanation of this outcome. It is shown that high tax rates bring about a lower likelihood of 5 percent for being in the tax compliant category, while low tax rates bring about a higher likelihood of 28 percent for being in the tax compliant category. More so, a large tax penalty will bring about a 50 percent higher likelihood of being in the tax compliant category, while a smaller tax penalty will bring about a 13 percent lower likelihood of being in the tax compliant category. Meanwhile, a low probability of not being detected for tax non-compliance brings about a higher likelihood of 16 percent to be in the tax compliant category, while a high probability of being detected culminates into a 12 percent lower probability of being in the tax compliant category.

The discussions above provide more explanation on the effects of economic factors on personal income tax compliance and empirical research keeps presenting mixed results of either positive, negative, or no relationship at all. The outcome of this study also showed that a slight increase in either of the economic factors has the most likelihood of putting a Nigerian in the low tax compliant level. Existing literature has also revealed that the directly assessed personal tax system in Nigeria is made up of more tax non-compliant persons than low tax compliant persons. It is therefore not too far from reality that a slight increase in economic factors will only move most Nigerians to the low tax compliant level than any other tax compliance categories. Therefore, depending on the extent to which the factors are employed, there is a higher likelihood of about 45-66 percent that most personal income taxpayers in Nigeria will remain low tax compliant.

From the findings of this study, the economic factor with the most likelihood of moving a Nigerian to the tax compliant regime is tax penalty. This outcome is buttressed in the model estimated for just economic factors as well as the model that combined the factors. This finding explains the reality of the behaviour of directly assessed personal income taxpayers. Majority of them are tax non-compliant but increasing tax penalties will move them to higher categories of tax compliance in Nigeria. However, as already revealed from this research finding, a proper mix of these factors must be sought after, even when the most significant factors are being combined.

Conclusion and Recommendation

This study started with the objective to understand and provide insight on the extent to which economic factors move personal income taxpayers to either tax non-compliant, low tax compliant, or tax compliant categories of tax compliance in Nigeria. This paper concludes that economic factors must be used in a way that would overtime move most, if not all personal income taxpayers to the tax compliant category.

Having successfully answered the research questions and fulfilled the research objectives, this paper recommends that policymakers in Nigeria and other developing countries use the peculiar features of their tax system to implement policy measures to increase the number of compliant personal income taxpayers. These peculiar features could be the number of tax non-compliant individuals, the extent

to which economic factors have to be improved as well as time considerations in the use of these factors to yield desired objectives.

This paper also recommends that tax rates should be kept low, tax penalties should be deepened and utilised to ensure that people know that there are punishments for tax non-compliance. Also, the probability of detection for tax non-compliance should be improved upon to reduce the number of persons that can evade taxes.

One of the limitations of this study is that the quantitative household survey dataset employed in this study did not account for the role of time in moving tax non-compliant persons to the tax compliant category. Further research should, therefore, be conducted in this regard to proffer more explanations on how the factors for tax compliance interact. Also, the interactive and cross re-enforcing effects of economic and psychological factors can be ascertained using other research methods that adequately capture this.

Abstract

Strategic fit orientation is crucial to competitive performance as it involves matching internal activities of firms with diverse external context. The capability of a business to grow and survive depends on its ability to be timely and flexible (agility) in responding or reacting to market changes. Extant research has shown that entrepreneurs, especially women in the non-oil export, are not strategically fit to arrange their limited resources in alignment with prevalent competition and market environment. As a result, this study examined the effect of strategic fit orientation on business agility among women entrepreneurs in non-oil export, Lagos state. This study adopted a descriptive design and quantitative approach to elicit information from selected 402 female entrepreneurs and export managers who are actively involved in non-oil exporting activities in the agribusiness, textile, as well as information and technology business processing outfit (ITBPO). The respondents were conveniently and purposively selected. The data collected was analysed using measurement and structural modelling. The finding indicated that 66.3% variance of business agility is explained by strategic fit orientation ($r=0.814$, $p= <0.05$). This finding implies that women entrepreneurs adapt to technological changes and provide a relative, focused and stable market for their customers. Based on this, women entrepreneurs should consistently develop strategies to alleviate potential risks, evaluate situations and possible consequences of threats in agreement with their objectives to remain dynamic in the business environment.

Keywords: Strategic Fit Orientation, Business Agility, Non-Oil Export, Women Entrepreneurs.

Introduction

The Global Entrepreneurship Monitor report (GEM, 2015/) revealed that women entrepreneurs are akin to starting new businesses at a rapid rate, but rarely grow or perform sustainably beyond the start-up stage. Small firms often face the dilemma of crafting strategies that best suit their resource base in cognisance of the externalities. In Nigeria, women entrepreneurs in non-oil export have issues regarding creating and managing high- performance ventures. Some fail at start-up stage due to insufficient orientation about strategy and externalities influence on performance, strategic and managerial capabilities, in terms of market access and inadequate information (Uchegbulam, Princess, Samuel, and Ayodotun, 2015). Strategic fit orientation (SFO) is the process of tactically matching the internal activities of the firm with its diverse external changing contexts. SFO, through firm agility, releases the ability to respond or react to changing markets using an appropriate strategy to manage different customer needs by the strategic allocation and reallocation of firm resources while hedging disruptions in the system (Ofoegbu and Akanbi, 2012; Cui, Walsh, and Zou, 2014). The rise of turbulence in the business environment caused by open market competition, business dynamism, and globalisation necessitated the ability of organisations to cope, survive and be competitive through the agility of firms to respond to changes, and innovation activities (Arokodoye and Asikhia, 2020). Responsiveness facilitates the ability to consistently identify and seize opportunities more quickly than the competitors through a focused effort to sourcing and sharing real-time market information to aid the performance of the firm's objectives and goals with exigency. Thus, the study aims at filling the gap in the knowledge of strategic fit model as a necessary tool for organisational agility, and further aversion of women business failure.

Literature Review

Strategic Fit Orientation

Strategic fit orientation is a universal strategic management framework which pinned the competitiveness and growth of an organisation on how effectively it matches its strategy and structure with its business environment (Lisboa, Skarmeas, and Lages, 2013; Cui, Walsh, and Zou, 2014; Ingram, Kraśnicka, Wronka-Pośpiech, Głód, and Głód, 2016; Youssef, and Christodoulou, 2017; Ibidunni *et al.,* 2018; Worlu *et al*., 2019). Strategic fit is the alignment in the degree to which the firm strategically matches its internal resources, and capabilities, with its external environmental opportunities, to enable consistent performance and deterrent to imitation (Rivkin, 2000; Siggelkow, 2002; Vorhies and Morgan, 2003; Aagaard, 2016; Kanagavalli. and Surya, 2017). Several researchers have studies strategic fit relating to the performance of organisations (Lukas, Tan, and Hult, 2001; Majukwa and Haddud, 2016; Mohammed, Fatima, Abdennour, and Lakhdar, 2017; Alesksic, and Jelavic, 2017). Understanding the dynamics of the business environment is of utmost importance to strategic fit and for business agility.

Business Agility

The concept of agility arises as a solvent to the dilemma of unpredictable business dynamism. It appeared first in the Iacocca Institute survey in the United States in 1991. It focused on capability-based, flexible and agile production to meet the rapidly changing needs of the market (Iacocca Institute, 1991). Organisation agility is the proclivity for internal strategic flexibility in prompt adaptability to opportunities and response to mitigating threat in the external environment in a fit continuum for sustainable competitive advantage. In practice, however, most women firms, have difficulties in achieving the required strategic fit due to culture, inadequate information, access to markets, and ineffective communication (Iyiola and Azuh, 2014; Nigeria Export Promotion Council NEPC, 2016; Bako and Syed 2018; Etim, and Chux, 2018; Arokodare and Asikhia, 2020). Oyerinde, Olatunji and Adewale (2018) pointed out that poor strategic agility to uncertain regulation and policy instability, challenges of political interference and inadequate infrastructural facilities created erratic firm performance. Yet, existing literature pointed the significance

of firm strategic agility to organisational changes (Zhou and Wu, 2010); and flexibility to responding to the changes in the internal and external environment (Zhang, 2006; Chiang, Kocabasoglu-Hillmer, and Suresh, 2012; Mondal, Rahman, SanoarHosin, and Sarkar, 2017; Shaheen and Almohtaseb 2020); customer satisfaction (Dominici, 2008; Barve, 2010; Bharadwaj, Chauhan, and Raman, 2015); market competition (Johnson, Lee, Saini and Grohmann, 2003; Networks (Gutierrez and Pérez, 2010).

Methodology

This study adopted a descriptive design and quantitative approach to elicit information from selected 416 female entrepreneurs and export managers who are actively involved in non-oil exporting activities in the agribusiness, textile, as well as information and technology business processing outfit (ITBPO). The use of a structured questionnaire was adopted to elicit information from a cross-section of female entrepreneurs who were conveniently and purposively selected in Lagos state, Nigeria. Majority of the non-oil exporting activities in Nigeria are based in the south-west region with most of them located in Lagos, the commercial centre of Nigeria (MAN, 2018). The items in the survey were adapted from prior studies. The questionnaire comprised ten (10) questions with the aid of five (5) point Likert's scale. The strategic fit was measured using cost advantage, risk alleviation, innovative delivery, market stability, adaptation to change, opportunity identification., and consequences of threat evaluation (Vorhies and Morgan, 2003; Aagaard, 2016; Kanagavalli. and Surya, 2017). While business agility was captured using adaptation to unforeseen changes, streamlining of core processes for optimum performance, and capability to deliver products in the most cost-effective manner (Zhou and Wu, 2010; Chiang et al., 2012; Mondal et al., 2017; Shaheen and Almohtaseb 2020).

The Likert's scale ranges from strongly agree (5), Agree (4), undecided (3), disagree (2) and strongly disagree (1). Out of the four hundred and sixteen (416) copies of the questionnaire distributed, only four hundred and two (402) representing 80.2% response rate. The researcher achieved a high response rate due to frequent visitation and familiarisation with the target respondents at their various meeting points. The data collected was analysed using measurement and structural modelling. The use of Partial Least Square – Structural Equation Modelling (PLS-SEM) technique was adopted for the data analysis.

Data Presentation and Analysis

The strategic fit orientation descriptive statistics captured statements, like trying to achieve the cost advantage by producing at the lowest cost. Developing strategies to alleviate potential risks. Service to customers best defined as innovative. Providing a focused, relatively stable market for the customer. Adapting to technological changes, identifies opportunities in the market, evaluating situations and possible consequences of threats on a scale of 1 to 5. The analysis is presented in Tables 1 and 2, respectively.

Table 1: Strategic Fit Orientation

Table 1 indicated that the assessment of the selected respondents on achieving cost advantage. 368 (91.5%) of the women entrepreneurs believed in attaining cost advantage, 24(6%) were indifferent, and 10(2.5%) had an opposing view. Also, their response on development of strategies to alleviate potential risks, disclosed that 350(87.1%) of the respondents thought that they develop strategies to mitigate potential risks, 33(8.2%) were unmoved, and 19(4.7%) had a contrary view. Some 343(85.3%) of the selected women entrepreneurs agreed that their service to customers is best defined as innovative, while 45(11.2%) were indifferent, and 19(4.7%) had an opposing view. In the same vein, the report stated that 324(80.6%) of the respondents believed that conducting an assessment of potential customer needs to provide a focused, relatively stable market is crucial. 66(16.4%) of the respondents were unresponsive, while 12(3%) of the respondents had an opposing view. Similarly, 336(83.6%) of the selected female entrepreneurs and export managers adapted to technological changes, 55(13.7%) were unconcerned, and 11(2.7%) of the respondents had a differing view. The assessment on the identification of opportunities in the market revealed that 352(87.6%) of the respondents identify opportunities, 35(8.7%) were uninterested, while 15(3.7%) had a contrary view about identifying opportunities. In the same way, the effort at evaluating threat situations and possible consequences showed 331(82.3%) of the respondents do evaluate threat situations, 51(12.7%) were indifferent about the statement. In comparison, 20(5%) of the respondents had an opposing view.

The table also displayed the mean and standard deviation of each item measured on strategic fit orientation in the non-oil exporting activities in the agribusiness, textile, as well as information and technology business processing outfit (ITBPO) in Lagos state. The mean value was above 4.00 on a scale of five (5). The result implied the degree of affirmation of the **respondents' adherence to strategic fit practice.**

Table 2: Business Agility

Items		SA	A	U	D	SD	Mean	SD
Quick adaptation to unforeseen changes	Agribusiness	23	82	38	1	-	3.881	.663
	Info-Tech	42	127	26	6	-	4.019	.677

	Textile	19	28	8	2	-	4.122	.780
Total		**117**	**234**	**41**	**8**	**2**	**4.125**	**.724**

For the assessment of the business agility, the selected female entrepreneurs and export managers' effort to quickly adapt to unforeseen changes revealed that 317 (78.8%) of the respondents opined that they facilitate quick adaptation to unexpected changes, 75(18.7%) were indifferent. In comparison, 10(2.5%) had an opposing view. Also, the researcher found out that 338(84.1%) of the respondents had the opinion that significant steps are taken to streamline core processes for optimum performance, 50(12.4%) were unconcerned, and 14(3.5%) of the respondents had a contrary view. Besides, the question on the capability to deliver products to its customers in the most cost-effective manner revealed 351(87.3%) of the respondents had the belief that they have high ability to deliver products to their customers in the most cost-effective way, 41(10.2%) of the respondents were indifferent. In comparison, 10(2.5%) had an opposing view of the statement.

Test of Hypothesis

Both structural and measurement models were considered for data analysis. For the measurement model, all items are reflective, and the minimum acceptable value for a factor loading is 0.60 (Fornell and Larcker, 1981), and remarkably, all the constructs have values higher than 0.60. Few items that have a factor loading less than 0.6 were removed, and the results are presented in Figures 1 and 2, respectively. The structural model is the inner model in structural equation modelling. It measures path coefficients (R2) values and significant values. Boots strapping method finds the significance (Vinzi, Chin, Henseler, and Wang, 2010; Sanchez, 2013). The default bootstrapping in PLS is 5000 subsamples to gain significant results (Wetzels, Odekerken-Schroder, and Van Oppen, 2009). This study calculated 5000 subsamples in bootstrapping gains more precise results and path coefficient values to show the relationship between strategic fit orientation and business agility. Results showed that selected women entrepreneurs sampled had almost the same opinion. The hypothesis formulated thus:

H_0: Strategic fit orientation of women entrepreneurs does not influence the business agility of selected women entrepreneurs

The hypothesis has one exogenous variable (strategic fit orientation) and one endogenous variable (business agility). The coefficient of determination/ r-squared, path coefficient (β value) and T-statistic value, effect size ($f2$), the predictive relevance of the model, and Goodness-of-Fit (GOF) index were the core standards for evaluating the structural model as presented in Figures 2 and 3 respectively. Path estimates were calculated by using Maximum Likelihood Estimation (MLE), which was considered to be tolerant to violations of normality assumptions in most of the psycho-behavioural studies (Fornell and Larcker, 1981).

Results of structural models and direct path analysis for strategic fit orientation and business agility have been presented in the figures and tables below:

Figure 1: Predictive relevance (Path co-efficient) of strategic fit orientation and Business Agility

Figure 2: Path Co-efficient and P-values for strategic fit orientation and Business Agility

Figure 3: Path Co-efficient and T-values for strategic fit orientation and Business Agility

Estimation of Path Coefficients (β) and T-statistics

The path coefficients in the PLS and the standardised β coefficient in the regression analysis were similar. Through the β value, the significance of the hypothesis was tested. The β denoted the expected variation in the dependent construct for a unit variation in the independent construct(s) (Astrachan, Patel and Wanzenried, 2014). The β values of every path in the hypothesis model were computed, the higher the β value, the more the substantial effect on the endogenous latent construct. However, the β value had to be verified for its significance level through the T-statistics test. The path co-efficient is presented in Table 3.

Table 3: Path Coefficients

Variables and Cross Loading	Path Co-efficient (O)	Indirect Effect (IE)	Std. Dev. (STDEV)	T Statistics (O/ STDEV	P Values
Achieving cost advantage at the lowest cost #q1 → Strategic fit orientation	0.292		0.021	4.537	0.000
Achieving cost advantage at the lowest cost #q1 → Business Agility		0.258	0.019	3.829	0.000
Developing strategies to alleviate potential risks #q2 → Strategic fit orientation	0.106		0.184	1.992	0.047
Developing strategies to alleviate potential risks #q2 → Business Agility		0.101	0.155	1.980	0.041
Service to customers is innovative #q3 → Strategic fit orientation	0.309		0.018	5.691	0.000

Service to customers is innovative #q3 → Business Agility		0.281	0.014	5.627	0.000
Providing a stable market for its customer #q4 → Strategic fit orientation	0.110		0.021	2.052	0.041
Providing a stable market for its customer #q4 → Business Agility		0.103	0.013	1.997	0.038
Adapting to technological changes #q5 → Strategic fit orientation	0.189		0.019	3.487	0.001
Adapting to technological changes #q5 → Business Agility		0.150	0.016	3.399	0.000
Identifies opportunities in the market #q6 → Strategic fit orientation	0.180		0.019	2.917	0.004
Identifies opportunities in the market #q6 → Business Agility		0.142	0.015	2.893	0.003
Evaluating the consequences of threats #q7→ Strategic fit orientation	0.207		0.019	4.044	0.000
Evaluating the consequences of threats #q7→ Business Agility		0.169	0.018	3.968	0.000
Strategic fit orientation → Business Agility	0.814		0.083	7.023	0.000
	R Square (R^2)		R Square (R^2) Adjusted		
Strategic fit orientation → Business Agility	0.663		0.629		

P-values <0.05 are desirable for reflective indicators

This hypothesis predicted that strategic fit orientation which comprised achieving cost advantage at the lowest cost, developing strategies to alleviate potential risks, service to customers is innovative, providing a stable market for its customer, adapting to technological changes, identifies opportunities in the market and evaluating the consequences of threats significantly and positively influence business agility of selected women entrepreneurs. The **path co-efficient** affirmed that achieving cost advantage at the lowest cost #q1 indirectly and significantly influenced business agility ($\beta = 0.292$, $f2 = 0.258$, $p < 0.05$). The indirect influence of developing strategies to alleviate potential risks was observed on business agility of selected women entrepreneurs #q2 ($\beta = 0.106$, $f2 = 0.101$, $p < 0.05$). Service to customers is innovative #q3 also recorded a positive and significant impact on business agility of selected women entrepreneurs ($\beta = 0.309$, $f2 = 0.281$, $p < 0.05$). Providing a stable market for its customer #q4 indirectly and significantly influenced business agility ($\beta = 0.110$, $f2 = 0.103$, $p < 0.05$). The indirect influence of adapting to technological changes was observed on business agility of selected women entrepreneurs #q5 ($\beta = 0.189$, $f2 = 0.150$, $p < 0.05$). Identifying opportunities in the market #q6 also recorded a positive and significant impact on the business agility of selected women entrepreneurs ($\beta = 0.180$, $f2 = 0.142$, $p < 0.05$). In the same way, evaluating the consequences of threats #q7 have also recorded a positive and significant impact on the business agility of selected women entrepreneurs ($\beta = 0.207$, $f2 = 0.169$, $p < 0.05$). Overall, the relationship between strategic fit orientation and business agility of selected women entrepreneurs is confirmed to be directly significant with a beta value of 0.814, which also indicates a strong degree of association.

The indirect effect (IE) of the path co-efficient as depicted in Table 3 is often used to indicate the **effect size** of each item of the exogenous (strategic fit orientation) variables on the endogenous (business agility) in a PLS-SEM model. The effect size (also known as $f2$) indicate the substantive impact of all the items. $f2$ measure the strength of each predictor variable in explaining endogenous variables. Cohen (1988) recommended a guiding principle for determining the effect size. The values of 0.02, 0.15, and 0.35 respectively, signify small, moderate, and large effects of an independent construct on dependent construct; while the $f2$ values of less than 0.02 show that there was no effect. Basically, the effect size of #q1 ($f2 = .258$) was relatively moderate; #q2 ($f2 = .101$) was relatively weak; #q3 ($f2 = .281$) was relatively moderate; #q4 ($f2 = .103$) is relatively weak; #q5 ($f2 = .150$) is relatively moderate; #q6 ($f2 = .142$) was relatively small; and #q7 ($f2 = .169$) was relatively moderate. The result shows that the effect size of strategic fit orientation on the business agility of selected women entrepreneurs is relatively moderate.

The **value of R2** explains the variance between endogenous variables (Henseler *et al.,* 2009; Hulland, 1999). According to Henseler, Ringle, and Sinkovics (2009) and Hair, Ringle and Sarstedt (2013), an R^2 value of 0.75 were considered substantial, an R^2 value of 0.50 was regarded as moderate, and an R^2 value of 0.26 was considered as weak. In this study, the value of 0.663 was observed. This implies that 66.3% variance of business agility is moderately explained by the strategic fit orientation of selected women entrepreneurs. As a result, the analysis provided evidence that the hypothesis was supported. Hence, the R2 value in this study was moderate. By implication, the null hypothesis (H_0), which indicates that strategic fit orientation does not significantly have combined effects on the business agility of selected women entrepreneurs is as a result of this rejected. Above all, the results established that strategic fit orientation is a significant predictor of business agility among the selected women entrepreneurs.

Model Fit and Goodness of fit Index

Model fit can be analysed through Standardised Root Mean Square Residual (SRMR), and Normed Fit Index (NFI) values in PLS under model fit, factor analysis in PLS algorithm. The minimum acceptable value for SRMR is less than 0.08 (Hu and Bentler, 1998). In this research, the SRMR value of strategic fit orientation is less than 0.8. The CMIN/DF indicates an acceptable fit when the hypothetical model is < 3 (Ferron and Hess, 2007). The decision rule that is adopted to determine the acceptability of the model includes CMIN/df must be < 3; RMSEA/SRMR <0.8; NFI, CFI must be > 0.90 (Ferron and Hess, 2007; Fornell and Larcker, 2009). The relative Chi-square = 273.19; CFI = .944; NFI = .907; GFI = 0.910; SRMR = .043 as displayed in Table 4. The model fit indices satisfied the critical threshold, which indicated a fitting model.

Table 4 : Goodness of Fit and Model Fit Index

The Model Fit Index Calculation		**The goodness of fit (GoF) Model**			
Construct	**AVE** ≥0.50		**Cut-Off Value**	**Results**	**Conclusion**
Achieving cost advantage at the lowest cost	0.598	d_ULS		1.551	Good
Developing strategies to alleviate potential risks	0.683	SRMR	≤ 0.08	0.043	Good Fit
Service to customers is innovative	0.719	RMSEA	≤ 0.08	0.076	Good Fit
Providing a stable market for its customer	0.682	Chi-Square	273.19	273.19	Good
Adapting to technological changes	0.729	CMIN/DF	≤ 3.00	1.889	Fit
identifying opportunities in the market	0.684	NFI	≥ 0.90	0.907	Fit
Evaluating the consequences of threats	0.711	CFI	≥ 0.90	0.944	Good Fit
Business Agility	0.788	GFI	≥ 0.90	0.910	Fit

The measurement model indicated that all the model fit indices were found to be in an acceptable range and above the recommended cut-off level as suggested by Lacker and Fornell (2009). The SRMR is an index of the average of standardised residuals between the observed and the hypothesis covariance matrices (Chen, 2007). The SRMR is a measure of the estimated model fit. When SRMR = <0.08, then the study model has a good fit (Hu and Bentler, 1998). The table shows that this study model's SRMR was 0.043, which revealed that this study model has a good fit. The goodness of fit was conducted to evaluate the appropriateness of the model. The Goodness of Fit (GOF) of a statistical model describes how well a model fits into a set of observations. The values of the CFI, TLI and GFI were uniformly high. By implication, this result suggests that all parts of the model fit equally well and the overall or average fit of the model has reached an acceptable level.

Discussion of Findings

The results established that strategic fit orientation is a significant predictor of business agility. By implication, the result shows that achieving cost advantage at the lowest cost will assist in developing

strategies to alleviate potential risks and sustainable business agility among women entrepreneurs. In line with these findings, several studies have shown a relationship between strategic fit orientation and business agility, which is typically relatively strong and positive (Malik, Ghafoor and Iqbal 2013; Kanagavalli, Surya, and Phil, 2017). The finding supports the work of Aagaard, 2016; Aleksic and Jelavic (2017) who reported that ability to strategically fit the activities of the firm internally with appropriate strategy to align with its diverse external context implies the performance. The study by Camuffo and Wilhelm (2016) also affirmed that sustainable performance could be achieved when firms create opportunity in the external environment that match the firm's overall objectives. On the other hand, Hill and Cuthbertson (2011) supported by Kim, Lee, and Park (2015) researched the inevitability of strategic fit in a changing environment. They concluded that responding to changes in the environment and developing strategies for continuous improvement is central to increased performance. Hence, it can be argued that strategic fit is vital for achieving business agility and organisational success. However, the strategic fit concept has also been criticised as being too static and limiting, focusing on existing resources vis-a-vis the environment, instead of the strategic intent of sensing potential opportunities and/or threats. This implies that business sustainability can only be stimulated when women entrepreneurs consistently provide a stable market for its customer, adapt to external changes, recognise opportunities, simplify core processes for optimum performance, and develop the capability to deliver products in the most cost-effective manner.

Conclusion and Managerial Implications

This study brings to knowledge about how cost-effectiveness, evaluation of situations and possible consequences of threats will help to enhance business agility. Since strategic fit orientation is a multidimensional and sophisticated approach that explains how organisations learn and bring themselves close to their ideals. Female entrepreneurs across the agribusiness, Textile, and Information Technology/Business Processing Outfit (ITBPO) should continue to evaluate situations and possible consequences of threats thoroughly in agreement with its objectives and be very responsive to new market demands. To produce superior customers' satisfaction, and have a competitive edge, firms need information at every turn to proactively respond to customers ahead of their competitors.

Abstract

The common consensus is that a well-developed financial system will aid financial intermediation, destroy asymmetric information and enable access to finance for all, if it is inclusive, it will enhance stability and if not, it will threaten stability and undo the very purpose of financial inclusion. It is on this premise that this study examined the interactive effect between financial inclusion and financial stability in twenty seven (27) sub Saharan African countries. Error Correction Method (ECM) with General Methods of Moments (GMM) of Arellanon & Bond (1991) were used to analyze the short panel data obtained from the World Bank database. The study found the existence of a bidirectional long run influence between financial stability and financial inclusion by usage for the low, moderate and high stable countries. However financial stability reacts more quickly to temporal shocks in financial inclusion by quality for countries with highly stable financial system than poor and moderate financial system. The study therefore recommended that efforts should be concentrated in developing the financial system to make it more robust and inclusive. This is because a well-developed and inclusive financial system will make deposit rate to increase while at the same time lending rate plunges.

Keywords: Financial intermediation, financial development, poverty, digital finance, SSA

JEL Code: G21, G23, L26, I24

Introduction

Empirical and theoretical evidence have shown that while financial inclusion drives financial development, financial stability sustains financial development and reduces the risks arising from financial and economic shocks. However, pursuing both financial inclusiveness and stability objectives will result to synergies and trade-offs to both households and firms. (Martin ,David, Mare, Melecky, 2016). It is expected that greater

financial inclusion should result to tangible economic benefits for the users, such as higher GDP growth and lower income inequality and poverty reduction.When a person or group of person's irrespective of geographical location, political affiliation, religion and social strata receive adequate, cost effective and sustainable financial support it will help to encourage stable growth by smoothening savings and investment. The result will culminate into efficient and equitable income redistribution from lenders to borrowers. By this development, individuals are able to create wealth for themselves, income level rises and of course poverty is reduced while at the same time the economy is protected from adverse economic shocks, Adigun & Kama (2013). This argument can be encapsulated in a number of development finance theories which includes Schumpeter (1960), McKinnon (1973), and Shaw (1973) where the authors demonstrated that the services provided by financial institution are impetus for technological innovations, which consequently trigger economic prosperity and stability. CGAP (2012), Christine (2016) and Robinson (2010) posit that extending financial access to the poor will help them create wealth and manage their financial lives as well as contribute to economic growth and prosperity. In the same vein. The Department for International Development (2016) report recommended that for any policy to be successful it must be targeted at rapid and sustainable growth that translates to financial wellness and security of the citizens. Hannig, Alfred; Jansen, Stefan (2010) posit that although financial inclusion exposes the lender to institutional risk, such risk are managed at the institutional level and do not result to systemic risk. The reason is that low income savers and borrowers are resistant to external shocks emanating from financial crisis because they keep their deposits secured and service their loans. One unique thing amongst these theories and studies is their emphasis on the need to provide the poor and those in the informal sector with the required credit to create wealth and reduce poverty and inequality gap as well as achieve stability in the financial market and economy at large.

While lending to the poor seems plausible as supported by various theories and studies, it is important to exercise caution as not every person has the capacity to incur and service debts (Anh, Van, Vo & McAleer, 2019; Garcia, 2016 and Rajan, 2010), . This is because empirical evidence, as well as experience has established an inverse relationship between loan defaults and stability (Priyadarshee & Ghalib, 2011). Lending without proper credit appraisal will bring about high non-performing loans which will make the liquidity and stability position of such lending institution to become weak culminating to insolvency and financial instability. Anh, Van, Vo and McAleer (2019) posit that financial services extended to low income individuals in an economy has potentials to trigger instability into a financial market. Garcia (2016) raised concerns that financial inclusion and financial instability may have strong correlation by either financial inclusion stimulating growth or reinforcing stability or both contradicting each other and vice versa. Ahmad (2018) is of the view that greater financial inclusion is associated with financial instability. These authors are unanimous on the opinion that uncontrolled expansion of credit in support of financial inclusive growth and its instruments might fundamentally lead to higher risks in the financial system. When trust and confidence can no longer be reposed in the formal financial system due to instability people tend to patronize more of the informal savings groups and shadow banking institutions which lend to them at very high interest. Reduction in economic activities as a result of cash crunch and formal financial exclusion will lead to financial instability and systemic risk, which was a major trigger for the global financial meltdown of 2007 -2009 and the 2010 Andhra Pradesh micro finance crisis in India. This in essence, tends to contradict (undo) rather than complement the very objective of financial inclusion and prosperity. Most studies examined the linear relationship between financial inclusion and financial instability and not much have been said about the mutual dependency between financial inclusion and stability especially in SSA region. The main thrust of this study is to ascertain whether increase financial access and usage to the active poor and low income dwellers in rural communities in SSA will strengthen financial stability or otherwise. The question to be addressed by this study is - what interactive relationship exist between financial inclusion and financial stability in SSA countries? The major objective is to ascertain to what extent does financial inclusion drive financial stability or vice versa. The hypothesis written in its null form is that financial inclusion does not have mutual relationship with financial stability.

Conceptual and Theoretical Literature

The Mutual Dependency theory adapted for this study posit that a symbiotic relationship exist between financial inclusion and financial stability, thus, implying a feed-back effect between both concepts. The idea of the mutual dependency hypothesis is that when affordable financial products and services that meets the users' needs are made available in a sustainable and most convenient manner. The customers tend to use more of such products and this will engender the development of a viable and resilient financial market culminating to acceleration of real sector growth and stability of the financial system (Robinson, 2001). When such products are delivered on digital ecosystem it will be able to break most barriers hindering formal financial inclusion of the low income and active poor individuals and micro enterprises in rural communities. When trust is established in the financial system and users of the financial products are able to fulfill their financial needs and attain food and financial security, all economic agents, financial instruments and institutions will be able to perform their expected role in the intermediation process therefore culminating to financial stability. A stable financial system will further reinforce an inclusive financial system and vice versa.

Empirical Literature

The Financial Access Survey (2009) study provides no evidence that financial stability is threatened by increasing basic access to financial transactions, such as receiving wages and subsidies or making payments. But financial stability risks can arise when it comes to broadening access to credit to a wide section of the population. By enabling women and low income users open accounts, obtain credit and enjoy good financial infrastructures economic growth will become more inclusive. When financial systems become more inclusive, they help broaden financial markets and make monetary policy more effective. By bringing more sections of the population into the formal sector, the effects of fiscal policy—both tax and expenditures—are broadened (Christine, 2016). Consequently, while the goal of financial inclusiveness seems laudable and enjoys the support of most economies of the world, just making funds available to a wide spectrum of active poor in rural communities without proper credit analysis, control and monitoring is usually counter-productive and results to poor lending which was a major trigger for the 2007-2010 global financial meltdown (World Bank, 2015). Rajan (2010) posits that uncontrolled expansion in access to financial services could lead to instability. The study argued that policies can contribute to financial instability and social discontent if supervision and regulation do not keep pace. Financial instability, in turn, can lower growth and worsen inequality (as evidenced, for example, in the United States following the global financial crisis), and thus undo the very objectives that were sought through inclusion.

The Consultative Group to Assist the Poor (CGAP) posit that savings strengthen stability especially when done by individuals and households who are large in numbers. This is because small savers have the capacity to contribute to stability at the financial system level notwithstanding that the stability effect of savings at both levels could be discovered in greater details, especially at the level of the financial system (CGAP, 2012). Financial access as well as easy and affordable sources of finance are necessary preconditions for accelerated economic growth and reduction in income inequality and poverty alleviation (Serrao et al, 2012). Rajan (2010), cautions that granting financial access without control could result to devastating effect on financial stability as evident with the U.S. financial distress of 2007 and India's 2010 microfinance crisis. The study argues that financial development can give rise to financial instability and communal disaffection if not properly managed. Financial instability, in turn, can lower growth and worsen inequality (as evidenced by the global financial crisis that emanated from the US), and thus undo the very objectives that were sought through financial inclusion. Likewise, in Brazil, experience have shown that rapid expansion of credit over four years created potentials for bad debt especially among the active poor in rural communities. Aggressive promotion of low cost loans through "Crediamigo" has increased access to credit and correspondingly, the levels of debt (IMF, 2013).

Another study investigated the 2008/2009 Banking Crisis in Nigeria: The Hidden Triger of the Financial Crash, the study found that sudden divestment of FPI in 2009 from the Nigerian economy was the trigger of the financial crash. Improvement in financial inclusion creates opportunities to promote financial stability, Hannig, Alfred; Jansen, Stefan (2010). Also in Kenya evidence shows that those who adopted M-Pesa platform for their financial transactions lived a better life than those who did not adopt (Beck, Cull, Fuch, 2010). 2018 African Economic Outlook report of the ADB shows that 152 million Nigerians live below $2 per day ((Africa Economic Outlook Report, 2018). Distress is when a financial intermediary cannot meet its day-to-day cash withdrawal obligations (illiquid) or when the net worth of the financial institution becomes negative (insolvent). When such illiquidity and insolvency become rampant then the whole financial system is said to be distressed (Adegbite, 2015). According to Adetiloye et.al, CBN should sustain the cashless policy to reduce available cash in the financial system and also improve the education of staff in order to reduce fraud in the banking industry (Adetiloye, Olokoyo and Taiwo, 2016). Also, during crisis, bank run and frequent withdrawals were inherent due to anxiety by depositors, but concurrent withdrawals by depositors could be reduced if depositors are more diversified or accounts held by more individuals than few depositors (Han, Rui; Melecky, Martin, 2013). In a recent report, the Deputy Governor (Financial System Stability) of CBN, stated that 80% (percent) of economic activities in Nigeria is driven by the banking system which underlines the need to make the banking system resilient (NDIC, 2018). In a related development, another study on "Credit Risk Management: Implications on Bank Performance and Lending Growth found that sound credit management strategies can boost investors and savers confidence in the bank and lead to a growth in funds for loans and advances available for lending by banks Taiwo, Ucheaga, Achugamonu, Adetiloye and Okoye (2017). Achugamonu, Adetiloye, Adegbite, Babajide and Akintola (2020) investigated how exclusion of bankable adults impede on financial inclusive drive. The study found that financial exlusion represented by unemployment is not a major factor impeding financial inclusion growth in 27 SSA countries sampled.

Methodology

The study population comprises of the fifty (50) countries located within the sub-Saharan African region. However using a purposive sampling technique, only twenty seven (27) countries were selected for the period 2007 to 2017 from the data sourced from the World Bank database. The sample size therefore accounts for fifty four (54) percent of the total population. This study adopted Granger Error Correction Method (ECM) specification for a short panel data structure. To deal with the problem of persistency, heterogeneity and endogeneity associated with short panel data the study employed differenced Generalize Methods of Moments (GMM) of Arellanon and Bond (1991) for the model specification.

Sample Identification Number

The identification number of the countries sampled are as follows: Angola is 1, Burundi is 2, Botswana 3, Central African Republic 4, Cameroon 5, Congo Democratic Republic 6, Congo, Republic 7, Equatorial Guinea 8, Ghana 9, Guinea 10, Gambia 11, Kenya 12, Liberia 13, Lesotho 14, Madagascar 15, Mozambique 16, Mauritania 17, Mauritius 18, Malawi 19, Namibia 20, Nigeria 21, Rwanda 22, South Africa 23, Seychelles 24, Tanzania 25, Uganda 26 and Zambia which is 27. The choice of this identification number is based on the position of a country in the alphabetical order. Therefore, it does not have any statistical importance/value for explanation of the result except for identification purpose alone.

Definition of variables

Financial inclusion is represented by two strands: (i) inclusion by usage, which is proxy by deposit in commercial banks per 1000 adults (dcpa) and (ii) inclusion by quality, proxy by ratio of depositors to borrowers (rdtb). While financial stability is represented by ratio of bank liquid reserves to bank assets (brba). The justification for using the variables mentioned is based on the recommendation of the World

Bank of the choice of these variables as ideal for measuring financial inclusion and digital finance. Also see Chibba (2009) and Cihak, Mare and Melecky, (2016).

Model Specification

According to Chibba (2009) and Cihak et al (2016), ECM-ARDL Granger framework is adopted to initiate a dynamic short run and long run specification for the model. Thus, financial inclusion is defined as the independent variable {represented by deposits in the commercial bank per 1000 adults (dcpa), and ratio of depositors to borrowers (rdtb)} and financial stability is defined as the dependent variable represented by ratio of bank liquid reserves to bank assets (brba). To establish a mutual relationship, the model will be reversed to have financial inclusion as the dependent variable whereas financial stability becomes the independent variable.

To understand the features of this model, the variables are stated in its general form as:

$$\ln y_{it} = \lambda \ln y_{i,t-1} + \lambda_2 \ln y_{i,t-2} + \phi_0 \ln x_{it} + \phi_1 \ln x_{i,t-1} + \phi_2 \ln x_{i,t-2} + \psi_t + v_{it};$$
$$i = 1,\ldots,N; t = 1,\ldots,T \quad \ldots. \ 1$$
$$v_{it} = u_i + w_{it} \quad \ldots.. \ 2$$

Where: y_{it} is the response variable, x_{it} is the covariate variable, ψ_t is the time fixed effects, v_{it} is the composite error, u_i specific error, and w_{it} is the common error. The specific error is time invariant but the common error varies across time and units.

The specific or derived form of the model is stated as below:

$$\ln brba_{it} = a_0 + a_1 \ln brba_{i,t-1} + a_2 \ln brba_{i,t-2} + a_3 \ln dcpa_{it} + a_4 \ln dcpa_{i,t-1} + a_5 \ln dcpa_{i,t-2} + \psi_{i1} + v_{it1}$$
……3

$$\ln brba_{it} = b_0 + b_1 \ln brba_{i,t-1} + b_2 \ln brba_{i,t-2} + b_3 \ln rdtb_{it} + b_4 \ln rdtb_{i,t-1} + b_5 \ln rdtb_{i,t-2} + \psi_{t2} + v_{it2}$$
……4

The reversal of the model is as stated below:

$$\ln dcpa_{it} = i_0 + i_1 \ln dcpa_{i,t-1} + i_2 \ln dcpa_{i,t-2} + i_3 \ln brba_{it} + i_4 \ln brba_{i,t-1} + i_5 \ln brba_{i,t-2} + \psi_{t3} + v3$$
……...5

$$\ln rdtb_{it} = g_0 + g_1 \ln rdtb_{i,t-1} + g_2 \ln rdtb_{i,t-2} + g_3 \ln brba_{it} + g_4 \ln brba_{i,t-1} + g_5 \ln brba_{i,t-2} + \psi_{t4} + v_{it4}$$
.....6

Where: $\ln dcpa, \ln rtdb, \ln brba$ are natural log of deposits in commercial banks per 100 adults, ratio of depositors to borrowers and financial stability respectively.

Results

Inferential Statistic and Post Estimation Results

In this section, the parameters of the models stated in section three are estimated using one step Diff-GMM estimation technique. This technique provides robust test for the hypothesis stated for this study. The hypothesis focus mainly on the symbiotic relationship between stability and inclusion. Before reporting the results on the tests of these hypotheses, the study displays graphical reports on sample identification

number, average individual country financial inclusion usage and average group usage for the purpose of decomposing the countries into high usage (large saving countries) and low usage (small saving countries) to enhance the uniqueness of the results. The countries are also decomposed into low-financial stable, moderate-financial stable and high-financial stable countries (see the sample identification number in section three).

Figure 1: Individual Country's Average Financial Service Usage

A sight view of figure 1 above reveal that Burundi, Central African Republic, Cameroon, Congo Democratic Republic, Congo, Republic, Equatorial Guinea, Guinea and Madagascar have very low usage of financial service. This is followed by Angola, Botswana, Ghana, Kenya, Lesotho, Nigeria and Rwanda that have moderate usage of financial services. Nevertheless, countries like Mauritius, Malawi, Namibia, South Africa and Seychelles are large saving countries because they display high usage of financial services.

Figure 2: Decomposing Countries into High Usage and Low Usage of Financial Services

The line marked by blue color indicates the movement of individual average usage, while the group average usage is marked by orange color. The group average usage is constant (value=482.64 approximately) and any country that has average return above group average return is considered as large saving country or high usage of financial service; such countries are Botswana, Kenya, Mauritius, Malawi, Namibia, Nigeria, South Africa and Seychelles. While other countries whose individual average return falls below the group

average return are called low saving countries. Thus, the test of the short run and long run dynamics of financial inclusion is conducted for the low saving, high saving and the overall countries in the sample for the study. While the tests of the remaining hypothesis is conducted for low-financial stable, moderate-financial stable and high-financial stable countries.

Causality between Financial Stability and Financial Inclusion

This is conducted to test whether causation (in other word influence) run from financial stability to inclusion or there is symbiotic influences. This test is separately conducted for low, moderate and high financial stable countries, and the results are reported in table 2 below.

Table 1: Causation between Financial Stability and Inclusion by Usage from 2007 to 2017

1) The figures in parentheses are the p-values, *, ** and *** indicate significant at alpha value of 1%, 5% and 10% respectively.
2) Estimation by one step Diff-GMM (Arellano, and Bond)
4) The Sargan test is based on the assumption that the instruments are not correlated with the residuals.
5) AR1 and AR2 tests are based on the hypothesis that the errors are not serially correlated
6) The instruments used are the lags of the regressors.

7) Yearly dummies are excluded.

Table.1 above displays the results of the test conducted on the symbiotic relationship between financial stability and financial inclusion by usage for low-financial, moderate-financial and high-financial stable countries:

For the low-financial stable countries, the ECM coefficients is -0.36 when causation runs from stability to usage and -0.33 when causation runs from usage to stability, and the coefficients are both significant at 1 percent. This suggests that there is long run bidirectional influences between stability and usage. That is in the long run usage Granger causes stability, and equally stability influences usage. Likewise, financial stability response to temporal shocks in financial usage at the speed of 36 percent, usage response to temporal changes in financial stability at the rate of 33 percent. This means that short run disequilibrium in financial stability adjusts faster to equilibrium than short run disequilibrium in financial inclusion by usage. The coefficient of short run effects of usage on stability is -0.079 with p value of 0.83 and the coefficient of short run effects of stability on usage is 1.30 with p value of 0.01. This means that in the short run, there is no significant influence from usage to stability but there is significant influence from stability to usage. In other words, financial stability leads financial inclusion by usage in the short run. The coefficients of long run elasticity are 0.16 and 1.73 respectively for equations where stability is dependent variable and usage is dependent variable. The associated p values are 5 percent and 3 percent respectively. This implies that while, inclusion by usage responses to permanent shocks/changes in financial stability, financial stability also adjusts significantly to permanent shocks in usage. Thus, in the long run the changes in financial stability can be predicted from the changes in financial inclusion by usage.

For the moderate-financial stable countries, the ECM for the equation where stability is dependent variable is -0.92 and the ECM coefficient for the equation where usage is dependent variable is -0.36, and they are both significant at 1 percent. Therefore, there is evidence that long run causation run from financial stability to financial inclusion by usage, and vice versa. Additionally, short run disequilibrium is corrected within a year at the rate of 92 percent and 36 percent respectively for equation where stability is dependent variable and equation where usage is dependent variable. Meaning that stability adjusts faster to equilibrium than usage. Alternatively, financial stability responds to temporal shocks in financial usage, and in the same vein, financial usage responds to temporal shocks in financial stability. The coefficient of the short run effects for the equation where stability is dependent variable is 0.36 and the equation where usage is dependent variable is 0.33. The respective p values are 0.82 and 0.10. This is an indication that while financial usage has significant short run effect on financial stability, financial stability does not maintain significant effect on usage in the short run. However, the direction of the relationship is positive in both cases. The long run elasticity coefficient is significant in each of the equations but negative in the equation where stability is dependent variable. This implies that financial stability declines with the persistent shocks in financial inclusion. While financial inclusion rises with prolonged shocks in financial stability.

The results of the countries with highly stable financial system show that the ECM coefficient for equation where stability is dependent variable is -0.32 and equation where usage is dependent variable is -0.20. The two coefficients are significant at 1 percent level of significance. This is in tandem with the earlier results that confirm long run relationship between financial inclusion and financial stability in both countries with low and moderate financial stable system. The only difference is that in high-financial stable countries, financial stability responds slower to temporal shocks or changes in financial inclusion by usage than it responds to them in low and moderate financial stable countries. Therefore, policy needed to induce stability in high-financial stable country are different from those in low and moderate-financial stable countries. The coefficients of short run effects is -0.12 for equation where stability is dependent variable and 0.03 for equation where usage is dependent variable. Only the coefficient of usage equation that is significant at 5 percent. This suggests that there is significant short run dynamic (positive) effects of financial usage on financial stability. However, such influence does not run from stability to financial service usage. The coefficient of the long run elasticity is not significant even at 10 percent. This is an

indication that financial stability does not response significant to prolong shocks in financial inclusion, and vice versa. The AR (2) and Sargan tests reveal that all the equations are adequately specified, while AR (1) and Sargan in difference tests show evidence of autocorrelation and weak instruments. Thus, it is plausible to uphold the results displayed by these equations, and to discourse their link with existing literature on the subject matter.

1) The figures in parentheses are the p-values, *, ** and *** indicate significant at alpha value of 1%, 5% and 10% respectively.
2) Estimation by one step Diff-GMM (Arellano, and Bond)

4) The Sargan test is based on the assumption that the instruments are not correlated with the residuals.
5) AR1 and AR2 tests are based on the hypothesis that the errors are not serially correlated
6) The instruments used are the lags of the regressors.
7) Yearly dummies are excluded.

Table 2 displays the results of the test conducted on the interdependence between financial stability and financial inclusion by quality. The test is carried out for three sets of countries vis: countries with highly stable financial system, moderately stable financial system and poorly stable financial system.

For the low stable financial system, the ECM coefficients for the equation where stability is dependent variable is -0.46 and for the equation where financial inclusion by usage is dependent variable is -0.72. The p values are respectively 0 percent and 72 percent. This simply implies that long run dynamic influence does not run from financial stability to financial inclusion by quality, but in contrast long run influence trickles down from financial inclusion by quality to financial stability. Explicitly, by implication it means that in the long run, financial inclusion by quality leads to financial stability, and it responses fast to temporal breaks in financial stability. Therefore, there is one way/unidirectional causation between financial inclusion by quality and financial stability in countries with poorly stable financial system. The coefficients of the short run effects are -0.03 for financial stability equation and -1.41 for financial inclusion by quality equation. Both coefficient are not statistically significant. Meaning that in the short run dynamics, financial inclusion by quality does not drive financial stability positively (and vice versa), and there is no significant influence in-between the two variables in the short run. Furthermore, the long run elasticity coefficients are positive for the two equations but not significant. Thus, we have confirmed that financial stability does not respond to permanent shocks in financial inclusion by quality.

For the countries with moderately stable financial system, the coefficients of the ECM term are -0.80 and -0.16 respectively for stability equation and financial inclusion by quality equation. However, while the ECM coefficient is significant at 1 percent for stability equation, it is significant at 10 percent for the financial inclusion equation. This suggests that the two variables maintain a long run relationship with a bidirectional causation running from both sides. Therefore, financial stability responds to temporal shocks in financial inclusion by quality, and the same time financial inclusion by quality responds to temporal breaks in financial stability. The short run effect coefficients are -0.45 and 0.013 respectively for the two equations. But while the coefficient is significant at 5 percent for stability equation it is not significant even at 10 percent for financial inclusion by quality equation. This confirms the argument that short run dynamic influence only run from financial inclusion to stability (however, influence could run from stability to inclusion in the long-run). Confirming this from the results, the ECM coefficients are significant for the two equations, meaning that there is evidence of feedback effects. The long run elasticity coefficients are positive and significant for both equations. Hence, for the countries with moderately stable financial system financial stability respond to permanent shocks in financial inclusion by quality.
The equations for the countries with highly stable financial system have ECM coefficients -0.36 and -0.30, and they are both significant at 1 percent. This implies that there is long run relationship between financial stability and financial inclusion by quality. Alternatively, in the long run financial stability granger causes financial inclusion by quality (and vice versa). The coefficients of the short run effects are 0.15 and 0.17 for the two equations. Meaning that there is no significant short run influence from financial inclusion by quality to financial stability. However, there is existence of positive interaction between the variables in the short run. The coefficients of the long run elasticity appear to be negative but only significant at 10 percent alpha value for the financial stability equation. It means that only financial inclusion by quality that responds to permanent changes in financial stability in countries with highly stable financial system.

Summary, Conclusion and Recommendation

Summary of Findings

The hypotheses tested is the assertion that there is existence of symbiotic causation/influence between financial stability and financial inclusion by either usage or quality. The test was conducted for three samples of SSA (countries with low stable, moderately stable and highly stable financial systems). The results show that all the ECM coefficients with respect to financial stability-financial inclusion (by usage) relationship for the three sets of countries are negative and significant. This means that there is a bidirectional long run influence between financial stability and financial inclusion by usage for the three sets of countries. This result agrees with a priori expectation that financial inclusion drives stability and in turn financial stability reinforces to promote further inclusion. By implication, as more persons are captured into formal financial net by way of providing financial services that meets their need at affordable cost. Such persons will be able to invest in productive ventures that will create wealth, generate employment and reduce poverty. When persons are gainfully employed, they can achieve food security and weather financial and economic shocks as they arise. They would be able to save money for precautionary, transaction and speculative purposes. Banks and other financial institutions mobilise funds from the surplus to the deficit units for further investment by all economic agents thereby promoting stability and economic growth. This argument can be encapsulated in a number of development finance theories which includes Schumpeter (1911), where the author demonstrated that the services provided by financial institution are impetus for technological innovations, which consequently trigger economic prosperity and stability. Others are supply leading and demand following finance theories, social development, financial intermediation and mutual dependency theories amongst others. CGAP (2012), Christine (2016), Robinson (2010) and Serrao (2012) posit that extending financial access to the poor will help them create wealth and manage their financial lives as well as contribute to economic growth and stability. In the same vein Hanning et. al (2010) posit that although financial inclusion exposes the lender to institutional risk, such risk are managed at the institutional level and do not result to systemic risk. The reason is that low income savers and borrowers are resistant to external shocks emanating from financial crisis because they keep their deposits secured and service their loans as they fall due.

The second major finding is that there is existence of bidirectional long run influence between financial inclusion by quality and financial stability for both moderate and high-financial stable countries. Evidence of unidirectional causation is found for countries with poorly stable financial system. Furthermore, the finding reveals that financial inclusion by quality adjusts faster to financial stability for countries with highly stable financial system, than for countries with either poorly stable or moderately stable financial system. Equally surprising, is that financial inclusion by quality has positive short run effects on financial stability for both countries with moderately and highly stable financial systems. While the effects appear to be negative for countries with poorly stable financial system. This demands that the countries must run different short run domestic policy for intermediation particularly varying the ratio of depositors to borrowers in order to improve financial stability. Long run elasticity is negative for countries with highly stable financial system, but however, positive for countries with poorly and moderately stable financial structures. By implication, for highly stable financial system countries, financial stability declines with prolonged changes in financial inclusion by quality; conversely, for poorly and moderately stable financial system countries, financial stability increases with prolonged changes in financial inclusion by quality. Therefore, long-term policy adjustment must vary in these countries.

Conclusion

In the first place, the study establishes evidence of long run bidirectional influence between financial stability and financial inclusion for SSA countries. In view of this, the study concludes that financial inclusion induces the growth rate of financial stability, simultaneously; stability causes inclusion to change

significantly in the long run. In addition, the study concludes that financial stability adjusts more quickly to temporal shocks in financial inclusion by usage for countries with moderately stable financial system, than countries with either poorly or highly stable financial system. On the contrary, financial stability reacts more quickly to temporal shocks in financial inclusion by quality for countries with highly stable financial system than poorly and moderately stable financial systems. Based on one of the major findings of this study, the researcher concludes that either in the short run or long run dynamics, financial inclusion by quality is a positive determinant of financial stability for countries with poorly and moderately stable financial systems, which is in tandem with the general claims in the literature. However, for the highly stable financial system, financial inclusion by quality is only a positive determinant in the short run go-ahead.

Recommendations

Government, through the central banks should mandate domestic commercial banks to increase deposit rate or shrink the gap between deposit rate and lending rate. That is government should introduce a potentially optimum rate for depositor funds by the policy of guided deregulation. This will unequivocally attract much funds from the public and the number of people who use financial services will increase over time. Thus, consequently the financial system will become more stable. This is a sufficient reason for commercial banks to introduce a self-sustaining policy that can mobilize deposit with attractive interest rate to further reduce the idle funds outside the banking system. In addition to encourage investment in rural communities by financial institutions government should provide amenities such as uninterrupted electricity or aid the means of sustaining consistent power supply; probably through subsidies being granted to power holding companies. This will lead to a drastic reduction in the cost of intermediation, and consequently enhance the quality of financial services.

Abstract

Modern realities of economic activity in the conditions of digital transformation of economy demand from industrial enterprises of any scale to provide search of intensive ways to increase productivity and reduce production costs. In the practice of developed countries, there are many methods to streamline economic processes, which can include lean production tools. Russian enterprises practically do not use lean technologies in their activity, which does not allow obtaining additional financial benefits from more competent use of available material and human resources. This article is devoted to the development of instrumental approaches to develop a method that will calculate the economic efficiency of the investment project to implement lean production on specific structural units of the industrial enterprise. For quantitative and qualitative evaluation of the efficiency of the investment project it is proposed to use an algorithm based on mathematical calculation of indicators. Practical application of the proposed instrumental approach will allow to substantiate the efficiency of the investment project on the introduction of lean production tools at certain departments of the industrial enterprise and will give a reasonable conclusion about its introduction at other structural units. It is offered to direct the further workings out on adaptation of the developed approach for estimation of advantages from introduction of lean production in various branches of national economy that will allow to receive more complete picture concerning efficiency of lean technologies at the various industrial enterprises, and also will give the chance to develop recommendations, taking into account branch specificity.

Keywords: Lean Manufacturing, Lean Management, Financial Benefits, Finance, Instrumental Approach, Process Optimization, Investment, Loss Reduction, Investment Project, Cost-Effectiveness, Effective Management.

Introduction

Unstable economic conditions make it necessary for business entities to find new ways of organizing effective management. In such conditions, intensive methods that allow a more rational use of enterprise resources, primarily internal ones, come to the fore. At the macro level, it is industrial economic entities that contribute to the strategic competitiveness of the national economy, which increases the importance of finding ways to maximize the efficiency of their functioning at the expense of available internal reserves and rational production (Balashova, Gromova, 2015; Zharikov et al, 2018).

Thoughtful introduction of lean production tools will allow to get a positive effect caused by saving of material resources, reduction of working hours of technological equipment and employees at the workplace. The key idea of lean production is the development of social orientation of business and subordination of economic activities to the interests of consumers, taking into account the capabilities of human resources in the company itself. Employees perform their functions in order to meet the needs of consumers. There is a minimization of secondary tasks that distract employees from their functions and lead to increased workload (Balashova, Gromova, 2017; Vetrenko et al, 2017; Ostrikova et al, 2019).

The development of economic theory has led to the fact that the impact of tangible assets on the capitalization of the enterprise has decreased and has given way to intangible or intangible elements, which determine the intellectual capital. The main factor that affects modern production is people, their knowledge, talents, skills and ability to make creative decisions. It is these factors that determine the commercial success of a business entity in the process of conducting its activities, so that workers, employees, and management personnel who provide production must have the appropriate qualifications, competence, and motivation (Vinogradova et al, 2017; Tkachenko et al, 2019; Zaytsev et al, 2019).

Graphical reflection of the essence of lean production in corporate social responsibility is shown in Figure 1 (Markov, Markova, 2018).

Fig. 1: Lean manufacturing in the CSR system

In the "household" perception, lean production is viewed only as cost saving and worker orientation, while the flow of values to consumers and the company itself is ignored. The object of management in this case is the formation and maintenance of the flow of value creation at an optimal level. It is necessary to create a situation where all participants in the flow become profitable to make efforts to achieve their goals, while other alternative actions were not economically profitable (Pavlova et al, 2018; Asaturova, Khvatova, 2019).

It is worth considering that there is no investment without risk. It is necessary to realize impossibility of achievement of 100 % profit, so the organization in the course of conducting the economic activity aspires to minimization of risks, rejecting inefficient investment projects. The factors influencing profitableness of the investment project on introduction of tools of lean production, it is very difficult to calculate. These may be external macroeconomic reasons in the form of economic crises, growth of inflationary processes or currency fluctuations, as well as internal factors related to internal problems (Avduevskaia et al, 2018; Fayzullin, Dmitriev, 2020).

Thus, introduction of lean production should be grounded, that defines high urgency of research on construction of a technique of an estimation of economic efficiency from realization of the investment project on introduction of tools of lean production.

Scientific novelty of research is under construction on reception of possibility of a substantiation of efficiency of lean technologies on separate divisions of the enterprise both in quantitative, and in qualitative expression. Also the author's approach assumes search of a range of possible financial benefits, considering impossibility of an exact estimation of efficiency. The given substantiation will allow to judge about the further introduction of the given tools on other structural divisions.

The aim of the study is to develop an instrumental approach that allows to assess the effectiveness of the investment project for the implementation of lean production tools in individual production units

of the industrial enterprise.

This requires the following tasks to be completed:

- To consider the essence of lean production from the point of view of evaluation of future efficiency, and also to compare the traditional approach of doing business with the concept of lean production;
- Build a model that can determine the level of lean production implementation and identify the difference between basic and absolute efficiency from project implementation;
- Determine the method of calculation that will help to identify the range of profit obtained in quantitative and relative terms;
- Develop an algorithm of the instrumental approach, which will include step-by-step actions.

Theoretical and practical importance of the work consists in substantiation of the investment project realization on introduction of tools of lean production to use on separate structural divisions of the industrial enterprise by performance of algorithm developed by the author that has been practically tested on an example of the economic entity. At the same time, the importance of the work is emphasized by the possibility of defining both minimum (absolute) efficiency from the investment project and maximum (basic) efficiency, taking into account the difficulties of precise evaluation of financial benefits from the introduction of lean technologies in the production process.

Research Methodology

For a substantiation of development of a technique of an estimation of efficiency from introduction of lean production it is necessary to consider its essence from the point of view of an estimation of future efficiency. It is offered to carry out the analysis of available researches on resource management and use of lean technologies in production processes that will allow to make comparison of the traditional approach of business dealing with the concept of lean production.

The essence of modern resource management is explored in detail in the works of T. Luyster, D. Tapping (2006), D. Hobbs (2007), A. Byrne, J.P. Womack (2013), according to which the use of resource-saving technologies consists in achieving the efficiency of enterprises' activities through a more rational use of available resources, minimizing production costs, increasing profits, maximizing the capitalization of industrial enterprise. In these works there is a sufficient amount of theoretical material, on the basis of which it is possible to build an author's method of assessing the efficiency of lean production at an industrial enterprise.

Lean Production (Lean Production or Lean Manufacturing) is one of the main models of resource management, which was developed by Toyota and otherwise called Toyota Production System (Ohno, 1988). The concept of lean production is discussed in detail in J. J.'s works. Liker (2004) and M. Rother (2009), according to which the company gains a competitive advantage by implementing measures to continuously reduce costs, improve the quality of products and processes, optimize the speed of material flow by following the logic of Just In Time, improve operational efficiency through existing internal reserves and available resources through continuous improvement of all processes, and so on.

In the course of the analysis of the economic literature in the field of lean production, the work of J. J. was highlighted. Liker (2004), who reviewed the practical results of implementing Toyota's production system at various stages of business activities. It should be noted that from the point of view of this concept, lean technologies means the implementation of certain measures to streamline the process, including the creation of output values for the end user of the product, building a consistent stream of creating such values, ensuring continuity of material flow, "pulling" from the customer down the process, as well as the desire for further improvement (Muris, Moacir, 2010).

Based on scientific articles by A.S. Ptuskin, V.Y. Antsev, N.A. Vitchuk (2014), A.B. Dutta, S. Banerjee (2014) and E. Vitchuk (2014). Frackleton, R. Girbig, D. R. Girbig, D. Jacquemont, A.J.

Singh (2014), Zaitsev (2019) it is possible to draw a conclusion that construction of model of calculation it is necessary to understand essence of lean production which organization consists that the finished production should pass stages of addition of cost with the minimum quantity of expenses or with absence of any kind of losses. Lean production is a philosophy of management and culture of production, when every element and subject of an intrafirm structure seeks continuous improvement. Thus, introducing tools on one structural division, it is necessary to direct investments and on neighbouring divisions on which lean production will not be realized that is connected with interaction of divisions.

Having analyzed the works of M. Imai (1986), N. Vamsi, K. Jasti, R. Kodali (2015), M. Butler, M. Szwejczewski, M. Sweeney (2018), V.V. Ling, A.V. Yumashev (2018) proposed a comparison of traditional business and the concept of lean production.

We can say that the main characteristics of traditional business are: meeting targets and achieving maximum indicators of final results by any available means, weak production flexibility and high dependence on supplies in large volumes, focus on mass consumers and mass production of products in large volumes, the company's management is aimed at solving problems and finding those responsible for their appearance, strong control over the activities of production and management workers, a high degree of bureaucratization and hierarchy of management, workers and employees are considered as costly resources of the company.

While the production based on the concept of lean production can be characterized as decentralized, aimed not at identifying problems, but at preventing their occurrence, where the implementation of measures to continuously improve all processes takes place. In such a management, the importance of employees and workers is increased, control is reduced, the cost of training and professional development is increased, in case of problems the culprit is not so important, and the possibilities to correct them, production is focused on reducing changes.

Thus, it can be concluded that the use of lean production can have significant positive effects in the process of production activities, while the concept is based on organizational measures and investment is minimal. As a result of implementing lean manufacturing tools, the company has developed a system of organization and management of production operations, which aims to develop relationships with suppliers and consumers, allowing to adjust production in accordance with customer needs and minimize production defects (Kiseleva et al, 2017; Ivanina, Dmitriev, 2019).

Reductions in production, labour and time costs are not final positive effects. In addition to the above, there is a reduction in production space while maintaining the specified capacity (Tolstykh et al, 2017).

The use of lean production tools in practice leads to the reduction of labor costs by at least 40%, production areas and capital investments by at least 55%, more than 80% less time for the development of new products and production orders (Muris, Moacir, 2010; Tolstykh et al, 2017; Pavlova et al, 2018).

The study of lean production was mainly conducted by foreign authors and there are a large number of scientific and applied works on this problem. Nevertheless, there is an insufficient quantity of approaches which can be used for a substantiation of introduction of the lean approach from the financial point of view, considering impossibility to give an exact estimation of the received financial effect that confirms expediency of working out of a theme.

The great importance of lean manufacturing processes affects the innovative development not only of economic entities, but also of territorial associations (Rudskaia, 2017). From the industrial point of view, there is a growth of intellectual rent, which can be calculated by the method proposed by V. Degtereva, A. Zaytsev, N. Dmitriev (2019). The growth of intellectual rents in enterprises leads to innovative economic renewal at all levels.

E.S. Balashova, E.A. Gromova (2017) and J. Asaturova (2019) note in their works that the lack of a unified concept for calculating the economic effect of the introduction of lean production tools is a problem in the context of Russian experience of industrial development. In their work the ways of calculating the economic effect were proposed and the prospects for further development of lean production as an opportunity to increase the competitiveness of the industrial sector of the economy were determined.

In order to develop an instrumental approach to evaluate the implementation of the investment project to introduce lean production, the study used a mathematical method of making calculations. The main theses of this study were published in the paper by N.D. Dmitriev and A.A. Zaytsev (2019).

Research Results

Measures to implement lean production tools are carried out in separate units of the company, so it is necessary to take into account the economic effect of a particular unit. Investment expenses for project realisation are minimal, however there are difficulties at an estimation of its economic efficiency as profit growth can be insignificant that is connected with insufficiency of introduction of actions in concrete division or negative consequences from absence of these actions in other structures (Suetina, Safina, 2018).

Any investment of economic resources in the long term should have the goal of generating income in the future. To conduct a competent assessment of the financial benefits of lean production tools it is necessary to achieve a certain level of implementation, it can be conditionally called the basic value, above which the company definitely receives benefits.

If annual production data are available, it is possible to present these data in monetary terms, and if there is information on the units where lean production is implemented, it is possible to determine the level of its implementation in the company.

To determine the annual average profit for all structural units it is necessary to use formula 1:

$$V = \sum_{i}^{N} Vi + \sum_{i}^{L} Vi \ , \qquad (1)$$

where V is the average annual output in monetary terms for all divisions of the enterprise;

Vi - the average annual volume of produced goods in monetary terms, obtained at a specific structural unit of the enterprise, where i - number of structural unit (subdivision) at the enterprise;
N - number of structural units where lean production tools are used.
L - number of structural units where lean production tools are not used, but investments are required to maintain functioning.

Then the level of implementation of lean production at an industrial enterprise can be calculated by formula 2:

$$Lm = \frac{\sum_{i}^{N} Vi}{V}, \qquad (2)$$

where Lm is the level of lean production implementation;
V - the average annual volume of produced goods in monetary terms for all divisions of the enterprise;

Vi - the average annual volume of produced goods in monetary terms, obtained at a specific structural unit of the enterprise, where i - number of structural unit (subdivision) at the enterprise;
N - number of structural units where lean production tools are used.

In order to find the absolute financial benefits, it is necessary to determine the basic value of the lean manufacturing implementation level, which can be designated by $Lmbas$. If this value exceeds Lm,

there will be an increase in profits, which will be 100% dependent on lean production (in the absence of other related investment projects). This is shown graphically in Figure 2 (Y1-Yj - time period).

Fig. 2: Graphic display of the basic value of the lean production implementation level (*Lmbas*)

That is, the absolute efficiency at *Lmbas* > Lm will be equal to the difference between the profit that should have come in the standard scenario and the profit in fact. The basic value of lean production level in the company can be found using both mathematical methods and expert method, based on the variety of implemented tools.

On the example of Figure 2, for the absolute profit we consider only profit above plan, which was received for a time period starting from Y4, while for the time period Y1 there was no lean production, and profit above plan received for periods Y2 and Y3 can not be attributed with 100% probability to lean production.

So it is possible to speak about existence of 2 possible kinds of profit from the investment project on introduction of tools of lean production: approximate and absolute.

If $P_{(plan)}$ is the profit that the enterprise will get without introducing lean production, and $P_{(fact)}$ is the actual profit that the enterprise will get after introducing lean production, then the approximate profit is equal to their difference (ΔP). Estimated profit is calculated using formula 3.

$$\Delta P = \sum(\mathrm{Yj})\ (P_{(fact)} - P_{(plan)}), \qquad (3)$$

But if we take into account only the profit made after the base value of Lean Production Implementation Level (*Lmbas*), then the absolute profit (ΔRabs) will be equal to the difference between the actual profit made during these years and the planned profit. In this case, the profit made in excess of the plan for the years up to the baseline implementation level is taken as a deviation from the plan and is not taken into account for the calculation of the absolute indicator. Absolute profit is calculated using formula 4.

$$\Delta P_{(abs)} = \sum(\mathrm{Yj} \geq Lmbas)\ (P_{(fact)} - P_{(plan)}), \ (4)$$

Figures 3 and 4 (Y1-Yj - time period) show the graphical change in profits before and after the introduction of lean production, as well as the dynamics and accumulation of absolute and approximate financial benefits.

Fig. 3: Graphic representation of planned and actual profit, as well as absolute and approximate financial benefits received from the investment project

Fig. 4: Graphic representation of planned and actual profit, as well as accumulation of absolute and approximate financial benefits received from the investment project

According to Figure 4, the profit that the company will receive from the investment project is in the range of *X*. Thus, the profit range can be expressed using formula 5:

$$\Delta P \leq X \geq \Delta P_{(abs),} \quad (5)$$

After quantitative calculations, there is a relative economic effect (*E*). It reflects the qualitative result of the investment project to implement lean production in the company for a specific period of time. The amount of investment required for the project (*I*) depends on many factors and is calculated separately, taking into account production needs and specific lean production tools for each structural unit.

However, the amount of investment in the introduction of lean production is insignificant, as notedin the works (Michael, George, 2003), (Markov, Markova, 2018), (Suetina, Safina, 2018).
Calculation of investments by structural units is calculated using formula 6:

$$I = \sum_{t} \left(\sum_{i}^{N} Ii + \sum_{i}^{L} Ii \right) , \qquad (6)$$

where I is the level of investment needed to implement lean production;

Ii - volume of investments in monetary terms necessary for a specific structural unit of an enterprise, where i - number of structural unit (subdivision) at the enterprise;
N - number of structural units where lean production tools are used.
L - number of structural units where lean production tools are not used, but investments are required to maintain functioning;
t is a time period.

The relative economic effect of the estimated profit is calculated using formula 7:

$$E = \Delta P / I, \qquad (7)$$

The relative economic effect of absolute profit is calculated using the formula 8:

$$E_{(abs)} = \Delta P_{(abs)} / I, (8)$$

Thus, the relative efficiency (Y) of the investment project is in the range (formula 9):

$$E \leq Y \geq E_{(abs)}, \qquad (9)$$

The general algorithm of evaluation of the investment project on implementation of lean production tools is shown in Figure 5.

1. Calculation of investment investments for the project, their justification and feasibility.
$$I = \sum_t (\sum_i^N I_i + \sum_i^L I_i)$$

2. Calculation of the planned average annual volume of production by structural divisions in monetary terms.
$$P_{(plan)}$$

3. Calculation of the actual average annual volume of production by structural divisions in monetary terms.
$$P_{(fact)}$$
$$V = \sum_i^N V_i + \sum_i^L V_i$$

4. Determining the level of lean manufacturing implementation for each year
$$Lm = \frac{\sum_i^N V_i}{V}$$

5. Determining the basic level of lean manufacturing implementation in the enterprise
$$Lm_{bas}$$

6. Calculation of approximate profit from the investment project
$$\Delta P = \sum(Y_j)\,(P_{(факт)} - P_{(план)})$$

7. Calculation of the absolute profit from the investment project
$$\Delta P_{(abs)} = \sum(Y_j \geq Lm_{bas})\,(P_{(fact)} - P_{(plan)})$$

8. Determining the range of received profit (X) from the investment project
$$\Delta P \leq X \geq \Delta P_{(abs)}$$

9. Calculation of the relative economic effect approximate profit
$$E = \Delta P / I$$

10. Calculation of the relative economic effect of the absolute profit
$$E_{(abs)} = \Delta P_{(abs)} / I$$

11. Determining the range of relative efficiency (Y) of an investment project
$$E \leq Y \geq E_{(abs)}$$

12. Final conclusions on the effectiveness of the investment project in the structural divisions and the decision to extend it to other divisions

Fig. 5: Evaluation algorithm of the investment project on implementation of lean production tools

Consideration of the proposed algorithm on a practical example is a priority for further development of the problem. At the moment, the authors analyze the company that implemented a project to

introduce lean production in 2015.

The company implements its activity on the territory of the Russian Federation in the industry. The company has 6 structural units, two of which have implemented projects on the introduction of lean production tools as an experiment. The total investment amount was 16.41 million Russian rubles.

The authors analyzed the dynamics of productivity growth in each of the 6 divisions both after the implementation of the investment project and after. As a result, there was a sharp increase in productivity in lean production units.

Based on the author's calculations, it was revealed that from 16.41 million rubles of investment over 4 years, the company received from 43.63 (approximate profit) to 53.12 (absolute profit) million rubles of net profit (excluding discounting), which indicates the effectiveness of the project. Accordingly, the efficiency ranged from 324% (approximate) to 266% (absolute).
After obtaining all the necessary data, it is possible to conduct a more comprehensive study with consideration of each individual step of the author's algorithm, discussed in figure 5.

Conclusions

Lean production can become a rational way to manage the efficiency of the innovation program at an industrial enterprise. Resource management makes it possible to optimize intra-company processes with minimum implementation costs and focus on organizational components (Nikolova et al, 2017).
The result of the proposed algorithm will be the result that testifies to the efficiency of the investment project for the implementation of lean production tools for a specific structural unit. On the basis of the received result it is possible to draw a conclusion about possibility of the further introduction of the given measures on other structural elements.

The instrumental approach will allow quantitatively and qualitatively to estimate economic efficiency from realization of measures on introduction of lean production in the company and to substantiate possibility of realization of such project in practice.

In conclusion of the article it is possible to note that in the Russian practice lean production is practically not used, the main constraint is the imbalance of interests of market participants and non-market mentality of the majority of owners, managers and employees of Russian companies. There are considerable contradictions in the regional innovation activity, which makes it necessary to find and overcome them (Goncharova, Degtereva, 2018).

It is offered to direct the further workings out on adaptation of the offered approach for an estimation of advantages from introduction of lean production in various branches of a national economy.

Abstract

The combat task execution and soldiers' readiness are influenced by many factors. One of them is the proper preparation for the task execution, achieved through military training. Equally important is mental and physical resilience, determining the right attitudes even in the toughest environment. Healthy lifestyles - including proper nutrition - have a major impact on the fitness of troops. One of the indicators for fitness assessment is the Body Mass Index (BMI). It has been analysed in this article. The test group consisted of candidates for professional soldiers. Based on the collected data, the impact of gender and year of studies on cadet BMI level was assessed. ANOVA variance analysis was used for this purpose. The obtained results showed a significant correlation between the selected factors (gender and year of studies) and the examined variable, which indicates a need to take measures to regulate the process of nutrition and enhance physical activity.

Keywords: ANOVA Variance Analysis, Cadet Nutrition, BMI, Combat Readiness

Introduction

Nutrition is one of the key determinants of the proper functioning of the human body. Depending on such variables as social or occupational group, the requirements on food consumption may be completely different.

Armed forces nutrition is a variety of mass nutrition. It has to satisfy all the soldier's needs in this area, resulting from activities in different situations and under different physical strain. A food ration should be appropriate in terms of quantity and quality, complement the loss of energy, provide building blocks for the regeneration of tissues that are being used, and contain the required number of ingredients regulating metabolism. In order to develop properly and live in full health, a person should consume daily food that provides the necessary energy volume and contains about 60 different nutrients (Bertrandt, 2002). A low energy value of the food ration may cause soldier malnutrition. The resulting energy deficit, in the first phase, does not always cause visible symptoms, because then the adaptation mechanisms are activated, consisting, *inter alia*, in the reduction of resting metabolic rate (RMR). Prolonged caloric deficiencies cause malnutrition, which in turn trigger certain disease symptoms. Also, excessive consumption (over-consumption) may adversely affect the soldier's health, causing the formation and development of metabolic diseases

of civilisation (Hill et al., 2011; Purvis et al., 2013). This is mainly due to the excessive energy value of food, containing excessive fat and simple carbohydrates in the ration. On the other hand, prolonged consumption of monotonous meals in terms of quality can cause deficiencies in certain nutrients and resultant health disorders (Pillsbury et al. 2011; Caldwell et. al, 2017; Rahmani et al., 2018).

Contemporary scientific research shows that there is a close correlation between the foodstuffs consumed, the nutrients they contain and human health (Papas, 2019; Celis-Morales et al., 2017). This proves that the proper body development, its physical and mental fitness, as well as its general health condition are related to nutrition, the health quality of food and its nutritional value. Knowledge in this area is becoming increasingly important, especially with regard to metabolic disease prevention. In order to maintain proper life processes, the human being should consume a specific portion and type of food every day, providing an appropriate dose of energy and the necessary amount of nutrients. This is referred to as rational nutrition.

In the nutrition of soldiers, as in the nutrition of any man, the priority is to provide the right energy volume. While planning energy demand in the form of carbohydrates, fat and protein, as well as for microelements and vitamins, one should not forget to take into account physical activity and the tasks performed by the soldiers.

Candidates for professional soldiers are a specific group requiring an individual approach. Taking into account the specific operational conditions of cadets, it can be concluded that proper nutrition of the troops has a great impact on the official task execution and, consequently, on the proper operation of the armed forces. In the nutrition of soldiers, special attention should be paid to many factors characteristic only for this group. It requires, above all, a proper planning process that takes into account the daily lifestyle, the duties performed and the resultant physical and mental (emotional) burden. Food supplied to soldiers should provide them with the appropriate nutritional and energy value to enable them to regenerate their bodies before the performance of further tasks. Special attention should be paid to the type of foodstuffs consumed, but also to the facilities where soldiers are fed. They must meet a number of quality and proper performance requirements. Failure to meet the quality and functional requirements may lead to a deterioration in the quality and safety of the meals consumed inside them and thus create conditions representing health hazard and, in extreme conditions, even life hazard to the consumers. In order to prevent such problems, the Polish Armed Forces pay special attention to maintaining high levels of nutrition. However, implemented solutions are not subject to evaluative surveys. Especially in the group of candidates for professional soldiers, their readiness to accept the proposed standards is assumed. Moreover, cadets, due to their position in the military hierarchy, are not willing to lodge claims and make comments - including those on nutrition. That is why this group has become the subject of survey.

Military nutrition literature provides knowledge primarily on the assessment of the consumed products from the perspective of satisfying energy and nutritional demand (Tomczak et al., 2016; Bertrandt, 2013). Macroelements such as protein, carbohydrates and fats as well as microelements such as iodine (Szymandera-Buszka et al., 2007), magnesium (Bertrandt et al., 2001) or calcium (Bertrandt et al., 2018), vital from the perspective of human body functioning. Various military formations are being studied, but special attention is paid to the feeding of special units (Tomczak et al., 2014) and soldiers carrying out tasks under Polish military contingent (PKW) (Kłos et al., 1997) , Budinský et al., 2012). Moreover, most of the publications concerning nutrition of the Polish soldiers are in Polish, which significantly limits their availability. Articles written in English most often concern armed forces in other countries (Kuhar et al., 2009, Bovill et al., 2003) and, according to their authors, can only serve as a point of reference for comparisons, as national characteristics and culture of a given country strongly influence the formation of eating habits.

This article analyses one of the factors evaluating the correct body weight and at the same time the nutritional pattern in a military unit. The Body Mass Index (BMI) was selected. Thanks to BMI, you can learn about the state of your body fat and determine whether your lifestyle and diet are appropriate. BMI correct value determines high ability and readiness to perform tasks, better condition, reduces the risk of metabolic diseases. In order to assess the impact of selected factors - in this case related to gender and year of studies of the respondents - the ANOVA's Analysis of Variance was applied to their BMIs.

Survey Method

The collected data concerned the evaluation of the level of soldiers' nutrition carried out among candidates for professional soldiers in one of the Polish military schools. The survey was carried out in December 2019. 100 students of the 1st, 2nd, 3rd and 4th year of studies were covered by the survey. The main objective of the survey was to assess the nutrition level at the military canteen. The survey material comprised a questionnaire, involving questions about the level of soldiers' nutrition in terms of quality, quantity and nutrition diversity.

The respondents were of similar age - from 22 to 25 years of age, but they were students of different years of studies. The most numerous group was made up of men, the number of women was far fewer. Detailed results are presented in Table 1.

Table 1: Size of surveyed groups of respondents

Surveyed respondents					
Gender	1 year of studies	2 year of studies	3 year of studies	4 year of studies	Total
Man	21	16	16	22	75
Woman	5	10	7	3	25
Total	26	26	23	25	100

Additional data in the carried out surveys were questions about the weight and height of the respondent. Apart from satisfaction with the nutrition level, an important issue is the evaluation of the body mass index. There are many indicators to keep track of whether your body weight is correct and whether there is a risk of diseases associated with an improper diet. The Body Mass Index (BMI) is a particularly useful indicator in assessing the risk of diseases such as atherosclerosis or ischemic heart disease (IHD) that are caused by overweight. This BMI is reliable for adults, excluding pregnant women, athletes and people with significant amounts of muscle tissue, as well as the elderly.

BMI is calculated by comparing height with body weight, according to the following formula (Tomlinson et al., 2019):

$$BMI = \frac{weight\ [kg]}{height^2\ [m]} \tag{1}$$

The result obtained can be analysed by reference to the following values (Khan, 2018):

- below 16 – starved;
- 16 - 16.99 – skinny;
- 17 - 18.49 – underweight;

- 18.5 - 24.99 - correct weight;
- 25.0 - 29.9 – overweight;
- 30.0 - 34.99 - 1st degree of obesity;
- 35.0 - 39.99 - 2nd degree of obesity;
- above 40.0 - extreme obesity.

Therefore, in this article, using the information collected about the height and weight of students, the BMI index has been calculated and examined whether its level is significantly influenced by gender and the year of studies. Based on the results obtained, BMI weight and growth index values and total body fat content were calculated as the basis for determining the occurrence of overweight and obesity. The obtained BMI values, according to the Ferro-Luzzi classification(Ferro-Luzzi et al., 1992), made it possible to classify the surveyed soldiers into underweight, overweight and obese categories (Table 2.).

Table 2: Data collected for the survey.

	Height [m]	Weight [kg]	BMI	Gender	Overweight	Year of studies
1	1.69	68	23.8	M	NO	3 year
2	1.73	69	23.1	M	NO	1 year
3	1.65	57	20.9	F	NO	2 year
4	1.74	69	22.8	M	NO	3 year
5	1.76	74	23.9	M	NO	3 year
6	1.75	74	24.2	M	NO	4 year
7	1.74	70	23.1	M	NO	1 year
8	1.72	64	21.6	M	NO	2 year

It turned out that in the surveyed group there are cases where the ratio of weight to the square of height is too high and on this basis selected students can be classified as overweight. Detailed results in the male and female categories are presented below in Fig. 1, whereas for individual years of studies in Fig. 2.

Fig. 1: Number of overweight and normal weight people in the male and female population

Fig. 2: Number of overweight and normal weight people by individual years of studies

For further research we used Anova's Analysis of Variance, which is a statistical method that allows to check whether an independent variable (factor) influences the results of a dependent variable (single factor analysis of variance) or assesses the influence of many independent variables (factors) on the value of the dependent variable under consideration (multi-factor analysis of variance). In the presented survey, the analysis of variance will be used to verify the hypothesis about the equality of variance in populations determined by variables grouping the year of studies and gender.

In the analysis of variance, the null hypothesis assumes that the variances in all groups are equal, i.e. the analyzed factor does not affect the dependent variable:

$$H_0: \sigma_1 = \sigma_2 = \cdots = \sigma_j = \cdots = \sigma_k \tag{2}$$

Meanwhile the alternative hypothesis provides that are at least two groups for which the variances are different:

$$H_1: \exists j_1 j_2: \sigma_{j1} \neq \sigma_{j2} \tag{3}$$

The analysis of variance uses the F Snedecor test. It is the quotient of two independently estimated variances. In the numerator there is the so-called intergroup variance, meaning the variation of the results of the dependent variable explained by the influence of the independent variable. In the denominator there is the so-called intra-group variance, i.e. the weighted average of variance in individual groups.

Let σ_1^2 and σ_2^2 be independent average squares from a population with normal distributions. If H_0 is true $\sigma_1^2 = \sigma_2^2$ then the statistics:

$$F = \frac{S_1^2}{S_1^2} \tag{4}$$

where: $S_1^2 > S_2^2$,

has Fisher-Snedecor's F-distribution with the numbers of degrees of freedom $u = n_1 - 1$ and $v = n_2 - 1$, where u is the number of degrees of freedom for variance in the meter, and v the number of degrees of freedom for variance in the denominator. If $F_{obl} > F_{\alpha,u,v}$ then H_0: $\sigma_1^2 = \sigma_2^2$ we reject

at significance levelα; variances in the studied populations differ significantly. If the above condition is not met, we have no grounds to reject the zero hypothesis.

In the analysis of variance, two assumptions are necessary to meet:

- the tested variable should have a normal distribution in all$k$ populations,
- The homogeneity of variances in the compared groups is confirmed - they are similar to each other.

Therefore, the above requirements should be checked before testing.

Test Results

Preliminary Analysis

First, a statistical analysis of the collected observations was performed. The sample consists of a quantitative variable BMI and qualitative gender and years of study variables. The basic descriptive statistics for the BMI variable in individual groups are presented in Table 3.

Table 3: Basic descriptive statistics on the groups under study

Descriptive statistics								
Grouping factor	**No. of observations**	**Mean**	**Median**	**Min.**	**Max.**	**Std. deviation**	**Coefficient of variation**	**Skewness**
Male	75	24.1	24.3	19.5	26.9	1.5	6.1	-0.57
Female	25	22.0	21.6	19.2	27.1	1.9	8.8	1.19
3 year	23	24.0	23.9	20.6	27.1	1.8	7.7	-0.31
1 year	26	23.0	23.0	19.2	26.3	2,1	8.9	-0.3
2 year	26	22.9	22.5	19.8	25.5	1.5	6.6	0.007
4 year	25	24.5	24.7	20.7	26.9	1.4	5.8	-0.65

The number of valid observations is similar for each year of studies, due to the similar number of training groups. Large differences in sizes apply to gender - there are far fewer females than males, due to the specific nature of the university.

The measures of the central trend in each group are very close to each other, which is a satisfactory result because the median, compared to the mean value , is an unbiased value. The analysis of distribution variability shows that the results are not high (the highest value of the coefficient of variation is for Year 1 students and is V=8.9%). Of all the groups, men, 1, 3 and 4 years of studies are characterized by left-handed asymmetry (negative coefficient of skewness), which means that larger part of observations are below the mean value. In the other distributions the opposite is true - the asymmetry is right-handed, so most of the observations are above the mean value (positive coefficient of skewness).

At the next stage the assumptions of ANOVA's Analysis of Variance were checked. First, an assessment was made of the compatibility of the distribution of the tested variable in each group

with the regular distribution. Due to the size of the sample, the Shapiro - Wilk test was used. The results obtained for each group are presented in Table 4.

Table 4: The results of Shapiro - Wilk test

Element	Grouping factor	S-W statistics	p-value
BMI	Male	W=0.976	0.164
	Female	W=0.882	0.088
	3 year	W=0,955	0.363
	1 year	W=0,95	0.243
	2 year	W=0,943	0.157
	4 year	W=0,95	0.251

All the above results indicate that there are no grounds for rejecting H_0 about the compliance of the tested distributions with normal distribution. The next step was to compare variances in groups. For this purpose the Levene test was applied to variances in groups for which the null hypothesis assumes their equality. The results are presented in Table 5.

Table 5: The results of Levene test

Grouping variable	Homogeneity of variance Lavene's test	
	F	p
Gender	0.88	0.35
Year of study	1.94	0.13

For the significance level $\alpha = 0.05$ the assumption of variance equality has been fulfilled in all groups. In view of the results obtained, it is possible to use ANOVA's Analysis of Variance.

The main research problem presented in this article was to verify the hypothesis that the BMI level does not depend on gender, nor on the year of studies.

Testing of Gender Impact on BMI

In accordance with the above considerations, the ANOVA's Analysis of Variance was carried out for gender-defined populations. The obtained results are presented in Table 6.

Table 6: BMI significance results for the gender grouping variable

Grouping variable	F	p
Gender	34.17	0.00

The results obtained indicate that there is a gender impact on the BMI of the surveyed students. This is confirmed by the p-value obtained, which reached the level of $p < 0.05$ and that means that the BMI level is highly dependent on whether it applies to men or women.

This is also confirmed by the consumption median values (Fig. 3), that total 24.1 for men and 21.96 for women respectively, which may imply higher nutritional awareness in the population of female cadets.

Fig. 3: BMI level depending on the gender

Testing of the impact of the year of studies on BMI

Similar results were obtained by analysing the year of studies (Table 7). The results show that BMI differs significantly in at least two groups. This is evidenced by the p-value obtained, which reached the level of $p < 0.05$ and that means that the BMI level is highly dependent on the year of studies it applies to.

Table 7: BMI significance results for the year of studies grouping variable

Grouping variable	F	p
Year of studies	5.28	0.00

Fig. 4 shows BMI results of individual years of study. The graph shows definitely different results for the 3rd and 4th year of studies, while for the 1st and 2nd year the results are similar. This is confirmed by the median values for individual groups that for the 3rd year amount to 23.99, for 4th

year - 24.51 respectively, whereas for 1st and 2nd year they are similar and amount to 22.97 and 22.9 respectively.

Fig. 4: BMI level depending on the year of studies

Therefore, it was checked whether there are significant differences in BMI for Year 1 and 2 of studies. For this purpose the Student's t-test was used as a statistical method to check whether the two averages differ significantly in statistically terms from each other. The null hypothesis assumes that they are equal. The Student's t-test results are presented in Table 8.

Table 8: Student t-test results for Year 1 and 2 of studies.

Mean 1 year	Mean 2 year	t	df	p	Nvalid 1 year	Nvalid 2 year	Std. deviation 1 year	Std. deviation 2 year	quotient F Variances	p Variances
22.97	22.90	0.13	50	0.89	26	26	2.05	1.52	1.83	0.14

The generated test statistics confirms previous considerations. The groups do not differ from each other significantly. Ultimately, therefore, the differentiation applies to 1st and 2nd year jointly, and to 3rd and 4th year.

To sum up the above results, it should be stated that the BMI level in the student population is influenced significantly by gender and year of studies. Higher BMI values apply to men, which indicates that women place more emphasis on a healthy lifestyle and maintaining proper body weight. It also turns out that subsequent years of study clearly influence the BMI growth trend. This may be due to the mode of academic training and the additional scientific challenges faced by cadets

in each consecutive year of studies. The need to spend more time on learning reduces physical activity, and as a result, the calorie portion supplied becomes too large and results in weight increase.

Conclusions

The energy demand of candidates for soldiers is an important element of the full process of their training, as well as the shaping of correct habits and attitudes. Proper diet requires considering the specificities of military studies, which at each stage are characterized by different levels of training projects. These include traditional academic classes as well as physical and combat training. Additionally, many cadets engage in additional physical education activities, participating in sports sections or training individually. The planned food rations therefore take into account the high energy expenditure and may contribute to weight gain among those who are less active. Therefore, it is necessary to monitor such indicators as BMI which allow for an approximate assessment of the accumulated body fat, lifestyle and diet - including the adequacy of the calorific value of meals to the performed official and non-official activities, which differ throughout subsequent years of studies, which became the subject of the presented research.

The carried out survey indicated a high percentage of soldiers with the correct weight (85% of the total). The remaining 15% of the total number of respondents were slightly overweight. As it turns out, the factor influencing the BMI level is gender and year of studies. The watch for figure and proper body weight is stronger in the group of women. The year of studies is also significant. Each consecutive year at university is conducive to BMI growth. The main reason may be the specific nature of the course, which at the beginning is full of high physical activity. With each consecutive year, the scope of knowledge that students have to acquire goes up. This often requires many additional hours of study and reduces the time spent on sport. Meanwhile, the number of calories consumed in each year of the studies remains unchanged, which may be the reason for such results.

Based on carried out analyses, it is worthwhile, as part of follow-up research, to make in-depth analysis of the energy demand and calorific value of the meals in relation to each stage of the study. Furthermore it is worthwhile - through training - to propagate among soldiers the benefits of the basic principles of rational nutrition in order to avoid diseases of civilization and thus improve the level of implementation of the prescribed training tasks.

Abstract

Pollution from petroleum waste has caused a decline in soil productivity. Hydrocarbon spills on the soil has led to disruption to the surrounding ecosystem, including towards people living around the region. This issue remains as Indonesia is an oil-generating country that produces in large scale along with high waste of petroleum. The amount of land contaminated due to the oil production process increases thousands of tons annually. Oil spills may reduce the stability of the soil and the soil function degradation that results into critical lands. The technique of restoring contaminated land with phytoremediation could be used as an alternative to land restoration using plants to immobilize pollutants, absorb and transform them into cells of plant tissue. Plant groups such as grass have higher potential for land restoration compared to other plants as they have plenty of roots and vigorous roots system spreading onto the soil. However, the use of this technology requires coordination between stakeholders to ensure the use of phytoremediation is optimized. The purpose of this research is to analyze grass plants and their potentials to restore oil-polluted soil in connection to the land sustainability. Phytoremediation technology may be applied to remove contaminants from polluted soils with affordable, effective cost, and environmentally friendly.

Keywords: Grass; Land Sustainability; Oil Spill; Phytoremediation

Introduction

Oil industry activities from exploration to refining processes have the potential for oil spills. Oil spills contain pollutants that disrupt the ecosystem on contaminated soils (Fahmi *et al*., 2010). Soil and water pollution from petroleum spills is some of the pollution forms that are harmful to the ecosystem and human health (Viesser *et al.*, 2020). The characteristics of petroleum has undergone changes due to contact with the environment in which the interaction is caused by physical and biological factors (Balachandran *et al.*, 2012). The presence of petroleum in the environment is the result of gradual biodegradation that put the quality of soil and water in jeopardy (Abdel-Shafy and Mansour, 2016).

The decline of soil and water quality caused by oil spills could disrupt the surrounding ecosystems, including humans (Hatami *et al*., 2019). Environmental pollution caused from oil spills remains to be present as Indonesia is an oil-generating country with substantially large quantities along with high of petroleum waste. Efforts are needed to maintain the quality of the environment by removing hydrocarbon pollutants from the soil through physical, chemical and biological technology (Kurnaz, 2016). According to Sari et al. (2018), remediation efforts are required on the topsoil to prevent further crude oil percolation within the soil. Phytoremediation technology serves as an alternative to overcome oil pollution which is environmentally friendly. Phytoremediation conducts an interaction between plants and rhizosphere microorganisms that function to reduce, eliminate and stabilize contaminants in soil and water (Gerhardt *et al.*, 2009; Ali *et al*.,2013). According to Fatima *et al.* (2018), phytoremediation is a promising approach to clean up petroleum hydrocarbon on contaminated soils.

Unlike the other restoration techniques, phytoremediation is also referred to as green technology that is environmentally friendly with the lowest cost. Plant groups such as grass have higher potential for land restoration compared to other plants. Based on the outcome from previous studies, the use of *Brachiara decumbens*, *Brachiaria humidicola*, *Elucine indica*, *Paspalum notatum*, *Setaria splendida* were seen to be receptive and adaptive towards the petroleum-contaminated soils at the initial Total Petroleum Hydrocarbon (TPH) levels amounting to 3.42%. *Paspalum notatum* grasses were able to reduce TPH by 43.4% within 12 months (Suryati, 2016).

In other cases, the implementation of phytoremediation also requires coordination with stakeholders in order to produce optimal results. The use of phytoremediation has not been significantly utilized by the oil industries or the general public, despite of the technology with high level potential, affordable cost and a positive impact towards the pollutant-contaminated soils (Bramley-Alves *et al.*, 2014; Chen *et al.*, 2020). Based on the Decree of the Ministry of Environment No. 128 of 2003 regarding Procedures and Technical Requirements for Biological Waste and Petroleum Contaminated Soil Waste Management, the maximum limit of TPH on land is 1%. Every business and activity that generates petroleum waste are required to carry out waste management with a maximum initial TPH concentration prior to the biological treatment amounting to ≤ 15%.

The purpose of this study is to examine the grasses and their potentials to recover oil-contaminated soils in connection to the land sustainability. According to da Silva and Maranho (2019), choosing the appropriate choice of remediation strategy could restore the environment to its previous condition and reduce the threat of additional or prolonged impacts on the environment, as well as at the lowest cost. Proper coordination between stakeholders is also one of the keys to success to implement this green technology.

Methods

This study utilizes qualitative methods and literature studies on the use of phytoremediation as a rehabilitation effort for oil-polluted soils. The selected area is located in Sedari Village, Cibuaya District, Karawang Regency, Indonesia. This area was chosen as the research area because a pipe leak occurred that caused contamination of soil and water. The data collection techniques utilized in-depth interviews with selected informants with pre-determined criteria. The characteristics of the informants chosen were the Chairperson of the Sedaris Village Community Development Committee and the communities affected by the oil spills. The data that are to be obtained comprise of various research questions, namely (1) the impact of oil spills (2) industrial and government efforts in oil spills management and (3) stakeholders who conduct the phytoremediation technology. Furthermore, an observation was conducted as a review and alignment of interview outcomes with the condition at the area.

The literature study used is secondary data from previous researches and the Indonesian Government Regulation. The source of research data that were used are in relation to the phytoremediation to reduce the concentration of petroleum pollutants due to industrial activities. The research used in this literature study is the research conducted for the last ten years.

Result and Discussion

Utilization of Grass as a Phytoremediation agent

The use of phytoremediation by using selective plants is one of the most cost-effective remediation methods for recovering petroleum-contaminated soils. Plant receptiveness in contaminated soils with organic pollutants such as petroleum occurred through the association of microorganisms with the roots. The stimulation used for hydrocarbon biodegradation is also referred to as rhizodegradation. Rhizosphere organisms utilized petroleum hydrocarbons as the carbon source and convert them into carbon dioxide, water, and biomasses. The use of grass plants as a phytoremediator agent has a high

capability for reducing the oil concentration in the soil as grasses have strong roots and spread within the soil. A literature study method on phytoremediation technology with grass plants to reduce petroleum concentrations is generally presented in Table 1.

Table 1: Types of Grass and Their Benefits for Petroleum-contaminated Soils

No	Years	Grass species	Benefit	References
1	2020	*Chrysopogon zizanioides*	Reduces or takes PAHs on the soil, has a high receptiveness to various pressures and fast growth rate.	(Chen *et al.*, 2020)
2	2019	*Spartina Anglica*	Reduces TPH by 19.1% and significantly reduces C8-14 concentrations and trycilic PAHs	(Zhen *et al.*, 2019)
