
The article discusses the main goals, objectives, stages of work at socio-psychological support of students with disabilities and persons with limited health capabilities in higher education institutions. The experience of the Chuvash State Agricultural Academy in the socio-psychological support of students with disabilities and people with limited health capabilities is considered. The article presents research materials on the social adaptation of students with disabilities and with limited health capabilities. It is shown that to improve work with students with disabilities is to create special conditions at higher education institutions. Attention is drawn to the fact that the socio-pedagogical support of students with disabilities and persons with limited health capabilitiesinclude such forms of assistance and other forms of workas described in the plan of socio-psychological support.

Keywords: students with disabilities, limited health capabilities, social adaptation, socio-psychological support.

Introduction

Obtaining higher education for students with disabilities and people with limited health capabilities is an important opportunity to realize themselves in the future. This is primarily material independence, freedom of choice, adequate self-esteem, the formation of important volitional qualities such as stability, endurance, patience.

To date, a study conducted in different regions of the Chuvash Republic showed that only four out of a hundred aged 18 to 30 with disabilities have higher education. An analysis shows thatnot all individuals with disabilities seek to graduate. But those who want to get higher education are hindered by material difficulties, living conditions, limited physical mobility, low self-esteem, fear of society, etc.

Training and education of students with disabilities requires special conditions, specialized training and a high level of professional skill in the socio-psychological training of students of this category. Federal Law No. 273-ФЗ “On Education in the Russian Federation” dated December 29, 2012, Federal Law No. 181-FZ (amended on July 29, 2018) “On the Social Protection of Persons with Disabilities in the Russian Federation” dated November 24, 1995 (amended and added, entered into force on 01.01.2019), the Convention on the Rights of Persons with Disabilities of 2012 solve the problems associated with higher education for students with disabilities and people with limited health capabilities.

Materials and Methods

The object of the study is the process of adaptation through socio-psychological support of students with disabilities and people with limited health capabilities in a university. The methodological basis is empirical research methods, such as observation and research.

Research Results and Discussion

The sample consisted of 10 students with disabilities and limited health capabilities. The research methodology is "Adaptation of students in a university".

During the study an analysis was conducted of the level of adaptation of students with disabilities and limited health capabilities, which revealed a fairly low level of their adaptability, low communicative level which amounts to 40%. In the process of observation we saw a number of problems of adaptation of students with disabilities and limited health capabilities and they are associated with:

-low self-esteem;
- low communicative capabilities;
- low motivation for professional activity;
- sometimes the lack of desire to self-develop.

The Chuvash State Agricultural Academy solves not only a number of these problems but also the problems of organizing inclusive education and creating conditions for higher education for students with disabilities and special needs. After conducting a study the following work is supposed:

- organization of adaptation in higher educational institutions;
- improving the system of education by creating the necessary conditions and teaching faculty to work with students with disabilities and people with limited health capabilities;
- assistance in finding employment;
-organization of social and psychological support for students.

The purpose of the socio-psychological support of students with disabilities and persons with disabilities is to help adapt to the scientific process, to develop an independent personality and to support them socio-psychologically.

To achieve this goal it is necessary to solve the following tasks:

1.To create a welcoming atmosphere that facilitates the establishment of interaction with classmates, teachers.
2. To Help in early adaptation to the educational process.
3. To create conditions for the formation of such volitional qualities as determination, perseverance, discipline, confidence.
4. To identify interests and hobbies of students with disabilities and people with limited health capabilities.
5. To intensify the activities of students with disabilities and persons with limited health capabilitiesin extracurricular activities.
6. To assist curators of study groups in working with people with disabilities and people with limited health capabilities.
Based on these tasks a plan for the socio-psychological support of students with disabilities and persons with limited health capabilities was developed and implemented (Table 1).

22.	Individual correction work with physically challenged students and students with disability of health, having missing classes without	During the academic year	The Academy	10	Sergeeva N.A.

	valid excuse and with pure academic performance				
23.	Individual consultations on the issues of the students	During the academic year	The Academy	10	Sergeeva N.A.
24.	Finaldiagnostics (the analysis of monitoring satisfaction with the quality of educational services)	During the academic year	The Academy	10	Sergeeva N.A.

The study showed that implementing this plan of socio-psychological support of students with disabilities and limited health capabilities, students' adaptation is successful. It also revealed intellectual and creative opportunities of students of these categories. It showed that students with disabilities and limited health capabilities have developed stable social and moral personality traits like patriotism, honesty and justice.

In addition, the characteristics of these students are taken into account at the Chuvash Agricultural Academy and a favorable psychological atmosphere has been created that allows each of them to feel comfortable in the team.

In the process of the study a favorable psychological atmosphere was created which activated students with HIA to social activities through pedagogically correctly organized student activities. The benevolent atmosphere facilitated the establishment of interaction with classmates, teachers, as well as free thought and views expression.

So, Petrov V., a 2nd year student, 2nd group invalid, 3rd year student I. Havanskaya, 2nd group disabled person, active members of the Volunteer Corps. This year for the first timethey participated in the professional skills championship among disabled people and people with limited health capabilitiesAbilimpix in Moscow.

Conclusion

Thus despite the identified problems 80% of students with disabilities and limited health capabilities have developed a positive attitude towards learning, their adaptation is quite effective. Socio-psychological support aimed at adapting students with disabilities and with limited health capabilities, at solving their own problems positively built a relationship with others. An important place was given to the teaching staff, the closest associates who, together with a changing personality of the disabled, promptly guide but do not patronize, help to escape passivity, helplessness and direct them to the road of independence and responsibility.

Innovativeness of Enterprises Vs Emigration – Example of Poland

Anna RYBAK

University of Technology, Czestochowa, Poland
anna_rybak@wz.pcz.pl

Abstract

The work is of an analytical character. It is aimed at analysing the impact of emigration on the innovativeness of Polish economy. On the grounds of the reports of The European Innovation Scoreboard and Oslo Manual, indicators on which emigration had specific impact were selected. As a result, correlations between particular indicators and the number of persons who had emigrated were obtained. On the grounds of the analysis conclusions have been drawn, which unequivocally indicate the close correlation between studied features.

Keywords: Emigration, Innovations, Entrepreneurship

Introduction

Innovations constitute a source of developing sustainable economic growth of countries, regions and economies. Knowledge-based economies raise interest of many researches, as they decide on the world's development directions. Knowledge and innovations constitute resources that contribute to creating wealth of the nations.

When in 2004 the Republic of Poland signed the Accession Treaty to the European Union, the European labour market was opened to Poles. Many used this opportunity and emigrated to, among others, Great Britain or Ireland. The economy has been especially devoid of young people, who are carriers of innovation and entrepreneurship energy. The research conducted by Anelli et al (2019) in Italy proved that per 1,000 emigrants, on average, 10 young, innovative enterprises were not established. If we refer to the research conducted by Nordhaus (2004) stating that the total excess on innovation is allocated to the creators thereof (companies) only in the amount of 2.2% (the author indicates the range between 1.3% and 3.3%) and the remaining part constitutes the society's share, then, the emigration of creative people has a significant impact on the economic future of the country from which the significant part of the society emigrated (e.g. Poland). The aim of the work is to study the impact of emigration on the innovativeness of Polish economy. To this end, the following research questions have been asked:

1. Is there a correlation between Poles' emigration and the economy's innovativeness?
2. What is the impact of citizens' emigration on innovations in Poland?

Answers thereto will allow to better understand the issue related to the emigration of people from less industrialised countries and impact thereof on the further deepening income distance related to the low innovativeness of the economy of the emigrant's country of origin.

Literature Review

Innovations and innovativeness constitute the source of the nation's wealth, therefore, it is so important that the organisations are able to create innovations and states support them in this scope. The subject literature concerning the knowledge-based economy indicates the following sources of innovations' development (Domański, 2010):

- human capital understood as people's competences and abilities to develop knowledge and implement innovations, as well as continuous improvement of their qualifications and skills during practical use of knowledge as a result of the R&D achievements in innovation processes;

- creating proper economic (including financial), organisational and legal conditions to create knowledge and its effective use in economy in compliance with the society's needs and expectations;
- knowledge flow and development during cooperation of enterprises and scientific institutions, R&D institutions, other participants of the online innovative environment, including transfer agents, funding innovations, organisations specialising in innovation development;
- using ICT technology and effective forms of funding innovations in the organisation's innovative activity;
- developing innovative culture inside the organisation and in the society, which encourages people's engagement in knowledge development and use to their benefit and to the benefit of economies.

The above factors cannot be considered separately, but have to be considered jointly. Human capital as an innovation carrier constitutes the main element of creative-innovative solutions. Countries which have the ability to attract talents, such as the United States of America, develop faster and their innovative products and services are sold internationally and thus, their enterprises collect high bonuses for innovations. Such skills constitute a precedence related to increasing the technological distance between countries and regions, which cannot or are not able to stop emigration, especially emigration of highly skilled employees. Works Kerr (2019) or Kerr and Lincoln (2015a), or Hunt and Gauthier-Loiselle (2010), who studied the impact of policy, economy and business on migrations of highly skilled talents from all around the world to the USA, proved that the concentration of talents has a significant impact on the growth and innovativeness of the economy of the United States of America. Stuen el al (2012) finds that international doctoral students contribute to knowledge production at scientific laboratories in the US, and argues that visa restrictions on the entry of high-quality students are particularly costly for academic innovation.

In the years 2006-2012, in the United States: Immigrant founders of engineering and technology companies have employed roughly 560,000 workers and generated an estimated $63 billion dollars in sales during this time. While the rate of growth of immigrant entrepreneurship has stagnated, these numbers nonetheless underscore the continuing importance of high-skilled immigrants to the maintenance and expansion of the national economy. These findings are interestingly complex, since the two major skilled-immigrant groups — Indian and Chinese — are starting companies at higher rates than they did previously. Across engineering and technology fields, immigrant entrepreneurs displayed the greatest concentration in the innovation/manufacturing related services (45 percent) and software (22 percent) fields. Historically and today, the United States continues to benefit directly from the contributions of such immigrants. Far from expendable, high-skilled immigrants will remain a critical asset for maintaining U.S. competitiveness in the global economy. (Wadhwa et al., 2012)

Factors related to attracting talents to a given country or region could be various. Ivus et al. (2019) believe that the problem of highly skilled persons' migration is related to protecting the intellectual property by particular regions. Northern states lead in the proper protection of intellectual property. Hall and Sena (2014) drew attention to the correlation between the intellectual knowledge diffusion and the quality of legal protection both, formal - patents and informal – confidentiality agreements etc., of the innovative invention or innovative technological solutions. Knowledge, innovative development of selected regions results from interactions between companies, decision-makers and institutions shaping the environment in which companies introduce innovations. Depending on the type of innovation, at the same time enterprises create legal barriers preventing from (for some time) imitations or absorptions of this solution. Migration of creative persons is also related to the environment in which they have the opportunity to use the cutting-edge technologies or innovative solutions. Kerr (2019) underlines the significance of the flexible employment system which has been implemented by the United States of America and allows selection of emigrants (with desired qualifications), guarantees direct employment upon arrival and allows fast access to specialists from all around the world. Simultaneously, this system quickly reacts to the changes occurring in the labour market, supplementing human capital shortages. In order for such a system to be created, first, the USA had to become the leader in offering the most attractive working conditions in order to absorb the best specialists.[1]

In Poland the issue of emigration was discussed in works by i.a. Chmielewska et al. (2019), Homoncik et al (2017), or Hybel (2016). The structure of emigration (Work Servce, 2018), selection of the target countries (e.g. Wnuk, 2019), the aims of the Polish emigrants (e.g. Krawczyk, 2017) and the impact of emigration on global changes were studied (Gieorgica, 2018). Engbom (2019) developed an equilibrium theory of joint firm and worker dynamics that captures the notion that older individuals are less likely to switch employers and enter entrepreneurship. When potential entrepreneurs age, the fall in firm creation implies fewer new better jobs for workers. Furthermore, Karahan et al. (2019) highlighted role the share young age in birth rate of start-ups.

The research gap constitutes the lack of the analysis of the emigration's impact on the economy's innovativeness.

Research Methodology

The research was conducted on the grounds of data collected by the Statistics Poland. The work concerns emigration, therefore, it has been considered justified to describe the manner of collecting data by GUS (2019), The European Innovation Scoreboard (2019), Oslo Manual 2018 (2019). Data for the years 2010-2018 concerned persons temporarily residing abroad for over 3 months. Persons often residing abroad, even for many years, who have not deregistered from the permanent residence in Poland due to the permanent relocation abroad, should also be considered as persons temporarily residing abroad. In principle, estimates' results do not include seasonal emigration of Poles which, due to the duration thereof – usually up to three months, in the majority of the EU states are subject to simplified formal-legal procedures or are not registered at all.

Another issue is the unequivocal manner of measuring innovations. In order to avoid errors, two sources of innovations: (EIS), Oslo Manual were used.

EIS Report presents innovativeness' results for particular countries by inputs and effects. The Summary Innovation Index – SII proposed therein, used for the innovativeness assessment of 27 European Union states, is calculated on the basis of 27 partial indicators. The report distinguishes 4 main areas influencing the innovativeness: Framework conditions (Human resources, Attractive research systems, Innovation-friendly environment), Investments (Finance and support, Firm investments), Innovation activities (Innovators, Linkages, Intellectual assets), Impacts (Employment impacts, Sales impacts). It studies the level of innovativeness in particular EU states. The analysis covered data from the years 2011 - 2018.

The innovation index, proposed by the OECD in Oslo Manual, identifies four types of innovation by object that is: product innovation, process innovation, marketing innovation and organisational innovation. The Report presents comparable results regarding the level of innovativeness in particular, and best developing global economies, on the basis of 7 groups (Types of innovation, Public financial support for innovation activities, Innovation cooperation partners, Intellectual property protection, Innovation and participation in international markets, Turnover from innovation, Employment-based innovation indicators), 36 indicators (Innovation-active firms as a percentage of total firms; Innovative firms as a percentage of total firms, Product and/or process innovative firms as a percentage of total firms; Product and/or process innovation-active firms as a percentage of total firms; Product innovative firms as a percentage of total firms; Process innovative firms as a percentage of total firms; Organisation innovative firms as a percentage of total firms; Marketing innovative firms as a percentage of total firms; Product and/or process innovation-active firms only as a percentage of total firms; Organisation and/or marketing innovative firms only, as a percentage of total firms; Product and/or process AND marketing and/or organisational innovations only as a percentage of total firms; Product innovative firms with innovations that were new to the firm's market, as a percentage of total firms; R&D active product and/or process innovative firms, as a percentage of product and/or process innovation-active firms; Firms receiving public support for innovation, as a percentage of product and/or process innovation-active firms; Firms receiving public support for innovation, as a percentage of total firms; Firms cooperating on innovation activities, as a percentage of product and/or process innovation-active firms; Firms cooperating on innovation activities with clients; Firms cooperating on

innovation activities with higher education or government institutions, as a percentage of product and/or process innovation-active firms; Firms engaged in national collaboration only, as a percentage of product and/or process innovation-active firms etc.), in three research areas (firm size, economic sector, R&D status). Since the last issue of Oslo Manual is from 2018, data presented therein comes from the years 2014 - 2016.

Data analysis consisted in estimating the matrices of correlations between measured indicators related to the SII and emigration, and indication of k-means clustering models for selected Oslo Manual indicators. In order to create matrices and k-means clustering models the statistical programme STATISTICA taking into consideration the level of significance p=0,1[2] was used due to the explorative character of the research.

Emigration of Poles

Emigration of population has an immense impact on the country's economy. This situation influences both, the labour market and the entities' financial results. According to GUS results, at the end of 2018, approximately 2,455 thous. Polish permanent residents temporarily resided abroad, i.e. by 85 thous. (3%) fewer than in 2017. In Europe, approximately 2,155 thous. persons resided (by 86 thous. fewer than in 2017), the majority of them – approximately 2,031 thous. – stayed in EU Member States (fig.1).

Fig. 1: Estimated value of Poles' emigration to the permanent residence in the years 2004 – 2008

Most often Poles reside in the territory of Great Britain and Germany (bar chart). These countries are selected by 57% of all emigrants from Poland. The country outside the EU that becomes the place of residence is Norway. In order to better understand the issue of emigration one should study the age structure (fig. 2).

Fig. 2: Emigrants from Poland by age and gender

The working-age population of Poles who go abroad is between 20 and 59 years (76.6%). A significant number of young people after studies[3], 25-35 years, who decided to emigrate from Poland, should be noticed. This data is highly alarming, since young people are carriers or new ideas and are more prone to taking risks related, for example, to conducting innovative enterprises or start-ups. Emigration of young, educated people impoverishes the country's economy, which also incurred the costs of education, yet, cannot retain the creative human capital, which should be used for innovative and economic growth of the home country. Many Poles go abroad in search of better working conditions and start families there. Furthermore, the research implies that 4% more women emigrate than men (aged 25-34 years).

The impact of emigration on Poland's innovativeness indexes

The hitherto research concerning emigration is focused on two issues, that is, the social aspect (the impact of emigration on the issues of poverty and unemployment etc.) and the economical aspect (the impact of emigration on demographic indicators or the labour market). The research gap concerns the impact of emigration of the innovativeness indexes of the emigrant's home country, which significantly influences the issue of emigration.

Table 1: Correlation matrix of the level of emigration on the SII.

Variable	Correlations (innovativeness index with population emigration) Marked correlation coefficients are significant with p < .10000 N=8 (Lacks of data were removed by cases)
	Emigration of population from Poland
Summary Innovation Index	0.533145
Human resources	0.854422
Research systems	0.907663
Innovation-friendly environment	0.681626
Finance and support	-0.721029
Firm investments	0.814942
Innovators	-0.940984
Linkages	-0.848881

Intellectual assets	0.955824
Employment impacts	-0.276900
Sales impacts	-0.754187

Emigration of population from Poland in the research period has a weak (at the level of 53%) impact on the SII, yet, a strong (at the level between 68% and 96%) impact on other indicators comprising the Index. The correlation matrix unequivocally indicates that emigration has both, a positive impact e.g. on Human resources (0.85), Attractive research systems (0.91), Innovation-friendly environment (0.68), Firm investments (0.81) and Intellectual assets (0.95 – the highest level of correlations), and a negative impact i.e. Finance and support (-0.72), Innovators (-0.94), Linkages (-0.85), or Sales Impacts (-0.75). Explanation of this situation is extremely difficult, therefore, each indicator should be analysed separately. The **Human resources** indicator captures new doctorate graduates, population aged 25-34 with completed tertiary education and population aged 25-64 involved in education and training (EIS, 2019, p. 4), and, in fact, a large part of emigrants have higher education. However, it should be taken into consideration that their education is related to social sciences, which have a smaller impact on the innovativeness of enterprises. Moreover, the indicator covers the number of persons who are involved in education and training and those persons do not emigrate, which influences the stability of this indicator (the number of persons does not change despite emigration). Next indicator is the **Attractive research systems**, which includes three indicators and measures the international competitiveness of the scientific base by focusing on international scientific co-publications, most cited publications and foreign doctorate students. The positive correlation with the number of people who emigrate is related to the fact that young emigrants do not constitute the current (yet, they can do so in the future) academic staff. Their presence in the home country can have a positive impact on the domestic educational market, since well-educated young people are ambassadors in the countries, in which they reside (living advertisement of knowledge gained at domestic universities). The same refers to the quality of the academic staff, whose publication achievements are not related to the external migration.

Innovation-friendly environment captures the environment in which enterprises operate and includes two indicators – Broadband penetration among enterprises and Opportunity-driven entrepreneurship – measuring the degree to which individuals pursue entrepreneurial activities as they see new opportunities, for example resulting from innovation. To a certain extent emigration forces more frequent use of the Internet as the channel of distributing products by domestic enterprises. Due to emigrants, enterprises can benefit from the knowledge of persons staying outside the borders of their home country and their experience, as well as their being used to domestic products and brands. Expansion to foreign markets by using emigrants allows diminishing the risk related to the lack of knowledge on foreign markets.

Finance and support includes two indicators and measures the availability of finance for innovation projects by Venture capital expenditures, and the support of governments for research and innovation activities by research and development expenditures in universities and government research organisations. As results from the correlation, the increase in the number of emigrants is accompanied by the decrease in the amount of funding on scientific research. The situation is surprising, difficult to interpret. The irreversible consequences of such activity should be considered. Emigrants are a flagship and the competences they have also due to the education obtained in Poland allow them to achieve success also abroad. Therefore, the level of the education should not be decreased due to the lack of funding on scientific research, which can retain talented young people in the country.

Firm investments includes three indicators of both R&D and non-R&D investments that firms make to generate innovations, and the efforts enterprises make to upgrade the ICT skills of their personnel. The positive correlation is possible due to using the opportunity of entering new foreign markets where emigrants from Poland reside.

Innovators is another dimension of the innovativeness aspect, which includes three indicators measuring the share of firms that have introduced innovations onto the market or within their organisations, covering both product and process innovators, marketing and organisational innovators, and SMEs that innovate in-house. The correlation with the population emigration is negative, which

has a direct impact on the studied issue. Along with the outflow of intellectual capital from the domestic labour market, the level of innovative ventures decreases in the product, process, marketing and organisational sphere. Such a situation should be especially studied. Thus, in the further part of the work the attempt to explore this issue has been undertaken.

Linkages includes three indicators measuring innovation capabilities by looking at collaboration efforts between innovating firms, research collaboration between the private and public sector, and the extent to which the private sector finances public research and development activities. This aspect of innovativeness is also negatively correlated with emigration. The size and quality of emigration has a negative impact on correlations between the private and public sectors, which can prove a small adjustment of the staff from these sectors to mutual cooperation.

The value of correlation between emigration and intellectual assets is the highest among studied indicators. **Intellectual assets** captures different forms of Intellectual Property Rights (IPR) generated in the innovation process, including PCT patent application, Trademark applications and Design applications. The positive correlation shows that formal innovation value hedges are not a reason for emigration of highly skilled staff from Poland. Furthermore, domestic entities strive to hedge their intellectual assets against losing them, especially against exporting them by emigrants.

Export of medium and high-tech products, export of services requiring extensive knowledge and sales due to innovative activities (**sales**) have a negative impact on the size of emigration. If young, educated people can pursue their ambitions in the domestic market, they do not emigrate. This indicator, which measures the economic impact of innovations allows unequivocally stating the outflow of talents from the country has a direct impact on the innovativeness of enterprises.

The emigration especially influenced the Innovators. Thus, the indicators related to this area should be analysed in-depth.

Table 2: Correlation matrix of Innovators indicators with emigration

Variable	Correlations (innovativeness index with population emigration) Marked correlation coefficients are significant with p < .10000 N=8 (Lacks of data were removed by cases)
	Emigration of population from Poland
SMEs introducing product or process innovations as % of SMEs	-0.533943
SMEs introducing marketing or organisational innovations as % of SMEs	-0.938198
SMEs innovating in-house as % of SMEs	-0.653679

Emigration had the biggest impact on the decrease in innovative marketing or organisational solutions of SMEs, which confirms the thesis that young, educated people are carriers of innovations, and starting by them work outside the borders of the home country does not favour creative solutions and impoverishes the domestic market of innovative solutions. The result thereof may be the decreased number of established, new, innovative entities with larger emigration.

The analysis will be supplemented with clustering models for selected indicators from Oslo Manual 2018. Emigration had a significant impact on innovative solutions, therefore, the following indicators have been selected to the k-means clustering models: Innovation-active firms (product/process or ongoing/abandoned or organisational/marketing), Innovative firms (product/process or organisational/marketing), Product and/or process innovation-active firms (product/process or ongoing/abandoned innovation activities, regardless of organisational or marketing innovation), Product innovative firms (regardless of any other type of innovation), Product and/or process

innovation-active firms (product/process or ongoing/abandoned innovation activities, regardless of organisational or marketing innovation), Product innovative firms (regardless of any other type of innovation), Process innovative firms (regardless of any other type of innovation), Product innovative firms with innovations that were new to the firm's market, Turnover from new or significantly improved products, Turnover from new or significantly improved products that are only new to the firm, Turnover from new or significantly improved products that were new to the market.

Fig. 3: Diagram of k-means clustering of selected indicators.

Table 3: Elements of clustering 1 and distances from the middle of relevant clustering

Indicators	Distance
Product innovative firms with innovations that were new to the firm's market	12.24382
Turnover from new or significantly improved products	2.295938
Turnover from new or significantly improved products that are only new to the firm	2.932471
Turnover from new or significantly improved products that were new to the market	3.219157
Emigration	6.420908

Table 4: Elements of clustering 2 and distances from the middle of relevant clustering

Indicators	Distance
Innovation-active firms (product/process or ongoing/abandoned or organisational/marketing)	8.398155
Innovative firms (product/process or organisational/marketing)	5.642839
Product and/or process innovation-active firms (product/process or ongoing/abandoned innovation activities, regardless of organisational or marketing innovation)	5.935562
Product innovative firms (regardless of any other type of innovation)	9.043666
Product and/or process innovation-active firms (product/process or ongoing/abandoned innovation activities, regardless of organisational or marketing innovation)	5.935562
Product innovative firms (regardless of any other type of innovation)	9.043666
Process innovative firms (regardless of any other type of innovation)	6.591228

The analysis by the k-means clustering method allows selecting groups with similar features. In the studied cases, the population emigration occurred in the first clustering, where, in particular, the indicators related to the trading in new products for the company or the market occurred. This group also included (the furthest) indicator: Product innovative firms with innovations that were new to the firm's market. Conclusions should be drawn that the hitherto emigration has influenced new, innovative solutions primarily related to the improvement or modernisation of the trade flow of companies. Further research should follow this observation.

Discussion and Conclusions

Creating innovations, the use and diffusion of knowledge constitute the sources of prosperity of the country, which is developing its economic and financial independence, also become the sources of prosperity for the local and international communities. Innovations as the source of the increase in effectiveness and productiveness become a part of analyses related to the research on economies in terms of the innovative abilities and/or adaptation thereof. Since the human capital and its ability to creatively create and solve problems constitute the carrier of innovations, the author considers it justifiable to study relations between the human capital and migration of population. The aim of the work was to analyse the impact of emigration from Poland on innovativeness. To achieve this aim two research questions have been asked: if there is a correlation between emigration and innovativeness of the Polish economy and what impact it has.

On the grounds of EIS and Oslo Manual, correlations between the number of persons who emigrated from Poland and economy innovativeness indexes were studied. The research implies that migration had the largest impact on indicators related to innovations of small and medium entities (- 0.94). Along with the increase in the number of persons emigrating from Poland, the number of new innovative economic entities is decreasing. The feature thereof has a negative impact on the future economic development where innovators establishing a start-up have opportunities to develop innovations especially of a creative character and not imitating or adaptive character. The results are consistent with ideas put forth by Anelli et al. (2019) or Karahan et al. (2019).

The positive correlation occurs, among others, with indicators related to the scientific capital (0.85) and scientific research (0.91). This phenomenon does not favour innovations so much, since it causes a change of a calculative character (the indicator's denominator is decreasing). Another positive correlation is related (0.81) to innovative in-house ventures (trade flow). Emigration favours entry of enterprises into new markets and absorption of new products and solutions for companies. Emigration is a characteristic phenomenon in the contemporary world. Nevertheless, one should consider, whether persons who leave the country do not cause intellectual and innovative impoverishment of this country. In the era of open labour markets, easy penetration of resources and information, the human capital constitutes the factor which will allow technical, technological and, primarily, intellectual development, especially in the era of knowledge-based economies. Further research should take into consideration the quality of emigrants and their impact on the innovativeness of economies of settlement countries.

---

[1] The work is not aimed at describing the whole system of support for science and business of the United States, but at presenting the system that influences the increase in the USA's innovativeness most effectively.

[2]Controversies concerning indicating the level of significance allowed the author to specify the level as cited in: Aranowska and Rytel (2000).

[3] The research conducted by NBP implies that, depending on the state to which the emigrant goes, from 34% in the UK to 18.3% in Germany have higher education. Persons with higher education have a very diverse educational profile. The majority – from 4.0% to 11.0% of registered persons were those who graduated from social sciences (e.g. sociology, psychology, economy, management, social policy). Approximately 5.0% of persons in each country declared medical education (broadly understood as medicine, nursing, veterinary medicine, cosmetology, dietetics). Participation of

persons with IT education only in the case of Great Britain reached 4.0%, in the case of other states it was at the level of 1.0%. (Chmielewska et al., 2019).

Quality Assessment of Websites of Rural and Urban-Rural Municipalities' Local Governments in The Silesian Voivodeship In Terms of Accessibility

Anna RYBAK

University of Technology, Czestochowa, Poland
anna_rybak@wz.pcz.pl

Abstract

The article is aimed at the quality analysis in terms of websites accessibility of e-offices of rural and urban-rural municipalities in the Silesian Voivodeship. The automatic web application detecting errors and warnings of municipalities' websites has been used herein. On the grounds of the statistical analyses, correlations between the quality of websites and the population, as well as the municipalities' income have been presented. The disclosed correlations can influence quality improvement and thus, accessibility of websites to digitally excluded people.

Keywords: Quality of Websites, Local Governments, E-Office.

Introduction

The ICT is the fastest growing global technology. In compliance with the report: Progress towards the Sustainable Development Goals (Report of the Secretary-General 2016, 2017, 2018, 2019) in 2015 the number of people residing in areas covered with mobile broadband networks amounted to 69% all around the world and in the countryside this share amounted to only 29%; whereas, in 2016, 95% of the world's population and 85% of people in the Least Developed Countries were covered with the mobile signal. Currently, almost all people around the world live within the cover of mobile networks, of which 90% live within the cover of 3G or higher quality network. However, this evolution of mobile networks is growing faster than the percentage of the population using it. The current system faces a challenge of the issue related to the digital exclusion of a part of society. The group of digitally excluded people primarily includes persons with sensory disabilities (blind, visually impaired, deaf, hearing-impaired and deafblind), persons with manual and intellectual disabilities, seniors, foreigners, as well as uneducated and not well-off persons. (The Ombudsman Report, 2013)

The website accessibility means the possibility of using contents published thereon by as large number of users as possible to the largest possible extent. It provides everyone with full access to information and sources of obtaining it without the necessity to leave the place of residence. Furthermore, social relationships, which allow entering interactions by creating so-called "social geometry" (Sztompka, 2016), are also established. An accessible website is a website that allows universal, convenient and intuitive use of its resources, with full access to the information sought by the user in a safe and certain manner. Due to such an approach, accessible websites can be used by all persons, especially those digitally excluded, without losing trust to the contents and form of transferred information or while entering digital interactions.

Safety of websites that belong to public entities is especially important. Persons using the websites' resources must be certain that contents included thereon are valid, since doubts undermine trust to both, institutions and the state system, as well as ICTs. Persons with disabilities are especially exposed to the threat of losing trust due to the lack of knowledge, limited perception, as well as the lack of experience in handling this technology.

This work is aimed at conducting quality assessment of websites in terms of their accessibility to digitally excluded people. The analysis covered websites of urban-rural municipalities (22 websites), and rural municipalities (96 websites) of the Silesian Voivodeship. The choice of the object of the

research is intentional due to the fact that the rural areas are inhabited particularly by persons from the group especially exposed to the risk of digital exclusion.

Accessibility of websites of public entities in the Polish legislation.

Accessibility of IT tools and the issue of adjusting them to the specific needs of persons with disabilities undoubtedly constitute the issue noticed by the domestic and international authorities responsible for law-making and stipulation of social policies. Legal accessibility guarantees are expressed in constitutional norms, international law acts, as well as statutory regulations and ordinances. The legal grounds binding globally are provided by the UN Convention on the Rights of Persons with Disabilities, which was adopted by the General Assembly of the United Nations on 13 December 2006. The Polish government signed the Convention on 20 March 2007, and it was ratified by Poland on 6 September 2012 (Dz. U. Nr 0, 2012). Article 9 "Accessibility" of the Convention especially underlines preventing digital exclusion of persons with disabilities.

Accessibility does not mean disclosing each information. In Poland, the Act on Access to Public Information (Dz. U. Nr 204, 2001) regulates the rules and modes of accessing information having a value of public information and specifies, in which cases the access to public information is subject to limitation and when the information requested by the applicant cannot be disclosed. Thereunder, *Bulletin of Public Information* (BIP) was developed, and which, pursuant to the provision of Article 8 of the specified Act, constitutes the official ICT publication for the purposes of announcing public information. BIP is a unified system of standardized pages in the ICT network, intended as the basic tool for sharing public information. Apart from the BIP homepage there is a series of so-called BIP subject pages administered by entities obliged to maintain them, among others: public authorities, local government units, business and professional self-government authorities, trade unions and related organisations, political parties and other entities performing public tasks.

In the doctrine and jurisdiction, public information is considered to be *"any message generated by or referred to the broadly understood public authorities and generated by or referred to other entities performing public functions in the scope of their performance of tasks of the public authorities and management of communal property or assets of the Treasury."* (Banaszak, 2012) Furthermore, the Act on Access to Public Information introduces the obligation to publish a specific type of information, the scope of which was gradually extended along with entry into force of consecutive articles. The discussed legal act specifies categories of data, which must be obligatorily disclosed in BIP, including: legal status or legal form of a given entity, the object of its operations and competences, authorities and persons exercising specific functions and their competences, assets they are at a disposal of, operation mode, manners of accepting and dealing with cases, information on kept registers, records and archives, as well as manners and rules of sharing data included therein. This is basic information, which the person visiting the website of a given institution should be able to learn. (The Ombudsman Report, 2013)

As of June 2015, pursuant to the Ordinance of the Council of Ministers on the National Interoperability Frameworks, all public websites must comply with the minimal (Web Content Accessibility Guidelines (WCAG) in version 2.0 at the level of A and AA) requirements of accessibility of public registers, exchange of information in electronic form and minimal requirements for ICT systems.[1] In 2019, the Act on the Digital Accessibility of Websites and Mobile Applications of Public Entities (Dz. U. 2019 poz. 848, Dz. Urz. UE L 327 z 02.12.2016), introduces requirements of WCAG in version 2.1. (Tab.1). WCAG is a collection of documents published by *Web Accessibility Initiative* (WAI), targeted at websites' developers and administrators. They include guidelines that allow developing webpages and websites accessible to all persons in compliance with the principle of equality, which means a specific architecture of a webpage that allows using it also by persons with disabilities without the necessity to use additional tools and applications. (The Ombudsman Report, 2013)

Table 1: Requirements from websites and mobile applications of public entities in Poland.

Principle	Requirements	Level A	Level AA
1. Perceptibility	1.1 Alternative text	1.1.1	
	1.2 Time-variable media	1.2.1 – 1.2.3	1.2.5
	1.3 Adaptability	1.3.1 - 1.3.3	1.3.4 - 1.3.5
	1.4 Possibility to distinguish	1.4.1 - 1.4.2	1.4.3 - 1.4.5 1.4.10 – 1.4.13
2. Functionality	2.1 Accessibility from the keyboard	2.1.1 - 2.1.2 2.1.4	
	2.2 Sufficient time	2.2.1 - 2.2.2	
	2.3 Seizures - Flickering	2.3.1	
	2.4 Possibility to navigate	2.4.1 – 2.4.4	2.4.5 – 2.4.7
	2.5 Manners of entering data	2.5.1 – 2.5.4	
3. Comprehensibility	3.1 Legibility	3.1.1	3.1.2
	3.2 Predictability	3.2.1 – 3.2.2	3.2.3 – 3.2.4
	3.3 Assistance in entering information	3.3.1 – 3.2.2	3.3.3 – 3.3.4
4. Reliability	4.1 Compatibility	4.1.1 – 4.1.2	4.1.3

In Poland, Accessibility is monitored by the Ministry of Digital Affairs for which public entities are obliged to fill in and submit the so-called: Accessibility Statement[2] (all public entities must submit it until 31 March starting from 2020 – for websites and until 2021 – for mobile applications (Article 10 of the Act on the Digital Accessibility)). The aim of publishing the Accessibility Statement is to enable reading the information on the accessibility of the public sector body. This information is primarily useful for persons with disabilities, who will be able to know what kind of assistance or supporting solutions are accessible with regard to the given entity.

The Accessibility Statement must be digitally accessible in full (in HTML format, in any version), even when the website or mobile application itself does not meet them. (Warunki, 2020)

Accessibility as the key right of each citizen to information and knowledge should become a basic right of each citizen of the European Union. Moreover, a special attention should be paid to the safety of information included on the website, as well as the safety of persons using such information. The fear, whether the accessibility is not introduced at the cost of safety becomes, in fact, justified. Therefore, the legislator should ensure monitoring and controlling pages in terms of the safety of collecting, processing and especially storing personal data of persons using the Internet or the mobile network of the public administration. It is a challenge for mobile networks' administrators of public administration offices.

The **Norton Cybercrime Report 2019** implies that 117 million adults, men and women, both young and older, all around the world have been affected by identity theft, also by shared information of public administration.

The General Regulation on Personal Data has been binding in the whole European Union for over a year. It constitutes the main element of coherent and modernised Union frameworks for data protection that also cover the directive on data protection in criminal cases and the regulation on personal data protection by EU institutions and bodies.[3] The public administration authorities are bound to appoint a data protection body monitoring and controlling all instances of violating citizens' privacy. Whereas, institutions and entrepreneurs owning websites and applications are bound to ensure users' data safety and protection. Such an approach forces local government members to ensure safety of citizens using their websites and mobile applications.

The object of the research and research methods

The Silesian Voivodeship in its current state was created on 1 January 1999 as a result of the administrative reform. It has an area of 12,333 km^2, and there are 4,548.2 thous. inhabitants, including 1,052.1 thous. people in the countryside. The number of persons collecting benefits from ZUS and KRUS amounted to 1,157.4 thous. persons. In the territory of the voivodeship there are 17 poviats, 19 cities with poviat status, 167 municipalities and 71 towns, 1,294 villages and 1,073 village representations.

The object of the research comprised websites of urban-rural municipalities' offices (22) and rural municipalities' offices (96) located in the territory of the Silesian Voivodeship. The choice of the object of the research was dictated by the fact that the Silesian Voivodeship is one of the fastest aging voivodeships in Poland (negative birth rate) and thus, the number of seniors is growing (post-working age people), and citizens residing in the rural areas are persons potentially digitally excluded due to their education and not being well-off. In the researched sampling the income tax per inhabitant amounted to PLN 1,431.75, whereas per voivodeship - PLN 4,481.57 (GUS, 2018).

The research focused on the accessibility of the website in the scope of electronic interaction with the target group of citizens (A2C - administration-to-citizen). Website addresses of entities were identified via Google Chrome search engine. Such an approach allowed verification, whether the address is easily accessible for a potentially interested person, who uses the most often used online tools.

The key to ensure accessibility is to adhere to the technical standards, thus, next websites were verified in terms of proper construction, requirements imposed by the WCAG standard and sharing documents in PDF format. The most often used tool that allows automatic verification is HTML Validator. This automatic tool for verification of the correctness of tags used in HTML or XHTML was created by the W3C (World Wide Web Consortium). Validator analyses, if the tags on the website are compliant with the characteristics of a given version of HTML. Therefore, the advantage of this tool consists in the easy analysis and continuous improvement and development of tools by the consortium, which allows on-going detection of errors on websites. (Kozłowski et. al., 2014)

Data collected with HTML Validator was analysed in terms of the quantity of detected errors and warnings on the entity's website. To this end, Statistica programme was used. Since the work is of an analytical character, it was also attempted to take into consideration the entity's income and the number of citizens in the given municipality. Thus, the following research questions can be asked:

1. Does the website quality depend on the number of citizens potentially using the services provided by the e-office?
2. Does the municipality's income influence the quality of the website?

It was attempted to answer thus asked questions with the use of the following statistical tools: correlation tables and descriptive statistics (median, arithmetic mean, normal distribution and box plot).

Research Results

The research was conducted in January 2020 on 118 webpages that belong to rural and urban-rural municipalities of the Silesian Voivodeship. One municipality does not have a website, on two websites

there was an error – websites did not open, and two websites were dangerous – google assistant alert, of which 113 websites were studied (96% of the research sampling).

The data analysis consisted in estimating correlations between lateral data and then, analysing descriptive statistics of errors and syntax warnings of codes noted by Validator.

Two data distribution models were analysed: warnings and errors. While verifying whether the given factor differs from zero, p=0.1 was adopted as the cut-off level of correlation significance due to the explorative character of the research.

Table 2: Table of correlations between errors and syntax warnings of codes noted by Validator for rural and urban-rural municipalities.

Variable	Correlations (assessment of municipalities' websites (B2:DK115)) Marked correlation coefficients are significant with p < ,10000 N=111 (Lacks of data were removed by cases)					
	Mean	SD	Income per capita	Population	Errors	Warnings
Income per capita	1440.44	459.011	1.000000	0.154836	0.216997	-0.129595
Population	10225.50	7227.513	0.154836	1.000000	-0.011947	-0.179128
Errors	40.31	110.065	0.216997	-0.011947	1.000000	0.209882
Warnings	22.63	17.025	-0.129595	-0.179128	0.209882	1.000000

The condition of significance has been met with regard to all variable data. The correlation coefficient indicates correlations between lateral variables. While analysing table no. 2. negative correlations between the number of people and the number of warnings related to the codes on websites of e-offices (-0.179) should be noted. Such a correlation indicates that along with the increase in the number of people, the number of warnings is decreasing.

As far as the number of errors is concerned, it depends on citizens' incomes and thus, municipalities' incomes (0.217). What is striking is the fact that along with the increase in incomes, the number of errors also increases, which proves that the incomes generated by municipalities' citizens do not influence the quality of the website. The positive correlation between errors and warnings (0.21) proves that the main reason for limited accessibility to services provided by e-offices of research entities depends on the administrators of websites and webpages. In conclusion, the accessibility of webpages related to the quality thereof depends on the number of potential users, citizens' incomes, however, primarily on the knowledge and experience of network administrators.

In order to have a better look at the quality related to the accessibility of websites, it has been decided to separately analyse errors of webpages' codes and warnings.

Fig. 1: Errors – summary of descriptive statistics.

While analysing errors of codes occurring on websites of municipalities' e-offices, one should pay attention to the number of these errors. Usually up to 200 errors per page were detected (98% of cases), whereas, mean is approx. 41 errors per website and the interquartile range is only 4.38.

The spread of the number of errors is huge and therefore, the quality of websites differs significantly (median amounts to 11, and the difference between minimal and maximal values amounts to as many as 96%). This situation is not satisfactory, since each error decides on the website quality and the municipal governments' care for citizens, who can use those websites. The errors' normality graph also presents the distribution of all studied cases. Two websites are negatively distinguished as compared to the other ones, thus, administrators of those websites should attempt to change the websites, as the number of errors is significant and deviates from the norm. It seems justified to state that the offices of municipalities of the researched voivodeship face a huge challenge of changes adjusting their websites to the Polish and international law provisions. The spread related to the number of errors is significant, which proves that some local governments have not dealt with the challenges of the digital reality.

Another studied factor influencing the quality of websites that belong to public entities - rural and urban-rural municipalities are warnings (fig. 2).

Fig. 2: Warnings – summary of descriptive statistics.

With regard to warnings, attention should be given to the fact of their lower number (maximum number of warnings is 78, in comparison to errors – 955). The mean of the number of warnings is 23, yet, on 72% of e-office websites up to 30 code-related irregularities were detected. The median of warnings is 17, which is a higher value than in the case of errors, that is, 50% of all detected irregularities per website is lower than 17. As far as the data spread is concerned, it is also lower and amounts to 78%. The interquartile range of the box plot amounts to 11.31, that is, it is higher than the interquartile range.

The normality graph of warnings also significantly differs from the errors' graph. The spread of cases is relatively equal, which results from lower qualitative differences between websites of studied entities. Moreover, no website is distinguished with a significant difference in the number of warnings. Such a situation should attract the attention of local government members and network administrators to the difference in the accessibility and quality of websites of these municipalities as compared with the voivodeship.

Summary

The work was of an analytical character. Two mediators: the number of errors and syntax warnings of HTML or XHTML codes detected by Validator were used for the analysis of the accessibility of websites of rural and urban-rural municipalities of the Silesian Voivodeship. The analysis proved that the number of warnings depends on the number of errors and the number of people residing in a given municipality. Whereas, the correlation between errors and warnings is positive, and the correlation with the number of people residing in a given municipality is negative. Drawn conclusions are unequivocal that the quality of websites primarily depends on the network administrators; if they have high competences, they react to errors quickly and thus, eliminate the number of warnings. What is interesting, the quality of network administrators depends on the number of potential e-offices' users, since along with the increase in the population, the number of warnings decreases.

If we analyse the number of errors, the correlation with municipalities' incomes is positive, which is a poor testimony for local government members. It results from the fact that the amount of funds in the municipality does not favour the quality of their webpages. It seems justified to state that persons responsible for developing and managing websites of municipalities' offices should take into consideration the fact of the law quality of their websites and adjust them better to the needs of persons using the Internet.

The discrepancy in the quality of websites suggests that some entities should change or archive webpages and replace them with new ones. In the future the challenges faced by local government members with regard to the quality and accessibility of websites should be supplemented with the opinion of digitally excluded persons. Administrators should design the architecture of websites based on the said opinion and thus, better adjust the contents and forms by sharing information publicly. The number of errors and warnings should also raise concerns of persons responsible for the safety of data held by municipalities. It is easily noticeable that the accessibility and safety constitute main tasks of the municipality's local government concerning the quality of websites and mobile applications of e-offices.

Abstract

In modern conditions any organization experiences the influence of both external and external factors, and in this connection there arise many problems, risks and threats. In conditions of economic development mechanisms and tools for prompt response of the cooperative sector to changes taking place on the microfinance market are required. A more balanced research and practical approach to solving the given problems is needed. The aim of the study is systematization of theoretical and practical basics of assessment of risk-contributing factors of a cooperative organization and development of mechanisms of providing economic security of the cooperative sector in quickly changing conditions. As a result of analysis of risk-contributing factors that determine economic security of a cooperative organization, we suggested mechanisms enabling solving cyclic problems that arise in the cooperative sector and providing economic stability of cooperatives by means of internal reserves and proper attention to risks on all levels of management and regulation on the microfinance market.

Keywords: Risk-Contributing Factors**,** Economic Security, External and Internal Environment, Credit Cooperation.

Introduction

In modern conditions the need in being proactive remains to be relevant for economic development. Risks and economic security are the notions that accompany any actions both in business and in government control. Prevention of risks and elimination of threats to economic security are still popular and attractive notions both for theorists and practitioners. From the point of view of the popular scientific approach, risks and threats as well as elements of economic security have various uses, but common content. Often these notions are mixed and considered to be interchangeable. From the point of view of the research approach, different authors put their own content material in the basis of differences in risks for and threats to economic security, for example, S.V. Bank et al. (2018). In studies by M.V. Barsukova and L.P. Fedorova (2018) technologies and competitive advantages in risk management are examined traditionally in modern organizations, while formation and implementation of the economic security model by L.P. Fedorova and M.V. Barsukova (2019) are taken on the level of a region, and, generally, this category, in the most part of the study, concerns the

macroeconomic level. Cooperation as a key development sphere is examined in the studies of A.V. Tkach (2014), R. Yanbykh, R. Saraikin and Z. Lerman (2019), O.V. Litvinova, G.V. Kalinina and L.P. Fedorova (2017), T.N. Egorova, S.N. Bogdanov and E.V. Bogdanova (2016), C. Sanchez Bajo and B. Roelants (2011) and others. Management of financial risks with regard for corporation, intermediaries and portfolio-balance approach was studied by the following authors: J.A. Batten, P. MacKay, N. Wagner (2013), Tim R. Adam and Amrita Nain (2013), Craig O. Brown (2013) and others. In the present study the emphasis is made on revealing of factors having significant influence on activities of cooperatives reflecting cyclicity of its development posing both a risk for and a threat to economic security of the cooperative sector.

Materials and methods of the study

The materials for the study were the experience of organizations of credit cooperation, in particular, the consumer credit cooperative "Sodruzhestvo", the Chuvash Republic. The following methods of study were used: problem-based approach, factorial analysis, analogy, systematization, generalization, graphical interpretation.

Results of the Study and Conclusions

In Russia, comparing to developed countries, insufficient attention is paid to examination of risk and threats of the external environment, but greater interest is concentrated around the spheres of influence of business and the state, opportunities for cooperation, search for new markets or growth of the occupied share of business market. All this is done with the aim of creating the background for fast and sustainable economic growth, in order to use any opportunity for business development. All these early interventions with respect to future influence of the external environment are reflected in the innovation investment model by S.L. Blau, L.P. Fedorova (2016) built on the basis of mobilization of internal resources. The wider the sphere of activity is, the greater is the need in managing its economic security. It is follows herefrom that in case of widening of the company's interests it is more interested in studying the external surroundings and risk-contributing factors, although business activity expansion is feasible not in all spheres of economy and might have no required effect. This is connected, first of all, with state control of activities of individual sectors and legislative requirements.

A situation has formed on the microfinance market when many entities make emphasis on survival and prompt response to changes in the legislation and regulatory measures, and only "large players" who participate in implementation of strategic benchmarks of the state policy of Russian public authorities can concentrate on strategic development tasks. Globalization in all spheres dictates its requirements. For example, in Russia the cooperation sphere is increasing despite external economic sanctions. This concerns international integration, at present, not only of the European direction, but Asian one as well, and provides for the following: facilitating entry into new international markets; expansion of the system of integration with large transnational companies; development of public-private partnership mechanisms. The field of integration and cooperation enabling greater "control" of the environment or thus trying to "resist" impact factors is becoming wider.

A.V. Tkach in his studies (2014) examines cooperation as a key sphere in the agroindustrial complex of Russia. Consumer cooperation has special historical importance. All risks inherent in this sphere of activity are closely connected with agriculture branches and directly influence credit cooperation. Trends of its development are connected with seasonality and cyclicity of agricultural production processes. Cooperative tradition in Russia is investigated in studies of R. Yanbykh, R. Saraikin and Z. Lerman (2019). For example, revival of agricultural service cooperatives can in its turn give a new direction for credit cooperative development. Forms of further cooperation in these fields (areas) and industries can give a new stimulus for credit cooperation development. It should be noted that the sectoral structure of Russian small business remains unchanged, according to T.N. Prokopyeva's book (2009): trade and repair industry are leaders that occupy almost a third of small business market, they are followed by real estate operations and building industry, encompassing another third of small enterprises. Development of individual kinds of spheres of services and attraction of small business

entities to the social sphere can open new horizons for cooperation development.

The adaptation mechanisms in development of the agroindustrial sector examined in the studies of T.N. Egorova and A.G. Ilyina (2018) make it possible to view increasing needs in investigating factors of external market surroundings. Conventionally, in studies impact factors are divided into 2 categories by the nature of the impact: external and internal ones. In works of O.V. Litvinova, G.V. Kalinina and L.P. Fedorova (2017) factors of direct and indirect impact are distinguished in the external surroundings and are distributed by the character of influence. Among top-priority and prominent factors those of market environment are distinguished which, as a rule, belong to direct impact factors: 1) consumers, 2) suppliers, 3) competitors, 4) direct state regulation. In separate cases indirect geographic environment is also distinguished as a direct impact factor. We believe that the geographic environment, in this way or another, is formed by the above mentioned 4 direct impact factors. In this connection for a modern organization solving of problems of assessment of external impact on business, which is reflected in the work of T.N. Egorova and A.S. Yanov (2019), provides for use of various methods, including factorial analysis, SWOT and PEST analysis and others. Quality of analysis and classification of environmental factors must ensure reliability of an organization's development forecasts built on their basis and making of corresponding managerial decisions. Such solutions are developed with the aim of preparing a list of measures of prospective development of the organization's activity that reveals all existing and assumed elements of impact (change) of the above mentioned four direct impact factors. Analyzing direct impact factors is a way of forecasting business development. Use of the given classification of factors by their impact depends on dependent and independent variables of external and internal environment as well as on the content of the phenomenon or process being the object of analysis. However, from the point of view of methodology, it is more important to study the degree of this impact, distinguishing between factors with significant level of impact, i.e. a high or strong significance, and factors of low, insignificant impact. In terms of importance of analyzing the results of this impact factors with a significant level of impact on the business activity results, i.e. of key or primary importance factors, and factors of less importance, belonging to secondary positions, are distinguished.

Thus, one can suggest dividing the risk-contributing factors into two groups by significance: key (top-priority), important for business factors and secondary, less significant factors.

According to assessment direction of impact of factors, positive and negative impacts (or threats, risks, risk-contributing factors) are distinguished. Classification and analysis of external impact factors are carried out with the use of methods of ranging and probabilistic assessment of the nature of impact of the factors. At that, variants can be used:

1) impact factors with opposite (differently directed) values of assessment focus are selected. For example, gain in money income of the population is a positive opportunity, while reduction of population's income is a negative characteristic or a threat;

2) factors having no oppositely directed focus and independent ones. For example, entry into a new market is an opportunity that has no negative opposite factor in the analysis process. It can be viewed only as a positive characteristic. However, there arise numerous unsolved issues of negative connotation (risk of occurrence of assumed problems), for example, barriers for entry into the field, presence of competitors, increasing of costs, adherence with regulations and control of activity. According to this example, one can state that for individual organizations negative, risk-contributing factors can turn into positive ones and vice versa. For example, inflation in most cases is determined as a negative characteristic of economy, but some enterprises can turn this factor into a favorable opportunity to increase prices for their products. There are quite a few examples of this kind in Russian practice since annual inflation, seasonal rise of prices encourage business to raise prices with no adequate reasons therefor.

The situation on the microfinance market during the recent years has significantly changed, which made work of the market participants more difficult. The common problematic field of risk-contributing factors remains irrespective of development cyclicity – this is, first of all, low paying

capacity of the population against the background of the economic crisis; secondly, imperfection of legislation and its mismatch with the actual market situation; thirdly, a short term of loans with high interest rates, etc. The macroeconomic situation and change of general state benchmarks (strategy) in the country, as a whole, aggravate the course of unfavorable internal processes of the microfinance market. Debt overburden and financial ignorance of the population, absence of financial assurances upon stiffening of regulatory functions, introduction of new institutions, in particular, bankruptcy of individuals remain to be risk-contributing factors, all this impedes activity of its participants and causes development slowdown (and even reduction in the number of market participants).

Thus, having generalized stages of development of the given sphere, once can conclude that there were more favorable periods due to state support and target development programs as well as financing from different funds, including foreign ones. They were replaced by stricter regulation at times changing into pressure on the microfinance market, displacement of small businesses and acquisition by large players. This often leads to unfavorable consequences of risk-contributing factors, which we observe at present in the credit cooperation. However, there exists an opinion, for example, in A.F. Maksimov's article (2019), where a conclusion was made that regulation of activity, in particular, of agricultural credit consumer cooperatives (ACCC) on the part of the Bank of Russia is not the only determinant of the reduction of their number. As a whole, to reduce the regulatory load the state authorities, including the Bank of Russia, start to use the risk-oriented approach to organization of state control and supervision.

It should be noted that the microfinance market has used up its previous excess returns he had in the middle of the 2000s and entered a regulated stage during its cyclic slowdown. Because of it credit cooperatives were in unequal competitive conditions, and their survival experience can be transformed for other markets, which is proved by foreign experience of cooperative movement described in the investigatory monograph of Claudia Sanchez Bajo and Bruno Roelants (2011).

As an example, let's examine the activity of the consumer credit cooperative "Sodruzhestvo", one of large cooperatives of the Chuvash Republic, which has been operating on the financial market for 17 years (Fig. 1).

Fig. 1: Dynamics of the loan and savings portfolio of CCC "Sodruzhestvo" during 2014-2019

At the peak of activity in 2013 the loan portfolio increased comparing to the pre-crisis one of 2008 2.6 times. Opening of new divisions in regions of the republic had positive influence and the number of cooperative members increased during the first decade of operation almost 5 times. The loan portfolio grew up to 2014, incl. thanks to active work of the divisions – offices in the rural area. However, the crisis and turbulence in economy at the end of 2014 inevitably led to reduction in the loan portfolio volumes by 7 % with respect to the maximum of 2013, further reduction of the portfolio corresponds to the level of 2012, and for the period of the economic crisis from 2014 till present times the number of actual members has reduced almost twice, just like the loan portfolio, the outflow of savings - 6 times.

The reasons for aggravation of financial indicators of the cooperative since 2014 are interconnected risk-contributing factors, which include the economic crisis in Russia that led to reduction in the level of income of the population and growth of debt overburden of the population. The situation was further aggravated by stiffening of requirements to borrowers both inside the cooperative and in the external legislative environment. As a result, this led to provision of fewer loans in the cooperative, consequently, to loan portfolio reduction. Worsening of payment discipline on the part of borrowers led to an increase in the overdue amount by the loans provided. Untimely receipt of monetary means as repayment of loans from the borrowers started to create difficulties with fulfillment by the cooperative of its obligations with respect to its savers. In connection with active return of savings to members the cooperative cannot meet the financial ratios of its own and borrowed means. This is a cyclic problem faced by all cooperatives in different periods of financial recessions in conditions of self-regulation and regulation of the credit cooperation's activity by the Bank of Russia.

Higher rates of formation of reserves for possible loan losses (RPLL) during 4 years aggravated the market situation. Most cooperatives experienced these problems when by the end of 2017 they had to form 100 % RPLL to meet the requirements of the Instruction of the Bank of Russia "On the order of formation by consumer credit cooperatives of reserves for possible loan losses" No. 3322-У of 14.07.2014. The decision was made to direct a part of members' contributions for formation of RPLL as well as formation of a stabilization fund out of members' contributions. This measure solved a part of problems. However, the solution turned out to be unpopular in the beginning and caused panic among a part of savers that provoked their outflow. About 3% of the total number of members wanted to return their savings.

In our case the panic of a certain part of members was caused by the trend of closing of many well-known large and small credit cooperatives of the Chuvash Republic that had been operating on this market for over 10 years, which is present even nowadays. Also, credit cooperatives of other regions operating in the Chuvash Republic through representative offices are closed in the bankruptcy procedure. Well-known banks are deprived of licenses, which also increases "panic" mood of the population. The image of cooperatives as "financial pyramids" used by swindlers with the aim of non-refundable withholding of savings of the population is formed in the mass media. In conditions of financial ignorance of the population this negatively affects the image of the credit cooperation and leads to mistrust to the microfinance market sector, as a whole. So faithfully operating cooperatives have to maneuver, fighting difficulties that may arise on a standalone basis.

With the aim of ensuring financial stability a cooperative should have enough of its own resources. Different variants are suggested by us for formation of a "safety cushion". For example, it is creation of targeted funds (stabilization funds) by attracting members for its formation as well as the possibility of increasing members' contributions to the reserve fund.

The suggested measure of transition to mainly contribution-based operation will provide the cooperative with real possibilities of reducing the dependence on attracted members' savings to the level of less than 50% in the Fund of mutual financial assistance. Also, as an effective measure, there was a suggestion concerning payment by members of additional contributions for covering the losses by the results of RPLL formation that was adopted in 2018 and approved by the Board and the general meeting of cooperative members. The given measure enables increasing responsibility of members for observation by the cooperative of historical operation principles, including adherence with financial regulations of CCC.

In case of nonadherence with financial regulations a cooperative develops and implements a solvency recovery program, which is a measure of ensuring economic security. With the aim of preventing losses from RPLL formation the more favorable time period, according to practitioners, would be a period of minimum 7 years, instead of 4 years established by Instruction No. 3322-У. The given measure would enable formation of about 15 % of reserves annually, reduce members' burden and would not affect operation of faithful cooperatives oriented at stable and continuous functioning on the market. A top-priority task of the present time is to prevent increasing of overdue debts of a cooperative.

The authors (T.N. Egorova and S.N. Bogdanova (2019)) in their studies suggest using the measures of involvement of internal reserves of economic security. We distinguish internal elements of economic security of a consumer credit cooperative as the key ones the adherence with and implementation of which is possible within the framework of the Basic standards on risk management used in the sphere of activity of consumer credit cooperatives and approved by the Bank of Russia as a regulator of the microfinance market:

1) financial stability confirmed by adherence with financial regulations;
2) formation of required funds which are to be used in force majeure circumstances;
3) acquiring of objective information about loan portfolio quality and formation of reserves for possible loan losses;
4) organization of work with overdue debts, an example is studying operation of a department on collection of overdue debts (Table 1).

Table 1: Characteristics of key elements of economic security of a consumer credit cooperative

Name	Characteristic	Document	Result
1. Financia l stability	Adherence with financial regulations of CCC proven in dynamics by calculations and controlled on the part of the Bank of Russia as a mega-regulator and CCC SRO	Instruction of the Bank of Russia "On numerical values and the order of calculation of CCC financial ratios" dated 28.12.2015 No. 3916-У	Enables comparative assessment of entities' activity, sustainable and economically stable operation of a cooperative
2. Formation of funds and reserves	Use of the resources of CCC funds and reserve fund is provided for in case of economic instability on the market, a shortage of monetary means for provision of statutory activity of a cooperative as well as in force-majeure circumstances	Instruction of the Bank of Russia "On the order of allocation of resources of CCC reserve funds" dated 24.09.2015 No. 3805-У	Creates the required balance and prevents onset of negative circumstances in operation of a cooperative: gaps (shifts) in attraction and use of members' monetary means
3. Loan portfolio quality, share of overdue loans	Acquiring of objective information about loan portfolio quality by formation of reserves for possible loan losses	Instruction of the Bank of Russia "On the order of formation of CCC reserves for possible loan losses" dated 14.07.2014 No. 3322-У	Provides for statutory activity of a cooperative, ensures its stability and liquidity of CCC assets
4. Claim-related work of cooperative with overdue debts by loans provided	Formation of a service for collection of overdue debts, a center of out-of-court settlement (COS), a service (department) of internal control, appointment of persons responsible for supervision over fulfillment of contractual obligations and timely payments by borrowers for the loans provided, effective work of managers of overdue loans	Basic standard on risk management in the sphere of CCC activity, approved by the Bank of Russia, Protocol No. КФНП-11 of April 17, 2018	Systematic work with overdue debts, constant interaction between loan managers and members with overdue debts and a service of court bailiffs

A key task of a cooperative in conditions of risk-contributing factors is keeping trust of the most part of members and joint work between members and the management of a cooperative to escape a difficult situation. Undoubtedly, a cooperative has to continue providing financial mutual assistance, giving loans, along with returning savings to its members – this is one of the main conditions of its survival, operability, maintaining of the cooperative's financial stability. The management of CCC "Sodruzhestvo", together with the Board, employed its internal reserves, namely, it attracted the cooperative's members to solving of existing problems. One of important internal reserves specific namely for the cooperative form of organization is procurement, through mutual assistance of members, of the required resources for fulfillment of obligations with respect to all members and prevention of bankruptcy for stabilization of further operation. Solving of this problem provides the cooperative with possibilities of transition to a less risky form of contribution-based operation, which ensures its economic security.

A cooperative's development prospects, in lieu of formation of economic security, are seen by us as CCC sustainability and operation stability, attraction of new solvent borrowers, including those from competitors, provision of new, more competitive services on the financial market, winning over trust to itself, enlargement and integration with other cooperatives in the way enabling adherence with principles of cooperation community, ensuring economic security and preventing significant risk-contributing factors.

Thus, economic security of a consumer credit cooperative is perceived by us as an anti-crisis program of its stable operation. When outlining economic security elements, we considered their interconnection with the theory and practice of anti-crisis management and risk management. We suggested the following key elements: ensuring financial stability, formation of required funds and reserves; active use of tools of assessment of borrowers' risk profile for ensuring quality of the loan portfolio with a low share of overdue debts; adherence by the cooperative with the "Provision on risk management"; effective monitoring of borrowers' financial behavior and members' financial literacy; improvement of effectiveness of claim-related work, program-based scoring, tools of preventing loan-related fraud, etc.

Classification and analysis of external impact factors are concentrated around business impact spheres, forms of cooperation, search for new directions, so we should suggest classifying direct and indirect impact factors dividing them by the nature of impact into: key, top-priority, significant for business and secondary, less significant ones; by impact assessment positive impacts and negative impacts (threats, risks, risk-contributing factors) are distinguished, with the use of methods of ranging and probabilistic assessment of the nature of impact of factors.

The examined risk-contributing factors have critical influence on economic security of a consumer credit cooperative, i.e. they act as threats to economic security. This is, first of all, outflow of savers as a result of panic moods because of the existing market situation and, secondly, the risk of formation of overdue loans and the need in formation of reserves for possible loan losses, when a cooperative, having a loss, makes up for it using its own resources, including members' resources. Here lies the main difference between a cooperative and microfinance and other credit organizations. Active members' participation in the work of the cooperative existing for provision of mutual assistance to members within the framework of cooperative community ensuring transparency of its operation for members, improvement of their financial literacy and trust is believed to form economic security of organizations of the cooperative sector both in the past and in future.

Uniformed Classes in Poland And Their Role in The Process of Shaping Young People's Pro-Defense and Citizen Attitudes

Milena PALCZEWSKA

War Studies University, Warsaw, Poland
m.palczewska@akademia.mil.pl

Abstract

The purpose of this article was to present the impact and role of uniformed classes in shaping civic and patriotic attitudes among young people. A study was conducted on a group of 1,100 students in uniformed classes. The main purpose of this study was to show the role of uniformed classes in shaping civic and pro-defense attitudes of young people. The study showed that uniformed class students highly value civic attitudes, such as helping other people both in Poland and around the world, as well as understanding and accepting other people's views and arguments. Controlling the government's work, paying taxes, complying with the law or participating in elections also plays an important role for them. In addition, the study showed that young people attending uniformed classes exhibit pro-defensive attitudes. Uniformed class students are people who support education for safety or access to firearms. These are people who declare their readiness to give their lives for their homeland in the event of an armed conflict or planning to start working in uniformed classes in the future.

Keywords: uniformed classes, patriotic education, security, defense.

Introduction

The main purpose of this study was to learn about the role played by uniformed classes in shaping civic and pro-defense attitudes among young people. At the beginning, bearing in mind the problem situation described above, the research problem was adopted. It is based on indicating what kind of civic and pro-defense features students of uniformed classes manifest. In order to solve the assumed research problem, the attitude of uniformed students to the presented classes was analysed civic attitudes, such as paying taxes, complying with the law, participating in elections, controlling the work of the government, tolerance for other views, social activity, economic patriotism, or willingness to help other people, both in Poland and around the world. Further on, questions were asked regarding pro-defense attitudes of uniformed class students, such as attitudes towards military service, law, weapons, and education for security (Falkowski, 2013). This allowed the key conclusions to be established, as well as outlines of positions that affect the final conclusions.

In this study, the author used a deliberate selection of a research sample. The respondents were selected from uniformed students of three upper secondary schools. This study was conducted in November 2019. In this case, the targeted selection method used was most appropriate for the type of study. It is the most typical example of non-random selection. Its features include the use of subjectively selected units to obtain the fullest and widest range of information in the study.

Materials and Methods

In this study, the diagnostic survey method, the survey technique and the popular research tool, the questionnaire, were used. When planning the research, the author decided that this tool is the most helpful, and therefore and the most adequate for the subject studied, as it allows full transparency of the results obtained. The author wanted to maintain the variety of questions used. For this purpose,

among others, categorized questions that allowed receiving many answers from respondents. The survey questionnaire also includes closed questions.

The research group in the study was 1100 people, coming from high schools, leading uniformed classes. All respondents are students of uniformed classes (1st, 2nd and 3rd class). Some respondents refused to participate in the study. They motivated their decision by lack of interest and their negative attitude towards various types of surveys. It is worth mentioning that for many respondents a high level of interest in the subject of the study was observed. They showed this interest by requesting to receive the test results by e-mail.

On the basis of the record questions used, the characteristics of the studied population were analyzed. The majority of respondents are men in the number of 660 respondents, and the remaining part were 440 women. 46% of respondents attend class I and they constitute the largest group. 35% of participants attend Class II, while 19% attend Class III. The most numerous group consists of students living in a small town - up to 50,000 residents (390 people), then students living in the village (380 people) and residents of the average city from 50,000 up to 100,000 residents (290 people). The least people live in a large city - over 100,000 residents (40 people).

Results

The survey questionnaire consisted of 21 questions, divided into 3 parts: the first part concerned the citizens' attitudes of the students, the second part - pro-defense attitudes, while the third part was metric data. The article will present only part of the results of the survey.

The first panel of the survey concerned the determination of civic attitudes among students in uniformed classes. They were asked to indicate on a scale from "1" (definitely not important to me) to "7" (this is very important to me) of their attitude to the values and theorems presented. The average for individual statements was calculated based on the answers given by the respondents (Kaliński, 2000).

In the case of saying that you should take part in all elections, the vast majority of respondents, as much as 50% indicated the answer "7", which means that participation in the elections is extremely important for them. Answers "5", "6" and "7" testifying to the validity of a given statement were indicated in total by as much as 75% of respondents. A neutral response, i.e. "4" was given by 20% of respondents. Participation in elections is not significant only for 5% of respondents who indicated answers "1", "2" and "3".

In the statement about the obligation to pay due taxes, the largest number of respondents also indicated the highest level of significance, i.e. the answer "7", i.e. 43% of respondents. A total of 77% of respondents pointed to the high significance of this issue. A neutral answer was given by 13% of respondents, and an answer indicating the lack of significance of paying taxes to 10% of high school students from uniformed classes.

Another statement concerned the attitude to absolute compliance with the law. In this case, also the largest number of respondents indicated the highest importance of this statement - it was as much as 49%. A high level of importance of paying taxes was indicated by a total of 82% of respondents. A neutral answer was given by 10% of respondents, and the answer indicating a low level of significance of the statement only 8% of respondents.

In the case of the statement about the need to control the actions of the government, most respondents pointed to the highest importance of this statement - 44%. A total of 83% of respondents gave a high-level response. A neutral answer was given by 11%, while a low-answer answer was given by 6% of high school students.

Another statement was that one should try to understand other people's arguments and views. Here also the highest number of respondents indicated the highest level of significance - 44%. A total of 85% of

respondents indicated a high level of significance of this statement. Neutral answer was given by 11% of high school students, while the answer indicating low importance was 4% of high school students.

In the remainder of the study, respondents referred to the statement that one should be an active member of political and social associations. In this case, the majority of respondents indicated the moderate validity of this statement - 31%, and the neutral response. In total, 53% of high school students replied that this statement was valid. In turn, a neutral answer was given by 27% of respondents, and those providing low significance - 20%.

Another statement concerned whether to be guided by ethical, political or environmental considerations when purchasing a given product, even if the product should be more expensive. In this case, the highest number of "4" answers was given, i.e. the neutral - 28%. The validity of this statement was declared by 50% of respondents, and low level of significance was indicated by 27% of respondents.

In the case of the attitude of high school students from uniformed classes to helping other people in different parts of the world, the highest number of answers were given - 42%. In total, 90% of responses attesting to the importance of this statement. Neutral answer was given by 6% of high school students, and only 4% of respondents who testified to low significance.

The last of the statements, to which students of the uniformed classes were asked, concerned their attitude to helping people in Poland whose standard of living is worse than their own. In this case, the majority of respondents indicated the highest level of significance of this statement - 46%. In total, 90% of respondents declared high significance answers. A neutral answer was given by 6% of high school students, and a response indicating a low level of significance of this statement by 4% of respondents.

In order to analyze civic attitudes among students of uniformed classes, the average for individual theorems was calculated. Against the background of the results obtained, the importance of economic patriotism, respect for the environment or political considerations when purchasing a given product is relatively clear - here the average answer was the least - 4.11. A similar result was obtained in the case of social activity in the form of active participation in pro-defense associations and organizations - here the average answer was 4.59.

For a relatively large number of respondents, participation in elections (average 5.0) and unconditional payment of taxes (5.47) are of high importance. Even more important for high school students from uniformed classes is compliance with the law (5.79) and control of the government's work (5.81). Definitely the highest level of importance for them is helping people in need around the world (5.9), as well as understanding for other people's views and arguments (5.9). The highest average, and thus the highest level of importance for respondents is to help people in Poland whose standard of living is lower than the standard of living of the respondents (Chart 1).

Chart 1: Attitudes of students in uniformed classes

The further part of the study concerned pro-defense attitudes among students of uniformed classes. In the first question of this panel, respondents were asked to indicate their opinion on military service. The majority of respondents, as much as 58%, indicated the need to maintain voluntary military service. Less than 38% believe that military service should be compulsory. 4% of uniformed students do not have an opinion on this topic. This shows that the majority of students in uniformed classes are people for whom voluntary attitude towards military service is of high value (Kanarski, Koter, Urych, 2014).

Another question related to the students' declarations whether in the event of a specific situation, e.g. armed conflict, they would be ready to give their lives for their homeland. The vast majority of respondents declared such readiness - 80%. The lack of readiness to sacrifice their life for their homeland was declared by 8% of respondents, and 12% of respondents have no opinion on this topic (Chart 2). This shows that students of uniformed classes are people who, in the event of armed conflict, declare their readiness to give their lives in defense of their homeland.

Chart 2: Opinion on readiness to give life for the homeland

In the next question, the respondents were asked to indicate whether they are in favor of further investing in increasing Poland's security. The vast majority of respondents are supporters of this

solution - they constitute 94% of respondents. Only 2% of respondents hold a different opinion. No opinion on this subject was declared by 4% of high school students from uniformed classes. This shows that students of uniformed classes are strongly supporters of spending more on Poland's defense.

In the further part of the panel examining pro-defense attitudes of uniformed class students, respondents were asked whether they plan to take up employment in uniformed services in the future. As many as 82% of respondents indicated that they intend to look for employment in uniformed services in the future. 11% of respondents have a different opinion and 7% have no opinion on this subject. This shows that for students of uniformed classes, the vast majority of them plan to work in any of the uniformed services in the future.

In addition to the desire to take up employment in uniformed services, an important aspect is also the prestige of this service in the eyes of uniformed class students. Students participating in the study were asked about this prestige. For 63% of respondents, work in the uniformed service has high prestige. Interestingly, none of the respondents indicated the low prestige of uniformed competitions. It is worth noting that as many as 37% of respondents indicated moderate prestige of work in uniformed services (Chart 3). This shows that the prestige of work in uniformed service is quite highly rated by students of uniformed classes, but actions should be initiated to increase this percentage.

Chart 3: Opinion on taking up a job in the uniformed services in the future

The next question was whether the respondents belong to pro-defense organizations or associations. The vast majority, as much as 82% of respondents, do not belong to any organization of this nature. Only 18% of respondents belong to this type of organization. This shows that students of uniformed classes are reluctant to belong to associations or pro-defense organizations. It is worth taking actions to promote various types of organizations or associations (Skrabacz, Urych, Kanarski, 2016).

Respondents were also asked to indicate their attitude towards gun ownership. For the majority of respondents, up to 58%, weapons should be available to the public after meeting certain conditions. In turn, for 29% of respondents, access should be limited to special cases only. For 7% of respondents, weapons should be freely available, without any conditions. In turn, 5% of respondents have no opinion on this topic. Only 1% of respondents believe that access to weapons should be completely banned (Figure 4). This shows that students of uniformed classes are in favor of general access to firearms, but under certain conditions.

Chart 4: Opinion on access to weapon

In the next part of the study, respondents were asked to provide their opinion on whether introducing a compulsory subject Education for safety at school is a good idea. For the vast majority of respondents, as much as 87% is a good idea. No opinion on this subject was declared by 9% of respondents, and for 4% of respondents the introduction of such a subject is a bad idea. This shows that students of uniformed classes are for the most part supporters of education for safety at school level.

The last question was whether students of uniformed classes are considering leaving Poland permanently in the future, e.g. for work purposes. Interestingly, only 36% of respondents do not intend to go abroad. In turn, as many as 43% of respondents consider such a trip in the future. No opinion on this subject was declared by 21% of respondents. This shows that, unfortunately, most students in uniformed classes are considering leaving the country for good (Chart 5). It is worth taking action to encourage young people to stay in the future in Poland. Permanent travel abroad of young people, especially future graduates of uniformed classes, can have a negative impact on the defense capabilities of the country.

Chart 5: Opinion on the possibility of leaving the country permanently

Discussion

It is worth emphasizing that all civic attitudes mentioned in the survey were assessed as important for the majority of uniformed class students participating in the survey. Among the listed civic attitudes, students of uniformed classes consider to the least important such as following national, political or environmental prerequisites when shopping, as well as belonging and working in pro-defense associations and organizations. In the case of the first attitude, it is worth including in the educational program elements of knowledge on the impact of consumer choices on the economy or the environment. In the case of the second attitude, it is worth paying attention to appropriate promotion of pro-defense organizations and associations among uniformed class students. This could take place during all kinds of open days or classes organized by these associations and organizations in schools where uniformed classes are conducted (Kanarski, Koter, Loranty, Urych, 2014).

Most respondents indicated that military service should be the voluntary choice of a given person. This shows that for students of uniformed classes, an important aspect is maintaining the voluntary nature of military service, in accordance with current legislation. In addition, students of uniformed classes in the vast majority declare their readiness to give their lives for their homeland in an armed conflict. This is especially important in the case of national defense.

The vast majority of students in uniformed classes are people who support increased spending on Polish defense. Also, many students of this type of classes plan to take up employment in uniformed classes in the future, which should be of special interest to those responsible for recruitment to this type of service. This is particularly important in relation to the demographic decline and the situation on the flare market, which is not conducive to recruitment to uniformed services. Unfortunately, for a large percentage of students, work in uniformed services does not enjoy high social prestige. It is worth undertaking various types of promotional activities that can raise this type of rating.

Conclusions

The study can be considered as fully effective. The main goal was to show the role of uniformed classes in shaping civic and pro-defense attitudes of young people. For this purpose, a study was conducted in which a questionnaire was used as a research tool.

Most uniformed class students are in favor of general access to firearms when certain conditions are met. This seems to be in line with pro-defense attitudes. Uniformed class students are also supporters of education for safety. In their opinion, introducing such a subject to schools is definitely a good idea. Undoubtedly, it plays an important role in shaping pro-defense attitudes among young people.

Unfortunately, a large proportion of students in uniformed classes are considering the possibility of leaving Poland permanently in the future for work purposes. This can have a definitely negative impact on Poland's defense through the outflow of educated youth who could join the ranks of various types of uniformed services. It is worth considering wide-ranging activities in the field of education, economy or social policy, which would encourage young generations to plan their future in Poland. This is undoubtedly a task for those who rule in the state. This study allowed to effectively analyze the citizens' and pro-defense attitudes of young people. Further research is postulated on the issues discussed as it has a great impact on the future of Poland and Poles. In addition, it is postulated to continue the research on a larger research group that would allow for a broad generalization of the results obtained.

It is worth analyzing the pro-defense and civic attitudes of uniformed class students with students of classes with different profiles. Only such research will be able to fully demonstrate the role and influence of uniformed classes on pro-defense and civic attitudes. This seems necessary, especially with the current desire to introduce uniformed classes as a permanent element of the Polish education system. These types of activities seem to be not so much advisable as, in principle, necessary, but they should be carried out in an orderly and coordinated manner, and what is the most important together with the support of the world of science.

Acknowledgment

Publication is an effect of project under the Ministry of National Defence Republic of Poland Program - Research Grant.

Abstract

Condition-Based Maintenance can be treated as a decision-making strategy, based on the data, information and knowledge collected from a manufacturing company. This article uses literature studies and the Analytic Hierarchy Process method, in order to determine the framework for the Supporting Decisions regarding CBM: (1) Maintenance Worker Selection Map, (2) the acquisition of data and information on the condition of machinery, (3) the amount of necessary repair costs entailed, (4) the creation of a data and information base, (5) a repair schedule, using the Analytic Hierarchy Process method, (6) and generating activity scenarios. The proposed approach is applied and validated in a real-case study.

Keywords: Maintenance, CBM, Competence, Decision Support

Introduction

Condition-Based Maintenance (CBM) can be treated as the strategy for potential maintenance schedules, based on prognostic models (Bousdekis et al., 2015). The development of methods and tools, supporting the implementation and realisation of this strategy, is in line with the concept of Industry 4.0. CBM, within manufacturing enterprises, enables failure to be predicted (Vafaei et al., 2019). However, for implementation of this strategy to be effective, it is necessary to develop and use decision making systems, in order to monitor machines (Kothamasu et al., 2006). One of the most important maintenance issues, for a manufacturing company, is the need to maintain a balance between a high level of reliability and economic cost. In CBM, strategy decisions can be made using historic data, collected during any manufacturing process. According to Shafiee (2015) the advantage, when using CBM, is that failures can be predicted; however, the disadvantage is the cost of the monitoring itself. The main our research question is whether, on the one hand, there is a decision model that combines the possibility of predicting failures, based on the historical values of parameters of the machinery and devices used in a maintenance department, while, simultaneously, taking into account the amount of necessary repair costs; moreover would such a decision model allow selection of the right employee to repair the machine? According to our previous research (Patalas-Maliszewska and Kłos, 2017) we have determined that the core competences of employees, in the context of Industry 4.0, are (1) technical competences, including general knowledge, expertise

and qualifications. (2) methodological competences, to include problem solving, the ability to organise work, creativity and analytical skills. (3) social competences, to include personal culture, the ability to work in a team, the ability to work with customers and communication skills. (4) personal competences, to include flexibility, the ability to undertake task-oriented work and work under pressure. Moreover, (in Patalas-Maliszewska and Kłos, 2019) we defined the most important competences of each maintenance worker as hard skills, knowledge-based skills, methodical skills, soft skills and experience. In this article, we assume that we have a specific number of employees in the maintenance department with suitable competences to repair a given machine, the 'Maintenance Worker Selection Map', so-called. (Patalas-Maliszewska and Kłos, 2019). We are looking for a machine repair schedule, depending on the amount of necessary repair costs to include labour costs, the cost of spare parts, downtime costs, penalty costs and the costs of lost benefits. In addition, we define in our approach, the needs of a maintenance department. in terms of the expected competences of the workers.Thus, motivated by the need to collect and store data and information about maintenance costs, the decision support model, for Condition-Based Maintenance (CBM), based on the identification of competence, is presented. The first element of the model is identification of those employees who have suitable competences, according to the 'Maintenance Worker Selection Map'. The values of the parameters of the machinery and devices used and also the amount of necessary repair costs, in a maintenance department, based on historical data, are then described. Using the Analytic Hierarchy Process method (AHP), the machine repair schedule is then constructed. Once all the competences held within a maintenance department are fully recognised, the final repair schedule can then be defined. On this basis, a decision-making model, for selecting the order in which machines were to be repaired was constructed, assuming minimum repair costs and according to suitable competences. In the last section of this paper, the implementation of our approach, based on a real case study, is presented.

A decision support approach for condition-based maintenance (CBM)

The collection of data and information during any manufacturing process is now easier because of the development of cyber-physical systems and also because sensors are cheaper; however, such data and information collection is still needed, in order to improve the decision-making process in CBM. Managers need ever more robust maintenance models, in order to implement predictive maintenance strategies (Park et al., 2016). According to Tsang et al. (2013) the important issue, within CBM, is what consequences - for the order process- will any potential malfunction have for a production line.

Vafaei et al. (2019) stated in the literature that a significantly increased use of intelligence techniques for monitoring and forecasting malfunctions can be observed in CBM; these include, decision trees (Bonissone and Goebel, 2001) and neural networks (Lee et al., 2006). The motivation for this paper was the study of Erosan (Erosan, 2019) in which was presented a method for identifying the critical components of the manufacturing system, using such as the AHP method.

We are looking for a model for collecting data about the parameters of the machinery and the devices used, within a manufacturing process and also about necessary maintenance and repair costs. The maintenance strategy of Zhao et al. (2018) is based on the minimisation of expected cost rates. We propose a more complex approach to monitoring repair costs including the following costs, viz., labour costs, the costs of spare parts, downtime costs, penalty costs and the costs of lost benefits. Moreover, in our model, we can identify which suitably competent employees should be given which machines to repair and finally we can recognise the competence needs of a maintenance department. The concept of the decision support approach for Condition-Based Maintenance (CBM) includes the following elements (1) the 'Maintenance Worker Selection Map', (2) the acquisition of data and information on the condition of machines, (3) the amount of necessary repair costs, (4) the creation of a data and information base, (5) a repair schedule, using the Analytic Hierarchy Process method, (6) generating activity scenarios. (Fig. 1).

In the first element of our approach, the value of the competence function $f(W_m)$ so-called, for each maintenance worker, is described. According to our work, (Patalas-Maliszewska and Kłos, 2019) each employee must complete a dedicated questionnaire for each competence, in order to acquire the

competence values, *viz.* hard skills, knowledge-based, soft skills and experience. A competence questionnaire is assigned to each resource, serviced by maintenance workers. Based on the defined rules and the test results of each employee, it is possible to calculate the value of the competence function $f(W_m)$ so-called, for each maintenance worker and for each resource, within a manufacturing company (Table 1). The higher the value of $f(W_m)$ for a given resource, then the more likely it is that this employee should be selected to repair a given machine.

The second element (Fig. 1) is to obtain the historical data on the work of a given resource. It should be assumed that employees in the enterprise use a cyber-physical system and that it is possible to obtain data regarding the time that spare parts 'k' are used for a given resource, $1 \leq k \leq 4$ - as also data regarding the time between failures for a given resource in this system. Table 2 presents the formulae for the first machine.

Fig. 1: The concept of the decision support approach for Condition-Based Maintenance (CBM).

Table 1 : The Maintenance Worker Selection Map

Resource within a manufacturing company	$f(W_1)$	…	$f(W_m)$
R_1	$0 \leq f(W_1) \leq 25$	…	$0 \leq f(W_m) \leq 25$
…	…	…	…
R_l	$0 \leq f(W_1) \leq 25$	…	$0 \leq f(W_m) \leq 25$

Table 2: Parameters received about each resource in one year

	1th data exchange for spare parts or data on failure	…	d-th data exchange of spare parts or data on failure	Mean time that spare parts were used
Spare part 1				vP_1
Spare part 2				vP_2
Spare part 3				vP_3
Spare part 4		…		vP_4
Failure				vP_5

The values of the necessary repair costs are then obtained from the cyber-physical system used, within a manufacturing company (Table 3).

Table 3: Values of the necessary repair costs received for each resource in one year

	The salary value for time taken up diagnosing and finding a solution	**The salary value for time taken up by maintenance operations**	**The salary value for time taken up by testing.**	**Costs of spare parts**	**Costs of downtime**	**Costs of lost benefits**	**Penalty costs**

Using the AHP method, the repair schedule is then constructed.

AHP is an effective method for dealing with complex decision making and may aid the decision maker to set his/her priorities, in order to arrive at the best decision. By reducing complex decisions to a series of pairwise comparisons, and then synthesizing the results, the AHP method enables us to capture the subjective and objective aspects of a decision. In addition, the AHP method encompasses a useful technique for checking the consistency of the decision maker's evaluations, thus reducing any bias in the decision-making process (Saaty, 1980). The AHP method considers a set of evaluation criteria and a set of alternative options from which the best decision is to be made. The AHP method can be implemented in the three following steps, namely, computing a vector of criteria weights, computing a matrix of option scores and ranking the options. In our approach, we created the following, pairwise comparison matrix A, based on Table 4:

(1) so-called process factors: $f(W_m)$- the competence function, P_1- mean time that spare parts 1 were used for a given resource; P_2- mean time that spare parts 2 were used for a given resource; P_3 - mean time that spare parts 3 were used for a given resource; P_4 - mean time that spare parts 4 were used for a given resource; P_5 - mean time between failures for a given resource.
(2) so-called cost factors: C_1 – labour costs C_2 - costs of spare parts k, for a given resource, C3 – costs of downtime, C4 – penalty costs, C5 – costs of lost benefits

The relative importance between the factors is measured according to a numerical scale from 1 to 9, where: 1-both criteria are equally important; 3- the first is slightly more important than the second; 5 – the first is more important than the second; 7 - the first the first is strongly more important than the second; 9 - the first is absolutely more important than the second and 2,4,6,8 - are intermediate values. The AHP method includes an effective technique for checking the consistency of the evaluations made by the decision maker when building each of the pairwise comparison matrices, involved in the process, namely matrix A and matrices B(j). Matrix B(j) is a n×n real matrix, where n is the number of options evaluated. Each entry of the matrix represents the evaluation, compared to the second option with respect to the first criterion. Based on the results of using the AHP method, we can indicate the order in which the machines should be repaired in an enterprise and finally generate activity scenarios in a maintenance department, based on the historical data regarding the state of resources and necessary costs, as well as in accordance with suitable competences in the company (Table 4).

Implementation of the proposed approach was presented in a real case study from a maintenance department.

A Case Study

In our case study, the enterprise is a manufacturer of car parts and accessories. 4 employees, servicing 8 resources in the company, work in the maintenance department. According to the first element in our approach, we identified the values of the so-called competence function for each worker and for each resource, based on the results from competence questionnaires (Table 5).

Table 5: The competence function values for maintenance workers

Resource within a manufacturing company	$f(W_1)$	$f(W_2)$	$f(W_3)$	$f(W_4)$
R_1	17	12	15	0
R_2	15	12	8	18
R_3	8	20	0	9
R_4	5	5	0	12
R_5	25	0	18	4
R_6	9	0	8	20
R_7	15	0	12	0
R_8	20	0	18	16

In addition, thanks to the definition of the competence function for each worker, it was pointed out that the competence of the W_3 employee should be raised, in order to be able to replace employee W_1. More detailed research on this issue will be discussed in future work.

Based on the data from the ERP system, implemented and used within a company, the data regarding the exchange of spare parts in each of the 8 resources, for one year, was then collected (Table 6) and the mean, usage time for the index values of the spare parts (day/per year) was also calculated.

Table 6: Data for the exchange of spare parts, from each of the 8 resources, for one year

Resource 1			
	1 Data	2 Data	Mean time that spare parts were used (day/per year)
Spare part 1	15.02.2019	02.09.2019	199
Spare part 2	10.01.2019	07.07.2019	178
Spare part 3	12.03.2019	15.10.2019	217
Spare part 4	15.02.2019	28.09.2019	225
Failure	10.01.2019	28.09.2019	261
Resource 2			
	1 Data	2 Data	Mean time that spare parts were used (day/per year)
Spare part 1	03.03.2019	23.09.2019	204
Spare part 2	05.02.2019	16.06.2019	131
Spare part 3	19.01.2019	27.08.2019	220
Spare part 4	17.02.2019	11.10.2019	236
Failure	05.02.2019	11.10.2019	248
Resource (…)			
Resource 8			
	1 Data	2 Data	Mean time that spare parts were used (day/per year)
Spare part 1	07.01.2019	14.09.2019	250
Spare part 2	07.01.2019	28.06.2019	172
Spare part 3	07.01.2019	23.05.2019	136
Spare part 4	07.01.2019	16.10.2019	282
Failure	07.01.2019	14.09.2019	250

In the third element of our approach, the values of the necessary repair costs, received for one year, 8 resources, were calculated (Table 7) based on the following rules:

- labour costs = (mean time that spare parts were used (day/per year) - (time for problem diagnosis and finding solutions + time for maintenance operation time + time for testing)) x salary/per day/worker,
- costs of spare parts – data form ERP system,
- costs of downtime = (mean time that spare parts were used (day/per year) – (time for problem diagnosis and finding solutions+time for maintenance operation time+time for testing) x cost of not completed in t this time order,
- costs of lost benefits = value of rejected orders from ERP,
- penalty costs = costs of delay in completing the order (cost for each day of delay) mean time of delay x penalty per day.

Table 7: The values of repair costs, for one year

Resource 1					
	Labour costs	Costs of spare parts	Costs of down-time	Costs of lost benefits	Penalty costs
Spare part 1	2500	1850	800	0	0
Spare part 2	3000	2270	3500	1500	5000
Spare part 3	1500	1230	500	0	0
Spare part 4	1000	1540	1500	2000	4000
Failure	4000	2410	8000	3500	5000
∑	12000	8600	14300	7000	14000
Resource 2					
	Labour costs	Costs of spare parts	Costs of down-time	Costs of lost benefits	Penalty costs
Spare part 1	2500	1500	800	2000	5000
Spare part 2	4000	2000	4000	0	0
Spare part 3	1000	1500	500	0	0
Spare part 4	1000	1000	500	0	0
Failure	2500	1000	6000	2000	5000
∑	11000	7000	11800	4000	10000
Resource …					
Resource 8					
	Labour costs	Costs of spare parts	Costs of down-time	Costs of lost benefits	Penalty costs
Spare part 1	500	1500	500	0	0
Spare part 2	2000	2000	3500	0	0
Spare part 3	5000	1200	3000	5000	8000
Spare part 4	500	1500	1500	0	0
Failure	1500	2200	3000	2000	5000
∑	9500	8400	11500	7000	13000

Finally, based on Table 5 and Table 7, the data and information base about resources for one year, is created at Table 8.

Table 8: Data and information, based on resources for one year

	R1	**R2**	**R3**	**R4**	**R5**	**R6**	**R7**	**R8**
$f(W_m)$	$f(W_1)$ =17	$f(W_4)$ =18	$f(W_2)$ = 20	$f(W_4)$ =12	$f(W_1)$ = 25	$f(W_4)$ =20	$f(W_1)$ =15	$f(W_1)$ =20
vP_1	199	204	149	185	145	216	191	250
vP_2	178	131	263	236	207	171	193	172
vP_3	217	220	162	157	220	255	233	136

vP_4	225	236	217	211	272	145	198	282
vP_5	261	248	222	234	245	211	232	250
vC_1	12,0	11,0	8,2	10,5	11,3	9,8	10,9	9,5
vC_2	8,6	7,0	6,5	7,7	8,2	7,9	7,6	8,4
vC_3	14,3	11,8	15,6	18,2	12,8	13,4	14,5	11,5
vC_4	7,0	4,0	5,0	8,0	9,0	6,0	6,0	7,0
vC_5	14,0	10,0	15,0	16,0	12,0	14,0	15,0	13,0

On the basis of the data presented in Table 8, the pairwise comparison of manufacturing resources in the AHP method could be performed.

In Table 9, the vectors of the criteria weights are presented.

Table 9: Criteria weight vectors

Resource selection	Process factor	Cost factor				
Weights	0,667	0,333				
Process factors	f(Wm)	vP_1	vP_2	vP_3	vP_4	vP_5
Weights	0,358	0,224	0,071	0,113	0,153	0,081
Cost factors	vC_1	vC_2	vC_3	vC_4	vC_5	
Weights	0,351	0,112	0,242	0,219	0,076	

In Table 10, the example of AHP pairwise comparisons, for manufacturing resources for cost factor vC_1, is presented.

Table 10: AHP pairwise comparisons for manufacturing resources for vC1 condition

R_1	**R_2**	**R_3**	**R4**	**R5**	**R6**	**R7**	**R8**
1,00	0,92	0,68	0,88	0,94	0,82	0,91	0,79
1,09	1,00	0,75	0,95	1,03	0,89	0,99	0,86
1,46	1,34	1,00	1,28	1,38	1,20	1,33	1,16
1,14	1,05	0,78	1,00	1,08	0,93	1,04	0,90
1,06	0,97	0,73	0,93	1,00	0,87	0,96	0,84
1,22	1,12	0,84	1,07	1,15	1,00	1,11	0,97
1,10	1,01	0,75	0,96	1,04	0,90	1,00	0,87
1,26	1,16	0,86	1,11	1,19	1,03	1,15	1,00

Using the AHP method, the repair order for the manufacturing resources could be properly planned. In Table 11, the ranking of resources is presented.

Table 11: The results of the AHP method – ranking the repair of the manufacturing resources

R_2	R_3	R_6	R_7	R_5	R_4	R_8	R_1
0,136	0,133	0,127	0,123	0,122	0,121	0,119	0,118

On the basis of the results of the AHP method (Table 11), the repair schedule of the manufacturing resources quite automatically once the main criteria can be defined. Therefore, the maintenance department can prepare repair scenarios for resources, by allocating workers W_1 and W_4 to those resources having the highest priority of repair. In our further work, in that context the problem considered can be solved with use of the logic programming techniques (Bocewicz et al., 2008). The

logic rules will be built for generating each step of the repair scenarios for resources depending on reasoning and exact way of expression.

In the example proposed, some process and costs factors are taken into account but the concept limits neither the number of factors nor the hierarchy of the criteria; this means that the proposed approach could be implemented in different sectors of industry.

Conclusions

In this paper, a model for the Condition based Management System, using the AHP method is proposed. The model enables the repair of manufacturing resources to be ranked according to priority, on the basis of selected process and costs factors by using the AHP method.

This paper demonstrates that using the AHP method for the repair schedule definition can improve CBM strategies with the aim of matching the right employees, according to their competence, to repair the given machine. To illustrate the proposed approach, we implemented our model in the polish small manufacturing enterprise of car parts and accessories to discuss its utility for improving CBM strategies. However it is still needed to provide the validation on our approach to assess its consistency. Summarizing, from the results obtained from real-life case study we can conclude that our approach to supporting decisions regarding Condition-Based Maintenance (CBM) using the AHP method contribute to improve CBM strategies.

Abstract

The problem area dealt with in this paper places into in the current and very important research area concerning innovation management, especially including the selection of cooperation partners for implementation of innovative projects in the manufacturing enterprises' networks in metal (processing) and automotive industries. Due to the fact that in the XXI century, the functioning of many enterprises depends on innovation projects, the selection of cooperation partners must be carried out on the basis of credible and reliable data. The sources of such data about a manufacturing company active in a particular industry are ERP (Enterprise Resource Planning) systems. Therefore, it has become useful to develop the decision-making model of selection cooperation partners for innovation project implementation based on data available in such systems in the networks of metal (processing) and automotive companies. This article has presented the results of the conducted surveys together with their interpretation as well as the model, method, and concept of software to support the selection of cooperation partners for the implementation of innovative projects in the manufacturing enterprises' networks in metal (processing) and automotive industries is presented.

Keywords: Innovative Project, Selection Of Business Partners, Metal And Automotive Industry, Ordered Logit Model

Introduction

In 21st century, development of Polish manufacturing companies active in metal and automotive sectors federated in various networks depends mostly on their innovative potential. An indicator of such a potential may be the number of innovative projects carried out jointly with other manufacturing partners (Technical Innovation Systems, 2018). The results of such projects should be implemented into the production process in the form of new products or processes (Mikołajczyk, 2013). Many of the enterprises need to face many problems while implementing the strategy of innovative projects management (Głuszczuk, 2016). These problems derive from, among others, selection of improper cooperation partners for realisation of the projects. In the process of co-operator selection, wrong decisions are made immediately or are influenced by customs and habits (Nowakowski and Werbinska-Wojciechowska, 2012). They lead to great losses of time and money by the company and derive from e.g. delays in the order realisation by the co-operator (Janowski, 2013). Such situations result in significant decrease of the enterprise competitiveness on the market.

Subject area fits in actual and important stream of research concerning manufacturing company management and innovation management with particular focus on the selection of co-operator for joint realisation of innovative projects. The importance of co-operation is frequently underlined in scientific literature due to the results of many studies which show that innovations often take place as a result of a combination of knowledge obtained within the company and knowledge gathered from the outside by co-operation with different partners (Bell, 2005). Methods for selection of co-operators available in the literature on this issue usually use the distribution of importance and values of particular criteria by a given expert. However, persons making such decisions may evaluate the issue in a subjective way (Goodwin and Wright, 2011). They may also see the possible future actions differently in the changing situation (Goodwin and Wright, 2011). Due to the fact that innovative projects determine the company development these days, the selection of co-operators for joint realisation of a project should be carried out based on real and objective data. In the article, an innovative project is understood as a temporary undertaking whose aim is to create a unique product or provide a unique service (Duncan, 2013). An example of such projects, carried out in the automotive industry, are those using alternative energy sources (electric and hydrogen engines), which involve the entire network of entrepreneurs - brand owners and OEM Original Equipment Manufacturer (Dąbrowski et al., 2018). Reliable data sources characterising companies are Enterprise Resource Planning (ERP) systems. Over the last decades, these systems have become significant tools supporting realisation of various processes taking place in an enterprise (Kłos, 2010). Undisputable advantage of such systems is combination of the production processes related to product manufacturing, logistic and administrative processes (Banaszak, et al., 2011). Characteristic feature of ERP systems is also a thorough current and historical data analysis which may constitute a great support in the process of making decisions in a manufacturing company (Banaszak, et al., 2011). Nevertheless, ERP systems are mainly used for data processing and information analysis and very rarely are treated as a source of knowledge (Cumbie, 2005). Therefore, it is highly recommended to develop a model and method of making decisions on the selection of co-operator for joint realisation of an innovative project on the basis of the data available in the ERP systems for company associations in the metal and automotive sectors.

Justification of the research subject area

There are various research and branch reports concerning companies only from metal and automotive sectors informing that these sectors are completely dependent on each other, i.e. when fewer orders are claimed for one sector the other automatically reports losses (PricewaterhouseCoopers, 2015). Nevertheless, these publications omit the fact that there is a number of manufacturing companies in Poland active in both sectors federated in various networks. Therefore, the research area presented in this paper was narrowed only to enterprises actively operating in metal and automotive sectors, who are members of associations and who implemented the standards ISO/TS or IATF 16949:2016. Such enterprises usually belong to the group of small and medium enterprises. Thus, with regard to innovation creation and implementation, they face the ordinary problems characteristic for this group of companies (SMEs). According to the literature, apart from insufficient financial and human resources, main issue limiting the enterprise innovativeness is lack of co-operation with e.g. other industrial partners (Skrzypek, 2017), (Duncan, 2013).

The analysis of the collected data on particular companies proved the necessity of support to manufacturing enterprises from the selected sectors federated in various networks in order to increase their competitiveness. Enterprises with the ability to produce unique products and technical solutions (implementing innovative projects) achieve increased revenues and are considered more attractive in comparison with the competition by customers (Szymanik, 2016). The literature often emphasizes the importance of cooperation in innovative projects because many research results indicate that innovations are often created thanks to cooperation with various partners (Bell, 2005). The methods of selection of partners available in the literature use the assignment of weights, importance and value of criteria by the expert (Dąbrowski and Skrzypek, 2016), (Skrzypek and Dąbrowski, 2015), (Skrzypek et al., 2015). However, the persons making such decisions may make subjective assessments and change their opinion over time (Goodwin and Wright, 2011). Therefore, as

innovative projects in the modern world influence the development of an enterprise, the selection of partners for joint implementation should be carried out objectively and using real data. The authors assumed that the enterprises function in a network (or networks) using Information Technologies and the model of data processing in the cloud, thanks to which it is possible to obtain the variable values for the model and method of the co-operator selection from ERP systems. It was also assumed that the risk of failure of co-operation decreases with the increase of the co-operator innovativeness level (Ujwary-Gil, 2009) and that the innovative project coordinator is its initiator or originator.

Solutions suggested

The authors, based on the literature review, decided to apply an integrated approach for co-operators selection for carrying out joint innovative projects among the network of manufacturing enterprises in metal and automotive sectors. Thus, the FAHP method using the R programme was combined with method presented by Chen and Yager (Chen, 2000), (Yager and Filev, 1993). Thanks to this combination, it was possible to apply the selection criteria of both, quantitative and qualitative nature, set the importance values of particular criteria by the decisive person (selecting the co-operator), carrying out the evaluation of different variants in the form of description (which makes the decision process easier and is understandable for the decisive person) as well as create a ranking list of the examined enterprises ordered linearly – from the most to the least complying to the accepted selection criteria.

It was assumed in the developed model that the enterprises function in a network (or networks) using Information Technologies and the model of data processing in the cloud, thanks to which it is possible to obtain the independent variable values (defining the agreed indicators of a company innovativeness) for the model and method of the co-operator selection from ERP systems. It was also assumed that in the network, there are only enterprises eager to exchange their own data and have the ISO/TS or IATF 16949:2016 standards implemented. Additionally, the authors assume that the risk of failure of co-operation decreases with the increase of the co-operator innovativeness level and that the innovative project broker and coordinator is its initiator or originator. The model is supposed to answer the question: “Which co-operators should be selected in order to successfully realise an innovative project?”.

According to the agreed research procedure, a hierarchical structure of multi-criteria analysis of potential co-operation enterprises (Fig.1) was created, whereas the selection criteria were price realisation time and innovativeness level of the evaluated company.

Fig. 1: The hierarchical structure in the develop model (Source: own study)

The review of the literature concerning Public Procurement Law in Poland showed that indeed price and realisation time are still the most frequently used criteria for selection of potential co-operators (Czerwinski and Werner-Wós, 2018). Nevertheless, the selection based on only these two criteria is often incorrect as very often they lead to incurring of significantly higher exploitation costs of the subject of the order as well as decrease of the provided services quality (Urząd Zamówień Publicznych, 2017). Hence, according to the assumption agreed upon the model, the authors decided

to apply the third most important criterion – the innovativeness level of the co-operating enterprise. The quality criterion was omitted on purpose because the considered group of companies have ISO/TS or IATF 16949:2016 standards implemented and they thoroughly define the requirements of providing quality of products and services. Based on the subject literature it may be claimed there is no single method suggested for measure the level of innovativeness of manufacturing enterprises. The existing measuring tools (i.a. InnScore method, a method recommended by OECD, Technical Innovation Systems method) use detailed measuring indicators which require very specified knowledge of the examined company (Głuszczuk, 2016), (Mikołajczyk, 2013), (Technical Innovation Systems, 2018). Thus, its application is very time-consuming and that is why these methods are mostly used for specialised innovation audits. In this paper, the authors present their own method for measuring of the company innovativeness level dedicated specifically to the manufacturing enterprises in metal and automotive sectors. In order to do so, a survey to collect data characteristic of the selected group of companies was carried out in the first stage. Next, in the second stage, a method of multi-nominal ordered logit models for evaluation of the innovation level of the selected manufacturing enterprises.

Survey

For the purpose of the research and based on the literature review, a questionnaire, whose aim was to unify the questions asked to entrepreneurs, was composed. The aim of the survey was obtain the data for development of the model and method for making decisions on the selection of co-operator for joint realisation of an innovative project on the basis of the data available in the ERP systems for company networks in the metal and automotive sectors as well as selection of a proper method for statistic modelling. The survey sample was selected on the basis of data obtained from the National Business Registry (REGON). The surveyed companies were manufacturing enterprises belonging to the group of small, medium-sized and large enterprises and active in the former year in metal and automotive sectors at the same time (verification based on NACE codes and reports submitted to and published by Statistics Poland) that had the ISO/TS or IATF 16949:2016 standards implemented and were members of the company network(s). The selected enterprises met all the requirements and assumptions agreed for the research.

The survey was conducted in 2017. The questionnaire was sent by e-mail to the group of 293 respondents located in the territory of Poland representing small, medium-sized and large manufacturing enterprises active in the desired sectors. From among them, the authors selected the ones active in both metal and automotive sectors at the same time (referred to in the business activity description as primary profiles) – 257 enterprises. The other 36 companies turned out to be active in other sectors, such as wood industry, shoe-making, etc. Next, this number was limited to the enterprises that were active in the former year (131). The data were verified based on annual reports submitted to Statistics Poland by the companies.

The survey consisted of a set of closed questions divided into four categories and a respondent's particulars where the respondents defined the size of the company and sector of business operation. The survey was anonymous, however, the surveyed employee had to state the position at a company. The respondents represented at least middle management (specialist, inspector, chief specialist, constructor, technologist/process engineer, manager, shift manager, president, board member, owner, director, managing director/CEO).

The questions in the questionnaire were related to i.a. evaluation of the innovativeness level of own enterprise, Polish manufacturing enterprises in metal and automotive sectors or the reasons for unsatisfactory innovativeness level of these companies.

Statistical analysis of the links between pairs of variables was performed for nominal variables with the use of Pearson's chi-square independence test. In case the assumptions of this test were not met, its p-value was determined by simulation using the Monte Carlo method (Hosmer and Lemeshow, 2013). The presence of monotonic correlation for variables measured on the ordinal scale was verified by the Spearman test. Additionally, the force of this dependence was also measured by

adding the r_s co-efficient of the Spearman correlation. In case of all the statistical tests, the significance value was defined at the level of 0,05. The statistical analysis was conducted with the use of R statistical block distributed on an open source licence [GPL] (R Core Team, 2014). The detailed results were already published by the authors in other publication (Skrzypek et al., 2019).

Assumptions to the method for evaluation of the innovativeness level in selected manufacturing enterprises

A variable of innovativeness level (dependent variable) was selected for modelling. The examined enterprise could be classified as: non-innovative enterprise, moderately innovative enterprise or innovative enterprise.

Based on the statistical analyses, literature review, preliminary model evaluation and then after application of the Akaike criterion (Gruszczyński, 2012), four independent variables were selected for modelling of the enterprise innovativeness level were selected:

- number of new products developed at the enterprise in the last 3 years,
- number of new technologies developed at the enterprise in the last 3 years,
- number of total employees with higher technical education in the last year,
- income percentage spent on R&D operations in the last year.

In case of the enterprises active on the market shorter than three years or having ERP system without historical data entered, it was agreed that time limit would be lifted and the indicators would reflect the situation from the beginning of the system functioning. In case of lack of data, 0 value would be automatically ascribed to particular variables.

Each variable had three reply variants (categories):

- 0 – 10 range,
- 11 – 20 range,
- above 20.

The reference category was 0 to 10 range.

There is no single recommended method to measure the innovativeness of manufacturing companies in the literature. Existing methods of measurement (e.g. the InnScore method, the method recommended by the OECD organisation, the Technical Innovation Systems method), using detailed measurement indicators, which require a very large, specialist knowledge of the surveyed organisation (Głuszczuk, 2016), (Mikołajczyk, 2013). Their use is therefore time-consuming, hence these methods are most often used to perform specialist innovation audits. To determine the level of innovation, the authors decided to use an multi-nominal ordered logit model. It is important that the values of individual explanatory variables can be determined on the basis of data stored in ERP systems owned by enterprises. The advantage of this approach is that the use of ERP systems eliminates the possibility of data manipulation, and thus, the assessment of the level of innovation can be made on the basis of objective data.

Multi-nominal ordered logit model

The approach suggested in this paper is the application of ordinal logit model which (Gruszczyński, 2012), (Hosmer and Lemeshow, 2013):

- enables modelling of dependent variable of ordered character,
- considers independent variables of qualitative and quantitative character,
- enables analysis of influence of particular variables on the dependent variable,
- enables creating forecasts of dependent variable for new values of the independent variables.

The model presented in the paper allows determining of the enterprise affiliation to one of the categories: non-innovative enterprise, moderately innovative enterprise, innovative enterprise and creating of forecasts of the innovativeness level for new enterprise, e.g. becoming members of a network at a later time (Skrzypek, 2017).

For ordinal logit model, the probability that for i – of this object, the dependent variable will get the value j – this category is formulated by a general formula (Gruszczyński, 2012), (Hosmer and Lemeshow, 2013):

$$p_{ij} = P(y_i = j) = \frac{\exp\,(\kappa_j - x_i{}'\beta)}{1 + \exp\,(\kappa_j - x_i{}'\beta)} - \frac{\exp\,(\kappa_{j-1} - x_i{}'\beta)}{1 + \exp\,(\kappa_{j-1} - x_i{}'\beta)} \tag{1}$$

where:

$i = 1,\ 2,\ \ldots, n\ \ (n \in \mathbb{N})$	–	object index
$j = 1,\ 2,\ \ldots, J\ (J \in \mathbb{N})$	–	the value taken by the explanatory variable
p_{ij}	–	the probability that for the *i*-th object the explained variable will take *j*
κ_j, κ_{j-1}	–	cut-off points
$x_i = [x_{i1}, x_{i2}, \ldots, x_{ik}]'\ (k \in \mathbb{N})$	–	explanatory *k*-value vector
$\beta = [\beta_1, \beta_2, \ldots, \beta_k]'\ (k \in \mathbb{N})$	–	vector of unknown model parameters with real values

Estimated in research multi-nominal ordered logit model

For modelling of an enterprise innovativeness level, for independent variables were selected:

- x_1 - number of new products developed at the enterprise in the last 3 years,
- x_2 - number of new technologies developed at the enterprise in the last 3 years,
- x_3 - number of total employees with higher technical education in the last year,
- x_4 - income percentage spent on R&D operations in the last year.

In research for multi-nominal ordered logit model estimated by the highest credibility/reliability method, the formula for affiliation probability of i – of this enterprise to one of categories (1 - non-innovative enterprise, 2 - moderately innovative enterprise, 3 - innovative enterprise) is in the form of:

$$\hat{p}_{i1} = \hat{P}(y_i = 1) = \frac{\exp(1{,}24 - m_i)}{1 + \exp(1{,}24 - m_i)} \tag{2}$$

$$\hat{p}_{i2} = \hat{P}(y_i = 2) = \frac{\exp\,(3{,}6 - m_i)}{1 + \exp\,(3{,}6 - m_i)} - \frac{\exp(1{,}24 - m_i)}{1 + \exp(1{,}24 - m_i)} \tag{3}$$

$$\hat{p}_{i3} = \hat{P}(y_i = 3) = 1 - \frac{exp\,(3{,}6 - m_i)}{1 + exp\,(3{,}6 - m_i)} \tag{4}$$

where:

$$\mathrm{m_i} = 0{,}39\mathrm{x_{i,1.2}} + 1{,}63\mathrm{x_{i,1.3}} - 0{,}85\mathrm{x_{i,2.2}} - 2{,}13\mathrm{x_{i,2.3}} + 1{,}1\mathrm{x_{i,3.2}} + 1{,}0\mathrm{x_{i,3.3}} + 1{,}42\mathrm{x_{i,4.2}} + 2{,}19\mathrm{x_{i,4.3}}$$

$i = 1, 2, \ldots, 131$ index of the enterprise

$j = 1, 2, 3$ value of the explanatory variable (level of innovation)

$\kappa_1 = 1{,}24, \kappa_2 = 3{,}6$ cut-off points

Denomination e.g. $x_{i,1.2}$ should be understood in the following way: value of the first independent variable for the second range - [11-20]. 0-10 range was selected as the reference category. All the calculations were performed with the use of R statistical block (R Core Team, 2014).

Model and method of selecting co-operators for joint innovative project realisation federated in a manufacturing enterprises network for metal and automotive sectors

Based on the selected FAHP method, Figure 2 presents the hierarchical structure of the multi-criteria problem, which is the selection of partners for the implementation of innovative projects in a network of metal and automotive manufacturing companies. Detailed description and formal record of the methods is described in publications (Łuczak and Wysocki, 2011), (Chang, 1996).

The first stage of implementation was to determine the evaluation criteria. The evaluation criteria included the price, order realisation times and the level of innovativeness of the partner. Due to the adopted assumption concerning standards, the quality criterion was intentionally omitted. These standards clearly describe what quality features should be met by the offered products and services. In order to assess the level of innovativeness of the cooperating company, an own method was proposed, using the theory of multi-nominal ordered logit model. The criterion of innovativeness was chosen as the key criterion in the process of selection of the partners, according to the assumed assumption that the failure of the cooperation decreases with the increase of the level of innovativeness of the partner.

Fig. 2: Hierarchical structure of a multi-criteria problem selection of partners to implement innovative projects in a network of metal and automotive manufacturing companies. (source: own study)

In the next step, the level of innovation was determined by means of an estimated structured logit model for each potential partner. The statistical package R was used for calculations.

In stage 3, a fuzzy matrix of pair comparisons was created on the basis of opinions of 10 experts - project managers, supply or materials department managers and logistics department managers working in 3 manufacturing companies of selected industries (Table 1).

Table 1: Created fuzzy matrix of pair comparisons (source: own study).

	Innovation level	**Price**	**Delivery**
Innovation level	(1;1;1)	(6;7;8)	(8;9;9)
Price	(1/8;1/7;1/6)	(1;1;1)	(1/2;1;2)
Delivery	(1/9;1/9;1/8)	(1/2;1;2)	(1;1;1)

In the next step, data on innovation, price and delivery time were introduced. It was assumed that:

- the level of innovativeness will be defined as 1 when the production enterprise is non-innovative, 2 - moderately innovative and 3 – innovative (in accordance with the designations adopted in the logit model),
- depending on the complexity of the project, the values of the criteria will change: price and delivery time. In order to avoid mistakes, the person who makes the decision to choose the partners should assign the data to three thresholds set by himself. Preferred prices and deadlines in the first range will then receive 3 points, average preferred 2 and unacceptable 1 point.

Figure 3 presents the calculation process for a decision analysis using the R programme. After entering the data into the R program, and analyzing them using the FAHP method, the ranking was carried out using the methods proposed by Yager (defuzzified) and Chan (ranked). Detailed description and formal record of the methods is described in publications (Dudek and Jefmański, 2015), (Ruziyeva and Dempe, 2013), (Akkoç and Vatansever, 2013).

Model and Method Verification

Verification of the developed model and method of selection of co-operators for joint innovative project realisation federated in a manufacturing enterprises network for metal and automotive sectors was carried out on the basis of archived data concerning innovative project realisation by manufacturing enterprises active in the sectors of interest to the authors. The projects were related to development and implementation to series production of new products. The enterprises did not agree to publish data related to new technologies. For the research purposes, a questionnaire with manual was created. The prepared questionnaire was sent to three manufacturing enterprises treated as innovative by organisations associating employers (associations "Organizacja Pracodawców Ziemi Lubuskiej", "Dolnośląscy Pracodawcy", "Konfederacja Lewiatan"). Furthermore, these enterprises were also evaluated as innovative by Polish Agency for Enterprise Development as well as Enterprise Europe Network offices (Enterprise Europe Network, 2018). The examined enterprises had three weeks to gather the data from their ERP systems. Next, direct interviews with the delegated employees were conducted. In any case, the respondents were director/manager of quality management, head of R&D unit, production manager (expert panel having knowledge in the tested/examined area). The questions were related to innovative project successfully carried out within the company, its management process and co-operation with co-operators among others.

Verification of the developed model of the co-operators selection was carried out on the basis of archived data concerning innovative project realisation by 3 manufacturing enterprises active in the metal and automotive sectors. In total, four innovative projects realised in the period 2012-2016 were analysed. In this paper, the specific data of only 3 projects are presented because one of the enterprises did not allow the authors to publish their data. The decision-making process for selection of co-operating partners and the consequences of these decisions for the realisation of a particular project were verified. All the necessary calculations were performed with the use of R statistical block (R Core Team, 2014). The summary results of the verification process are presented in Table 2.

Table 2: Verification of the model on the basis of the compiled results (Source: own study)

Indicator	Result
Number of enterprises surveyed	3
Number of projects analysed	4
Number of analyzed decision making processes concerning the selection of partners	4
Number of companies - potential cooperators	38
Number of correctly qualified co-operators by model	33
Number of co-operators whose assessment is inconclusive	2
Number of incorrectly qualified co-operators by model	3

As shown in Table 2, the model properly selected 87% of co-operators in the examined cases. This means the companies selected by the model successfully accomplished the ordered tasks in proper time, with proper quality and within the agreed budget. In case of 5% of the analysed enterprises, it is impossible to unambiguously decide based on the model whether these companies should be selected as co-operators or not. It is because these enterprises were evaluated with almost the same probability as either non-innovative or moderately innovative. Therefore it would be advisable to provide these enterprises with additional selection criterion. In case of improperly selected enterprises (8%), the model rejected the selection of these companies due to their innovativeness level. Nevertheless, the enterprises accomplished their tasks without any problems during realisation period of a particular innovative projects.

Summary and Further Research

The developed model of selection of co-operators for joint innovative project realisation federated in a manufacturing enterprises network for metal and automotive sectors presented in this paper is of utilitarian nature and may be applied in such organisations as clusters of manufacturing enterprises in the sectors specified in the paper (Auto-gration Consortium 2013), (Auto-gration Consortium, 2018). In case of other sectors, only the proposed own method of innovativeness level evaluation should be properly adapted. It should be verified whether for other group of enterprises, the set of independent variables influencing the modelled variable, innovativeness level, will not change.

Due to obligatory implementation of IATF 16949:2016 standard in 2018, the survey should be re-done with enterprises that have this standard implemented. The aim of the survey will be to obtain the data necessary for making the proposed method for evaluation of the co-operation partners innovativeness level more detailed. In this way, the model of selection of co-operators for joint innovative project realisation federated in a manufacturing enterprises network for metal and automotive sectors. After verification tests of this model, the works on designing and implementing of an IT tool should be initiated. After necessary tests and eliminating of errors and making all the necessary improvements, this IT tool should be implemented in a manufacturing enterprise. The next stage could be creating of analogous model, method of innovativeness level evaluation as well as IT tool for other sectors of Polish industry.

Aggregation of Feature Assessments Expressed with Numerical Grades and Linguistic Values – Using Interval-Based Representation of Meaning

Radosław P. KATARZYNIAK

Wrocław University of Science and Technology, Department of Computer Science and Systems Engineering,
Wybrzeże Wyspiańskiego 27, 50-370 Wrocław, Poland, radoslaw.katarzyniak@pwr.edu.pl
ORCID: 0000-0002-8941-9638

Abstract

The paper presents a set of formal tools supporting design and implementation stages of an original strategy for aggregation and integration of a heterogeneous set of feature assesments built using the concept of grading scales and linguistic variables. Feature assessments are provided by a collective of respondents answering research questionnaires. The proposed tools, both of theoretical and conceptual nature, support the analysis and implementation of the first two stages of the aggregation and integration strategy responsible for collecting feature assesments and transforming them into computationally-oriented machine representations. In the approach, each individual opinion is finaly represented by a finite set of normalized numerical intervals, which as a whole set captures its meaning. The proposed interval-based machine representation of collective assesment is the input to an original adaptation and implementation of an algorithm for collective knowledge aggregation and integration defined over the universe of numerical intervals and presented elsewhere by other authors.

Keywords: Collective Assessment, Knowledge Aggregation, Knowledge Integration, Interval-Based Knowledge Representation.

Introduction

In work by Modliński et al. (2018) an original knowledge integration and communication algorithm was presented, designed for processing linguistically-oriented fuzzy-modal representations of collective beliefs. In the work the collected knowledge was given as a set of controlled natural language sentences, assumed to be generated by experts using values of linguistic variables (further called linguistic values). The algorithm was based on a decision model for choosing the so-called representation of numerical intervals profile, and therefore its utilizations in practical contexts could be effectively supported by a rich collection of computational well-verified tools dedicated to processing numerical intervals. It was an implementation of an original framework for the integration of distributed knowledge and further communicating the result of integration using linguistic and fuzzy-modal descriptions. The framework was presented elsewhere by Lorkiewicz et al. (2013).

In this work partial results of an original *R&D* project, currently being implemented, are reported, the gole of which is to design, implement and apply a modified version of the algorithm presented by Modliński at al. (2018). The adapted algorithm, set as part of a broader knowledge processing (integration) strategy, is intended to solve the task of collective knowledge aggregation and integration, provided that the knowledge is represented as a heterogeneous set of controlled natural language sentences, produced by respondents assessing the intensity of the occurrence of a certain gradation (fuzzy) property **P** in an object of control (management) to be collectively evaluated and then linguistically described. By gradation (fuzzy) property we mean any property that from the respondents' point of view may be observed (experienced) in target objects to be assessed with varying degrees of intensity. Obviously, a rich list of examples of practical situations that require solving such a knowledge management task can be found in the literature. An example of a task in which it may be necessary to aggregate and integrate collectively yielded assessments of the degree in which a particular feature is realized in an object to be evaliated, is a collective assessment of the

degree of friendliness of a particular human-computer interface, carried out by respondents participating in an interface usability study (see the work by Chynał et al. (2019) as a reference). Further examples or references are provided in works by Dweiri et al. (2006), Roszkowska (2011), and many other works.

The aggregation and integration strategy of heterogeneous collection of assesments (AAI strategy), in which it is planned to use the above mentioned adaptation of the algorithm presented by Modliński et. al (2018), consists of the following four stages:

```
Stage 1: The use of dedicated surveys to obtain assessments from a collective of
respondents.
Stage 2: Transformation of collected grades into computationally oriented machine
representation based on the micro- and macrostructure of the universe of
normalized numerical intervals.
Stage 3: Aggregation and integration of the set of collected assesments using a
selected method of object grouping and the adapted algorithm for choosing the
representation of profiles of numerical intervals.
Stage 4: Constructing the final linguistic summary of the result of aggregation
and integration using a controlled natural language with fuzzy and epistemic
modalities.
```

The forthcoming presentation covers some methodological and theoretical issues related to Stage 1 and Stage 2 of the AAI strategy just outlined above.

The model of input assessments built with numerical grading scales

Formulation of assesments based on predefined grading numerical scales is one of the most popular and simplest methods of obtaining assesments from respondents embedded in real practical contexts. The basis for constructing such assessments is usually a finite and linearly ordered subset of natural numbers. Obviously, the minimum numerical value, fixed for a particular graded scale, refers to situations in which the respondent perceives the object *u* as completely devoided of property **P**. In contrast, the maximum numerical value on the graded scale represents the cognitive states in which the respondent assesses the object *u* as exhibiting the property **P** to the full extent, i.e. without raising any doubt as to its occurrence in the object.

Let all grading scales, available to members of the target respondents' collective be denoted by $Scale_i, i = 1,..., N$, and given as:

$$Scale_i = [s_{i,1}, s_{i,2},..., s_{i,levels(i)}],$$

where the following three requirements hold:

$$\forall j \in \{1,2,...,levels(i)\}.(s_{i,j} \in Nat),$$

$$\forall j \in \{1,2,...,levels(i)-1\}.(s_{i,j+1} = s_{i,j} + 1),$$

$$\forall p, q \in \{1,2,...,N\}.(p \neq q \Rightarrow levels(p) \neq levels(q)).$$

The respondent's construction of an assessment based on a grading scale $Scale_i$ is interpreted as responding a request in a survey, the meaning of which can be communicated as follows:

(Based on everything you know), please indicate to what extent object u exhibits property P!

The respondent's response is to select a particular numerical grade from this particular list of grades $[s_{i,1}, s_{i,2},..., s_{i,levels(i)}]$ which is presented along with the request. The choice of a particular value $s_{i,j}$ should be interpreted as equivalent to the respondent's production of the following controlled natural language statement:

(For all what I know), I find the object u exhibiting property P with the degree $s_{i,j}$.

Obviously, when surveys are used, generation of statements is replaced by a manual indication of value $s_{i,j}$ by target respondents.

The model of input assessments built with values of linguistic variables

The second group of assessments considered in the discussed *R&D* project is constructed by target respondents using the value of a linguistic variable *var*(**P**) related to property **P**, the intensity of which the respondents assess for a particular object and in a particular practical context. The approach referse to the classic definition of linguistic variable as given by Zadeh (1975), with an additional requirement that in the set of possible linguistic values $\{P_0, P_1,..., P_j\}$ of variable *var*(**P**), for practical reasons, the so-called base linguistic value is distinguished, further denoted by P_0, being this value of the linguistc variable which is grounded directly in linearly ordered, permissible intensities of property **P**. For instance, for case of linguistic variable EFFICIENCY, with the following set of terms of its values {*efficient*, *inefficient*, *very efficient*, *slightly efficient*, *almost efficient*}, it is acceptable to choose term *efficient* as the basic linguistic value. The intuitions underlying this choice are quite obvious.

In the discussed approach to collective assesment processing, respondents can generate their assesments by choosing linguistic values, when replying to directly stated requests. In the logical and procedural sense, their formulation of an assesment can be treated as equivalent to converting the following formula:

Object u *is* Y,

Into a particular sentence by instantiating the variable Y with a particular linguistic value, chosen from set $\{P_0, P_1,..., P_j\}$, usually suggested along with the request. Obviously, in controlled natural languages each particula result of instantiation may usually be communicated in multiple ways, depending on lexical and semantic resources constituting this versions of a controlled natural language which is used by the respondent. However, without loss of generality it can be assumed that producing a particular assesment is semantically and pragmatically equivalent to producing the following sentence:

For all what I know, object u is P_j.

Similarly to the assesments built with the grading scales, the assesments under consideration should also be treated as communicating strictly subjective beliefs respondents can mentally (cognitively) develop while analyzing (experiencing) degree to which a particular object *u* exhibits a property **P**.

A model of unified interpretation of assesments meaning

In our approach it is assumed that the basis of an assesment meaning representation and interpretation is given by the numerical interval [0,1], provided that numbers in [0,1] are treated as numerical representations of the strength of beliefs mentaly developed by respondents, regarding the object's exhibition of property **P**. Such model for belief semantics, underlying linguistic production of assesments, refers in a direct way to the model of TRUTH linguistic variable, originally formulated by Zadeh (1975). The model suggests, in particular, that machine oriented interpretation of an assesment produced by a particular and external respondent, may be effectively represented in

computationally-oriented knowledge base by a set of sub-intervals of [0,1]. The machine-oriented model for determining semantics of assesments, which is presented below, is strictly consistent with such theoretical perspective.

A model of semantics for assesments built with grading scales

Let us consider the case of assesment built by the respondent using grading scales $Scale_i$. It is assumed that a respondent's reply is communicated with the sentence:

(For all what I know), object *u* exhibits property ***P*** with the degree $s_{i,j}$.

Obviously, for all implementations of the AAI strategy it is necessary to define a certain computationally-oriented semantic tool, allowing effective representation of individual grades' meaning. That is why a dedicated function f_{Scale_i} is defined for each $Scale_i$, further called the scale-related grade meaning function, where:

$$f_{Scale_i} : [0,1] \rightarrow \{s_{i,1}, s_{i,2}, \ldots, s_{i,levels(i)}\}.$$

For each $x \in [0,1]$ the function value $f_{Scale_i}(x)$ is determined according to the formula:

$$f_{Scale_i}(x) = \begin{cases} s_{i,1} \quad iff \quad x \in [0, x_1) \\ s_{i,2} \quad iff \quad x \in [x_1, x_2) \\ \ldots \\ s_{i,levels(i)-1} \quad iff \quad x \in [x_{levels(i)-2}, x_{levels(i)-1}) \\ s_{i,levels(i)} \quad iff \quad x \in [x_{levels(i)-1}, 1] \end{cases}$$

where numbers $x_1, x_2, \ldots, x_{levels(i)-1}$ fulfill the requirement $0 < x_1 < x_2 < \ldots < x_{levels(i)-1} < 1$ and determine the partition $[0, x_1), [x_1, x_2), \ldots, [x_{levels(i)-2}, x_{levels(i)-1}), [x_{levels(i)-1}, 1]$ of interval [0,1] such that each element of the partition is assigned one and only one grade from $[s_{i,1}, s_{i,2}, \ldots, s_{i,levels(i)}]$.

Defining a particular form of function f_{Scale_i}, to be used in a particular implementation of the AAI strategy, involves two goals: selecting specific numbers $x_1, x_2, \ldots, x_{levels(i)-1}$ and providing explicit formula for determining the function's value. Unfortunately, developing a certain form of the function may not be easy, because it should reflect actual expectations formulated for the level of compliance of the function with pragmatic commonsense rules governing actual use of the grades by target respondents, and and guessing the form of these rules is not easy at all.

In most *R&D* projects in the field of knowledge management, functions imitating cognitive processes responsible for language generation are usually developed in two steps. The implementation of the first step consists in formulating rational, preferably commonsense grounded postulates regarding the desired behavior of functions sought. The implementation of the second step is devoted to sometimes a very tedious search for a function whose behavior guarantees the fulfillment of the previously defined postulates. This approach can be described as an analytical and structural one.

Example

Let us assume that the following grading scale $Scale_a = [0,1,2,3,4,5]$ be used. A reasonable postulate for the behavior of its scale-related grade meaning function f_{Scale_a} may be formulated as follows: *It is commonly believed that at their cognitive (mental) level, the target respondents evaluate the difference between two adjacent grades as being the same for all possible cases of such pairs. Therefore it should be required that the same property be exhibited by the scale-related grade meaning function.* A rational proposal to fulfill the requirement is to use numbers $x_1, x_2, ..., x_{levels(a)-1}$ such that formula $\forall p \in \{1,2,...,levels(a)-1\}.(x_p = \frac{p}{level(a)})$ holds. Obviously, they fulfil the requirement $0 < x_1 < x_2 < ... < x_{levels(a)-1} < 1$. It can be argued, too, that in many ways the resulting partition of [0,1] divides this universe evenly.

Unfortunately, in practical contexts the analytical and structural approach can be treated as characterized by too much arbitrariness. Namely, the quality of the obtained result, in particular the achieved level of compliance of the function behavior with the actual cognitive processes, seem to depend too strongly on the completeness and correctness of the set of adopted postulates, both of which may be disputable even in the above presented proposal. In particular, one can strongly doubt whether the difference between the grades 0 and 1 is actually felt at the cognitive level as equal to the difference between grades 4 and 5.

To deeper understand the nature of the doubt just raised in the previous sentence one can start with the editorial work by Campbell (1992). Luckily yet, in the area of machine processing, one can find interesting examples of a significantly different approach to determining functions that model semantics of lexical tools used to represent and process gradual and fuzzy features of objects at the level of communication. In such approach, the form of the function f_{Scale_i} is suggested to be determined on the basis of empirical data collected with actual participation of target respondents rather than derived from a set of formally stated postulates. A deeper discussion and presentation of interesting aspects of such approach, relevan to developing implementations of the AAI strategy, can be found in the paper by Pedrycz (2008), where multiple computational and mathematical tools fulfilling the assumptions of the so-called user-centric approach to semantic systems design and analysis are proposed.

Model for semantics of assesments formulated with linguistic variables

Let $P_j \in \{P_0, P_1, ..., P_j\}$ be a particular linguistic value of variable *var*(**P**). The following two theoretical assumptions are made for each target implementation of the AAI strategy under consideration.

Firstly, actual processing of assessments, communicated by target respondents in form of the following sentences:

For all what I know, object u is P_j.,

is to be realized using the original model of linguistic variable formulated by Zadeh (1975). In Zadeh's approach the semantics of each linguistic value from $\{P_0, P_1, ..., P_j\}$ is defined as a function:

$$f_{P_i} : U_P \to [0,1],$$

where U_P denotes a particular universe of objects, each embedded in a practical context, and to be described by the above mentioned sentence. It is also assumed in Zadeh's definition of linguistic

variable that for each $u \in U_P$ the value $f_P(u)$ should be interpreted as representing the degree of cognitively (mentaly) perceived compliance of the meaning of sentence *Object u Is Pi* with an actual instance of object *u*, if such an instance were presented to the subject uttering the sentence to express anrelated internal belief.

Secondly, each linguistic value, possible to be used as part of the sentence *For all what I know, object u is P_j.*, is assigned the so-called linguistic activation threshold $\lambda_{P_i} \in [0,1]$. The threshold indicates the minimum required level of intensity of property **P** recognized mentally in an assessed object u, allowing the respondent to generate the sentence under consideration as an adequate linguistic representation of the experienced state of object u.

The collection of all semantic functions $f_{P_i}(u)$, $P_i \in \{P_0, P_1, ..., P_j\}$, along with the associated linguistic activation thresholds λ_{P_i}, make up a vitally important system of dedicated cognitive tools, both of semantic and pragmatic nature. The existence of such system is necessary for solving effectively multiple aggregation and integration tasks, carried out in practical contexts for the considered class of sentences (assesments).

Designing computational tools to carry out automatic implementations of aggregation and integration of assessments for some practical contexts may be a task of a relatively high complexity. It can follow from mulyiple reasons one of which is the complexity of the process of transferring (interpreting) linguistically or semi-linguistically expressed assessments into a necessary low-level, computationally oriented machine representation.

Another source of inherent complexity may be the nature of universe U_P, itself. Namely, in actual contexsts the universe U_P can be equipped, which usually happens, with the so-called macrostructure being a function:

$$d_P : U_P \times U_P \rightarrow (R^+ \cup \{0\}),$$

where $R^+ \cup \{0\}$ denotes real positive numbers with zero.

The role of a particular macrostructure, resulting from a certain practically context, is to map at technical and computationally oriented level the way in which objects of the universe U_P are usually compared by actual users at the level of real cognitive processes. It usually happens that macrostructures of real practical importance meet additional requirements, in particular the definition requirements imposed on similarity (dissimilarity) or distance functions.

Regarding the functions of linguistic value semantics, possible to be used in this approach, the following additional remarks should be made. Firstly, the accepted definition of semantics allows universes with very different nature and characteristics. In particular, target implementations of the AAI strategy can support processing linguistic values defined over the normalized interval [0,1], a sub-set of natural numbers *Nat*, as well as a set over which no linear order is defined at all. Secondly, similarly to the already outlined functions of grade semantics, a particular function of linguistic value semantics can be potentially defined the analytical and construction mode or derived from empirical data, maintaining the assumptions of user-centered approach. Again, for the latter case, see the work by Pedrycz (2008).

Computationally-oriented representation of assesments

The above-introduced semantics for grade-based and linguistic value-based assesements constitute the starting point for defining knowledge representation and knowledge processing tools used in

possible target implementation of the AAI strategy to built interpretation of collected assessments and construct computational-oriented machine representations of their meaning. In order to cover the aspects in a more technical way the following symbols are introduced:

Let $INTERVAL = \{[x, y] : x, y \in [0,1] \wedge x \leq y\}$ be the set of all subintervals of [0,1].

Let $\overline{\overline{2^{INTERVAL}}}$ be the set of all multisets $\{i_1, i_2, ..., i_m\}$, where $\forall i \in \{1,2,...,m\}.i_k \in INTERVAL$

Let GSA be the set of all statements *For all what I know, object x exhibits property P with the degree* $s_{i,j}$, further denoted by $v_{/s_{i,j}}$, and possible to be constructed by target respondents using grading scales $Scale_i, i = 1,..., N$.

Let LVA denote the set of all statements *For all what I know, object x is* P_j., further denoted by $v_{/P_j}$, possible to be constructed by target respondents, where $P_j \in \{P_0, P_1, ..., P_j\}$ are linguistic values used in the context of a particular implementation of the AAI strategy.

The computational interpretation of input assesements, yielding machine representations of assessments' meaning, can formally be understood as the function:

$$meaning : (GSA \cup LVA) \rightarrow \overline{\overline{2^{INTERVAL}}}.$$

For each assessment $v \in (GSA \cup LVA)$, the value of $meaning(v)$ is computed with respect to related semantic function f_{Scale_i}, $Scale_i, i = 1,..., N$, or $f_{P_i}(u)$, $P_i \in \{P_0, P_1, ..., P_j\}$, by a particular procedure, which should be different for grading scale – based and linguistic value – based assesments.

At first, let $v_{/s_{i,j}} \in GSA$ be considered. The related grading scale and semantic function are $Scale_i$ and f_{Scale_i}, respectively. Then, in each implementation of the AAI strategy the related $meaning(v_{/s_{i,j}})$ should be computed according to the formula:

$$meaning(v_{/s_{i,j}}) =$$

$$= \{[x, y] : x, y \in [0,1] \wedge f^{-1}_{Scale_i}(s_{i,j}) \subseteq [x, y] \wedge \neg\exists z \in [0,1].(f^{-1}_{Scale_i}(s_{i,j}) \subseteq [x, z] \subseteq [x, y])\},$$

where $f^{-1}_{Scale_i}$ is the inverse function of function f_{Scale_i}. Obviously, for all $v_{/s_{i,j}} \in GSA$ the value $meaning(v_{/s_{i,j}})$ is a singleton with one and exactly one sub-interval of [0,1] as its element. It is quite obvious, too, that the definition of f_{Scale_i} ensures the existence of inverse function $f^{-1}_{Scale_i}$.

At second, let $v_{/P_j} \in LVA$ be considered. In this case an adequate effective procedure for computing $meaning(v_{/P_j})$ requires a more significant reference to the above introduced concepts of linguistic value functions $f_{P_i}(u)$, $P_i \in \{P_0, P_1, ..., P_j\}$ and linguistic activation thresholds λ_{P_i}. Namely, setting

the threshold value λ_{P_i} for a specific implementation makes it possible to determine the following subset $U_P(\lambda_{P_i}) \subseteq U_P$, consisting of all objects in U_P for the description of which, the linguistic value P_i can be used, in accordance with commonsense rules accepted by users of the language LVA:

$$U_P(\lambda_{P_i}) = \{u \in U_P : f_{P_i}(u) \geq \lambda_{P_i}\}.$$

In turn, the assumption of the existence of a macrostructure d_P makes it possible to determine, store, and then even possibly update in a regular manner, the following related clustering of $U_P(\lambda_{P_i})$, which in a specific way corresponds to the threshold value λ_{P_i}:

$$U_P^{(1)}(\lambda_{P_i}), U_P^{(2)}(\lambda_{P_i}), \ldots, U_P^{(size_{P_i})}(\lambda_{P_i}), \text{ where}$$

$$\forall p, q \in \{1,2,\ldots,size_{P_i}\}.(p \neq q \Rightarrow U_P^{(p)}(\lambda_{P_i}) \cap U_P^{(q)}(\lambda_{P_i}) = \varnothing) \text{ and } \bigcup_{p=1}^{size_{P_i}} U_P^{(p)}(\lambda_{P_i}) = U_P(\lambda_{P_i}).$$

It is worthwhile of mentioning that the pragmatically – inspired assumption to compute and maintain a dedicated division of the universe U_P into disjoint classes of similar (or close) objects, for which linguistic value P_i can be used as an adequate linguistic label, is defined in this presentation with no relation to any particular grouping strategy or method possible to be used in actual implementation of the AAI strategy, see the work by Jain et al. (1999) for examples. In fact, the possibility to choose from multiple alternatives allows final implementations to be varied.

Particular clusters $U_P^{(q)}(\lambda_{P_i}), q=1,2,\ldots,size_{P_i}$ are used to determine the value $meaning(v_{/s_{i,j}})$. Namly, objects in each particular cluster $U_P^{(q)}(\lambda_{P_i})$, originally chosen from U_P using the function f_{P_i} and related linguistic activation threshold λ_{P_i}, they can also be used to determine the range of intensities of **P**, but supporting the semantics of basic linguistic value P_0. The final result is computed according to the following equation:

$$meaning(v_{/P_j}) = \bigcup_{q=1}^{size_{P_i}} \{(x,y) : x = \min_{u \in U_P^{(q)}(\lambda_{P_i})} (f_{P_0}(u)) \wedge y = \max_{u \in U_P^{(q)}(\lambda_{P_i})} (f_{P_0}(u))\},$$

and is a multiset belonging to $\overline{\overline{2^{INTERVAL}}}$, too.

The definition, just formulated above, completes all list of computational tools required for the first two stages of the AAI strategy to be successfully implemented, e.g. as follows:

```
Step 1: Collect input assesements {op₁, op₂, op₃, …., opₛ} from all target
respondents.                        /Stage 1

Step 2: OUTPUT := ∅.                /Stage 2

Step 3: Forall op∈{op₁, op₂, op₃, …., opₛ} do begin
             if v∈GSA then begin   /grading scale-based assesement
             extract sᵢ,ⱼ from v
```

```
        OUTPUT := OUTPUT ∪ meaning(v/s_{i,j})
        end
        else begin            /linguistic value-based assesement
        extract Pi from v
        OUTPUT := OUTPUT ∪ meaning(v/P_j)
        end
end.
```

where OUTPUT constitutes a rational input to actual implementations of Stage 3.

Final Remarks

In this paper an approach to implementing an original strategy for aggregation and integration of a class of linguistically and semi-linguistically expressed assesments was partially discussed, as well as few design, functional and theoretical assumptions for target implementations of the strategy presented. The strategy is being developed as a part of a R&D project in the field of distributed knowledge management and processing. The assessments are assumed to be provided by a collective of target respondends, responsible for evaluating the intensity of a particular property **P** in a particular management or control object. The target of the strategy is to aggregate and integrate the collective assessment and then describe the content of result back, using fuzzy-modal language of communication. The discussion carried out in the paper shows how the assessments expressed using numerical scales or linguistic values should be transferred into machine and computationally oriented representation t make effective aggregation and integration possible.

The major theoretical assumption for the strategy itself is that the internal machine representation of the meaning of each particular assessment is given as a multiset consisting of sub-intervals of the normalized interval [0,1]. This coincides with one of the main objectives of the broader R&D project, mentioned in the presentation, which provides for the practical application of a wide spectrum of computational tools dedicated to solve numerous optimization and decision tasks defined over the universe of numerical intervals.

Abstract

Ensuring safe working conditions is the task of both employer and employee. Considering the risk arising from the production activity of the enterprise, it is necessary to take into account the exposure of employees arising from the system: human - technical object - the environment in which this activity is performed and affects the entire process. All elements of the system can be a source of danger, and each of them can relate to the consequences of the risk of accidents or occupational diseases. During the production of aluminium castings in the pressure casting process, many factors and substances that threaten the health and life of employees can be specified. The specificity of technological processes, as well as materials used and produced in the foundry make it an activity classified as a hazardous process for the employee. The article presents the assessment of occupational risk of foundry machines and devices operator in the automotive industry plant by using the Risk Score method.

Keywords: automotive industry, pressure die casting, occupational risk assessment, Risk Score method

Introduction

Occupational health and safety directly affects production efficiency, which is one of the basic factors influencing the company's profit. This point of view is influenced by the high requirements of manufacturers, expecting a high level and commitment to creating a culture of work safety. Certainly, an important role in this case is the awareness that avoiding breakdowns, damages, accidents and potentially dangerous events is appropriate for the company's operations. In this case, people's safety is a need inscribed in the company's business. Most people think that it is worth taking care of life and health in the workplace, but it does not always correspond to everyday behaviours, which often result from the culture of safety or its lack in the structures of the company by Nordlöf H. et. al. (2015). Technological development gives the employee increasingly perfect and complex tools and machines that contribute to the replacement of people's work. As a result of process automation and robotization, the working conditions at a given position are also changing. As a result of the above, in enterprises there is a significant increase in loads caused by the harmful effects of equipment, loads related to noise, and above all the phenomenon of transforming dynamic load into static by Mgonja (2017). The concept of health and safety (OHS) is related to both the conditions of work organization and employee behaviour. Occupational health and safety at work is the foundation for the proper functioning of the company, which is its inseparable element. The aspect of work safety is fully subject to European Union directives, which define the main tasks of employers. One of the key is the Framework Directive on health and safety at work by 89/391 / EEC , which introduced understandable principles into European legislation describing specific obligations in the field of the health and safety of employees and management by Council Directive 89/391/EEC (1989). The most important are the legal regulations contained in section X of the Labour Code regarding the proper functioning of the labour protection system in the country. In accordance with art. 66, first paragraph, of the Constitution of the Republic

of Poland, every person undertaking work has the right to obtain hygienic and safe conditions. This constitutional law is a response to the employer's obligation to ensure hygienic and safe working conditions for employees, which the legislator has recognized as one of the leading principles of labour law and is part of Art. 15 of the Labour Code. The provisions contained in the said chapter characterize and specify the principle of ensuring hygienic and safe working conditions for employees, specifying the obligations of employees and employers in this area. By Poździoch (2015). One of the main employer's obligations referred to in art. 207 of the Labour Code, is required to adapt the company to the principles of occupational health and safety and eliminate irregularities in their implementation, and thus comply with the recommendations dictated by the labour inspectorate. Article 207 of the Labour Code imposes on the employer the obligation to protect the life and health of employees, which should be met by ensuring hygienic and safe working conditions, using the achievements of technology and science. This risk accompanies every human activity and is generally associated with the possibility of loss. It is therefore a consequence of risk. When considering the risk associated with the company's production activities, exposure should be taken, resulting in the creation of a system: human - technical object - environment in which this activity is carried out. All elements of this system can be a source of danger, and each of them can refer to the consequences of accidents. Risk in the system: human - technical object - the environment can be defined in a different way, namely risk is a combination of the frequency or probability of occurrence of specific hazards and losses that may cause, is a measure of the probability of an adverse event and its effects are a combination of the probability or frequency of a dangerous event or the consequences of related events by Karkoszka, Szewieczek ; Broszkiewicz (2016); Pan, X et. al. (2020). Occupational risk is taken by the employee in accordance with the performance of the work. In the Ordinance of 26 September 1997 on general health and safety regulations, risk was defined as the probability of adverse work-related occurrences causing losses, and in particular adverse health effects of employees as a result of threats to the work environment or its operation. The same definition has been presented in Polish standards. Occupational risk, simply presenting the problem, is the likelihood of harmful health consequences associated with the work process (illness or injury), given their severity. The assessment of this risk should be the main element of any occupational health and safety management system and its main purpose is to provide effective protection for all employees by Obolewicz, Dąbrowski (2018). Also important in this case is occupational risk assessment, defined as a systematic and periodic examination of all work aspects. Risk assessment is carried out in order to detect hazards appearing in the work environment that may become the reason for deterioration of health or the cause of injury. It is important whether certain hazards can be eliminated, when this is impossible, protective measures should be taken to limit the risk. In the analysis of occupational risk, two main stages can be identified, including risk analysis and determination of its admissibility, thus making decisions on eliminating or reducing or accepting it. Hazards are identified based on the information collected in the occupational risk assessment. At this stage, knowledge on the occurrence of hazards at the analyzed workplace is primarily used. Occupational risk analysis is to enable the prevention of dangers before their negative consequences occur. Its result should be to identify any hazards arising from work and assess the likelihood and severity of their consequences by Geller, E. S. (2005) and Larsson Tholén S. et. al. (2013). As a result of the analysis, appropriate preventive measures can then be planned and implemented to reduce or eliminate potential threats. Given the above further on, the essence of occupational risk assessment will be discussed further in the article.

Literature Review

The work environment of employees in heavy industry, including metal foundry, is associated with many specific working conditions. In this case, there are a very large number of occupational hazards. This mainly concerns the threat of harmful and carcinogenic chemical substances and dust resulting from technological processes implemented in the above-mentioned industry by Daroń, Górska (2019); Zakaria, A. et. al. (2005) and Holtzer (2007). The work environment is defined as the environment in which certain professional activities are carried out. Therefore, the work environment consists of, among others, noise, plant and animal microorganisms, toxic substances, irritants, sensitizers, carcinogens, hot microclimate and the level of air dustiness as well as radiation. Exposure to chemical agents occurs when a chemical agent in the process enters the human body during work, usually through the skin or the respiratory tract. Inhalation of toxic chemicals, however, is the most common hazard in

working conditions when performing duties. Gases, dusts, vapours get mainly into the employee's body through the respiratory system during ongoing technological processes. The effect of toxic substances on an employee depends on the specific properties of the substance and the concentration of the dose introduced into the body. The World Health Organization indicates that 50% of the human population around the world spends a third of their lives at work. The work process takes place in a material environment, which is shaped by the factors present in it, such as: biological, chemical, physical, which have their source when carrying out processes in which raw materials and materials are processed. By Health and Safety Guidelines on the Management of hazards in the Metal Casting Industry New Zealand Inc (OSH) (1997). Dangerous, harmful and troublesome factors appear in the process environment. The degree of intensity of these factors determines whether the work environment is a threat to the health or life of an employee. Harmful or troublesome factors may cause a decrease in the employee's mental and physical fitness. They can also lead to poisoning, death or occupational disease by International Labour Office Geneva (2013). Metal casting is one of the most harmful metal production technologies. The process of forming metals into ingots or castings involves the production of metal parts by pouring the mold into liquid metal under pressure and then cooling. The next step is the process of separating the casting from the mold and removing the cores reproducing the internal shapes of the produced elements. The further process is cleaning the casting surface, technical inspection and finishing. Despite the continuous development of technology, increasingly advanced technologies, environmentally friendly raw materials, as well as safer devices and machines, they set up casting as a high risk profession. Despite the continuous development of advanced technologies and environmentally friendly materials, as well as safer devices and machines, casting is classified as high risk profession by Senthil Kumar R.P., Naveen K. (2016); Sadowski, Szykowny and Ciechacki (2010). There is a large amount of hazardous chemical, physical and psychophysical factors in this work environment. Physical factors mainly include moving parts of machinery and equipment, moving products and materials, noise, high temperatures, vibrations, electromagnetic fields, electric current and chemical dust. Other harmful and hazardous factors to which an employee is exposed are: vibration, noise, dust and industrial gases, which are found in processes carried out in the main workplace and in other locations. In further part the article will discuss each stage of the metal casting production process and associated occupational risk. The first stage of the production process in foundries is the production of models made of various materials, including plastics, metals and silicones. During the production of models, plastic processing is carried out, so the main source of threats in this case are the devices used for this processing (e.g. lathes, milling machines). Mechanical factors lead to immediate consequences in the form of injuries, including crushing, bruising, puncture and even loss of employee's life. We distinguish the following groups of mechanical factors: protruding, sharp elements, slippery surfaces, fluids under pressure, transported objects and moving machines, falling elements. The next stage of the process is the preparation of molding sands. These masses are very harmful to the environment. However, during casting, an equally important factor for the operator's well-being is the microclimate. The microclimate is influenced by factors such as humidity, temperature or heat radiation. The position of the casting machine operator is characterized by a hot microclimate. Working in hot conditions causes fainting and slows down the work of the heart, which is why the main responsibility of the management is to ensure an appropriate thermal conditions microclimate, which can be ensured, e.g. by adequate and effective air exchange by Scholz, et.al .(2008); Majidi. et. al. (2011) and Wan (2004). The main hazards in the casting process are also noise, vibration and dust. Noise in production plants is emitted mainly by working machines. If its value exceeds the operational threshold, it is the employer's responsibility to limit it. The permissible value of noise in production plants is 85 dB during eight hours of operation. In the event of noise exceedances, management should isolate the worker from the area exposed to noise and put in place appropriate personal protective equipment. The process of pouring and assembling casting molds is associated with a significant increase in hazards. The main threat in this case is the burn with liquid metal splashes, as well as the threat of products emitted from the decomposition of mass components and during the reaction of liquid metal with materials on the surface of the mold. Accidents can also occur when filling spoons and ladles with liquid metal, and in turn the introduction of water into the molten alloy can cause a violent explosion. The next step is to separate the castings from the molds and remove the cores. This stage involves mass separation by removing mold cores. Punching of castings is also a very onerous technological process. During this process, a significant amount of dust, steam, as well as large amounts of heat and noise values of up to 110 dB are released. Vibration also affects the well-being of the machine operator. There are three

main causes of vibration, namely: construction (when machines are equipped e.g. with a cam, technological (due to mounting inaccuracies, bearing clearances) and operational (looseness, machine wear, surface deformation, improper lubrication). Dust is also a serious hazard during grinding and there is also a high risk of explosion. The final step of production is quality control of castings. This test is often performed using X-ray tests, which are associated with the influence of ionizing radiation that causes diseases e.g. cancer. Unit manager assesses employee exposure. If the analysis required exposure limits, it sets further limits for them. In the event of high risk, measures should be taken to reduce the risk. If there is a medium risk, this should be considered. Management should review the effectiveness of actions taken, which are aimed, inter alia, at reducing radiation doses received by employees In the event of a measures should be taken to reduce such risk. If there is a high risk or medium risk of exposure to ionizing radiation, management should review the effectiveness of the actions taken, which are aimed to minimizing the radiation doses received by casting control employees by International Atomic Energy Agency; International Labour Organization; World Health Organization (2010).

Research Question

Regarding the subject analysed in the study, it should be considered which factors plays the most important role in risk assessment of die casting machines operator. This subject requires a detailed examination and diagnosis base on the Risk Score analysis of such area of the company. The main purpose of the article is to analyze the impact of metal casting process conditions and environment on the operator's health and occupational risk and the level of process safety. The analysis of the subject could was realized and evaluated after answering the following research questions:

1. What conditions determine and have a great impact on the increase of danger at the workplace of the foundry machine operator ?
2. What corrective actions must be introduced by the company's management board to ensure safe working conditions for foundry machine operators ?
3. Did the Risk Score analysis specify important factors improving the working conditions of foundry machine operators that will be taken into account when implementing work safety procedures in the foundry ?
4. What is the probability of implementing corrective actions obtained by the Risk Score method into industrial practice by the management board ?

Research Design and Methodology

This risk accompanies every human activity and is generally associated with the possibility of incurring a loss. It is therefore a consequence of the threat. Occupational risk is the likelihood of harmful effects that are hazardous to the employee's health in connection with the work process (illness or injury), depending on their severity. Risk assessment should be the main element of any occupational health and safety management system, and its main purpose is to provide effective protection for all casting machine workers. Therefore, the paper presents occupational risk assessment using the Risk Score method according to the current state of occupational safety in the enterprise. The risk assessment method is a universal method of occupational risk assessment. In this method, the probability of hazard occurrence is presented using two parameters. The first parameter is the employee's exposure to the type of hazard indicated, and the second is the probability of occurrence of the event. The estimation of risk assessment in the universal risk assessment method is carried out by determining three factors: probability of occurrence of the event, exposure to the hazard, consequence of the event. In this method, occupational risk assessment is based on an indicator that results from the following formula by Kinney et. al. (1976); Smolarkiewicz (2011):

$$\mathbf{R = S \bullet E \bullet P}$$

where:
R – risk,
S – consequences of the event,
E – exposure to the threat,

P – probability of occurrence.

The most important hazards which occur at foundry machines job position were identified and results of risk assessment using the Risk Score method are summarized in Table 1.

Table 1: Occupational risk analysis of foundry machines operator by Risk Score method

	Hazard type	Source of hazard	Effects of the hazard	Risk assessment before corrective action				Preventive solutions	Risk assessment after corrective action			
				S	E	P	R		S	E	P	R
MECHANICAL FACTORS												
1.	Protruding machine parts	Protruding elements that result from the design of the machines	Cuts, scratches, limb injuries,	1	6	6	36	Securing hazardous places, Using guards, Carrying out systematic, machine repairs, Health and safety training	1	3	3	9
2.	Rotating machine components and devices	Moving parts of foundry machines, Robots for moving and transporting castings	Body injuries, Limbs pulling in through moving parts	7	6	1	42	Take special care, Use covers, Follow procedures, Employees training	3	6	1	18
3.	Sharp edges	Sharp mold parts, Casting edges	Skin cuts, Serious injuries	1	6	10	60	Particular caution when changing the mold, Observing health and safety rules, Using gloves protecting against cutting the skin, Observing work instructions	1	6	3	18
4.	Surfaces on which a fall is likely	Slippery surfaces, Steps when changing molds,	Contusions, fractures of dislocations of limbs	3	6	3	54	The use of appropriate non-slip footwear, extreme caution, maintaining cleanliness at the workplace	3	6	1	18
5.	Electric current	Machines and devices powered by electricity,	Employee death	7	6	1	42	Caution when working with machines powered by electricity, Carrying out multiple checks of the condition of the electrical system, Using safeguards to prevent electric shocks	7	2	1	14
6.	Moving means of transport	Forklifts, Overhead Cranes, Handling Trucks	Fractures, crushes, bruises,	7	6	1	42	Moving only in marked places, Exercise extreme caution when moving around the plant area	3	6	1	18
PHYSICAL FACTORS												
7.	Noise	Production machines and equipment	Hearing loss, Hearing deterioration	3	6	1	18	The use of hearing protectors, if necessary, Systematic inspections of machinery and equipment that will allow reducing noise and systematic measurements of noise levels,	3	2	1	6
8.	**Explosion, fire**	Poorly heated liquid metal dosing spoon, Faulty gas installations, Contact of water with liquid aluminum, Grinding dust	Employee death	15	10	1	**150**	Correct heating of the bucket, Frequent inspection of the gas installation, No fire in hazardous areas, Separation of hazardous areas	15	10	0,5	**75**
9.	**Incorrect microclimate**	Hot and emerging microclimate from the presence of pressure casting furnaces	Fainting, Dry skin, Heat stroke, Reduced work performance, Weakness,	3	6	6	**108**	Adjustment of temperature to specified requirements, Ensuring efficient ventilation, Performing numerous measurements, Ensuring the possibility of cooling the body, Applying protection measures,	3	3	3	**27**
10	**Hot surfaces**	Preheated casting molds, Hot ready castings, Hot leads,	Burns with degree I, II or III,	7	6	10	**420**	Caution, Use of suitable gloves to protect against heat, Compliance with health and safety regulations and procedures	3	6	6	**108**
11	Inadequate lighting	Poor workplace lighting	Headaches, eye aches, lacrimation, visual defects, fatigue	3	6	1	18	Ensuring adequate lighting	1	6	1	6
12	Blowing with compressed air	Dizziness	Eye aches	3	6	3	54	The use of protective glasses, Preventive examinations of employees	3	1	1	3
BIOLOGICAL HARMFUL FACTORS												
13	Bacteria, viruses	Factors at the workplace	Skin reactions, gastroenteritis, allergies,	3	6	1	18	Keeping the workplace clean, taking care, maintaining personal hygiene	1	6	1	6
CHEMICAL HARMFUL FACTORS												
14	Chemical substances	Oils, Acids, solutions and alkalis for cleaning molds, Used chemicals for wetting and lubricating mold surfaces,	Skin burns, Allergies, rashes, Poisoning,	3	6	3	54	Compliance with workplace instructions and health and safety rules. Conducting regular preventive examinations of employees,	3	3	3	27
PSYCHOPHYSICAL FACTORS												
15	Physical load	Forced body position, Manual handling of castings and other loads,	Tearing, muscle strain, hernia, bone diseases	3	6	3	54	Frequent breaks, compliance with transport standards, appropriate handling,	3	6	1	18
16	Psychonergic load	Stress, night work	Deterioration of mental state, nervous disease, Absenteeism	3	6	3	54	Compliance with working time standards, Selection of employees in psychological terms, Conducting training and instructional meetings,	3	6	1	18

Results

The aim of a conducted analysis was to assess the occupational risk of foundry machines and devices operator by using Risk Score method. On the basis of this method, hazards and risks to which the operator is exposed were identified. The table 2 contains 16 most important threats base on which full occupational risk assessment was realized.

Table 2: Hazards and risks selected by Risk Score method for job position of foundry machines operator before and after implementation of corrective actions

HAZARD TYPE		RISK R	
		BEFORE CORRECTIVE ACTION	AFTER CORRECTIVE ACTION
MECHANICAL FACTORS	Protruding parts	36	9

Source: own study based on information collected during an industrial internship in an analysed metal foundry

The assessment presents factors which a metal foundry worker is most exposed. These factors are among others: hot surfaces, inappropriate microclimate, explosion and fire. They are typical factors for the working environment. Calculation of their value allowed to present the risk for each of the factors. These values were as follows: hot surfaces - risk level R = 420 (very high risk), inappropriate microclimate - risk level R = 108 (significant risk), explosion and fire - risk level R = 150 (significant risk). Risk related to hot surfaces assumed the value of R> 400, which allowed categorizing the risk as very large. Preventive activities must be used immediately in this case. After using particular preventive activities the risk is possible to reduce about more than a half. But, the risk of threats related to explosion and fire as well as improper microclimate have been categorized in the range of 70 <R ≤ 200, which proves a significant risk, in this case also an improvement is needed. Threats connected with the occurence of hot surfaces should be limited by special precautions when rebuilding the molds, and wearing clothes covering the entire body surface to eliminate the threats that also cause liquid metal splinters. In addition, it is required to use appropriate gloves to protect against high temperature body contact, and in addition it is recommended to comply with health and safety regulations and established procedures. After applying the adjustment, the risk decreased to the value of R = 108. The risk related to the occurrence of an inappropriate microclimate after applying preventive measures decreased to the level of R = 27. The key action which is necessary to minimalize the high level risk is providing efficient ventilation and, above all, adjusting the temperature to the set requirements. The last of the factors reaching a significant level of danger was the risk associated with explosion and fire. An important way to prevent it is to ensure that the spoon for dispensing molten metal is always in contact with liquid metal to be warmed up. What is more, a very important aspect is for liquid aluminium to never have contact with water or wet, moist elements. An employee hired as a casting machine operator must be qualified and be especially careful when performing his professional duties. Another important preventive factor is to abide by the stand instructions and particular caution when operating the furnace for heating and melting Al alloys. It is also important to separate hazardous areas where a fire ban would apply. Gas installations should be frequently inspected and checked. The level of risk after applying preventive measures decreased to R = 75 (table 1). In order to provide a comprehensive picture of the impact of prophylactic measures on reducing the level of risk, selected risks are summarized in Table 2 together with a comparison of the risk values before and after the adjustment. From the analysis of the hazards it might be stated that with the use of appropriate preventive measures in a facility being an object for occupational risk assessment, it is possible to reduce the occupational risk occurring

in the enterprise to an acceptable level. Occupational risk, unfortunately, cannot be fully eliminated but with use of proper preventive measures and actions it is possible. The risk, which is classified as very large, was reduced to the level of small risk using appropriate measures, while the other factors gained an acceptable level, which is a huge achievement for the company.

Discussion

The issue of occupational risk assessment is extremely important for all persons performing work. The analysis of the actual state of the plant was carried out using the Risk Score method, based on the recognition of a deviation from the required condition. The implementation of the proposed corrective actions was necessary to use their constitutional rights to safe and hygienic working conditions. The proposed actions, however, do not end only with the implications of ad hoc actions, but must take into account the process of continuous improvement of the occupational health and safety system in the plant. However it should be remembered that the effectiveness of the suggested corrective actions is determined in the main group of commitments of the management board. The proposed corrective and preventive actions will only be successful if they are introduced enough early. The plant is required to respond quickly to detected non-compliances related to the operation of the occupational health and safety management system. Undoubtedly, work safety has a huge impact on the external perception of the plant as a well-managed institution in terms of both production and maintaining human-friendly health and safety conditions at work. The organization should respond immediately to emerging irregularities by improving health and safety procedures at all job positions in the plant. It has been proven that the situation of the plant, in terms of work safety, is affected by a large number of factors. These are mainly hazards that appear in the work environment, which the plant should try to eliminate continuously. Based on the assessment of occupational risk carried out using the Risk Score method, attention was drawn to threats that are unacceptable in a work environment and have the most severe consequences. The analyzed plant boasts a high level of safety due to the lack of accidents in 2019. However, it was important to examine the employee's subjective assessment, which showed errors resulting from occurring deficiencies. The main problem was the lack of personal protective equipment used by employees, which significantly threatens the life and health of employees. As a preventive measure, frequent inspections and enforcement of employees to comply with applicable health and safety regulations and procedures were suggested. First of all, the employee should use personal protective equipment and keep the workplace clean, including machinery and tools. In addition, he must check on a regular basis whether the protective clothing is clean and intact. One should also remember about its frequent exchange. The analyses carried out by the plant after the introduction of preventive measures suggested as part of the study showed that the use of the Risk Score results has significantly improved the safety status of casting machine operators, which confirms that they have been properly identified. The conditions and occupational risk assessment presented in the paper as an operator of foundry machines and devices may be an introduction to the search for areas where an analysis and assessment of occupational risk allows assessing and indicating possibilities of improving occupational health and safety, as well as limiting occupational risk. The financial means incurred for the implementation of corrective and preventive actions will ultimately reduce the costs resulting from e.g. sickness absence, compensation after accidents at work, and thus lead to an increase in profits for the company. Continuous improvement of the OHS system is a consequence of the legal obligation, which is also contained in a situation in which the OHS system never reaches the standard state, and therefore there will be a constant need to improve it. The OHS system defined in a given plant has a positive effect on preventing hazards in order to completely eliminate their consequences. Its most important element is the occupational risk assessment, which should allow identifying and correctly defining threats and their consequences for both the employee and the workplace.

Conclusions

The purpose of this manuscript is to analyze the level of safety at a selected position in the metal foundry. Actions taken have led to a thorough assessment of the level of safety at the position of the operator of foundry machines and devices. First of all, after the implementation of corrective actions in the discussed position, its proper functioning is checked. Verification activities should be associated with auditing, monitoring, documenting and detecting non-conformities. Monitoring refers to checking

the employee and the proper functioning of the equipment in the plant in relation to applicable regulations and specific occupational health and safety policy. Documents related to the functioning of the occupational health and safety system should contain information on: identified threats, applicable rules and regulations, training received by employees in the field of occupational health and safety, results of risk analysis, accident analysis, control methods used, results of controls carried out by supervisory authorities Health and safety and management reviews. Using selected research methods, it was noticed that the situation in the plant in terms of health and safety at the examined position has improved. It has also been proven that many factors influence the situation in the plant in terms of work safety. The issue of occupational risk assessment is therefore extremely important for all persons appearing in the work process. The analysis of the actual state of the plant was carried out using the Risk Score method. On its basis, deviations from the expected level of occupational safety were identified. The implementation of the proposed corrective actions was necessary to ensure that employees have their constitutional rights to safe and healthy working conditions. The proposed actions do not end only with the implications of temporary actions, but include the process of continuous improvement of the OHS system in the plant. It should be remembered that the effectiveness of the proposed corrective actions is primarily determined by the involvement of the management board.

Risk Factors Management in the Process of Real Estate Appraisal. Research Results

Piotr KURAS

Czestochowa University of Technology, Czestochowa, Poland
piotr.kuras@pcz.pl

Abstract

The issues addressed in the work concern the conditions of making decisions in the process of real estate appraisal that belongs to the area of management sciences. The paper aims to analyse and evaluate factors that affect the quality of the appraisal process and the final estimation of the real estate value. It constitutes the final report on the research on the risk factors of real estate appraisal, which was partly described in the article *Identification of Risk Factors in the Process of Real Estate Appraisal* prepared for IBIMA 2019, Madrid, Spain. The article contains the results of the analysis of the factors and their evaluation. A qualitative approach was used to describe the research results. The methods of scientific inference such as analysis and synthesis were employed as research methods. Although the survey was conducted among Polish property appraisers, its results are largely universal due to the advanced and continuously progressing valuation standardisation process worldwide. Therefore, they can provide a starting point for researchers from other countries to design their studies in this area.

Keywords: Management, Real Estate, Risk, Valuation.

Introduction

Value is one of the most fundamental economic categories, and its understanding determines the effectiveness of decisions made on the market. In the free market conditions, value is shaped by the exchange mechanism. The seller and the buyer create this mechanism by revealing their intentions and making specific choices related to the sale and purchase of specific goods. The exchange of goods takes place in the result of voluntary transactions between the seller and the buyer at a price set by them. Under efficient market conditions, the price reflects the value of the good. The more efficient the market is, the more prices match the value and the prices of the same goods have a smaller price range in the market. And vice versa (Wrzosek, 2002; Bryx, 2006). Therefore, knowing the value of a good is necessary for making economically rational choices. Estimating the correct value while deciding and projecting the future value of the good is a prerequisite for assessing the effectiveness of a decision whether to buy or sell the good. It applies to all goods. As far as real estate is concerned, it is particularly significant for several reasons.

Real estate has several characteristics that make the real estate market inefficient (Kucharska-Stasiak, 2004). These include its high heterogeneity as a commodity, lack of mobility, and high capital intensity. The real estate market is characterised by a relatively small (compared to other markets) number of transactions, high entry barriers due to the high capital intensity of the property, and low liquidity. Moreover, access to data on prices and information on transaction conditions is hindered. Hence, not all market information is reflected in the price, which is a necessary condition for the price to be a good measure of value (Koncepcje..., 2010). The real estate market is highly opaque (Kuraś, 2013). Lack of appropriate information leads to difficulties in achieving market equilibrium, and the lack of this equilibrium makes it harder to value property (Kucharska-Stasiak, 2006). Correct property valuation requires full knowledge of the market, i.e. both direct and indirect transaction conditions (Gawron, 2006).

The paper aims to analyse and evaluate factors that affect the quality of the valuation process and the final estimation of the property value. It constitutes the final report on the research on the risk factors of real estate appraisal, which was partly described in the article *Identification of Risk Factors in the Process of Real Estate Appraisal* prepared for IBIMA 2019 (Kuraś, 2019). The article contains the results of the analysis of the factors and their evaluation.

Theoretical Background

The value category has been an object of interest for many centuries, and some sources say that the first interpretations can be found in Xenophon – V-IV BC (Historia..., 2008). In modern times, it was dealt with by representatives of classical economics, such as A. Smith (Wartość..., 2004), D. Ricardo (Źróbek-Różańska and Źróbek, 2008), J.B. Say, J.S. Mill, or neoclassical economics, e.g. Jevons and Menger (McKnight, 1994). Further development of values-Walras (Landreth and Colander, 2005) and A. Marshal (Kucharska-Stasiak, 2012). Researchers were interested in the category of values as it was crucial for socio-economic relations and its understanding determined whether the decisions made by the parties to the transaction were beneficial or unfavourable to them. Value is essential in the market for commodities that are highly capital intensive. In this case, the consequences of incorrect value estimation are much more severe than for goods with lower unit prices.

The progressing process of globalisation of the economy manifests itself, among other things, in tendencies to standardise similar economic and financial processes, including such areas as property valuation. The increasingly free movement of capital has created new investment opportunities and new markets. The property valuation standardisation is a consequence of these processes. Different solutions have been applied in different countries. However, the global community of investors, lenders, accountants and valuers is interested in standardising approaches and methods of valuation. The *International Valuation Standards Council – IVSC* (International..., 2017), *The European Group of Valuers' Associations – TEGoVA* (European..., 2016), *The Royal Institution of Chartered Surveyors* (*RICS*) and the relevant European Union agenda have all been involved in the valuation standardisation process (www.rics.org).

As a general rule, valuation should be understood as a process to achieve value, which requires the proper planning of specific activities, their organisation, the correct implementation of previously planned and organised activities, and a critical assessment of all previous stages for the best possible final result (Szacowanie..., 2012). Being aware of differences in valuation assumptions from one country to another, certain elements of universal nature can be identified. The article analyses the process of valuation according to legislation binding in Poland.

In Poland, the valuation of property has been regulated by law (Ustawa..., 1997; Rozporządzenie..., 2004) and professional standards (Powszechne...) of property appraisers issued by *The Polish Federation of Valuers' Associations* – PFVA (www.pfsrm.pl). The regulations include the principles of using different approaches, methods and techniques of valuation, as well as the methods of determining the value for different purposes. A valuer carries out the valuation in the form of an appraisal report (Wilkowska-Kołakowska, 2010), the method, form and content of which are regulated by law. The appraisal report is a written opinion on the value of the property. It contains the information necessary to perform the valuation, including the legal basis and conditions of the activities performed, substantive solutions, the course of calculations and the result in the form of a specific number. The choice of approach and method of valuation is made by the property valuer taking the utmost account of the purpose of the valuation, the type and location of the property, the equipment level in the technical infrastructure, the state of development as well as available data on prices, income, and characteristics of similar properties. In the Polish valuation practice, there are the following approaches: comparative, income, cost, mixed.

The comparative approach consists in determining the property value in the effect of its comparison with similar properties that were traded on the market. The income approach assumes that the future buyer of the property being valued is willing to pay a price for it, which depends on the amount of income that the property may generate. The cost approach takes as its premise that the property is

worth as much as its replacement costs, considering the current level of its consumption. The mixed approach allows for the use of the different approaches listed. Various methods are employed within these approaches and a variety of techniques within the methods. That will depend on the characteristics of the property being valued and the availability of market data.

In Polish conditions, the market value that is the most essential in any market economy is most often determined (Kucharska-Stasiak, 2016). It is the estimated amount that can be obtained for a property if there are no special conditions of the transaction. The general course of the valuation process in the Polish conditions can get a specific framework, as presented in Figure 1.

Figure 1: Scheme of the valuation process according to Polish regulations

Standardisation of the process of real estate appraisal contributes to the reduction of the risk of incorrect value estimation. That risk cannot be completely eliminated, however, proper actions can significantly limit its extend. The risk is an inevitable part of each activity and decision (Korombel, 2012).

Risk factors management includes identifying the risk factors, constructing a plan on how to limit them, and undertaking actions that can lead to risk reduction. The final stage of this process is checking whether undertaken actions gave the predicted result and if so, in which scope.

Research Methods

The article presents the results of an extensive survey, which lead to the formulation of research assumptions, development of a questionnaire, and then analysis of the data thus obtained. The research process began with an analysis of sources on practical aspects of valuation. The analysis included scientific articles, legal regulations, industry literature, articles in renowned newspapers and magazines, industry websites. In the study, the observation method was also applied to analyse the valuation process in practical terms and, as a result, comments and suggestions were recorded. The survey questionnaire construction was preceded by a standardised interview with several experts to identify possible errors and inaccuracies.

A survey followed the above. The questionnaire contained 27 questions, 6 of which were the so-called demographics, and the remaining 21 were specialist questions. The survey was conducted in June 2019, and its duration was 15 days. The survey used a publicly available database with basic valuers' data and their e-mail addresses to contact potential clients with them. In this way, 1627 addresses were obtained. A request together with a link to the online survey was sent to each address to complete the survey. Two hundred twenty-seven people took note of the content of the survey. Eventually, the survey was completed by 131 people, which constitutes 8% of all e-mails sent with the request to do so. All persons who decided to fill in the questionnaire did it completely and correctly.

The survey results were partially published in the article *Identification...* presented in the IBIMA 2019 materials. The paper contains the results and conclusions from the survey, which have the nature of the simple quantitative analysis, without the use of statistical methods.

Discussion of Research Results

The work was prepared based on the data from 131 questionnaires. Most experts who decided to fill in the questionnaires were women (56%) than men (44%). The largest group were respondents aged 30-39 (47%), followed by those aged 40-49 (21%). Both age groups are more than 2/3 of the total number of respondents. Experts with 5-10 years of seniority (41%), followed by 11-20 years of seniority (28%) were the largest group, while experts with less than five years of seniority were the least numerous (19%). The highest number of questionnaires was completed by respondents operating in cities with more than 500 thousand inhabitants (49%) and in cities with 100-500 thousand inhabitants (23%), in total it is almost ¾ of all respondents. The most numerous group was made up of valuers who carried out over 100 valuations (38%), over 1000 valuations during their professional activity were conducted by over 20% of the respondents.

Property appraisers in Poland are professionals who have the exclusive right to make valuations in certain cases under the relevant legislation. It always applies to properties that are part of the state treasury and local government. In other cases, there is no formal requirement to do so, as is the case when estimating the value of real estate as collateral for bank mortgages or private property transactions. In practice, however, banks, and the courts as well, frequently use qualified valuers. The court expert for property valuation does not have to be a person with professional qualifications issued by the relevant ministry, although there is obviously the principle of having appropriate, otherwise certified knowledge and experience to perform this function. Nonetheless, in these cases both banks and courts often use experts. In the author's view, the reason for this is the desire to reduce the risk of the valuation being undermined by one of the parties concerned in disputed situations. The structure of valuations made by the valuers surveyed is shown in Figure 2.

Figure 2: Structure of valuations made by the surveyed property appraisers

The largest recipients of valuations in Poland are banks (44.3%), followed by local government units (19.8%), retail investors (17.6%), and courts (7.6%). Slightly more than a tenth of all valuations are entities which belong to none of the institutions mentioned above.

The respondents' responses made it possible to determine the most vital, in their opinion, factors influencing the correctness of their valuations. They are described in detail in the article *Indentification...*Table 1 displays them in the synthetic approach.

Table 1: Most significant risk factors in the process of real estate appraisal

Risk factors	Risk area	Risk source	Manifestations of risk
Factors related to the identification of the object and scope of valuation (independent of the valuer)	Information in public real estate information resources	Information in land and building registers (geodetic information)	Non-compliance, non-validity, non-disclosure
		Information contained in court registers (information on legal status)	
		Information contained in the local law of local government units (information on the designation of real estate)	Accessibility
	Analysis of the real estate market	Sources of data and information about the market	Lack or small amount, level of credibility and reliability, topicality
	Pressure to distort the valuation result	Ordering party requesting or suggesting an over- or understatement of the valuation result	Wrong valuation result
Factors relating to the estimation procedure (totally or partially dependent on the valuer)	Inspection of the property	Intentional lack of inspection or inability to carry out the inspection on the date(s) relevant to the valuation or inspection carried out unreliably	Incorrectly established condition of the property and/or its market characteristics, errors in the selection of the market and comparative properties
	Determination of dates relevant to the valuation	Failure to understand or take into account special provisions (especially for rare cases)	Incorrect adoption of dates of the property's condition and market condition (price level)
	Formulating valuation assumptions	Incorrectly carried out analysis process and/or and defects in reasoning logic	Incorrect determination of the object, scope, area or period of analysis (incorrect assumptions)
	Choice of approach, method and techniques of valuation	Incorrectly conducted process of choosing the method of valuation due to incorrect determination of elements such as object, purpose, scope of valuation, purpose of the property	Incorrectly chosen method of valuation
	Degree of difficulty of	Complicated property or	Errors in the assumptions of the

	the estimation procedure	complicated valuation	procedure or the estimation procedure itself
	Selection of comparative properties	Difficulty in obtaining data, quality of market information	No or little similarity between the property being valued and comparative properties
	Determination of income losses from real estate	Lack of objective market data or difficulty in obtaining such data (e.g. on vacancy and rent arrears for the income approach)	Incorrectly estimated income losses and, consequently, the value of the real estate
	Determination of rates of return		Incorrectly determined rate of return and consequently the value of the property

In general, all risk factors in the property valuation process can be subdivided into those relating to the identification of the subject matter and scope of the valuation beyond the appraiser's control and others connected with the valuation procedure over which the valuer has total or partial influence and can, therefore, manage them.

The first group of factors includes the risk of obtaining incorrect, outdated or incomplete information from public property information resources primarily. In Polish conditions, the valuer is required to determine the surveying designation and the legal status (rights and restrictions) of real estate. A geodetic marking involves the necessity to obtain data concerning the location, area, boundaries, type and distribution of land application, etc., enabling the spatial identification of real estate. The information is obtained in location-specific departments of geodesy. Appraisers determine the legal status through the analysis of entries in real estate land and mortgage registers, i.e. registers of information about real estate understood as a legal entity. Land and mortgage registers are maintained by district courts competent for the location of real estate. The third source of information about real estate is the local law - spatial development plans. They are obtained in the municipality offices where the property being valued is located.

The survey asked whether appraisers in practice meet, and if so, how often, with the problem of incorrect, outdated or undisclosed data in public registers of real estate information. The results are presented in Figure 3.

Figure 3: Frequency of flawed data in public registers of real estate information

Nearly all poverty appraisers faced a situation where entries in public registers had various flaws. As many as 18.3% of those surveyed stated that it occurs very often. A quarter (25.2%) sometimes encountered this problem. However, 27.5% of appraisers are rarely confronted with this problem. Only 3.0% have never met with such a situation. The frequency of incomplete records in land registers and map errors were asked to identify the source of the problem and the importance of flawed records for the valuation process. The results are displayed in Table 2.

Table 2: Frequency of occurrence of flawed data in geodetic registers

Frequency of occurrence	Land and Building Registers (%)	Maps (%)
Very often	1,5	5,3
Often	13,0	11,5
Sometimes	35,1	26,7
Rarely	42,7	42,0
Never	7,7	14,5

The distribution of responses about land registers and maps is similar. As many as 35.1 % of appraisers sometimes encounter incomplete records in the registers. For deficient maps, this was also a very high figure of 26.7%. Only 7.7% and 14.5% of the valuers respectively have never encountered such problems. The results reveal a surprisingly high number of irregularities, thus making public property information registers an essential source of risk.

Irregularities in the land and mortgage registers also constitute a significant source of risk. That is illustrated by the data in Table 3.

Table 3: Frequency of erroneous entries in the land and mortgage register

Type of error	Frequency (%)
Rightsholder (person of owner/co-owner)	17,6
Scope of rights to real estate	28,2
Restrictions on the disposal of real estate	20,6
Not applicable	33,6

There are far fewer errors in court registers than in the case of geodetic sources. One-third of the surveyed appraisers did not meet with flawed entries in land and mortgage registers at all (33.6%). Defects most often concern the scope of rights to real estate, primarily a failure to disclose the facts or changes in this respect. To a lesser extent, this concerns restrictions in the disposal of real estate and persons in charge of real estate.

One of the next questions referred to the availability of data concerning the purpose of the property. It was a resolution of the municipality council on spatial development in its graphic form in the form of a plan. Table 4 presents the results.

Table 4: Availability of data on the purpose of the property

Availability	Frequency (%)
Very good	12,2
Good	32,8
Average	32,1
Sufficient	9,2
Insufficient	13,7

Nearly half of the appraisers (45 %) rated access to information to determine the purpose of the property as good and very good, while 41.3 % as average or sufficient. By contrast, 13.7 % indicated that it is insufficient. The results prove that this element is not a significant source of risk of mispricing.

The quality of analysis of the relevant market is another element that affects the correctness of valuation. That is a critical area as an incorrectly conducted analysis results in wrong valuation

assumptions, which disqualifies the valuation, even though all the other steps have been carried out properly. The quality of the analysis and the accuracy of conclusions is affected by the quality of input data. Since the real estate market is opaque, there are often severe difficulties in obtaining the relevant data (in terms of quantity and quality) that give a high probability of a proper representation of the market. However, an appraiser can manage risk in this area by joining various initiatives undertaken by the professional community, creating own databases, monitoring the market, reports of consulting and advisory companies, and purchasing databases on a commercial basis. The survey asked whether the valuer assesses the role of market analysis in the valuation process. The results are presented in Figure 4.

Figure 4: The importance of real estate market analysis for the correctness of valuation

Almost all experts considered that the analysis of the relevant market in terms of the subject matter of the valuation is either crucial or important. That means that valuers have a very good understanding of the importance of market analysis for the valuation process.

Another question was about the risk of pressure from the principal to distort the outcome of the valuation. There are always two parties to a property valuation whose interests conflict and who are interested in completely different valuation results. The expectation on the part of the principal is obviously not legally permissible and the valuer should be completely resistant to it. The survey asked whether valuers in Poland face such a problem. Figure 5 provides the results.

Figure 5: The frequency of pressure to distort the valuation results

More than half of the appraisers (51.9 %) are under pressure to distort the results explicitly or with such suggestions. Nevertheless, such irregularities are rarely encountered by another quarter of the professional community surveyed. That means that together as many as ¾ of the appraisers encounter such a problem in their work. Only 3.8% have never faced it.

The above part of the analysis closes the analysis of factors related to the acquisition of data and information on real estate and the relevant market. Further, the sources of valuation risk associated with the assessment procedure are considered.

Factors related to the property being valued include the inspection of the property. The inspection is necessary to determine the condition of the environment, the spatial development, the technical and utility condition, and the level of equipment in the technical infrastructure. The assessment of these elements is required under Polish conditions by the provisions of the relevant Act. Appraisers agree that for the valuation, the importance of visual inspection is crucial, very important or essential - respectively: 71,0 %, 22,9% and 5,3%. Only one person gave it minor importance (0.8%). It can be assumed that the source of risk is not so much in underestimating the visual inspection, but possibly in an incorrect assessment of the property based on the visual inspection.

Establishing dates relevant for the valuation is another fundamental element in Polish formal and legal conditions. It appears particularly important in the case of valuation for the assessment of various fees by relevant entities (e.g. municipalities). These are, for example, the fee for an increase in the property value caused by the construction of technical infrastructure facilities by the municipality, or the consolidation of fragmented plots of land and their redistribution (betterment levy), or the planning fee resulting from changes in the designation in the local zoning plan, when the effect is an increase in the value of the property. For these cases, it is vital to determine the condition and value of the property on specific dates, i.e., before and after the municipality's actions that brought the growth of the value of private properties. In market transactions, establishing dates is vital as well. As a rule, two dates should be established, i.e. the date on which the condition of the property is assumed, and the date of the market condition, i.e. the price level for this date. More than half of the appraisers believe that this is a key element 53.4%, 32.8% thinks that a significant one. On average, 11.5% of those surveyed consider it to be of medium importance, and 2.3% as insignificant. That proves that a small proportion of the environment underestimates the importance of this element for correct valuation.

A significant risk area is a stage of formulating valuation assumptions. Such sensitive points include the definition of similar properties. To this end, it is necessary to specify characteristics that determine the price differentiation of a property similar to the one being valued. In addition to identifying the market characteristics, it is required to establish their impact on the price range in the set of purchase/sale transactions of similar properties or differences in potential income that may be generated by the property or differences in replacement costs (depending on the valuation approach). In general, the best possible representation of the functioning of the relevant market in terms of valuation should be provided. The formulation of assumptions is a consequence of all the stages mentioned so far.

An important area of risk is the choice of the appropriate approach, method, and technique of valuation. Given it, the type of property, the purpose and scope of valuation and the purpose of the property should be taken into account. These are the main factors determining the choice of the right approach. On the other hand, the availability of relevant market data and the nature of the property or how the property may generate income influences the choice of the method and, in some cases, the valuation technique. The survey asked whether the results of market analysis in any way contribute to the choice of valuation method (approaches, methods, and techniques). The vast majority of appraisers - 86,2 % in total - are of the opinion that the role of market analysis in the choice of the valuation method is very significant (45 %) or significant (41,2 %). 8,4 % of the surveyed is convinced that it is medium-important; the weight is insignificant for 3,1 % and irrelevant for 2,3 %. The results indicate that a small group of appraisers do not see a cause and effect relationship between the analysis and the choice of estimation that should be obvious. The degree of difficulty of the procedures used in property valuation was also asked. The results are shown in Figure 6.

Figure 6: Level of difficulty in choosing an appropriate method of valuation

Most valuers believe that regulating valuation in Poland is medium-difficult (45.8%) or easy (38.9%). A total of 10% (9.2% and 0.8% respectively) consider them difficult and very difficult. However, 5.3% described them as very easy. These results allow the conclusion to be drawn that regulations are assessed as transparent in this respect and not very troublesome, which makes this element a source of low risk.

Property valuation is a complex issue and requires interdisciplinary expertise. It requires knowledge of law, economics, construction, geodesy, and agriculture. As a result, appraisers usually specialise in specific areas. Valuations from outside this area can be more difficult and sometimes even very embarrassing. It applies to complex commercial, industrial, agricultural or forestry properties. Different methods and techniques differ significantly in the degree of difficulty not so much in the calculation procedure as in the boundary conditions which determine the correctness of the valuation result. The results of evaluation of the level of difficulty of valuation procedures are displayed in Figure 7.

Figure 7: Level of difficulty of valuation procedures

The few assessors (2.3 % and 12.2 %) consider the estimation procedures to be very difficult and difficult. Half of them (50.4%) indicates that it is medium-difficult, and another quarter (27.5%) that quite easy. 7.6% of those surveyed found it easy. These results show that the estimation procedures do not pose any significant difficulties for them in carrying out their professional tasks and as such, are not a significant source of risk.

The survey also asked to what extent the selection of comparable properties affects the determination of market characteristics weights. As many as 90.1 % of the surveyed are of the opinion that to a very large extent (62.6 %) or to a large extent (27.5 %). 6.1 % rated it as having little impact, 0.8 % - little impact, and 3.1 % - no impact.

For income-generating properties, it is necessary to establish the annual net income to estimate their value, and this, in turn, requires the determination of income losses, e.g., from non-rented areas. Due to the low transparency of the market and demanding access to such data, this can pose problems for valuers. By contrast, incorrect input assumptions increase the risk of an improper valuation result.

Nevertheless, the appraiser can offset this risk by monitoring the market and gathering and exchanging the necessary information with other valuers. The above also applies to the determination of rates of return. The assessment of these valuation areas is presented in Table 5.

Table 5: Level of difficulty in determining rates of return and income losses

Level of difficulty	Determination of rates of return	Determination of income losses
Very difficult	19,1	19,1
Difficult	41,2	37,4
Medium-difficult	34,4	37,4
Quite easy	5,3	5,3
Easy	0,0	0,8

Appraisers generally consider the determination of rates of return and loss of income to be at least difficult - 60,3 % and 56,5 % respectively. 34,5 % and 37 % of the respondents, respectively, believes that these elements are medium-difficult. A very small percentage indicates that these elements are quite easy, and only one person considers the determination of income losses to be an easy task.

Conclusion

The article describes the results of the study that aimed to identify and evaluate the most critical areas and sources of risk in the property valuation process. These actions are necessary for rational planning of activities in the management of the property valuation process. They are also a starting point for decisions made during this process. Awareness of areas and sources of risk enables effective risk management.

The survey allowed for the identification of the most critical factors. The kick-off was the analysis of scientific and professional literature and interviews with experts. Besides, the observation method was applied. These activities ended with the construction of a survey questionnaire - the analysis of answers allowed for initial identification of the risk factors. The results were published in the article *Identification...*

This article presents the author's proposal of risk factors classification. They have been divided into two main groups. The factors concerning the identification of the object and the scope of valuation constitute the first group. The second one is those related to the estimation procedure. Additionally, those factors were assigned risk areas, and sources and manifestations were identified.

The first group includes factors which are not dependent on the valuer, i.e., they cannot be limited. However, awareness of their existence and importance should result in the application of the principle of limited trust towards public sources of information about real estate and sources of data about the real estate market, or preparation for pressure from the ordering party to distort the result of valuation. The second group of factors is characterised by the fact that an appraiser can manage them effectively as he/she has a significant influence on them. They relate to the estimation procedure. It concerns the activities of the inspection of the real estate, establishing the dates necessary for the valuation, formulating the assumptions of the valuation, choosing the methods of valuation, selecting the real estate for comparison, and determining the income from the real estate. The valuer has an exclusive influence on some of these elements, such as setting dates, while limited on others. For example, some market data is complicated to obtain since it is not publicly available. However, an appraiser can reduce the valuation risk in this area through activities such as active data mining, working with other professionals to continuously monitor the property market, understanding the relationship between the property market and other markets and the economy to recognise the mechanisms of value creation.

The issues raised are significant since the value is one of the essential economic categories, and its knowledge determines the effectiveness of decisions made in all markets, including real estate. Nonetheless, the issue is insufficiently researched, especially concerning Polish valuation conditions. This paper attempts to fill this gap. The author is aware of some limitations of the described research and the obtained results. The applied analysis method is straightforward, and statistical instruments do not support conclusions. Further research in this area needs to be undertaken. Despite those limitations, the author hopes that the presented study can become a source of inspiration for researchers from other countries and a starting point for designing their research.

The Impact of Institutional Factors on IFRS Voluntary Adoption in EU Selected Countries

Marcin KEDZIOR[1] and Dorota KEDZIOR[2]

[1]Cracow University of Economics, Financial Accounting Department, kedziorm@uek.krakow.pl
[2]Cracow University of Economics, Corporate Finance Department, kedziord@uek.krakow.pl

Summary

The objective of the article is to identify the most important institutional factors affecting the voluntary use of IFRS in selected Western European countries. In the article factors affecting the voluntary adoption of IFRS were presented, they were divided into internal and external. The following institutional factors have been empirically verified: stock exchange and banking development, government efficiency, freedom from corruption, business freedom, investment freedom, judicial independence, protection of property rights, and legal enforcement of contracts. The analysis of these factors can be regarded as an relatively innovative approach in the literature. The subject of the analysis were annual reports of listed companies belonging to the manufacturing sector in countries such as: Germany, France, UK, Italy and Finland. Enterprises were divided into those applying IFRS and applying local accounting standards. Non-parametric Mann-Whitney test was used to check the significance of differences between companies using local GAAP and IFRS. The article proved that the institutional environment of enterprises affects the voluntary IFRS application.

Introduction

International Financial Reporting Standards are the world's most widely used accounting standards. IFRS is adopted and accepted in more than 120 countries of the world. The adoption of IFRS leads to a number of benefits. It improves the quality of of public disclosures (Bassemir and Novotny-Farkas 2018), IFRS decrease use of earnings management techniques (Yang and Abeysekera 2018) and improve usefulness of financial data (De George et al 2016; Tanko 2012; Kouki 2018). Also, it increases the transparency and comparability of financial reporting. It should be noted that the practical aspects of IFRS adoption can be different in particular countries. In some countries IFRS is mandatory for listed companies or the largest listed companies. In other countries IFRS for non-listed companies is voluntary, forbidden or mandatory.

There are a number of factors in business theory and practice which have an impact on IFRS voluntary adoption. Research studies in this field can be divided into those which focus on internal factors related to company activities and those which give attention to external economic or institutional factors. With regard to the first group, researchers refer to very different determinants of IFRS voluntary adoption. André et al (2012) analysed such factors as company size, auditor reputation, profitability, capital intensity, an economic entity's industry, shareholder structure, and employee productivity. Bassemir (2018) conducted an empirical verification of types of investors, development opportunities, indebtedness, financial rating, stock market activities, international operations, and cooperation with renowned certified auditors. On the other hand, Bessieux-Ollier and Walliser (2012) conducted empirical tests of such factors as overseas sales volumes, ownership concentration, indebtedness, share of fixed assets in balance sheet total, profitability, listed company status, and the examination of a financial statement by a renowned auditor. Matonti, and Iuliano (2012) regard the following to be the most significant factors: company size, type of investor, industry, cooperation with a foreign investor, indebtedness, profitability, membership in a capital group, listed company status, renowned auditor, and management shareholding.

The other group of researchers focuses on external, i.e. economic, institutional and macroeconomic factors. Shima and Yang (2012) stress that IFRS voluntary adoption is determined by political and

economic relations. The likelihood of IFRS voluntary adoption is greater in countries in which businesses record higher debt levels as well as those which apply common law system. IFRS adoption is more common in countries characterised by higher economic growth levels and higher economic advancement. Other significant factors include capital markets and their development, and tax and inflation rates. Francis, Khurana, Martin and Pereira (2008) conducted an empirical verification of such factors as economic advancement, legal systems, a given country's availability of financial resources, corruption rates, court efficiency, stock market and banking sector advancement, and the adoption of common and statutory law. Renders and Gaeremynck (2007) analysed capital market development, legal investor protection systems, and the scope of corporate governance instruments. Hope et al (2006) analysed relatively similar variables, regarding the following to be the major institutional factors of IFRS voluntary adoption: legal disclosure requirements, anti-director rights, public enforcement, the availability of share capital, GDP per capita, and capital market development. It should be noted that literatures have given much less attention to institutional factors, however, these concepts are still being developed in the literature (Pais and Bonito 2018, Damak-Ayadi et al 2020, Salem et al 2017, Zahid and Simga-Mugan 2019).

Institutional factors affect many areas of business financial management. Strong capital markets enable proper risk management (Öztekin and Flannery 2012). Strongly developed stock exchanges with a highly developed banking sector enable obtaining financing at a low cost (Francis et al 2008). In turn, low levels of corruption and high-quality legal systems affect the profitability of business units Lee and Hong (2012). Economic freedom and trade freedom cause that the value of investments is significantly increased. Therefore, a friendly institutional environment in a given country means that making numerous financial decisions is much easier and less costly. It is therefore worth considering whether the voluntary use of IFRS by the enterprise sector is also dependent on the institution's institutional development.

For the purpose of this work the authors focus their analysis on such areas as stock exchange and banking development, tax freedom, government efficiency, freedom from corruption, trade freedom, business freedom, investment freedom, judicial independence, protection of property rights, and legal enforcement of contracts. The analysis of these factors can be regarded as an relatively innovative approach in the literature. It is expected that a high-quality institutional environment necessitates the voluntary application of high-quality accounting standards, such as IFRS. The objective of the article is to identify the most important institutional factors affecting the voluntary use of IFRS in selected Western European countries. The paper aims to verify the impact of institutional factors on IFRS voluntary adoption in EU selected countries: Germany, France, UK, Italy and Finland. The analysis of nearly 500 companies was conducted in 2014-2018. Non-parametric Mann-Whitney test was used to check the significance of differences between companies using Local GAAP and IFRS. The choice of test was dictated by the fact that the analyzed variables did not have a normal distribution in the compared groups (as verified by the Shapiro-Wilk test), and thus the assumptions of the Student's t test were not met. The research results are important for users of financial statements, listed companies, policy makers, governments and their institutions as well as institutions supervising the stock exchanges or the banking sector.

Review of the literature

Decisions related to IFRS voluntary adoption depend, to a large degree, on the institutions which determine the quality of private contracts in a given economy. A country's effective institutions protect the interests of both investors and lenders. Therefore, all participants of the market are more inclined to enter into agreements in the conditions of the greater transparency, quality and comparability of financial statements (IFRS). Institutions are usually better developed in industrialised countries which have sufficient resources for their financing. In this context it is also necessary to ensure property rights and facilitate the process of concluding private contracts (Francis et al 2008). A similar opinion is expressed by Renders, and Gaeremynck (2007). They believe that companies often decide not to adopt IFRS for opportunistic reasons, especially in countries with low quality laws and weak institutional environments. In countries with low quality institutions the costs of IFRS adoption are regarded to be excessively high by management boards due to the possible loss of various private benefits. On the

other hand, in countries with effective investor protection systems and excellent corporate governance tools reduced private gains resulting from control procedures lead to lower IFRS adoption costs. An effective corporate governance system is capable of easing a company's internal and external tensions. Reducing the impact of managerial opportunism increases the quality, transparency and comparability of financial statements, advocated by IFRS. Some other authors, e.g. Hope et al (2006), believe that a reversed situation can occur – a negative correlation between an institutional environment (investor protection and legal enforcement) and IFRS adoption. The authors claim that IFRS adoption allows for mitigating local adverse business conditions through reducing investment risk thanks to adopting high quality and globally recognized and approved financial standards. Moreover, such a policy attracts international investment. It is also true for stock markets. IFRS adoption increases the comparability of financial statements, IFRS adoption improves the quality of disclosures and increases the decision making potential resulting from financial data.

The financial systems which provide necessary funds for corporate activities in a given country are usually based on stock exchanges or banking sectors. Well-developed stock exchanges and banks can finance the sector of enterprises to a similar degree. Developed stock exchanges mitigate investor risk and increase the effectiveness of the banking sector. However, effective control over the management boards of large companies can be hindered by a considerably fragmented shareholder shares (Yartey 2010). Investor interests are usually well protected on developed stock markets. In this context, protecting the interests of minority investors, who cannot affect the functioning of listed companies, is of key importance. Moreover, minority investors, unlike large or dominant investors, do not have easy access to financial data (Hope et al 2006). Developed stock markets are characterised by a larger number of the acquisitions of listed companies, which increases demand for high quality financial data (Demirgüç-Kunt and Levine 1999). The above capital market deficiencies can be partly compensated for by introducing high quality accounting standards. Undoubtedly, the development of capital markets – apart from the quality of shareholder right enforcement and disclosure requirements in equity markets – is influenced by the quality of accounting standards (López de Silanes et al 1998, La Porta et al 2006, Djankov et al 2008). In countries with developed stock markets and effective stock investor protection systems private gains resulting from control mechanisms are much limited (Renders and Gaeremynck 2007). In these countries the costs of IFRS adoption are relatively low because people operating in company internal structures cannot benefit much from potential private gains. The transparency and quality of accounting is greater in countries with developed stock markets and effective stock investor protection systems as compared with nations with less developed systems.

H1: The voluntary applicability of IFRS is more likely in countries with highly developed stock exchanges

A well-developed banking sector ensures business entities' easy access to preferential financing, and loan application procedures are more favourable for entrepreneurs (Öztekin and Flannery 2012). A well-developed banking system is the one in which lenders' rights are effectively protected, which is reflected in the creditor rights index (Demirgüç-Kunt and Levine 2005). The banks which enter into long-term cooperation with entrepreneurs can offer lower costs of funds. However, a significant role in the lending process is also played by the quality of financial reporting – the basis for assessing a company's creditworthiness. IFRS adoption has also a positive impact on the availability and cost of foreign capital (Tanko 2012).

H2: Enterprises voluntarily use IFRS more often in countries with a high level of banking sector development

The tax freedom index provides information on the costs and efficiency of central and local government institutions. The higher the index, the higher the profitability of companies (as a rule) (Aburime 2008). Therefore, it is necessary to achieve higher results before taxation in order to reach the owners' desired level of rates of return. Companies which face a large tax burden tend to downsize their operations in a given country (Devereux et al 2002). Countries with high income tax rates are characterised by higher costs of equity finance, and these be reduced as a result of IFRS adoption. High quality accounting standards can partly counterbalance lower rates of return for owners. In the conditions of high income

tax rates economic entities can rely more heavily on foreign capital. It implies the possibility of deducting interest on foreign capital from taxable income. In this situation equity finance is even less favourable.

H3: High tax freedom in a given country means that the scope of voluntary use of IFRS increases

IFRS adoption is also affected by the efficiency of governments and their institutions. In this context, a significant role is played by appropriate supervision of financial reporting and an effective corporate governance system, as well as the quality of public services, administration competences, government reliability, the stability of policies towards a broadly understood group of enterprises, and the stability of accounting regulations (Firth et al 2013, Ngobo and Fouda 2012, Gugler et al 2013). Undoubtedly, the inefficient work of administration staff increases the risk of investors who may require a larger extent of disclosures (IFRS). The lack of qualified administration staff and of the consistency between balance sheet law and globally recognized solutions leads, in the long run, to the necessity of adopting globally approved accounting standards. Another adverse impact on the efficiency of governments is the lack of political stability (Ngobo and Fouda 2012). Developing a modern economy, based on advanced technologies and participation of foreign investors, is not possible without the support of highly efficient government institutions.

H4: The low level of Government efficiency in a given country causes, that the scope of voluntary use of IFRS to increase

The corruption index in a given country reflects the ineffective enforcement of law and legal regulations. In such conditions shareholder interests are not well protected (Demirgüç-Kunt and Levine 1999), which leads to increased corporate financing costs and thus necessitates improvements in the efficiency of government institutions which combat the adverse phenomenon (Gugler et al 2013). Countries with a high corruption index are characterised by high transaction costs, and the concluded contracts are not effectively enforced (Öztekin and Flannery 2012). Corruption involves additional costs incurred by enterprises (Lee and Hong 2012). A high corruption index increases business risk and reduces corporate profitability, hence additional premiums required by stock market investors. Frequently, corruption implies unfair competition which distorts a company's financial result and financial standing (Aburime 2009). Corruption cannot be easily quantified, and it increases risk and uncertainty. It results in inappropriate capital allocation and changes the actual level of economic entities' profitability. Therefore, there is an increasing demand for reliable and high quality financial information, communicated on the basis of high quality standards (IFRS).

H5: High levels of corruption on the coutry level is correlated with increasing the demand for voluntary use of IFRS

Trade freedom facilitates the opening up of an economy to foreign trade, which translates to signing relevant international trade agreements. Business operations carried out on a given country's market by renowned companies indicates a more frequent adoption of such global standards as IFRS. Local companies which considerably increase the critical mass of their sales volumes and which intend to grow and compete with industry leaders show greater interest in IFRS adoption. They need to be more competitive to successfully face global rivalry. Simultaneously, it can lead to deterioration in local businesses' profitability (McMullen et al 2008). Such conditions can increase business risk for local enterprises (Agnello and Sousa 2013). IFRS adoption can mitigate this risk and increase a company's reliability.

H6: A high level of freedom of trade in a particular country results in greater voluntary applicability of the IFRS

Business freedom has a great impact on company operations. This concept indicates the freedom to start and carry out activities without the state's licences or permits (Muriu 2011). Numerous administrative restrictions imposed on economic activities make specific market entry and exit barriers difficult to overcome (Driffield et al 2013). It results in a smaller number and pace of implemented

investment projects, while companies' profitability deteriorates. In an unfavourable economic environment the providers of capital tend to require higher rates of return. High costs of capital (higher risk, lower profitability) can be counterbalanced by a higher level of accounting disclosures and higher quality accounting, compensating for higher institutional risk (IFRS). Deregulation ensures easier access to markets and rare resources, lowering agency and transaction costs (Driffield et al 2013).

H7: The low level of business freedom in a given country means that the applicability of IFRS in the corporate sector will be greater

Also, investment freedom can encourage IFRS voluntary adoption. Freedom in this area indicates the lack of restrictions for foreign entities and the possibility of investing in various sectors of national economies without any barriers, as well as the free movement of capital (McMullen et al 2008). Investment freedom indicates greater transparency of economic activities, as well as healthy and fair competition among business entities (Miller and Kim 2013). Greater transparency also implies the need for fully open settlement of business operations, which is reflected in a higher level of accounting disclosures. In such conditions it is easier to introduce high quality accounting standards (IFRS). Global accounting standards can arouse foreign investors' interest in a given company, especially in local markets not yet acquainted with high quality accounting standards. Investment freedom indicates easier access to foreign financing, reducing a company's overall business costs and increasing its profitability (Miller and Kim 2013, Bellak et al 2010). It is worth noting that foreign investors prefer investment in companies with dispersed shareholding, applying high quality accounting standards (IFRS) (Pichler et al 2018).

H8: The high value of investment freedom in a given country implicates, that the scope of voluntary use of IFRS will be greater

A significant role in a broadly understood economic environment is played by judicial independence. It can be treated as the independence of courts of a broadly understood political domain (Tevdovski and Ivanovski 2013). The independence of courts is much affected by the legal tradition of a given nation. The business practice of European countries is based on English, German, French and Scandinavian business laws. The independence of courts mainly originates from the tradition of English and Scandinavian laws (Demirgüç-Kunt and Levine 2005) rather than from German and French law. Legal systems can also be defined as those based on Roman law and statutory law (Gugler et al 2013). Statutory law systems are more independent, provide better protection for the owners of capital, and their enforcement procedures are more effective. Legal systems have an impact on the availability of various sources of financing. Systems based on common law are used in countries with highly developed stock markets – access to share capital is easier and its cost is lower. Countries with legal systems based on the tradition of Roman law are usually characterised by more developed banking systems as compared with stock markets (La Porta et al 1998). If IFRS adoption is more frequent in highly developed stock markets as compared with financing in economies based on well-developed banking sector, it can be assumed that IFRS adoption will be more frequent in countries based on common law. It can be concluded that judicial independence has an impact on IFRS voluntary adoption. Moreover, effective corporate governance systems, based on high quality accounting standards, are commonly used in countries with independent courts. Independent courts accelerate business operations and lower companies' transaction costs (Sill 2010). In such conditions IFRS adoption is likely to be more common. On the other hand, the lack of judicial independence increases risk and economic uncertainty. Therefore, companies in countries with insufficient judicial independence can also adopt IFRS to mitigate company risks.

H9: In countries with significant judicial independence, the voluntary applicability of IFRS by the enterprise sector will be greater

The protection of ownership rights is also a significant component of a broadly understood legal environment. It should be noted that an overwhelming majority of business operations involve ownership transfers. Respect for ownership rights affects business activities and the number of concluded agreements; it increases the capital engagement of stock market investors and provides

easier access to debt financing instruments (Gugler et al 2013). Without the full protection of private ownership investors are not inclined to invest funds in local companies due to increased investment risk. This risk can be mitigated by a more transparent communication of financial information, which is ensured by high quality accounting standards such as IFRS. Protection of ownership rights is of key significance in companies whose core activity is based on intellectual rights. Such entities are more vulnerable to the effects of violating ownership rights, hence their efforts aimed to counterbalance business risks in the form of effective corporate governance systems which are based, among others, on high quality accounting standards (IFRS).

H10: Low protection of property rights in a given country causes the need to use IFRS on a voluntary basis

A significant role in legal systems is played by effective contract enforcement procedures. In a practical sense, it involves the verification of whether contract provisions are effective and implemented in a proper manner, and whether local authorities do not interfere with contract enforcement processes. In countries with unsatisfactory enforcement procedures businesses tend to compensate for increased investor and lender risk by mitigating risks involved in financial reporting and by improving the quality of accounting. Strict adherence to contract enforcement rules indicates easier access to foreign capital and equity at lower costs (Demirgüç-Kunt and Levine 1999). Ineffective contract enforcement increases transaction costs (Lombardo and Pagano 1999). These costs can be lowered by adopting high quality accounting standards (IFRS).

H11: The low level of legal enforcement of contracts means that companies use IFRS on a voluntary basis

Research Methodology

The analysis encompasses listed production companies in Germany, France, UK, Italy and Finland. The analysis of nearly 500 companies was conducted in 2014-2018. Non-parametric Mann-Whitney test was used to check the significance of differences between companies using Local GAAP and IFRS. The choice of test was dictated by the fact that the analyzed variables did not have a normal distribution in the compared groups (as verified by the Shapiro-Wilk test), and thus the assumptions of the Student's t test were not met.

Statistical significance was at the level of 0.05. The following variables were analysed:

- IFRS (1;0) – IFRS adoption, or not,
- level of advancement of stock markets = stock exchange capitalization/GDP,
- advancement of the banking sector = value of loans made to the private sector/GDP,
- government efficiency is measured in the scale from -2.5 (the lowest value) to 2.5 (the highest value),
- freedom from corruption expresses the level of corruption (CPI) for a given country in the scale from 0 (very low level) to 10 (very high),
- tax freedom assumes values from 0 (lack of tax freedom) to 100 (the highest level of tax freedom),
- trade freedom assumes values from 0 (lack of trade freedom) to 100 (full trade freedom),
- business freedom - values range from 0 (lack of freedom) to 100 (the highest value of freedom),
- investment freedom assumes values from 0 (lack of freedom in implemented projects) to 100 (full investment freedom),

- judicial independence assumes values from 1 to 10, 1 indicates a complete lack of freedom, and 10 – full judicial freedom,
- protection of property rights is expressed by values from 1 (weak protection) to 8 (very effective protection),
- legal enforcement of contracts assumes values from 0 (the lowest level of enforcement) to 10 (the highest level of enforcement).

The empirical material comes from, among others, Orbis Database, Standard & Poor's, Global Stock Markets Factbook, World Bank, International Monetary Fund, International Financial Statistics, Heritage Institute, Transparency International, Heritage Institute, and Fraser Institute.

The Results of Empirical Research

An analysis of data presented in Table 1 indicates that IFRS is more frequently adopted in developed stock markets; hence the costs of implementation on stock exchanges already requiring high quality disclosures and financial reporting are not high (Renders and Gaeremynck 2007). Similar correlations are observed for the development of the banking sector – the higher the level of development, the more frequent IFRS voluntary adoption. Therefore, the quality of financial reporting and a broad range of disclosures have an impact on banks' lending decisions. Companies which carry out business activities in the environment of low taxes and openness to foreign trade are characterised by IFRS voluntary adoption to a similar degree, which indicates that stiff international competition (McMullen et al 2008) and low tax rates do not increase IFRS adoption. IFRS adoption is more frequent in countries with greater investment freedom. Therefore, there is a natural need for adopting IFRS in the countries which promote a free flow of capital and in which demand for a broad range of disclosures is high. It should be noted that IFRS adoption is more frequent is countries with lower central and local government efficiency and lower levels of freedom from corruption. In countries characterised by low government efficiency investor rights are not well protected (Demirgüç-Kunt and Levine 1999). In countries with lower levels of business freedom IFRS adoption is also more frequent, so difficulties in carrying out business operations discourage investors. The adoption of high quality accounting standards can attract investment and improve the image of a given company and economy. A similar interpretation of more frequent IFRS adoption applies to lower levels of judicial independence, lower ownership rights protection and lower legal enforcement of contracts. Greater investment risk and weak legal systems resulting from the lack of protection of capital providers necessitate risk reporting, i.e. additional disclosures, characteristic of high quality accounting standards (IFRS).

Table 1: Analysis of correlations between IFRS and institutional variables for publicly traded production companies in EU selected countries in 2014 -2018

Variable	IFRS Variable	Mean	Standard Deviation	Median	Q1	Q3	p
Tax freedom	0	58,48	4,85	58,5	53,2	61,8	p=0,06

Concluding Remarks

Most literatures in the field present verifications of variables dependent on a business entity, which affect IFRS voluntary adoption. The main variables include company size, indebtedness, risk, investor profile, renowned certified auditors, and company status (listed companies). Literatures do not present in-depth analyses of the impact of institutional factors on IFRS voluntary adoption. Hitherto verifications have focused on such factors as GDP per capita, capital market development, legal systems (common and statutory law), and the availability of capital for economic entities.

The work shows that a broadly understood institutional environment is related to IFRS voluntary adoption in listed production companies in EU selected countries. The impact of the institutional environment is diversified – certain factors increase IFRS voluntary adoption in developed markets, while other factors influence economies with less developed institutional sectors. Simultaneously, free trade turns out to be statistically insignificant. IFRS voluntary adoption occurs more frequently in developed stock markets, developed banking sectors and in countries with high levels of investment freedom and free movement of capital (highly developed markets). Also, IFRS adoption increases when selected factors are at a lower level. These factors include low government efficiency, higher corruption levels, lower business freedom indices, lower judicial freedom levels, inappropriate protection of property rights, and less effective legal enforcement of contracts (less institutionally developed economies).

Based on the above research results, it should be noted that the use of IFRS is an important element of the company's corporate governance system. In countries with low level of institutional environment development, the use of IFRS strengthens the credibility and image of enterprises and minimizes the institutional risk of doing business. It is particularly true in a situation of low government efficiency, high corruption levels, lower business freedom, lower judicial freedom, inappropriate protection of property rights, and less effective legal enforcement of contracts. Therefore, the low-quality external institutional system within a given country can be at least partly overcome by the internal element of the corporate governance system, which are high-quality accounting standards (IFRS). The research results are important for a wide range of users of financial statements, accountants, auditors, policy

makers, as well as institutions supervising the stock exchanges and the banking sector.

Abstract

This research paper investigated the influence of Human Resource Management (HRM) practices on job satisfaction and organizational performance in Abu Dhabi Agriculture and Food Safety Authority. This research employed six HRM practices such selection and recruitment, career planning, training and development, performance management, incentives and rewards, empowerment and job security. Self-designed structured questionnaire was used to collect data from respondents, purposive sampling was employed in this research. Smart-PLS was used to analyze the data in order to determine the effect of HRM practices on job satisfaction and organizational performance. The result revealed that empowerment practice has the most significant influence on job satisfaction as indicated by a path coefficient of 0.234 which is significant (t-statistics = 3.577, P-value = 0.000). The second most influential human resource management practices on job satisfaction is the performance management as revealed by path coefficient value of 0.178 which is significant (t-statistics = 3.499, p-value = 0.000). The third most influential human resource management practice on job satisfaction is the training and development practice as indicated by path coefficient of 0.183 which is also significant (t-statistics = 3.102, p-value = 0.002). Similarly, on the influence on organizational performance, the result indicated that performance management practice has the most significant influence on organisational performance as indicated by a path coefficient of 0.145 which is significant (t-statistics = 2.671, P-value = 0.0008. The second most influential human resource management practices on organisational performance is the training and development practice as revealed by path coefficient value of 0.171 which is significant (t-statistics = 2.531, p-value = 0.011). The third most influential human resource management practice on organisational performance is the job security practice as indicated by path coefficient of 0.333 which is also significant (t-statistics = 2.381, p-value = 0.017).

Keywords: HRM, Organization, Performance, Job, Satisfaction.

Introduction

Human Resource Management (HRM) involves the management of the human resources needed by an organization and also being sure that human resources is acquired and maintained for purposes of promoting the organization's vision, strategy and objectives. In other words, HRM focuses on securing, maintaining, and utilizing an effective work force, which organizations required for both their short and long-term survival (Javed, Javed, Ahmed, and Anjum, 2019). The terms of human resource management (HRM) have largely replaced personnel management (PM) in the processes of managing people in the organizations. While human resource management is defined as a strategic and coherent approach for the organization's most valued assets behind on the workers, there is no upon description

of it. Personnel department is mostly to manage the paperwork around hiring and paying people (Mohammad, Miah, Rahman, and Rahaman, 2017).

Human resource management undertakes a critical role in organizations because its deals with humans which differ from other production elements in terms of characteristics, features, physiological disposition, social economic backgrounds, and cultural conditions. Under the behaviorism, managers shifted their more classical concern from the befits of employers towards employee-oriented approaches that seek to create common benefit for both employers and employees and respond to changes taking place in the internal and external environments, most importantly the changes in the characteristics of employees themselves. After all, employee in different managerial and technical places forms the hub of the institutional system and for manager's serves as leverage to achieve the organizational goals (Ling, Ning, Chang, and Zhang, 2018).

There is a positive relationship between HRM Practice and performance at the individual and organizational level, this positive relationship can help generate favorable outcomes such as organizational loyalty, rapid career progression, job satisfaction and organizational citizenship behaviors that all lead to high Performance (Nabi, Syduzzaman, and Munir, 2016).The relationship between perceived sufficiency of Human Resource Management practices, person-organization fit, and person-job fit has not been examined before (Sembe, and Ayuo, 2017).

Human resource management undertakes a critical role in organizations because its deals with humans which differ from other production elements in terms of characteristics, features, physiological disposition, social economic backgrounds, and cultural conditions. Under the behaviorism, managers shifted their more classical concern from the befits of employers towards employee-oriented approaches that seek to create common benefit for both employers and employees and respond to changes taking place in the internal and external environments, most importantly the changes in the characteristics of employees themselves. After all, employee in different managerial and technical places forms the hub of the institutional system and for managers' serves as leverage to achieve the organizational goals (Qazi and Jeet, 2017).

Organizations operate in an environment characterized by uncertainty, instability and change that provoke the appearance of various challenges (Sultan, Ismael, Mohammad, Abas, and Abdulla, 2019). Such environment includes many factors as increased globalization, rapid technological change, and the growing need for qualified employees and improved performance (Omar, Salessi, and Urteaga, 2017). This forces organizations to try and exploit the resources at its disposal to achieve a competitive advantage (Anwar, Tufail, and Mujahid, 2017). Human resources are considered critical factors contributing to an organization's success (Miah and Hafid, 2019). Organizational performance is the basic pattern of shared assumptions, values and beliefs considered to be the correct way of thinking about and acting on problems and opportunities facing the organization. It is what is important and unimportant in the organization. Kamal and Lukman, 2017) argued that the organizational performance is a holistic effort scheme aims to change and staff development by affecting their values, skills and behavior patterns and by changing technology used as well as the processes and organizational structures and a way for the development of human resources and an investigation of organizational goals.

However, job satisfaction is the phenomena that defines the harmony of employees' job satisfaction, expectations and job's characteristics. This phenomenon is a composition of social security, fair wages, job and work security, and balance between job skills and knowledge job-related pride, promotion opportunities, management policies and the social climate (Sharma, 2017). Employee's jobs satisfaction is mostly related with how the employees' jobs expectations meet with his needs and desires (Bastida, Marimon and Carreras, 2017). It is not possible to mention a satisfaction related with only physical and economic realities. In addition, there need to be a psychological satisfaction. Abu Dhabi Agriculture and Food Safety Authority is making great effort to ensure organizational opportunities that are meant to provide employee' satisfaction.

There are two distinct reasons to classify job satisfaction research as an employee and organization. Firstly, employees' views and feelings about their jobs have on both themselves and their jobs. Secondly, the impact on performance and productivity of employees' behaviors against their jobs is very important. Because job dissatisfaction leads to turnover, absenteeism, poor performance, mental and physical illness (Singh and Shilu, 2018). When these two approaches are considered together, the job satisfaction has its place as a basic concept in psychology and management psychology in means of making a connection between working conditions, individual and organizational results (Noreen, 2017).

Moreover, Organizational commitment is one of the highly asserted modern management concepts. Studies about the concept of organizational commitment have increased since the 1970s, although the history dates back to 1950. Commitment, as the word, means "show respect, love and loyalty against one" (Kampkötter, 2017). According to Meyer and Allen (1984), commitment is "an emotional return to a particular entity".

Organizational commitment is also one of the ultimate goals of the organizations to continue their existence. The reason is that employees who have been loyal to their organizations are more compatible, have more job satisfaction and productivity and work with a high degree of responsibility and a sense of loyalty. Consequently, those who work with high organizational commitment bring less costs to organizations (Khan and Khan, 2017).

Organizational commitment has become a vital issue for organizations depending on five reasons. The first reason is that organizational commitment seems closely related to absenteeism, quitting, retreat and job searching activities; the second reason is related to job satisfaction, behavioral, emotional and cognitive structures such as morale and performance, the third reason is related to features towards to employee's job and his role such as the autonomy, responsibility, participation and, sense of duty, the fourth reason is related to the personal characteristics of employees such as age, gender, education and duration of work. Finally, it is estimated that knowing the estimators of the organizational commitment that employees have would provide benefits greatly in the future and improving the organizational commitment organizational would greatly reduce the organizational costs (Prajogo and Cooper,.2017).

It has been considered that one of the main duties of the organization is to ensure satisfaction of employees with their organizations. Therefore, the importance of the concept of organizational commitment which is defined as adoption of the organization's goals and values, making efforts to achieve them and be willing to remain as a member of the organization is increasing.

Methodology

The methodology employed in this research was quantitative approach which falls within the positivism paradigm. However, the collection and analysis of quantitative data that helped the research to identify emerging themes within the relationship between Human Resource Management Practices, Job Satisfaction and Organizational Performance in Abu Dhabi Agriculture and Food Safety Authority. Purposive sampling was employed to collect data from the target audience. The data collected through questionnaire was subject to quantitative analysis using SPSS and Smart-PLS software (Nardi, 2018). This approach helped to bring coherence to the research while leading to an enriched understanding of perceptions and events.

Result and Analysis

Respondents Profile

Information about the respondents' gender, position, educational background, professional discipline, years of experience, as well as the emphasis they place on quality management were collected and presented in table 1.

Table 1: Respondents' Profile

S/N	Respondents' Details	Response	Frequency	Percent
1	Gender	Male	256	68.1
		Female	120	31.9
2	Age	Less than 21 years old	51	13.6
		21-30 years old	139	37.0
		31-40 years old	60	16.0
		41-50 years old	39	10.4
		51 years old and above	87	23.1
3	Educational Level	Diploma	117	31.1
		Degree	232	61.7
		Masters	19	5.1
		PH.D	7	1.9
		Others	1	.3
4	Human Resource Management	Yes	279	74.2
		No	97	25.8
5	HRM Equivalent	None	279	74.2
		Managing Director	2	.5
		Assistant Manager	13	3.5
		Finance Director	74	19.7
		Production Director	6	1.6
		Company Secretary	2	.5

The profile of the respondents is presented in Table 1. The table shows the demographic information of the respondents such as age, gender, and educational qualification as well as human resource management in the organisations. The result shows that majority of the respondents are males as indicated by 86.1 percent response and mostly below the age of 40 years old. Majority of the respondents have first degree as indicated by 61.7 percent response followed by those that have diploma as indicated by response rate of 31.1 percent.

279 respondents representing 74.2 percent of the sample indicated that they have dedicated Personnel/Human resource management department in their organisation. They remaining 25.8 percent of the respondents indicated that the human resource management function is performed by managing director, assistant manager, finance director, production director and company secretary. The result should that the alternative human resource management function is mostly performed by finance director as indicated by 19.7 percent followed by assistant manager as indicated by 3.5 percent response.

Level Human Resource Management Practices in Abu Dhabi Agricultural and Food Safety Authority

The research conceptualizes the human resource management practices to include selection & recruitment, career planning, training & development, performance management, incentives and rewards, empowerment and job security. These are individually presented in the following subsections.

Selection and Recruitment

The result for selection and recruitment human resource management practice is presented in table 2.

Table 2: Selection and Recruitment

Statements	Mean
Head of departments and Assistant Registrars participate in selection process	3.89
The selection system is highly scientific and rigorous	4.01
Valid and standardized test are used when required in the selection process	3.87
Selecting employees having desired knowledge, skills and attitude	3.57
Aggregate	3.84

Table 2 shows the selection and recruitment practice of human resource management in Abu Dhabi Agriculture and food safety authority. The result shows that the four items in the constructs have mean values ranging from 3.57 to 4.01 with aggregate mean value of 0.84 indicating high level of selection and recruitment practice in Abu Dhabi Agriculture and food safety authority human resource management.

Career Planning

The result for career planning human resource management practice is presented in table 3 below.

Table 3: Career Planning

Statement	Mean
Prefers an internal employee when vacancy occurs	3.80
Plans for career and development for me as an employee	3.90
I am aware of my career path	3.91
I have clear career paths	3.85
My personal and organizational growth needs are matched	3.89
Promotion is done based on merit	3.88
My career aspirations are known by my immediate supervisor	3.88
I have more than one potential position for promotion	3.78
Aggregate	3.86

Table 3 shows the career planning practice of human resource management in Abu Dhabi Agriculture and food safety authority. The result shows that the eight items in the constructs have mean values ranging from 3.78 to 3.91 with aggregate mean value of 0.86 indicating high level of career planning practice in Abu Dhabi Agriculture and food safety authority human resource management.

Training and Development

The result for training and development human resource management practice is presented in table 4.

Table 4: Training and development

Statement	Mean
Training needs are identified through a formal performance appraisal mechanism	3.79
New knowledge and skills are imparted to me to work in teams	3.85
There are formal training programs to teach new employees the skills they need to perform their jobs	3.81
Attending training programs every year	3.86
Training needs identified are realistic, useful and based on business strategy	3.91

Extensive training programs for its employees in all aspects of quality	3.88
Aggregate	3.85

Table 4 shows the training and development practice of human resource management in Abu Dhabi Agriculture and food safety authority. The result shows that the six items in the constructs have mean values ranging from 3.79 to 3.91 with aggregate mean value of 0.85 indicating high level of training and development practice in Abu Dhabi Agriculture and food safety authority human resource management.

Performance Management

The result for performance management human resource management practice is presented in table 5 below.

Table 5: Performance Management

Statement	Mean
Strong national and international linkages	3.82
Strong marketing and branding capabilities	3.71
Produces more products and services	3.82
Invest a lot funds in research and development	3.73
Adequate and best infrastructure and facilities compared to the competitors	3.82
Good reputation to attract customers	3.75
Managements are recognized by professional	3.80
Introduces new executive and professional development system	3.89
Produces globally marketable and outstanding employees compared to other organizations	3.88
Reputable international ranking among organization	3.81
Aggregate	3.80

The practice of performance management practice in human resource management in Abu Dhabi Agriculture and food safety authority is presented in table 5 above. The result shows that the 10 items in the constructs have mean values ranging from 3.71 to 3.88 with aggregate mean value of 0.80 indicating high level of performance management practice in Abu Dhabi Agriculture and food safety authority human resource management.

Incentives and Rewards

The incentives and reward practice of human resource management result is presented in table 6 below.

Table 6: Incentives and rewards

Statement	**Mean**
Compensation is decided on the basis of competence or ability of employee	3.96
The compensation is directly linked to my performance	4.03
Attractive compensation system	4.05
Salary reflects the standard of living	4.05
Salary comparable to the market	4.05
Job performance is an important factor in determining the incentives and compensation of employees	4.19
Aggregate	4.06

Table 6 shows the incentives and reward practice of human resource management in Abu Dhabi Agriculture and food safety authority. The result shows that the six items in the constructs have mean

values ranging from 4.03 to 4.19 with aggregate mean value of 4.06 indicating high level of incentives and rewards practice in Abu Dhabi Agriculture and food safety authority human resource management.

Empowerment

The result for empowerment human resource management practice is presented in table 7 below.

Table 7: Empowerment

Statement	Mean
My organization provides me the space to implement ideas for improvement	3.67
My ideas and suggestions are seriously considered	3.88
I have the opportunity of flexible working hours	3.89
I may contribute to the development of policy within the organization	3.92
I am well informed about the views and policies of the organization	3.82
I have the opportunity to give my opinion on work-related issues	3.95
I have the opportunity to be involved in decision-making within this organization	3.85
Aggregate	3.86

The practice of empowerment in human resource management in Abu Dhabi Agriculture and food safety authority is presented in table 7 above. The result shows that the 7 items in the constructs have mean values ranging from 3.67 to 3.95 with aggregate mean value of 3.86 indicating high level of empowerment practice in Abu Dhabi Agriculture and food safety authority human resource management.

Job Security

The job security practice of human resource management result is presented in table 8 below.

Table 8: Job Security

Statement	**Mean**
The duties of my job are clearly defined	3.52
My job has an up to date job description	3.70
I know very well what is expected of me from my job	3.73
The actual job duties are shaped more by myself than the formal job description	3.81
The job description for my job contains all the duties performed by me	3.77
Aggregate	3.71

Table 8 shows the job security practice of human resource management in Abu Dhabi Agriculture and food safety authority. The result shows that the five items in the constructs have mean values ranging from 3.52 to 3.81 with aggregate mean value of 3.71 indicating high level of job security practice in Abu Dhabi Agriculture and food safety authority human resource management.

Aggregate Level of Human Resource Management Practices

The overall human resources management practices used by the Abu Dhabi Agriculture and Food Safety Authority including the selection & recruitment, career planning, training & development, performance management, incentives and rewards, empowerment and job security are presented in table 9 below.

Table 9: Level of Human Resources Management Practices

Practices	Mean
Selection and Recruitment	3.84
Career Planning	3.86
Training and Development	3.85
Performance Management	3.80
Incentive and Reward	4.06
Empowerment	3.86
Job Security	3.71
Aggregate	3.85

The level of human resource management practices is presented in table 9 above. The result indicated that the most highly practiced human resource management by the Abu Dhabi Agriculture and Food safety authority is the incentive and reward practice as indicated by a mean value of 4.06 followed by career planning, empowerment, training and development, selection and recruitment, performance management, and job security with mean values of 3.86, 3.86, 3.85, 3.84, 3.80, and 3.71 respectively. Overall, the aggregate mean score for all the human resource management practices is 3.85 indicating that there is high level of human resource management practice by Abu Dhabi Agriculture and Food safety authority.

Job Satisfaction

The result of job satisfaction in the Abu Dhabi Agriculture and Food Safety Authority is presented in table 4.17.

Table 11: Job Satisfaction

Statement	Mean
I feel I am being paid a fair amount for the work I do.	3.70
There is really too little chance for promotion on my job.	3.77
My supervisor is quite competent in doing his/her job.	3.77
I am not satisfied with the benefits I receive.	3.90
When I do good job, I receive the recognition for it that I should receive.	3.74
Many of our rules and procedures make doing a good job difficult.	3.92
I like the people I work with.	3.79
Sometimes I feel my job is meaningless.	3.85
Communication seems good within this organization.	3.82
Those who do well on the job stand a fair chance of being promoted.	3.94
My supervisor is unfair to me.	3.88
The benefits that we receive are as good as most of the other organization offer.	3.86
I do not feel that the work I do is appreciated.	3.82
I find I have to work hander at my job because of the incompetence of people I work with.	3.95
I like doing the thing I do at work.	3.85
The goals of this organization are not clear to me.	3.98
People are get ahead as fast here as they do in other places.	3.81
My supervisor shoes too little interest in the feelings of employees.	3.70
The benefit package we have is equitable.	3.88
There are few rewards for those who work here.	3.88
I often feel that I do not know what is going on with my organization.	3.83
I feel a sense of pride in doing my job.	3.77

I feel satisfied with my chances for salary increase.	3.88
I am satisfied with my chances for promotion.	3.79
My job is enjoyable.	3.92
Aggregate	3.84

Table 11 shows the job satisfaction in Abu Dhabi Agriculture and food safety authority. The result shows that the twenty-five items in the constructs have mean values ranging from 3.70 to 3.98 with aggregate mean value of 3.84 indicating high level of job satisfaction in Abu Dhabi Agriculture and Food Safety Authority.

Organizational Performance

The employee job performance of Abu Dhabi Agriculture and Food Safety Authority is presented in table 12.

Table 12: Employees' job performance

Statement	Mean
The organization achieves its stated goals.	3.74
Work in this organization is easier because of laid down procedures	3.85
Each department understands the role it plays in achieving organizational goals.	3.73
The organization functions smoothly with a minimum of internal conflict	3.85
Resources needed for proper functioning of the organization are always available.	3.77
The organization is normally understaffed.	3.87
The organization has enough human capital to accomplish its goals.	3.81
The organization is able to satisfy the owner(s) /shareholders.	3.77
Customers/clients‟ expectations are met.	3.90
We do not have problems in dealing with state and local government.	3.93
Most suppliers are happy to work with my organization.	3.76
Employees are motivated to stay with this organization.	3.80
Aggregate	3.81

The level of organisational/employee job performance in Abu Dhabi Agriculture and food safety authority is presented in table 12 above. The result shows that the 12 items in the constructs have mean values ranging from 3.73 to 3.90 with aggregate mean value of 3.81 indicating high level of organisational/employee job performance in Abu Dhabi Agriculture and food safety authority human resource management.

Influence of human resource management practices on job satisfaction in Abu Dhabi Agriculture & Food Safety Authority

The first research objective of this paper is to find the influence of human resource management practices on job satisfaction in Abu Dhabi Agriculture & Food Safety Authority. The result of the PLS-SEM analysis to achieve the stated objective is presented in table 13.

Table 13: Influence of human resource management practices on job satisfaction

Paths	Coefficients	T-statistics	P-value
EMP -> EJP	0.234	3.577	0.000
PMG -> EJP	0.178	3.499	0.000
TDV -> EJP	0.182	3.102	0.002
SER -> EJP	0.146	2.595	0.010

JSC -> EJP	0.166	2.334	0.020
CPL -> EJP	0.096	1.666	0.096
IRW -> EJP	0.025	0.479	0.632

Table 13 shows the influence of human resources management practices on job satisfaction. The result indicated that empowerment practice has the most significant influence on job satisfaction as indicated by a path coefficient of 0.234 which is significant (t-statistics = 3.577, P-value = 0.000). The second most influential human resource management practices on job satisfaction is the performance management as revealed by path coefficient value of 0.178 which is significant (t-statistics = 3.499, p-value = 0.000). The third most influential human resource management practice on job satisfaction is the training and development practice as indicated by path coefficient of 0.183 which is also significant (t-statistics = 3.102, p-value = 0.002).

The least significant influential human resource management practice on job satisfaction are the selection and recruitment and job security practices as indicated by path coefficients of 0.146 and 0.166 respectively. The practices have t-statistics value of 2.595 and 2.334 as well as p-values of 0.010 and 0.020 respectively.

The human resource management practices with insignificant influence on job satisfaction are the career planning and incentives and rewards as indicated by path coefficients of 0.096 and 0.025 respectively. These paths are insignificant based on the t-statistics values of 1.666 and 0.476 as well as p-values of 0.096 and 0.632 respectively. Thus, of the seven human resources management practices, five have significant influence on job satisfaction and the remaining two are insignificant in influencing employee job satisfaction.

Influence of human resource management practices on organizational performance in Abu Dhabi Agriculture & Food Safety Authority

The second research objective sought to investigate the influence of human resource management practices on organizational performance in Abu Dhabi Agriculture & Food Safety Authority. The result of the PLS-SEM analysis to achieve the stated objective is presented in table 14 below.

Table 14: Influence of human resource management practices on organisational performance

Paths	Coefficients	T Statistics	P Values
PMG -> OP	0.145	2.671	0.008
TDV -> OP	0.171	2.531	0.011
JSC -> OP	0.222	2.381	0.017
CPL -> OP	0.114	1.736	0.083
SER -> OP	-0.108	1.438	0.151
IRW -> OP	-0.071	0.956	0.339
EMP -> OP	0.054	0.791	0.429

Table 14 shows the influence of human resources management practices on organisational performance. The result indicated that performance management practice has the most significant influence on organisational performance as indicated by a path coefficient of 0.145 which is significant (t-statistics = 2.671, P-value = 0.0008. The second most influential human resource management practices on organisational performance is the training and development practice as revealed by path coefficient value of 0.171 which is significant (t-statistics = 2.531, p-value = 0.011). The third most influential human resource management practice on organisational performance is the job security practice as indicated by path coefficient of 0.333 which is also significant (t-statistics = 2.381, p-value = 0.017).

The human resource management practices with insignificant influence on organisational performance are the career planning and selection and recruitment practices as indicated by path coefficients of

0.114 and -0.108 respectively. These paths are insignificant based on the t-statistics values of 1.736 and 1.438 as well as p-values of 0.083 and 0.151 respectively. Other insignificant human resource management practices on organisational performance are incentive and rewards as well as empowerment practices as indicated by path coefficients of -0.071 and 0.054; t-statistics of 0.956 and 0.791, as well as p-values of 0.339 and 0.429respectively. Thus, of the seven human resources management practices, three have significant influence on organisational performance and the remaining four are insignificant in influencing organisational performance.

Conclusions

This research paper investigated the influence of HRM practices on job satisfaction and organizational performance in Abu Dhabi Agriculture & Food Safety Authority, the current study used six HRM practices. On the basis of the findings of this research work, it can be concluded that the human resource management practices with insignificant influence on job satisfaction are the career planning and incentives and rewards as indicated by path coefficients of 0.096 and 0.025 respectively. These paths are insignificant based on the t-statistics values of 1.666 and 0.476 as well as p-values of 0.096 and 0.632 respectively. Thus, of the seven human resources management practices, five have significant influence on job satisfaction and the remaining two are insignificant in influencing employee job satisfaction, similarly, The human resource management practices with insignificant influence on organisational performance are the career planning and selection and recruitment practices as indicated by path coefficients of 0.114 and -0.108 respectively. These paths are insignificant based on the t-statistics values of 1.736 and 1.438 as well as p-values of 0.083 and 0.151 respectively. Other insignificant human resource management practices on organisational performance are incentive and rewards as well as empowerment practices as indicated by path coefficients of -0.071 and 0.054; t-statistics of 0.956 and 0.791, as well as p-values of 0.339 and 0.429respectively. Thus, of the seven human resources management practices, three have significant influence on organisational performance and the remaining four are insignificant in influencing organisational performance.

Abstract

Purpose: This article is dedicated to the formation of the state policy of Ukraine in accordance with the challenges the country has faced and new needs of the state at the present stage of development, which can currently be characterized as a "weak state". As a result of the analysis of changes in the economy, civil society, public administration, the content and orientation of public policy need to be reviewed. It is important to look for effective tools and approaches that will stop external aggression, permanent influence and support by aggressors in uncontrolled territories, achieve border restoration and social reconciliation, and ensure the effective functioning of public administration institutions.

Methodology: Laws and principles of organizational theory were applied during the study, considering every system from the point of view of organizational order. Analysis of efforts of state bodies and civil society towards reconciliation and dialectical method were applied during the research of the relationships between the formation and implementation of state reintegration policy with complications of reconciliation and implementation of reengineering processes in public administration. Method of situation modeling was used as well as the overview of the successful practices of transformation of executive power and local self-government reform.

Conclusions: Clear results have been obtained on the characteristics of Ukraine, which make it possible to consider it a “weak state” under conditions of political instability and military conflict. The clear directions of the state policy concerning reconciliation, return of the occupied territories and development of effective public administration are defined.

Implications: A clear definition of the contemporary challenges and needs of the state, as well as the use of a systematic view of the situation from the standpoint of organizational theory have allowed us to gain a new understanding of the content of state policy, namely its information format, social and psychological orientation, as well as the security component.

Keywords: State Policy, Weak State, Theory of Organization, Reintegration, Reconciliation, Reengineering of Public Administration

Introduction

The problem of recent period of time is the presence of so-called "double standards" in human consciousness, as well as in social thought and in the behavior of certain communities within individual territorial associations and entire states. In the meantime, the perception of existing reality is based on the so-called "life in the realm of uncertainty". What used to be considered purely business terminology is quite relevant today as characteristics of public life, coexistence of groups of people, regions, states.

If we consciously take the starting point of particular events in the world as a whole and in a certain region or specific country, then there is a possibility of its clear characterization with determining the list of understandable circumstances and potential directions of their further development.

Over the last six years, Ukraine has experienced acute political, security and economic problems. Since the Maidan uprising in February 2014, the country has witnessed several major events, including the outbreak of the conflict in eastern Ukraine and the annexation of Crimea. From 2014 to 2019, the government implemented key reforms, including significant fiscal consolidation, moving to a flexible exchange rate, reforming energy and social assistance tariffs, increasing transparency in public procurement, simplifying business regulation, stabilizing and restructuring the banking sector, moving forward medical and pension reforms and the creation of anti-corruption agencies. The lack of trust in government institutions was the most fundamental. Corruption remained endemic - from the financial sector to the healthcare - and powerful oligarchs still dominated over the economy (The World Bank In Ukraine, 2019).

The situation should be considered systematically with using a comprehensive approach that allows to reconstruct the real state of affairs in society and in the state, to cite additional facts and to avoid uncertainties at a specific point in time in a particular place, namely, the second half of 2013 in Ukraine. It is necessary to underline, that that the GDP of Ukraine in 2013 was $ 183 billion. The country had moved market relations towards integration into the world economy, it had clearly defined borders, created legislation, harmonizing it with EU regulations. Russia was considered to be a friendly state with the longest border, common history and strong ties to Ukraine.

According to the terminology of the theory of organization, Ukraine got to the first, let's call it "basic", the point of bifurcation. At this point there are at least two different ways of further development of the system. These paths were accession to the European Union (Western vector) on the basis of associate membership or the Customs Union (Eastern vector). At the moment, Ukraine was an independent and united state according to both the Constitution and de facto.

As a result of the refusal of the incumbent President of Ukraine from the European vector, a political crisis in the form of popular uprising arose in the country, the President ceased to fulfill his duties and immediately left the territory of the country in early 2014.

This demonstrated the weakness of this branch of government and the signs of a state betrayal of certain first state officials. However, impeachment procedures were not followed and the country ended in unstable political state, led by weak politicians and institutions, and hence - temporarily unmanageable. Two hot spots have emerged: Donbass and Crimea. Both were eventually occupied by a neighboring country, the Russian Federation. Moreover, the Donbass was occupied indirectly, through comprehensive military assistance and targeted financing of the vital activities of the respective territories. The Crimea is directly annexed to the Russian Federation at the legislative level and the aggressor state officially declares the occupied peninsula as a part its territory.

As a result, Ukraine, remaining an independent state, lost its territorial integrity. This was followed by the election of a new president and beginning of a military conflict.

The current president, Vladimir Zelensky, was elected on April 21, 2019. He received 73% of the vote in the second tour, which brought him victory over the former president Petro Poroshenko. On July 21,

President Zelensky's party “Servant of the People” won the parliamentary elections and received 60 percent of the seats in the Rada (parliament).

Economic growth in Ukraine was strong, accounting for 3.2% in 2019. It was ensured by good harvest and industries, dependent on domestic consumption. The COVID-19 crisis is expected to affect economic activity in the country (The World Bank In Ukraine, 2019).

The problem of “strong” and “weak” states has been worrying professionals in Europe and the world for much longer than a decade. State policy has a special place in research of this area.

Michael M. Atkinson (2009) in his work «Strong States and Weak States: Sectoral Policy Networks in Advanced Capitalist Economies» emphasizes that the concepts of strength and weakness must pay much greater attention to specific bureaucratic arrangements and the relationships with key societal actors which, in company with bureaucratic agencies, form the core of ‘policy networks’ at the sectoral level.

Stefan Wolff and Tatyana Malyarenko (2018) in the article «The logic of competitive influence-seeking: Russia, Ukraine, and the conflict in Donbas» state that «that Russia has instrumentally used societal destabilization as a set of tools in the framework of its military and security doctrine of managed escalation-deescalation in order to avoid the consolidation of a stable, pro-Western regime in Kyiv as a second-best option short of achieving a stable pro-Russian regime. This has resulted in the creation of two new Russian-backed de facto states in the post-Soviet space that provide Russia with leverage over Ukraine and its Western partners and simultaneously serves as a “placeholder” before an opportunity may arise in the future for establishing a stable pro-Russian regime».

They point to the conclusion about Russia's competitive influence on a weak Ukraine: «The evolution of Russia’s tactics from nomadic, to creeping, to entrenching occupation, and ultimately to some limited form of state-building is consistent with our view that Russia’s neighborhood strategy in Ukraine is driven by the logic of competitive influence-seeking. Russia is hedging against the consolidation of an unfriendly and stable, Western-supported regime in Kyiv by consolidating its control over parts of eastern Ukraine and solidifying the dependence of local regimes there on Russian support. This gives Russia the opportunity to either maintain the current status quo or settle for favorable re-integration terms that establish Moscow-controlled regions with special status (and hence special powers) within Ukraine through which Russia can assert and sustain its long-term influence over Ukraine’s domestic and foreign policy orientation…».

Samuel Huntington (2003) says that when the pace of political modernization is too high, the expansion of political participation outstrips the pace of political institutionalization and can lead to disruption of political stability and even its degradation. In his view, in these circumstances, a strong authoritarian power is needed to prevent chaos and to consistently implement reforms, create a coalition of reform forces, and consider time factor.

Huntington, studying the effects of the changes of traditional institutions in the process of modernization, concluded that their destruction usually causes destabilization of political relations, increase of social conflicts, even creating, authoritarian regime of military character in some cases. Therefore, he believed that, above all, a stabilization of development was required, and this was possible with a strong authoritarian state power.

Robert I. Rotberg notes that nations-states fail because they are convulsed by internal violence and can no longer deliver positive political goods to their inhabitants. Their governments lose legitimacy, and the very nature of the particular nation-state itself becomes illegitimate in the eyes and in the hearts of the growing plurality of its citizens.

In his work Foreign Policies of Weak States Matter (2013), Nussaibah Younis considers that the lack of interest in Iraq as a foreign policy actor is a part of a wider problem in the field of international relations that focuses heavily on strong or powerful states. Such an approach underestimates the impact

that weak and unstable states can have on international politics. Despite its recurrent political crises, the way in which Iraq chooses to position itself will have an increasingly important impact on regional conflicts. Younis cautions us, for instance, to keep a close eye on the role that Iraq's communities are playing in the Syrian civil war. When discussing the complexities of Iraqi foreign policymaking, Younis refers to her recent trip to the Iraqi Kurdish cities of Erbil and Suleymaniyah. She was astonished to find the extent to which Iraqi Kurdistan is functionally independent of Baghdad and talked about the Iraqi Kurds having their own parallel foreign policy structures.

Yuriy Kovbasyuk, Konstantin Vashchenko, Yuriy Surmin (2014) focus on the content and purpose of public policy, considering it as set of value goals, state-administrative measures, decisions and actions, the order of implementation of state-political decisions (goals set by state authority) and the system state development management of the country.

Therefore, the development of modern state policy in the conditions of uncertainty or emergence of internal or external force majeure requires the public administration to systematically and comprehensively elaborate key conditions of a nuanced and reflexive approach in analyzing existing policy and developing its derivative forms.
Emerging bifurcation points can at any time lead a “stable state” to a “weak state”, “failed state”, or even more negative scenarios of a state's inability to fulfill its functions.

One of the main objectives of our study is to identify key criteria for a “weak state” speaking of Ukraine, and to identify specific directions for creating and implementing effective state policies that can prevent the state from collapsing in the most complex scenarios.

In order to avoid the historical recurrence of the situation in which Ukraine usually finds itself as a “ruin” (and the crisis in economy and politics are the first indicators of t), it should be mentioned that the first negative option is the complete seizure by another neighboring state, the second - the emergence of an authoritarian regime.

Our task – based on the laws and principles of organizational theory - is to build a new state policy on key issues and directions for Ukraine's development for the coming years and even decades. Information policy, reintegration and reconciliation policies, as well as public administration reform aimed at sustainable development of Ukraine, are one of the sets of areas that need to be developed at the level of policy analysis. Policy analysis should be transparent, open and based on public values (Kovbasyuk, 2014).

Analysis of the characteristics of a weak state on the example of Ukraine in the context of the theory of organization

Thus, the conceptual content of our study is to prove that Ukraine today has some signs of a weak state. The organizational component of public administration should take into account the alternative paradigms offered by the theory of organization. Their concept states that any chaos is also an order, though more complicated. And that is why the organization (in our case it is a state) must reflect in response to the transformation of the existing order into a certain chaos, create new conditions for the development of the system. In this case, the state becomes adaptive and flexible in response to threats and challenges. This leads to the emergence of additional properties, namely, self-regulation and self-development.

An example of the limited effectiveness/efficiency of the first paradigm is the recent history of Ukraine. The state ensured the creation of order out of chaos and further supported the created order, wasting resources. In another variant – chaos is rising again. This option can be considered "classic", but the problem is that it does not always work.

Our study looks at the moment when, at the next bifurcation point, state institutions were too weak to keep the situation under control, and when a powerful external influence from Russia emerged in 2014, the state began to demonstrate step-by-step patterns of non-performance in most areas: information,

security, diplomatic/international relations. The articles of the Constitution had been turned into meaningless phrases, which are not mandatory for a higher instance.

Weak states constitute a wide circle. These are:

1) naturally weak due to physio-geographical position or adverse ecological and economic situation and limitations of resources;
2) strong from the beginning, but showing weakness at some stage of their functioning through poor management, despotism, internal contradictions, or an external attack;
3) mixed-state are those which combine the characteristics of the two above.

The weak state is characterized by the presence of certain problems of religious, linguistic, ethnic orientation and other confrontational issues of intergroup coexistence. Such signs may at some point go from a latent phase to an open military confrontation. The economic development of a "weak state" is slows down fairly quickly, the level of corruption inside is maximum, and in most cases the political regime goes to the authoritarian one.

Weak state – can be defined as a country / state that has all the attributes of a democratic state (in particular, state-political institutions), but is not able to perform the basic functions of the state and provide its citizens with public services. This state can be a separate sovereign entity within the world community, be an independent actor in world politics. However, in these weak, hybrid states, there are undoubtedly all the hallmarks of a democratic regime – "democratic" elections are held, freedom of expression and assembly proclaimed and even "almost respected", citizens' rights respected, power arbitrariness reduced, in other words, the minimum procedural requirements are respected (Zelinska, 2019).

We are well aware that the main features of a state characterized as "weak state" are:

- loss of physical control of the territory;
- loss of the right (monopoly) of the state to lawful use of force;
- impossibility of making collective decisions by representatives of the authorities;
- increasing levels of corruption and organized crime;
- impossibility of collecting taxes;
- large-scale displacement of large numbers of refugees and demographic catastrophes;
- environmental disasters;
- invasion from outside.

If you give an assessment to modern Ukraine using the above list of features, you can surely say that half of them can be marked with a "+" sign, as confirmation of the presence of this feature. Among the features inherent in Ukraine are the following: loss of physical control of the territory (7% occupied, with Crimea officially annexed to Russia, which is legislated by the aggressor state, despite the fact that the world community not recognize this fact, the peninsula functions as an administrative unit of Russia); large-scale displacement of big numbers of refugees and demographic disasters - a feature fully present in the Ukrainian format; environmental disasters are increasingly becoming a permanent feature of Ukraine's map - fires, disappearance of lakes, massive deforestation plus a global pandemic can at some moment lead to a critical point of failure; invasion from outside is clearly tracked both in the Crimea and in Donbass (when fake states/republics create institutions such as the FSB, namely "MGB", use Russian-made military equipment and weapons, receive assistance from Russian military experts, financial aid for all institutions on in the occupied territories comes exclusively in Russian rubles, there is no doubt left about the occupation of certain regions of Ukraine by another state).

Moreover, it cannot be said that the state does not have a full policy on these issues, there is corresponding legislation on securing state sovereignty, the NSDC is working, and new ministries have been created. For example, in accordance with the Law of Ukraine "On Features of State Policy for Ensuring State Sovereignty of Ukraine in Temporarily Occupied Territories in Donetsk and Luhansk Oblasts".

The goals of the state policy for securing the state sovereignty of Ukraine in the temporarily occupied territories in Donetsk and Luhansk regions are:

1) liberation of the temporarily occupied territories in Donetsk and Luhansk regions and restoration of the constitutional order in these territories;
2) protection of the rights, freedoms and legal interests of individuals and legal entities;
3) ensuring the independence, unity and territorial integrity of Ukraine. (Law of Ukraine, 2018)

The past authorities have signed "Minsk Agreements" which, according to experts, have created the conditions for a long-term conflict and can be quickly implemented only at the will of only one side of the negotiations – Russia.

According to Malyarenko & Wolff, “Given the importance of Ukraine's case and the Russia-West relationship in the disputed neighborhood as a whole, this is obviously important for policymaking in terms of future scenarios in this region and and in terms of proposing policy recommendations."

The present state policy is focused on maintaining independence and sustainable development in the country. However, at the same time the state demonstrates a long-term plunge into the political crisis, economic decline and lack of systematic and integrated work to overcome the crisis. Accordingly, the positive results available are one-off and do not have the opportunity to become a trend.

In addition to these weakness indicators, it is also possible to consider additional options that have a positive or negative connotation. According to UNESCO Science Report: towards 2030 (2017) Ukraine's economy save most in 2009, by 15%; it is the only Black Sea country where GDP per capita remains below 2008 levels. The current economic crisis in Ukraine is associated with the ongoing conflict, which saw GDP drop by more than 6% in 2014. Many post-Soviet states suffer from diminished territorial integrity, which hinders their ability to focus on long-term development issues. They bear the stigma of what has been termed 'frozen conflicts,' the legacy of short-lived wars that have ice to part of their territory escaping their control: the mountainous Karabakh (Arcakh) region, disputed by Armenia and Azerbaijan since 1991, the breakaway Transnistria region in Moldova (since 1992), the breakaway regions of Abkhazia and South Ossetia in Georgia (both since 1990–1992) and, most recently, Crimea and the Donbass regions in Ukraine.

Noting UNESCO's updated human and financial resources for R&D for 162 countries and territories, we also do not find Ukraine in the top two. As part of the Sustainable Development Goal 9, countries have committed themselves to “create sustainable infrastructure, promote inclusive and sustainable industrialization and innovation. In particular, the objective is to stimulate innovation, increase technological capacity, significantly increase the number of researchers, as well as public and private R&D expenditures.

For example, Ukraine has an indicator of the number of researchers per 1 million, which is equal to 988, while in Russia - 2800, Germany - 5000, Finland - 6700, Israel - 8300. (2017)

Financial performance is the topic of a separate study, but compared to $ 183 billion in 2013, in 2019 we see a GDP of $ 153.2 billion.

The consequences of the political crisis of 2013-2014 and the simultaneous interference of Russia in the internal affairs of Ukraine require an analysis of the causes and the use of the dialectical method in the formation of a modern model of effective state policy on reintegration, reconciliation and reengineering of public administration.

The country's investment attractiveness has deteriorated sharply, even a certain outflow of investment resources has been present. Becoming member of European Community and NATO has been delayed, and it is clear that the country's sustainable development processes have slowed down.

However, against the backdrop of losses, Ukraine received support in Europe and the world, the experience of warfare stopped the aggressor at certain borders, while Russia made statements that free republics would be created across the Left Bank of Ukraine and the aggressor would receive a land route to Crimea. Ministries have started to set up reform offices, full-fledged reform of local self-government has begun, the country has received new police and many successful practices.

Yet some questions remain unanswered:
- what recourses does the state require to make a transition from a “weak state” to a “strong state”;
- what format of relations with Russia will be appropriate after the problems of Donbas and Crimea are resolved;
- how to eliminate the participation of Ukrainian oligarchs in public administration and to protect state’s own economic interests?

A new format for state policy: from declarations to content

Speaking of creating a new state policy, one must consider not only the internal factors, but also the policies of the countries around. Among them will be those who are interested in the positive scenario of Ukraine's development, and, of course, those who will direct their policy towards undermining the existence of our country.
Relying on a more practical area of public policy, namely, “policy analysis,” one can build a new model of public policy formation and its implementation.

Instead of the declarative approach in public policy we have outlined above (Law of Ukraine "On the Features of State Policy… ..), it is necessary to systematically define the policy goals, select effective tools and thus ensure the passage of a real cycle from problem definition to its solution.

The implementation of a policy, which is, the implementation of planned policy measures to solve a problem with respect to known goals and objectives, produces a variety of results, first and foremost, direct and immediate, which are called policy products. A product is one that is directly spent on budgetary resources allocated to the implementation of policy measures.

However, unlike the cost of resources, a policy product is not always easy to identify and measure, especially when it comes to purely "bureaucratic" measures. A similar problem arises when evaluating the activities of government agencies, when it is necessary to find out what is the product of a government agency, what it produces (Kovbasyuk Yuri, 2014).

Here are some examples that illustrate the importance of meaningful elaboration of public policy environment on reintegration, reconciliation and public administration reform. Elaborating a specific model has fundamental importance.

Interestingly, weaker states can also be seen as a condition for the survival of a neighboring powerful state. If a weakstate is in a vital strategic space (be it geography, resource security, economic potential, territory, population or competence, large states can act aggressively to gain control over this weak state.) Weak states in such circumstances will be forced to adhere to the strategy balance: and therefore, win, negotiate or, if they are lucky, remain neutral in an attempt to guarantee their own survival. Weak states can learn from their specific historical experience and, therefore, continue the policy of neutrality to ensure their continued existence. Other describe the passive policy of the existence of a state in the status of weak state; this policy may include rigid balancing (military campaign or global alliance for countering the threat), soft balancing (diplomacy or economic management of the state to counteract the threat), countering (neglecting the claims of the hegemonic state), blackmail (using threats to obtain some concession), slipping of the leash (increasing abilities irrespective of the existence of neighboring large states), connecting (linking a great power with weak power economically or through institutions) and gluing (the development of a "special relationship" with the powerful state) (Kassab, 2015).

However, there is also the opposite situation with the "bad neighbor" – experts recognized the "domino effect" as an extremely dangerous one, when conflicts in one weak state necessarily affect the fragile

stability of the same "weak" neighbors. An example of the spread of instability from one "failed" state to its weak neighbors was the situation around Liberia. Conflicts in this country, creeping in during the 1990s, crossed the border and captured Sierra Leone and Cote d'Ivoire. Together, these subjects formed the whole "failed region".

That is, in the situation in which Ukraine has been in 2014 with its "bad neighbor", it can already be said that the tactics of tight balancing (a military campaign or a global alliance to counteract the threat) have not yet led to significant changes in this conflict. And here it makes some sense to change the strategy of behavior in the context of reintegration policy and implementation of the Minsk Agreements. Again, Ukraine in its current state of weak state, in our opinion, can successfully apply the soft balancing tactics of diplomacy or economic governance to counter the threat) and blackmail (the use of threats to obtain some concessions).

If we analyze the actions of the previous authorities in this direction, the fatal mistake was not their attempts to "make friends" with the Russian Federation or make certain concessions in relations with it (which is a very common opinion among opponents of reintegration of occupied territories and any agreements with Russia) but the fact that Ukraine has been getting weaker during all this time. We had the chance to strengthen the army and strengthen the protection of the borders, but we felt that threats were emerging everywhere except our country. This is not the fault of the “bad neighbor”, but it is the fault of the internal policy of the state apparatus, the inability of the state to perform its functions, the corruption component, meaning, there is no impulse to strengthen the state.

Taking into account the traditional realistic view of international relations, international security challenges come from strong, aggressive states that seek to gain greater influence on the international scene and expand their area of responsibility. Speaking about new security challenges, they come not from force, but from the internal weakness of the state, which determines the social, economic and political factors of the state administration. Consequently, our attention is given to the view of the nature of modern international security and international conflicts that increasingly confirm the transformation of the Westphalian world order into the post-World Transparency, when internal and external factors of state policy affect international security in the same way. In fact, this approach recognizes that the inalienable right of the state to govern the sovereignty of the state within a single country and the inviolability of that sovereignty (a norm that has never been completely respected of the Westphalian) are no more absolute. If the state ceases to be the main actor of international relations, then conflicts are more likely characterized by civil wars, insurrections, the inability of states to perform their functions, and not intergovernmental wars (Mashura, 2015).

Particular attention needs to be paid to the reconciliation of the parties, because in the state of today it looks surreal. The military conflict in the East, ideological influences, the propaganda of the enemy and the worst thing - the deaths of loved ones testify to the current impossibility of reconciliation. Each policy contains a strategic component that needs to be implemented in the future, but we must work on the issue now. Unfortunately, there is no unity in this issue in Ukraine, and this is another sign of a weak state - a lack of consolidated thought. There are chances, but political PR is conquering common sense, and in the country again the key controversy concerns the return of occupied territories, the return not only of land but also of people who are temporarily lost. Instead of Poroshenko and Zelensky, we need a passionate and competent Lech Walesa, Vaclav Havel or the super-intelligent Zbigniew Brzezinski, who looks into the future even while pouring himself a glass of orange juice. Consolidation of society is one of the priority tasks of public policy, which involves both the information-ideological component and economy at the same time.

Public administration reform can only be implemented by new politicians. They can be both citizens of Ukraine and already well-known expats in Ukrainian society. Hatia Decanoidze is known for creating a new police force, Max Nefyodov is the driver of Prozorro's new public procurement system. Aivaras Abramavichus was a head of a ministry and rebooted it, cutting half of its staff by raising the payroll of the etc. Mikhail Saakashlvili headed the Odessa region, built the Odessa-Reni highway, made the regional authorities closer to the people and tried to break the corruption in customs. Vladimir

Zelensky did the impossible – proving that in a free country, an ordinary citizen without a political background can defeat an incumbent, very powerful president-businessman-oligarch.

Therefore, we are promoting our vision of public policy in the area of public administration reform. The system of public administration requires radical change, which is meaningful reengineering, both in the processes and in the officials' composition. Offices of reform, process automation, reloading of entire ministries and the creation of modern institutions are the ways to development. Digitization is a tool.

Here is an example of an effective format. The Ministry of Digital Transformation of Ukraine was established in Ukraine to ensure the formation and implementation of state policy in the field of development of national electronic information resources and interoperability. Specialists know what is possible to achieve to ensure interoperability, meaning the interoperability of heterogeneous information systems.

Local self-government reform was one of the most successful in terms of the new format of administrative division of the country. United territorial communities, the legislation that accompanies their activities, and most importantly, the financial consolidation of communities, prove that Ukraine has the potential for political, economic and social recovery.

Conclusion

Summarizing the theoretical research on the issues of formation of effective state policy in Ukraine in the context of modern approaches and paradigms of the theory of organization, and taking into account the conducted analysis of the political and socio-economic situation in which the country has been in during the last six years, we were given the opportunity to draw a certain list of conclusions and results of our study.

There is a certain list of signs of a weak state and we have found that Ukraine meets at least half of them. In this regard, it can be identified as a "weak state" by analyzing the reasons for getting into the relevant position and attempting to find effective ways to overcome crisis phenomena and achieve sustainable development.

The modern theory of organization assumes that any system and state are not always capable of forming a certain state system to hold it further. In certain situations and circumstances, the classic organizational paradigm does not work and order changes to chaos. Therefore, the state should develop adaptive state policies and become flexible through a systematic and integrated approach, setting both operational objectives and strategic goals.

There is an urgent need in the state to move away from the declarative approach to the formation of the state policy and to rely on the applied nature of "policy analysis" to build a new format for its creation and implementation, setting relevant goals, determining the need for an appropriate resource and understanding the size and content of expected results.

Ukraine is characterized as a weak state not only by the internal crisis, but also by a significant external factor - a "strong/powerful state" which is recognized by the world community as an aggressor and which has occupied 7% of the Ukrainian territory. Therefore, when considering the challenges of public policy formation, we focus on the reintegration of territories, the issue of reconciliation and consolidation of the state through the reengineering of the public administration system, which also implies a security component.

The dialectical method of research allowed us to consider all of these areas in relation to each other, offering different models of behavior of the state of Ukraine for the return of the occupied territories. A weak state must be flexible and adaptive, using every opportunity to strengthen its position.

Reconciliation requires certain conditions that Ukraine does not have yet. Therefore, in the nearest future, public policy should finally decide on the development of compromise behavior with the parties of the conflict and consolidate this ideologically in the people's minds. Today, we are consolidated and united in our vision of the many problems that need to be resolved.

Successful practices of reengineering public administration and breaking the existing system with the outdated ruling political elite and oligarchy testify to the considerable potential of the Ukrainian state. Reforming processes in state institutions, setting up reform offices, successful phased integration of territorial communities can be a powerful impetus to the derivative forms of innovative development of the state and regions. Such successful practices can be one of the arguments for the return of temporarily occupied territories and their inhabitants. However, the need for a charismatic figure(s) with relevant competencies remains unmet. Despite that, successful precedents are evidence of opportunity rather than of despair.

Therefore, in the case of a sound approach to the formulation of state policy, considering the policies of the neighboring countries and identifying key internal problems, Ukraine is able to overcome the crisis phenomena of the current period and gradually stabilize the situation and ensure sustainable development in all spheres of public life.

Service Offer Integrator Business Model Adoption Scenarios for the RO-Smart Ageing Platform

Gabriel NEAGU and Marilena IANCULESCU

National Institute for Research and Development in Informatics - ICI Bucharest, Romania
gabriel.neagu@ici.ro, marilena.ianculescu@ici.ro

Abstract

During recent years the quality of IoT based monitoring services has continuously increased due to the growing market requirements, on the one hand, and with support of various technological advances like Cloud-IoT architectures, next-generation IoT with distributed intelligence, edge and fog computing, advanced analytics of heterogeneous data, on the other hand. Health monitoring is an important driver and a priority beneficiary of this evolution. Considering the complexity of IoT monitoring services, the service offer integrator role has the advantage of a unique point of contact in relation to service users and beneficiaries. To illustrate this approach the health monitoring architecture being currently implemented in the RO-SmartAgeing project is presented and two adoption scenarios of this business model are proposed, for the case of small medical units and large hospitals, respectively.

Keywords: Health Monitoring, Cloud-Iot Architecture, Sensing Service Integrator, Business Model.

Introduction

During the last years, the increasing market for high-quality IoT based monitoring services has fueled the development of IoT platforms. The Gartner's Emerging Technologies Hype Cycle from August 2018 edition already placed the IoT platforms on the peak, in the five major technology trends (Panetta, 2018). A decisive role in this evolution has played the integration of IoT and Cloud technologies, due to their inherent complementarity: on the one hand, the cloud computing was able to compensate limited computing and storage capacities of the IoT devices to support complex analysis of sensor-generated data, and on the other hand, the interaction with real-world specific to IoT devices enlarged the opportunities to diversify cloud-based services and applications (Diaz et al, 2016). Sensing as a Service model is a specific example of the potential of the Cloud-IoT approach to diversify and improve provided services. It is considered a win-win IoT ecosystem based on data sharing principle, where the data owners trade their data and decide about conditions of their usage, while the data consumers can benefit from a larger volume of data acquired through the data trading process, which enables the use advanced data analytics solutions to extract useful knowledge and insights (Perera, 2017). More recently, the next generation of IoT with distributed intelligence based on edge computing is characterized by the real-time collection of data, ubiquitous connectivity, distributed stored information, local computing power, cognize capability (analytics, real-time AI) and high potential to diversify services, interactions, business models (Vermesan et al., 2018). The role of edge computing as a complementary solution to dominating cloud computing was confirmed by Gartner's Hype Cycle for Cloud Computing, 2018 (Smith and Anderson, 2018).

A step further in diversifying computing and storage capabilities of the Cloud-IoT architecture, the fog computing was introduced as an intermediary provider of such capabilities between end devices and traditional cloud computing data centers, being considered suitable for real-time, low latency, and high response time applications, especially in healthcare (Mutlag et al., 2019). Its benefits include: minimized volume of data sent in the cloud, improved privacy of sensitive data stored locally, limited network communication impact on the time response performance, greater scalability in terms of the number of connected devices, and the amount of generated and collected data.

Health monitoring is one of the main drivers and also a priority beneficiary of advanced Cloud-IoT sensing services due to well known contextual reasons: demographic ageing trend and patients'

reluctance to leave their home environment, increasing impact of chronicle diseases and higher costs of clinical healthcare, the interest of medical staff to access high-quality decisions based on advanced analytics of data coming from heterogeneous sources (Shah and Bhat, 2020). Based on the reference architecture for an IoT platform dedicated to the Cloud-IoT services (Neagu et al., 2016), the service offer integrator (SOI) role was proposed as a unique point of contact with service users and beneficiaries. The viability of this role on the service market is influenced by the potential of the adopted business model to cover and orchestrate all specific contributions and business interactions that condition the successful delivery of the integrated service offer.

The project entitled "Non-invasive monitoring and health assessment of the elderly in a smart environment (RO-SmartAgeing)" has as its main objective a system for monitoring and assessing the health status of the senior patients, that integrates non-invasive motion and physiological wearable sensors for the collection of health parameters, a smart environment sensors to monitor daily activities and lifestyle, and a cloud platform for data storage and aggregation, including the presentation of advanced data analysis results (Ianculescu et al., 2019).

The remaining part of the paper is organized as follows: Section 2 presents the rationale of the service integrator approach in terms of specific roles and the characteristics of the business model ensuring its sustainability. Section 3 is devoted to the health monitoring architecture developed within the RO-SmartAgeing project – a seven-layer architecture covering all components of the integrated service offer. Two adoption scenarios of the service integrator business model in Health monitoring, in the case of small medical units and large hospitals, respectively, are outlined in Section 4. Some concluding remarks are presented in the final section.

Service Offer Integrator

The main ideas behind this approach were derived from the previous results in experimenting sensing services, where their successful implementation depends on the availability of various components of this type of service, their efficient configuration and operation to meet users' requests (Neagu et al., 2019).

Specific Roles

The Service Offer Integrator (SOI) is an IoT platform provider that intends to improve the quality of provided services with the aim to access the market of complex sensing services as it is the case of health monitoring. The other contributors on the provider's side are the Cloud Infrastructure Provider (CIP), the Sensor Device Owner (SDO), and the Extended Service Provider (ESP) for additional value-added services/applications to meet highly specific users' requirements.

On the consumer's side, the SOI should identify the Integrated Offer Beneficiary (IOB) whose problem has to be addressed by high-quality services. Complementary to the IOB role, the Integrated Offer User (IOU) has the expertise to evaluate the problem and to formulate requirements regarding the configuration of the integrated service offer. At the operational phase, the IOU can understand and interpret the provided results and formulate recommendations to the IOB.

SOI Business Model

The main reason for a business model is to describe the rationale of how the value is created, delivered, and captured. In our case, the business model is built on main business interactions between various business actors playing the SOI specific roles, as presented in Figure 1.

Fig. 1: The SOI business interactions

According to identified market opportunities, the SOI negotiates the access to the Cloud infrastructure (1), the availability of necessary sensor devices (2), and value-added services for advanced sensing data analysis and visualization (3). It should be mentioned that there may be different approaches to implement these roles and to simplify their interactions.

On the customer side, the IOU negotiates with the SOI the contract, which stipulates the configuration of the integrated service offer and the conditions of its activation and access, according to requirements derived from the analysis of the beneficiary's problem (4). Based on this contract, the IOU concludes a subsidiary contract with the IOB regarding her/his access, for a given period, to the negotiated services, as well as the outputs the IOU will deliver based on the interpretation of the service results (5). Finally, the IOB concludes the contract (6) with the SOI on activation and access conditions for services stipulated in the contract (5), as well as the assistance she/he should receive as a service user.

The main characteristics of the SOI business model are synthesized in Table 1, according to the nine building blocks structure proposed in (Osterwalder and Y. Pigneur, 2010).

Table 1: Main characteristics of the SOI business model

Building block	Characteristics
1. Customer segments	Within a specialized domain (e.g. Health monitoring) the most suitable market model is "segments with slightly different needs and problems", in terms of specific requirements regarding sensor devices, data collection, storage, cleaning and aggregation, event processing, value-added applications layer for analytical processing and visualization.
2. Value propositions (products and services that create value for a specific customer segment)	The main sources of value are: performance level of the Cloud-IoT infrastructure, the relevance of value-added services, service accessibility including data privacy and integrity issues, and usability of provided results.
3. Channels to communicates with and reaches its customer segments	The direct channel adapted to an emerging market: awareness rising, customized services, focus on the value proposition to customers, post-purchase customer support.
4. Customer relationship with specific customer segments	The direct, personal relation and dialogue with each customer is highly desirable for understanding specific needs, for diversifying value-added components of the integrated offer, and for the co-creation dimension of the customer relationship.
5. Revenue streams from each customer segment	From the consumers' side, the revenue streams are specific to service providers: usage fee or subscription fees, depending on

	how the customer needs to access the service results. From the providers' side, these streams are specific to the SOI business profile, which is closed to the classical Full-Service Provider model.
6. Key resources /assets required by the business model	The key resources are the Cloud-IoT infrastructure, the human resource expertise of providing integrated services, the intellectual resources represented by licensed software.
7. Key activities a company has to do according to its business model	The SOI is a service company, therefore its key activities are those providing solutions to customers' needs.
8. Key partnerships (suppliers and partners) that are relevant for key resources and key activities	The partnerships that optimize the allocation of resources and activities by complementarities of proposed contributions to the integrated service offer, and reduce risk and uncertainty regarding the availability of key resources (distributed infrastructure, the value-added applications).
9. The cost structure for key resources, activities, and partnerships	The cost structure includes fixed costs for infrastructure operation, variable costs for sensor devices, and value-added applications. Also, the economy of scale is specific to this business model (valorisation of IoT data through their sharing between more interested users).

RO-Smart Ageing monitoring architecture

Among the most important functionalities to be developed within the RO-SmartAgeing project in the benefit of senior patients are:

- non-invasive monitoring of the current health status to define a real elderly profile for presenting the current state of some health parameters (physiological and cognitive);
- defining a model for tracking the locomotor decline and fall prevention;
- monitoring of current activities and lifestyle;
- personal safety supervision;
- personalized ambient adaptation in the event of an abnormal health parameter or an unforeseen and dangerous event;
- supporting the remote assessment of the senior's current health status and early diagnosis;
- creating facilities to support the social interactions of the senior;
- facilitating the senior's empowerment and involvement in the optimal management of his/her health.

The six-layer architecture monitoring architecture is presented in Figure 2.

Data Acquisition Layer is responsible for collecting various types of health and ambient-related raw data from different types of sensors and devices.

Communication Layer is in charge of both vertical communication by sending the collected data through a gateway towards upper architectural layers, and horizontal communication specific to the data-gathering network.

Edge Layer implements context-awareness capabilities based on collected data storage and pre-processing close to the logical edge of the network, providing low latency reactive monitoring in case of risky events triggering and avoiding sending all the data towards upper layers.

Fog Layer provides the capacity of bringing larger storage and computational capabilities to the edge of the network to perform time-sensitive pre-processing of received from lower layers and giving a primary diagnosis. It plays the role of a smart gateway enabling data to be and stored and processed according to local necessities, and finally, to be aggregated and sent to the upper layers.

Fig. 2: RO-Smart Ageing architecture (adapted from (Ianculescu et al., 2019))

Cloud Layer ensures long-term and high volume storage, as well as computing power to support advanced data analytics generation insights specific to personalized healthcare decision-making, predictive analysis, and higher performance in remote monitoring of health status in cooperation with edge and fog layers. To leverage this potential, a whole range of advanced applications are deployed on this layer, including patient health management, behavioural monitoring, predictive models, and other advanced diagnostic support services.

Consumption Layer provides an interactive interface via standard web service protocols and service composition technologies to allow the targeted beneficiaries (as patients, healthcare providers, or public authorities) to access applications, data, and information available on the RO-SmartAgeing platform.

The architecture implements all identified contributions for highly performant health monitoring, providing full support for experimenting with the proposed SOI business model sustainability.

SOI Business Model Adoption Scenarios

There are envisaged two scenarios, adapted to two types of medical units. In both cases, the RO-SmartAgeing team is playing the SOI role as the provider of the IoT infrastructure and end-user specific services on the edge and fog layers. Also, the team will fulfill the advanced data management tasks and specific applications on the cloud layer and will provide the web-based user interface at the consumption layer.

The first scenario is specific to small medical units in the outpatient setting. At the consumer side, the IOB is a monitored patient, while the IOU is the medical unit which has neither the capability nor the interest to develop and administrate its own IoT oriented infrastructure, due to obvious reasons related with the technical complexity of this task and high QoS indicators regarding the service availability and scalability. The SOI negotiates with the IOU the integrated service configuration, terms of its activation, number of users, and their access rights per category of service consumers, according to requirements derived from the IOBs' needs. During the service activation period, each IOB interacts with the SOI for assistance regarding the service usage.

At the provider side, depending on customers' requirements, the SOI activates contractual relations with SDOs, the CIP, and the ESP for some advanced data analytics and implementation of predictive models on the cloud layer.

The second scenario addresses the case of large medical units (hospitals) with both the institutionalized patient and the outpatient setting. Specific for this case is the fact that the hospital might have the potential to implement and administrate locally the IoT infrastructure and its functionality through its IT department, outsourcing only cloud layer services. Also, the hospital may decide to administrate its stock of frequently used sensor devices and to ask the SOI assistance only for highly specific ones. Therefore the configuration of the integrated offer should be adapted and negotiated accordingly considering also its impact on the business model itself.

Conclusions

The paper proposes the service offer integrator approach having its main mission to achieve the match between requirements of a problem formulated on the market and the potential solution based on advanced IoT based sensing services. To consolidate this provider's place in the supply chain, its business profile was identified, its business interactions are identified and the main characteristics of the proposed business model have been described.

The approach is illustrated by two adoption scenarios in the case of small medical units and large hospitals, according to the health monitoring architecture being currently implemented in the ROSmart Ageing project.

Acknowledgment

This work was supported by the project "Non-invasive monitoring and health assessment of the elderly in a smart environment (RO-SmartAgeing)", funded by the Core Program of the Romanian Ministry for Research and Innovation.

Information Management in the 4th Railway Package

Marzena GRABOŃ-CHAŁUPCZAK

Department of Transport and Information Technology, WSB University, Poland

Correspondence address: mchalupczak@wsb.edu.pl

Abstract

A high level of safety in the implementation of transport processes is associated with quick access to reliable and current information as part of the Safety Management System. The amount of data and the speed of changes taking place in the environment necessitates the introduction of an information management system and their flow channels in communication with third parties. Proper management of information resources increases the efficiency and effectiveness of policy implementation and safety objectives. The article presents the possibility to identify channels of external and internal information flow of a railway undertaking by the safety requirements set out in the 4th Railway Package. Similar maps can be identified in infrastructure managers' Safety Management Systems by identifying critical elements of its functioning.

Keywords: Information Flow, Safety, 4th Railway Package

Introduction

Under the Act on rail transport of March 28, 2003, railway undertakings are required to have a safety certificate to gain access to infrastructure, and managers must have safety authorization to manage the infrastructure. Railway entities must develop and implement a Safety Management System to obtain these documents. The system must comply with several national and EU legal requirements. All those operating the railway system, i.e., railway undertakings and infrastructure managers, bear full responsibility for the safety of the system, each for their part, and the establishment of a properly functioning SMS is identified as the appropriate way to fulfil this responsibility. The purpose of the SMS is to ensure that the organization safely achieves its business objectives and complies with all the safety obligations that apply to it. These safety obligations must always be fulfilled in today's ever-changing and complex railway environment.

Safety Management System in the 4th Railway Package

The 4th Railway Package is a set of legislative texts designed to complete the single market for rail services (Single European Railway Area). It should revive the rail sector and make it more efficient and competitive with other modes of transport. It was divided into two areas, called pillars:

- technical pillar,
- market pillar.

The technical pillar, which was adopted by the European Parliament and the Council in April 2016, includes:

- Regulation (EU) 2016/796 on the European Union Agency for Railways and repealing Regulation (EC) n° 881/2004,
- Directive (EU) 2016/797 on the interoperability of the rail system within the European Union (Recast of Directive 2008/57/EC),

- Directive (EU) 2016/798 on railway safety (Recast of Directive 2004/49/EC).

The 'market pillar', which was adopted in December 2016, includes:

- Regulation (EU) 2016/2338 amending Regulation (EU) 1370/2007, which deals with the award of public service contracts for domestic passenger transport services by rail ('PSO Regulation'),
- Directive 2016/2370/EU amending Directive 2012/34/EU, which deals with the opening of the market of domestic passenger transport services by rail and the governance of the railway infrastructure ('Governance Directive'),
- Regulation (EU) 2016/2337 repealing Regulation (EEC) 1192/69 on the normalisation of the accounts of railway undertakings.

The market pillar will complete the process of gradual market opening initiated by the first railway package. It regulates the right of railway undertakings established in one Member State to provide passenger services throughout the EU. It also lays down rules aimed at improving impartiality in the management of rail infrastructure. It introduces the principle of a mandatory public tender for the provision of rail services Competition in rail passenger services markets will railway undertakings to improve their service quality and cost-effectiveness better. Competitive bids for public services will save public money. The market pillar is expected to provide European citizens with choicer and better-quality rail services, which is the overarching goal.

The technical pillar aims to increase the competitiveness of the rail sector by significantly reducing costs and administrative burdens for railway companies wishing to operate throughout Europe. As a result, companies will not have to submit costly multiple applications for operations outside one Member State. The European Union Railway Agency will issue vehicle authorizations and safety certificates for railway companies that are valid throughout the EU. Until now, railway undertakings and manufacturers had to be certified separately by each relevant national safety authority. It will:

- save businesses from having to file costly multiple applications for vehicle authorisations and safety certificates in the case of operations beyond one single member state,
- create a ‘one-stop shop’ IT tool which will act as a single-entry point for all such applications, using accessible, transparent, and consistent procedures,
- ensure that European Rail Traffic Management System (ERTMS) equipment is interoperable,
- reduce the large number of remaining national rules, which create a risk of insufficient transparency and disguised discrimination against new railway undertakings.

The executive acts applicable to the implementation and functioning of Safety Management Systems are also:

- Commission Delegated Regulation (EU) 2018/762 of 8 March 2018 establishing common safety methods on safety management system requirements pursuant to Directive (EU) 2016/798 of the European Parliament and of the Council and repealing Commission Regulations (EU) No 1158/2010 and (EU) No 1169/2010,
- Commission Implementing Regulation (EU) No 402/2013 of 30 April 2013 on the common safety method for risk evaluation and assessment and repealing Regulation (EC) No 352/2009,
- Commission Regulation (EU) No 1078/2012 of 16 November 2012 on a common safety method for monitoring to be applied by railway undertakings, infrastructure managers after receiving a safety certificate or safety authorisation and by entities in charge of maintenance.

Information Flow

According to the new legal requirements from June 2020, a railway carrier or railway infrastructure manager applying for a single safety certificate/authorization should demonstrate compliance with the relevant requirements for the Safety Management System set out in Commission Delegated Regulation

(EU) 2018/762. To this end, it should provide the National Safety Authority) or, where applicable, the European Union Railway Agency with evidence of the establishment of a Safety Management System by Article 9 of Directive (EU) 2016/798. The organization should describe the scope of the Safety Management System, considering legal requirements. During planning, developing, implementing, and reviewing its operational processes, the organization should ensure that risk acceptance criteria and safety measures are applied, plans are implemented to achieve safety goals, and information is collected for monitoring purposes.

The documentation includes a description of the Safety Management System, including:

- the identification and description of the processes and activities related to the safety of rail operations, including safety-related tasks and associated responsibilities,
- the interaction of these processes,
- the procedures or other documents describing how these processes are implemented,
- the identification of contractors, partners and suppliers with a description of the type and extent of services delivered,
- the identification of contractual arrangements and other business agreements, concluded between the organisation and other parties, necessary to control the safety risks of the organisation and those related to the use of contractors,
- reference to documented information required by this Regulation.

According to the regulations, it is necessary to define adequate communication channels to ensure that safety-related information is exchanged among the different levels of the organisation and with external interested parties, including contractors, partners, and suppliers.

To this end, procedures shall be used to ensure that safety-related information reaches those making judgments and decisions, the organisation shall manage the identification, receipt, processing, generation, and dissemination of safety-related information.

Also, the entity ensures that safety-related information is:

- relevant, complete, and understandable for the intended users,
- valid,
- accurate,
- consistent,
- controlled,
- communicated before it takes effect,
- received and understood.

Figure 1 presents proposals for external information flow channels for the railway undertakings. Relevant information provided in the legal requirements is included.

As part of the external information flow map (Fig. 1), third parties cooperating with the railway undertakings were identified, i.e.:

- National Safety Authority (NSA),
- National Investigation Body (NIB),
- emergency services and public authorities,
- suppliers,
- entities in charge of maintenance – ECM,
- railway undertakings,

Fig.1: External information flow channels for the railway undertakings

Fig.2: Internal information flow channels for the railway undertakings

- infrastructure managers,
- users of railway sidings.

The map describes critical safety information passed between identified parties, along with an indication of who the sender is and who the recipient is.

In the case of internal information flow (Fig. 2), the security management system was divided into four areas:

- main process - including transport implementation and planning,
- safety management - covering supervision, monitoring and risk management processes,
- personnel management - related to the supervision over the competences, tests, and training of personnel related to the system,
- supervision of transport - including audit, control, and supervision over the implementation of security management system processes.

The external information flow map describes the critical safety information passed between identified sites and an indication. From the map, we can read who the sender and recipient of this information are. This information includes, but is not limited to:

- safety improvement program,
- annual safety report,
- activity reports, also for the transport of dangerous goods,
- information from the NSA and NBI,
- information on railway events,
- information about the technical condition of vehicles,
- information on railway events,
- information related to the risk management process,
- contracts.

Key safety-related information has been identified in external information flow channels. These are information generated, sent, and used in the system, among them:

- system documentation,
- technical documentation,
- employee documentation,
- information on railway events,
- information related to the risk management process,
- internal rules and regulations.

Summary

The requirements for information supervision in the Safety Management Systems described in the publication require verification and updates of existing systems. In this regard, we are dealing with the evolution of existing requirements.

Obtaining a high level of safety is conditioned by quick access to reliable and up-to-date information about the processes taking place in the railway undertaking. The amount of information and the speed of changes taking place in the environment makes it necessary to identify their flow channels, especially in communication with third parties. Also, the railway undertakings must verify that the organization provides:

- application of risk acceptance criteria and safety measures,
- implementing plans to achieve the objectives in the field safety,
- exchange of information related to safety in system improvement.

The article presents the possibility of a formal description of the flow of external and internal information in a well-functioning railway carrier's Safety Management System.

The Role of the Equipment Monitoring and Diagnosis System in Production Management

Piotr Wittbrodt

Opole University of Technology, Department of Management and Production Engineering, Poland, p.wittbrodt@po.edu.pl

Abstract

Equipment monitoring and diagnosis systems have become fundamental elements of production management. This paper presents production management in a manufacturing company, with a focus on operational and strategic decisions and their impact on production planning and control. The proposed operational decision-making support system consists of one measurement sensor and two tools for extracting production equipment performance characteristics from the measured signals. Implemented in production, it will provide performance data describing technical objects executing production processes, which could set the foundation for a more elaborate production management tool that would increase the competitiveness of an enterprise in the modern market.

Keywords: Diagnosis System, Production Process, Production Management, Operational and Strategic Decisions

Introduction

Growing consumption of goods spurs the demand for products, which are readily provided in a rich variety by manufacturers. Offering an extensive range of products constitutes a monumental challenge for manufacturing enterprises: it simultaneously determines the object of their economic activity, the functioning of the organisation and above all the production system itself. Given the circumstances, proper arrangement of production that embraces its construction, technological and organisational aspects requires considerable effort, not to mention the amount of difficulty involved in successful control and management of production.

Production activities are executed in an environment characterised by either steady or unsteady conditions. In the former case, working in a constant environment allows for high-probability estimation of future production levels, and, thus, enables to develop scenarios for remedial actions in anticipation of potential production risks. In the latter case, *i.e.* when working conditions are unstable, developing fixed action scenarios is impossible due to the unpredictability rooted in the sheer range of potential disruptions that could potentially occur, *e.g.* equipment and machinery breakdown through overrunning. For the reasons such as soaring demand, currently, it is the latter production environment that prevails in enterprises, however, it could be explained by other factors. One reason to consider is the high-degree customisation that is expected by customers. Manufacturers must keep abreast of changing trends in society, respond to the wishes of clients, their suggestions and comments. Meeting the requirements determines the company's chances for existing on the market.

Mounting requirements and the internal drive to minimise manufacturing costs means that designers and constructors are introducing products of increasingly complex geometry. Intricate geometry features are the source of additional technological difficulties during production. Moreover, their presence necessitates employing piece production, which raises the cost bar even further. The lack of repeatability, which is a characteristic feature of lot production, is blocking the emergence of good practices or organisational patterns of production structure, leading to the accumulation of errors in production control and management. Therefore, companies and scientists alike are actively seeking solutions that would lend support in handling the disruptions.

Although production monitoring and diagnosis systems have shown good effectiveness in tackling the emerging problems, this solution is typically overlooked by manufacturers faced with failure and error prevention problems in unstable production conditions. Their value for production cannot be undermined given that they generate data describing the actual state of production equipment (technical condition diagnostics). Moreover, the data can be fed into specialist control and production management systems (decision-making software, expert systems) to aid enterprises in dealing with uncertainty. Implementing such systems in the flexible production scheme can ensure high-stability and mitigation of uncertainty, *i.e.* typical features of mass production.

Production Management

Production management is a broad concept that encompasses a set of such activities as:

- planning (scheduling jobs and ensuring their effective execution),
- ordering/organising (allocation of production resources),
- management/leadership – motivating personnel and managing the execution of production jobs,
- controlling the production processes (assessment of job performance and implementing corrective actions.

Production management consists in making decisions related to the execution of production processes so that products are manufactured according to the specification, in the required quantity, on schedule and at a minimal cost. In production management, supervision involves overseeing the design process, the quality control as well as organising and controlling employees (Muniz, Batista, Loureiro (2010)).

The primary goal of production management is to assure that the goods are produced in the right quantity and required quality, using suitable equipment and machines and following the optimal production technology, so as to boost the competitiveness of the company on the market, bring maximum profit and guarantee the sustainability of the enterprise. To this end, various tools have been developed to support production management. Traditionally, production management models distinguish two domains: technical and social. The technical domain (the classic model) refers to the organisation of production, processes, activities, layout of equipment and material flow. The prevailing idea of this model is to focus on rationalising production organisation and maximising work efficiency. The social domain (the socio-technical model) concerns work organisation from the perspective of personnel. The central point of focus is the behaviour of employees at work, within the specified organisational structures and tasks. Employee satisfaction with tasks they perform is understood to improve work efficiency, which is why the socio-technical model attains excellence in terms of both technical performance and employee satisfaction.

The development of enterprises has been accompanied by the evolution of production management systems. Numerous solutions have been proposed and deployed to improve the level of functioning and innovation in modern enterprises. The most commonly employed production management methods (taking into account the operational specificity of various types of production) are as follows (Pałucha 2012), Kosieradzka 2012), (Borkowski, Ulewicz 2008):

- Material Requirements Planning (MRP) and related techniques – systems aiding production planning and scheduling. They enable controlling production type, quantity and dates. In contrast to rudimentary inventory control methods, MRP enables determining and predicting inventory levels, tracking and quantitative accounting.
- Just in Time – a method of planning and controlling production that aims to eliminate all waste from the production process by manufacturing the right products in the required quantity and time and by ensuring that they are delivered where and when required.
- Reengineering – fundamental and radical reinventing and redesigning of processes in the enterprise, leading to a dramatic (even ground-breaking) improvement in business performance (*e.g.* costs, quality, service).
- Kanban – the method aims to eliminate excess in production by controlling the stage of job processing and continuous striving for inventory reduction. Kanban identifies the "*7 x nos*" to

be eliminated from manufacturing: no defects, no delays, no stocks, no queues anywhere and for anything, no idle time, no unnecessary technological and control operations, no movements.

- Time-Based Management – a method that identifies time as the key factor of competitiveness. It focuses on reducing processing times (saving time), meeting deadlines (punctuality), reforming existing processes (time flow) or developing new products and processes (innovation). Time is given priority in management processes and prevails in all areas of the enterprise.
- Lean Manufacturing (Lean Production, Lean Management) – the method's assumption is to provide customers with exactly the products they demand and to do it in the easiest way, while showing respect to all employees of the company. The goal is to reduce waste, develop high-quality products, ensure timely delivery and reduce inventory.
- Agile Manufacturing – a concept which assumes that the activities are undertaken to build a competitive advantage through continuous improvement, rapid response, systematic quality improvement, social responsibility and focus on the needs of customers. Agile enterprises immediately respond to opportunities and threats emerging in the environment. An opportunity is an instantaneous circumstance – it is only by seizing the opportunities that a business can achieve the desired results or goals. Agility, on the other hand, is the major characteristic of an enterprise, it is the ability to make effective changes in the scope of operations, processes and business involvement in response to an ever-changing situation, both external and internal to the organisation.

All the solutions listed above share a common feature, a prerequisite of efficient production management – an efficiently working production system. The reliability of production management methods is rooted in the dependable execution of production processes and the work of technical equipment. The lack of knowledge about the operational capabilities of objects is the cause of instability and unpredictability of production; therefore, it is the technical condition of the machinery that plays a key role. As a result, the monitoring and diagnosis systems of technical facilities enhance the capacity of businesses on the way to competitive success.

Monitoring and Diagnosis Systems in Production

Monitoring and diagnosis systems have become an established element in manufacturing. The systems are available in various versions, either as general-purpose solutions or as stand-alone and dedicated systems, specialised for a specific diagnostic problem. In the early days, only approx. 38% of their users were satisfied with these solutions (Ketteler 1999); however, currently, they are rated positively by about 78% of users.

The definition of *monitoring* encompasses all tasks carried out in real time that consist in measuring, reading and recomputing variables of a given process for the sake of comparative analysis and contrasting with the previously specified limits, including alarming, *i.e.* ordering control and automatic signalling tasks. These tasks also include recording data (Pieczyński 2003). *Diagnostics*, on the other hand, is understood as a determination of equipment condition from monitoring and classing it under a relevant typology. A diagnosis provides a holistic cause-and-effect description of *e.g.* production, including determining its current phase and anticipating its further development (Kościelny 2001). This covers all theoretical and practical issues related to the identification and assessment of the past, current and future states of technical objects and their environment (Kościelny 2001). What can be synthesised from the two definitions is that monitoring and diagnosis systems perform real-time measurements of an investigated value along with simultaneous data archiving, analyse the measured value according to the implemented algorithm and correlate the assessment of the past, current and future states of an object with the measured value. Any technical object, machine, device or operation of the production process can be subjected to such an analysis. New areas of application of monitoring and diagnosis systems in production are being included on a regular basis; this is what contributes to their growing popularity. The systems allow us to determine:

- the object status at t (time),
- the object status at t + Δt, including scheduling its next diagnosis,
- the object status at t - Δt, the condition of the object at the time t - Δt, which includes determining the location of damage in an event of failure.

A technical object, *i.e.* any device or machine, generates a signal that contains information about its status. The diagnostic signal measured by means of a sensor is transmitted to the block, where it is subjected to analysis (*e.g.* filtration through a high- and low-pass filter or analogue-digital conversion). The prepared diagnostic signal is transmitted to the computer with the installed diagnostic software. The programme processes the signal according to the specified algorithm in order to extract the features that will allow the operator to correlate the measured signal with the actual condition of the object. By correlating and comparing it with the past statuses the performance characteristics of studied objects (operative/inoperative) may be determined. The proposed solution is a simple monitoring and diagnosis system.

The evolution of basic monitoring and diagnosis systems included the implementation of additional features, such as methods and techniques for extracting equipment performance characteristics of diagnostic signals or new sensors. Among the extensive variety of systems, two basic categories have been identified that systematise the diagnostic signal acquisition techniques: the direct and indirect methods. Direct status determination methods are divided into:

- optical methods,
- touch methods,
- induction methods,
- electrofusion methods,
- radiometric methods – employing radiation measurement and mass loss assessment.

A typical optical signal acquisition system consists of the analysed object, camera, image sensor and computer (Fig. 1).

Fig. 1: A schematic diagram of the measuring system using image analysis

Camera images are discretised to the maximum pixel intensity values. By properly manipulating the pixels from the images it is possible to extract the investigated features describing the condition of the equipment.

The use of direct methods in industrial conditions is burdened with numerous shortcomings, including the insufficient accessibility to the monitored object during the performance of production jobs, let alone their inherent inefficiency, high time consumption and large measurement error. The methods are slow in action and rather inaccurate. At the same time, the condition of the object is described in a binary fashion: operative/inoperative. It is for these reasons that they are used rather infrequently in

flexible production systems. Indirect methods are far more widespread in industry. These methods are based on monitoring process variables using signals, which can then be subjected to processing to determine (predict) the operative condition of the object (*e.g.* degree of wear). In indirect methods, the signal is measured during equipment operation.

Indirect methods register and process secondary phenomena during the operation of the object. They measure the effects that processing jobs by a given object exerts on the machine itself. They employ a simpler technical estimation of the object's state than the direct methods, however, the results are still subject to uncertainty, which may result from inadequately understood or misinterpreted operational phenomena. The indirect methods typically measure the following physical quantities:

- forces and loads (static and/or dynamic),
- acoustic emission (50-400 kHz),
- temperature,
- vibrations (1-10 kHz),
- deformation,
- power consumption of the device or machine tool motors.

Unlike direct ones, indirect methods require a two-step procedure: measuring a specific physical quantity and establishing an appropriate relationship to infer about the state of the object from the measurement. The scheme of the indirect method measuring system is shown in Figure 2 below.

Fig. 2: The schematic of the monitoring and diagnosis system employing the indirect method

What emerged from previous experiments was that the parameters that show a strong correlation with the signal describing the state of a technical object are:

- acoustic emission,
- forces and loads,
- temperature
- the amplitude of the vibroacoustic signal.

Considering indirect methods, monitoring and diagnosis systems tend to base on a constant strategy of determining the measurement threshold, which consists in that the selected features of the measured signal are continuously compared with the pre-determined threshold of equipment degradation. A fixed threshold is defined for a certain set of object's operating conditions. This necessitates developing and storing a complete set of threshold values for various parameters of processes and types of objects. In addition, the threshold value must be pre-determined experimentally so that when the real process commences, properly determined limits effectively prevent further wear of the object.

Monitoring and diagnosing the condition of an object using indirect methods can be considered in two ways: theoretically and empirically. Theoretical techniques are based on analytical modelling of the main factors affecting the process conditions. On the other hand, theoretical models contain a series of simplifications that prevent their effective introduction in an industrial environment as self-teaching systems for the control of machine operating conditions. In order to employ empirical models in the design of control systems, it is necessary to precede it with a series of experiments to determine the permissible levels of safe operation of an object. This constitutes a serious disadvantage of empirical models as they require extensive experimental testing in industrial conditions, which leads to increasing

production costs and extending the reaction time. An ideal monitoring and diagnosis system would be one that combines the features of a theoretical and empirical model.

In recent years, the scientific researches on the development of multi-sensor monitoring and diagnosis strategies have been conducted with increased intensity. A multi-sensor system involves two or more monitoring and diagnosis systems simultaneously. The principle of operation is similar to that of single-sensor systems, except for the fact that multi-sensor systems employ a set of sensors to monitor and diagnose the same phenomenon and the same technical object. The combination of different systems enables determining the condition of equipment and various degrees of its degradation intensity with higher accuracy and precision. In industrial practice, solutions for estimating performance characteristics typically combine the measurement of forces and acoustic emission, forces and vibrations or forces and power consumption of the engine of an analysed object obiektu (np. (Chung, Geddam, 2003), (Cho, Asfour, Onar, Kaundinya 2005), (Liya, Xuemei, Jing, Chuanjiang 2020)).

Recent developments in the field of monitoring and diagnosing technical objects have been marked by the emergence of intelligent methods (expert systems, fuzzy logic, neural networks) (Snatkin, Karjust, Eiskop, Tungel 2018). Intelligent systems employ identical signal acquisition algorithms as the traditional methods, however, these are the novel signal analysis techniques that mark their superiority.

At present, multi-sensor systems are believed to be the most effective measures for controlling the condition of technical objects. However, in purely economic terms, this is a cost-intensive solution whose degree of complexity increases its susceptibility to failure. Therefore, cheaper solutions with comparable effectiveness are still being sought. From the currently conducted scientific considerations, it can be seen that AI-supported single-sensor systems based on two (or more) methods for the real-time estimation of object state characteristics exhibit a comparable capacity at a fraction of a cost and risk. The combination of actions is effective and eliminates the disadvantage of the threshold method, *i.e.* the difficulties in determining the threshold value itself from a series of tests. In addition, the threshold value is assumed as a constant value, regardless of variable operating parameters of monitored objects. The threshold value should be constantly updated in accordance with the real-time working conditions so as to increase the methods' applicability in the monitoring of technical objects.

Monitoring and Diagnosis Systems in Production Management

The role of monitoring and diagnosis systems in production is difficult to evaluate. On the one hand, the systems can determine the technical condition of objects at work, on the other, they increase the costs of manufacturing operations. In addition to elevating the cost-intensity of production (which becomes profitable in the longer time horizon, once the implemented monitoring and diagnosis systems increase the working efficiency of the technical objects), they significantly affect the planning system, production control and decisions.

Data obtained from monitoring and diagnosis systems can aid the process at two levels of decision-making distinguished in manufacturing, strategic and operational. The sphere of strategic decisions embraces the long-term preparation of the production system. At the goal-setting stage, when the production strategy is established, the data on currently used technical objects are capable of affecting investments in additional technical objects, as well as shaping the solutions pertaining to the organisational structure of the production system. The company's activities in the long-term horizon that are based on such operational data allow the management to focus on achieving market efficiency and ensuring the company's competitiveness.

The monitoring and diagnosis system has a far stronger impact on operational decisions than strategic ones. At the production structure level, operational decisions in production management are executive by nature. Implemented *in vivo*, they are focused on achieving operational efficiency of the enterprise. The decisions are made immediately when the problem occurs and, supported by data from operating systems, they should exhibit high accuracy and precision as well as streamline and shape production schedules. The character of decisions may contribute to more efficient use of production resources. The aim of operational decisions is to counteract the events accompanying production activities *(e.g.*

prevent failure). In addition, failure prediction is a step towards determining optimal levels of operation of company departments, including maintenance. It is for these reasons and purposes that the implementation of monitoring and diagnosis systems, and in the future predictive systems, is highly desirable for the economic success of enterprises.

There are two distinct phases in the execution of operational activities that facilitate manufacturing: planning and control. During the planning stage, production planning functions are performed, whereas in the control phase – the functions of ordering, management and control. These elements concern the effective management of material resources (supplying the production with materials) as well as technical resources (production capacity) of an enterprise. Their implementation is primarily aimed to answer the demands of effectiveness (meeting consumer needs), efficiency (minimising production costs) and the feasibility of production (balancing the production capacity and the size of production orders).

From the considerations presented in this section, it emerges that production management in an enterprise is a critical part of its operation that is present on the decision-making, production planning and control levels. In addition, it is closely integrated into monitoring and diagnosis systems. However, in order for such a system to attain market-effectiveness levels, it must be prepared to provide effective and continuous operation and support the resource flow management in production.

The proposed decision-making support system for operational decisions in production

The decision-making support system for aiding operational decisions in production, which is presented in this section, has been developed as a tool for the determination of the condition of technical objects in operation. The operating status of objects is considered on two levels: the standard level of operation (natural wear) and failure level (critical wear). The design of the developed decision-making system is shown in Fig. 2, and the operational signals were measured using the indirect vibroacoustic signal measurement method; as a result, a series of waveforms (amplitude *versus* time) were obtained (Fig. 3).

Fig. 3: Examples of recorded waveforms: a) the functional object, b) object in the state of critical wear

Subsequently, the recorded waveforms were used for machine wear assessment, which was performed by means of the Fast Fourier Transform for preliminary sensitivity analysis. The analysis confirmed

that during normal machine operation, the amplitude changes slightly (Fig. 3a), as the critical wear approaches, substantial changes can be observed (Fig. 3b).

The signal spectra obtained from the FFT analysis were subjected to a comparative analysis using the Euclidean distance formula between two vectors.

$$odl(x, y) = [\sum_i (x_i - y_i)^2]^{1/2}$$

where: *odl* – Euclidean distance, x – standard spectrum vector, y – current signal spectrum vector.

The analysis algorithm was then repeated and subsequent Euclidean distances were recorded and saved. The decision regarding whether a given machine was permitted to continue production was based on the dynamics of changes in the *odl* parameter.

The effectiveness of the algorithm was increased by means of wavelet transform – the Daubechies, Coiflet and Symlet wavelet families that were chosen. The signal was decomposed to represent particular forms of machine wear in order to boost the accuracy of interpreted results, and thus the correctness of decisions. From the results of signal decomposition levels, it emerged that above level three, wavelet decomposition did not bring the expected results. Examples of signals analysed using the wavelet transform are presented in Fig. 4.

Fig. 4: Examples of wavelet transforms: a) an operative object, b) an inoperative object with failure

By employing the wavelet transform it was possible to determine the time intervals in which the signal energy is the highest. The determined time intervals enable complete documentation of equipment degradation and failure.

The next element of the machine failure prediction algorithm is the AI component, which serves to further improve the capabilities of the system. The three-layer MLP (Multilayer Perceptron Network) artificial neural network with 20 neurons in one hidden layer was trained with the backpropagation algorithm, from the family of linear activation functions. The function was shown to provide the best learning results that correctly predicted the actual wear rates from the modelled relationships. The network was verified with the test data set and taught until a 5% relative error level was attained. The ANN was tested on sets that were not involved in the learning process. The modelled data showed a good fit with the real data. A fragment of the neural network algorithm code is shown in Fig. 5.

Cultural Conditions for The Allocation of German Capital in The Form of FDI In Poland

Maria BERNAT

Opole University of Technology, Opole, Proszkowska Street 76, Poland
m. bernat@po.edu.pl
ORCID ID: https://orcid.org/0000-0003-4520-662X

Abstract

The article presents cultural attributes typical of German culture, which contribute to the success of German economy and the well-being of German society. Cultural features which determine the specific economic behavior and the nature of the internationalization of German investors include collectivism enhanced by a high level of social trust, the tradition of cooperation between enterprises and the state, increased propensity to avoid risk (resulting in the concentration of economic activity in medium-tech branches) and long-term orientation. An important element of this economy, which became a peculiar artefact of German culture, are family businesses. Many of them have successfully transformed into international corporations. Nowadays, this phenomenon is reflected in the managing strategy of these entities and in the positive perception of products labelled as *made in Germany* (country of origin effect) on international markets. The article shows that the cultural complementarity of Germany – the country of origin of capital and Poland – the host country is beneficial both for the investor and the host country.

Keywords: foreign direct investment (FDI), cultural dimensions, host economy.

Introduction

Being one of the world's greatest economical powers, Germany plays the leading role in internationalization. Due to the specific set of features German economy has become highly competitive and German society – wealthy. Internationalization has been one of the essential elements of German economic development, however, it was seriously inhibited during the First and Second World War. The following paper aims to present German internationalization as a process deeply rooted in culture. Investment expansion during system transformation in Poland has clearly demonstrated cultural inclinations towards this process such as the complementarity of cultural dimensions. This complementarity ultimately generates the synergy effect for both investors and economies participating in the capital flow.

Capital transfer in the form of foreign direct investment, owing to the complexity of this form of allocation, entails the necessity of business culture implementation, or at least adaptation of its elements in the host country environment. When the form of taking over the ownership is an acquisition or a merger with a foreign economic entity, there is an immediate confrontation of two different cultures on the level of national values, business culture but also on the level of organization. Also the greenfield investment is not a lonely enclave within the environment of a foreign country, because it employs local personnel, builds relations with local suppliers and business co-operators, who are affected by their culture. The process of culture confrontation takes place, despite its deferment in time. It is expedient to determinate the level of complementarity and difference of national and business cultures, which clash as a consequence of FDI. German investors, who are under discussion in the paper, represent a set of features allowing to determine the specificity of business culture of their country. The culture enjoys the reputation in the world, because of great efficiency of German companies, their competitive position on the international market. German organization and timeliness has won universal recognition. Germany's lasting role at the forefront of global FDI capital flows (3rd place worldwide in 2017, after the United States and Hong Kong in

terms of FDI stock WIR 2018) indicates internationalization in the form of FDI as a component of the success of the German economy. The example of investment expansion in Poland discussed in the article allows to answer the question: to what extent cultural factors favor this process and how they inhibit it.

Research Aim

The aim of this paper is to examine the role of cultural factors in the allocation of foreign capital in the form of FDI exemplified by German investments in Poland. Due to the form of capital allocation, FDI indicate not only the transfer of anonymous financial capital but also the whole set of values related to knowledge, technology, organizational culture, and even the values' system and standards typical of the investor's home country. The author investigates to what extent culture impacts internationalization theories and international enterprise management. The case study illustrates the role of German capital invested in Poland during the 30 years that followed Poland's political transformation. It also provides useful insights on the importance of cultural factors in the internationalization process, the role of the country's culture, the origin of capital and the host country, and potential synergies between them as a source of benefits for investors and the hosting economy. The long-lasting process of developing relationships, spatial closeness in the context of cultural conditions is seen as a premise for enhancing investment but also as a risk of a hasty assessment of investment conditions.

Literature Review

The character of modern competition necessitate active presence of a company in foreign markets, and in the process it requires it to function in the environment which is culturally and socially multinational. This phenomenon is a challenge for companies' management and a subject of scientific study for the researchers. In management theory, the cultural aspects in the decision-making processes were consider relatively late, in the 1980s.

It was the age of success for Japanese companies – culturally exotic in the western world, yet capable of successful competing with American or European corporations. Searching for the source of competitiveness of corporations from the land of the rising sun, as well as the attempts of copying their business solutions contributed to 'discovering' culture as a factor of competitiveness of a company and an economy. The success of the tigers of the Far East in the first and the second generation, and China's entering the arena of economic competition confirmed even more the importance of the factor.

In the last decades of the 20th century, there was a considerable increase in foreign investment activity of international corporations, including international mergers and acquisitions, which resulted in greater demand for the knowledge within the scope of management in a culturally diverse environment. Intercultural management, treated for many years as 'a business undercurrent', has become an integral element of the company's strategic management (Mintzberg, Ahlstrand, and Lampel, 2005). In the economics literature, Perlitz distinguishes two approaches connected with the role of national cultures in management:

- Culture free thesis, endorsing the thesis on universal methods of management, mainly represented by the researchers strongly marked by their own culture, and having little international experience.
- Culture bound thesis, indicating that different cultural conditions of countries, require diverse, adjusted to the environment, styles of management, represented by people who experienced cultural differences on their own (Perlitz, 1995).

The first approach is based on the assumption of advanced cultural convergence on the world's scale, corresponding to Bauman's futuristic thesis, that we are "perfect tourists, vagabond beyond remedy" with no roots, with loyalties subordinated to the interest of large corporations (Durska, 2003). In the era of globalization, the second approach is becoming more and more popular. Paradoxically, it is

globalization that forces us to take into consideration a broader spectrum of cultural differentials, where economic processes take place. As Doremus et al. (1999) prove in *The Myth of the Global Corporations,* "globalization increases the role of national differences in management, and not their erosion". The research of Hofstede et al. (2011) support the fundamental importance of cultural differences of individual countries and their influence the course of economic processes.

At the same time they challenge the theory on universal methods of management, effective under any conditions, independent of its location. The popularization of American business culture in the 1960s and 1970s, connected with American economic expansion in Western Europe, has strengthen the conviction about high effectiveness of American managerial solutions, as well as professional qualifications of managers on the basis of MBA studies, disregarding the cultural environment, in which the decision-making processes take place. An international activity of organizations which have their headquarters located in the USA: International Monetary Fund, World Bank – which imposed the American standards of business culture, as well as an opinion-forming power of American research centres in the field of economics (Durska, 2003) turned out to be great means of persuasion of universal effectiveness of American solutions. Furthermore, the phenomenon was fostered by the worldwide popularity of English language, and popularization of Anglo-Saxon institutional solutions in the countries which used to be the colonies of the British Empire.

The process of far-reaching convergence of economic behaviours of international companies, connected with creating 'a cross border civilization' and currently popularized by the media, applies to a narrow array of social behaviours, mainly consumer-oriented. Cultural autonomy, characteristic of individual countries, are one of the most lasting phenomena of human civilization. The notion of culture itself, imposing the imperative of differences, is explicitly defined by the researchers. Hofstede et al.(2011) define culture as the collective programming of the mind which has elements such as symbols, characters, rituals, and other immanent values of a given community. According to Cozier, culture is the way in which a group of people solves problems and resolves dilemmas (Crozier, 2009). The central issue concerning mankind, which forces men to make economic decisions, is a problem of rarity, and the way of solving it (specific for a given nation) is implicated in the cultural specificity. Basing one's knowledge of culture of a potential host country, and motivations of economic behaviours of its inhabitants, on the features perceived on the surface, without referring to those basic values, is comparable to estimating the size of an iceberg (Schein, 1984) on the basis of its tip jutting out of the water. In practice, the investment projects, whose managers ignore cultural factors, or treat them superficially from the angle of the tip of an iceberg, are in risk of economic catastrophe on the scale of the Titanic.

Some researchers of the phenomenon such as Hofstede, Hall, Gesteland, Hampden-Turner and Trompenaars attempt to characterize the cultural differences characteristic for individual nations on the basis of an array of features, treated as dimensions of cultures. A detailed cultural analysis of a potential country of internationalization, paying special attention to specific cultural characteristics, allows to optimize the selection of managerial tools and marketing strategies, hence creating favourable conditions for reducing the risk connected with capital allocation. Comparing the intensity of particular features allows to create a specific map of cultural similarities and differences, which is essential in terms of directions of internationalization activity. As its realistic exemplification, we can accept a map of similarities created as early as 1966, by Haire and Ghiselli enclosing not geographical, but motivation and attitude coordinates collected on the basis of psychological similarities and cultural differences (Chryssides and Kaler, 1999). This, indicated by the researchers, "third" dimension for the area of international capital allocation – cultural distance has not yet been reduced by the technological progress.

Bilateral flows between countries can be a certain confirmation of the thesis on the importance of culture factors in the internationalization of companies in the form of FDI. Very high concentration of capital transfers can be observed within the countries of the same language community, especially English-speaking countries. Language is a substantial component of culture, and its idioms and semantic allusions are in fact understandable only for representatives of a given nation. Language

often can be a more uniting factor than nationality, e.g. Flemish-speaking Belgians are more in agreement with the Dutch than with their French-speaking countrymen (Sznajder, 1999).

In the countries of the same language community, speech is not only important as a medium of communication, but also as a facilitator mirroring the similarities of values originated from the native tongue. It encourages mutual understanding between economic partners, which at the same time reduces the communication risk of an investor functioning in a foreign environment. For example, a high inflow of American capital to Ireland from the 1970s was the result of the same language community and social similarities to the inhabitants of the Emerald Isle. It is Ireland, and not Portugal or Spain, which has become a production stronghold of American IT concerns on the European market. Intensive historical Irish emigration to the USA resulting from the Potato Famine, also had a significant impact. Irish representatives in the management circle of American corporations, had an advantage of knowledge on their country of origin and its culture, which influenced the direction of investment expansion of these economic entities. The factor of personal connections emphasized by Y. Aharoni in the concept of FDI motivation finds its confirmation (Aharoni, 1996). A broader approach to global capital flows shows that more than a half of the global FDI stream circulates between European countries and the USA. Americans, apart from the Native Americans, to a great extent are emigrants from the old world , who are connected with Europe by cultural roots, on the basis of the Christian religion. This aspect reduces the gap and sense of cultural differences. A relatively low level of FDI absorption is still concentrated in countries located in other continents (except for South-East Asia), and especially African ones, which are characterized by distinct cultural differences in comparison to the countries – main capital exporters.

In the case of internationalization, where there is a clash of cultures which are fundamentally different in the values they hold, as in the case of the Islamic and Western world, which is defined by Barber as "Jichad vs. Mcworld", there are often conflicts (Baber, 1996). As remarked by Rymaryczyk, the consequences of dominance of the American way of thinking, as an effect of the activity of American corporations, are: xenophobia, aggression of local communities, as well as terrorism (Rymarczyk, 2007).

The inter-cultural preferences in management, as well as consumption processes, are often entirely superficial and reminds the "rain-dance" of the locals employed in the branches of foreign corporations, who on the outside adjust themselves to incomprehensible rules and rituals imposed on them by the investors, rooted in a different cultural environment (Trompenaars and Hampden-Turner, 2002). The result of such superficial cultural preferences is virtually no organization efficiency, and failure in reaching intended goals. When analysing the possibility of implementation of managerial solutions derived from one cultural region, to another one, Hofstede states that a workplace can marginally influence the change in an employee's system of values, and the system has an impact on the employee's susceptibility to motivation stimuli (Hofstede, 1994). Mintzberg points to the fact that a strategy of a company tried and true in specific cultural circumstances, in other cultural regions often proves ineffective due to different responses of the environment. The strategy can result in extremely strong resistance against strategic changes in the organization (Mintzberg, Ahlstrand and Lampel). Hofstede provides a vast array of unsuccessful mergers and takeovers (Leyland-Innocenti, Imperial Typewritere, Vereinigte Flugzeugwerke-Fokker, Citroen-Fiat), which ended in ignominious failures owing to, among other things, neglecting the specificity of cultural factors, and concentrating on strictly financial aspects during the decision-making stage (Hofstede, 2000). As an adequate example, one can mention a 1998 merger of German Daimler-Benz AG and American Chrysler, which became a spectacular flop after 10 years, and the reason for it is largely attributed to mismatching the cultures of the organizations, and the lack of strategies of their convergence. They can be described metaphorically as "as different as chalk and cheese."

German formalism on decision-making, importance of titles, dominant attitudes towards the employees of an acquired company, and the motivation system of German managers based to a lesser degree on quick individual achievements, collided with a relaxed, joint work way of problem solving, the emphasis on quick individual success, characteristic for American business culture. Instead of a

successful synergy, the merger resulted in shareholders' disappointment (Welge and Holtbrügge 1998).

In opposition to the attitude of neglect of cultural conditioning presented by the companies mentioned above, there is a strategy of one of the largest international corporations – General Electric, which attaches great significance to cultural differences characteristic for the host countries of direct investments. In many cases, the have a dominant influence on the final decision on a foreign merger or takeover. The process of acquisitions is preceded by preparation of transcultural analyses for the operation. If the differences harmed or prevented full integration of the acquired company, GE would abort the transaction, regardless financial aspects (Aniszewska, 2000). In the 1980s Lorach called for performing a cultural audit in the companies (Lorach, 1986). It allows the assessment of the risk resulting from cultural differences of the human factor, and at the same time the possibility of adaptation of the strategy derived from the country of origin of the corporation. Even if the financial effects are predicted to be advantageous, a negative cultural audit should induce to abort the operation. Cultural differences, usually treated as a barrier and an important risk factor of internationalization, can also become powerful non-material assets of the organization (Aniszewska, 2000). According to Hofstede "the cultural factors play more and more important role in gaining an economic advantage, whereas competing in technology and prices brings short-term effects." (Hofstede, 2000). Barney perceives culture as a source of the long-term economic advantage. At the same time, he defines the cultural specificity as an incredibly effective (even more than legal sanctions), long-term barrier for copying and imitating advantageous features of a company by the competition, originating from other cultural regions (Barney, 1991). One should consider that taking advantage of a company's achievements, not only technological ones, but also organizational, as in accordance to the theories of Hymer and Dunning (Dunning, 1988) is the source of the decision on realizing foreign direct investments (FDI) (Döhrn and Heiduk, 1999). Cultural differences support preserving the monopoly of knowledge and not making it accessible to the surrounding, which ensures foreign investors' advantage over local competitors of a host country. Many failed attempts at copying Japanese methods of management by American and West European companies in the 1980s support the thesis. Internationalization of companies has always been an activity undertaken on the verge of at least two cultures, which usually signifies the clash of social norms, values, and ways of thinking deeply rooted in the many century old tradition and history of the nations. The most advanced stage of internationalization of a company connected with making direct foreign investments, and in this way creating a foreign daughter company in the environment of an alien country, becomes one of the greatest challenges for the managers as it forces the managerial personnel to do their job in an alien environment in an institutional sense, but also in a sociocultural one. Apart form an anonymous financial capital transfer, the holistic character of FDI results almost always in professional people migration (mainly of managerial personnel, and specialist in the field of technology) with their specific knowledge, their business habits, and their interpretation of a business situation shaped by the culture of countries of origin. They are transferred to the environment of a host country, where they are accepted or rejected. Cultural dissimilarity of the environment, and, above all, the ignorance of its key features is a major risk factor in the internationalization of investment activity. It is also a source of cultural shock for managers transferred to work in foreign branch companies. Cultural differences can hold back the implementation of efficient business solutions of mother companies. One can take as an example the implementation of an American management instrument *Management by Objectives – MBO*, which requires co-operation and establishing mutual goals between a supervisor and a subordinate, and not general hierarchical subordination. This assumption eliminates the possibility of using the instrument in high power distance countries e.g. France (Perlitz, 1995). Awarding individual bonuses, in the form of a monetary reward, to above-average employees may turn out to be similarly ineffective. This instrument will not be a sufficient motivating factor in collectivist cultures such as Japan or Italy (Trompenaars and Hampden-Turner, 2002). Also organizational structure for international companies, as in the case of matrix structure, based on dual-reporting relationship, thus it clashes with so called "family business model" permanently rooted in the culture of Mediterranean countries (Trompenaars and Hampden-Turner, 2002). The similarities of cultures spatially close, especially better understanding of one another, result in the increased capital inflow in close geographical proximity. Beckermann defines this phenomenon as "the small psychological distance" connected

not only with the geographical union, but also the union of culture and language between investor's mother country and its host country (Kraszewski, 2004). The process of cultural interpenetration occurring in the countries in direct geographical vicinity, which is a result of migration and individual private contacts among other things, increases the tendency of internationalization of companies within the countries' economies. The impact of the cultural factor in the theories explaining the motives for FDI is not entirely ignored, however, it is not of the utmost importance. The cultural element of a host country is placed in the localization theory next to the market, cost and political factors. It is taken into consideration in the internationalization decisions, when a company considers the cost-effective alternative for selling of know-how assets or their transfer to the branches of foreign companies (Oziewicz, 1998). Also in Hymer's monopoly concept, in the calculation of gains resulted from discounting the monopoly of technological and organizational advantage in the environment of a foreign country, among other things one needs to take into consideration the costs ensuing from considering cultural differences. On the other hand, Y.Aharoni, referring to managers' particular motivations in the assessment of the foreign investment, pays special attention to the element of knowledge of foreign cultures possessed by managers (as a result of studies in foreign countries, being brought up in a heterogeneous family, individual private contacts, etc.) as a favourable factor in the decision on embarking on foreign investment expansion (Y. Aharoni , 1996). In this aspect, the complex economies, which consider a broad spectrum of human motivation, and are not limited to an artificial creation such as "homo economicus", can finally emphasize the importance of cultural elements in economic decisions, including internationalization. Naturally, it is not the issue of cultural determinism – yet another monocausal theory on FDI motivation – but of acknowledging the importance of the factor, which combined with other groups of identified determinants gives finally a proper perspective for the analysis and assessment of FDI phenomenon.

In the analysis of cultural differences in the process of internationalization, the stress is usually put on the cultural specificity of a potential host country. However, it turns out that the tendency of managers towards internationalization, connected with working in a foreign branch, is diversified, depending on the country of origin, and national culture, in which the managers are rooted. The results of the research by Hampden-Turner and Trompenaars suggest a strong tendency on the part of Swedish, Dutch, Swiss, and American managers towards internationalization. Whereas, the analysis points to French, Italian, and Spanish managers as the ones who display a relatively slight tendency towards mentioned economic activities (Trompenaars and Hampden-Turner, 1998). Clarification of the phenomenon partially relates to the specificity of development of a given nations and experiencing cultural diversity. According to Hofstede, the tendency towards internationalization, creating international enterprises, is expressed mainly by economic entities originating from the cultures that have low power distance, which is results in the facility of delegating the decision-making powers to foreign branches. The author states that the enterprises originating from the high power distance countries (measured by the power distance index), carrying out mergers and takeovers in the low power distance countries, usually experience serious problems. The managers of those companies do not accept the possibility of decentralization of power, and they are unwilling to agree to cultural opportunism. This asymmetry of power distance in the countries where there is capital flow, turns out to be a barrier for efficient functioning of direct investment enterprises, and eliminates a natural source of development inherent in the potential of a host country. According to Hofstede, success is achieved usually by organizations which come from the cultures that have low power distance and they decide on economic activity in the cultures with high power distance (Hofstede, 2000). The results of the research on managers' willingness to work abroad, published by Finance Magazine in 2007, showed practically identical gradation of managers' countries of origin to the case of the research by Ch. Hampden-Turner and F. Trompenaars on managers willing to work in foreign branches (Hampden-Turner and Trompenaars, 1998). The nations, where managers express more willingness to internationalization, are characterized by a relatively low value of the power distance index assigned by G. Hofstede. Power distance is not the only cultural variable influencing the managers' willingness to being economically active abroad. Listing a broader catalogue of cultural features (table 18) for individual groups of countries of a different level of willingness to internationalization measured by the FDI index per 1 inhabitant, allows to create a certain map of features, which just like DNA distinguishes individual groups of countries depending on the intensity

of foreign investment expansion. Naturally, the cultural factor, however important, should not be treated in an autonomous way in the face of economic variables, since the internationalization behaviour is influenced by the size of the home market, the level of external capital accumulation, as well as a wide array of motivation, presented in the first chapter of this paper. The importance of cultural factors is complementary to the other factors, and the character of the correlations is often in the form of feedback. It regards among other things, the tendency to save, and at the same time the capital accumulation, which in its own is strongly culturally conditioned. According to M.Weber cultures rooted in Protestantism are more willing to save. This feature is also known among representatives of Asian cultures rooted in Confucianism (Weber, 2007). A comparison of the cultural features and the internationalization activity suggests that a greater tendency is exhibited by the nations which:

- have relatively low power distance
- are individualistic
- have a universal approach to rules
- are fragmentary
- internally controlled

Accumulated cultural heritage has become a favourable or hindering factor to a company's competitiveness in the conditions of global market competition. Basic values shaped over the centuries, influence the willingness to migration and internationalization behaviours, as well as taking the risk of capital allocation outside the mother country, and often connected with the phenomenon – people migration. In M. Porter's diamond model, what is decisive to the competitive advantage of nations is a constellation of six groups of factors, which is supplemented by Dunning with the transnational economic activity (Porter, 1991). The internationalization tendency, treated by Dunning as a competitive factor, has its cultural reference. As previous discussions on the subject suggest, a greater tendency to foreign investment expansion is exhibited by economic entities originating from the cultures with specific features. This leads to the conclusion that open cultures, with low power distance, high risk-taking tendency, universalist, future-oriented, potentially increase their competitive advantage of their economies in the times of globalization. Javidan emphasized the aspect of cultural influence on competitiveness on macro, as well as microeconomic level. Owing to his empirical research, he confirmed the hypothesis that the future-oriented cultures, inspiring to rewarding and giving bonuses adjourned in time favours the competitiveness of their economies. Among the most future-oriented ones he placed Singapore, Switzerland, Netherlands, and in the other extremum are: Russia, Argentina, Poland, and Hungary. On the microeconomic level, Javidan points out to management problems in the muliticultural environment, when managers coming from the future-oriented cultures have difficulties in applying their managerial tools in the present-oriented cultures, with the short planning horizon (Javidan 2007).

Ignoring the differences exposes the employees directly involved in the process of internationalization, mainly expats, to a deep culture shock. The phenomenon is defined as a human's emotional state, which is a result of a contact with a foreign culture, which decreases the efficiency of managers and employees' economic activity, in some cases completely paralysing their work. Thus, it is a real cost of internationalization.

The internationalization of companies achieved through foreign direct investments is a process, which entails strong cultural interactions. Even though the process of globalization has caused certain standardization of management methods and behaviours, it has not had a substantial effect on the cultural convergence of the nations. Ongoing mental differences, dissimilarities in systems of values and in interpretations of a given situation, strongly influence the outcome of economic decisions in given countries. Modern international corporations, despite numerous similarities, and specific standardization of structures and behaviours, resulting from operating on a highly competitive international market, still bear specific features allowing to determine their national identity. These attributes are transferred together with the investment capital to host countries. Cultural dissimilarity of economic surrounding, where the activity of branches of international companies is done, may become an effective barrier for implementation of the organizational methods well-tried in the

country of origin, and the strategies adopted by the company. The cultural factor, which is difficult to submit to direct quantification, and has often been underestimated in the decisions on international mergers and acquisitions, in extreme cases can lead to substantial financial losses for the companies performing internationalization. Identifying the technological and organizational advancement of a company as equal to the cultural advancement is a trap of relativism, constituting a grave mistake on the part of managers. The ability to use cultural differences in management and to adjust them to the needs of employees and clients from different cultural regions, is an important competitive factor for the company in the era of globalization. In order to use the differences in management effectively, it is essential to recognize them properly, to determine the extent of cultural complementarity and the possibility of using it in the process of building the competitive position of a company. Nowadays, the need for complex recognition of cultural specificity and its implications for the management processes effects not only large international corporations, but also small and medium companies, which more and more confidently take part in the internationalization process, via direct foreign investments. Globalization is a powerful process of permanent internationalization, that is why economic activities on the verge of cultures, which essence one cannot change, should be flexibly adjusted according to the economic method in line within the process.

Results of the Study

Since introducing social and economic reforms in Poland in 1989, Germany has been consistently investing in the Polish economy. From 1989 to 2017, Germany invested EUR 35.1 billion in FDI. (data reported by National Bank of Poland) In 2017, 22.2% of foreign companies in Poland represented non-German investors and 17.7% of foreign capital originated from Germany.

The increased economic activity of German companies in Polish economy during transformation has been a natural continuation of economic relationship established between these two countries as far back as the beginning of the 18th century and the Kingdom of Poland when Franciszek Ksawery Drucki-Lubecki wishing to economically activate Polish lands, encouraged German craftsmen to settle on these Polish territories. In the interwar period, 26% of foreign investment in Poland came from Germany (Morawski, 2008).

In case of countries situated in such geographical proximity as Poland and Germany there is the temptation to ignore cultural differences in the analyses of conditions for international capital allocation. Ph. Very attracts the managers' attention and warns them against this problem. Ignoring cultural differences in case of close cultures is known as the "hasty assessment trap" which, later on, leads to serious unexpected problems. The practice shows that the due diligence analyses conducted before making investment usually omits cultural aspects (Aniszewska, 2004).

In the context of reasons for business culture adaptation in the country hosting the capital, Hofstede emphasizes the role of authority distance factor. Capital flow from countries characterized by low authority distance to countries with large distance creates certain predispositions to the success of investment enterprise based on cultural adaptation (Hofstede, 2000). By applying the author's observations to the organizational culture differences between Poland and Germany it is possible to answer the question to what extent they form predispositions to capital cooperation. According to his classification, German organizational culture is characterized by relatively low authority distance index, while Polish researchers (Pietrewicz, 2001; Bildhauer, 2005).

This culture is thus characterized by large authority distance, which results from the centralization of the decision-making process immanent for the imposing economy of the previous political system. As noted by Bildhauer, changes take place also in this area. As far as the managerial culture in Poland under the previous social and economic system built its authority on the seniority, loyalty or connection principles, nowadays is undergoes revaluation in favour of functionality, effectiveness and efficiency, which brings it closer to the standards present in international business. Therefore, in case of investment flow from our western neighbour, the flow from the country with relatively low authority distance to the country with higher distance takes place, which, according to the findings of Hofstede's research, is the foundation of good assimilation of managerial solutions from this country.

Considering the process of capital inflow to Poland in terms of the whole range of countries of its origin, one should pay attention to the fact that more than 50% of the capital comes from the countries characterized by low authority distance (PDI index value below 50) so one may speak of the positive social and cultural foundations for this process (Tab.1).

Table 1: Selected authority distance indices (*Power Distance Index*) for individual countries (the highest values correspond to the largest distance)

Country	Power Distance Index (PDI)	Country's participation in FDI in Poland in 2017 (%)
France	68	13.6
Belgium	65	2.8
Spain	57	2.7
Japan	54	0.8
Italy	50	2.6
USA	40	2.8
Netherlands	38	20.1
Germany	35	17.7
United Kingdom	35	4.1
Switzerland	34	2.0
Finland	33	1.0
Norway	31	0.6
Sweden	31	2.0
Ireland	28	0.1
Austria	11	2.4

When it comes to other cultural characteristics defined in a measurable manner by Hofstede (Fig.1), the greatest difference between the Poles and the Germans refers to the degree of uncertainty avoidance. The Poles are characterized by considerably greater willingness to take risks and improvise.

Figure 1: Culture dimensions for Poles and Germans (Hofstede, Minkow2011)

The most characteristic feature of the German organizational culture is its collectivism expressed by emphasis on cooperation and tendency to make decisions collectively. It is exemplified by the participation of employees in enterprise management which is permanently sanctioned by the German co-decision law of *Mitbestimmung*. The collective model seems to be closer to society under transformation like the Polish society than the one based on Anglo-Saxon individualism. According to Hampden-Turner and Trompenaars "German type of capitalism is closer to the former communist world not only in a geographical but also in psychological and ideological sense." In Germany, unlike Great Britain or the United States, many decisions are still being made at the meso-economic level, where employees work alongside with financial industrial and government representatives. (Hampden-Turner and Trompenaars, 1998). Some elements of economic behaviour developed within the social market (*Soziale Marktwirtschaft*) seem to be more acceptable in post-socialist societies. Similarly to countries of Central and Eastern Europe, the eastern federal states of Germany underwent a systemic transformation. Thus, Germany was the only country among the highly developed countries that absorbed the economic and social organism burdened with the legacy of the centrally controlled economy. In this sense, business entities have gained experience of functioning in the realities of a transforming economy. Therefore, they are easier to navigate in the Central European area. Naturally, the presence of German corporations' subsidiaries does not mean that they automatically transfer the multi-plane system of decision consultations between the enterprise's management and crew developed there to the Polish reality. The observation of the operations of companies with German capital, as well as other foreign companies, in our country points to the phenomenon of avoidance of trade unions in direct investment enterprises. Such employees' organizations are present by the principle of continuity in enterprises whose shares have been purchased in the process of privatization, while one may note their non-existence in entities established as *greenfield investment*. In this sense the process of internationalization of German enterprises may be treated as an escape from the over-developed form of employees' participation in their home country which dangerously restrains the competitiveness of German enterprises on the international market. However, certain model of the management-crew conflict solutions, forms of dialogue and consultations developed in Germany's organizational culture seem to fall on a fertile turf in the Polish reality. It is confirmed by low frequency of conflicts between the crews and employers originating from this country which are related in the media. It is also attested by the

research findings of Listwan's team concerning foreign capital companies operating in the Lower Silesia region. They generally point to good relations between foreign management boards of these enterprises with the representatives of the crews of such entities, particularly the German ones, which confirms the thesis of successful adaptation of their organizational culture in the Polish reality (Kawka, 2007). In case of German enterprises one deals with the transfer of certain tested behaviour patterns like the gradual introduction of an employee to their post and not "throwing in at the deep end" which is practiced in American enterprises. The employees' recruitment process in German capital enterprises is also primarily based on internal resources of the enterprise, as they rarely utilize the mediation of external companies (Przytuła, 2007), which is typical of the collective cultures. When it comes to the German tendency to collective activity, a typical phenomenon is the cooperation of enterprises with national and regional authorities in this country. German entrepreneurs are used to receive assistance of various kinds in return for the execution of certain liabilities towards the authorities. In this relation both parties are beneficiaries. In case of investments in Poland German entrepreneurs are surprised by the lack of such cooperation (Szumski, 2005).

A typical feature of German business culture is the tradition of close cooperation with banks, where industrial groups centred around the bank offer a stable financing system that allows German companies to implement long-term investments as effectively as American joint-stock companies do (Fukuyama, 1997). The German symbiosis between industry and banks was reflected in the character of the inflow of German capital to Poland, when industrial companies were supported by Commerzbank and Deutschebank banks developing a close involvement in the Polish economy, transferring know-how and proven business solutions.

The research in intercultural differences between the two nations indicate that the Poles very highly value the quality of technological solutions and work organization, which forms an important foundation for successful adaptation of German production and managerial solutions in Poland. Known in the literature as COE, i.e. *country of origin effect* (Drelich-Skulska, 2007), the phenomenon consisting in the positive association of the product's features with its country of origin is very clear with regard to the perception of German products and technologies in Poland. Similar phenomenon refers to nearly entire region of Central and Eastern European countries, which explains to some extent the activity of German capital in this area. Social perception of the quality of technological solutions identified with specific country of the investor turns out to be an important element of the attitude of the environment, including administrative entities, with which the investor starts negotiations already at the allocation site selection stage. The case study conducted by Globokar in the French motorization consortium's subsidiary in Slovenia indicated that the local authorities had approached the French investor's investment project with significant distance. This was caused by their image of the French. The Slovenes associated them more with comfortable life style (*bon Vivat*) than the symbol of advanced technology being the source of competitiveness on the world markets (Globokar, 2002). Local authorities did not hide their preferences being inclined towards German corporations. This situation proves the influence of the sphere of social images and stereotypes concerning the investor's country of origin on the investment climate.

While researching a group of Polish and German managers, Bildhauer identified similarities and differences between the two cultures which may affect the effectiveness of economic cooperation (Bildhauer, 2005). Among the latter he points to the role of emotional attitude in business relations. Unlike more practical Germans, the Poles value the emotional factor which influences the partner's evaluation and longer negotiation period. The same attribute is mentioned by T. Globokar who also adds that this element distinguishes the Poles even among the Central European nations (Globokar, 2002). Wurz who represents Belitz, an international company specializing in intercultural training courses for business clients, points to the Poles' attention to the role of personal contacts preceding the transaction which are of marginal interest to Germans (Wurz, 2006). As noted by Bildhauer, the Poles are more open to the outside, which corresponds to their great flexibility, kindliness, persistence and the need for harmony; they are unwilling to voice firm objections with the word "no" and they expect the same from their business partners. However, these are not differences that could form a significant barrier for economic cooperation. Bildhauer treats the above-mentioned distinctions in a more complementary way. In his opinion, the features of Polish employees that are

highly valued by Germans include flexibility, ability to improvise, openness and initiative. He sees the combination of Polish flexibility and ability to improvise, and German precise system of organization and management as the source of quick growth of German subsidiaries in Poland.

Complementarity does not mean the lack of differences, which is exemplified by their attitude to time and punctuality treated in Central and Eastern European countries less fundamentally than in Germany.

While analysing cultural differences between the two nations in business contacts from the point of view of a psychologist, Schroll-Mach identifies eight cultural standards that most frequently cause misunderstandings in business communication. They are as follows:

1. Objective vs. subjective orientation,
2. Organization vs. improvisation,
3. Control in accordance to consistent rules vs. control in accordance to people-oriented rules,
4. Monochromic vs. polychromic time experience,
5. Division vs. synthesis of individual areas of life,
6. Certainty and stabilization vs. "uncertain certainty",
7. Low context vs. high context,
8. Orientation towards confrontation and conflict vs. avoidance of conflict and confrontation .

Such synthetic picture is based to a large extent on the typologies of cultural differences as presented by Trompenars, Hofstede, Hall and Gesteland, while the author documented it further with her own broad experiences gained during her business activity.

Similar catalogue of features differentiating business cultures of the two nations is presented by Wojciechowski, who adds several vital German attributes like high ability to focus (Fukuyama, 1997) accompanied by the ability to create the atmosphere of concentration as opposed to certain chaos (frequent interruptions of meetings by mobile phone rings) of the Polish partners. This feature is associated with the polychromic nature of our culture, less linear perception of time and frequent reversion to the previously approved elements of the contract which are treated by Germans as unequivocally binding. The author also attracts one's attention to the Germans' high pressure towards goal achievement accompanied by a can-do spirit in the negotiations. This feature intimidates the Poles and lowers their negotiation performance (Wojciechowski, 2005). An essential observation made by Wojciechowski refers to the perception of law by the representatives of the two nations. Germans treat legal regulations as drafted by the authority, while the Polish understanding of the law is a mixture of respect and fear of the state authority, as well as recognition of the shrewdness of people who break the law with impunity. Such attitudes are vividly exemplified by "the uhlans' fantasy" and "the Prussian order". While characterizing Polish culture, Hofstede mentions the need of strong authorities and unwillingness to respect them, and refers to the Russian saying: "Poland is an animal that is difficult to break in and that will always throw you off its back." (Durska, 2003).

On the other hand, while analysing behaviour in international corporations, Murdoch pays attention to high contextuality of the Poles manifested in the usage of large number of allusions and metaphors which are difficult to understand, particularly to the representatives of low-context cultures like Germans. The Poles' communication process abounds with non-verbal means, proverbs and allusions to collective knowledge. Word play and peculiar coding of their utterances result partly from the 50 years of post-war history when censorship forced one to encode one's messages (Murdoch, 1999). Contextuality clearly distinguishes us from the western cultures, including the German one, where the messages transmitted are more understandable and unequivocal.

Cultural differences between the two nations refer to the whole range of non-verbal symbols and body language which are equally important in communication as language and tend to be interpreted in various ways. Poles are more expressive than Germans who definitely retain greater distance to their private space (Szkodny-Ciołek, 2005). Permanent eye-contact interpreted as importunity by Poles is – for Germans – a signal of good intentions (Wojciechowski, 2005).

Another general difference in attitude refers to the Polish fatalism as opposed to the Protestant optimism typical of Germans. As noted by Koźmiński, complaints are not treated in Poland as something negative, and melancholy is associated not with failure but with the positive values of romanticism and rich internal life (Koźmiński, 1995).

The above-mentioned differences in culturally conditioned behaviours affect the course of negotiations with Polish partners already at the initial stage of investment, and become acutely manifest during the operational stage of the enterprise and in the relations with local employees, clients, contractors and competitors. Hence, the vital role of improving intercultural skills of both parties. The recently growing number of surveys and publications on this subject is the foundation for improving intercultural knowledge of the practicians of life deciding about internationalization, and thus better adaptation of behaviours related to international investment activity. The knowledge of potential investors and managers diminishes the risk of faulty decisions, which affects the rate of return on the capital involved. According to the theory by Johanson and Vahlen the increase of knowledge about foreign locations, including the intercultural knowledge, contributes to further intensive capital involvement.

The range of differences in the area of analyzed cultures characterized by geographical proximity and direct contact that has been identified by researchers proves the relevance of cultural factor to internationalization. It seems that the FDI investment expansion in countries that are situated in spatial proximity is an experimental field for corporations where they gradually gain intercultural skills and thus master the difficult art of coping with differences and exploiting them as the source of enterprise's competitiveness, which forms the knowledge capital and instruments useful in much more difficult cases when the international process takes place in the areas marked with serious cultural differences.

The presented research findings are confirmed by the public opinion polls conducted in Poland, where nearly 60% of those questioned by Instytut Spraw Publicznych Polaków (Polish Institute of Public Affairs) (2005) believes that Germans are different from them, and only 9% claims that the two nations are similar. At the same time they emphasize the German modernity, good organization and professionalism. Large number of these answers corresponds to high assessment of organizational and technological culture of enterprises originating from this country. Polish respondents very highly value competences and professionalism of their western neighbours but they are relatively rarely willing to assign them with "soft" features like kindliness, openness and tolerance (Fałkowski, 2006). In the context of the organization of German enterprise operating in Poland this may generate some problems concerning interpersonal relations.

In certain conditions cultural diversity may constitute a valuable non-material assets of international corporation. To use Hofstede's terms, it constitutes the organization's psychological property influencing the ultimate financial results of the company.

As the mutual familiarity reduces problems with communication and interpretation of situations, it seems that the above-mentioned complementarity of features in the area of organizational cultures of both countries is a factor positively affecting the cohesion of enterprise organization of German corporations' subsidiaries in Poland.

Another aspect related to German investors is more broadly associated with the phenomenon of internationalization of German capital. It results from the role of Poland as a bridge in further internationalization of Eastern enterprises (Russia, Ukraine). Investment expansion of many German enterprises located in Poland into Eastern markets involves active participation of Polish management. This natural process results from the location and the knowledge of economic and social conditions of Poland's neighbours. On the other hand, Polish managers are experienced and know the modern environment of international corporations. This naturally involves them in this process, often as organizers and managers of new branches in these countries. The experience gained in organizing an international corporation combined with the knowledge of economic conditions and

social aspects of these societies, which share Slavic origins, enable them to intercede in further investment expansion.

The issue of social acceptance of foreign entities in the economic life and the attitude towards the phenomenon co-creates an important element of the investment climate ultimately manifested in the legal regulations concerning these matters. The previously presented social perception of foreign companies in the Polish economy points to the steady process of their assimilation in the social environment. Despite the fact that the range of disapproval of foreign companies' presence in the economy is relatively small, the degree of acceptance depends on the country of the investor's origin. Such polarization of attitudes is influenced by the stereotypes and prejudices against other nations, as well as other experiences rooted in the social awareness. Because of the historical past they are more firmly articulated in relation to our western neighbour, which favours the perception of capital cooperation in the categories of sovereignty threat or political expansionism. The violent history of mutual neighborhood, particularly the Second World War, formed the negative image of Germans in the Polish eyes. As noted by Gakan, it was additionally strengthened by the propaganda of the People's Republic of Poland which intended to keep the Polish society in the psychosis of permanent threat posed by Germany and thus legitimize the alliance with the Soviet Union (Gakan, 2007). The feeling of threat and fixed stereotype of our western neighbour influenced the results of surveys reflecting social atmosphere, particularly in the initial period of transformation. The survey conducted by CBOS (Public Opinion Research Centre) in the middle of the 1990s indicated that the relatively smallest acceptance in our country referred to investors from the following nations: Russians, Jews, Germans and the Japanese (CBOS [Public Opinion Research Center], 1995). On the other hand, in the survey conducted ten years later by the Institute of Polish Affairs the questioned Poles pointed to Germany as the main country with which Poland should intensify its economic cooperation (Ćwiek-Karpowicz, 2005). In this way our western neighbour got ahead of the countries previously considered as the pillars of Poland's economic cooperation like the United States of America, the United Kingdom and Russia in the public opinion ranking. The doubling increase in positive evolution of social attitude towards the Germans, reported by CBOS (Research report no. 31, 2020), which in 1993 was declared by only 23% of respondents, and by 46% in 2017 is a consequence of many processes that accompanied the Polish transformation, of which the public perception of the presence of German investors in Polish economic and social reality is very important. The positive evolution of social attitude towards the phenomenon of economic cooperation with Germany, of which capital flows form a vital element, is one of the symptoms of restoring normal relations between the two countries. It is also a part of a broader process which refers to the transformation of the society's mental sphere at the time of the economy's wide opening to the outside, multi-plane participation in the globalization processes and thorough system changes. In the course of the last 30 years the change in the social attitudes has been evidently witnessed by the reduced perception of our western neighbour in the category of threat to Poland. On the brink of transformation in 1990, 88% of the respondents pointed to Germany as a country threatening our sovereignty, while in 2017 this percentage dropped to 22% CBOS Research 2020.

Conclusions

In the light of the discussed cultural implications of internationalization, it is justified to claim that these implications form a favorable environment for the development of German companies in Poland in the form of direct investment. Additionally, investments as such contribute to transferring elements of organizational culture that lead to the international success of the German economy and incorporate well in Polish reality. It is also one of the most significant outcomes of the presence of foreign enterprises in the economy. The complementarity of cultural dimensions, which facilitates the implementation of management solutions typical of the investor's country culture, is a premise for achieving high efficiency in branches located in Poland.

A Study on Product Color Ratio Based on Aesthetic Principles in Industrial Design Assessment

Alexandra-Elena CrACIUN

University Politehnica of Bucharest, Bucharest, Romania
craciun_alexandra@outlook.com

Abstract

The present paper represents an objective approach in the aesthetic assessment of industrial products from the perspective of harmony ratios between colors. Currently, there are multiple studies that address the selection of colors in order to determine accordance relations between them, much further, it was observed that color can be approached quantitatively. The proposed study represents a subsequent analysis, based on extended work that has applicability in product design, therefore guidelines can be set for establishing the colored surfaces ratios of products, in order to assess color harmony in industrial design.

Keywords: Industrial Design, Color Harmony, Color Ratios, Product Aesthetics

Introduction

The aesthetic assessment of design is one of the most controversial fields of design, aesthetics being sometimes considered a subjective element (Bowie 2003), even though there are numerical approaches (Stiny, Gips, 1978). From an aesthetic point of view, industrial products can be analyzed from the perspective of the visual complexity (Dumitrescu 2017), the material used (Post, Blijlevens, Hekkert, 2014), sizing ratio (Elam 2001) or color schemes (Goethe 1840). Color is one of the easiest ways to differentiate products, with a strong impact on product significance. Starting from Newton's principle, that color is a form of light, light that when passes through a prism generates the seven spectral colors (DeLong, Martinson, 2012), based on the phenomenon of light dispersion, Goethe studied the effects and the way we perceive colors, as elements of contrast (Goethe 1840).

In product design, unlike other color approaches that are based on technological restrictions (color codes), cultural references (Yu 2014) and the psychological impact that color can have on human perception, harmony between colors and their relative position (Lara-Alvarez, Reyes, 2018), color aesthetics refers to harmony. Among the most thorough studies based on color harmony, generally accepted and used until now, Itten (1970) starts from the well-known color wheel and studies the link between the primary colors (red, yellow and blue), the secondary colors (green, orange and violet), as well as the symmetry relations between the complementary colors. As a result of color theory, harmonic relations can be interpreted in color selection, the extent to which certain colors are considered appropriate in connection to the others. Based on Goethe's (1840) studies, Ou and Luo (2006) also referring to the pure values of the intensities, they analyzed two color combinations in order to achieve color harmony, however, the estimated hue values need to be correlated with the harmonious areas, therefore a color that is defined by high intensity should cover less surface than a low intensity one. On this premise of study, Itten (1970) deepens the relationships of color-covered areas and combinations of defined harmony colors that can be generated. On the same principle of harmony ratios, Moon and Spencer (1944) proposed an algorithm for establishing color harmony, based on Birkoff's (1933) aesthetic formula, the same as Hsiao, Chiu and Chen (2008), their reference values are based on observers' preferences on color perception, whereas Goethe (1840) and Itten (1970) studies take into account the intensity of light and color hues as numerical values.

Profile of the quantitative model of harmony color ratios

The analysis of the optimal color ratios in surface coverage was carried out on the premises of numerical values of hue intensity. Referring to any given surface, the relations (1) to (3) are specific to the color quantity required as a degree of coverage needed in obtaining harmony for the complementary colors, the denominator representing the total value described in units of area (Itten 1970).

$$Yellow : Violet = 3 : 9 = {}^{1}/_{4} : {}^{3}/_{4} \quad (1)$$

$$Orange : Blue = 4 : 8 = {}^{1}/_{3} : {}^{2}/_{3} \quad (2)$$

$$Red : Green = 6 : 6 = {}^{1}/_{2} : {}^{1}/_{2} \quad (3)$$

As seen, the proposed ratios apply on primary and secondary colors only. Industrial products are often defined by non-colored surfaces, therefore, in order to set ratios for white, black and variations of grey, the author proposes a system that transforms Itten's values for color intensity ratios in values for gray scale (Fig 1). The non-color values already obtained were correlated with the corresponding grey scale ratios set from 1 to 10, where the minimum value 1 is for white and the maximum value 10 represents black, and thus used as numerical values of reference (Fig 2).

Fig 1. Color ratios transformed in gray scale

Fig 2. Proposed gray scale ratios

The values for colored surfaces as seen in relations (1) to (3) were correlated with the ones obtained for non-colors and mentioned in Table 1 as indicators.

Table 1: Colors and non-colors ratios relation

Color	Color C	Value V
Red	R	6
Orange	O	4
Yellow	Y	3
Green	G	6
Blue	B	8
Violet	V	9
White	Wh	1
Grey	Gr	2..9
Black	Bk	10

Extrapolating Itten's (1970) principles and adding the non-colors values, the color indicators were considered in a direct ratio towards their referenced value.

In order to determine the percentage of covered surfaces as a harmonious correlation, in any given scenario, regardless of how many colors are considered, the value to which the proposed relation refers to was defined as the sum of the numerical indicators.

$$C \in \{R, G, B \ldots Wh, Bk\} \tag{4}$$

$$\frac{C_1}{v_1} = \frac{C_2}{v_2} = \cdots = \frac{C_n}{v_n} = \frac{100}{\sum_{i=1}^{n} v} \tag{5}$$

where, C represents the color;
n – number of colors used in a certain relation;
v – corresponding value for each color.

Implementation Procedure

When assessing a product, it must be determined the dominant colors that define the product. In some cases, the product may contain colors that are used particularly with a technical purpose, such as red or green for on/off buttons, yellow signs to appeal attention etc. Usually, the ratio of technical colors is small and is part of fine details; in this case, the colored detail will not be used as part of aesthetic assessment, technical colors will be subtracted from the list of the product colors used in assessment and only the dominant surfaces will be considered. Even with colors, technical symbolism is considered highly important, as being one of the main elements that concern safety.

Considering the comparative assessment of different products, defined by different ratios of color covered surfaces, in order to increase the objectivity of the analysis it is important to reduce as much as possible variations regarding shape, material, sizing or any other difference that may interfere with the perception of aesthetic pleasure.

Fig 3. Product 1A

Fig 4. Product 2A

Fig 5. Product 3A

In the considered selection of product assessment, the products have the main surfaces colored in red, blue and white, and their correlation ratios were presented in relations (6) and (7).

$$\mathrm{P}_1 = \{\mathrm{R}, \mathrm{B}, \mathrm{Wh}\} \tag{6}$$

$$\frac{R}{6} = \frac{B}{8} = \frac{Wh}{1} = \frac{\%}{15} \tag{7}$$

In order to determine the best proportion of product colored surfaces using comparative assessment of multiple design concepts, after the main colors corresponding to the product were established, the next step is to compare the values obtained for each color from the algorithm with the values estimated for the product.

Table 2: Values and ratios for Product 1

P_1	Model values x_i	Estimated surface values y_i
Red	40% - 0.40	25% - 0.25
Blue	53% - 0.53	65% - 0.65
White	7% - 0.07	10% - 0.10

Table 3: Values and ratios for Product 2

P_2	Model values x_i	Estimated surface values y_i
Red	40% - 0.40	40% - 0.40
Blue	53% - 0.53	50% - 0.50
White	7% - 0.07	10% - 0.10

Table 4: Values and ratios for Product 3

P_3	Model values x_i	Estimated surface values y_i
Red	40% - 0.40	60% - 0.60
Blue	53% - 0.53	30% - 0.30
White	7% - 0.07	10% - 0.10

The value of deviation for P_{1A} was determined in relation (8).

$$s_{P1} = \sqrt{\frac{\sum_{i=1}^{N} (x_i - y_i)^2}{N-1}} = \sqrt{\frac{0{,}0189}{2}} = 0{,}1375 \quad (8)$$

where, N is the number of colors (criteria in this case);

x_i - is the value calculated from the quantitative model;

y_i - is the product surface estimated value.

On the same principle, the deviation values for all three products s_{P1}(0.1375), s_{P2}(0.0300) and s_{P3}(0.2166) were determined. The results were compared and the minimum value obtained is for P_2, which is considered the closest to color harmony ratio.

Validation Procedure

The aim of this procedure was to determine the correlation between referenced values from the proposed quantitative model as a design assessment tool and consumer preferences of color ratios in product aesthetics. Based on the presented model of assessment, a survey was completed, in which 15 different products are presented, in groups of three. In order to increase the degree of objectivity of the survey, the products were strictly modified on the color ratios, the other elements of dimension, shape or material being unchanged.

Table 5: Deviation values for the products and the preferences percentage

Series	Type of value	P_1	P_2	P_3
A Series	Deviation	0.14	0.03	0.22
	Preferences	41.00%	34.60%	24.40%
B Series	Deviation	0.10	0.05	0.35
	Preferences	34.60%	39.70%	25.60%
C Series	Deviation	0.02	0.10	010
	Preferences	34.60%	21.80%	43.60%
D Series	Deviation	0.31	0.56	0.02
	Preferences	26.90%	32.10%	41.00%

E Series	Deviation	0.04	0.28	0.53
	Preferences	57.70%	28.20%	14.10%

The survey was carried out on a sample of 78 persons from different fields of activity (IT, financial, advertising, sales, economic, etc.), the observers being 15.4% with the age under 25 years, 76.9% with the age included between 25 and 45 years old and 7.7% over 45 years old. Regarding the educational level, 74.4% of the observers have higher education. In completing the survey of aesthetic evaluation of the color ratios, the observers were tasked to identify the product considered most attractive among the three variants for each proposal. For each product, from the five groups, using the quantitative model, the deviation values were determined and compared with the observer's preferences and noted in Table 5.

Fig 6. A series - deviation versus preferences

Fig 7. B series - deviation versus preferences

Fig 8. C series - deviation versus preferences

Fig 9. D series - deviation versus preferences

Fig. 10: E series - deviation versus preferences

When analyzing the data, it can be observed that, in the case of three of the five groups, preferences corresponded to the minimum deviation value as B series (0.05/39,70%), D series (0.02/41.00%) and E series (0.04/57.70%), the other two being associated with secondary deviation values as A series

(0.03/34.60%) and C series (0.02/34.60%). Reviewing the results with the Pearson analysis, when minimum deviation variable is referenced to maximum preferences, the value of the correlation coefficient is 0.6131, this highlighting the degree of applicability of the quantity model of aesthetic design assessment for color ratio products surfaces.

Conclusions

The proposed assessment model can facilitate design starting from the designing stage, so that the color harmony ratios can be early analyzed and related to the standard proposed guideline, and therefore, the process can help optimize the amount of color selected before the actual production phase. There is also the case where the model can be used, with unlimited number of colors, for a product, as a comparative analysis, in order to review multiple different products and determine the best amount of color combinations. Although the basic analysis proves its applicability, the presented method has limitations in terms of color variations, being analyzed as a reference study only basic colors, primary and secondary and intensities of grays in ten units range, thus for the best possible results, further studies are recommended for extended color palettes.

Conditions of Work with Chosen Information Technologies in The Era of Digital Economy and Their Consequences for Management of The Enterprises

Anna KARCZEWSKA

Czestochowa University of Technology, Czestochowa, Poland
anna.karczewska@wz.pcz.pl

Abstract

The article highlights the chosen changes in the modern labour sphere connected with the development of information society and digital economy. These phenomena affect the way employees perform work, the time of work, the tools of communication for the purpose of work, while also the scope of independence in performing professional duties. Moreover, the requirements of the competition on the global market influence the necessity of implementing new technologies and innovative solutions in the companies.
The aim of the study was to examine the level of use of the Internet and selected communication tools and its relation with creativeness and competitiveness in Polish companies and formulate some recommendations to enterprises management. It presents the results of the survey research conducted in 2019 on the 179 companies largest by revenue in Poland and the research conducted in 2018 on the 276 employees working in Częstochowa district. They showed that the majority of large Polish companies use communication technologies, but mainly the most common tools like e-mail or Intranet. The use of Internet in professional work correlates with creative and intellectual kind of work, as it results from the research of a regional scope on the various types of companies. The use of new technologies and innovative solutions characterise mainly the companies which require new technologies to stay competitive on the market. The results of the study may be of interest to the researchers of relations between new technologies and the performance of contemporary companies and practitioners of management.

Keywords: New Communication Technologies, Working Conditions, Digital Economy, Management

Introduction

The conditions of the business activities of modern companies undergo constant economic, social and technological changes. Globalization and the digitalization processes and the development of new technologies accelerate the pace of these changes. The way the companies are organized, the way they operate and cooperate with the environment are also changing. All of this influences the reality in which the employees perform their work, as well as the methods they are managed by.

Apart from the development of information and communication technologies, the major aspects of work which are changing are: forms of work together with occupations, flexibility of the workforce, the organizations in which employees work, the role of work in employees' lives, forms of education and job training (National Academies of Sciences, Engineering, and Medicine 2017, p. 80). Contemporary changes in the conditions of work provide many advantages and facilitations for both employees and employers, yet simultaneously they may be endangering to the quality of work or satisfaction from work of employees. This paper's goal is to investigate the level of use of the Internet and selected communication tools and its relation with creativeness and competitiveness in Polish companies and formulate certain recommendations to enterprises management.

Present situation may be a challenge to management of the enterprises, so the managers ought to take these conditions into consideration and their implications in order to adapt, e.g. the human resources

management or knowledge management and communication processes to the requirements of the digital economy. The whole organizational culture in the organization may be subject to gradual changes in order to meet this challenge.

Background and Literature Review

The digitalization and computerization phenomena both contributed to the change from industrial to the so-called digital economy, in which human knowledge and information technology are crucial for business processes (McKeown 2009). The report of Bangeman presented a summary of the changes which are taking place in modern society as a consequence of the popularization of Information Technologies (IT). It described the information society as an information-based revolution, in which technological development enabled processing and transferring information without the limits of distance, time or size (Europe and the Global Information Society 1994, p. 5). This revolution has changed greatly the way people communicate, learn, work and live.

In the era of digital economy, the implementation of information technology has become the source of competitive advantage for contemporary companies. The usage of information and communication technology facilitates development by raising the productivity levels of companies. Moreover, it increases work efficiency and stimulates innovation by enhancing people's creativity and first and foremost, it enables organizations to exist and compete on the global market (Berisha-Shaqiri & Berisha-Namani 2015, pp. 78-80, Zamcu 2014, pp. 3-8).

The popularization of the Internet and information and communication technology has changed the conditions in which organizations operate and people perform work. The temporal and spatial limits have become relative. The trends of cultural, economic and technological globalization have led to the unification of the world of business, consumer trends, fashion, lifestyles, as well as leading to a new style of work. ICT development enables the existence of virtual companies and virtual teams, remote work, outsourcing of business processes and facilitates the transformation of organizations from a hierarchical to a structural network (OECD 2017).

Virtual organizations are "a new type of entity, which was created thanks to the development of global information networks, especially the Internet, as a response to the needs of the market and necessity to adopt to its competitiveness" (Kisielnicki 2008 p. 355). They may also be described as: "a temporary coalition of reconfigurable, independent, networked, geographically dispersed organizations including high level trust and competencies that collaborate and share their resources and competencies in order to respond to the customer request" (Nami, Malekpour 2008, pp. 192). Information technology provides the infrastructure of management for the virtual organizations: e.g. the Internet, electronic exchange of data, multimedia transmission, e-mail, etc. Moreover, it fosters the emergence of the network society, which may be defined as "a society whose social structure is made up of networks powered by microelectronics-based information and communications technologies" (Castells 2004, p. 3).

New technologies facilitate innovations and internationalizing of companies, which are key factors in growth and survival among small and medium enterprises in a very competitive and technology driven global economy. Particularly innovation of services is highly significant in the more and more digitalized global trade. What is also very relevant in service industry is human capital management and employees' technological skills and abilities. (Vuorio, Torkkeli, Sainio 2020, p. 92)

Moreover, in manufacturing industry, the use of advanced manufacturing technologies (AMTs) facilitates standardizing and customizing, reducing transaction costs or the need for scale. Additionally, the implementation of information and communication technologies may result in an improved business decision-making, customer relations and maintaining customers' loyalty. (Coreynen, Matthyssens, Van Bockhaven 2016, pp. 42-43)

Information and communication technologies (ICT) also provide benefits for all type of organizations by reducing production and material costs, as well as the costs of marketing and distribution. They

improve customer service, internal functioning of organizations, while also their competitive skills and effectiveness. Electronic business optimizes business processes such as production, distribution, marketing, sales, etc., which enables the maintenance of relations with the environment, e.g. customers, distributors, suppliers and use of services such as accounting, legal and corporate finance services, etc. (Farooq, Ganaie and Ahirwar 2018, pp. 355-360; Berisha-Shaqiri and Berisha-Namani 2015, p. 81).

In the digital and knowledge-based economy, the role of intangible resources including information, knowledge and intellectual is growing. The intellectual capital of each organization includes structural capital and human capital (Pobrotyn 2012, p. 124; Robak and Słocińska 2017). Contemporary human capital management makes use of the new information and communication technology in performing the main management functions.

Human resources management of standard activities such as recruitment and selection, performance management, employee relation, training and development, communication and compensation may all benefit from ICT which enhances the effectiveness of the performance of tasks, as well as stimulating creativity, innovativeness and knowledge sharing among employees (Torres-Coronas and Arias-Oliva 2005, pp. 74-75; Ibarra 1993, pp. 56-87). The specific tools worth mentioning include the following: e-learning, internal networks, videoconferencing, document management systems, decision support systems, groupware, workflow and other.

The literature on the use of information technologies in Polish companies is wide and discusses it in various contexts. Among others, there are researches conducted about the general state of the e-business in Poland by Statistics Poland (national statistical office) (GUS 2018). Other general studies were carried out together with determining perspectives of IT development (E-gospodarka w Polsce 2010). The level of the use of information technologies Polish companies of all sizes was investigated, yet it was not detailed in terms of the particular tools and solutions used (Grzywińska-Rąpca 2014). The connection between the use of ICT as a factor improving the competitiveness of Polish companies were indicated (Leoński 2014). The most popular and numerous researches are those concerning the use of ICT in the small and medium enterprises (Adamczewski 2015, Wiechetek 2015, Gubik, Bartha 2017).This paper attempts to study, apart from the general use of the Internet, the chosen tools of new communication technologies in Polish companies and the relation of the use of new technologies with competitiveness of the large companies.

The requirements of constant availability, lifelong education, the pressure to be up-to-date in the information society may cause stress and burnout of the employees. All these aspects of changing work environment should be taken into account by the managers of contemporary companies. The digitalization of numerous processes in the organizations and usage of new technologies are one of the most important present changes in the companies, which is especially evident in the situation of Covid-19 pandemic and increasing significance of remote work.

Methodology

The paper presents the chosen aspects of implementation of new information and communication technologies (ICT) and tools into the practice of management of contemporary companies. The aim of the study was to investigate the level of use of the Internet and selected communication tools and its relation with creativeness and competitiveness in Polish companies and formulate certain recommendations to enterprises management. The research question of the paper is as follows: What are the consequences of the implementation of new ICT for the employees and the managers in the sphere of professional activity? The results come from two survey research projects: one conducted among the employees in one district of Poland and one among the managers of the largest companies in terms of revenue in Poland, thus it juxtaposes the opinions of the employees with the perspective of their supervisors. It provides some interesting conclusions about the perception of both parties regarding the conditions of performing professional duties in the information society. However, the limitations of one survey which is of regional scope should be taken into account while making generalizations.

The results presented in the paper facilitate the indication of strengths and weaknesses in the implementation and usage of a wide range of new communication tools and provides some suggestions as to how to benefit more from the possibilities which are offered by the new technologies in terms of management of an organization, including knowledge management and human capital management. Likewise, some potential directions of future research are proposed in the paper .

The method used in the study was the survey method. The survey of employees was conducted among the population of the Częstochowa district in the year 2018. The respondents consisted of the employees working in the Częstochowa district from companies of various sizes and industries. They filled in the traditional paper questionnaires anonymously - 300 questionnaires were distributed, 276 was returned, hence the return rate equals 92%. The additional survey of the managers and representatives of the companies chosen from the 500 companies with the largest revenue in Poland (according to the Rzeczpospolita newspaper ranking, which served as a sampling frame) was conducted in 2019 within the project entitled: 'New trends in human resources management in large enterprises' by a group of scientists from the Faculty of Management of Czestochowa University of Technology, which included the author of this article. The research adopted quantitative research methods and mixed techniques such as the following: the CAWI technique (Computer Assisted Web Interview - electronic questionnaire filled in by the respondent) and the CATI technique (Computer Assisted Telephone Interview- interview with the respondent by the phone). The combination of two quantitative methods was used to increase response rate. Research was started with the CATI method. Those who refused to participate in the study or who interrupted the survey were given the opportunity to complete the survey via dedicated online platform (CAWI method). The respondents consisted of managers and supervisors from the human resources management who provided facts and opinions on the issues concerning the whole company. The random sampling was used and statistical data analysis was carried out with the use of Statistica software. For the statistical testing purpose in the comparisons, $p<0,05$ was adopted.

Results

The survey conducted among the employees in the Częstochowa district covered mostly the subject of the use of the Internet in their professional activity, the type of work they perform in terms of its level of creativeness or routine and their well-being with relation to the work performed. The first aspect analyzed was the degree of the use of the Internet in a professional activity depending on the type of profession of the respondent. The answers are presented in Table 1.

Table 1: Answers to the question: "To what degree do you use the Internet and its tools in your professional work?", depending on the profession of the respondent. N=276

Internet usage in professio-nal activity	Public authorities, managers, directors	Specialists, usually with higher education	Technicians and other associate professio-nals	Office employees	Service and sales personnel	Industrial workers and craftsmen	Machine operators, unskilled workers, farmers
To a very low degree	0.00%	4.55%	23.08%	4.90%	**30.00%**	**61.54%**	**38.90%**
To a low degree	0.00%	0.00%	0.00%	11.76%	10.00%	7.69%	27.80%
To a medium degree	35.71%	21.21%	15.38%	16.67%	14.00%	23.08%	16.70%
To a high degree	**42.86%**	28.79%	23.08%	29.41%	22.00%	7.69%	11.10%

To a very high degree	21.43%	**45.45%**	**38.46%**	**37.25%**	24.00%	0.00%	5.50%
Sum total	100%	100%	100%	100%	100%	100%	100%

The Chi-square test value of 88,9 at p<0,05 (df=24) confirms the statistically significant differences in the responses and Cramer's V value of 0.28 indicates the medium strength of the test result.

Professions such as the representatives of public authorities, managers, directors, specialists with higher education, technicians and other associate professionals, as well as office employees are more likely to use the Internet in their professional activity to a high or very high degree (over 64%, 74%, 62% and 66% of the respondents respectively). The opposite is true when dealing with professions such as services and sales personnel, industrial workers and craftsmen, machine operators, unskilled workers and farmers, whose representatives use the Internet to a low or very low degree (40%, 69% and 66% respectively).

The respondents from the Częstochowa district assessed the level of creativeness of the work performed. Their answers were analyzed by considering the level of Internet usage in their professional activity (Table 2).

Table 2: Answers to the question: "To what degree do you use the Internet and its tools in your professional work?", depending on the answers to the question: "How would you describe your work on a "creative and routine" scale?". N=276

Internet usage in professional activity	Definitely routine	Rather routine	Partly creative, partly routine	Rather creative	Definitely creative
To a very low degree	**40.00%**	**23.17%**	8.06%	3.23%	7.14%
To a low degree	8.00%	15.85%	6.45%	0.00%	0.00%
To a medium degree	16.00%	19.51%	20.97%	16.13%	0.00%
To a high degree	8.00%	21.95%	**34.68%**	22.58%	14.29%
To a very high degree	28.00%	19.51%	29.84%	**58.06%**	**78.57%**
Sum total	100%	100%	100%	100%	100%

Rho Spearman value of 0.3665 indicates the statistically significant positive correlation of medium strength between the variables: the Internet usage in the professional activity and creativeness in the professional activity (p<0.05). The employees who intensively use the Internet in their work are more likely to describe their work as rather creative or definitely creative (cumulatively 80% and 92%), in contrast to the employees who rather marginally use the Internet who are more likely to describe their work as rather or definitely routine (48% and 39%).

The results of the research also show that almost 40% of the employees declare that they feel stressed with work to a high or very high degree, 31 % of respondents feel stressed to a medium extent and 29 % feel stressed to a low or very low degree. There is a weak positive correlation between the variables: feeling stressed at work and using the Internet in the professional activity (rho Spearman value of 0.1910, p<0,05).

The study of the largest companies in Poland investigated the issues of new communication technologies and tools used in a professional activity. The results are presented in Table 3.

Table 3: Usage of the chosen new communication tools in the largest Polish companies. N=179

Type of communication tool	Share of users in percentage (use of a tool at least to a medium extent)
E-mail	98.3%
Internal network (Intranet)	85.5%
ERP (Enterprise Resource Planning) systems	63.7%
Social media (e.g. Facebook, Twitter, Instagram)	42.4%
Internet communicators (e.g. Skype for business, Messenger)	39.6%
Online platforms of communication (document exchange, group work coordination e.g. Workflow, Google Docs)	33.5%
Webinars (online trainings)	21.8%
Systems monitoring work efficiency	18.4%

The most widely used communication tools are e-mail messages (over 98% of users) and internal network (over 85% of users). This is followed by Enterprise Resource Planning Systems (almost 64% of companies use it) and social media (over 42% of companies use it). Almost 40% of companies use Internet communicators such as Skype for business, Slack, Google Hangouts, Messenger and over 33% of respondents use online platforms of communication, e.g. document exchange, group work coordination e.g. Yammer, Skype, Workflow, Google Docs, Realtime Board). Around 20% declared using online trainings or webinars and systems that monitor work efficiency.

What is more, the respondents were asked if in the company's industry the use of new communication technologies is essential to maintaining competitiveness on the market. Figure 1 describes the results.

Figure 1: Answers to the question: "Is the use of new communication technologies in the company's industry essential to maintaining competitiveness on the market?". N=179

As the respondents indicate, the use of new communication technologies is essential to remaining competitive on the market to a high and very high extent in case of 30% of companies. This situation applies to a medium extent for over 44% of surveyed companies. This averaging answer may mean that the respondents did not have much to say on this topic or the question could have been surprising. In future studies this could be deepened and verified.

Another question was asked as to whether new technologies have been implemented in the company in the last two years. The answers are shown in Figure 2.

Figure 2: Answers to the question: "Have new technologies been implemented in the company in the last two years?". N=179

New technologies have been implemented in the last two years in over 50% of surveyed companies, while over 30% denied implementation of new technologies in the last two years. The positive statistical correlation between the implementation of new technologies and the necessity of using new technologies to stay competitive on the market has been observed (table 4).

The representatives of the companies were also asked if innovation is a key value in the company. The extent to which the respondents agreed to this statement is presented in Figure 3.

Figure 3: Answers to the question: "Is innovation a key value in the company?". N=179

Generally speaking, innovation is a key value for 27% of the companies and it is partly true for almost 22% of the companies. There is a sense of disagreement with this statement expressed by 36% of the companies. The companies, which stated that it is necessary to use new technologies to remain competitive on the market have been asked if the innovation is a key value in the company and if new technologies have been implemented in their company in the last two years (Table 4).

Table 4: Values of rho Spearman correlation between the chosen variables concerning new technologies usage. Value of p<0.05, N=179

Variables	Usage of new communication technologies is essential to remaining competitive on the market in the company's industry
New technologies have been implemented in the company in the last two years	0.2355
Innovation is a key value in the company	0.2833

The positive statistical correlation of weak strength measured with rho Spearman test has been observed between the variables: the usage of new communication technologies is essential to remaining competitive on the market in the company's industry and new technologies have been implemented in the company in the last two years (0.23, p<0,05), innovation is a key value in the company (0.28, p<0,05).

Discussion of Findings

The results of the research conducted among the employees of various companies and branches of the economy in the Częstochowa district have confirmed on a regional scale the assumption that the degree to which an employee uses the Internet and its tools in his or her professional work differs, depending on the profession of an employee. In the case of intellectual work, the Internet is used in the vast majority of cases to a high and very high extent. If the subject of work is connected with communication, the Internet tools are used more often. For instance, the lowest use among white-collar workers has been observed among technicians (e.g. physical, technical, chemical sciences, medical, pharmaceutical, nutrition, veterinary, optician, lifeguard, inspector, control technicians) in contrast to the rest of white-collar workers (managers, specialists with higher education, office employees), whose work is more based on communication than that of technicians.

The managers from the largest Polish companies distinguished the most often used communication tools connected with new technologies. They were those of general use and universal use such as email messaging, internal network or ERP systems (the majority of the surveyed companies use them at least to a medium extent). The minority uses more specialized communication tools on a regular basis (for specific purposes/tasks) or tools narrowed down in terms of the audience such as social media, internet communicators, online platforms of communication, online trainings or systems monitoring work efficiency. The relatively low level of social media usage may be surprising. These media sources seem to be underestimated in the case of a large proportion of Polish companies. Other research concerning widely understood social media in Polish companies indicated that almost 30% of companies used at least one kind of social media (GUS 2018, p.79-80). The responses of the respondents may be also the result of restraint in admitting to conducting marketing activities in social media.

Subsequently, there is a statistically significant positive correlation of medium strength between the variables: the Internet usage in the professional activity and the level of creativeness in the professional activity. The employees who use the Internet in their work to a rather high extent or very high extent are more likely to describe their work as "rather creative". Employees whose work is rather routine use the Internet to a lesser extent. The possibilities which are created by the Internet, e.g. its communication tools or knowledge resources are compatible with creative work and trigger creativity of an employee. Yet, it does not mean that it is the cause and effect relationship, because it may be a relationship of co-occurrence due to the fact that the Internet is simply supporting creative work. The key element stimulating employees' creativity is creation of the culture, work environment and climate conducive to creativity and innovation (Król 2017, p.42). One of the element of this work environment may be providing access to new technologies.

Not all branches and industries require new technologies to a high or very high extent, the most common answer was that "it applies to a medium extent" in the company's industry. The question concerning this result is if it really reflects the reality or if it shows the low level of awareness of the significance of new technologies of the respondents. In the majority of the surveyed companies, new technologies have been implemented in the last two years.

According to the PARP research (2019, p.24-25), in the years 2016-2018 only around 35% of companies operating in Poland was active in the sphere of innovation (i.e. introduced or tried to introduce at least one innovation). However, the innovation is claimed to be a key value by almost half of the surveyed companies. Still, it is not valid for one-third of the companies analysed.

The subject of new technologies is connected with the potential overload due to "technological stress", as its burden on the employees is noticed by the managers from the majority of companies surveyed, yet mainly assessed as applying to a medium extent. This poses a question as to whether managers properly monitor and assess this new type of stressor for their employees.

The implementation of new technologies, innovativeness being a key value in a company, as well as overload due to technological stress are all positively correlated with the recognition that the usage of the new communication technology is essential to remaining competitive on the market in the company's industry. ICT implementation is usually connected with environment characterized by flexibility and open organization (Stanos, Prastacos, Poulymenakou 2002, p. 670). The awareness of the significance of new technologies for the level of competitiveness on the market results in the pursuit to implement it, in order to seek innovative solutions, yet it also increases the level of employee stress connected with the use of new technologies.

ICT helps in performing the main managerial functions of an organization, enhancing innovations, knowledge management, talent management and the general functioning of organizations on the global market, particularly adapting to changes and networking. (Karczewska, 2012, pp. 238-249).

As the results of the research revealed, not all tools of ICT are used even by the largest companies in Poland or are used to a small extent. Social media is one of the latest marketing platforms and a very useful Customer Relationship Management tool, which is not appreciated enough by quite a large number of Polish companies. Similarly, the potential of online trainings, platforms of cooperation and online communicators is very high. They enhance the communication and cooperation processes and sharing knowledge, as well as stimulating creative and innovative solutions in organizations (Omona, Lubega, van der Weide 2012, pp. 1-19).

Such tools as online platforms of communication and collaboration, online trainings, not to mention the systems monitoring work efficiency, are all worth taking into account by the managers of Polish companies who are responsible for knowledge management or new personnel adaptation process. The benefits in terms of saving costs and time of these solutions are underestimated in a significant number of Polish companies.

ICT facilitates competitiveness by improving the efficiency of activities, adaptation to changes and enabling the existence on the global market. Moreover, they facilitate developing employee skills and knowledge, hence talent management and human capital management in general. It is advisable to increase the awareness of the significance of new technologies and its competitive potential of the managers in the companies.

Conclusion

The first study was conducted among employees of companies of all sizes on a regional scale, while the other study was carried out among managers of the largest companies on a national scale. The scope of issues concerned the chosen aspects of ICT and this may be expanded in the further research. It should be noted that in the second study, the answers concerning the whole company were provided by the managers or the supervisors in human resources departments, thus it would be

good to compare these opinions with the opinions of the employees of the company. The future research project might apply the present findings by examining and taking other aspects of communication technology into consideration, while also broaden the range of companies for analysis to small and medium ones on a national scale.

Modern companies face global competition and in order to meet this challenge, they need to include such concepts as innovativeness, knowledge management and the usage of new technologies into their management strategy and practice. They are all connected with the requirements of information society, in which the fast flow of information and the knowledge resources are one of the most important factors characterizing the activity of individuals and organizations.

The proper implementation of new communication technologies and the associated tools may be profitable for the company and facilitate its development and competitiveness on the market. This is especially clear in the situation of Covid-19 pandemic, in which new communication technologies support the development and implementation of remote work where possible on a wider scale. It is advisable to repeat the research in some time to compare the changes which took place in the companies after the pandemic.

New Communication Technologies and Employees' Well-Being in The Management of Polish Largest Companies

Anna KARCZEWSKA

Czestochowa University of Technology, Czestochowa, Poland
anna.karczewska@wz.pcz.pl

Abstract

In modern world the development of new technologies changes the rules of operation and competition of companies on the market. The need of innovativeness and adaptation to constant changes requires from the companies to implement new information and communication technologies into their activities. The changing operating conditions influence the way the employees perform their work and entail the necessity of acquiring new skills and knowledge.
This paper tries to answer the question of the scope of use of new communication technologies in the largest Polish companies and the consequences of their use to the employees well-being. It presents the results of the survey research conducted in 2019 on the 179 companies largest by revenue in Poland. The results suggest that for many companies the use of new communication technologies in their professional activity is essential for their existence and competitiveness on the market, but many of the newest information and communication technologies (ICT) are not equally in use. A lot of employees use new communication tools and remote work what influence their work-life balance and general well-being.

Keywords: Information and Communication Technologies, Technological Stress, Work-Life Balance

Introduction

Socio-economic conditions in which modern employees operate are constantly changing due to the progressing processes of globalization, digitalization and development of science and technology. Changes in the sphere of work concern among others more and more frequent contact with knowledge and information resulting from the development of modern information society, as well as organization of work and the manner and the time of performance of work.

The use of new communication technologies in managing the organization becomes necessary in many industries to successfully compete in the global market (Stare, Jaklič, Kotnik 2006, p. 287-302). Soft competences, especially communication competences become increasingly important in the work environment and human resource management. As recent situation connected with Covid-19 pandemic has shown, new communication tools may be a significant support for remote work in case of many crisis situations.

In the modern management of an organization the communication processes become very significant. The appropriate communication in an organization is the basis for cooperation among the employees and for creating and transferring knowledge in an organization. Effective knowledge management in an organization is essential for developing and adapting to changing environmental conditions as well as creating and implementing innovative solutions. The purpose of this article is to present and discuss the results of the research on new means of communication in the sphere of work in the largest companies in Poland and its consequences for the organizations and for the employees themselves.

Literature and Theoretical Background

The development of information and communication technologies (ICT) supports the creation of the network society while also enhances the creation of information and knowledge.

At the end of the last century, the organizations have undergone some major changes in way they are organized and operate. They started to transform from static, fixed structures with clear hierarchy into more networked, flexible entities. This is the main characteristic of the so-called culture of new capitalism. New communication technologies enabled creation of unlimited connections between different spheres and entities and the development of networked economy (Castells 2007, p. 86). According to R. Sennett (2010, pp. 33-39, pp. 71-84) with this phenomena came several major cultural changes in organizations. Old values of craftsmanship has been replaced with the talent management, mobility and orientation on the short-term attachment rather than long-term attachment to the organization. Moreover, in contemporary organizations prevail a focus on the development of modern production and communication technologies, the increasing importance of knowledge and growing independence of the individuals. However, not all types of companies are short-time oriented as Sennett claims, it may be more typical for the smaller companies, while larger ones are more prone to implement the rules of sustainable development and reach sustainable competitive advantage over the competition on the market (Adams, Lamont 2003, Kotabe, Murray 2003, Brown 2005, Krupski 2007).

Such phenomena as digitization, technological development and increasing importance of knowledge as a resource characterizes knowledge-based economy (Giju, Badea, López Ruiz, Nevado Peña 2010, pp. 27-36). The use of information and communication technologies results in constant availability of the employees to the employer, usually by maintaining email or telephone contact. The spatial mobility and the flexibility of the time of work of modern employees are increasing, resulting in both positive and negative consequences for the sphere of labour and the private life.

The digitalization leads to the situation, in which a share of work performed outside the companies and the share of self-employed people whose work involves realization of projects for different customers is rising. (EPRS study 2018, p. 5). The new style and form of work require new competences from the employees, such as the skills connected with operating a computer, organization of working time and maintaining a balance between work and private life.

There are numerous benefits of the use of information systems in the operation of a company and the digitalization of business processes. In recent years the infrastructure in the world of business has become digitalized to a very large degree, digital technologies has transformed the strategies, various processes of the companies as well as their products and services. Some researchers propose to join the business strategy and information technologies strategy into a digital business strategy, coherently co-occurring in the reality of global business (Bharadwaj, El Sawy, Pavlou, Venkatraman 2013, p. 471).

Larger companies are more advanced in the digitalization processes than small and medium-sized enterprises, what influences their effectiveness of performance. Such benefits of technological development of companies as creating new possibilities of communication, constant learning, enhancing financial performance and increase in innovativeness are indicated by the researchers. (Eller, Alford, Kallmünzer, Peters 2020, pp. 119-127). Developing the strategy which enables the employees to adapt and learn the skills connected with the use of new information and communication technologies is recommended. Thus, it is suggested by OECD to identify the set of skills required to enhance quality employment and active involvement in a digitalized economy while also to promote policies and aims to support ICT development and use (OECD 2017, p. 114)

One of the studies of over 320 European enterprises which use social media, big data, and information technologies in their business models showed positive overall companies performance effects. Social media enhance companies interaction with the customers and may improve the delivery of services. Big data is essential for marketing and customer relationship management as

well as optimizing internal processes. Incorporating new technologies greatly changes companies' business models. (Loebbecke, Picot 2015, pp. 149-157; Bouwman, Nikou, de Reuver 2019, pp. 1-2)

The development and new technologies may bring numerous benefits, however, it is also connected with some threats which human resources managers should take into consideration. Telework can be a facilitation for various professional groups, affecting the increase of productivity and satisfaction of the employees. However, as studies show, it may be associated with a sense of isolation and consequently a decrease in employee's satisfaction with work. (Rudnicka 2007, pp. 104-110) There is also an increase in the complexity of highly qualified work and a need for faster and faster assimilation of new knowledge and innovation (Ratajczak 2007, pp. 32-34). These aspects influence maintaining work-life balance and the well-being of an employee.

What is more, there is a danger of the exclusion of certain groups due to varying degrees of access to new technologies, e.g. the elderly people, employees living in regions with a less-developed telecommunications network. They may be exposed to digital exclusion and the creation of barriers preventing them from professional activity development (Bauman 2005, pp. 87-97; Rudnicka 2007, pp. 110-112).

Hence, the consequences of living in the information society may contribute to increased competition, exerting pressure on the employees and entrepreneurs, creating social exclusion, deepening the inequalities or lowering the level of the quality of life and work (Boswell & Olson-Buchanan 2007).

From the point of view of the effectiveness and competitiveness of the organization, it is desirable that the activities in the organization are enhanced by the use of new multimedia technologies and software enabling teamwork. Employees can use a variety of tools and forms of modern communication to improve their individual work: video conferences, online trainings and webinars, software facilitating teamwork or remote work like workflow etc. Using new technologies makes it easier to achieve the objectives of human resource management and the functioning of the organization as a whole, yet it is advisable to monitor the psychological aspect of working with new information and communication technologies.

Research Methodology

The article tries to answer the research questions: What is the scope of the use of new communication technologies in the largest Polish companies and what are the consequences of their use to the employees well-being? The quantitative research of enterprises was conducted as part of the project 'New trends in human resource management in large enterprises' carried out in 2019 (so it reflects the state of affairs before the COVID pandemic) by the team of scientists from the Department of Sociology, Psychology and Social Communication in Management at the Faculty of Management of Czestochowa University of Technology, which included the author of this paper. The study used quantitative research methods, using mixed techniques: CAWI technique (Computer Assisted Web Interview - electronic questionnaire filled in by the respondent) and the CATI technique (Computer Assisted Telephone Interview- interview with the respondent by the phone). The combination of two quantitative methods was used to increase response rate. Research was started with the CATI method. Those who refused to participate in the study or who interrupted the survey were given the opportunity to complete the survey via dedicated online platform (CAWI method). The survey sampling frame was a database of 500 companies largest by profit in Poland (according to the Rzeczpospolita newspaper ranking). The random sampling was used. In case of the refusal to participate in the project of a given enterprise, another one was drawn. As a result, a representative sample of 179 companies was tested according to the following parameters: size of the general population equals 500, confidence level equals 95%. The statistical data analysis was conducted with the use of Statistica software. For the purpose of statistical testing in all comparisons $p<0,05$ was adopted.

Results and Interpretation

Entities which were surveyed in the conducted research consisted of companies of various industries and branches of economy, with different profiles of activity. 179 entities out of 500 companies largest by revenue in Poland have been surveyed. The detailed specification is presented in the figure 1.

Figure 1: Characteristics of surveyed companies in terms of type of the activity. Number of companies. N=179

The largest share of the surveyed companies were those of production industry (75 companies) and those of services (49 companies). The companies from production and services (26), trade (15) and production and trade (14) were also surveyed. The answers to the questions on the issues regarding employees of the entire company were provided by the manager or Human Resources employee from a company.

Respondents from the surveyed companies among others answered the question: to what extent does your company use the enumerated modern technologies and communication tools? The answers show that there is no consistency in this matter and different kinds of tools are used to a different extent. The most common tool used in the professional activity by the majority of researched companies are traditional and popular e-mail messages (91,6% use it to a very high extent, around 7% use it to a lesser extent) and secondly the Intranet, which is used to a very high extent and to a relatively high extent by appropriately 28% and 50,3% of companies (jointly 78% of them). Next, very common communication tools are text messages (SMS) and MMS, which are used to a relatively high extent or more by jointly 77% of companies surveyed. The details are presented in figure 2.

Figure 2: Answers to the question: To what extent does your company use the enumerated modern technologies and communication tools? E-mail, Internal network (Intranet), SMS,MMS. N=179

The popular tools used in the professional activity by a quite large share of companies are social media (42% of companies uses them to at least medium extent) and internet communicators (nearly 40%). Less, but still popular are online platforms of collaboration, which are used by one third of companies to at least medium extent. The detailed data are presented in figure 3.

Figure 3: Answers to the question: To what extent does your company use the enumerated modern technologies and communication tools? Online platforms of collaboration (communication, document exchange, group work / projects coordination, e.g. Yammer, Skype, Workflow, Google Docs, RealtimeBoard), Internet communicators available to the public and for business (Skype for business, Slack, Google Hangouts, Messenger), Social Media (Facebook, Twitter, Instagram, Snapchat) N=179

The tools such as webinars are used to at least medium extent by almost 22% of companies (in over a half of companies they are used to a small extent) while Enterprise Resource Planning systems (ERP) are used by nearly 64% of surveyed units. Videoconferences or teleconferences are used relatively more often – nearly 68% of companies uses them to at least medium extent. More data are shown in figure 4.

Figure 4: Answers to the question: To what extent does your company use the enumerated modern technologies and communication tools? Webinars/online trainings, ERP Systems (Enterprise Resource Planning), Videoconferences, Teleconferences. N=179

As the results of the study indicate, there are the differences in using certain tools of ICT among the companies in various industries. The level of usage of certain communication tools are presented in table 1, table 2 and table 3. Internet communicators are more often used by the manufacturing companies (nearly half of the companies use them to at least medium extent) than those dealing in trade (26,5%) and services (over 20%).

Table 1: Differences in using internet communicators between companies with main area of activity: manufacturing, trade and services. N=179

INTERNET COMMUNICATORS	Manufacturing	Trade	Services
are used to a very high extent	18,67%	16,33%	0,00%
are used to a relatively high extent	14,67%	10,20%	6,67%
are used to a medium extent	16,00%	8,16%	13,33%
are used to a low extent	8,00%	8,16%	26,67%
are not used	42,67%	57,14%	53,33%
Sum in a column	**100%**	**100%**	**100%**

Meanwhile, in case of social media, these are the service companies which use them more often (almost 67% of companies uses them to at least medium extent) while only 43% trade companies and 40% of companies in manufacturing industry use them. The details are shown in table 2.

Table 2: Differences in using social media between companies with main area of activity: manufacturing, trade and services. N=179

SOCIAL MEDIA	Manufacturing	Trade	Services
are used to a very high extent	16,00%	16,33%	26,67%
are used to a relatively high extent	14,67%	10,20%	33,33%
are used to a medium extent	9,33%	10,20%	6,67%
are used to a low extent	17,33%	10,20%	13,33%
are not used	42,67%	53,06%	20,00%
Sum in a column	**100%**	**100%**	**100%**

When it comes to the intranet, the vast majority of manufacturing companies uses this tool (nearly 90% of them to at least medium extent) and the majority of trade and service companies (over 80% and over 70% respectively). The results are presented in table 3.

Table 3: Differences in using intranet between the companies with main area of activity: manufacturing, trade and services . N=179

INTRANET	Manufacturing	Trade	Services
is used to a very high extent	25,33%	44,90%	13,33%
is used to a relatively high extent	60,00%	24,49%	40,00%
is used to a medium extent	4,00%	12,24%	20,00%
is used to a low extent	2,67%	4,08%	6,67%
is not used	8,00%	14,29%	20,00%
Sum in a column	**100%**	**100%**	**100%**

The respondents have been also asked if employees are in contact (available) with superiors or colleagues also after business hours. The 26% of companies claims that this applies to the working conditions in their company to a very high or high extent. What is more, nearly half of the companies admitted that this applies to their companies to a medium extent (figure 5).

Figure 5: Availability after working hours. Answers to the question: Are employees in contact (available) with superiors or colleagues also after business hours? N-179

The level of importance of new technologies in company's activity correlates with the level of availability to the superiors or coworkers after working hours. Rho Spearman equals 0,18 ($p<0.05$)and indicates the statistically significant positive correlation of medium strength between the variables.

Another question concerned the presence of signs of a technological stress burden (associated with the use of new information technologies, information overload, etc.) in the case of the company's employees (Figure 6).

Figure 6: Answers to the question: Do the employees show signs of a technological stress burden (associated with the use of new information technologies, information overload, etc.)? N=179

The managers or supervisors of the HR departments who answered this question in the majority of cases claimed that this situation applies to their company to a medium or low extent. It does not apply at all in the case of almost 20% of companies and to a very high or high extent in the case of 11% of companies. It is debatable whether this definitely indicates a lack of stress or a lack of awareness of the supervisors of this problem.

The following variables are also correlated: the perception of necessity to monitor employees' psychological problems in the company and the extent to which (at least partial) remote work is currently implemented in the company. Rho Spearman equals 0,20 ($p<0.05$) and indicates the positive correlation of weak strength.

Rho Spearman value of 0,39 ($p<0.05$) indicates the statistically significant positive correlation of medium strength between the variables: level of importance of new technologies in the company's activity and the idea of a balance between work and private life of employees is reflected in the company's organizational culture. All the mentioned associations are presented in table 4.

Table 4: Correlations between chosen variables concerning the use of new technologies in a company and the psychological well-being and WLB of the employees. N=179

Variables		Correlation (rho-Spearman)
level of importance of new technologies in the company's activity	availability to the superiors or coworkers after working hours	0,18
level of importance of new technologies in the company's activity	the idea of a balance between work and private life of employees (WLB) is reflected in the company's organizational culture	0,20
the extent to which (at least partial) remote work is currently implemented in the company	the perception of necessity to monitor employees' psychological problems in the company	0,39

The correlations are of weak or medium strength, yet it shows some tendencies and are worth further research and analysis in the wider population of enterprises of different sizes and trades.

Discussion of Findings

The majority of largest companies in Poland implement and make use of the ICT in the their everyday activity. The ICT enable, among others, remote work, the increase in the pace and effectiveness of information flow in a company and in the flexibility of time of work. Whereas on the other hand, it may result in overloading the employees with the technological stress and disturbing their work-life balance.

Among the most commonly used communication tools are those rather traditional, not inducing costs and of general use: e-mail messages with over 90% of text messages (SMS) and MMS which are used by 77% of the companies surveyed. The companies acknowledge the benefits of the intranet network hence around 78% of companies implemented it. Less, but still popular are tools such as Enterprise Resource Planning systems and videoconferences or teleconferences, which have permanently entered the practice of companies' activity. They are used by over 60% of companies. The use of tools of remote communication, both audio and visual has become a necessity. It is particularly evident in present times of the pandemic lockdown and an increase in demand for remote work. Yet, the possibility of this kind of work does not apply to all the employees, only those with good access to ICT and the ability to control the use of time and technology (Grantham, Tsekouras 2004, p. 366).

The differences in the use of various types of ICT tools were observed among the companies in various industries. The level of usage of certain communication tools depends on the type of activity of a company, which require advantages of a chosen tool the most. The tools conditioned by the needs of a given industry are, among others: social media (commonly used in the service companies),the intranet (popular in the vast majority of manufacturing companies) and the internet communicators (used by the manufacturing and trade mostly). It is worth underlining that each process in a company may benefit from specific e-business solutions supporting its effectiveness and profitability, starting from the supply chain, through relations with partners and among employees to the customer service. (Żurak-Owczarek 2011, pp. 125-126)

The usage of new communication technologies in the professional activity of individuals results in the possibility of remote working and constant availability of the employees to the employer or the coworkers. It may result in a increase in the technological stress burden. This type of stress is connected with the information overload, the pressure of being up-to date, available to the clients or employer. Hence, it makes a threat to the work-life balance of the employees and may lower their satisfaction from work and life (Nam 2014, pp. 1017–1040

The companies which intensively use new technologies in company's activity note higher level of employees' availability to the superiors or coworkers after working hours. Companies which implement remote work at least partially tend to notice the necessity of monitoring psychological problems of employees. Similarly, the companies for which the use of new communication technologies is very important for the functioning of the company declare more often that the idea of a balance between work and private life of employees is reflected in the company's organizational culture. It is debatable if noting these problems and declaring the presence of policies supporting the well-being of employees means that the employees actually receive the kind and the scope of help they need. It is an interesting issue for further research, especially from the employees' perspective.

The benefits of new communication technologies usually go together with the threats and potential disadvantages. These largest Polish companies which often use ICT and remote work claim, that they tend to monitor and care for the work-life balance of their employees. It is necessary to provide support for the employees who are exposed to stress or burnout, including those working remotely and using ICT to a large extent (Wallace 2014, pp.70-77).

Conclusions

In present times, the era of globalization, information society and development of new technologies enterprises face challenges such as increasing competitiveness, innovativeness or adapting to changing market requirements. For many companies the use of new communication technologies in their professional activity is the basis for their existence and competitiveness on the market and managing crisis situations such as present COVID-19 pandemic crisis. This crisis situation showed that the companies which implement the new ICT solutions will be able to adapt to changing circumstances (e.g. conversion to e-commerce or remote work) and will increase their performance and effectiveness. It seems that not all of the Polish companies were prepared and able to adapt quickly to the requirements of the crisis. This issues are worth investigating in a future research.

Not all of the newest information and communication technologies are equally popular among the companies. The most common are those of general use and which are not cost-inducing. Solutions more expensive in implementation and functionally specialized are not widely used by the majority of the companies. They are usually used in particular industries and business sectors or for specific economic purposes. The level of usage of particular communication tools is related with the type of company's industry. Social media are more commonly used in service companies to maintain relations with the customers. The majority of manufacturing companies implement the internal network (intranet), which may enhance their performance and internal communication. Moreover, a large percentage of companies in manufacturing and trade use internet communicators such as e.g. Skype for business, Slack, Google Hangouts, Messenger as well. Thus, some activities specific for a given trade need advantages of certain tools more than the others.

The tools which may be used outside also the workplace and after work time may disturb work-life balance more than the tools used only in the time of work and at the workplace only to enhance working performance. The tools such as internet communicators, videoconferences, online platforms of cooperation may be a greater burden in terms of technological stress than intranet, ERP systems or the tools which can be turned off after work and do not enable constant availability to the employer. This assumptions are worth further research to confirm.

The benefits which are offered by new technologies are accompanied by potential risks. Information overload, constant availability to the employer, lack of monitoring of the psychological well-being and health of the employees are important risk factors. It is advisable for the companies which implement new technologies in their business activity to take into consideration potential threats of ICT to the work-life balance of their employees and monitor the level of stress and psychological health of the employees.

The Performance of Health – System – A Theoretical Perspective

Ana-Mădălina POTCOVARU

Bucharest University of Economic Studies, Bucharest, Romania
ana.potcovaru@amp.ase.ro

Abstract

Countries should report health system performance to the public annually by use of a dashboard of key metrics (e.g., health outcomes, people's confidence in the system, system competence, and user experience). Achieving high-quality health systems requires expanding the space for improvement to structural reforms that act on the foundations of the system. First, health system leaders need to govern to obtain efficiency, effectiveness and equity by adopting a shared vision of quality care, clear strategies, strong regulation, and continuous learning. Countries should transform the health workforce by adopting competency-based clinical education, introducing training in ethics and respectful care, and better supporting. Health crises, such as the COVID-19 crisis, illustrate the need for resilient systems, defined as systems that can prepare for and effectively respond to crises while maintaining core functions and reorganizing if needed. An effective health system is an improvement in the nation's health status. Health systems are a powerful way for improving health equity

Keywords: Healthcare System, Performance, Resilient System, Effectiveness, Equity, Efficiency

Introduction

The WHO definition of health system is as following:" all the activities whose primary purpose is to promote, restore, or maintain health" (WHO, 2000). These activities are under complete or partial control of governments. In developing countries, the providers of health services and the primary funders are the governments. (Kruk & Freedman, 2008).

Performance measurement is essential for health system. Most health systems are in the early stages of performance. For improve and secure health system, policymakers should monitories performance.

Performance measurement is an opportunity for policy makers to secure health system and its aim is to improve the quality of decisions within the health system throw an active role of the government.

In assessing the performance of a health system, the first step is defining the goals. The goals defined by WHO are to deliver equitably, efficiently, and effective preventive and curative health services to the entire population. (WHO, 2000). These goals are the same in developed and developing countries. In 2010, Michael Porter proposed that health systems be fundamentally accountable for producing value, which should be defined around the user. (Porter, 2010).

States must ensure availability, accessibility, acceptability, and quality of health services (UN, 2000). The key aims of health systems are patient satisfaction, accountability and public participation in decision making process.
The governments play an important regulatory role also in the case of private sector in health.

Case study: The framework for Health Systems Performance

I described the state of health system. Also, I presented different indicators regarding health system effectiveness, health system equity and health system efficiency based on the literature review.

Fig. 1: Framework for health systems performance measures

Source: Kruk & Freedman, 2008

Indicators of health system performance cannot be seen in isolation. Process indicators should be linked to outcomes. Indicators that are applied to measure health systems performance are the most used indicators.

As it can be seen in figure 1, the inputs of the health system measurement are policies, funding/financing, organization. The outputs/ process indicators are: access to care, quality of care, access for disadvantaged groups, quality for disadvantaged groups, participation/accountability, adequacy of funding, costs and productivity, administrative efficiency.

The outcomes are health status improvement, patient satisfaction, health status improvement for disadvantaged groups, fair financing, risk protection and maximizing value of resources.

The inputs policies, funding/financing and organization mixed with access to care, quality of care contribute to effectiveness: health status improvement, patient satisfaction.

The inputs policies, funding/financing and organization combinate with access for disadvantaged groups, quality for disadvantaged groups and participation/ accountability contribute to equity: health status improvement, fair financing and risk protection.

The inputs mixed with process indicators: adequacy of funding, costs and productivity efficiency are the measurement for efficiency: maximizing value of resources.

Fig. 2: High-quality health system framework

Source: Kruk, Gage, Arsenault, Jordan, Leslie, Roder-DeWan, ... & English, 2018, e1200

The authors propose a new conceptual framework for high – quality health systems. The key domains are: foundations, process of care and quality impacts.

Table 1: High-quality health system framework components

Quality impact	
Better health	Level and distribution of paticient – reported outcomes: functions, symptoms, pain, wellbeing, quality of life and avoiding serious health – related suffering
Confidence in system	Satisfaction, recommendation, trust and care uptake and retention
Economic benefit	Ability to work or attend school, economic growth, reduction in health system waste and financial risk protection
Process of care	
Competence care and systems	Evidence-based, effective care: systematic assessment, correct diagnosis, appropriate treatment, counselling and referral; capable systems, safety, prevention and detention, continuity and integration, timely action and population health management
Positive user experience	Respect: dignity, privacy, non-discrimination, autonomy, confidentiality and clear communication, user focus, choice of provider, short wait times, patience voice and values, affordability and ease of use
Foundations	
Population	Individuals, families and communities as citizens, producers of better wealth outcomes and system users: health needs, knowledge, health literacy, preferences and cultural norms
Governance	Leadership, political commitment, change management, policies, regulations, standards, norms and policies for the public and private sector, public health functions, financing, funding, fund pooling, insurance and purchasing, provider contracting and payment; learning and improvement, institutions for evaluation, trustworthy data, etc
Platforms	Assets: number and distribution of facilities, public and private mix, service mix and geographic access to facilities; care organizations, primary

	care, secondary and tertiary care, engagement of private providers, connective systems, emergency medical services, facility community outreach
Workforce	Health workers, laboratory workers, planners, managers, number and distribution, skills and skill mix, training in ethics, and people centred care, supportive environment, education, team- work and retention
Tools	Hardware, equipment, supplies, medicines and information system, software, culture of quality, use of data, supervision and feedback

Source: Kruk, Gage, Arsenault, Jordan, Leslie, Roder-DeWan, ... & English, 2018, e1201

Table 1 presents the components of the framework domains: quality impacts, processes of care, and foundations. The quality impacts include better health, reduced mortality and morbidity, confidence in system, trust in health workers. Trust motivates active participation in care and maximize outcomes. A good quality of care might require additional investments in health systems. A competent care and user experience are parts of the processes of care. A competent system provides health promotion and prevention. Patients expect to receive evidence-based care, careful assessment, counselling, appropriate treatment, and correct diagnosis.

A high-quality health system needs a strong governance, good policies, a strong financing. Health care leaders will have to inspire and sustain the values of professionalism and excellence

Health care is provided by three platforms: communities, primary care and hospital care. Health workers need equipment, medicines and supplies. Also, they need adequate numbers, preparation, professionalism, a supportive environment for obtaining the desired performance and high – quality competency. (Kruk & Freedman, 2008).

The authors believe that the quality of health systems should be primarily measured by these processes and impacts rather than by inputs. (Kruk, Gage, Arsenault, Jordan, Leslie, Roder-DeWan, ... & English, 2018, e1201).

Aspects Regarding Effectiveness, Equity, And Efficiency

Health System Effectiveness

The components of effectiveness are health status and patient satisfaction (outcomes) and access and quality of care (outputs) (Kruk & Freedman, 2008)

In developed countries access to basic services, aggregate access and continuity are measured less regularly than access for disadvantaged groups, quality, safety, equity and patient satisfaction.

In developing countries one of the major barriers to better health is access to basic services.

Some authors use as a synonym for effectiveness the term “quality”. Some specialists include in the term “quality” technical efficacy, safety and continuity.

The literature review show that patient satisfaction is used as an outcome indicator of the effectiveness.

In developed countries long life expectancies make measurement of the health systems impact on health outcomes.

In developing countries examples of health outcomes include: infant mortality, maternal mortality, perinatal/neonatal mortality, low birth weight and incidence of infectious diseases. (Kruk & Freedman, 2008)

The indicators such as survival rates from cancers, although this can also be seen as a measure of the quality of care (Hurst & Jee-Hughes, 2001).

Providing health services without guaranteeing a minimum level of quality is ineffective, wasteful, and unethical.

The IOM Committee defined quality of care as "the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge". (Institute of Medicine Committee on Quality of Health Care in America Crossing the quality chasm: a new health system for the 21st century, National Academies Press, Washington, DC2001)

Patient Satisfaction

This indicator is particularly important in countries where health system is largely funded throw tax revenue or access to health is guaranteed by the Constitution. This indicator shows the ability of government to deliver on a key obligation.

In Canada and Britain health system performance is a key part of election debate.

American researchers found other indicators important for patients: caring behaviour, provider competence, being treated with respect, bedside manner, good information sharing, efficient care process and administrative simplicity of health insurance. (Jennings, Heiner, Loan, Hemman, & Swanson, 2005).

Common criteria of patient satisfaction are patient-centred care, access, communication and information, courtesy and emotional support, technical quality, efficiency of care, structure and facilities (Sofaer & Firminger, 2005)

Patient satisfaction is an important measure of the success of a health system.

Access

A measure of access is population coverage with essential health services. Service cover age is an example of an output indicator.

Population coverage of services has three components: availability, utilization and timeliness.

Availability of services is a process indicator linked to the policies, funding levels and organizational arrangements.

Availability is the level of input (physicians, nurses, hospitals, clinics per population or within a geographic area).

Health worker density has an important impact on improving certain health outcomes. Another aspect is organizational access.

Industrialized countries use utilization of screening test (brest and cervical cancer) as measures of access. Other indicators for access are: case detection rates for TB, use of malaria, bed-nets, contraceptive concepts, attended deliveries, equity in financing.

The need should be the first benefit of the users of health, not the social status. Financing for health services should be progressive. (Ensor & Ronoh, 2005)

Quality of care is a component of effectiveness. There is not a clear definition for quality of care, but it is similar with efficacy, safety and continuity (Bruce, 1990).

Safety of care is another dimension of quality. Kruk & Freedman, 2008)

Health System Equity

This requires eliminating health disparities, inadequate access to services, unhealthy living or working conditions manifested through wealth, gender, race or ethnicity.

Equity means the contribution for improving the health status of the poor

The markers of effectiveness: comprehensiveness, access, quality, continuity, patient satisfaction can be analyzed by income, ethnicity, gender, geographic location (Kruk & Freedman, 2008)

Continuity of care is an important aspect of technical quality. Another important feature of access is the notion of timely access.

Equity in financing includes protection for the poor from catastrophic health expenses. Public participation and accountability are means to realizing equity.

Improving access and fair financing are important in assuring equity.

Health System Efficiency

This concept includes the value of workers and patient time (Kruk & Freedman, 2008)

Efficiency is divided in allocative efficiency and technical efficiency. Allocative efficiency means to direct funds to activities that will maximize health gains. Technical efficiency is the highest possible sustained output and is a combination of workers, drugs and equipment – as resources.

Inputs such as costs and productivity are central aspects for efficiency. The health system efficiency can be influenced by the budgets and the modes of financing.

For example, national health system and social security system produce better outcomes such as reducing costs. The cost per case is a common measure that includes drugs, personnel, diagnostics, hospital beds, surgical supplies and recurrent costs for providing a full course of treatment. Also, this cost includes out- of pocket costs. This need to be included in the cost calculation.

Efficiency can be measured throw productivity of health care inputs.

Researchers considered that efficiency in Mexican health system can be measured throw output indicators such as physicians' consultations per day, hospital occupancy rates and length of stay and the number of contracts with the health system per person each year. (Kroeger & Hernandez, 2003).

Efficiency can be measure by health budgets spent on hospitals, economies of scale and scope for hospitals

Research in Vietnam demonstrated that provincial general and specialty hospitals were not as efficient as district hospitals were not as efficient as district hospitals in terms of costs per case given their number of beds (Weave & Deolalikar, 2004)

In Uganda, the costs per case for maternal health services were higher when performed in hospitals versus health centres. (Kruk & Freedman, 2008)

Administrative Efficiency

Efficient systems also maximize the value of health workers and the value of patients' time.

The systems which are poorly managed and funded have reduced performance, reduced quality and reduced demand for services.

This refers to availability of updated operational plans and work schedules, regularity of team meetings, adequacy of facility, level of workers motivation (Chukwuani, Olugboji, Akuto, Odebunmi, Ezeilo & Ugbene, 2006).

Health systems need to work with people not only to improve health outcomes, but also to generate non-health-related value, such as trust and economic benefit for all people, including the poor and vulnerable. (Kruk, Gage, Arsenault, Jordan, Leslie, Roder-DeWan & English, 2018).

Conclusions

Measuring health system is complicated. The health indicators are connected with the purpose of health systems and determine the degree of impact of healthcare.

A well- performing health system is effective, equitable and efficient.

As it can be seen, these indicators presented in this article are suitable for measuring the performance of a health care system. It is important to observe the quality and usefulness of each indicator. These indicators represent key aspects of health system functioning.

These indicators measure the performance of the systems and can best capture the performance of health systems.

Health systems are complex adaptive systems. The improvement of health outcomes is the sine qua non of health systems; these outcomes include longer lives, better quality of life, and improved capacity to function. In addition to better health, people derive security and confidence from having a trusted source of care when illness renders them most vulnerable.

Health systems should seek to improve performance on six dimensions of quality of care: safety, effectiveness, patient-centredness, timeliness, efficiency, and equity.

High-quality health systems are underpinned by four values: high-quality health systems are for people and are equitable, resilient, and efficient

Demotivated providers cannot contribute to a high-quality health system

High-quality health systems also need everyday resilience to respond to routine challenges, and this requires accountable leaders who respect and motivate their frontline staff. (Gilson, Barasa, Nxumalo, Cleary, Goudge, Molyneux, ... & Lehmann, 2017)

High-quality health systems also need everyday resilience to respond to routine challenges, and this requires accountable leaders who respect and motivate their frontline staff. (Gilson, Barasa, Nxumalo, Cleary, Goudge, Molyneux, ... & Lehmann, 2017)

There are important limitations of this article that are connected with the experience of these indicators on the ground and how these indicators can be applied to different research themes.

Abstract

The developed economies are currently in a transition from industrial to the digital society. Today, information and knowledge create a ranking of the most developed countries and economies, transferred through their productivity and performance. After studying history, a parallel can be found between the orientation of the economy and world trends. By analogy, the new economy is now a flow of innovation and adaptation. It marks several changes, not only quantitative, which have changed the structure and functioning of the economy since the 1980s. It is an economy of innovation, information and new ideas that are becoming a commodity. In the paper the authors are pointing to the importance of the innovation potential, which present the base of competitiveness in alimentary companies.

Keywords: Economics of Change, ITK, Innovation, Value Creation, Global Innovation Index, Competitiveness, Creativity

Introduction

This economy is bringing new opportunities and pushing for innovation, affecting employment growth and labour productivity growth. But it is also an economy of social tensions and income disproportions. It completes the effect of shifting the workforce from manual, labour-intensive industries to industries requiring knowledge and information. Today's global internet economy brings new opportunities that need new rules to be defined. Those playing according to its new rules will prosper, and those ignoring them will lose (Atkinson, 1998).

Spirkova, Caganova and Bawa note, that an important instruments for promoting competitiveness of regions, companies and economic growth are innovations. The level of science, research and innovation in individual countries depends on political decisions, institutions and other factors, which together act on the creation of an environment motivating to innovative activities (.Innovation plays a key role in moving manufacturing industries towards sustainable production. For example, evolving sustainable manufacturing initiatives – from traditional pollution control through cleaner production initiatives, to a lifecycle view, to the establishment of closed-loop production – can be viewed as facilitated by eco-innovation (Spirko; Spirkova; Caganova and Bawa 2016). The position of the innovative process of value creation is not equally applicable to individual types of companies. Based on the research, we state that not specific kinds of companies can meet all innovation goals due to different innovation processes and the innovation process, such as value growth or labour productivity. We evaluated the innovation goals defined in the model case 1 with following conclusion:

- particular types of companies can meet only some innovation goals,
- in the case of small and medium-sized enterprises, the innovative goals of value creation processes are met. The use of ICT products, the fulfilment and realization of all innovation goals can be expected in medium-sized and large enterprises,
- according to the model case - the impact of innovation on the performance and competitiveness of the company cannot be universally related or defined, because there are factors mentioned such as the number of employees, type of company, company size, size of production base.

This economy is also synonymous with the Internet economy (net economy), innovation economy, digital economy, the Internet, or knowledge economy.

The expansion of technology, digitalization and the Internet are behind all processes underway. These phenomena today affect the competitiveness of individual sectors and entire national economies and change the whole society, from households to governments.

The information and communication technology industries are today a network of industry. Today, networks are interconnected through multiple communication nodes. The extraordinary features of the IT-supported network industry are referred to as network externalities such as globalization, competition and technological change and they are interconnected. Individual actors and companies create nodes and binders. About the impact of the economy today, we can even say that there is not only e-economy but also e-society, e-policy, e-culture and all-e-world.

The role of innovation in the value creation process in terms of creating a competitive advantage for the company and from the view of increasing the productivity of the company is

- Use of Information and Communication Technology products,
- Innovation activities - value creation and product growth,
- In terms of the position of the industry,
- Challenges of innovation and competitiveness.

The paper aims to examine the economic aspects of the company innovation potential and the impact of innovation on the performance and competitiveness of the entrepreneurial economy.

Methodology

In the paper the authors drew mainly from the theory of innovation manufacturing in economic development according to several authors as: Wallas (1926), Schumpeter (1934), Drucker (1985), Atkinson and Court (1998), Menbere (2004), Heckova (2007), Tidd, Bessant and Pavitt (2007), Ritomský (2009),Schwab (2009), Spirkova, Caganova and Bawa (2015) etc. Statistical data for the analysis come from the European Commission materials, Statistical Office of the Slovak Republic and the Eurostat. The authors also analyzed the selected expert and Materials of European Union (Report of The Global Innovation Index 2019), World Economic Forum, conceptual documents and regulations of the Ministry of Economy of the Slovak Republic and the Slovak Innovation and Energy Agency (SIEA).

Discussion and Results

Contradictions in the view of a new economy

If we compared the old and the new economies, we would find differences both in the sectoral structure and orientation as well as in the workforce structure or government regulation. The old economy applied mass production; the importance of research was lower and concentrated on full employment in addition to a high degree of management control. The new economy is oriented towards flexible production, higher real wages contrary to full employment in the old economy, and market instruments contrary to regulations. The new economy is an economy that considers

knowledge as the capital and central resource of the economy. It understands managers at different levels as one of the means of their placement into practice. Although the old economy did not respect knowledge, it is evident that nowadays knowledge bears much more importance. Not only the use of primary production factors generates expertise and experience, but experience also affects more effectively the allocation of available resources. It changes their importance to a sort of dividing point and at the same time, a link between the old and the new economy. The new economy is also referred to as internet economy (net economy), innovation economy, digital economy, the Internet, or knowledge economy (knowledge economy). Behind all, the processes taking place in it are the expansion of technology, digitization, and the Internet. These phenomena affect the competitiveness of individual sectors, entire national economies, and the society, from households to governments. A prerequisite for a qualified expansion of innovations in the food industry are model cases investigated with two basic approaches (Adler, Kwon 2002):

the model case 1- the subject of the research was the impact of innovations on the performance and competitiveness of the company. We present the breakdown from the following points of view:

- the value creation process,
- use of ICT products,
- innovation activities,
- in terms of the position of the industry,
- the role of innovation and competitiveness,
- corporate competencies and innovations,
- starting conditions for innovation

and model case 2 - the subject of the research was the factual definition of the potential of the food industry.

Position of innovation in the process of value creation

Innovation is a dynamic element of production and growth. Without innovation, further development of enterprises, the economy and the society is impossible. Sustainable productivity development cannot be ensured without innovation.
The term innovation is based on recent innovations, i.e., to innovate, or to do something new. In this conception, it is the process transforming an opportunity into a new idea and transforming it into a widespread practice (Tidd, 2007, p. 64).
Based on further definitions, it can be stated that it is "a specific tool for entrepreneurs through which they use change to create opportunities to differentiate their products or services from competitors" (Drucker, 1985).
J. Schumpeter is considered as the "spiritual father" of innovation. He defined economic innovation in his work "The theory of economic development, 1934". He defines it as:

1. introduction of new products that customers are not yet familiar with or introducing better products
2. introduction of new production methods,
3. opening new markets to which the production sector has not yet entered,
4. the acquisition of new sources of raw materials and semi-finished products which have not yet been used in the production of goods,
5. to create a new way of organizing the production sector, creating a monopoly position, trusts.

Innovation can be manifested through new products, business directions, cost reductions, increased labour productivity, product quality, or in shaping or winning new markets.
However, its contribution can be both positive and negative. As already mentioned, innovation is a combination of knowledge. It may already exist as part of our experience, or may be the result of exploration of markets, technologies, stocks, competition, etc.

Innovation is also of crucial importance in the economic process. It is mainly through its ability to change production processes, the structure of the economy and thereby accelerate value creation. The importance of innovation in the process of value creation can be seen from two essential points of view:

- in terms of creating a competitive advantage for the company
- from the perspective of increasing business productivity.

Innovation affects the competitiveness of enterprises by creating new products or improving the quality of existing products. A competitive company must be able, using the potential of its own employees and social consensus, to generate and use innovation and thus respond to the rapidly evolving interests of customers and companies (Heckova, 2007). In terms of types of innovation, its benefits can be felt at different levels of business activity. In our studies, we have encountered several definitions and examples of innovations.

From our point of view, the division into product, process, position and paradigm innovations is particularly essential (Tidd, 2007, p. 11). A similar division is given in the above mentioned Frascatti Manual, which, apart from product, process of innovations, also recognizes as marketing (Ritomský, 2009, p. 10).

The relationship between innovation and competitiveness can be seen through another dimension - productivity. Innovation through the accumulation of knowledge enables the creation of entirely new guidelines that lead to new ways of doing things more efficiently. It, therefore, leads to resource savings, higher production volumes and strategic advantages.

In general, the most innovative industries traditionally have the highest productivity gains. The implementation of innovation increases the appreciation efficacy of both human and physical capital, which directly increases the proportion of the created added value.

The specific sector - Information and Communication Technologies (ICT) - deserves special attention in the analysis of the innovation impact on economic development. Among the most critical areas of innovation, it ranks as the first. Its effect on productivity growth is so impressive that it deserves a specific definition within the pillars of innovation.

In our work (Gust and Marquez, 2000), we have identified three channels through which the ICT industry contributes to overall productivity growth. The first channel is the contribution by which the information technology (IT) industry contributes to productivity growth, through the increased productivity achieved in the IT - computer, software, and high-tech industries. Although the share of these products in the final product is low, they can make a significant contribution to overall productivity through high productivity growth in these sectors.

The second channel is the use of ICT products in other sectors of the economy. It means that investigations in IT equipment (purchasing, not manufacturing) can improve the capital/labour ratio and thus contribute to the growth of labour productivity. Finally, information technology can create network effects in the form of promoting information dissemination, communication and thus providing to incarnate technical progress.

The actual development of ICT is not only a question of the amount of investments in the technology and capital equipment but also the efficient use of new technologies and investments in human resources (Bilsen, 2009).

The pillar of innovation in terms of creating new products, streamlining processes, contributes to increasing product volume and resource savings. It brings a competitive advantage for the company and the country and so increasing productivity growth.

Linking skills, competences, and qualifications in the synthesis of knowledge means linking specific aspects, impulses, and challenges to the potential of human capital. Analyzing the process of innovation without understanding the nature of human capital is thus incomplete.

Productivity and Innovation Pillars

It would be desirable to define a model that could provide theoretical and quantitative determinants of productivity development in Slovakia to ensure a stable rate of productive growth of the Slovak economy. This finding is analogous to the so-called paradox of IT sector productivity, which means that the increase in IT investments alone will not bring the expected effect without the necessary information infrastructure, such as the IT infrastructure, educated human capital, access to capital and technology (Menbere, 2004).

The external relations of the economic system, the level of interactions and the framework of potential future interdependencies must also be considered when defining the pillars. From the view of the Slovak Republic as an economy with a high degree of openness, the position and application within the broader economic-political grouping and the global economic position becomes a priority, modifying the parameters of productivity (Klas, 2005).

Globalization, as a significant factor in the development of the world economy, has significantly modified the position and importance of traditional manufacturing industries.

We note that global competitiveness requires the ability of a business to mobilize a range of skills and skills accumulated in the business, in different regions and even continents.

One of the criteria for assessing innovation activity and economic growth of individual countries is considered the Global Innovation Index (GII), which examines the innovation capacity of 129 economies (Schwab, 2009). From the above assessment, we chose V4 economies, whose position in the Global Innovation Index evaluation is presented in Tab. 1.

Table 1: Global Innovation Index - V4 Country Ratings

V4 countries	Rank from 129 countries	Count from 100
Czech Republic	26	49,4
Hungary	33	44,5
Slovak Republic	37	42
Poland	39	41,3

Source: Reported by The Global Innovation Index 2019 -The Human Factor in Innovation

Sub-index of innovative inputs and Sub-index outputs.

Innovation performance with the best prerequisites for effective integration into the innovation process should be a key priority. They should be able to focus on cutting-edge research and use the development potential given by the economic and social environment in the SR in a rational way. From the perspective of the European Economic Area, Slovakia must benefit from specialization in favour of strong economic sectors. On the national level in Slovakia, there are more critical strategic documents.

In 2000, European leaders adopted the Lisbon Strategy to stimulate employment and economic growth, setting a strategic goal for the next decade: to become the most competitive, dynamic and knowledge-based economy in the world able to sustain economic growth with more and better work and greater social cohesion. The Lisbon Strategy is built on three pillars: competitiveness - the economic pillar, social cohesion - the social pillar and sustainable development - the environmental pillar.

New challenges of innovation and competitiveness

The development of innovations is not only a question of individual economic entities by their economic activity contributing to the creation of value but also a matter of cooperation and common achievement of set goals. A broad area of innovation pillars, covering policymakers, various economic actors, but even individuals, requires mutual coordination of processes based on mutual acceptability. We can also see the relationship between innovation and competitiveness through another dimension. It is productivity. Innovation via accumulation of knowledge allows for new recipes, which lead to new possibilities to provide the issues more effectively. So, it leads to saving supplies, higher volume of productivity and reaching strategic advantages (Majernik et al., 2019)

The level of partnerships takes different forms depending on the level and position of the actors involved - international partnerships, regional, business and partnerships of different social groups, but also informal forms. We mean the so-called informal networks that represent a structured set of specific relationships within a department or environment.

The development of business competencies is an essential prerequisite for success in every innovation (Tidd, 2007, p. 64). It represents the ability of the company to use specific knowledge of the company in combination with the potential of the local company environment, with the possibilities of the macroeconomic environment, the character of the industry and the overall socio-economic environment. An enterprise located in a particular environment, or the industry is influenced by a range of factors, whose potential is either or is not able to exploit. In the area of innovation development, Tidd (2007, p. 72) further considers the following environmental factors.

Sector - characteristics, sector specificities, size of competition interfere with the innovation process.

Business Size - Small businesses have less access to resources, technology, and human capital, which are decisive factors for the development of innovation. Large and medium-sized companies mostly represent the medium-tech sector compared to the ICT sector. National systems - they represent different contexts of economic policies affecting the position of companies. In the Slovak Republic, there can be a significant support of the government, especially for large companies, which, as we have already mentioned, have a considerable representation in the manufacturing industry.

Investment incentives in the form of tax reliefs and various types of institutional support prefer the medium-tech sector.

Lifecycle - different phases of the life cycle require various aspects of innovation.

Novelty - each type of innovation requires a different way of applying it to your organization. In extreme cases, radical changes (disruptive) may also require the introduction of so-called "innovation". In this case, smaller, more flexible companies are an advantage.

External institutions - some sectors are significantly influenced by external factors, mostly in the form of standards, institutional regulations or certification permits.

The presented development factors can significantly influence the success rate of the innovation process under different initial conditions. On the one hand, they favour traditional, established companies based on their size, production experience, conventional links to the environment, on the other hand, the flexible ability of small companies to innovate dynamically, especially in the area of processes, contradicts. A qualified expansion of innovation envisages, besides identifying the core sectors of innovation development, support for other vital aspects of its development. We have analyzed and identified two main areas of imbalance in innovation performance development:

- support for innovation in small and medium-sized enterprises
- the efficiency of innovation processes.

At present, it is necessary to create an environment for the transfer of knowledge and technology to products and production processes and to support the establishment of links among institutions of the private, public and non-profit sectors. It is also essential to promote awareness of the need for expansion in terms of innovation development and competitiveness.

Innovative Development and Creativity

Creativity is an activity that brings up to now unknown and at the same time, socially valuable creation work - outputs. Socially precious creations are works that are valuable not only to the creator himself but also to a community, not necessarily for all people at the same time. In evaluating the output of a product, the time factor is essential. This factor causes the socially valued creation of a work to be subject to change, often passing from the initial affirmative acceptance through the various stages of devaluation or vice versa.

A product that deserves creative designation can take any form, an invention or an original machine, but just as well an organizational project, not only a work of art.

Novelty is based on the discovery of new truths but may also consists of justifications some long-time known facts. Modernity is sometimes associated with a reminder of important factors that are known for other areas than previously anticipated.

For the creative process is characteristic that it is not entirely determined by knowing and knowing in advance how to proceed elements of uncertainty, exposure to the risk of experimentation.

Secondary or Subjective Creativity

Secondary creativity is a situation where the product was created by the processes of a specific and close nature, such as processes that bring new and contemporary socially valuable results. It means separate cutting through the way that require similar effort and invention. This process is called secondary creativity, often also subjective creativity, based on own research:

assumptions of qualified expansion of innovations in the food industry. A model case in the food industry based on the impact of innovation on business performance and competitiveness. The model case is processed according to the EU definition of the business division.
The role of innovation in the value creation process:

A) in terms of creating a competitive advantage for the company
B) from the point of view of increasing the productivity of the company is

- Use of Information and Communication Technology products,
- Innovation activities - value creation and product growth,
- The position of the industry,
- The challenges of innovation and competitiveness.
- Business competencies and innovations

Creativity and Originality

Originality must, as far as possible, show similarity and a causal link with an authentic, fruitful creative process. Products are referred to as genuine. Where there is something original, we mean something extraordinary, rare, your own, not emulation. The original is not the same as "creative". The association is an inexhaustible source of novelty based on similarity, also called analogous thinking. Ribot (2003) has expanded two types of creating new things in fantasy based on analogy:

1. personification as the transfer of human qualities to objects the surrounding world,
2. transformation (metamorphosis) which, by using partial similarity, brings new as assemblies and creations.

He assumed asocianizmus as a one-sided and mechanical theory, unable to prevent and explain the entire complexity of the human psyche, or even the processes of thoughts that cannot be produced by association laws.

Creativity as a problem-solving process

It involves the problems of targeted thinking emerging in situations when we try to solve the task, also in management, for example. The creative process according to Wallas (1926) has the following primary phases:

1. Preparation
2. Incubation
3. Inspiration
4. Verification.

The basic principle of creativity

It is emphasised that new creations of man come from old elements. If this thesis is correct, the basic principle of the creative process is to select, reshape, and combine aspects of prior experience in which results combine novelty with some usefulness.

Creativity as penetration into science and education

For the direction of science and education and their management at the university today the boom of scientific knowledge and the development of sciences, the acquisition of information, its processing becomes extremely important. From a cyber perspective, management is an information process, processing and transmission of information, which implies, in particular at school, to review the laws of transformation of information to describe its structure in descriptive and prescriptive systems with the scientific involvement of descriptive information systems.
In this respect, the scheme of the information process for the school which is possible to be outlined is stated as follows:

Receiving rolling information

a) Treatment

- forecasting and systematizing information
- development of concepts / combining and process of variant building
- taking decisions and choosing options
- programming of decisions / drawing up of programs/plans; and
- management models

c) Transmission of information to the executive authorities

d) Feedback.

This scheme should be explicitly specified:
- in the field of education - own educational process
- in the field of science - research activities.

Modelling of education and science

The more complex the science-research process and the practical life of people become, the modelling method penetrates almost every human activity and becomes one of the primary methods of knowledge. Today, we can classify in some sense the features that characterize the current state and perspectives of scientific phenomena, the style of scientific thoughts, examined in the broadest

sense. Without exaggeration, it turns out that life and being of contemporary science is unthinkable without models. The previous triumph of the modelling method is due to the incredible results of cybernetics and its fruitful use in management practice.

There was a need for basic rebuilding, setting a whole new goal, meaning and tasks for the school system. Our school system lags the revolutionary changes in science and technology, the original structure and classification of sciences, the emergence of qualitatively new features and branches of knowledge, especially the altered relationship between science and practice. Today it is becoming increasingly clear that these emerging tasks cannot, in any case, be solved by existing methods and means of pedagogy. It also means that new pedagogical research is based on the agenda of the day, which must be found on the principle of new methodological and methodological means, the results of logic, cybernetics and general system theory.

The use of a model case for innovation for a specific company is based on the fact that the model presents a particular object or system that is understood from a certain point of view. The model case that we present is based on a summary of information obtained, where we want to verify the accuracy of previously known facts, which allows to answer research questions. The model case may not always be answered. In this article, we did not use a standard questionnaire survey as a research method, as all questionnaires are marked by subjectivity in the way of evaluation by respondents and thus the credibility of the output data of the questionnaire. Therefore, we chose a model approach, which is a more demanding, professional and credible procedure and through a questionnaire survey. At the same time, we used other suitable scientific methods. The examined model cases form a suitable output for the design and recommendations of innovations in the food industry.

Conclusion

Applying innovation potential is an important part of business management and the basis for the growth of the company's competitiveness. For this reason, businesses need to pay increased attention to innovation and their individual information and assessments, which they acquire and can use in managing business development and in choosing the next strategy.

The economic aspects of the company innovation potential should become an integral part of financial management and decision-making also in the conditions of these companies. It should become an instrument that enables SMEs to know their competitiveness and financial possibilities better, but also to understand how to develop trends.

Loss of competitiveness causes economic tensions in business practice, the increasing importance of maintaining or obtaining solvency, or the threat of bankruptcy, increasingly emphasizing the management and analysis of the company financial and economic situation.

It is only a matter of time before the measurement - assessment of business innovation becomes an element of the standard management and decision-making process in the practice of small and medium-sized enterprises, and not just the necessary turning point to satisfy creditors, curious investors or shareholders.

Management of each business entity should pay increased attention to the economic aspects of the company innovation potential concerning the advent of information and communication technologies. It makes possible to simplify and streamline any human activity while drawing on recommendations and solutions for the future and the existence of the business.

In the EU countries, innovation and innovation development has become a priority. Innovation policy is mainly implemented at the national level, with most Member States having relatively large programs to support innovation. The aim of the European Commission for the Information Society and Entrepreneurship is to strengthen the role of European research to consolidate the scientific and research base. In this way, the achievement of the desired synergy effects from this combination will allow the EU to increase its overall competitiveness more significantly.

City Branding and Tourist Gaze: A Systematic Review in Tourism Research

Andriani KUSUMAWATI

Department of Business Administration, Faculty of Administrative Science,
Universitas Brawijaya, Malang, Indonesia, andriani_kusuma@ub.ac.id

Abstract

Topic of city branding has attracted significant attention in academics fields in the past view years. As many cities tend to compete globally in attracting tourism or investment, the concept of brand strategy is increasingly being adopted from tangible products and has been applied to city development in order to improve the value of city life. City branding helps increase the status of a place as a tourist destination, housing, or business location. There are many places are primarily labeled as tourist destinations, where urban tourism is one of the promptest growing segments of the world tourism market. Tourism is a "way of seeing" where business stages visual experiences and tourists consume them visually. Focusing on the gaze brings out how the organizing sense in tourism is visual. Therefore, this paper intends to discover the essence of city branding related to tourism and the "Tourist Gaze" theory, city image, and the relationship between city image and its influence on tourist visiting decisions. Large databases were selected to search for published articles related to urban tourism. Thereafter, the retrieved articles were categorized and analyzed. Finally, a theoretical framework was provided for future studies on city branding and tourist gaze theory.

Keywords: City branding, Tourist Gaze Theory, Urban tourism, Tourism.

Introduction

Competition between cities to obtain tourists is increasing (Selby 2004). For this reason, more and more cities are investing in city branding. The branding strategy used typically has a dual purpose (Jansson and Power 2006): cities highlight the material characteristics of places for example buildings and events, or their non-material aspects, for example, stories, slogans, and logos. Like this, cities expect to distinguish themselves from rivalry and attract tourists. In this case, city branding can be a useful method for building tourist images. The idea of "Brand city" is one of the concepts applied in business administration and transferred to city literature. To make cities center of attraction and to provide competitive advantage are of the fundamental aims of the city's branding process. In this sense, city branding is a vision. Cities might be successful depend on the way they manage this process with a good strategic approach, determine their route map for the needs of the city by identifying their existing situations in its whole reality, observe it and monitor its results and revise their plans.

City branding can be seen as a process of differentiating and diversifying, in which local tourism organizations, cultural and artistic facilities, museums, historic conservation groups join and build the image of a place, helping in generating tourist sites with a common goal of attracting consumers and investment to a particular place. This process involves two main components, namely: (1) Making a place or building a city, (a process that makes a particular place more attractive) and (2) Imaging of the city or place (the process of promoting a place), (Anholt 2008; Avraham and Ketter 2008; Kavaratzis 2004). The main purpose of a city image is to give the impression of a particular city through perception, depend on the identity of the place and of course by understanding the local culture of the place. However, city branding is more than just the promoting and marketing of places, which is about building and reshaping

the image of the city from historical architecture and roads throughout the city, the image of the city heard or read, the art produced by its inhabitants, thereby attracting targeted consumers and maximizing consumer spending at the city. Therefore, city branding aims to: (1) develop new ways to communicate the city image; (2) achieving competitive advantage, and (3) strengthening the city's reputation, as well as increasing its economic welfares.

Building a good city image is an important mix of activity and structure. As successful brands benefit beyond the physical aspects of the city, there is an intense need to process visual images into unique brand images through clear strategies. As stated by Ashworth and Kavaratzis (2009), "city branding must be linked to the main things people must know about a place". Thus, the process of creating a brand requires the image produced by the media; urban brand project; city life, historic buildings, important architectural signatures, and the overall shape of the city, and should be synchronized with the main target's focus on how to develop a brand (tourism, investment, attracting new residents).

According to Költringer and Dickinger (2015), research in city branding, place marketing, and city image has received great attention among researchers and industry circles. The city sightsee in several aspects has produced added value with respect to the way city space is presented, which in turn will give a meaningful view to the viewers as well as provide added value in an effort to increase city branding. Initially, the concept of city branding was only used by city marketing professionals. This study seeks to find a relationship between the role of urban space on city image in increasing the competitiveness of cities, both in terms of physical and non-physical aspects.

However, up to now there is still limited research on strategies to build the city image in accordance with the established city branding, as well as efforts that can be done by the city to attract tourists and residents attention or in other words the factors causing a city can turn into a 'magnet' of tourists through the 'tourist gaze' theory approach (Urry 1990). Therefore, this paper presents the results of a systematic literature review of city tourism area and the role of city branding as a valuable tool for developing tourist gaze. The purpose of a systematic literature review is to systematically collect, document, examine and critically analyze previous research literature on marketing, city tourism, and city branding.

Literature Review

A brand is an identity that inherent in a product or service. Brands are also used in the area of tourism to give an identity to an area in order to have its own characteristics namely city branding. According to Anholt in Moilanen and Rainisto (2009), city branding is the management of a destination the image through strategic innovation and coordination of economic, social, commercial, cultural, and government regulations. They stated that city branding is a process or effort to create a brand of a city to make it easy for city owners to introduce their city to the target market (investors, tourists, talent, events) by using positioning sentence, icon, slogans, exhibitions, and various other media. Region brands are defined as marketing activities to promote a positive image of a tourist destination in order to influence consumers' decisions to visit the place (Blain, Levy, and Ritchie 2005).

Over the year, city branding evolved into various approaches. There are several approaches regarding city branding from various scientific fields. Kavaratzis (2004) views city branding in the context of communication from the image of a city through three stages of communication, namely primary, secondary, and tertiary. While Rainisto (2003) explains the place branding theory framework that focuses on efforts to market the city. Based on the explanation, it can be concluded that city branding is a strategy to market a region through economic, social, commercial, cultural, and government regulations to introduce the city to the target market.

According to Murfianti (2010), city branding is widely used by cities around the world in an effort to improve or change the image of a city by highlighting the advantages and uniqueness of the area. The benefits gained in implementing city branding are: (1) the area is widely known (high awareness),

accompanied by good perception; (2) considered appropriate for specific purposes; (3) It is considered appropriate for investment sites, tourist destinations, residential destinations, and organizing activities/events; and (4) perceived as a place with high prosperity and security.

On the other hand, a British sociologist, John Urry, develops a theory on why tourist travel for leisure and why they visit certain places in his book 'The Tourist Gaze' (Urry 1990, 2002). He convinces that city tourism without graphic images is hardly conceivable. Urry's theory of "Tourist Gaze" comes from the necessity for people to have a fun atmosphere, leave their daily activities and travel. This kind of trip usually raises the need for various things, both goods and services that they usually do not need in everyday life. Tourist pay for these things because they search for pleasure experiences that are considerably distinctive from their daily lives. These different experiences include views about various spaces and landscapes of the city and the atmosphere of life that they do not see in everyday life. While visiting a new place, they might look at the new environment with enthusiasm and with great curiosity. This illustrates how a person appreciates or at least considers places to visit. The initial concept of 'gaze' comes from a pure human perspective. Humans see the world through filters in the form of ideas, skills, joy, and hope, all of which are limited by social class, gender, nationality, age, and education (Berger 1972). Viewing in certain circumstances can also be conditioned individually by one's experience and memory, and is limited by habits and styles such as the circulation of images and writing in other spaces and places of the same type (Urry 2002).

In fact, the views do not merely belong to tourists who come to visit the city. On the contrary, everyone has their own views (Maoz 2006). Tourists have their own views about a city and the way people behave. City residents also have their own views about visitors coming to their city. None of them is more dominant or dominant since they are interrelated together (Cheong and Miller 2000). Urry (2002) argues that photography provides an increase in taste, especially in terms of sensory perception for instance sight, touch, aroma, and hearing. This leads to location and the phenomenon of dislocation in the feeling of space and the experience of being in space (Bruno 2002). Mahn (2014), in his study found that tourists already have a virtual picture of life in the location they will visit when they first arrive in Greece. That proved true because many of them brought two important things when visiting Greece, namely a travel guide book and a pair of glasses to watch the opera (Mahn 2014). A tourist's gaze distinguishes "seeing" from gaze or "gazing"; for example, the world can see the city through the view of an architect as a historic city because of the many heritage buildings in the city. This view is limited by social class, gender, nationality, age, and education (Urry and Larsen 2011). There is no universal tourist gaze (Urry 1990, 2002) and they have been manipulated to do so by a variety of multimedia channels constructing that gaze and those are enable be avoided, such travel websites, blogs and public photo-sharing sites (Hospers 2009). To facilitate the compilation of conceptual writing of this idea, the paper presents previous research that is in line with the design that is the focus of this study.

Research Method

This research employed a systematic review type of study in the area of interest. A systematic approach to literature review seeks to obtain a systematic overview of research publications. Such approach prioritizes empirical studies that are relevant to specific questions. Overall this systematic review uses data from major studies in areas of interest rather than from direct experiments. This literature review was conducted by analyzing academic journal articles in the scholarly journal namely: ScienceDirect, ProQuest, Emerald, and Google Scholar databases according to the interest keywords of the research. The subject areas of business administration and marketing, tourism and hospitality was used to define the scope of journals as the literature sources. Search strategies use search terms, such as "city branding", "place branding", "destination branding", "tourist gaze". The word "gaze" or "gazing" that appearing in the title, abstract and keywords were also scrutinized. Additionally, internet searches were also carried out to identify other publications and secondary references by the authors identified in previous searches.

Publication searches between 1990 and 2019 were completed to identify relevant studies that thoroughly explored the tourist gaze theory that became a reference in this further research. To facilitate a systematic analysis, with a possibility of using quantitative data, this search also focused on research-published articles in academic journals (Green and Hall 1984). Articles published in academic journals also assure a peer-reviewed quality, which is not the case with books and other non-academic material. It was decided to limit articles to those published after 2004 since these articles would be more relevant for this current global tourism trends. For the purposes of this article writing, publications on city branding related to tourist gaze criteria were reviewed and classified based on the paper structure. This includes the main objectives, types of study identified by the systematic review process, for example, whether qualitative or quantitative, data collection methods, samples, and data analysis methods. Findings from empirical studies were identified for review based on themes that emerged during the analysis, as well as the discussion part, and followed by recommendations. The first search process identified 150 papers that coverage journal articles and conference proceeding. Also, each of the papers was screened to verify that its content was pertinent to this paper purposes.

Findings and Discussion

Currently, urban tourism is one of the fastest growing world tourism market segments. The growing number of travel applications guided tourist trips around cities in the world is becoming increasingly popular. City trips organization and planning has become a part of more than half of the world's consumers by organizing their holidays through travel applications. Owing to this phenomenon, more cities are trying to invest in their city branding to attract those tourist segments. In their Research Report on the Nordic Innovation Center in Oslo, with the tittle "Image of the City: Urban Branding as Constructed Capabilities in Nordic City Regions", Jansson and Power (2006) states that branding strategies commonly used usually have a dual purpose namely material characteristics of places such as buildings and events, or immaterial characteristics such as stories, slogans and logos to distinguish the city itself from competition and attract tourists.

Indeed, city branding can be a useful tool in building tourist perception regarding the image of the city. However, actually how does this image building work? What can the city really do to attract attention? Why, for example, Rome, Paris or Venice are turning into tourist magnets? To better understand the phenomenon of why tourists prefer some cities over others, which may have the same historical value, the "tourist gaze" theory by Urry (2002), will be explored. The "tourist gaze" theory developed through the support of mass tourism which was triggered by the increase in the airway budget. At the same time, the similar thing happens to new industries, which are based on information technology, and are run by tourism and travel agents. According to MacCannel (1999), the increasing number of images that spread allows "site" to "sight" or a place to become a meaningful location. Tourists start visiting the church not for religious purposes but to take pictures at that location. In fact, something that is somehow special in a particular city is able to attract tourists. The most popular items are seen differently from what people usually encounter at home or at work, in terms of scale, meaning, or experience.

Tourists visit the city to gaze at objects built in the city environment. Based on Lynch's (1960) research, it is stated that most of the individual's perceptions about cities are as packages consisting of objects such as: patches (roads, railways, places where people travel); district edge (part of the city) with characters such as settlements, neighborhoods, etc.) nodes or vertices (strategically located meeting places such as squares, street corners, etc.); landmarks (special objects serve as general reference points). Lynch (1960) also found that the passages of the city that passed had the effect of making the image of the city stronger for humans, some cities were easier to remember than others. For tourists, edges and landmarks in particular have more functions to lift the image of the city, because it is more interesting, and easier to notice and remember.

Although the "tourist gaze" theory of Urry (2002) did not examine in the context of the city image, however, the notion of the tourists views is a lot of relevance to cities that want to build an image and

attract tourists. Therefore, if people visit places mainly because of photographic images, then the image of the city itself could help in providing and distributing these images. City branding can be a powerful tool in building a positive and trusting tourist outlook in providing experiences that resemble the images used in city branding. Although there is a pragmatic view of historical and socio-cultural reasons (Morgan, Pritchard, and Pride 2004), city branding is able to offer hope and possibilities for every place, town, city, village, region that is less well known for offering anything special.

In addition, tourists visit a city because they associate it with someone's personality, such as a famous painter, musician, writer, or others. It is not uncommon to claim sites that have special relationships with famous individuals are the result of city image. Thus, Ashworth (Ashworth and Kavaratzis 2009) calls this brand technique Gaudi Gambit after the creation of a successful Barcelona brand with its architect and designer Gaudi. Painter and music are the right icons for a city, whether related exclusively to the place in question or not. From a literature review with the intention of identifying the main study conducted on city branding from 2004 to June 2016, it is known that the current literature is typically limited to studies that focus on dimensions for example, negative and positive assets (Kerr and Johnson 2005); tangible and intangible elements in small town (Parkerson and Saunders 2004); physical and economic environment, culture, activities and facilities, psychological elements (Cheng and Taylor 2007; De Carlo et al. 2009; Hankinson 2004; Laaksonen et al. 2006), and logo design (Hayden and Sevin 2012), calling for the needs to bring a new approach to the topic. Regarding the site of study, predominantly the city branding research were conducted in the Europe and western countries. Table 1 specifies a brief of city branding surveys from various countries.

Existing research on city branding initiate from the fields of marketing and urban studies, focus to follow parallel directions rather than interdisciplinary paths. However, study also shows that marketing and branding methods can also be employed to overcome negative opinions about a city. Hence, Urry agrees and comments that interest in tourist views has shifted over the years. This has been seen through theoretical lens changes such as for example. Visual theories, postmodernism, and new paradigms of mobility and empirical reality (eg, media saturation, globalization, the peak of oil, and changes in advertising). Urry views that how the sustainability and existence of a wide and globalized tourist outlook. He suggested that future research regarding the views of tourists should explore ways in which it could be localized and de-exotic and more virtual. There is a need to find out the views of tourists globally. Meanwhile Urry also emphasized the need to examine how the increasing number of non-Western tourists as seen seems to be a total focus on Western tourists. There have been several studies on how Asian tourists gaze and they all suggest that the views of tourists as explained earlier. Table 2 explained some focal research related to tourist gaze topic. However, from those papers, only few researches associated to the concept of city branding.

Given the number of low-cost transportation operators, city travel is becoming increasingly popular. Clearly, competition between cities for tourists has increased (Huang, King, and Suntikul 2017). Because of this phenomenon, more cities are trying to invest in designing city branding. In designing city branding, the concept of tourist gaze theory is inseparable from it. City branding is also influenced by photography taken by tourists, who not only seeing objects taken in photographs but also the reasons for taking photos based on the objectivity of the images as memories to be shared by tourists with their friends and colleagues or even as a reason to revisit. There are some reasons that are seen from the psychological and sociology of the photographer as shooting. In the literature, three main categories of urban image carriers have been identified: the built environment, events characteristic and well-known personalities (Lynch 1960). This makes several views. First, tourists visit the city to see objects in an artificial environment. Based on extensive empirical research in American and European cities, Lynch (Lynch 1960) and his followers argue that most individuals view a city which is largely a set of objects that are built. Tourists also direct their gaze to the characteristic events that take place in the city. Some events repeat every year, while others only occur once. A city cannot only identify with activities organized during an event (for example, music, art or sports), but also show its organizing capacity with hosting it. Although the benefits of a typical event for the local economy are mostly too high, the impact on the local image can be very large.

Gillespie (Gillespie 2006) states in its issue of “Annals of Tourism Research”, the act of photographing places that are no longer used, the way is turned into a scene: thus tourists visit the church, not to pray, but to take pictures (Gillespie 2006) looking at the phenomenon as a sacralized site that has become the engine behind tourism, in an effort to become an expected place, the tourism industry has thus produced many pseudo authentic attractions (Richardson and Armitage 2012). Urry reports that not all mass tourism tourists are forms of tourism that involve tens of thousands of people going to the same resort at the same time and year (Urry and Larsen 2011). City branding can be a powerful tool in building a positive and trusting tourist outlook in providing experiences that resemble the images used in their branding. Despite a pragmatic view, regarding historical and socio-cultural reasons (Abbasian 2019), city branding can offer hope and possibilities for every place, town, town, village, region that suffers from not offering anything special.

As mentioned earlier, tourists tend to visit cities because of associations with personalities, such as famous artist, where very often, place affiliations with those individuals may tend to be the result of city

branding. Hospers (Hospers 2009) noted that for city brands, tourists are an attractive target group, especially in terms of urban and cultural tourism, seen as a growing market, where tourists are quite responsive to their branding techniques (Hospers 2009). Tourist gaze theory by Urry shows that people visit cities to see the truth, looking for certain features in the urban landscape that have been presented to them through pictures (Urry and Larsen 2011). This theory explains the effects that strengthen themselves in cities that become tourism magnets, such as Venice, Paris, New York, and others. Cities that can be seen that already have their image in the eyes of the public are attracting even more attention to well-known facts. Conversely, cities that have no effect must prevent the emergence of visual excess for tourist views, building stronger tourism images through new tourism facilities (Hospers 2009).

In the impetus to create a city brand, many city governments tend to support the importance of aspects of the local population, where this group is largely ignored in the process of building a city brand. However, the number of stakeholder groups with an interest in cities is potentially unlimited (Stone and Nyaupane 2018). Yet, in building a brand that must be admired by tourists and other short-term visitors, in many cases the population is neglected, regardless of their important role as loyal supporters. Thus, residents must be considered as a key factor in establishing an identity for city branding, a credible, attractive, and sustainable identity in the minds of stakeholders (Cohen 2011). Tourists may visit the city since they associate it with a personality as a famous person at the city. Often, place claims have special links with named individuals that are the result of city branding.

Conclusion and Recommendation

The city branding topic has attracted remarkable attention in certain scholars and policy makers. Because numerous cities are likely to compete worldwide in attracting tourist, investment or talent, the concept of brand strategy is increasingly being adopted from commercial advertisements and has been applied to the development of cities, regeneration and quality of city life. Previously published study on city branding derive from the disciplines of marketing and urban studies, tending to follow parallel directions rather than interdisciplinary paths. The parallelism drawn between city branding and tourist gaze has attracted the attention of many researchers back in recent years, due to the complexity and mobilization of theories by Urry in accordance with social psychology in marketing to tourists later. At this point the complexity of a city brand is determined by its accountability to address the broad spectrum needs of different target groups, and which may be different, from tourists, sports enthusiasts, fashion consumers and residents. However, research also shows that marketing and branding techniques can also be used to overcome existing negative perceptions about a city. Therefore, continued research has major challenges for cities that have independent branding and revolve around the issue of how to develop strong brands or umbrellas that can be coherent in different fields of activity with different target audiences. In addition, the target audience of city is varying from residents, potential investors, tourists and stakeholders or policy maker.

Ecology: Between Ethical and Economic Reasons. The Attitude of Accounting Students Towards Pope's Francis Theses Formulated In "Laudato Si'" Encyclical

Marta NOWAK

Wroclaw University of Economics and Business, Wroclaw, Poland
marta.nowak@ue.wroc.pl

Abstract

The study investigates accounting students' attitudes to the pope's Francis ecological theses formulated in "Laudato Si" encyclical. It confronts their ethical and economic assessment of its statements. The results prove the dissonance between the moral and economic perception of theses formulated in "Laudato Si'". The attitude towards them is more favorable when the ethical approach is taken rather than the economic one. The theses which are given the highest ethical assessment are characterized by clearness, concreteness, being easy to imagine, affecting respondents, and relating to their self-interest. The statements which are given the highest economic assessment are characterized by the use of economic terms (such as costs, risks, results) and relation to structures, processes, and infrastructure. The differences between ethic and economic assessment of pope Francis "Laudato Si'" theses can be attributed mostly to the explicit or implicit liberal economy and free-market assumptions of accounting education offered at business and economics universities.

Keywords: "Laudato Si'", ecology, accounting students, accounting education.

Introduction

Global and local ecological problems nowadays are becoming crucial not only for ethical but also for economic reasons. The most significant health, social, and economic challenge of today's world is to stop COVID19 and its influence on all aspects of the lives of single persons, societies, and humankind. Furthermore, the pandemic itself is attributed to many reasons, but lack of sustainability and ecological approach is one of the most important causes. For many decades economic education treated sustainability and ecologic issues as less serious matters. Wildlife preservation, moderate resource use, and decrease of rubbish and pollution were treated as the domain of biology, medicine, and technical sciences. The manifestation of ecological issues at business and economic schools and universities was scarce. The accounting education included those problems only from non-financial reporting, which is usually treated by accountants, auditors, and accounting educators as far less significant than financial reporting.

Surprisingly, the relations between ecology, ethics, and economics are widely discussed in a book of a religious character, namely encyclical of pope Francis, titled "Laudato Si'" (2015), which has the status of a Vatican document. The encyclical points out different problems of how people treat wildlife, natural resources, and other human beings and shows many deep cause-effect relations which manifest not only in the field of sustainability but also in economic and social life. In this manner, encyclical goes far above one-religion only character and becomes the source of exhibiting deep concern about humankind, wildlife, and its preservation and quality of people's life

Hypotheses Development and Research Method

Stankiewicz (2003) describes ecological philosophy (eco-philosophy) as a relatively new current of thought formulated in the 2nd half of the XXth century. It encompasses many concepts. They can be distinguished by the effort of changing the predominant cultural and scientific modern paradigm of nature, according to which it should be treated as a passive, supine, non-living object, into a perception, which encompasses human beings and nature as co-existing unity.

According to Hull (2006a, 2006b, 2012), the eco-philosophy has mostly two meanings. One of them relates mainly to ecological movements, and the second one concerns the academic way of understanding, defining, explaining, and evaluating and relates to the world, human beings, and their relations.IN the view of Dołęga (2006a, 2006b), eco-philosophy, as a science, encompasses different fields, such as general philosophical matters, anthropological matters, axiomatic matters, educational matters.

Tyburski (2006) argues that in the great mission of stopping nature degradation, many sciences should take effort. Technical and technological intervention is needed. Biology, the economy, and the law should be engaged. Moreover, humanists have a role to play. The humanistic approach to environmental preservation is called ecological humanism. It encompasses, as its integral elements, philosophical-ethical thought and co-exists with other humanistic disciplines, such as eco-pedagogy, eco-psychology, eco-esthetics, and eco-theology.

Eco-philosophy was incorporated into business mostly by such trends in economics and management and business as sustainable development and stakeholders' inclusion). In accounting, it became present with the necessity (or fashion) of making environmental and corporate social responsibility reports.

There is a vast amount of studies (Andon et al 2015, Brown et al. 2015, Chen et al. 2007, Ferguson at al. 2005, Ferguson at al. 2007 , Gray 2001, Gray et al 1995, Gray et al 1996, Gray et al 1997, Greenwood 2007) concerning the needs of incorporation of stakeholders' points of view (which often relates to ecological issues) into the company's action, including measurement and reporting. Regardless, the practice shows that in business such a trend is treated more as a public relation technique or legal obligation than as genuine care about the environment, sustainable growth, and responsibility towards different groups, which can be affected by the company's actions. Moreover, the managers and accountants produce more and more documents, such as social corporate responsibility reports, environmental reports, etc. Nevertheless their content is often very unclear, and a large amount of numbers makes the understanding of the real influence of the company's actions on the environment and society impossible. Often the reports relating to ecological issues are perceived in accounting departments as "necessary evil", as something that must be done but does no sense. Therefore motivation of this study emerges from the problems related to the gap between ecological, moral awareness and perceived lack of economic sense of some ecology-related actions. The research bases on the Pope Francis "Laudato Si'" as it is a complex document, formulating many ecology-related theses, which makes it possible to construct research based on those postulates. Moreover, it also encompasses social and economic problems related to sustainability issues.

The purpose of the paper is to identify the attitude of accounting students towards the theses of pope Francis encyclical letter "Laudato Si'". The hypotheses are the following:

1) The accounting students exhibit re is the strong agreement with "Laudato Si'" statements from the ethical point of view.
2) The accounting students exhibit re is the strong agreement with "Laudato Si'" statements from the economic point of view.
3) There is a dissonance between moral and economic attitudes of accounting students toward attitudes towards "Laudato Si'" theses.

In order to investigate the attitudes toward the encyclical theses, I have selected the typical statements from the encyclical. I have chosen only the statements without explicit religious connotations. The reason was to prevent the assessment from being influenced by respondents' religiousness or attitudes towards the pope. The list of selected theses is presented ion table 1. Some statements were adjusted to the needs of the survey (e.g. they were shortened, or their grammar format was changed). However, their merit remained unchanged.

Table 1: Statements selected from "Laudato Si'" for analysis

Number of statement	Article in encyclical	Statement
1	164 I	An interdependent world not only makes us more conscious of the negative effects of certain lifestyles and models of production and consumption which affect us all; more importantly, it motivates us to ensure that solutions are proposed from a global perspective, and not simply to defend the interests of a few countries.
2	165	Technology based on the use of highly polluting fossil fuels – especially coal, but also oil and, to a lesser degree, gas – needs to be progressively replaced without delay.
3	170	The countries which have benefited from a high degree of industrialization, at the cost of enormous emissions of greenhouse gases, have a greater responsibility for providing a solution to the problems they have caused.
4	172	For poor countries, the priorities must be to eliminate extreme poverty and to promote the social development of their people.
5	172	Poor countries need to acknowledge the scandalous level of consumption in some privileged sectors of their population and to combat corruption more effectively.
6	172	Poor countries are bound to develop less polluting forms of energy production, but to do so they require the help of countries which have experienced great growth at the cost of the ongoing pollution of the planet.
7	172	Taking advantage of abundant solar energy will require the establishment of mechanisms and subsidies which allow developing countries access to technology transfer, technical assistance and financial resources, but in a way which respects their concrete situations.
8	172	The compatibility of infrastructures with the context for which they have been designed is not always adequately assessed.
9	173	Relations between states must be respectful of each other's sovereignty, but must also lay down mutually agreed means of averting regional disasters which would eventually affect everyone.

10	174	What is needed, in effect, is an agreement on systems of governance for the whole range of so-called “global commons”.
11	175	It is essential to devise stronger and more efficiently organized international institutions, with functionaries who are appointed fairly by agreement among national governments, and empowered to impose sanctions.
12	177 II	The limits which a healthy, mature and sovereign society must impose are those related to foresight and security, regulatory norms, timely enforcement, the elimination of corruption, effective responses to undesired side-effects of production processes, and appropriate intervention where potential or uncertain risks are involved.
13	177	There is a growing jurisprudence dealing with the reduction of pollution by business activities. But political and institutional frameworks do not exist simply to avoid bad practice, but also to promote best practice, to stimulate creativity in seeking new solutions and to encourage individual or group initiatives.
14	180	On the national and local levels, much still needs to be done, such as promoting ways of conserving energy.
15	180	There should be favoring forms of industrial production with maximum energy efficiency and diminished use of raw materials, removing from the market products which are less energy efficient or more polluting,
16	180	There should be improvement of transport systems, and encouragement of the construction and repair of buildings aimed at reducing their energy consumption and levels of pollution.
17	180	Political activity on the local level could also be directed to modifying consumption, developing an economy of waste disposal and recycling, protecting certain species and planning a diversified agriculture and the rotation of crops.
18	180	Agriculture in poorer regions can be improved through investment in rural infrastructures, a better organization of local or national markets, systems of irrigation, and the development of techniques of sustainable agriculture.

19	180	New forms of cooperation and community organization can be encouraged in order to defend the interests of small producers and preserve local ecosystems from destruction.
20	181	Continuity is essential, because policies related to climate change and environmental protection cannot be altered with every change of government. Results take time and demand immediate outlays which may not produce tangible effects within any one government's term.
21	183 III	Environmental impact assessment should not come after the drawing up of a business proposition or the proposal of a particular policy, plan or program.
22	183 III	Environmental impact assessment should be part of the process from the beginning, and be carried out in a way which is interdisciplinary, transparent and free of all economic or political pressure. It should be linked to a study of working conditions and possible effects on people's physical and mental health, on the local economy and on public safety. Economic returns can thus be forecast more realistically, taking into account potential scenarios and the eventual need for further investment to correct possible undesired effects.
23	183 III	A consensus should always be reached between the different stakeholders, who can offer a variety of approaches, solutions and alternatives. The local population should have a special place at the table; they are concerned about their own future and that of their children, and can consider goals transcending immediate economic interest.
24	183 III	We need to stop thinking in terms of "interventions" to save the environment in favor of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.

25	184	We need to stop thinking in terms of “interventions” to save the environment in favor of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.
26	185	In any discussion about a proposed venture, a number of questions need to be asked in order to discern whether or not it will contribute to genuine integral development. What will it accomplish? Why? Where? When? How? For whom? What are the risks? What are the costs? Who will pay those costs and how?
27	186	Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a pretext for postponing cost-effective measures which prevent environmental degradation. Here the burden of proof is effectively reversed, since in such cases objective and conclusive demonstrations will have to be brought forward to demonstrate that the proposed activity will not cause serious harm to the environment or to those who inhabit it.
28	187	In case of technological innovations the profit cannot be the sole criterion to be taken into account, and that, when significant new information comes to light, a reassessment should be made, with the involvement of all interested parties. The outcome may be a decision not to proceed with a given project, to modify it or to consider alternative proposals.
29	189 IV	Politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy.
30	189	In view of the common good, there is urgent need for politics and economics to enter into a frank dialogue in the service of life, especially human life.
31	190	Environmental protection cannot be assured solely on the basis of financial calculations of costs and benefits. The environment is one of those goods that cannot be adequately safeguarded or promoted by market forces.
32	191	Decrease in the pace of production and consumption can at times give rise to another form of progress and development.
33	191	Efforts to promote a sustainable use of natural resources are not a waste of money, but rather an investment capable of providing other economic benefits in the medium term.

34	191	More diversified and innovative forms of production which impact less on the environment can prove very profitable.
35	192	A path of productive development, which is more creative and better directed, could correct the present disparity between excessive technological investment in consumption and insufficient investment in resolving urgent problems facing the human family. It could generate intelligent and profitable ways of reusing, revamping and recycling, and it could also improve the energy efficiency of cities.
36	192	Productive diversification offers the fullest possibilities to human ingenuity to create and innovate, while at the same time protecting the environment and creating more sources of employment. Such creativity would be a worthy expression of our most noble human qualities, for we would be striving intelligently, boldly and responsibly to promote a sustainable and equitable development within the context of a broader concept of quality of life.
37	193	In any event, if in some cases sustainable development were to involve new forms of growth, then in other cases, given the insatiable and irresponsible growth produced over many decades, we need also to think of containing growth by setting some reasonable limits and even retracing our steps before it is too late.
38	193	Unsustainable is the behavior of those who constantly consume and destroy, while others are not yet able to live in a way worthy of their human dignity. That is why the time has come to accept decreased growth in some parts of the world, in order to provide resources for other places to experience healthy growth.
39	193	Technologically advanced societies must be prepared to encourage more sober lifestyles, while reducing their energy consumption and improving its efficiency
40	194	For new models of progress to arise, there is a need to change models of global development; this will entail a responsible reflection on “the meaning of the economy and its goals with an eye to correcting its malfunctions and misapplications.

41	195	Only when the economic and social costs of using up shared environmental resources are recognized with transparency and fully borne by those who incur them, not by other peoples or future generations, can those actions be considered ethical.
42	196	We should keep in mind the principle of subsidiarity, which grants freedom to develop the capabilities present at every level of society, while also demanding a greater sense of responsibility for the common good from those who wield greater power.
43	196	Today, it is the case that some economic sectors exercise more power than states themselves. But economics without politics cannot be justified, since this would make it impossible to favor other ways of handling the various aspects of the present crisis.
44	197	What is needed is a politics which is far-sighted and capable of a new, integral and interdisciplinary approach to handling the different aspects of the crisis.
45	197	A strategy for real change calls for rethinking processes in their entirety, for it is not enough to include a few superficial ecological considerations while failing to question the logic which underlies present-day culture. A healthy politics needs to be able to take up this challenge.
46	198	Politics and the economy tend to blame each other when it comes to poverty and environmental degradation. It is to be hoped that they can acknowledge their own mistakes and find forms of interaction directed to the common good.

Source: own elaboration based on Encyclical Letter Laudato Si' (24 May 2015) of the Holy Father Francis on Care of our Common Goods

After constructing the list of selected statements I asked the group of accounting students to assess the selected statements on the five-point Likert's scale (were 1 point meant "I totally disagree", 2- "I rather disagree", 3 – "I neither agree nor disagree", 4 – "I quite agree" and 5 – "I strongly agree"). The students were to assess the statements in two aspects: ethical and economical one. The students were not informed that the sentences were taken from pope encyclical. The reason for that was to prevent the answers from being formulated on the basis of respondent's personal attitude to the pope or his popularity.

The research was conducted among the students of the third year of bachelor studies of Wrocław University of Economics and Business majoring in accounting. The characteristic of the group is presented in table 2.

Table 2: Group of respondents

Respondents	Male	Female	Total
Number	14	42	56
Percent	25%	75%	100%

Source: own elaboration

As can be seen, 75% of respondents are female, and ¼ of the group is male. It is a typical situation for Poland, where both accountant's profession and accounting studies are feminized. It as discussed in various research papers and books. Some of them (Masztalerz 2018, Kabalski et al 2015) analyzed the phenomenon of Polish accounting feminization directly, and some of them (Nowak 2017, Nowak 2018, Nowak 2019) just were made on the groups of accounting professionals or students, and the respondents turned out to be predominantly female. Average age of respondents was 21 years old.

Results

After the collection of answers, for each sentence, the mean assessment was calculated. The results of ethical attitudes are presented in table 3, starting from the most popular thesis, which is characterized by the highest agreement, to the least popular one, which is characterized by the west agreement.

Table 3: Ethical attitudes towards statements

Number of statement	Article in encyclical	Statement	Mean assessment from an ethical point of view
14	180	On the national and local levels, much still needs to be done, such as promoting ways of conserving energy.	4,88

29	189 IV	Politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy.	3,38
11	175	It is essential to devise stronger and more efficiently organized international institutions, with functionaries who are appointed fairly by agreement among national governments, and empowered to impose sanctions.	3,21

Source: own elaboration

Table 4 presents the division of theses into these, which assessment was higher than average (which means that for a 1-5 Likert scale, the mean assessment was higher than 3), average (mean equal 3), and lower than average (lower than 3). As can be observed, moral attitudes towards encyclical statements were highly positive when formulated from the moral point of view.

Table 4: Assessment of statements from the moral point of view

Assessment of statements	**higher than average**	**100%**
	average	0%
	lower than average	0%
	total	100%

Source: own elaboration

As presented in tables 3 and 4, all statements are assessed higher than neutrally when evaluated from an ethical point of view. There is a general high agreement with ecological theses included in pope's encyclical Laudato Si. Therefore accounting students acknowledge the moral significance of ecology-related actions and appreciate the care for the environment as highly moral.

There are also ten statements with a mean agreement above 4,5. The higher level of agreement (4,88) is related to the statement stating that on the national and local levels, much still needs to be done, such as promoting ways of conserving the energy. The statement is concrete and clear. Moreover, it can be applied to the macro-level (such as state or global) and personal level. Moreover, everybody can imagine different sources of energy and their promotion. The second statement in order of moral assessment (4,82) says that relations between state must be respectful of each other's sovereignty, but must also lay down mutually agreed means averting regional disasters which would eventually affect everyone. The statement connects with the question of international relations but also points out the problems which can emerge in each local community and affect everybody. Therefore once more, every person can imagine some bad effects of lack of international agreements on ecology-related matters. The third statement amongst the most popular ones (mean equal 4,71) is that there should be improving transport systems, and encouraging the construction and repair of buildings aimed at reducing their energy consumption and levels of pollution. Again, this statement is very concrete. Moreover, every person, especially living in a city, can imagine, and usually suffers from problems with transport and pollution. Furthermore, it is obvious that during their studies, students are becoming inhabitants of the city characterized by a huge pollution and transport problem. Therefore we can guess that the statements with the highest ethical assessment are not only characterized by clearness and concreteness but also as a field of personal interest of respondents who can suffer from problems diagnosed in the statement and profit from the implementation of the solution presented in the statement. Therefore it should be stressed that this can be kind of proof that ethical attitudes are determined to a large extent by self-interest. The fourth statement (mean assessment 4,61) argues that for poor countries, the priorities must be to eliminate extreme poverty and to promote the social development of their people. Again, this sentence is formulated in quite a clear manner. Moreover, its content is near to the generally agreed-upon demand of the modern world. The next statement (4,61 as well) says that political activity on the local level could also be directed to modifying consumption, developing an economy of waste disposal and recycling, protecting certain species, and planning a diversified agriculture and the rotation of crops. Again, the statement is quite clear, and it can be argued that it is more recommending solutions than presenting problems. It also relates to the issues which are probably encountered by most of the respondents, such as recycling. Moreover, because in Poland for several years the rubbish collection services are more expensive, and their price

depends on the rubbish selection to make recycling more effective, people are more aware of the value and necessity of reducing rubbish. Again, the reduction of rubbish can be perceived as an ethical issue, but the strong agreement with the statement can be affected by self-interest. The next statement (4,59) says that continuity is essential, because policies related to climate change and environmental protection cannot be altered with every change of government; results take time and demand immediate outlays which may not produce tangible effects within any one government's term. The statement again is very concrete and clear and refers to things known to all citizens, such as irresponsible changes in sustainability politics with every government change. It also refers to things that are everyday bread for each accountant and accounting student, such as costs and their incurrence. The next statement (mean 4,57) says that view of the common good, there is urgent need for politics and economics to enter into a frank dialogue in the service of life, especially human life. The sentence again refers not only to sustainability matters but can be perceived as the question of the self-interest of each human-being. It also exhibits an anthropocentric view on ecology. The next statement (mean 4,55) says that politics and the economy tend to blame each other when it comes to poverty and environmental degradation; it is to be hoped that they can acknowledge their own mistakes and find forms of interaction directed to the common good. The statement is quite clear. For students who are young people, it also can be important that the argument refers to politics and economy, which both can stand for people who rule the counties, institutions, and syndicates and who can be perceived by the students as kind of opposite to them. The students can simply understand politics and economy as symbolizing "those on the top", unknown powerful people, whereas environmental degradation (manifesting by rubbish and pollution) and poverty (manifested by homeless people) are phenomena that can be encountered by each student. The students can even themselves feel like victims of the "war on the top" between politics and economics. The next statement (4,54) refers to changes: "A strategy for real change calls for rethinking processes in their entirety, for it is not enough to include a few superficial ecological considerations while failing to question the logic which underlies present-day culture. A healthy politics needs to be able to take up this challenge." This sentence is also quite clear for people who study at the university of business and economics. Although respondents specialize in accounting, they all learn management and strategic management; therefore, they are aware of the necessity of long-term view and holistic approach. The last statement assessed from an ethical point of view above 4,5 (with mean 4,52) says that in any discussion about a proposed venture, a number of questions need to be asked in order to discern whether or not it will contribute to genuine integral development. What will it accomplish? Why? Where? When? How? For whom? What are the risks? What are the costs? Who will pay those costs and how? The questions which are enumerated here are understandable to the economy and business students, especially students of accounting, esp. when it comes to costs and risks. Also, the formulated questions are aimed to identify the true beneficiaries of ventures versus people and societies who actually will suffer from the disadvantages of venture implementation. Therefore the ethical context is again quite clear.

Also, the least popular (although assessed above average) statements need commenting. However, it should be stressed that only 2 of them were assessed with a mean lower than 3,5. The lower ethical assessment (3,21) was given to statement that it is essential to devise stronger and more efficiently organized international institutions, with functionaries who are appointed fairly by agreement among national governments, and empowered to impose sanctions. It can be attributed to the fact that people, especially young ones, treat big institutions, such as organized international institutions, with a certain degree of suspicion and usually do not think the to be moral. Therefore giving them power does not seem to be a particularly ethical idea to some students. The second least popular statement (3,38) says that politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy. The lower assessment of this statement may probably be partly attributed to the fact that respondents were about to complete their economic studies; therefore, some think the economy is more important than politics. Also, there can be a question about self-prestige and self-importance and self-interest as well (future economists have aspirations of being those who are important, who govern, who set the rules for other people such as politicians).

Summing up the moral assessment of the content of "Laudato Si" encyclical several aspects of most popular theses can be distinguished. They are characterized by clearness and concreteness. The content is easy to envisage and imagine. Often they refer to the situations known by the respondents and reflecting some problems in their life. They also can be perceived from the self-interest of respondents themselves.

Table 5 contains statements and their assessment from the point of view of the economy. The list starts with the statement with the highest economic assessment and is organized according to the economic perception of statements.

Table 5: Economic attitudes towards statements

Number of statement	Article in encyclical	Statement	Mean assessment from an economic point of view
14	180	On the national and local levels, much still needs to be done, such as promoting ways of conserving energy.	4,41
26	185	In any discussion about a proposed venture, a number of questions need to be asked in order to discern whether or not it will contribute to genuine integral development. What will it accomplish? Why? Where? When? How? For whom? What are the risks? What are the costs? Who will pay those costs and how?	4,11
9	173	Relations between states must be respectful of each other's sovereignty, but must also lay down mutually agreed means of averting regional disasters which would eventually affect everyone.	3,86
8	172	The compatibility of infrastructures with the context for which they have been designed is not always adequately assessed.	3,79
45	197	A strategy for real change calls for rethinking processes in their entirety, for it is not enough to include a few superficial ecological considerations while failing to question the logic which underlies present-day culture. A healthy politics needs to be able to take up this challenge.	3,66
16	180	There should be improvement of transport systems, and encouragement of the construction and repair of buildings aimed at reducing their energy consumption and levels of pollution.	3,61
20	181	Continuity is essential, because policies related to climate change and environmental protection cannot be altered with every change of government. Results take time and demand immediate outlays which may not produce tangible effects within any one government's term.	3,61

25	184	We need to stop thinking in terms of “interventions” to save the environment in favor of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.	3,59
30	189	In view of the common good, there is urgent need for politics and economics to enter into a frank dialogue in the service of life, especially human life.	3,59
13	177	There is a growing jurisprudence dealing with the reduction of pollution by business activities. But political and institutional frameworks do not exist simply to avoid bad practice, but also to promote best practice, to stimulate creativity in seeking new solutions and to encourage individual or group initiatives.	3,57
46	198	Politics and the economy tend to blame each other when it comes to poverty and environmental degradation. It is to be hoped that they can acknowledge their own mistakes and find forms of interaction directed to the common good.	3,55
33	191	Efforts to promote a sustainable use of natural resources are not a waste of money, but rather an investment capable of providing other economic benefits in the medium term.	3,52
36	192	Productive diversification offers the fullest possibilities to human ingenuity to create and innovate, while at the same time protecting the environment and creating more sources of employment. Such creativity would be a worthy expression of our most noble human qualities, for we would be striving intelligently, boldly and responsibly to promote a sustainable and equitable development within the context of a broader concept of quality of life.	3,52
17	180	Political activity on the local level could also be directed to modifying consumption, developing an economy of waste disposal and recycling, protecting certain species and planning a diversified agriculture and the rotation of crops.	3,50

35	192	A path of productive development, which is more creative and better directed, could correct the present disparity between excessive technological investment in consumption and insufficient investment in resolving urgent problems facing the human family. It could generate intelligent and profitable ways of reusing, revamping and recycling, and it could also improve the energy efficiency of cities.	3,48
12	177 II	The limits which a healthy, mature and sovereign society must impose are those related to foresight and security, regulatory norms, timely enforcement, the elimination of corruption, effective responses to undesired side-effects of production processes, and appropriate intervention where potential or uncertain risks are involved.	3,46
34	191	More diversified and innovative forms of production which impact less on the environment can prove very profitable.	3,45
44	197	What is needed is a politics which is far-sighted and capable of a new, integral and interdisciplinary approach to handling the different aspects of the crisis.	3,39
24	183 III	We need to stop thinking in terms of “interventions” to save the environment in favor of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.	3,34
23	183 III	A consensus should always be reached between the different stakeholders, who can offer a variety of approaches, solutions and alternatives. The local population should have a special place at the table; they are concerned about their own future and that of their children, and can consider goals transcending immediate economic interest.	3,31
18	180	Agriculture in poorer regions can be improved through investment in rural infrastructures, a better organization of local or national markets, systems of irrigation, and the development of techniques of sustainable agriculture.	3,30

22	183 III	Environmental impact assessment should be part of the process from the beginning, and be carried out in a way which is interdisciplinary, transparent and free of all economic or political pressure. It should be linked to a study of working conditions and possible effects on people's physical and mental health, on the local economy and on public safety. Economic returns can thus be forecast more realistically, taking into account potential scenarios and the eventual need for further investment to correct possible undesired effects.	3,30
3	170	The countries which have benefited from a high degree of industrialization, at the cost of enormous emissions of greenhouse gases, have a greater responsibility for providing a solution to the problems they have caused.	3,29
19	180	New forms of cooperation and community organization can be encouraged in order to defend the interests of small producers and preserve local ecosystems from destruction.	3,29
21	183 III	Environmental impact assessment should not come after the drawing up of a business proposition or the proposal of a particular policy, plan or program.	3,25
28	187	In case of technological innovations the profit cannot be the sole criterion to be taken into account, and that, when significant new information comes to light, a reassessment should be made, with the involvement of all interested parties. The outcome may be a decision not to proceed with a given project, to modify it or to consider alternative proposals.	3,23
37	193	In any event, if in some cases sustainable development were to involve new forms of growth, then in other cases, given the insatiable and irresponsible growth produced over many decades, we need also to think of containing growth by setting some reasonable limits and even retracing our steps before it is too late.	3,23
4	172	For poor countries, the priorities must be to eliminate extreme poverty and to promote the social development of their people.	3,18
31	190	Environmental protection cannot be assured solely on the basis of financial calculations of costs and benefits. The environment is one of those goods that cannot be adequately safeguarded or promoted by market forces.	3,18

43	196	Today, it is the case that some economic sectors exercise more power than states themselves. But economics without politics cannot be justified, since this would make it impossible to favour other ways of handling the various aspects of the present crisis.	3,18
27	186	Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a pretext for postponing cost-effective measures which prevent environmental degradation. Here the burden of proof is effectively reversed, since in such cases objective and conclusive demonstrations will have to be brought forward to demonstrate that the proposed activity will not cause serious harm to the environment or to those who inhabit it.	3,14
40	194	For new models of progress to arise, there is a need to change models of global development; this will entail a responsible reflection on "the meaning of the economy and its goals with an eye to correcting its malfunctions and misapplications.	3,14
11	175	It is essential to devise stronger and more efficiently organized international institutions, with functionaries who are appointed fairly by agreement among national governments, and empowered to impose sanctions.	3,13
15	180	There should be favoring forms of industrial production with maximum energy efficiency and diminished use of raw materials, removing from the market products which are less energy efficient or more polluting,	3,11
42	196	We should keep in mind the principle of subsidiarity, which grants freedom to develop the capabilities present at every level of society, while also demanding a greater sense of responsibility for the common good from those who wield greater power.	3,11
7	172	Taking advantage of abundant solar energy will require the establishment of mechanisms and subsidies which allow developing countries access to technology transfer, technical assistance and financial resources, but in a way which respects their concrete situations.	3,07
32	191	Decrease in the pace of production and consumption can at times give rise to another form of progress and development.	3,05
39	193	Technologically advanced societies must be prepared to encourage more sober lifestyles, while reducing their energy consumption and improving its efficiency	3,02

41	195	Only when the economic and social costs of using up shared environmental resources are recognized with transparency and fully borne by those who incur them, not by other peoples or future generations, can those actions be considered ethical.	3,02
5	172	Poor countries need to acknowledge the scandalous level of consumption in some privileged sectors of their population and to combat corruption more effectively.	3,00
10	174	What is needed, in effect, is an agreement on systems of governance for the whole range of so-called “global commons”.	2,96
2	165	Technology based on the use of highly polluting fossil fuels – especially coal, but also oil and, to a lesser degree, gas – needs to be progressively replaced without delay.	2,89
6	172	Poor countries are bound to develop less polluting forms of energy production, but to do so they require the help of countries which have experienced great growth at the cost of the ongoing pollution of the planet.	2,89
29	189 IV	Politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy.	2,89
1	164 I	An interdependent world not only makes us more conscious of the negative effects of certain lifestyles and models of production and consumption which affect us all; more importantly, it motivates us to ensure that solutions are proposed from a global perspective, and not simply to defend the interests of a few countries.	2,70
38	193	Unsustainable is the behavior of those who constantly consume and destroy, while others are not yet able to live in a way worthy of their human dignity. That is why the time has come to accept decreased growth in some parts of the world, in order to provide resources for other places to experience healthy growth.	2,41

Source: own elaboration

Table 6 presents the classification into the statements with the highest, average, and lowest level of acceptance.

Table 6: Assessment of statements from the economic point of view

Assessment of statements	**higher than average**	**85%**
	average	2%
	lower than average	13%
	total	100%

Source: own elaboration

It should be stressed that the assessment of encyclical statements made from an economic point of view is lower than moral assessment. Only two statements are assessed with the mean higher than four, and no assessment was given above 4,5. For the economic assessment, 85% of statements are higher than average (3), one is assessed with average (3), and 13% are given less than average mean of points (less than 3).

The first statement, with the order of mean (4,11), is that on the national and local levels, much still needs to be done, such as promoting ways of conserving energy. The statement includes both economic action (promoting) and the economic result (conserving energy). Therefore the high assessment of the statement from the economic point of view is not surprising. The thesis both discusses the need to motivate people, societies, and nations to energy-saving and the necessity of acting on different levels. This is very convincing for accounting students of the university of business and economics. As already mentioned, they passed the courses on management. Therefore the need for proper motivating people is known to them. So it is quite evident that they assess the theses highly from the economic point of view. Second, in the order of popularity (mean 4,11), is the following thesis: “In any discussion about a proposed venture, a number of questions need to be asked in order to discern whether or not it will contribute to genuine integral development. What will it accomplish? Why? Where? When? How? For whom? What are the risks? What are the costs? Who will pay those costs and how?" This statement is also very economy-oriented in terms of used vocabulary and aspects which were mentioned. Such terms as a venture, risks, costs, and payments are included. It can be assessed as reflecting economic reality and asking about economic facts, forecasts, and simulations. The next thesis (3,86) says that relations between states must be respectful of each other's sovereignty, but must also lay down mutually agreed means of averting regional disasters which would eventually affect everyone. This sentence refers to well-known economic issues such as organizations and structures (relations between states) and effects (disasters affecting everyone). The following statement (mean 3,79) says that the compatibility of infrastructures with the context for which they have been designed is not always adequately assessed. Again, this relates to economic issues, such as infrastructure and the context of its use. The next statement (mean 3,61) says that there should be improvement of transport systems, and encouragement of the construction and repair of buildings aimed at reducing their energy consumption and levels of pollution. Again,

this argument is the issue of managerial and engineering issues. The statement sounds very reasonable from an economical point of view as it refers to the savings (made by reducing energy consumption). Another statement with the same assessment (mean 3,61) says that continuity is essential because policies related to climate change and environmental protection cannot be altered with every change of government; results take time and demand immediate outlays which may not produce tangible effects within any one government's term.

The thesis with the lowest economic assessment (mean 2,41) is the following: "Unsustainable is the behavior of those who constantly consume and destroy, while others are not yet able to live in a way worthy of their human dignity. That is why the time has come to accept decreased growth in some parts of the world, in order to provide resources for other places to experience healthy growth." The disagreement from the economic point of view can be attributed to different reasons. First of them is rooted in western economic education done in a liberal free-market paradigm. From a market-oriented perspective, consumption is always perceived as a positive phenomenon that boosts the economy. Moreover, the free market economy point of view does not operate terms such as "human dignity". It also does not support the thesis that sharing is rational. Therefore it is not surprising that accounting students from the university of economics and business do not agree with the presented statement from an economic point of view. In the order of unpopularity, the second thesis (2,70) states that: "An interdependent world not only makes us more conscious of the negative effects of certain lifestyles and models of production and consumption which affect us all; more importantly, it motivates us to ensure that solutions are proposed from a global perspective, and not simply to defend the interests of a few countries." Again, the low assessment of this argument from the economic point of view is rooted basically in the free market paradigm, which is implicitly and explicitly present in our economic education. This paradigm does not accept the fact that there are some detrimental models of lifestyles, production, and consumption. It sees them only as profitable or unprofitable ones. Also, from the point of view of this paradigm, any interference in the free market is unacceptable. Therefore searching for and imposing global solutions is seen as acting against the market laws.

A close look at the statements which are assessed highly from an economic point of view leads to several conclusions. Most popular theses among accounting students are characterized by referring to matters such as management, processes, infrastructure, costs, and results. They use much economy-related vocabulary, although this vocabulary is often used in a broader context. They often raise questions relating to strategic management. The theses with low assessment often emphasize a need for sharing, help, intervention, etc. Therefore they oppose the self-interest approach and free-market paradigm.

The moral and economic assessments are especially interesting when they are confronted. Pearson's correlation between their means is 0,62. Therefore the correlation is significant. Moreover, for each statement, there was a difference between economic and moral assessment, and ethical assessment was always higher than the economic one. Table 7 shows for each statement difference between economic and moral assessment. The theses are presented in ordered of the level of disagreement (the difference between the means for two types of attitudes).

Table 7: Difference between ethical and economic attitudes towards statements

Number of statement	Article in encyclical	Statement	Difference between ethical and economic mean attitude towards statement
2	165	Technology based on the use of highly polluting fossil fuels – especially coal, but also oil and, to a lesser degree, gas – needs to be progressively replaced without delay.	1,52
38	193	Unsustainable is the behavior of those who constantly consume and destroy, while others are not yet able to live in a way worthy of their human dignity. That is why the time has come to accept decreased growth in some parts of the world, in order to provide resources for other places to experience healthy growth.	1,45
4	172	For poor countries, the priorities must be to eliminate extreme poverty and to promote the social development of their people.	1,43
15	180	There should be favoring forms of industrial production with maximum energy efficiency and diminished use of raw materials, removing from the market products which are less energy efficient or more polluting,	1,30
5	172	Poor countries need to acknowledge the scandalous level of consumption in some privileged sectors of their population and to combat corruption more effectively.	1,29
23	183 III	A consensus should always be reached between the different stakeholders, who can offer a variety of approaches, solutions and alternatives. The local population should have a special place at the table; they are concerned about their own future and that of their children, and can consider goals transcending immediate economic interest.	1,15
39	193	Technologically advanced societies must be prepared to encourage more sober lifestyles, while reducing their energy consumption and improving its efficiency	1,13
19	180	New forms of cooperation and community organization can be encouraged in order to defend the interests of small producers and preserve local ecosystems from destruction.	1,13
7	172	Taking advantage of abundant solar energy will require the establishment of mechanisms and subsidies which allow developing countries access to technology transfer, technical assistance and financial resources, but in a way which respects their concrete situations.	1,13
16	180	There should be improvement of transport systems, and encouragement of the construction and repair of buildings aimed at reducing their energy consumption and levels of pollution.	1,11
18	180	Agriculture in poorer regions can be improved through investment in rural infrastructures, a better organization of local or national markets, systems of irrigation, and the development of techniques of sustainable agriculture.	1,11

22	183 III	Environmental impact assessment should be part of the process from the beginning, and be carried out in a way which is interdisciplinary, transparent and free of all economic or political pressure. It should be linked to a study of working conditions and possible effects on people's physical and mental health, on the local economy and on public safety. Economic returns can thus be forecast more realistically, taking into account potential scenarios and the eventual need for further investment to correct possible undesired effects.	1,11
17	180	Political activity on the local level could also be directed to modifying consumption, developing an economy of waste disposal and recycling, protecting certain species and planning a diversified agriculture and the rotation of crops.	1,11
42	196	We should keep in mind the principle of subsidiarity, which grants freedom to develop the capabilities present at every level of society, while also demanding a greater sense of responsibility for the common good from those who wield greater power.	1,09
1	164 I	An interdependent world not only makes us more conscious of the negative effects of certain lifestyles and models of production and consumption which affect us all; more importantly, it motivates us to ensure that solutions are proposed from a global perspective, and not simply to defend the interests of a few countries.	1,05
6	172	Poor countries are bound to develop less polluting forms of energy production, but to do so they require the help of countries which have experienced great growth at the cost of the ongoing pollution of the planet.	1,02
46	198	Politics and the economy tend to blame each other when it comes to poverty and environmental degradation. It is to be hoped that they can acknowledge their own mistakes and find forms of interaction directed to the common good.	1,00
20	181	Continuity is essential, because policies related to climate change and environmental protection cannot be altered with every change of government. Results take time and demand immediate outlays which may not produce tangible effects within any one government's term.	0,98
30	189	In view of the common good, there is urgent need for politics and economics to enter into a frank dialogue in the service of life, especially human life.	0,98
9	173	Relations between states must be respectful of each other's sovereignty, but must also lay down mutually agreed means of averting regional disasters which would eventually affect everyone.	0,96
12	177 II	The limits which a healthy, mature and sovereign society must impose are those related to foresight and security, regulatory norms, timely enforcement, the elimination of corruption, effective responses to undesired side-effects of production processes, and appropriate intervention where potential or uncertain risks are involved.	0,95
3	170	The countries which have benefited from a high degree of industrialization, at the cost of enormous emissions of greenhouse gases, have a greater responsibility for providing a solution to the problems they have caused.	0,93

28	187	In case of technological innovations the profit cannot be the sole criterion to be taken into account, and that, when significant new information comes to light, a reassessment should be made, with the involvement of all interested parties. The outcome may be a decision not to proceed with a given project, to modify it or to consider alternative proposals.	0,93
31	190	Environmental protection cannot be assured solely on the basis of financial calculations of costs and benefits. The environment is one of those goods that cannot be adequately safeguarded or promoted by market forces.	0,91
45	197	A strategy for real change calls for rethinking processes in their entirety, for it is not enough to include a few superficial ecological considerations while failing to question the logic which underlies present-day culture. A healthy politics needs to be able to take up this challenge.	0,88
10	174	What is needed, in effect, is an agreement on systems of governance for the whole range of so-called “global commons”.	0,86
24	183 III	We need to stop thinking in terms of “interventions” to save the environment in favour of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.	0,86
13	177	There is a growing jurisprudence dealing with the reduction of pollution by business activities. But political and institutional frameworks do not exist simply to avoid bad practice, but also to promote best practice, to stimulate creativity in seeking new solutions and to encourage individual or group initiatives.	0,80
36	192	Productive diversification offers the fullest possibilities to human ingenuity to create and innovate, while at the same time protecting the environment and creating more sources of employment. Such creativity would be a worthy expression of our most noble human qualities, for we would be striving intelligently, boldly and responsibly to promote a sustainable and equitable development within the context of a broader concept of quality of life.	0,80
34	191	More diversified and innovative forms of production which impact less on the environment can prove very profitable.	0,78
37	193	In any event, if in some cases sustainable development were to involve new forms of growth, then in other cases, given the insatiable and irresponsible growth produced over many decades, we need also to think of containing growth by setting some reasonable limits and even retracing our steps before it is too late.	0,77
40	194	For new models of progress to arise, there is a need to change models of global development; this will entail a responsible reflection on “the meaning of the economy and its goals with an eye to correcting its malfunctions and misapplications.	0,70
25	184	We need to stop thinking in terms of “interventions” to save the environment in favor of policies developed and debated by all interested parties. The participation of the latter also entails being fully informed about such projects and their different risks and possibilities; this includes not just preliminary decisions but also various follow-up activities and continued monitoring.	0,70

32	191	Decrease in the pace of production and consumption can at times give rise to another form of progress and development.	0,64
33	191	Efforts to promote a sustainable use of natural resources are not a waste of money, but rather an investment capable of providing other economic benefits in the medium term.	0,61
27	186	Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a pretext for postponing cost-effective measures which prevent environmental degradation. Here the burden of proof is effectively reversed, since in such cases objective and conclusive demonstrations will have to be brought forward to demonstrate that the proposed activity will not cause serious harm to the environment or to those who inhabit it.	0,59
8	172	The compatibility of infrastructures with the context for which they have been designed is not always adequately assessed.	0,50
21	183 III	Environmental impact assessment should not come after the drawing up of a business proposition or the proposal of a particular policy, plan or program.	0,48
29	189 IV	Politics must not be subject to the economy, nor should the economy be subject to the dictates of an efficiency-driven paradigm of technocracy.	0,48
41	195	Only when the economic and social costs of using up shared environmental resources are recognized with transparency and fully borne by those who incur them, not by other peoples or future generations, can those actions be considered ethical.	0,48
14	180	On the national and local levels, much still needs to be done, such as promoting ways of conserving energy.	0,46
26	185	In any discussion about a proposed venture, a number of questions need to be asked in order to discern whether or not it will contribute to genuine integral development. What will it accomplish? Why? Where? When? How? For whom? What are the risks? What are the costs? Who will pay those costs and how?	0,41
35	192	A path of productive development, which is more creative and better directed, could correct the present disparity between excessive technological investment in consumption and insufficient investment in resolving urgent problems facing the human family. It could generate intelligent and profitable ways of reusing, revamping and recycling, and it could also improve the energy efficiency of cities.	0,41
44	197	What is needed is a politics which is far-sighted and capable of a new, integral and interdisciplinary approach to handling the different aspects of the crisis.	0,39
43	196	Today, it is the case that some economic sectors exercise more power than states themselves. But economics without politics cannot be justified, since this would make it impossible to favor other ways of handling the various aspects of the present crisis.	0,34
11	175	It is essential to devise stronger and more efficiently organized international institutions, with functionaries who are appointed fairly by agreement among national governments, and empowered to impose sanctions.	0,09

Source: own elaboration

There should be a close look at the theses characterized by a high level of disagreement. The highest dissonance (1,52) relates to the statement that technology based on the use of highly polluting fossil

fuels – especially coal, but also oil and, to a lesser degree, gas – needs to be progressively replaced without delay. The difference can emerge from specific Polish conditions. Although students know the need for pollution reduction and assess it highly from the moral point of view, their economic assessment of the thesis is much lower. It is probably caused by the government's propaganda, saying that Poland is and should be a coal-based economy. Such behavior of the leading party is affected by the strong position of coal miners' labor unions and by the fact that they support the government. Moreover, previous Polish governments were also reluctant about reforms of the coal branch, which was a result of the strong position of coal labor unions and the threat of significant unemployment rate in the coal regions in case of closing mines. Therefore, although coal mines in Poland are not only polluting the environment but also causing substantial financial losses, there is a deeply rooted convenience that coal mines are the base of the Polish economy.

The second statement with a high level of dissonance between moral and economic assessment (1,45) is the following thesis: "Unsustainable is the behavior of those who constantly consume and destroy, while others are not yet able to live in a way worthy of their human dignity. That is why the time has come to accept decreased growth in some parts of the world, in order to provide resources for other places to experience healthy growth." Again, this statement contains vocabulary which is morality-related (e.g. dignity). It also criticizes socio-economic trends such as consumerism, which predominate in reach western countries. As the students at the university of economics and business often are convinced that high consumption leads to mostly positive economic outcomes (higher wealth, employment, and investments), they do not see the dark part of it, such as destruction of wildlife and widening the gap between rich and poor. Moreover, economic growth is usually perceived as an autonomic value itself. Therefore accounting students oppose the thesis that there is the necessity of economic decline.

Another high-dissonance (1,43) statement says that for poor countries, the priorities must be to eliminate extreme poverty and to promote the social development of their people. The difference probably emerges from the suggestion of the social transfers which are looked upon in the liberal economies. Moreover, accounting students probably think that social development is an issue which functions outside of the sphere of economy. That makes their level of economic agreement low. From another point of view, moral legitimacy of this argument seems evident as the elimination of extreme social poverty is one of the essential ethical postulations of today's world. Therefore the dissonance between ethical and economic assessment is getting huge.

The next thesis with the high level of disagreement between ethical and economic assessment (1,30) says that there should be favoring forms of industrial production with maximum energy efficiency and diminished use of raw materials, removing from the market products which are less energy efficient or more polluting. The enormous dissonance can be attributed to the fact that in a liberal economy, which is explicitly or implicitly preferred on economics and business universities, favoring any business or type of production is suspicious. From another point of view, students acknowledge the moral significance of reducing pollution and using environmentally-friendly forms of energy. That makes the gap between ethical and economic assessment very wide.

Conclusions

The moral assessment of the content of "Laudato Si" encyclical several aspects of most popular theses can be distinguished. They are characterized by clearness and concreteness. The content is easy to envisage and imagine. Often they refer to the situations known by the respondents and reflecting some problems in their life. They also can be perceived from the self-interest of respondents themselves. In the case of the statements which are assessed highly from the economic point of view, several conclusions can be formulated. Most popular theses among accounting students are characterized by referring to matters such as management, processes, infrastructure, costs, and results. They use much economy-related vocabulary, although this vocabulary is often used in the broader context. They often raise questions relating to strategic management.

Fig. 1: Attitudes towards statements formulated in "Laudato Si'" formulated from the moral and economic point of view

It can be guessed that higher agreement from the moral than the economic point of view has its causes in demographic characteristics of respondents and in their education. Accounting education includes some aspects of corporate social responsibility, sustainability, and ecology. However, it is mostly technical, related to writing and reading non-financial statements, such as corporate social responsibility reports. Therefore, the students know the importance and are taught the ethical meaning of some actions. Nevertheless, this is not the core of accounting education. Therefore there is an understanding of the moral aspect of ecology. However, the economic approach sometimes seems to be separated from ecological issues.

Moreover, it seems that attitudes toward encyclical arguments differ depending on whether they are perceived from the moral or economic point of view, because of different paradigms which are used. It is especially evident that the lower assessment of statements from the economic viewpoint is caused by a liberal, free-market approach. This viewpoint is (implicitly or explicitly) forced upon the students during their education.

I argue that what can be a really significant outcome of this research is itself the fact of dissonance between the ethical and economic assessment. I should remain here that first economic theories were formulated by philosophers-ethicists. Therefore at the beginning of the development of economic studies, there was no gap between them and moral philosophy, as economic theories were built on philosophical assumptions.

The research was done long before the COVID19 pandemic. Therefore it would be interesting to replicate the study during and after it. It can be expected that after the economy suffers from the pandemic of the virus, which can be partly contributed to the lack of sustainability and insufficient ecological actions, the results would show high agreement with "Laudato Si" also from the economic point of view. Other further research could focus on different respondents groups, such as ethicists or biologists.

Competitive Benchmarking:

Improving the Performance of a Transport Company

Adriana - Mihaela IONESCU

Ioana-Ruxandra LIE

PhD, Economics Department, Faculty of Entrepreneurship, Business Engineering and Management, POLITEHNICA University of Bucharest, Bucharest; ruxandra.lie@gmail.com

Abstract

Due to the competitive environment they act in, companies are constantly looking for new ways to improve their performance. To this end, benchmarking becomes an efficient external management tool; it can be applied to the business practices of any company interested in finding the best practices in their industry, in knowing the market trends and competition in the field in which it operates. Also, benchmarking studies can be used in order to find new ideas that will materialize in future development plans. The aim of this paper is to highlight the advantages of groupage trips, LTL (less than truckload), compared to the complete ones, FTL (full truckload), by applying the benchmarking technique. The paper is based on real data obtained from competing companies whose field of activity is the international transport of goods. The study highlights the advantages of introducing the benchmarking process in the current activity of a company, while proposing a series of measures to reduce operational costs and efficient fleet management.

Keywords: Benchmarking, Transport, FTL, LTL, Costs, Performance

Introduction

Road transport is the most widely used mean of transport in the European Union, both for passengers and goods. The considerable increase of international trade led to a rising number of participants in these exchanges and, at the same time, to the diversification and specialization, especially as a result of technical - scientific and economic progress. All these contributed to the need to develop transport services.

The opening of the transport market and the increase of competition are the main direct effects of Romania's EU accession in 2007**.** Even for the transport field, performance is the motivation to carry out the activity. In order to be able to achieve it, the company needs to be oriented to continuously improve its processes, services, fleet, customer portfolio, and working methods.

This paper highlights an essential tool for improving the performance of a company, namely the implementation of a benchmarking process following an analysis of the strengths and weaknesses of a company whose field of activity is road freight transport.

The second section of the paper presents the relevant literature on benchmarking techniques, and the third one presents the methodology used and the method of collecting data for the study. The following section shows the results of applying benchmarking on two transport companies, while the fifth part identifies the ways to optimize the activity of one of the companies, as a consequence of previously mentioned results. We conclude with the main ideas we extract from our research and with further

directions for study.

Literature Review

Economy and society mean interaction and choice, and this socio-economic puzzle needs to be restored to get a map to guide people's actions towards shared progress (Nicolae, 2017). In this challenging economic context, "companies set their goals to such an extent that, if achieved, they improve performance" (Ionescu, 2014); improving performance is the permanent concern of any company that aims to stay sustainable on a market in which competition is fierce, and benchmarking provides the instruments for such improvement.

Practicing benchmarking is the equivalent of looking for the best methods used in a business. These methods allow the company to improve its performance, to understand the importance of costs and to identify opportunities to reduce them, but also to build a strategic advantage. Quite often, the benchmarking concept is understood to be an act of imitating or copying. But in reality, this proves to be a concept that helps in innovation rather than imitation, as stated by Thompson and Cox (1997).

Benchmarking was initiated in the 1980s by Rank Xerox as a method of achieving high performance and improving product quality. Due to the success it has had among companies that have used this technique, specialists have modified it and started to apply it in other sectors of activity, such as the production of consumer goods, tourism and even public administration services.

Allaire (1992), Chairman of Xerox Corporation said that "The prime objective of benchmarking is to understand those practices which will provide a competitive advantage in the marketplace; target setting is secondary". As an addition to that, Champ (1989) considers that benchmarking is the continuous process of evaluating our products, services and methods in relation to the most serious competitors or with the companies recognized as leaders in their sector. Due to that, benchmarking for Chiavenato (2005) is an inexhaustible source of ideas provided by other organizations; he emphasizes that this type of research allows the comparison of processes and practices, to identify the "best of the best" and to achieve a level of superiority or competitive advantage.

Ionescu and Bigioi (2016) consider that benchmarking is the only tool that teaches us how "good" can turn into "best" and that shows what is today's "best" and how to achieve this level of excellence.

Depending on the organization chosen for the comparative evaluation, authors such as Murray et al. (1997), Camp (1998), Owen (2002) and Chiavenato (2005), highlight the most common types of benchmarking:

- internal benchmarking, which takes place within the company, and
- external benchmarking, performed with entities outside the organization. This type of benchmarking can be classified as follows:
    - Strategic benchmarking: involves the analysis and evaluation of strategies that have generated high performance;
    - Competitive benchmarking: specific comparison with competitors on the product, method, processes. For this type of comparison between two directly competing companies, it is very difficult to obtain information.
    - Functional benchmarking: the comparison of similar functions between non-competing firms in the same industry for the detection of innovative techniques.
    - Generic benchmarking: comparison between companies from different sectors on processes or working methods.

Camp (1998) emphasizes that benchmarking consists of a process composed of five basic phases: planning, analysis, integration, action and maturity. These phases must take place dynamically and they should be followed by reviews on the principle of a continuous process. Camp's view is reinforced by Spendolini (1993), who points out that in order to use benchmarking properly, it becomes necessary to understand in a generic way, the five steps that summarize the basic process:

1) Determine what you want to do.

2) Form a team.

3) Identify comparison partners.

4) Collect and analyse information.

5) Develop and follow action plans.

Benchmarking should be used especially before launching a new business project or before starting work on a new project within an existing business. It can also be used when the aim is to bring the company to a higher level, but the initial stages are not very well known. In this situation, the method is perfect to offer those interested the opportunity to collect a wide range of information that helps to find new ideas and facilitates the exchange of experience.

Methodology

The main methodology used in this paper is benchmarking itself, as we want to show how it can be applied by real life companies. To achieve this aim, we used data from two companies: the companies that are the subject of the study are providers of road freight transport services. In order to ensure the data protection of the analysed companies, we chose to name the company that uses the benchmarking process - company “A”, and the reference company, the one we compare it to - company “B”.

All organizations want to constantly improve their performance in order to remain competitive; thus, the benchmarking process in the field of business emerged as a necessity implementing a form of competitive analysis, study of industrial fields and as a comparison of performance and functions. It is necessary for any company to have certain targets to reach or successful competitors with which constantly compare in order to evolve.

Benchmarking, even in the case of transport companies, involves comparing with others, analysing them and understanding their methods of achieving performance. As a result, new standards and objectives can be set, which will help to better meet customer requirements for the quality of transport services and their price. The benchmarking process can give companies in the transport industry the opportunity to add value to customers and differentiate themselves from competitors.

In order for competitive benchmarking to become an efficient process for the transport company “A”, mentioned before, the following aspects need to be assessed: evaluation of its own activity; identification of strengths and weaknesses (SWOT analysis); selecting a service that can be improved; identifying key values for performance; knowledge of competitors in its branch and identification of the company with which the comparison is made; collecting data on performance and common practices; data analysis and identification of opportunities for improvement; incorporating best practices into one's own business. All these, except the SWOT analysis, were included in this paper.

In order to complete the study, the data was collected by interviews with both companies, which are providers of freight services on the same routes.

Use of Benchmarking for The Implementation of Groupage Freight Transport. Case Study

Company “A” is a privately held company, which began its activity in 1999 on the local market. Subsequently, it expanded its activity in Europe, getting to be known due to the efficiency and quality of services offered to customers in the road transport of goods. It is a limited liability company, which has established as its main objective to become a reference company on the Romanian transport market, through the excellence of the services offered. To this end, the vehicle fleet has gradually expanded, from one truck to six trucks currently available for freight transport. The organization's strategy is to comply with contracts and customer relations, by carefully managing and controlling the truck fleet.

Following the analysis of the performance and processes of the company "A", we noticed the possibility that the company should focus on another way of transporting goods, namely group transport (LTL-less than truckload). But in order to identify the benefits of implementing this model of performing freight transport, it is necessary to perform a comparative analysis with a competing company, which is one of the leaders in freight transport in Romania. In general, when applying benchmarking techniques, the comparison partners are chosen according to criteria like the position of the respective organization within the branch in which it operates, average number of staff, and market share held.

The company that has been identified as a reference for the implementation of the benchmarking process is the competing company "B". This is a commercial company with Romanian private capital, which started its activity in 1989 and whose field of activity is also road transport of goods on the Romanian and European market. This company owns: 8 trucks (22 t); 2 trucks (10 t + crane); 10 trucks (7.5 t). The competing company performs group type transports (LTL- less than truckload).

Analysis of the costs of FTL (full truck load) transport services

The main link between the financial-accounting function and logistics is made through the information provided by costs. This information helps managers make logistics decisions. For example, when setting prices for the transport of goods or for their storage, important information on material, labour, maintenance, fuel, etc. costs is required, and negotiations with suppliers on purchase prices can only be done if accurate information on the cost structure is available.

Table 4.1 shows the average costs of a Romania - Germany - Romania itinerary for a tractor + semi-trailer assembly, 20 t payload, 4306 km travelled on average on a round trip Romania-Germany (loading and unloading locations vary), 129,180 km travelled on average per year, performing an average of 2.5 trips per month. Values do not include VAT.

Table 4.1: Detailed analysis of the costs related to a Romania - Germany - Romania trip

km/trip: 4306	**calendar days / race: 10**	
	Value	Measurement unit
1. Direct costs		
Tires (12 pieces) – 350 eur/piece	0.032	euro/km
Diesel fuel	0.343	euro/km
Motor oil	0.009	euro/km
Driver's per diem	0.077	euro/km
AUSTRIA motorway toll	224.595	euro
GERMANY motorway toll	225.160	euro
2. Variable costs		
HUNGARY motorway toll	0.200	euro/km
Parking Hungary	0.004	euro/km
Parking Austria	0.002	euro/km
Parking Germany	0.005	euro/km
Parking Romania	0.004	euro/km
Washing	0.005	euro/km
Accessories + Spare parts	0.036	euro/km
Phone expenses	0.007	euro/km
3. Monthly fixed costs		
CASCO + cargo insurance	225	euro/month
RCA insurance	55	euro/month
Administrative costs	330	euro/month
Amount to be amortized	1271.667	euro/month
Road taxes Romania	100	euro/month

License	25	euro/month
Periodic technical inspection and tachograph	20	euro/month
Local taxes	17	euro/month
Driver's salary	218.328	euro/month
Mechanic	75	euro/month
Financial expenses	2000	euro/month
4. Cost calculation / km = Total trip cost / no km		
Direct costs/trip	2434.82	euro
Variable costs/trip	310.03	euro
Fixed costs/trip	865.67	euro
Total trip cost	3610.52	euro
Cost/km	0.84	euro/km

Source: Authors' calculations based on data gathered from company "A".

Based on the data in the table above:

- **Analysis of direct costs**: Direct costs generally have a directly proportional behaviour to the number of km traveled and therefore they are recognized as direct costs / km. These direct costs include the costs related to the consumption of diesel, engine oil and tires. Also included in this category are the driver's per diem expenses. Although the daily allowance is generally calculated according to the number of days, after fairly elaborate calculations, for the simplification and efficiency of the model we chose to reflect this cost in euros / km, given the average per kilometer of expenses per driver's per diem. We consider this approach to be an efficient one, very close to reality and which is in fact quite common in modeling this type of cost.
    - Tires: 12 pcs were considered. Tires related to a truck-semi-trailer assembly, which must be replaced after traveling 130,000 km, the price of a tire being on average 350 euros.
    - Diesel: A consumption of 34 liters / 100 KM was taken into account; the price of diesel 0.94 euro / liter (an average price in Romania and abroad).
    - Austria Motorway Fee: it is currently 0.3255 Euro / km for 20 t trucks (on average 690 km in AU in one trip).
    - Germany Motorway Fee: is currently 0.13 Euro / km for 20 t trucks (on average 1732 km in DE in one trip).
    - The driver's daily allowance often varies depending on the number of loadings and unloadings, but also on his physical work that he submits by arranging goods in the truck. The daily allowance of 0.077 euro / km (table 4.1) is calculated according to the data in table 4.2:

Table 4.2: Daily allowance calculation for a trip Romania - Germany – Romania

DEPARTURE RO border		ARRIVAL RO border								
Date	**Time**	**Date**	**Time**	**Destination**	**Calc. number of days**	**Due days**	**Days granted**	**Per diem(*)**	**Currency**	**Value**
03/01/20	08:00	12/01/20	12:00	Germany	9d4h	9.5	9.5	35	euro	332.5

Source: Authors' calculations based on data gathered from company "A".

(*)According to the laws in force, the foreign daily allowance is granted from the moment of crossing by road the state border of Romania, both on departure and return to the country, depending on the number of days in which

the trip takes place, considering every 24 hours one day of delegation. For the fractions of time that do not amount to 24 hours, the daily allowance is granted as follows: 50% up to 12 hours and 100% for the period exceeding 12 hours. In the EU countries, the same minimum daily allowance level of 35 euro / day is provided.

- **Variable cost analysis:** These costs vary depending on the number of km traveled and include the costs of accessories and spare parts: bulbs, straps, ferrules etc.
- **Analysis of fixed costs:** Fixed costs are calculated monthly. These costs include the costs of insuring the car and goods, the licenses held, the salaries of drivers and mechanics, as well as the costs of depreciation for the cars. The value to be depreciated reflects in the accounting the wear of the car. The normal repayment period is five years, ie sixty months. For the truck + semi-trailer assembly, the initial value (acquisition cost) was 109,000 euros, and the residual value at the end of the five years is 32,700 euros. The depreciation method applied is the linear method. Therefore, the depreciation calculated and registered during the 5 years of use is 109,000 - 32,700 = 76,300 euros. (1271.667 / month) The inclusion of depreciation in costs allows the company to be able to purchase another means of transport at the end of the truck's life. This amortization does not include additional financial costs, which appear in the case of a leasing contract or when hiring bank loans.

Following the analysis of the costs of company “A” for the completion of a transport of goods Romania - Germany, in comparison with the good business practices applied by company "B", we noticed the possibility for the company to focus on another way of transport, namely in group mode LTL (less than truck load).

Analysis of the costs of LTL groupage transport services (less than truck load)

This section focuses on the strategy of company “B”, which applies a different strategy when it comes to loading its trucks: LTL (less than truck load) groupage transport services.

Freight transport in LTL groupage involves deliveries considered too small for FTL transport (full truck loading) and multiple loadings and unloading during transit. Therefore, quantities of goods below the total capacity of a trailer can be transported in a variety of shapes and packaging.

This service is addressed to a large number of customers, for whom, apart from an affordable transport price, the most important thing is the transit time of the package (it should be as close as possible to the transit time in full-truck mode).

The European road transport sector needs combined transport as an alternative for reasons of capacity, but also for commercial reasons related to flexibility in organizing drivers' working time, avoiding traffic bans and optimizing routes.

For the analysis, we chose a concrete example of transport on the route Romania - Germany - Romania, presenting the route itinerary in table 4.3. The trip lasts between five and twelve days, being influenced by the driving program, but also by the loading/unloading times at each point.

Table 4.3: Romania - Germany - Romania transport route itinerary in groupage regime

Nr. crt.	Date	Truck type	Activity	Location	Quantity
1.	10.01.2020	7.5t (I)	Loading	Bucharest	762kg (1 parcel)
2.	10.01.2020	7.5t (I)	Customs	Bucharest	-
3.	11.01.2020	7.5t (II)	Loading	Ploiești	2862kg (3 parcels)
4.	11.01.2020	7.5t (II)	Customs	Ploiești	-
5.	12.01.2020	7.5t (II)	Loading	Craiova	2504kg (5 epallets)
6.	13.01.2020	7.5t (II)	Loading	Scornicești	1000kg

Nr. crt.	Date	Truck type	Activity	Location	Quantity
					(4 epallets)
7.	13.01.2020	7.5t (II)	Customs	Bucharest	-
8.	13.01.2020	20t	Loading	Băicoi	2300kg (15 epallets)
9.	13.01.2020	20t	Loading	București	goods from the 7.5t trucks (7128 kg)
10.	16.01.2020	20t	Unloading	Reichenbach (code:07629)	8 epallets (from Baicoi)
11.	17.01.2020	20t	Unloading	Bremen (code:28357)	7 epallets (from Baicoi)
12.	17.01.2020	20t	Unloading	Bremen (code:28197)	7128kg
13.	17.01.2020	20t	Loading	Bremen (code:27798)	2 machinery (6.1ldm, 4650kg)
14.	19.01.2020	20t	Loading	Glinde (code:21509)	12 epallets (5300kg)
15.	19.01.2020	20t	Loading	Glinde (code:21509)	2 pallets (1500kg)
16.	19.01.2020	20t	Loading	Reinbeck (code:21465)	2000kg
17.	21.01.2020	20t	Unloading	Craiova	1 machinery
18.	21.01.2020	20t	Unloading	Slatina	1 machinery
19.	22.01.2020	20t	Unloading	Bucharest	in the 7.5t truck, the 2000kg loaded at Reinbeck
20.	22.01.2020	7,5t	Unloading	Buftea	2000kg
21.	22.01.2020	20t	Unloading	Ploiești	12 epallets +2 pallets (6800kg)

Source: Authors' calculations based on data gathered from company "B".

Transport costs are influenced by many factors and even if the distance between the point of origin and the destination is the most important, there are other factors that lead us to the conclusion that two transports between the same two points will cost differently (for example, the characteristics of the products to be transported, which determine distinct requirements of the transport system and implicitly distinct costs regarding human, financial and material resources).

For a clear record of the costs of the transport journey described in Table 4.3, they were broken down by truck type as follows (euro):

Table 4.4: Costs for a Romania - Germany - Romania transport route itinerary in groupage regime by type of truck

Truck type	Direct costs/trip	Variable costs/trip	Fixed costs/trip	TOTAL Costs/trip	Traveled distance (Km)	Cost/km (euro/km)
7.5t trucks	739.03	94.50	713.67	1547.20	587	2.63
20t truck	2466.16	328.46	1038.80	3833.42	4563	0.84

Source: Authors' calculations based on data gathered from company "B".

In the case of 20 t trucks, the direct, variable and fixed costs are calculated according to the calculation model presented in table 4.1.

In the case of 7.5 t trucks, 6 pieces of tires that must be replaced after covering 130,000 km were considered for direct costs: the price of a tire is on average 150 euros. The driver's per diem expenses, calculated according to the number of days, indicated an average for the entire journey of 0.04 euro / km. Regarding the variable costs / trip, we made an average of the expenses with the parking lots in Romania (0.007 euro / Km), with the washing of the truck (0.003 euro / km), with the accessories or spare parts (0.02 euro / km) and with expenses for the driver's mobile phone (0.005 euro / km). Fixed costs / month include: CASCO insurance (84 euros / month), MTPL insurance (22 euros / month), depreciated amount (254.68 euros / month), driver's salary, tolls (85 euros / month) etc.

Optimization Measures Following the Benchmarking Process

As a consequence of the benchmark analysis, we conclude that there are some aspects that can be improved in company's "A" activities: fleet monitoring and optimal route selection on one hand, in order to change full truck load by less than truck load, and, on the other hand fleet sizing, in order to improve costs.

Fleet monitoring and optimal route selection

Vehicle programming, routing and monitoring, transportation cost analysis and fleet sizing are ongoing activities, closely monitored by fleet management. It is important to use a fleet tracking computer system to reduce the level of operational costs. At the same time, thanks to the monitoring system, the drivers' behaviour towards the company's goods and implicitly the efficiency in using the cars can change. In order for the employee to be aware of the use of a monitored truck, he will follow the routes, will have to justify the breaks and the delay in the delivery of the goods. Inadequate driving will also need to be explained.

In search of the best route, for a round trip Romania - Germany, 5 possible routes were identified, highlighting both the number of kilometres and the potential costs of the freight service.

Route 1: Romania (București – Nadlac) – Hungary (Nadlac – Nickelsdorf) – Austria (Nickelsdorf – Passau) – Germany (Passau – Reichenbach)

Route 2: Romania (Bucharest – Bela Crkva) – Serbia (Bela Crckva – Batrovci) – Croatia (Batrovci – Bregana) – Slovenia (Bregana - Maribor) - Austria (Maribor – Salzburg) – Germany (Salzburg – Reichenbach)

Route 3: Romania (Bucharest - Ruse) – Bulgaria (Ruse - Dimitrovgrad) – Serbia (Dimitrovgrad - Subotica) – Hungary (Subotica - Pince) – Slovenia (Pince - Maribor) – Austria (Maribor- Salzburg) – Germany (Salzburg - Reichenbach)

Route 4: Romania (Bucharest - Nadlac) – Hungary (Nadlac - Rajka) – Slovakia (Rajka – Brodske) – Czech Republic (Brodske - Waidhaus) – Germany (Waidhaus – Reichenbach)

Route 5: Romania (Bucharest - Vidin) – Bulgaria (Vidin - Roszke) – Serbia (Roszke -Subotica) – Hungary (Subotica - Rajka) – Slovakia (Rajka - Brodske) – Czech Republic (Brodske – Waidhaus) – Germany (Waidhaus – Reichenbach)

Table 5.1: Highlighting routes and related costs

Transited countries	Route 1	Route 2	Route 3	Route 4	Route 5
Romania	✓	✓	✓	✓	✓
Hungary	✓		✓	✓	✓
Austria	✓	✓	✓

TOTAL Cost (euro)	850.97	903.78	1021.15	881.87	999.20

Source: Authors' calculations.

Referring to the example presented above, we made a calculation for the trip Romania - Germany (one way), assessing the ratio between costs and efficiency.

In case of opting for groupage regime trips, choosing the most efficient transport route is the most important step. The selection of the route (R) must take into account a series of constraints, the most important of which is to identify the route that would minimize the costs of the transport service (C), but also maximize efficiency (E).

$$R = f\ (\min C;\ \max E)$$

The shortest route is not necessarily the least expensive. Identifying an optimal route contributes substantially to increasing the quality of transport and, consequently, the logistics system. The aim is to minimize transport time or distance to the destination.

The costs to be taken into account in the route selection process are fuel costs and tolls. In terms of fuel consumption, it varies depending on each vehicle. For a 20-ton truck, the average consumption is 32 l / 100 km, and for a 7.5-ton truck, the average consumption is 16 l / 100 km.

It is essential for such a process that the loading or unloading points be as close as possible. For a trip with minimal costs, when the dispatcher is looking for customers who have goods to transport, he must follow the postal codes, because the addresses must be close.

Regarding the investment in a tracking system, we consider it essential for the good development of the company's activities. Management of transport routes and truck drivers is now easier and safer to do with the fleet monitoring application. The investment to be implemented is an opportunity to improve the company's performance by monitoring vehicles. The investment consists in installing tracking systems on trucks in order to reduce operating costs and for efficient fleet management.

Following the results obtained, the route with the lowest cost or the shortest route is chosen, if the customer requires the goods to reach their destination as soon as possible.

Fleet sizing

When operating your own fleet, an important aspect to consider is fleet sizing. This involves knowing or approximating an average monthly or annual quantity of goods to be delivered.

In practice, however, most of the time, the demand for goods is not constant, it can vary significantly over a year. Under these conditions, two major types of risks can occur:

- Impossibility to honour all orders at a time (and implicitly bear the negative consequences arising from this);
- Poor use of means of transport most of the time, when the fleet is oversized in order to be able to honour all orders received (and thus record much higher total transport costs).

To minimize these two risks, a company can opt for a solution that keeps costs to a minimum. This solution involves sizing your own fleet to honour an optimal level of orders, and for periods of overload of transport capacity to opt for vehicle rental.

Naturally, the selection and purchase of vehicles must take into account the two categories of costs: fixed and variable, respectively. Fixed costs do not depend on the annual number of kilometres travelled by the vehicle nor on the quantity of goods transported. Variable costs, on the other hand, depend directly on the annual number of kilometres travelled and are influenced by various factors such as fuel consumption or the number of hours paid to human resources.

Conclusions

Rapid changes in the business environment have led to the development of benchmarking as a process of comparing business practices and performance levels between organizations, in order to identify new opportunities for improvement for companies seeking competitive advantage.

Benchmarking requires a dedication to change, and therefore the organization must begin this process only if it is open to transformation and wants to improve performance. A major deterrent to the benchmarking process may be the refusal of the assessment partner, recognized in terms of performance, to disclose its business practices. At the same time, organizations need to understand that the success rate can differ significantly, because applying the best practices of a successful organization does not necessarily guarantee the success of the organization that adopted them. Organizations that decide to use it, especially small and medium-sized enterprises, must pay particular attention to the allocation of resources needed to implement this process, which must be justified by the returns provided.

Applying benchmarking in the field of transport is essential to obtain a complete understanding of the performance of a company in relation to competing companies. The main performance indicator are the transport rates, but there are other important indicators that help the company to determine if deliveries are made on time, complete and without defects. Improving the business practices of organizations gives them a competitive advantage in their logistics operations, in the current competitive environment.

Benchmarking promotes a “culture of learning”, which is essential for improving quality and long-term competitiveness, as benchmarking efforts can stimulate organizational learning and increase business performance and industry competitiveness. In fact, in a future research we aim to perform an analysis of the value of organizational learning in the context of using benchmarking.

Abstract

Previous studies show that in providing the best relationship quality of services, the marketing mix has important roles. The relationship quality of services has three important elements, namely satisfaction, trust and commitment. In this study, the authors focused on the marketing mix strategy applied by Bank Sumsel Babel as one of the 26 regional banks in Indonesia. This research aims to measure the attitudinal loyalty of customers of the Bank Sumsel Babel and future behavioral loyalty by looking at the relationship between relationship quality and dimensions of marketing mix for Services Company. The data was collected through the questionnaire that was disseminated to 280 customers of Bank Sumsel Babel. The data then processed and analyzed using Structural Equation Modeling (SEM). The results of the research show that all the relationship quality (satisfaction, trust and commitment) have positive and significant influence on attitudinal and behavioral loyalty. Furthermore, from all marketing mix variables, product quality is found to have the biggest influence on satisfaction, while place has the biggest influence on trust. These results are useful as inputs for banking industry in assessing performance and making management decisions to be able to formulate the right corporate strategy.

Keywords: Marketing Mix, Relationship Quality, Attitudinal Loyalty, Behavioral Loyalty.

Introduction

Marketing is an effort made to meet the needs and satisfy customer desires. A series of efforts to achieve this are stated in the marketing mix which consists of products or services offered, pricing, location or place of business and promotional efforts (Kotler, 1999). The service industry has a slightly different marketing mix and is an adaptation of the traditional marketing mix. In the service industry there are three additional important things, namely people, processes and physical evidence, which added in American Marketing Association (AMA) conference in 1980. The banking industry is one of the service companies that strives to deliver these elements into a good experience for customers. Providing an unforgettable customer experience is the main goal of banking today. Every element in the service marketing mix tries to be optimized to form a value that is expected to improve the quality of relationships with its customers. Every bank employee is an agent who tries his best to create good value in conveying customer experience so that it can lead to customer satisfaction, trust and commitment.

Banking industry in Indonesia still has resilience amid the current global turmoil. Digitalization carried out by many banks in Indonesia can be an opportunity for banks to implement efficiency, the application of digitalization can also increase the income of non-interest income or known as fee-based income. The competition in the banking world is quite dynamic, each bank makes many innovations to be able to compete with the aim of maintaining customer loyalty. Maintaining customers is very important for banks engaged in consumer banking.

One of the banks that is present to assist economic growth and development in the region is the Regional Development Bank. As the function of banks in general, the Regional Development Bank also performs the same function, namely by intervening between the owner of the excess funds and the party who needs the funding, usually in the form of loan. The function of Regional Development Banks is to assist regional development by providing financing in the framework of National Development Planning. Bank Sumsel Babel (BSB) that will be discussed in this study is one of the banks owned by the regional government of South Sumatra and Bangka Belitung. Bank Sumsel Babel collected third party funds from individuals and companies into savings, current accounts and deposits and then channeled them back into loan and other transactions. Distribution of funds to the public other than credit, other banking services, including sending money, leasing safety boxes, bank guarantees, credit cards, buying and selling foreign exchange and others.

Banks must maintain the quality of relationships with customers in order to survive in this industry. Lu and Wang (2017) define relationship quality refers to the overall assessment of the strength and depth of relationships between a business and its customers in achieving their goals, expectations and desires. The focus of relationship quality is to develop an increasingly better process of maintaining and improving individual relationships with consumers which results in an interesting perception (Nguyen and Waring, 2013). In the quality of the relationship there is an element of trust, satisfaction and commitment which serve as benchmarks to foster good quality relationships.

Customer loyalty is obtained when the customer comes back for the product or service offered. Griffin (2002) revealed that loyalty can be identified through buying behavior, loyal customers are customers who make regular repurchases, buy products or other services from the main product line, provide advices to other people / parties, and the customer is immune to the influence of competitors. To measure customer loyalty, Buttle and Maklan (2015) has 2 (two) approaches, which are based on attitude, this loyalty approach is measured from the attitude component, namely beliefs, feelings and desire to buy and behavior, this loyalty approach is measured from buying behavior available to the customer by seeing whether the customer is still actively buying. Along with this, Ledikwe *et al* (2019) confirms that loyalty can be defined and measured based on behavior and attitudes. In this study, researchers will examine: (1) How do service marketing mix variables influence customer satisfaction and trust? ; (2) How do satisfaction and trust influence customer commitment? ; (3) Is there an influence of customer satisfaction, trust and commitment on customer attitudinal loyalty? ; (4) Is there an influence of customer attitudinal loyalty on behavioral loyalty?

Literature Review

Customer Loyalty

Customer loyalty according to Tunggal (2008) is customer attachment to a brand, store, manufacturer, service provider, or other entity based on a favorable attitude and good response, such as repurchase. Based on these definitions, it can be concluded that there are behavioral and attitude elements in customer loyalty. Customer loyalty is obtained when the customer comes back for the product or service offered. Brand loyalty is related to the customer's deep sense of commitment to the product or service consistently in the future (Izogo, 2016). Shobri *et al*. (2012) agree with this definition, they commented that brand loyalty reflects the tendency of consumers to join themselves with certain brands, regardless of price adjustments or changes in product features. Buttle and Maklan (2015) has 2 (two) approaches which are based on attitude, this loyalty approach is measured from the attitude component, namely beliefs, feelings and desire to buy and the second is based on behavior, this loyalty approach is measured by the buying behavior of the customer by seeing whether the customer is still actively buying. Along with this Huang (2017) confirms that loyalty can be defined and measured based on behavior and attitudes. This is confirmed by research conducted by Nyadzayo *et al* (2018) and Ledikwe *et al* (2019) which proves brand loyalty actually exists when attitudes and behaviors are considered when determining consumer purchase intentions in the future.

Relationship Quality

The key of relationship quality is to establish a systematic process that individually preserves and improves customer relationships resulting in a favorable image (Nguyen and Waring, 2013). There's ambiguity in some literature when deciding the relationship between trust, satisfaction, and commitment. Researchers don't always make a clear distinction between these three constructs (Crosby et al. 1990). According to Athanasopoulou *et al*. (2013), the quality of relationships is multidimensional. Agariya and Singh (2011) said that trust, commitment and satisfaction are the most frequently cited dimensions of relationship quality between 1982 and 2010. These three variables have been adopted in this study to examine the quality of relationship.

Trust

Munnukka *et al*. (2016) note that trust is linked to the degree to which other parties in a partnership can honestly provide accurate information. This concept emphasizes confidence, creating a feeling of faith in organizations' statements and commitments to preserve relationships (Van Tonder, 2016). Ndubisi *et al*. (2011) argue that the strength and quality of a relationship depends on the degree of trust: the higher the confidence degree, the better the partnership.

Satisfaction

Satisfaction has been defined as the fundamental marketing target, because the core marketing aim is to please customers. Kim *et al*. (2016) suggest that satisfaction refers to consumers' overall emotional reaction during the brand experience after the last purchase. Thaichon and Quach (2016) reinforce this view, arguing that satisfaction represents the state of happiness, satisfaction and enjoyment that consumers get from a brand and its goods or services through their overall perceptions and brand experiences. Thus satisfaction is an important determinant of customer decisions to continue or terminate their relationship with the business, as shown if the perceived performance of the product or service meets the desired expectations (Ndubisi *et al*., 2011).

Commitment

According to Mpinganjira *et al*. (2017) commitment refers to the ability to preserve the importance of a relation. Bojei and Alwie (2010) add that commitment exists when the exchange partner believes that it is very important to have an ongoing partnership with another partner so as to guarantee full effort to sustain it. Customers who are committed add value and benefits to service providers as well as ensure continuity of the business, so commitment is a key factor for the success of any long-term relationship (Zeithaml *et al*., 2001), As a result, when commitment exists, This helps minimize feelings of insecurity when interaction occurs and provides social space to establish long-term relationships (Mpinganjira *et al*., 2017).

Service Marketing Mix

The concept of marketing mix formalized by Neil Borden in 1953, McCarthy (1960) summed up all the 12 Borden elements to 4Ps. The service marketing practitioners found that the marketing mix does not address their needs (Helm and Gritsch, 2014). Services are basically is not the same in comparison to physical products (Fukey *et al*., 2014), the three additional Ps are added to meet the marketing challenges posed by the characteristics of services such as people, physical evidence, and process. Nowadays, customers have a lot of options, they can turn easily from one service provider to another that covers better coverage at lower cost (Bhardwaj, 2007). So the focus of banking services now has been completely shifted from a transactional marketing approach to a customer oriented approach. In this regard. According to Wilson *et al*. (2008), marketing services mix can be a critical component in the effective operation of a company in today's economy. Furthermore, it will change the essence of the marketing operation and will influence the decision-making and execution of the service marketing mix (Lovelock *et al*, 2011).

Hypothesis Development

Some literary analysis shows that the definition of marketing mix and the addition of three P marketing services are identified by many marketing researchers in different contexts and industries. The marketing mix does not produce a marketing strategy of only one component but is an interaction of all 7P elements at the same time.

Relationship between Marketing Mix and Relationship Quality

Product Quality

A product is anything offered to the market for exchange or consumption (Kotler, 2000). In banking, the product is described as services given to people like various customer banking accounts, such as current accounts and saving accounts. The key components of this group are banking products such as savings accounts, current accounts, fixed deposits and investment options (Estiri *et al*., 2011)

Service Quality

Adopting Hyun's research (2010), which states that service is a very important thing and is the key in creating trust and satisfaction where the element of elegance in assessing service in this study is very closely related to People and Process, the researchers include these two variables as gauges of quality service in the banking industry. Process is a system and sequence of customer services that were planned according to the interest the company promised (Lovelock, 2001). In the case of banking, according to Shokrani and Haghihi (2019) the service employees are often the primary contact points for the customer. The quality of services is highly related to the way of presentation to the customer. The customers' perception of the performance among services employees is a matter when the customers are evaluating the service (Barnes *et al*., 2004).

Environment

Within the reach of banking services, the service environment commonly referred to as servicescape or physical evidence. According to Lovelock (2007) these are relating to the nuances or arrangement of the room and also the elements that come in contact with consumers in the place where the service is performed. Services are often intangible and the standard cannot be accurately measure by the customer. The appearance of buildings, landscaping, interior furnishing equipment, staff members' uniforms, signs, communication materials, and other visible items such as noise levels, odors, temperatures and colors all provide tangible evidence of the service quality of a firm (Fukey *et al*., 2014).

Place

A place or distribution channel is a way for transferring the products (goods) to the customer. In regard to services, this term refers to the places where the services are being offered. According to several studies a place also refer to the opening hours, distance to reach a bank, parking places and automated teller machines (ATM) availability (Levesque and McDougall, 1996; Wu, 2011).

Price

In the banking sector, price includes fees, bank charges, interest rates and the interest paid on the deposits (Gerrard and Cunningham, 2004). Pricing is yet another strong variable of the marketing mix (Shanker, 2002). Many studies finding that pricing is an important key driver for different customer related variables such as attraction, satisfaction, trust, retention and loyalty (Low, 2012; Lees *et al*., 2007; Z Mavri and Ioannou, 2008; Manrai and Manrai, 2007).

Promotion

Promotion reflect business communications, including ads, public relations, personal sales and sales promotion. (McCarthy and Perreault, 1993). Hence, promotional activities such as community relations, event management, flash media, and corporate identity programs have relevance and they should be used innovatively and effectively (Kotler, 1986; Trainor, 2012).

Marketing mix does not result in a single marketing 'P' strategy. It may be the interplay of all the elements of 7P at the same time (Kushwaha & Agrawal, 2015). Banks' desired service standards can

be fast, convenient, value-added, low-cost, with advanced technology, easy and smooth, secure and reliable via modern branch configuration (Wilson *et al*, 2008; Gronroos and Vioma, 2013). With the right and agile strategy on marketing mix a firm can achieve the competitive advantage from its competitors and surpass the competition. It significantly influences the creation and delivering of superior value, customer satisfaction, customer trust, competitive advantage, growth opportunity, and profitability of the firm (Shamah, 2013; Lytle and Timmerman, 2006; Gronroos and Vioma, 2013; Haas *et al*., 2012 ; Gounaris and Venetis, 2002). On these grounds, we propose the following hypothesis:

H1. Product quality has significant influence on Trust
H.2 Service quality has significant influence on Trust
H.3 Environment has significant influence on trust
H.4 Price has significant influence on Trust
H.5 Place has significant influence on Trust
H.6 Promotion has significant influence on Trust

H.7 Product Quality has significant influence on Satisfaction
H.8 Service Quality has significant influence on Satisfaction
H.9 Environment has significant influence on Satisfaction
H.10 Price has significant influence on Satisfaction
H.11 Place has significant influence on Satisfaction
H.12 Promotion has significant influence on Satisfaction

Relationship between trust and satisfaction to commitment

De Wulf *et al*. (2001) describe commitment as the persistent desire of a customer to continue his relationship with a retailer followed by the ability of that customer to make efforts to preserve it. Commitment also plays a significant role in inter-firm relationships and being characterized by stability and sacrifice where members are willing to make temporary sacrifices to maintain long-term stable relationships (Wu *et al*. 2004). Considering commitment involves potential vulnerability and sacrifice, it is unlikely that the organization would be willing to commit to a partner unless trust has been established. Trust is therefore a necessary prerequisite for developing relationship commitment which is achieved when the customer has the confidence that the supplier will meet demand (Caceres and Paparoidamis 2007). Customer satisfaction contributes to strong customer-organization relations and is related to commitment (Rexha *et al*. 2003). On these grounds, we propose the following hypothesis:

H.13 Trust has significant influence on Commitment
H.14 Satisfaction has significant influence on Commitment

Relationship between Relationship Quality and Loyalty

Customer satisfaction is defined as an emotional response to a consumption experience, which translates into attitudinal loyalty (Babin and Griffin, 1998). The affective judgments of satisfaction lead to the formation of an attitude which is embodied in the construct of attitudinal brand loyalty (Bennett, 2001; Carpenter, 2008). The positive impact of customer satisfaction on attitudinal loyalty has been widely confirmed (Huang (2017) and Ledikwe et al (2019). On these grounds, we propose the following hypothesis:

H.15 Satisfaction has significant influence on Attitudinal Loyalty

Prior research implies two forms of commitment - affective commitment and calculative commitment (Gustafsson *et al*., 2005). Affective commitment reveals the emotional commitment of a customer to the service provider and the outcomes of an evaluation of affective relations (Mattila, 2006; Tsai, 2011). Affective commitment based on emotional attachment create strong attitudinal loyalty (Evanschitzky *et al*., 2006). Several of empirical studies have have shown that affective communication has a positive impact on attitude loyalty (Gustafsson *et al*., 2005; Richard and Zhang, 2012; Wu *et al*., 2012; Ledikwe *et al*., 2019). On these ground, we propose the following hypothesis:

H. 16 Commitment has significant influence on Attitudinal Loyalty

In the field of relationship marketing, Watson *et al* (2015) finding trust as the important factor of any long-term relationship. Trust also build an exchange relationships that are highly valued and therefore promotes attitudinal loyalty (Morgan and Hunt, 1994). Chaudhuri and Holbrook (2001) found that trusted brands are purchased more often and evoke a high degree of attitudinal loyalty. Research demonstrates a positive connection between trust and attitudinal loyalty (Chaudhuri and Holbrook, 2001; Watson *et al*., 2015; Sarkar *et al*., 2016). Based on that, we create propose following hypothesis:

H.17 Trust has significant influence on Attitudinal Loyalty

The conceptual framework of loyalty has evolved from a behavioral approach to a cognitive (attitudinal) approach and finally to a hybrid approach (Watson *et al*., 2015; Bilgihan *et al*., 2016). The majority of researchers conceptualize and calculate loyalty based on the behavioral dimension, focusing on sum and frequency of purchase (Carpenter, 2008; Lee *et al*., 2012). Attitudinal loyalty includes psychological commitment to a brand and include product / service superiority as well as positive and accessible brand reactions (Liu-Thompkins and Tam, 2013). Therefore, in line with various researchers this study proposes a comparative measure of customer loyalty in line with different studies, integrating both behavioral and attitudinal dimensions. For this study behavioral loyalty is seen as the readiness of consumers to buy back the service provider's services and maintain a partnership with the business. Based on that, researcher build a hypothesis:

H.18 Attitudinal Loyalty has an influence on Behavioral Loyalty

Figure 1 below depicts the proposed conceptual model for this study.

Fig. 1. Proposed Conceptual Model

Methodology

Questionnaire and Sampling

For quantitative descriptive research, researchers used a program using the Structural Equation Modeling (SEM) program in constructing data generated from questionnaires distributed. The use of SEM is used for social studies because SEM is able to connect between latent variables of the observed variables. There are 11 variables in this study, namely: 6 variables that act as antecedents (Product quality, Service quality, Environment, Price, Place and Promotion), 3 variables in Relationship Quality (Trust, Satisfaction and Commitment), variables Attitudinal Loyalty stands as a mediating variable and Behavioral Loyalty as a dependent variable.

In this research process, the stage of determining operational variables is very important because this stage serves as a link that connects the deductive thinking patterns towards inductive thought patterns. Through the operationalization of variables, the research hypothesis is transformed into data. The data will then be analyzed and tested hypotheses. Thus in quantitative approach-based research the stages

of measuring variables are crucial things that determine the success or failure of a study explaining a phenomenon

The marketing mix variables are adapted from Shokrani & Haghighi (2018) for product, price, location and promotion. Hyun (2010) for people, process and physical evidence, with as many as 20 (twenty) item questions. For the Relationship Quality variable, the authors adapted the question items from Hyun (2010) for satisfaction and trust, and Alnsour (2018) for commitment with as many as 11 (eleven) items. To examine attitudinal loyalty and behavioral loyalty variables, indicators were adapted from research of Choi *et al* (2017), with 6 (six) item questions. All indicators are measured with six-point likert scale.

Table 1. Demographic data of participants

Category	N	Percentage (%)
Gender		
Male	116	41.43
Female	164	58.57
Age		
<20	5	1.79
20-30	98	35.00
31-40	119	42.50
41-50	27	9.64
51-60	28	10:00
> 60	3	1.07
Education Level		
Elementary	1	0.36
Junior High School	2	0.71
Senior High School	46	16.43
Under Graduate	33	11.79
Graduate	171	61.07
Post Graduate	27	9.64

The population of this study is all customers of the Sumsel Babel Bank in the operational area of the Sumsel Babel Bank which have been active in transactions and saving in the past year. The application of non- probability sampling technique is used in determining respondents, in this case the researcher will conduct judgment sampling to select respondents in accordance with predetermined criteria that have been active customers for 1 year at the Bank Sumsel Babel. The demographic data of participants are shown in Table 1.

Data Analysis

Researchers collected primary data through questionnaires distributed to customers of the Bank Sumsel Babel, *Likert scale* were used to measure the indicators. The data obtained was processed using SEM analysis with AMOS version 20. The data analysis steps taken by the researchers are tabulating the results of the answers from the respondents 'questionnaires, conducting pre-tests for validity and reliability testing, conducting descriptive analysis of respondents' responses, conducting SEM assumption tests, checking outliers and looking at normality of data followed by conducting structural analysis models.

Results

Pre-Test

We distributed questionnaires to 30 respondents in order to conduct preliminary exams before collecting primary data. Questionnaires that were distributed had been done by wording test, by paying attention to sentence structure, concordance, words, diction and language so that later it would be easily understood by prospective respondents. Preliminary tests carried out consist of Validity and Reliability

Tests, and the results will be reflected in the Cronbach Alpha value, where the value if above 0.5 then the data is declared reliable. While the validity test is done by looking at the value of KMO (*Kaiser Mayer Olkin*) and component matrix, if the number is more than 0.5 then the data is valid. Pre-test results of this study show that all variables and indicators are valid reliable.

Measurement Model Assessment

After conducting a preliminary test, the researchers distribute further questionnaires to obtain primary data. From the questionnaire distributed there were 298 responses received, however only 280 respondents passed the screening question as explained before.

Validity indicates the extent to which the gauge measures what you want to measure. Indicator measurement is appropriate in constructing a construct if the value of standardized regression weight> 0.50, whereas to see consistency in the measurement of a construct the construct reliability value is calculated and its value is expected to be greater than 0.70, but if the resulting construct reliability value approaches 0.7, then it can be said this value is enough to justify a research result. The researchers also evaluate the measurement model with square root of average variance extracted, if the AVE value is greater than 0.5 then it can be said to be good. Average extract variants with values> 0.5 used as a determinant of convergent validity. From the tests conducted, the data used are valid and reliable and the existing validity is valid, as can be seen on Table 2.

Structural Model Assessment

A structural model was used to assess the links between the constructs and to validate the research H1 – H18 formulated for this study. Tests on the goodness of fit model must be carried out to ensure that the structural model that has been prepared can explain the direction of the relationship and the direction of influence precisely and does not cause estimation bias. Based on Table 3 below, it appears that the results of the model evaluation for the full structural modification model have shown better criteria where for each measure of goodness of fit values are appropriate, so as a whole it can be concluded that the structural model that has been modified has been able to produce an estimated level is expected. Further, table 4 shows the result of hypothesis testing using the SEM analysis.

Table 2. Validity and Reliability results

Variable	Item	SLF	Composite Reliability	AVE
Product quality	P1.1	0.921	0.943	0846
	P1.2	0.921		
	P1.3	0.917

Behavioral Loyalty	BL1	0.947	0.964	0899
	BL2	0.946		
	BL3	0.951		

Table 3. Goodness of Fit Full Structural Model Testing

Goodness of fit index	Cut-off value	Model results	Information
RMSEA	≤ 0.08	0.060	Good
GFI	≥ 0.90	0821	Marginal
AGFI	≥ 0.90	0789	Marginal
TLI	≥ 0.95	0.958	Good
Cmin / DF	≤ 2.00	1,991	Good
CFI	≥ 0.95	0.963	Good

Discussion

The Relationship between Marketing Mix Variables and Trust

H1, H2, H3, H4, H5 and H6 which proposed Product Quality, Service Quality, Environment, Price, Place and Promotion, respectively, has a positive influence on Trust was supported, because all of T-values are greater than 1.65 and the value of $p < \alpha = 0.05$. Therefore, it can be concluded that Trust can be significantly influenced by all the proposed Marketing Mix Variables.

The Relationship between Marketing Mix Variables and Satisfaction

H7, H10, H11, and H12 which proposed Product Quality, Price, Place and Promotion, respectively, has a positive influence on Satisfaction was supported, because all of T-values are greater than 1.65 and p value $<\alpha = 0.05$. Therefore, it can be concluded that Satisfaction can be significantly influenced by Product Quality, Price, Place and Promotion.

H8 and H9 which proposed Service Quality and Environment, respectively, has a positive influence on Satisfaction was not supported, because the T-values are smaller than 1.65 and p value is bigger than $\alpha = 0.05$. Therefore, it can be concluded that Service Quality and Environment cannot influence Satisfaction significantly.

The Relationship between Relationship Quality (Trust, Satisfaction and Commitment) and Loyalty

H13 and H14 which proposed Trust and Satisfaction, respectively, has a positive influence on Commitment was supported, because all of T-values are greater than 1.65 and p value $<\alpha = 0.05$. Therefore, it can be concluded that Commitment can be significantly influenced by Trust and Satisfaction.

H15, H16 and H17 which proposed Satisfaction, Commitment and Trust, respectively, has a positive influence on Attitudinal Loyalty was supported, because all of T-values are greater than 1.65 and p value $<\alpha = 0.05$. Therefore, it can be concluded that Attitudinal Loyalty can be significantly influenced by Satisfaction, Commitment and Trust.

H18 which proposed Attitudinal Loyalty has a positive influence on Behavioral Loyalty was supported, because the T-value is greater than 1.65 and p value $<\alpha = 0.05$. Therefore, it can be concluded that Behavioral Loyalty can be significantly influenced by Attitudinal Loyalty.

Conclusion and Managerial Implications

This study proposes a composite measure of customer loyalty incorporating both behavioral and attitudinal dimensions by looking at relationship quality that has been built based on Marketing Mix that applied to Bank Sumsel Babel. Based on the problems that have been formulated, the results of the research conducted obtained the majority of marketing mix elements significantly influence trust and satisfaction, but Service Quality and Physical Evidence do not significantly influence satisfaction.

The results of this study indicate that the product quality is the most influential variable on satisfaction, this can be seen from the high enough estimate value (SLF: 0.300) and the high T-Value (3.956). This shows that the products being marketed, product diversity and product compatibility with customer needs are important factors in determining overall satisfaction. This research also shows that the place variable is the variable that has the greatest influence on trust (SLF: 0.223) and a high T-Value (2.376). This shows that the accessibility of bank office, the availability of ATM and quietness of branches are important factors in determining overall trust.

This study also found that satisfaction and trust have a significant relationship to commitment. It can be concluded that the increase made in trust and satisfaction will provide a significant increase in commitment. This is in line with the results of research conducted by Kaur and Soch (2018) and Ledikwe *et al* (2019) that suggested the same thing.

The results also obtained that trust, commitment and satisfaction of customers of Bank Sumsel Babel may significantly influence attitudinal loyalty. From the results obtained it can be concluded that the three variables in Relationship Quality have an influence on Attitudinal loyalty. This is in line with the results of research from Ledikwe *et al* (2019) who found the same relationship. This study also found a positive and significant association between attitudinal loyalty and behavioral loyalty. The results confirm prior studies, for example Bilgihan *et al*. (2016), Choi *et al*. (2017), Kaur and Soch (2018) and Ledikwe at all (2019) who also found a similar relationship.

Bank Sumsel Babel must pay attention in building the quality of relationships through trust, satisfaction and commitment because this has a significant effect on attitudinal loyalty. The firm can increase the quality of trust, commitment and satisfaction. To build customer commitment, company must first build trust and satisfaction. In terms of increasing the trust and satisfaction, the company is expected to give attention to products quality that have a strong influence on satisfaction and improve place attributes which are significant in influencing trust in customers. To achieve this, the company must pay attention to location and accessibility of branches if the company want to open new office. The company also need to maintain the quietness of the office and also make sure the availability of ATM is maintained. Furthermore, company is also expected to continue to innovate banking products and features that are tailored to customer needs to improve customer satisfaction. Those strategy are expected to create strong and sustainable customer loyalty.

Abstract

Insurance is an economic sector with high potential that needs to be capitalized effectively by the authorities responsible for quantifying this opportunity of economic growth, considered the engine of progress and development of a nation. As part of the financial system through the function they perform, they act as an agent that contributes to improving the economic growth. The insurance sector does not only help the development of the financial sector, but it indirectly promotes economic growth. Consequently, the role of insurance varies for different levels of economic development and largely depends on the indicators used to measure this type of activity. The goal of this paper was to focus on an extremely relevant topic for the specialized economic literature, namely, the influence of insurance on economic growth. The motivation for approaching this theme is a theoretical and methodological preamble for the analysis and identification of diverse aspects and effects of inflation on the insurance sector in the process of economic growth, approach that will be later continued in another study through an econometric model which will evaluate the intensity and direction of influence of this sector in Romanian economy.

Keywords: Insurance sector, Economic growth, Banks, Financial markets, Inflation, Romania.

Introduction

The insurance activity in a modern economy plays an important role and more attention needs to be paid to understanding its environment and its interaction with other sectors of economy. A well-organized insurance sector, with good governance on regional or national level, is one of the catalysts of the socio-economic process of a country or of a region (Ciurea & Ianoș, 2019). The insurance sector plays, in fact, a fundamental role in the functioning of a modern economy as many activities cannot be achieved without insurance. The importance of insurance, the presence of financial institutions is vital for the sustainable economic growth of any country.

Particular attention must be paid to the socio-economic necessity of insurance and its influence on economic growth. Economic growth can be influenced by the insurance sector; still, the hypothesis is not generally available. The idea emerges from the comparative chronological analysis obtained by other researches who have studied this problem and have used diverse research methods, among which we can mention: regression models, statistical correlations, causality tests, co-integration tests, statistical analyses, cross-section analyses. In Romania, there is no correlation between the insurance markets, measured by the degree of insurance penetration and the degree of density and economic growth, measured by GDP per capita (Preda, 2012).

Ward și Zurbruegg (2000) were the first to explore the relationship between insurance and economic growth for the OECD countries. They measured insurance by total purchasing of gross issued premium

as they applied the Causality Granger Test in order to study supply or demand, as well as the influence of insurance on economic growth.

Other authors, (Webb, Grace & Skipper, 2002), presented how life and public liability insurers can contribute to economic growth due to various aspects, such as: life insurance can increase productivity by reducing demand for liquidity and through a more efficient use of available resources, or insurers have the potential to stimulate return on investment by reducing the costs of financing risks.

Outerville (2013) addresses in his paper the relationship between the insurance sector and the economic growth from the perspective of demand, while multinational organizations become aware of the importance of insurance in achieving economic growth.

In another research, Cristea, Marcu și Cârstina, (2014) studied the influence of economic growth on the trend of gross issued premiums in the European Economic Community (EEC) countries. Thus, by using a panel-type model: cross-cutting with fixed effects, where the real increase of the premiums was explained by the growth of the GDP, they showed that the growth potential of the insurance market in the EEC countries is highly correlated with the rate of the economic growth in that area.

Ul Din, Abu-Bakar & Regupathi (2017) studied the relationship between insurance and economic growth in 20 countries for the period 2006 – 2015, where the insurance activity was measured in terms of net issued premiums, of insurance penetration and density, identifying a positive and significant relationship between life insurance, measured through the respective variables and the economic growth for developed countries, the same is true for the developing countries when insurance is measured by the degree of insurance penetration.

Consequently, all the studies carried out on the theme of insurance influence on economic growth so far do not have a common denominator because the approach is different in all cases.

It can contribute to economic growth both as a financial intermediary and through the function of supplier and risk transfer identifier, respectively by achieving an effective risk control and by mobilizing the savings of the population. Over the last decades, there has been a rapid growth of insurance market, especially in the developing markets, due to the financial liberalization and integration, which has raised questions regarding the impact of this sector on the economic growth. A large volume of papers in the literature has been devoted to the way financial systems influence savings and investment decisions and, implicitly, the rhythms of long-term economic growth through several ***functions***, among which the following can be mentioned (Levin, 2005; Măcriș, 2009): *exercising corporate governance; trading, diversification and risk control; mobilization and investment of savings; conductor of exchanges of goods and services; attenuator of negative consequences which random shocks can have on capital investments.*

Financial intermediations support economic growth by improving these functions and ameliorating market frictions such as the costs of acquiring information, conducting transactions and concluding contracts, respectively allowing the economic environment to allocate resources to investments in a more efficient way. However, the positive effects of financial development are tailored by macroeconomic policies, laws, regulations, financial infrastructure and by strengthening the rules applied across countries and times.

The insurance sector can contribute to the economic growth (Skipper & Klein, 2000) in several ways as one can notice in Figure 1.

Source: adapted from Skipper & Klein, 2000.

Fig. 1: The ways insurance contributes to economic growth

In addition, it is desirable that there be various effects on economic growth from the side of life or non-life insurance (property - bonds), given that these two types of products insure households and corporations against different types of risks which affect economic activity in different ways. Moreover, life-insurance companies facilitate long-term investments rather than short-term ones, as in the case of non-life insurance companies.

Aspects of the interaction between the insurance activity, banks and financial markets

The literature in this field has been more concerned with the potential interdependence or the substitution effect between banks and financial markets. On the other hand, the emphasis is laid on the fact that banks, rather than financial markets, play a crucial role in reducing information frictions and in reducing transaction costs, respectively in improving the allocation of resources. Similarly, the role of financial markets is emphasized rather than that of banks due to the corporate nature of markets in encouraging innovative and growth-enhancing activities. The development of the banking sector can strengthen the insurance activities through a more effective payment system which will allow the improvement of financial intermediation of services (Beck & Webb, 2003; Webb, Grace & Skipper, 2002). In addition, the development of the banking sector provides liquidity to insurance companies which allow them to meet the payment claims for damages.

In the last two decades, the interdependence between banking activities and insurance activities has increased a lot due to risk transfer. As a result of the fact that banks and insurance sector have mutual exposure in many areas, banks spread credit risks to insurance providers mainly; both by securing loan portfolios (valuing bank securities and collateralizing debt bonds) and by derivatives (credit exchanges with difficulties). From the insurance sector side, insurers have transferred credit risk to banks through liquidity facilities and letters of credit. At the same time, the development of financial markets can strengthen the development of insurance activities because liquid capital markets help insurance companies to invest the resources collected through premium payments. This is especially important for insurance companies which want to compensate long-term bonds for long-term assets that are not normally available through banks. Finally, what is true for banks is also verified in the case of the links between insurance companies and financial markets, for risk transfer reasons.

According to Rule (2001), insurance companies transfer to financial markets not only the market risk, through the hedging options included in the life-insurance portfolios, but also the insurance risks related to natural disasters. From the insurance sector side, financial markets can transfer market risk to insurance companies when the latter write options and buy bonds with included options (for example: bonds which can be withdrawn before deadline).

The demand for life insurance has rapidly grown over the past few decades, significantly surpassing global income growth. The wide spread of socio-economic changes has favoured this development, in

particular, the dramatic extension of life expectancy and the high enrolment rate in tertiary education. Nevertheless, these factors contribute to the rising cost of dependency and provide reasons to cover life insurance. In addition, the limits of social welfare, as tax pressure reaches a critical threshold, are largely anticipated as the stimulators of life insurance consumption in the coming years, as households anticipate that public institutions will cover less of their financial needs (Zouhaier, 2014).

The evolutions in the market structure have similarly contributed to the growing popularity of life insurance. The magnification of the opening of domestic markets to foreign competition as a result of international trade agreements, in particular the Uruguay Round, has resulted in the emergence of more attractive and better priced products, that are better placed in consumers' demand. Moreover, the development of financial savings in the perspective of retirement is seen as a factor which has strongly supported the demand for life insurance in the fast-growing economies.

Approaches rearding life insurance and the determinants of insurance demand

Life insurances have a great potential to contribute to the Romanian economic growth. In the much more advanced European economies, life insurance plays an important role in alleviating the risk of poverty by ensuring the financial security of individuals and families if confronted with unexpected events, such as death or disability. At the same time, they also act as savings instruments for the population, channeling significant volumes of long-term funds towards financial markets and to other sectors in need of investments, thus contributing to the economic growth and stability as a whole.

An insurance policy provides financial support to the dependent persons and to the beneficiaries designated by the insured person. In addition, it provides a measure of financial security for the policyholders (family, loved ones) so that after the death of the insured person they are able to assume financial responsibilities. Policy payments can be made in a lump sum or in several instalments. The most common ***types of insurance*** are:

- ***Term life insurance*** – the policy is available if only the death occurred in a certain period of time which coincides with the term when the insured person makes monthly payments. A term life insurance policy pays benefits to the beneficiaries if only the policyholder dies during the period for which the policy was initially contracted and remained current through monthly or annual premium payments.
- ***Lifetime/ Permanent insurance*** – has no time limit as in the case of term life insurance. Moreover, it remains effective as long as the insurance payments are paid and other contract obligations with the insurance company are met, these types of policies also increase the cash value.

Consequently, there are two basic types of life insurances: *the term life insurance,* which can be purchased for a fixed period of time and *the lifetime insurance*, which retains its effects until the death of the insured person. In addition, with no time limit, all permanent life insurances build cash value with a form of investment otherwise taxed or with a savings plan. Due to this investment component, the premiums are significantly higher than in the case of term life insurances.

Based on the information taken from the literature, we can identify the main socio-economic characteristics and the market conditions of the product for which there is data available, which could affect the demand for life insurance. **These factors are presented as follows:**

- ***Disposable income*** – is a central variable in the insurance demand model that positively affects the consumption of life insurance. In addition, as the value of life insurance products increases, a high income results into a greater loss of the dependents' anticipated utility in the event of an early death of the income earner. The effect that occurs increases the value covered by the life insurance and, therefore, it contributes to the positive relationship with income. By analysing the data on households' income, the insurance demand increases with the husband's future earnings (and decreases with the wife's future earnings). Most empirical analyses on national panels use nominal GDP per capita as a proxy variable for disposable income.

- ***Life expectancy*** – according to Lewis (1989) theoretical development, in which the goal is to maximize the anticipated utility of the dependents during their lifetime, the consumption of life insurance is considered as ascending with the probability of the death of the salary earner. Considering that life expectancy is reversely correlated with the probability of death, it is expected that there should be a negative relationship between life expectancy and insurance consumption. One explanation may be that a longer life expectancy will also diminish the price of life insurance and, consequently, it will stimulate consumption.

- ***Number of dependents*** - Campbell (1980) argue that the dependents' protection against financial difficulties represents the major driving force of life insurance consumption. As Lewis showed (1989), the demand of life insurance increases with the anticipated value of the lifelong consumption of the dependents. This anticipated value obviously increases with the number of dependents. Hence, the greater need for security against the premature death of the salary earner.

- ***Level of Education*** – the level of Education positively affects the demand for life insurance in two ways. Truett and Truett (1990) argued that a higher level of Education is associated with a greater desire to protect the dependent persons and their living standard, too. Browne and Kim (1993) explained that a higher level of Education results into a greater concern about the uncertainties of life, hence a better awareness of the benefits covered by life insurance. In addition, the level of Education is associated with the degree of dependence of the descendants, resulting into an increase in the need to protect beneficiaries through life insurances.

- ***Social insurance expenses*** – social insurances are a factor that reduces the demand for life insurance. Social insurance spending represents a proxy variable for national welfare, which can be seen as a substitute for what life or car insurance covers, risk coverage. Skipper and Klein (2000) show that generous social insurance programs reduce the cost of dependency. Following tis theoretical development, Lewis (1989) argues that social insurance spending represents a form of mandatory life insurance that can replace taxes, which reduce available income for the purchase of life insurances; the high level of social insurance expenditure is assumed to be a factor that reduces life insurance consumption.

- ***Financial development*** – is associated with the wide spread of insurance cash-flows, which allow households to insure their future income by holding financial assets. By offering similar benefits, it is expected that life insurance generate higher sales in countries with a higher level of financial development.

- ***Foreign market share*** – the high levels of domestic market penetration by foreign firms can reflect market attractiveness for foreign insurers and suggest a high level of insurance consumption. A low level of foreign firms' participation may also reflect the high degree of competitiveness of the domestic market, as well as a possible saturation of this market.

- ***Anticipated inflation*** – the negative effect on the demand for life insurance, turning it into a less attractive product. Fortune (1973) explains that inflation erodes the value of life insurance, making it a less attractive product. Some authors (Măcriș, 2013), have provided empirical evidence which demonstrates that anticipated inflation has a negative effect on life insurance consumption. As Babel (1981) also demonstrated, using data from the Brazilian economy in a period characterized by rapid inflation, even when adjusted insuranc

- e products are used, the demand for these products is affected by the harmful effects of inflation.
- ***Real interest rates*** – one of the theoretical justifications of this influencing factor is that high rates of real interest can reduce the insurance cost and thereby stimulate the demand for insurance. On the other hand, they can determine the consumers to reduce the number of purchases due to the anticipation of high revenues

In their work (Beck & Webb, 2003), they detected a positive relationship using interest rates on loans. However, it can be noted that the interest rates on loans contain a credit risk premium that varies from one country to another, depending on their experience on lending systems

The role of insurance markets in the Developing Countries

The insurance industry plays an important role in our society and in other developing countries by encouraging better risk management and protecting the insured person when something bad happens, the protection granted to the people and the companies where they are employed, and insurance stimulates economic growth and stability through association with long-term investments.

The developing countries are not only consumers, but also providers of insurance services. In a domestic market, the general insurance offer consists of services provided by national companies, with local and/or foreign capital, as well as foreign companies and agencies or their subsidiaries. Insurances, as well as other financial services, have gained importance in the process of general development of the financial institutions. The Governments of many developing countries have induced, throughout history; the vision that the financial systems they had inherited could not adequately serve the development needs of their countries so that, in the recent years, they have directly made considerable efforts to change the structure of these financial systems, which are considered as crucial components of the developing programs (Umoren & Joseph, 2016). The life insurance sector is restricted in many developing countries because life insurance can be considered irrelevant or inappropriate for ideological, cultural or religious reasons or because the economic security is provided by the family.

According to the studies made by Liebenberg, Carson and Dumm (2012), a function of demand for life insurance derived from the optimization of the consumer's utility function should be dependent on welfare, income trend, a vector of interest rates, a vector of prices, including insurance premium rates and subjective discounting functions of the consumer in terms of the utility functions of consumption and welfare, which are affected by the level of financial development of the market.

The fundamental reasons for savings in developing countries should be similar to those in industrialized countries. However, the environment in which decisions for savings are made is extremely different. Under the life cycle assumption of savings, capital markets are supposed to be perfect so that lending and borrowing are assumed to be in such a way that decisions regarding income and savings be separated. According to this formulation, the standard instantaneous utility functions (concave in consumption) will generate a relatively flat consumption demand throughout the life cycle, because the income obtained is described as an age function, which does not follow the same form, there is only the assumption that a change in the population growth rate does not affect the intergenerational distribution of income, under the conditions of the life-cycle assumption.

Another concern refers to the fact that an increase in the population growth rate determines the existence of an asymmetric distribution of personal income. A rapid growth of the population determines a large share of the young population, which tends to consume more than it produces. In this context, Luciano, Outreville and Rossi (2015) shows that an increase in the population growth rate, caused by the increase of fertility rate, implicitly reduces aggregate savings. The widespread belief, that a more ethical distribution of income encourages the savings of low-income groups, is confronted with a difficult problem for many developing countries, since personal savings are only made by a very small segment of the population. The connection with the distribution by age groups is even more difficult to be achieved in relation to the insufficiency of the available data. Moreover, a relatively large share of the households derives their income from agriculture, and the income is subject to some large fluctuations caused by the variations in global prices of agricultural commodities and climatic conditions.

Finally, the structural characteristics of markets and financial institutions play a major role in determining the efficient allocation of demand and supply of financial services. Distortions also occur when the Government imposes a set of control and tax measures. A variety of factors, especially in the economies of developing countries, can determine the prevalence of price distortions.

The Romanian insurance market is still in an early growth stage, specific to the developing countries rather than to an UE Member State. Despite optimistic forecasts, (a turnover of 10 billion euro in 2010 and around 20 billion euro in 2020), the level of the insurance market in Romania is still low. The contribution of the insurance industry to the formation of the GDP in Romania is still under the European average. Therefore, we remain on the last position in terms of insurance density and insurance penetration in GDP (ASF Romania, 2019).

The Romanians are reluctant when it comes to life insurance, reluctance that comes from superstition and fatalism "*I'm not talking about some illness as this way I attract it and what is about to happen will happen anyway*". We note that the internet access and the communication with the Romanians working abroad are factors which contribute to the change in the perception of those who want to take out insurance.

From the investigations performed, we cannot say that there is homogeneity between states; on the contrary, we notice great discrepancy among states, generated by the economic power of each of them. The way European citizens invest is most striking. Thus, while Scandinavian countries and the most economically developed ones lay emphasis on life insurance, there are also exceptions, such as the case of the Netherlands, which give priority to private health insurance.

The effects of inflation on life insurance contracts

The inflation effects on life insurance contracts are particularly pronounced due to the following factors: these contracts are usually specified in fixed nominal monetary units and most are intended to cover long periods of time. Since the values of life insurance are specified in fixed nominal monetary units, these do not adjust to compensate for the value erosion produced by inflation and, considering that the contracts are on long-term, the accumulated erosive effects of inflation on the insured value may be substantial (Dragoș, 2014; Ciurea, 2019). Thus, while life insurance products are designed to provide protection against long-term hazards and premature death, inflation and a rising cost of living may undermine this protection. If the insurance is a term life insurance policy for only a few years, then inflation may not be considered a major factor, but if we deal with long-term insurance policies – for example, for 20 years or more – then the future value of money should play an important role in calculations.

In assessing the effect of inflation on the cost of life insurance, the consumer may be influenced, to various degrees, by "the monetary illusion". Consumers can estimate the net cost of life insurance in either nominal or real terms. More than that, they can link these costs to the nominal or real values of the life insurance that provides protection. By combining these alternatives, **there are four general classifications of the approaches that the consumers can make**: *"monetary illusion", "partial monetary illusion", "policy illusion" and "no illusion"*.

The consumers who suffer from monetary illusion may realize that inflation is present, but they fail to admit the impact of inflation on real costs and of the value of their life insurance policies. Moreover, if insurers are able to reduce the burden of the premium due to the higher income of the investments with higher interest rates, the consumers who suffer from this degree of monetary illusion could actually believe that the cost of life insurance decreases. Their focus is on nominal costs and on nominal levels of protection and when inflation affects these nominal values, consumers won't recognize the impact of inflation on life insurance. Such consumers could use a number of specific costly procedures, which may lead to growth or to the reinforcement of their illusion.

While a consumer who relies on monetary illusion would be tempted to believe that inflation has no effect or if inflation determines insurers to reduce the burden of the premium and/ or the increase of dividends and of the cash values or that it only has a reducing effect of the cost of life insurance, a consumer with partial monetary illusion would be tempted to believe that inflation determines the increase of the cost of life insurance (Cummins & Weiss, 2009). Consumers who are at this stage are somewhat less naive in their thinking. They realize that the identification or the cash payment value, if it's actually received, it will bring him a value which is eroded by the inflation that occurs in the period

between the date of the policy purchase and the date of its completion at death, renouncement or maturity. This phenomenon often leads to the criticism of life insurance products on the grounds that premiums are paid with "good money" while the benefits are received in "bad money", or in money whose value has been eroded by inflation.

A more subtle error is made when consumers are short-sided in their view of life insurance, considering the net cost in terms of the actual or present value of a policy which provides a given number of units of the actual insurance. Their attention is incorrectly directed to the vehicle (be it the policy contract) rather than to the project (be it the protection provided) of the life insurance purchased. This focusing error is called the "policy illusion" and it is a case of monetary illusion. In discussing this type of monetary illusion, attention is paid to the elaboration of the capital budgeting procedure, usually based upon the measuring impact of inflation on the costs and benefits associated with life insurance. If consumers are affected by monetary illusion, partial monetary illusion or policy illusion, they are inclined to see the influence of inflation as generating costs of life insurance which are uncovered, higher or lower ones, respectively.

The current context of the specifics of the inflation rate in Romania

For Romania, the inflation rate was 4.04% at the end of 2019 and it was above the level forecast by the NBR by 0.55%. As a result of a strong base effect at the level of the fuel group, the evolution reflected the combined effect of some shocks from the supply side in the case of some agricultural food products (such as: fruit and pork), whose transmission in the final prices was facilitated by the maintenance of pressure from fundamental factors. The slight depreciation of Romanian's currency, 'leu', towards the end of the year, in relation to the main currencies, also acted in inflationary sense (The National Bank of Romania (NBR), 2019; 2020).

According to the AGERPRESS press release of April the 4th 2020, the average rate of consumer prices for the last 12 months (April 2019 – March 2020) compared to the previous 12 months (April 2018 – March 2019), calculated on the basis of the CPI is 3.7%.

According to the NBR Inflation Report on February 2020, in conjunction with that from November 2019, the annual rate of CPI inflation indicates its return and maintenance within the interval of variation around the central target over the coming quarters, being projected at 3% at the end of 2020 and at 3.2% in December 2012. As compared to the previous edition of the Report, the value recorded in December 2019 was by 0.2 percentage points higher while for the end of the current year the projection was revised down by 0.1 percentage points. The return of the inflation rate in the specified range will be mainly due to the attenuation of the dynamics of the exogenous components of the consumer basket and, to a lesser extent, to the adjusted CORE2 index, preponderant on the base effects determined by the unfavourable developments in the first part of the previous year. Such maintenance is due to the persistence of inflationary pressures from the domestic environment, associated with the excess of demand and inflation anticipations while, in the medium-term, an increase in the pressures coming from imported inflation is also expected. Similarly, the risk balance in projecting the annual inflation rate is assessed to be inclined in the direction of deviations upward from the trajectory described in the baseline scenario, mainly due to the influence of internal factors.

Expressed as the annual average, the inflation rate remained at the level registered at the end of previous quarter: the value determined according to the national methodology reached 3.8% in December 2019, while the indicator calculated on the basis of harmonized structure reached a level of 3.9%. However, Romania remains the country with the highest level of the annual average HICP rate among the Member States of the EU for 18 months in a row, the difference compared to the European average being of 2.4

percentage points, given the marginal decline of the EU average. This aspect is also shown in the table below.

Table 1: Annual average HICP in the UE at December 2019

Curr. No.	Country	HICP (average annual variation %)
1.	Romania	**3.9**
2.	Hungary	3.4
3.	Slovakia	2.8
4.	Latvia	2.7
5.	Netherlands	2.7
6.	Czech Republic	2.6
7.	Bulgaria	2.5
8.	Estonia	2.3
9.	Lithuania	2.2
10.	Poland	2.1
11.	United Kington	1.8.
12.	Sweden	1.7
13.	Slovenia	1.7
14.	Luxembourg	1.6
15.	Austria	1.5
16.	Malta	1.5
17.	Germany	1.4
18.	France	1.3
19.	Belgium	1.2
20.	Finland	1.1
21.	Ireland	0.9
22.	Spain	0.8
23.	Croatia	0.8
24.	Denmark	0.7
25.	Italy	0.6
26.	Cyprus	0.5
27.	Greece	0.5
28.	Portugal	0.3
29.	European Union	**1.5**

Source: adapted from National Institute of Statistics of Romania (NSI), The National Bank of Romania (NBR), www.eurostat /statistics-explained.

From the analysis of the investigations carried out on the evolution of inflation in the UE Member States, the period 2014 – 2016 was characterized by a decreasing evolution of prices in most of the EU states, influenced by lower energy prices across the world, and starting with the year 2016, it placed on an upward trajectory as a result of the propagated effect of lower oil prices, as well as of the favorable developments in the labor market. Across the EU as a whole, the annual inflation was 1.5% in December 2019.

Although Romania registered a negative inflation at the end of 2016 (-1.5%), occupying the best place, from this perspective, in Europe, its effect was felt negatively in 2017, in the sense that the inflation rate was on an upward trend, located at 1.3% at the end of that year and growing continuously until the level of 2019.

Unlike the NBR, the statistical data, calculated on the basis of their CPI from the previous year, is not optimistic and positions Romania with the highest inflation rate, as one can see from the table below in conjunction with table 1.

Table 2: Evolution of inflation rate

%	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
Inflation rate (end of year)	7.96	3.14	4.95	1.55	0.83	-0.93	-0.54	3.32	3.27	4.04
Inflation rate (annual average)	6.09	5.79	3.33	3.98	1.07	-0.59	-1.50	1.3	4.6	3.8

Source: NSI, calculations performed based on the NBR Annual Inflation Reports

As one can see in the graph below and as stated in the explanations given by EUROSTAT at the end of 2019, the highest inflation rate was recorded for food, alcohol and tobacco (2.2%), followed by services (1.8%), as well as for non-energy industrial goods (0.5%)

Source:https://ec.europa.eu/eurostat/statisticsexplained/index.php?title=File:Euro_area_annual_inflation_and_its_main_components_(%25),_March_2010_-_March_2020.png

Fig.1: Evolution of inflation rate in the European space and its main components during March 2010 – March 2020

The main uncertainties and risks associated to the perspective of inflation arose from the future conduct of fiscal and revenue policy, especially in the context of 2019 – 2020 election calendars, and the level and trend of the current account deficit remained worrisome. Increased uncertainty continued to be associated with the growing weakening of the euro economy area and of the global economy, as well as with the increase in risks, in the context of the trade war and of Brexit.

In the current context of the rapid spread of the corona virus, a number of international organizations and financial institutions have revised down their economic growth forecasts for 2020, signaling the possibility of even more abrupt deterioration of economic growth rates. Given the fact that the fundamental objective of the NBR is price stability, it is natural to understand the determinants of inflation rate, the way it evolves and its future prospects.

For the insurance sector, the cognition of inflation is important because it erodes the value of money, vitiates the correlations between the relative prices of various goods and services, enhances uncertainty and risk, etc.

Conlusions

The evolution of the insurance market in the Romanian economy in the last decade is due to the strongest players that entered the market, the services provided by the insurance companies, whose products have evolved a lot to meet the requirements of the consumers and to familiarize them with this type of investments. In our country there is a high potential demand because of the large number

of citizens, but the actual demand is reduced because of the low economic power of the citizens and because of their perception on the use of insurance. The reality is that, at present, the insurance market is becoming more and more important for Romania. This process of redefining the operational structures has caused a number of effects, represented by the new dimension of the market, both in terms of quality and quantity. The Romanian insurance market has experienced a significant increase in product quality and a great diversification of services in the recent years. The presence of a high level of companies in the market proves that the Romanian scene has a real potential for growth and development, being at the same time one of the most attractive markets for foreign investors. This is the result of the diversification of supply, especially in the field of life insurance, where competition is growing. The fact that many companies operating in this market are financial groups with international experience and recognition is a strong argument in favor of quality and significant contribution to economic growth.

The share of life insurance activity in the total insurance sector in Romania, from the perspective of the volume of gross written premiums, is at a low level as compared to other EU analyzed states. Nevertheless, in recent years, there has been a more pronounced growth of the life insurance sector in Romania, which indicates a growing trend of the Romanians' interest towards life insurance products. Although Romania has recorded lower levels of insurance indicators as compared to the European average, the development prospects of this sector remain favorable. Launching new insurance products and adapting them to the needs of the population, increasing the consumers' degree of confidence into the insurance sector and enhancing financial education prove to be effective ways to strengthen the insurance sector in Romania and to significantly contribute to economic growth.

The global macroeconomic context was marked in 2019 by a series of challenges, mainly related to the US – China trade tensions and by the uncertainties over the outcome of Brexit negotiations. The year 2020 started with a reduction, to some extent, of the risks at global level, simultaneously with the emergence of some new risks related in particular to the emergence and spread of Covid -19, declared a pandemic by the World Health Organization in March this year. A reduction in geopolitical tensions was based on the signing of Phase 1 of the China – US Agreement and of the negotiations between the EU and Great Britain which clarified trade relationships between the EU and Great Britain by the end of 2020.

However, uncertainties about the US trade policies, on the one hand, and the long-term relationships of the EU with Great Britain, on the other hand, remain relevant. In this context, the trend of attenuating the economic growth rates of the EU states and, implicitly, of Romania continued.

Nevertheless, the emergence and spread of Covid -19 represents the main source of concern at global level, as well as for Romania in terms of public health and economic activity, the restrictions imposed by the states affecting the mobility of people and the trade relationships between countries with a negative effect on the already reduced economic growth and the global economy that is still balance, a relatively fragile one.

Therefore, in order to better understand the relationships between insurance and economic growth, the decision-maker factors, that is the Government and the regulatory authorities, will have to adopt a series of measures for sustainable economic development and will have to recommend the promotion of educational programs aimed at spreading the benefits of insurance and at orientating the consumers' interest towards it.

From the analysis made in this paper, we can conclude that the insurance sector makes an important contribution to the economic growth through its contribution to the formation of the gross domestic product, as well as through its function of supplier and risk transfer identifier, respectively by achieving an effective risk control and by mobilizing the savings of the population. Carrying out the same activities in parallel and/or selling the same products to the banking sector have contributed to the emergence of new risks and of some techniques also, especially regarding the actuarial system. Thus,

the joint effort obtained with the banking sector makes the development of insurance business to encourage bank lending by reducing the market cost of capital for economic entities, influencing economic growth through an increase in the demand of financial services. The deepening of insurance and of the banking system seem to play complementary roles in the growth process, though the insurance and the banking field make separate positive contributions to economic development, their individual contributions are far more significant when they are both present.

Abstract

This study provides a structured methodology based on a multi-criteria approach (technique for order of preference by similarity to ideal solution – TOPSIS), which is suitable for supporting hospitals and ophthalmologic centers when selecting the optimum instrument for cataract diagnostics. Purchases of technology in general (not only in healthcare) are a much-discussed issue.The main task when selecting a diagnostic instrument is to optimize the diagnostic output due to the suitable technical parameters of the instrument, but also with regard to operator user-friendliness. This study considers cataract diagnostics in three main steps: measuring the axial length of the eye with the corresponding calculation; measuring the corneal curvature; and verification measurement of the axial length of the eye complemented by two-dimensional B-scan and ultrasound (UBM -– Ultrasound Biomicroscope) measurements. Within each step, a pair of instruments available on the Czech market was identified and, in each category, ten key criteria were established by an expert group. Weight values for individual criteria were then established with the aid of Saaty's matrix, and costs related to one-year operation as well as other effects entering into the cost-efficiency analysis (CEA) were evaluated with the aid of the TOPSIS method. The new generation of diagnostic instruments, i.e., the IOL Master 700 and Pentacam 70700, are better from the cost-efficiency viewpoint in the first two steps of the diagnostics, while in the third step of the diagnostics, the DGH Scanmate biometer, distinguished by a unique three-star quality-assessment system, has a worse level of cost efficiency than the OTI-Scan 2000.

Keywords: Cataract, Diagnostics, Cost Efficiency, Costs, TOPSIS

Introduction

According to a review by the WHO, cataract is the most frequent global cause of worsening visual acuity (Bourne *et al.*, 2017). Surgical intervention is an efficient solution for patients suffering from cataract; nonetheless, establishing the exact diagnostics of the cataract severity prior to surgery is a sheer necessity to ensure not only the safety of the patients but also the overall quality of the treatment (Xiong, Li and Xu, 2017). Diagnostics in the Czech Republic are based on a thorough ophthalmologic examination and also with regard to the patient's overall health condition and additional diseases. Within a detailed anamnesis, the visual acuity is assessed (both short- and long-distance; as well as without correction and with the best available correction), the eye adnexa are examined, the intraocular pressure is measured with a tonometer, and eye biomicroscopy is made on a slit-lamp in the mydriasis (direct or indirect ophthalmology of the *fundus oculi*). The remaining measurements and thorough diagnostics are, in principle, carried out in three main steps – cf. Fig. 1.

Fig. 1: Diagnostic approach to determine the cataract severity and calculation of the IOL value with the aid of the instruments available on the Czech market

For a successful surgery and ensuring excellent visual acuity, it is very important to exactly measure the axial length of the eye and calculate the parameters of the IOL – intraocular lens (Kunavisarut *et al.*, 2012). A problem arises with the correct calculation of the IOL if the patient has undergone – very popular nowadays – laser treatment for dioptric correction. If this is the case, the direct use of the measured topographic/keratometric values without any corrections leads to an inaccurate IOL calculation. There are several reasons for the inaccurate IOL calculation after keratorefractive surgery (Borasio, Stevens and Smith, 2006). At the last stage of the thorough diagnostic, the axial length of the eye and distances between structures present along the eye axis are measured (Qureshi and Laghari, 2010).

We can observe that approaches to cataract diagnostics are strongly dependent on the territory. For example, Guo (Guo *et al.*, 2015) says that in China, effort has been being taken to develop computer systems for comfortable and cost-efficient diagnostics, namely, diagnose the cataract severity on the basis of analyzing the fundus oculi, obtaining information on the recommended treatment from ophthalmologists. The trend goes towards developing the analysis of the retinal image (based on automatically recognizing the cataract severity), thus relieving the load put on ophthalmologists. This approach is particularly advantageous in countries in which there is a lack of doctors (ophthalmologists). A study in Australia (Dimock *et al.*, 1999), confirmed that the popularity is ever-growing of objective measurements to determine the type and severity of cataract. As an example, let us mention taking a digital photo of the lens with subsequent densitometric digital analysis. This method is currently accepted as the best method for recording the changes in cataract. A serious disadvantage of this method is its high-level costs. This approach is also confirmed by the study (Xiong, Li and Xu, 2017), which evaluates the blurriness for cataract diagnosis with vitreous opacity removal. Other study (Tabatabaei *et al.*, 2020) recommends SS-OCT-based preoperative examinations for all patients suffering from traumatic cataract. In low-income countries (LIC) it is, in the opinion of next study (Singh *et al.*, 2019), important to introduce remote retrieval of eye-related information via mHealth, which allows non-specialized ophthalmic practitioners to provide low-cost, high impact eye care in resource-limited regions. As examples, the PEEK retina device, the HelpMeSee simulation system, etc. are listed.

When deciding about purchasing a suitable diagnostic instrument, not only should its technical parameters be considered, but also the information about the controls, defect rate, quality of outcome and, of course, the cost aspects (Rosina *et al.*, 2014). In this instance, utilizing the methods of Multiple-Criteria Decision-Making (MCDA) (Rogalewicz and Jurickova, 2014)(Oliveira, Mataloto and Kanavos, 2019) has proved to be suitable. MCDA enables us to take into account several parameters and weigh them in line with experts' preferences (Rogalewicz and Jurickova, 2014). Rossi (Rossi, Marciano and Cabassa, 2019) suggests multi-criteria methodology to select the best ultrasound device capable of optimizing workers' well-being and satisfying company production objectives. Other author (Ivlev, Vacek and Kneppo, 2015) developed a methodology to be used as support for purchasing medical devices under uncertainty; subsequently, they demonstrated their theory on an MRI example. Abdel-Basset (Abdel-Basset *et al.*, 2019) described similar applications;

in fact, Neutrosophic TOPSIS applied to an MCDM problem; namely, the selection of a sugar-analyzing device for diabetics, was concerned.

A combination of the results achieved by the above-mentioned authors was an inspiration for applying this approach in decision-making about purchasing diagnostic instruments for ophthalmology.

Methods

Cost-Efficiency Analysis (CEA) includes the effects (MCDA results), and also costs adjusted to one year of the instrument's operation. In other words, the one-year-operation costs were thus calculated as a sum of the following expenses: procurement, repair and maintenance, safety and technical inspections, spare parts, sterilization, labor, energy supply, etc. A group of experts defined the criteria to be applied to the instrument selection and the weights of individual criteria. The group consisted of: a biomedical engineer, optometrist and nurses, for whom the requirement was at least five years of practice in the given ward and a university education.

Saaty's matrix was used to determine the weight values (Rogalewicz, 2019). This matrix is based on evaluating relative significance, i.e., decisions on how much the i-th index is more significant than the j-th one. The values are written as integer entries v_i in a square matrix (usually 1, 3, 5, 7, and 9). The second value in the pair to be compared is set to $1/v_i$. The weights for individual criteria are calculated as follows:

1) Summing up all n entries s_{ik} in the k-th column of Saaty's matrix,

$$\sum_{j=1}^{n} s_{jk}$$

2) The entries in each column are divided by the corresponding sum, i.e.,

$$t_{jk} = \frac{s_{jk}}{\sum_{j=1}^{n} s_{jk}}$$

3) Entries in each row in the T matrix are summed up, i.e., all entries t_{ij} in the j-th line

$$\sum_{k=1}^{n} t_{jk}$$

and then all entries of the entire T matrix are summed up:

$$\sum_{j=1}^{n}\sum_{k=1}^{n} t_{jk}$$

4) Quantified values of the indices' relative significance are calculated via normalizing the row sums,

$$v_j = \frac{\sum_{k=1}^{n} t_{jk}}{\sum_{j=1}^{n}\sum_{k=1}^{n} t_{jk}}\,.$$

Now we apply the TOPSIS method, which appears to be suitable for evaluating the purchases of medical devices by health-care centers (clinics, hospitals, etc.) (Rogalewicz and Jurickova, 2014). The method is based on choosing the alternative that is the closest to the ideal variant represented by the vector (H_1, H_2,…, H_k) and the farthest from the basal variant represented by the vector (D_1, D_2,…, D_k) (Rogalewicz and Jurickova, 2014).

This approach consists of the following steps:

1. Converting the minimization criterion to a maximization one.
2. Setting up a normalized criteria matrix as follows:

$$r_{ij} = \frac{y_{ij}}{\sqrt{\sum_{i=1}^{p}(y_{ij})^2}}$$

where y_{ij} stands for the evaluation of the *i*-th criterion by the *j*-th expert, *i = 1, 2, … , p, j = 1, 2, … , k.*

3. Calculation of the weighted criteria matrix W

$$W = \begin{bmatrix} w_{11}, & w_{12}, & \dots, & w_{1k} \\ w_{21}, & w_{22}, & \dots & w_{2k} \\ \vdots & \vdots & \vdots & \vdots \\ w_{p1}, & w_{p2}, & \dots & w_{pk} \end{bmatrix} = \begin{bmatrix} v_1 \cdot r_{11}, & v_2 \cdot r_{12}, & \dots, & v_k \cdot r_{1k} \\ v_1 \cdot r_{21}, & v_2 \cdot r_{22}, & \cdots, & v_k \cdot r_{2k} \\ \vdots & \vdots & \vdots & \vdots \\ v_1 \cdot r_{p1}, & v_2 \cdot r_{p2} & \cdots & v_k \cdot r_{pk} \end{bmatrix}$$

4. Establishment of the ideal (H) and basal (D) variants on the basis of the weighted criteria matrix W.
5. Calculation of the distance from the ideal variant:

$$D_i^+ = \sqrt{\sum_{j=1}^{k}(w_{ij} - H_j)^2}$$

and from the basal variant:

$$D_i^- = \sqrt{\sum_{j=1}^{k}(w_{ij} - D_j)^2}$$

6. These distances from the ideal and basal variants are used for calculating the relative index of the distance from the ideal variant with the aid of the following formula:

$$c_i = \frac{D_i^+}{D_i^+ - D_i^-}$$

Further, a cost-efficiency analysis (CEA) was performed. The calculation of CEA is one of the HTA (Health Technology Assessment) cost-approach methods (Goodman, 2014). Real prices are replaced with costs, while the MCDA results are deemed the values of the effects. We can thus obtain the monetary value per unit of effect (Rosina *et al.*, 2014). CEA is given as

$$CEA = \frac{C}{E}, \text{ where}$$

C … cost (EUR),

E … effect (natural expression).

The CEA value determines a ratio between the incremental costs and gains (ICER), which enables us to assess the cost efficiency for the intervention to be evaluated, as compared with the comparator. The ICER value is a ratio between a difference of total costs and a difference of total gains for the interventions to be evaluated and to be compared. It is calculated as follows:

$$ICER = \frac{C_1 - C_0}{E_1 - E_0},$$

where C_1 and E_1 stand for costs and effects (respectively) for the intervention to be evaluated, while C_0 and E_0 stand for costs and effects of the comparator. ICER expresses the costs to be additionally incurred on obtaining one additional unit of effect (Bang and Zhao, 2012).

Finally, the threshold analysis was performed (kind of sensitivity analysis), by which it is possible to observe how the outputs of the model will be changed if the values of the selected parameter in the whole range will be modeled. In our case, the outputs of the model are the results of CEA and the acquisition costs are considered as a chosen parameter, which will be changed. The main advantage of this analysis is to determine a threshold value at which the main output of the model can vary.

Results

Evaluation of instruments for the 1st step of the diagnostics – measuring the axial length of the eye with the corresponding calculation

For this comparison, we have chosen a pair of instruments, the IOL Master 700, and its older generation IOL Master 500, both made by Carl Zeiss. The expert group identified the criteria (parameters) and, for each criterion, the functionality for the given criterion and its significance were evaluated. The weights of individual criteria were then calculated with the aid of Saaty's matrix –cf. Table 1.

Table 1 : Weights of the criteria for the IOL Master 700 and IOL Master 500

Criterion	Weight
Measurement speed	0.146
Measurement accuracy and calculation correctness	0.269
Eye photo quality (important for toric IOLs)	0.076
Database of examinations	0.048
Data transmission to the system	0.031
Calculation modes (SRK/T, Hoffer, Holladay)	0.207
Measurement scope	0.110
User-friendliness	0.019
Necessity to calibrate	0.079
Optional RDP (Remote Desktop Protocol)	0.013

The TOPSIS method identifies the IOL Master 700 as more efficient with a value of 0.549; the IOL Master 500 has a value of 0.451. When calculating the costs for one year of operation, only different items were considered. Identical items (i.e., the average costs on repairs and maintenance, technical safety inspections, sterilization, spare parts, consumables and labor) were disregarded. The acquisition price of the IOL Master 700 is higher than the other one and amounts to 42,440 EUR including VAT (also including training costs). The annual energy-supply costs are very low, namely, 28 EUR. The total costs adjusted to one-year operation of the IOL Master 700 (for a five-year life cycle) amount to 8,516 EUR/year. The acquisition price of the IOL Master 500 amounts to 37,724 EUR including VAT, and the energy supply costs are also very low – namely, 56 EUR. The total costs adjusted for one-year operation of the IOL Master 500 (for a five-year life cycle) amount to 7,601 EUR/year. The CEA outcome is 15,512 EUR/effect for the IOL Master 700 and 16,854 EUR/effect for the IOL Master 500. The ICER value (when the IOL Master 700 is taken for the comparator) is 9,337 EUR/effect.

Evaluation of instruments for the 2nd step of the diagnostics – measuring the corneal curvature parameter

The Pentacam 70700 and its older generation made by OCULUS, l.t.d. were now compared. The expert group identified the criteria (parameters) and, for each criterion, the functionality for the given criterion and its significance were evaluated. The weights of individual criteria were then calculated with the aid of Saaty's matrix –cf. Table 2.

Table 2 : Weights of the criteria for the Pentacam 70700 and Pentacam of an older generation

Criterion	Weight
Measurement speed	0.060
Measurement accuracy	0.284
Examination modules (topography, pachymeter, cataract grading)	0.151
Database of examinations	0.084
Comparison with the preceding examination	0.110
Photo quality	0.197
PC licensing	0.021
Internal network connectivity	0.035
Report generating	0.047
Optional RDP (Remote Desktop Protocol)	0.012

Effect values were calculated for both instruments with the aid of the TOPSIS method, resulting in 0.882 for the Pentacam 70700 and 0.118 for the older-generation Pentacam. The one-year operation costs amount to 30,651 EUR including VAT for the Pentacam 70700; only the acquisition costs are considered because all the remaining costs are identical and have, consequently, been disregarded. The corresponding costs amount to 28,293 EUR for the older-generation Pentacam. The one-year operation costs amount to 6,130 EUR for the Pentacam 70700 and to 5,659 EUR for the older-generation Pentacam**.** The CEA outcome amounts to 6,950 EUR/effect for the Pentacam 70700, and to 47,954 EUR/effect for the older-generation Pentacam. The ICER value (when the Pentacam 70700 is taken for the comparator) is 617 EUR/effect.

Evaluation of instruments for the 3rd step of the diagnostics – verification measurement

The DGH Scanmate A+B made by DGH Technology and OTI – Scan 2000 made by Optos Hialeah were subject to this comparison. The expert group identified 10 criteria and, for each criterion, the functionality for the given criterion and its significance were evaluated. The weights of individual criteria were then calculated with the aid of Saaty's matrix –cf. Table 3.

Table 3: Weights of the criteria for the DGH Scanmate A+B and OTI-Scan 2000

Criterion	Weight
Measurement speed	0.121
Measurement accuracy and calculation correctness	0.275
Calculation modes (SRK/T, Hoffer, Holladay)	0.145
Ultrasound B -scan quality	0.096
Ultrasound B -scan loop length	0.095
Size of the instrument	0.162
Internal network connectivity	0.020
User-friendliness	0.033
Necessity to calibrate	0.042
Optional RDP (Remote Desktop Protocol)	0.011

The effect value has, with the aid of the TOPSIS method, been identified as 0.296 for the DGH Scanmate and 0.704 for the OTI-Scan 0,704. The acquisition price of the DGH Scanmate A+B amounts to 11,317 EUR including VAT. The acquisition price of the OTI-Scan 2000 amounts to 22,163 EUR including VAT. The one-year-operation costs amount to 2,263 EUR for the DGH Scanmate and to 4,433 EUR for the OTI-Scan. The CEA outcome amounts to 7,647 EUR/effect for

the DGH Scanmate A+B and to 6,296 EUR/effect for the OTI-Scan 2000. The ICER value (when the DGH Scanmate is taken for the comparator) is 5,317 EUR/effect

Treshold Analysis

In figure 2 purchase price of IOL Master 700 was changed, purchasing price of IOL Master 500 was constant.

Fig. 2: Impact on the CEA result in the case of the price modeling (EUR) – IOL Master 700

In figure 3 purchase price of Pentacam 70700 was changed, purchasing price of Pentacam – old generation was constant.

Fig. 3 : Impact on the CEA result in the case of the price modeling (EUR) – Pentacam 70700

In figure 4 purchase price of OTI - scan was changed, purchasing price of DGH Scanmate – old generation was constant.

Fig. 4: Impact on the CEA result in the case of the price modeling (EUR) – OTI-scan

Discussion

When evaluating instruments in the first step of thorough diagnostics, the TOPSIS method identifies the Master 700 as more efficient. This higher level of efficiency is mainly implied by a higher level of quality of the photos to facilitate the correct assessment of suitability and implantation of a toric IOL; the older-generation IOL Master 500 cannot cope with that task and, thanks to this feature, the IOL Master 700 has a better value of cost efficiency than the IOL Master 500. These new contactless interference biometrics utilize the method of partial coherent interferometric measurement to determine the axial length of the eye based on reflection of the interference signal from the retinal pigment epithelium. This technique is deemed 10-times more accurate than the acoustic method – in a normal cataract eye without pathologies, and even in an eye filled with silicon oil (Kunavisarut *et al.*, 2012). The IOL Master 500 makes use of a contactless method for measuring, with the aid of image processing, the axial length (LA) and keratometric value (K), white to white (WTW) and the anterior chamber depth (ACD) from the corneal epithelium to the frontal surface of the lens. The measurement technique utilized by most instruments available on the market is based on partial interferometric coherence. The most recent technique is that of optical coherence tomography (OCT) with the so-called swept-source optical coherence tomography (OCT-SS). This technique is employed by the IOL Master 700, which measures the LA, K, ACD, and WTW values, as well as the lens thickness and the mean thickness of the cornea. We can observe that there are statistically significant differences between these two generations of the IOL Master family; namely, in the values of the axial length (LA) and the anterior chamber depth (ACD) (Saucedo-Urdapilleta *et al.*, 2019). An additional study has proved that the IOL Master 700 has excellent ability to carry out biometric measurements in comparison with the IOL Master 500 (Yoo *et al.*, 2017). Use of sensitivity analysis was verified - if the purchase price of IOL Master 700 has changed by 10 %, the sequence of purchase variant would also change. This situation (IOL Master 700 the purchasing price would increase 10 %) makes IOL Master 500 more cost-effective.

Within the framework of evaluating instruments for the second step in thorough diagnostics, the instruments made by Oculus-Pentacam have been considered for the Czech market. These instruments can determine or estimate the front and rear curvature of the cornea. The measured values can be put into the formula for Gauss optics to calculate the corneal thickness in a laser-non-operated eye, but also an eye after keratorefractive surgery (Borasio, Stevens and Smith, 2006). The TOPSIS method identifies the Pentacam 70700 as substantially more efficient than the older-generation

Pentacam. It can be observed that this innovated version has a great degree of importance with respect to the quality and accuracy of measurements. The new Pentacam 70700 model is only 2,358 EUR more expensive than the older version, which means that it has a better level of cost efficiency. Use of sensitivity analysis was verified - if the purchase price of Pentacam 70700 has changed by 590 %, the sequence of purchase variant would also change. This situation (Pentacam 70700 the purchasing price would increase 590 %) makes Pentacam – old generation more cost-effective. in this case, it is clear that a change in the order of the variants is unlikely.

The instruments can carry out not only the A-scan (one-dimensional) examinations but also the B-scan (two-dimensional) ones, even if the corneal opacity is high. This feature is particularly advantageous for patients with an associated diagnosis (such as age-related macular degeneration, or diabetic retinopathy). If a massive loss of visual acuity occurs, the condition of the retina can be directly checked (Qureshi and Laghari, 2010). For the last category of instruments, the TOPSIS method has proved that the effect of the OTI-Scan 2000 is much larger than that of the DGH Scanmate A+B. The acquisition costs of the OTI-Scan are nearly doubled, but its CEA is better despite this difference in prices. These results cannot be compared with the literature abroad because no papers have yet been published on this topic. Use of sensitivity analysis was verified - if the purchase price of OTI – scan has changed by 25 %, the sequence of purchase variant would also change. This situation (OTI - scan the purchasing price would increase 25 %) makes DGH Scanmate more cost-effective.

In the coming decade, we can expect great systemic changes in diagnostics. According to Yusuf (Yusuf *et al.*, 2019) these changes will mainly be based on an automated process, namely, a web-based Computer Aided Diagnostic for cataract detection system using a Convolutional Neural Network. The formal methods for detecting cataract, such as physical examinations, tests, and diagnostics, are clinically and professionally bound. For this reason, it is necessary to move the process towards non-professionals outside the clinic environment.

Conclusions

The TOPSIS multiple-criteria decision-making method has been used for establishing cost efficiency with respect to diagnostic instruments. Costs for one year of operation were calculated, because they also enter the CEA. In the available literature, no papers have been found on evaluating cost efficiency with respect to cataract diagnostic instruments.

A Literature Review of The Factors Influencing Financial Reporting Quality

Adam ZABOR

Wroclaw University of Economics and Business, Wroclaw, Poland
adam.zabor@ue.wroc.pl

Abstract

The paper presents a review of the literature about factors influencing financial reporting quality (FRQ). It aims to gather recently described factors and some new findings of previously investigated ones. It can be useful as for now some literature reviews have been done on particular factors, i.e. IFRS adoption, however, there is no such paper allowing to create a complex set of different factors. Further research can be focused on extending this set. Also, the extension of previously conducted research on particular ones, e.g. cross-country research, can be beneficial.

Keywords: Financial Reporting Quality, Literature Review

Introduction

Financial reporting quality is of key importance for all stakeholders of the reporting entity. It is worth understanding the factors that can significantly affect the level of FRQ. A review by Dechow et al. (2010) contributed significantly to the understanding of FRQ. The authors described the determinants of earnings quality, dividing them into six categories: (1) firm characteristics, (2) financial reporting practices, (3) governance and controls, (4) auditors, (5) equity, market incentives, and (6) external factors. Having in mind theirs and other authors' work I present in this paper a brief review of factors recently described, giving some new light on previous results. Firstly, I discuss the relation between IFRS adoption and FRQ. I aim to provide facts being not consistent with general belief and research results about the positive influence of IFRS adoption on FRQ. Secondly, I describe some of the recent findings of the relation of internal audit and FRQ. Then I present works on the relation between debt and FRQ in the way it has not been so widely described – the influence of debt on FRQ, not the opposite way. Finally, I mention four factors that have been recently researched for the first time (or there was little evidence before). It is worth noting that FRQ can be defined or measured by authors in different ways. Here I do not assess the conceptions of FRQ, however, it is also a matter I focus on in my scientific work. This paper focuses on FRQ as reported by entities before performing an external audit.

Accounting Standards

The first factor investigated in the literature with a significant influence on FRQ is the level of compliance with accounting standards. While two main systems of accounting standards, IFRS and US GAAPs, define qualitative characteristics of useful financial information and emphasize the importance of information quality, it leads to the assumption that the level of compliance with these standards should be a proxy for FRQ level. To verify this, analyzing the results of the research made by W. Newman et al. (2016) can be useful. The authors review the literature to determine whether and how IFRS adoption increases FRQ. Their article concludes that, even though this field of research has already been deeply investigated, there is equivocal evidence on how IFRS adoption affects reporting quality. The authors emphasize that previous papers which determined this relation analyzed mainly the situation in developed countries. The research focused on less developed countries showed no significant relation. The conclusion is that FRQ depends on a variety of factors. Similar conclusions are made by Emmanuel T. De George, Xi Li, Lakshmanan Shivakumar. They point out that it is difficult to determine whether the increasing level of reporting quality is a result of IFRS adoption or possibly any other institutional changes taking place at the same time. Basing on Italian cases from 2005 to 2008 (Cameran, 2014) the decrease in quality of reporting is a fact for non-listed (private) entities. Authors

present that in this case IFRS, allowing a more flexible attitude to reporting, causes using the regulations for company's own interests. In this section of the paper, the conclusion is that compliance with IFRS is not a definition of high-quality financial reporting and its influence on FRQ depends on many different factors. The effects differ especially between developed and less developed countries.

Internal Audit

Another factor influencing FRQ is internal audit, which can be considered as a mechanism of corporate governance. The first research worth mentioning is one by Abbott et al. (2016). They investigate the influence of Internal Audit Function (IAF) quality defined as its competence and independence – relating to cases from US companies. They emphasize the role of independence of internal auditor explaining that other competencies can allow detecting errors, but independence is crucial in the meaning of taking proper actions. They conclude FRQ strongly depends on the auditor's independence. Another research was related to German listed companies. Its results mainly support those from the USA. Authors note that the high quality of IAF assures earnings management which means improving FRQ. They also formulate other suggestions, like benefits from certifications of IAF and IAF employees, that positively influence their performance together with reporting quality as a result. It could be considered by regulators to introduce obligatory certification in this field. Bajraa et al. (2018) also performed research on internal audit but focused on audit committees. They related to the 8th EU Company Law Directive which introduced an obligation of the presence of an audit committee in publicly listed companies in the EU. Its results present that FRQ depends on the audit committee's competencies and effectiveness. However, the fact of the presence of the committee affects the level of quality negatively. Authors explain these results as the existence of an audit committee is not enough for increasing reporting quality if the committee's competencies are not sufficient. To sum up – the role of corporate governance for FRQ is unquestionable. However, the existence of an internal audit committee itself is not enough to provide better reporting quality. Auditors must have strong competencies and independence and this last one is crucial.

Debt

Most of the research on the relation between debt and reporting quality considers the influence of reporting quality on the cost of debt. While this is not the subject of this work, it is worth investigating the potential opposite relation. Research by Hasik (2018) focuses on the influence of changes in debt mix in Polish listed companies from 2006 to 2017. In this period there was a significant increase in bond debt in Polish companies. Economic reality suggests that increasing market debt in place of bank debt should be related to better reporting quality. It would lower the cost of debt by lowering the risk perceived by market investors. However, the research provides evidence that the growth in reporting quality, in terms of disclosure, has not increased with the rate of growth of bond debt. Another study of debt as a factor of FRQ is research performed on Portuguese private firms from 2013 to 2015 (Paiva, 2018). The author analyzed reporting quality in terms of earnings smoothing, discretionary accruals, and timeliness of disclosure. The evidence shows that increase in contracting of debt is a proxy for an increase in FRQ. Both authors suggest a need for further research on more types of entities, as well as conducting cross-country research.

Other Factors

In addition to the ones mentioned above, the factors also worth describing are director tenure, management's personal ideology, company reputation, and innovation.

The first of them is investigated by Kim and Sun (2014) – director tenure, meaning a period the present director works on the board. Basing on Korean listed companies, authors investigate FRQ in terms of discretionary accruals, earnings persistence, and the earnings response coefficient. Their findings show a positive relation in directors' tenure and FRQ. The most probable explanation is that the advantages in case of long tenure are directors' experience and expertise. This research is the first and, for now, the only one investigating such a relation. I find useful performing similar research in a cross-country context, as well as, consistently with authors' suggestion, using different proxies for FRQ.

Relatively new research of Notbohm et al. (2019) investigates one of the manager-specific factors – management's personal ideology. Ideology is considered primarily in terms of conservatism. Using data from US Federal Elections Commission, authors verify their two hypotheses: (1) that the level of earnings management is lower in firms whose managers represent more conservative ideologies and (2) that those firms manage earnings less. In this case, the results seem consistent with intuition, that conservatism leads to providing more accurate information. It is true for accounting in general, however, in my opinion, the influence of managers' ideology itself was not so obvious and worth to confirm.

Cao et al. (2012) ask a question if the company's reputation matters for financial reporting. Reputation is a factor that strongly determines an entity's position on the market. To check the relation with financial reporting quality authors use the scores from Fortune's Most Admired (MA) Companies List. FRQ is measured by CEO tenure, corporate governance, and audit fees together with performance-matched discretionary accruals. Authors prove positive relation between reputation and FRQ. The company's reputation can strengthen corporate governance leading to a reduction in agency problems. There is one more interesting relation according to FRQ – regarding innovation. Lobo et al. (2018) prove that innovation negatively affects the level of FRQ. They explain the reason is that innovative activities cause an opaquer environment. Entities may take advantage of that in managing their earnings. This is worth noting while innovative firms are exposed to greater business risk and lower quality in reporting adds another risk factor for potential investors.

Conclusion

The article demonstrates diversity in factors influencing financial reporting quality. Relatively new research added more factors relating to FRQ and put some of them in different light, e.g. accounting standards. This short paper will be extended as part of my research. Additionally, I find a wider field for further research. Firstly, it is to verify the influence of newly presented factors in cross-country research. Secondly, in some cases, there is a need to investigate factors using other known proxies for FRQ. Finally, what is in the center of my scientific interest, to create a set of conditions conducive to the high level of FRQ.

Abstract

A preponderance of studies has been conducted to investigate the importance of board composition for board effectiveness, particularly in large firms. Nevertheless, little has elucidated how board composition is essential for board effectiveness in SMEs. This study, therefore, purports to explore from the standpoints of SMEs on the components of board composition that help to bring board effectiveness. In doing so, the study employs a qualitative approach in which a series of interviews are conducted as the main instrument of the data collection. There are 18 participants including professionals and SMEs directors have been interviewed. Besides, the company profiles of 100 SMEs of which have won E50 awards was analysed to corroborate the interview. The study unfolds two mains findings. First, board size is suggested to be essential for board effectiveness in SMEs. Second, the company profile indicates that gender diversity is vital for board effectiveness as compared to ethnic diversity.

Keywords: Board Composition and Board Effectiveness

Introduction

Several researchers found that board composition plays a vital in ensuring board effectiveness which in turn spurring the firm performance (Marimuthu, 2008; Abdullah and Ismail, 2013; Hassan and Marimuthu, 2016). As a matter of fact, it has been given due consideration in several written guidelines of corporate governance practices issued by some countries. For instance, Malaysia has issued the Malaysian Code on Corporate Governance (MICG) which was primarily envisioned for public listed companies. In this code, corporate governance mechanisms such as board independence and board diversity are clearly promoted and embedded in the code. However, this is not the case for Malaysian SMEs. They are starved for attention in corporate governance systems that oversee the shareholder and stakeholders' interests. The following discussion will fold into several sections. First, it discusses the literature review that underscores the main elements of board composition and followed by the methodology of the study. Finally, result, discussion and conclusion in the closing section.

Literature Review

Board Composition

The term board composition is typically referred to board independence, i.e. the proportion of inside and outside directors, the board size, CEO duality (board leadership structure) and board tenure (Bammens, Voordeckers, and Van Gils, 2008; Fiegener, Brown, Dirk, and Jr, 2000; Finkelstein and

Mooney, 2003; García-Ramos and García-Olalla, 2011; Minichilli, Zattoni, and Zona, 2009; Voordeckers et al., 2007). The empirical evidence shows that whether board composition can affect firm performance is still not conclusive. Some found that board composition may positively or negatively influence firm performance contingent on various ways. As Van den Berghe and Levrau, (2004) commented that board composition had been much discussed by academic researchers on which agency and stewardship theories are based.

Gender and Ethnic Diversity

Abundant studies, especially in large companies, found that diversity can influence a better board (Lisa M. Fairfax, 2006; Miller and Del Carmen Triana, 2009). Most of the studies in board diversity referred diversity to the involvement of women and multi-racial ethnic in the boardroom. First, with regards to the participation of women in the boardroom, many studies found that the advantages of appointed women are enormous. From the perspective of agency and resource dependency theory, it is believed that women offered better monitoring and supervising as compared to their counterpart (Azmi and Barrett, 2013). A study among 10,786 SMEs in Spain using panel data analysis found that the ratio of women on the boards of Spanish SMEs are more than in listed companies (Minguiz-Vera and Lopez-Martinez, 2010). It is found that gender diversity in the boardroom exerts a positive effect on firm performance (Minguiz-Vera and Lopez-Martinez, 2010). Studies also found that the presence of women on board positively affects firm financial performance and shareholder value (Campbell and Mínguez-Vera, 2008; Carter, Simkins, and Simpson, 2003; Smith, Smith, and Verner, 2006). Second, empirical evidence also showed that diversity in ethnic in the boardroom offers a positive relationship with firm reputation and innovation (Miller and Del Carmen Triana, 2009).

Board Size

Size of the board becomes one of the debatable antecedents in board composition, particularly in large companies. However, it is still ambiguous whether board size factor will affect significantly in the SMEs board. The typical size of the SMEs board is smaller than large companies. It is contended that a small number of boards will mitigate the possibility of free-riding yet heighten the accountability of the individual member of the board (Dzigba, 2015). Evidence in the banking sector found that a bank needs a smaller board so that it can make a swift decision (Aminu, Aisha, and Muhammad, 2015).

Conversely, abundant of studies supported larger boards exerted positive impact monitoring and increased board diversity (C. M. Dalton and Dalton, 2005), higher management skills and strategic decision (Zahra and Pearce, 1989)**.** In India, it is found that a bigger board has a positive effect on firm valuation and suitable for a board in a developing country (Saibaba, MD, and Ansari, 2012). This is in line with the agency theory, which underpins the notion that larger board size offers more monitoring function and at the same time reducing the CEO supremacy and in turn leads to the firm performance. Similarly, resource dependency theory assumes that greater board size offers more valuable resources. Likewise, more directors on board can perform better in relation to innovation performance as it provides more valuable resources coming in, especially from the external points of view (Shapiro et al., 2015).

However, along with positive connotations, there were studies that found a negative effect on firm performance. They implied that bigger boards would invite more intense and challenging to control and thereby less effective and therefore smaller boards are more effective (Eisenberg, Sundgren, and Wells, 1998; Lopez-iturriaga et al., 2005;De Andrés et al., 2005; Eisenberg et al., 1998). Along the same line, Arosa et al., (2013) found a negative impact of board size on firm performance among 307 SMEs in Spain. More contradictory, García-Ramos and García-Olalla, (2011) studied in publicly traded family firms where they found two distinct results. First, board size positively affects firm performance when they are led by non-founder. Second, it is the contra-wise result when those firms led by the founder of the firms. Nevertheless, to date, it is still debatable as to the ideal board size for SMEs. A study in the 234 UK listed SMEs employing unbalanced panel data regression analysis found that board size has a significant negative impact on the performance of both small and medium companies (Afrifa and Tauringana, 2015). Similarly, a recent study among listed companies in India showed that board

size exerted firm performance as far as Tobin's Q and market capitalization is the performance measure. Given the present evidence, it can be inferred that the ideal board size is contingent on the type of company and type of performance measurement (Nidhi Bansal and Anil K. Sharma, 2016).

Board Independence

Board independence refers to a number of outside directors who have no conflict of interest in the company. In a practical way, outside directors are also known as independence director or non-executive director (NED). In agency theory, the role of the outside boards is to mitigate the agency problem such as agency costs notably in supervising the conduct of executive management, heightening shareholder value and at the same time minimizing opportunism (Fama and Jensen, 1983). In doing so, the board is structured and composed with a mixture of inside and outside directors. Listed companies in Malaysia through MCCG refers to board independence as board composition. The code strongly encourages listed companies to have at least half of board encompassing of independent directors. Even for large companies, the majority of the board members shall comprise of independent directors. Nevertheless, it is still contentious with regards to the number of independent directors should be in smaller firms like SMEs. Some scholars argued that since there is no hard and fast rule regarding the ideal number of independent directors in SMEs, the optimal board structure may depend on the case by case basis. Larger companies may need more independent directors taking into account their operational complexity and the risk arising out of mismanagement (Christensen et al., 2015)

Conversely, SMEs may not need a more significant number of independent directors for board effectiveness as the majority of managers themselves own the firms (Christensen et al., 2015). For this reason, the quality of the decision depends much on the profound insights, values, and attributes of the owners. More importantly, owners are self-responsible for whatever decisions that they have made. It is evident that small firms with a small number of independent director is performing better than their counterparts (C. Daily and Dalton, 1994).

Board Leadership Structure

Elsayed (2011) refers board leadership structure as a practice of a firm whether to exercise the combined roles of CEO duality (CEO and the chairman) or non-CEO duality, i.e. CEO and the chairman of a different individual. Research on this domain has its roots on the agency and organization theory (Daily and Dalton, 1997) as well as the team production approach (Gabrielsson, Huse, and Minichilli, 2007). Drawing on the agency theory, several scholars or even codes of corporate governance in many countries strongly recommend the separation of roles between the CEO and board chair. Having said that, the evidence adduced an incompatible result in relation to the firm performance. As such, preponderance studies employing meta-analyses revealed that CEO duality does not exhibit any evidence of a relationship with firm performance. (Daily and Dalton, 1997; Dalton et al., 1998; Krause and Semadeni, 2014). Zona (2014) extended this finding that the effects of board leadership structures are varied from one case to another. A call for future research to take into account other factors such as time and length of tenure as a CEO may produce a distinctive result (Zona, 2014).

Based on the above reviews, a proposition arises as follow;

1. Is board composition considered to be essential for the effectiveness of Malaysian SMEs boards, and why are they important?

Methodology

Given the exploratory nature of this study, the qualitative method is employed to investigate the manner in which board composition is essential for board effectiveness. This method is plausible for the study to seek the complexity of the board composition using an interview strategy. Alongside, the data are gathered through the information and close interaction with the participants, which involves the richness of data.

Selection of Samples and Interviews

In terms sampling method, the study adopts a purposive sampling strategy of which only a selected list of targeted participants has been interviewed. Those targeted interviewees are mainly the board directors from SMEs as well as those individuals or professionals who have been engaging SMEs directors closely for business consultancy. There were 18 participants have been selected for interview sessions either via face to face or over the phone call. The in-depth interview technique was based on open-ended and semi-structured design. In qualitative research, an interview is common but yet an effective technique to collect the evidence. The interviews took place about 45 minutes to an hour, contingent on the information given and other factors. Geographically, the participants are from several parts in Peninsular Malaysia such as Penang, Kuala Lumpur, Selangor, Pahang and Johore. Most of the interview sessions are carried out in person while a few only have been conducted through telephone call due to the long-distance as well as the participants' preference. The following table shows the basic background of the participants. The names of the participants are disguised for the purpose of confidentiality

Table 1: Basic Background of the Participants

No.	List of Participants	Professions	Years of Experience	Gender
1	Yat	Lawyer	30	Female
2	Than	Accountant	32	Male
3	Sabar	Company secretary	20	Female
4	Rod	Accountant	25	Male
5	Saif	Company secretary	18	Male
6	Ahmed	Lawyer	16	Male
7	Zai	Company secretary	18	Female
8	Shah	Company secretary	15	Male
9	Ida	Company secretary	23	Female
10	Pai	Lawyer	16	Male
11	Rafiz	Lawyer	18	Male
12	Lim	SMEs Director	10	Male
13	Poh	SMEs Director	40	Male
14	Hijrah	SMEs Director	13	Male
15	Azha	Director of SME Bank	30	Male
16	Mohd	SMEs Director	35	Male
17	Man	SMEs Director	20	Male
18	Emy	Company secretary	10	Male

One of the compelling reasons in which the data need to be collected through the interview is due to the inaccessibility of data through observation. As Patton, (2002) observed that in certain conditions like behaviours, feelings, thoughts, and intention are impossible to be reached by the presence of the observer (Patton, 2002). Thus, the objective of an interview is then to be inside of the respondents' standpoints by gathering their stories. In contrast to quantitative methods, the interview is capable of analysing the finding by allowing respondent's life (Alshenqeeti, 2014). Besides, company profiles, internal memos, and employee's personnel files for secondary evidence were gathered and analyzed as the secondary data collection.

Secondary Data

In order to strengthen and corroborate the finding, a set of 100 SMEs company profiles were purchased through Company Commission of Malaysia. These companies were selected on account of their achievement in receiving E50 awards from 2014 until 2017.

Data Analysis

Qualitative data normally form in a non-numerical data stemming from opinions, feelings, thoughts, policies, reports and so on and so forth. One of the advantages of qualitative data is that they tend to be collected in the nexus of the situation, such as interview and observation (Miles et al., 1994). It can answer some curiosities that quantitative data unable to riposte. To date, there is no hard and fast rule regarding data analysis in qualitative research. Nonetheless, many scholars cautioned that qualitative data analysis should be conducted with a cautious and vigilant manner (Miles et al., 1994; Patton, 2002). There are several approaches in which qualitative data can be analysed. For instance, (Miles et al., 1994) introduce three concurrent flows of analyzing qualitative data, i.e. data condensation, data display and drawing and verifying conclusions. The interviews were audio-taped recorded and were then be transcribed to allow for data analysis which was based on inductive technique, featuring processes based on data reduction, data display, and drawing conclusions and verification (Miles and Huberman, 1994). This study uses the latest qualitative software to analyse the data called NVivo 12 software of which was purchased from the website.

Validity and Reliability

In this study, the feedback given by participants was validated by using a member check strategy. Merriam and Tisdell, (2016) comment that a member check strategy is a common method for ensuring internal validity and credibility. The purpose of referring back to the participants is to avoid any misinterpretation on the data that has been transcribed. This is also to minimise any biases on the interpretation and therefore escalate the level of validity. Alongside, the initial result of the interview was sent back to all participants in order for them to revisit their opinions as well as reconsider the others' opinions.

Results

This section summarises the findings and contribution made in the study. The purpose of our study is to investigate the manner in which board composition is essential for board effectiveness. Whether a small or large board is laudable for board effectiveness is still ambiguous. Some studies found that a smaller board is worthier as it can mitigate free-riders, and therefore, the board can arrive at a decision swiftly (Aminu, Aisha and Muhammad, 2015; Dzigba, 2015). Whereas, others found that bigger size can stimulate an encouraging effect towards the board (Dalton and Dalton, 2005; Saibaba, MD and Ansari, 2012; Zahra and Pearce, 1989). To the best of our knowledge, it is hard-pressed to find a study of board size of SMEs. For this reason, the following findings are beneficial to gain insights, especially on the right size of the SMEs board. There were 18 participants who were willing to participate in the interview sessions. However, only 11 were willing to verify others' opinions. The rest decided to withdraw from participating in the verification procedures. During the interview sessions, a small number of participants commented on board size as follows;

> *"Generally, not necessary but if he can give a piece of fruitful advice for the betterment of the company, why not.. Size of the board should not be too large. 3 to 5 persons is just enough. Otherwise, there would be many unwarranted conflicts taking place and the issue of profit sharing as well." (Ahmed)*

> *"There must be odd in number so that easier for them to make a final decision. A number of 3 to 5 to me is just more than enough in SMEs. Otherwise, there will be*

unnecessary debates in the board meeting. Diversity may not help much in influencing board effectiveness. It depends on the individual as long as they can work." (Pai)

"Outside directors and diversity generally hmmm…. are not necessary for the board effectiveness contingent on the need and size of the business. Similarly, the size of the board varies on the necessity of the companies. Companies with two directors are better than one and three are better than two. Bearing in mind, companies may take all accounts while appointing directors, including the cost incurred as well as duties that the director shall perform upon his appointment." (Sabar)

"Board with bigger size will face more troublesome. There would be a lot of unresolved ideas. In other words, the smaller the company is, the smaller board will be. The best size is 3-5 members of the board is more than enough." (Shah)

"The ideal board size should be within 3 to 5 members. The more members will make the board chaotic and less effective……. These three characters must present for the board to be effective. The chairman leadership, along with the small size of the board will make the board more effective because the board with many members always in chaotic with enthusiastic members giving and defending their owns opinions." (Yat)

"Size that ideal for SMEs board is between 2 to 5. The lesser the better. If I were to be a secretary 2 directors in a private limited company is more opportune. The more number of directors invite more hassle at the boardroom."(Zai)

Based on the above interviews, board size is recurred and comes up as a theme that attracts participants' concerns. Table 1 summarised the breakdown of board size of SMEs for board effectiveness. Closer inspection of the table shows the majority of participants (8/11 participants) are in the opinion that 2-3 directors or 4-5 directors in the board room are most suitable for SMEs. Of 11 participants, three indicate that the board size should match the company's need. While nobody perceives six directors and above are ideal for board effectiveness of Malaysian SMEs.

Table 2: Ideal Board Size for Board Effectiveness

	Board Size	Interview Result	After Verification
1.	2-3 directors	3/18 participants	4/11 participants
2.	4-5 directors	3/18 participants	4/11 participants
3.	6 directors and above	1/18 participants	0/11 participants
4.	Match to the company's requirement	1/18 participants	3/11 participants

The above interviews results are corroborated with the profile company's data of 100 SMEs. As shown in table 2 it is apparent that the majority (97%) of SMEs that have won E50 awards are led by 2 to 5 directors. The lowest percentage (3%) of companies are run by 6 or more directors.

Table 3: Board Size in 100 SMEs

Board size	Frequency	Percentage
2 to 3	70	70.0%
4 to 5	27	27.0%
6 or more	3	3.0%
Total	100	100%

Ethnicity

In this study, the ethnic diversity in the boardroom is explored whether it is important for board effectiveness. Based on the interview results, there was no participant who commented on this. However, secondary data have shown some information to answer this phenomenon. The following table demonstrates the proportion of directors which is based on the ethnic. Based on the figure, it can be clearly seen that there is a large discrepancy among the races that make up in the boardroom. Evidently, out of 296 directors, the Chinese is by far lead to be the members in the boardroom amounting to 166 (56.1%) people. While the Malays rank the second recording 109 (36.8%), directors, this is followed by the Indians with only 15 (5.1%) directors. Other local ethnic and foreigners with 1 (0.3%) and 5 (1.7%) directors respectively.

Table 4: The Overall Proportion of Directors from Ethnic Base

Ethnic	Frequency	Percentage
Malay	109	36.8%
Chinese	166	56.1%
Indian	15	5.1%
Other locals	1	0.3%
Foreigners	5	1.7%
Total	296	100%

Comparatively, table 3 illustrates the composition of the board, which is based on the ethnic of 100 SMEs companies that have been awarded E50 awards. It also shows how diverse the board is composed as far as ethnicity is concerned. The figure shows an interesting fact from which this study can be learned. Apparently, it is exactly half of 100 companies composed of all Chinese ethnic in the boardroom. The rest is followed by the Malays and Indian with 33 and 3 companies respectively is presided by the same ethnic. In terms of diversity of the board, only 14 companies are run by different ethnic across the board.

Table 5: Board Composition Based on Race and Company

Board Composition	Frequency	Percentage
All Malays	33	33.0%
All Chinese	50	50.0%
All Indians	3	3.0%
Diverse	14	14.0%
Total	100	100%

On the whole, a close inspection of both tables shows that in terms of the overall ethnic population, was dominated by Chinese. Further, with regard to diversity of ethnics among 100 companies that won E50 awards shows little account on it. Thus, it may be suggested ethnics diversity is not important for board effectiveness.

Gender

The preponderance of evidence suggests that gender diversity is important for firm performance (Campbell and Mínguez-Vera, 2008; Carter et al., 2003; Minguiz-Vera and Lopez-Martinez, 2010; Smith et al., 2006). Studies also found that the presence of women in the board room offered better monitoring and supervising as compared to their counterpart (Azmi and Barrett, 2013). However, in this study, evidence from the interview showed the opposite result. Several participants commented:

> *"Other factors, like gender, is not important at all." (Ahmed)*

> *"The age must be 18 years and above irrespective the gender as long as he or she has the knowledge and skills relating to the business. The board shall have the knowledge to govern the company in accordance with the companies act." (Rod)*
> *"To me age, gender and qualification are not important for the effectiveness of the board. Gender, either a male or female director, has no bearing on the board effectiveness." (Saif)*

> *"It is a matter of whether you have a gut to learn and improve yourself. Nothing to do with gender, colour, education or age it is a matter of personal attitude." (Than)*
> *"Gender is not the priority and has to be set aside as the predictor in board effectiveness. Both male and female directors have a positive and negative side, and there are pros and cons as female are more meticulous, committed and of no-nonsense as compared to their counterparts. While male directors are more relaxed and flexible, but they are hesitant and quite defensive in accepting women's ideas in the board meeting." (Yat)*

All in all, all participants viewed that gender irrespective of women or men is of no account for board effectiveness. In fact, they were prone to relate to other factors such as knowledge and skills and experience rather than gender factor. We are now turning to the secondary evidence.

Table 6: Directors with Gender Base

Gender	Frequency	Percentage
Male	219	74.0%
Female	77	26.0%
Total	296	100%

Table 5 shows the proportion of gender in the boardroom of 100 E50 awards winning companies. The figure demonstrates the leading number of males that dominates female directors. The board is overwhelmed by 219 male directors. In comparison, only 77 female directors. Evidently, it shows a crystal-clear a male domination in the boardroom. However, when it comes to gender diversity, the data showed another interesting discovery: The following table has a detailed explanation about this contention.

Table 7: Gender Composition with Company Base

Gender Composition	Frequency	Percentage
All Males	39	39.0%
All Females	0	0%
Diverse	61	61.0%
Total	100	100%

Nevertheless, in terms of gender composition, a large number of companies have a diverse gender composition. What is revealing in table 6 is that there are 61 companies is presided by mix male and female directors while only 39 companies are dominated by male directors.

On the whole, both table 5 and 6 must be read together. Although the board are dominated by male directors in terms of the overall number, looking at the company base, it has a contradictory explanation. While the board is dominated by males as shown in table 5 but table 6 suggests a different perspective that diversity in gender may be workable in the board as the majority of the company promotes gender diversity in the boardroom.

The data from the interviews as well as the secondary data were coded using Nvivo 12 software. The following figure 1 shows the coding procedures.

Figure 1: Coding Procedures in Nvivo 12

Next, the following project map is the outcome of the analysis using Nvivo 12 software. It illustrates how board composition is essential for board effectiveness.

Figure 2: Board Composition Project Map of SMEs

Discussions and conclusion

In this study, two main findings pertaining board composition is unfolded. First, the majority of the participants and the data suggested that the number of board members of SMEs should range between 2-3 and 4 to 5 members for board effectiveness. Accordingly, some participants are in the opinion that a larger board tend to drag the board into unnecessary debates and conflict. Second, the study found the diversity in gender is suggested to be important for board effectiveness.

The existing evidence, along with the previous works demonstrated that board size plays an important role in board effectiveness. (Zona and Zattoni, 2007; Levrau and Berghe, 2009; Levrau, Berghe and Van Den Berghe, 2009; Lorca, Sánchez-Ballesta and García-Meca, 2011; Mensi, Boubaker and Aloui, 2012; Mehta et al., 2017). The proponent of the agency theory underscored the importance of the right size of the board since a larger board tends to be less effective (Mensi, Boubaker and Aloui, 2012). Once again, the question arises on the ideal number of members of which a board is composed. To the best of our knowledge, there is little information available regarding the right number of the board, especially among SMEs. Nevertheless, findings of this study have given some insights to the small and medium firms regarding the ideal number of members in a SMEs board based on the opinion of the SMEs owners as well as the professionals. The threshold number of the board should range between 3 to 5 members. This result may be explained by the fact that given the nature of SMEs themselves with limited resources, it needs a small yet ideal number of board members to optimize the operation cost.

The study also confirms that gender diversity is important for board effectiveness. This finding broadly supports the work of other studies in this area linking gender with firm performance (Campbell and Mínguez-Vera, 2008; Carter et al., 2003; Minguiz-Vera and Lopez-Martinez, 2010; Smith et al., 2006). Surprisingly, the finding of ethnic diversity in this study produces the other way around. This outcome

is contrary to that (Abdullah and Ismail, 2013; Marimuthu, 2008; Upadhyay and Zeng, 2014) who found ethnic diversity is important for firm performance. A plausible explanation for this might be that previous studies were conducted mostly in public listed companies of which requires diversity in a variety of forms to grow exponentially. While our study is SMEs base of which founders are among family members from the same ethnic background.

Conclusion

This project was undertaken to investigate the manner in which board composition is helping board effectiveness. The results of this investigation show that the importance of board size in bringing the board to be effective in SMEs. Further, it also suggests that the ideal number of board size an effective board is ranging from 3 to 5 members. The second major finding was that gender diversity is also essential for board effectiveness. However, ethnic diversity suggests the opposite result. These results are subject to certain limitations. For instance, it does not take into account other factors like age, tenure and board independence. Despite its exploratory nature, this study offers some insights into the issue of board composition in SMEs, especially regarding its size and board diversity. Given the limitations of this study, further works need to be done using a quantitative method to explain the causality of board size and diversity in Malaysian SMEs. Finally, this study suggests the policymaker to develop corporate governance mechanisms or guidelines exclusively for SMEs by taking into account the board composition, as suggested in this study.

mateescuadina000@gmail.com, msmuscalu@yahoo.com, daniela.baleanu38@yahoo.com

Abstract

Today, one of the main goals of the EU policies is an adequate management for the waste recycling with minimizing environmental impact. This paper presents a supervisory management system (SMS) used to obtain the optimal solutions for the waste recycling. The system requires a database with codes for each resources and recycling modes, each manufacturer offering the recycling solutions.

Keywords: waste recycling, supervisory management system, COVID-19 pandemic

Introduction

The improvement in the living standards leads to an increase in the consumption of natural resources and a negative impact on the environment. The world waste production is estimated to be around 27 billion tonnes per year by 2050. Thus, the management of natural resources and the waste are important global issues.

The current society uses inefficiently the materials, even wasting them. Municipal waste can be a source of raw materials but they can also be toxic waste due to the dangerous components.

By maximum extraction of resources from waste and by using fewer materials in the production processes it works less wasteful and the toxic substances released are reduced, thus reducing their effects on the environment and the population health.

In the last ten years, the quantity of natural resources used in Europe decreased. However, the efficient use of natural resources varies from state to state, from a quantity of about 12 tonnes per capita in Italy to 38 tonnes per capita in Finland.

In Europe, about one third of natural resources used is turned into waste. So it is a large amount of waste, the percentage of recycled waste being 30%, the percentage of incinerated waste is 21% and the percentage of composted waste is 13%. The 43% of municipal waste is sent to landfills (Eurostat, 2019)

Fig. 1 : Waste generated by a person in the EUMember States in 2017
Source: Eurostat, Packaging waste statistics, 2019

In Fig.1 it can be observe how much th waste per capita is produced. In 2017 the largest production of municipal waste in Europe was 781 kg per capita, in Denmark. In Romania, the quantity of waste produced was 272 kg per capita. This difference is due to the fact that Romanians usually buy from the open markets, where the products are sold without packaging, this causes much less waste.

The waste incineration is a source of air pollution representing the risk factors for the health of population. The incineration plants generate CO_2, dioxins, furans, polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs), mercury and other toxic substances.

So, the main objectives of European Union's environmental policy are the efficient use of natural resources, the reduction of waste produced and the conversion of a larger quantity of waste into resources.

This paper presents a supervisory management system to determine the optimal solutions regarding the exploitation of natural resources and the recycling of waste.

At first, this system can be used in the home appliance industry and then to be extended to other industries.

The supervisory management system needs a public database with the codes for each natural resource and with the recycling modes, each manufacturer offering the recycling solutions.

The proposed system requires a special international legislation to codify and to use of natural resources.

Literature Review

The current society faces a multitude of environmental problems, many of these can be solved by modeling and simulation of the environmental processes (Gavrilescu et al., 2005; McDougall et al., 2001). The models have a simple or complex structure and they include equations that describe the behavior of the system and an algorithm to solve the system of and they include equations that describe the behavior of the system and an algorithm to solve the system of equations.

The waste management is a complex and multidisciplinary problem, it involves the economic and technical aspects and many constraints regarding the minimum requirements for recycling.

To solve the problems of waste management, one of the best solutions is a supervisory management system, most managers prefer this option. These systems are designed to help the decision makers to create the integrated programs to choose the optimal solution for the waste management such as: recycling, treatment, incineration or disposal.

Many of the supervisory management systems developed in recent years are based on the different methods such as: cost-benefit analysis, life cycle assessment, environmental risk assessment, multi-criteria decision analysis, environmental impact analysis. (Kirkeby, 2005), (Costi et al., 2004; Hung et al., 2007; Morrissey and Browne, 2004).

In urma cu cincizeci de ani, sistemele suport de decizie pentru managementul deșeurilor se bazau pe modele pentru optimizare rutelor de transport a deseurilor, metodă care se mai aplică și acum în țările în curs de dezvoltare (Helms and Clark, 1974; Hung et al., 2007; Sahoo et al., 2005; Truitt et al., 1969). In the last years, the supervisory management systems for the waste management are based on: cost-benefit analysis models (CBA), multicriteria analysis models (MCA) and life cycle analysis models (LCA).

The supervisory management systems based on the cost-benefit analysis were developed by: Begum and collaborators (2006) to minimize the construction waste; Tam (2008) to recycle the concrete; Lavee and collaborators (2009) found the uncertainty about the price of materials for recycling may induce

the municipality to prefer the storage of waste instead of recycling; Finnveden and Moberg (2005), Villanueva and Wenzel (2007) used the method to determine the priorities in the field of natural resources and the environmental impact; Gasparatos and collaborators (2008) made a comparison between the cost/ benefits in the future and the cost/ benefits in the present.

The supervisory management system system based on the multicriteria decisions analysis were developed in the field of environment by: Hermann and collaborators (2007), Cziner and collaborators (2005) and others.

In their papers, Morrissey and Browne concluded that the multicriteria methods are aplicable to any complex decision taking into account the various criteria such as: risk, economic, safety.

Also, an important advantage of using the multicriteria analysis method is that both quantitative and qualitative data can be incorporated.

Based on these methods, Behzadian and collaborators (2010) developed a PROMETHEE method used with ARGOS software for the waste management.

The production, the collection and the treatment of waste were considered based on several criteria such as: the volume of waste per household, the number of households, the use of collection means, the duration between two collections; the distance between the households frequency of waste collection, the payment of taxes for the waste management, etc.

The supervisory management systems based on the life cycle method were built by: Banar and collaborators (2009), Consonni and collaborators (2005), De Feo and Malvano (2009), Khoo (2009), Rigamonti and collaborators (2009), Iriarte and collaborators (2009), Dimitrios Aidonis and collaborators (2019). These systems were built to compare several methods (recycling, reuse, treatment/ disposal or export) to select the optimum scenario for the waste management and to quantify the impact on the environment of the systems for the selective waste collection.

All these presented systems are based on a lot of data, on solving some systems with many mathematical equations and with many parameters and on the experience of the decision makers, and the waste reduction techniques are not considered.

Challenges of the waste recycling during the COVID-19 pandemic

- The consumer concerns about hygiene lead to a high consumption of disposable items. This requires a high packaging usage.
- Currently, the amount of recycled polyethylene terephthalate, recycled polyethylene, recycled polypropylene and recycled polyolefins decreased. The recycled polyolefins are used for automobile, construction, bags, packing, outdoor furniture, etc.
- The fear of spreading a SARS- COV-2 virus lead to many municipalities suspend the work in the recycling centers.
- The money reserves of recyclers are reduced.
- Long-term investments are limited both in the mechanical recycling as well as in the chemical one.
- The prices for the R-PET (Recycled Polyethylene Terephthalate), the R-HDPE (Recycled High Density Polyethylene) and the R-PP (Recycled Polypropylene) are higher than the virgin plastic.
- The logistic problems involve that some companies create the stocks in order to handle any disruption. Other recycling companies avoid new order requests (ex: An Australian company recycled the bottle caps and turned them into plastic hand and arms for the children. This project, called “Envision Hands”, was stopped. Until recently the bottle caps were not recyclable).

Environmental and Human Health Effects of Waste

Some of the electric and electronic waste items contain hazardous materials, among which the most important are the heavy metals (mercury, lead, chromium, cadmium, cobalt, manganese etc) and chemicals such as ozone depleting chlorofluorocarbon or various flame retardants (Balde et al., 2017). Usually these materials listed above are in the e-waste.

When this waste is arbitrary disposed in the landfills, the toxic compounds are slowly dissolved by rain water and transported into subsurface water reservoirs. Therefore, the e-waste items must be adequately manipulated, stored, dismantled and recycled.

The proper recycling of e-waste permits the recovery and neutralization of these hazardous substances, avoiding the environmental pollution associated to their disposal into landfills or non-controlled incineration. Alternatively, the recycling of e-waste permits the diminution of virgin metal and plastics production, associated with a reduction in greenhouse gas emissions.

The energy saving associated to the recovery of the metal and plastics from e-waste is accompanied by avoidance of greenhouse gas emissions and generation of low value by products. As shown by Kumar et al. (2017), besides the energy saving, the recycling 10 kg aluminum avoids the generation of 13 kg of bauxite residue, 20 kg of carbon dioxide and 0,11 kg of sulfur dioxide.

Besides the environmental negative impact, the hazardous substances present in the e-waste are also a threat for the people health and safety. The e-waste items may impact the human health, particularly by direct contact with hazardous substances, when people are working in primitive recycling processes, in improper conditions. Long time exposure in the space of e-waste storage or direct contact with the substances contained in the e-waste boards, circuits and welding area may affect the kidney, lung and liver or induce carcinogenic effects. Details regarding the potential hazardous effects of different components present in the e-waste are detailed by Grant et al. (2013), Kiddee et al. (2013) and Kumar et al. (2017).

Supervisory Management System for Waste Management

The long term objective of EU policies is to avoid getting waste. In case this situation is inevitable, it is preferable to use the waste as a resource. Thus we tried to build a supervisory management system to help achieve the objectives required by the EU.

In Fig.2 we present schematically the concept of this supervisory management system.
It comprises two main subsystems, namely: a database and a decision making system regarding the recycling of waste.

The database is public. Each manufacturer of different industrial component or packaging products introduces the informations about the manufactured products. These informations include the composition of the product (natural resources used) and the recycling mode, each manufacturer offering the recycling solutions for each component of the product.

During manufacture process, each component/ subassembly designed as an independent module (for example: engine block, various plates, circuits, tires, sheet metal, furniture tops, equipment housings, etc) receives a CRRC coded label in the QR code (https://en.wikipedia.org/wiki/QR_code).

CRRC labels can also be placed at product level consisting of several components, depending on the situation. For example, it doesn't make sense to read all components of a washing machine or a refrigerator. In this case, the label specifies that it is a set of components and the label contains the references to all informations about the components.

Fig. 2 : Supervisory management system for the waste recycling

Source: Own sources

The CRRC label sticks to a protected area of the product. A damage CRRC label can be identified in the public database according to several product characteristics such as: manufacturing series, model/ year, etc.

By reading the CRRC label of product and by querying the public database we find out all information made available by the manufacturer regarding the recycling of product, starting from the type of materials used up to the recycling modalities.

The decision block of the supervisory management system decides whether or not the recycling can be done.

The automatic supervisory management system can be provided by a simple software application with fuzzy decision trees. In this subsystem the following are taken into account: the materials from which the product for recycling is built; the market requirement of these materials; the recycling procedures and their costs; the time during which the whole recycling process takes place.

Both the recycling costs and the recycling time must be within certain maximum limits.

In order to establish the maximum limits of the recycling costs, it is necessary to take into account the current policies of states to encourage recycling at certain higher costs. For example, higher labor costs may be admitted (jobs appear) but high energy costs are not accepted.

Testing this system can begin with the home appliance industry then it can be generalized to other industries as well, so that each manufactured product has associated an information for its recycling. So, it is easy to estimate the level of resources required, the impact being essential on the resource exploitation industry and its limitation. Thus, many precious elements including rare metals can be identified and recycled.

The application is simple but it requires the worldwide legislation regarding the coding of resources. This system cannot function when there are products whose manufacturing materials are secreted.

Conclusions

An increase in the standard of living leads to the new tendencies in the modern life style and so the natural resources are reduced and the amount of waste increases continuously.

The long term objectives of EU policies are: efficient use of natural resources, avoiding waste as much as possible, use of an adequate waste management with selective collection, recycling / reuse respecting the concept of „waste hierarchy", with minimizing the impact on the environment.

In this paper we present a supervisory management system for the efficient use of natural resources and for the recycling of waste. This system requires the worldwide legislation regarding the coding of resources.

The advantage of using this system is that all manufactured products have associated the information for recycling. The level of resources required is estimated easily, the impact being essential on the resource exploitation industry and its limitation. Thus, many precious elements, including rare metals, can be identified and recycled.

The characteristics of this system are:

- contains a public database with the composition of each product (the natural resources used) and the recycling solutions;
- has the ability to collect and to manage the descriptive knowledge and other types of knowledge (procedures, rules);
- has the ability to present the knowledge as soon as the database is queried;

- has the ability to select a subset of knowledge to be viewed or to derive other knowledge needed in the decision making process;
- it can interact directly with decision maker and it allows the flexibility in choosing the solutions and the knowledge management.

Testing this system can start with the home appliance industry, then it can be generalized to other industries as well.

This system cannot work for the products whose materials are secreted.

Abstract

The article contains postulates regarding conditions and procedures for the development of the Polish Armed Forces professional soldiers' career. The authors note that the decisions to appoint candidates to subsequent official positions are made to a large extent intuitively, without proper recognition of the professional soldiers' competences and appropriate selection procedures.

Keywords: Military Career Development, Polish Armed Forces

Introduction

The issues of the functioning of systems (models) of human resources development in the organization are represented in the literature of management sciences quite abundantly. Particular attention is paid to linking development systems with employee assessment systems and training (professional development) systems. The development of human resources by many authors: [Armstrong, (2009), Listwan (2010), Pocztowski (2019), Mis et al, (2007)] is perceived as a key human capital management process, while the overall goal of human resource development is to provide employee organization with such characteristics as the organization which needs to achieve her goals, i.e. increase and increase efficiency.

A significant number of scientific studies [Majewski (2013), Witaszek (2006), Zaloga et all (2018), Kacala, Michaluk (2010)] does not translate into the improvement of real solutions in the field of official pragmatics. There is no specific "link" that would translate into available theoretical solutions with official practice, in many aspects - it seems - contradicting existing, and even verified in other institutions, knowledge. In management sciences, attention is paid to the phenomenon of ignoring the results of analyzes and projects of improvement solutions. It is also common to "justify" management decisions as the "personal experience" of decision makers. In many situations, these phenomena can even bring short-term successes, but in the long run they are definitely ineffective. Especially in hierarchical institutions with a strong decision-making center, there is little chance of "breaking through" solutions other than those presented by the top management.

The interpretation of the concept of "career" is not explicit due to the diverse approach of researchers to this problem. For the purposes of this study, it has been assumed that the individual's career is a "unique sequence of professions and positions, values and roles played by the individual during his life, shaped by the period preceding his professional career and affecting the later period", Krol, Ludwiczynski, (2006).

Therefore, a career is a certain sequence and a specific consequence of the positions held by the employee, functions performed or works performed by Jamka (2011). It may concern the sphere of

economic life, but also political, cultural, scientific or even sports. It means then obtaining a specific title or a high position in a given area of activity. On the other hand, the concept of employee career is identified mainly with displacements closely related to professional development in larger enterprises, in which a multi-level hierarchy of jobs can be distinguished.

The human resources management of the Polish Armed Forces, and especially the personnel policy of the Ministry of National Defense, are extremely strongly determined by cultural factors and a long tradition. The sequence of military ranks received through promotion is one of the oldest ways of conceiving a military career in all armies of the world, from antiquity. This "bright" side of career and military promotions may be disturbed by his supervisor (commander). The only way to eliminate this incidental phenomenon is reliable and coherent personnel policy systems, enabling "maintaining highly qualified personnel resources, as well as ensuring a stable number and quality structure of professional staff through proper recruitment, selection, training and education as well as rational use of personal resources for the needs of the Polish Armed Forces "

The article will present the conclusions from the analysis of the career management process of professional soldiers of the Polish Armed Forces and directions for its improvement.

The article is co-financed from the "InterEkon."

Soldiers' Career Management - System Diagnosis

Research on the personnel policy of the Ministry of National Defense, and in particular on the personnel development system in the Polish Armed Forces, was focused on both theoretical areas of broadly understood career management and personnel practice implemented in individual types of armed forces or personnel corps. In particular, the research was focused on those areas of the armed forces that have a measurable impact on the ministry's personnel police.

The main areas that have been diagnosed are:

1. Organizational culture. The dominant type of organizational culture in the Polish Armed Forces is hierarchical culture. It is characterized by high formalization and hierarchization. Procedures decide how soldiers and their commanders (leaders) should function. The main goal of the Polish Armed Forces is to maintain their smooth functioning and long-term pursuit of durability, predictability and efficiency. Organizational coherence is ensured by detailed standards, regulations, laws and principles. The rules for appointment to subsequent positions (promotions) are determined by precise procedures. However, the study found that bureaucratic procedures to set out rules for commanders (supervisors) or personnel bodies are not sufficiently accurate or, worse, widely used. Areas of "free interpretation" of applicable rules do not guarantee the required quality of decisions made. In many places we deal with market culture with elements of adhocracy rather than traditionally understood bureaucracy. Soldiers must take actions themselves in the design of their career paths, instead of entrusting this task to competent supervisors and specialized human resources bodies. Thus, independent search for vacancies in the structure of the armed forces is quite common, which is also associated with taking specific actions to employ in a given unit (institution) bypassing the formal selection procedure.
2. Leadership in military organization. It is identified with firmness, expansiveness and results orientation, but also tends to maintain (preserve) conformist behavior. Strong personalities with elements of charisma to a large extent go to the army, because they tend to "lead", maintain order in the organization based on fear and forcing subordinates to give up their professional ambitions. Although the term of office has eliminated the phenomenon of many years of "prescription" in official positions and activities of "blocking" subordinates, there are again tendencies to repeat the term of office in a given position, preventing the development of subordinates waiting for promotion. There is a noticeable lack of mutual trust, showing respect and involving subordinates in the process of solving problems and making decisions. Soldiers declare that they expect to be shown a vision of further service and to design a strategic path to achieve individual goals.

3. Style of management (command). In the course of research, it was found that the organization prefers mainly employment security, subordination, predictability and immutability of interpersonal relations. The consequences of this approach mean that soldiers are often not interested in taking on various challenges if it involves the necessity to change the place of service. Therefore, they prefer to remain in the same degree longer (not necessarily in the same position) than to be promoted to a higher position in a distant place. This phenomenon intensifies with the increase in the size of the town where the soldier serves. Conducting research also found increasingly fierce competition for positions, especially if it involves promotion in the degree. Therefore, attempts to influence the increase of the full-time position of a given position in the hierarchy of the armed forces are also observed.
4. Coherence of organization. It is ensured by formal rules and regulations, including military provisions of the nature of an act, ordinances of the Council of Ministers and ordinances or decisions of the Minister of National Defense. The condition for this coherence is proper care for the legal side of these military regulations. Their quantity is not a special problem, but quite often they are subject to amendment. Updating individual entries (articles, points) often necessitates changes in other regulations. This causes low stability of the law, which in the absence of its knowledge among soldiers (despite widespread Internet versions) hinders the correct decision-making process and, as a consequence, also an appeal.

The Personnel policy of the Ministry of National Defense regulates personnel procedures in sufficient detail and to a sufficient degree. The basic task, which is the starting point for shaping the personnel policy of the Ministry of National Defense in the field of filling official positions in military units and institutions, is the general assessment of the personnel situation. The analysis of the personnel situation is carried out in two stages:

a) reporting and executive, implemented from 1 October each year in the bodies referred to in art. 44 section 1 of the Act [Act of 11 September 2003 on the military service of professional soldiers];

b) analytical and decision-making, implemented until the last day of February of the following year at the office of the Minister of National Defense.

The assessment of the personnel situation is prepared in a given calendar year, for the period from 1 January to the end of the assessed calendar year, by the authorities competent to appoint and dismiss from official positions [Regulation of May 9th, 2014].

The results of the personnel situation assessment are sent by the commander of the military unit to the immediate superior, directors of organizational units present the personnel situation assessment to the Minister of National Defense through the Director of the Human Resources Department.

Career Management of Professional Soldiers - Legal Conditions

The condition for issuing the decision [Regulation of September 9th, 2014] on the appointment of a professional soldier for a higher official position and assuming duties in this position is the prior issue of a decision appointing this soldier for a military rank corresponding to the full-time rank of that official position.

A professional soldier is appointed to the official position, by way of decision, according to the needs of the armed forces, depending on the required professional qualifications specified in the description of the official position and assessment included in the official opinion, and the professional soldier in the permanent service also from the individual prognosis set for him professional military service. The determination of the individual prognosis of the professional course of military service of a professional soldier in permanent service is based on models of the course of service

A professional soldier may perform professional military service in the same official position for no more than two terms, if he holds the position whose name includes the term "commander". The period of holding the position with the same full-time position is at least three years. If the needs of the armed forces speak for it, this period may be shorter, but not less than eighteen months.

The designation of a soldier for an official post is deemed to have been made after all of the following conditions have been fulfilled: the decision to designate the soldier for the official post and the commander of the military unit, in the daily order, the date on which the soldier took up his duties in the official post.

Professional career management in the Polish Armed Forces - research conclusions

The current state of the personnel development system in the Polish Armed Forces, presented above, was verified based on the opinions of professional soldiers. Previously, surveys were conducted, subjecting verification of research tools.

The research was carried out in two areas. On the one hand, selected decision-making procedures in the field of personnel, issued by military bodies with personnel competence, were analyzed, including the role of the successors of the so-called managers of personal corps, i.e. persons (bodies) responsible for service models in individual corps and personal groups. On the other hand, the research included a group of officers in terms of meeting expectations as to the quality of the applicable system of business opinions, forecasting the course of service and appointing and dismissing from positions.

The diagnosis of business practice used, due to the size of the sample, should be treated as emerging trends.

The first proposal concerns an issue that requires improvement in official practice, namely the provision of a statutory provision on equal access for professional soldiers to higher official positions. This means that the procedure for appointing soldiers to official positions should ensure that all soldiers who apply for them can be included in it.

During the analysis, military personnel formulated the need to create in the personnel management structures an independent unit to counseling individual career paths, because HR cells in military units are not objective in this role, being subordinated to their direct commanders.

In a situation where the number of candidates is greater than the number of appropriate positions, a selection is organized, as a result of which the best candidate will be selected. As officers postulated in the survey, the final choice should be decided by the authority responsible for designating a soldier for a specific position after consulting the soldier who is the head of the given position.

Such qualification should take into account:

1) results of official opinions;

2) opinions of other authorities, if the obligation to draw up such opinions results from separate provisions;

3) compliance of qualifications with the requirements set out in the job description card for which the officer is to be appointed after appointment;

4) professional experience and career path;

5) seniority in military rank;

6) predisposition to occupy specific official positions;

7) information about criminal record and whether preparatory proceedings are being conducted against the soldier.

In the selection procedure, the body designating the official position must have the official opinions of all candidates.

Therefore, it would be advisable to introduce a system of official opinion on soldiers, which will gradually determine in which direction their career path should develop. This gradual matching process

should also take into account the views of those concerned about where to continue their service (type of military unit, city).

In the first stage, a soldier would only be judged for results in service in the position he held. A high result of this assessment would be the basis for proposing a soldier for another higher position. Lower results of this assessment could be the basis for a possible retention of a soldier in an occupied position or referral to equivalent positions, or dismissal from military service.

In the second stage of service in a position, a soldier would also be assessed for the results obtained in the position held (this is about confirmation of his involvement in the service), but a forecast would also be formulated as to further service in a specific category of positions. This would be the basis for qualifying a soldier for improvement training in terms of gaining new competences.

In the third stage of service as a soldier, he would be assessed not only for the results achieved during the entire term of office, but also in terms of meeting the requirements specified for the new position. Then, in the closer forecast, one could already write down a specific position, which he could apply in the selection process.

The three-stage selection presented above could also take into account the possibility of variant formulation of forecasts of further service.

Successive changes in the Polish Armed Forces undoubtedly contribute to a significant modification of the approach to professional career management.

The traditional approach to professional careers focused primarily on selection, development management, evaluation, counseling, staff mobility and consequence planning should be enriched with such elements as self-improvement, mentoring, "learning organization", information systems, contact networks and flexible work organization.

The very definition of possible forms of promotion or career paths does not yet guarantee the proper development of professional soldiers. The point is that the interest of the Ministry of National Defense in the professional development of professional soldiers should be no less than their own interest. Therefore, all human resources bodies responsible for human resource management play an important role here. In addition to developing possible career paths, they should also:

• forecast careers, i.e. identify staffing needs and adapt staffing to the existing supply of human resources,

• plan careers, adapt the needs and aspirations of soldiers to the needs and expectations of staff resulting from career anticipation, so that benefits are derived from both sides,

• advise on the issue of career, that is, carry out all activities related to the assessment of the current service of soldiers and on this basis provide advice on further career development; Specialists in personnel matters or other bodies responsible for personnel matters in the department of HR must play an important role here,

• help in professional development by creating opportunities for further education, training, long-term leave for further training or assistance in starting or continuing studies.

Human resources management and career planning should be strategic and closely related to the strategy for the development of the armed forces, as well as the development of the potential of official positions. They allow mutual benefits, reducing selection costs, as well as strengthening the organizational culture in the armed forces and reducing the number of conflicts between soldiers' personal goals and their organizational tasks.

Good development of a career path brings benefits in the form of higher qualifications of soldiers, better matching their interests to the performed service in the position and greater satisfaction, which results.

Excellence Management Models and Multidimensional Assessment of Their Impact on The Organization's Branding Strategies

Barbara MRÓZ-GORGOŃ
Wroclaw University of Economics and Business, POLAND
E-mail: barbara. Mroz-gorgon@ue.wroc.pl

Joanna MARTUSEWICZ
Wroclaw University of Economics and Business, POLAND
E-mail: joanna.martusewicz@ue.wroc.pl

Abstract

The frequency of using models of management excellence in business practice, as well as the intensification of brand communication activities, provide evidence that there is space (knowledge gap) for scientists to contribute to management practice, developing theories that will help answer the question to what extent and in what context the introduction of the management excellence model influences the organization's branding strategies and the mechanisms of this correlation. This paper refers to an ongoing project and presents research in progress which authors are carrying out as a part of a grant. The research goal of the project is to identify the level of impact of the excellence management model introduced in the organization on the branding strategies of the organization, and to define areas of this impact . Therefore, the research problem will be the answer to the question how the excellence management model introduced into the organization's activities influences the organization's branding strategies. The implementation of the project goal will therefore focus on defining the impact factors and specific criteria determining the level of impact of the implemented model of excellence on the branding strategies of the organization in its many dimensions. After a systematic review of the literature in the first period of the project, both qualitative research is planned.

Keywords: Excellence Model, Assessment, Branding, Strategy

Introduction

Many researchers, such as D. Aaker (1991) and K. Keller (2003) paid a lot of attention in their publications to the issue of the brand's life cycle, thus joining the wide -international debate (among scientists and business practitioners) on concepts of constantly changing and modifying branding strategies. However, this debate lacks specific theories about the impact of a given management models (such as excellence management models) on branding strategies (Schultz, Hatch, 2003) and holistic approach to the creation of the company strategy and branding strategy (simultaneously) with the usage of the given tool, which is defined in the literature as a research gap (Merrilees, Miller, 2008). Referring to the business practice, excellence business models are also consider as a management tool, with small attention to how their impact marketing filed of the company, and so the authors of the article finds the issue of the connection of the excellence business model and their marketing/ branding meaning as of a high importance.

The increasing frequency of using models of management excellence in business practice, as well as the intensification of brand communication activities, provide evidence that there is space (knowledge gap) for scientists to contribute to management practice, developing theories that will help answer the question to what extent and in what context the introduction of the management excellence model influences the organization's branding strategies and the mechanisms of this correlation.
This paper refers to an ongoing project and presents research in progress which authors are carrying out as a part of a grant.

The aim of the project is to fill the scientific gap by identifying the factors and mechanisms of the impact of implemented business excellence models on the branding strategies of the organization based on extensive research conducted among medium and big enterprises.

Literature Review

The concept of excellence is an example of a systemic approach to management. It is created in accordance with the evolution of the external environment and at the same time is considered as a modern way to achieve perfection. Consequently, the transition from quality to perfection can be observed.

The evolution of the path of perfection was shown in their work by P. Hermel and J. Ramis-Puyol (2003), anticipating the concept of integrated improvement, the so-called "Perfection 5.0", what are the characteristics of today's most important models of excellence. The path of evolution Perfection was as follows: "Perfection 0.0" was evolving from stage to stage before the publication of the book by Peters and Waterman In Search of Excellence in 1982, results-oriented, among which maximizing value was the most important goal of perfection. "Perfection 1.0" was based on Peters theory and Waterman. "Perfection 2.0" emphasized the importance of change, "Perfection 3.0" was about learning and "Perfection 4.0" was about designing models of excellence as a basis for comparison and self-assessment. In contrast, "Perfection 5.0" is a concept integrated improvement, based on system view on management taking into account all dimensions of the organization (Stańczyk - Hugiet E 2014).

In management sciences and business practice, one can find many different models that are designed to help in achieving business excellence. That models can be classified in three areas:

- global / national models,
- academic models,
- corporate models.

In a research study by Wagner et al. (2011) 94 models of excellence, that are used in 83 countries around the world have been identified. Global models that have become the canvas of models of excellence, including national models, are:

• Deming model by Douglas and Fredendall (2004)- was created in 1951 and thanks to it the Japanese economy achieved high quality products and reduced costs, became so competitive for the American market and threatened its competitiveness;
• Malcolm Baldrig's Model of Excellence (MBNQA) (chart1.) was created in 1987 (NITS, 2020) as a response to the needs of American companies to increase their competitiveness. Over time, it has gained recognition as a global standard in the field of customer-oriented management systems and the search for good practices. It is partly modeled on the Canadian Quality Award model, which was created in 1984. In Australia (The australian Business Excellence Framework) the model was created in 1989;

Chart 1: Baldrige Excellence Framework

Source: Baldrige Excellence Framework: Leadership and Management Practices for High Performance. Gaithersburg, MD: U.S. Department of Commerce, National Institute of Standards and Technology. https://www.nist.gov/baldrige.

• The EFQM model was created in 1991 with the support of the European Quality Management Organization and the European Commission (EFQM, 2013). The main purpose of creating the model of excellence was to strengthen the position of Western European companies on the global market. His task was to accelerate the implementation of quality and then excellence as a global strategy to achieve competitive advantage in global markets.

Chart 2: EFQM model

Source: https://www.efqm.org/index.php/efqm-model/ access 12.04.2020

EFQM, Deming and MBNQA models have become the basis of national models around the world. Literature analysis (Dahlgaard-Park, 2008, Doeleman and Diepenmaat, 2014) indicates that the values and goals of these models are similar and focus mainly on improving the competitiveness of companies on the domestic and global market. The key areas of improvement are leadership, employees, customers, strategy orientation, process management, etc. Important aspects of improvement are strong stakeholder orientation, the environment and long-term orientation to the success of the company. The assessment criteria for these models are similar and focus on both business results and stakeholders on the one hand, as well as internal areas of the organization, i.e. leadership, strategy, processes and

knowledge management. Socio-cultural conditions have a key role in creating the principles of excellence models. According to B. Talwar (2011) western countries mainly focus on the development of the individual, developing freedom, creative thinking or entrepreneurship, while in Asian countries they focus on the development of the group and "Eastern philosophy."

Until the middle of the previous decade, the world was divided into areas of influence of individual models. Analysis of enterprise assessments (EFQM made by the assessors of the EFQM Foundation indicates that the EFQM model has also become popular in companies around the world, i.e. in Asia, Arab Countries and Central and South America.

The analysis of model assumptions indicates that the use of Models of Excellence facilitates the implementation of a modern management system and further improvement of the organization thanks to: obtaining an overview of the whole organization, identifying the strengths of the organization and areas for improvement, the ability to check the effectiveness of actions taken, the possibility of comparing with other organizations, help in identifying and sharing best practices within the organization, increasing employee involvement in continuous improvement, or improving internal communication, and integrating various pro-quality and improvement initiatives.

Literature analysis (Bou-Llusar et al., 2005, 2009; Boulter, Bendell, Abas,Dahlgaarh et al., 2005; George et al., 2003; Jackson & Bircher, 2002; Sanchez et al., 2006) indicates that BEM can give an immediate picture of where the enterprise is located and show the way to its continuous improvement. This is achieved thanks to two key elements of the model implementation process, i.e. self-assessment and benchmarking.

It seems that the self-assessment of enterprises based on the Model of Excellence, in comparison with other assessment systems, takes into account the richer range of issues that comprehensively refer to various activities for quality and excellence. Model criteria show the image of the organization being assessed, including social and environmental aspects. Criteria regarding "Results of operations" are of key importance, which impose the necessity to assess, among others the company's level of competitiveness on the market, as well as its ability to meet the expectations of shareholders. Non-financial factors such as effective working time and productivity are also taken into account during the assessment.

Kacala and Kolaczyk (2012) mentioned that the model gives organizations the opportunity to improve their activities in such areas as:

- strategic management by creating a set of key results necessary to monitor progress in the implementation of the vision, mission and strategy, enabling leaders to make effective decisions;
- customer value by clearly defining and communicating it, as well as engaging it in the product design process
- shaping leaders' skills to adapt, respond and gain the involvement of all stakeholders to ensure the lasting success of the organization
- organization of processes enabling implementation of the strategy of balance between the strategic goals of the organization and the expectations and aspirations of employees
- stakeholders as a potential source of creativity and innovation by developing and engaging them in cooperation
- partnership relations by shaping lasting and mutual benefits, outside the supply chain
- responsibility for the actions taken by the organization and impact management as it evokes in society.

Another goal of this tool is to encourage and motivate organizations to systematically improve their operation, identify the next stages of improvement Organizations can apply for such a level of recognition that reflects their degree of maturity and the results obtained in applying the model. The key advantages of using the model by Kacala and Kolaczyk (2012) are the possibility of implementing a modern management system and further improving the organization due to the possibility of comparing with other organizations, assistance in identifying and sharing best practices within the organization, increasing employee involvement in continuous improvement, improving internal communication and integrating various pro-quality initiatives and improvement methods.

In the book by Haffer (2011)the basic difficulties that have been identified by independent assessors in implementing the model and confirmed in surveys conducted among entrepreneurs are:

- lack of organizational resources to work with the model (people, knowledge and time);
- difficulties in learning the principles and criteria of the model and translating them into the language of the organization;
- lack of awareness and commitment among management and employees;
- organizational difficulties in creating a new approach and management paradigm in the organization
- the complexity of self-assessment and the time needed to write a report;
- quality and involvement of external assessors;
- direct and indirect costs of implementing the model.

Effective implementation of the EFQM model principles should ensure greater efficiency and positive results of running the business in the short and long term.

Interesting from the point of view of analyzing the behavior of companies in the approach to improvement are studies in which the author (Mann et al. 2011) draws attention to three basic motivators of activities, i.e.

- procedural benefits - related to the improvement of the company's internal processes and operations
- marketing benefits - resulting from certification and affecting customer perception
- external market conditions - related to pressure from the industry market and competitors

It is worth noting that such an approach may have an active dimension - resulting from the need to shape and improve relations on the market and in the industry, as well as a passive dimension - consisting only in responding to the current market situation.

Research Problem

The research goal of the project is to identify the level of impact of the excellence management model introduced in the organization on the branding strategies of the organization, and to define areas of this impact (both in the external dimension - brand communication, internal branding and in the employer branding layer). Therefore, the research problem will be the answer to the question how the excellence management model introduced into the organization's activities influences the organization's branding strategies.

Based on the literature review authors formulated the hypothesis: **the factors that determine the level of impact of the implemented excellence management model and branding strategy of a given organization (firm) are in particular: type of the excellence model (external factor) and: accumulated knowledge of the market, holistic approach of marketing and management, as well as participatory management style towards internal and external stakeholders (internal factors).** The implementation of the project goal will therefore focus on defining the impact factors and specific criteria determining the level of impact of the implemented model of excellence on the branding strategies of the organization in its many dimensions. To achieve the research goal it will be necessary to:

• defining the factors that determine the impact (including the translation of values brought into the organization) of the management excellence model on the organization's branding strategies;
• creating a scale to determine the level of impact;
• creating a multifactorial model illustrating the hypothetical relationship between the introduced management excellence model and the organization's branding strategies.

Research Method

After a systematic review of the literature in the first period of the project, both qualitative research is planned, including: Individual In-depth Interviews, with representatives of the management of entities that have already introduced a model of management excellence (N = 15), as well as quantitative research carried out by means of standardized interviews using the online questionnaire (CAWI-type computer aided interview) with representatives of companies that have introduced a selected management excellence model in their activities (N = 450). The collected data will be subjected to computer processing and quantitative analysis using descriptive statistics and the use of the SEM / PLS structural model.

The applied research method will allow to generate (in the systematic literature mode) a multifactorial model of hypothetical relationships; then, based on qualitative research (interviews with business practitioners), it will be possible to specifically clean the model by narrowing the model factors to the most common ones - based on practitioners' indications (this is necessary due to the time and financial constraints of the project). Quantitative research will be conducted on its own using the survey tool created as part of the project, thanks to the database of international companies made available by the EU Development Foundation in Wrocław that has introduced a model of management excellence. Quantitative research will allow verification of assumptions, and thus verification of the main hypotheses, that has been formulated based on the literature study.

Acknowldgement

"The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN"

Abstract

Digitalization plays an important role in 21st century business success or failure. Companies founded after the 1990s built digitalization into their startup plans, whereas companies started before the 1980s had to reconfigure themselves to compete in a digitalized world. Companies in developing countries have less access to digital resources compares to developed country and these companies must often spend more of their budget on basic needs. In Lebanon, Engineering and construction (E & C) all of the problems mentioned above and rely on systems and methods used prior to the digital age. To the author knowledge, Lebanon lack behind in digitalization and does not currently have the infrastructure needed to support digitalization. This study was undertaken to assess the obstacles to digitalization currently faced by C & E firms in Lebanon with the goal of helping companies find ways to overcome these obstacles and enter the digital age. Findings showed that employee resistance and lack of training are not as big a problem in Lebanon as in other areas. The biggest problem, lack of infrastructure, will take a considerable amount of time and energy to overcome. Engineering and construction companies who wish to become digitalized must work not only at the local level but at the national level to help build an infrastructure capable of supporting Lebanon's digitalized and globally connected companies.

Keywords: Digitalization, Construction, Engineering, Construction and Engineering Companies, Lebanon.

Introduction

Digitalization plays a vital role in 21st century business success or failure (Wertz, 2018). The process of digitalization, however, can present significant problems. Some businesses, given their products or length of time in the marketplace, can be digitalized more easily and naturally than others. Companies started after 1990 can build digitalization into their startup plans whereas companies started before the 1980s must reconfigure themselves to compete in a digitalized world (Harsh, 2016). Obviously reconfiguring a company for digitalization takes longer, is more complicated and more expensive than building a company where digital systems are incorporated into the original plan. Another impediment to digitalization is the country in which a business is located. Companies located in countries with money to invest in digital infrastructure and training in digital processes have access to more digital resources (Hanna, 2017). Companies in developing countries must often spend more of their budget on basic needs (UNCTAD, 2019).

Certain types of companies find it easier to incorporate digitalization into their systems. For example, companies dealing primarily with information face fewer obstacles to digitalization than those with multiple sites, products, suppliers, subcontractors or collaborators.

Engineering and construction (E & C) companies in Lebanon face all of the problems mentioned above. E & C companies established after 1980 still rely on the systems and methods used prior to the digital age. Lebanon does not currently have the infrastructure needed to support digitalization on a country

wide or local scale. E & C companies deal with multiple work sites, multiple stakeholders, multiple suppliers and funding sources, and widely varied projects.

This study seeks to determine the obstacles to digitalization currently faced by C & E firms in Lebanon with the goal of helping companies find ways to overcome these obstacles and enter the digital age.

Literature Review

Despite evidence of the benefits of digitalization (Blanco et al, 2017; Global Industry Council; Halsey, 2016) the E & C industry has made few advances into the digital age (Ismail, 2019; Okumu, 2019). According to the World Economic Forum (Chew, 2019), "the E&C industry continues to operate today as it has for the past 50 years, heavily relying on manual labor, mechanical technologies and legacy business models". This is true even in countries with a digital infrastructure in place and being used in both the public and private sector. Okumu (2019) found "the civil engineering and construction sector is one of the world's least digitised sectors, particularly in Europe".

E & C companies face many obstacles to digitalization (Blanco et al, 2017; EYGM, 2018; Ibem EO, et al, 2018; Sandle, 2018). Okumu (2019) categorized the obstacles as follows: "unclear definitions of the meaning of digital, poor integration of digital technologies, lack of sustainable improvements, lack of replication (projects differ widely), decentralization (funding comes from multiple sources, projects take place in numerous locations), constant change (workforce turnover, changing teams and organizations), and fragmentation (a project could have several organizations, companies and disciplines working on it)." Ernest & Young (2018) characterized E & C industries as "conservative and reactive" (Ernest & Young, 2018) leading to a reluctance to change even when the change is beneficial. "Companies interested in digitalization report other obstacles including: poor return on investment, employees who resist learning digital systems, companies are interested in digital systems but don't want to be the first adopters, lack of digital systems designed for the E & C industry" (Ernest & Young, 2018). Pressure for digitalization comes from outside the industry as well as from within (EYGM, 2018). A survey conducted by Oliver Wyman (2018) showed the following outside pressures: "evolving client expectations, new technological capabilities, booming start-up environment, supportive legal frameworks, launch of large infrastructure projects" (Oliver Wyman, 2018).

E & C companies in countries with a weak or nonexistent digital infrastructure face even greater obstacles (Hanna, 2017; Ibem EO, et al, 2018; UNCTAD, 2019). While Lebanon recognizes the need for digitalization, the country is struggling to become a digitalized nation. "Currently, Lebanon lags behind in terms of digital adoption and captures only 4.7% of its digital potential, well below the 8.4% average for Middle Eastern countries, highlighting a large untapped growth and potential jobs resource" (World Bank, 2019). At a 2019 conference on digitalization, "speakers from an entrepreneurial start-up background expressed their concerns with launching digital applications in Lebanon, citing the lack of local awareness that would enable them to succeed locally" (Mezher, 2019). Lebanon does not have the necessary infrastructure nor does it have enough people trained in digital processes to build and maintain an infrastructure. Funding is another issue that must be addressed before Lebanon can become digitalized. The problems might seem unsurmountable however Lebanon has taken significant steps in addressing them. A ministerial committee for digital transformation has been established, chaired by the Prime Minister (AbdulMalak, 2019) The committee oversees establishment of guidelines for governance, implementation and monitoring for public and private digitalization. While these steps are important in the nation's digitalization process, companies operating in Lebanon do not have access to the same level of digital resources as those in countries with a well-designed and comprehensive digital infrastructure.

Research Question

The literature review discusses obstacles to digitalization that are common to C & E companies in general and to companies in developing countries in particular. While some research has been conducted on digitalization in Lebanon, few studies address digitalization obstacles for Lebanon's C & E companies. This study seeks to expand on the literature by asking the following question: What

are the greatest obstacles to digitalization currently faced by owners of C & E firms operating in Lebanon?
The hypotheses for this study are:

H1: The belief that the company has insufficient internal skills has a significant negative impact on C & E readiness for digitalization.

H2: The belief that their employees are resistant to using digital technology has a significant negative impact on C & E readiness for digitalization.

Methodology

The Order of Engineers list of C & E companies in Lebanon will be consulted and 50 companies that operate in Lebanon selected from the list. Consent forms will be sent to the owners of the selected companies. Those who agree to participate will be sent surveys by email or hard copy. Participants will also be given the option of filling out an online survey. The survey will consist of 13 questions, see below, asking the owners to rate the significance of perceived problems of digitalization and impediments to digitalizing using a Likert scale. Appropriate statistical tools (e.g., T-test, average, standard deviation) will be used to analyze the survey results. The study results will be shared with E & C companies and with appropriate government agencies.

Survey questions

1. Digital technology does not allow the flexibility needed in my business.
2. Using digital technology will cause errors in measurement.
3. My data will not be safe if I use digital technology.
4. It will be hard to train my employees to use digital technology.
5. Changing over to digital technology costs too much.
6. My employees don't have the skills to use digital technology.
7. My business is successful without using digital technology.
8. I don't know how we would integrate digital technology into my business.
9. I don't like using digital technology.
10. My investors/backers don't want to spend the money on digital technology.
11. Lebanon doesn't have the infrastructure to support use of digital technology in my business.
12. My employees are resistant to using digital technology.
13. Other

Results Presentation

A total of 27 people responded to a questionnaire consisting of 20 questions. Questions one through seven asked for demographics. Questions eight through 19 asked participants to rate their responses to statements about technology using a Likert scale of one (strongly disagree) to five (strongly agree). Question 20 provided space for additional quiet comments.

Question one asked if the firm was a sole proprietorship, partnership, or limited liability company. Eight respondents (29.6%) were in a sole proprietorship. 12 (44.4%) were in a partnership and seven (25.9%) were in a limited liability company.

Question two asked about the age of the firm. Eight participants (29.6%) had firms that were less than five years old. 10 participants (37.0%) were worked for firms that were 6 to 10 years old. One participant (3.7%) was in a firm that was 11 to 15 years old. Eight participants (29.6%) worked in firms that were more than 15 years old.
Question three asked about the number of employees in the firm. 11 respondents (40.7%) worked in firms with less than five employees. Six respondents (22.2%) worked in firms with more than 5 to 10 persons and 10 respondents (37.0%) worked in firms with more than 10 employees.

Question four asked about the type of services provided by the firm's three persons (11.1%) worked in firms that only did design. 15 respondents (55.6%) worked in firms that did both design and construction. Four respondents (14.8%) worked in firms that provided project management. Five respondents (18.5%) worked in firms that provided construction services.

Question five asked if the firms had any of the following social media presences: website, Facebook page, Twitter account, other. 17 respondents (63.0%) stated their firms had a website. 15 respondents (55.6%) had a Facebook page for their firm. Four respondents (14.8%) had a twitter account. Seven respondents (25.9%) answered other, listing the following: platinum holding, both website and Facebook page, email, and Instagram.

Question six asked about the presence of Internet services in the respondent's offices. 26 persons (96.3%) answered yes while one person (3.7%) said no.

Question seven asked about the participants' educational background. Zero respondents had a Bachelor of Science degree. 17 respondents (63.0%) had a bachelor of engineering. Eight (29.6%) had a Masters and one respondent (3.7%) had a PhD. One respondent (3.7%) replied other, civil engineer.

Questions eight through 19 (Question 1 through 11, indicated previously) asked for responses to statements about digital technology. Respondents were asked to rate their answers based on a Likert scale of 1 to 5 with one being strongly disagree, two disagree, three neutral, four agree, and five strongly agree.

Question eight stated "digital technology does not allow the flexibility needed in my business". 10 persons (37.04%) strongly disagreed, eight (29.63%) disagreed, seven (25.93%) were undecided to (7.41%) agreed and zero persons strongly agreed. The mean response for question eight was 2.04 with a 0.98 standard deviation.

Question nine stated "using digital technology will cause errors in measurement". 10 persons (30.04%) strongly disagreed. 10 persons (37.04%) disagreed, three persons (11.11%) were undecided, four persons (14.81%) agreed, no one strongly agreed. The average response was 2.04 with a standard deviation of 1.06.

Question 10 stated "my data will not be safe if I use digital technology". Seven persons (25.93% strongly agreed. 10 persons (37.04%) disagreed. Six (22.22% were undecided. Four (14.81%) parentheses agreed. No one strongly agreed. The average response for question 10 was 2.26 with a standard deviation of 1.02.

Question 11 stated, "It will be hard to train my employees to use digital technology". Five persons (18.52%) strongly disagreed. 14 persons (51.85%) agreed. Five persons (18.52%) were undecided. Three persons (11.11%) agreed. No one strongly agreed. The average response was 2.22 with a standard deviation of 0.89.

Question 12 stated, "Changing over to digital technology cost too much". Space zero respondents strongly disagreed. Nine persons (33.33%) disagreed. Seven persons (25.93%) agreed. Two persons (7.41%) strongly agreed. The average response was 3.07 with a standard deviation of 0.96.

Question 13 stated, "my employees don't have the skills to use to digital technology". Five respondents (18.52% strongly agreed. 13 (48.15%) disagreed. Four respondents (14.81%) were undecided five persons (18.52%) agreed. No one strongly agreed. The average response was 2.33 with a standard deviation of one.

Question 14 stated, "My business is successful without using digital technology." Two persons (7.41%) strongly disagreed. Seven persons (25.93%) disagreed. Eight persons (29.63%) were undecided. 10 persons (37.04%) agreed. No one strongly agreed. The average response was 2.96 with a standard deviation of 0.98.

Question 15 stated, "I don't know how we would integrate digital technology into my business. Three respondents (11.11%) strongly disagreed. 12 (44.44%) disagreed. Six (22.22%) were undecided. Six (22.22%) agreed. No one strongly agreed. The average response was 2.56 with a 0.97 standard deviation.

Question 16 stated, "I don't like using digital technology." 11 persons (40.74%) strongly disagreed. 12 persons (44.44%) disagreed. Four persons (14.81%) were undecided. None of the respondents agreed or strongly agreed. The average response was 1.74 with a standard deviation of 0.71.

Question 17 stated, "my investors/backers don't want to spend money on digital technology. Two persons (7.41%) strongly disagreed. 10 persons (37.04) disagreed. 10 persons (37.04%) were undecided. Five persons (18.52%) agreed. No one strongly agreed. The average response was 2.67 with the standard deviation of 0.88.

Question 18 stated, "Lebanon doesn't have the infrastructure to support use of digital technology in my business." No one strongly disagreed. Five people (18.52%) disagreed. Six persons (22.22%) were undecided. 12 persons (44.44%) agreed. Four persons (14.81%) strongly agreed. The average response was 3.56 with a 0.97 standard deviation.

Question 19 stated, "my employees are resistant to using digital technology". Five persons (18.52%) strongly disagreed. Nine persons (33.33%) disagreed. Six persons (22.22%) were undecided. Seven persons (25.93%) agreed. No one strongly agreed. The average answer was 2.56 with a standard deviation of 1.09.

Question 20 allowed space for additional comments. Three persons responded with comments as follows: I would like to add from my previous experience working in the field of digital transformation for the public sector that the resilience of change is not usually coming from the employees (at least in my case) rather than from local governments. In fact, yes our infrastructure is not ready yet but it all depends on the mindset and the company's culture. Many corporate and Lebanon have moved to the cloud services and trained their employees for using digital technology, a proof that this can be done; the older the company, the harder and the more expensive the change to digital technology will be.

Discussion

The questions can be grouped into five categories: 1) beliefs about employees (questions 11, 13, 19), 2) manager lack of knowledge or motivation (questions 14, 15, 16), 3) could cause problems for my business (questions eight, nine, 10), 4) cost (questions 12, 17), 5) lack of infrastructure space (question 18).

The first category, beliefs about employees, including questions about employees' skills in using, ability to be trained and, and resistance to the use digital technology. 62.96% of the respondents believed their employees would be open to the use of digital technology, and either had the skills or could be trained in the use of digital technology. 18.52% were undecided while only 18.52% believed it would be difficult to train their employees or that their employees didn't have the skills or were resistant to using digital technology, Refer to Table 1.

Beliefs about Employees
11 It will be hard to train my employees to use digital technology.
13 My employees don't have the skills to use digital technology.
19 My employees are resistant to using digital technology.

Table 1: Survey results for questions 11, 13 and 19

Q	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree
11	18.52%	51.85%	18.52%	11.11%	0
13	18.52%	48.15%	14.81%	18.52%	0
19	18.52%	33.33%	22.22%	25.92%	0
Average	**18.52%**	**44.44%**	**18.52%**	**18.52%**	**0**

Category two, refer to Table 2, the respondents' lack of knowledge or motivation, showed some interesting results. While 37.04% indicated their businesses were successful without using digital technology, 85.18% of the respondents either strongly disagreed or disagreed with question 16, I don't like using digital technology. 55.55% of the respondents indicated they knew how to integrate digital technology into their businesses. 22.22% were undecided while the remaining 22.22% indicated they did not know how to integrate digital technology into their businesses. These results indicate that resistance to using digital technology is more about the belief that digital technology would not add to the quality or quantity of business rather than an innate unfamiliarity with, dislike or suspicion of digital technology.

Manager lack of knowledge or motivation
14 My business is successful without using digital technology.
15 I don't know how we would integrate digital technology into my business.
16 I don't like using digital technology.

Table 2: Survey results for questions 14, 15 and 16

Q	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree
14	7.41%	25.93%	29.63&	37.04%	0
15	11.11%	44.44%	22.22%	22.22%	0
16	40.74%	4.44%	14.81%	0	0
Average	**19.75%**	**38.27%**	**22.22%**	**19.75%**	**0**

The third category related to respondents' beliefs that digital technology could cause problems for their businesses – responses are summarized in Table 3. An average of 12.34% of the respondents agreed that digital technology could cause problems more problems than it solved in their business. However, none of them strongly agreed. 67.91% of the respondents disagreed, indicating they believed that digital technology would not cause more problems in their business. 19.75% were undecided. These results suggest that managers see digital technology as potentially useful.

Can cause more problems for my business
8 Digital technology does not allow the flexibility needed in my business.
9 Using digital technology will cause errors in measurement.
10 My data will not be safe if I use digital technology.

Table 3: Survey results for questions 8, 9 and 10

Q	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree
8	37.04%	29.63%	25.93%	7.41%	0
9	37.04%	37.04%	11.11%	14.81%	0
10	25.93%	37.04%	22.22%	14.81%	0
Average	**33.34%**	**34.57%**	**19.75%**	**12.34%**	**0**

For cost, category four (shown in Table 4), the results were almost evenly spread with 38.9% saying cost is not a factor, 35.19% saying they were undecided and 25.94% stating cost was definitely a factor. The questions did not discriminate between the investors and backers not wanting to spend money or company management not wanting to spend the money on digital technology. Therefore, it is impossible to say which of those two factors are most important when it comes to cost.

Cost
12 Changing over to digital technology costs too much.
17 My investors/backers don't want to spend the money on digital technology.

Table 4: Survey results for questions 12 and 17

Q	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree
12	0	33.33%	33.33%	25.93%	7.41%
17	7.41%	37.04%	37.04%	18.52%	0
Average	**3.71%**	**35.19%**	**35.19%**	**22.23%**	**3.71%**

The results in category five, lack of infrastructure, indicated companies are uncertain if Lebanon has the necessary infrastructure for supporting the use of digital technology. A total of 59.24% believe that it does not with an additional 22.22% undecided. Only 18.52% believed Lebanon did have the necessary infrastructure and no one strongly believed that it did. Table 5 shows a summary of the survey results for question 18.

Infrastructure

18 Lebanon doesn't have the infrastructure to support use of digital technology in my business.

Table 5: Survey results for question 18

Q	Strongly Disagree	Disagree	Undecided	Agree	Strongly Agree
12	0	18.52%	22.22%	44.44%	14.8%

Conclusion

Employees' lack of skills and resistance to using digital technology were two of the greatest obstacles to digitalization found in the literature. Employee training in the use of digital technology, allocating funds for digitalization, professional seminars and workshops on the value of the digitalization are all affirmed as important factors in this study. The biggest obstacle to use of digital technology for the participants in this study, however, was Lebanon's lack of infrastructure. As mentioned before, Lebanon is in the process of strengthening its digital infrastructure. One way that companies could contribute to this is to form consortiums advocating for improvement of the country's digital infrastructure and providing resources for Lebanese initiatives.

On a local level, managers can participate in professional development and workshops on digitalization in the engineering and construction sector. They can also contact managers, academics, and other professionals around the world who have knowledge or expertise in the area of digital it digitalization in engineering and construction industry. Managers tend also provide training for their employees in preparation for digitalization of their companies. They can act as advocates for digitalization with others in the organization the organization (e.g., coworkers, subordinates, investors) by providing research, feasibility studies and examples of successful digitalization projects.

The results of this study show that employee resistance and lack of training are not as big a problem in Lebanon as in other areas. The biggest problem, lack of infrastructure, will take a considerable amount

of time and energy to overcome. Engineering and construction companies who wish to become digitalized must work not only at the local level but at the national level to help build an infrastructure capable of supporting Lebanon's digitalized and globally connected companies.

Consequences of Green Certificates Oversupply on The Polish Energy Market

Joanna WYROBEK

Cracow University of Economics, Cracow, Poland
wyrobekj@uek.krakow.pl

Abstract

The purpose of the publication was to discuss the financial situation of wind farms in Poland in the period 2010 - 2018 when this sector was undergoing a crisis caused by the excess supply of green certificates. The publication discusses the genesis of the phenomenon, actions taken to resolve the crisis, and its impact on the wind farm sector. The paper, as one of the few, presents the financial aspect of this phenomenon, combining the issues of sustainable development with the economic viability of entities from the green energy sector. As it turns out, at least in Poland, these entities had severe financial problems, and many wind farms were liquidated. In order to make comparisons, we used financial data for wind farms in the United Kingdom as a reference. Wind farms in the United Kingdom, as one of the few in Europe, are profitable, and one of the government support systems was also the system of tradable renewable energy certificates.

Keywords: sustainable development, TREC, RES, financial analysis

JEL classification: Q01, Q56, O33

Introduction

In the period 2005 - 2014, Poland used only the system of tradable renewable energy certificates (TREC) to support wind companies. The TREC system is colloquially called the green certificate system. The main legal act regulating this system is the Energy Law (Paragraph of 10 April 1997, Journal of Laws of 1997, No. 54, item 348 as amended). The green certificate system has been in force in Poland since the first of October 2005.

The scheme covers not only wind farms but also: solar farms obtaining energy from solar energy, plants producing electricity using geothermal sources, power obtained from waves, currents and tides, as well as the fall of rivers and derived from biomass.

The concept of the system assumed that producers producing renewable energy receive a negotiable certificate for each unit of electricity generated. In this way, they receive revenues both from physical energy sales and from trading certificates (Gnatowska, 2010, p. 147). Industrial (TSO) and distribution (DSO) system operators are required to purchase renewable energy. Energy companies producing or selling electricity to end users are required to obtain and submit for redemption a certain number of green certificates (Renewable Portfolio Standard - RPS).

In the assumptions, the system was, therefore, to increase wind farm revenues by proceeds from the sale of green certificates, and the market was to decide on the prices of green certificates. The ceiling of these prices was controlled with the substitute fee, which was set by the ministry of energy, and it could be paid instead of the certificates.

The system functioned correctly until around 2012 (Mikołajewicz-Woźniak, 2013, p. 97) when the oversupply of certificates appeared on the market and increased until 2016. The oversupply resulted from many reasons. One of them was the launch of a large number of new wind farms, which along

with technological progress, produced energy significantly cheaper than the old-technology wind farms. Another reason was the generation of electricity by burning straw and coconut shells, which was also categorized as electricity production from renewable sources. Yet another reason could be the storage of green certificates and postponing the submission of these certificates for redemption (Mikołajewicz-Woźniak, 2013, p. 102) or choosing a substitute fee despite overproduction of green certificates on the market which was popular among vast energy holdings in Poland.

The process oversupply s green certificates have been described in the literature (scarcely), among others, by Mikołajewicz-Wozniak (2013), Adamczyk-Graczyk (2020), or Wędzik et al. (2017). The authors have focused on the causes of oversupply, the estimation of its scale, and only mention how devastating it was for the wind farms sector. This paper intends to fill this research gap and analyze the financial situation of the wind industry in Poland.

In contrast and for comparison, we related the financial situation of Polish wind farms with the condition of wind farms in the United Kingdom. The United Kingdom, like Poland (as well as Romania and Italy among others) also used the system of certificates of origin (until 2017), although this is not the only scheme of financial support for wind farms in this country (also Poland after 2014 introduced the auction system and started slowly departing from the certificates of origin system). In both countries, however, certificates continue to operate because the wind farms covered by this system are still operational. However, while there was no disturbance in their market in Great Britain, in Poland this system collapsed at some point. Unlike Poland, Romania, or Italy, wind farms in the United Kingdom as a sector throughout the period analyzed in the article remained profitable.

State of the Art

The development of installations generating electricity from renewable sources is an essential element of the European Union's sustainable development policy. According to the Directive EU 2009/28 / EC (Directive 2009/28 / EC "Of The European Parliament And Of The Council of 23 April 2009 on the promotion of the use of energy from renewable sources", by 2020 the European Union has to achieve the share of renewable energy in final energy consumption of at least 20%. This goal applies to the entire European Union, while each member country has a described goal set at a different level because different countries have different possibilities in this respect. For example, for Poland, the target is 15%, and for Sweden, 49%.

Looking at the Eurostat data presented in Table 1 (the last available data refer to 2018), one can see that already in 2018 the goal was achieved by 12 countries, and four states were very close to their goals (the distance from the target did not exceed one percentage point).

Looking at Table 1, it would seem that due to such specific goals to be achieved in 2020, each country will try to favor green energy producers to stimulate private sector investment in this area and achieve the goal imposed by the EU Directive 2009 / 28 / EC. In fact, in some countries, after the first period of active support for green energy producers, they began to move away from it and reduce it. This was due to various reasons - high costs of this support, increased technology efficiency (which reduced the cost of generating energy), and sometimes the desire to change the structure of the market (e.g., supporting small energy producers instead of large holdings). Examples of regulations hindering the operation of wind farms were, for instance (Blau and Hubik, 2019; Gonzales and Lacal-Arantegiu, 2015): the Distance Act in Poland, which requires maintaining considerable distances between wind turbines and residential houses, suspension of government assistance for large farms wind Cyprus and Portugal, suspension of existing aid schemes for the promotion of new energy installations in Spain, the abolition of Feed-inn- Tariff in the Czech Republic, the introduction of special taxes for new and existing wind installations by Wallonia, limiting the maximum power generated by a single wind farm in Bulgaria (maximum power generation), imposing a levy on the gross income on all operating RES (Renewable Energy Systems) projects in Greece, finally slashing mandatory quotas for green certificates in Romania.

One of the countries in which the crisis of financial assistance for wind farms was evident seems to be Poland. This effect was not intended; nevertheless, in 2017, about 70% of wind farms in Poland ended the year with financial losses. It resulted from very low prices of green certificates on the stock exchange. As can be seen in Table 2, in 2017 prices of certificates of origin fell in Poland from PLN 265 in 2009 to PLN 37 in 2017 (a decrease of 86%). For comparison, prices in the UK increased from PLN 173 (for comparability, prices expressed initially in British pounds were converted to Polish zlotys) to PLN 221 in 2017 (an increase of 28%, despite the weakening of the British pound to the Polish zloty).

Table 2: Average prices of green certificates in years 2009 – 2020 in Poland and the UK (for comparison)

The reason for the certificates' prices drop in Poland was a large oversupply of green certificates on the market which began in 2012 (oversupply began to decrease in 2019, but it persisted until the time of writing this publication), and this, in turn, resulted from the opening of many new wind farms, co-firing of imported biomass (on, for example, coconut shells, compare in Table 3 the "co-firing " line), the small number of redeemed certificates and the lack of expiration date of these certificates (they could be kept in the portfolio indefinitely). Another reason (Adamczyk, Graczyk, 2020) was the inclusion in the system of large hydropower plants with a capacity of more than 10 MW in the green certificates system, which generated 2/3 of all certificates. As can be seen in Table 3, all this led to a sharp increase in the number of certificates on the market and a persistent high oversupply since 2009. For comparison, in the UK, the certificate system covered only new hydroelectric plants and existing power plants with a capacity below 20 MW. As Table 4 shows, there was never a large surplus of certificates in Great Britain, although in 2014 it also occurred. However, it began to decline from the next year and did not cause a drop in certificate prices on the market.

The Polish government, when realized the situation, took measures to resolve the crisis, but it was not easy. In 2015 the government passed the Act of Renewable Energy Sources (RES), which drastically reduced financial support for plants that were using co-firing; by virtually withdrawing them from the system. Another group removed from the system were large hydro-plants. In 2015, the already quoted Act of Renewable Energy Sources introduced the auction system, and this new auction system covered all new RES producers. The system of green certificates was ended, and it only was maintained for the producers that were already participants of this system. The amendment to the RES Act introduced on January 1, 2016, presented additional blue certificates to support agricultural biogas plants, which were then excluded from the system of green certificates.

In October 2018, special auctions were launched, under which existing installations could switch from the green certificate system to the auction system. However, the auctions did not include wind farms or solar farms. In 2018, another amendment to the RES Act introduced further assistance instruments for selected installations: feed-in- tariffs and feed-in- premiums (Adamczyk, Graczyk, 2020, p. 6585). Also, the Energy Regulatory Office (pl. URE – Urząd Regulacji Energetyki) began inspections and investigations to determine why energy suppliers did not redeem their certificates, which could be regarded as attempts to manipulate the market. The URE reports contain huge fines imposed for failure to comply with the obligation to redeem certificates or to pay a replacement fee (the URE sets its level).

Another measure aimed at reducing the oversupply of green certificates was the amendment of the RES act introduced in 2018. The amendment contains a provision that significantly limits the use of the substitution fee (payment instead of submission of green certificates). The Act states that if the price of certificates from the previous year is lower than this year's fee calculated as 125% of last year's price, one cannot use a substitute fee. To enable substitute fees, the prices of green certificates would have to be very high. In practice, under this new regulation, no substitution fee could have been paid for the level of certificate prices in 2012-2020.

Besides, the government increased the obligatory share of green energy in the final electricity consumption. In the following years, this share is raised, which also helped to reduce the oversupply of certificates (Table 5).

Summing up, as one can see, the government went to many lengths to solve the oversupply of green certificates problem. Many changes made in Poland were similar to British solutions: exclusion of large hydroelectric plants from the system, arrangements to reduce co-firing, and finally abandoning the system of certificates. The problem persisted, however, for many years and had a significant and negative impact on the financial situation of wind farms in Poland.

Description of the Research Method

The purpose of the publication was to analyze the financial situation of the Polish wind farm sector during the described oversupply of the RES certificates period in Poland. For this purpose, we calculated the median ratios of liquidity (current ratio and quick ratio), profitability (return on equity and return on capital employed), debt (solvency ratio calculated as equity divided by total assets), interest coverage, and days in payables. As a benchmark, we compared the Polish median sector results with the British counterpart.

The data used for the calculations came from the van der Vijk Orbis database, the Polish Power Exchange (PGE), reports from the Energy Regulatory Office (Polish Energy Office), Ofgem, and Renewable Energy Foundation reports and datasets. (Since many wind farms belonged to the same owner, and they only prepared one financial statement for the entire company, we could not analyze only the wind farms which participated in the green certificates system, we had to analyze the whole sector). We obtained financial statements for 287 wind farms in Poland and 549 wind farms in the United Kingdom. Tables 6 and 7 show the results of calculations for (respectively) Poland and the United Kingdom.

Table 6 presents the medians of the most popular financial indicators for Polish wind farms, focusing on those indicators that should show the deterioration of wind farms' financial situation. In Table 7, one can see the benchmark values calculated for the wind farms in the United Kingdom. The results presented in Table 6 and Table 7 are also shown in Figures 1 - 7. The data shows that the most massive cumulative oversupply of green certificates in Poland was recorded in 2015 - 2016, but a very high level also remained in the years 2017 and 2018. The lowest prices of certificates took place in 2017, which can be interpreted as a delayed market reaction to this oversupply.

Therefore, one could expect that the lowest values of financial ratios for wind farms in Poland should also take place in 2017 (in the year 2017, around 70% of wind farms in Poland ended the year with a financial loss; for comparison, whereas only 17% of farms in the UK sustained financial losses). In reality, the lowest level of liquidity ratios was observed in 2014, and they remained at a very low level until 2016 (Fig 1 and Fig 2). From 2015 Poland introduced the auction system (and ended the green certificates system), and probably it was the new wind farms operating in the auction system that improved the financial liquidity of the entire sector in 2017 (and bankruptcies of less efficient old-technology wind farms). So contrary to expectations, liquidity ratios for wind farm sector were the lowest not in 2017, but in 2014 (when the oversupply only began to accumulate, and the prices of energy with green certificates only dropped from 462.51 PLN/MWh in 2009 to 346.54 PLN/MWh in 2014, that is, by 25% - until 2017 the total price drop was 55% compared with the year 2009). It seems that the 25% income drop between 2009 and 2014 was sufficient to reduce the sector's liquidity and cause many bankruptcies. In our sample of 287 wind farms, 92 of them were in the state of liquidation. So 32% of the analyzed sample was constituted of wind farms that went bankrupt during the analyzed period. At the same time, British farms maintained an adequate level of financial liquidity, which began to deteriorate only in 2017 and 2018, i.e., before Brexit.

As for the profitability ratios of wind farms in Poland, they remained negative throughout the entire period until the end of the green certificate system and implementation of the auction system (in 2015). There is no deterioration correlated with the decrease in green certificates prices. It should be remembered, however, that 32% of the analyzed winds farms went bankrupt at the time of low green certificates prices, and the configuration of entities constituting the sector changed. As for British wind farms, the lowest median of profitability ratios can be observed for 2012 and 2014, when the market also had the lowest total energy prices (the wholesale price of electricity together with revenues from the sale of renewable obligations). Low energy prices continued in the United Kingdom, also in 2015, but the profitability of wind farms has already improved this year. This could be due to the launch of the auction system in 2015. What is clearly seen in Fig. 3 and Fig, 4 is that the introduction of the equity system in both countries - both Poland and the United Kingdom has improved the profitability of the wind farm sector.

Fig. 1: The median current liquidity ratio for wind farms in Poland and the UK, years 2010 – 2018

Fig. 2: The median quick liquidity ratio for wind farms in Poland and the UK, years 2010 – 2018

Fig. 3: The median return on capital employed for wind farms in Poland and the UK, 2010 – 2018 [%]

Fig. 4: The median return on equity for wind farms in Poland and the UK, years 2010 – 2018 [%]

Debt ratios for wind farms in Poland (interest coverage and solvency ratio depicted in Fig 5 and Fig 6) were the lowest in 2012 - 2013, after which they improved. The median of interest coverage ratio for farms in Poland was, however, negative throughout the entire analyzed period, while for British farms, it was all the time positive. The coverage ratio was the lowest in the years 2010 – 2014 and improved after 2014 when Poland left the certificates of origins system and implemented the auction system. In contrast, apart from 2013, the median solvency ratio for wind farms in Poland was higher compared to wind farms operating in Great Britain, which indicates higher overall wind farm debt in the UK.

The worst level of debt ratios in Poland dates to the period of oversupply formation on the certificates market (compare Fig 6), not to the time when the oversupply reached its maximum, probably due to bankruptcies of many farms, the opening of new farms and the transition in 2015 to the auction system. Regarding farms in Great Britain, debt ratios remained relatively constant throughout the entire analyzed period.

Fig. 5: The median interest cover for wind farms in Poland and the UK, years 2010 – 2018

Fig. 6: The median solvency ratio (equity/total assets) for wind farms in Poland and the UK, years 2010 – 2018 [%]

Due to the unusually high median of days in payables ratio for Poland in 2009 (the median of days in payables ratio was then 365 days), it is easier to analyze the values contained in Table 6 and Table 7 to observe its changes, not the Fig. 7. As can be seen in Table 6 and Fig. 7, the days in the payables ratio for Polish farms except for the year 2009 fluctuated in the range of 10 - 40 days, and for British farms, it was in a range from 2 to 7 days.

Fig. 7: The median days in payables ratio for wind farms in Poland and the UK, years 2010 – 2018
[days]

Fig. 8: Difference between green certificates creation and cancellations in Poland and the UK, years 2010 – 2018 [TWh]

The last three charts, i.e., Fig 8, Fig 9 and Fig 10 show (respectively) the difference between the number of generated and redeemed certificates of origin, average certificate prices and the number of certificates generated by co-firing. Fig 8 confirms the significant oversupply of certificates in Poland compared to the United Kingdom, and Fig 9 shows a sharp decline in their prices in Poland in 2012-2017. In 2009 and 2010, certificate prices were more than 1/3 higher than in Great Britain, in the years 2011 – 2014 they leveled out between countries, and then fell to around 16% of the UK price level in 2017 and about 40-50% in 2015 and 2018. Figures 8, 9, and 10 constitute a graphic illustration of the problem, which was discussed in the theoretical part (and in Table 2, Table 3, and Table 4), which is the collapse of certificate prices in Poland. Fig 10 shows the level of co-firing, as it was one of the reasons for this situation.

Fig. 9: Average annual prices of green certificates in Poland and the UK, years 2010 – 2018 [PLN]

Fig. 10: Amount of MWh accepted for the green certificates generated with co-firing in Poland and the UK, in years 2010 – 2018 [TWh]

Conclusions and Recommendations

Analysis of the data presented in the article shows inconsistency in the picture of the financial situation of wind farms as an entire sector. This is undoubtedly primarily due to the bankruptcies of a large part of these entities (in terms of reports that were available in the Orbis database).

The analysis of the financial situation of wind farms showed that, in fact, the liquidity ratios of farms in Poland indeed deteriorated during the oversupply of certificates, but more at the beginning of the oversupply period than during the highest level. The apparent improvement in the sector's liquidity resulted from the wave of the bankruptcy of many units; in the analyzed population, it was 32% of the wind farms (in Poland). Financial liquidity could also be improved recently by the entry of new generation wind turbines, which allow electricity to be produced more cheaply than coal-fired power plants.

As for profitability ratios, they were negative throughout the entire period of functioning of the green certificate system in Poland, and their improvement occurred (median for the sector) since 2015, i.e., since the departure from the certificate of origin system in favor of the auction system. The profitability of wind farms in Poland, however, throughout the entire study period much lower than British farms, which could be due to differences in wind conditions between countries, but also to higher energy sales prices (including subsidies).

In the case of the interest coverage ratio, as in the case of profitability ratios, the change between the period 2009-2014 and the period 2015-2018 is more visible, i.e., the transition between the period of functioning of the certificates of origin system and the period of operation of the joint-stock system. This indicator has significantly improved for wind farms in Poland after the implementation of the auction system. This behavior of the interest coverage ratio is due to its design - it has an operating result in the numerator. Therefore, this indicator had to at least partly behave like profitability indicators. The solvency ratio based on the relationship of assets, equity, and liabilities does not depend directly on the financial result in a given year, but on the financial results for the last few years. This indicator also reached its lowest level in 2012-2013, i.e., during the beginnings of the oversupply process in Poland.

The days in payables ratio showed no response to the oversupply of certificates and fluctuated between 10 and 40 days or to a change in the support system for renewable energy producers.

The presented indicators confirm the financial problems of the wind energy sector in Poland and that these problems at least partially were caused by the oversupply of the certificates of origin. Research results also suggest that the situation is slowly improving (in 2020). Wind farms established in the years 2006 - 2012 assumed in their business plans the level of green certificate prices around PLN 200-250 (Wyrobek et al., 2018, Wędzik et al., 2007, Mielcarek 2014, Suska- Szczerbicka, Weiss, 2013), so for many of these farms, the prices of the certificates are still insufficient. However, they are still better off financially than in the worst years 2015-2017.

The current situation in the market still poses the risk of further bankruptcies, which may cause consolidation of the sector and push out of small producers with low capital resources. Recent legal changes (in 2019) favor the development of small installations, but the strongest market players buy many older farms. Support for small installations concerns mostly new windmills, not already existing plants.
To sum up, our analysis shows that, indeed, Polish wind farms had significant financial problems in recent years, and the proper legal adjustments and government support were delayed in time by three years. The oversupply appeared in 2012, and the reaction of appropriate bodies occurred in 2015. The numerical analysis also shows that at least partially, this problem was caused by large hydropower plants and co-firing of straw and coconut shells in traditional hard-coal power plants. They produced so many green certificates that their prices dropped by almost 90% compared to earlier years. These problems did not occur in the United Kingdom, where the financial situation of the wind farm sector was much more stable and predictable.

The Role of Language Policy of State in Crisis Management: A Case Study on The Example of Access to Information and Public Services in Polish Sign Language During Epidemic of SARS-Cov-2

Karolina KULIŃSKA

Uniwersytet Wrocławski, Wrocław, Poland
karolina.kulinska2@uwr.edu.pl

Abstract

The paper analyses the impact of sign language legislation and its implementation and the public safety on the example of the Republic of Poland during the epidemic of SARS-CoV-2. The first part (I) of the paper describes a legal framework of the language right during epidemic in Poland. Is it is divided into three sub-sections on the basis of the main subject matter of the analyzed regulations: (1) Constitutional emergency measures – state of natural disaster, (2) A state of epidemic emergency, (3) Sign language legislation in the Republic of Poland. Legal analysis is followed by a case study regarding implementation of the language rights of Polish Sign language users during the state of epidemic emergency. The final section titled: "Beyond discrimination: critical assessment of legal compliance with policy measures in the context of public safety" includes an evaluation of the national legal instruments and its implementation by state authorities in Poland. The third part is followed by conclusions, where critical areas for further research are designated.

Keywords: language rights, language policy, deaf persons rights, sign language

Introduction

Sign languages are natural languages of deaf people, equivalent in terms of complexity, grammar and semantics with spoken (oral) languages. This fact well established in language and social sciences does not – yet - translate into universal recognition of status of national sign languages by states worldwide. Thus, national legislators are challenged to include their citizens with hearing losses which impair communication via official spoken languages by a variety of legal means in order to comply with international standards and prevent discrimination in access to areas of life such as education, work, health care or public administration.

The paper argues, that inclusion of sign language into states' language policy has a far-reaching consequence relevant for public safety and protection of basic human rights. The relation between sign language legislation and its implementation and the increased danger to public safety is demonstrated on the example of the Republic of Poland during the epidemic of SARS-CoV-2. The limitation of proposed research problem to one country is justified due to the abovementioned lack of international or even local (i.e. European) model or a standard of regulation of the matters related to the protection of language rights of Sign language speakers. However, a thorough analysis of the legislation of this matter in Poland in the perspective of national emergency laws confronted with its implementation shall serve as a reference framework and basis for further research, especially comparative legal analysis.

The first part (I) of the paper describes a legal framework of the language right during epidemic in Poland. Is it is divided into three sub-sections on the basis of the main subject matter of the analyzed regulations: (1) Constitutional emergency measures – state of natural disaster, (2) A state of epidemic emergency, (3) Sign language legislation in the Republic of Poland. Legal analysis is followed by a case study regarding implementation of the language rights of Polish Sign language users during the state of epidemic emergency. The final section titled: "Beyond discrimination: critical assessment of

legal compliance with policy measures in the context of public safety" includes an evaluation of the national legal instruments and its implementation by state authorities in Poland. The third part is followed by conclusions, where critical areas for further research are designated.

Legal Framework

Constitutional Extraordinary Measures – State of Natural Disaster

The Constitution of the Republic of Poland of April 2, 1997 provides for three categories of emergency states: state of emergency, martial law and state of natural disaster. In the current public debate among lawyers there is agreement that the SARS-CoV-2 epidemic meets the constitutional prerequisites for a declaration of the latter one - a state natural disaster, therefore only this category of emergency measures will be discussed in greater detail. It should be emphasized that at the time of submission of this paper, the state of natural disaster was not declared by polish government, and instead extra-constitutional measures were adopted. The analysis of provisions regulating this issue is, however, necessary to show the difference of scope of protection of language rights depending on the chosen mode of governmental crisis regulation for preventing an epidemic. Moreover, it cannot be excluded that a state of natural disaster could be introduced in the future.

According to the art. 232 of the Constitution: *In order to prevent or remove the consequences of a natural catastrophe or a technological accident exhibiting characteristics of a natural disaster, the Council of Ministers may introduce, for a definite period no longer than 30 days, a state of natural disaster in a part of or upon the whole territory of the State*. The prerequisites for introducing the state of natural disaster correspond to the criterion of "exceptional public danger which threatens the life of a nation" known from international human rights pacts.25 In the course of work on the International Covenant on Civil and Political Rights, it was agreed that this clause also includes natural disasters. It was noted, however, that a natural disaster can justify a derogation of human rights only if in a given area it is a "rare and extraordinary" phenomenon, and that "*force majeure* can be an excuse for restricting some human rights, but not for their derogation ".

Article 232 of the Constitution applies to the damages caused by forces of nature itself (natural disaster) and damages caused by devices created by man and using forces of nature (technical failure). In the second case, however, it is not about every technical failure, even if it bears the mark of a "special risk" that cannot be removed by ordinary constitutional measures, but a failure bearing the signs of a natural disaster. The mode of introduction and removal of the state of natural disaster, as well as the principles of operation public authorities and the scope of restrictions on the freedom and human and citizen rights during a natural disaster were specified in the Act of 15 September 2017 on the state of natural disaster.

According to art. 3 clause 1 point 3 of the Act on the state of natural disaster, the term "technical failure" should be understood as "sudden, unforeseen damage or destruction of a building, technical device or system of technical devices causing a break in their use or loss of their properties". According to art. 3 clause 2 of the Act on the state of natural disaster, "a natural disaster or technical failure may also be an event caused by a terrorist activity". Both, natural disaster and technical failure must bear the characteristics of "natural disaster". In the light of art. 3 clause 1 point 1 of the Act, a natural disaster should be understood as "a natural disaster or technical failure, the effects of which threaten the life or health of a large number of people, property of large sizes or the environment in large areas, and assistance and protection can only be effectively taken using extraordinary measures, in cooperation with various organs and institutions as well as specialized services and formations operating under uniform management". In summary, a state of natural disaster is limited to the situations causing a threat to human life and health, as well as property of large proportions, regardless of whether their relationship to the disruption of the national economy can be ascertained.

From the perspective of the research goal, the key issue in this context is the scope of permissible limitation of human and citizens' liberties and rights, including language rights, during a state of natural disaster. This problem is primarily regulated in art. 233 of the Constitution. Due to its unfortunate structure, it is quoted below in its entirety:

Article 233

1. *The statute specifying the scope of limitation of the freedoms and rights of persons and citizens in times of martial law and states of emergency shall not limit the freedoms and rights specified in Article 30 (the dignity of the person), Article 34 and Article 36 (citizenship), Article 38 (protection of life), Article 39, Article 40 and Article 41, para.4 (humane treatment), Article 42 (ascription of criminal responsibility), Article 45 (access to a court), Article 47 (personal rights), Article 53 (conscience and religion), Article 63 (petitions), as well as Article 48 and Article 72 (family and children).*
2. *Limitation of the freedoms and rights of persons and citizens only by reason of race, gender, language, faith or lack of it, social origin, ancestry or property shall be prohibited.*
3. *The statute specifying the scope of limitations of the freedoms and rights of persons and citizens during states of natural disasters may limit the freedoms and rights specified in Article 22 (freedom of economic activity), Article 41, paras. 1, 3 and 5 (personal freedom), Article 50 (inviolability of the home), Article 52, para. 1 (freedom of movement and sojourn on the territory of the Republic of Poland), Article 59, para. 3 (the right to strike), Article 64 (the right of ownership), Article 65, para. 1 (freedom to work), Article 66, para. 1 (the right to safe and hygienic conditions of work) as well as Article 66, para. 2 (the right to rest).*

The Constitution of the Republic of Poland in this respect is fully consistent with the standards of international protection of human rights. The article consists of three parts. A negative clause was adopted for martial law and the state of emergency, and a positive clause for the state of natural disaster. According to the adopted solution, art. 233 par 1 regulates - in a negative form - the scope of restrictions on human and citizen freedoms and rights during martial law and the state of emergency. Article 233 par 3 regulates - in a positive form - the scope of restrictions on human and citizen freedom and rights during a state of natural disaster.

Based on Article. 233 par 3 of the Constitution, the Act determining the scope of restrictions on the freedoms and rights of man and citizen in a state of natural disaster may limit the freedoms and rights specified in the Constitution. Following this delegation, restrictions are further specified in art. 21 par 1 of the Act on the state of natural disaster. The Act provides that restrictions on the freedom and human and citizen rights of all natural persons residing or temporarily staying in the area in which the state of emergency was declared, as well as - respectively - legal persons and organizational units without legal personality, having their registered office or conducting activity in the area subject to the state of emergency (Article 20 of the Act on the state of natural disaster). The restrictions indicated in it do not, however, relate to language rights or the right to information.

Article 233 (1) 2 of the Constitution states that it is unacceptable to limit the freedom and human rights of citizens of exclusions due to race, sex, language, religion or lack thereof, social origin, birth and property. Compared to international human rights pacts, the constitution does not contain a clause that requires no contradiction with other "obligations under international law." Putting this provision between the regulation of the state of martial law and the state of emergency and the regulation of the state of natural disaster is very unfortunate, as it could suggest that it refers to only to the state of martial law and the state of emergency. According to Prokop (2005), such a conclusion would obviously be wrong. Since it is difficult to assume that the legislator would allow for the restriction of human rights and freedoms and the citizen, and for the reasons indicated in this provision in the case of statutory regulations regarding the state of natural disaster ".

On the contrary, Safjan and Bosek (2016) argue, that the internal systematics of the provision indicates that the prohibition of discrimination provided for in para. 2 applies only to the restriction of freedoms and rights during martial law and the state of emergency, but does not apply to the restriction of freedoms and rights during a state of natural disaster. However even if such interpretation would be accepted, in such a case Article 32 of the Constitution containing general prohibition of discrimination in political, social and economic life would apply.

The last element requiring clarification is whether the scope of discrimination on grounds of language also includes Polish Sign Language. The Constitution uses the terms 'language' and 'official language'. In accordance with art. 27 of the Constitution: “Polish shall be the official language in the Republic of Poland. This provision shall not affect the rights of national minorities arising from ratified international agreements”. This implies the interpretation according to which “a language” is every structured system of communication, in other words every natural language. The fact that Polish Sign Language is a natural language was recognized by the legislator in the Act of 19 September 2011 on Sign Language and other means of communication.

Extraconstitutional Measures - State of Epidemic Emergency

Following the official declaration of epidemic in the Republic of Poland, national authorities decided to apply extra-constitutional measures on the basis of secondary legislation instead of declaring state of natural disaster.

Pursuant to the Act of 5 December 2008 on preventing and combating infections and infectious diseases of humans, the state of epidemic threat or the state of epidemic shall be declared - in the event that the epidemic threat or epidemic covers more than one voivodship – by way of a regulation by the Minister of Health in consultation with minister competent for public administration at the request of the Chief Sanitary Inspector.

The announcement of the state of epidemic emergency or state of epidemic allows the Council of Ministers to determine the affected area and several types of zones. They can be so-called zero zones - defined as areas where epidemic conditions have occurred, directly around the virus outbreak. They are subject to bans, orders and control measures. Authorities may prohibit infected or potentially infected persons from leaving the zone.

A buffer zone may be established around the zero zone. This is an area subject to such restrictions as a ban on the movement of people. The government may also specify other types of zones - e.g. threats, where the risk of an epidemic is likely; the affected area - one or more units of the territorial division of the country and the quarantine zones.

The state of epidemic allows to introduce a temporary restriction on the specific manner of movement and functioning of institutions or workplaces. Pursuant to the Act, it may be ordered to provide access to real estate, premises or areas and to provide vehicles for anti-epidemic activities.

The introduction of the state of epidemic threat and the state of epidemics also allows for the introduction of temporary restrictions on the supply of certain types of articles, the obligation to undergo medical examinations and the use of other preventive measures and treatments by infected and potentially infected persons, including mandatory quarantine and a ban on leaving the established area. In the absence of medicinal products, medical devices or other means necessary for the patient, the Minister of Health may recommend their release from the Material Reserves Agency, and the agency is required to replenish stocks as soon as possible.

Implementation of the described measures took place in two stages. Firstly, the state of epidemic emergency was announced on the basis of the Act of 2 March 2020 on specific solutions related to the prevention, prevention and eradication of COVID-19, other infectious diseases and crisis situations caused by them. The Act takes into account the need for deaf citizens to use sign language in art. 15o paragraph 1 point 1: “For reasons related to counteracting COVID-19, whenever in accordance with the Act of 12 March 2004 on social assistance, a family environmental interview or update is required, in particular with a person or family who have been quarantined in connection with suspected infection or contagious disease, determination of personal, family, income and property situation instead of conducting family environmental interview or updating it can be made on the basis of: 1) telephone conversation with a social worker, and in the case of people with disabilities due to hearing impairment using support measures communication referred to in art. 3 point 5 of the Act of 19 August 2011 on sign language and other means of communication (…)”.

Subsequently, on the basis of the Regulation of the Minister of Health of 20 March 2020, the state of the epidemic was declared. There are no separate provisions directly related to communication in Polish Sign Language, but the regulation provides for the use of technical means that allow the implementation of such solutions (video interpreter). Pursuant to § 8 point 1 of the Regulation: "During the period referred to in § 1, entities providing healthcare services via ICT systems or communication systems confirm the identity of the recipient referred to in art. 50 paragraph 2 point 1 of the Act of 27 August 2004 on healthcare services financed from public funds based on the data provided by this recipient through these systems, including by phone".

Sign language legislation in the Republic of Poland

The issue of access to information and public services in Polish Sign Language is defined by two acts: Act of 19 September 2011 on Sign Language and other means of communication and the Act of 19 July 2019 on ensuring accessibility for people with special needs.

National sign language in the Republic of Poland is the Polish Sign Language (PSL). There is also artificial Polish Sign-Language System (*Polski System Językowo-Migowy*) which could be defined and manual code for spoken language. Both were acknowledged in the Act of 19 September 2011 on Sign Language and other means of communication, along with Communication Systems of Deafblind Persons and means supporting communication (such as text messages or video interpreting). The Act defines PSL as natural language, however it does not include a general freedom of using it except for the circumstances provided therein, that is in contacts with public administration, state emergency health service, health care providers and Police, State Fire Service, municipal services and voluntary units operating in the area (referred to as "obliged entities"). Only spoken (oral) Polish language is recognized as official language of the Republic of Poland, and language of polish administration as provided in the Constitution and the Act of 7 October 1999 on Polish language, however, the latter states that Polish is a language of public entities unless otherwise provided.

The Act of 19 September 2011 on Sign Language and other means of communication entitles persons who permanently of temporarily experience difficulties in communicating to freely choose the form of communication when they interact with one of the entities listed above. In case of interpreting, entitled persons have a right to be assisted by the "assisting person", that is a person who is at least 16 years of age and was chosen by the entitled person to facilitate communication and assist in settling matters with obliged entities. Assisting persons must not prove their knowledge of Sign language or any other form of communication.

Alternatively, persons with hearing loss have a right to receive help of a chosen Sign language interpreter or guide-interpreter and the obliged entities shall ensure that such help can be obtained. The more detailed obligations are addressed solely to public administration bodies, including free access to interpreter. Even then, an entitled person must first obtain a certificate of disability and the statutory remuneration for the interpreter is relatively low. In other situations, including health care provision, persons who need a help of an interpreter can apply for funding to the National Fund for the Rehabilitation of the Disabled Persons.

In addition, the provisions contain an exemplary catalogue of means supporting communication, which should be understood as solutions or services enabling contact, in particular through: the use of electronic mail, sending text messages, including the use of SMS, MMS or instant messaging, audio-visual communication, including using instant messengers, sending faxes and websites meeting the accessibility standards for people with disabilities. De facto, the legislator therefore also provided for the fourth form of communication, i.e. communication in Polish in writing (e-mail, SMS, MMS) messengers). It is the remote forms of translation (video translator) that are most often used in practice in the implementation of statutory obligations, which was reflected in the Act of 19 July 2019 on ensuring accessibility for people with special needs.

The Act of 19 July 2019 aims to improve the accessibility of public entities to people with special needs in such a way that they can use public services in a more independent way. Addressees of this act include persons who, due to their external or internal characteristics, or due to the circumstances in which they are located, must take additional actions or apply additional measures to overcome barriers that prevent or hinder their participation in various spheres of life based on the principle of equality with other people.

As part of providing the indicated accessibility, the public entity is obliged to undertake actions aimed at (1) considering needs of those persons in the activities planned and conducted by the entity, (2) removing barriers as well as preventing their formation. In terms of digital availability, the public entities are required to comply the requirements set out in the Act of 4 April 2019 on the digital availability of websites and mobile applications of public entities.

In addition, in terms of information and communication availability, public entities are obliged to:

- provide services with the use of means supporting communication, referred to in art. 3 point 5 of the Act of 19 August 2011 on sign language and other means of communication (Journal of Laws of 2017, item 1824), or by using remote online access to the translator's service through websites and applications,
- installation of equipment or other technical means to support the hearing impaired, in particular induction loops, FM systems or devices based on other technologies whose purpose is to support hearing,
- providing on the website of a given entity information on the scope of its activities - in the form of an electronic file containing machine-readable text, recordings of content in Polish sign language and information in an easy-to-read text,
- ensure, at the request of a person with special needs, communication with a public entity in the form specified in that application.

Implementation of the language rights of Polish Sign language users during the state of epidemic emergency

On March 9, 2020, the National Health Fund introduced a separate helpline (chat) for people using sign language. In principle, this right solution was available from Monday to Friday from 8am to 4pm. For a long time, it was the only top-down initiative for deaf people. Due to the lack of access to official information related to the threat, the Polish Deaf Association intervened.

The Polish Association of the Deaf is the largest organization in Poland that associates the deaf, hard of hearing and deaf. Currently PDA has about 100,000 members. The Associations' activities include education, rehabilitation, and offering legal services and representing deaf, hearing-impaired and speech-impaired communities before authorities and other institutions and organizations. The Main Board of the PDA is a member of the World Federation of Deaf and European Union of the Deaf.

On March 11, 2020, PDA called for sign language information on coronavirus to be indicated, stating that "there must be no consent for the Deaf community, Polish citizens, to be deprived of access to information so important to their health." Then, the deaf community sent a petition to the Prime Minister and the Minister of Health stating: "The deaf community, who are full Polish citizens, does not agree to discrimination and disregarding access to information transmitted through the mass media on the most important topic currently is the threat of the new SARS-Cov-2 coronavirus causing COVID-19 disease. Press conferences on the safety and protection of human life, where important information related to counteracting the spread of coronavirus is transmitted, is conducted in a way inaccessible to our society, because it is not translated into sign language. We are part of society and, just like hearing people, we should be guaranteed equal access to media and information. In the current situation, we feel discriminated because the constitutional rights and those arising from the Act "On ensuring accessibility for people with special needs" are ignored by the Polish Government". Then, in a letter of 16 March 2020, PDA pointed to the lack of real access for deaf people to public healthcare

poinys, also arguing that the constant restriction of access to government news and press information causes constant fear in the deaf society".

Due to the continued lack of reaction, the Ombudsman in a letter of 20 March 2020 addressed the Prime Minister. Ombudsman noted in it that the adopted solutions are insufficient (not all information is translated) and that the translation did not meet the needs of the deaf (the windows in which the translation was displayed were too small). The Ombudsman also reminded that providing access to information for deaf people, not only in an emergency, is the responsibility of the Polish government also having its source in international law, i.e. the Convention on the Rights of Persons with Disabilities, drawn up in New York on December 13, 2006.

In response, Prime Minister's Office announced that it aims to ensure that all citizens, including persons with disabilities have equal access to information. Therefore, press conferences held in the office of the Prime Minister are currently translated into sign language, the interpreter is also provided by Polish Television. It was pointed out that work is underway to disseminate sign translations from other events in which members of the Council of Ministers take part. The law firm also said that the Ombudsman's speech was forwarded to all ministries with a request to consider the possibility of introducing changes proposed by the Ombudsman, aimed at increasing the availability of relevant information for people with disabilities.

Finally, PDA took over the implementation of comprehensive translation services for deaf people, creating a 24-hour helpline in PSL. The helpline was created thanks to the support of the Ministry of Funds and Regional Policy, a subsidy from the PGNiG Foundation of Ignacy Łukasiewicz and own resources of the Polish Deaf Association. The line operates around the clock, seven days a week.

The situation related to the translation of ministerial websites and conferences, however, still needs to be improved. The position of the Ombudsman and the Commission of Experts on Deaf People at the Ombudsman of April 9, 2020 reads: television stations and public authorities still do not apply translation standards in PJM, which means that the translator / translator and subtitles are not visible or very difficult to receive (they are obscured or the translator / translator is too small). Because of this, the deaf receive only fragmentary information. This is not conducive to understanding what is happening, does not allow to know and understand the decisions and actions taken by the authorities. This, in turn, affects the deepening state of confusion and additional frustration, intensifies the sense of danger and a much higher level of anxiety. This is even more dangerous because the deaf have much less opportunity than hearing the opportunity to use psychological support".

Further, it was recommended to adopt and widely use translation standards of PSL translation, developed by the University of Warsaw, as necessary to limit discrimination against deaf people in accessing information. The second key element is education among public institutions. The Ombudsman's office pointed out how big the problem can be when wearing deaf masks for deaf people in public space. Prevents deaf people from reading their lips, for whom this is an important way of understanding information provided in Polish. City guards and police officers must know different ways of communication between deaf people and allow them to choose the way of communication that is most convenient for them (in writing, through the application with the PJM translator or the application editing the audio message).

The situation shows, that the whole burden of protecting deaf people during an epidemic has been shifted to those concerned. Only non-governmental entities were able to provide efficient remote access to translators and had adequate competence to perform translations. Due to the prevailing restrictions, also contact with representatives of the Police and Guards will be possible only using the technical means offered by the non-governmental sector.

Beyond discrimination: critical assessment of legal compliance with policy measures in the context of public safety

The study showed that comprehensive regulating access to information and public services in Polish Sign Language is in force in Poland, and this issue is not overlooked when adopting emergency measures during an emergency. The legislative activities undertaken, however, do not translate into effective performance of the imposed obligations by state authorities and other entities obliged to comply with them. This applies in particular to ensuring adequate, competent human resources and technical facilities enabling the implementation of statutory solutions in an efficient and effective manner. For this reason, the organizational burden related to sign language communication is passed on to its users and the regulations remain an empty declaration.

According to the data reported by the Polish Ombudsman (2014) there are between 50,000-100,000 of PSL users and up to 100 PSL interpreters. EUD reports 50,000 PSL users and 200 PSL interpreters. The number of deafblind persons is a bit more certain approximately 2500 (Deafblind Assistance Association, 2016). Given the scale of the spread, Covid 19 is a huge risk group. In fact, preventing such a significant group of citizens from accessing health care drugstuffs and information on appropriate prevention, and providing such access with a significant delay in the presence of infected persons among them can be critical in the spread of the disease and at the same time constitutes a direct exposure to their lives. The above argues that policy towards sign language should be distinguished as a separate risk factor when analyzing crisis management on the national level.

Conclusions

In conclusion, it should be noted that the problems that have occurred in Poland are not isolated. European Union of Deaf, an NGO representing Deaf European Citizens rights in the European Union issued a following statement (2020): „In light of the outbreak of the coronavirus (COVID-19) the European Union of the Deaf (EUD) is deeply concerned by the lack of accessibility of information provided by the European Institutions when responding to the outbreak of COVID-19. The EU leaders must lead by example ensuring that the information about the COVID-19 outbreak and European Union's response to it is accessible to all of the citizens in the EU, including to the deaf EU citizens who are sign language users. EUD reminds that the EU is legally committed under the United Nations Convention on the Rights of Persons with Disabilities (UN CRPD) to ensure full access to information under UN CRPD Articles 9 and 21, especially during the times of emergencies as such. Therefore, EUD urges the European Commission and all relevant EU leaders to make their announcements available in International Sign. EUD sees this as a matter of high importance and requests the televised or streamed (whether live or pre-recorded) announcements related to the coronavirus outbreak to be interpreted in real time into International Sign with sign language interpreters being on screen and clearly visible the entire time of the broadcast, as the EU has a legal obligation to make its communications, announcements and information accessible to all". The presented area shall be a subject of further analysis in the comparative and supranational context.

Abstract

The article presents the results of a study of trends in traditional patterns of consumer behavior, attitudes and habits of consumers in the context of the COVID-19 pandemic. Based on the analysis of Internet resources and expert analytics, the authors identified sectors of the economy that were most affected by the pandemic, and revealed approaches to adjusting marketing tools caused by radical changes in consumer behavior patterns. Their implementation in practice will increase the effectiveness of marketing planning and, ultimately, accelerate the recovery of the domestic economy.

Keywords: Marketing, Marketing Tools, Marketing Response, Coronavirus, Coronavirus Crisis, Consumer Behavior Patterns.

Introduction

Crisis phenomena in the economy caused by the coronavirus pandemic have no analogues in practice. In addition, until now, most of the hypotheses related to possible development scenarios and the consequences of a pandemic are purely probabilistic in nature. As a result, the timing and way of overcoming the economic crisis remain unclear.

However, it is possible to highlight trends associated with changes in consumer behavior patterns, established consumer habits, which are likely to continue after COVID-19. Their analysis and use in the development of anti-crisis marketing strategies will increase the effectiveness of marketing planning and, ultimately, accelerate the recovery of the domestic economy. All this actualizes the problem of studying changes in consumer behavior in a pandemic.

Results and Discussion

The forecast of changes in consumer behavior in Russia can be formulated based on the experience of other countries. For example, at the height of the epidemic in China, consumer demand fell by 85–90%, and negative dynamics were observed even in the “Food Products” category, where the decline was 50–70% compared to last year. Similar situation was observed in European countries (Bashkatova A., 2020).

According to Sberbank of Russia, only in the first week of quarantine, the financial activity of Russian consumers decreased by more than 22%. The peak of the fall was in the service sector, where non-cash expenses fell by 58% compared to the same period last year. Demand for goods decreased by more than 11% (Chernyshova E., 2020). In the following weeks of self-isolation, the described trend continued and stabilized. According to the apt remark of Andrei Movchan, the coronavirus epidemic will bring the world changes comparable in scale to those caused by world wars (Uskov N., 2020).

Naturally, under quarantine conditions, there is a drop in consumer interest in the segments of "air travel", "tourism", "sports", "beauty industry", HORECA and "entertainment". At the same time, a similar trend is observed in the markets of clothes, shoes, furniture, home furnishings, household appliances, electronics and others, which experienced a sharp drop at the beginning of quarantine and continue to fall (Chernyshova E., 2020).

It should be noted that prolonged stress, in which the world's population lives due to a pandemic, is highly likely to lead to massive post-traumatic stress disorder for consumers. It is associated with a complex of factors:

- sharp drop in household incomes caused uncertainty and seriously hit demand, shaking consumer confidence;
- anti-epidemiological efforts by governments hit the supply, causing sharp changes in the markets for goods and services, structural unemployment and high labor market turbulence;
- forced self-isolation and prolonged anxiety for one's life and health of loved ones led to an increase in depressive disorders in society.

Thus, the emergency situation changed the social life of the society, as a result of which the priority was mainly for the lower needs of consumers - food, safety, self-preservation. Social psychologists believe that the longer a pandemic lasts, the more mental resources of a population will be depleted, and the more consumer-like "caution" will be expressed when it ends. According to Sandro Galea, a mental health expert at Boston University, with whom the authors agree, the large-scale consequences of the COVID-19 pandemic will be traced for many years (Naralenkova O., 2020).

In addition, in the course of self-isolation, social distancing of consumers will continue to intensify. Despite the fact that at present it is positioned as a temporary measure, the risk is great that after the end of COVID-19 social distance will remain in many ways, causing accelerated atomization of society, encapsulating consumers in their life problems and the further growth of virtual communities and identities. In this situation, the digital environment will survive even greater globalization, an indirect confirmation of which can be found in the fact that one of the few markets that survived during the period of self-isolation is not a fall, but growth, is the digital goods market (+17.4%) (Chepurenko A, 2020, Chernyshova E., 2020).

As a result, it is likely that after the pandemic, consumers will significantly change their behavior, showing increased caution in the consumption of goods and services. In turn, the markets, having experienced a coronavirus crisis, will face a recession and will recover for a long time, which will require systematic marketing efforts and new marketing tools. Let us analyze what market trends are currently being traced.

Firstly, according to the authors, one of the most significantly affected by the pandemic is the key sectors of the economy of impressions - show business, media, event and film industry, museums, offline services and entertainment (hairdressing, fitness, sports), etc. Secondly, serious damage was also inflicted on foreign trade, air and road transport. Finally, it should be noted that there are also sectors that have benefited from coronavirus: e-commerce, especially products and ready-made food;

online entertainment; production and sale of medicines; medicine, including remote; production and sale of food (Korischenko K., 2020).

The situation is complicated by the fact that it is precisely the branches of the economy of impressions that have so far had a significant impact on the life of the largest Russian cities. In connection with the pandemic, the considered industries will be forced, according to the authors, to modify the systems of marketing interaction with consumers. Opportunities for the development of marketing activity will be largely associated with going online, with the creation and digital promotion of their own virtual platforms (Chepurenko A., 2020).

One of the most severely affected sectors of the coronavirus crisis is tourism, whose services are at the top of the Maslow pyramid. The damage from quarantine measures in tourism is so great that, according to the authors, it is already important for the industry to make systematic efforts to restore the reputation of tour operators and comprehensive customer support.

First of all, tour operators need to implement and consistently implement a comprehensive anti-crisis PR-management program. Its goal should be to maintain customer confidence. It is important that the program solves the problem of explaining to consumers what steps the industry and the tour operator are taking to address the emergency and the steps of the client. At the outlet, the consumer must be convinced that everything possible is done to protect his interests. The consumer must clearly understand the terms and conditions for solving their problems.

At the same time, the practice of tour operators is not free from marketing mistakes. An analysis of the official websites of tour operators showed that anti-crisis information is insufficient and incomprehensible to consumers, which exacerbates an acute crisis of confidence. Experts believe that the restoration of the tourism market will be slow and phased due to the likelihood of several waves of the epidemic and a high level of consumer anxiety (Rykova A., 2020). The restoration of the tourism industry is possible, according to the authors, through the implementation of the following measures:

- gradual increase in business trips with the subsequent shift of emphasis on recreational and other types of tourism;
- adjustment of tour offers in terms of providing greater antiviral protection for tourists;
- implementation of comprehensive PR programs that reduce the level of consumer anxiety and aimed at informing them of the security measures taken.

Another trend is the spasmodic development of corporate and delivery services, previously unevenly represented in different segments of the consumer market. It can be argued that the delivery market for several weeks of self-isolation has grown more than for the previous year. According to the representative of the online hypermarket Ukonos Danny Perekalsky, “the need for online stores on some days increases from 200 to 400% of past performance… Utkonos today uses all its resources to meet customer demand… over the past two weeks we have increased the staff by 600 people… our growth is limited only by a small warehouse area” (Uskov N., 2020).

The efforts in the field of emergency organization of delivery services are undertaken by the restaurant business. However, the development of this area is associated, according to experts, with difficulties and limitations. So, the Russian consumer basically independently provides himself with products that he buys in stores. At the same time, consumer is inclined to limit secondary expenses, including those associated with ordering restaurant food, which creates restrictions in the development of delivery services (Sapozhnkov P., 2020).

In addition, if the restaurant has not previously been engaged in delivery, it will take time to begin this activity, to change the technological processes of production. It can be argued that the restaurant business needs to strengthen consumer loyalty, the formation of communities of loyal consumers based on their taste preferences, time and frequency of food consumption. As a result, the role of digital marketing is growing, the use of artificial intelligence and the Internet of things is being updated (Sapozhnkov P., 2020).

An interesting trend was the development of cross-distribution projects and after-sales interaction with consumers, which can significantly increase business opportunities. An example here is the delivery of books from the Chitay-gorod online store to retail stores of the Pyaterochka chain.

In general, according to experts, all online trading is experiencing explosive sales growth. If it was predicted before the pandemic that it would exceed the traditional one in 2036, now this can happen earlier. The outflow of the audience after the pandemic is possible, but the demand is likely to decrease only in comparison with the period of isolation. Online purchases are expected to be tested by people who have not used them before. They will transfer part of the purchases to the digital world. As a result, the percentage of people shopping online will increase (Babenko L., 2020, Parshin I., 2020).

So, the main marketing tools to neutralize the effects of coronavirus crisis are:

- development of technologies to engage consumers in interacting with the brand, focusing communication activity on key customers and projects, which may reduce overall sales, but significantly improve the quality of projects and client base;

- restyling of corporate values in terms of increasing meaningfulness, avoiding formalization, optimizing communications with clients and employees;

- digital transformation of business processes, partial or complete transition to remote, and, in the future, human-independent technologies for interacting with consumers. In this regard, it is worth mentioning, first of all, the sphere of education, healthcare, psychological assistance, after-sales services, etc.

The implementation of these measures will provide an adequate marketing response to the challenges of the coronavirus crisis.

Statistical Analysis of The Energy Poverty in the EU. Is the Geographic Location or The Time of Accession the Main Reason for Differences?

Abstract

Objectives: The paper aims at emphasizing the differences between the old and the new member states with respect to the range of energy poverty. An additional goal is to classify the countries according to the energy poverty levels. **Background:** Energy poverty is a distinct form of poverty and consists of difficulties in meeting the basic energy needs of household members. Despite growing awareness of its importance, there are still no widely accepted methods for measuring the extent of energy poverty and comparing between countries because of the diverse climate, housing base and relationship between income and energy costs. However, a common framework for measuring energy poverty is needed, and knowledge of the dynamics of energy poverty in the long term can be crucial for a wise and effective policy to tackle this phenomenon. **Results:** The EU Member States are not a homogenous group with respect to energy poverty but the differences between the countries are diminishing. We proved that the time of accession is no longer the main factor that differentiates Member States with respect to energy poverty levels. Nowadays the energy poverty level is rather determined by the geographic location of a country. **Policy Implications:** The results of our work can be used as a recommendation for measuring and tackling energy poverty at the EU and country levels. They can also be treated as a statistical evidence to support the use of certain measures within the social and housing policy areas.

Keywords: Energy Poverty, Indicators, Convergence, Ranking

JEL: C43, I39, R29

Introduction

Energy is a fundamental factor in ensuring sustainable socio-economic development and improving the living conditions of households. It creates comfortable conditions for work and rest thus making life more comfortable and safer. It is necessary for lighting the apartment, preparing meals, heating water, as well as heating the apartment in winter and cooling it in summer.

Some EU households have problems meeting their energy needs due to high energy costs, low income, energy-inefficient buildings or electrical appliances, leading to high energy bills. These households save energy, e.g. by limiting heating, lighting or the use of plugged-in appliances.

In 2018, more than 7 % of all households declared that they were unable to heat the apartment according to their needs. In the group of households at risk of poverty or social exclusion, this percentage rises to almost 18%, i.e. almost one in five poor Europeans has struggled with this problem. The worst situation is in Bulgaria, where 56% of the poor and one in four people who are not at risk of poverty cannot keep their homes warm. The lowest percentage of positive responses was in Finland (1.7% of all households and 3.1% of households at risk of poverty).

Every fifth (21.9%) poor European lives in a poorly insulated house (14% for all households). 6.6% of households in the whole of the EU were in arrears in paying their utility bills on time, and in the group of households at risk of poverty or social exclusion, this percentage was reaching 16%.

All these symptoms are manifestations of energy poverty. Energy poverty is a global problem that can relate to two types of social inequality - affecting different countries in different ways. In developing countries, the term has traditionally been used to describe situations where access to modern energy services is limited due to a lack of electricity grid in a given country/region, or the use of outdated energy generation technologies or inefficient fuels to supply homes with energy for cooking, heating or lighting (e.g. cooking on the burning fire). In Europe (and other developed countries), this term, also known as fuel poverty, refers to situations where households have to bear a disproportionately high proportion of their income to meet their energy needs, a cost they cannot afford (Maxim et al., 2016).

One of the effects of energy poverty, if not addressed properly, is the destruction of homes and buildings caused by low temperatures and humidity. The link between the condition of a building and human health cannot be neglected either. This relationship is known in the literature as Sick Building Syndrome and defined by the WHO: "Sick Building Syndrome (SBS) describes a medical condition where people in a building suffer from symptoms of illness or feel unwell for no apparent reason" (Fabbri, 2019).

In Sweden, multi-family residential buildings exposed to moisture were examined and a significant increase in symptoms consistent with SBS was found. Moreover, a relationship was established between building dampness and the levels of certain inflammatory markers. This means that humidity in a dwelling can lead to chronic systemic inflammation (Sahlberg, 2012).

The effects of energy poverty are mainly manifested in the range of adverse consequences for people's health, especially among children (Liddel and Morris 2010), the elderly (O'Sullivan, Howden-Chapman, and Fougere 2011) and the chronically ill (Snell, Bevan, and Thomson 2015). The persistent cold in the home and the resulting humidity can lead to respiratory (e.g. asthma, inflammation) and cardiovascular problems. Energy poverty not only affects physical health but also has a visible, negative impact on human mental health. Poor housing conditions may lead to isolation and social exclusion of an individual and, in the longer term, to depression (Libor and Bouzarovski 2018).

Another effect of energy poverty is the growing indebtedness of the household to the energy supplier. It is important to note that the necessity to pay high energy bills leads to a reduction in household income that could be spent on other needs: purchase of medicines, recreation, education and culture, etc., as well as on improving housing conditions. An important effect of energy poverty is also an increase in CO2 emissions, which leads to a deterioration in air quality and hinders policies directed at the fight against climate change (Hills, 2012).

There is a broad consensus that energy poverty in Europe is predicated upon high energy prices, low household incomes, inefficient buildings and appliances (Thomson, Bouzarovski, and Snell 2017). Energy poverty has two important aspects: financial (energy prices and household affordability on utility bills) and technical (energy efficiency of the building).

There are two main approaches to defining metrics for energy poverty in the literature. One of them is the expenditure-based approach and the other one is consensual-based. Expenditure-based metrics define energy poverty based on information on the household's energy expenditure and income. On the other hand, consensual-based indicators are metrics that identify those households that declare that they have difficulties in meeting basic energy services ('perceived deprivation') (Rademaekers et. al, 2016).

An example of the first type of metrics are indicators like 10% energy cost ratio (household has to spend more than 10% of their income on all household fuel use – an official threshold in Northern Ireland) (DSDNI, 2011) and LIHC (low-income high-cost indicator, calculated in the UK) (Hills 2012). Consensual-based approaches are derived from surveys and rely on subjective answers of respondents to issues related to energy poverty, such as their ability to keep home adequately warm or to pay their utility bills on time or regarding living in a dwelling with e.g. damp walls. At the European level, data from the European Survey on Income and Living Conditions (EU-SILC) is available, and for this reason many studies on energy poverty conducted in this geographic area are based on consensual indicators (Rademaekers et al., 2016; Thomson and Snell, 2013; Szamrej-Baran and Baran, 2014).

Most analyses of the phenomenon of energy poverty are based on microdata and they aim at identifying individual households as energy-poor or non-energy-poor. We aim to develop a methodology for assessing the phenomenon of energy poverty on a macro scale using aggregate data available in the Eurostat database. The objective is to determine whether a given country is moving in the right direction and reducing the extent of energy poverty. Various quick monitoring indicators are useful for this purpose. We propose a slight change in the approach from an arbitrary to a more statistics-based one.

Data and Methods

Energy poverty due to its complexity and multidimensionality is not easy to identify. An additional difficulty is the availability of statistical data, which should be consistent and comparable between countries. Such features are characteristic of the data from the Eurostat database, derived from the EU-SILC survey. Therefore, the variables selected for the following analysis come from this survey. The list of variables has been complemented by 2 variables from the ECHP (European Community Household Panel) and 4 variables from energy statistics.

The analysis of the range of energy poverty was conducted using multivariate statistical methods and a consensual approach. Statistical methods used include agglomerative clustering and multi-attribute methods of object assessment, such as the Hellwig's method described below (Hellwig, 1968). Such an approach is both flexible and efficient. It allows the researcher to include and exclude variables in a mostly objective way. The weakness of the method is the lack of comparability of the results between years, but it can be circumvented by scaling the data into a range observed throughout the whole surveyed period rather than scaling each year separately. The Authors' plan to make this amendment in their next paper.

The survey covered all 28 countries belonging to the European Union in the years 2005, 2010, 2015 and 2018. An initial list of 23 variables potentially characterizing energy poverty was further statistically analyzed and reduced to 11 variables, based on the correlation matrix. In the last step, another way of reducing the number of features was used. The remaining variables were divided into separate groups using the Ward method, and then the variables representing these group were selected arbitrarily. The results of the grouping are presented as a dendrogram (Fig. 1).

Fig. 1. Hierarchical clustering of a pre-selected group of 11 variables, 2018 data.

The final list of features contained 7 variables:

- 3 variables from the "Economic strain" area:
  - (ilc_mdes01_B_MD60) - inability to keep home adequately warm (households below 60% of median equalized income),
  - (ilc_mdes07_B_MD60) - arrears on utility bills (households below 60% of median equalized income),

- (ilc_mded04_B_MD60_BUR) - financial burden of the total housing cost (households below 60% of median equalized income).
- 2 variables from the "Housing conditions and material/housing deprivation" area:
  - (ilc_lvho07a_B_MD60) - housing cost overburden rate (households below 60% of median equalized income),
  - (ilc_mdho01_B_MD60) - total population living in a dwelling with a leaking roof, damp walls, floors or foundation, or rot in window frames or floor, (households below 60% of median equalized income).
- 1 variable from the "Final consumption" area:
  - (nama_10_co3_p3_CP045_PC_TOT) - share of electricity, gas and other fuels expenditure in final consumption expenditure of households (COICOP 3 digit).
- 1 variable from the "Energy statistics" area:
  - (HDD) - heating degree days by country in °C - annual data, (table: nrg_chdd_a).

Even merely measuring the range of energy poverty is not straightforward. In order to assess this range, one needs to measure and weigh several indicators and the lists of indicators used in the literature vary significantly. We have used the above-prepared list of variables to conduct the calculations.

To maintain comparability with other research, an approach proposed by Bouzarovski (2014) was used in part of our survey. Composite fuel poverty indicator (hereafter CFPI) is a measure aggregated from four variables coming from the EU-SILC survey. First, we add three variables describing the different aspects of energy poverty (housing cost burden – ilc_lvho07, arrears in bills payments – ilc_mdes07, and housing deprivation – ilc_mdho01) with equal weights of 1/3 and then add another variable to the outcome – the share of affirmative answers to the question if the respondent's home cannot be heated as needed – ilc_mdes01:

$$CFPI = \frac{1}{3} \cdot (ilc_lvho07 + ilc_mdes07 + ilc_mdho01) + ilc_mdes01. \quad (1)$$

This simple measure allows for a quick calculation and can be easily compared between various groups of countries and between years. However, this approach is based on an arbitrary choice of variables and weights and does not allow for the use of variables of a different nature (e.g. indicators of other aspects of energy poverty). This is the reason why we propose to use common multivariate statistical tools instead.

In the next step, the EU Member States were ranked according to the level of energy poverty, which was described using previously selected 7 variables. For this purpose, a version of a method for the linear ordering of elements (in our case the objects are the EU's Member States), based on an aggregate - a taxonomic (synthetic) measure of development (hereafter TMR), proposed by Hellwig (1968), was applied.

At the beginning of this procedure, each variable was normalized with a formula

$$z_{ij} = \frac{x_{ij} - \min_i x_{ij}}{\max_i x_{ij} - \min_i x_{ij}}, \quad (2)$$

Where

x_{ij_j} – j-th explanatory variable for i-th Member State, i = 1, ..., 28, j = 1, ..., 7
z_{ij} – j-th normalized value of xij.

As a result, the range interval was set to $\langle 0,1 \rangle$ for each variable (the normalized value was set to 0 for the minimum value of the explanatory variable and 1 for the maximum value of the explanatory

variable). Then for every entity Euclidean distance from an artificially constructed reference point is calculated as

$$d_i = \sqrt{\sum_j \left(z_{ij} - z_{0j}\right)^2}, \tag{3}$$

Where

d_i – Euclidean distance from *i*-th Member State to the reference object,

z_{ij} – normalized value of *j*-th variable for *i*-th Member State,

z_{0j} – value of *j*-th variable in the reference point, with the normalization (2) z_{0j} is by definition equal to 1, hence the whole formula (3) renders to

$$d_i = \sqrt{\sum_j \left(z_{ij} - 1\right)^2}. \tag{4}$$

In the end the TMR – a synthetic measure of energy poverty risk, an aggregate of all selected variables is calculated as

$$TMR = 1 - \frac{d_i}{\max_i d_i}, \tag{5}$$

Then the ranking of EU countries by level of energy poverty given by TMR was constructed. This procedure has been repeated for each of the years under examination, i.e. 2005, 2010, 2015 and 2018.

In the next step, the countries were divided into clusters according to a group of seven energy poverty indicators listed above in search of an intrinsic grouping present in the years 2005 and 2018. Then Kruskal-Wallis tests were performed along with Dunn tests to confirm the differences between the groups of countries obtained in the procedure as well as for the groups of countries based on membership duration and geographic location.

Research Results

The research was divided into three parts. In the first part of the survey, we calculated TMR for 2005, 2010, 2015, and 2018. Although the values of the measure cannot be directly compared between years, we can compare rankings based on them. Comparison of such four rankings is depicted in Fig. 2

Fig. 2: Change in the rankings based on TMR over the period 2005-2018

Three countries that gained many positions in the ranking are Poland (15 positions), Estonia (9 positions) and Czechia (8 positions, all marked with solid black lines in Fig. 2). The most notable declines in the ranking (marked with dashed lines) are those of Denmark, Spain, and Portugal. The fact that the 'new' Member States are gaining while at the same time the 'old' Member States are losing positions can be seen as an indication of convergence between the 'old' and the 'new' Member States which is described below in more detail.

Our study revealed that the overall level of energy poverty in the EU decreased over the period 2005-2018 and that convergence between the Member States can be observed. This was done using a different approach, described below.

The second part of the work was designed to be comparable with the results of other studies. We calculated the CFPI given by Bouzarovski (2014) for the 2005 and 2018 data jointly. After disaggregating the index into two dimensions – one containing the three variables in the brackets in (1), i.e. housing cost, arrears in bills payments, and housing deprivation, and the other being the inability to keep home warm. This allowed us to observe changes in the value of the measure as a move in two directions. Most of the countries converged to a lower level of the two energy poverty dimensions defined this way. Said convergence in the CFPI is depicted in Fig. 3. We observe significant

changes in the order of countries and the values of the indicator over the period under examination (Fig. 4, 5, and 6). The most notable changes are those of Poland, Bulgaria, or Lithuania. It is worth noting that 12 out of 13 'new' Member States improved their status (Fig. 6), and many of these changes are huge. The same is true for 7 out of 15 'old' Member States, but the changes are less significant. In Fig. 6 we can see that the largest change in value is for Poland, gaining 14 positions over the period (second worst in 2005, thirteenth in 2018). A big change in CFPI value for Bulgaria was too small to gain position in the ranking (ranked 28th in both 2005 and 2018), and a significant increase in Greek CFPI made the country fall from position 20 in 2005 to 27 in 2018. The average level of energy poverty measured for the whole EU has also decreased slightly (shown with the dashed arrow in Fig. 3).

Fig. 3 : Convergence in energy poverty (CFPI disaggregated) among EU Member States over the period 2005-2018 (selected countries shown)

Fig. 4: CFPI levels and CFPI-based ranking of EU Member States in 2005.

Fig. 5: CFPI levels and CFPI-based ranking of EU Member States in 2018.

Fig. 6: Change in CFPI value over the period 2005-2018

In the third and last part of the study, we wanted to confirm that the EU Member States are not a homogenous group according to energy poverty level and that there exist easy to spot groups of countries. First, we assumed that we would confirm differences between the 'old' and the 'new' Member States. We also wanted to find out if the countries could be divided into groups based on their geographic location. Beside those two points, we assumed that there may exist a natural grouping of countries, other than location-based or membership-durability-based. In order to confirm this assumption, we used hierarchical clustering outcomes. The clustering was provided using the 7 variables described in paragraph 2 as derived from 2005 and 2018 data. The Kruskal-Wallis test was used in all cases, supplemented by the Dunn test on occasions when multiple comparisons between groups were made (Y2005NAT3, Y2018NAT3, and GEO3).

Fig. 7: A dendrogram and a clustering of EU countries into three groups, 2005 data

Fig. 8: A dendrogram and a clustering of EU countries into three groups, 2018 data

Table 1: Partitions of the EU Member States used in the study

SE	1	3	3	1	1
SI	2	3	2	1	3
SK	2	3	3	1	1
UK	1	3	3	1	3

The partitions of countries into groups are shown in Table 1. The groupings designated as GEO2 and GEO3 require a comment. In the former case, a group of eight southern European countries was named (Bulgaria, Croatia, Cyprus, Greece, Italy, Malta, Portugal, and Spain); in the latter case, an additional

group of seven countries was distinguished, mainly from Western Europe (Belgium, France, Ireland, Luxembourg, the Netherlands, Slovenia, and the United Kingdom). Thus, GEO2 is a division into two groups (having 8 and 20 members), GEO3 is a division into three groups (8, 7, and 13 members each). The partitions Y2005NAT and Y2018NAT are the effects of agglomerative ('natural') clustering of 2005 and 2018 data, respectively, stopped at 3 groups (the variables were standardized, clustering was done using Ward method with Euclidean distance) – cf. Fig. 7 and Fig. 8.

Fig. 9: The 'old' and the 'new' Member States TMR values distribution in 2005 (left panel) and in 2018 (right panel)

As we can see in Fig. 9, the 'old' and the 'new' Member States differed significantly in 2005 according to TMR values (left panel) but the values converged before 2018 (right panel). In Table 2 we can find evidence that the values of TMR converged between the groups of 'old' and 'new' EU countries (χ^2 gets lower with time). The same is true for CFPI values, but the convergence was faster in that case. We can also see that, probably because it consists only of four variables, CFPI does better differentiate countries in geographic groups. Table 3 provides us with further results confirming the observation. CFPI differentiates the countries better than TMR also when there exist three groups of countries based on their location. The partitions obtained from the agglomerative procedure are natural, so we expected good differentiation here. The case of TMR not performing well in 2018 is supposedly again connected with the convergence of the EU Member States. It may also be a side effect of TMR inability to differentiate in specific circumstances. We plan to investigate it in our further works on the topic.

Conclusions

Our study proves that even relatively simple statistical methods can contribute to a more complete and accurate description of energy poverty. The use of multivariate statistics makes it possible to select criteria more objectively and to make use of different types of data, which is crucial for phenomena as complex as energy poverty.

The convergence of EU countries in terms of energy poverty has been shown to be taking place. The 'new' Member States are improving faster in this respect. At the same time, the overall level of the phenomenon is improving, i.e. the reach of energy poverty is decreasing, and this is evident in most countries over the period 2005-2018.

We have proven that the time of countries' accession to the EU was an important differentiating factor, but the convergence mentioned above has meant that in 2018 there is no strong evidence for this claim. The level of Member States in terms of energy poverty is now much more evenly distributed and the 'new' Member States are no longer different from the 'old' EU countries. On the other hand, we still observe differences between groups of countries resulting from geographically based division. Regarding the question stated in the title, we believe that the geographic location is the main reason for differences in the range of energy poverty. According to our results the time of accession is no longer a variable that differentiates the Member States in that respect.

The results of our study may be of interest to economic decision-makers in energy poverty prevention policies, both as a proposal for proven tools as well as schemes of using them in macro-level analysis.

Michal SIMON
Department of Industrial Engineering and Management, Faculty of Mechanical Engineering, University of West Bohemia, Pilsen, Czech Republic, simon@kpv.zcu.cz

Abstract

We are at the beginning of the fourth industrial revolution, which is already fundamentally influencing how goods are produced and distributed. Also, the rapid progress of the digitizing wave is exacerbated by the increasing availability of automated machines. Autonomous machines are no longer and may not be part of large companies, but today even smaller companies can afford them. Companies can start with a higher level of automation and show a significant advantage over the competition. How companies are prepared for the Industry 4.0 concept, and their current level can be assessed based on readiness models. Although this modern concept has a wide range, it focuses on the field of logistics, within the concept is extended the concept of Logistics 4.0 This article focuses on the field of internal logistics, which enter and apply the principles and technologies of the concept of Industry 4.0. Warehousing is selected from internal logistics. The introductory sections define terms such as Logistics 4.0, warehousing and individual modern elements that enter this area and aim to improve the current level and readiness of the company. In order to assess the current level and readiness, the maturity models are used, which are described in the next part of the article. The models are analysed, and based on their evaluation, a new model of readiness is created, conceived in the field of the warehouse. The primary purpose of this article is to design a model of readiness for warehousing and to characterize all levels. The highest levels will correspond to the principles of Industry 4.0.

Keywords: Internal Logistics, Logistics 4.0, Warehouse, Maturity Model, Readiness

Introduction – Internal logistics

According to Schulte (1994), logistics can be divided in several ways according to various criteria. One of the many divisions, according to the breadth of focus, is on the study of material flows, i.e. the division into macro logistics, micro logistics and the logistics company (metal logistics). Macro logistics deals with complete logistics chains beyond individual companies. Within our article, it is essential to define micro logistics (internal logistics). Micro logistics deals with logistics chains within one company, or only one part of it (specific plant, hall, and warehouse), so this logistics focuses only on logistics processes within the company.

Lambert et al. (2005) mention that the view of logistics can affect the way logistics activities are provided, but also the way employees are involved in logistics activities, their participation in projects aimed at ordering, purchasing, internal handling and transportation, forecasting and management inventory, distribution, planning and management of warehouse systems. This creates one of the possible

insights into the concept of logistics and the classification of logistics management in the company, which is based on a process view, so company logistics is divided.
According to Lambert et al. (2005) is in the form of four groups:

- supply logistics,
- production and internal logistics,
- distribution logistics,
- reverse logistics.

Production and internal logistics focus on the solution and optimization of material flows, the creation of handling systems, the use of space and working conditions during and other tasks related to the product.

Based on the publication of the author Heinrich (2011), it is possible to mention the main key areas of internal logistics, which are further divided into sub-parts. The primary operational functions of internal logistics are handling, warehousing, internal transport within the company (warehouse, production, etc.), picking and packaging.

Internal logistics is, therefore, the essential part of the factory's production processes and an integral part of the supply chain. Continuous supply of input lines to production lines and workplaces is one of the company's key processes. Internal logistics covers the planning, implementation, control and efficient flow and storage of materials, semi-finished and finished products in production processes and the production environment, and the term internal logistics will be used in this article

Storage and main functions

Warehousing is part of every logistics system. It is a crucial link between the manufacturer and the customer, and warehousing plays an essential role in the logistics system. If we define the areas of warehousing, the author Gross (1996) mentions in his publication that warehousing helps the company in improving the quality of services provided and thus achieve a better level of customer satisfaction and at the same time can reduce costs through warehousing. Cost savings can be achieved mainly by the concentration function of warehouses, the possibility of postponing final operations until the customer orders goods or by storing seasonal items, sending bulk orders. All this will allow us to use the warehouse capacity evenly. Warehousing, therefore, contributes to improving customer service by increasing and facilitating product availability.

Other authors such as Sixta and Mačát (2005) and Daněk and Plevný (2009) also recognize three essential storage functions in their books:

1) Product transfer
    - Receipt of goods
    - Storing goods
    - Completion of goods according to the order
    - Transhipment of goods
    - Dispatch of goods
2) Storage of products
    - Temporary storage
    - Time-limited storage
3) Information transfer
    - Stock status, information on stocking and removal of goods

Logistics in the concept of Industry 4.0

The main principles of Smart Logistics intersect in many respects with the principles of Industry 4.0. We are already focusing on the description of the Logistics 4.0 concept. However, we briefly characterize the Industry 4.0 concept, from which the technologies that are integrated into internal logistics are based. Terms such as Logistics 4.0, Smart Logistics are used according to the author Horenberg (2017).

According to Botlik and Botlíková (2020) Industry 4.0 and its implementations suggest changes in business paradigms and production models that will be reflected at all levels of production processes and supply chains, including all production process workers, managers, cyber system designers and end-users. The implementation strategy of the Industry 4.0 concept in corporate sectors means the introduction of independent automation, configuration, diagnostics and problem solving, as well as new knowledge and intelligent decision-making.

The author Mařík (2015) mentions in his publication that new networks will be created based on the interconnection of production equipment into cyber-physical systems - CPS. These systems are an essential element of the creation of intelligent factories, and they will be able to autonomously exchange information, trigger the necessary actions in response to current conditions and mutually independent inspections. Sensors, machines, components and IT systems will be interconnected and will interact and analyse data on an Internet basis. Emerging smart products will be identifiable and localizable. Vertical production processes will be horizontally interconnected within the company's systems, which will flexibly respond to individual customer requirements in real-time. The authors also define the essential characteristics of intelligent factories with the principles of the Industry 4.0 concept, some of which are appropriate and suggestive of how logistics could work within this concept. Mutually communicating robots, ancillary equipment, production equipment and products make autonomous decisions in real-time. Automated logistics equipment in all areas of internal logistics (handling, storage, packaging) uses autonomous logistics elements and robots and adapts to production needs.

Necessary technologies of Industry 4.0 include the CPS systems, Big Data, autonomous robots, sensors, cloud computing and data storage, as well as additive manufacturing, augmented reality. The entire scientific discipline of cybernetics and artificial intelligence forming thought and technology the core of the ongoing industrial revolution, according to a source National Industry Initiative 4.0 (2015).

According to Tomek and Vávrová (2017), digitization and robotization cannot be stopped. It does not only appear in large companies but also applies to small businesses. Small and medium-sized enterprises use new possibilities, new technologies and principles with an appropriate application

Logistics 4.0 - technology and applications

According to the authors Hofmann and Rüsch (2017), logistics represents a suitable area of application of the principles of Industry 4.0. The integration of Cyber-Physical Systems (CPS) and Internet of Things (IoT) systems into logistics promises to enable real-time monitoring of material flow, better manipulation of handling units and accurate risk management. Industry 4.0, in its pure form, can only become a reality in this area if logistics can provide production systems with the necessary input factors at the right time, in the right quality and the right place.

The authors Barret, Amaral and Pereira (2017) mention that, the term Logistics 4.0 is used to denote the combination of the use of logistics with innovation and the addition of CPS applications. Logistics 4.0 is a logistics system that can increase flexibility, adapt to market changes and approach the company's needs. This will improve the level of customer service, optimize production and reduce storage and production prices. The authors mention technologies and principles based on the research of the Industry

4.0 concept, which are then applied to logistics areas such as resource planning, warehouse management systems, traffic management systems, intelligent transport systems and information security.

Internet article by William (2019) describes, Logistics 4.0 enables process improvement through several technological innovations, including intelligent robotics, driverless transport vehicles and automated systems for handling parts inside warehouses and factories. The authors mention that everything is not just technology or digital applications, but a new way of managing the supply chain, where client processes and stakeholders are fully interconnected. The authors list some important technologies, such as industrial WLAN, RFID, RTLS (internal GPS) and DMC (Data Matrix Code) for precise positioning and free navigation (ANS +), automation automats PLS (Proximity Laser Scanner), AI modules, camera readers, control software.

Author Wang (2016) states that the development of IoT, IoS and Big Data will significantly reduce the work required for human intervention at every step of the supply chain. New technologies, such as the automatic guidance vehicle (AGV) and the storage robot, are replacing the process that people perform and make decisions. Internal logistics or the movement of goods within the factory are fully automated using autonomous forklifts, AGVs and robots with a routed program that is based on predictive logistics. All logistics activities will be based on information obtained from an internet platform used by all stakeholders. Logistics 4.0 needs support for the rapid development of many technologies, such as smart sensors, large-scale mining technology, computing, mobile Internet technology, and intelligent robots and AGV systems.

Logistics 4.0 is part of the Industry 4.0 concept and will support the development of this concept. There is no Industry 4.0 without Logistics 4.0. The technical aspects of Logistics 4.0 in specific areas are based on technological assumptions and principles from the comprehensive general concept of Industry 4.0. The sources for Logistics 4.0 mention the principles that will be a necessary part of logistics processes in a company that will apply the attributes of Industry 4.0, the areas of internal logistics are one of the critical areas of the company. In particular, the use and importance of the development of IoT, IoS, Big Data, CPS systems, intelligent robots, automatic identification of RFID, sensors and more are mentioned.

The Logistics 4.0 paradigm can, therefore, be summarized as optimizing incoming and outgoing logistics, which must be supported by intelligent systems built into software and databases, from which relevant information is provided and shared via the IoT to achieve a significant degree of automation.

Warehouse 4.0 – technology

More detailed, we can discuss the part of the Logistics 4.0., the Warehouse 4.0 section. A Smart Warehouse is defined by authors Liu, Cao and Yang (2018) an automated, unmanned, and paperless warehouse when conducting the operations of a pickup, delivery, and bookkeeping. Using intelligent management that's adopted and implemented correctly by supporting Industry 4.0 principles, together with hardware and software technologies results in changes in warehousing systems. This can be called Warehouse 4.0., and this can change some already adopted warehousing management systems in companies. Also, authors Juntao and Yinbo (2016) introduce the IoT technology with concrete applications within the warehouse operations like RFID technology, management and control technology, sensor technology. Adopting this technique requires simultaneous treatment of production and warehouse infrastructure, transport-warehouse technology and warehouse management systems. Warehousing 4.0 represents a brand-new area of storing and retrieving goods by using shuttle-based storage and retrieval systems rather than fixed-crane automated warehouses, and this is described by the author Lerher (2018).
The goal is to avoid wasting warehousing costs to a minimum. In some cases, we attempt to eliminate them. This can be thanks to possibility thanks to process orders from consumer's suppliers at the identical time. In keeping with the publication, according to Wang (2016), transforming warehouse management into Warehouse 4.0. Needs Industry 4.0. components implemented into technical logistics.

One of the core components of Warehouse 4.0. is automation. If the PC collects technology-based data, we will speak about developing automation. Within the context of Warehouse 4.0. the automation technology was applied within the form of bar-codes, smart-cards, tablets, RFID, real-time locating systems – to spot automatically and track the situation of products, smart scanning technology (smart sensing) – to detect the condition of products or environmental changes that occur around the item. AGV is integrated into the warehouse the net of thing, and this can be associated with warehouse/truck loading automation.

However, there are some limitations to using new technologies. In 2016, a report from Zebra Technologies (2016) stated that the retail, wholesale, transportation and logistics sectors are transitioning to "best-of-breed" warehouse management systems that take automatization to new heights – from equipping workers with mobile devices that increase speed and accuracy of order picking to the roll-out of RFID for real-time inventory visibility. However, the authors Vijayaraman and Osykseveral (2006) mention that concerns still exist, and scepticism remains (cost savings or a positive ROI).

They are using CPS when transforming from traditional Warehouses to Warehouse 4.0. is the best way, because they create a virtual copy of the real-world (workplace, component, industry processes). Thus we will know the status of every component in real-time even before the particular process running. CPS can combine virtual and physical worlds and communicate and interact through smart objects. This also means fewer errors, waste management and better end up in the shape of efficiency and accuracy. The CPS – based smart warehouse contains four main components: thousands of CPS devices working together (affixed through RFID or NFC tags, Wi-Fi, Bluetooth technologies, cameras). They need to have communication scheduled among them efficiently. Inventories which know their status and site context in keeping with the info reported by the attached devices. Robots who collaboratively accomplish repetitive and harmful to people tasks. Humans recognize their gestures or other activities to do operations (answerable for sending instructions to the warehouse and monitoring operation).

Readiness models of evaluation companies with a focus on Logistics 4.0

After studying several sources, we can generally define models for assessing the readiness of companies within the Industry 4.0 concept as a model, which can be used to identify and evaluate the current state of the company in various areas within the Industry 4.0 concept or seek to improve the state of preparedness for the future. The analysed areas (dimensions) are always defined. For some models, the dimensions are further extended to sub-dimensions. In addition to dimensions, the method of evaluation is also essential. Individual levels of maturity give the similarity in the method of evaluation in the given areas (dimensions). Degrees or levels have their names and their characteristics of requirements and properties for meeting a given degree within a given area (dimension).

Basic models of readiness

The critical concept behind most types of preparedness models is the Capability Maturity Model (CMM), the later developed Capability Maturity Model Integration (CMMI), and the word integrated means that the model integrates several standards. The model was created under the auspices of the Sofware Engineering Institute (2010).

CMM by Paulk et al. (1993) provides a framework for organizing evolutionary steps into five levels of maturity. These five levels of maturity define the ranking measure for measuring the maturity of an organization's software process and its ability to evaluate the software process. In CMM, these are the following levels of maturity:

1) Initial: Teams at this level do not perform defined processes or only partially.
2) Managed: Project management is established, and activities are planned.

3) Defined: Procedures are defined, documented and controlled.
4) Quantitatively Managed: Products and processes are quantitatively managed).
5) Optimizing: The team is continually optimizing its activities.

The current version of the CMMI model is very related to the SPICE (Software Process Improvement and Capability Determination) initiative. Based on SPICE, other models for process assessment were created, especially Automotive SPICE for the automotive industry. According to a book by Bruckner (2012), the SPICE model works with six levels of readiness, from level 0 and an incomplete process to level 5, where the process is optimized. The individual models are based on the same or very similar principles, which are based on the principle of CMMI models.

Readiness models evaluating internal logistics – warehousing

A total of 20 preparedness models were found, which evaluate companies within Industry 4.0 and their readiness for this concept. There are a large number of models. However, the scope of Industry 4.0 is extensive, and in this article, we focus on the evaluation of internal logistics, or warehousing. In terms of quality and relevance, a selection was made, and models were worked on that contain the potential for evaluating internal logistics. In the area of internal logistics, there is a solved area of warehousing. The models were not only academic but also models of practical associations or consulting companies. Characterized models of readiness are of different qualities and scope of processing, and some are very complex, some more concise forms. The individual models were analysed with the main characteristics and attributes.

These attributes include the origin of the source, the further analysed dimensions and areas where the dimensions are in the number from a minimum of 3 dimensions to 9 dimensions, in some models the dimensions are still divided into sub-dimensions. Furthermore, the potential of the logistics dimension is sought, if one of the areas of internal logistics is not directly in the model, we are looking for the perspective and potential of some of the activities of internal logistics within other dimensions. Another critical attribute is the method of assessing readiness - Evaluation has a very similar methodology to some models, and individual dimensions are evaluated, or their sub-sub-dimensions, which are evaluated according to specific criteria. Models with several levels, often from 4 to 6 levels, are used for the final evaluation, and these levels are characterized. The last attribute is the intent of the model, where the preparedness model can have a descriptive, comparative purpose with other companies, or prescriptive, where, in addition to evaluation, other necessary steps and instructions are provided to achieve higher levels of maturity.

The readiness models, which contain the potential for evaluating internal logistics, were analysed in detail, and the area of warehousing was sought. There were 6 of these models out of the total, the reasons were in terms of quality, relevance for our research and the design of a new model of readiness with a focus on warehousing. The models described were:

1) Impuls - Industrie 4.0 Readiness by Cologne Institute for Economic Research (2015)
2) PwC Industry 4.0: Building the Digital Enterprise by Geissbauer, Vedso and Schrauf (2015)
3) A Maturity Model for Assessing Industry 4.0 Readiness and Maturity of Manufacturing Enterprises designed by Carolis et al. (2018)
4) WMG - An Industry 4 Readiness Assessment Tool designed by authors from the International Institute for Product and Service Innovation (2018)
5) The Singapore Smart Industry Readiness Index developed by Singapore Economic Development Board (2018)
6) The Logistics 4.0 Maturity Model is described by Oleskow - Szlapka and Stachowiak (2018)

Table 1 provides an overview of all analysed readiness models with a description of the main attributes.

Table 1: Analyzed readiness models and main attributes

Readiness model	Origin of individual source	Analysed dimensions/areas	The potential of the logistics	Method of assessing readiness	The purpose of the model
Impuls – Industrie 4.0 Readiness	Academic Practical association	6 - Strategy and Organization. Smart Factory. Smart Operations. Smart Products. Data-based services. Employees.	YES	Evaluation of 6 dimensions, divided into 18 criteria. Use a 6-level readiness model	Comparative Descriptive Prescriptive
PwC Maturity Model	Consulting company	7 - Digital business models and customer approach. Digitization of products and services. Digitization and integration of value chains. Data tools. Agile IT architecture. Security compliance, legal and tax area. Organizations, employees and digit. culture.	YES	Evaluation of 7 dimensions. Use a model of 4 levels of readiness with characteristics.	Descriptive
Maturity Model for Assessing	Academic Practical association	5 - Design and Engineering. Production management. Quality management. Maintenance management. Logistics management.	YES	Evaluation of 5 dimensions according to 4 criteria. Use a model of 5 levels of readiness with characteristics.	Descriptive
An Industry 4 Readiness Assessment Tool	Academic Consulting company	6 - Products and services. Production and operation. Strategy and organization. Supply Chain. Business model. Legal aspects.	YES	Evaluation of 6 dimensions, divided into 37 criteria. Use a model of 4 levels of readiness with characteristics.	Comparative Descriptive Prescriptive
The Singapore Smart Industry Readiness Index	Practical association	3 - Process (Operations, Supply Chain, Product Life Cycle). Technology (Automation, Connection, Intelligence). Organization (Talent Readiness, Structure and Management).	YES	Evaluation of 3 dimensions, divided into 8 pillars and further divided into 16 criteria. 6 levels of readiness with description.	Descriptive

The Logistics 4.0 Maturity Model	Academic	3 - Management. Material flow (automation and robotics in warehouses and transport, IoT, 3D printing, 3D scanning, augmented reality). Information flow (data services, Big Data, RFID).	YES	Evaluation of 3 dimensions. Use a model divided into 5 levels of readiness.	Descriptive

Readiness models evaluating storage – evaluation

Warehousing did not occur as a dimension/area in any of the analysed models. Therefore the area of internal logistics was also examined in general. After reviewing and analysing the readiness models, it can be stated that none of the models comprehensively evaluates the company's readiness within the concept of Industry 4.0 in the field of internal logistics and does not focus specifically on the given area of warehousing. It does not evaluate the overall area of internal logistics, nor its partial activities or the very concept of logistics activities within the company.

There are models where, in general, internal logistics is included within one dimension/area, or it is addressed by partial dimensions or criteria for questions in various questionnaires and evaluation forms. However, it is only a more briefly defined form of focus and evaluation. The models work with different levels of readiness (0 to 6), and each contains the minimum requirements that must be met for the level to be completed. For some models, the disadvantage is the evaluation according to the very general levels for them, and there is only a brief verbal description for each dimension, which unfortunately is not very telling.

Design of a new readiness model focused on warehousing

Although no analysed readiness model focuses in detail on warehousing processes and does not evaluate this area, these models were the inspiration and cornerstone for designing a new readiness model evaluating the storage area within internal logistics. In the newly designed model, the parameters that occur in all models enter the intersection. It is always an area of dimension. This is generally the area we are evaluating. This area can be assessed in several sub-areas. Another main parameter is the level of evaluation of the given dimension. The thorough analysis provided the basis for the creation of a new model of readiness with defined main 3 parameters. These parameters are:

- warehousing dimensions
- areas for evaluation of warehousing processes (technology, information, people)
- levels of evaluation of logistics processes

Determination of the main parameters for a new model of readiness in the field of warehousing

The model for assessing readiness will, therefore, be based on 3 parameters, similar to other models of readiness. The difference from other models, however, will be that this model is focused in detail on the area of internal logistics - warehousing. One of the main parameters is, therefore, already established, it is a dimension of warehousing. In this, the proposed model differs from the others. The models are instead general, and they evaluate several dimensions within the whole company. However, they are not detailed, and the evaluation is, therefore, not relevant.

Another critical parameter is the levels of readiness. These levels then determine the actual readiness of the business. As mentioned in the evaluation of the analysed models, the models use different numbers

and characteristics of levels. The Singapore Smart Industry Readiness Index (2018) was the inspiration for this proposed model. This model has a total level of 6 for evaluation, because the model also has a zero level, next to the name is a brief definition and description of the degree. A thorough analysis of this model provided the basis for the creation and partial modification of new levels of preparedness.

At this stage, with a brief definition, these are the following levels:

- Level 0 - Processes are not explicitly defined.
- Level 1 - Certified process management.
- Level 2 - Digitized data collection (from processes), implementation of automation.
- Level 3 - Part of the processes is automated, connection to an external data source.
- Level 4 - Processes are automated, with limited human intervention.
- Level 5 - Processes are automated, human-made.

The next part is to determine the main areas for evaluating the warehousing dimension. For the dimension, 3 main areas will be evaluated, which are sufficient coverage of the whole dimension. These are the areas:

- Information provision
- Technological support
- Human safety

An essential part of the whole concept of Industry 4.0 is the transfer of information. This, of course, plays an essential role in storage areas, even if they are internal processes, each accompanied by a flow of information and securing is a crucial part. Principles and technologies Logistics 4.0 is also entering the technologies used in warehouses. These are leading technologies for manipulating from the receipt of goods, storage to location and removal of material for the manufacturing sector. The last area for evaluation is human security and the gradual change of cooperation of employees with processes according to the increasing level of readiness. From the lowest level, the role of the worker gradually changes.

Demonstration of a model of readiness for the evaluation of the warehousing within internal logistics

The main parameters (dimensions, areas and levels) are included in the new model of readiness for the storage area. The design of the new model is shown in Table 2. The levels are from the lowest level 0 to level 5. For each level, the area for technological security, information security and human security are characterized. Although the characteristics of each level are in a concise form, it should concisely describe the level.

Table 2: Design of a new model of readiness for warehousing

Level	Characteristics of the area at a given level		
	Technology	**Information security**	**People**
0	Warehousing technologies are human-controlled. Standard method of storage without the use of information technology.	Paper documentation, insufficient IS implementation. No interconnection of data sources.	Processes are controlled by humans based on experience and regime. Ignorance of IS.

1	Warehousing technologies automatically provide data in given process certification. Records in printed documentation or in IS.	Electronic data processing in simple IS, manual data collection, low capacity of data warehouses.	Basic possibilities of an employee using an information system. Combination of essential activities and IS.
2	Introduction of basic tools for data collection. During the actual storage, the material identifiers of the material and the warehouse location are read.	Data knew from all processes/areas, better storage conditions thanks to databases.	The employee makes full use of the possibilities of the standard IS and is fully trained to do so.
3	Warehousing technology connected to IS. Introduction of automated robotic devices and equipment.	Creation of automatic information processing using simple algorithms, continuous transmission and sharing of cloudy information.	Worker with the ability to control automated systems.
4	Warehousing technologies are integrated into the information environment. Robotic devices receive real-time instructions on which material to store. In the case, people receive instructions.	Automatic information processing using progressive algorithms. Comprehensive connection to external data sources, including automatic processing, the interconnection of warehouse systems.	The employee interferes minimally in the processes. Use of automated and robotic technologies with close cooperation.
5	Warehousing technologies are automatically controlled by IS. The complex warehouse system is controlled by intelligence or advanced algorithms, online and is fully digitized.	Automatic data entry into IS, and their processing without human intervention, automatic material identification, the connection of IS with handling robots.	The employee only controls the processes but does not interfere with them. IT specialists, programmers, data analysts.

Thus, a new model of readiness for the area of internal logistics - warehousing is proposed. The model is designed to cover the broadest possible range of equipment and current status according to levels, and each company could be characterized in the field of warehousing to a certain level. The model is also designed about modern technologies and principles according to the concept of Industry 4.0. Levels 4 and 5 correspond to this concept, where especially for level 5 it is a matter of setting in a smart factory. There, all machines and equipment in both production and storage are interconnected and can communicate and transmit input data together, respond to situations and evaluate them according to chips, sensors and software. However, level 4 also corresponds to Industry 4.0, but at this level, we can say that it is a collaborative environment where machines and people still work together. Most processes are automated here.

Conclusion

Internal logistics is one of the active factors involved in increasing the overall production performance of the company, as internal logistics has a direct impact on optimizing the use of resources, reducing product production time, optimizing production inventory, stock utilization and increasing production quality.

Absolute visibility within the company is a necessary prerequisite for the emerging trend of individualized production, where each finished product meets the parameters precisely according to customer requirements. Interconnected production and warehousing systems must know precisely where, when and in what quantities a particular component is so that this modern approach to production is feasible at all. Industry 4.0, based on digitization and automation, presents not only enormous challenges for logistics but also opportunities for further growth and development.

The introductory part of the article deals with the application of technologies and principles of the Industry 4.0 concept in the field of internal logistics. Within internal logistics, the area of warehousing has a significant influence and potential on the economic side of the company. With the integration of the technologies of this modern concept into the field of internal logistics or warehousing, the field of warehousing is emerging in the fourth industrial revolution - Warehouse 4.0. How companies are prepared for this concept, they evaluate models of readiness, which are conceived in different areas. However, in the models, the area of internal logistics - warehousing after analysing the models is often not occupied and therefore, there is excellent potential to develop specialized models in this area. The primary purpose of this article is to create a design of a readiness model for the evaluation of the storage area. The model is a primary input form and will be further developed and more specified for the researched area. The characterized areas are brief, but they are apt for the assigned level. The proposed model has the potential for further development in several areas to make the model detailed. Other steps to determine a detailed model applicable in practice include, for example, a detailed definition and description of the level. Furthermore, it is appropriate to assign logistics active and passive elements to all areas. It is essential to create some link between the levels, and the next task will be the need for an evaluation tool. This can take the form of questionnaires, checklists and also the implementation of logistical audits and inspections.

Acknowledgment

Abstract

The development of tourism in cross-border regions has been attracting the interest of several international researchers in this area. This article aims to evaluate the tourist experience in the Eurocity Chaves–Verín region, in particular, to identify the relationships between the characteristics of the trip, the individual profile and the experience perception based on the 4 E's, on the behavioural intentions of tourists, regarding the intention of recommending the destination, through a proposed hypothesis: the length of stay, the tourist resources visited, and the individual profile of the tourist positively influence the perception of the 4E's and the intention to recommend the destination. A total of 166 visitors/tourists were interviewed, 87 in Chaves and 79 in Verín. In the evaluation of the data obtained in Chaves and Verín, for the global model, all the dependent variables are related to the independent variables, statistically significant: the intention to recommend the destination Chaves is superior for those who spend 3 to 5 nights compared to those who spend 5 to 10 nights, and for those who visit the Way of St. James; the intention to recommend the destination Verín is superior for those who visit religious heritage/religious festivals/pilgrimages, and for those who do not visit natural spaces/landscape/nature.

Keywords: Cross-Border Regions, Tourism, North Portugal, Galicia, Chaves-Verín

Introduction

Cross-border destination

History shows that the relationship between Galicia and northern Portugal is very old. In fact, between these two regions there have been, over time, strong ties, as Pereiro and Silva (2000) refer to. Also, according to the same authors, the two regions share a historical, cultural, geographical reality and the economic patterns of Northern Portugal and Galicia are not very divergent. Another characteristic that gives uniformity to this region is its peripheral character in relation to the political and economic decision-making centres of the two countries. Cross-border tourism marketing is a relatively new trend, which comes to the forefront in the globalizing era, and a good promotion and management will allow mutual exploration, cultural exchanges and knowledge enhancement regarding a growing regional competitiveness (Dredge & Jamal, 2013; Herrero de la Fuente, 2001; Ioannides et al., 2006; Cancela, 2008; Prokkola, 2010; Pardellas, 2011; Castañer & Feliu, 2012; Blasco et al., 2014; Trillo, González & Carril, 2015; Liberato, Alen, Liberato & Dominguez, 2018; Liberato, Alén, Búa, & Liberato, 2020;

Liberato, Alén & Liberato, 2020; Tatar, Studzieniecki, Czimre & Penzes, 2020). The Eurocity Chaves – Verín, the region addressed in this investigation, has been considered as a pioneer project in the Iberian Peninsula, which, in addition to having become a European Grouping of Territorial Cooperation (EGTC), has developed a valuable work in entities such as the Atlantic Axis, the Galicia - Northern Portugal Working Community, the Iberian Network of Cross-Border Entities (RIET), and a platform, recently created, only for the tourist activity – Portuguese-Spanish tourist border which aims to create a border tourism product, promoted with the administrations of cross-border cities, and the existing Eurocities (Guadiana and Chaves – Verín), – with the aim that the tourist does not cross it, to go through it, thus knowing the entire border offer. The Eurocity Chaves–Verín was awarded for the strategic vision, with the European Oscars of the European Commission as the best European project – won the RegioStars 2015 award in the CityStars category, an initiative organised by the European Commission since 2008 that distinguishes the most innovative and inspiring projects in Europe funded by EU cohesion policy funds (for the positive impact of collaboration between the two localities, both at institutional, economic, social, cultural and environmental level. In addition to the results achieved in the development of structures of cooperation and joint development in the areas of youth, cultural events, commerce, sports, leisure, tourism and entrepreneurship, and the strategic vision of putting together services and instruments, equipment, infrastructure, which already existed separately but were optimized by common use because they lowered costs and optimized their effectiveness and quality). In the words of Trillo et al. (2015) we are faced with two cities that cooperate across the border, cooperation justified by proximity, affinity and historical relations; opportunities for economic growth and development; which avoids duplication of equipment and costs, as well as the practical application of the principle of European integration, presented in the document "Eurocity Strategic Agenda" which created three main objectives (Trillo et al., 2015): Euro-citizenship, sustainable development, and economic dynamism. In the tourism sector several initiatives have been presented, through networks of collaboration and cooperation, following a bottom-up strategy: the brand "Visit Chaves – Verín" as the first cross-border destination of the Iberian Peninsula.

Literature Review

Experience Model

The experience economy model developed by Pine and Gilmore (1999) has stood out among the various applications of the experimental view of consumer behaviour, considering four fundamental domains: Entertainment (passive, absorption), Educational (active, absorption), Escapist (active, immersion), and Aesthetic (passive, immersion), concluding that the richest experiences include aspects of all four realms. Pine and Gilmore (1998, 1999) agree that consumers increasingly buy experiences rather than products or services (figure 1). The vertical axis studies the connection of the consumer with experience (absorption and immersion); the horizontal axis addresses consumer participation in the tourist experience (passive and active). From the relationship between these four positions in relation to experience, the four realms evaluated emerge: entertainment, educational, aesthetics and escapist (evasion).

Figure 1: Experience realms in Tourism

Source: Pine & Gilmore (1998, 1999), Adapted

This model has already been applied in several types of tourist destinations, such as historical cultural routes, by Hayes and MacLeod (2007), in special events by Pullman and Gross (2003), and others. realmsThe incorporation of these four realms fully enriches the tourist experience as well as the memories associated with it, and the evaluation of the tourist experience (Gilmore and Pine, 2002), being the memorable tourist experiences associated with positivism, commitment to others, and acquisition of new knowledge (Kim, 2010; Tung and Ritchie, 2011). Also, the positive evaluations concerning a tourist experience and resulting in a high degree of satisfaction have been investigated by authors such as Bigné et al. (2001), Bigné and Andreu (2004), Mendes et al. (2010), Eusébio and Vieira (2011), among others, being determinant in the positive consequences on the behavioural intention of the visitor/tourist, which materialize in the intention to recommend and return to the destination visited. Based on the main objective, the partial objective was defined "to identify the relationships between the characteristics of the trip, the individual profile and the respective perception of the experience based on the 4 E's, on the behavioural intentions of tourists, in particular, in the intention of recommending the destination".

Methodology and Results

Based on the studies by Gilmore (1999), Pine and Gilmore (1999), Bigné, et al. (2001), Gilmore and Pine (2002), Pullman and Gross (2003), Bigné and Andreu (2004), Hayes and MacLeod (2007), Tussyadiah and Fesenmair (2009), Kim (2010), Mendes et al. (2010), Eusébio and Vieira (2011), Tung and Ritchie (2011), the objectives related to visitors/tourists were established, and the main objective of the research was to evaluate the tourist experience in the Eurocity Chaves – Verín region. The sample consists of 166 elements. 87 tourists/visitors were surveyed in Chaves (52.4%) and 79 visitors/tourists in Verín (47.6%).

Table 1: Sample individual profile

	Frequency	Percentage
Chaves	87	52,4
Verín	79	47,6

Source: compiled by the authors

Based on the main objective, this research proposed an Hypothesis: **H1-**The length of stay, the tourist resources visited, and the individual profile of the tourist positively influence the perception of the 4E's and the intention to recommend the destination.

Dependent Variables (DVs) and Independent Variables (quantitative factors) are presented:

1. Dependent Variables (DVs):

Educational Realm
Evasion Realm
Aesthetic Realm
Entertainment Realm
Intention to recommend the destination

2. Independent Variables (quantitative factors):

11. Length of stay (nights)
12. Eurocity is the main destination or a route area
13. Tourism Resources
13.1 Religious heritage/ Religious festivals/ Pilgrimages
13.2 Thermal Spa
13.3 Museums
13.4 Natural spaces/Landscape/Nature
13.5 Way of Saint James
13.6 Gastronomy
13.7 Gastronomy and Wine
13.8 Hotel offer
13.9 Tourist routes
1. Gender
2. Age (years)
3. Qualifications
4. Gross monthly income (Individual)
5. Country of Origin

For Visitors/Tourists of Chaves:

*For the global model, all Dependent Variables (DVs) are statistically significant (**p<0.01).*

By analysing the values of partial Eta squared (whose value is equal to the coefficient of determination r^2), we can also verify which dependent variables are most related to the independent variables, since this value represents the percentage of variation in the dependent variables that is explained by the independent variables.

Individually for each independent variable:

—to "11. Duration of stay" has a significant relationship with all DVs;
—to "12. Eurocity is the main destination or a route crossing area" has a significant relationship with all 4E's realms, but not with the "Intention to recommend the destination";
—of the tourist resources/ attractions you have visited/enjoyed, only the following statistically significant relationships are verified: between "13.3 Museums" and all DVs; between "13.4 Natural Spaces/Landscape/Nature" and the Educational, Evasion and Entertainment realms and the Intention to recommend destination; between "13.5 Ways of St. James" and the educational, evasion and entertainment realms and the Intention to recommend destination; between "13.9 Tourist routes" and the Educational realm and the Intention to recommend destination;
—the "1. Gender" has a significant relationship with the Evasion, Aesthetics and Entertainment realms.
—the "4. Gross monthly income" has a significant relationship with the Entertainment realm.
—the "5. Country of Origin" has a significant relationship with the educational and evasion realms.
—to "2. Age" and the "3. Qualifications" have no significant relationship with the DVs.

Source: own elaboration based on SPSS outputs *$p<0,05$; **$p<0,01$*

For statistically significant relationships, it is verified that:

— to "11. Length of stay (nights)" being "No overnight" causes a decrease of 1.824 in the DV Educational Realm, compared with "from 5 to 10", to "11. Length of stay (nights)" being "From 1 to 2" causes a decrease of 1.845 in the DV Educational Realm, compared with overnight stay "from 5 to 10", that is, the Educational Realm is lower for those who do not sleep overnight and for those who pass from 1 to 2 nights compared to those who spend "5 to 10" nights, statistically significant;

— to "12. The Eurocity" being "Main Destination" causes a decrease of 1,334 in the DV Educational Realm, compared to being "Route Area", i.e. the Educational Realm is lower for those who have Eurocity as their main destination, in a statistically significant way;

— not visiting "13.3 Museums" causes an increase of 1,621 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who do not visit Museums, statistically significant, contrary to what would be expected given that it is a tourist resource that is associated with the Educational Realm;

— not visiting "13.4 Natural Spaces/Landscape/Nature" causes an increase of 1,521 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who do not visit Natural Spaces/Landscape/Nature, in a statistically significant way;

— not visiting "13.5 Way of Saint James" causes a decrease of 1,829 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who visit Way of Saint James, in a statistically significant way;

— not visiting "13.9 Touristic Routes" causes an increase of 0.464 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who do not visit Tourist Routes, in a statistically significant way;

— to "11. Length of stay (nights)" being "from 3 to 5" causes an increase of 0.699 in the DV Intention to recommend the destination, compared with "from 5 to 10", that is, the Intention to recommend the destination is higher for those who pass 3 to 5 nights compared to those who spend "5 to 10" nights, statistically significant;

— not visiting "13.3 Museums" causes an increase of 0.497 in the DV Intention to recommend the destination, compared to visiting this resource, ie the Intention to recommend the destination is superior to those who do not visit Museums, in a statistically significant way;

— not visiting "13.4 Natural Spaces/ Landscape/Nature" causes an increase of 1,887 in the DV Intention to recommend the destination, compared to visiting this resource, that is, the Intention to recommend the destination is superior to those who do not visit Natural Spaces/Landscape/Nature, in a statistically significant way;

— not visiting "13.5 Way of Saint James" causes a decrease of 0.957 in the DV Intention to recommend the destination, compared to visiting this resource, that is, the Intention to

recommend the destination is superior to those who visit “Way of Saint James”, in a statistically significant way;

— not visiting "13.9 Touristic routes" causes an increase of 0.230 in the DV Intention to recommend the destination, compared to visiting this resource, ie the Intention to recommend the destination is superior to those who do not visit Tourist routes, statistically significant.

Therefore, in conclusion:

For the city of Chaves, the "Hypothesis H1: The length of stay, the tourist resources visited and the individual profile of the tourist positively influence the perception related to the 4E's and the intention to recommend the destination", is confirmed for the statistically significant relationships listed above.
Assumptions of the MANOVA model (when qualitative variables are used as factors):

To analyse the assumption of homogeneity of variances of dependent variables (DVs) between the groups, the Levene test is used, which tests the null hypothesis that the variance of the DVs remains constant in the various categories studied.

Table 4: Levene test for homogeneity of variances

	F	*gl1*	*gl2*	*P*
Educational Realm	26,880	83	66	** 0,000
Evasion Realm	9,577	83	66	** 0,000
Aesthetic Realm	2,145	83	66	** 0,001
Entertainment Realm	24,193	83	66	** 0,000
Intention to recommend the destination	3,662	83	66	** 0,000

Source: own elaboration based on SPSS outputs *** p < 0,01*

The results indicate the rejection of the hypothesis of equality of variances within the groups for all DVs ($p<0.05$). Thus, there is no assumption of homogeneity of variances. However, since the sample under study can be considered large, the non-verification of this assumption does not invalidate the results obtained. To apply this model, it is necessary to verify the assumption of normality of the distribution of standardized residues of the model, with the K-S test.

Table 5: Assumption of normal distribution of standardized waste of the model, with the K-S test

	K-S (a)		
	Statistics	Gl	Proof value
Standardized Waste: Educational Realm	,141	84	** ,000
Standardized Waste: Evasion Realm	,191	84	** ,000
Standardized Waste: Aesthetic Realm	,123	84	** ,000
Standardized Waste: Entertainment Realm	,159	84	** ,000
Standardized Waste: Intention to recommend the destination	,215	84	** ,000

a Lilliefors significance correction ***p<0.01* *Source: own elaboration based on SPSS outputs*

The normality of the distribution of standardized residues does not occur, because the test value is less than 5%, so the null hypothesis is rejected. However, as the sample is large, the non-verification of this assumption does not bring problems for the developed model.
For Visitors/Tourists from Verín:

a R^2 = ,925 (R^2 Adjusted = ,906) *p<0,05; **p<0,01 Source: own elaboration based on SPSS outputs
b R^2 = ,934 (R^2 Adjusted = ,917)
c R^2 = ,547 (R^2 Adjusted = ,433)
d R^2 = ,913 (R^2 Adjusted = ,892)
e R^2 = ,663 (R^2 Adjusted = ,579)

For the global model, all DVs are statistically significant (**p<0.01). By analyzing the values of partial Eta squared (whose value is equal to the coefficient of determination r^2), we can also verify which dependent variables are most related to the independent variables, since this value represents the percentage of variation in the dependent variables that is explained by the independent variables. Individually for each independent variable:

- to "11. Duration of stay" has a significant relationship with all DVs;
- to "12. Eurocity is the main destination or a route crossing area" has no significant relationship with the DVs;
- of the tourist resources/ attractions you have visited/enjoyed, there is only a statistically significant relationship between "13.4 Natural Spaces/ Landscape/ Nature" and the Educational, Evasion and Entertainment realms and the Intention to recommend the destination.
- to "2. Age" presents a significant relationship with the Aesthetic realm and the Intention to recommend the destination.
- the "1. Gender," the "3. Qualifications" or "4. Gross monthly income" and "5. Country of Origin" has no significant relationship with the DVs.

Table 7: Estimates of model parameters

DV	Factor	B	Standard Error	t	p
Educational Realm	Interception	6,004	,403	14,893	0,000

	[a13.4 Natural Spaces/Landscape/Nature =0]	2,484	,569	4,365	** 0,000
	[a4. Gross Monthly Income =2]	-,335	,146	-2,299	* 0,026

Source: own elaboration based on SPSS outputs **p<0,05; **p<0,01*

For statistically significant relationships, it is verified that:

- to "11. Length of the stay (nights) "Without overnight" causes a decrease of 2,726 in the DV Educational Realm, compared with "from 5 to 10", to "11. Duration of stay (nights) "From 1 to 2" causes a decrease of 2,752 DV Educational Realm, compared with overnight "from 5 to 10", that is, the Educational Realm is lower for those who do not sleep overnight and for those who pass from 1 to 2 nights compared to those who spend "5 to 10" nights, statistically significant;
- not visiting "13.1 Religious heritage/Religious festivals/Pilgrimages" causes a decrease of 1,715 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who visit religious heritage/Religious festivals/Pilgrimages, in a statistically significant way;
- not visiting "13.4 Natural Spaces/Landscape/Nature" causes an increase of 1,790 in the DV Educational Realm, compared to visiting this resource, that is, the Educational Realm is superior for those who do not visit Natural Spaces/Landscape/Nature, in a statistically significant way;
- the reading of statistically significant relationships between the variables under study and the other realms is made in a similar way to the previous ones.
- to "11. Length of stay (nights) "without overnight stay" causes a decrease of 1.223 in the DV Intention to recommend the destination, compared with "from 5 to 10", to "11. Length of stay (nights) "from 1 to 2" causes a decrease of 1.221 in the DV Intention to recommend the destination, compared with "from 5 to 10", that is, the Intention to recommend the destination is lower for those who do not sleep overnight or who pass from 1 to 2 nights compared to those who spend "5 to 10" nights, statistically significant;
- not visiting "13.1 Religious heritage/Religious Festivals/Pilgrimages" causes a decrease of 0.509 in the DV Intention to recommend the destination, compared to visiting this resource, that is, the Intention to recommend the destination is superior for those who visit the religious heritage/Religious Festivals/Pilgrimages, in a statistically significant way;
- not visiting "13.4 Natural Spaces/Landscape/Nature" causes an increase of 2,484 in the DV Intention to recommend the destination, compared to visiting this resource, that is, the Intention

to recommend the destination is superior for those who do not visit Natural Spaces / Landscape / Nature, in a statistically significant way;

— the "4. Net monthly income (Individual)" being "1001 – 2000 €" causes a decrease of 0.335 in the DV Intention to recommend the destination, compared to "> 3000 €", i.e. the Intention to recommend the destination is lower for those with illiquid monthly income between "1001 – 2000 €" compared to those who have "> 3000 €", statistically significant.

Therefore, in conclusion, the "Hypothesis H1 for Verín: The length of stay, the tourist resources visited and the individual profile of the tourist positively influence the perception related to the 4E's and the intention to recommend the destination", for the statistically significant relationships listed above.
Assumptions of the MANOVA model (when qualitative variables are used as factors):

Table 8: Levene test for homogeneity of variances

	F	*gl1*	*gl2*	*P*
Educational Realm	6,335	34	31	** 0,000
Evasion Realm	3,743	34	31	** 0,000
Aesthetic Realm	2,877	34	31	** 0,002
Entertainment Realm	10,508	34	31	** 0,000
Intention to recommend the destination	3,600	34	31	** 0,000

*Source: own elaboration based on SPSS outputs ** p < 0,01*

The results indicate the rejection of the hypothesis of equality of variances within the groups for all DVs ($p<0.05$). Thus, there is no assumption of homogeneity of variances. However, since the sample under study can be considered large, the non-verification of this assumption does not invalidate the results obtained.

Table 9: the assumption of normal distribution of standardized residuals of the model, with the K-S test

	K-S (a)		
	Statistics	Gl	Proof value
Standardized Waste: Educational Realm	,289	66	** 0,000
Standardized Waste: Evasion Realm	,240	66	** 0,000
Standardized Waste: Aesthetic Realm	,217	66	** 0,000
Standardized Waste: Entertainment Realm	,145	66	** 0,002
Standardized Waste: Intention to recommend the destination	,130	66	** 0,007

*a Lilliefors significance correction **p<0.01 Source: own elaboration based on SPSS outputs*

There is no normality of the distribution of standardized waste as in the previous case. However, as the sample is large, the non-verification of this assumption does not bring problems to the developed model.

Conclusion

The objective of this research was to identify the relationships between the characteristics of the trip, the individual profile and their perception of the experience based on the 4 E's, on the behavioural intentions of tourists: **H1**-The length of stay, the tourist resources visited, and the individual profile of the tourist positively influence the perception of the 4E's and the intention to recommend the destination.

Dependent Variables (DVs) were established for the analysis of this hypothesis: Educational Realm; Realm Evasion; Aesthetic Realm; Realm Entertainment; Intention to recommend the destination; and Independent Variables (quantitative factors): Length of stay (nights), Eurocity is the main destination or a route crossing area, Religious heritage/Religious Festivals/Pilgrimages, Thermal Spas, Museums,

Natural Spaces/Landscape/Nature, Way of St. James, Gastronomy, Gastronomy and Wine, Hotel Offer, Touristic Routes, Gender, Age, Qualifications, Gross Monthly Income (Individual), and Country of Origin. In the evaluation of the data obtained in Chaves and Verín, for the global model, all The DVs are related to the independent variables, statistically significant (**p<0.01).

For the destination Chaves and in the analysis in H1, it is observed, for statistically significant relationships, for example: the Educational Realm is lower for those who do not sleep overnight and for those who pass from 1 to 2 nights compared to those who pass from 5 to 10 nights, and for those who have Eurocity as their main destination, and superior for those who do not visit Museums, contrary to what would be expected given that it is a tourist resource that is associated with the Educational Realm, for those who do not visit Natural Spaces/Landscape/Nature, for those who do not visit Touristic Routes, and for those who visit the Ways of Santiago. The intention to recommend the destination is superior for those who spend 3 to 5 nights compared to those who spend 5 to 10 nights, for those who do not visit Museums, for those who do not visit Natural Spaces/Landscape/Nature, for those who do not visit Tourist routes, and for those who visit the Way of St. James.

With regard to the data obtained in Verín, and for the statistically significant relationships, it is verified, for example, that: the Educational Realm is lower for those who do not stay overnight and for those who spend 1 to 2 nights compared to those who spend 5 to 10 nights; and is superior for those who visit religious heritage/Religious festivals/Pilgrimages, and for those who do not visit Natural Spaces/Landscape/Nature. The intention to recommend the destination is lower for those who do not stay overnight or who spend 1 to 2 nights compared to those who spend 5 to 10 nights and for those who have an illiquid monthly income between 1001 – 2000 € compared to those who have more than 3000 €. The Intention to recommend the destination is superior for those who visit the religious heritage/ Religious Festivals/Pilgrimages, and for those who do not visit Natural Spaces/Landscape/Nature.

The discussion around the development of tourism activity in cross-border regions has been widely debated by regional DMO's and the scientific community. The joint valuation of tourist resources, transforming them into tourist products and joint promotion by the DMO's of both regions, Northern Portugal, and Galicia, should be considered, with a strong investment in the resources less valued in this research.

Non-Financial Reporting Practices in The Chilean Healthcare Sector

Małgorzata MACUDA

PhD, Universidad Bernardo O'Higgins, UBO. Centro de Investigación Institucional, CII, Santiago, Chile
malgorzata.macuda@ubo.cl

Abstract

Healthcare organizations from all over the world have recently developed a culture of sustainability by integrating social, environmental and economic concerns into their values, strategy and decision making process. Social responsibility and social responsiveness in the healthcare sector imply a new social dimension of care as well as new organizational patterns. Being a sustainable healthcare organization is more and more frequently communicated by issuing non-financial reports, containing information about social responsibility related activities. The aim of the paper is to examine the non-financial reporting practices among healthcare organizations in Chile. The aim was achieved through studying the GRI Sustainability Disclosure Database where non-financial reports are published and performing their content analysis. The key findings are the following: (1) non-financial reporting practices in the Chilean healthcare sector are not widespread, (2) all Chilean healthcare organizations chose to follow international reporting standards – Global Reporting Initiative (GRI) guidelines, and more specifically GRI G.3, GRI G3.1, GRI G4 and GRI Standards, (3) the majority of CSR disclosure categories are included in their non-financial reports, while the information regarding financial data on CSR, measurement of CSR and value created EC-1 are in most cases missing.

Keywords: Non-Financial Reporting, CSR Reports, Healthcare Sector, Chile

Introduction

Sustainability cannot be attained and entrenched in the culture of organizations without the application and balance of environmental, social, and economic elements (Ramirez et al., 2013). According to Block (2016), sustainability is best understood as actions designed to drive triple-bottom-line results around economic prosperity, environmental stewardship and social responsibility. He points out that healthcare organizations struggle with the design, development and implementation of a wide range of activities, supporting environmental and social sustainability, while simultaneously integrating them into their daily operations. Boone (2012) claims that sustainability in healthcare sector represents a particularly ambitious undertaking as it necessarily encompasses the wide variety of facilities, operations and activities in a typical healthcare organization. In his opinion, the scope and size of healthcare's social and environmental impact represent tremendous opportunities for the industry. Nevertheless, effectively implementing sustainability in healthcare organizations presents a unique challenge. He underlines that healthcare is one of the most complex and rapidly changing industries. Tehemar (2012) finds this industry one of the most operationally difficult. He emphasizes that corporate social responsibility (CSR) could play a major role by highlighting the performance of the healthcare organizations in a transparent and sincere way and result in better understanding from the community about the variety of challenges that this sector faces, such as stringent regulatory compliance, intense labor shortages in nursing, increased and costly technological advancements, implementation of international quality standards and substantial community dependence. The Report of the International Bioethics Committee of UNESCO on Social Responsibility and Health (2010) has addressed the concept of social responsibility in the context of healthcare, thus proposing its new paradigm.

As healthcare organizations pursue to evolve worldwide in search of improved quality outcomes, patient safety, cost-effective services, and equitable access to health services, stakeholders continue to demand a higher level of accountability and sustainability of care (Ramirez et al., 2013). Being sustainable (socially responsible) healthcare organization is more and more frequently communicated

by issuing non-financial reports, containing information about CSR-related activities. The aim of the paper is to examine the non-financial reporting practices among healthcare organizations in Chile. The aim was achieved through studying the GRI Sustainability Disclosure Database where non-financial reports are published and performing their content analysis.

Non-Financial Reports Issued by Healthcare Organizations in Latin America

GRI Sustainability Disclosure Database comprises 2400 non-financial reports (CSR reports) published by 629 healthcare organizations from all over the world, including 809 reports issued by 245 organizations delivering healthcare services and 1591 reports prepared by 384 organizations involved in manufacturing and selling healthcare products. The empirical analysis shows an increased interest in publishing non-financial reports in the healthcare system in the last 10 years among Latin American countries. The first three reports related to social, environmental and economic activities were elaborated and issued in 2007 by Brazilian healthcare organizations. In subsequent years a growing number of CSR reports, prepared by organizations operating in the healthcare sector in Latin America, appearing in the GRI Sustainability Disclosure Database may be observed (Figure 1).

Figure 1: Number of non-financial reports issued in Latin America in 2007-2020

Source: own work based on https://database/globalreporting.org/

In total, 115 organizations from the healthcare sector in Latin America prepared and published 386 CSR reports in the GRI Sustainability Disclosure Database from 2007 to 2020: 60 organizations from Brazil, 19 from Colombia, 12 from Argentina, 7 from Peru, 5 from Chile, 5 from Mexico, 4 from Ecuador, 1 from Bolivia, 1 from Honduras, and 1 from Uruguay. The information for the last 3 reporting years (2018-2020) is incomplete due to ongoing data collection and the Standards Report Registration process. The idea of corporate social responsibility has recently become increasingly relevant in the healthcare context among Latin American countries, thus the growing interest in communicating about CSR involvement of healthcare organizations and a large number of CSR reports comparing to the first years when the non-financial reporting practices were recognized. A noticeable increase occurred in 2013, 2014 and 2015, respectively. Since 2015, when the number of non-financial reports amounted to 53, it remains roughly at the same level – approximately 50 CRS reports annually. Some healthcare organizations have just started their experience with the disclosure of CSR information, for others it is already a routine practice.

Results of the Conducted Research

In Chile, there is no legislation imposing the disclosure of CSR-related activities with respect to any organizations, regardless of their type, size or activity profile. Therefore, all CSR reporting initiatives are totally voluntary. As it may be noticed in the Figure 1, the values regarding Chilean healthcare organizations are not high. Non-financial reporting practices in the healthcare sector in Chile are not widespread. The Table 1 presents the name, size and type of five Chilean healthcare organizations disclosing non-financial information, the number of CSR reports issued in 2011-2020 and their number of pages, the guidelines according to which these reports were prepared, the statement if the report is the integrated one, if it was verified by the external auditor, and if it contains the contact person data.

Legend: L – Listed; NL – Non-listed; NPO – Non-profit organization; PC – Private company; HS – Health services; HP – Health products

The first non-financial report issued in Chilean healthcare sector was elaborated in 2011 by private company delivering health services named Mas Vida. Unfortunately it is inaccessible, hence its analysis is not possible; the same applies to two consecutive CSR reports published in 2012 and 2103 by Mas Vida. Among all five Chilean healthcare organizations which reported their sustainability performance, two of them issued their reports for the second time, two for the third time, and one for the fourth time. 1 report–has only online version, while 10 were prepared and published in a traditional way in the form of separated reports. 2 reports were examined by external auditors and they constituted integrated reports. All five organizations chose to follow international reporting

standards – Global Reporting Initiative (GRI) guidelines, progressively evolved year after year (GRI G3, GRI G3.1, GRI G4, and GRI Standards).

A content analysis of CSR reports published by Chilean healthcare organizations in the GRI Sustainability Disclosure Database has been applied in order to examine the area of disclosures regarding environmental, social, and economic issues (Table 2).

Table 2: Area of disclosures in CSR reports issued by Chilean healthcare organizations

Name	Stakeholders	Clients / Patients	Employees	Local society	Environment & ecology	Values	Corporate governance	Code of ethics	Risk	Human rights	Business model	Anticorruption and bribery	Financial data on CSR	Negative impact	Measurement of CSR	Value created EC-1
Clínica Ciudad del Mar	√	√	√	√	√	√	√	√	√	√	-	√	-	√	-	-
Clinica Las Condes	√	√	√	√	√	√	√	√	√	-	√	√	-	√	-	-
Empresas SB	√	√	√	√	√	√	√	√	√	√	√	√	-	√	-	√
Mas Vida	√	√	√	√	√	√	√	√	√	√	√	√	-	√	-	√
Mutual de Seguridad CChC	√	√	√	√	√	√	√	√	√	√	√	√	√	√	√	√

Source: own work

As it may be noticed, the main areas of disclosure, completed in 100% by each Chilean healthcare organization, are the following: stakeholders, clients (patients), employees, local society, environment and ecology, values, corporate governance, code of ethics, risk, anticorruption and bribery, negative impact. The content information of CSR reports differs only in a few categories: financial data on CSR and measurement of CSR, which are the most difficult to perform (only one healthcare organization undertook the effort to calculate and present them, probably because their reports were integrated), as well as value created EC-1, business model, and human rights.

Conclusions

Sustainability appears to be a complex and multidimensional organizational phenomenon, which consists on re-evaluating and recalibrating the relationship between the organization and its wider context. In the last decade, non-financial reporting appears as a new trend in healthcare organizations in Latin America. The number of CSR reports is growing and further countries start to communicate their CSR-related activities, and so does Chile. The key findings are the following: (1) non-financial reporting practices in Chilean healthcare sector are not widespread, (2) all Chilean healthcare organizations chose to follow international reporting standards – Global Reporting Initiative (GRI) guidelines, and more specifically GRI G.3, GRI G3.1, GRI G4 and GRI Standards, (3) the majority of CSR disclosure categories are included in their non-financial reports, while the information regarding financial data on CSR, measurement of CSR and value created EC-1 are in most cases missing. The research sample is small, so in the near future, the healthcare sector in Chile should be monitored and new non-financial reports, becoming available in the GRI Sustainability Disclosure Database, ought to be studied. In addition, the detailed level of conformity with the international guidelines and recommendations could be verified at the next stage of the study. A content analysis of these reports and a comparative analysis among non-financial reports, published by healthcare organizations form other Latin American countries, would be an interesting topic and could bring remarkable conclusions.

Microservices, A Dynamic Response for Accelerating the Assessment of Patient-Centric E-health Solutions

Marilena IANCULESCU
National Institute for R&D in Informatics - ICI, Bucharest, Romania
University Politehnica of Bucharest, Bucharest, Romania
marilena.ianculescu@ici.ro

Abstract

Nowadays healthcare systems are undoubtedly relying on digital technology to support, improve and deliver medical services. The unceasing emerging of more performant technologies, together with the increased access to information, have led not only to enhanced healthcare delivery, but also to the augmented empowerment and awareness of the patients regarding the relationship with their healthcare providers, shifting that towards a partnership. In this context, the patient-centric feature of eHealth solutions has strengthened and become imperative. Therefore, microservices, a relatively recent approach in software architecture, have been more and more chosen to accelerate the assessment of this category of solutions. Their particular characteristics drive to improvements in terms of efficiency, scalability, composability, resiliency, or flexibility of the developed eHealth solutions. Not least, microservices facilitate a real customization of the functions and capabilities of eHealth applications. This paper aims to emphasize the main aspects related to microservices and their closed link with patient-centric eHealth solutions. The added value brought by microservices in this area is endorsed by the brief presentation of RO-SmartAgeing system, which main objective is to framework a remote monitoring in a smart environment in order to allow an elderly person to continue his life with dignity in a familiar space, while receiving the best health surveillance, treatment and physical support. RO-SmartAgeing system is currently developed by the author together of a team from ICI-Bucharest; as it is in the general architecture design phase, the involved developers aim to take advantage of the opportunities provided by microservices in order to lend it well-defined features like scalability and flexibility to make it age-friendly and customizable.

Keywords: Microservices, E-health, Patient-Centric, Empowered Patient.

Introduction

Information and Communication Technologies (ICT) have become a *sine qua non* reality in our present-day life, therefore in the healthcare landscape all over the world. ***eHealth*** is defined by World Health Organization (WHO) as the use of ICT in large health-related areas like treating patients, pursuing research, public health, health education etc. (eHealth at WHO, 2019]).

eHealth implies the implementation and the use of digital tools, technologies and devices for sustaining, supporting and promoting diagnosis of diseases, treatments, preventative strategies, health and daily behavior.

The three main functions associated with eHealth according to (van der Kleij R.M.J.J. et al., 2019) can be extended to:

a. monitoring health status, environmental and lifestyle parameters;
b. collecting and communicating data and information;
c. applying analytics, getting insights for supporting healthcare procedures;
d. providing (smart) support for medical decision-making;
e. sustaining the identification and implementation of preventative and diagnosis methods and protocols;

f. ensuring appropriate healthcare managements and business models for good practices, health strategies and programs.

There are a number of issues that have a direct and dynamic impact on an adequate evolution of eHealth: healthcare and ICT developments, medical research advances, health and ICT literacy of patients and health professionals, digital infrastructure, access to internet and ICT, the lack of unitary standardization in the field, national and cross-border interoperability, security, privacy and confidentiality of health data, ethical aspects, and last, but not least, patient empowerment that leads to a shift of the healthcare systems towards a patient-centric approach (Ianculescu, Alexandru, and Rădulescu, 2018).

The broader access to health information, the growing skills of an increasing number of populations in daily use of ICT have led to the rising of a well-aware and informed patient that is willing to be better informed and to have better access to more opportunities related to his health status. Consequently, the relationship with the doctor has converged to a partnership and the eHealth solutions have been developed more and more with the patient in their core.

Microservices (microservice architecture as is also called) is a quite recent approach for designing and developing software applications that allow the functionalities of the application to be associated uniquely to a single well-established component. Basically, the loosely coupled components that communicate with each other through Application Programming Interfaces (APIs) are the architectural solution for making the complex applications more efficient from many points of view as an independent deployment, fault tolerant or readiness for market (Nadareishvili I. et al., 2016). Microservices come with the solid potential of being usable and quickly adaptable to vary contexts in short time, with fewer human resources and with less financial effort.

This paper aims to highlight the added-value of microservices in the nowadays eHealth domain. In section 2 the main principles that characterize microservices are presented. Section 3 introduces the benefits of choosing microservices for designing and developing eHealth solutions. Section 4 concentrates on a specific type of eHealth solution, namely the patient-centric one. In order to demonstrate the advantages brought by selecting microservices for those, an underdevelopment eHealth application – RO-SmartAgeing system - is briefly presented, emphasizing some main features. Section 4 concludes about the potential of microservices to push forward the eHealth solutions towards the requirements imposed by the higher engagement of the patients in the 21th century.

Fundamental Principles of Microservices

The Change from Monolithic Architecture to Microservices

A monolithic architecture implies that the application is built and developed as a single unit, and all the components, being tightly coupled, are developed and deployed as a whole item, as a single executable logical.

The main features of monolithic architecture are:

- there is a single codebase;
- since there is a unique programming language, the developers should all have good knowledge of it;
- data being centralized, a shift of data model has impact on the whole database;
- one function of the application depends on another one/ones;
- for debugging and upgrading the application (even when it's a matter of a single component) an updated version must be developed and redeployed; therefore, there is a restricted number of reuses;
- the application will be tested without external dependencies because all the components are inside;

- in earlier stages, a monolithic architecture has a lower level of complexity compared with the one gained in time after multiple upgrading and increased size and functionalities;
- because the components are tightly coupled, a single one can't be scaled, and thus the monolithic architecture can be scaled in only one dimension;
- it is difficult to migrate towards a new technology - or even an updated version of the same technology - because the entire application has to be re-written.

Taking into consideration the weakness of some of the above features, microservices approach entails when it comes about more complex applications that ask for individual component management.

"Microservice architecture is a style of engineering highly automated, evolvable software systems made up of capability-aligned microservices" (Nadareishvili I. et al., 2016). Each component has a single functionality and thus delivers a single service.

Some of the most consistent reasons for shifting from monolithic architecture to microservices are:

- increased scalability, deployment velocity and availability are obtained, mainly because of the opportunity to develop new components in cloud;
- as each component provides a single function/business capability, it can be many times reused in different contexts;
- augmented possibility to choose other technologies / programming languages for new components to be added to the already developed application;
- developers with different programming skills can be easily integrated in the team;
- cost-efficiency in terms of financial and human resources and speed to market.

Characteristics of Microservices

The wider spread of microservices approach is rooted by reliable characteristics presented as follows:

- well-defined organization around business capabilities;
- decentralized data management and standards;
- independently running multiple components;
- possible different codebases and technologies;
- autonomous developing;
- failure tolerance;
- self-sustaining monitoring and debugging capabilities for each service;
- optional security mechanisms for each service;
- decreased operational complexity;
- enabled evolutionary design for future unpredicted capabilities (Nadareishvili I. et al., 2016), (Kumar M., 2020), (Filip I. D. et al., 2018).

Benefits of Microservices

This architectural solution brings many benefits that make it appropriate for complex applications:

- as the most suitable programming language and technology can be chosen differently by the developers, the building of the application is faster, more accurate and cost-efficient;
- getting advantage of the opportunities brought by the emergence of new technology or versions is facilitated by the possibility of adding or upgrading a service without negative upshot on the existing ones, due to the independent feature of microservices;
- well-defined and strict component boundaries are very expedient for extended teams;
- integrating databases is dropped out as each service can have its own manageable database;
- faster and complete fault isolation leads to an uncompromised continuous functioning of the application;
- the unique business capability associated to each component allows it to be reused as another service either in the same application, or in a different one and contexts;

- the easier understandability of the capabilities of the application implies smaller, faster deployments and composability;
- improved scalability and performance are achieved (Taibi D. et al.., 2017), (Dragoni N. et al. (2018), (Hasselbring W. et al., (2017).

Disadvantages of Microservices

Despite the established advantages associated to microservices, there are some disadvantages that have to be taken into consideration for adopting this architectural style, namely:

- the developing and testing management of the whole application is more difficult and has to be attentively coordinated, since the communication among services is complex, there are multiple databases, each service has also to be tackled independently, different programming languages can be used, etc.;
- more diverse ICT skills of the developing team might be required;
- the more services are generated, the more resources are needed;
- the number of operations is increased;
- for a small company it might be too overwhelming to properly deal with the complexity of microservices.

Considerations for choosing the microservices for eHealth solutions

Advantages Brought by Microservices To E-health Solutions

Nowadays eHealth solutions have to meet the intricate problems arisen from the burden put on the healthcare systems by the increasing number of people, aging population, higher cost of medical services, lower number of professional caretakers, appearance of new diseases and drug-resistant aspects, etc.

Although there is a great amount of issues associated to a substantial number of diseases and health dysfunctionalities, a remarkable number of eHealth capabilities addressing some of these issues can be replicated with minimum changes, for a faster development of new ICT tools, devices, solutions or applications.

Microservices represent a practical and fruitful driver having the power to urge the development of comprehensive, agile and re-usable applications. Whether they are Hospital Information Systems, public health large systems, remote monitoring applications, or personalized patient-centric solutions, if they are built on microservices-based architecture, they have the potential to evolve quickly and effectively.

Health data is crucial in every aspect of healthcare systems (Dobre C. et al., 2019). Due to the burst of smart technology commonly used by average citizens and healthcare providers, the amount of health data has been reaching unexpected levels, opening new ways for innovation, including customization of medical procedures according to the patient particularities, but also enabling multiple entities that generate and absorb data.

The lack of a wide adoption of standards, established interoperability models, the need to respond faster than before to the dynamic requests for implementing new flexible models of good practice are some of the most important aspects that sustain the use of microservices in designing eHealth solutions.

According to a recent report (Transparency Market Research, 2020) the adoption of the microservices by the worldwide healthcare systems can be structured based on: component (i.e. platforms and services), deployment (i.e. cloud-based and on premise) , organization size (i.e. small & medium and healthcare organizations), end-user (i.e. healthcare providers, healthcare payers, life science

organizations, and clinical laboratories), and region (North America, Middle East & Africa, South America, Europe, and Asia Pacific).

The main advantages brought by microservices specifically to eHealth solutions are:

- the extensive use of Big Data and the compliance with the General Data Protection Regulation (GPPR) - in Europe - and HIPAA (Health Insurance Portability and Accountability Act (HIPAA) –in USA- regulations are easily accepted, because microservices are data and function-oriented;
- as data can be easier managed and drawn out, microservices provide capabilities for customizing the presentation of health data according to the specificities of the end-users;
- an augmented resiliency is gained due to the fault tolerance characteristics;
- they enable dynamic cross-functional teams with different skills and specializations able to reconfigure quickly an application by reusing components and adding new services obtained from adapting the former built components, gaining thus an accelerated time to healthcare market.

Microservices and use cases in healthcare domain

Microservices approach provides the opportunity to directly support the use cases for health data management.

For instance, a Healthcare Information System can be structured on sets of services appropriate for every specific applications like Clinical Information Management, Demographic Information Management, Picture Archiving And Communication System, Radiology Information System Laboratory Information Systems, Computerized Physician Order Entry, Clinical Decision Support, User Authentication, Medical Recording Apps, Scheduling (Gutierrez P. P., 2019). Once the Health Information System is developed on microservices-architecture, it has a strong portability feature, so it can be quite easily adapted and reused completely or partially in another medical unit located in another place, with another extent, structure or organization.

Regarding Electronic Medical Records and Electronic Health Records, where multiple categories of health specialists need different outcomes of the same centralized data, the use of microservices approach allow building highly modular applications, with loosely coupled components that can be aggregated in significant numbers of solutions able to respond to changing legal regulations, healthcare services and business needs (CitiusTech, 2018).

In the healthcare domain, microservices facilitate an enlarged development, fast deployment and rapid integration of emerging advances required by the extended use of Internet of Things (IoT), bioinformatics, Artificial Intelligence, Data mining, blockchain. As the services are more granular, they provide the capacity to build a highly composable new application according to the end-users needs.

Patient-Centric E-health Solutions Better Enabled by Microservices

Patient-centric approach in the landscape of eHealth

The more a patient is aware about the importance of adopting a sane behavior on daily-basis, preventative methods and habits, of improving his health-related knowledge through continuous informing, the more he is empowered and engaged in choosing the best decisions regarding his own health status. He becomes an informed and agile healthcare consumer that claims an improved control of the available resources for reaching the best personalized services.

Nowadays patient demands a more open relationship with his direct health providers which, in their turn, must evolve into team members ready to sustain patient involvement and choice. Deloitte has defined the profiles of eight archetypes of healthcare providers that underline the patient-centric approach (Gordon R. L. et al., 2019) (see Figure 1). In the light of patient empowerment, healthcare

providers should better take into consideration the patient's personal values and needs, should better adapt to his level of education and literacy for bridging the gaps, and, unquestionably, they must keep a close contact with the eHealth technologies and solutions that are unceasing progressing at a rapid pace.

A reliable patient-centric eHealth application should minimize the constraints in accessing health information and services; it must carefully choose the most appropriate and secure methods and technology to manage personal health data alongside the whole flow, from generating and collecting it, till it is analyzed by healthcare analytics to gain insights, support decision-making and predict risks of chronic disease; it should support a fast provision of related business models and good practices; it should be tailored according to the patient's personal health profile; it should drive to long-term cost efficiency.

A patient-centric approach implies designing eHealth solutions taking into account the patient's insights, data and information, the most convenient technology for obtaining high compliant functionalities and improved health outcomes. In this context, microservices represent one of the most suitable drivers for adjusting the patient-centric systems, applications or other types of eHealth solution able to meet all the above-mentioned challenges and requirements.

Figure 1: Nowadays patient, the main target of healthcare providers and eHealth solutions (Gordon R. L. et al., 2019)

Case study: How microservices can better trigger RO-SmartAgeing system

a. Brief introduction of RO-SmartAgeing System

"Non-invasive monitoring and health assessment of the elderly in a smart environment (RO-SmartAgeing)" is an is an underdevelopment project whose outcomes will be able to support the provision of more advanced elderly patient-centric healthcare services by facilitating the orientation of medical practice to prevention and personalized assistance (Ianculescu M. et al.., 2019).

The main objective of the RO-SmartAgeing system is to provide services for a better quality and safety of life at home of the elderly, to support him in daily activities, to create a monitoring system both for health status, lifestyle and daily activities, and for his home environment, as well as to improve the relationship between the elderly with caregivers, doctors and family.

The services provided can be expanded based on the needs of the elderly, adding with minimal effort, and new personalized services through extensible configurations or plug-ins (Alexandru et al., 2019). The implemented services will be integrated in the user interface. Interfaces for the elderly are intended to be created with a simple design to increase the usability of the system.

The most important general functionalities are:

- RO-SmartAgeing system is an independent system, capable of gathering, storing, displaying and transmitting (via a communication link) data and information about the elderly.
- It is a patient-centric eHealth solution that provides support for data storage-transmission, as well as real-time remote monitoring and consultations, creating a complete technological basis for a wide range of healthcare services;
- RO-SmartAgeing system is able to manage and store data and information, including, but not limited to, the registration of the elderly's health and environmental data, remote monitoring / consultations / diagnosis, based on the legislation in force;
- personal data is associated with unique identifiers for physicians, the elderly and caregivers;
- the physicians and caretakers of the elderly can view at any time his medical history, respectively his current health status;
- RO-SmartAgeing system ensures a secure manner of data exchange, which guarantees the validity of the data transmission and acceptance, the confidentiality and privacy of the elderly's personal data;
- the functions provided by RO-SmartAgeing system ensure support for personalized healthcare services as reports based on the evolution of the elderly's profile inside a smart environment, trigger alerts in case of emergencies, a database that can be analyzed with analytics tools for establishing customized preventative procedures or predictive models;
- RO-SmartAgeing system is designed to allow an easy integration with other systems from the Romanian Unique Integrated Information System (SIUI), in accordance with standards such as HL7 and applicable legislation;
- the architecture of RO-SmartAgeing system is designed to be scalable with modular functionality.

By implementing the project "Non-invasive monitoring system and assessment of the health of the elderly in a smart environment" (RO-SmartAgeing)" the following outcomes will be achieved: increased quality of life of the elderly by providing smart non-invasive remote services such as: monitoring, diagnostics, assistance for daily activities, trigger alerts; improved knowledge in the field of non-invasive smart services for the elderly, in the analysis and modeling of health and quality of life in relation to health, in evaluating the acceptance and usefulness of technological solutions in the field of healthcare.

The personalized smart environment for an elderly patient that is developed in this project integrates IoT technologies (physiological, motion and environmental sensors), data analytics and cloud computing technologies, interconnected digital devices able to provide services for sustaining the well-being of the elderly, continuous and remote monitoring of his daily activities, health status and safety (Alexandru and Coardos, 2018).

b. Added value of microservices to RO-SmartAgeing system

The main beneficiary of RO-SmartAgeing system is an elderly person. As it is known, an elderly is a person that may suffer from multiple diseases in different stages and might have different cognitive and physical age-related dysfunctionalities. In the same time, the type of disorders and the degree of dysfunctionalities is different and completely variable from one person to another. The reactions to a standard therapeutic protocol or preventative method are also distinct. Therefore, all these dissimilarities should be tackled in a customized manner in order to reach the best health outcomes.

RO-SmartAgeing aims to deliver personalized support for healthcare services, and thus the microservices approach matches perfectly to its objective and provides the necessary capabilities to build it.

The proposed architecture (see Figure 2) is designed around a group of loosely coupled microservices that allow an increased scalability, portability and maintenance of the system. Containers are associated to microservices for a faster and easier development, or cloud migration.

The microservices-based architecture of RO-SmartAgeing grants to this system some specific features like agility and scalability (as it can be easily adapted to different elderly persons), composability (it can be reused in reduced time), independent manageability (for every component), or increased efficiency.

Data Collection Layer has the purpose to create the framework for gathering the input data from physiological, motion and environmental sensors / IoT, from additional information given by the elderly himself (for instance, about his lifestyle or accidental behavior), or by the current physicians and caretakers.

The data is taken over by *API Gateway* and sent to *Data Analyzing Layer* where distinct microservices parse, validate, process and prepare it to be stored. REST API calls based on HTTP protocols were chosen for the communication model.

Data Storage Layer sets up specific tools for managing data, as a database storage engine, log files, etc. Data management is decentralized as each service uses its own database.

Figure 2: The architecture of RO-SmartAgeing system highlighting the microservices approach

Service Layer is the level where there are a flexible number of microservices with a single associated business task. They can be replicated for another business task, as it might be the management of different data gathered by another type of sensor.

Presentation and Application Layer includes all the patient-centric applications like patient health management, diagnostic support services, behavioral monitoring, predictive models for preventative health protocols, triggered alerts.

The *Container Orchestration* goal is to automate all the issues associated to coordination and management of the containers and their dynamic environment.

Each microservice is structured on several layers: Data Access, Business Logic, API Interface and User Interface. The API layer enables the client request to reach the microservice and the communication among microservices. The Business Logic layer deals with a unique functionality/task.

Each microservice can be written in a different programming language that best suits the envisaged functionality.

As each microservice is loosely coupled, it can be isolated, debugged or replaced without affecting the functionality of RO-SmartAgeing system. This resiliency feature is particularly useful for the remote monitoring that implies attentive and accurate continuous connection with the elderly patient. If something gets wrong somewhere along the flow of data management (from collecting it, till providing insights from it), the identified microservice is isolated, but the rest of monitoring process goes on unaffectedly.

Conclusions

The increasing advances and availability of digital technology and the growing engagement of the nowadays patients in the management of their health status have imposed the need to identify new ways to develop faster more personalized healthcare applications. Microservices have emerged as a dynamic answer for minimizing the limitations of monolithic architectures. Their associated features have made them appropriate for better development and deployment of eHealth solutions, including those with a patient-centric approach. This paper was intended to demonstrate the potential brought by microservices to the development of patient-centric eHealth solutions and the fact that they are consistent with the outcomes generated inside an underdevelopment research project, RO-SmartAgeing.

RO-SmartAgeing system is currently designed by a team from ICI-Bucharest in an ongoing research project (2019-2022) and it is in its third phase of development, i.e. the general architecture design. Taking into consideration that the elderly usually have manly co-morbidities and the fact that those can degenerate in quite short and unpredicted period of times, RO-SmartAgeing team has designed the architecture of the system so as to make it agile, adaptable, scalable and easily to be personalized according to the particularities of a specific elderly person, his/her lifestyle and home environment. RO-SmartAgeing system will be further developed and changed (if necessary) in the next phases of the project taking into account the emerging technologies that might become available.

PGNiG SA as a Leading Enterprise in The Fuel and Gas Sector in the Polish Economy

Ewa BABUSKA

Cracow University of Economics, Cracow, Poland
babuskae@uek.krakow.pl

Abstract

The purpose of this article is to present the financial situation and the development prospects of PGNiG SA (Polskie Górnictwo Naftowe i Gazowe Spółka Akcyjna [Polish Oil and Gas Joint Stock Company]) as a leading enterprise in the fuel and gas sector in the Polish economy. The novelty of the article consists in diagnosing the state of the Polish economy during the ongoing systemic and economic transformation. The author puts forward the thesis that the driving force behind the development of the Polish economy are strong enterprises of strategic importance for the Polish state and with a large share of the State Treasury, such as PGNiG SA.

Keywords: Polish Economy, Financial Statements And Their Analysis, Energy Security, Oil And Gas.

JEL classification: G30, G39, M41

Introduction

The strength and stability of a country's economy depends on many factors. One of them are big and strong enterprises of strategic importance which constitute a driving force for the economy. In Poland, PGNIG SA (with 71.9% of its shares owned by the Treasury) can be seen as a model example of such enterprises. The company operates in the oil and gas sector and its mission is to ensure Poland's energy security and prevent the country from overreliance on gas supplies from only one source. The situation of this company was assessed on the basis of financial statements and their analysis. The novelty of the article consists in painting the picture of the financial situation of PGNiG SA as a company of strategic importance for Poland against the background of changes in the Polish economy and in terms of its future development. The limitation of this article lies in focusing the whole research on only one Polish company and conducting only a preliminary analysis of the company's financial statements.

The characteristics of the Polish political transformation and the Polish economy

The Polish economy has been undergoing the system transformation since 1989, moving from socialism to capitalism, from the so-called "planned economy" to the free market economy. The socialist system was imposed in Poland after the World War II, when the country was incorporated into the Eastern Bloc, dominated by the USSR. The transformation period has not finished yet and has brought all kinds of defects, mistakes, scandals and costs, but also numerous advantages and social, economic and political benefits. On 1st May 2004 Poland joined the European Union in order to be able to act in the community of the European states and in the common European market, as well as in order to regain its due place in Europe, to which it has belonged for a thousand years. The accession was preceded by long-term pre-accession negotiations and depended on Poland's ability to meet numerous requirements. The EU was enlarged not only by Poland, but also by the Czech Republic, Hungary, Slovakia, Estonia, Lithuania, Latvia, Slovenia, Malta and Cyprus. Only the last three countries did not have the socialist economy. Among these countries, Poland is the largest. The 16th anniversary of Poland's accession to the EU, which was celebrated in 2020, provides an opportunity for summarizing the costs and the benefits of this deed and for reflecting on the state of

the Polish economy, but this aspect, though largely determining the Polish economy, lies beyond the framework of this article.

The problems of the Polish economic transformation have been analyzed by many Polish economists and their evaluations have always differed significantly. The main authors include, most of all, the transformation author, L. Balcerowicz (1992, 1997) and critics of the course adopted in the transformation: G.W. Kołodko (1990, 1992, 1999, 2007) and T. Kowalik (1997, 2007). A critical evaluation of the transformation was also presented by W. Kieżun (2013), who pointed at a number of pathological phenomena in the Polish transformation. The above mentioned author believes that it was a mistake to open wide the borders for trade, especially for free import as a way of fighting inflation, which, in the situation of great imbalance between the internal market and the global market, led to the bankruptcy of many domestic producers and to the liquidation of the Polish industry and a quick growth of unemployment. It was also a mistake to leave the overwhelming majority of the domestic bank sector to foreign capital. Jarmołowicz and Piątek (2013) presented theoretical foundations of the economic transformation and showed the course and the results of the shock therapy on the example of Poland. Another evaluation of the transformation, 25 years after its implementation, was presented by S. Gomułka (2016), who discussed positive and negative effects of the transformation to the market economy. He stated that some popular and negative evaluations of the transformation simply contradict the facts. He also indicated the reforms and policies that are necessary for Poland to continue the process of catching up with the most advanced countries in order to bridge the civilization gap. In a wider context and a longer time horizon, the Polish economic system was described by S. Swadźba (2007, 2009, 2019). The Polish economy was also analyzed by foreign authors. The work by Andreea N. Kiss, Wade M. Danis, S. Tamer Cavusgil (2012) on international research on entrepreneurship in emerging markets shows that emerging economies comprise various countries in terms of geography and development level. The research on entrepreneurship conducted in 51 emerging economies indicated that the most frequent ones were in China (23), Russia (14), Poland (11) and Taiwan (10). The greatest attention was paid to Europe and Central Asia, with the most frequent research being conducted in Russia, Poland and Hungary, then in East Asia and in the Pacific, where the research on China, Taiwan, South Korea and Singapore dominates.

On the other hand, the underground gas storage containers and their role in ensuring energy security were presented by S. Nagy and J. Siemek (2009). The influence of the liquefied natural gas terminal on the distribution network and gas bunkering in Poland was discussed by E. Chłopińska and M. Gucma (2018). The Polish gas market was compared to the European markets by G. M. Niewiński, K. Badyda and J. Kopałka (2017). Poland's energy security and the opportunities, threats and tasks it brings were analyzed by K. Czerniewicz (2015). The causes of the decreasing gas prices were discussed by T. Furman (2019). Also the www.pgnig.pl website provides a lot of information on the gas market in Poland. We can ask about the state of the Polish economy today, over 30 years after the political and economy transformation. What type of economy can it be classified as: the developing economy, the emerging one or the advanced economy? The division of economies into developing, emerging and advanced economies was applied by Colwell and Narayanan (2010) in the presented model of conditional entrepreneurship policy. For each of the distinguished economies they proposed a transformation policy and a policy of improvement and described activities implementing these policies. The state of economic development, whether it is an economy at an early stage of development (developing), an economy at a higher stage of development and thus an emerging one (promising growth), or an already advanced economy, is determined, inter alia, by the pursued entrepreneurial policy. A brief description of these entrepreneurial activities for individual economies is presented in Figure 1 below.

Figure 1: Division of economies in connection with entrepreneurship policy

Source: Own elaboration on the basis Colwell, K. & Narayanan, V.K. (2010), p. 300.

In September 2018 the Polish economy was officially considered the advanced economy in the FTSE Russell index (belonging to London Stock Exchange – LSE), where it was positioned on the 23rd place. FTSE Russell stated that the index of advanced markets includes 37 Polish companies. PKO Bank Polski is in the group of large companies. Medium companies include: PKN Orlen, Grupa Lotos, PGE, PGNiG, KGHM Polska, Bank Pekao, PZU, BZ WBK, mBank, LPP, Dino Polska, CD Projekt, Cyfrowy Polsat. Among small companies we can find: Bank Millennium, AmRest Holdings, Bank Handlowy. JSW, Alior Bank, CCC, Play Communications, Orange Polska, Grupa Azoty, Enea, Tauron Polska Energia, Kernel Holding, Kruk, Asseco Poland, Budimex, Eurocash, Ciech, Energa, PKP Cargo, Lubelski Węgiel Bogdanka, GPW, Boryszew, Neuca. Poland had waited for this promotion since 2011. This is the result of the continuous growth of the capital market in the country and the constant growth of the GDP. Thanks to it, Poland has become the biggest economy in Central and Eastern Europe and the only economy in the region classified as an advanced market (2018). [Online]. https://www.money.pl/gospodarka/wiadomosci/artykul/dolaczylismy-do-elitarnego-grona-polska,23,0,2416663.html

Along with obvious benefits, this situation may also bring some threats, since in the previous group of economies Poland was the leader and now it is at the end of the list. In the author's opinion, advanced economy is one in which there is a large share of processed products intended for the acquired markets. It is an economy that has something to export and the customers to buy it, and the Polish economy currently does not meet these requirements. This issue, however, remains open for discussion and is well beyond the scope of this article. Since the Polish economy officially joined the group of advanced economies, it has been widely accepted that it can develop thanks to strong domestic enterprises of strategic importance. The article puts forward a thesis that the essential catalysts of the Polish economy development are big and strong national enterprises of strategic significance, such as companies from the “fuel and gas sector”, including PGNiG SA. This company should guarantee energy security of Poland, therefore its asset and financial situation and its financial results, obtained from the published financial reports, as well as the prospects for its activities, shall be presented in this article as the justification of the proposed thesis.

PGNiG SA analysis and assessment based on financial statements and market data

Thanks to a detailed description of the company's real condition, financial statements create a strong basis for thorough control and analysis of its operations as well as for formulation of conclusions, assessments and forecasts as to its future. The aim of these statements is to show the financial position of the company, according to the primary accounting principle of true and fair view. The general purpose of financial reporting has been formulated in "Conceptual assumptions for financial reporting" and the purpose of financial statements in IAS 1. Both regulations relate to the usefulness of financial information, the former describes this feature for investors, lenders and other creditors (IFRS, 2016, par.C1, p.34) and the letter for a wide range of users (IFRS, 2016, par. 9, p.844).

Financial statements are used to disclose the financial results of the company's operations that have their origin in changes in the value of assets and capitals (funds). A financial report is an ordered collection of information about the company's situation, prepared for a given period using the required formulas for description and presentation, based on data from entries in the accounting books. The basic financial statements under the Polish Act on Accounting are: balance sheet, profit and loss account, additional information, and in addition the cash flow statement and statement of changes in equity. Additional statements become mandatory for entities subject to the annual audit of financial reports (Act on Accounting, art. 45 item 2 and 3). Financial reports are also submitted to the relevant court register and made available and announced (Act on Accounting, Art. 69, 70 and 70a). Financial statements, together with accounting records (bookkeeping) and cost calculation, constitute an integral part of accounting and are its final product. The accounting discipline itself can be considered as theory (Hendriksen, van Breda, 2002, pp.37-44). Accounting is now considered social and applied science, i.e. it is not pure theory or art (Jaruga, 1991, pp.12-13).

In this empirical part of article, following a brief description of the financial statements, I analyzed the financial statements of PGNiG SA for the 2014-2018 period. In order to conduct the preliminary analysis of the financial statements and to present the results of the research in a more convincing way, I made some tables containing appropriate reported data in PLN million and the calculated analytical ratios. I analyzed balance sheets (reports on financial situation), profit and loss accounts and cash flow statements of PGNiG SA for the 2014-2018 period.

Then the following detailed research theses were adopted: 1) the political and economic activities of the European countries and the risk posed by oil and gas prices in the world exert significant influence on the company activities, 2) aiming at ensuring Poland's energy security, PGNiG is involved in investment activities, thanks to which it consolidates its position in the domestic market and implements the strategies of entering foreign markets. The proposed theses were positively verified on the basis of the analysis of changes in the prices of oil and natural gas in recent years, on the basis of the analysis of financial indicators, and also by examining the investment activity shown in the cash flow statements and the analysis of the current political and economic events.

Below the reader can find three tables (No 1, No 2 and No 3), containing PGNiG SA balance sheets, profit and loss accounts and cash flows in the 2014-2018 period. Table 1, presenting the preliminary analysis of assets and liabilities, shows us that on 31st December 2018 the balance amount was PLN 36,993 million and was the highest in the analyzed period. It increased by 10.6% compared to the balance amount as of 31st December 2017, which amounted to PLN 33,447 million and was the lowest in the analyzed period. The amount from 2017 was 6.5% lower than that at the end of 2016, reaching PLN 35,769 million and 3.7% higher than the balance amount at the end of 2015, which was PLN 34,489 million. The balance from 2015, on the other hand, was 2.5% lower than the amount of PLN 35,356 recorded at the end of 2014.

The PGNiG SA assets oscillate around PLN 35 billion. The fluctuations observed in the sum of assets and liabilities were not high. Fixed assets of the balance sheet account, on average, for 70% of the balance sum, whereas the current assets – 30%. The sum of fixed assets in 2018 was PLN 25,742 million and compared to 2017 it grew by 6.2%, whereas in previous years there had been some decreases. The biggest share of fixed assets in 2018 (just like in previous years) was occupied by tangible fixed assets, interests and shares, as well as loans granted. The current assets in 2018

accounted for 30.4% of the balance sum (in 2017: 27.5%, in 2016: 28.0%, in 2015: 25.1%, in 2014: 22.8%). The current assets value grew from PLN 7,969 million in 2014 to PLN 11,251 million in 2018, which constitutes a 41% rise. The biggest share in the current assets in 2018 was occupied by cash and other monetary assets (8.5%), stocks (7.30%), receivables (6.40%), cash pooling (4.90%). The granted loans, derivative finance instruments and other financial assets had a relatively small share in the asset structure.

In 2018, the liabilities structure was composed in 78% by own capital, 8% - long-term liabilities and 15% - short-term liabilities. The share capital grew from PLN 23,780 million in 2014 to PLN 28,833 million in 2018, which constituted a 21% growth. The own capital is composed of share capital and reserve capital from sales of shares above their nominal value and in the overwhelming part – retained profits.

Source: Own elaboration on the basis of single financial statements of PGNiG SA for the 2014-2018 period.

Table 2 presents the preliminary analysis of the profit and loss account in PGNiG SA for the 2014-2018 period. We can see that the company presents the profit and loss account in the comparative variant. As sales revenues it distinguishes between revenues from sales of gas and other revenues. Other operating revenues and costs, as well as financial revenues and costs are presented in one column, without marking these groups. In the whole analyzed period the company had net profit, the biggest one – PLN 3,289 million in 2018, then PLN 2,576 million in 2017, and the lowest one – PLN 1,472 million – a year earlier.

Revenues from sales from 2014 to 2016 showed a downward trend, just as costs by nature and total costs, other operating revenues and costs, as well as financial revenues and costs. Revenues from sales fell in 2016/2015 period by 7.8%, whereas in the 2015/2014 – by 21.5%. 2017 marked the increase in the revenues from sales by 10.9% compared to 2016, and in 2018 – by 17.2% compared to 2017. In 2018 revenues from sales amounted to PLN 22.344 million, but did not reach the level of 2014 – PLN 23,738 million. The revenue structure is dominated by the revenues from sales of gas, accounting for over 80% in all analyzed years (the lowest ratio – 80.8% was in 2016, the highest – 84% in 2014). The highest revenues from sales of gas, PLN 18,349 million, were recorded in 2018, including methane-rich gas – PLN 17,067 million. In 2016 PGNiG SA started selling this gas outside Poland, therefore revenues from such sales grew significantly. The second strategic product is nitrogen-rich gas, with its sales in 2018 amounting to PLN 1,396 million. The revenues from sales of other services, products, goods and materials in the analyzed years did not reach 20%; in 2018 they accounted for 17.9% of all revenues. The biggest revenues in this group are obtained by the company from the sale of electric energy and crude oil with gasoline and the right to use the storing installations. Other services include sales of gas, maintenance, transport, geology, mining services and renting real estate properties.

The most important cost item is the cost of the sold gas, which covers the cost of purchasing gas, both in Poland and abroad, part of system and transaction costs, costs of excavating gas and removing nitrogen. The cost of the sold gas reveals a strong correlation with the revenues from the sales of gas and, analogically, it fell in 2015-2016, only to increase in 2017-2018. The share of this cost in the revenues from the sales of gas was: 69.4% in 2014, 78.4% in 2015, 72.4% in 2016, 77.2% in 2017 and 79.9% in 2018. The second biggest cost item is the consumption of other raw materials and materials. These are mostly costs of energy used for trading purposes, and also other raw materials and materials. These costs were kept on a similar level in 2014-2015, but grew significantly in 2016 (by 33.8% compared to 2015), whereas their growth in 2017/2018 amounted to 27.7%, and in the 2018/2017 period – 15.6%. On the other hand, the costs of transmission, distribution and storing services, which decreased significantly from PLN 3,341 million in 2015 to PLN 1,171 million in 2014 (by 65%) in the next years oscillated around PLN 1 billion. The costs of other outside services are most of all costs of re-gasification[1], costs of written off negative drills, costs of other geological, search, renovation and exploitation services, etc. The company also obtained high revenues from dividends from affiliated entities.

Table 3 presents the cash flows in PGNiG SA in the 2014-2018 period. The company makes the report on cash flows using the direct method[2]. In all analyzed years net profit was shown. This profit was corrected in cash flows from operating activity with standard corrections. The flows from the company's operating activity were positive each year. They were mostly affected, apart from the financial result, by interests and dividends. Other important items also included: results of the investment activity and depreciation. The financial result in operating activity flows was in 2018 corrected by -PLN 601 million, in 2017 by –PLN1,172 million, in 2016 by –PLN74 million, in 2015

[1] The appearance of the re-gasification costs in 2016 was associated with the opening of the LNG terminal in Świnoujście and the contract concluded with Polska LNG SA, valid until 2034, according to which PGNiG undertakes to restore the gas from the liquefied to the gas form.

[2] Cash and other monetary assets shown by PGNiG in the report on the cash flow at the beginning of the period differ from the balance of cash and monetary assets at the end of the previous period. There is also a difference between the state of the funds shown in the report on cash flow and the balance of the funds in the report on the financial situation. The difference is attributed to the contract signed in 2014 on managing cash inside the group (the cash pooling contract).

by –PLN1,015 million and in 2014 by –PLN2,087 million. The positive cash flows from operating activity must be interpreted positively, especially as PGNiG SA has an established position in the market and has been a major player in this market for many years. Positive flows from operating activity occur in all analyzed years, therefore we cannot claim the company ever had, even temporary, financial problems.

The cash flows from investment activity were positive in 2018 and 2015, and negative in 2017, 2016 and 2014. In 2018 the balance was PLN 644 million. The biggest revenues came from the dividends from affiliate entities (PLN 1,726 million) and from given loans (PLN 943 million). The biggest expenditure was incurred for giving loans (-PLN 914 million) and for tangible fixed assets related to seeking and evaluating mineral deposits (-PLN 835 million), but also for intangibles and other fixed assets (-PLN 379 million). The net cash flows from financial activity in all analyzed years were negative, however, in 2018 they amounted to only –PLN 138 million, whereas in 2017 they were –PLN 4,017 million, in 2017 –PLN 2,001 million, in 2015 –PLN 1,530 million and in 2014 –PLN 2,149 million. This type of flows is mostly affected by the dividend, which was paid out in each analyzed year. The total net cash flows should also be evaluated as beneficial. In 2018, 2016 and 2015 they were positive, whereas in 2017 and 2014 they were negative. The highest positive flows – exceeding PLN 3 billion – were reported in 2015 and 2018. The negative flows in 2017 resulted from the lowest in the whole analyzed period, though still positive flows from operating activity (PLN 862 million) and the highest negative flows from financial activity in the whole period (-PLN 4,017 million) due to repayment of credits and loans in the amount of PLN2,152 million. In 2014 the total net cash flow was –PLN 12 million. However, taking into account the high flows from operating activity and the expenditure on investment and the fact that a significant item then was the expenditure on buying out debentures, the negative net cash flows in 2014 definitely do not reveal the bad situation of the company. Moreover, in each year the company obtained a positive financial result. This is a very beneficial situation, taking into account positive cash flows from operating activity in all analyzed years. This means that the company is profitable in conducting its core operating activity and also obtains profit, taking into account all investments and expenditure and revenues from the financial activity.

The financial situation of PGNiG SA is also affected by economic and political factors. There is no doubt that such a large company is susceptible to external risks, which may appear in the next years and which cannot be identified directly from financial reports. Such risks may significantly affect the financial and asset situation of the company. The financial situation of PGNiG SA may largely depend on trends on the natural gas and crude oil markets. Figures 2 and 3 show the prices of natural gas and Brent crude oil – we can observe high fluctuations of rates over the past ten years 2010-2020, but there is a clear downward trend. Comparing May 2010 to May 2020, the price of natural gas fell by 52,58%, whereas the price of crude oil – by 49,03%. The two figures show heavy dependence of PGNiG SA on changing prices on raw material markets. The most profitable segment of the activity is trading and storing (82% of total revenues from sales). As we can see from the financial report data, revenues from sales are decreasing and the volume of natural gas sales is growing – this clearly confirms the influence of prices in the natural gas market. In conclusion, we can say that the financial situation of the company depends heavily on the prices of natural gas in global markets.

Figure 2: The price of natural gas in USD/million BTU

Source: Own elaboration.

Figure 3: The price of Brent crude oil in USD/barrel

Source: Own elaboration.

PGNiG SA is a strategic company belonging to the Treasury and the most important company for the energy security of our country. The Yamal-Europe pipeline, connecting Europe and the Russian Yamal peninsula, where natural gas deposits are located, goes through Poland. PGNiG owns 48%

shares in the company which owns EuRoPol GAZ S.A. pipeline. The same percentage of shares is owned by the Russian state concern excavating natural gas – Gazprom. This means that PGNiG must cooperate with the Russian enterprise. The construction of the Nord Stream 2 pipeline constitutes a major threat to the company. In 2010 the Nord Stream pipeline was opened, connecting Russia and Germany. It omits Poland, going straight through the Baltic Sea. Even that pipeline accounts for the deterioration of the energy security of our country – Poland must obtain hydrocarbons in the East as its own supplies are not sufficient (Czerniewicz, 2015). The agreement, thanks to which the construction of Nord Stream 2 was to start, was signed in 2015. The construction was objected by the Polish Office of Competition and Consumer Protection in 2016. However, this did not stop the plans of building another line of the pipeline. Nord Stream 2 was to be put into use at the end of 2019, but its construction has not yet been completed and is being prolonged due to many reasons, including political ones. The Nord Stream 2 gas pipeline may pose a significant threat to PGNiG SA, which wants to diversify its sources of gas and oil supplies not only from the east but also from other directions, including the north and west. Focusing on one source of supply of such important raw materials as crude oil and natural gas is not desirable by PGNiG SA, as it may cause economic dependence. The goal of this company is to obtain supplies of raw materials from various sources. Lower diversification of the sources of supplies by concentration on one supplier may lead not only to economic overdependence, but also to political one. It is important, therefore, to keep the gas bunkers full – in Poland at the end of 2016 the level of gas filling was 77%, whereas the European average was 66% (The Report of the Board of PGNiG S.A. and GK PGNiG S.A. for 2016. PGNiG SA faces a daunting challenge of maintaining gas supplies, becoming the company which does not pursue the financial result growth, but which ensures energy security for Poland.

The construction of another line of the Nord Stream pipeline should provide the Company with some impetus to make new investments and, as a result, to become more independent of external supplies. Due to natural reasons, which are beyond the control of PGNiG, it is practically impossible to increase production in the domestic market. It is hard to expect the discovery of new gas deposits, but the works on the already developed deposits can be expanded. A good solution here could be to develop production in other countries. The PGNiG Capital Group invests in deposits in other countries, namely in Norway, Pakistan, Libya, Germany and Iran. It also conducts seismic work in some European and African countries. The investment expenditure in the search and excavation segment in Poland in 2016 amounted to PLN 830 million, whereas projects implemented in Norway cost PLN 343 million. The shares in search and excavation concessions in the Norwegian Sea, the Northern Sea and the Barents Sea are owned by PGNiG Upstream International, which is owned in 100% by PGNiG. In the context of the efforts made to become independent from external sources of supplies, investments in deposits in Poland and Norway must be evaluated positively.

Conclusions

Based on the review of PGNiG SA financial statements for the 2014-2018 period, the financial situation of the company was evaluated as positive, the company assets have been increasing, reaching now the value of PLN 36,993 million. In all the analyzed years the company generated net profit – the highest in 2018 – PLN 3,289 million. In each analyzed year the company achieved substantial positive flows from its operational activity, which confirms its good financial standing. In 2018 net cash flow was positive and amounted to PLN 3,164 million, of which the flow from operational activity was PLN 2,658 million and from investment activity – PLN 644 million, compared to negative flow from financial activity – minus 138 million. Such relations between the flow directions in particular types of activity indicate the mature stage of the company operations and the assessment of its situation caused by cash flow. The earned profits and the means from positive cash flows are allocated by the company for investment and for payments of the dividend to its shareholders. The financial indicators are generally correct, the solvency ratios demonstrate that the company is able to pay its current liabilities. I also checked how the price of natural gas in the markets accounted for the decreasing revenues from sales in 2014-2016. This only confirms the significant influence of market prices of gas on revenues from sales and the serious risk over which the company, unfortunately, has no influence. Nevertheless, since 2017 the revenues from gas sales have been growing and in 2018 they amounted to PLN 18,349 million. To conclude, the financial

situation of PGNiG SA can be evaluated positively. PGNiG SA is a strategic company owned by the Treasury and exerts the greatest influence on the energy security of Poland. The completion of the Nord Stream pipeline and the plans to build the second line – the Nord Stream 2, encourage the Board to invest – not only in utilizing the deposits in Poland, but most of all – abroad. The aim of the company should not be only to obtain profits and positive cash flows, which was accomplished in the analyzed years, but most of all to ensure the energy security of Poland. The investment in the Norwegian deposits should be viewed positively, especially in the context of the threat of the Russian gas blackmail. Also the talks with Norway and Denmark concerning the construction of the Baltic Pipe must be seen as a positive aspect. The pipeline will allow the Company to transport gas directly from the deposits of the Norwegian continental shelf (where PGNiG has obtained concessions for exploitation) to Poland. Thanks to this, Poland will not be dependent on the Russian supplies which should lead, inter alia, to greater competition in the European market and thus to cheaper gas for domestic clients. Therefore it is necessary to conduct investment activities aimed at building the Baltic Pipe and to monitor continuously the construction of Nord Stream 2. Poland lies in the middle of Europe, so we can make a final conclusion that a strong Polish state and its stable and dynamically developing economy can guarantee the strength and development of other European countries and the whole of Europe. However, it should be also noted, that in the current situation of the announced Covid-19 pandemic, the Polish economy has slowed down a bit, like other world economies, and has to make up for losses and meet new challenges in order to return to its normal state and pace of development.

Selection of Optimal Water and Sewage Infrastructure Development Project Under The Idea of Smart City

Dorota GAWRONSKA

Silesian University of Technology, Faculty of Organization and Management, Zabrze, Poland

dorota.gawronska@polsl.pl

Abstract

This article presents the hierarchical structure of EU criteria in the field of Green Public Procurement (GPP) with regard to environmental protection. The presented criteria are recommended when awarding public contracts for water and sewage infrastructure projects, however the choice of these criteria is left in line with the project goal. Based on the adopted criteria, a multi-criteria project evaluation model was presented, taking into account the importance of individual criteria. On the basis of the model constructed in this way and the assumptions made, it is possible to simulate optimal solutions and, as a result, thoroughly analyze the projects and determine the optimal design.

Keywords: Multi-Criteria Programming, Water And Sewage Infrastructure, Smart City

Introduction

Nowadays, great emphasis is placed on the use of the latest technologies in such a way that they serve the city residents best and facilitate their everyday life: universal access to information about the city, quick settlement of matters in offices, efficient public transport, the safety of city residents, etc. this is the intensive increase in the population in the largest cities, which in turn generates new tasks related to the maintenance and planning of technical infrastructure. Technical infrastructure by Borcz (2000) "is a set of basic facilities, equipment, and installations, such as roads, bridges, energy, and telecommunications networks of a service nature, indispensably needed for the proper functioning of society and production sectors of the economy". Technical infrastructure includes transmission networks and related facilities providing the necessary services for a given spatial and economic unit in the field of energy, heat, water, sewage and waste disposal, transport, etc. By Rutkowska G. (2007) "technical infrastructure consists of all types of transport, energy and communications systems and water and sanitary facilities, which include: roads, bus stops, railways, stations, river and seaports, gas, power, drainage network, telecommunications and post facilities". One of the essential elements of technical infrastructure is water and sewage infrastructure in spatial development plans of cities, municipalities, and villages. It conditions the quality of life of the inhabitants and influences the social and economic development of these regions.

The current proposal to solve the issue of municipal infrastructure is the idea of Smart City. Technological facilities of water and sewage infrastructure cannot be only elements of the urban structure that carry out separate tasks. They should implement new IT and exploitation and management technologies, as well as should be designed as firmly integrated elements of one managed structure to improve the quality of life of residents without excessive burdening the environment: the systematic raising of requirements for the quality of water treatment and the degree of wastewater treatment, taking into account free-market economy, low service costs, high quality of operation. Companies providing water and sewage services should look for technological and technical solutions aimed at highly active water and wastewater treatment that affect faster socio-economic development. One of the answers are:

1. increasing the technological and functional efficiency of the treatment plant

2. implementation of technical solutions ensuring low energy consumption and recovery of part of energy in the technological process

3. minimizing the volume of sludge after the end of the technological process

4. proper municipal waste management - e.g., joint processing of sludge from water treatment with sludge from sewage treatment plants, sewage sludge with municipal or industrial waste.

This article presents the hierarchical structure of EU criteria in the field of Green Public Procurement (GPP), the use of which is recommended when awarding public contracts for water and sewage infrastructure projects (Urząd Publikacji Unii Europejskiej (2013)). GPP criteria should be seen as an opportunity for wastewater management authorities to build and use water and wastewater infrastructure in an environmentally friendly way. Public authorities do not have to implement all the criteria. They can analyze the whole set of rules and identify those that are relevant in the context of a given project.

Model of Assessment

Assessment models are often developed to identify the evaluation of complex projects to determine which of the proposed projects that best meet the criteria. They are usually prepared at the initial stage of the project and then improved, up to the award stage.

This part of the article describes an exemplary model of project evaluation from the water and sewage infrastructure at the offer evaluation stage. It is a proposal dedicated to supporting the qualification process of infrastructure projects. This model takes into account economic, technical, and environmental criteria that the public authority can apply when awarding the contract for water and sewage infrastructure facilities. This model takes into account the variability of weights of individual rules and sub-criteria. The final choice of criteria and the importance of different elements depends on local conditions and the priorities of the contracting authority.

The hierarchical structure of the criteria is presented below (by Urząd Publikacji Unii Europejskiej (2013)):

1. Financial evaluation - one of the variants of cost evaluation presented in items 1.1-1.3 may be chosen for the economicassessment. The assessment against this criterion may be an assessment expressed in monetary units or points.

1.1. The cost of construction, operation, and maintenance
1.2. Standard LCC
1.3. Environmental LCC
2. Technical evaluation
2.1. Process and technology of wastewater treatment
2.1.1. Proven technology
2.1.2. Reliability
2.1.3. Flexibility to handle different amounts and quality of input sewage
2.1.4. The scope and quality of the process and efficiency guarantees
2.2. Plant and equipment
2.2.1. Equipment quality and performance
2.2.2. The look and layout of the plant
2.2.3. Ease of use and maintenance
2.2.4. Processcontrol and automation
2.3. Other environmental impacts
2.3.1. Environmental management plan (EMP)
2.3.2. Architectural design and visual effect
2.3.3. Odorcontrolmeasures
2.3.4. Noise control measures
3. Environmental assessment
3.1. The efficiency of wastewater treatment

3.1.1. The purification efficiency of the total nitrogen content
3.1.2. The purification efficiency of the complete phosphorus content
3.1.3. The efficiency of purification from lead and its compounds
3.1.4. The effectiveness of purification from mercury and its compounds
3.1.5. The efficiency of purification from nickel and its compounds
3.1.6. Purification efficiency of di (2-Ethylhexyl) phthalate (DEHP)
3.1.7. Naphthalene purification efficiency
3.1.8. Efficacy of purification from nonylphenols and octylphenols
3.1.9. The efficiency of purification from benzo (a) pyrene (representative of polycyclic aromatic hydrocarbons (PAHs))
3.1.10. The effectiveness of purification from tramadol and primidone
3.1.11. Efficacy of purification from pathogens
3.2. Energy performance requirements
3.2.1. Total energy consumption per m3 of wastewater
3.2.2. Energy consumption by aeration systems (kg of oxygen introduced into water per consumed kWh)
3.2.3. Sludge dewatering equipment (kWh per tonne of dewatered sludge)
3.3. The efficiency of flue gas purification - point assessment of this criterion granted depending on the percentage level indicated in legal regulations
3.3.1. Purification efficiency (energy consumption per tonne of sludge)
3.3.2. The efficiency of nitrogen dioxide purification
3.4. Other - the number of points awarded depending on the percentage level indicated in legal regulations
3.4.1. Total water consumption
3.4.2. Consumption of coagulants

A Hierarchical Model of Evaluation of Water and Sewage Infrastructure Projects

Based on the criteria described in point 2 papers, the following designation marks were adopted under individual rules:

1. Financial evaluation FE_i (assessment of the Level 1 criterion)

1.1. The cost of construction, operation, and maintenance FE_COM_i

1.2. Standard LCC FE_S_i

1.3. Environmental LCC FE_E_i

1. Technical assessment TA_i (evaluation of the Level 1 criterion) and its sub-criteria (Level 2)

2.1. Process and technology of wastewater treatment PT_i

2.1.1. Proven technology PT_pt_i

2.1.2. Reliability PT_r_i

2.1.3. Flexibility to handle different amounts and quality of input sewage PT_f_i

2.1.4. The scope and quality of the process and efficiency guarantees PT_sq_i

2.2. Plant and equipment PE_i

2.2.1. Equipment quality and performance PE_e_i

2.2.2. The look and layout of the plant PE_ll_i

2.2.3. Ease of use and maintenance PE_eu_i

2.2.4. Process control and automation PE_pca_i

2.3. Other environmental impacts OE_i

2.3.1. Environmental management plan (EMP) OE_e_i

2.3.2. Architectural design and visual effect OE_mp_i

2.3.3. Odor control measures OE_ad_i

2.3.4. Noise control measures OE_nc_i

3. Environmental assessment EA_i (Level 1 criterion assessment) and it's Level 2 sub-criteria

3.1. The efficiency of wastewater treatment $E-wt_i$

3.1.1. The purification efficiency of the total nitrogen content E_nc_i

3.1.2. The purification efficiency of the complete phosphorus content E_pc_i

3.1.3. The efficiency of purification from lead and its compounds E_l_i

3.1.4. The effectiveness of purification from mercury and its compounds E_m_i

3.1.5. The efficiency of purification from nickel and its compounds E_n_i

3.1.6. Purification efficiency of di (2-Ethylhexyl) phthalate (DEHP) E_di_i

3.1.7. Naphthalene purification efficiency E_np_i

3.1.8. Efficacy of purification from nonylphenols and octylphenols E_no_i

3.1.9. The efficiency of purification from benzo (a) pyrene (representative of polycyclic aromatic hydrocarbons (PAHs)) E_pah_i

3.1.10. The effectiveness of purification from tramadol and primidone E_t_i

3.1.11. The efficiency of purification from pathogens E_p_i

3.2. Energy performance requirements EPR_i

3.2.1. Total energy consumption per m3 of wastewater EPR_tec_i

3.2.2. Energy consumption by aeration systems (kg of oxygen introduced into water per consumed kWh) EPR_ec_i

3.2.3. Sludge dewatering equipment (kWh per tonne of dewatered sludge) EPR_sde_i

3.3. The efficiency of flue gas purification - point assessment of this criterion granted depending on the percentage level indicated in legal regulations EFG_i

3.3.1. Purification efficiency (energy consumption per tonne of sludge) EFG_p_i

3.3.2. The efficiency of nitrogen dioxide purification FG_n_i

3.4. Other - the number of points awarded depending on the percentage level indicated in legal regulations O_i

3.4.1. Total water consumption O_twc_i

3.4.2. Consumption of coagulants O_cc_i

The presented model assumes taking into account the importance of individual criteria and sub-criteria. To this end, variables describing the validity of the requirements have been introduced. The validity of the Level 1 criteria is presented by the Wk (*k*-Level 1 criterion) variable. It is assumed that

the validity of the requirements are specified in the range [0,1], which is related to the condition that the sum of the criteria weights must be 1.

$$\sum_{k=1}^{K} W_k = 1. \tag{1}$$

The validity of Level 2 criteria (sub-criteria of Level 1 criteria) is given in the form of a variable (*k* - Level 1 criterion, *l* - Level 2 criterion). The validity of the requirements are specified in the range [0,1], and the sum of the weightings of the rules must be 1.

$$\sum_{l=1}^{L} W_{kl} = 1.$$

(2)

The validity of Level 3 criteria (sub-criteria of Level 2 criteria) is given in the form of a variable (*k* - Level 1 criterion, *l* - Level 2 criterion, *n* - Level 3 criterion). The validity of the requirements are specified in the range [0,1], and the sum of the weightings of the rules must be 1.

$$\sum_{n=1}^{N} W_{k\ln} = 1. \tag{3}$$

This article assumes that the considered projects belong to a finite set:

$$P = \{P_1, P_2, ..., P_m, ..., P_M\}, \qquad m = 1, ..., M, \tag{4}$$

Since the values of project assessments to individual criteria are treated as the degree of fulfillment by the 1st project of a particular ideal condition within the limits of a given rule, the values of these assessments should be normalized. For the criteria whose value should be maximum to optimize the location assessment value, the normalization takes place according to the formula (5). For example, for the technical criterion assessment - process and technology of wastewater treatment sub-criterion PT_t_i - reliability, the equation describing standardization is as follows:

$$PT_t'_i = \frac{PT_t_i}{\max\ (PT_t)} \tag{5}$$

For the criteria against which the assessment should be minimized, the variables are normalized as follows (example for the criterion - construction, operation and maintenance costs - if the assessment is determined in monetary units):

$$FE_COM'_i = \frac{1 - FE_COM_i}{\max\ (FE_COM)} \tag{6}$$

After standardization, variables $PT_t'_i$ and $FE_COM'_i$ are the new binding variables respectively PT_t_i and FE_COM_i

Based on specific normed assessments against Level 3 criteria, you can then specify the total project ratings for Level 2 criteria as a weighted sum of the grades within a given group of rules.

1. Assessment against the criterion The financial rating is normalized according to the formula (5) if we are based on point grades, or according to the method (6) if we are based on cost values

2. Before determining cumulative assessments, the level 3 criteria values are normalized. Based on standardized grades, the total level 2 criteria are determined.

3. The comprehensive evaluation within the rule - Process and technology of wastewater treatment is presented below PT_i

$$PT_i = \frac{V_{211} \cdot PT_pt_i + V_{212} \cdot PT_t_i + V_{213} \cdot PT_f_i + V_{214} \cdot PT_sq_i}{V_{211} + V_{212} + V_{213} + V_{214}}. \quad (7)$$

4. Total assessment within the criterion - Plant and equipment PE_i

$$PE_i = \frac{V_{221} \cdot PE_e_i + V_{222} \cdot PE_ll_i + V_{223} \cdot PE_eu_i + V_{224} \cdot PE_pca_i}{V_{221} + V_{222} + V_{223} + V_{224}}. \quad (8)$$

5. Cumulative evaluation under the rule - Other environmental impacts OE_i

$$OE_i = \frac{V_{231} \cdot OE_e_i + V_{232} \cdot OE_mp_i + V_{233} \cdot OE_ad_i + V_{234} \cdot OE_nc_i}{V_{231} + V_{232} + V_{233} + V_{234}}. \quad (9)$$

6. Cumulative assessments under the rule: sewage treatment process and technology, plant and equipment, as well as other environmental impact factors, are then subject to standardization following formula (5).

7. Total assessment within the criterion - technical assessment (evaluation of Level 1 criterion) is a weighted assessment of standardized assessments of Level 2 sub-criteria:

$$TA_i = \frac{V_{21} \cdot PT_i + V_{22} \cdot PE_i + V_{23} \cdot OE_i}{V_{21} + V_{22} + V_{23}}. \quad (10)$$

8. Cumulative assessment under the criterion - Efficiency of wastewater treatment E_wt_i

$$E_wt_i = \frac{V_{311} \cdot E_nc_i + V_{312} \cdot E_pc_i + V_{313} \cdot E_l_i + V_{314} \cdot E_m_i + V_{315} \cdot E_n_i + V_{316} \cdot E_di_i}{V_{311} + V_{312} + V_{313} + V_{314} + V_{315} + V_{316} + V_{317} + V_{318} + V_{319} + V_{31-10} + V_{31-11}} +$$
$$+ \frac{V_{317} \cdot E_np_i + V_{318} \cdot E_no_i + V_{319} \cdot E_pah_i + V_{31-10} \cdot E_t_i + V_{31-11} \cdot E_p_i}{V_{311} + V_{312} + V_{313} + V_{314} + V_{315} + V_{316} + V_{317} + V_{318} + V_{319} + V_{31-10} + V_{31-11}}. \quad (11)$$

9. Cumulative assessment under the criterion - Energy performance requirements EPR_i

$$EPR_i = \frac{V_{321} \cdot EPR_tec_i + V_{322} \cdot EPR_cc_i + V_{323} \cdot EPR_sd_i}{V_{321} + V_{322} + V_{323}}. \quad (12)$$

10. Total assessment under the criterion - Effectiveness of exhaust gas purification EFG_i

$$EFG_i = \frac{V_{331} \cdot EFG_p_i + V_{332} \cdot EFG_n_i}{V_{331} + V_{332}}. \quad (13)$$

11. A total score under the criterion - Other O_i

$$O_i = \frac{V_{341} \cdot O_twc_i + V_{342} \cdot O_cc_i}{V_{341} + V_{342}}. \tag{14}$$

Cumulative assessments under the rule: effluent treatment efficiency, energy performance requirements, flue gas cleaning efficiency, and others are then subject to standardization following formula (5).

12. Total assessment under the criterion - environmental assessment EA_i (Level 1 criterion assessment) is a weighted assessment of standardized Level 2 sub-criteria assessments:

$$EA_i = \frac{V_{31} \cdot E_wt_i + V_{32} \cdot EPR_i + V_{33} \cdot EFG_i + V_{34} \cdot O_i}{V_{31} + V_{32} + V_{33} + V_{34}}. \tag{15}$$

Cumulative assessments under the rule: financial assessment, technical assessment, and environmental assessment are then normalized according to the formula (5). Taking into account the validity of these criteria, we determine the weighted global evaluation of projects according to the formula:

$$OG_i = \frac{V_1 \cdot FE_i + V_2 \cdot TA_i + V_3 \cdot EA_i}{V_1 + V_2 + V_3}. \tag{16}$$

Based on the algorithm presented, each project is described by a number relative to the common criterion. On their basis, it is possible to indicate a project that is the optimal project from the adopted structure of rules and the importance of standards and sub-criteria.

Summary

The paper proposes a hierarchical model of evaluation of water and sewage infrastructure development projects. The model can also be used to support the process of technical and technological development of the Smart City idea. The purpose of the work is to support the development of regions within the Smart City idea, including activities in the search for solutions aimed at highly active water and wastewater treatment, exploitation of water supply and sewage systems in connection with caring for water quality and the environment. The direction of further research will be analyzes of the relationship between the level of water and sewage infrastructure and the quality of economic and social development.

Consequences of Implementing the Industry 4.0 Concept in the SME Sector in Poland

Aleksandra CZUPRYNA-NOWAK

Silesian University of Technology, Gliwice, Poland, aleksandra.nowak@polsl.pl,
DOI: 0000-0001-8565-1029

Abstract

Industry 4.0, which is a concept of data exchange, technology, and computerization of an enterprise, becomes the basis for building a competitive advantage. It is a modern concept of enterprise automation and computerization. First of all, it is the answer to the need to adapt enterprises to the constantly changing external environment. It is a new, emerging ideology already being implemented in many enterprises. This paper presents the assumptions of the doctrine of Industry 4.0. Theoretical considerations were supported by research results on the consequences of implementing the concept of Industry 4.0 in the SME sector in Poland.

Keywords: Industry 4.0, implementation consequences, SME sector.

Introduction

The concept of Industry 4.0 appeared in 2011 in the strategy of high techniques of the German government regarding the promotion of computerization of production processes. The underlying meaning in the development of the concept was the increase in the use of information technologies in the business. Customers' requirements regarding products and their properties have become a key factor. Customers are increasingly becoming designers of their products. At the same time, demanding that its price be a price close to the price of a product produced in mass production. P. Wittbrot and I. Łapuńka (2017).

The literature on Industry 4.0 is rich, also in Poland. D. Stadnicka, W. Zielecki, and J. Sęp (2017) focus in their publication on the concept of Industry 4.0, assessing the possibilities of its implementation. J. Grzywacz also dealt with the implementation problem (2017). He presented the benefits of using Industry 4.0. There is no shortage of works comparing the achievements of Polish enterprises with enterprises of other countries. Götz M. and Gracel J. deal with such topics (2017) comparing Polish enterprises with German ones. The authors state that Polish companies still have a lot to do in the context of Industry 4.0. They emphasize that if Polish enterprises do not understand the need to implement Industry 4.0, they will lose their competitiveness in international markets within seven years. However, they note that Polish enterprises have great potential to build an economy based on Industry 4.0. They point to the most significant asset they have - young, well-educated staff. In 2019, four reports about Industry 4.0 were published in Poland. The summary of reports is presented by Z. Piątek in his publication (Piątek 2019). These reports show that more than half of Polish enterprises in Poland met with the date of the fourth industrial revolution. Many companies have already begun to implement Industry 4.0 technology solutions. A significant conclusion is that companies have specific business needs and are aware of areas that need optimization.

Until recently, Industry 4.0 was only available to large industrial enterprises. At present, enterprises belonging to the SME sector in Poland have understood that Industry 4.0 is a requirement and a necessity for them. The Simens Financial Services report shows that the "critical point" of the adaptation of new technologies, i.e., the moment when more than 50% of all producers will switch to the Industry 4.0 model will occur in the SME sector, in Poland in 9-11 years. It seems to be an extended period, but this time cannot be wasted. Industry 4.0 may turn out to be a standard business model without which enterprises will not be able to manage on the market.

The purpose of the article is to present the results of research on the consequences of implementing the concept of Industry 4.0 in enterprises of the SME sector in Poland. The author has identified four areas of influence of Industry 4.0 solutions: production speed, digitization, flexibility, and robotization of production processes.

The article consists of two parts: theoretical and practical. The theoretical part is a discussion about the idea of the concept of Industry 4.0 and the benefits of using this ideology in the enterprise. The second part is practical and relates to research that has been carried out among Polish enterprises of the SME sector in Poland.

The idea of the concept of Industry 4.0

The fourth stage of the industrial revolution that is currently taking place is identified with the concept of Industry 4.0 (Kopp 2014, Stadnicka 2017). The first industrial revolution took place in the XVII century. It was primarily associated with the use of water energy, mechanization of work, and the invention of the engine. The use of steam power was the most significant breakthrough in the history of human production. Since then, steam engines have been used in industrial production. The second industrial revolution began in the nineteenth century. Its primary manifestation was the use of electricity and assembly lines. The third generation started in the 1970s with the implementation of partial automation of production and computers. At present, the era has come, which, due to the development of new technologies, is to lead to the integration of suppliers, customers, machines, processes, systems, and products. The combination of these elements is to point to the creation of an intelligent factory. It will continually deepen automation, optimize products and processes, process massive data sets in real-time. The implementation of the idea of Industry 4.0 will allow the development of production systems that will have the ability to self-organize and self-control (Wittbrodt 2017).

It was assumed that the company according to the concept of Industry 4.0 is an information system and numerically controlled machines. Production systems due to the diversity in the industries of the term Industry 4.0 cannot be generalized. The definition of Industry 4.0 should be considered individually for each enterprise.

The concept of Industry 4.0 means full integration of the real world of production machines with the world of virtual Internet. Devices, people, and IT systems exchange information on an ongoing basis, convert data sets, make necessary decisions.

The Industry 4.0 concept uses the following technological solutions presented by Hermann et al (2015), Knop (2014) and Wang (2016):

- Internet industrial of things (IIoT),
- direct communication between machines (M2M),
- simulation techniques,
- vertical and horizontal integration of software;
- augmented reality technologies (VR);
- prognostic techniques;
- cyber-physical systems,
- autonomous robots;
- mass individualization;
- additive technique;
- innovative methods of collecting and processing vast amounts of data along with the possibility of cloud computing potential (Clouds).

The concept of Industry 4.0 includes areas associated with numerous technologies that lead to the full integration of enterprise resources better and to integrate the resources at the enterprise's disposal.

Benefits of implementing the concept of Industry 4.0

The main goal of the Industry 4.0 concept is to get a company that will be more efficient and customer-focused. The benefits of implementing the concept of Industry 4.0 in enterprises will be related to the digital transformation of production. The essential advantages of Industry 4.0 are (Hermann 2015, Piątek 2019):

– increase in efficiency,
– improving working conditions,
– better product quality, thanks to monitoring the production process in real-time,
– better process quality,
– better use of resources,
– optimization of business planning,
– increase in sales revenues,
– obtaining information about the entire production process in real-time,
– increased operational reliability,
– low failure rate,
– personalization and adaptation to the needs of customers.

Industry 4.0 solutions will have an impact on improving productivity, increasing flexibility, quality, and speed of the production process. The implementation of systems that will collect and analyze data from the entire production process affects the rate of the production process and the time of the production cycle.

Robotization of the production process, which is another element of the Industry 4.0 concept, will improve the flexibility of the production process. Intelligent control systems, smart sensor technology will result in better adaptation of the production process to changing conditions. It will also cause the possibility of rapid production change, the possibility of producing products in short production series.

Industry 4.0 solutions will also affect product quality. The use of sensors that will inform in real-time about any deviations in the production process will eliminate defective products. Ultimately, this will improve production and product quality.

Consequences of implementing the concept of industry 4.0 in the SME sector - research results

The research was carried out among enterprises of the SME sector in Poland in the period December 2019 - February 2020. 580 SME enterprises were examined. A diverse research group was taken into the sample in terms of employment and turnover. Table 1 shows the number of enterprises participating in the survey by employment size. All enterprises belong to the SME sector.

Table 1: number of enterprises participating in the study by employment size

Employment volume	Number of enterprises	%
up to 10 people	279	48,10%
from 10 to 49 people	221	38,10%
from 50 to 250 people	80	13,79%
Sum	580	

Source: Own study

48,10% of the surveyed enterprises are micro-enterprises employing up to 10 employees. 38,10% of the surveyed enterprises employ between 10 and 49 employees. 13,79% are enterprises operating between

In the first question, the respondents were asked to answer the question of whether the implementation of the concept of Industry 4.0 increases the speed of production processes. Figure 3 shows the number of specific answers to the problem. The chart clearly shows that the surveyed enterprises do not show that the implementation of the concept of Industry 4.0 influences the increase of production processes. 39,14% of surveyed companies declare ('Yes' and 'Rather yes') that the implemented Industry 4.0 solutions increase the speed of the production process. 26,21% find it difficult to state. In 34,66% of enterprises, on the other hand, the answers did not significantly improve the speed of the production process.

Fig. 1: The number of definite answers to the question: Does the implementation of Industry 4.0 solutions increase the speed of production processes in your organization.

Source: Own study

The ANOVA analysis (Fig. 2) for the answer examining the impact of industry 4.0 solutions on improving the speed of production processes shows that there are differences in the average responses for individual enterprise sizes. The larger the company, the more significant the impact of Industry 4.0 solutions on the speed of production processes.

Fig. 2: The difference between means in the ANOVA analysis for a question examining the impact of Industry 4.0 solutions on the speed of the production process

Source: Own study

Also, the Tukey test (Fig. 3) identified two groups similar in terms of answering the question examining the impact of solutions on the speed of the production process. One group is a micro-enterprise, while the other includes enterprises employing 10 to 49 people and 50 to 250 people.

	HSD Homogeneous groups, alfa = ,05000 Error: MS intergroup = 1,9152, df = 577,00			
Nr	Employment volume	Process Speed Average	1	2
1	up to 10	2,652330		****
2	from 10 to 49	3,162896	****	
3	from 50 to 250	3,437500	****	

Fig. 3: Tukey HSD test for the answer regarding the impact of Industry 4.0 solutions on increasing the speed of the production process

Source: Own study

Another question concerned the digitization of the production process. As in the case of the previous problem, there are no significant differences between the answers of the surveyed enterprises (Fig. 4). The impact of Industry 4.0 on the digitization of the production process was observed in 43% of the surveyed enterprises. 24% replied that it is difficult to say that Industry 4.0 influenced the digitization of the production process in their enterprises. In 24% of enterprises, however, did not report such an impact.

Fig. 4 : The number of answers to the question: Does the implementation of Industry 4.0 solutions influence the digitization of production processes in your organization.

Source: Own study

ANOVA (Fig. 5) for the answer examining the impact of industry 4.0 solutions on the digitization of production processes shows that there are differences in the average responses for individual enterprise sizes. The larger the company, the more significant the impact of Industry 4.0 solutions on the digitization of production processes.

Rys. 5 : The difference between means in the ANOVA analysis for answering the question about the impact of Industry 4.0 solutions on the digitization of the production process

Source: Own study

Tukey's test identified two groups among the surveyed enterprises in terms of employment in responses regarding the impact of Industry 4.0 on the digitization of the production process. One group for enterprises employing up to 10 people. The other is enterprises employing from 10 to 49 people and from 50 to 250 people.

Nr	HSD Homogeneous groups,, alfa = ,05000 Error: MS intergroup = 1,8275, df = 577,00			
	Employment volume	Flexibility Average	1	2
1	up to 10	2,637993		****
2	from 10 to 49	3,149321	****	
3	from 50 to 250	3,475000	****	

Rys. 6: Tukey HSD test for the answer regarding the impact of Industry 4.0 solutions on the digitization of the production process

Source: Own study

The third question was about the impact of the Industry 4.0 concept on the flexibility of the production process (Fig. 7). In 26,38%, no such effect was observed. Only 13,79% of the impact was observable. 26,38% of enterprises say there is instead an impact. In 33,45% of the surveyed enterprises, such effect was not noticeable.

Fig. 7: The number of answers to the question: Does the implementation of Industry 4.0 solutions affect the flexibility of production processes in your organization.

Source: Own study

Similarly to research on the speed and digitization of the production process, also in the case of research on flexibility, one can notice differences in the responses between individual groups of enterprises (Fig. 8).

Fig. 8 : Difference between means in the ANOVA analysis for the answer to the question about the impact of Industry 4.0 solutions on the flexibility of the production process

Source: Own study

The Tukey test for the question about the impact of Industry 4.0 on the flexibility of the production process also identified two groups of similar enterprises: enterprises employing up to 10 people and enterprises employing 10 to 49 people and 50 to 250.

	HSD Homogeneous groups,, alfa = ,05000 Error: MS intergroup = 1,8275, df = 577,00			
Nr	Employment volume	Flexibility Average	1	2
1	up to 10	2,637993		****
2	from 10 to 49	3,149321	****	
3	from 50 to 250	3,475000	****	

Fig. 9: HSD Tukey test for the answer regarding the impact of Industry 4.0 solutions on the flexibility of the production process

Source: Own study

Another question concerned the impact of Industry 4.0 on the robotization of the production process (Fig. 10). Figure 10 shows that more SMEs sector enterprises did not notice the effects of Industry 4.0 on the robotization of the production process. 40,52% did not see any significant impact on Industry 4.0 on the robotization of the production process. 12,07% are convinced that there is preferably no such impact. As many as 24,14% believe that it is difficult to say whether the effects of Industry 4.0 on robotization exists. However, only 9,48% believe that such an impact has been observed in their enterprises.

Fig. 10: The number of answers to the question: Does the implementation of Industry 4.0 solutions affect the robotization of production processes in your organization.

Source: Own study

Figure 10 presents differences in means for answering the question about the impact of Industry 4.0 solutions on robotization. There are differences between the groups of companies between the answers. As in the previous issues, two groups were selected using the Tukey test (Fig. 12): enterprises employing up to 10 people and enterprises employing 10 to 49 people and 50 to 250.

Fig. 11: Difference between means in the ANOVA analysis for the answer to the question about the impact of Industry 4.0 solutions on robotization of the production process

Source: Own study

Nr	HSD Homogeneous groups, alfa = ,05000 Error: MS intergroup = 1,7823, df = 577,00 Employment volume	Robotic Average	1	2
1	up to 10	2,050179		****
2	from 10 to 49	2,633484	****	
3	from 50 to 250	2,950000	****	

Fig. 12: Tukey HSD test for the answer regarding the impact of Industry 4.0 solutions on robotization of the production process

Conclusions

The concept of Industry 4.0 is intensively developed. In practice, more and more of its elements are implemented in enterprises. As a rule, the idea of Industry 4.0. It is crucial and essential that Polish enterprises also apply the concept in question. It also seems necessary to implement the concept in the SME sector.

The purpose of the article was to present the results of research on the consequences of implementing the concept of Industry 4.0 in Poland. The author has identified four areas of influence of Industry 4.0 solutions: production speed, digitization, flexibility, and robotization of production processes.

In the conducted research, enterprises indicated the extent to which Industry 4.0 affects specific areas. A total of 580 enterprises were tested. In none of the four emerging planes of influence did the enterprises indicate that Industry 4.0 had a significant impact in any selected area. This attitude may be related to the SME sector. Considering the research (Gotz 2017) that stated that Polish enterprises do not implement Industry 4.0 solutions, the results of this work seem to confirm their opinions. The SME sector has insufficiently implemented solutions to be able to talk about its impact on production speed, flexibility, digitization, or robotization.

However, the research has selected groups into which the SME sector in Poland can be divided. One group was small enterprises employing up to 10 people. The second enterprise employs from 10 to 49 and from 50 to 250 employees. This indicates that micro-enterprises stand out from the others without noticing the advantages of the Industry 4.0 concept. Given the necessity and legitimacy of implementing the concept of Industry 4.0, this is a worrying conclusion. At the same time, it should be noted that the surveyed companies are aware of the need to implement the concept of industry 4.0. The research presented in the paper to some extent directs their application.

Abstract

The research is devoted to the study of the concept and process of applying the Treasury support tool in the field of public administration as an integral component of the modern system of distribution and redistribution of state financial resources in order to increase the efficiency of use of budget funds. The purpose of the study is the analysis of the Treasury support instrument using modern approaches to improving the efficiency of the use of budgetary resources, as well as the prospects for the development and application of this tool in Russia. The authors use general scientific (analysis, synthesis, induction, deduction) and special research methods, as well as methods of economic theory. The study analyses treasury support procedure, as well as the application of the treasury letter of credit, the most important tasks the procedure can help to solve, and the development prospects. As a result of the study, the authors revealed both the positive results of introducing the mechanism of treasury support, including the use of treasury letters of credit, as well as some shortcomings and problems that impede the full use of this mechanism in order to increase the efficiency of spending budget funds. The authors come to the conclusion that today, the emergence, implementation and further improvement of treasury support as a tool to increase the efficiency of the use of budget funds, in particular in the implementation of government contracts, is a new stage in the development of state financial control. Further study of this topic will allow a deeper understanding of the possibilities and prospects of integrated introduction of this tool into the general government sector.

Keywords: State Financial Control, Public Procurement, Budget Funds, Government Contract, Advance Payment, State (Municipal) Acquisitions

Introduction

The structural and economic transformations that are taking place in the field of public administration under the influence of information technology help significantly improve the quality of processes and simplify their mechanism in the provision of public services. This, in turn, makes it possible to increase the level of citizens' trust and the transparency of modern state processes. New approaches and economic models create conditions for maximum efficiency in terms of the use of all resources in the state, as well as a favorable environment for development and investment in the future.

State financial control is a necessary element of public administration, which is carried out at all stages of the budget process in order to identify, prevent and suppress illegal actions in the process of formation, distribution and use of budget funds.

Improving the mechanisms and methods of control, creating new ways of analyzing information leads to an increase in the quality of control and expert-analytical measures carried out by state financial control bodies.

Methodology

At present, the application of financial control is most relevant in areas with the greatest risk of illegal use of budget funds. The Federal Treasury identifies the following budget risks with a high level of significance: unjustified overpricing of government contracts, lack of transparency in settlements between co-executors of government contracts, incompleteness and / or inaccuracy of budget reporting data, and others.

Thus, one of the most risky is the sphere of state (municipal) acquisitions of goods, works and services, which is confirmed by the annual reports of the Accounts Chamber of the Russian Federation. So, for example, according to the results of 2016, it was revealed that about 56% of the total volume of violations (541.3 billion rubles) was accounted for by violations in the formation and execution of budgets, including the implementation of state (municipal) acquisitions and purchases by individual types of legal entities.

The organization and implementation of effective control over the spending of budget funds aimed at the execution of state contracts is one of the most labor-intensive areas of state financial control in the view of the fact that in general the acquisition system in the field of state (municipal) acquisitions in the Russian Federation is fully operational for 4 years under the Federal Law "On the acquisition system in the field of procurement of goods, works, services to meet state and municipal needs" dated 04.04.2013.

The functions for monitoring in this area at the Federal level are carried out by:

1. Accounts Chamber of the Russian Federation - conducting an audit in the field of procurement of goods, works and services carried out by objects of audit (control) based on the Federal Law "On the Contractual System in the Sphere of Procurement of Goods, Work, and Services to Ensure State and Municipal Needs";
2. The Federal Treasury of the Russian Federation as a federal executive body that exercises enforcement functions in cash servicing budget execution of the budget system of the Russian Federation based on the Federal Law "On the Accounts Chamber of the Russian Federation";
3. The Ministry of Finance of the Russian Federation is the federal executive body for regulating the contract system in the field of procurement of goods, works, services to ensure state and municipal needs based on the Federal Law "On the Federal Budget for 2018 and the Planning Period of 2019 and 2020";
4. Federal Antimonopoly Service of the Russian Federation - a federal executive body authorized to exercise control (supervision) in the field of state defense order and in the field of procurement of goods, work, services to meet state and municipal needs, as well as approval of the use of closed methods for determining suppliers (contractors, contractors) base on the Federal Law "On the Federal Budget for 2018 and the Planning Period of 2019 and 2020".

The existing legislation governing this area is still imperfect, so the presence of violations, in particular inappropriate and inefficient use of funds allocated by the corresponding budget is inevitable. The main violations identified in 2016 by the Accounts Chamber of the Russian Federation include:

- violation of the conditions for the execution of contracts (agreements), including the timing of implementation, including the timeliness of settlements under the contract (63.5% of the total amount

of violations identified); violations in substantiating and determining the initial (maximum) price of the contract, the price of the contract concluded with a single supplier (13.2%);
- violations in the acceptance and payment of delivered goods, work performed, services rendered that do not comply with the terms of the contracts (agreements) (8.1%).

In order to ensure the full functioning of the acquisition system and prevent the unlawful use of budgetary funds in this area, a new control mechanism was developed - Treasury support, which is designed to reduce the likelihood of such violations. It is used both in the implementation of state contracts, and in contributions to the authorized capital, the provision of subsidies.

Treasury support involves the following: personal accounts (co-executors) under state contracts, including those implying the presence of advance payments, to recipients of budget investments and subsidies are opened by a personal account by the territorial authority of the Federal Treasury in the institutions of the Central Bank of the Russian Federation. All earmarked funds are transferred to the personal accounts of the territorial bodies of the Federal Treasury, and not to the accounts of credit organizations, as it was before. Validation of expenses at the expense of these earmarked funds occurs exclusively after the submission of documents confirming the fact of delivery of goods, provision of services and performance of work.

It is important that in this way there is a constant analysis (operational control) of cash flows. As the result all interested parties (the state customer, the federal executive body that provided subsidies and budget investments) receive reports on transactions with specific target funds.

According to the Chairman of the Accounts Chamber of the Russian Federation, the solution to most of the problems in the field of public (municipal) acquisitions should be the creation of an integrated system that implies a direct relationship between the budget and the public procurement registry with mandatory Treasury support of the entire process.

The cooperation of the Ministry of Finance of the Russian Federation and the Federal Treasury of the Russian Federation, with the necessary powers in this area, will make it possible to build an integrated information system. So, for example, in the Decree of the Government of the Russian Federation of August 26, 2013 No. 728 at the beginning of 2017, amendments were made to transfer to the Ministry of Finance of the Russian Federation powers in the field of public procurement, which were previously assigned to the Ministry of Economic Development of the Russian Federation, thus laying the foundation for subsequent interaction of the Ministry of Finance of the Russian Federation with the Federal Treasury of the Russian Federation.

The new function of the Federal Treasury of the Russian Federation is significantly different from its function of cash servicing the budgets of the budget system of the Russian Federation, because with Treasury support, the subjects are not participants in the budget process. In the strategic map of the Treasury of Russia, designed for the period 2017-2021, one of the strategic goals is to provide Treasury support of funds. The social effect of achieving this goal is assessed as increasing the efficiency of using the financial resources of the state, as well as trust in the authorities on the part of citizens. Improving the availability and transparency of information disclosing financial activities in the public sector will also significantly affect the social and economic situation in the country.

Results and Discussion

Treasury support is a control tool not only for legal entities, but also means increased control over expenditures by the constituent entities of the Russian Federation from the federal level and, accordingly, over expenditures of municipalities from constituent entities of the Russian Federation, which are carried out through the provision of inter-budget transfers of targeted use from the top-level budget .

The formation and application of this innovation is caused by objective factors. Firstly, the presence of advance payments that accompany large government contracts. It often happens that the budget

funds provided are placed on deposits with commercial banks (or, for example, for the purchase of foreign currency), so they were not used to fulfill a state order. The participation of one-day firms in advance schemes is also a common practice.

The provision of significant amounts of advance payments has led to the formation of receivables in the amount of 4 trillion rubles.

Secondly, until 2015, targeted subsidies, budget investments, advance payments were transferred to accounts opened by legal entities with credit organizations, which is a potential opportunity for misuse of allocated budget funds. For example, subsidies could be transferred to a legal entity at the same period of time for the same purpose but by the different government bodies. Transfer and storage of budget funds in the personal accounts of the Federal Treasury of the Russian Federation will exclude the possibility of a similar situation.

The application of the following mechanism has begun in 2015 for certain types of government contracts. The first prerequisites for implementation were laid down in the Federal Law dated 01.12.2014 "On the federal budget for 2015 and for the planning period 2016 and 2017". Article 5 of this document on the features of the use of budget funds in 2015 stipulates that the target funds of certain legal entities (not participants of the budget process) that are recipients of subsidies, budget investments and in some other cases are subject to crediting and debiting from the personal accounts of these legal entities opened in the territorial bodies of the Federal Treasury of the Russian Federation. In relation to state contracts, it has been established that advance payments are carried out according to the same scheme in cases where the amount of the state contract exceeds 1 billion rubles.

In 2016, the scope of the Treasury support mechanism has expanded significantly, the main provisions of which were also enshrined in the Federal law on the federal budget for the corresponding year. In paragraph 1 of Article 5of the law the specific name of the new control instrument was recorded: “To establish that in 2016 ... the territorial bodies of the Federal Treasury carry out Treasury support of state contracts, agreements (agreements), as well as contracts, agreements, agreements concluded in the framework of their execution ... ". The same article records the list of objects for which Treasury support is established. The amount of the state contract, to which the use of this mechanism is not necessary, has decreased to 100 million rubles, and the fact of the presence of advance payments is not important based on the Federal Law "On the Federal Budget for 2016".

In the same year, detailed regulation of actions with Treasury support was included in various regulatory acts of the Government of the Russian Federation, in particular the Ministry of Finance and the Federal Treasury.

The full implementation of the Treasury support was introduced on January 1, 2017 based on the positive experience of using this method in the previous two years. A provision about the implication of this application for the calculations for the state defense order with the contract amounted more than 100 million rubles or availability of advance payment from 30 to 80% of the amount of the contract has also been introduced. Since 2018, Treasury support has also extended to contracts with a single supplier. Thus, the Federal Treasury is responsible for monitoring settlements between all levels of cooperation, including verifying the actual execution of government contracts.

Despite the fact that this mechanism has been finally introduced, the concept of Treasury support is not included in any regulatory act. At present, a draft Federal law is being developed “On Amending the Budget Code of the Russian Federation ... in terms of treasury execution and the system of treasury payments”, one of the points of which is to include the provisions in the Budget Code of the Russian Federation regarding Treasury support. New changes imply not only the definition of this mechanism, but also a detailed list of areas for spending budget funds allocated from both the federal and regional budgets, which are subject to Treasury support.

The use of the Treasury support mechanism defines a new principle in budget execution: the allocation of funds occurs exclusively "on demand", i.e. at a specific time of payment of the obligations assumed. The first results of its implementation were a decrease in accounts receivable (by 9% as of January 1, 2017 compared to January 1, 2013), in particular for subsidies to legal entities, as well as a reduction in unused balances (from 242.6 billion rubles to 6 billion rubles in the same period).

The implementation of such strategic projects as the construction of the Kerch Bridge, the preparation of the World Cup for football: the construction (restoration) of stadiums by 2018, as well as information support for the event, demonstrates a significant effect from the introduction of this mechanism.

The introduction of new provisions in the implementation of this mechanism is not yet completed. In 2018, it was planned to use a payment instrument on the basis of Treasury support - treasury bonds or treasury letter of credit. This payment document confirms the obligation of the recipient of the trust funds to pay the obligations of the contractor of the state contract / agreement on the provision of trust funds when the conditions specified by the contract / agreement are met. Thus, the treasury letter of credit can be used as a partial or full replacement of advance payments, due to which there is an increase in accounts receivable for budget expenditures of the budget system of the Russian Federation.

The figure below shows the process of providing a treasury letter of credit with Treasury support (Fig. 1). If it is absent at the 3rd stage of this procedure, a receivable arises. Moreover, the use of a treasury letter of credit prevents the situation of using additional personal accounts for the transferred powers.

*TBFT - Territorial bodies of the Federal treasury
MMBF - Main manager of budgetary funds

Fig. 1: Scheme for the provision of a treasury letter of credit as part of Treasury support of budget funds

(developed and compiled by the authors)

Thus, settlements under the treasury letter of credit are carried out exclusively after the contractor (co-contractor), having received the goods, work and services from the supplier, submits to the territorial bodies of the Federal Treasury a payment document confirming the fact of fulfilled conditions. The territorial bodies of the Federal Treasury of the executor sends a request for the

execution of the treasury letter of credit to the inter-regional operational department of the Federal Treasury, which transfers the amount to pay for deliveries.

It is mandatory to inform about the settlements under this treasury letter of credit both the territorial bodies of the Federal Treasury of the recipient of the subsidy (head contractor) and, accordingly, the recipient, and the territorial bodies of the Federal Treasury of the main manager of budget funds (state customer) and the main manager of budget funds.

One of the first who participated in the experiment on the application of the treasury letter of credit as part of Treasury support was the state atomic energy corporation Rosatom, acting as the state customer for the state contract for the amount of 150 million rubles with an advance payment of 28.4 million rubles.

A treasury letter of credit was issued in the amount of the advance payment, however, the execution amounted to only 9%. The experiment was conducted on the basis of three government customers, the total advance payments for all three government orders amounted to 1,451.4 million rubles, however, treasury letters of credit were executed only for 509.8 million rubles (35%). Already from this we can conclude that the use of this payment instrument in the framework of Treasury support is quite effective in order to ensure the targeted use of budget funds, in particular, allocated under state contracts.

Despite the positive results of introducing a mechanism of Treasury support, including the use of treasury letters of credit, there are some flaws and problems that impede the full use of this mechanism in order to increase the efficiency of spending budget funds.

These include the imperfection of the integration of the electronic budget information systems with the unified public procurement information system. In the absence of the necessary interaction, which ensures the receipt of complete and reliable information about the subjects and objects involved in the process of using budget funds, it is rather difficult to carry out the procedures of Treasury support and, accordingly, the authorization of expenses. As mentioned above, the Ministry of Finance has legislatively fixed the regulatory functions in the field of public procurement, which will allow for closer cooperation with the Federal Treasury in this area, in particular in the information sphere.

The strategic goals of the Federal Treasury for 2017-2021, which is the operator of the Unified Information System in the field of procurement, include stabilization of this system and ensuring the necessary interaction with the state integrated information system "Electronic Budget", as well as the overall further development of these systems.

The Chairman of the Accounts Chamber appreciates the introduction of this mechanism positively, but believes that Treasury support should be further improved. For example, due to the use of the new tool in almost the entire sphere related to the provision of budget funds to legal entities (with some exceptions, enshrined in the federal law on the federal budget for a specific year), recipients of targeted funds began to change the essence of the provision of subsidies. The reports on the funds used by them, in most cases, do not include the required information justifying the appropriateness of their use. As indicated above, Treasury support is directly related to the advance of contracts, however, not all contracts provide for advance payments. In their absence, the company can use banking support, avoiding control by the Federal Treasury. This problem was practically solved by expanding the scope of Treasury support: for example, in 2018, regardless of the advance payment, all state contracts under the state defense order, the amount of which exceeds 100 thousand rubles, are subject to Treasury support.

Conclusion

Summing up, we can make an unconditional conclusion that the emergence, implementation and further improvement of Treasury support as a tool to increase the efficiency of the use of budget funds, in particular when implementing government contracts, is a new stage in the development of

state financial control. The socio-economic effect of the introduction of this mechanism is to increase the transparency of cash flows and the quality of fulfillment of obligations, ensuring the safety and targeted use of budget funds, and others.

It continues to develop a treasury letter of credit as part of treasury control, as well as budget monitoring, as an instrument of operational control over the use of budget funds. The legal framework has substantially replenished with new provisions, resolutions, and in the long term - the introduction of new articles in the Budget Code of the Russian Federation. Also, a new system of organization of internal state financial control is being formed based on a risk-based approach in the framework of the "Concept of increasing the efficiency of budget expenditures until 2023", one of the provisions of which is to ensure operational efficiency by improving the procedure for Treasury support of budget funds and expanding the scope of treasury letters of credit.

COVID-19 Pandemic – A Permanent Socio-Economic Change?

Andreea M. MANTA

The Bucharest University of Economic Studies, Bucharest, Romania
andreeam.manta@gmail.com

Abstract

The purpose of this paper is to explore the most important effects of Coronavirus appeareance all over the world from psychological, social and economic perspective. The pandemic situation determined the public authorities to impose protective measures, in order to ameliorate the Covid-19 spreading. These measures have had important consequences for every person and for the society as a whole.
After Coronavirus will disappear, nothing will be the same and people will significantly change their lifestyle. The paper identifies the most popular measures imposed, the changes that took place in people's lives due to these measures, the future modifications that have to be taken into consideration and people will have to deal with. The originality of the paper consists in describing the future situation after Coronavirus will permanently disappear. The present research was based on the literature review of the official statistical data and the publications related to this subject. The conclusions will determine the readers to realize the huge differences in the way they are used to live and will convince them to study new ways of coping with the future changes.

Keywords: Pandemic, Covid-19 Social, Economic, Changes

Introduction

The idea of the article comes from the present pandemic situation and the urgent changes that people have to deal with in order to live. It seems like Covid-19 showed the humanity its weakness in fighting a new virus which naturally appeared probably from a "harmless" Chinese bat.

In spite of the colossal advancement made by the scientific world, there are still many threats that people have to cope with.

This new virus just remembered the humanity that nature will always dominate humanity and will dictate the rules in their lives.

Consequently, after the pandemic situation will vanish, people will permanently change the way they used to live. This implies the appearance of economic and social differences.

The article illustrates the image of the future based on the official data and logical deduction.

The sacrifice represented by the lives' losts should disciplinate the people and should impose new directions for the future public investments.

Literature Review

The World Health Organization's (WHO) declared, on the 30th of January 2020, the epidemic of coronavirus a Public Health Emergency of International Concern.The eruption started from four patients that were workers in Wuhan seafood market and also dealing with some wild animals. The

idea that COVID-19 was sheltered by a bat came from the fact that it contains 96% identical at the whole – genome level. (Fang et al., 2020)

As a response to this COVID – 19 eruption, the Chinese government took protective measures such as: "early detection, early isolation, early treatment, adequate medical supplies, patients' being admitted to designated hospitals, and comprehensive therapeutic strategy"(Fang et al., 2020), which are presented in the following Table 1:

Table 1 : Chinese protective measures against Coronavirus

Measures	Decembrie 2019	January 2020	February 2020
Early detection of the SARS-CoV-2			
Preliminary control			
(1) Public health level 1 response of 31 provinces			
(2) Strict exit screening			
(3) Medical support from other regions of China			
(4) Cancellation of mass gatherings			
(5) Methodological improvement on the diagnosis and treatment strategy			
(1) Public health level 1 response of 31 provinces			
(2) Strict exit screening			
(3) Domestic and international medical support			
(4) The larger scale of cancellation of mass gatherings			
(5) Further methodological improvement on the diagnosis and treatment strategy			
(6) Spontaneous household quarantine by citizens			
(7) Two newly built hospitals' put into use			
(8) A clinical trial of perspective medicines			
(1) Public health level 1 response of 31 provinces			
(2) Strict exit screening			
(3) Further medical support from home and abroad			
(4) Massive online teaching in a postponed semester			
(5) Orderly resumption of back to work			
(6) Addition of new diagnosis method—clinically diagnosis in Hubei province			
(7) Interagency mechanism			
(8) Further exploration of effective therapeutic strategy			

Source: adapted from Fang et al. (2020)

In China, these measures have reduced the number of new cases of Coronavirus with 90%. However, the public protective measures did not work in all the affected countries. Italy was particularly affected.

It is imperative for all the health systems to be prepared with proper medical equipments and treatments. (Remuzzi, A. & Remuzzi, G., 2020)

However, there are many cases of countries that suffer from lack of preparedness. In one study entitled *Straining the System: Novel Coronavirus (COVID-19) and Preparedness for Concomitant Disasters* elaborated by two American authors Nathaniel Smith and Michael Fraser stated that "*Advancing world-class data and analytics to support public health decision-making is vital to our disease surveillance and response activities*." They also blame the system from United States for using old technology, such as: faxes, to report information about the public health and use paper forms to follow up. The paper is still used to record important health data and spreadsheets are completed manually. Considering the unbalanced state of technology's evolution, the public health data system urgently needs a modernization (Smith & Fraser, 2020).

In the United States after the terrrorist attacks from September 11, 2001, significant investments were made to increase the level of public health preparedness. In addition, in 2018 the authorities created a special Reserve Fund for the public health system during epidemics and other kinds of urgencies. Nonetheless, the budget established for public health has been diminished from 2002 to 2019 by aproximately one third. The American authors sustain that increasing the budget for public health back to the level from 2002 should be a priority for the authorities, considering threats like COVID-19 (Smith & Fraser, 2020).

Anyway, the pandemic situation affects many sectors besides public health systems and medical care. It also generates social and economic vulnerabilities especially in cities with high population density. Consequently, specialists in managing urban data can have an important contribution to respond and better prevent different similar viruses. In this perspective, urban intelligence can bring value through means of continuous risk assessment and assist economic recovery. Therefore, to properly cope with this pandemic, it is necessary to invest in applying the best practices in urban intelligence. The next Table 2 presents several practices in urban intelligence which were grouped by five main components of urban intelligence (Lai et al., 2020):

Table 2: Examples of urban intelligence –related measures against pandemic

Components	People	Movement	Facilities	Engagement	Information
Sources	Community survey Population census	Air flights Ground transportation GPS tracing Cell phone pings	Facility catalogue Infrastructure performance Resource inventory	News and social media Open data portal Digital platforms	User agreement and protocols for data exchange
Measures	Provide additional services to vulnerable population groups and communities	Transportation control, checkpoints, identify quarantine zones, contact tracing	Logistical distribution and human resources, capital planning	Broadcast news and crowdsource local information	Integrate and manage data across various resources and agencies

Source: adapted from Table 1. A summary of five critical urban intelligence components for a pandemic response Lai et al (2020)

The problem of a possible pandemic situation was predicted by Bill Gates and other disease and flu experts. Bill Gates warned the public authorities that they should invest in the pandemics' preparedness. Furthermore a former official from the White House also sustained the idea of an upcoming pandemic threat. (Hoffower, 2020)

Regarding the prediction of the end of the COVID-19 pandemic situation, scientists from Singapore University of Technology and Design (SUTD) attempted to discover the answer by using a mathematical model. They predicted that the end will be in December. However, this date will differ from nation to nation depending on the start date. (Macaulay, 2020)

From a psychological perspective the pandemic situation COVID-19 has been undoubtedly affecting people all over the world. In a survey of people at higher risk of being infected with Coronavirus, the rates of depression, traumatic stress, generalized anxiety and insomnia reached alarming values (Sherman, 2020). The following Figure 1 illustrates them:

Figure 1: Results of survey on psychological impact

Source: based on information from (Sherman, 2020; Liu et al., 2020)

These results are quite shocking, but if they are compared with previous research materials on the psychological impact of other similar eruptions, it has been demonstrated that fear related to being infected is connected with anxiety, post-traumatic stress and suicidality (Sherman, 2020; Chong et al., 2004; Wheaton et al., 2012; Wu et al., 2009; Yip et al., 2010).

Another correlation discovered in the study is the higher level of coronavirus anxiety that people of younger age and higher education levels tend to have (Sherman, 2020).

Furthermore, in 2003 during SARS epidemics there was a positive connection between the virus related anxiety and the aversion to Chinese people, food and products (Sherman, 2020; Keil & Ali, 2006).

Covid-19 has created a massive panic world-wide and it has been compared with an "angel of death, a relentless and soulless invader that has infected the global psyche with fear and the bodies of our most vulnerable citizens" (Polizzi et al., 2020).

The pandemic managed to affect every aspect of people's lives such as: the way people earn their living, how they communicate with other people, the way they spend their spare time and other similar

ones. People are permanently concerned about the future, whether they and their families and friends will survive the virus. None of the previous pandemics created such prolonged perturbations as Covid-19 did. (Polizzi et al., 2020)

From an economic point of view, the negative impact of COVID-19 has started to be increasingly visible. People make stocks of food, hand sanitizer and other necessary products. Considering that the schools are closed, some parents give up work to stay home with their children. Other families are wondering about what will their children eat. Moreover, universities have closed, meanwhile the authorities imposed travel restrictions and some students have been stranded. Weddings and other similar events were all canceled. (*Science in the time of coronavirus*, 2020)

All these changes generate financial losses for people and for their countries. Some of the most powerful countries in the world have announced their intention to develop investments of thousands of billions for sustaining the economy as global production cannot be stopped and money needs to circulate regardless the COVID-19 global crisis' level of severity. Any hesitation in this way would cause incalculable consequences. Therefore, the powerful countries' governments declared from the beginning of the pandemic that they will implement immediate measures to sustain the economy. (*The big states are fighting coronavirus with colossal investments in the economy. Romania is calm and analyses*, 2020)

The next Table 3 illustrates the numbers associated with these investments and some details:

Table 3: Investments for sustaining economy

COUNTRY	INVESTMENT FOR SUSTAINING ECONOMY	DETAILS
GERMANY	550 billion €	The German Minister of Finance, Olaf Scholz, declared that companies will receive all the financial support they need during the pandemic situation.
ITALY	32,5 billion €	The Prime Minister Giuseppe Conte announced to allocate these funds in order to sustain the economy to face the Coronavirus pandemic's devastating impact, Italy being one of the most affected countries.
FRANCE	45 billion €	The Ministry of Finance, Bruno Le Maire, announced to use this investment in order to help the French companies during the pandemic. The President Emmanuel Macron promised that the government will guarantee credits of 300 billion € for the French companies to overcome the crisis.
SWEDEN	28 billion €	The investment aims to help the companies face the economic consequences caused by Coronavirus. In addition, the state will ensure the salaries for the employees that encounter problems due to their employer's activity reduction. Moreover, companies can postpone the taxes' payment.

SWITZERLAND	29 billion €	The banks consider to develop a loaning program for the thousands of businesses affected by the Coronavirus pandemics. The government announced that will create a fund for immediate assistance in order to ameliorate the pandemic's impact.
EUROPEAN UNION	40 billion €	The European Union can offer between 28 and 40 billion € for sustaining the small and medium enterprises (SMEs) which are affected by the pandemic. However, European Investment Bank requested additional guarantees from the Member States' governments that the bank can use for maintain the access to finance for SMEs.
UNITED STATES OF AMERICA	700 billion $	The Federal Reserve of USA has reduced the reference interest rate with 1%, has ameliorated the regulations for the banks and has launched a program for quantitative relaxation in order to protect the economy from the negative effects of the pandemic. The Federal Reserve of USA will procure treasury securities of at least 500 billion $ and mortgage-backed securities of at least 200 billion $. The Federal Reserve encouraged the banks to use the money in order to consolidate their capital buffers to sustain companies and households affected by the pandemic.
CHINA	170,6 billion €	The Chinese Central Bank has reduced the level of compulsory minimum reserves for sustaining the economy. Reducing the quantum of money that the banks have to preserve at the Central Bank, the banks were encouraged to offer more credits to companies in order to sustain the economy.
NEW ZEELAND	6,5 billion €	The Ministry of Finance, Grant Robertson is aware of the future economic recession. However, the authorities developed a relaunching plan consisting of grants for salaries, reduced taxes, support for health services.
INTERNATIONAL MONETARY FUND	50 billion $	The International Monetary Fund (IMF) has announced that it is providing 50 billion $ to emerging and low-income countries through its fast-track financing facility amid the Coronavirus epidemic.

Source: (The big states are fighting coronavirus with colossal investments in the economy. Romania is calm and analyses, 2020)

Based on the information provided by Eurostat, during the first quarter of 2020, the Gross Domestic Product (GDP) decreased by 3,5% in the European Union, compared with the previous quarter while GDP diminished with 2,7% in the first quarter of 2020, compared with the first quarter of 2019. The following Figure illustrates the evolution of the GDP growth rates from the last economic recession in 2008 (Eurostat, 2020, page 1):

Figure 1: European evolution of GDP growth during 2008-2020

Source: (Eurostat, 2020, page 1)

It can be observed that the negative difference of the GDP growth due to the Coronavirus pandemic is significantly high but not higher than the one recorded in 2008.

According to the Bureau of Economic Analysis (BEA) estimates, the United States' GDP growth decreased by 4,8% in the first quarter of 2020 in comparison with the previous quarter. The next Figure 2 exposes visually this change of GDP's evolution in US (Bureau of Economic Analysis, 2020):

Figure 2: GDP evolution in US,

Source: (Bureau of Economic Analysis, 2020)

In conclusion, the global economy will record high financial losses due to the COVID-19 pandemic situation.

However, the world succeeded to pass through similar situations by analysing all the pandemic's effects and identifying efficient solutions to cope with them.

Most of the public authorities from world-wide implemented the correct measures to cope with the pandemic situation from a socio-economic perspective.

The next chapter highlights the most important changes brought by COVID-19, changes that the world has to accept and to adapt to them. Therefore, the world has to adapt to the new directions imposed by COVID-19, directions that reveal the new "normality".

Potential irreversible changes after COVID-19

It is well-known the fact that the world has the capacity to overcome COVID-19 as in the past, economy managed to rebound after similar crisis.

The novelty of the current pandemic is represented by several potential changes that the world might have to accept. People are waiting to return to their lives before COVID-19 appeared. Unfortunately, this is not likely to happen because the pandemic situation imposed changes that will influence the world's evolution.

The next Table 4 displays some of the mentioned changes predicted by thinkers, experts and scientists:

Table 4: Potential changes after COVID -19

Subject	*Potential permanent changes*
People's interaction	People will prefer to avoid meet new people online. (Coronavirus Will Change the World Permanently. Here's How, 2020).
Hygiene	People will avoid to shake hands and touch their faces and will wash their hands more often. (The legacy of the pandemic: 11 ways it will change the way we live, 2020)
Recognition	People will consider doctors and nurses true heroes as they do with military veterans. Therefore, medical personnel will receive increased salaries, holidays, corporate discounts and other benefits. (Coronavirus Will Change the World Permanently. Here's How, 2020).
Public investment	Public authorities will make major investments in medical equipment, treatments, disinfectants and other necessary medical products. Another priority for the public authorities will be to invest in digitalization of public services.
Telemedicine	Telemedicine will be practiced and empowered to avoid queues and crowds in the hospitals. (Coronavirus Will Change the World Permanently. Here's How, 2020).
Education	Online public schools will be created in order to protect children's health.
Teleworking	If possible people will choose to work from home in order to avoid wasting time with transport and to have a more flexible program. (Coronavirus Will Change the World Permanently. Here's How, 2020). Employers will save money with office spaces.
Generosity	Teachers already offer free online classes to people.
Technology	Virtual reality glasses will be used for courses or psychological consultation or other activities.
Pharmaceutical industry	Pharmaceutical industry will be managed by the public authorities in order to produce the necessary treatments and vaccines with priority.

Voting	The public authorities will offer people the possibility to vote online for an extended period of time. (Coronavirus Will Change the World Permanently. Here's How, 2020).
Cooking	People will cook more being used during the pandemic crisis to do so. (Coronavirus Will Change the World Permanently. Here's How, 2020).
Economy	Many restaurants, tourism agencies, hotels, shops, malls, private kindergartens, schools and universities will be closed. Payments will be made mostly using cards, online banking, instead of using cash. Exchange value will be less important and mutual aid will become the guiding principle in the economy. After this crisis people will realize that "success came in states where government, civic and private-sector leaders joined their strengths together in a spirit of self-sacrifice for the common good"(Coronavirus Will Change the World Permanently. Here's How, 2020)
Real estate	The rents and prices for city apartments will decrease while the prices for houses with yards in the suburbs will increase. Families will prefer to move in the suburbs after realizing how important is for children to have enough space to play and enjoy fresh air.
Religion	Religion will accept the online future. (The legacy of the pandemic: 11 ways it will change the way we live, 2020)
Pollution	The air will be cleaner and the public authorities will impose similar rules in order to maintain it this way.

Sources: own contribution and adapted from (Coronavirus Will Change the World Permanently. Here's How, 2020; The legacy of the pandemic: 11 ways it will change the way we live, 2020)

Some of these changes might not happen but the world has to accept that this is the time for a radical change being so vulnerable in front of a very little virus.

Conclusions

The present Coronavirus pandemic has caused over 240.000 deaths and has seriously affected people's lives from psychological, social and economic perspectives.

Nevertheless, the world will successfully overcome the COVID-19 pandemic and will find the proper methods to adapt to the new reality.

Moreover, people have to learn the lessons offered by this pandemic, appreciate health and hope for a better world in which the guiding principle is the life's protection.

Public authorities, people, private companies and NGO's have to form a capable team that can win the war against climate changes, nature hazards and new viruses. In addition to that, people should remember to resist human weaknesses as greed, arrogance, vanity and egoism.

Who are loyal voters? – Implications for Political Marketing

Ana PAP

E-mail address: ana.pap@efos.hr

Abstract

As well as the customer is in the centre of marketing, the voter is (and should always be) in the centre of political marketing. It is crucial to understand voters' attitudes, needs, desires, and behavior to be able to influence their political decisions. One of the main aims of political marketing activities is to create and to retain a loyal voter. To be able to create and retain a loyal voter, it is necessary to understand their attitudes and behavior. The aim of this paper is to divide voters into clusters according to their political loyalty. The primary research was conducted in five counties from Eastern Croatia using a highly structured questionnaire. For the purposes of obtaining survey results, univariate statistics (frequencies and arithmetic mean) and cluster analysis techniques were performed with the Statistical Package for Social Sciences (SPSS) 21.0. Results of cluster analysis provide specific socio-demographic, psychographic and behavioural characteristics of each segment obtained (inactive floating voters, inactive stabile voters, and active loyal voters). These results deliver valuable insights for political parties and candidates regarding political marketing voter segmentation. The limitations of this research are referred to the sample because only one Croatian region was covered. Based on that, the recommendations for further research would be to expand the research nationally and also to include some additional segmentation variables.

Keywords: Political Marketing, Voter Segmentation, Loyal Voters

Introduction

Although in the latter decade the academic interest in political marketing is growing, there are still quite some gaps in the theory. One of these gaps can be found when looking at the subject of voter loyalty. In the period from the fifties to the eighties, an average of two-third of voters in democratic countries used to vote for the same party in sequential elections (Shachar 2003). Ever since, political analysts have observed a general worldwide decrease in voter loyalty. This decrease was attributed to the continuing evolution of the media and the weakening of social divisions (Butler and Harris 2009; Negrine and Lilleker 2002).

Because of the decline in voter loyalty, political parties find it difficult to balance acts of appealing to floating voters while still keeping the loyal voter base satisfied. Political marketers often focus on the floating voters, forgetting their loyal voter base (Lilleker 2005). This neglect of loyal voters does not seem reasonable, particularly when comparing politics to a conventional business setting. Namely, companies also try to attract new customers, but simultaneously devote many resources to retaining existing ones, even creating special customer loyalty programs (Dowling and Uncles 1997; Dubé et al 2009). Taking their voters for granted can lead to voters unexpectedly switch parties (Dann and Hughes 2008). The fact that politician marketers sometimes underestimate the value of voter loyalty seems to be an indication that voter loyalty is the subject that should get more attention.

The purpose of this research is segment voters according to their level of voting loyalty in order to obtain some valuable socio-demographic, psychographic, and behavioral characteristics of each segment. Political parties/politicians need to be aware of who loyal voters are and how they behave so they could build successful marketing strategies targeted directly to them in order to retain them.

Literature Review

Political marketing and brand loyalty

The emergence of a multi-party system, that is, parliamentary democracy, inevitably created a competition between individual parties, programs and candidates in the political market. The very existence of competition creates the need for marketing activities, which, in the context of the political market, help to better "sell" certain ideas or programs.

There are numerous definitions of political marketing. Maarek (1995) considers political marketing a complex process, the outcome of a global effort that embraces all factors of political communication, and also emphasizes that political marketing is the main method of political communication. From his point of view, marketing has become its integrated and vital component. The same author argues that the main areas of application of political marketing campaigns are focused on building image and election campaigns. Lock and Harris (1996) emphasize that political marketing is focused on communication with party members, the media, potential donors, and the electorate. Wring (1997) defines political marketing as the use of opinion polls and environmental analysis by political parties or political candidates to build and promote a competitive political program that will meet organizational goals on the one hand, and groups of voters on the other in exchange for their votes. Lilleker (2005) defines political marketing as a discipline that applies theories and concepts from commercial marketing to understand and explain the organizational behavior of political parties, candidates, governments, government departments, and pressure groups. All of the previous definitions have one common key thing, which is voter satisfaction. Voter satisfaction is the key to achieving and maintaining political loyalty. In order to achieve political loyalty, politicians/political parties need to build a strong political brand.

Brand loyalty can be applied in explaining voter behavior from several aspects. First, brands can simplify choice and reduce dependence on detailed product information in much the same way as party labels relieve voters of the need to familiarise themselves with all the party's policies (Duckowrth, 1991). Secondly, brands promise standardization and replicability, generating trust between producer and consumer as much as parties emphasize unity and coherence in order to build up voter trust (Feldwick, 1991). Thirdly, brands, like parties, are aspirational, evoking a particular vision of the “good life” or holding out the promise of personal enhancement (van Ham 2001). And fourthly, in order to be successful, brands must be perceived as authentic and value-based, necessitating congruence between the internal values of the product or company and its external message. In the same way, successful parties must link their external presentational strategies to a set of core values, if they are to retain voter support (Morzano 2000). In politics and the marketplace, voters and consumers must negotiate the conflicts between loyalty to trusted brands and the novelty of the new, while making sense of complex and conflicting product information (Needham 2005).

Needham (2005) points out that party brands provide a basis for long-term loyalty in an environment where products (policies) are fairly fluid. Initial patterns of support — for political parties as for other infrequent purchases such as financial products — are likely to be shaped by family, but the process of detachment from these formative social settings appears to be intensifying. One of the most important aspects of a political brand are political leaders. Smith (2001), in his research, proved that the image (of leaders and parties) was a greater determinant of voting behavior than the parties’ policies. Needham (2005) concludes that, using the party leader as the brand, it is possible for parties to reconfigure loyalty in an era where institutional ties are weak. Besides the latter, the same author points out that brands are the basis for ongoing relationship marketing through which incumbent parties can keep their winning coalitions together in order to ensure repeat sales.

Voter loyalty

Customer loyalty represents a significant concept in marketing. Harris and Goode (2004) described obtaining and maintaining customer loyalty as “the ultimate aspiration” for many companies. The

positive influence of loyalty on firm performances has even been called essential for a company to succeed (Anderson and Srinivasan 2003). Besides many economic and competitive advantages that loyal customers bring to the company, they are also less susceptible to competitors' marketing efforts and may even engage in favorable word-of-mouth advertising (Dick and Basu 1994).

Rubin (1993) has identified four crucial benefits of loyalty:

1. an increase in customer/new constituencies that have a positive description of the corporate/political party;
2. customer/new constituencies with positive recommendations tended to be loyal;
3. a rise in earnings/electability as a result of many customers/ constituents being loyal; and
4. the decline in the cost of promotion and advertising.

Those benefits are applicable to political organizations. Loyal voters are characterized by a strong desire to provide information by word of mouth that can not only bring new voters, but also reduce spending on advertising, promotion, and publicity, especially ahead of elections or simply to build the image of the political party (Baker 2014). Loyalty to a political party is a major asset because it can determine the life and death of a political party/politician.

Suaib et al (2017) describe voter loyalty as a multidimensional term. They emphasize that loyalty should be reflected by the involvement, bonding, and support for a political party. The support can be seen from the active participation in events such as party meetings and political rallies. Also, support should be reflected with a given vote in an election. Previously mentioned authors as dimensions of loyalty also include the desire and motivation of loyal voters to continue propagating forms of support in the future and the desire, commitment and concrete action to try to attract people outside the party to provide support and choose the party.

Previous researches in both conventional marketing and political marketing identify a number of variables that seem to play a role in voter loyalty. In conventional marketing, satisfaction is often seen as a prime influence on customer loyalty (Hallowell 1996). This variable is also frequently mentioned in political marketing as an important means of building brand loyalty (Lees-Marshment 2001; Osuagwu 2008). Shachar (2003) emphasizes the habit as a large role in voting. This variable is also thought to influence customer loyalty in conventional marketing (Aarts et al 1998) and to play a moderating role on the relationship between satisfaction and loyalty (Anderson and Srinivasan 2003). Lastly, some authors (Needham 2006; Taylor et al 2004) argue that brand equity seems to be an important factor in both conventional marketing and political marketing. In political marketing, a strong party brand can increase loyalty even if the political product changes a lot (Needham 2006).

Cluster analysis of voter loyalty

The aim of the analysis was to make clusters based on the level of respondents' political loyalty and to describe their socio-demographic and certain psychological characteristics. The research was conducted in five Croatian counties using an in-person survey method. Interviewers have administered paper questionnaires to participants over 18 years of age who are eligible to vote. Interviewers were instructed to choose one male and one female respondent from different age groups (18-31 years, 32-45 years, 46-59 years, and over 60 years old). The research was conducted in the year 2017, and 681 questionnaires were obtained. After preliminary analysis, 19 questionnaires were eliminated due to a large number of missing values, and 662 questionnaires were analyzed. The data analysis was performed with the statistical program SPSS 21.0. The study sample is described in Table 1.

Table 1: Sample description

		%
Gender	M	49.7
	F	50.3
Age at the time of the survey (years)	18-31	25.9
	32-45	25.7
	46-59	24.8
	≥60	23.6
Education	Primary school	9.4
	High school	56.5
	Faculty	31
	Master's degree	2.4
	Doctorate	0.7
Place of residence	Village	22.9
	Suburb	13.6
	Town/city	63.5
Employment status	Student	16.6
	Unemployed	9.7
	Employed	48.3
	Retired	25.4
Household income (€/month)	<400	10.3
	401-800	29.5
	801-1200	26.6
	1201-1600	19.8
	1601-2000	8
	>2000	5.8

Source: Author's work

Two-step cluster method was used to determine clusters of political loyalty. Measurement of cohesion and separation values were above the recommended value of 0.0. Analysis has resulted in three clusters. Table 2 shows the items that were used in cluster analysis and their means for each of the three obtained clusters.

As it was previously mentioned, political loyalty is reflected by the involvement, bonding, and support for a political party. The support can be seen from the active participation in the work of a certain political party and events such as political meetings and rallies. In addition, support should be reflected with a given vote in an election. Loyalty also becomes evident when there are a desire and motivation to continue propagating forms of support in the future. The cluster analysis has included four different dimensions that measured political loyalty: *voting stability*, *conventional political participation*, *conventional political participation intention*, and *trust in a political party*.

Voting stability scale was adapted from the research of O'Cass and Pecotich (2005). Respondents were given three statements about their voting stability by evaluating it on the scale from 1 to 5 their level of agreement or disagreement (1 – I completely do not agree; … 5 – I completely agree).

Conventional political participation is referred to as participating in the activities related to the political party or a politician. It was measured by the author's construct, and it consisted of nine statements about the level of political participation of the respondents in the past. Respondents were asked to evaluate on the scale from 1 to 5 how often they participated in certain activities (1- never, 2 – rarely, 3 – sometimes, 4 – often, 5 – very often).

Conventional political participation intention was also measured by the author's construct, comprised of eleven statements. Respondents were asked to evaluate their conventional political participation intention on the scale from 1 to 5 (1 – I completely do not agree; … 5 – I completely agree).

Trust in the political party was measured from three aspects: general trust in the political party, trust in political party leaders, and trust in political party's program. The statements were adapted from the research of Banerjee and Chaudhuri (2016).

The analysis has resulted in three significantly different clusters, which were, based on their characteristics, named: *inactive floating voters*, *inactive stabile voters*, and *active loyal voters* (Table 2).

Graph 1 shows the sizes of the three obtained clusters. As can be seen in Graph 1., 54% of respondents belong to the cluster called *inactive stabile voters*, 28,9% of respondents belong to the cluster called *inactive floating voters*, and 17,1% of the respondents belong to the smallest cluster, called *active loyal voters*.

Graph 1: Cluster sizes (Source: Author's work)

Table 2: Means for obtained clusters

Variable	Cluster 1 **Inactive floating voters** N=191	Cluster 2 **Inactive stabile voters** N=357	Cluster 3 **Active loyal voters** N=113
I am loyal to one political party.	1,15	2,95	3,97
I strongly prefer one political party.	1,12	3,00	3,81
I always vote for the same political party.	1,29	3,09	3,98
I have started and lead political discussion.	2,17	2,66	3,26
I have affected the voting decisions of people close to me.	1,51	1,85	2,72
I have worn badges and marks as a sign of support to the party.	1,06	1,17	2,21
I have publicly expressed my political attitudes.	1,64	2,32	3,07
I have paid a membership fee to a political party.	1,03	1,04	2,23
I have actively participated as a member of a political party.	1,02	1,11	2,88

I have visited political rallies.	1,12	1,35	3,21
I have volunteered for a political party.	1,02	1,04	2,57
I have actively participated in a political campaign.	1,00	1,04	2,53
Trust in a political party.	1,63	2,90	3,19
Trust in a party leader.	1,66	3,26	3,60
Trust in certain political party's program.	1,68	2,84	3,15
I have the intention to start and lead political discussions in the future.	1,43	2,18	2,97
I have the intention to influence the voting decisions of people close to me.	1,24	1,71	2,71
I have the intention to influence the voting decisions of other people.	1,14	1,59	2,57
I have the intention to visit political rallies.	1,12	1,48	3,21
I have the intention to wear badges and marks as a sign of support to the party.	1,03	1,10	2,17
I have the intention to pay a membership fee to a political party.	1,04	1,07	2,39
I have an intention to participate in political meetings of the party I support.	1,03	1,16	3,21
I have the intention to actively participate as a member of a political party.	1,01	1,13	3,14
I have the intention to visit political rallies in the future.	1,03	1,22	3,23
I have the intention to volunteer for a political party.	1,04	1,13	2,88
I have the intention to actively participate in a political campaign.	1,03	1,05	2,28

Source: Author's work

The largest cluster (54%), called *inactive stabile voters*, is characterized by low values of political participation but high values of voting stability. Members of this cluster also express higher levels of trust to a certain political party, mostly in the party's leader. 28,1% of the respondents belong to the cluster called *inactive floating voters*. Those voters are characterized by low values of political participation and low levels of voting stability. They also have no trust in political parties, their leaders, or the program. The smallest cluster with 17,1% of respondents, called *active loyal voters* are characterized by a higher level of political participation, a high level of political stability, and a high level of political trust.

The results of cluster analysis also provided some socio-demographic and psychological characteristics of each segment.

Psychological characteristics were measured by a set of different variables: informing about politics through different media (adapted from the research of Park and You 2015), political cynicism (adapted from the research of Pinkleton and Austin 2009), perceived political risk (adapted from the research of O'Cass and Pecotich 2005), political involvement (adapted from the research of O'Cass and Pecotich 2005), perceived political knowledge (adapted from the research of Winchester et al 2016), religiousness (construct developed by the author), political orientation (adapted from the research of Bagić and Gvozdanović 2005) and satisfaction with the political party (adapted from the research of O'Cass and Pecotich 2005). All of the variables were measured with Likert type scale from 1 to 5 (1 being the strongest level of disagreement and 5 being the strongest level of agreement). Political orientation was measured as 5 being right-oriented and 1 being left-oriented. These variables, as well as socio-demographic characteristics (gender, age, education, and income), were included as evaluation

fields in performed cluster analysis. The analysis has resulted in the description of three main clusters depicted in Table 3.

Table 3: Cluster description

Cluster characteristics	Inactive floating voters	Inactive stabile voters	Active loyal voters
Socio-demographic			
Gender	Female	Female	Male
Age	18 - 45	Above 46	18-31
Education	High school	High school	High school
Income	801-1200€	401-800€	401-800€
Psychographic and behavioral			
Informing about politics through television	3,36	4,08	3,86
Informing about politics through radio	2,30	2,81	2,19
Informing about politics through printed media	2,46	2,97	3,14
Informing about politics through internet pages	3,02	2,91	3,19
Informing about politics through social networks	2,39	2,40	2,86
Political cynicism	4,43	3,88	3,50
Perceived political risk	3,66	4,11	4,24
Political involvement	1,18	1,66	2,74
Perceived political knowledge	1,94	2,50	3,26
Religiousness	3,62	3,86	3,85
Political orientation	2,36	2,48	2,88
Satisfaction with the political party	2,16	3,71	4,15

Source: Author's work

Inactive floating voters are mostly female, from the age of 18-45, with high school education and monthly income 800-1200 euros. They mostly inform about politics through television and internet pages. They are characterized by a high level of political cynicism and an extremely low level of perceived political knowledge. This segment does not vote for the same party but does vote. That is why this segment is called floating voters. Their inactivity is shown at an extremely low level of political participation – they do not engage in higher levels of conventional political participation.

Inactive stabile voters are mostly female, above 46 years of age, with high school education and monthly income 401-800 euros. They mostly inform about politics through television and printed media. This segment also expresses rather high levels of political cynicism and high levels of perceived risk. They are not really satisfied with the party they vote for (which can explain their inactivity in promoting the political party) but they do continuously vote for it.

Active loyal voters are mostly men, age 18 – 31, with high school education and monthly income 401 – 800 euros. They mostly inform about politics through television, internet pages, and printed media. They express high levels of perceived political risk, and in regards to other segments, lower levels of political cynicism and higher levels of perceived political knowledge. They trust their political party, especially the party leader. They also express an extremely high level of satisfaction with their political party. They are the ones who participate in the party's activities, and often they are formal members of that party. They express the intention to continue participating and promoting their political party.

Conclusion

This research provided some interesting findings that may be familiar to academics, but the value lies in the application of the results to the field of political marketing. Segmenting voters according to their loyalty provides findings that can be used for better understanding voters and as a basis for creating strategies to obtain and to retain voters' loyalty.

Three identified segments: *inactive floating voter*, *inactive stabile voter*, and *active loyal voter* are described by different characteristics. *Inactive floating voters* are voters who do not express any dimension of voter loyalty. Those voters usually have no interest in politics and consider politics and politicians corrupted and selfish. To attract this segment of voters, political party/politician would first have to work on eliminating high levels of cynicism and gaining trust. To turn this type of voter into a loyal one would require much work, but it is not impossible. However, it would be easier to concentrate on the segment of *inactive stabile voters* since they already have a certain amount of trust in the political party. They always vote for the same party but cannot be seen as a loyal voter because they do not participate in the party's activities and do not have an intention to do so. They also do not promote their party and have no intention to. These types of voters are also politically cynical and require strategies that will eliminate this cynicism. It would be interesting to investigate the reasons why these voters always vote for the same party that they are not really satisfied with it. It could be out of habit, the influence of family and friends, or simply because they think that they do not have a better choice. Lastly, the segment of *active loyal voters* is the one that political parties should concentrate on. Those are satisfied voters that participate in the party's activities and have a great deal of trust, especially to political leaders. This proves the importance of political brand. It is crucial to retain these voters and to mobilize them to promote the party with good word of mouth. These voters are a valuable asset of a political party and need a great deal of marketing attention.

The main limitation of this research is the sample. The research was conducted on the convenient sample in only one region in Croatia, so the results cannot be generalized, especially in some other countries because of the influence of cultural, economic, and political differences. Future research should address to a deeper investigation of these segments and include more different variables. Also, it would be interesting to conduct research in different countries to make a comparison and to identify some crucial differences.

Abstract

Analysis of the food supply of the country's population shows that food security problems arise due to the low level of economic development of the country, the lack of development of its own agricultural production, which is reflected in the low productivity of agricultural industries, the use of predominantly extensive factors in the management of the agro-industrial complex, the lag of productivity in the domestic agricultural sector from the same indicator in developed countries. In order to address these problems and to ensure food security, agricultural production must be increased through the introduction of innovative technology, that international trade is well conducted and subsidies, subsidies and other government support measures are provided to producers in a timely manner. In the transition to a market economy, the purposeful installations have undergone significant changes. The state serves as the basis for social stability and at the same time stability ensures the existence of the state. The interaction of elements in ensuring food security is determined and regulated by the market and the state through the production and processing of agricultural products, food consumption by the population, regulated by imports, exports and stocks, and formed by the conditions for food consumption according to consumption standards.

Keywords: Food Security, Social Stability, Agro-Food Market, Consumption Rate.

Introduction

Today Kazakhstan's priorities in solving the country's food security problem are becoming priorities to improve the efficiency of domestic agricultural production, develop the food and processing industry, improve the mechanism of state regulation of the agro-food market, as well as implement the relevant interests of national producers of foreign trade policy. The level and quality of food security directly depends on the state of development of agriculture and related sectors of the agro-industrial complex. The reliability of food security is ensured by sufficient food production in the country, the availability of funds for food imports with a low degree of vulnerability of supply in the event of complications (rising prices, lack of currency) and violations in interstate food supplies (embargoes, etc.). In General, the country's food security refers to the ability of the state, regardless

of external and internal threats, to meet the needs of the population for food in volumes, quality and assortment that meet accepted standards and norms. Food security should be a criterion for food security, according to physiological consumption standards. How this problem is solved in the country can be studied and analyzed through the assessment of its economic indicators (Sigarev & Syzdykov., 2017). Analysis of food of the population shows that the problem of food security caused by low level of economic development, lack of development of own agricultural production, resulting in low productivity sectors of agriculture, using mainly extensive factors in the management of agro-industrial complex, the lag in productivity in the domestic agricultural sector from the same period in developed countries. These problems also occur in the Kazakh agricultural market.

Methods

The peculiarity of Kazakhstan's agricultural market is that its production depends directly on the prevailing natural and climatic conditions in the country. The range of cultivated products is influenced by the specialization of farms in the regions, which also depends on the prevailing natural and climatic conditions and the state of fertility of agricultural land. Many farms are located far from the place of processing of agricultural producers and the final consumer. Many commodity producers suffer lesion from untimely sale of grown products. Due to lack vehicles and unscrupulous intermediaries accounted for sell products at a low price. Therefore, it is necessary to ensure agriculture related market infrastructure.

The market infrastructure development of the agro-food market in the country is a priority in the maintenance of the food and economic security of any state.

It is necessary for maintaining independence, stability and dynamic, economic development of the country.

In the world to assess food security, as mentioned above, there are many indicators that are widely used in practice. In our view, food security will be achieved in part in the country if the following conditions are met:

- the country's population is provided with domestically produced food by at least 85% and these products are environmentally friendly and healthy. This standard is close to that adopted by the International Food Organization (IFO);
- prices for these products are available to the majority of the country's working population;
- strategic food stocks are limited and do not provide a sustainable supply to the population in the event of an emergency;
- production capacity can increase food production;
- the scientific and technical base, although lagging behind the level of the highest: the world's reach of the region but is developing.

The country's food security will not be achieved if:

- the country's population is provided with environmentally friendly and healthy food products of domestic production by 60-80%;
- strategic food stocks are depleted or lacking; production capacity does not allow to increase food production (Abdimomynova et al., 2019).

Results.Kazakhstan's food market, in terms of these aspects, is not yet fulfilling its intended role.

A number of problems need to be solved here. It should be noted that not all programs adopted in Kazakhstan are implemented in practice. For example, a program adopted in 2002-2003 on import substitution. Kazakhstan still imports agricultural products from other countries. The country has not properly developed channels of delivery of products from production to the consumer. There is still a lack of processing capacity enterprises, places of wholesale storage, as well as special equipment for transportation of products during the transformation The main problems of the economy of the Republic Kazakhstan is a decline in agricultural production, due to serious miscalculations made

what affected the goals of agricultural production - full support of population with domestic food and industry with raw materials.

Kazakhstan's agriculture in its role in the structure and reproduction of the economy as a whole is basic. In accordance with the Development Strategy until 2022, the agro-industrial in a set of seven priority sectors should fully realize their industry advantages and large-scale potential (Nikitina, 2013).

In order to provide the population with domestic agricultural products, it is necessary to achieve stable development of this industry. Therefore, the problem of sustainable agricultural development must be addressed. In the course of research, factors have been identified that negatively affect the sustainability of the development of the crop and livestock industries. The common factors that reduce resilience are presented in Table 1.

Table 1: Factors reducing sustainability of agricultural development

Plant growing	Livestock
1	2
Decline fertility land and insufficient introduction of mineral and organic fertilizer	Small-scale production, low level of specialization
Non-compliance with evidence-based crop rotation and poor development of seed production	Extensive development industry accompanied by an increase in livestock while maintaining low productivity
Low concentration commodity production in a number of industries	Insufficient level feeding, irrational structure feed, predominance of purchased feed
Extensive industry leadership - the main increase in production due to growth sown area	Weak breeding and poor product quality
Lack of state boost support land fertility, productivity and quality products at optimum publicly necessary expenses	Not enough state small business support
Weak labor motivation, low incomes, imperfection the system sales and promotion of goods, as well as the mechanism partner relationships	Underdeveloped sales system and weak labor motivation
Declining solvent demand with rising consumer prices	Declining solvent demand with rising consumer prices
Source: own development based on the research results	

Specific factors that adversely affect sustainability of crop and livestock industries.

Grain production: unsustainable external customer demands the market, rising costs with a continuing trend of instability yields and prices. Great exposures to weather conditions, as grain growing regions are located in the risky farming zone. Weak material and technical base.

Sugar production: lack of resource-saving technology, not perfection of industrial and economic relations in the system production - sugar beet processing and trade.

Vegetables and potatoes: low concentration of production and high seasonality, low range and quality of products, high imports early vegetables and the lack of a modern field storage system production and consumption.

Dairy cattle breeding: high marketability of milk, high imports dairy products, lack of an effective system of measures to create specialized commodity farms in raw materials processing zones enterprises.

Beef cattle breeding: lack of pastures prepared for cattle meat production, weak introduction of advanced technology, poor development of product promotion on foreign markets.

The food industry of the country is characterized by: insecurity raw materials, underdeveloped system of procurement, transportation and storage of raw materials and lack of working capital for its purchase. All of the above problems in the republic require their solution.

Thus, the product offer in the agro-food market Kazakhstan acquired such specific features as small commodity production, historically recognized by economists as ineffective any production because it does not allow you to create a win on the basis for cost reduction and growth competitiveness of any market products.

In the structure of gross agricultural output of the republic livestock production is 44,6%, including agricultural enterprises -5,0%, peasant farms – 6,2%, households – 33,4%, products crop production – 55,4%, including agricultural enterprises – 18,8%, peasant households – 24,8%, households – 11,8%.

In the structure of gross output to the share of agricultural the enterprise accounts for 572,0 billion tenge or 24%, the share of peasant households – 734,4 billion tenge (30.8%) and households – 1079,7 billion tenge or 45,2%.

In the crop sector, the share of agricultural enterprises is 18,8%, or 443,3 billion, tenge, to the share of peasant farms – 24,8% (587,3 billion tenge) and 11,8% (282,4 billion tenge) accounted for by households.

Specific weight agricultural enterprises at structure gross agricultural products of the republic in 2018 amounted to 24%, peasant farms - 30.8%, households - 45.2% (Smailov. 2019) (Picture 1).

Source: own development based on the research results

Fig. 1: The structure of gross agricultural products in the context of all forms farms for 2018, billion tenge.

In the structure of crop production in the total volume of all categories of farms by region, the main share is: in the North Kazakhstan region – 14,7% (192,5 billion tenge); Almaty – 14,4%

(189,3); Akmola - 13% (169,4 billion tenge). Low level of development crop production celebrated in Mangistau (0,1%) and Atyrau region (1,0%).

The largest share in the structure of livestock products Almaty has - 17.5% (186.7 billion, tenge), East Kazakhstan - 16% (168.8 billion, tenge), Turkistan region - 12% (127.5 billion tenge).

It should be noted that domestic production indicators agricultural producers significantly lag behind world level standards, which indicates the weak competitiveness of Kazakhstan enterprises. Average annual milk yield per dairy cow in 2018 in agricultural enterprises amounted to 2280 kg, the average annual cut wool from one sheep 2,4 kg, and the average annual egg production of laying hens – 220 pc. In the cost structure for livestock production the largest proportion is feed. Therefore the need improving production technology in this industry is one of main tasks for the medium term. If these questions are not resolved in the near future, then domestic enterprises will not stand competition in comparison with Eurasia countries.

World experience shows that this development is ensured through the creation of large commodity agricultural structures that will ensure food security, increase labor productivity and produce products for export to external market.

Today, about 7 thousand large enterprises work in the country's agribusiness agricultural enterprises, 184 thousand agricultural producers and more than 2 million people are employed, of which 1.5 million are considered self-employed. This indicates that small-scale production predominates in agriculture, which does not allow domestic agricultural products successfully compete in the global agricultural market (Berikbolova et al., 2016).

An analysis of agricultural production indicates about the growth of its effectiveness. Gross output in 2018 compared since 2017 has grown in all categories of farms by 45,0%, including products crop production by 41,0%, livestock - by 51,0%, in agricultural enterprises - by 54,0%, including crop production by 43,0%, livestock production 2,0 times, in households - 36.0%, including plant growing - by 32,0%, livestock - by 38,% (Bekenov, 2018).

The key task of the agricultural sector of the country is to protect interests of domestic producers, which requires research not only common problems inherent in this market, but also analyze problems of each regional market separately. Here you have to decide following problems: attracting investment, improving quality products increase production environmentally friendly clean food products, eliminating price disparity between manufacturing and processing industries etc. Should note that the development of regional markets depends on nationwide agro-food market of the country. Therefore talk about the food market as a separate market country concept conditional, as it is one of the constituent elements national markets.

The balance of export-import of key processed products shows Kazakhstan's great import dependence for a number of products (Table 2).

Table 2: Import dependence of Kazakhstan in the main types of products

Product	Import in %
Condensed milk and cream	74.2
Canned fruits and vegetables	70.5
Confectionery	67.4
Cheeses and cottage cheese	58.3
Cookies	48.7
Sausages	44.8

White sugar	40,2
Chocolate	34.2
Butter	32.8
Source: own development based on the research results	

Scientists believe that if the import of a certain type of product is 20 % of the volume of domestic production, we can talk about stagnation of this production. If this figure reaches 60%, then production perishes. Our indicator of food imports averages 40%, i.e. domestic agricultural sector is a step away from death.

In addition, it should be taken into account that Kazakhstan must maintain equal trade with Eurasian Economic Union, which is an objective trend economic development.
However it should be noted that:

- most agricultural sectors in the country are located in less favorable climatic conditions compared with leading exporting countries;
- agricultural production has a weaker technical security;
- underdeveloped market infrastructure and distribution system domestic products to the consumer (Balabanov, 2013).

Therefore, it is proposed to regularly monitor production agricultural products (supply volumes, stocks and prices for main strategic types of food) and develop activities on export and import of food products. If necessary use food import quotas.

In addition, it should be taken into account that Kazakhstan must maintain equal trade with the countries of the Eurasian Economic Union, which is objective economic development trend.

However it should be noted that:

- most agricultural sectors in the country are located in less favorable climatic conditions compared with leading exporting countries;
- agricultural production has a weaker technical security;
- underdeveloped market infrastructure and distribution system domestic products to the consumer.

Conclusion

Therefore, it is proposed to regularly monitor production agricultural products (supply volumes, stocks and prices for main strategic types of food) and develop activities on export and import of food products. If necessary use food import quotas.Today, one of the main tasks is the development of economic mechanisms to protect domestic agricultural producers from dumping of imported food products. It is well known that with Kazakhstan's accession to the WTO and during financial crises risk will increase many times. This situation in the food market will lead to lower economic growth and food security independence of the country.

Adaptability Revised: Process-Aware Information System in Modern Organization Management

Andrzej NIESLER

Wroclaw University of Economics and Business, Wroclaw, Poland
andrzej.niesler@ue.wroc.pl

Abstract

Acquiring the ability to adapt has been one of the most important challenges since the very beginning of history. Evolutionarily always important to an individual, it has now become equally crucial for many business organizations. The business and social environment is turbulent and less predictable. In the age of global economy, mass connectivity, and ubiquitous computing, there is a need to better understand the nature of this change, in both organizational and technological terms. There is also a need to reconsider the approach to understanding adaptability as an organizational quality, and as a result, instead of just adjusting to the change, be able to truly embrace it and gain a real, sustainable advantage. The paper attempts to analyze the intrinsic ideas behind the concept of systemic and organizational adaptability, with a particular focus on attaining this quality of organization as an implementable feature of its information system. Based on Kant's analytic–synthetic distinction, a revised approach to understanding adaptability is presented and discussed. In this context, Process-Aware Information System (PAIS) is being examined as an architectural and technological reference point in establishing the premises and objectives for "synthetic adaptability", i.e., the proposed theoretically-revised view on the concept under consideration.

Keywords: Adaptability, Adaptive Systems, Process-Aware Information System (PAIS), Business Process Management (BPM).

Introduction

Achieving adaptability has been one of the most important challenges since the beginning of human history. Evolution-wise, in the long term virtually no other physical characteristic or skill has been ever as important and, literally, vital in pursuing survival and expansion—the ultimate goals of the competitive struggle. What has always been so crucial to individuals is now becoming equally important to business organizations in the marketplace. We are living in the world of global economy, mass connectivity, and ubiquitous computing. In many market segments everyone is competing with everyone. There is often no easy way to develop a strategy that could secure the already gained position, even for the segment leader, or to be able to measure own position on the market if the boundaries are unclear or fluid (Reeves and Deimler, 2011). It is getting harder and harder to find a safe niche unless you can create it yourself. The information is in abundance and same sources can easily be accessible to many competitors. It can be collected and processed in large data sets, used for discovering relevant patterns, then integrated and accessed from anywhere via low-latency broadband internet connections.

The change is frequent and rapid, leaving often no chance to hold on to the traditional model of planning in advance for many years. To survive and grow, organizations need to develop a novel attitude towards adaptation. This requires a new understanding of the current business context, leveraging technological opportunities, and rethinking the concept itself. What does it mean to adapt? How to foster adaptive capabilities in your own organization? How to develop awareness of a broader business context, identify and filter meaningful signals? The key to finding answers to these questions is to see adaptability as a quality that goes beyond the scope of a single organization and is fostered through integration, cooperation, and exchange of experiences with external environment. The foundation for this vision is adaptive, process-aware information system.

This paper is organized as follows. In Section 2 we try to investigate the concept of adaptability by juxtaposing two perspectives: organizational and systemic, with selected technological aspects and interdisciplinary view on related work and literature references. Section 3 introduces a theoretical perspective on the approach to defining "synthetic adaptability". It contributes the idea of considering organizational adaptability as a synthetic feature based on Kant's analytic–synthetic distinction. In Section 4 we use Process-Aware Information System (PAIS) as an architectural and technological reference point for discussing the applicability aspects. Next, in Section 5, we establish the premises and objectives for "synthetic adaptability" as an information system feature. Finally, in Section 6, we conclude with a summary.

Understanding Adaptability

The concept of adaptability is interdisciplinary in nature and has been a subject under investigation in many areas of science for a considerably long time. Although originated and firmly rooted in the natural sciences, such as the evolutionary biology or ecology, it has been successfully applied and assimilated in various other fields, from cybernetics to business operations and organizational management. Taking the standard dictionary definition as a starting point, it can be described as "*the quality of being able to adjust to new conditions*" (The New Oxford Dictionary of English).

Quality vs. feature

That first attempt on expressing the core idea indicates straightaway the first dualism in perception worth to be reflected upon: quality vs. feature. Adaptability is an invariably desirable characteristic of every development-oriented organization. Business environment is constantly changing and success in a long run is always the domain of the best fitted. Adaptability as the quality that an organization can manifest outwardly and leverage as competitive advantage on the market shall, therefore, be reflected inwardly and become the intentionally implemented feature of its information system as well. Proper alignment of these matters has long been reported as one of the very desirable yet equally difficult and challenging objectives to achieve (Gillies, 2011).

Object vs. Subject of Adaptive Change

From the standpoint of how organization is perceived, its operational behavior is highly dependent on the implementation of business processes and that, in turn, relies nowadays on the corporate systems and the information technology in use. This raises the question whether such a system is to be considered as the object or the subject of adaptive change. The first one implies merely some kind of passive capability of being adapted (i.e., a possibility of becoming the object of change initiated and conducted externally), the latter introduces a more complex behavior based on exercising system's autonomy and the ability to adjust to the new conditions by itself. For the reasons discussed later in this paper, it is the second one that enables the significant progress in what such a self-adaptive system can introduce to modern organizational management.

However, it is still common for organizations to think about information systems just in terms of software tools that are purchased as the solutions for once articulated concerns and pre-defined requirements. The ISO/IEC 25010:2011 (SQuaRE) Product Quality Model regards adaptability as a sub-characteristic of *portability* and defines it as a degree to which a system can effectively and efficiently be adapted for different or evolving operational or usage environments (Estdale and Georgiadou, 2018; ISO Standard, 2011). The software product quality metric for adaptability acceptance to organization's environment (Galin, 2018) is calculated with regard to the number of functions that failed adaptability testing, out of all functions required to be adapted. This example demonstrates a valid but narrow, technical view that focuses entirely on the low-level aspects, e.g., the scalability of internal capacity or suitability for individualization, and is insufficient to adequately address the current adaptability needs at the higher, organizational management level.

Nature and scope of adaptive change

As the environment becomes increasingly turbulent and unpredictable, organizations are challenged to identify and process increasingly complex signals, and make adaptive decisions within a very limited time frame. This affects the nature and scope of what can be applied as an adaptive response, beyond the constraints already imposed by the type of organization and its management style. According to Jahan, traditional organizations are perceived as valuing stability and predictability at the cost of limited flexibility, and overall readiness and agility in introducing changes to their businesses (Jahan, 2016). On the other hand, modern organizations prefer flattened structures, rely on empowerment and delegation of authority in the decision-making chain, and, what appears to be most important in the context in consideration, they aim to leverage the new potential of large data sets and the usage of advanced information technology.

This orientation on technology and data has been visible for many years now. Sousa describes it as "a fifth strategic dimension needing to be accounted for in many companies" (Sousa and Moço, 2017). Reeves and Deimler mentioned it a decade ago while defining the four organizational capabilities behind attaining adaptive advantage, pointing out that the new technology facilitates creative experimentation with business processes and models, and enables establishing and managing complex systems of co-operation, exceeding corporate boundaries (Reeves and Deimler, 2011). As they noted, "the speed of adaptation is a function of the cycle time of decision making" (ibid.) With the support of IT, it is possible not only to automate business processes (fully or partially), but also implement sophisticated mechanisms of real-time monitoring and control. This raises the possibilities of what can be achieved in terms of adaptability to the level of instantaneous reactivity in the environment where all competing sides have access to similar information and response time is crucial in seizing the opportunity. Considering the recent achievements in the field of artificial intelligence and its applications in business (Barta and Görcsi, 2019), effective solutions can be applied to automate the decision-making process or at least filter the information noise to relieve decision-makers of the burden of performing it all manually.

Design-time vs. run-time

Organizations act in a way that can be designed—at least to some, usually large, extent. One common example of this is Business Process Management (BPM) (van der Aalst, 2013). In this approach the crucial, value-creating organizational processes are identified and expressed as workflows, structurally analyzed for soundness, and gradually improved based on redefined goals and the insight from the enactment and monitoring of their prior versions. Creating business process models is a well-established practice of documenting and, in fact, formalizing effective and desired behaviors in organizations. These artifacts, as well as other internal regulations, policies, and codified procedures, can be together considered as a design of how the organization operates.

What was designed can be then observed in action. Since these models are usually just an attempt to structure predominantly human work, their enactment in practice may, for obvious reasons, be different from the intended course. In particular, these processes can exhibit a certain degree of discretionary interpretation, due to people's natural ability (or tendency) to react spontaneously on changes and emergencies, e.g., by not following formal rules blindly, by improvising, or simply being subjective and creative. Human factor in this way contributes to the natural adaptability on the operational or execution level. However, at the same time we can observe the opposite, i.e., negative impact on flexibility, when technology is applied to automate business processes. To mitigate these issues, the problem must be addressed from several perspectives, combined in a business process model, and on different IT levels. Reichert and Weber published a comprehensive work on fostering flexibility for various phases of the process life cycle (Reichert and Weber, 2012).

IT systems, like any properly applied software solution, introduce efficiency gains and reduction of errors when a well-structured process is automated and implemented. In traditional approach, the behavior exhibited by a system when it is in use (i.e., during run-time) is directly the result of what

was decided in the design-time. Fig. 1 depicts the BPM life cycle and its main phases in relation to the design-time and run-time. If the system can perform any self-adjustment during run-time, it is still considered to be the result of featuring a functionality implemented in the design-time. Therefore, any significant changes or alterations in functioning, the need for which has been identified already after the system has been run, require going through a full cycle: redesign, amended implementation, reconfiguration, and, finally, re-launch of the updated version.

Fig. 1: The BPM life cycle. Three main phases: (1) design / redesign, (2) implement / configure, (3) run and adjust (cf. (van der Aalst, 2013))

Organizational adaptability as a synthetic feature

In his work "Critique of Pure Reason", the German philosopher Immanuel Kant introduced a semantic distinction called the analytic–synthetic dichotomy. It refers to distinguishing statements (especially affirmative subject–predicate judgements) into two types of propositions: *analytic* and *synthetic*. In the first case, the concept of the predicate is semantically contained within the concept represented by the subject, and, from the cognitive point of view, serves as a clarification. In the second case, although the predicate relates to the concept of the subject, it lies entirely outside of it and because of that provides cognitive amplification. Kant juxtaposed this distinction between analytic and synthetic statements with another one: *a priori* and *a posteriori* proposition. The *a priori* propositions are those which can be known independent of experience and their justification does not rely upon it. On the other hand, the *a posteriori* propositions are based on experience and validated by it (cf. (Huemer and Audi, 2002)).

Analytic Adaptability

We can use the above outlined epistemological approach to revise the concept of organizational adaptability, with a special regard to the role the organization's information system plays in this context. Let us first consider organization's adaptability as a quality that is analytic in Kant's sense. Since the combination "analytic" and "*a posteriori*" has been rejected by Kant himself as self-contradictory (being analytic excludes any reference to experience), the only valid way to define it would be as "analytic" and "*a priori*". Analytic adaptability (DTAA) shall therefore imply, that the ability of the organization to adapt is understand as its intrinsic quality (based entirely on its internal

structures and properties) and is expressed solely as the designed capability, e.g., implemented as a feature of its information system, conceptually fully controlled and understood within the scope of the organization (v. Fig. 2). In design science, however, constructs are usually created in an iterative way and are developed using, e.g., continuous integration approach. Moreover, considering reflective paradigm, meta-programming, etc., we cannot rule out the situation in which system could be capable of changing its behavior by adjusting the design and making that alteration persistent. That opens up the possibility for interpretation, that the "*a posteriori*" variant (RTAA) might be a valid case.

	a priori	***a posteriori***
analytic	design-time (DTAA) (*design, redesign*)	run-time (RTAA) (*adjust the design*)
synthetic	design-time (DTSA) (*implement, configure*)	run-time (RTSA) (*run and adjust*)

Fig. 2: Adaptability decomposed as Kant's analytic–synthetic and *a priori–a posteriori* dichotomies

Synthetic Adaptability

Synthetic adaptability (SA) can be perceived as both an "*a priori*" and "*a posteriori*" concept. Unlike AA, SA can be considered as an extension to the foundation (i.e., AA), that introduces new capabilities based on interaction with the external environment. It offers functional and operational amplification, and can be defined in two distinctive ways. The first one, the "*a priori*" SA, is just a conceptual enhancement of AA, achieved by adding new adaptive abilities utilizing external resources but remaining within the organization's scope of control and under its own formal specification created in the design-time (DTSA). The second one, which we will refer to as run-time synthetic adaptability (RTSA) or just (the full) "synthetic adaptability", is the "*a posteriori*" concept. It takes DTSA as the foundation and extends it with advanced adaptive autonomy, available to experience only in the run-time. Conceptually, it requires implementing in the information system functional and behavioral features, that are developed in the design-time, but relay on external systems, data, and behavior, which cannot be determined *a priori*, i.e., without actual participation in an interaction with the external world.

To understand the practical implications of such theoretical revision, it is worth finding and discussing a more practical, technological reference point, facilitating comprehension, and providing some insight on the feasibility aspects.

Process-Aware Information System (PAIS)

Dumas et al. define Process-Aware Information System (PAIS) as "a software system that manages and executes operational processes involving people, applications, and/or information sources on the basis of process models" (Dumas et al., 2005). Such systems extend what has been previously defined as the domain of the Workflow Management (WfM) Systems (Reijers and Van Der Aalst, 2005) by offering support for additional phases of the full BPM life cycle, including business process analysis, redesign, implementation, execution, and monitoring.

Business process models and process awareness

Being "process-aware" means that the information system is not only delivering the technological support for enacting business processes, but is also capable of handling the needs and maintenance

requirements of their models. The model can be externalized and serialized using meta-model-based languages with visual notation and formal specification like, e.g., Business Process Model and Notation (BPMN) managed by OMG (Object Management Group, 2013). In scenarios with full business process automation, it allows for altering the organizational behavior by introducing changes to the (next iteration of the) process model without the need of making any significant modifications to the software or in the technological layers and IT infrastructure. The system engine acts as the middleware layer providing access to the functionality implemented in other corporate systems and business applications, exposing granularity level compatible with tasks and subprocesses, and delivering auxiliary services, like messaging or event handling. It maintains the execution context for every instance of any running processes and collects execution data, which can then be used for process mining and other analytical tasks targeted towards improving understanding of how the organization's processes are executed in reality and whether there are any discrepancies worth investigation during such a *post-mortem* analysis.

Context-Awareness and Reflection

The PAIS is aware of the business process, but in case of the discussed synthetic adaptability the process must be aware of the context and even aware of itself. The term *context* is used in many different areas of science and can have a very different meaning depending on the selected perspective. For the purpose of this study, we can define it concisely after (Chalmers, 2011) as the circumstances relevant to the interaction between a process and its execution environment. Context-aware process is able to scan and catch the relevant events occurring in its environment, interact with the whole ecosystem by communicating (triggering) its own events, thus possibly invoking and influencing the behavior of others. The capability of a system to understand the context and translate this understanding into action is the essence of context awareness. Systems featuring this capability are often referred to as "intelligent", "smart", or "adaptive" (Mahalle and Dhotre, 2020).

In computing, *reflection* is the ability of a process to access, examine, and even alter (consciously) its own state and behavior through a well-defined programming interface. By analogy, it is a similar concept to what in the field of artificial intelligence is described as "self-awareness". Such properties, although accessible in the same way as regular (meta-) data structures, are typically observable only from some external (meta-level) viewpoint (Sobel and Friedman, 1996). Since in PAIS processes are instantiated based on the process models, that opens the possibility for modification of not only the behavior of a single (current) instance of the process in its run-time, but (by altering the model) also all the future instances of that model, hence making the adaptive change in behavior persistent.

Event-driven vs. state-driven behavior

In a stable environment, system's behavior can be designed and implemented as a set of predefined states. Such a system can still manifest certain level of flexibility or ability to identify some changes in its surroundings and adapt to them, but the task of constantly monitoring the environment must be implemented in the state machine. Event-driven paradigm introduces another common behavioral policy: event-condition-action (Erradi et al., 2006). System is able to react to predefined events and, based on the evaluation of the condition, decide which action should be performed. In PAIS these types of conditions can be defined as embedded attributes in the process model (e.g., as a conditional expression of an exclusive alternative gateway in BPMN) or externalized and delegated for storing and managing in a central business rule repository. In some situations, such business rules may be calculated in real time, on a per-instance basis. That introduces new possibilities in terms of injecting intelligent, flexible behavior into a business process in the run-time—an interesting approach has been presented in (Patiniotakis et al., 2019). With the use of Big Data technologies, AI, and advanced analytic techniques, it becomes possible to achieve new levels of adaptive, data-driven behavior.

An example of such an attempt, i.e., to create a framework combining Big Data analytics and BPM paradigm has been discussed in (Hassani and Gahnouchi, 2017). This trend in computing can be successfully applied to PAIS-based enterprise solutions, as it is by design modular and suitable for

injecting integration links to external systems delivering additional functionality. In a complex, interorganizational business scenarios, it may involve integrating PAISs of several business partners and realizing in practice complex multicompany process-oriented systems, as was envisioned almost a decade ago by (Reeves and Deimler, 2011).

Premises and objectives of synthetic adaptability

The original premise of Business Process Management and process-orientation in the information system development was to use process models as means of capturing, documenting, and constantly improving well-structured business processes. In real-world scenarios, about 80% of the process model instances follow the structure expressed by 20% of the process variants; pursuing the remaining 20% in order to achieve the complete behavioral representation is much more challenging (van der Aalst, 2019). Designing the PAIS-based enterprise solutions emphasizes the role of this model-based approach and proves that it can be very effective, especially considering future process automation. However, in the age of constant change, even the externalized process model may be not enough to satisfy the needs and expectations of modern organizations' managers.

Languages such as BPMN are great tools for modeling structurally sound processes, but they are not well suited for modeling dynamic, adaptive processes, that are hard to describe in the classic imperative manner. There are already attempts to fill that gap, e.g., Case Management Model and Notation (CMMN) standard managed by OMG (Object Management Group, 2016), that introduces more human-centric and adaptability-oriented way of thinking about processes. It does not bring the same level of maturity or technological robustness as the well-established BPMN tools on the market, but it manifests the direction in which the development will certainly head: towards adaptive capabilities that leverage technological advancements. Moreover, considering advances in cognitive computing, we can expect the new category of knowledge-intensive processes to emerge and redefine the approach to implementing flexibility (Hull and Motahari Nezhad, 2016).

Table 1: Synthetic vs. analytic adaptability—feature comparison

Feature	Analytic adaptability	Synthetic adaptability
Modus operandi	State-driven, data-oriented	Event-driven with complex event processing
Behavior style	Deterministic, reactive within the defined scope	Autonomous, proactive
Change introduction possible phase	Design-time	Design- and run-time
Interaction mode with the environment	Well-structured protocols, predefined events	Ad hoc, self-learning, discovering patterns
Available level and scope of change	Process model	Process model and process instance

The main objective of the proposed synthetic adaptability is to open it for better integration with what is already available in the cloud and externalize more than just a process model from the host information system's workflow engine. Event-driven processes are nothing new, but with current level of variability and unpredictability in the business environment, it is more and more a challenge to identify what is the real signal for adaptation. Data analytics offers a new way of defining complex events and allows for implementing near real-time processing. Behavior of a process can be adapted in run-time at the instance level, and the most accurate information available can be used for that in

the decision-making process. Adaptability as a concept needs to be revised. Table 1 gives a summary of selected features comparing the two discussed.

Conclusion

The business environment is constantly changing, and the dynamics of these fluctuations are more rapid and unpredictable. Embracing the change is now the basis for maintaining the *status quo* and planning the strategy for further development and expansion in the future. The ability to adapt has become one of the most important qualities of every competitive organization, and requires special attention and thorough consideration by the management. In this paper we have addressed the problem of understanding the concept of adaptability from two different but closely interrelated perspectives: as an organizational quality, and as a feature of organization's information system. While the perception of the role of information system and technology in general in fostering adaptability of an organization is widely known and recognized, we argue that this is no longer a sufficient understanding of the matter. There is a need to rethink the approach in which the behavior of an organization is predominantly conveyed in rigid, formally defined, and well-structured business processes, and move towards much more flexible, knowledge-intensive, hybrid models. Adaptability is no longer to be defined once and then forged in the system design.

In order to revise the concept of adaptability, the novel approach based on Kant's analytic–synthetic dichotomy has been introduced and discussed. The main idea behind this attempt is to extend the perception of flexibility from what has been strictly planned and implemented in the information system's design-time, to also include the possible *ad-hoc*, adaptive behavior enacted or experienced during the run-time. The revised concept defined as "synthetic adaptability" has been confronted with Process-Aware Information System as a technical reference point and implementation background for discussing the applicability issues. With the latest technological advancements, organization's adaptive capabilities can now be amplified through external interactions and shared with other business entities in the environment. The adjustments in behavior shall be considered not only from the perspective of a separate, external business process model, but also of its individual, context-aware instances and their abilities to discover and persist the new, improved behavioral patterns. Future IT solutions for modern organizational management, when identified as "intelligent" or "smart" should be considered in terms of the level of their synthetic adaptability.

The Impact of the COVID-19 Coronavirus Pandemic on Tourism - A Perspective on the Influence of the Brand on Tourism in the Current Context

PhD student **Ionela – Valeria POPESCU**

The Bucharest University of Economic Studies, Bucharest, Romania
E-mail: ionelavaleriapopescu@yahoo.com

Abstract

The article presents an overview of the tourism industry in the context of the COVID-19 coronavirus pandemic, as well as a perspective on how the brand of tourism service providers can help to relaunch companies affected by this crisis.
Travel is an important component of active people in 2020, and tourism is a field strongly affected in this difficult period for public health. Therefore, it must be the subject of debates and solutions must be identified in order to overcome the current situation.
Furthermore, the article presents a series of real current challenges, but also measures that can be taken to reduce the effects of the health crisis which also affects the tourism industry.

Keywords: tourism, coronavirus, pandemic, recovery measures, brand, tourism services
JEL classification: L83, I12,I15, M31

Introduction

The tourism industry is one of the most vulnerable sectors when it comes to a potential threat related to an economic, health, military or other crisis that may cause people to think twice before traveling. This is natural, because, first of all, people will most probably give up traveling being scared of the effects of these crises worldwide on themselves or on economic mechanisms. Whether we are talking about restricting travel, traveling only in cases of necessity or in the interest of work, people will tend to minimize their own exposure, the risks that may arise and, obviously, they will save money for difficult moments that they will go through.

The health crisis brought about by the COVID-19 coronavirus pandemic currently experienced by humanity is a moment of hardship for the health system of each state, testing people's resilience to stay in their own homes without being allowed to enjoy the freedom of a trip, a city break, a hike or even a quiet walk in the park, in the conditions of social distancing that we all have to respect, so that the epidemic does not increase and does not perpetuate endlessly.

In this context, people in 2020, for whom a trip to almost any corner of the world was possible until recently, are faced with restrictions and challenged, while they also find themselves surrounded by the fear of the unknown, an unseen enemy and the lack of a predictable reality at least in the short term.

For people, one of the most dangerous fears is that of leaving the comfort zone, respectively, in this case, traveling to another area than the comfort of one's own home (one's own country). People will always feel that they are more protected at home or in their country of residence and this explains why a high number of citizens returned to their countries of origin when this pandemic started, on the one hand due to job losses in the countries where they lived and on the other hand out of fear of getting sick, dying or being locked in a country other than their country of origin, away from family and friends.

In this conjuncture, people will consider very carefully the need to travel, on the one hand for vacations or trips out of personal interest, on the other hand for business trips, while more and more managers have understood that working from home can be more useful for employees and for their safety against the disease, but even in the case of medical trips, which people used to make until a few months ago either for emergencies or for cosmetic interventions in countries where costs were more convenient or there were higher quality services compared to those in their country of origin.

Research Methodology

Taking into consideration the fact that the COVID-19 coronavirus pandemic is ongoing, the research method is a continuous one, based on collecting the information that is transmitted and the events that take place from one day to the next. However, in order for the article to present a more accurate image of the current reality, the research method used was the analysis of data from secondary sources, such as articles from books and magazines, the written press and recent market studies. The aim was to identify the issues highlighted in the specialised literature on the influence and role of brands on tourism services so far, but also the extent to which they can remain relevant in the context of an international health crisis. Also, the article is formulated as a starting point to conduct future quantitative and qualitative research, based on the hypotheses launched and testing their validity in different environments and on various target audiences.

The ***hypotheses*** of the article are presented as follows:

-> the brand in tourism represents a guarantee for the consumer regarding the observance of the ethical, moral, safety and hygiene norms to perform the activity from the departure point of the tourist to the travel destination and back home;

-> the coronavirus pandemic experienced by humanity at this moment can highlight the importance of the brand of a tourist service provider for the tourist;

-> tourism service providers can use the brand in the current promotion, in order to create a favorable attitude in the minds of consumers at the end of the health crisis.

The current state of knowledge and directions of influence of the brand in terms of the current challenges in tourism – Analysis

The COVID-19 pandemic is a global challenge for all industries. Out of them all, however, without a doubt, tourism is among the most affected, as it has been almost completely stopped, by limiting or permanently banning travel on all continents. If in certain areas or countries travel has not yet been banned, the fact that it has been stopped in most countries is a blockage of the mechanism of free movement of people and, implicitly, a limitation or a complete cessation of tourism activity.

The linguistic origin of the term “tourism” is closely related to the meaning of the Latin words “tornare” (to turn) and “tornus” (circular movement) and designates a journey (circular movement) returning to the departure point.

In July 1991, the World Tourism Organization (WTO) Conference in Ottawa redefined the basic concepts of tourism, assimilating the term tourism to „activities that are undertaken by people during their travel or stay in places outside the residential environment for a period of more than 24 hours or at least one night, without exceeding one year, for leisure, business or other reasons, for purposes other than performing a remunerated activity in the place visited.”

The trend to diversify and increase the complexity of consumer needs, manifested in recent years as a result of a growing level of education of consumer behavior, has contributed to the introduction of new activities in the service delivery process. In the case of tourism services, this involves, in most cases, activities grouped in the following types of services (Nistoreanu P., 2012): accommodation, food, transport, leisure and treatment.

Thus, the article aims to bring to the readers' attention the impact of the COVID-19 pandemic on these tourism services, the role of tourism providers brands, but also several measures to reduce the disaster that could hit tourism if not acted upon as soon as possible ifor a worldwide recovery. The damage will be on several levels, but the two most important to mention are without question the job loss of a large number of tourism employees and the financial losses both from the lack of customers and from investments not recovered by tourism players for the current year.

In the definition provided by the American Marketing Association (AMA) and later taken over by other authors, the brand is „a name, a term, a sign, a symbol or a design, or a combination of these elements, with the role to allow the identification of goods or the services coming from a vendor or group of vendors and their differentiation from the competition" (Kotler, 2008).

Given this definition, it is noticed that the brand, by its nature, helps companies to differentiate themselves from the competition and, therefore, to act in various ways in times of hardship or crisis regardless of the field they belong to, whether it is tourism, agriculture, clothing or anything else.

Therefore, both the challenges and the measures taken, despite being common, must be viewed separately by each tourism company, in accordance with the values transmitted by its brand until that moment in order to remain credible for tourists.

The results of the Research

What should be done? Considering all the services that support tourism and, basically, those which shape it and make it exist, it is necessary to align them with the current reality and present them in a way that develops the confidence of potential tourists, so that they have the intention to travel again, to interact with all the service providers in this process and, of course, to enjoy their experience - the main purpose of tourism, besides recreation, relaxation and travel in itself.

Following the analysis of the current situation presented in a series of specialized articles and in the writings of well-known specialists in tourism, we will present the present challenges, but also a set of measures that tourism workers can consider in order to recover and restart the activity soon, so that their human resource does not suffer, and the tourists can enjoy their long-dreamed trips as soon as possible.

The ***biggest challenges*** identified, generated by the health crisis, are the following:

-> Cancellation of reservations and / or requesting the refund by tourists;

-> Tourists who were caught in the middle of a trip during the pandemic, those who were stuck / isolated in their respective destinations and how travel agencies or countries of origin manage these situations;

-> Managing customer relations both by phone and online, through social networks, as tourists have a lot of questions, concerns, dissatisfaction, fears, anxieties about the money paid in advance for the holidays and it is important not to lose contact with them, to reassure and maintain them as loyal customers;

-> The danger of job losses by tourism employees, in the context of losing the basic activity, stopping it temporarily or fully digitising certain positions that until now required the presence of a person to perform those tasks;

-> Managing short, medium and long term resources by both parties, both tourism companies and tourists; thus, we are talking about loans, utility expenses, payment to hotels in advance - from the perspective of travel agencies and, on the other hand, overdue loans, job losses and running out of resources - from the perspective of tourists;

-> People's reluctance to travel.

All these challenges are real for the tourism industry, but a solution for the recovery of this health crisis by tourism workers with caution and responsibility can be the observance of certain measures so necessary for all fields worldwide. Thus, the proposed measures are divided into two categories:

those of a managerial nature, which concern more the organization of the activity of tourism service providers from a strategic, financial and administrative point of view and those of safety, hygiene and maintenance of social distancing between tourists, recommended to hotels, restaurants and other tourism fields.

A. The managerial measures proposed to travel agencies, hotels and other tourism service providers are the following:

-> Negotiations with suppliers to freeze or postpone certain invoices for several months (as appropriate) and relaxation of payment terms;

-> Maintaining cash to keep employees in the pre-crisis formula for as long as possible;

-> Stopping short-term investments in technology or research;

-> Contracting certain loans for enterprises, if the financial situation allows / requires it;

-> Discussions and support from the state (states / European Union) regarding the granting of time to pay taxes and access to certain investment funds;

-> Orienting investments towards employees, especially towards the sales force and the communication force of the company;

-> Trying to maintain the employees' jobs after resuming the activity, even if it will have a slow start;

-> Completely moving the activity online, in order not to endanger the tourists or the company's employees;

-> Limiting the interactions with the company's partners in order to protect them, but also their own employees;

-> Restoring the budget for 2020, having in the foreground the reorganization of expenses and investments and the redirection of revenues to important directions regarding the maintenance of the agency, hotels and related staff;

-> Maintaining permanent contact with customers, employees and suppliers through the online environment and on all means of communication which, as much as possible, do not involve face-to-face interaction;

-> Continuing to promote the company's services, without the clear purpose to sell; people need to stay connected with values, services and sales forces, but they need understaing in a time of more limited resources; don't sell aggressively, without empathy, a service to which people will return anyway, for the simple reason that they will wish to escape the daily routine in a dream trip at the end of the coronavirus pandemic;

-> Relaxed payment terms for tourists, cancellations without penalties for the emergency/pandemic period, special offers, extension of the early booking period (in collaboration with hotel service providers and other suppliers in the chain), fee reductions where applicable, offering vouchers for certain services included in the package;

-> Flexibility regarding reservations made by tourists;

-> Streamlining online promotion activities;

-> Strategies and offers for tourism inside the country more than the external one which may involve several services included in the package with a risk factor, for example air transport; promoting rural tourism, in nature, in areas with large green spaces for walking, where tourists will not interact with crowds and will be able to respect the social distancing;

-> Personalized approach to each request for postponement or cancellation, as each customer is different and has a different history or travel wishes;

-> Massive communication of the measures taken, both offline and especially online, in order for the message to reach all parties involved in the tourism carried out by the company and, especially, in order not to create confusion, misunderstandings or missing relevant information by customers (tourists) and company partners.

B. The safety, hygiene and social distancing measures between tourists recommended to hotels, restaurants and other tourism service providers, are the following:

-> A specific strategy and procedures to act in case a tourist has a fever and presents symptoms specific to COVID-19;

-> Protection equipment for all staff;

-> Waiting places at the reception, in the restaurant, cafes, terraces, elevators, halls or wherever crowds can be created;

-> Daily monitoring the temperature of the employees upon arrival at work and of the tourists, upon check-in or when returning to the hotel after a trip.

-> Setting disinfectant mats, disinfectant gel devices, disinfectant dispensers, antimicrobial foil, sanitary bootees, disposable masks and gloves at the entrance;

-> Setting plexiglass protection panels at the reception, between the customer and the receptionist, similar to those present between the sellers from the supermarket and the customer;

-> Simplification of the check-in procedure by completing it either online or through certain devices installed at the entrance of the hotel, or when booking and confirming payment to the agency/hotel;

-> Hygiene procedures at the reception, for luggage carts, in elevators, for railings, and for all surfaces frequently touched by tourists;

-> Removing magazines, leaflets, maps and any other printed materials that could contribute to the spread of the virus;

-> Dividing tourists into series for breakfast, lunch and dinner (as appropriate, depending on the type of meal services offered by each hotel or restaurant); making reservations in advance at the reception in the order of first come first served / based on age / other options identified as convenient for both parties involved;

-> Replacing the Swedish buffet with the a la carte menu (preferably) and offering the option to eat in the room with no additional cost;

-> Adapted cleaning procedures in the room and in open / common spaces;

-> Sanitizing children playgrounds several times a day, with increased attention to the surfaces most frequently touched;

-> Placing sunbeds on the beach, at the pool or in the garden respecting the rules of social distancing;

-> Increased procedures regarding hygiene at swimming pools, saunas, massage rooms, beauty, care and body relaxation salons;

-> Providing disposable booties for tourists to be used in common areas, as is done, for example, in private medical centers, SPAs, gyms or private kindergartens and nurseries;

-> Temporary closing the common toilets inside the accommodation unit, so that tourists can use only the toilet in their room to avoid contact with other people;

-> Maximizing the space outside the hotel / restaurant, if it exists and if the place allows it.

It is essential for tourism service providers to understand that these challenges, but also the measures proposed to address them, must be correlated with the company's brand policy. A tourist who trusts a travel agency which has not disappointed him for years regarding their services will first contact this agency for a new journey even after the pandemic, as the faithfulness relationship has already been created, and now can easily be turned into a loyalty relationship through effective communication and empathic promotion methods towards the customer.

Conclusions

Therefore, we can understand from the analysis performed the fact that tourism is a strong sector challenged by this health crisis. Serious losses in all business segments are highlighting this: airlines have reduced their flight schedules as passenger traffic has been stoppee; cruise lines stopped operations for the next few months, several hotels have been closed and thousands of workers in the industry have already been laid off.

\However, if we see the situation as a whole and with optimism about the future, we can gradually notice that sooner or later, the crisis will pass or diminish in magnitude like other crises in the history, and specialists in the field will have to think about what they will do from now on. It is obvious that things will not be the same for at least a good period of time, or maybe never, but people will continue to travel and will want to do so perhaps even more, given their prolonged isolation at home, in contrast to the numerous trips they usede to go on until not long ago, an ascending worldwide trend.

People will continue to visit places, but they will be more careful and will want to convince themselves that it is safe to travel again after noticing effective measures and results that will convince them.

It is expected that travel behavior will change, with an upward trend towards nature tourism, outdoor adventure parks, camping and recreational activities, car trips on your own and individual household travel. Also, for tourists with high financial possibilities, there is a growing demand for renting or buying private islands, somewhere to be expected in the case of those who can afford these tourist extravagances, for both privacy and increased protection against the virus.

On the other hand, tourists will feel safer in hotels than in apartments rented from strangers, which was usually very popular until the beginning of 2020.
In addition, it is predictable that people will expect price declines, and this could destabilize tourism players who expect a recovery only starting in 2021.

But above all, humanity will remain with an important lesson that needs to be understood as soon as possible, although people should have done so by now: personal hygiene and public hygiene are two topics that must not and cannot remain taboo any longer, both for authorities and for citizens, who need to understand that only by starting with our own example can we make a change in the world and that protecting others is the solution to change ourselves.

The article was prepared with the financial support of the Russian Federal Property Fund. Grant "Development of theoretical and methodological provisions for the formation of a system for the reproduction of labor resources in rural areas under conditions of labor migration and demographic restrictions" 19-010-00654

Abstract

The problem of employment and retention of agricultural personnel is an extremely urgent problem, both for the Russian economy and in the general scientific context. Qualified personnel ensure the effectiveness of any territorial production system. At the same time, not all sectors are equally attractive. First of all, applicants pay attention to the level of wages, compensation package, social package. The topic is also being updated due to the specifics of agriculture as the most important industry ensuring the country's food security. The purpose of this work is to analyze the features of employment of agricultural staff in the Sverdlovsk region. During the study, methods of analysis and synthesis, as well as deduction, were used

Keywords: Salary, Staff Remuneration, Labor Market, Employment, Agriculture.

Introduction

Labor in agriculture has specific characteristics, namely, it is characterized by sectoral characteristics of production and changes under the influence of technical factors. The working period in agriculture often does not coincide with the period of production (the result manifests itself after a sufficiently long time); the efficiency of the use of labor resources depends to a large extent on natural factors; labor is seasonal; work is carried out with living organisms, which requires universal qualifications from workers.

The population as of January 1, 2019 was 146.8 million people (a decrease of 0.07% compared to the level of 2018). At the same time, the rural population decreased by 0.79%. Since 1995, the rural population has declined from 40.1 million to 37.3 million.

Characteristics of Employment in Agriculture

In 2018, 4,936.6 thousand people were employed in the agriculture of the Russian Federation (about 6.9% of the total number of employees in the country), which is 2.7% lower than the level of 2017, Figure 1.

Fig. 1: The number and structure of employed in agriculture, relative to the total number of employed in the Russian Federation for 2015-2018

Analyzing the data presented in Figure 1, we note that from 2015 to 2018, the number of people working in agriculture in Russia decreased by 481.4 thousand people.

Problems of Unemployment in Agriculture

Rosstat data show that the unemployment rate fell by 0.7 percentage points. Favorable changes are also taking place in terms of reducing unemployment among people living in rural areas, over a period of duration, Figure 2.

Fig. 2: Indicators reflecting the number of unemployed by the length of the period of unemployment, people living in rural areas in 2015-2018, thousand people

The largest number of unemployed living in rural areas, according to employment services, are registered to search for a new job from 1 to 4 months. [1]

The problem of unemployment remains unresolved, despite the creation of jobs in agriculture (in 2017 - 61.6 thousand new jobs, in 2018 - 62.6 thousand). The number of vacant jobs is also growing. In 2018, their number amounted to 28181 places (an increase of 135.79% over the year), which is about 3% of the payroll number of employees.

In recent years, there has been a significant reduction in the number of educational institutions in the countryside, which indicates the loss of the social infrastructure of rural areas. The number of general educational organizations and evening general educational organizations decreased. At the same time, the number of students per educational organization is increasing.

Another unresolved problem is the reduction in the number of graduates (skilled workers and employees) from 19.3 thousand people to 17.2 thousand people. Thus, we can talk about a reduction in the number of young qualified personnel employed in agriculture.

The most important factor affecting the formation of labor resources and the attractiveness of the industry is the level of remuneration. We calculated in table 1 indicators of the level of wages in agriculture.

Table 1: The level of nominal accrued average monthly wages of workers employed in agriculture

Indicators	**2015**	**2016**	**2017**	**2018**	**Rates of growth, %**
The average monthly wage in	34030	36709	39167	43724	128,49

the economy, thousand rubles					
The average monthly salary in agriculture, thousand rubles	20670	22915	25671	28699	138,84
The ratio of the average monthly wage in agriculture and the economy as a whole,%	60,74	62,42	66,31	65,64	+4,87

Data on the average monthly wage indicate that a significant difference continues to remain between the level of wages of workers employed in the economy as a whole and workers employed in agriculture. So the gap in the wages of agricultural workers and other sectors of the economy decreased over the study period from 40 to 35%. Despite the narrowing of this gap, the agricultural sector in terms of labor remuneration remains unattractive for young professionals who either live and work in the city, or for highly qualified specialists with experience who move to the city. [2,5] youth in rural areas is actively involved in the state. Various programs are being developed and implemented to attract people to the countryside, various benefits are offered, including to support agricultural producers [3, 4].

Characteristics of the labor market of the Sverdlovsk region

The number of labor, including those employed in the economy of the Sverdlovsk region, over the past 5 years is shown in Figure 3.

Fig. 3: The number of labors, including those employed in the economy of the Sverdlovsk region for 2014-2018, thousand people

The number of labor in the Sverdlovsk region has been declining over the past five years (5.9%) [6]. There has been a decrease in the employed population in such economic activities as agriculture, as well as mining, manufacturing, construction, and education.

According to the forecast of the balance of labor resources of the Sverdlovsk region, the population of the Middle Urals is expected to grow by an average of 0.23% per year, and according to estimates by 2035 it will reach 4,497.0 thousand people. The population that will be of working age will decrease by 87.2 thousand people and is expected in the amount of 2279.9 thousand people.

The ratio of expected and estimated wages in the labor market.

Despite the increase in unemployment, for example, in Yekaterinburg (with readiness to move), there is a mismatch between supply and demand in the labor market, table 2.

Table 2: Assessment of discrepancies in supply and demand in the labor market for agricultural specialties (fragment).

Profession	Demand in the labor market of Yekaterinburg		The offer on the labor market of Yekaterinburg	
	Number of vacancies, units	Average proposed salary, rub.	Number of resumes, units	Average offered salary, rub.
Agronomist	18	42352	41	48125
Veterinarian	24	29550	103	43280
Livestock specialist	3	38000	42	42714

Thus, the proposed average monthly wage is lower than expected by applicants by 18%, which leads applicants to seek other employment options.

With such a mismatch between the expected and real level of wages, a decrease in the working-age population and a migration outflow are possible.

Thus, we can talk about the low competitiveness of the agricultural sector in terms of wages.

Such a mismatch in the level of wages can aggravate the situation of unemployment in the region.

These vacancies indicate the level of education - higher. Almost all applicants (more than 87%) are ready to move. At the same time, their salary expectations are higher than the employer is prepared to offer.

The efficiency of use of labor resources, including in agriculture, is estimated according to labor productivity. In agriculture, to assess the effectiveness of the use of human resources, it is advisable to use in-kind indicators, for example, labor costs per unit of output.

To reduce the number of vacancies in agricultural organizations, it is necessary at the state level to make a decision to increase the amount of state support. Particular attention should be paid to the development of rural infrastructure, the improvement of housing improvement for rural residents, and the creation of jobs paid at a level not lower than the average for the economy.

Abstract

Background: At the moment, our country undergoes significant reform, concerning each person. The transition to a new procedure for the use of cash registers is to follow the requirements of modern realities associated with the use of technological progress. *Object*: Analysis of the use of cash registers by small businesses, the consequences for their economic activities, as well as ways to solve applied problems for taxpayers. The following methods were used in the work: formal-legal, description, generalization. *Findings*: The main provisions of the new legislation, past and resolved problems were described. As the most vulnerable part of entrepreneurship, small businesses strongly felt the changes brought about by the reform of the use of cash registers. *Conclusions*: This article discusses applied issues of practical importance for entrepreneurs. The legal collisions of legislation on cash registers, the complexity of the transition to a new order of cash discipline are revealed.

Keywords: Cash Register Equipment, New Order, Online-Working Tills, Legislation, Small Business Subjects.

Introduction

The purpose of the study is to analyze the use of cash registers by small businesses, the consequences for their economic activities, as well as ways to solve applied problems for taxpayers. The relevance of this study is due to the scale and significance of the reform relating to the use of cash registers, not only for the state, but also for business entities. Since July 15, 2016, after preliminary "voluntary" testing in Moscow, the Moscow and Kaluga Regions, and Tatarstan, the legislation of the Russian Federation has been amended to change to a new procedure of using cash registers when making cash payments and settlements using electronic means of payment.

Literature Review

Over the past 5 years in Russia, the idea of the use of cash registers has been raised repeatedly in professional circles. However, often, in the scientific community, specialists did not have time to analyze the changes that took place in the legislation. Small business activities have proven to be an experimental platform for reform. In 2017, an article by Zvereva A.O., Golubtsova E.V., Ilyashenko S. B., was published that disclosed certain aspects of the use of cash registers in retail trade (Zvereva, Golubtsova and Ilyashenko, 2017). These authors spoke about the difficulty of using online cash registers for small businesses and the emerging trend of expansion of large network structures. Some authors, such as Magomedov R.M., Fomicheva T.L. and Pavlova E.S. (2018) are of

the opinion that online cash registers contribute to the transparency of the economy, improving technologies in the field of small business.

Methods

General scientific methods of cognition, including the principle of objectivity, are consistency, induction, deduction. Along with general scientific methods of cognition, private scientific methods were used: descriptive, comparative legal. The legislation of the Russian Federation on the use of cash registers in the time period since 2003 has been investigated, the current problems associated with the use of cash registers have been considered.

The first edition of the Federal Law d.d. 22.05.2003. No. 54-FZ was called "On the use of cash registers when making cash settlements and (or) settlements using payment cards," to the present date, more than 13 editions have been used. Changes in the legislation on the use of cash registers at the same time not only change the behavior of users of cash registers, but also oblige users to purchase newly created technical equipment to comply with changing laws.

The use of cash registers may vary for individual groups of entrepreneurs. So, from 01.07.2016 it is forbidden to trade in strong alcoholic drinks for retailers of alcoholic products not registered in the unified state automated information system (EGAIS). At the same time, the use of cash registers is a licensing requirement for the sale of alcohol products, and the multifunctional transport module (MTM) of EGAIS, through which alcohol products must be legally sold, can only be used with certain models of cash registers, which forced alcohol retailers to purchase appropriate cash registers.

Starting 01.07.2017 a new procedure for the use of cash registers has entered into force. Changes in the legislation on the use of cash registers related to the use of "online cash registers" are unprecedentedly large-scale and affecting all participants in the market for trade and services, which determines the relevance of this research topic (Chrástecký, 2016; Osipova, 2018).

The legislation of the Russian Federation on the use of cash registers consists of the Federal Law of 22.05.2003. 54-FZ "On the use of cash registers when making settlements in the Russian Federation" and normative legal acts adopted in accordance with this law, which primarily include the Federal Law of 03.07.2016. No. 290-FZ "On amendments to the Federal Law" On the use of cash registers when making cash settlements and (or) settlements using payment cards "and certain legislative acts of the Russian Federation", which indicate the main stages of the transition to the new procedure application of cash registers. The current situation in the legal sphere of application of cash registers is unique, users of cash registers, the federal tax service as a public authority controlling the use of cash registers are compelled to follow the provisions of several versions of Federal Law No. 54-FZ when carrying out their activities.

The definition of the term cash register equipment is now given in 1.1 of Federal Law No. 54-FZ - these are electronic computers, other computer devices and their complexes that provide recording and storage of fiscal data in fiscal drives, generating fiscal documents, ensuring the transfer of fiscal documents to tax authorities through the fiscal data operator and printing fiscal documents on paper in accordance with the rules established by the legislation of the Russian Federation on the application of cash registers, essentially, does not differ from the definition given in the revised Federal Law No. 54-FZ in force until 15.07.2016, where the following definition was given - it is cash registers equipped with fiscal memory, electronic computers, including personal, software and hardware systems, but it is more specific and indicates that cash registers should not only print fiscal documents and store fiscal data, but also transfer them to a third party - the fiscal data operator.

New concepts have appeared - this is primarily the concept of calculation, a fiscal memory device, an office of cash register equipment, a fiscal data base. So, a fiscal memory device is the hardware of cash registers that the user changes upon reaching the limit of operations or after a certain time, ensuring the operation of cash registers in fiscal mode and subsequent storage of fiscal data (Defossez, 2017). Cash registers can also be registered through the "cash registers" section of the

taxpayer's personal account on the website www.nalog.ru. The section contains data on cash registers registered by the entrepreneur. The data transmitted by the user of the cash register equipment are accumulated in the fiscal data base and further processed and analyzed. The concept of settlement before changes was usually used with the words "cash", "cashless". Currently, the concept of settlements combines the entire reception and payment of funds in any form.

In the scope of cash register equipment, new participants appeared - these are fiscal data operators, the technical service centers of cash register equipment disappeared, which were the participants before the changes came into force and provided the use of cash register equipment for more than 15 years. Until 2017, the conclusion of an agreement with a technical service center was mandatory, the technical service center itself received accreditation from the manufacturer of cash registers, was a third party and participated in all actions of entrepreneurs to register, re-register, deregister cash registers in accordance with the requirements of administrative regulation for the registration of cash registers No. 94n dated 29.06.2012. After 01.02.2017 when registering cash register equipment, entrepreneurs are required to register cash register equipment in accordance with the provisions of Article 4.2 of Federal Law No. 54-FZ as amended after July 15, 2016, where there are no references to technical service centers.

Clause 1.1 of Federal Law No. 54-FZ gives the following definition of a fiscal data operator - it is an organization created in accordance with the legislation of the Russian Federation, located on the territory of the Russian Federation, and received, in accordance with the legislation of the Russian Federation on the use of cash registers, processing fiscal data. When registering cash registers for the transfer of fiscal data, an entrepreneur is required to conclude an agreement with the operator of fiscal data, the details of which are indicated in the application for registration of cash registers. Currently, 19 organizations have received permission to process, their register is maintained by the Federal Tax Service.

The legislation identified the following key dates for the reform of the use of cash registers:

- starting 15.07.2016 - amendments to the Federal Law d.d. 22.05.2003 come into force. "On the use of cash registers when making settlements and (or) settlements using electronic means of payment". You can register online cash desks and work with their application;

- starting 01.02.2017 - registration of cash registers is terminated in accordance with the provisions of the administrative regulations for the registration of cash registers approved by order of the Ministry of Finance of 29.06.2012. No. 94n;

- starting 01.07.2017 - there is an obligation to use cash register equipment for organizations and individual entrepreneurs, with the exception of payers of a single imputed income, a patent tax system, entrepreneurs providing services that perform work, as well as for activities carried out through vending. The registered cash registers of the old type are deregistered by the federal tax service unilaterally and are not subject to further use;

- starting 01.07.2018 - cash register equipment is required to apply payers of the single tax on imputed income and payers of the patent system of taxation, with the exception of legal entities and individual entrepreneurs engaged in retail trade, providing catering services without involving workers with whom labor contracts are concluded, as well as individual entrepreneurs providing cosmetic and hairdressing salons services, repair services of radio equipment, computers and communication equipment, transportation of passengers and cargo by water and land transport, veterinary services, physical education and sports classes, rental services, hunting services, medical or pharmaceutical activities, a person licensed for these types of activities, dairy products, commercial and sport fishing;

- starting 01.07.2019 - cash registers are required to apply when making payments to all entrepreneurs;

- starting 01.02.2021 All users of cash registers are required to indicate on the cash receipt the name of the goods sold, work performed, services rendered. Until 01.02.2021 this obligation is only for entrepreneurs selling excisable goods.

Entrepreneurs whose obligation to use “online cash desks” did not occur on a specific date are required to make settlements in accordance with the requirements of Federal Law No. 54-FZ as amended up to July 15, 2016.

Less than half of organizations and individual entrepreneurs falling under the third stage of cash reform use online cash desks. This is evidenced by the results of a survey as of the 2nd quarter of 2019, conducted by the NAFI Analytical Center together with the manufacturer of the online cash register “Evotor”.

The old procedure for using cash registers involved fixing the purchase and receiving money to pay for the goods or services using the control tape, which duplicates all the amounts that the cashier “passes through” and issues a receipt directly to the buyer, then the adopted amendments change the whole process and make it more specific.

Modern cash registers have a memory card and are connected to a computer, so all the money received at the cash register is recorded and stored in the device itself and the cash book, which the cashier keeps and fills.

In carrying out inspections, the tax authorities compared the correspondence between the reflection of received funds in the cash book and the data of the fiscal memory of the device itself.

And if the cash register was a kind of intermediary between two parties to the transaction: the seller and the buyer, then the new order is significantly different from the current one (Iordachi and Timus, 2017; Nagy, Gergely and Katona, 2018).

Now, not only the seller and the buyer participate in the purchase and sale transaction, but also the fiscal data operator (FDO), as well as tax authorities, each of which has its own functions.

All cash registers must be connected to the Internet, and fiscal memory is replaced by a fiscal drive. From a technical point of view - this is a more advanced device, with the ability to protect against changes in the information received and transfer it to the operator of fiscal data (Gorbatov, Zhukov and Murashov, 2018).

Let’s try to track how everything will look with the help of a standard situation when a buyer comes to a regular grocery supermarket and walks to the checkout lane with a shopping basket.

The cashier pass all the goods through CRE and sends the FDO (fiscal data operator) information about the purchase and the amount of money received via the Internet.

The FDO processes the check, places it in its database and sends back to the seller’s cash register a unique number that is assigned to the check, then all information about the completed purchase is sent to the tax service server.

The buyer receives a paper check from the cashier and additionally (at his request) an electronic version must be sent to his Internet mail or phone.

At the same time, information about the details where the electronic check should be sent is provided to the seller by the buyer before it is passed through.

Despite the apparent complexity of the entire operation, it is assumed that this will take a split second.

According to the requirements of the adopted law, it is assumed that the receipt will look a little different, it will have a QR code, thanks to which it can be identified on the website of the FDO and the tax service.

The receipt should contain the following information:

- about the fiscal data operator, its website;
- date, time and place of purchase;
- the seller himself and his tax system;
- type of operation: incoming or outgoing;
- the amount payable with VAT;
- about the form of payment: cash, by credit card or through electronic wallets.

The fiscal registrar has a wide range of functions: it is able to generate informative receipts, detailed cash reports, invoices and other documents. However, most models do not have their own display and keyboard. All settings and actions are performed through the service mode or using a computer on which the appropriate software is installed.

The cashier must be trained and instructed. Then he gets access to the cashier desk, cash of exchange and receipt tape. The first action at the beginning of the day is to open a shift. To do this, the cashier prints a shift opening report, which is sent to the fiscal data operator and includes information about the device, the shift and the cashier. The shift is closed at the end of the day, the cashier deposits cash and generates a report on the closing of the shift.

When the amendments were adopted, the goal of innovations was declared, according to which the rights of the consumer are protected, which even with the loss of a paper check can always prove the fact of purchase using its electronic duplicate.

Well, the main goal, according to financiers and lawyers, is to control cash flows and withdraw from the shadow of some segments of economic and civil legal relations (Appleman, 2016).

Indeed, now trading on the Internet should also be accompanied by the issuance of receipts, and due to the fact that information is immediately transmitted through the FDO to the IFTS server, all monetary transactions become transparent (Imanpour *et al.*, 2019).

The fiscal data operator is a new face in the financial world, a kind of intermediate link between the consumer, seller and tax authority. Any organization that has received permission from the Federal Tax Service to process information from cash desks connected to its information and electronic database can act as an operator. The current list of fiscal data operators can be found on the official website of the tax office.

This activity should be carried out by legal entities with technical equipment that allows real-time processing of each receipt, passed through the CRE. Moreover, all information arriving at the FDO server must be protected in a cryptographic manner and inaccessible to other persons.

Results

The transition to a new procedure for the use of cash registers is a large-scale task that has priority for the Russian economy, the fulfillment of this task is entrusted to the Federal Tax Service. The Federal Tax Service carries out registration actions, checks compliance with the laws of the Russian Federation on the use of cash registers, and carries out information work. At the same time, the

procedure for the delivery of cash registers from the manufacturer to the end user, the regulation of prices for it, the procedure for the maintenance of cash registers, which are complex electronic equipment, are practically not regulated by anyone, these issues were dealt with by the maintenance centers of cash registers, which have long occupied the field of application of cash registers. Entrepreneurial, technical experience and established contacts with users of cash registers which allowed the reform of the legislation of cash registers to go much easier than it could be. Almost nothing has changed for the user of cash registers from the service side - they go to the technical service center where they were previously serviced, which is also an agent authorized to conclude contracts on behalf of one of the fiscal operators.

After 01.07.2017, the first problems with logistics appeared - not all models of cash registers could be purchased by entrepreneurs in the regions, manufacturers could not provide existing cash registers with fiscal drives. At the end of 2017, entrepreneurs experienced a massive malfunction in cash register equipment related to its automatic update. A cash failure occurred on December 20, 2017, it was reported by retailers, gas station operators and fiscal data operators themselves. The reason is a software failure that disabled part of the online box office of the manufacturer "Shtrikh-M". According to some estimates, in particular, the Association of Internet-trading companies, retailers could receive about 10 billion rubles due to non-working cash registers. More serious losses were avoided by an explanation from the Federal Tax Service. After the notice of the biggest failure since the system was launched, the Federal Tax Service explained: organizations and individual entrepreneurs who have cash registers blocked can temporarily sell goods and services without registering cash, but then, when the equipment works, it will be necessary to draw up a cash register correction, to record unaccounted income.

Discussion

The possible problems of the transition to a new procedure for the use of cash registers of individual entrepreneurs, whose activities have always been exempted from the use of cash registers, but who are required (will be obliged) to use cash registers, are causing concern. This problem is not only psychological in nature, this category of entrepreneurs will incur expenses that they did not bear before - to pay for the services of fiscal data operators, purchase cash registers, purchase fiscal drives, purchase communication services, expenses related to training cashiers, etc.

In order to comply with the requirements of the law, the cashier must comply with the following rules:

- do not work during a power outage (otherwise the cash register will not have information for transfer to the tax authorities);
- if there is no connection with the FDO, it is possible to issue receipts only within 30 days, after this period the online cash register is blocked and it will need to be replaced;
- the seller must not leave the workplace if the cash register is in working condition and allow unauthorized persons to access it;
- the cashier is obliged to provide an electronic version of the receipt if the client provided a QR code from the FTS application or said his phone number or e-mail.

Thus, the legislation on the use of cash registers does not contain exceptions for entrepreneurs in case of technical failures with cash registers. There are no explanations about the use of cash registers at low temperatures (in open air outlets).

Starting from July 1, 2019, in addition to the listed details when purchasing in cash or using cards, representatives of organizations must indicate additional details: name of the buyer-client (legal entity or individual entrepreneur), TIN, information about the country of origin of the goods, excise tax amount, registration Number of customs declaration. This is indicated in paragraph 6.1 of Article

4.7 of Federal Law No. 54-FZ “On the Use of Cash Register Equipment in Settlements in the Russian Federation”. The seller must indicate these details if the buyer has presented a power of attorney on behalf of the legal entity.

The obligation to accept cash on incoming cash orders is set out in clause 13 of the Procedure for conducting cash transactions d.d. 22.09.93 No. 40, which is approved by the Central Bank of Russia. The procedure also established that a cash receipt voucher with the necessary signatures and details is issued on the receipt of money. This Order has not been canceled. For this reason, now, along with the cashier's receipt, sellers are obliged to issue to the buyer a cash receipt vousher. However, the law does not establish penalties if paragraph 13 above is violated. According to Art. 15.1 of the Code of Administrative Offenses imposing an administrative fine entails the following violations of the procedure for working with cash and cash transactions: - extrabudgetary cash settlements with counterparties; - incomplete recognition of the cash; - non-compliance with the procedure for storing free cash; - accumulation of cash in excess of the established limits. Non-receipt or incomplete recognition of cash is expressed in the fact that the sales revenue actually received is not reflected (not fully reflected) in the cash book. This means that the amount shown in the financial statements used by CRE exceeds the amount indicated in the cash book. Judicial practice also refers to this violation as untimely reflection in the cash book. In both cases, this is a violation of paragraphs 22 and 24 of the Procedure for conducting cash transactions. If cash is transferred through cash register, the amount of revenue per shift is present in the control tape and is recorded in the cash book in the same amount, then there are no violations of the Procedure.

The question is the universal access to the Internet at the place of installation of cash registers for transferring fiscal data by an entrepreneur, the adopted provisions on “hard-to-reach” and “remote” areas do not solve this systemic problem. Sales outlets can be located in buildings where there is no Internet, and the GSM-module of the cash register equipment will not be able to transmit fiscal data due to interference.

The degree of responsibility of legal entities and individuals for the non-use of cash registers, or the sale of goods, the performance of work or the provision of services in the absence of established information is determined by the Code of Administrative Offenses of the Russian Federation in accordance with Article 14.5.

First of all, the size of the sanctions is affected by the amount earned for the period of work without a new standard CRE.

The repeated commission of an administrative offense provided for in paragraph 2 of Article 14.5 of the Code of Administrative Offenses of the Russian Federation, if the amount of settlements made without the use of cash register equipment, amounted, in total, to one million rubles or more, shall entail disqualification of officials for period from one year to two years; in respect of individual entrepreneurs and legal entities - administrative suspension of activity for a period of up to ninety days.

It is not enough to correctly issue the receipts. Part 4 Article 14.5 of the Code of Administrative Offenses indicates that organizations that use non-conforming or incorrectly registered cash registers are held liable. The verification of the use of CRE is carried out exclusively by the tax authorities, guided by the administrative regulations (approved by Order of the Ministry of Finance of the Russian Federation of October 17, 2011 No. 132H).

Specialists of the federal tax service have the right to organize a scheduled inspection or randomly visit a sales outlet, if there are grounds for this, for example, a statement from the consumer.

Fines for individual entrepreneurs for non-use of CRE are set in the following amounts:

- work without an online cash register after a period established by law - 25-50% of revenue, but not less than 10,000 rubles;

– repeated violation, when the income for both times is from 1 million rub. and more - suspension of entrepreneurial activity for a period of 1 to 2 years.

The fine is also imposed for failure to provide information on time at the request of the tax inspectorate, failure to send the check to the buyer electronically, and failure to issue a paper copy of the check.

As explained by the Supreme Arbitration Court of the Russian Federation in the resolution of July 31, 2003 No. 16 "On some issues of the practice of applying administrative responsibility ..." when applying Art. 14.5 of the Code of Administrative Offenses of the Russian Federation, the courts must proceed from the fact that this article does not specify otherwise, that these persons are liable for officials. In this case, it is required to prove not only the fact of the commission of an illegal act by the entrepreneur, but also the presence of his guilt. Therefore, if it is confirmed that CRE was not applied due to the fault of the employee of the entrepreneur, and the employer himself took all measures to prevent the commission of illegal actions (inaction), then the penalty should be imposed on the employee but not on the businessman. Thus, it is in the interests of the employer to hire a competent, trained cash register employee, or to train an existing one.

There is also dissatisfaction with small businesses, which is amplified by the lack of law, the lack of clarification on significant issues. This is due to significant costs for the purchase of CRE (completion), installation and maintenance of new cash registers. For most small and medium-sized businesses, the cost of switching to online cash registers is quite substantial, and for some, it is not high. In general, the purchase of a new cash register with a fiscal drive, its installation, the services of telecom operators and fiscal data will cost the entrepreneur an average of 35,000 - 40,000 rubles. In the future, the annual maintenance of one cash register will cost about 10,000 rubles. When the fiscal drive expires, it will be necessary to pay for its replacement, an average of another 6,000 to 8,000 rubles. For micro-business, such loads are significant, which again entails some businessmen to go “off the radar”.

Conclusion

Most of the problems associated with the use of online cash registers in Russia are associated with the imperfection of the legal framework and the complex tax system (Dovbiy, 2017). Undoubtedly, the introduction of online cash registers allows us to strengthen tax administration, reduce the number of on-site inspections, thereby reducing government spending. The existence of special tax regimes, such as the patent system of taxation, a single tax on imputed income in this regard, becomes impractical both for the state and for small businesses. Small businesses can generally go off the radars, or go into the status of self-employed citizens (Barysheva, 2018). The main feature of this category of taxpayers is lightweight taxation and certain concessions in the use of cash registers. Self-employed citizens have the right not to use online cash registers. It can be concluded that the legal structure of small business will undergo significant changes. How simple the administration of such a changing structure of the tax system in Russia could be is another question (Osipova, 2018).

Thus, in order to assess the implementation of this reform with qualitative and quantitative indicators, the completeness of data from not only the tax authorities, but also a large-scale joint economic, sociological, statistical study of certain public and state institutions is necessary.

Public Sector Project Office: From Information Repository to Coworking Center

Gulnara K. ISSENOVA

Branch of the Academy of Public Administration under the President
of the Republic of Kazakhstan, Pavlodar, Kazakhstan
E-mail: issenova.bafe@bk.ru

Abstract

The speed of project management growth of in Post-Soviet countries is ahead of technological and institutional changes. Today, the project management in government is becoming very trendy, and this entails both positive and negative consequences: project offices are created, but the regulatory legal framework for project management has not been created; management expects initiatives from citizens, but programs and projects traditionally descend from top to bottom; various information software products are used, but they are not integrated into a single national project management system, as a result of which tools for manual control of projects continue to dominate. There is a lack of understanding of the essence of the project approach at all levels of government, which is aimed not so much at creating project documentation or organizational structure as at predicting changes and benefiting from the results of changes. The article proposes to consider the project office in terms of public benefit: how public servants - project managers can manage changes with the active participation of citizens.

Keywords: Project Management, Public Administration, Project Office, Citizens.

Introduction

Digital technologies, like technical changes and other factors of economic development, are part of the growth process. However, according to the Nobel laureate D. North, the key to economic growth is the effective organization of the economy, i.e. an organizational factor that plays a more important role than the technical ones, since they lead to a change in institutions, which, in turn, have a significant impact on economic development (North, 1997).

With regard to public administration, the mission of which is to serve the people, institutions should not be created or changed on their own (this is not a startup in which the risks of failure are passed on to the owner or venture fund), but in response to a society's request, on the one hand, and global challenges development - on the other. For example, the development of IT technologies and the spread of the Internet has led to the creation of e-government in all countries, and the population's need for accessibility and transparency of information has led to an open government. The state has accumulated a demand for information as a means of political decision-making in the implementation of government programs, which led to the transformation of non-governmental structures into independent analytical organization, known as think tanks. Think tanks have become not only one of the forms of expression of public opinion, but also the nodal points of public policy, in which initiatives are formed to solve public problems in the course of mass communication.

Relevance of the Topic

The fourth industrial revolution requires the transformation of corporate and public administration institutions into project-oriented integrated structures with overlapping management functions on the one hand and the formation of autonomous teams with a high level of initiative, involvement and responsibility of employees and stakeholders on the other hand.

In corporations, the project-oriented business is due to increased competition based on time, acceleration of the product life cycle, and, consequently, a reduction in the total amount of net profit

received over the life period of the product. The creation of project offices in corporations is accompanied by the development of a rigid system of quantitative indicators for evaluating project activities, ranging from profit to ROI (return on investment).

In the public sector, project orientation is caused by the requirements of society for obtaining a quality product - public service and profit - the social effect of implemented programs and projects, increasing the customer focus of civil servants, minimizing hierarchical levels, the effectiveness of each unit and the personal responsibility of employees.

Available databases provide enough publications on the experience of preparing and transforming the organizational environment of project management of reputable professional managers. E. Larson and K. Gray (2011), A. Polkovnikov (2017), V. Voropaev and others (2014), Gergert D.V. (2019) explore the problems of evaluating the effectiveness of project offices in companies. However, the topic of the appropriateness of creating project offices in the public sector has not been sufficiently developed both in post-Soviet countries and abroad. Also, to date, there are no practices in the formation of autonomous temporary project teams in government agencies and measuring their effectiveness (Issenova, 2018, 2017).

The purpose of this study is to develop practical recommendations for the public sector on the creation of project offices focused on the benefits of citizens and other stakeholders.

Project office concept came to us, as usual, from international standards and experience in which the field of knowledge or the Organization process is described in details. The PMBOK (Project Management Body Of Knowledge, 6th edition) considers under such a body an organizational structure Project Management Office (PMO) that solves the problems of structuring project management processes, sharing resources, tools, methodology and methods (Project Management Institute, 2018). The standard allows for multiple options for the responsibility of project offices and types their structures: project management service; project management office; office of the project; project office.

The ISO 21500: 2012 (International Organization of Standardization) standard does not regulate the organization of a project management office, limiting itself to listing its possible functions: management, standardization, project management training, project planning and monitoring (International Organization for Standardization, 2012).

Organizations see a project office as a tool to increase coherence, efficiency, and better manage costs. “The project office helps to achieve a level of coordination that is difficult to achieve by simply managing projects well. It gives more clarity, focuses the company on strategies, and new opportunities for effective coordination of projects”- Margot Nack, PMP, Adobe Systems (Greengard, 2013).

Various models of project offices have appeared, for example:

The “chancellery”, “information repository” or “repository” model, in which the project management office or project office (hereinafter - PMO) serves to collect information about completed projects, accumulates experience and forms a knowledge base on projects for subsequent use. In fact, this is a kind of knowledge bank, an archive of reports and lessons learned on current projects in the organization.

Mentor, center of responsibility or manager model. This model is often found in companies with a large number of external projects, performing mediation and control functions. PMO is on a par with other functional units: planning and control of resources, schedules, project budgets, assessment of assumptions and risks (Kendall and Rollinz, 2009). If this model is used, project managers are employees of the PMO, and the project office manager is responsible for coordinating projects, results, costs.

The profit center model is the coordination of the actions of the main functional units.

The Ambulance model is a service center for answers to questions raised by project managers, curators, administrators, and other project participants in the company. The main task is to find and give the necessary information.

The analysis of models of project offices shows that a functional approach is used in their creation. For example, in government bodies of Russia, "functional", "basic", "supporting or managing" project offices are created as additional departments for ordinary administrative functions by ordinary employees who have basic programs and projects knowledge and experience: collecting data, following the general methodology, paperwork, coordination and control (Figure 1, Figure 2).

Fig. 1: Organizational structure of project management in the Leningrad region, Russian Federation (Voronov and Grineva, 2010)

Civil servants at their workplaces are implementing action plans for programs that are being lowered from ministries and are accountable for their implementation to management. Some subprograms are allocated to separate projects, or, as it is fashionable to call them, initiatives that also go down from the top, or are combined into other programs, which are also reported on, but to another management.

In Russia and Kazakhstan, PMO are headed by heads of state bodies, who, in accordance with their official duties, are already responsible for the implementation of programs, or authoritative leaders of public opinion, who perform, to a greater extent, the representative function.

An additional vertically hierarchical project management structure is being created in government bodies in the form of various add-ons: organizational and coordination headquarters, implementation headquarters, coordination offices, and offices for supporting the activities of project committees. New roles appear in the organizational structure of project offices: methodologists, specialists in the implementation and development of motivation, chief designers (Razumnyi, 2016), project curators, project office curators, curators - customers, etc. At the same time, Kazakhstan and Russia approved national standards for project management, which lack the above conceptual framework.

Fig. 2: Organizational structure of the Implementation Headquarter on the "Improving tax collection" project of the "Financial sustainability" cross-cutting area of the State Revenue Committee of the Ministry of Finance of the Republic of Kazakhstan (The Ministry of Finance of the Republic of Kazakhstan, 2017)

Funding for projects is carried out, like ten years ago, in the framework of budget programs. Financing of PMO as a structure is not provided, but due to the staffing limit, whole positions of civil servants are allocated who are seconded to the project office and are responsible for the development of project passports, schedule of events and reporting.

The motivation system for project teams and project offices does not facilitate the influx into the public sector of highly qualified certified project managers, for example, PMP (Project Manager Professional), PRINCE 2Practitoner. The current motivation system is clearly demonstrated by the head of the department of design and analytical work in the Belgorod region of the Russian Federation Irina Kirilova: "... the employee may not be distracted by the working hours of the project, he/she can do this at night or during vacation. People really do it. Their motivation: to participate in the project is an honor, it is a recognition of your expert qualities, it is also an opportunity to light up and get an opportunity for career growth" (Voronov and Grineva, 2010).

Thus, the appearance of implementing project management is created, in which the functions of the organization and the motivation system do not change.

World experience shows that project offices are created when signals from the community are received:

- low level of citizen's satisfaction;
- lack of projects transparency;
- significant discrepancies in project results.

It turns out a paradoxical situation: the society signals that there is no transparency in the projects, there are significant differences in the results of the projects, a low level of satisfaction of citizens, and in response: the methodology, compliance with the strategy, a service center for project managers, new structures and positions, etc.

Of course, all this is important: maintaining the methodology, matching the strategy, concentrating information, training employees and disseminating the project culture.

However, the purpose of the project office in the public sector, according to the author, is somewhat different.

According to the analysis of 157 difficult projects financed by the World Bank, A. Golan, director of the World Bank's Institute for Economic Development, sees the key problem of large infrastructure projects in the unclear definition of the roles of the customer, project manager and contractor and the lack of differentiation of responsibilities (Shestopalov, 2016). According to PwC, approximately 1/3 of all project offices in the world do not achieve the desired results (Greengard, 2013).

The author sees the main reason for the low efficiency of project offices in the traditional, functional approach to creating a project office. When deciding to create a project office, managers do not question themselves: What changes citizens are waiting for? How will the project office help to engage stakeholders, citizens in the development and implementation of programs and projects funded by taxpayers? How will the project office affect changes in the quality of public service delivery or the effectiveness of the state program? What is the contribution of the project office to achieving the goals of the organization's strategy in the face of constant change? What problems will it solve? Are there any means and resources for creating a project office? And most importantly, are there people who have the knowledge and skills of project management, a high level of emotional intelligence, who are able to think creatively and implement ideas into projects?

In the period from November - December 2018, April - May 2019, the author conducted surveys of 64 government officials in the branch of the Academy of Public Administration under the President of the Republic of Kazakhstan, 12 heads of non-governmental organizations and 8 representatives of social flax-vulnerable populations. The survey was preceded by training respondents in the basics of project management according to the standard ST RK 21500:2014 (national standard of the Republic of Kazakhstan).

According to civil servants, project offices today act as the next intermediate link in the hierarchy of government bodies, endowed with the function of collecting information on the achievement of only project results. This leads to duplication and complication of reporting, inefficient use of resources.

65% of civil servants and 98% of the leaders of non-governmental organizations and representatives of socially vulnerable groups noted that project offices should be accountable to the population.

The rural akims called one of the main obstacles to the implementation of project management in the public sector "lack of a single standard for project management", a different interpretation of the concepts "project", "results", and "benefits". For example, in the Law "On Public-Private Partnerships in the Republic of Kazakhstan", the concepts of "bottom line", "benefits", "stakeholders" are absent (Parliament of the Republic of Kazakhstan, 2015).

Representatives of non-governmental organizations and socially vulnerable groups of the population pointed to inter-agency disunity in the implementation of socially significant projects. Often, the same project is implemented by several government agencies, while allowing for blurring of goals, objectives and results.

Seven Insights Before Deciding to Create a Project Office

From the point of view of project management, the creation of a project office, like any organizational structure, is also a project. In accordance with the international standard ISO 21500:2012, which is selected as the only standard for use in government bodies of Post-Soviet countries, the first stage of the project life cycle is initiation. The CEO of IPA, the UK Government Project Office, Tony Meggs, considers the initiation phase to be the foundation of the project's future success (Infrastructure and Projects Authority, 2016).

But before deciding to initiate the creation of a project office in the public sector, an understanding of seven insights is needed.

The first key insight. Used by ISO, the term "project" (International Organization for Standardization, 2012) does not bind it to a unique practical result or to the customer, although, according to the author, any project is initiated to change what does not bring benefits and advantages to the organization in the ordinary course of business (Benefits implementation - BRM (International Organization for Standardization, 2012), and for citizens - a solution to the problem.

The ISO project aims to bring a new set of processes or new stakeholders or new resources to new practical results. Moreover, this practical result should be maximally efficiently implemented in operational activities within a certain time frame so that the organization receives benefits or a solution to the problem (International Organization for Standardization, 2012).

In Figure 3, the author shows a project management scheme in a government organization to achieve benefits through practical project results. Awareness of the problem, the formulation of goals for its solution and the receipt of benefits is carried out at the strategic level of the organization and transferred to the appropriate strategic level of the project. At this level, a decision is taken to initiate a project that is temporarily withdrawn from its core business. The interim project manager at the task level and the temporary project team (operational level), using a unique set of processes and resources, get a practical result and pass it on to the organization. It should be noted that the levels of organization and project management are identical.

Fig. 3: Goals-tasks-result-project and Organization's benefits relationship (designed by author)

But the practical result of the project, even adopted by the customer organization, in the public sector is not a criterion for the success of the project. The value or success of the project is determined in the

post-project period, from the moment the organization receives benefits from operating activities in which the practical results of the project are tested and a specific problem is solved.

The author focuses on the external environment of the project, including stakeholders, which may temporarily not coincide with the environment of the organization. But this temporary environment significantly affects the goals, objectives and practical results of the project and the benefits of the organization.

The second insight. The organization is thinking about creating a project office from the moment of increasing the number of projects combined into programs and projects and, at the same time, expanding the environment of the organization and stakeholders. If the state body implements one project, then there is no need to create a project office.

Before deciding to create a project office, management should see a "big picture", i.e. place of the project, project office in the organization and its relationship with the external environment.

Unfortunately, in practice, often the authority of the project office is replaced by an external Project management - the strategic level of the project. The "project management office" in government bodies includes all project managers. Project managers report to the project office, which contradicts ISO 21500:2012.

In other government agencies, the PMO is located at the operational level (Figure 4).

Figure 4: Project management model of the Administration of the Head of the Komi Republic and Komi Republic Government, the "Information Technologies Center" autonomous public institution, "Information Security Center" public budgetary institution of the Komi Republic (Boldyrev, 2011)

In the project management system (Figure 5), developed by A. Polkovnikov, there is no project office at all.

Fig. 5: Project management system (Polkovnikov, 2017)

This, according to the author, proves that the project office is considered as an auxiliary, secondary, providing unit, not included in the project environment (Project environment).

Such an understanding of the project office contradicts the management philosophy and all international project management standards.

In order to understand the place of the organization's project office, we use Figure 6.

Fig. 6: Stakeholders and project organizational structure (Infrastructure and Projects Authority, 2016)

The ISO standard takes the project office out of the organizational structure of the project and puts it higher than the external management of the project, placing it on the same line with the project stakeholders. The place of the project office is symbolic next to users (beneficiaries), special groups and the public. This arrangement once again emphasizes the focus of the project on the expectations and problems of citizens, and not just the customer.

By the way, among the stakeholders of the project, ISO distinguishes the employees of the organization who are not included in the project or in the PMO. This is a very important remark, confirming the author's opinion that the project office goes beyond the organization, and therefore cannot be its structural unit. In addition, the environment of the PMO, as well as the environment of the project, is not necessarily the environment of the organization.

Due to the fact that the ISO standard does not describe the processes associated with program management, the project portfolio, the author offers his own vision of the place of the PMO and organization.

In Figure 7, the PMO is presented by the author in the form of a rectangle, emphasizing the absence of a vertical hierarchy in the project office, as well as its isolation from the tactical and operational level of the projects. The boundaries of the project office are indicated by a dotted line, which means the temporality of the organization.

Fig. 7: Position of the Project office in the Organization (designed by author)

The PMO, according to the author, in the conditions of constant changes in the requirements of the external environment, customers and citizens is the link between the organization's leadership - the person responsible for the implementation of the program or portfolio of projects, the strategic management of the projects and everyone who is outside it.

Another question is what is the organizational form and legal status of the PMO. The status "division of a state institution" does not reflect the specifics of the PMO as a link between project teams, customers, contractors and ultimate beneficiaries.

In the era of the transformation of the vertical bureaucratic structure of state bodies into a project-oriented one based on horizontal connections (see page 2), the status of a PMO in the form of a coworking center is interesting. This is the center where expert groups representing all stakeholders, primarily citizens, evaluate projects from design to public benefits. This is the center where, in the framework of public consultations, civil servants listen and hear the problems of citizens, solving them together as partners. This is "think tanks" of the organization through which mass communication is carried out to solve a social problem.

PMO in the form of a coworking center will ensure earlier involvement of stake holders in the development and implementation of projects and consensus, both on the prioritization of projects, the main constraints, and the expected benefits.

The third insight. Before the creation of project offices, a full-fledged legal framework should be developed on the methodology of project management in the public sector. Roadmaps, headquarters, competitions, guidelines are not an appropriate basis for the implementation of project management and the creation of PMO in government agencies. Legislation should provide for the concepts of "temporary structure", "temporary public office" or "temporary technical position" and an appropriate system of remuneration and motivation. It is necessary to harmonize the legal base of project management with the current budget legislation in the field of public service and the national standard ISO 21500. This should be a single methodology without confusing the concepts and principles of other international standards and approaches in order to avoid double interpretation and enforcement.

The fourth insight. The information system of state bodies should be ready for integration with the information system of managing state programs and projects. There are examples of government agencies copying information systems of other countries that work according to international standards PRINCE 2, PMBOK or which are applications to other information systems, such as 1C - Accounting. Project management information systems operate autonomously, which is unacceptable in the conditions of transparency and accountability of public administration to citizens.

The fifth insight. The horizontal matrix structure of project management has nothing to do with the traditional vertical hierarchical structure. The organizational structure of the project office should not detract from the independence of project managers.

In Figure 8, the author shows that the PMO focuses only on the level of goals - the benefits of the organization, stakeholders and projects. The project office does not interfere with the activities of project managers, in turn, the organization's management does not interfere with the activities of the project office and does not control it.

Fig. 8: Project office organizational structure (designed by author)

Many functions for developing a project management methodology, monitoring its compliance, benchmarking and implementing best practices, organizing training for civil servants and everyone involved in project management processes, the author recommends transferring, for example, to the Project Management Development Center of the Russian Academy of National Economy and public service under the President of the Russian Federation (RANEPA) or the Academy of Public Administration under the President of the Republic of Kazakhstan.

And monitoring the effectiveness of projects and financial audits should be outsourced.

A unified project management methodology, a unified information system, understanding of the project location and project office and its purpose will help to avoid bureaucratization of project management, managerial links and new roles that are not provided for by international standards.

A separate issue is the qualification requirements for the competence of civil servants working in project offices, as well as in project teams.

It is logical that when selecting candidates for the positions of the head of the PMO and experts, in addition to excellent knowledge of the national standard, best practices of project management, ownership of the information system, it is necessary to take into account the experience of developing and implementing successful government projects.

Sixth insight. Prior to initiating a project to create the PMO as part of the pre-project activity, an assessment is carried out of the opportunities provided by the strategy of the state body and the search

for the "bottleneck" (Goldrat and Koks, 2009), which prevents the organization from achieving strategic goals.

At the same time, there is a collection of requirements for the future PMO, which it should be from the point of view of legislation, the ISO national standard and stake holders: senior management, organization employees, partners, project customers and citizens. It is in the pre-project period that the author proposes to first develop a register of stake holders, and then an analysis of their needs and requirements. Prior to the initiation phase, the organization should have a clear idea of what the stake holders expect to see at the exit, do the objectives of the projects meet the expectations of citizens?

The next important step in the pre-project activity is the analysis and assessment of risks when creating a project office. The main goal of risk analysis is to minimize losses that may occur during the implementation of the project.

The pre-project period is completed by the development of a brief business case for the project to create a project office, for example, based on the cost-benefit analysis methodology. The entire set of sociological and economic methods is used to collect relevant information and calculations. At the same time, so-called public consultations with stake holders and citizens play a special role.

The seventh insight. The outsourcing of administrative functions of the classical models of project offices, the shift of the focus of attention to the expectations of stake holders, according to the author, will make it possible to concentrate the following functions in it:

- selection of projects based on regulatory impact assessment (Organisation for Economic Co-operation and Development, 2004);
- improvement or optimization of business processes for project management, repeated in several projects, or change in their relationship;
- optimizing the resources of several projects to achieve their effective use;
- involvement of new stakeholders in the projects based on the results of public consultations with the non-governmental sector and initiative groups of citizens;
- post-project monitoring: assessment of the benefits of implementing practical project results in operational activities for the organization and stakeholders.

Conclusions

Thus, a new approach to creating project offices as coworking centers with the participation of citizens, the main stakeholders, is the basis for transparency and accountability.

The project office in the public sector is an independent institution with the maximum participation of citizens and other stakeholders.

The project office is an integrated structure with overlapping management functions on the one hand, and autonomous teams with a high level of initiative, involvement and responsibility of professional employees and stakeholders on the other hand.

The functions of the project office should be aimed only at assessing the public benefit of the projects being implemented, which, in turn, is an assessment of the activities of the project office and the organization as a whole, increasing the confidence of citizens in the public sector.

Abstract

This article contemplates on the conceptual and methodological fundamental framework for corporate social responsibility as an institutional innovation and the key pillar for enabling sustainable development of businesses. This paper analyzes the practices to create the corporate social responsibility (CSR) framework in Russia and explores the ways to set CSR standards and the mechanism for arm's-length evaluation and monitoring non-financial reporting in the country. The work also contemplates on regional-level efforts to bring about social welfare partnership schemes and the Russian business community's charity policies. The study concludes that social in-vestments by businesses constitute an efficient viability tool, and that the social responsibility concept is effective economically as a corporate viability driver.

Keywords: corporate social responsibility, business viability, social investments, social accountability of a business.

Introduction

In today's modern world, including Russia, businesses have consistently become more social-oriented and relevant, and implementing social responsibility programs and growing the corporate governance quality has become more of a priority for them. Contemporary businesses align their interests with other social actors as a key element of their competitive strategies. With the corporate social responsibility and the modern social relationships between employers and their employees, a new social and economic relationship framework has started to exist not only municipally, regionally and nationally, but also internationally, as it has reflected the global changes such as accelerated integration and the world going global. It is apparent that the more socially responsible a business is, the more economically viable it becomes.

As transaction costs have been constantly surging up due to the globalization of markets, growing numbers of stakeholders involved and tougher competition, such costs can be minimized by creating legal institutions for aligning interests between all key market actors, that is, businesses, state, and the people. Amid this backdrop, businesses have to assume the responsibility for many aspects of social development that are not even in the least directly associated with its operations, spanning environmental welfare and social programs in education, healthcare, occupational safety, culture, and sports).

As the rest of the world tends to do, Russian businesses have adopted social responsibility practices, which has become the determinant for choosing areas for and understanding the scale of balanced and efficient socially responsible investing. With pillar industries bouncing back after a deep downturn, with businesses set to use innovative ways of development, and with the government implementing

national projects, we can understand that studying the prerequisites for the development of corporate social responsibility, its role and avenues is essential and of immediate interest today.

As today's nation and its communities evolve, they face a growing number of risks and challenges, so the state is unable to handle social issues without a significant support from businesses and community organizations. As a Russian businessman and politician Vladimir Pligin told in his interview to the *Expert* magazine, "we cannot just believe that a socially-oriented state is here to rely on without doing anything to make this happen. We not just cannot do that. That would be really stupid to do that." (Gurova, 2018, p. 71). That is why, for the civil society to be able to operate soundly, it is essential that various institutions (including the business community) and community organizations and associations become more active socially and politically.

As experts note (Biryukova and Okhotnikov, 2018; Igumnov, 2012; Ostroukhova, 2012; Banket, 2014), businesses' becoming progressively more active socially is based on an extensive historical, social, and cultural background, and this process is induced not only from the side of companies and business organizations, but also from the side of the government and the society as a whole, which raises a question of mutual responsibility of the government, business community, and community organizations. To give rise to the process of distribution of social responsibility and to so create more degrees of freedom for the businesses, the balance between the government regulation and business activity needs to be clearly defined and to develop the mechanism for transferring the authority, and to ensure that the businesses are willing to take charge of solving multiple social challenges and have the professional capabilities for doing it.

This article explores this given topic along its specific purpose and objectives, because it is really vital for today's Russia to study, understand and overcome practical challenges in the field of creating the national corporate social responsibility system. The purpose of this work is to study the global academic narrative regarding the emergence and evolution of the corporate social responsibility concept and its application nationally in Russia. Thus, the objectives set are to study the essence, key underlying drivers, the prerequisites for CSR to start to exist, and the ways it affects the viability of national businesses; and also to analyze the national CSR standard-setting practices and the mechanisms for externally evaluating and monitoring the corporate social responsibility activities and reports in Russia.

Key Points

The corporate social responsibility phenomenon has long attracted the attention of social and political scientists and economists, with the book by an American economist Howard R. Bowen titled *Social Responsibilities of the Businessman* (1953) considered the foundation for the modern concept of corporate social responsibility. Howard Bowen originally defined corporate social responsibility as "the obligations of businessmen to pursue those policies, to make those decisions, or to follow those lines of action that are desirable in terms of the objectives and values of our society." (Igumnov, 2012, 5, p. 75).

Bowen's ideas were extended and revisited by Keith Davis and Robert Blomstrom. In the first edition of their Business and its Environment textbook, Keith Davis and Robert Blomstrom (1966) defined social responsibility by stating that "social responsibility is the obligation of decision-makers to take actions which protect and improve the welfare of society as a whole along with their own interests" (Banket, 2014, p. 69).

The libertarian economists and proponents of corporate egoism theory Milton Friedman and David R. Henderson (Henderson, 2003, p. 24-26) challenged the concept of the corporate social responsibility by arguing that if a business does not evade taxes, sets acceptable salary levels and complies with the occupational safety and environmental requirements, it is considered to be operating in good faith and so acts in a socially responsible way. The only responsibility of corporations is to maximize profits for stockholders. In his Capitalism and Freedom book (1962), Milton Friedman advocates that social responsibilities have to be assumed by individuals, and not by corporations. According to Milton

Friedman, the government actually makes corporations resolve social problems it should resolve itself by imposing the social responsibility concept (Friedman, 2006, 14, p. 157-160).

Over 1972 to 2002, J.D. Margulis and J.P. Wallish analyzed 127 research works exploring how corporate activities to promote social welfare are linked to corporate financial figures. And the analysis proved that such activities had positive impact in slightly more than in 50 percent of cases (Savchenko, 2009, p. 86), which evidences the efficiency of socially responsible investment and corporate social initiatives' effectively driving profits and contests Milton Friedman's idea that socially responsible activities "distort economic freedom" and that the government forces corporations to be socially responsible.

In September 2007, Grant Thornton polled more than 500 executives about what they think about the impact of the social corporate responsibility practices on their companies' business. According to the poll findings published by The Holmes Report, 75% of the respondents believed that socially responsible activities driver greater profits, 77% of them expect that the corporate social responsibility would be an important determinant for their business over the coming 7 years; and 68% of the people polled said they expected statutory environmental reporting to be introduced in 3 to 5 years to come (CSR, n. d.).

The pollees identified 3 key advantages of a socially responsible business: favorable public opinion; improved company-customer relationships; competitive strength for hiring talent, while 4 main hurdles to success of CSR programs were: focus on short-term outcomes, high CSR program costs, complex performances and ROI assessment, and absence of relevant background in terms of the corporate culture.

The poll by the Economist concerning if CSR affected business capitalization proved that the one was actually linked to the other. The opinion poll with more than 1,200 global major's executives interviewed was held in February 2008 and proved that the level of companies' social responsibility affected the value of its traded securities, with businesses that said they performed really well in terms of social responsibility reporting profits increase by 16% and equity price growth by up to 45%. Meanwhile, the companies with a reportedly weaker focus on the CSR said their profits rose by 7%, and their equity prices grew by 12% (CSR, n. d.).

For many people corporate social responsibility means sponsorship and charity. This idea is based on the ideas developed by economists advocating ethical (conditional) egoism (A. Smith, F.A. von Hayek et al.). The ultimate outcome of this approach is the argument that occasionally lower profits due to socially-oriented spending enables favorable social environment thus driving sustainable progress of the business, that is, being socially responsible is a good deal for a business that can so avoid the long-termprofitloss. By spending its money to finance social welfare and philanthropic programs, companies earn less in the short-term, but then affects a favorable social context to drive its future steady profits.

From the standpoint of socially responsible behavior, businesses enhance their social standing by running charitable and social programs. A proponent of this theory Joseph Galaskiewicz believes that the key factor of motivation for businesses is to gain a higher social status by gift-giving (Yakimets, 2004, p. 246-247).

The outcomes of the corporate social responsibility studies are logically coherent according to the conclusions made by a US economist and a pioneer of business-society interaction discussion Archie Carroll (Carroll, 1979), whose idea is to distinguish between four levels of social interaction (Figure 1): economic, legal, ethical, and philanthropic.

Fig. 1: Carroll pyramid of corporate social responsibility

If a business behaves in a socially responsible way at all of the four levels, it is considered a socially responsible one, which is achieved by inter-complementing the economic, legal, ethical and philanthropic responsibility.

In the end of 20th century, the *corporate* citizenship *concept* was developed. The term was coined by Howard Bowen and was later made part of the philanthropic responsibility level of the CSR pyramid by Archie Carroll. The corporate citizenship is thus the level of a business' social responsibility when its objective is to improve the quality of life and wellbeing in the communities where they operate while maintaining strong profits for the stakeholders. As noted by management study experts J. Longsdon and D. Wood, *corporate citizenship* is not about the relationships with stakeholders, but is about focusing on the challenges and needs of the local community where a business operates, often through charity. 'Corporate citizens' are companies that position themselves as 'good corporate citizens' (Igumnov, 2012, 5, p. 81) and perceive themselves as individual citizens in terms of social obligations.

Another noteworthy and offbeat approach is the 3P Model (People, Planet, Profit). As noted by Vera Ostroukhova in her study (Ostroukhova, 2012, p. 26), the model's 3 elements interact symbiotically all the time, and evolution an element triggers the evolution of the rest of them. The 3P model is also called triple bottom line (3BL, TBL) principle that is used as a corporate social accounting framework. Companies using the 3P model must cover economic, environmental and social aspects in their corporate social reports. The triple bottom line was introduced as a term in 1994 by John Elkington, the co-founder of Sustainability and a major CSR concept researcher.

Another foundation of the corporate social responsibility concept is the stakeholder theory. This theory became popular in the 1980s due to the works by American philosopher and professor of business administration R. Edward Freeman (Blagov, 2012, p.109-115). In this context, stakeholder means any individual, group or organization affecting decisions made by a firm or who are affected by such decisions, including the firm's employees (workforce), investors, stockholders, partners, consumers, public authorities, and non-government organizations. Businesses see the society and communities as a system of stakeholders groups that have their specific requirements and expectations with respect to a business. Therefore, companies have to find balance between the often conflicting expectations of stakeholders and their own interests.

Company-stakeholder relationships may be either direct or indirect. The company interacts with the society directly when it operates in order to derive profits by meeting consumer's needs as its key objective. The direct company-stakeholder relationships shape the strategies of businesses and illustrate the important role of stakeholders in the company's doing business. Direct stakeholders include the company's employees, stockholders, lenders, suppliers, rivals, and customers.

Secondary stakeholders are third parties (entities, groups or individuals) are interested in a company's activities, its business outcomes and performances, and how it affects the environment. The relationships between a business and indirect stakeholders stem from the company's main business operations. Indirect stakeholders include actors who directly or indirectly influence a business or are associated with it outside its core operations. Such indirect stakeholders include federal, national and local authorities, other countries' governments, activist groups, mass media, business promoter groups, general public, and local communities.

Indirect stakeholder relationships are no less important for the operations of a business that the direct ones. They are indirect not because they do not directly concern a business, but because they are caused by a company's main business. The interaction between the direct and indirect stakeholders triggers the stakeholder dialogue. On the one hand, the stakeholder dialogue model acknowledges the fundamental role a business plays as an economic contributor to the social welfare progress. While on the other hand, in a stakeholder dialogue, managers are expected to take decisions and actions benefitting the overall society and promoting the company's economic interests at the same time.

Today, most experts study corporate social responsibility in keeping with the fact that companies generally willingly seek to resolve most vital social challenges and to use their own resources to do that. It is acknowledged that corporate social responsibility concept virtually reflects companies' unenforced choice to contribute to improving social welfare and protecting environment. This understanding emphasizes the unenforced mature of the socially relevant activities taken by businesses.

Therefore, corporate social responsibility means all the obligations that companies' management are willing to assume obligations to pursue important in-house and external social programs that are created together with key stakeholders. By implementing the CSR practices, businesses are able to progress sustainably in a competitive market (by growing outputs, boosting products and/or services quality, etc.), to build a better reputation, shape their corporate identity, develop corporate brands, and to enhance partnership with the government, business partners, local communities, and civic institutions.

As businesses all over the world have adopted the CSR concept, harmonized CSR and CSR-related standards came to exist, either focusing considerably on the social security of employees or covering CSR aspect only. Today, the main regulation constituting global framework for corporate social responsibility is the UN Global Compact. In addition, it is recommended to use international business CSR review framework is constituted by principles, rules and CSR disclosure indicators developed by reputable international organizations.

Businesses use multiple formats to account for their CSR activities: first, reports created using their own formats; second, integrated London Benchmarking Group or Corporate Social Citizenship triple bottom-line reports or similar TBL reports; and, third, standard reports such as AA1000, SA8000, ISO 26000, GRI, etc.).

Corporate social responsibility accounting is business CSR reports containing comparable indicators, with specific figures verified by external auditors. In 1997, Global Reporting Initiative(GRI) was created by multiple corporations, non-government organizations, and UN agencies. The key idea of the GRI is that a company's CSR reports shall be based on the same principles as ordinary financial statements do.

In 2010, the International Organization for Standardization (ISO) as the world's leading international standard-setter, offered its understanding of the fundamental CSR principles and recommendations by issuing ISO 26000:2010 (Guidance on Social Responsibility). The standard guides the companies to integration of the social responsibility principles (transparency, accountability, ethical practices, etc.) into business processes covering all activities and management levels. So far, ISO 26000:2010 may be considered the basic corporate social responsibility standard. It offers guidance on the CSR underlying principles, key CSR topics and challenges, and the ways to integrate socially responsible behaviors into companies' strategies and practices.

Like in the Western countries, in today's Russia, non-financial (social) reporting is considered a very important tool for informing all the stakeholders about the companies' progress in acting to become sustainable, and to enable social welfare and environmental security. In Russia, the framework for the social accountability and socially responsible business practices was laid by launching the *Russian Business Culture* national program. *Doing Business in Russian* principles were created and multiple industry codes were adopted. In September 2000, professional ethics code was adopted by the Russian appraiser industry. And in July 2002, Code of Conduct and Business Ethics was adopted by Troika Dialog.

In December 2002, Russian Union of Industrialists and Entrepreneurs (RSPP) approved its Business and Corporate Ethics Charter (Social Responsibility Charter). As of January 01, 2020, the Social Responsibility Charter for Russian businesses was signed by 268companies and entities, together employing 7 million people (RSPP, n. d. b).

Over recent years, the RSPP has been developing regulations to provide guidance regarding corporate social responsibility practices. In 2005, RSPP issued the guidelines (recommended practices) for assessing the business performances and preparing non-financial reports called *Five Steps Towards Social Sustainability of Businesses*. As decided by the RSPP Management Board on June 21, 2006, National Registry of Non-Financial Reports was created, that was maintained since then in order to maintain a common national database of corporate non-financial reports (with reports available to stakeholders);to align, classify, bring together and share the non-financial reporting practices; to promote information transparency of businesses and further progress of voluntary non-financial reporting, and to offer information-based support to advertise socially responsible efforts on the part of the business community.

By January 01, 2020, the National Registry has featured non-financial reports from 186 companies and1,034records about the reports issued from 2000 to 2020, including environmental reports (88), social welfare action reports (361), sustainable development report (358), and integrated reports (RSPP, n. d. a).

The key aspects of Russian CSR reports are employee policies, charity, and regional development. Normally, it is major businesses who act as socially responsible investors financing public amenities. Such investments provide an appreciable long-term support across various fields and illustrate how businesses work together informally with the national government, as both big companies and the government work to balance their interests and responsibilities. A regulatory avenue for promoting CSR by the Russian government is issuing of regional SME development acts.

To illustrate this point, a number of regional acts may be cited focusing on mechanisms for socially relevant public-private partnership and charity policies. The examples include *Development of Small and Medium Businesses in the Vladimir Region* act (No. 90-OZ, dated October 07, 2010), with the key focus of this act being the partnership between the public authorities and businesses to encourage businesses to do charity and pursue sponsorship, and to support socially relevant efforts; *Social Responsibility of Businesses* bill (Yakutia) that primarily aims to establish the framework for regulating the social, economic and environmental interaction between public authorities, business communities, and local people. There are also other best CSR practices created regionally, including the *Guidelines for Assessing the Voluntary Corporate Social Responsibility Performances for the Saratov Region* (*Guidelines for Assessing the Voluntary Corporate Social Responsibility*

Performances for the Saratov Region, n. d.), settingout the methods used and the annual voluntary CSR performance rating procedure.

On March 15, 2013, GOST R ISO 26000:2012 national standard was adopted nationally in Russia after it was approved by the President of the Federal Agency for Technical Regulation and Metering (Order No. 1611-st. dated November 29, 2012). GOST R ISO 26000:2012 is harmonized with ISO 26000:2010 (Guidance on Social Responsibility). As mentioned above, the standard is aimed at integrating CSR principles into the business processes spanning all activities and management levels. Another step in this direction was made by the RSSP that offered to the business community the *Guidelines for Self-Assessment under ISO 26000*). And Sakhalin Energy was the first Russian company that implemented complete diagnostics and self-assessment of its business processes and operating performances across core areas of its socially responsible business practices using the ISO 26000 standard. After that, the company designed and implemented the action to improve its practices and management systems based on the ISO 26000 self-assessment.

The new CSR project conceived by the Russian Union of Industrialists and entrepreneurs is constructing of the corporate social responsibility index. Its purpose is to promote public corporate accountability and the tools for external assessment of socially responsible business practices, and to create a platform to enable continuous monitoring of the CSR developments. The index construction guidelines for *the Responsibility and Transparency* (‘Otvetstvennost' i otkrytost’’) and the *Sustainability Dimension* (‘Vektor ustoychivogo razvitiya’) indices were developed by the RSPP together with the European University in Saint Petersburg (RSPP, 2015).

To assess the performances and progress of businesses who are active in the field of charity, a joint project was created 11 years ago by Financial Donor Forum (association of major grantors operating in Russia), PricewaterhouseCoopers (PwC) and the *Vedomosti*, called *Corporate Charity Leaders* (Social Welfare Donors Forum, n. d.). The purpose of the project is to identify the best charity program practices and share the corporate charity information in the business and wider community.

The project is a major corporate charity rating project in Russia. Over 11 years, it was participated in by more than 250 Russian and international companies operating in Russia, with annual turnovers topping RUB100 million. One of the project’s aspects is the corporate charity assessment research that is based on a dedicated approach and produces the rating of companies covering only sector leaders having implemented dedicated charity frameworks and policies, complemented with the best corporate charity program contest. This approach enables companies not only to report the amounts of the money they have donated to finance charity efforts, but also to highlight their projects’ message and to showcase their mission, methods, expectations, and outcomes.

The facts explored prove that the CSR in Russia is evolving intensely. Businesses tend to move towards assuming greater amounts of social obligations (becoming more socially responsible) and adopting corporate accountability, where the national government makes such action legitimate and sets the CSR framework. Therefore, it is important to highlight that it is critical that such efforts are supported and promoted by the state. And the key priority here should be the ability of both the businesses and the government to attain real interests and benefits on an equal partner basis.

Conclusion

To conclude, the following takeaways may be made:

1. Social responsibility of businesses is perceived by modern Russian society as benefitting both the business and the society.

2. By acting in a socially responsible way, Russian companies become able to improve the management quality and boost their app for investors, thus enabling sustainability of Russian businesses in a competitive environment.

Though the resources Russian companies could bring to the table to resolve social issues has not been completely unlocked, it is apparent that businesses tend to act in a more socially responsible manner. At the same time, it is evident that with insufficient social responsibility framework, most of businesses are unable to fully use their socially relevant potential to achieve best results. Socially responsible businesses should be strategically and tactically aware that the economic operations and social efforts are complementary.

There are two critical aspect to highlight in this respect: first, the two dimensions (business and socially relevant efforts) need to be balanced as far as businesses own staff is concerned, while they need to be optimized at the same time as the business viability prerequisite, because business and social welfare directly impact the operating and financial performances of a business; second, the further evolution of a business is determined by how a company's business policies affect its CSR policies and vice versa. Ability to derive profit is a CSR principle for businesses, since no corporation can be socially responsible unless it is a profitable business.

As far as the legal framework is concerned, today's Russian business community is convinced (speaking unofficially) that "the more assets you get, the more opportunities you have". This means that while in the West private businesses are restricted by own regulations and does not interfere with the public sector, in Russia, national projects are if not privatized by businesses, but then significantly 'moderated' by them. A compelling proof of the negative impact of the model where businesses dominate the public sector that hurt the people, the state, and eventually businesses themselves, are the outcomes of the 1990s economic transformation in Russia.

Therefore, for Russia to be able to really become part of global community and to transform its economy in a fully viable system globally, it must, among other things, adopt a different relationship model. And a key element of such model is the corporate social responsibility of businesses and the regulatory framework to implement it. The corporate social responsibility obligations fails to be explicitly set out in the Russian Constitution. Such obligations may be deduced from the provisions saying that while each person may freely use its abilities, resources and assets in order to do business, Russia is a socially-oriented state, whose policy purports to bring about the environment fostering people's wellbeing and unrestricted development (Articles 7 and 34). So we can reasonably conclude that Russian lawmakers are responsible for creating a legal framework to promote the balance between the interests of businesses and Russian people.

From the standpoint of economic performance, all big and medium businesses need their socially-related policies revisited to enable active and sustainable adoption of socially-oriented model instead of the business-performance-driven one. They key overarching concept should be that boosting economic performances means growing the people's wellbeing as much as growing the people's wellbeing means boosting economic performances. Cheap workers cannot be efficient. And the low level of wellbeing hurdles national economy from progressing dynamically amid technological modernization.

The Run-Up to The Economic Transformation of Poland

Wiktor SZYDLO
Wroclaw University of Economics and Business, Wroclaw, Poland
wiktor.szydlo@ue.wroc.pl

Abstract

Poland faced unprecedented challenges after the disastrous Second World War. Between 1950 and the mid-1970s the communists managed to slightly narrow the huge gap between Poland and the US in terms of GDP per capita (PPP). In the subsequent 15 years the average growth was highly unsatisfactory. In the mid-term horizon the ambitious import substitution and export-led growth strategy proved to be a failure. The country overburdened by foreign debt was practically insolvent. As the reforms introduced by the communists lacked adequate impetus the country seemed ready to the systemic transformation. In certain spheres (such as relatively high share of the private sector) Poland was better prepared for this unprecedented undertaking.

Keywords: socialism, economic reform, the lost decade, the 1980s, Poland

Introduction

Poland is often perceived as a leader of both political and economic transition among the countries from the former Eastern Bloc. Indeed, the end of communism in Poland was famously announced on the main Polish news by a TV presenter Małgorzata Szczepkowska on 4 June 1989, hence five months before the fall of the Berlin wall (November 7 1989). During the very same day (June 4) partly democratic parliamentarian elections (35% upper limit for opposition in Sejm, i.e. Lower House) took place. Pro-democratic 'Solidarność' ('Solidarity') trade union and civic movement won 35% seats in Lower House and in Senate (Upper House) - with no upper limit for opposition - it won spectacular 99% of seats. In the first round of the elections (4 June 1989) candidates from 'Solidarity' won 160 seats in Lower House out of 161 seats which were available also for opposition (35% limit out of total 460 seats) and in completely democratic election for the Upper House (Senate) 92 seats out of total 100 seats. As noted by Dudek (2016) and Roszkowski (1992) 65% of seats (i.e. 299) in the Lower House were in advance granted to the members of communist party, two satelite parties (including peasant party) and three pro-governmental catholic organizations.

Earlier suggestions or preliminary arrangements between the communists and "Solidarity" were more favourable for democratic opposition: 60% of seats in the Lower House were reserved for communists and their allies, while 40% could be won in democratic elections by opposition (such as "Solidarity"). The deadlock was solved by surprising proposition by Aleksander Kwaśniewski (one of communist leaders from young generation): in exchange for government variant in the Lower House, elections to Senat were totally democratic (Dudek 2016: 28) (Terlecki, 2018: 271).

This peaceful turnaround towards democracy in Poland was preceded by the so-called Round Table meetings that started already on 6 February 1989. The Round Table documents were signed by the ruling communist party (with its small parliamentarian satellite parties) and the outside-parliamentarian, pro-democratic and newly re-legalized movement (trade union) 'Solidarity' on 5 April 1989. In fact, before and during Round Table talks a number of more cameral and informal negotiations between high rank communists, the trade union leaders and even clergy took place in Magdalenka (a village near Warsaw) were the representatives from opposition acknowledged that the future president will be general Jaruzelski - the undisputed communist leader since 18 October 1981 (i.e. just before the introduction of the martial law in December 1981). These talks in Magdalenka started already in September 1988.

For advocates, the Round Table is the symbol of sensible accord that started pro-democratic and bloodless political and socio-economic transformation towards free market and Western Europe. For opponents, it was a compromise that enabled smooth transformation of communist leaders into democratic politicians and led to the division and weakening of Solidarity movement in the 1990s. The constructed system, according to critics, was a combination of crony capitalism with 19th century version of capitalism characterised by high unemployment and brutal hyper-individualism.

Undoubtedly, Poland was a leader of pro-democratic movement in Central and East European countries in the late 1980s. In Hungary the end of communist ruling was announced on 23 October 1989 which was also the consequence of the round table negotiations. The beginning of the demolition of the Berlin Wall started on 9 November 1989, while the uprising against Romanian dictator Nicolae Cauşescu broke out on 16 December 1989.

Poland's early leadership, however, had its price: partly democratic elections and legitimisation of communist elite. The bulk of communist crimes remained unpunished. Lech Wałęsa – the symbol of the pro-democratic change and the Peace Nobel Prize winner – replaced Wojciech Jaruzelski and became first democratically elected president on 9 December 1990. Once in office Wałęsa seemed to postpone first democratic parliamentarian elections (Zaremba 2010: 103) which finally took place on 27 October 1991 - i.e. more than 2 years and 4 months after partly democratic, contract elections. To put it into perspective the aforementioned agreement reached during the Hungarian round table in October 1989 directly led to free elections in March 1990. Therefore, "the country "jumped" directly into democracy [...] and Hungarians avoided any form of pseudo-democracy or government of national unity" (Žídek 2014: 57). Interestingly, also in the Czechoslovakia the political changes were much faster and more decisive than in Poland. Already on 29 December 1989 (i.e. only one month after the Velvet Revolution) Vaclav Havel became the 10th President of Czechoslovakia. In contrast, Wałęsa had to wait almost one year to be elected President of the Republic of Poland. By no means communist elite was well prepared for the change of the system.

The turnout in first wholly democratic parliamentary election after the fall of communism in Poland on 27 October 1991 was surprisingly low and amounted only to 43.2%. By contrast, the turnout during parliamentarian elections in 1922 amounted to 67.7%, while in the following elections it reached 78.3% (Dudek 2016: 183). Again, Poland was one of the last post-communist countries to conduct wholly democratic parliamentary election. Certainly, it was a clear sign of failure of young democratic system and all political class (Dudek 2016:183-184). Those that did not take part in the elections were mainly: less educated, young, with low income and indifferent attitude to religion, living in small towns and villages (Markowski 1992). The most passive voters constituted of people that suffered most during transformation and those who did not believe that the election could change their fate (Dudek 2016: 184).

The misery of the late 1970s and 1980s

This seemingly peaceful and bloodless transformation was not that easy to achieve. Poland was the biggest (in terms of population and area) satellite country of the former Soviet Union. Both Hungary and Czechoslovakia (the country peacefully split into the Czech Republic and Slovak Republic on 1 January 1993) could boast higher standard of living and better connection with the West European countries. East Germany was not only more developed but also received massive financial support from West Germany especially in the 1990s.

This backwardness even in comparison with a number of former socialist neighbours was partly the consequence of Polish tragic history. It is worth noting that for 123 years (1795-1918) Poland lost its independence and was split into three neighbouring countries. Already in 1920 the newly independent country managed to defeat Soviet army in the Warsaw battle and then 19 years later it was invaded by Nazi Germany (1 September 1939) and Soviet Union (17 September 1939). During the Second World War Poland lost the highest percentage of its population i.e. 20%. In the case of Yugoslavia it was 11.7%, USSR - 8.9%, Greece - 6.8%, Austria - 5.7%, Germany - 5% (Zawistowski 2010, p. 185). The overall losses were much greater because of the territorial changes and emigration. In consequence, the population declined from 35 million in 1939 to less than 24 million, i.e. by about

34% of its pre-war population (Eisler 2018: 73). As the consequence of the Second World War a third of Polish city dwellers were dead. The country lost over 50% of lawyers, 40% of doctors, one third of university professors and catholic priests, many government administration workers, military officers, sportspersons, artists, secondary school teachers, journalists and engineers. Among killed intelligentsia by Third Reich substantial part comprised of assimilated Polish Jews (Kotkin, Gross:103). In fact, the Polish intelligentsia were exterminated by both totalitarian regimes: Third Reich (Sonderaktion Krakau, AB Action and many other murders were committed especially in west and central former Polish territories) and the Soviet Union (for example the murder of nearly 15 thousand, Polish, mostly higher rank POW and civil servants in Katyń and other places).

Population of Poland returned to its pre-war level as late as mid 1980s. In addition, the country lost 20% of its territory as eastern part of the country was taken over by the Soviet Union. A number of Polish cities were also massively ruined. In some cases loses amounted to 70-80 percent as in the case of Warsaw, Wrocław, Gdańsk and many others. In July 1945 it was estimated that out of 30017 industrial factories more than 60% were completely or partly destroyed (Landau, 1985; Skodlarski, 2000). The situation in villages was also miserable where 22% of the farmhouses were either destroyed or damaged, the livestock of horses declined by 57%, cattle by 67% and pigs by 83% (Eisler 2018: 74). Eisler (2018: 73) also notes that the national income declined by about 60% and the total costs of the destruction during the war was nearly thirteen times greater than the level of national income in 1938.

Undoubtedly, the new communist regime in Poland faced dramatic socio-economic challenges. According to OECD database and Maddison (2003) Poland's GDP growth per capita between 1950 and 1990 was modest especially in comparison with some West European countries (table 1).

Table 1: GDP per capita (1990 International dollars) and GDP dynamics 1950-1990 (1950 = 100)

The centrally planned Polish economy under the so-called real socialism underwent several crises. Janusz Beksiak (1984) identified the following four ones: 1953/1954-1956, 1962-1963, 1970 and 1975/1976-1984. This is very much consistent with the classification provided by Zbigniew Landau (1995) who divides the the Communist rule in Poland into four periods

Generally, in the second half of the 1970s and 1980s there was an ongoing economic crisis characterised by lack of goods in shops, long queues, economic stagnation and pessimism in the society. Mass demonstrations that broke out in June 1976 in Radom, Ursus and to lesser extent in Płock against the planned increase of prices were brutally pacified by special militia troops. Protest were particularly vocal in the province were living conditions and wages were lower than in the capital. This is contrary to common perception that communist or real socialist countries focus on even development of the whole country. It could be argued that the changes of the administrative division of Poland that came into force in June 1975, i.e. the introduction of 49 instead of 22 (including five separated cities) voivodeships was an effort to limit the widening gap between the centre and the periphery. Nevertheless, the protests of 1976 were a clear sign of crack in the government's economic policy led by progressive leader of Polish communist party (i.e. first secretary) Edward Gierek (December 1970- September 1980) whose ascent to power was in big part the consequence of mass protests in December 1970 (the so called wydarzenia grudniowe) in the Pomerania region. These protests were brutally pacified: during the massacre over forty people get killed and about one thousand were seriously wounded (Dobrowolski 2018: 20). The turmoil was fuelled by the planned increase of administered prices. It was an untimely move as it shortly preceded Christmas. During the fourteen-year-long rule of Władysław Gomułka such operation was conducted for the third time. K. Modzelewski (2013: 222) illustrates it by providing data on the price movement of an ordinary sausage per kilo which was perceived as the most strategic good at that time: in the first case in 1959 its price was lifted from 18 zł to 26 zł, in the second in 1967 from 26 zł to 36 zł and the third attempt which proved unsuccessful the prices were supposed to increase from 36 zł to 42 zł. Generally, meat was dubbed the strategic good. Its real availability to the clients and low prices functioned as a barometer of the social climate – by not increasing prices of meat and its by-products the government "bought" the social peace (Eisler 2018: 273). However, it does not necessarily mean that the demands of the Polish society were exaggerated. At that time the government conducted the policy of the restraint of wages. In the second part of the 1960s the real wage growth in Poland which stood at 1-2% annually was practically indiscernible for the society and was markedly lower than in other Eastern Bloc countries where it amounted to 2.4% in Hungary, 3% in USSR, 3.5% in Czechoslovakia and 4.1% in Bulgaria (Eisler 2018: 275). J. Eisler (2018: 275) also notes that the situation in Poland was getting worse as the annual real wage dynamics declined from about 3.5% in 1966 to 2.5% in 1968 and only 1.5% annual growth in 1969-1970. Taking into account the data provided by J. Eisler the crude average annual growth in Poland was slightly above the range of 1-2% and amounted to 2.25% in 1966-1970.

After the strike in Łódź the new leader (E. Gierek) finally decided to back down from the planned increase, what according to K. Modzelewski (2013: 222) blocked the already malfunctioning mechanism of price adjustment to the market equilibrium. Hence, the problem of shortages, instead of being resolved only gained momentum.

E. Gierek took on foreign credit in order to modernise heavy, chemical and car industry, residential building, transport infrastructure and cooperative farming. However, this investment boom ended up with shortages of basic goods. Putting of price increases at a time of high wage growth and several poor harvests (1974-1980) and floods (1977 and 1979) contributed to serious economic imbalances, especially in the food market. The scheduled price hike of many goods in June 1976 led to the acute social protests. It was estimated that in 1980 meat and chocolate stocks could cover 75% of demand, margarine could be bought by 79% of the people and cheese by 80% (Zawistowski: 207).

It needs to be stressed that economic policy conducted in the 1970s was also shaped by the demographic situation. At that time massive number (about 700 thousand) of post World War II baby boomers were entering the labour market every year what exerted unprecedented pressure on limited possibilities of university education, as well as access to own housing and desired social and employment positions (Adamski 2014: 30). Kabaj (2016: 210-211) claims that at that time (i.e.

1970s) Poland faced a danger of 2-3 million unemployment. Certainly, the communist party wanted to defuse this demographic bomb by increased investment and production of consumer goods (especially consumer durable goods). There was also a speed up of construction of residential housing.

In the 1970s the economic ties with the West were intensified. The symbol of opening up to the West was the deal with Italy to introduce mass production of Fiats in Poland). These efforts to avert the looming crisis proved unsuccessful. According to IFiS PAN in 1980 still almost 50% of workers at the age of 30 and above were waiting for their own apartments and the queue was even lengthening (Adamski 2014: 30). Nevertheless, E. Gierek's plan to increase employment was successful (in total about 2.5-3 mln jobs were created) (Kabaj 2016: 212).

Part of the government's success in the labour market was the consequence of the channelling relatively small amount of money from large central investment into development of small extensive projects in industry, handicraft and services. Thanks to this shift it was possible to create 20 jobs instead of one in spectacular capital intensive mega-projects (Kabaj 2016: 211).

However, with time this communist achievement proved counterproductive. Assuming the objectivity of central statistical office (GUS) the was a spectacular growth of excess demand for labour, especially in the 1980s. Indeed, numerous evidence even in the popular discourse at that time point to growing absenteeism and falling commitment to work, especially in these sectors of industry which were too small to receive special treatment from the central government. This also applies to cooperative sector with also relatively low wages.

Table 2: Excess demand in the Polish labour market (ration of vacancies to job-seekers) in 1978-1989

1978	**1979**	**1980**	**1981**	**1982**	**1983**

52.4	66.5	57.6	44.5	86.8	90.1

Source: data from GUS presented by Kramer (1995: 77).

Surprisingly, it took place when investment to GDP ratio markedly decreased in comparison with the previous decade. Part of the explanation of this phenomenon was substantial increase in private entrepreneurship already in the 1980s and post-martial law wave of emigration to the West.

Growing openness to the West in the 1970s together with favourable situation in the labour marked (despite growing working age population) led to the mounting dissatisfaction with the poor access to consumer goods. The year 1980 is famous for the so-called carnival of "Solidarity" – in August 1980 almost 300 factories were on general strike that covered all Pomerania region. Finally, on November 10 1980 the statute of this independent trade union was officially registered. It is worth mentioning that USSR had it own carnival at that time as it organized Olympic Games in Moscow in summer 1980. The cost of the games were quite substantial as they were held in several soviet cities and included building a road between Moscow and Minsk (which is currently the capital of Belarus). The trade in the Eastern Block was conducted in artificial (not market) prices and the partners (unofficially) accused one another of propping up terms of trade. In particular, the USSR authorities claimed that they cheaply sell commodities (especially crude oil and gas) to satellite countries (Orłowski 2010:113). The satellite countries, in turn, argued that they sell industrial products below market prices to the USSR (especially in relation to the input of components purchased for hard currency from Western countries). Orłowski (2010: 113) claims that there is no way to resolve this disagreement, however he acknowledges that there are solid grounds based on (Brus 1986) to claim that USSR used its dominant position (advantageous terms of trade) in relation with satellite countries in the 1950s. In fact, cancelation of any payment claims (the so called "zero option") between Poland and Soviet Union in the early 1990s was possible thanks to the Polish specialist

working at Centralny Urząd Planowania (CUP) who proved that the prices of Soviet gas imported by Poland many times exceeded the global market prices (Ancyparowicz :237).

Poland's hopes of political and socio-economic transformation initiated by massive popularity of "Solidarity" in 1980 was preceded by the spectacular choice of Polish archbishop from Cracow to become the new Pope in 1978. This optimism markedly faded with an assassination attempt on John Paul II in May 1981 and the introduction of the martial law (13 December 1981 - 22 July 1983) by the communist leader – general Jaruzelski. In consequence, sanctions were imposed on Poland through credit and export restrictions and the suspension of the MFN (most favoured nation) clause (Lavigne 2018: 3173). According to Śleszyński (2018: 56) "after martial law a quarter of people with higher education left Poland what made an enormous hole in the human capital as the number of tertiary students at that time was relatively low and the people with a master's degree constituted absolute intellectual and technical elite."

The ending of the martial law did not stop persecutions of the pro-democratic opposition. For example, the year 1984 was tragically marked by assassination of charismatic and very popular chaplain of industry workers Jerzy Popiełuszko by communist internal secret service. Mysterious deaths or disappearances of pro-democratically oriented people (including priests) occurred as late as 1989, hence shortly before the Round Table talks. Priests Stanisław Suchowolec and Stefan Niedzielak were murdered in 1989 (Błażejowska 2019: 8) (Woroszylski 2019: 155)

Macroeconomic indicators point to dramatic worsening of the situation in the country, especially in the early 1980s. Between 1980 and 1983 the national income produced decreased by 12.4%, while total investment outlays plunged by 25.1%, both figures in constant prices (see table).

Table 3: National income and investment outlays in Poland (constant prices) (1950 = 100)

	1946	**1950**	**1960**	**1970**	**1980**	**1983**
National income produced	56.8	**100**	207.5	373.8	632.1	553.5
National income produced per capita	59.5	**100**	174.2	285.3	441.5	377.7
Total investment outlays	41.8	**100**	259.6	531	1000	749
Including investment outlays in the public sector	24.2	**100**	249	526.9	1000	702.8
Investment outlays per capita	43.3	**100**	217.9	405.2	714	508.4

In the mid 1980s the economic situation got worse also in the Soviet Union. Already in March 1985 young reformist Mikhail Gorbachev became the general secretary of Communist Party of USSR. It was partly the consequence of President Reagan's Star Wars initiative (which was supposed to show that USSR cannot keep pace with the US in expensive and technologically advanced arms race). As put forward by Hanson (2014: 191) Soviet Union started to have difficulties in crude oil production in 1985 and there was also a decline in world oil prices in 1986.

While in Poland (net oil importer) food rationing was partly abandoned in 1986. Positive changes in global crude oil prices did not markedly prop up the Polish economy. The economic stagnation was not only the consequence of inefficient central planning.

The country desperately needed hard currency in order to service its foreign debt that greatly increased during the era of E. Gierek. There is a clear parallel between Poland and Latin American countries that were also caught in a debt trap in the 1980s.

Fig. 1: Investment outlays (constant prices) (1980=100) in Poland

Source: GUS

Hence, ambitious import substitution industrialization strategy conducted by a number of developing countries reached a dead end. For example, import substitution industrialization in Argentina was conducted in 1950-1976 with an average annual growth rate of 3.5 (Amico, Fiorito 2014: 216). Export oriented strategy of growth in Poland was a failure. According to Dariusz Ledworowski (2014) the looming debt trap was visible from the beginning by the professor Witold Trzeciakowski and some of his colleagues from Institute of Economic Cycles and Prices (Instytut Koniunktur i Cen). It quickly turned out that the economy opened up to import and there was a lack of export promoting elements (Ledworowski 2014).

According to Witold Bień (1984), the economic woes originated from payment imbalance rather than the sheer size of the debt. Export denominated in hard currency was too low in comparison with the size of the debt. In 1980-1981 "the total indebtedness of the USSR and Eastern Europe combined exceeded USD 80 billion, more than four times its level of the end of 1974" (Lavigne 2018: 3174). Debt per capita in Poland was almost half of that in Mexico and Brazil and more than 50 percent lower than in Chile, but its debt to export ratio was alarmingly high (table 2).

Table 4: Debt (in hard currency) and export (in hard currency) in 1982 of selected countries

	Debt as of end of 1982 (bn USD)	Export of goods in 1982 (bn USD)	Debt to export ratio (%)	Debt per capita (USD)
Poland	**24.8**	**5**	**496**	**681**
Yugoslavia	18.3	5.9	319	832
East Germany	11.3	8	141	677
Romania	9.4	6.2	152	418
Hungary	7.5	4.9	153	701
Mexico	87	21	414	1222
Brazil	85.2	20.2	422	672
Argentina	36.5	7.6	480	1285
Philipines	24.5	5	490	471
Turkey	22.3	5.7	391	472
Chile	17.2	3.7	465	1470

Source: compiled by W. Bień (1984). Based on: Morgan International data, February 1984; Rocznik Statystyczny GUS, 1983; Die Wirtschaft der Rgw - Länder 1982/1983.

Since February 1981 Poland was neither servicing its debt owned by governments from Western countries nor guaranteed by these governments but was still servicing it in relation with private banks (Gomułka 2016, p. 104). The moratorium on debt servicing preceded the introduction of the martial law by 10 months. Hence, the development of anti-communist "Solidarity" movement was partly the consequence of mounting socio-economic problems in the late 1970s and early 1980s.

The economic stagnation in Poland and many other net oil-importers from the Eastern Block also sprang from the dramatic increase of crude oil prices especially during the second oil crisis in late 1970s. When the prices collapsed in 1984-1985 the oil-rich Soviet Union caught the "Polish disease" as it was forced to take on credit from capitalists to satisfy desires of their own consumers (Kotkin, Gross: 38). To be more precise, crude oil prices – after their spectacular jump from 13.20 USD/bbl in November 1978 to their peak of 40.75 USD/bbl in November 1979 (the second oil shock) – were in the downward trend. In January 1986 price lowered to 24.68 USD/bbl and then dropped to 9.62 USD in July 1986 (figure 2).

Fig 2. Crude oil, average (USD/bbl) (monthly prices in nominal US dollars)

Source: World Bank

Of course, the rising costs of servicing debt were also the direct consequence of highly restrictive monetary policy conducted by Paul Volcker (the chairman of Fed) in the first half of 1980s (his policy started already in October 1979). It is estimated that the 60% appreciation of USD between 1980-1985 led to the reduction of 1.8 million jobs in the US (Levinson 1992: 43-44), but also deepened the insolvency crisis in a number of highly indebted developing countries in Latin America and Central and Eastern Europe. It needs to be stressed that USD also strengthened against West European currencies. For example, since the end of 1979 till February 1985 total appreciation of USD against German Mark amounted to 47.9% (Krugman et al. 2018: 381).

The economic situation of Poland was particularly difficult as the bulk of its debt was denominated in hard currency (including USD) (table 5).

Table 5: Indebtedness* of Poland in the years 1960-1990

	Debt to first payment area (million transfer roubles)	Debt to second payment area (million USD)
1960	432	690
1970	604	1077
1980	1450	24128
1990	5100	48500

** Including overdue interest payments* *Source: Historia Polski w liczbach. Handel (1995: 191)*

The country needed to strengthen its ties with international financial institutions. In late 1981 (a couple of days before the introduction of martial law on December 13 1981) the country applied to re-access the IMF. It was rather an empty gesture as, according to some historians from IPN, the preparation to introduce the martial law lasted almost one year. Because of the sanctions, Poland was admitted to the IMF much later in 1985 (Polska transformacja, 2014).

Undoubtedly, the 1980s was a lost decade for Poland. The new calculations conducted by ZBSE (i.e. Zakład Badań Statystyczno-Ekonomicznych – a unit within Polish Statistical Office and Polish Academy of Sciences directed by prof. L. Zienkowski) revised downward the level of average annual growth in the 1980s to mere 0.8% (Nowy szacunek 1999). In 1989 Poland, a country rich with arable land, received food support from West European countries. Yet according to GUS problems with debt slightly eased, i.e. debt denominated in currencies of socialist countries decreased by 100 million roubles from December 1988 to the end of May 1989, while the debt denominated in currencies of capitalist countries fell because of the USD movements against other hard currencies from 39.2 bn USD at the end of 1988 to 36.9 bn USD at the end of May 1989. This debt markedly increased to 48.5 bn USD in 1990.

To put it into perspective, according to data collected by Roszkowski (2008: 120) the gross sovereign debt of Eastern bloc countries in 1989 amounted to: 9 billion USD in Bulgaria, 5.1 billion in Czechoslovakia, 20.6 billion USD in East Germany, 39.9 billion USD in Poland, 1.4 billion in Romania, 20.6 billion USD in Hungary and 48.3 billion in the Soviet Union. It is clear that more adequate relative measures of sovereign debt (such as debt per capita and debt to GDP ratio) reached the highest levels in Hungary and Poland.

Summary

This rather murky picture of socio-economic situation in the late 1970s and 1980s could be brightened by several positive developments. The tragic crisis in the 1980s reined in conspicuous investment projects which would prove not profitable in the new capitalist system. In this regard, the situation in Poland was better than in several other former Soviet satellite countries which continued their investment boom in the 1980s. The intensification of investment in Poland in the 1970s partly defused demographic problems (caused by baby boom generation entering the labour market). Certain free market reforms were also initiated at that time. According to Kołodko (2001) "the reforms of the 1970s and 1980s significantly influenced later transformation. Thanks to these reforms – despite conceptual mistakes and errors during implementation at the beginning of the 1990s – the duration of the recession was rather short (...) and certain market mechanisms started functioning earlier than in other post-socialist economies which had not made an effort to reform earlier, as in the case of Czechoslovakia and Bulgaria." Communists tried several times to reform the system. For example, the second phase of reform was introduced in Autumn 1987 and included rather deep and qualitative changes of the economic system (Wilczyński 1996: 22). Socialism (centrally planned economy) was not homogenous. Different countries implemented different versions of this system (Swadźba 2019: 24-25). The system also underwent different phases within one country.

Despite much effort the economic situation in Poland was worse than in Hungary and Czechoslovakia. The consumer goods market in Poland was overstretched and not well prepared for growing demand caused by baby boom generation. At the same time, it is worth noting that many other Central and East European countries had similar demographic situation. Also gains from investment projects were unsatisfactory. The export led growth strategy was not functioning good enough. At the same time, rather modest spending on centrally planned investment projects in the 1980s, coupled with relatively high share of the private sector (family-owned farms, small family business), better prepared Poland for economic transformation. Yet, the introduction of the martial law in December 1982 further deepened the economic, social and political crisis. Hopes for democracy and economic stability proved illusory. These hopes were raised again in 1989.

Doubtless, the study of the final years or even months of communist ruling should be continued. This especially applies to the countries (such as Poland) with surging inflation. To acquire broader perspective it is indispensable to conduct detailed comparative studies of Eastern Bloc economies in this pivotal time.

Abstract

Contemporary management of global supply chains takes place in conditions of permanently increasing uncertainty and a relatively high risk of disturbances occurring in supply chains. This paper describes nine pillars of the Industry 4.0. In addition, this work addresses the very important, according to the authors, topic of interrupting the continuity of processes flow implemented in modern supply chains. Verifying the hypothesis formulated in this article the authors of this paper indicated potential influence of Industry 4.0 tools, as well as their usage, on particular supply chain disruptions. Furthermore, as part of this article the authors pointed out main Industry 4.0 tools implementation of which enables levelling of interference arising at individual stages along the smiling curve. This paper is the basis for the development a framework for future research focusing on the methodology of selecting Industry 4.0 tools, the usage of which could be helpful in preventing supply chain from breakage, or compensate for its effects, caused by a crisis situations (currently an example is a coronavirus pandemic).

Keywords: Supply Chain disruptions, Industry 4.0, Smiling Curve

Introduction

Global supply chains are changing constantly. These changes are forced by the need to meet different expectations and needs of locally dispersed clients. Customers whose satisfaction is the most important factor conditioning the way processes are implemented in the supply chain.

The effectiveness of the supply chain is conditioned by the ability to not only adapt products and/or services to customer requirements, but also the ability to anticipate their needs before the recipient demonstrates a requisition for a given product or service. The wider and the longer the supply chain is, the more difficult it becomes to respond to the changing needs of customers and fulfil their requirements. Continuous communication between supply chain partners becomes a key element, regardless of the range and the length of the given supply chain. Hence the continuous exchange of data, providing by the usage of intelligent, digital solutions can contribute to increasing the effectiveness of processes and more effective response to consumer requirements, especially in crisis situations, such as the current coronavirus pandemic.

The purpose of this article is to investigate the research problem related to disturbances occurring in all phases of the supply chain and the possibility of using Industry 4.0 tools to prevent the appearance of disturbances and to compensate for the effects of existing problems.

The authors of this article have formulated the hypothesis that Industry 4.0 tools have the potential to prevent and also enable quick response to disturbances that may appear in particular phases of the supply chain.

According to the authors, Industry 4.0 and its impact on supply chains, often also called Smart Supply Chains, continues to be an area that requires a number of studies to be provided that the authors would like to address, as part of developing this topic. The results of future research will enable the development of mechanisms of using the tools supporting the increase in the efficiency of processes pursued as part of the flow of products and services through subsequent links of the chain regarding preventing Smart Supply Chains from disruption.

Industry 4.0

The term Industry 4.0 was first used in Germany in 2011 (Kosacka-Olejnik and Pitakaso, 2019). Industry 4.0 is a concept that combines digital technologies and automated as well as autonomous tools and solutions that allow many companies to exceed the process efficiency barrier achieved so far by them and even open up to the unlimited possibilities of processes implemented by Smart Factories (Venkateswaran, 2020). Industry 4.0 is a concept based on the digital transformation of processes implemented both along and across the value chain (Ellefsen et al., 2019).

When defining Industry 4.0, reference should be made to the key elements underlying the concept. Industry 4.0 includes (Rojko, 2017):

- Cyber-Physical Systems (CPS),
- Internet of Things (IoT),
- Information and Communications Technologies (ICT).

In addition, it is very important to also remember about elements regarding Industry 4.0 such as Big Data, Cloud Computing or Process Simulation (Tay et al., 2018).

CPS integrates both physical objects such as machines, devices, but also Smart Products with their users enabling both people and autonomous machines to communicate with each other in real time. Data flow between system components is possible thanks to Internet of Things, which provides the possibility of autonomous data exchange between system components, which does not require the initiation of information flow by users (people), nor is it dependent on human who mans the machine (Frank, Dalenogare and Ayala, 2019).

The authors of this article define Industry 4.0 by referring to nine pillars listed, among others, by Alcácer V. and Cruz-Machado V. (2019).

These dimensions of Industry 4.0 will be used to determine which tools of the 4th Industrial Revolution can be used to prevent supply chain from disruptions in each of its phases and how they can be used to compensate for the effects of problems arising in the supply chain.

The first pillar of Industry 4.0 is the Industrial Internet of Things (Alcácer and Cruz-Machado, 2019). The main assumption of IIoT is to ensure a permanent connection with all elements as well as users of CPS for continuous exchange of data in real time. IIoT enables production machines to acquire key data for the process for analysis as well as self-learning activities and becoming more intelligent devices. Machines equipped with appropriate sensors are able to independently download data or obtain them in a different way, e.g. from other machines organized within the same CPS or also system users (people). What is also very important, the sensors can be installed in both new and used machines (Majeed and Rupasinghe, 2017).

Due to the growing number of data that is generated every day by users and machines the use of existing tools becomes ineffective and makes it barely impossible to make independent, effective decisions. Big Data are tools based on advanced algorithms used for automatic and autonomous data collection,

storage and processing to support decisions made inside the entire supply chain. Data analysed using advanced intelligent algorithms allow decisions to be made to ensure that the purposes set by the supply chain are gained (Szymańska, Adamczak and Cyplik, 2017).

Cloud Computing enables the development of enterprise functionalities integrated within the supply chain, providing them the continuous real-time access to data collected by Big Data tools or licensed software for supply chain's process management which is not physically installed in the company's IT environment. Thanks to the possibility of using functionalities located in the cloud, managed by a specific group of software providers, the systems become practically maintenance-free in terms of IT and hardware, allowing also small companies access to cloud solutions that were previously unattainable due to the high costs (Oztemel and Gursev, 2020).

Process simulation is another important tool used in Industry 4.0. The simulation makes it possible to reflect a system, e.g. a factory, in a virtual way to identify all activities that do not add value. Process analysis carried out as part of the simulation enables identifying activities ensuring the increase in the efficiency of the activities carried out, improving the quality of the processes or services offered and reducing the operating time. The simulation also results in lowering process costs or increasing the quality of created products (Alcácer and Cruz-Machado, 2019).

Augmented Reality connects the virtual world with the real one, supporting the processes performed so far with innovative technologies, which results in reducing the time of processes implementation, lowering costs and minimizing the number of errors. AR allows not only to increase the efficiency of processes, but also allows you to implement activities related to predictive maintenance (Tay et al., 2018).

The next pillar of Industry 4.0 is Autonomous Robots capable of communicating with each other and making autonomous decisions that do not require human intervention. When talking about Autonomous Robots, Artificial Intelligence should also be mentioned, thanks to which machines are becoming more intelligent, much more flexible in terms of adapting to customer requirements and guaranteeing increased process efficiency and reduced costs (Oztemel and Gursev, 2020).

Additive Manufacturing, including spatial manufacturing technologies, is another important aspect of Industry 4.0. AM assumes a departure from traditional methods produced as a result of the use of rapid production technology based on computer models, which allows to significantly reduce the long-term design and prototyping phase of products and thus reduce production time and costs of the manufacturing process. An example of the use of Additive Manufacturing can be 3D printers or digital manufacturing (Schöning, 2018).

The eighth pillar of Industry 4.0 is the Horizontal and Vertical System Integration allowing continuous flow of information and material stream both inside factories and links located on the same layer of the chain as well as subsequent links in the process. In addition, horizontal and vertical integration assumes the possibility of product tracking throughout the entire life cycle, i.e. from the moment of collecting production raw materials through the production, distribution phase to the final recipient as well as monitoring of products used by the customer (end-to-end). The use of system integration also contributes to reducing the differences between successive stages of processes implemented within the supply chain, including reverse logistics and product decommissioning (Alcácer and Cruz-Machado, 2019).

The last pillar of Industry 4.0 is Cybersecurity, which is an intelligent solution for securing the system that collects huge amounts of data against hacker attacks, data theft and also inappropriate, often unconscious, use of the system by employees. Ensuring security with such a high level of integration and sharing sensitive data is a key role in the development of Industry 4.0 (Schöning, 2018).

Transformation of supply chains in the context of shaping added value and its resistance to interference

A characteristic feature of global supply chains is undoubtedly the fragmentation of their production, manifested, inter alia, in the transfer of its individual works, but not people performing them, to countries offering mainly cheaper materials and lower labour costs. This phenomenon, or even a process, is somewhat simplified by the smiling curve (shown in Figure 1 based on United States International Trade Commission, 2010, p. 2-4 and OECD, 2013, p. 214), which presents the share in the added value of individual activities along the global value chain.

Fig. 1: Smiling curve and offshoring phenomenon

The description of the smile curve three main phases are distinguished: pre-production activity (including research and development, project development, design), production activity and post-production activity (including sales and distribution, marketing, services). Each of these aggregated phases reflects a contribution to creating added value along the global value chain, which is high at first, then falls and increases again. Shape of this curve resembles the "U" letter (United States International Trade Commission, 2010; OECD, 2013).

In the era of observed disruptions in global supply chains (among others caused not only by a pandemic), there are premises to suppose that some global supply chains will start to break away from their links, transferring production activity back to the home country. In this case the authors are talking about the opposite tendency to offshoring, which is reshoring. Reshoring means return of previously transferred works, but not transferring people who are responsible for performing the process, due to the significant cost increase in the traditional low-cost countries (LCC).

Industry 4.0 as a tool preventing supply chain from disruptions

By analysing the literature related to the main reasons for the interruption of the supply chain, the authors of this article attempted to consider the most likely areas of implementation of Industry 4.0 tools to prevent supply chain interruption and compensation of its effects.

G. Wieteska in her publication indicates the areas which, in relation to processes implemented in the supply chains are most exposed to the appearance of distortions that may cause its interruption (Wieteska, 2018):

- supply logistics,
- production process,
- production logistics,
- order management for individual and institutional clients as well as distribution logistics.

Furthermore, analysing the considerations presented in the publications (Ivanov, Dolgui and Sokolov 2018; Alcácer and Cruz-Machado, 2019), the authors of this article have noticed the impact of Industry 4.0 tools on the possibility of preventing disruptions in individual phases of the supply chain.
Based on the nine pillars of Industry 4.0 and their characteristics, the authors assigned the tools of the Fourth Industrial

Revolution to the identified disturbances of supply chain due to indicate their likely impact on emerging disturbances application (Ivanov, Dolgui and Sokolov 2018; Alcácer and Cruz-Machado, 2019). The impact of Industry 4.0 tools on supply chain disruptions refers to both the ability to counteract existing problems and to compensate for the effects of emerging disruptions, adding value to this paper. Industry 4.0 tools have been assigned to selected disturbances that may occur in particular phases of the supply chain. These tools are divided into three categories (preventive, responding to the effects of disruption or preventive and responding to the effects of disruption) due to their likely impact on the resulting interference. In addition, the authors indicated the recommended application of specific tools, the use of which can lead to prevention or rapid response to disturbances that may arise in each phase of the supply chain. The authors' considerations are presented in the Tables 1-4.

Table 1: The impact of Industry 4.0 tools on supply chain disruptions in the supply phase

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Delays in supplies	IoT	Responding to the effects of disruption	Input data for load tracking and optimal route selection
	Big Data and Cloud Computing	Responding to the effects of disruption	Real-time data access from any place on Earth enabling verification which partner will be able to complete the process without delay
Failure to meet quality standards for raw materials	Big Data and Cloud Computing	Responding to the effects of disruption	Supports the quality control process based on analysis of customer needs and accepted quality standards
	Augmented Reality	Preventive	Identification of defective product components; instructions for the process of quality control

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Lack of real-time access to information about the next link production plans, which may result in a unavailability of resources capable of covering demand	Horizontal and Vertical Systems Integration	Preventive	Product life cycle analysis enriched with the ability to control during its use by the customer (end-to-end integration)
	Big Data and Cloud Computing	Preventive	Predictive analysis of the manufacturer's needs
	IoT	Preventive	Ability to connect supplier and recipient systems to identify real raw material needs; real-time product traceability
	Cybersecurity	Preventive	Secure two-way information flow between supplier and manufacturer
Raw materials prices fluctuations	Big Data and Cloud Computing	Responding to the effects of disruption	Real-time access to offers enables choosing the best supplier in terms of defined criteria
Errors in quantities of raw materials orders/supplies received	Big Data	Preventive	The use of predictive analysis to optimize the size of orders placed
Excessive stock	IoT	Responding to the effects of disruption/Preventive	The use of predictive analysis to optimize the level of inventory - reducing excess by inventory sharing within supply chain partners
	Big Data and Cloud Computing		
	Cybersecurity		
No availability of production raw materials	Big Data and Cloud Computing	Responding to the effects of disruption	The use of tools to locate potential suppliers, analysis of needs and their inventory levels to secure the continuity of process flow in the supply chain
Fluctuations and variability of demand	Big Data and Cloud Computing	Preventive	Predicting fluctuations in demand, creating forecasts that guarantee the link protection against demand volatility or its effects
	Additive Manufacturing	Responding to the effects of disruption	Producing missing components using 3D printing in unit production

Table 2: The impact of Industry 4.0 tools on supply chain disruptions in the production phase

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Low flexibility level in products adjusted to customers' needs and requirements	Additive Manufacturing	Preventive	Using 3D printing to produce products that meet the needs of customers by significant shortening the design and prototyping phase
	Autonomous Robots	Preventive	Intelligent robots able to select the appropriate parameters of production processes to adapt the product to the needs of customers
	Simulation	Preventive	Supports the production of items based on the process model used to verify the correct selection of process parameters, machine and product settings, shortening the production cycle
Machines breakdowns	IIoT	Preventive	The machine is able to identify the causes of failure and prevent them e.g. by reporting and sending diagnostic data
	Augmented Reality	Responding to the effects of disruption	Machine failure does not require a service call - an employee with the right tool will be able to locate the fault and repair it as soon as possible
	Autonomous Robots	Preventive	Machines that do not require operator control use IIoT to communicate with an employee or service in the matter of the need to perform a review
	Simulation	Responding to the effects of disruption	Simulation of failure compensation (analysis of available solutions and selection of the optimal option)
No availability of production raw materials	Big Data and Cloud Computing	Preventive/Responding to the effects of disruption	Access to information on suppliers' inventory, in the absence of the possibility of ordering a fine amount of raw materials, the tool will allow to react early enough and find another source of supply
	Cybersecurity		
	Horizontal and Vertical Systems Integration	Responding to the effects of disruption	Full integration of all links in the supply chain - compensation of deficiencies by other supply chain partners
	Additive Manufacturing	Responding to the effects of disruption	Producing missing components using 3D printing, especially in unit production

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Demand fluctuations due to changing customers' requirements	Big Data and Cloud Computing	Preventive	Predicting fluctuations in demand, creating forecasts that guarantee the link protection against demand volatility or its effects
	Autonomous Robots	Responding to the effects of disruption	Intelligent robots capable of continuous operation and compensating for fluctuations in demand
No employees / no qualified employees	Autonomous Robots	Preventive/Responding to the effects of disruption	Robots able to replace human work, in particular repetitive activities affected by errors arising from the human factor
Errors arising from the human factor	Augmented Reality	Responding to the effects of disruption	Process execution supported by the use of real-time instructions for its implementation
	Autonomous Robots	Preventive/Responding to the effects of disruption	Robots able to replace human work, in particular repetitive activities affected by errors arising from the human factor
Quality errors in production process	Big Data and Cloud Computing	Responding to the effects of disruption	Supports the quality control process based on analysis of customer needs and accepted quality standards
	Augmented Reality	Responding to the effects of disruption	Identification of defective product components; instructions for the process of quality control
	Simulation	Preventive	Selecting production parameters and the product itself guaranteeing the production of a product that meets the intended quality standards
Insufficient efficiency of the production process	IIoT	Responding to the effects of disruption	Responding to performance decrease. Management decentralization - machines and devices capable of making autonomous decisions, communicating with each other
	Big Data		Identification of elements reducing process efficiency based on the analysis of key parameters for the process
	Augmented Reality and IIoT	Responding to the effects of disruption	Real-time process monitoring (e.g. KPI analysis)
	Simulation	Preventive	Protecting the process against performance loss by simulating and preventing performance-degrading situations
		Responding to the effects of disruption	Reconfiguration of the system in the event of disruptions

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Delays in production process	Simulation	Responding to the effects of disruption	Reconfiguration of the system in the event of disruptions
	Big Data and Cloud Computing	Responding to the effects of disruption	Real-time data access from anywhere on Earth enables identification of delays causes and respond to them

Table 3: The impact of Industry 4.0 tools on supply chain disruptions in the distribution phase

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Delays in picking process	Autonomous Robots	Preventive/Responding to the effects of disruption	Intelligent robots used in the picking process entitled to make independent decisions without human intervention (e.g. placement of goods in the warehouse)
	Augmented Reality	Preventive/Responding to the effects of disruption	Shortening the picking time, eliminating errors arising from the human factor through real-time availability for picking instructions
Inefficient use of storage space	Autonomous Robots	Preventive	Robots responsible for the placement of goods in the warehouse - no need to use forklifts - the possibility of reducing the width of transport routes between racks
	Augmented Reality	Preventive	Tips for optimal placement of goods / picking up goods from appropriate storage locations reducing the number of errors affecting the efficient use of storage space
No availability of information of product location in the distribution network	Horizontal and Vertical Systems Integration	Responding to the effects of disruption	Product life cycle analysis enriched with the ability to control during its use by the customer (end-to-end integration)
	Big Data and Cloud Computing	Preventive/Responding to the effects of disruption	Real-time data access from any place on Earth enabling verification which partner will be able to complete the process without delay
	IoT	Preventive	The ability to real-time product identification
	Cybersecurity	Preventive	Secure two-way information flow between supplier and manufacturer
Delays in deliveries	Horizontal and Vertical Systems Integration	Responding to the effects of disruption	Product life cycle analysis enriched with the ability to control during its use by the customer (end-to-end integration)

	Big Data and Cloud Computing	Preventive/Responding to the effects of disruption	Real-time data access from any place on Earth enabling verification which partner will be able to complete the process without delay
Quantity errors and errors in orders (assortment)	Big Data	Preventive	Predictive analysis used to optimize the size of orders placed
No availability of products	Big Data and Cloud Computing	Responding to the effects of disruption	Real-time data access from any place on Earth enabling verification which partner will be able to complete the process without delay
Quality errors in delivery processes	Big Data	Responding to the effects of disruption	Supports the quality control process based on the analysis of customer needs and adopted quality standards
	Augmented Reality	Preventive	Identification of defective product components; instructions for the process of quality control
Demand fluctuations due to changing customers' requirements	Big Data and Cloud Computing	Preventive	Predicting fluctuations in demand, creating forecasts that guarantee the link protection against demand volatility or its effects

Table 4: The impact of Industry 4.0 tools on supply chain disruptions in the reverse phase

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Lack of customer knowledge of how to return a product	IoT	Preventive	Providing information to customers about the destination of returns in value chain, automatically preparing return documentation (e.g. labels). The system suggests when to return the product and how to do it
	Cloud Computing	Preventive	Availability of procedures, method of returning the goods
Lack of means ensuring the return of goods from the client to production or supply chain links	Big Data	Preventive/Responding to the effects of disruption	Analysis of deliveries to customers and effective planning of the return process without increasing costs
	Horizontal and Vertical Systems Integration	Preventive/Responding to the effects of disruption	Supports planning of the transport process throughout the entire supply chain by tracking the product life cycle
	IoT	Responding to the effects of disruption	Access to vehicle location in real time and indication of the units responsible for collecting goods from the customer

DISRUPTION CATEGORY	INDUSTRY 4.0 TOOLS	TOOL INFLUENCE ON SC DISRUPTION	RECOMMENDED USAGE OF TOOLS
Product failure (product under warranty)	Horizontal and Vertical Systems Integration	Responding to the effects of disruption	Product life cycle analysis enriched with the ability to control during its use by the customer (end-to-end integration)
Incorrect assessment of the condition of the product that can be reused	Simulation	Preventive	Simulation of the product consumption process to verify which components will be reusable
	Augmented Reality	Responding to the effects of disruption	Product condition analysis and verification of its usefulness in terms of re-development
	Big Data and Cloud Computing	Preventive	Tracking the product life cycle and the ability to predict when the product will no longer meet customer expectations - planning how it can be reused in the production process or processing it into raw material - recycling
Inappropriate allocation of withdrawn products to the links of the chain	Simulation	Responding to the effects of disruption	Optimal allocation of product components after analyzing scenarios of allocation of its components
	Big Data and Cloud Computing	Preventive	Predictive analysis of the needs of previous links in the context of reusable components
	Horizontal and Vertical Systems Integration	Preventive	Product life cycle tracking, also at the customer's, and information about the product's condition and suitability can also be obtained during use
Uncertainty of origin of products affecting the delay of the recall process or errors / fraud related to products used by customers	IoT	Responding to the effects of disruption	Confidence about the origin of the product due to life cycle tracking, visibility, transparency
	Horizontal and Vertical Systems Integration	Preventive	Product life cycle tracking, also at the customer's, and information about the product's condition and suitability can also be obtained during use
Lack of knowledge about the time of expiry of the product's usefulness and possibilities of its reuse	Horizontal and Vertical Systems Integration	Preventive	Product life cycle tracking, also at the customer's, and information about the product's condition and suitability can also be obtained during use
	IoT	Preventive	Smart Products integrated through the use of IoT as part of Cyber-Physical Systems

The above tables were used by the authors to indicate the main tools of Industry 4.0, the use of which allows levelling the interference arising at individual stages along the smiley curve, which in graphic terms is presented in Figure 2.

Fig. 2: Potential application of Industry 4.0 tools in particular stages of supply chain which leverage the biggest impact on preventing supply chain from disruptions

After analyses, it has been pointed out that in the pre-production phase using of Big Data and Cloud Computing enables the creation of predictive analyzes, the use of which helps secure the supply chain against unplanned changes in demand. In addition, the use of, among others 3D printers as part of Additive Manufacturing makes it possible to secure the process against arising material shortages in unit production and assumes responding to interference as part of the production of spare parts for machines.

The key tools of the production phase included IIoT integrating machines, devices as well as intelligent robots and people. It allows to manage and control the manufacturing process, increasing its flexibility. Process Simulation enabling the creation of Digital Twin being a virtual reflection of the enterprise's system. The simulation is used to reconfigure the system in the event of interference - simulation of alternative scenarios for the functioning of the system. In addition, Autonomous Robots able to make decisions independently were awarded in the production phase. Robots capable of continuous, uninterrupted operation are used in the absence of human resources. Augmented Reality used to real-time process control, assess product quality or maintain the operation of machinery and production equipment.

In the post-production phase, Big Data and Cloud Computing, as well as Horizontal and Vertical Systems Integration, play a key role again, enabling tracking the product life cycle not only along the smiling curve, but also during customer use, which enables process control and protects it against any process delays distribution.

In the reverse logistics phase, Big Data and Cloud Computing tools as well as Horizontal and Vertical Systems Integration were again considered as key ones. In addition, a significant impact of the ability to simulate product consumption, to verify which components would be reusable, was also recognized.

In the opinion of the authors of this article, these areas should be further analysed in order to verify the correctness of the assumptions and conclusions regarding the possibility of preventing supply chain breaks.

Summary

The considerations made in the article allowed the authors to emphasize the essence of the Industry 4.0 concept relating to the nine pillars constituting the tools of the Fourth Industrial Revolution. A literature review regarding the possible use of Industry 4.0 tools has considered their impact on prevention and response to examples of disturbances arising in individual phases of the supply chain. Impact of tools was grouped into preventive, responding to the effects of disruption and simultaneous interaction of both elements. In addition, the recommended use of each of the tools used is also indicated, depending on the impact on example disturbance categories.

In addition, the authors referred to the main Industry 4.0 tools that may affect the prevention or response to interference arising at individual stages along the smiling curve.
Thanks to this, it is possible to secure global supply chains against their interruption, as well as to compensate for the consequences associated with delay or suspension of processes implemented by individual links in the chain.

The main purpose of this paper was achieved as a result of confirming the hypothesis that Industry 4.0 tools have the potential to prevent and also enable quick response to disturbances that may appear in particular phases of the supply chain.

These tools, due to the ability to respond in real time, are an attractive solution for both the industrial and logistics industries. Customer requirements, constantly changing, specialized impose on modern chains the need for maximum process security, preventing the interruption of the flow of a product or service within the supply chain.

The implementation of intelligent solutions supporting the performing of processes becomes particularly important in crisis situations, requiring real-time decision making, or even well, decisions made in advance.

The authors of this article would like to elaborate on the considerations made in this paper in subsequent publications regarding methodologies of using Industry 4.0 tool in preventing supply chain from ruptures.

Psychological Support for Employees in Polish Companies in The Context of Selected Variables Based on The Results of The Survey "New Trends in Human Resources Management in Large Enterprises"

Ewelina CHRAPEK

Czestochowa University of Technology, Czestochowa, Poland

ewelinachrapek@wp.pl

Abstract

The article presents selected results of research carried out as part of the project: "New trends in human resources management in large enterprises". The objective of the project was to identify social and psychological factors supporting the development of employees in organisations, identification of intangible assets as well as processes used for the management of social capital and trust in organisations.

Purpose: The purpose of this study was to identify selected factors related to offering individual support in enterprises. The relationship between the provision of psychological support in companies and such characteristics as: annual revenue, number of employees, type of business activity was analysed

Methods: Sample: The survey involved 179 representatives of enterprises randomly selected from among the 500 largest businesses in Poland. Measures: Quantitative methods of measurement were applied in the study – CAWI online survey and CATI telephone survey techniques were used. Procedure: The CATI or CAWI survey was addressed to representatives of companies with substantive knowledge of the subject matter of the study.

Findings: Of the factors measured by the study, a statistically significant relationship was revealed only for the revenue factor. This means that the amount of material income can have a significant impact on the decision to provide psychological support to workers in the form of individual counselling.

Research limitations: The research was carried out using survey tools.

Practical implications: On the basis of the results, according to which the decision to employ a psychologist depends on financial conditions and the related market standing of the company, some practical recommendations can be formulated. It is advisable to introduce systemic solutions that would support entrepreneurs in the process of implementation of mental health care systems for employees. Such solutions should include financial but also formal and organisational aid. Furthermore, it would be advisable to motivate entrepreneurs in their efforts to promote the mental well-being of employees by raising their awareness of the benefits of such efforts – both individual and also those for the entire company.

Keywords: companies, mental health, psychological support, psychological counselling, work, workers

Introduction

Mental health problems are becoming increasingly common. A report by the World Health Organisation (WHO) suggests that by 2020 mental disorders will take second place among the leading causes of the global burden of disease (World Health Organisation, 2001). The report of the European College of Neuropsychopharmacology (ECNP) and the European Brain Council (ECB) published in 2011 attempted to estimate the occurrence of mental disorders in Europe (Wittchen et al., 2011). The research project lasted 3 years and covered a total population of 514 million. The results revealed that 164.8 million Europeans (38.2%) suffered from mental health problems every year. Furthermore, the study shows that the most common mental health disorders were: anxiety disorders (14%), insomnia (7%), depression (6.9%), somatic disorders (6.3%), disorders caused by the use of alcohol and psychoactive substances (>4%). Given the scale of mental health problems, their impact on every area of human activity is not without significance. An extremely important area of impact is the area of professional activity. Mental health problems can affect activity in the working environment in different ways. Significant consequences are related to absenteeism at work and the so-called

presenteeism which occurs when employees are at work, but their cognitive energy is not devoted to their work (Gilbreath, Karimi, 2012). As researchers emphasise, emotional disorders and overall mental health are strongly associated with presenteeism, resulting in a significant reduction in productivity at work (Burton et al., 2004; Burton et al., 2008; Collins et al., 2005). According to the WHO, in many developed countries as much as 35-45% of work absence is caused by mental health disorders (World Health Organization, 2003). Mental health problems are also associated with more frequent errors at work, decision-making difficulties, decreased motivation and commitment, tensions and conflicts between colleagues (Harnois, Gabriel, 2000). These arguments justify the need for different types of support and mental health systems at the workplace. This is also important because of the role of work in the context of the psychological well-being of employees. Work can have a health-promoting effect – protecting against mental health problems or encouraging recovery when they occur but, in some cases, it can increase the risk to the well-being of an employee, e.g. when there is a constant high level of stress.

Research Background

The Bureau of Labour Statistics (USA) predicts that by 2022 employment of industrial-organisational psychologists will increase by approx. 53% (Richards, Terkanian, 2013). Many workplaces employ a psychologist in order to increase the competences of their employees and thus develop the potential of the company, improve communication within the organisation, etc. (Chudzicka-Czupała, 2007). However, psychologists are increasingly employed in the business sector not only as coaches or recruiters, but also as specialists focused on protecting the mental health of employees (Hauk, 2010). One of the forms of psychological assistance that an employer can provide to their employees is individual support. This type of aid relates to the possibility of individual counselling session on a one-off basis or a series of meetings aimed at solving a specific problem for a particular employee. These problems may result from the functioning of the employee (e.g. mood disorders, addictions) or from responding to stress related to the nature of the workplace (e.g. being a witness or victim of a work-related accident). The model of individual psychological work should be adapted to the nature of the employee's problem. According to the guidelines developed for the UK Employee Assistance Programmes (EAP)[i], psychological assistance can be based on different therapeutic approaches (UK Employee Assistance Professionals Association. Counsellors' guide to working with EAPs, 2014). Including:

- Solution Focused Brief Therapy – short-term therapy, which usually does not exceed 8 meetings. The therapeutic work in this case is primarily focused on needs rather than the reported problem (Kosman, 2013). It is the resources and strengths of the client that are important, not their deficits and disorders.

- CBT – a therapy which, in classic approach, is short-term, structured and aimed at a specific client problem (Madej, 2010). This model offers specific techniques to address specific problems, such as anxiety or anger management techniques.

In addition, the psychologist may also apply practices taken from other therapeutic models or based on selected scientific theories, adapting them to the type and severity of the reported problem in order to achieve the desired effect (UK Employee Assistance Professionals Association. Counsellors' guide to working with EAPs, 2014). An example is Eye Movement Desensitisation, which is most frequently used in the treatment of post-traumatic stress disorder.

Psychological support in the form of individual counselling for employees, although it appears more frequently in different workplaces, still seems to be a practice insufficiently appreciated by entrepreneurs. The project also analysed the occurrence of various forms of psychological support in the largest enterprises in Poland. The results of this study are presented in Table 1. Individual support covered 12.8% of the responses of the surveyed representatives of enterprises. On the other hand, the most frequently (14.8%) offered form of support turned out to be training focused on specific skills or problems. What is important, as much as 60.1% of the responses are included the category *We do not offer such support to employees.* Nevertheless, the level of awareness of the importance of the mental well-being of employees for the functioning of the company seems to be high. In this survey, as many as 63.7% of the 179 company representatives stated that psychological problems of employees should be monitored in relation to their impact on productivity and working environment. In Polish companies,

the practice of psychological assistance for employees is being implemented slowly, systemic solutions supporting this practice, such as "Program Wspierania Pracowników" (equivalent to the *Employees Assistance Program* - EAP) are gradually being introduced (Leśnikowska-Marciniak). However, an important question arises as to what is conducive to decisions on providing psychological assistance for employees and whether the factors determining the characteristics of the company are relevant. Identifying these factors may facilitate the process of implementing psychological support programmes for employees in the workplace.

Table 1: Forms of psychological support offered to employees in companies

What forms of psychological support does the company offer for its employees? (choose all matching answers)	**number of responses**	**% of all responses**
Individual employee support	26	12.8
Support groups for employees	3	1.5
Training regarding communication, motivation, resolving conflicts, dealing with stress, occupational burnout, dealing with pathologies in the organisation (e.g. mobbing, discrimination, sexual harassment)	30	14.8
Workshops regarding developing diverse competences, dealing with stress, occupational burnout, dealing with pathologies in the organisation (e.g. anti-mobbing workshops)	14	6.9
Other	1	0.5
We do not offer such support to employees	122	60.1
I have no opinion	7	3.4

This article presents selected results of the study within the project: *New trends in human resources management in large enterprises,* illustrating the relationship between the existence of psychological support in the form of individual support and the revenue of the company, the number of employees and the type of business activity.

Methods

The study was conducted as part of a research project *New trends in human resources management in large enterprises*. The objective of the project was to identify social and psychological factors supporting the development of employees in organisations, identification of intangible assets as well as processes used for the management of social capital and trust in organisations.

Sample

The sampling frame was a database of the 500 largest companies in Poland classified on the basis of the ranking of the *Rzeczpospolita* daily newspaper by revenue for 2018. Random sample selection was used. In case of refusal to participate in the project, another company was randomly selected. As a result of the random selection, a survey was carried out on a representative sample of 179 companies according to the following parameters: general sample size – 500, confidence level: 95%.

Measures

The research within the project was carried out using quantitative research methods with mixed techniques: Computer Assisted Web Interview (CAWI) and Computer Assisted Telephone Interview (CATI). The combination of two quantitative methods served to increase the response rate.

Procedure

The study was started with representatives of companies using the CATI method. Those who refused to participate in the survey, interrupted the survey or declared other time frames were given the

opportunity to complete the survey via a dedicated web platform (CAWI). The survey was addressed to employees with substantive knowledge of the subject matter of the study. The study was conducted in the first half of 2019.

Statistical Analyses

To measure the relationship between the variables, the chi-square test ($\chi 2$) and Cramér's V were used.

Results

For the purposes of this article, selected results of the study regarding the relationship between the forms of psychological support used in enterprises based on individual counselling and the enterprise's revenue, number of employees and type of business were used. The results are presented in Table 2. In addition, Figure 1 illustrates the percentage distribution of enterprises with regard to annual revenue.

Figure 1: Percentage distribution of the surveyed enterprises according to revenue

The largest number of enterprises surveyed (68.2%) declared annual revenue between PLN 51 and 200 million. The lowest number of the surveyed companies (13.9%) were those which reported revenues of over PLN 200 million.

For the purpose of this study, the revenues of companies in the range of PLN 5-50 million were defined as lower, PLN 51-200 million - higher, while over PLN 200 million – highest among the largest companies in Poland.

Table 2: Psychological support for employees in the form of individual counselling with regard to the revenue of the company

Annual revenue of the company	Individual employee support		Total
	present	absent	
PLN 5–50 million			
n	12	20	32
%	37.50%	62.50%	100%
PLN 51–200 million			
n	11	111	122
%	9.02%	90.98%	100%
> PLN 200 million			

n	3	22	25
%	12%	88%	100%

χ2	df	p
16.7153	df=2	p=0,00023
Cramér's V		
0.3056		

Statistically significant differences were identified between the responses indicating the existence of a form of individual employee support and the amount of revenue of the company (p=0.00023). Of the companies that have defined their revenue in the range of PLN 5-50 million (lower), 37.5% indicated that psychological support in the form of individual counselling is offered to employees in their company. Among the companies with the highest revenue (> PLN 200 million), 12% of respondents indicated that this form of support is present in their company. These results must be treated with caution due to the low number of companies in this group (n=3). The lowest percentage (9.02%) in terms of the presence of individual support was found in the case of larger companies (PLN 51-200 million).

Table 3: Psychological support for employees in the form of individual counselling with regard to the number of employees

	Individual employee support		Total
Number of employees	present	absent	
201-500 employees			
n	18	113	131
%	13.74%	86.26%	100%
over 500 employees			
n	8	40	48
%	16.67%	83.33%	100%

χ2	df	p
0.2423	df=1	p=0.62257

There were no statistically significant differences between the responses indicating the existence of individual employee support and the number of employees in companies (p= 0.62257).

Table 4: Psychological support for employees in the form of individual counselling with regard to the type of business activity

	Individual employee support		Total
Type of business activity	present	absent	
production			
n	65	10	75
%	86.67%	13.33%	100%
production and service			
n	23	3	26
%	88.46%	11.54%	100%
service			
n	38	11	49

%	77.55%	22.45%	100%
commerce			
n	13	2	15
%	86.67%	13.33%	100%
production and commerce			
n	14	0	14
%	100%	0.00%	100%

χ2	df	p
5.1469	df=4	p=0.27255

There were no statistically significant differences between the responses indicating the existence of individual employee support and the type of business activity (p=0.27255).

Discussion

The article presents selected results of research under the project *New Trends in Human Resources Management in Large Enterprises* concerning the relationship between the individual psychological support offered to employees and selected variables describing the enterprise. Of the relationships studied, a significant correlation appeared only in terms of the revenue of the company. This means that the existence of psychological support for employees in a given company is related to the financial situation of that company, which, in the context of the study, seems to be understandable according to the regularity with which large, wealthy companies are able to afford additional investments in their employees. In large companies, psychological support is generally offered more frequently than in small and medium-sized enterprises (SMEs), as the results of some studies show. Based on UK reports of the *Health and wellbeing at work: a survey of employees* only 1 in 10 SMEs offer occupational health support compared to 8 in 10 large organisations (Stevenson, Farmer, 2017). The research presented by Weinberg et al. (2019), where awareness and implementation of National Institute for Clinical Excellence (NICE) guidance on workplace psychological health were analysed, shows a similar relationship. The availability of mental health support was significantly less among SMEs than in large organisations. Interestingly, the awareness and implementation of support systems were higher in public sector companies compared to private companies. This study uses the criterion of understanding of SMEs according to European Union standards, where these mean companies with less than 250 employees and an additional criterion may be an annual revenue of less than EUR 50 million (Berisha, Shiroka Pula, 2015). This study did not reveal a statistically significant relationship between the psychological support offered to employees and the number of employees in the company, however, the study did not apply the criteria for classifying the size of the company based on the number of employees. The surveyed companies were defined as the largest in Poland on the basis of the criterion of revenue, in accordance with the rules of the list created by *Rzeczpospolita* daily. However, when comparing the criteria for SMEs, a certain proportion of the companies surveyed (number of employees between 200 and 249) would be categorised as SMEs rather than large enterprises. Perhaps the inclusion of employment size criteria according to EU size definition standards (companies with up to 250 employees and companies with more than 250 employees) would have a significant impact on the relationships obtained.

The distribution of statistically significant relationships was interesting. The largest number (37.5%) of companies which indicate offering their employees support in the form of individual counselling are smaller companies (revenue between PLN 5 and 50 million). Among larger companies (revenue between PLN 51 - 200 million), this percentage was much lower and amounted to 9.02%. Similarly, among the largest companies (> PLN 200 million), only 12% confirmed individual support for employees, but in this case the results must be treated with great caution due to the small number of companies in this group (n=3). It can be assumed that the group of smaller companies includes relatively more of those which are developing companies, strongly focused on increasing competitiveness, competing for market position. Investment in mental health programmes could be one of the means to achieve this objective. As it is emphasised in the literature on the subject, programmes

promoting health in the workplace influence the increase of productivity by, among others, reducing sick leaves, reducing presenteeism or increasing the involvement of employees (Goszczyńska, 2017). It is also one of the forms of taking care of the company's image and building employer branding. S. Bevan's review of research (2010) indicates that those employers who care about their employees, including their health, increase the chances of attracting the best candidates maintaining their employment. In the long time frame, these measures lead to increased profits for the company. The authors of the British report published by the Department of Health in London presented estimates indicating possible savings for the company resulting from the implementation of various forms of mental health support for the employee (McDaid et al., 2011). In the case of a company with 500 employees, where support for mental well-being will be provided to all employees, it is estimated that an initial investment of £ 40,000 will result in a net return of £ 347,722 in savings. Thus, in the case of smaller companies, development considerations aimed at increasing competitiveness on the market may be a significant motivator for the introduction of psychological assistance in the form of individual counselling for employees. In the case of larger companies, whose competitive position on the market is usually relatively more stable, investments in such programmes may be assessed as unnecessary expenditure.

The study did not reveal the relationship between psychological support in the form of individual counselling and the type of business activity of the company. Perhaps the business activity sector does not determine the decision to provide support to employees as much as other factors. The aforementioned *Health and wellbeing at work: a survey of employees* report presents the distribution of health and wellbeing policies in companies with different business activity profiles (Department for Work and Pensions, 2014). The policies also include protection of mental health. The results of the survey indicate that 48% of companies from the banking and finance sector provide extended health and wellbeing policies, while from the manufacturing sector – 53%, construction – 49%, distribution, hotels and restaurants – 44%, and from the energy and water sector – 66%. The differences between the industry sectors are mostly small. Perhaps more important than the type of activity in this case is the form of company ownership (public/private), which is confirmed by the results of the aforementioned study (Weinberg et al., 2019).

Several limitations of this study should also be mentioned. The study was a questionnaire and was therefore based on a subjective assessment by the representatives of the companies concerned. This implies a certain likelihood that those who completed the questionnaire had incomplete knowledge of the situation in the company or misinterpreted the questions. Another restriction may have resulted from a non-heterogeneous group of surveyed entities, which were companies or branches of companies.

Conclusion

The scale of the prevalence of mental health problems in Poland and globally makes their impact on various areas of human functioning increasingly clear. This impact also applies to the professional environment, where it results in significant consequences such as, among others, employee sick leaves, presenteeism, and a decrease in involvement in work. These problems lead to a gradual increase in the demand for psychologists working in business, not only as HR personnel, but also as employee mental health professionals. Psychological support in the form of individual counselling is one of the possible forms of assistance provided to employees. It can be offered both in the case of problems not directly related to work – typical for a given employee (e.g. addictions) or problems resulting from the nature of the workplace (e.g. long-term stress at work).

The article presents selected results of a survey conducted as part of the project *New Trends in Human Resources Management in Large Enterprises*. The purpose of this study was to identify selected factors related to offering individual support in enterprises. The relation between the provision of support in 179 enterprises from the group of enterprises classified as the largest in Poland (according to the ranking of the *Rzeczpospolita* daily newspaper) and such characteristics as: annual revenue, number of employees, type of business activity. A statistically significant relationship was revealed only for the revenue factor. This means that the amount of material income can have a significant impact on the decision to provide psychological support to employees, with support systems appearing relatively more frequently in large companies than in companies categorised as SMEs. Within the scope of the

discussed dependence, detailed relationships emerged, where from among the surveyed enterprises – the percentage of occurrence of the individual support was the highest (37.5%) in relatively smaller organisations (revenue of 5-50 million PLN). It is possible that these companies, forced to strive for market position more intensively than larger companies, decide to invest in their employees, seeing this practice as a way to increase their competitiveness.

The results of the study emphasise the importance of the financial situation of the company as the key – among other respondents – factor related to the psychological support offered in the company. Therefore, if the decision to hire a psychologist is a decision that mainly depends on financial conditions and the related market standing of the company, some practical recommendations can be worthy of consideration. A significant improvement would be the development of systemic solutions common in the Western world that would support entrepreneurs in the process of implementation of mental health care systems for employees. Such solutions should include financial but also formal and organisational aid and could be offered e.g. by government organisations. It is assumed that the prevalence of the forms of psychological assistance, even among the smallest companies, will increase when their availability is increased by full or partial compensation of the financial costs. It is worth motivating entrepreneurs by making them aware of the fact that enabling employees to take advantage of psychological counselling can significantly improve productivity within the company. In the long run, this investment may prove to be extremely profitable – as the consequences will include reduced sick leaves and presenteeism, as well as an increase in productivity, motivation and involvement of employees in their work. In addition, regardless of the issue of revenue, all entrepreneurs should be encouraged to pay particular attention to the mental well-being of their employees and to intervene appropriately when that well-being is at risk. This awareness should be considered as binding in every work environment – wherever a human is present.

[ii] The goal of EAP is identifying 'troubled employees' (e.g. at risk of alcohol use disorders), motivating them to resolve their troubles, and providing access to counselling or treatment for those employees who need these services (Hartwell et al., 1996).

Abstract

Global Economy faces a challenge of the need for rapid decarbonisation. Households are responsible for 17,8% of CO_2 emissions. As vast part of this emission is used for heating and electricity, we are in need of innovations and original solutions in this area. Hence, the paper reflects the exploratory research carried out during the innovation process co-created by the Housing Cooperative Wroclaw South and District Heating Provider. Potential innovators are going to replace the existing unsustainable district heating system with more sustainable hybrid system combining air-heat pumps, powered by the electricity produced from photovoltaics and supported by district heating. This research paper based on grounded theory and multilevel perspective is a discourse on the source of innovation, participators' motivations, innovation functionalities, and challenges of innovation in its initial phase. The paper contribution to science concentrates on the exploration of academically underrepresented social energy transition projects from the Central and Eastern European region, where the traditional district heating system constitutes the dominant part of the market.

Keywords: Housing Cooperatives, Energy Cooperatives, Renewable Energy Sources Projects, Energy Transition, Multilevel Perspective, Grassroots-Led Innovation

Introduction

Nowadays, energy transition constitutes the most important multi-level transformation process of the economic and socio-technological system intended to increase its environmental sustainability and social fairness. It is also a key item on the political agendas of European countries, presented by the European Green Deal new growth strategy. The European Union is turning an urgent climate and environment challenge into a unique opportunity to steer the economy and society to a sustainable path. The aim of this strategy is to eliminate net emissions of greenhouse gases in 2050 and detach economic growth from the use of resources, supporting the shift towards a low carbon and circular economy, and increasing the use of renewable energy sources while promoting energy efficiency approach. At the same time, this transition must be just and inclusive. The strategy needs new policies for clean energy supply in all sectors: industry, transport, agriculture, and construction in order to achieve climate neutrality by 2050. Decarbonisation of the energy system is an effective way

of achieving that goal. European Green Deal will include policies and instruments supporting this transformation: regulation and standardisation, investment and innovation, national reforms, as well as dialogue with social partners.

The transformation into renewable energy is one of the most important environmental, social and economic processes. A variety of actors are involved; some support transformation, others are against it. The specific situation of Poland shows that governmental policies and actions slow the transformation down by rigidly regulating energy cooperatives, and that bottom-up activities of households and housing cooperatives (HC) are trying to accelerate it. The necessity of transition to renewable energy is crucial. Poland will not achieve its 15% target for the share of energy from renewable sources in 2020, as set out in the Renewable Energy Directive (2009/28/EC). The urban energy transition can be supported by important actors – housing cooperatives, which play a crucial role in the housing sector especially in Poland. Scientists state that an important factor in the process of energy transformation in countries that achieve the planned share of renewable energy in the energy mix is civic energy. Collaborative action of citizens contributes to transition in all the fields of renewable technologies (Bauwens, 2013) A vital role in this transition is performed by community energy initiatives, such as energy co-operatives and the like (Yildiz et al., 2015)

Legal and organizational difficulties obviate creating and functioning of energy cooperatives in Poland. In the absence of energy cooperatives – housing cooperatives have capacities to contribute to the energy transition processes. We argue that due to the scale of impact, the number of inhabitants and the competences of management boards could play a role in mobilising civic energy in Poland. In the centralised energy production system (the mainstream) in Poland, changes are difficult. That is why the cooperative's role is crucial. It is favoured by global trends in the development of the renewable energy sector and the attitudes of citizens who see the opportunity to reduce emissions and smog, while creating a chance to improve health. UE regulations (Renewable Energy Directive and Electricity Market Directive) put civic energy at heart of energy transition. The housing cooperatives initiatives can have substantial scalability and impact on renewable energy transition. Their action happens outside mainstream regimes and is challenging existing rules and solutions. Seyfang says that "Community energy projects are one example of this type of grassroots-led innovation, which aim to create more sustainable energy systems. They encompass a wide range of initiatives such as locally-owned renewable energy generation, community hall refurbishments, collective behaviour change programmes, and are claimed to bring additional public engagement benefits to top-down policy initiatives." In the paper, two dimensions of successful urban renewable energy transition were investigated. First, the housing cooperative as an actor of innovative urban energy transition with potential to challenge existing barriers. The second, the ability of HC to produce PV energy and combine it with the urban district heating (DH). Researcher confirmed that it is economically beneficial to convert excess power to heat when the market price of electricity is lower than the DH heat tariff (Pakere, Romagnoli and Blumberga, 2018). Especially during the summer season, the power produced by the solar heating system can be efficiently used, increasing the share of renewable heating (Lazzeroni and Repetto, 2016).

Regulations limiting the production and consumption of RES in housing cooperatives are at the same time opening opportunity to use excess of own PV electricity and to redirect it to heat HC buildings. We investigated this issue and asked the question what is the potential to increase RES share in the energy mix in Poland by expanding usage of PV electricity for heat pumps.

The central question is whether local renewable energy initiatives can be seen as a radical innovation or whether – and to what extent – can they contribute to the transition towards renewable energy production and consumption in Poland?

Our research approach consists of several steps. Introductions present the importance of HC innovation in energy transition in Poland. Then we review existing literature and complement it with insights from an ongoing Scalings project. The next step of the research process is an analytical framework based on Multilevel Perspective, Niche Management and grassroot innovation theory. This paper ends by discussing the application of grassroot innovation conceptualisation to Housing

Cooperative Wroclaw South (HCWS) case, drawing conclusions and discussing future research directions.

Methodology

The purpose of this study was to investigate how the res-coops innovative initiatives can speed up energy transition in Poland. Research methods have been adjusted to the purpose of the research. The article is using the multilevel perspective created by F.W. Geels - effective in the analysis of the energy transition. The energy transition is a part of a broader sustainable transition. Specific characteristics of these transitions is: multi-dimensionality, multi-actors process (politics, academia, industry, civil society and households), stability and change, long-term process, uncertainty. MLP is based on the assumption that the transformation is not a linear process, but a joint effect of occurrences observed on three distinct levels: in niches – as areas associated with radical innovations; in the dominant economic, technological and social system (the existing patterns of production, consumption, management, and legislation – the socio-technical regime); in the external economic, social and technological environment (demographic trends, political ideologies, financial crises, social values, and macroeconomic principles – the socio-technical landscape). Energy transition is the end result of all interactions that occur between processes on each of the aforementioned levels. In this view, niches are the environment involved in the initiation of changes with the potential to accelerate changes in the dominant system, while processes observed in the external surrounding exert pressure upon the system (Kemp, Schot and Hoogma, 1998). Destabilisation of the dominant system, in turn, forms windows of opportunity for further innovations generated at the niche level (Geels F. , 2011). Johan Schot cited by Savacool says that: ”a central finding from the MLP is that transitions happen only when niches are built up sufficiently to change or challenge a regime, usually through indicators such as deep and broad learning, deep and broad networks, or robust and specific expectations. Such acceleration of niches, regimes, and landscapes in sociotechnical transitions niches can create tensions or help to destabilise existing regimes; the sociotechnical landscape can also create pressures attuned to change. The key is the interaction between all three levels: the niches, the regime, and the landscape (Sovacool and Hess, 2017). Housing cooperative is the subject of our paper, so we apply also as a methodological framework of the grassroot innovation theory. Grassroots innovations are defined as: “networks of activists and organisations generating novel bottom–up solutions for sustainable development; solutions that respond to the local situation and the interests and values of the communities involved. In contrast to mainstream business greening, grassroots initiatives operate in civil society arenas and involve committed activists experimenting with social innovation as well as using greener technologies. (Seyfang and Smith, 2007). Grassroots innovations align with MLP by emphasising diverse actors including cooperatives, voluntary organisations and community initiatives, rather than firms; they are grounded in local and collective values, based on notions of solidarity, rather than efficiency and profit-seeking; and their niche protection consists of being a space for alternative – i.e. green, sustainability-oriented – values to be expressed, as opposed to shielding from market forces (Seyfang and Smith, 2007).

Preliminary selection of potential research entities has shown that HCWS is a promising case. The object of the study was the HCWS, whose pioneer Wroclaw Solar Power Plant (WSPP) project is the largest dispersed power plant of this type in Poland. The research had been carried out between December 2018 and March 2020, and is still ongoing. The study used the participant observation during which selected three key project meetings for the project were selected.

The study employed the use of partially structured interviews and document analysis. In total, eight interviews were conducted with key actors, including two interviews with members of the project team (including one with a member of the management), four interviews with residents and two with other partners (from the Provincial Environmental Protection Fund and the photovoltaic system contractor). All interviews were recorded with the consent of the respondents. The interviews were performed in a semi-structured format. The semi-structured format allowed the interviews to unfold in a conversational manner, offering the interviewees a chance to pursue issues they consider to be important. The research methods like the participatory observation were used also.

Case observation

The Housing Cooperative Wroclaw South (HCWS) manages 102 buildings and almost 11,000 apartments with approximately 30,000 inhabitants. The HCWS members are mainly retired people with low income. Therefore, improving buildings' insulation, changing windows in the stairways, introducing heat energy monitoring and management lasted decades. Thanks to this solution building operating costs decreased. Based on its previous experiences, HCWS has created Wrocław Solar Power Plant project (WSPP) on the roof of a 10-storey building, the largest rooftop power plant in Poland (Rozwadowska and Szymański, 2019) (Ryszawska, Haczkowska and Szymański, 2020). The WSPP was to organise a solar power plant and was developed in consultation with inhabitants. Thus, at the beginning of the WSPP, the overall project aim concentrated on decreasing the cost of electricity in the common areas of the building. During the process of co-creation, the next aim was established. Cooperative members leaders of change indicated that the second crucial aim should be a decrease of CO_2 emission. Due to project harsh legal regulations of the funding programme, PV were installed only on 35 buildings. The main obstacles include:

- the use of electricity produced only for the needs of the common parts of buildings and the associated lack of possibility to use the electricity produced for the individual needs of residents,
- unprofitability of investments in photovoltaics in 4-storey buildings, where the demand for electricity in common areas is relatively low.

These restrictions meant that HCWS could neither fully exploit the potential of its roofs, nor include a significant part of the cooperative's residents (residents of 4-storey blocks) in the project. The implementation of the WSPP helped the cooperative gain competence and experience, as well as encouragement on the part of the inhabitants to implement further and more challenging pro-ecological projects. Thanks to the enthusiastic public reception of the first project, HCWS developed ambitious goals for their own energy transformation materialising with the second project.

The second project is still in the incubation phase. There were over a dozen internal and external meetings during which project ideas were considered. Three participatory observations were a crucial source of data from the perspective of this paper. During the first meeting in June 2019, representatives of the company's management board pointed out the key functionalities of the project and the project's main direction. During the second meeting in September 2019, the cooperative's vice president responsible for the project and the cooperative's operational employees (representing the estate manager and technical services) discussed technical and architectural details with the architect and representatives of a consulting company looking for the sources of project financing. During the third meeting in February 2020, cooperative's representatives agreed on the functionality of the hybrid system with representatives of the Fortum – district heating provider in Wrocław (DHP)[1]. During these meetings HCWS authorities articulated that after the success of WSPP, HCWS management board filled the HC members' pressure to create a similar project for 4-storey buildings. Hence the second project – Wrocław Hybrid Heat System (WHHS) is created as a consequence of unmet community needs. In this case, economic and environmental aims were widespread on standards of living improvement. The idea of this project of energy transition merges RES technology (photovoltaics and air source heat pumps) with the existing district heating system delivering heat and hot water to the HCWS buildings.

During the last project meeting both parties (HCWS and DHP) agreed that the prepared solution has to combine the following functionalities:

1. raising the comfort of life in 4-storey buildings by adding lifts (most of the residents of the estate are retired people),
2. reduction of costs of electricity consumption from non-renewable sources in common parts of the buildings (installation of lifts will significantly increase the demand),

[1] The next meeting planned for March 2020, in which representatives of contractors were invited to participate, was cancelled due to the risk associated with the COV-19 pandemic.

3. reduction of thermal energy consumption for heating and domestic hot water purposes from non-renewable sources,
4. reduction of the carbon footprint associated with the operation of 4-storey buildings.

To achieve the second, third and fourth functionality, it was decided to install photovoltaic panels on the roofs of 4-storey buildings to power common parts of the buildings, including lifts and air-heat pumps. Preliminary estimations show that energy obtained from PV and used for heat pumps will be multiplied four times.

The hardest challenge in the project is the integration of air-heat pumps with the already existing sources of heat energy and hot utility water supplied by the district heating (DH). Currently, the municipal heating system is managed by two independent entities. One of them is heat generation, and the other district heating network. HCWS and DHP plan air-heat pumps to be a supplement to the existing heating system, not a complete replacement. The heating system in HCWS buildings is based on radiators that require high-temperature water feeding the system. In contrast, air-heat pumps are the most effective in low-temperature heating solutions requiring underfloor heating systems in buildings. Heat pumps can also supply domestic hot water to the building.

The interview with the DHP representative shows that the company is interested in this project due to its strategy, which assumes that one of its important goals is to carry out operations in the spirit of sustainable development. At the same time, the company is aware that in addition to the benefits, a decrease of revenues from the sale of heat to HCWS will be a side effect. And in case of scaling this project to other buildings or other housing cooperatives, this change in revenue streams could be even more significant. DHP recognises that such innovations are inevitable and chooses to adapt to expected changes on the district heating market. In a larger scope, it can align with the company‘s sustainability strategy and unexpectedly generate new profits from the demand of other cooperatives. The DHP co-creating this investment with HCWS has the opportunity to participate in the copyright of this solution and offer it to other customers in the future. The DHP could benefit from this innovation. The participation in this innovation creates new prospects for the DHP. Based on this co-created design, a new product may be created with a smaller carbon footprint for system heat recipients. At the same time, due to the gradual expansion of the district heating network (DHN) in the city‘s downtown districts, and assuming the spread of the hybrid solution, it will be possible to connect more buildings which are still using hard coal stoves for heating purposes to DHN.

While working on the new project, the main goals shared by both sides were pointed out. Representatives of management, administration and residents of HCWS and representatives of the DHP, initially agreed on the main operating factors of the hybrid system:

- Ecological (carbon footprint), – reduction of emissions, cleaner air in the city, mitigation of climate change,
- Economical for residents, – the effective funding system and the reduction of cost for residents,
- Secure heat system and hot water supply, – the smooth and reliable heat and hot water supply,
- Thermal comfort of building residents – the technological efficiency of the heating system

At this stage of work, no hierarchy has been defined as to which parameters will have priority and how they will affect the hybrid system control algorithm.

The parties engaged in this initiative are full of optimism and energy, but they realise that many problems (especially technical, digital, and concerning property rights) are still unsolved, simultaneously many other unexpected risk factors may occur.

Applying Multi-Level Perspective to HCWS case analysis

How does the existing energy regime in Poland influence the project of Housing Cooperative Wroclaw South?

Strong economic and political interdependence of the state and energy sector was created during communist period that imposed nationalisation and centralisation. This interdependence prevailed after the collapse of communist regimes. The energy system was serving the heavy industry and was based on coal. Electricity market is cartelised and dominated by four big publicly held companies (publicly traded companies) controlled by the government. As a result, any process of decentralisation of energy production was not desirable and seemed economically inefficient. Therefore, constraints of Polish renewable energy market are also currently maintained (Jankowska and Ancygier, 2017). Despite many voices arguing that large centralised energy systems should be replaced by the energy Internet paradigm (Popkiewicz, 2015), the incumbent regime is resistant to changes. The HCWS case indicates that change is happening outside the dominant regime (Berlo, Wagner and Heenen, 2016). Meanwhile, the centralistic narrative in Poland dominates the tension between what is central and what is local. Despite European trends in the development of civic energy, large state-owned energy providers with the support of the public funding intend to implement large-scale investments in RES.

The investigated Housing Cooperative is located in the city of Wrocław - the capital of the Lower Silesian Voivodeship. The population in 2019 was 641,607 – making it the fourth largest city in Poland. The statistics show that 62% of the Wrocław citizens (50% on average in Poland) buy heat energy from district heating companies. Fortum Power and Heat Polska is the owner of the district heating network in Wroclaw. The length of the district heating network in Wroclaw is over 500 km (Picture no. 1). The heat is produced in cogeneration with electric power at KOGENERACJA S.A., and it comprises of three production plants: EC Wroclaw (263 MW of electric capacity + 812 MWt of thermal capacity), EC Czechnica (100 MW of electric capacity + 247 MWt of thermal capacity) and EC Zawidawie (2,677 MW of electric capacity + 21,35 MWt of thermal capacity), and the total electric capacity of 365,7 MW and thermal capacity of 1080,4 MWt. KOGENERACJA S.A. is the producer of heat and electric power mainly in the process of cogeneration. Hot water is produced for the needs of central heating, hot tap water or for technological processes. As a source of energy they use mainly coal (93.3%) and in small extent biomass (6.7%). Using coal in Poland as a main source of energy causes huge emissions of CO_2 – 103 t CO_2/TJ in 2010 (48 t CO_2/TJ on average in Europe). Thus phasing out coal and turning to renewable will be the biggest transition challenge in Wroclaw, Lower Silesia region and in Poland. District heating companies in Poland are using second generation of district heating (high pressure and the temperature more than 100°C). Third generation of district heat in Poland is still a very rare solution.

Landscape

The landscape of the energy sector consists of three levels: global (international), national and local. The energy consumption for heating applications in Europe is expected to stay at a very high level for the upcoming decades. The situation is challenging as fossil fuels must be phased out to limit climate change effects, to make Europe less dependent on unreliable supplies of imported energy sources (natural gas, oil), and to avoid the health and environmental hazards from burning coal. Moreover, the United Nations Environment Programme (UNEP) stresses the pivotal role of DH in keeping the global temperature rise below 2 degrees.

Recent decisions and revised legislation in 2017 in the energy sector will lead to an increased role of coal in energy supply compared to past plans and a much slower expansion of renewable energies than in the recent years, in particular for wind power. Polish plans in the energy sector will not contribute to significant further emission reductions in the future. As Poland is the fifth largest EU emitter, this may slow down overall EU progress in emission reductions. Polish cities have a very large, yet untapped potential for generating energy from renewable sources.

Polish state policy analysis indicates a lack of political support for renewable energy. Lack of transparent and reliable policy framework towards Energy transition is visible. At government levels, there is no consensus on the anthropogenic aspects of climate change and the need for radical action to implement effective climate policies (Ceglarz, Benestad and Kundzewicz, 2018). European initiatives in this area are sometimes contested (Marcinkiewicz and Tosun, 2015)The high level of public funding for conventional energy (Gençsü et al., 2017) confirms the commitment of governments of all options to support this industry. Existing Polish energy policy is fit for the interests of large coal plants (Skjærseth, 2016).

This process translates into a lack of support for local, grassroots and decentralised renewable energy initiatives. Building public support for energy from renewable energy sources, in particular from

distributed energy systems, is crucial for the development of this branch and the success of the energy transformation (Seidla, von Wirth and Giaslason, 2018). The level of social support for renewable energy cannot be seen as a barrier in the case of Poland and solar energy (Ropuszyńska-Surma and Węglarz, 2019). Based on the case study of **Household Cooperative Wroclaw South**, we observe a high level of citizens' support for renewable energy technologies. According to residents' declarations, trust in cooperative administration employees has contributed to trust in technology. Technical knowledge and efficiency in the implementation of the project team's investment contributions were indicated as one of the factors. Appropriate participation and inclusion of numerous residents and other actors in the design of the project ensures social support for the technologies used in the projects (MacArthur, 2015). Research conducted in Poland indicates a significant degree of social acceptance for green electricity (Kowalska-Pyzalska, 2018).

This discrepancy between the social acceptance of renewable energy sources and the lack of this support from the government indicates that the Polish energy transformation is currently supported mainly by grassroots initiatives. Removing barriers that accompany bottom-up collective initiatives would contribute to achieving low-carbon goals faster. The energy transition project is part of the urban climate neutrality program and anti-smog programs. Local authorities have a favourable attitude towards such initiatives.

Niches as a place for grassroot innovations The ability of energy cooperatives to provide innovations for the energy transition process

Energy cooperatives are entities where innovation takes place. Cooperatives generate "grassroots innovations" that drive user-led change. Users/ EC members are not eager in innovating for innovation's sake. They seek solutions to reconfigure the reality that does not meet their expectations. The key of innovation of user-led change in reconfiguring existing technical solutions into new social, legal or economic results. Their innovative approach results in diverse outcomes. Configurational work combines off-the-shelf technologies with novel technical and non-technical ideas and concepts. Instead of trying to make explicit changes to existing devices they innovate in the field of business models and social concepts for local energy needs (de Vries, Boon and Peine, 2016). Using off-the-shelf solutions, but introducing an important non-existent novelty dedicated to the local community. Another inherent part of cooperative innovation is their ability to innovate within local and regional contexts. These contexts and the ways in which innovation and transition processes co-evolve with and transform existing systems (Wieczorek, Raven and Berkhout, 2015).

The successes in small-scale applications (niches) can under certain circumstances be up-scaled and become the new standard in the energy market (new regime) (Köhler i inni, 2019). Successful niches facilitate the diffusion of innovative sociotechnical practices and systems, and theory suggests three ways by which niches can influence the regime: by enabling replication of projects within the niche, bringing about aggregative changes through many small initiatives; by enabling constituent projects to grow in scale and attract more participants; and by facilitating translation of niche ideas into mainstream settings (Seyfang i Haxeltine, Growing Grassroots Innovations: Exploring the Role of Community-Based Initiatives in Governing Sustainable Energy Transitions, 2012). Niches therefore help to diffuse innovations more widely (Kemp, Schot and Hoogma, 1998).

In our case the niche area means HCWS (and potentially other housing cooperatives in Wroclaw) that is challenging the existing regime of energy production and provision. Facing obstacles occurring from existing regime energy cooperatives formulate innovative answers. Those obstacles being:

a. Prosumers are "punished" for oversizing of PV installations. Possible excess electricity generated by PV installations over the needs for the common parts of a given building during the settlement period cannot be used by the cooperative, it can be sold with an uneconomical ratio.
b. Housing cooperatives may only produce electricity for common purposes, hence not for individuals

Regulations forced HCWS to reduce their PV potential to ⅓. HCWS is advanced in preparation project which combine photovoltaic systems with air heat pumps. Thanks to this solution, photovoltaic installation will be efficient in 4-storey buildings, and air-heat pumps will lower the cost of heat energy and electricity for inhabitants.

The team‘s design work indicates that such disruptive solutions do not yet exist in Poland, hence there are many legal, technical and organisational problems to be determined. Overcoming these hardships would mean that project developers can set a new standard in the sector of DH and renewables. At the same time, each of these problematic areas can be a source of conflict between partners and cause the project to collapse.

The breakthrough of niche-innovation should be accompanied by powerful actors joining support networks (Geels and Schot, 2007). Having the DHP joining the co-creation process is a sign of project capacity to conduct a niche created change in the regime. HCWS co-creates solutions which combine electricity and heat production against all legal limitations in order to include 4-storey buildings in an energy transition process. HCWS is using the fact that the heat energy market is less regulated and decentralised on the national level but strongly concentrated on the local level.

HCWS‘s idea is breaking the existing centralised district heating system with centralised heat production and supply, decentralised heat consumption (Picture no. 2). HCWS and DHP have no doubt that the forthcoming system (HCWS and DHP innovation) is forward-looking. This system has to be hybrid heating, partly centralised, and partly decentralised heat production and supply with decentralised heat consumption). The heart of this system will be an air–heat pump powered by PV and supported by district heating (Picture no. 3).

Source: own work

The overview of the CO_2 emissions of different heating technologies per kWh of thermal energy shows that more efficient heat pump technology combined with green electricity has the potential to nearly fully decarbonise heating. According to the European Heat Pump Association analysis, HP combined with green electricity provides us with an opportunity to decrease CO_2 emissions from 600 kg per KWH in case of district heating based on coal to 23 per KWH (*Heat Pumps,* 2018). Hybrid heat production, distribution and consumption system in Wrocław projected by HCWS and DHP gives the opportunity to radically decrease carbon footprint and harmful emissions associated with heat production (Table no. 1).

Table 1: Existing and projected by HCWS and DHP hybrid system consequences for carbon footprint and harmful emissions

We know from the research that solar energy has become a reasonable solution for power and heat production due to the continuous advancements of solar technologies. There are several solar system technologies available for heat production in district heating (DH) – solar thermal collectors (SC), photovoltaic (PV) panels for power production and self-power consumption coverage of heating plants, as well as photovoltaic thermal panels (PVT) which can generate both power and heat energy. In addition, the authors of this research consider the integration of heat pumps, which can convert surplus of solar power from PV and PVT panels into heat when it is economically beneficial (Pakere and Blumberga, 2020).

The project implemented by HCWS introduces hybridisation of the solution that affects:

- organisational aspects,
- technological (PV with heat pumps and DH),
- business model.

Hybridisation of the technical solutions and creation of new organisational models could affect the system by cascading effects of the project outcome (Kemp, Schot i Hoogma, 1998). The project has great development capacities from niche to other units of this type ranging from the clients of a DHP in Wrocław, to its clients in other countries. Only in Wrocław, with approximately 700 thousands inhabitants, a dozen housing cooperatives exist. Only five of the biggest housing cooperatives in Wrocław manage more than 82,000 dwellings for approximately 246,000 inhabitants. On the national

level, there are approximately 3,680 housing cooperatives in Poland, with approximately 4 million members, which manage thousands of buildings that could be included in the developed innovation.

The DHP conducts operations in the Nordic countries, Baltic countries and India. Interviews with company representatives show that they are aware of the unique nature of the project and are ready to transpose it to other locations. Representatives of DHP face many challenges, but their awareness of friction and forces present in the landscape enabled them to see these factors as an opportunity, not a threat.

This process may cause interactions between multiple systems which will result in reconfiguration processes (Geels F. , 2007) (Papachristos, Sofianos and Adamides, 2013) (Konrad, Truffer and Voss, 2008) (Raven, 2007) (Raven and Verbong, 2009).

Cooperative projects often exceed sectors and combine separate regimes‘ frameworks. These are phenomena that can also be observed as part of the case study. The example of HCWS also exemplifies that cooperatives create more than just technical innovations in the field of renewable energy. The project bears social aspects as well – the process of energy transition in HCWS is co-created with the participation of residents who, through their local leaders, participate in meetings with DHP experts and the management board, expressing opinions and voicing their concerns. As a result, institutional, technological and social changes are created in a symbiotic way. The relationships that form in the system, determine the effectiveness of crossing niches (Raven, 2007). Openness to the co-creational approach, used in the HCWS, brought greater public acceptance for new solutions and that may cause a revolutionary effect (Avelino et al. 2019).

The project is still in its initial phase, which has been interrupted due to coronavirus hazard. Additional unforeseen uncertainty has been introduced in the process, which may result in both later acceleration of works in the future, or even withdrawal from the project.

Conclusions

Housing cooperatives can introduce solutions and innovations related to energy transformation in diverse ways. HCWS case study shows the ability to propose and implement disruptive innovations in the renewable energy sector by combining technologies (heat pump with PV), as well as through unprecedented business models and unique organisational solutions. Integrating PV installations into one solution in order to produce electricity for common areas of buildings (courts, elevators, staircases), and the energy produced to drive heat pumps that will provide heat and hot water to residents throughout the whole year. Therefore, housing cooperatives' renewable energy usage could increase and fuel energy transformation in cities and in the country. The project shows significant potential for scaling up in Wrocław, in Poland and in other European countries – mostly in Central-Eastern countries where DH constitutes a crucial part of the heat market.

Obstacles created by policymakers, regulators in one area (electricity production – decentralised electricity production from PV) limit prosuments' activity, and simultaneously provoke or force them to create other innovations in similar areas (heat production – district heating and air-heat pump production powered by electricity produced from PV). Innovations that arise in energy cooperatives go beyond strictly technological solutions. These projects are cross-sectional and take into account social and local context, building trust and confidence within the local society.

Materialising heat energy projects through community initiatives is difficult due to the shortage of people with the required expertise. Establishing partnerships is therefore vital for advancing the heat energy transition (Proka, Hisschemöller and Loorbach, 2018). Hybrid heat innovation (district heating network combined with air-heat pumps powered by PV) creates a lot of economic, technological, and legal challenges for both parties (prosument and district heating provider), which need to be resolved in order to avoid disrupting the innovation process. Those challenges and uncertainties in the project create risk and potential conflict. Further research will investigate the development process of creating innovations, which is currently suspended due to the threat of a

pandemic. The early stage of the project makes it difficult to definitively identify the phenomena occurring in the project. The final results of the research will be published after the conceptual part of the project is completed. Additionally, there is a possibility of future co-creative process led by Scalings' scientists and HCWS stakeholders to establish live lab to experiment with energy innovations and support other entities in Wroclaw's region, and to join the process of "learning by doing". The expertise of board management in technological aspects paired and enhanced with the ability to create partnership and win-win solutions could also be transferred into the learning process as a future part of engaged research. Subsequent study should include housing cooperatives operating in Wrocław to observe and compare differentiation factors creating innovation in energy transition projects.

Exploration of social energy transition projects from the Central and Eastern European region, underrepresented in the current academic research, is an important contribution to science. The next stage of research is scheduled as an international case comparison in the field of urban civic energy.

Declaration of Conflicting Interests

The author(s) declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

Funding

The author(s) disclosed receipt of the following financial support for the research, authorship, and/or publication of this article:

This project has received funding from the European Union's Horizon 2020 research and innovation programme under Grant Agreement No. 788359.

Impact of The Complexity of The Legal and Tax System on The Effective Income Tax Rate in European Companies

Piotr LUTY

Wroclaw University of Economics and Business, Wroclaw, Poland
piotr.luty@ue.wroc.pl

Abstract

The purpose of the article was to examine the impact of the complexity of the tax system on the effective income tax rate. The research group comprised companies from the European Union. The results of the study confirm the existence of a relationship between the complexity of the tax system and the effective income tax rate. The study used regression analysis and correlation analysis. This is a preliminary study covering only one reporting year - 2018.

Keywords: Income Tax Rate, European Companies, Accounting

Introduction and Literature Review

The scientific goal of the paper is to find out the determinants of tax avoidance in European countries with particular emphasis on countries from Central and Eastern Europe. The term "tax avoidance" in the study is defined as a set of activities resulting in a reduction of tax burden. A characteristic feature of tax avoidance is a legal action, which means that it is not a fraud (Kovermann 2019 a, Belz et al. 2019). This phenomenon of tax avoidance is particularly visible in developing countries, where awareness of social responsibility for the sustainable development of society is still low.

Tax avoidance by companies is a fact that has been noticed by many researchers (Kovermann 2019 a, Belz et al. 2019). On the basis of reviews of 79 scientific papers from the years 2006 to 2018 concerning tax avoidance (Kovermann 2019 a), it can be stated that most of studies included companies from developed countries, mainly from the United States. Dyreng et al. (2017) also conducted an analysis of American companies. In most papers (Kovermann 2019 a) research samples covered periods ended in 2011. It suggests that research results might be outdated. The problem of outdated research results is also confirmed in other publications (Akhtar et al. 2017). Based on the conducted research (Thomsen, Watrin 2018) it is stated that companies from the United States do not avoid taxes to a greater extent than companies from 12 largest European countries. The limitation of the study of these authors was the selection of only the largest European countries. Authors omitted or removed from the research smaller countries from Central and Eastern Europe. Verification of the hypothesis formulated in articles were made using mainly quantitative variables (Richardson 2007, Akhtar et al 2019 , Kovermann 2019b).

The article will examine large companies (division according to the definition of BvD Orbis) from countries belonging to the European Union. Due to the nature of the study, the preliminary study, the analysis concerns one year - 2018. In subsequent articles, the research period will be extended.

Tax avoidance is measured using the effective tax rate. There are many formulas of effective tax rate (Graham et al. 2012). In practice, it is stated that the gross result determined in accordance with the accounting law differs from taxable income, hence the effective tax rate is different from the statutory corporate income tax rate (CIT). The countries that belong to the European Economic Area have been trying to legally limit tax avoidance, as demonstrated by EU Council Directive 2018/822. At present, there is a gap in a knowledge how financial and non-financial factors influence the effective tax rate. Most studies in the field of tax avoidance cover highly developed countries (Kovermann 2019 a). Additionally the period of conducted research may indicate outdated results (Akhtar et al. 2017). Determinants used in majority of papers include varied quantitative and not qualitative factors (Belz,

et al. 2019, Chen, Chen et al. 2010; Badertscher et al. 2013). According to the applicant assumption, non-financial variables possess high information potential and should be used to a greater extent in tax avoidance studies.

Due to different statutory income tax rates in European countries, the analysis will be based on the deviation of the effective tax rate from the statutory tax rate. Negative deviations (STR-ETR) between tax rates will indicate that the effective tax rate is higher than the statutory tax rate. This means that there may be permanent book tax differences as well as companies that bear a higher tax burden. It may also indicate inefficient use of deferred income tax procedure. Positive deviations indicate that the accrued income tax is lower than the statutory income tax rate, which may indicate the use of tax optimization. Additionally, the research introduces a variable specifying the size of companies to check the legitimacy of political power theory or political cost theory.

In the research on the impact of the quality of corporate accounting on tax avoidance, the impact of the choice of an audit company on tax avoidance was examined. In the studies of Kanagaretnam et al. (2016) and Richardson et al. (2013) and Gaaya al. (2017) it is indicated that the choice of an auditor from the "big four" reduces tax avoidance. On the other hand, the research by Hogan, Noga (2015) and Apostol, Pop (2019) indicate that there is a positive relationship between the costs of legal and tax services and tax avoidance. Tax burdens are in focus of various tax authorities (national tax administration). The interest of state authorities may affect tax avoidance (research in this area was conducted on a group of American companies Kubick et al. (2016), Jiménez-Angueira (2018)).

The impact of legal regulations and tax administration on the effective tax rate will be measured on the basis of the average time tax preparation by companies. This measure objectively shows how much time it takes to prepare a income tax reports. It is assumed that the longer the tax preparation time, the more complicated the legal regulations are.

The article sets out two research hypotheses:

H1: There is a relationship between the complexity of law and the effective tax rate.
H2: There is a relationship between the size of companies and the effective tax rate.

Methodology

The survey will be conducted on a group of large companies. It is assumed that for large companies there are no simplifications regarding deferred income tax. This means that the difference between the statutory income tax rate and the effective tax rate results from the existence of permanent differences. The effects of permanent differences cannot be adjusted by applying deferred tax. Due to the fact that in different countries there is a different statutory rate of income taxation, the analysis will be based not on the effective income tax rate, but on deviations between the statutory income tax rate and the effective income tax rate.

The verification of the research hypothesis will be carried out using Spearman correlation analysis and regression analysis. The following variables were identified in the study:

- (STR-ETR) – statutory tax rate for a country minus effective tax rate
- ETR – effective tax rate, income tax rate from P&L divided by gross income
- TIME – „Time to prepare and pay taxes is the time, in hours per year, it takes to prepare, file, and pay (or withhold) three major types of taxes: the corporate income tax, the value added or sales tax, and labour taxes, including payroll taxes and social security contributions."[1]
- LNA – natural logarithm of the sum of assets

The list of country ISO code:

There are many measures of effective income tax rate. Some measures use actual income tax expenses, others use the tax burden on the income statement. In the case of actual income tax expenditure, it is difficult to obtain reliable data. Due to the limitations of available databases (BvD Orbis, EMIS), it seems that the best measure of effective income tax rate should base on data obtained from annual financial statements. In the research group (large European Union companies), all entities determine deferred income tax, so the methodology for determining the tax burden on companies is the same.

Figure 1 presents income tax rates in European countries.

Figure 1: Box Plot of STR

Source: https://www.theglobaleconomy.com/rankings/Tax_preparation_time/ [access 27/04/2020]

Based on Fig. 1, it can be concluded that in the European Union there are countries with very high statutory income tax rates (exceeding 30% - eg. France, Malta), as well as countries with very low tax rates (below 10% - eg. Hungary, Bulgaria). Such a large discrepancy proves the sense of analysing the deviations between the statutory income tax rate and the effective tax rate.

Figure 2 shows the values for the TIME variables in individual European countries.

Figure 2: Box Plot of TIME

Source: https://www.theglobaleconomy.com/rankings/Tax_preparation_time/ [access 27/04/2020]

One can notice large discrepancies between the time of preparing the tax settlement in individual European countries. If time is an indicator of the complexity of the tax system, the most complex tax system is in Bulgaria, Poland and Hungary.

Figure 3 presents an analysis of the size of companies in European countries (in the study group).

Figure 3: Box Plot of LNA

Source: own study

Based on Figure 3, it can be seen that even in the group of large companies there are differences in the size of companies in European countries.

On the basis of available financial data of large European companies (BvD Orbis), I received 67.022 companies that published financial data in the year 2018. Selection of the research sample is conducted in accordance with the recommendations contained in the papers Thomsen (2018) and Richardson (2007) and is as follows:

Full research sample covering the year 2018 - 137.316 companies,
Removal of companies with gross loss – 89.434 companies remaining,
Removal of companies with income tax lower than 0 – 76.018 companies left,
Removal of companies with an ETR higher than 1 – 72.334 companies left,
Removal of companies with missing data – 67.022 companies remained.

The removal of companies with a gross loss is caused by the interpretation difficulties of the final results and conclusions. In addition, in entities which disclosed a tax burden below 0 it may indicate settlement of tax losses over time or excessive optimism in disclosing deferred income tax assets.

Research Results

Based on descriptive statistics of explanatory and explained variables, it can be concluded that in Europe, on average, preparation and settlement of tax obligations takes 200 hours. Assuming an average work month as 160 hours (20 days multiply 8 hours per day), the accountant needs more than one month for tax settlements. Based on Table 1, it can be noticed that there are countries where tax settlements take only 50 hours (slightly more than a week) and there are countries where these settlements take over 450 hours (over 11 weeks). The study indicates that the complexity of legal regulations has an impact on the time of tax settlements.

Table 1: Descriptive statistics

Variable	Descriptive Statistics					
	Valid N	Mean	Median	Minimum	Maximum	Std.Dev.
TIME	67022	200,21	218,00	50,00	453,00	72,42
LNA	67021	9,57	9,55	3,64	12,93	0,98
STR-ETR	67022	-0,02	0,00	-0,90	0,34	0,14

Source: own study

Figure 4 presents deviations of the effective tax rate from the statutory tax rate in European countries. Based on Figure 4, it can be seen that in most countries the median deviation of the effective tax rate from the statutory tax rate is close to 0. This might indicate that the accounting system effectively corrects accrual income tax calculations.

Figure 4: Box Plot of STR-ETR

Source: own study

The verification of research hypotheses is carried out on the basis of correlation and regression analysis. Table 2 shows Spearman's correlation analysis.

Table 2: Spearman correlation

Variable	Spearman Rank Order Correlations MD pairwise deleted Marked correlations are significant at p <,05000		
	TIME	STR-ETR	LNA
TIME	1,000	**-0,333**	**-0,042**
STR-ETR	**-0,333**	1,000	**0,051**
LNA	**-0,042**	**0,051**	1,000

Source: own study

Based on Table 2, it can be concluded that the extension of the tax settlement preparation time reduces the deviation between the effective income tax rate and the statutory income tax rate. This situation may result from greater precision in determining deferred income tax, which requires more time expenditure. Additionally, it can be seen that the size of the company increases the deviation between the statutory tax rate and the effective tax rate. This may result from shifting higher tax burdens to large companies (as part of corporate social responsibility).

Table 3 presents the coefficients of the linear regression function in which the explained variable is the STR-ETR variable.

Table 3: Regression analysis

Effect	Parameter Estimates Sigma-restricted parameterization			
	STR-ETR (Param.)	STR-ETR (Std.Err)	STR-ETR (t)	STR-ETR (p)
Intercept	**-0,02005**	**0,00538**	**-3,72503**	**0,00020**
TIME	**-0,00039**	**0,00001**	**-53,91772**	**0,00000**
LNA	**0,00841**	**0,00053**	**15,86793**	**0,00000**
Dependent Variable	Multiple (R)	Multiple (R2)	Adjusted (R2)	
STR-ETR	**0,215999**	**0,046656**	**0,046627**	

Source: own study

Regression analysis indicates that there is a relationship between the TIME variable and STR-ETR. The coefficient for the TIME variable is negative, which means that reducing the time to prepare tax settlements will affect the distance from the effective tax rate from the statutory tax rate. If the TIME variable means complicated legal provisions, it cannot be said that the more complicated legal provisions, the greater the deviation between the statutory tax rate and the effective tax rate.

The size of companies is the other analysed variable. Based on Table 3, it can be concluded that the factor at the LNA variable is positive. This means that the larger the company, the greater the deviation between the statutory tax rate and the effective tax rate. Large companies reveal higher effective tax rates, which may be related to higher tax burdens.

Conclusions

The aim of the paper was to check the relationship between tax burdens of companies and the size of entities, as well as the time necessary for tax settlement in European Union countries. In the paper I positively verified two research hypotheses saying that there is a relationship between the dependent variable STR-ETR (deviation of the statutory rate and effective tax rate) and the TIME variable and

the LNA variable. The research is a preliminary study covering only 1 financial year (2018). The selection of the research sample, large companies, was dictated by the accounting regulations regarding the disclosure of deferred income tax. The research results show that the more complicated the legal system is (TIME variable), the difference between the effective tax rate and the statutory tax rate is bigger. This may indicate a prudent principal to determining the amount of tax burden by introducing permanent differences. On the other hand, the size (variable LNA) of the company reduces the deviation between the statutory tax rate and the effective tax rate. This may indicate a greater propensity for tax risk in the group of large companies.

Further studies will analyse the longer time series as well as introduce additional variables measuring the complexity of the tax system.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Abstract

Managerial overconfidence plays a substantial role in corporate decisions, particularly investment decisions. Company predictions are subject to representative biases, which lead to distortions in decision making. As a result, companies with overconfident managers are likely to show higher levels of corporate investment. Investment literature conducted in Indonesia, mostly linked investment decisions with company conditions such as cash flow, financial constraint, or agency problems. Therefore, this study focuses on the subject of the investment decision maker which rarely been conducted and give information for investor and management to understand that managerial overconfidence will affect corporate investment. This research aims to examine the influence of managerial overconfidence on corporate investment using a sample of 230 non-financial companies listed on IDX between the years 2008 and 2018. Data was collected from Thompson - Reuters (Eikon) and company's audited financial reports. Managerial overconfidence was measured by OC_FIRM4, OC_FIIRM 5, and OC_SCALA indices. Cashflow, opportunity growth, company size and corporate governance are used as control variables. All data for this study was generated using panel regression in Eviews. This research found that managerial overconfidence has a positive correlation on corporate investment. OC_FIRM4 and OC_SCALA has a significance of 0.01 meanwhile OC_FIRM5 has a 0.10 significance. As predicted, cash flow and opportunity growth had a positive correlation on corporate investment; company size had a negative correlation on corporate investment. Corporate governance in this research used a ratio of independent commissioners compared to total commissioners. This ratio had inconsistent significance for corporate investment.

Keywords: Managerial Overconfidence, Overconfidence Bias, Corporate Investment

Introduction

The goal of a company is to maximize its shareholders' wealth (Dayananda et al, 2002). To maximize value, top management plays a substantial role in company decisions regarding financing decisions, which focus on the firm's optimal capital structure; dividend decisions, which concern the form in which returns will be distributed to shareholders; and investment decisions, which deal with how funds raised are employed in a productive way to achieve a firm's goals (Dayananda et al, 2002).

WeWork is a start-up company founded by Adam Neumann. In 2011, WeWork has valuation no more than $10 million. But for the year between 2017-2019, it had a rapid change in valuation. In 2017, SoftBank invested $ 4.4B to Wework, this investing helped WeWork to expand its business and flourish its valuation (Peters, 2019). But in 2019, WeWork's valuation plummeted from $ 47B to $6,94B and failed to make its IPO happened (Alpeyev et al, 2020). Adam Neumann is considered overconfidence on WeWork's investment. Zeitlin (2019) stated that Neumann has a vision to make empire company from WeSleep to WeSail to WeBank. On top of that, Adam Neumann has conducted investment activities over his overconfidence decision with a total of $13 Million for a room with artificial wave (WaveGarden) and a school for elementary level start-up students (WeGrow). Consequently, the overconfidence decision failure led to bankruptcy and WeWork has laid off more than 2,400 employees globally.

Microsoft acquired Nokia for $ 7.9B in September 2013 and produced Lumia (Martin, 2016). Microsoft targeted to compete with Apple and Samsung in mobile phone industry. Unfortunately, as one of the Nokia's product, Lumia did not have big impact for the company, International Data Corporation

reported that in Q1 2013 dan Q1 2014, Samsung and Apple dominated the market with 30.8% and 15.2% respectively. With that result, in 2014 Steve Ballmer left Microsoft, then in 2015 Microsoft write off 96% of its Nokia's investment (Bass dan Ewing, 2015). Moreover, Hwang et al (2020) argued that the failure may be caused due to agency problems (CEO power) and CEO Overconfidence (managerial hubris).

Lippo Group is a prominent business group in Indonesia. It has subsidiary companies named PT Global Ecommerce Indonesia and PT Multipolar. PT Global Ecommerce Indonesia as an e-commerce business, had project namely MatahariMall.com. Meanwhile PT Multipolar has subsidiary company named PT Matahari Departement Store. In 2017, PT Matahari Departement Store invested in PT Global Ecommerce Indonesia for Rp 590 Billion (about $43 Million) in accordance to win in online market industry. In 2018, the net profit of PT Matahari Departement Store has declined by 42% compared to the previous year due to a decrease in investment value at MatahariMall.com (Rahmawati, 2019).

By looking at WeWork, Microsoft and Lippo Group, companies should consider internal and external conditions to review the feasibility of an investment. Internal condition can be seen from the amount of cash owned by the company. If the company has excess cash from its business operations, it means that the company is able to do an investment. Researches conducted by Fazzari et al, (1988) and Abel (2018) show a direct influence between cashflow and corporate investment.

Besides of its internal condition, management also needs to consider external condition such as macroeconomic policy, and the capital market. A company must also evaluate the potential impact of the investment on its external situation, including areas such as social and environmental impact, government perception, and the effect of the investment on the company's image (Dayananda et al, 2002).

Both internal and external condition need to be assessed using professional judgement. Therefore, this study focuses on the decision-maker; top management. The subject who made the investment decisions might have irrational behavior such as overconfidence which caused by the illusion of control or success trap. Malmendier and Tate (2005) argue that overconfidence arises when the CEO overestimates the future returns of the company (feeling "above average"). According to the report by Gervais et al, (2011), the CEO's overconfidence has a positive influence on the investment. The CEOs are committed to optimizing their company's investment, so they tend to find relevant information and attempt to increase the level of investment success. Gervais et al, (2011) also highlighted that exaggerated confidence has a negative impact for the corporate.

Although managers have incentives regarding the company's performance, and shareholder do not suffer from information asymmetry, it is still possible for managers to make non-optimal investments. However, since investment decisions are crucial to maintaining the company's going concern and value creation, companies should have policies to optimize corporate governance so that the company can control overconfident manager. As seen with WeWork, Microsoft, and Lippo Group, irrational and biased decision making can lead to negative consequences for the company. Investment decisions can be distorted by managerial overconfidence and may negatively impact the company's going concern.

Literature Review and Hypothesis

Investment decisions, focus how funds raised are employed in a productive way to achieve a firm's goals (Dayananda et al, 2002). A company's funds can be invested in short or long-term assets (Dayananda et al, 2002). In the long term, the company uses capital budgeting for either intangible or tangible assets to assess their investment feasibility. A company is able to make internal or external investments, such as mergers and acquisitions, in accordance with wealth maximation. This study focuses on the influence of managerial overconfidence on companies' internal investments.

A company refers to the capital budgeting process to identify and implement investment decisions and to ensure the decisions are in line with corporate goals (Dayananda et al, 2002). This evaluation process is required for the company to determine which investments to pursue. It includes strategic planning, identification of investment opportunities, preliminary screening, financial appraisal, evaluation of projects, an acceptance/rejection decision, project implementation, and monitoring, as well as post-implementation audits.

To ensure the feasibility of investment, net present value, internal rate of return, payback period, and Monte Carlo analysis are the assessment instruments that company relies on. These assessments require subjective judgment to calculate it. For example, to determine cash flow projections, a discount rate and risk assumption are involved. Professional judgement also needed to asses external conditions applied to the project and company.

Managerial Overconfidence

Managers have various psychological characteristics that affect their decision-making. One individual characteristic that influences decision-making is overconfidence. Overconfidence may originate in an individual's personality, or it may be generated by contingent situations. Overconfidence can be caused by the illusion of control, which can arise from an individual's faith that positive results from their decision-making on past occasions demonstrate the individual's capabilities.

Decision-making may be biased due to optimism and overconfidence. Statman and Tyebjee (1985) explained that decision-makers who are aware that their decision relies on a forecast display optimism bias. According to Baker and English (2011), overconfidence bias is related to the representativeness heuristic, in which decision-makers believe the decision is similar to other issues they have already dealt with. Kahneman and Riepe (1998) stated that human mindsets seek out logical patterns; this encourages the decision-maker to conclude that events occur due to rational and predictable patterns, even if the events are actually occurring randomly. Moreover, people may believe, incorrectly, that lucky conditions are a controllable factor. Kahneman and Riepe (1998) added that financial decisions are made in highly complex and complicated situations, therefore, the decision-maker relies on intuition.

According to Roll (1986) decision-making may be biased due to overconfidence traits, and irrational bias may appear when top management make a business decision. Gervais et al, (2011) explained that overconfident people tend to believe that their estimations are accurate, particularly at the CEO level. Furthermore, Malmendier and Tate (2005) explained that the CEO tends to overestimate the return of their investment opportunities and underestimate the risks related to their investments.

Research related to managerial overconfidence and corporate investment has been carried out in several countries.

In China, Ying et al, (2019) studied the influence of managerial overconfidence on internal financing decisions and investment efficiency. Internal financing causes excessive investment, especially for companies with managerial overconfidence.

In Korea, Koo and Yang (2018) found that managerial overconfidence intensified by self-attribution bias induced investment-cashflow sensitivity to get stickier, indicating corporate investment distortion.

In Tunisia, Baccar et al, (2016) found that corporate investment was affected by psychological biases, including overconfidence, on corporate decisions.

Kamoto (2014) tested the interaction between internal financing with managerial overconfidence. This research found that internal funding was correlated to the influence of managerial overconfidence about investment decisions. Companies with higher internal financing invested more.

Ben-David et al, (2013) found that subjects tended to miscalibrated due to overestimating the precision of their forecasts and underestimating the volatility of risk. It showed that optimistic executives tended to invest large amounts and rely on debt.

In Taiwan, Hsiao et al, (2011) examined the relationship between managerial sentiment and corporate investment, as well as the relationship between investment and corporate value. They found that optimistic managers tended to overestimate their investments.

In the U.S.A, Malmendier and Tate (2005) investigated the relationship between managerial overconfidence and corporate investment. They defined CEO overconfidence as a CEO who cannot reduce their personal exposure to company-specific risk. This research indicated a significant relationship between executive overconfidence and corporate investment.

Therefore, the following hypothesis can be proposed:

Managerial Overconfidence has a Positive Correlation on Corporate Investment

Control Variables

The fundamental matter in investment is the financing made by the company which can be viewed from two perspectives; financial constraint and agency problem. Financial constraint reduces the ability of company to obtain capital source; the agency problem involves on the conflict of interest between the principals (shareholders) and agents (managers).

In an imperfect capital market, asymmetric information leads to an expensive external financing compared to internal financing. Lewellen and Lewellen (2016) assert that the company tends to invest more if the internal financing has a lower cost than the external one. This is in line with the research conducted by Fazzari et al, (1988) and Carpenter and Guariglia (2008), which added that cashflow plays a substantial investment role in companies with financial constraints.

The agency problem refers to a conflict of interest between principals and agents (Jensen, 1986). The agent believes that the distribution of return to shareholders will reduce the agent's access to resources that can be used for investment. Furthermore, as Jensen (1986) explained, agents prefer to use free cash flow as an investment source since it is controlled by management, and this results in the principal receiving a minimum amount (or zero) of return. Chen et al, (2020) found a positive influence of CEO overconfidence on corporate cash holdings. Malmendier & Tate (2005) found positive influences of cash flow on corporate investment.

The use of internal financing also related to pecking order theory where management as an agent is assumed to understand the condition of the company better than the shareholders. Myers and Majluf (1984) stated that agent prefers to protect the interests of shareholder rather than to issue a debt to finance an investment which they believe that the company's valuation is undervalued on the market.

A company with high growth opportunities tends to maximize its growth. Growth opportunity can be assessed using the company's Tobin's Q (Lang et al, 1989). Q describes the ratio between the firm's market value and the replacement cost of the firm's physical assets. Tobin (1978) explained that if the company has Q greater than 1, then additional investment would be rational, since the profits generated would exceed the cost of the firm's assets. Malmendier and Tate (2005) found that Q has an insignificantly positive influence on corporate investment as a control variable.

Small-scale companies tend to have higher levels of investment. A negative relationship between the company's size and its investments may be caused by the heterogeneity of the company's investment opportunities. Research by Gala and Brandon (2016) showed that company size has an inverse influence on investment. The researchers sorted sample companies into separate decile portfolios; they found that the larger the company size, the lower the investment level. Gala and Brandon (2016) further determined that company size is as important as Tobin Q or cashflow in explaining corporate investment.

The principal-agent theory focuses on information asymmetry between the agent and the principal. The agent has better internal information compared to the principal, and the principal has difficulty ensuring that the agent will act in the principal's best interest—by maximizing shareholder value—rather than pursuing the agent's own self-interests.

A combination of managerial overconfidence and lack of corporate governance mechanisms can lead companies to choose investments with a negative present value (unfavorable for the company). Therefore, it is necessary for a company to ensure that corporate governance controls its investment decisions. Malmendier and Tate (2005) used corporate governance as a control variable in their research into managerial overconfidence and corporate investment. Francis et al, (2013), researching emerging markets, found that companies with better corporate governance mechanisms had better corporate investment allocation and were better able to mitigate financial constraints.

Research Method

This study aims to analyze the influence of managerial overconfidence on corporate investment. Using panel regression, this study analyzed 2530 data of 230 companies listed in IDX for the years 2008-2018. A sample of the research is as follows:

Table 1: Research Sample

Sub-Sector	Total Company
Agriculture	6
Basic Industry	42
Consumer Goods Industry	27
Infrastructure, Utilities and Transportation	19
Mining	18
Miscellaneous Industry	28
Property, Real Estate and Construction	31
Trade, Service and Investment	59
Total Sample	230

The independent variable in this research is managerial overconfidence, while corporate investment is the dependent variable. This study used cash flow, company growth, company size, and corporate governance mechanisms as control variables. The data in this study was generated from Thompson Reuters Eikon and the companies' own financial reports.

The dependent variable measured by capital expenditure normalizes with beginning-of-the-year capital. Managerial overconfidence as independent variable was measured using OC_FIRM indexes, refers to Schrand & Zechman (2012). OC_FIRM indexes are constructed from five components below:

Table 2 : Managerial Overconfidence Measurement

No	Category	Measurement	Remarks
1	Industry-adjusted excess investment	Firm's residual from a regression of total asset growth on sales less the industry median residual.	It indicates managerial overconfidence if the company's residual value is higher than the industry median.
2	Industry-adjusted net dollars	Industry-adjusted net dollars from an acquisition made by the company.	If the value of the acquisition exceeds the industry median, it shows overconfidence.
3	Industry-adjusted debt to equity ratio	Long-term debt scaled by the market value of the company, less the median industry.	Debt-to-equity ratio exceeding the industry median shows overconfidence.
4	Risky debt	If the company has preferred shares and/or convertible bonds.	Having preferred shares and/or convertible bonds indicates overconfidence.
5	Dividend policy of company	Dividend Payout Ratio of the company less industry median.	A dividend payout ratio under the median industry indicates overconfidence.

This research uses three indexes of OC_FIRM:

- OC_FIRM4 equal 1 if at least two of the four components indicates overconfidence, otherwise 0.
- OC_FIRM5 equal 1 if at least three of the five components indicates overconfidence, otherwise 0.
- OC_SCALA is indicated by total components (valued between 1 – 5).

The occupied variable control measurements in this research are as follow:

- Cashflow
  Adopted from Malmendier and Tate (2005), cashflow is calculated by EBITDA compared to the total capital at the beginning of the period.
- Growth opportunity
  Growth opportunity is measured by Tobin's Q at the beginning of the year. This research uses approximate Q, as per Chung and Pruitt (1994), the formula is (market value of equity + preferred stock +short term liabilities – short term assets + long term debt): total assets.
- The size of company
  Adopted from Malmendier and Tate (2005) and Francis et al, (2013), the size of company is measured by the natural logarithm of total assets at the beginning of the year.
- Corporate governance is measured by the ratio of independent commissioners compared to the total commissioners.

To test the hypotheses, this study uses panel data regressions as follows:

$$D_INVSt=\alpha+\beta OC_FIRM4t+\beta CASHFLOWt+\beta GROWTHT-1+\beta SIZEt-1+\beta INDPCOMMt+\mathcal{E}$$

$$D_INVSt=\alpha+\beta OC_FIRM5t+\beta CASHFLOWt+\beta GROWTHT-1+\beta SIZEt-1+\beta INDPCOMMt+\mathcal{E}$$

$$D_INVSt=\alpha+\beta OC_SCALAt+\beta CASHFLOWt+\beta GROWTHT-1+\beta SIZEt-1+\beta INDPCOMMt+\mathcal{E}$$

Where D_INVS is an investment as a variable dependent; OC_FIRM4, OC_FIRM5, and OC_SCALA are proxies of managerial overconfidence. Control variables are denoted as CASHFLOW, GROWTH (Company Growth), SIZE (Company Size), and INDPCOMM (Corporate Governance).

Result and Discussion

Table 3 shows the data distribution for each variable before Winsornize. Variables such as D_INV, CASHFLOW, and GROWTH have skewness values outside of -2 and 2. These indicate that the data are not distributed normally. According to Bodie et al, (2014), in order to normalize the data, outlier data can be replaced with values from calculated Mean ± (3 x Standard Deviation). OC_FIRM5 has a skewness value outside of -2 and 2, since it is dummy variable, there is no need to Winsornize.

Table 3: Statistical Descriptive Before Winsornize

	Mean	Median	Max	Min	STd.Dev	Skewness	N
D_INV	0.1286	0.0471	83.6787	-0.3999	1.6941	47.6033	2530
OC_FIRM4	0.2794	0.0000	1.0000	0.0000	0.4488	0.9830	2530

R^2	0.664378	0.663404	0.667244
Adjusted R^2	0.630158	0.629084	0.633316
F-Stat	19.41478	19.33017	19.66642
Prob Stat	0.000000	0.000000	0.00000

Form the regression, we conclude that models simultaneously influence corporate investment with Prob-stat 0.00000. All models have R^2 values between 66.3 – 66.7, this indicates that the models have 66.3% - 66.7% influence on corporate investment; the remaining ±34% is affected by variables outside the models.

OC_FIRM4, OC_FIRM5, and OC_SCALA have consistent results with regard to corporate investment. OC_FIRM4 and OC_SCALA have a significance level of 0.01. Meanwhile, OC_FIRM5 has a significance level of 0.10. We conclude that managerial overconfidence has a significant correlation on corporate investment. This result follows research conducted by Malmendier and Tate (2005) in the U.S.A., Ying et al, (2019) in China, Koo and Yang (2018) in Korea, and Hsiao et al, (2011) in Taiwan. We have now confirmed that corporate investment in Indonesia is correlate with managerial overconfidence; the more overconfident top management is, the greater investment will be.

CASHFLOW, GROWTH, and SIZE have a significant influence on corporate investment. But corporate governance reflected by INDPCOMM, unable to support the role of mechanism of corporate governance on corporate investment.

CASHFLOW and GROWTH have a significance level of 0.01, and have a positive correlation on corporate investment. This result follows research conducted by Malmendier and Tate (2005), Fazzari et al, (1988), Lewellen and Lewellen (2016), and Carpenter and Guariglia (2009). The Tobin Q, in this study, has a positive correlation on corporate investment, which mirrors the positive results of Malmendier and Tate (2005).

As predicted, SIZE has a negative correlation on corporate investment, with a significance level of 0.01. This is the opposite of the result found by Malmendier and Tate (2005). They found that company size had a positive correlation on corporate investment. Company size may have negative correlation on corporate investment in Indonesia, due to Indonesia is an emerging-market country in which companies in the growth stage are the majority, and most companies have a higher spending rate in this growth stage of the business cycle.

Meanwhile, corporate governance yields different results for each model. Corporate governance was predicted to control the spending level of corporate investment. The result found that corporate governance has no significant role in evaluating the efficacy of corporate investment.

Conclusion

Based on the results of the study, managerial overconfidence has a positive correlation on investment decisions. We conclude that overconfidence leads to higher investment spending levels. This accords with the results reached by Malmendier and Tate (2005) in the U.S.A., Ying et al, (2019) in China, Koo and Yang (2018) in Korea, and Hsiao et al, (2011) in Taiwan. In order to achieve a more in-depth understanding of managerial overconfidence, future research might investigate the impact of managerial overconfidence on over- and underinvestment, since this study was unable to capture the degree of overinvestment made by overconfident managers.

Cash flow as a control variable has a significant role in corporate investment decisions. This result is in line with those of Malmendier and Tate (2005), Fazzari et al, (1988), Lewellen and Lewellen (2016), and Carpenter and Guariglia (2009).

Growth opportunity has a positive correlation on corporate investment. This result accords with the findings of Malmendier and Tate (2005) that Q has a positive influence on corporate investment, even though Malmendier and Tate's result (2005) had no significance.

Company size has a negative correlation on corporate investment. Corporate governance has a positive correlation on corporate investment with different levels of significance. This indicates that our measurements were unable to capture and evaluate corporate governance mechanisms. In future

research, researchers may use qualitative aspects to represent corporate governance, such as educational background, experiences background, and else.

Research about managerial overconfidence is rarely conducted in Indonesia. Therefore, future researchers will have many opportunities to extend this research and achieve a more in-depth understanding of managerial overconfidence and its impact in terms of behavioral finance. We hope that an increasing body of literature on managerial overconfidence in Indonesia will provide managers with insight about decision-making in the corporate context.

A Fair Tax Policy as A Source of Competitiveness Of the National Economy

Michal SOSNOWSKI

Wroclaw University of Economics and Business, Wroclaw, Poland
michal.sosnowski@ue.wroc.pl

Abstract

In addition to globalization, increasing freedom in trade and progressing economic integration in the world, the issue of tax regulations, taxation and interaction between tax policy and the real economic sphere is invariably an essential factor determining the level of competitive advantage of enterprises and the competitiveness of the country's economy on the international arena. In this article, the author focuses on the issue of fair taxation, its impact on the existence of the informal economy, and thus on the level of economy's competitiveness, including tax competitiveness. The author attempted to examine the relationship between the level of competitiveness, the size of the shadow economy and the level of taxation in OECD countries. The conclusion states that low and fair taxes can reduce the shadow economy and increase the competitiveness of the national economy.

Keywords: tax policy, tax competition, shadow economy, economy's competitiveness.

Introduction

On the one hand, the sphere of regulations, the modern model of state policy have a significant impact on economic growth and development, and on the other - organizational structures, e.g. international trade, production, capital and technological connections. Global competitiveness has become a sort of common denominator for the quantifiers of the system of functioning of the economy mentioned above. It is a category that has gained significance in the face of new conditions (new challenges) in which economies must function - the global financial crisis, an aging society, the increasing interdependence of economic and political systems, negative climate change or shrinking natural resources in the face of an increasing population. It seems that the statement that the development of modern economies largely depends on the degree of their international competitiveness, which in turn also depends on fair tax policy, is fully justified.

The dynamic development of enterprises is currently one of the most critical issues regarding the prospects of sustainable growth and the good condition of the economy in the aspect of its place on the global economic arena. The process of economic integration has become a strong impulse for identifying economic factors that are stimulants or destimulants in the development of enterprises in the desired direction for them, especially in the aspect of increasing their economic efficiency and gaining more and more competitive advantage. For this reason, all activities in the fiscal sphere surrounding business activities are important here. The main role in supporting the development and level of competitiveness of the economy should be played by economic freedom, although the role of the state, in addition to guaranteeing an efficient framework for conducting economic activity, which can be reduced to building broadly understood institutions and concern for the existence of proper infrastructure. It must also consist in actively creating a good economic climate for entrepreneurship and its development. In this way, the state and the market will constitute complementary regulators of economic processes, creating the right environment for business operations of enterprises.

The purpose of this study is to analyze the relationship between the level of competitiveness, the size of the shadow economy and the level of taxation in OECD countries in the period 2005-2017 from the point of view of the problem of fair taxation. For this reason, by analyzing statistical data, an

attempt was made to answer the question whether these instruments, by creating a fiscal business environment, contributed to the international competitive advantage of the economy.

Competitiveness of the Economy

The competitiveness of the national economy is both a relative and a subjective concept. Over time, different importance is attached to specific competitiveness factors in countries with different levels of development. Authors of the known *World Competitiveness Yearbook Report* from the International Institute for Management Development (IMD) define competitiveness as the country's ability to create added value, and thus to increase wealth by managing resources, processes, attractiveness and aggressiveness, globality and proximity, and transforming the above relationships into an economic and social model (Garelli, 2003). A country is competitive if it generates proportionally more wealth than competitors on the world market (Institute for Management Development, 2009). In subsequent reports, the so-called academic definitione appears, where the competitiveness of countries is understood as "*the area of economic knowledge that analyzes facts and policies that shape the country's ability to create and preserve an environment conducive to the creation of greater value by enterprises and greater well-being of residents*". The OECD defines competitiveness as "the ability of enterprises, industries, regions, countries or transnational areas to generate, as a result of exposure to international competition, a relatively high income from factors of production and a high employment rate based on solid foundations" (Globalisation…, 1996).

An example of a multidimensional understanding of competitiveness is the definition of the World Economic Forum. According to this definition, competitiveness is a set of institutions, policies and factors determining the level of productivity of a given country. An economy is competitive if it has high productivity allowing it to achieve high incomes and a high standard of living for the citizens of a given country, as well as higher rates of return on investment. According to the *Global Competitiveness Report* initiated in 1979 by the WEF, there are 12 pillars that make up the GCI (*Global Competitiveness Index*), which affect the level of competitiveness, namely: institutions, infrastructure, macroeconomic environment, health and primary education, higher education and education, the efficiency of the commodity market, labor market efficiency, development of the financial market, technological readiness, market size, degree of business development and innovation. In 2001, the IMD transformed the typology of factors determining the international competitiveness of the economy, dividing them into four basic groups (World Competitiveness..., 2001): 1) economic situation (national economy, international trade, foreign investment, employment, prices); 2) government efficiency (public finances, fiscal policy, institutional structures, favorable legal conditions for enterprises, education); 3) business efficiency (productivity, labor market, financial markets, management practice, the impact of globalization); 4) infrastructure (basic infrastructure, technological infrastructure, scientific infrastructure, health and environment, value system).

As a result of globalization, the nature and intensity of competition processes on international markets have changed. Enterprises compete, but one cannot ignore the fact that e.g. state policy - as rules and regulations - exerts influence, among others on business processes. The increase in enterprise productivity is not determined in a vacuum, but by the features of the national economic system and increasingly by the quality of its interrelationship with the outside world (Hautbauer and Stephenson, 1995). Changes in the economic law of many countries and a favorable political climate create an incentive to create such transnational forms of economic activity.

In this context, a huge role is played by the state's policy supporting the creation of a business-friendly fiscal environment related to bearing certain tax burdens constituting the state's tax system, which individual elements may now become an important factor motivating potential investors to develop investments in a given country. The rational tax policy of the state should manifest itself in defining the shape of the tax system that stimulates economically effective ventures.

Economic activity is aimed at making profits, and any tax burden reduces the taxpayer's existing or future capital resources. Therefore, the taxpayer's natural behavior is to avoid such consequences of taxation or to minimize its negative impact. From the point of view of international economic organisms, the most advantageous would be the possibility of accumulating all profits in an enterprise which registered office is in the country with the most liberal tax system (relocation), because it is not without significance that transnational companies (Dicken, 1998) are guided primarily by the principle that their business activities should be subject to the lowest possible tax burden. Therefore, they will be highly sensitive to the level of taxation of such activities in a given country (Devereux and Hubbard, 2000).

The taxpayer's conduct may be reduced among others to legal optimization of the level of taxation by using the flexibility of the tax structure or by tax migration to countries with lower tax burdens, thereby using tax competition between countries. Tax competition is a phenomenon involving public authorities' use of such tax policy instruments designed to increase the attractiveness of a given territory as a potential or current location for business operations. Tax competition must be seen as a manifestation of a kind of struggle for potential investors and capital for the development of a given country.

International positive tax competition can be regarded as a favorable phenomenon and resemble perfect competition, in which countries compete with tax rates for mobile factors of production, in such a way as to achieve a balance between flows of factors of production and tax revenues. Mobile production factors move from countries with higher taxation to countries with lower taxation, unless the level of delivered public goods is high enough in a given country to compensate for the high tax burden. In other words, at the level of remuneration for the factor of production, it is important to achieve a stable relationship between the benefits received from the state and the tax burden. Therefore, the effect of international tax competition should be to equalize tax rates at a socially effective level, i.e. ensuring maximization of social well-being. The existence of fair tax competition is a stimulus to the increase in public finance discipline and may improve the efficiency of spending public funds through rational investment directions. As a result, tax competition leads to tax alignment at a socially effective level. This phenomenon is accompanied by the migration of taxpayers seeking the optimal relation for them of the received public goods to the taxes paid (Edwards and de Rugy, 2002). Tax competition based on general tax regimes, i.e. universally applying tax rates and a uniform tax base, is fair (Cerioni, 2005), and the migration of enterprises towards countries with more favorable tax regimes has a positive impact on the level of international competitiveness of these entities. Creating incentives for investing is particularly important for countries in which the economy is transforming due to the significant impact of foreign direct investment on this process (Sedmihradsky and Klazar, 2002).

In the conditions of globalization, it is necessary to shape the tax system in such a way that it encourages investment, innovation and creation of new jobs. Therefore, it is very important to create an optimal tax system that limits the possibility of escaping from taxes or illegal tax evasion by moving to the shadow economy.

The currently observed phenomenon of tax competition between countries appears - due to the globalization of economic processes in the world - an important (though not always and not everywhere the most important) factor in shaping the competitive advantage of a given country's economy on the global market. Undoubtedly, however, the increasing tax competition between countries encourages the transfer of profits (*transfer pricing*) in the form of manipulating prices in turnover between their companies which headquarters are in countries with different legal and tax systems), which causes problems on the line entrepreneur - tax authorities.

Alternatively, entities for which transaction costs associated with the migration of activities are too high are trying to operate in the shadow economy, hiding, in whole or in part, the sources of their income from economic activity, which is as unfavorable for a given country as the process of relocation or transfer pricing. However, the issue of defining the limits of taxation, and more

importantly the designation of such limits, which are fair and do not cause negative implications in the sphere of the economy, is not easy. It is difficult to determine the optimal level of tax burden, both in terms of fiscal and non-fiscal aspects, because it is not easy to reconcile the objective of efficiency and fairness of taxation in the tax system, while taking into account its social and economic dimension.

Already in the nineteenth century in France, P.J. Proudhon argued that the state budget revenues from taxes should not be more than one-tenth of the national income. It is also difficult to expect that in the near future the theory of economics and public finances will develop universal, within specific economic and social conditions of a given country, methods of determining such a tax limit.

An exemplification of the problem of the impact of the general level of tax burden on the dynamics of economic growth were the results of polish research, according to which the increase in the level of fiscalism by 1 percentage point causes a decrease in the economic growth rate per capita by 0.14 percentage points (Adamczyk et al, 2003). Leibfritz et al (1997) also showed in their research that in OECD countries for 1980-1995, the average (weighted) tax rate increased by approx. 10 percentage points resulted in a reduction of the GDP growth rate by approx. 0.5 percentage points with indirect taxes decreasing economic growth to a lesser extent than direct taxes.

The issue of the impact of fiscal burdens on economic activity, and thus on tax revenues of the state budget has become the subject of research and analysis, including of Laffer and Miles (1982), who formulated the relationship between the level of tax rate and the amount of tax revenues to the budget. In a broader sense, the relationship described using the Laffer curve addresses the problem of tax optimization on a macroeconomic scale. Various incentives occurring in the tax system may imply the emergence of often lasting habits, and thus strengthen certain behaviors, including negative ones. These behaviors will usually be a reflection of the fiscal policy pursued towards entrepreneurs and a response to it.

The issue of Fair Taxation

Tax is one of the tools of the instrument of economic policy of the state, which allows influencing the form of socio-economic relations between the state and taxpayers. However, the most important issue from the point of view of effective achievement of fiscal and non-fiscal goals of tax policy should be the even and moderate burden on taxpayers with public law levies. Gomułowicz (2013) wrote: "*The history of taxation is also the vastness of human harm, humiliation, lawlessness, rebellion, and at the same time pride, self-confidence and arrogance of power, convinced of its infallibility. Authority that felt exempt from thinking about the effects that taxation causes on the taxpayer's assets. The authorities who did not want to understand that her mistakes and wrong choices made the germ of a radical tax revolt*".

Undoubtedly, taxes, which in the social sense are unfair, too high, unevenly, poorly distributed, can be a serious determinant of the growth and duration of the shadow economy, because a kind of "overplaying", deceiving the state in this field is an opportunity to settle accounts on the citizen-state line, ipso facto achieving a higher level of social justice.

Already in ancient times, Aristotle pointed to the fact that justice is a virtue of the spirit that allows harmony to be achieved. The use of justice in interpersonal relations allows the cooperation of the whole society in the structures of the state (Aristotle, 1999; Szumlakowski, 2013). According to Rawls (1999), all public goods should be distributed equally, everyone should have the same rights to fundamental freedoms, and social and economic inequalities are to lead to the improvement of the lives of people in difficult financial situation. Proponents of egalitarian theory perceive justice as the state's ability to provide public goods and services to low-income individuals (Nowak-Far, 2011).

There are two independent concepts of justice in the literature on the subject of equality. This is horizontal justice and vertical justice (Musgrave, 1990). Horizontal justice consists in equal treatment of equals, i.e. units that are identical in all material respects. In turn, the principle of vertical justice consists in differentiating taxation in relation to what is unequal in terms of taxation. So if some are able to pay higher taxes, they should do so. However, the following problems arise: firstly, who - as a rule - should pay taxes at higher rates, secondly, how to formulate adequate law in accordance with this principle, and thirdly, it must be determined whether if the given entity is able to pay higher taxes (due to higher tax rates), how much more should they pay compared to others (Stiglitz, 2000). The answer to the postulate of applying the principle of horizontal justice is the use of a relatively low, proportional flat rate in taxation with a broad and equal tax base. In turn, relatively strong progression and a significant number of various tax breaks and exemptions are an expression of the implementation of the vertical justice principle in the tax system. Although the degree of this progression is a matter of separate discussion and opinions are divided here, there is an agreement that the steep progression contributes to the destruction of tax sources, is contrary to the idea of payment capacity and negatively affects the development of entrepreneurship.
