Nozick (1974) directly recognized taxation as unfair and equated it morally with forced labor, because it violates the rights of the individual. In turn, according to Murphy and Nagel (2002), private property is a legal convention, partly defined just by the tax system, therefore the tax system cannot be assessed by analyzing its impact on private property, understood as something that has an independent existence and importance. Taxes should be assessed under the general system of property rights that they help create. Tax justice or injustice can only mean justice or injustice in the system of property rights and rights arising from a particular tax system. In their view, social justice, not tax justice, should be the value that drives tax policy. Rights have budget costs and "*nothing that costs money can be absolute*" (Holmes, Sunstein, 1999). A democratically elected and organized public authority is an indispensable tool for effectively mobilizing and directing the dispersed resources of communities that are struggling with specific socio-economic problems. Enforcing rights is therefore cost-effective, and taxation is a necessary instrument to protect rights (Farrelly, 2004). The fact that rights come with costs means that redistribution is ubiquitous. This does not happen only if the government takes the money from taxpayers and gives it to the needy. Redistribution also takes place to protect wealthy people from violence and threats of violence (Holmes and Sunstein, 1999). Public goods have to be paid for and it is therefore necessary for everyone to have a fair share of it, although this is where disputes may arise regarding what is meant by "fair share".

According to Stiglitz (2012), however, it is evident that those who are at the top of the income pyramid and pay 15 percent from the reported income (while collecting hidden money in tax havens) do not contribute to the financing of these goods to the appropriate extent. Democratic states rely on trust and cooperation in matters related to paying taxes. However, if every citizen would devote as much energy and resources to avoid paying the tax as the wealthy devote to it, the tax system would either collapse immediately or should be replaced by a much more repressive and restrictive model. A market economy cannot function if every contract must be enforced legally. You can only talk about trust and cooperation if you believe that the system is fair. Recent studies have shown that the belief that the system is unfair undermines the ability to cooperate and undermines the efforts made. Currently, it is becoming increasingly clear that Americans are concluding that their economic system is not fair and the tax system is the best example.

Achieving tax justice is not easy, there are no universal methods of its implementation. The legislator's most noble intentions may not (and often in practice are not) received in the expected way by all taxpayers. Some of them will always think that they have been treated unfairly (Głuchowski, 1999). It should be realized that even if the tax rate, and thus the share of tax revenues in GDP, would be reduced to 1%, there will be a group of taxpayers operating in the shadow economy and justifying it with small benefits.

Justice in the concept of learning the law of public finances should be seen through the prism of the amount of taxes and emerging legal problems with an equal tax burden on society. The choice of a fair formula should create conditions that would stop the envy of other individuals, which affects the

functioning of social well-being (Nowak-Far, 2011). The principle of tax justice clarifies the principle of social justice in the context of justice of fiscal burdens of citizens, but it does not mean granting equal rights and obligations to all citizens.

A. Smith, who formulated the principle of fair taxation, argued that each state's subjects should contribute to maintaining the government as closely as possible to their capabilities, i.e. in proportion to the income each of them receives under the protection of the state. Smith (2012) compared the state economy to the private economy, which is governed by the principle of mutual benefits (equivalence). He also noted the ability-to-pay of the taxpayer, who should not pay more taxes than he is able to pay.

In everyday life, there is no unambiguous criterion that would allow us to state unequivocally that, e.g. only the amount of income obtained is the basis for specific differences in tax or social policy. Here are the questions: what about the different family situation or the different health status of two people with identical income - should this be taken into account or not, and if so, to what extent? How to create "fair" tax regulations that take into account all these variables? (Gwiazdowski, 2001).

Justice, however, means, among other things, equality of law, but equal rights are not the same as equal income. All people have the right to enjoy the fruits of their work and make their work fruitful. This does not mean, however, that they have the right to the fruit of other people's work. The biggest injustice is the same treatment of hard-working and lazy people, truthful and liars, good and depraved. In nine cases out of ten, inequality is due to differences in intelligence, strength, dynamics, dexterity, beauty, and other physical and mental qualifications. Meanwhile, J. Rawls is trying to search for a concept of justice that eliminates the impact of accidental salary with natural attributes on achieving political or economic benefits (Gwiazdowski, 2001).

Nowadays, the principle of fairness of taxation primarily means that a given tax does not cause excessive burdens for the state, especially by people living on the border of minimum subsistence, it is evenly distributed and adapted to the ability of a given taxpayer to pay it. In addition, the design of the tax must guarantee its universality, as well as eliminate or impede the shifting of taxes to other than those who, according to the intention of the legislator, is to bear the tax (Gajl, 1992).

Undoubtedly, unfair taxation is one of the reasons for tax avoidance in a given country (including the development of the shadow economy), as well as internationally, which in turn is a complex and multifaceted phenomenon, because it is no longer limited to aggressive tax optimization, but it is also related to with harmful tax competition between countries.

The problem of Informal Economy

The issue of unfair taxation, and consequently tax avoidance and the development of the informal economy, is one of the most important topics related to the implementation of fiscal policy. The shadow economy is located on the border of law and economy. Its size and the effects it causes for fiscal policy of the state are typical economic problems. In turn, the legal aspect of the shadow economy is e.g. legal regulations that stimulate or discourage action in the informal economy.

On the one hand, this informal economic activity may result in reduced tax revenues (and consequently the supply of public goods and services), lower tax morale and less compliance with tax regulations, as well as higher costs of control and lower rates of economic growth. On the other hand, the shadow economy can be a powerful force to accelerate institutional changes and can increase the overall production of goods and services in the economy. The shadow economy has implications that go beyond the economy to political order (Enste, 2018).

The main reasons for the occurrence and development of the informal economy include:

- **Tax burden and amount of social security contributions** – distortions of the general tax burden affect the choice of workplace and economic activity, can stimulate the supply of labor in the so-called shadow area. The greater the difference between the total cost of labor in the official economy and earnings after tax (from work), the greater the motivation to reduce the tax wedge and the shadow economy (Thomas, 1992; Johnson et al, 1998a; Johnson et al, 1998b; Tanzi, 1999; Schneider, 2005; Dell'Anno et al, 2007).

- **Quality of institutions and corruption** – bureaucracy, unclear law, lack of respect for property rights in connection with highly corrupt government officials stimulates the shadow economy (Teobaldelli, 2011; Hassan and Schneider, 2016).

- **Regulations** – legal regulations are an important factor limiting the freedom (choice) of private individuals in the official economy. Countries with a high degree of economic regulation usually have a larger share of the shadow economy in total GDP (Johnson et al, 1997).

- **Public sector services** – the increase in the shadow economy may lead to a reduction in state revenues and, consequently, a reduction in the quality and quantity of public services (Feld and Schneider, 2016).

- **Tax morality** – taxpayers are more likely to pay their taxes fairly if they receive valuable public services in return (Feld and Frey, 2007).

- **Deterrence effect** – the threat (amount of penalties) is not clearly and sufficiently researched as a factor affecting the level of the shadow economy in the economy. The size of the shadow economy may affect the level of penalties, but the level of penalties does not reduce the shadow economy (Pedersen, 2003).

- **Development of the official economy** – is another key factor in the development of the shadow economy, namely the lower the GDP growth (and higher unemployment rate), the greater the motivation to work in the shadow economy, *ceteris paribus* (Williams and Schneider, 2016; Feld and Schneider, 2010).

- **Self-employment** – the higher the self-employment rate, the more activities can be implemented in the shadow economy, *ceteris paribus* (Williams and Schneider, 2016; Feld and Schneider, 2010).

- **Size of the agricultural sector** – the larger the agricultural sector, the more opportunities to work in the shadow economy, *ceteris paribus* (Hassan and Schneider, 2016).

To sum up, the size of the informal economy is a resultant of many factors which significance is related to the historical, social and economic conditions of a given country. Economic entities operating in the shadow economy violate the rules of fair market competition, and their expansion is a serious challenge for the official sector (both its public and private segment). However, an informal economic activity sometimes constitutes a kind of economic buffer, absorbing shocks and crisis phenomena in the official sector (e.g. through employment offers for the unemployed). In the overall balance, however, negative implications prevail, both in macroeconomic (smaller budget revenues) as well as microeconomic (losses of specific enterprises) and social dimension (erosion of business ethics, moral norms etc.).

It can be seen that the observed tendency to reduce the informal economy level is to some extent correlated with the level of taxation of profits of economic entities and the level of competitiveness of individual economies. Of course, this is not a close relationship, its degree varies greatly from country to country, however, a certain regularity can be seen by juxtaposing the size of the shadow economy in individual countries with the level of corporate income taxation.

Results

Analyzing the years 2005-2017, it can be seen that the average value of the level of competitiveness (as the Global Competitiveness Index - GCI) for OECD countries increased and the average level of the shadow economy (as percentage of GDP) as well as the total tax rate (TTR, as percentage of profit), which can be considered a very positive fact. Analyzing individual countries, specific variables develop differently and with varying intensity. However, the vast majority of 2/3 of OECD countries recorded an increase in GCI (most Turkey). What's more, the TTR decreased in 30 out of 36 OECD countries (in Italy by 28.7 p.p.), as well as even 33 countries dropped the shadow economy level (most Lithuania). Is there any dependence and regularity due to this? Do lower (and therefore usually more just and even) tax burdens contribute to the reduction of the informal economy and a higher level of competitiveness of the economy? This is not a common correlation, which means that non-tax factors also determine the level of competitiveness, but also the informal economy.

Table 1: Global Competitiveness Index (GCI), Shadow economy, Total tax and contribution rate (TTR) in OECD countries, 2005-2017

Country	Shadow economy (% of GDP)		TTR (% of profit)		GCI (score)		Pearson's correlation (r) 2005-2017

Source: own calculations based on: The World Bank [Online] [Retrieved March 5, 2020] http://databank.worldbank.org; Medina and Schneider (2019), The Global..., (2005 and 2017).

In the analyzed period 2005-2017 for OECD countries there was a strong negative Pearson correlation between the level of competitiveness (GCI) and the size of the shadow economy (r_{2015} = -0.759; r_{2017} = -0.794), while the correlation between the GCI and TTR index was also negative but weak (r_{2015} = -0.289; r_{2017} = -0.241). Similarly weak but positive correlation occurred between the shadow economy level and TTR. When examining the above relationships for individual OECD countries in 2005-2017, it can be seen that at that time 2/3 of countries showed a negative correlation between the GCI and the size of the shadow economy, including a weak correlation for four countries. The correlation between GCI and TTR was again negative for 2/3 of OECD countries, including a weak correlation for five countries. In contrast, Pearson's linear correlation between informal economy and TTR was positive for 26 countries in the period under review, including a weak correlation for six countries.

Conclusions

Any positive impact of public authority on the economy, using available tools, in particular fiscal policy instruments, in the process of strengthening the competitive position of domestic economic entities in the global economy, is desirable. The creation of a rational institutional and legal framework for entrepreneurs' economic activity is a *sine qua non* condition enabling them to strengthen the competitive position of enterprises and the entire economy.

Countries with higher tax revenues achieved thanks to lower, fairer taxation, a smaller scale of legal regulations and more simple regulations, as well as lower levels of corruption, usually have a lower level of informal economy and a higher level of competitiveness.

Public authorities should perceive unregistered work and activities of business entities as a signal for actions aimed at reducing the attractiveness of the shadow economy through better tax law regulations, a fairer and more transparent tax system, as well as more efficient institutions. That is why it is important to create mechanisms and procedures that would eliminate dishonest players from the market and support economically effective ones. This is all the more important as too restrictive tax regulations may reduce the benefits of globalization, as well as limit the inflow of foreign direct investment, which for developing countries with low own capital resources could cause a slowdown in economic growth.

To conclude, it should be noted that the only way to properly implement the function of taxes and at the same time meet the condition that they are objectively fair in the public perception is to coordinate the activities of public authorities with the activities of economic entities and households. In the era of dynamic changes in the situation on world markets, finding a balance between market mechanisms effectiveness and the fairness of product distribution and income generated by the market.

Abstract

What about cyberattacks? We are all responsible for disrupting, blocking, destroying, degrading or maliciously controlling an information system / infrastructure, affecting the integrity of availability, confidentiality, authenticity and non-repudiation of data or theft of information with restricted access. For example, sensitive data (contracts, projects, etc.) can be ex-filtrated by computer attackers or recovered by them using specialized programs in case of the loss or theft of a portable device (smartphone, tablet, laptop, etc.). To secure classified information we have to use encryption system. It is a way to increase the integrity of information. We propose here a method who can be easy implemented, with low costs and maximum effectiveness. It is a safe solution in military information systems. The goal of this paper is to contribute to a better clarity regarding encryption and threats to the security of computer networks and military information systems.

Keywords: Encryption, Security, Information, Data, Shamir Encryption Method

Introduction

In this research we followed two steps. The first one was to develop a list of terminologies in cybersecurity and security frauds. The second step was to analyze the Shamir's encryption system applied in military information systems.

One element in the cybersecurity configuration is antivirus. As we all know this is a computer program designed to detect, prevent and eliminate the installation of any form of malware (viruses, Trojans, adware, spyware, etc.) on the computer systems. Updating it is especially important, because it have to be able to cope with the latest versions of malicious programs. On the same note we are aware that computer virus is a program that can self-replicate within a system, later spreading to other computers on the network without the user's knowledge. It may adversely affect the functionality, integrity, availability of the system or the data contained therein.

[https://www.kaspersky.com/resource-center/threats/computer-viruses-vs-worms] A computer worm is a malware that can self-replicate and spread in a computer network and beyond (other systems or networks), using network resources, without attaching to another program or process.

Threats to the security of Computer Networks

Threats of the security regarding a computer network can have the following causes:

- equipment failures
- human operating or handling errors
- frauds (or attempted fraud)

In the threats due to deliberate actions, there are two main categories of attacks:

- Passive
- Active

Passive attacks - are those in which the intruder observes the information passing through the "channel", without interfering with the flow or content of messages. As a result, only the traffic analysis is done, by reading the identity of the communicating parties and "learning" the length and frequency of the messages conveyed on a certain logical channel, even if their content is sometimes unintelligible. Like Lorrie F. (2007) wrote, the passive attacks have the following characteristics:

- Does not cause damage (data is not deleted or modified);
- Violate privacy rules;
- The objective is to "listen" to the data exchanged through the network;
- They can be achieved through a variety of methods, such as:
    - supervision of telephone or radio connections;
    - data routing through additional less protected nodes, etc

Active attacks - are those in which the intruder engages in:

- stealing messages
- delete, delay or modify messages
- inserting false or older messages
- changing the order of messages, in a certain direction, or in both directions of a logical channel

Masquerade - is a type of attack in which one entity claims to be another entity. For example, a user is trying to substitute for another or a service pretends to be another service, with the intention of taking secret data (credit card number, password or encryption algorithm key). A "masquerade" is usually accompanied by another active threat, such as replacing or modifying messages, as Henry I. (2012) mentioned in his report.

Resume - occurs when a message or part of it is repeated (repeated), with the intention of producing an unauthorized effect. For example, it is possible to reuse the authentication information of a previous message. In bank accounts, the resumption of data units involves doubling and / or other unrealistic changes in the value of the accounts.

Message modification - causes the message data to be altered by modification, insertion or deletion. It can be used to change the beneficiary of a loan in the electronic transfer of funds or to change the value of that loan. Another use can be to modify the recipient / sender field of the e-mail.

Denial of Service: Occurs when an entity fails to perform its own function or when it takes actions that prevent another entity from performing its own function.
Repudiation of service - occurs when an entity refuses to recognize a service performed. It is obvious that in electronic funds transfer applications it is important to avoid repudiation of the service by both the issuer and the recipient.

Types of destructive programs

Viruses - represent programs inserted in applications, which multiply themselves in other programs in the resident memory space or on disks; then, it either completely saturates the memory / disk space and locks the system, or, after a fixed number of multiplications, they become active and enter a destructive phase (which is usually exponential).

"Bomb" software - is a procedure or part of code included in a regular application, which is activated by a predefined event. Its author announces the event, letting it "explode", that is, to do the programmed destructive actions.

Trojan - is an application that has a well-known function of use and which, in a hidden way, fulfills another function. It does not create children. For example, a hacker can replace the code of a normal "login" control program with another code, which does the same thing, but additionally copies to a file the name and password that the user types in the authentication process. Later, using this file, the hacker will easily penetrate the system.

Type I and II cybercrime

Type I cybercrime it is generally represented by an isolated event when viewed from the perspective of the victim of a cybercrime. For example, the victim unknowingly downloads a Trojan from the Internet that installs a keystroke logger on its device. Alternatively the victim of the attack receives an email containing a link that comes from a known entity, but in reality is a web threat. It is usually facilitated by crime-ware programs such as keystroke loggers, viruses, rootkits, Trojan.

- Software defects and vulnerabilities in computer systems often provide support to the cybercriminal in criminal resolution. For example, criminals who control a particular website can take advantage of the vulnerabilities found in the web browser to place a Trojan Horse-type computer threat.

Cybercrime type II includes in addition to cyberstalking and harassment, child pornography, embezzlement, manipulation of capital markets, blackmail, corporate espionage and industrial espionage, planning terrorist attacks.

- It is generally a causal chain of a series of events involving repeated interactions with the target of the attack. For example, the victim is from a virtual relationship environment such as a chat room, and over time an attempt is made to obtain a close relationship with him by the attacker. If the virtual relationship succeeds, the attacker will take advantage and commit the crime.
- It is generally facilitated by programs that do not fall under the genre of crime-ware programs. For example, conversations can be done using a program like IM (instant messaging), but those involved can transfer files using FTP (File Transfer Protocol).

Threats to computer systems can be summarized as follows:

- Malware threats is represented by any malicious software, programming language or code created in such a language that is available in the criminal resolution in order to compromise or prejudice the right holder of certain patrimonial values without his knowledge.
- Hacking threats who can be defined as the intentional framework of all attempts to obtain or alter information with patrimonial value, without authorization or by exceeding the limits of authorization, by counteracting the logical security mechanisms. Hacking is advantageous in the case of remote targeted attacks because it allows attackers to enjoy anonymity and, in general, this method is more difficult to measure.
- Threats through the engineering of social networking sites

- Attacking users use tactics of manipulation, intimidation or inducing a state of disappointment to victims or use the skill in capitalizing knowledge (Know-how) to their advantage, in order to steal data that can be used in a subsequent criminal resolution.
- Computer threats through the use of abuse who can be defined as the use of the resources of a trusted organizational system or the privileges offered by such a system for any purpose or manner that is contrary to the rules established by that organization.

Attachment surprise - E-mails and their attachments play a very important role in carrying out cyberattacks. When receiving an email, pay attention to the following:

- the identity of the sender is not guaranteed, check the consistency between the sender and the content of the message;
- do not open attachments from strangers. They may contain software made for illegitimate or malicious purposes;
- do not reply to e-mails containing requests for personal or confidential data.

Cybercrime networks, through actions of manipulation of people (social engineering), distribute to several users unsolicited electronic messages (spam), with an apparent commercial content, advertising for products and services, to infect users.

Cybersecurity is a Very Dynamic Environment

Cybersecurity is a frequently discussed topic in recent years, being a dynamic environment. The technologies used are constantly being replaced, updated and modified, thus presenting new and new challenges in the context in which the level of awareness of Internet users is still very low.
The online environment has more and more connections with physical space, and many of the things we do in virtual space have real implications. Thus, when security is compromised in the virtual world, users may experience some of the most unpleasant consequences in the real world.

The password is an authentication tool used to gain access to a piece of equipment and its data. For the protection of your data, choose passwords that are difficult for the attacker to identify with the help of automated tools ("brute force") or to be guessed by him. The attacks aim at identifying the password and accessing the information restricted by that password. The most used methods of attack of this type are "dictionary attacks" and "brute force". "Dictionary attack" seeks unauthorized access to computer resources or systems by successively attempting passwords / decryption keys in a predefined list of words or phrases.

Periodically update the software Manufacturers generally assess software vulnerabilities and make patches - software updates to remove previous bugs / vulnerabilities. From a computer point of view, vulnerability is a weakness in the design and implementation of cyber infrastructures or related security measures that can be exploited by an attacker. These can be corrected by the manufacturer, who, after identifying them, can issue security updates to the software. The operating system must be updated as often as possible so that the equipment (computer, laptop, server, router, phone, tablet, etc.) runs optimally and is as vulnerable as possible to cyberattacks. There are vulnerabilities in every operating system.

Shamir's confidential system used in military systems for encryption

Shamir’s system is an alternative to to transmit classified information to higher structures.
The algorithm is complex and it is a form to protect information an secure them, like he describe in Shamir A. (1979).

Let t and w be two positive integers, $t \leq w$.

A confidential system (t, w) is a method of sharing a key K between the members of a set P of w participants, so that any association of t participants can calculate K, which is impossible for associations of t − 1 or fewer participants. The previous example is therefore a confidential system (2, 3). The value of K is chosen by an arbiter D. We will assume that D "∉" P. D will secretly distribute components of the key to the members of group P, so that no participant knows the components of the others and is not able to be part of its component. to be able to recompose the K key. Subsequently, participants in a subset B ⊆ P can pool the key components they know (or give them to an authority they trust) in order to determine K.

They must be able to succeed in this attempt if and only if card (B) ≥ t.
To note:

$P = \{P_i \mid 1 \leq i \leq w\}$ the set of w participants.

K is the space of all possible keys,
and S is the component space (all possible key components). The system presented in this section is due to Shamir and was created in 1979.

Let p ($p \geq w + 1$) be a prime number and $K= Z_p$, $S= Z_p$. So keys and components are numbers in Z_p. Shamir's confidential system, presented below, is based on a random polynomial a(X) of degree t at most t − 1, where the free term is K. Each participant P_i finds a point (x_i , y_i) on the graph of this polynomial.

Let now be a subset $\{P_{i1} , . . . , P_{it}\}$ of participants who want to reconstruct the key. They know the values x_{ij} and $y_{ij} = a(x_{ij})$ for $1 \leq j \leq t$; $a (X) \in Z_q[X]$ is the (secret) polynomial used by D. Since its degree is at most t - 1, we can write $a (X) = a_0 + a_{1X} + . . . + a_{t-1}X^{t-1}$ where a0 = K and $a_0, . . . , a_{t-1} \in Z_q$ are unknown. They are solving the linear system of equations $y_{ij} = a(x_{ij})$. If the equations are independent, the solution is unique, and the value of a_0 is even the key K.

A secret sharing scheme divides a secret into sub-secrets that are distributed to users. The secret can be reconstructed only by certain groups, groups that form the (authorized) access structure of the sharing scheme. Secret sharing schemes have been introduced independently by Blakley and by Shamir, as a solution for storing cryptographic keys. Secret sharing schemes can be used in any situation where access to an important resource must be shared. Access to a bank deposit or launching nuclear missiles are two such examples. The process of selecting cryptographic modules is as follows: - Planning phase In the planning phase, the purpose of the activity is to define the objectives that cryptographic techniques and methods must take into account. These objectives are based in part on applicable national and international regulations. These objectives are also established according to the existing (or proposed) security environment, as well as in connection with a preliminary analysis of the identified risks and vulnerabilities. - Security policy

Security policy (IT) is generally defined as the activity of establishing information security (electronic) decisions. Included here are the managerial policies regarding:

a. Creation of a security program for electronic communications networks, with the establishment of tasks and responsibilities,
b. Specifying security rules for certain computer systems,
c. Developing the necessary policies within the organizations. System design includes hardware and software implementations, procedures, environmental requirements, physical security considerations, etc.

An example of application regarding wiener attack is presented in figure 1, developed in C++.

        // We measure the time spent decrypting.
        LARGE_INTEGER frequency;
        LARGE_INTEGER start;
        LARGE_INTEGER end;
        double interval;
        QueryPerformanceFrequency(&frequency);
        QueryPerformanceCounter(&start);

        initializePublicKeyFromFile();
        initializeCryptotextFromFile();
        attackRSA();
        decrypt();
        writeDecryptedMessageInFile();

        QueryPerformanceCounter(&end);
        interval = (double)(end.QuadPart - start.QuadPart) / frequency.QuadPart;

        cout << "Time spent using basic decryption: " << interval * 1000 << "milliseconds.\n"
```

Fig. 1 : Wiener Attack

Usually, security policies are based on the need to protect IT resources, data and information. In an organization, security policies exist at all levels, from general situations to specific applications. There are also security policies at the national level, which apply to all organizations or agencies and, from this point of view, a precise course of action is guaranteed for the protection of national IT resources. As we will see below, the next important step in the planning phase is risk assessment, after which it will be possible to develop policies on the use of evaluated operating systems and cryptographic modules under certain environmental conditions. We give, below, only some of the problems that must be taken into account when elaborating the cryptographic requirements and policies:

1) the way of using the algorithms and the configuration of their parameters;
2) the classes of users who will use cryptographic methods and the privileges associated with these attributions;
3) defining confidentiality and integrity controls, as well as authentication techniques;
4) audit procedures;
5) key management, including distribution, generation, use and destruction;

A decryption code is presented in figure 2.

Conclusions

Cybercrime is a major problem in societies that widely use information technology, and in the absence of a standardized and unanimously accepted definition and the lack of credible statistics in the field, the study and legal examination of this new genre of crime, which has covered the whole world, is very important. The virtual environment, generated by cyber infrastructures, including information content processed, stored or transmitted, and actions performed by users, is already an integral part of personal and professional life, but security is an element taken into account far too rarely.

However, new technologies involve new risks that can seriously affect the individual or the organization, given that there are many hostile actions carried out in cyberspace that could affect the availability, integrity and confidentiality of the operation of information systems.

- Creating a vision and principles that should be translated into an information security policy;
- Implementing this policy within the organization and clearly defining roles and responsibilities;
- Development of an appropriate culture and mood, through the correct implementation of information security principles.
- The user represents the first wall of defense against threats behind the monitor, the first and sometimes the last sensor in identifying dangers and, depending on the case, reporting them to the IT manager of the institution. The user is also the one who can prevent the creation of substantial damages both for himself and for the institution in which he operates.

Using an encryption method is a solution for management of classified information and minimizing the risks of stolen information.

Abstract

The marketing strategy requires that Międzyzdroje be interpreted as a specific territorial product. Such a product is a set of conscious and purposeful projects whose task is to achieve goals and shape a team of benefits for residents, tourists and investors associated with Międzyzdroje. The purpose of the article is an analysis that allows determining the marketing position of the city against the background of the region and competitive cities by comprehensively examining the market realities of tourism and investment in Międzyzdroje. The information obtained and conclusions based on this analysis can be used to prepare detailed action plans for creating a territorial product in the tourist sense.

Keywords: Economics, Marketing, Tourism Strategy, Territorial Product, Tourism.

JEL classification: A11, D60, E71, F63, H41, M31, O21, R11.

Introduction

The city of Międzyzdroje is a commune with unique climate conditions and a very good basis for tourism development. Additional assets are primarily environmental and financial aspects, making Międzyzdroje a very attractive tourist municipality for foreign and domestic tourists (Municipal Office in Międzyzdroje, 2018). The city and commune development strategy presents a vision of shaping a modern, competitive tourist commune, but also fulfilling other very important tourist and business functions. The Międzyzdroje region has a great opportunity to become a big competitor on the national and international market, but it is important to take advantage of the opportunities facing the municipality and the city that can help and lead to significant development of the municipality not only in economic terms. The Międzyzdroje commune is surrounded by strictly protected natural areas of the Wolin National Park, and the basis of its development is the tourist function. On the one hand, this is a great opportunity to make Międzyzdroje a commune with extremely attractive tourist conditions, competitive in this respect in the region, the country and Europe. On the other hand, however, it introduces some restrictions that should be considered problematic. However, undoubtedly, the assumptions of the city and commune development strategy should be assessed

positively, which assumes that the tourist and recreational function is particularly important in the case of Międzyzdroje.

Literature Review

The marketing strategy requires that Międzyzdroje be interpreted as a specific territorial product. Such a product is a set of conscious and purposeful projects whose task is to achieve goals and shape a team of benefits for residents, tourists and investors associated with Międzyzdroje. The purpose of the analysis is to determine the marketing position of the city against the background of the region and competitive cities by comprehensively examining the market realities of tourism and investment in Międzyzdroje. The information obtained and conclusions based on this analysis will be used to prepare detailed marketing action plans aimed at:

• acquiring external investors with capital and know-how,
• tourist promotion of the city,
• building the territorial identity of entities operating in Międzyzdroje.
Marketing analysis of Międzyzdroje concerns two key elements of the resort's activity. The first of these is the market of investments implemented in the commune. The second element is the tourist market, i.e. people choosing Międzyzdroje for their vacation. Both markets are closely related and dependent, both in terms of marketing and economics (Aho, 2001). Marketing activities are an integral part of the social and economic policy of the local government (Alejziak, 1999).

The most important role of strategic marketing is the analysis of needs, which allows observation of market evolution and identification of existing and potential product markets (Altkorn, 1998). All activities should be geared to the needs of the client and user (Cabiddu et. al., 2013). Therefore, marketing management extends to the entire culture and atmosphere of the organization. The main goals of the marketing strategy include (Orlicki, 2010):

1. Increasing the tourist and investment attractiveness of Międzyzdroje.
2. Shaping a positive image of the region.
3. Increasing the level of residents' satisfaction and increasing economic benefits for the entire region from promotional activities carried out by the authorities.
However, in the operational objectives of the marketing strategy we distinguish (Orlicki, 2010):
1. Creating new channels for presenting the tourist offer.
2. Increasing the level of knowledge about attractions available in the region.
3. Adjusting the offer to the needs of individual market segments.
4. Integration of tourist environments in Międzyzdroje.
5. Creating a common accommodation base.
6. Creating a uniform visual identification system for promotional offers.

Activities carried out to achieve the above objectives should take into account the resources, resources, features and capabilities of the city and commune (Echtner and Ritchie, 2003). Proposed marketing and promotional solutions included in the city and commune development strategy must be subject to verification by the city authorities (Woodside A.G., Dubelaar, 2002). The actions suggested in the article are to be the driving force of tourist and investment development in Międzyzdroje.

The marketing strategy can be assessed due to the results arising from the implementation of the adopted marketing strategy in the areas of products, distribution channels, prices and marketing communication (Lambin, 2001). The normative types of marketing strategy include (Jędrzejczak, 2000):

• development - focused on the increase in production, sales, investments, and thus related market position and profit,
• maintaining the achieved market position,
• selective development, i.e. the development of specific products or services.

The marketing strategy can also be assessed from the point of view of the correctness of the construction, completeness and scope of the tools used (Gołębiewski, 2001). However, a marketing strategy can only be effective if it is based on detailed market knowledge (Miciuła, 2016). Implementation and implementation can only take place if there is consistency between market penetration plans and price, advertising and distribution policies. The marketing strategy is composed for specific tasks and goals facing the given organization. This may be a problem with making a profit or maintaining the current market position. Indirect goals tend to be towards the main (direct) goal. Therefore, one of the criteria for assessing a marketing strategy may be its final effect, for example regarding the generated profit, i.e. in our case economic benefits for the city and commune of Międzyzdroje.

The stages of building a marketing strategy include (Lambin, 2001, p. 121):

• needs analysis by segmentation,
• market attractiveness analysis,
• competition analysis,
• portfolio analysis,
• choosing an overall strategy and creating a strategic marketing plan.
Three phases of activities were carried out to create a marketing strategy at the Municipal Office in

Międzyzdroje (Green House Paweł Kranc, 2013):

• initial - research phase - identification of the market, objectives, segmentation,
• instrumental phase with sub-segments: product, price, distribution channels and promotions,
• audit phase - distribution and mobilization of funds.
That is why, as part of a detailed analysis, both micro and macro environments were recognized for the city and commune of Międzyzdroje. Thanks to this analysis, it was possible to identify tourist market segments for Międzyzdroje. Then, the goals of tourism development in the commune were presented, and a SWOT analysis of the tourist economy in the Międzyzdroje commune was made, as well as its development prospects.

Results of the Research

Identifying and characterizing the recipients of marketing activities, the so-called segments is one of the basic marketing issues of each territorial unit (Kruczek and Walas, 2004). The segment includes a group of relatively homogeneous entities to which we address an appropriate composed tourist, recreational and investment offer (Camilleri, 2018). Marketing activities of Międzyzdroje should be targeted at tourists visiting the resort (Sirakaya and Woodside, 2005). The group of vacationers should be divided into segments based on the following criteria:

• Age: people from 18 to 25 years old, from 25 to 35 years old, from 35 to 50 years old, over 50 years old.
• Children: children without children, families with children.
• Ways to spend your free time: sunbathers, enthusiasts of active recreation, patients, enthusiasts of exploring and exploring the area, connoisseurs of seaside cuisine.
• Marital status: single people, people living in informal relationships, marriages.
• Nationality: Poles, Germans, Norwegians, Swedes, Scandinavians.
• Place of residence (applies to Polish residents): Szczecin, Poznań, Wrocław and other cities of Lower Silesia, Gorzów Wielkopolski, areas of the western borderland belt of Poland.
• Assets: wealthy people choosing a higher standard of leisure, less well-off people looking for cheaper accommodation and tourist services.
• Time spent at the resort: 2 - 4 days, 4 - 7 days, 7 - 14 days.
• Purpose of stay: leisure (entertainment), training (conference), treatment (improvement of health).

Features from individual segments can combine to form more complex subgroups (Andrades and Dimanche, 2014). Representatives of the hotel industry are reporting a growing number of young

tourists up to the age of about 25 years, with a high standard of living. In addition to enjoying the charms of the beach and gastronomy, tourists most often ask about clubs, discos, places of entertainment. The period of stay in Międzyzdroje is shortening. The most frequently chosen period is a 2-4 day stay. It is also noticeable that longer stays are chosen by families with children and people over 35 years of age. Over the past five seasons, the cities from which tourists most often come to Międzyzdroje have not changed. "Pearl of the Baltic" is most often visited by the inhabitants of Szczecin, Poznań, Gorzów Wielkopolski and Lower Silesia. Tourists from Germany come mainly from around Berlin and Hamburg. Among the representatives of the above-mentioned segments of the tourist market, the number of people who expect a higher standard of leisure, professional service and comprehensive information about the region and the surrounding area is increasing (Stępień & Miciuła, 2017).

When segmenting the consumer products market, only a few segments from a wide range are most often selected. The situation is slightly different in the case of the Międzyzdroje tourist market. The tourist offer should be varied enough to provide the opportunity to meet the needs of the widest possible audience (Meyer, 2006). The abovementioned segments are to serve as guidelines for organizing the tourist offer, its distribution into individual regions of the city and appropriate targeting of the marketing offer. Also a very important, potential group of tourists are businessmen and people of science - participants of congress tourism. Their expenses are 2 to 3 times higher than those of other tourists (Tourist Market, No. 11 November 2009). In addition, this type of tourists can come all year round. To meet the needs of this group of tourists, local authorities should think about investments in the development of the necessary infrastructure. Conference rooms are located in the largest hotels in the city of Międzyzdroje, i.e. Rybak, Aurora, Wolin. It often becomes a chance for them to experience the dead tourist season lasting for many months. Serious clients can be attracted by establishing a specialized unit dealing with the acquisition of international congresses (table 1).

Table 1: Characteristics of segments of potential tourists of the Międzyzdroje commune.

	Segment 1	**Segment 2**	**Segment 3**	**Segment 4**	**Segment 5**
Net income per person	500 – 1000 PLN	200 – 500 PLN	1200 – 1800 PLN	800 – 1500 PLN	700 – 1000 PLN
Age	25 – 40 years	12 – 17 years	18 – 30 years	above 40 years	above 30 years
Education	Medium and higher	School youth	Vocational, secondary, students	Irrelevant	Higher
Time of visit	5 – 7 days	2 – 3 days	About one week	Above one week	2 days
Purpose of arrival	sightseeing	Teaching trips	Active recreation, entertainment	Health goals, rest	Conferences
The method of spending time	Trips, educational paths	Educational paths, monuments and museums	Sports and tourist attractions	Wellness treatments	Restaurants, discos, sports relaxation
A form of tourism	Walking, sightseeing	Staying, sightseeing	Active	SPA	Congress

Source: own study based on: (Hałub, et. al., 2005, pp. 68-69).

The investor market is divided into two basic segments. The division criterion is the type of planned investment. The first segment are investors planning to build residential, multi-family buildings, the so-called apartment. The second group consists of investors planning to build hotels. Acquiring investors from the first group guarantees higher revenues from the sale of plots for investment. However, subsequent "apartment" buildings are increasingly disapproved by the inhabitants of Międzyzdroje. Residents interpret subsequent apartment buildings as a short-sighted way to raise budget funds. "Apartment buildings" do not generate high budget revenues after construction (lower property tax). In this respect, acquiring an investor from the hospitality industry is more appreciated by the local community (Business Consulting DGA S.A., 2018). This gives a sustained budget impact in the long run, additionally guarantees the promotion of the hotel, and thus also Międzyzdroje. An additional advantage perceived by residents is the creation of new jobs in this way (Wojtaszek & Miciuła, 2018).

Entrepreneurship of the Międzyzdroje commune is based primarily on small companies oriented on tourism service. During the summer season entrepreneurs involved in selling souvenirs become active. Their location is mainly in the city center and on the promenade. As part of the accommodation base, private owners of pensions and hotels play a big role, outdoing each other in creating better and better conditions of stay for residents and tourists. Międzyzdroje has a diverse range of accommodation, from rooms for less demanding guests to luxury suites for businessmen and more affluent guests (table 2).

Table 2: Hotel facilities in the records of the city of Międzyzdroje

Specification	Number of Objects	Number of beds
Total facilities being in the commune records	367	10390

Guest rooms (private accommodation)	280	3100
Other objects reported to the commune records	10	490

Source: Municipal Office in Międzyzdroje, 2018.

According to the authors, the present times are very favorable for Międzyzdroje. Our membership in the European Union gives great opportunities for new investments and improvement of the current state. The city and entrepreneurs, thanks to the help of EU funds, have an unprecedented opportunity to match or even surpass the competitiveness of foreign seaside resorts (Miciuła, 2018). The main tourist asset of the area are still wide sandy beaches and numerous bathing areas allowing for the development of sun-sea-beach-type recreational tourism. In addition, the coastal area is characterized by extremely favorable microclimatic conditions, which, combined with the presence of spa resources (sources of brine, peat peat and mineral waters) creates favorable conditions for the development of spa and health tourism (Kotler et. al., 2017). The main product areas of the coastal belt include (figure 1):

• recreational tourism,
• health and spa tourism,
• active tourism.
Whereas supportive forms are:
• business tourism,
• urban and cultural tourism,
• specialized tourism,

• traveling tourism,
• sea tourism.

Figure 1: Outline of product concept for the Maritime Zone region.

Międzyzdroje is an ideal resort for foreign tourists, especially German tourists, mainly because the location of the city and commune is very convenient. The state border is about 25 km from the resort. The fact that the connection from the border from Kołbaskowo to Międzyzdroje is quite convenient and fast is also of great importance. The seaport in Świnoujście plays an important role, many tourists from Scandinavia come to Poland for economic reasons, and Międzyzdroje as a resort located very close to Świnoujście is becoming an extremely attractive place for foreign tourists. Mentioning the connections should not forget about the airport in Goleniów, which, although not so important in transporting tourists, it could significantly affect the transport of people from the interior of the country and the international population, in the face of the development of Międzyzdroje.

The experience gained through cooperation with the investor operating in Międzyzdroje allowed to develop a model of actions and expectations of a potential investor (Green House Paweł Kranc, 2013, p. 53). These observations may contribute to improving investor service and to better meeting his expectations. An investor assessing the investment attractiveness of a given location makes a comparison between two groups of values. The first group consists of the values and benefits of local government in a given area. Those are:

• shared land, buildings and premises,
• available natural resources,
• subsidies and subsidies (public aid),
• information provided, services provided,
• transferred movable goods - machines, devices, tools, semi-finished products, raw materials,
•workers,
• marketing image of the city and region,
• access to markets,
• access to economic, technical and social infrastructure,
• social atmosphere - acceptance of the inhabitants.

The investor decides on the location of the project not so much on the basis of the assessment of the benefits proposed by the city, but on the basis of the balance of benefits and costs (Gaworecki, 2006).

The other side of this specific account consists of various costs that the investor must bear when deciding to operate in a given area. These costs include:

• financial costs of launching the investment - availability and price of the land,
• costs of involving production factors - material and personal,
• costs of shaping the distribution system,
• costs of acquiring technology (e.g. construction on unfavorable ground),
• costs of time spent - unproductive time associated with the investment (eg waiting for administrative decisions),

• costs of mental involvement of staff (eg socio-cultural differences related to the need for temporary resettlement of staff).
Knowledge of the investor market will allow the city and commune authorities to acquire them for investment purposes for development and obtaining measurable benefits throughout the region.

SWOT analysis of the tourist economy on the example of the city of Międzyzdroje

A synthetic combination of opportunities and threats as well as strengths and weaknesses gives the opportunity to take a broad look at the current market situation of the described region (Panasiuk, 2010). SWOT analysis is an excellent tool supporting the formulation of marketing goals and strategies, based on which the local government can implement the next stages of marketing strategy (Hejduk, 2016). The SWOT analysis aims to thoroughly assess the broadly understood resources of Międzyzdroje from the point of view of the resort's competitive ability and achieved market position. It is a comprehensive and combined use of conclusions arising from both the analysis of the environment and the analysis of the city's resources (Stabryła, 2002). Below are the opportunities, threats, strengths and weaknesses of Międzyzdroje in a four-element matrix (table 3).

Table 3: SWOT analysis of the city of Międzyzdroje

Strengths:	**Weaknesses:**
1. Unique geographical distribution on Wolin Island, Wolin National Park, 2. Spa status, spa tradition, 3. Great interest among tourists from Germany and Scandinavia, 4. A rich and diverse range of accommodation, 5. High expenditure on the promotion of the city, 6. A strong brand of the "Festival of Stars", 7. Numerous tourist attractions, 8. Międzyzdroje ring road, 9. Low operating costs of the office, 10. Experience in attracting investors from the construction industry, 11. Performing a tourist audit, 12. Established position of the resort among the inhabitants of western Poland, 13. An extensive gastronomic offer, 14. Key investments started to develop the tourist offer, including the pier, promenade, amphitheater, 15. Development investments successfully completed in previous years, which may become the driving force of other investors, 16. Municipal plots for sale located in places attractive for tourists, 17. Conference facilities, 18. Support of residents for local government activities, 19. Good access from western Poland, 20. High marketing and promotional awareness of the City Hall employees, 21. Lack of industry - pollution, 22. Modern pier with the possibility of mooring passenger ferries, 23. City and commune known on an international scale.	1. Lack of a unified comprehensive database of accommodation and leisure offers, 2. Low level of investments intended for hotel operations in comparison with housing investments, the so-called apartamentowymi, 3. Poor condition of pavements in the most representative parts of the city, 4. Insufficient parking spaces for visitors, especially in high season, 5. The reputation of a holiday town with particularly high prices, 6. Difficult access from other than western part of Poland, 7. Trace use of renewable energy sources in the commune, 8. A small number of gas stations in the city, 9. bacteriological threat on the beach in 2008 10. Low quality of internal passenger transport, 11. A small number of international flights served at the nearby airport, 12. Poorly developed tourism management system at regional and local level 13. Potential threat to biocenosis and natural landscape values, 14. Employment of a large part of the local society only for the seasonal period.

Chances:	**Threats:**
1. Growing interest in Międzyzdroje as an excellent resort for organizing industry conferences, 2. Growing interest in Międzyzdroje among young, active and wealthy tourists, 3. Low value of Polish zloty on the currency market, which increases the price attractiveness of the resort among tourists from abroad, 4. Expansion of the tourist information system related to attractions available in the commune, 5. Rising costs of recreation abroad, which may attract native tourists to the Polish coast 6. Systematic expansion of road connections, especially in western Poland, 7. Sector cooperation in the hotel and recreation industry 8. Creating a comprehensive database of holiday offers in Międzyzdroje 9. Attracting investors from the hotel industry 10. Increasing tourists' awareness of the tourist attractions available in the commune, 11. Participation in tourist fairs and presentations, 12. Fashion for spending free days around Christmas at the Baltic Sea, 13. Germany as the most numerous nationalities visiting Poland for tourism purposes, 14. The reputation of Polish resorts abroad as cheap and hospitable places, 15. Promotional cooperation of the town hall and representatives of the hotel industry, 16. A steady increase in the number of international tourists, 17. Great interest in active forms of recreation in resorts such as Międzyzdroje, 18. Development of sea tourism (passenger ferry cruises), 19. Big profits for the city thanks to special economic zones.	1. The economic crisis as a factor deteriorating the financial condition of development enterprises, 2. The announced construction of a liquefied gas terminal, so-called the gas port in Świnoujście, which may affect the attractiveness of the west coast 3. Planned reduction of household expenditure on tourism 4. Possibility to popularize information about problems with bacteriological cleanliness of the beach 5. High position of other seaside resorts in terms of tourism and investment 6. Decisions about a holiday trip to the Baltic Sea are taken a short time in advance 7. Shortening the average stay at the sea, 8. Decreasing profitability of a number of services increasing the attractiveness of the tourist offer and increasing tourists' expenses, 9. Disputes between the city and entrepreneurs about issues related to renting space for erecting souvenir boxes, 10. Low sense of tourists' safety (state of public safety in cities and on roads), 11. The increase in the number of tourists affecting the intensification of natural environment exploitation, uncontrolled degradation of the natural environment.

Source: Own study based on: (City Hall in Międzyzdroje, 2018; The Green House Paweł Kranc marketing agency, commissioned by the Municipal Office in Międzyzdroje, 2018).

The analysis presented has many possible practical implications, both for institutions responsible for the development of the studied regions and individual enterprises focused on a given type of clients. The conducted case study also allows to use the illustrated research process together with the use of tools and methods used for other cities or tourist regions.

Summary

The creation and development of competitive tourist products is one of the most important areas of the "Development Strategy of the city and commune of Międzyzdroje". Creating and developing a diversified and competitive market of products is a priority task for 2020 for the tourism sector and regions in Poland. The objectives of this area include both the construction of new products and the improvement of quality and increasing the competitiveness of the range of products already on the market. The creation of attractive products at the local, regional and supra-regional level is only one of the stages of the competitive tourist product development program. Actions aimed at improving

products, processes of their modernization and increasing quality will also be supported. The development of brand tourist products, including the creation of modern and market-competitive offers, is a significant opportunity for dynamic development of regions. It will allow, among others for tourist activation within the entire area covered by the action, building a broad partnership around the program, increasing the synergy effect and achieving a lasting and significant economic effect for the region. This development also opens up great opportunities for interregional cooperation, including improving coordination of activities and conducting an effective policy of balancing development through tourism. Attention should also be paid to supporting the development of a specialized, personalized offer, in line with global trends, flexibly adapting to market needs. It is necessary to develop assumptions and concepts for the development of a group of competitive niche and specialized products, using primarily the so-called market niches that appear most often in areas of newly realized and created tourist needs. These types of products, according to global tourism development forecasts, will be gaining more and more popularity and market share. In the case of Poland, niche products should be created primarily at the level of regions depending on the specificity of tourist values of areas and assumptions of regional policy.

The vision of the city and the commune in 2015 presents the commune of Międzyzdroje as a popular health resort in Poland and Europe, possessing valuable natural and landscape assets and creates conditions for rest and provides its residents with access to work, education, culture and social care in accordance with their needs. As part of modernization and development of tourism, Międzyzdroje is a recreation, sport and tourism center of the western part of the Baltic coast that develops in a sustainable way, providing its inhabitants with prosperity and development opportunities. Such development perspectives and actions of local authorities towards their implementation should be assessed positively.

Acknowledgements

The project is financed within the framework of the program of the Minister of Science and Higher Education in Poland under the name "Regional Excellence Initiative" in the years 2019–2022, project number 001/RID/2018/19, the amount of financing PLN 10,684,000.00.

Abstract

Recent developments in the UAE have progressed towards the concept of disaster resilience. However, preparations for any impending disaster have been slow and in fact, due to the country's recent legal establishment as a nation, disaster preparation has featured on national agenda. In light of the new nuclear development at Braqa and other expansions in UAE energy sector, it is important to understand vulnerabilities of the sector as a means of preparedness for future natural or man-made hazards. However, over the last decades, awareness of the range of potential threats to the UAE has increased. In response to this, the National Emergency Crisis and Disasters Management Authority (NCEMA) was established in 2007 (NCEMA). NCEMA is a specialised authority that regulates and coordinates the disaster response efforts at the national level. In this organization (NCEMA) training plays a very crucial role among the staff in which well-trained employees performs better than less-trained employees in terms of disaster management. Therefore, this research explores the Mediating Effects of Staff Training on the Relationship Between Geoinformation and Natural Disaster Management in United Arab Emirate. The findings of this research papers show that there is a significant mediating effects of staff training on the Relationship Between Geoinformation and Natural Disaster Management in United Arab Emirate.

Keywords: Natural Disaster, Geoinformation, UAE, NCEMA.

Introduction

Increasing frequency and intensity of disasters have resulted in severe disruptions to communities and built environment facilities around the world. There is an evident increase in human and property losses from disaster events over the past few decades. In the period between 2000-2011, 2.7 billion people have been affected by disasters, 1.1 million of which were fatalities and the financial cost of disaster impact was estimated at $1.3 trillion (Wex et al., 2014). Evidence suggests that disaster risks are rising at a rate faster than affected communities can build resilience (Albano, & Sole, 2018). Fast growing cities and urban areas of the world increase disaster vulnerability due to economic growth and fast population expansion. Cities, where more than 50% of the global population resides and where much of the economic assets can be found (Haworth et al., 2015), are very much the epicentre for destruction and loss brought about by natural and man-made disasters.

Growing urbanisation results in increased built environment facilities such as buildings and infrastructure, and thus a greater exposure of potential human populations and services to natural or man-made hazards (Garcia, Istomin, Slesareva, & Pena, 2018). The need to address disaster vulnerability of built environment facilities such as infrastructure is becoming increasingly important. How, these facilities are designed and built, and where they are located, is critical to their ability to withstand different types of natural or man-made hazards. The energy sector is a strategic component of any modern society. As the demand for electricity and energy grows, so do the complexity of the system and the need to protect it. The significant increase in consumer demand and population in both developed and developing countries means that not only society dependents upon the energy sector, but also that more people and businesses require an increasing energy supply, in order to operate normally (Khalid et al., 2015). Failure to protect the energy system and build resilience into the infrastructure could have severe affects, should these assets have subjected to a natural or man-made disaster.

The disasters that have frequented the United Arab Emirates (UAE) or at least have the potential to do so, such as storms, earthquakes, tsunamis, terrorist attacks, are complex and diverse in origin as they are in effect. Energy sector dominates in the UAE economy, especially in terms of its production and supply, and holds a very important global position in the world's economy. The protection of these systems and assets and within the energy sector especially, the safeguarding of oil and gas infrastructure from any natural or man-made hazards should become the top priority of the UAE (Kunz et al., 2014). Recent developments in the UAE have progressed towards the concept of disaster resilience. However, preparations for any impending disaster have been slow and in fact, due to the country's recent legal establishment as a nation, disaster preparation has featured on national agenda only very recently. In light of the new nuclear development at Braqa and other expansions in UAE energy sector, it is important to understand vulnerabilities of the sector as a means of preparedness for future natural or man-made hazards (Saleh et al., 2015). Similarly, in toppling disaster in any nation, staff capacity is of greatest importance in which only capable staff could handle the disaster and defeat it if they have appropriate training and adequate equipment. Therefore, this research explores the mediating effects of staff training on the relationship between geoinformation and natural disaster management in United Arab Emirate (UAE).

Methodology

The methodological framework that was used in attaining the stated objective of this study is based on positivist paradigm i.e quantitative research methodology. It shows how the research hypotheses postulated were empirically determined and examined through relevant methodological approaches adopted in the study (Mackey and Bryfonski, 2018). The research design, types and sources of data was examined along with the procedure employed in testing the hypothesis and accomplishing the study objective. The methodology of this research paper focused on the study populations/sample frame and its characteristics, sampling technique chosen, and a description of the choice of data collection instruments, questionnaire design, methods of data measurement, analysis and presentation. The methodology employed was quantitative in nature and SPSS and Smart-PLS software were used to analyse data collected from the respondents in the National Emergency Crisis and Disasters Management Authority (NCEMA).

Result

Respondents' Demographics

The profile of the respondents is presented in table 1 below. It contains information on the gender of the respondents, their age, marital status, and the highest educational qualification attained by the respondents.

Table 1: Respondents' Profile

S/N	Respondents' Details	Response	Frequency	Percent
1	Gender	Male	274	83.3
		Female	55	16.7
		18-29 years old	48	14.6
		30-39 years old	140	42.6
2	Age	40-49 years old	103	31.3
		50 years old and above	38	11.6
		Single	73	22.2
3	Marital Status	Married	244	74.2
		Divorced	12	3.6
		Secondary Certificate	10	3.0
4	Educational Level	Diploma	36	10.9
		Degree	231	70.2
		Masters	35	10.6
		PH.D	17	5.2

Table 1 is used to present the respondents' information regarding their gender, age, marital status and educational level they attained. The result shows that the respondents are predominantly male as indicated by 83.3 percent response while females account for the remaining 16.7 percent response. Similarly, Majority of the respondents are within the age bracket of 30-39 years as indicated by 42.6 percent response followed by those within the age bracket of 40-49 years as indicated by 31.3 percent response rate. The younger respondents of between 18- and 29-years account for 14.6 percent while the elderly above 50 years account for the remaining 11.6 percent. Majority of the respondents have degree qualification as indicated by 70.2 percent followed by those with Diploma and Masters as indicated by 10.9 percent and 10.6 percent response respectively. 5.2 percent of the respondents have PhD qualification and the remaining 3 percent of the respondents have secondary school certificate.

Mediating Effects of Staff Training on the Relationship between Geoinformation and Natural Disaster Management

This section provides information on the role staff training played in natural disaster management in UAE. The result of the descriptive analysis conducted is presented in table 2 below.

Table 2: Training

	Mean
Staff training is paramount in working with disaster management gadgets	3.67
Trained staff perform better than untrained staff in tackling disaster	3.75
Training give staff more understanding in solving disaster management	3.76
Trained staff manage more resources than untrained staff in disaster management	3.79
Trained staff used new tools in disaster management	3.90
Training (Aggregate)	**3.7757**

Table 2 is used to show the influence of staff training in natural disaster management in UAE. The result shows that respondents agree that Staff training is paramount in working with disaster management gadgets; Trained staff perform better than untrained staff in tackling disaster; Training gives staff more understanding in solving disaster management; trained staff manage more resources

than untrained staff in disaster management; and Trained staff used new tools in disaster management as indicated by mean values of 3.67, 3.75, 3.76, 3.79 and 3.90 respectively. Aggregately, staff training has high application in tackling natural disasters in UAE as indicated by 3.776 mean value response.

Evaluation of Structural Model

The structural model establish the causal relationships between the measurement models in the structural model (Hair et al., 2016). The specified interrelationships are intended to answer the research question and to test the research hypothesis. The major objective of structural model evaluation is to assess the model quality based on its ability to predict the endogenous constructs. The structural model is evaluated by assessing the path coefficients and their significance through bootstrapping procedure; the coefficients of determination (R^2) of the endogenous construct; the effect sizes of the exogenous measurement model through Cohen's f^2; the model's predictive relevant using cross-validated redundancy (Q^2); and the global goodness of fit of the model (*GoF*) (Goh, Ali, & Rasli, 2014; Hair et al., 2014; Hair).

The structural model is presented in figure 1 depicting first run model's coefficients before final modifications.

Figure 1: First Run Structural Model

After the modification on the first run model, the final structural model for the research paper is presented in Figure 2 below.

Figure 2: Final Model

Figure 3: Final Model T-statistics

Figures 2 and 3 are used to present the final model and its t-statistics respectively. The coefficient of determination (R2) and the path coefficients are presented in Figure 2 while the t-statistics which shows the significance level is presented in figure 3. The information in the structural model is used in testing the formulated hypotheses.

The model's path coefficient and their significance provide the required information for testing the stated research hypothesis. The hypotheses are tested as presented in table 3 below.

Table 3: Hypothesis testing

Paths	Hypothesis	Path Coefficient	T Statistics	P Values	Remark
ST -> DM	H1	0.203	4.297	0.000	Supported
TT -> DM	H3	0.160	2.787	0.005	Supported
GIS -> DM	H6	0.252	3.899	0.000	Supported
TR -> DM		0.386	6.106	0.000	Supported
ST -> TR		0.171	3.451	0.001	Supported
TT -> TR		0.396	6.244	0.000	Supported
GIS -> TR		0.347	4.710	0.000	Supported
ST -> TR -> DM	H2	0.066	2.887	0.004	Supported
TT -> TR -> DM	H4	0.153	4.700	0.000	Supported
GIS -> TR -> DM	H5	0.134	3.465	0.001	Supported

In the structural model, there are 10 paths out of which 6 of them represent the earlier formulated hypotheses of the research. From table 3, it shows that all the hypotheses are supported. The result indicted that there is significant causal relationship between space technology and disaster management as indicated by path coefficient of 0.203 with t-statistics value of 4.297 and p-value of 0.000. Thus, supporting hypothesis H1. Similarly, tunnelling technology also has significant causal relationship with disaster management as indicated by path coefficient of 0.16 with t-statistics of 2.787 and p-value of 0.005 therefore supporting hypothesis 'H3'. H6 hypothesised significant relationship between GIS and disaster management. The research found significant causal relationship between GIS and disaster management as indicated by path coefficient of 0.252 with t-statistics of 3.899 and p-value of 0.000.

Training is modelled as mediating the relationship between space technology, tunnelling technology and GIS with disaster management. The result shows that all the disaster management technologies have significant relationship with training. Similarly, training significantly mediates the relationship between space technology, tunnelling technology, and GIS with disaster management as indicated by specific indirect effects of ($\beta = 0.066$, t-value = 2.887, p-value = 0.004), ($\beta = 0.153$, t-value = 4.700, p-value = 0.000), and ($\beta = 0.134$, t-value = 3.465, p-value = 0.001) respectively.

Cumulatively, about 81.4 percent of the variance in disaster management in UAE is explained by space technology, tunnelling technology, GIS, and training as indicated by coefficient of determination (R^2) value of 0.814.

Path Coefficients Evaluation

PLS-SEM has a major aim of predicting the causal relationship between research exogenous constructs and the endogenous constructs which are normally formulated in hypotheses. After running the model, the hypotheses are tested using the path coefficients (Hair et al., 2014). Path coefficients are used to measure the strengths of the relationships between the research's constructs in the structural model. The coefficients represent the strength of a relationship with coefficients closer to 1 showing strong positive relationship (Hair et al., 2014). The significance of the path is assessed using the t-statistics through the process of bootstrapping (Kock, 2014). The path coefficients and their significance level indicate evidence of model's internal quality. To ensure quality of the inner

model, the path coefficients are required be significant (Wong, 2016). The path coefficients of this study are presented in table 4 below.

Table 4: Path Coefficients

Paths	Path Coefficient	T Statistics	P Values	Remark
ST -> DM	0.203	4.297	0.000	Significant
TT -> DM	0.160	2.787	0.005	Significant
GIS -> DM	0.252	3.899	0.000	Significant
TR -> DM	0.386	6.106	0.000	Significant
ST -> TR	0.171	3.451	0.001	Significant
TT -> TR	0.396	6.244	0.000	Significant
GIS -> TR	0.347	4.710	0.000	Significant
ST -> TR -> DM	0.066	2.887	0.004	Significant
TT -> TR -> DM	0.153	4.700	0.000	Significant
GIS -> TR -> DM	0.134	3.465	0.001	Significant

The entire 10 paths in the structural model have significant coefficients. It can be concluded that the research structural model has the required quality as all the path coefficients are significant.

Conclusion

This paper is on the mediating effect of staff training on the relationship between geoinformation and natural disaster management in UAE with the case study of National Emergency Crisis and Disasters Management Authority (NCEMA). The research employed quantitative methodology to collects data from the respondents in the National Emergency Crisis and Disasters Management Authority (NCEMA). SPSS and Smart-PLS were used to analyse data collected from the respondents. The findings of this research papers show that there is a significant mediating effects of staff training on the Relationship between Geoinformation and Natural Disaster Management in United Arab Emirate.

Abstract

Digitalization of all social processes and phenomena requires the creation of an information environment in accordance with the semantic representation of reality and adaptation-value invariants of personality identification from the point of view of mathematical knowledge. The effectiveness of information processes in the methodology of cognition requires the algorithmization of cultural codes in the discourse of scientific schools. The possibility of unrealistic objective information about an object as a form of existence does not depend on subjective knowledge and is created independently of thinking. Since truths arising from pure concepts are objectively possible, and truth-in-itself is a direct object of cognition, purely logical means are the criterion of the truth of information knowledge. Thus, it can be assumed that the criterion of the truth of the event (expected) information is the form of the language within the framework of logical procedures. The principles of encoding logical information lead to the analysis of only definitions of concepts in statements. Specific intrasystemic interference created by the transmission channel of the evidence by its consumers comes to the fore. Such interference is subtracted in the form of a priori, external consumer attitudes, accompanying or preventing the receipt of evidence. These hindrances are objective in the sense that any subjective thinking in the process of receiving (perceiving) evidence has a priori information that in general does not coincide (at best, partially coincides) with the original premises of the proof logic and its codes.

Keywords: information, logic, knowledge, logical forms. thinking, truth, verbal-logical discourse.

Introduction

Looking through event information through logical procedures, one can single out the concepts of J. Bernoulli and B. Bolzano. These concepts underlie the theory of information. The first concept is defined by such probabilistic representations that occur in the absence of information, and the initial probabilities can be calculated solely on the basis of research and understanding of the properties of objects of interest (in other words, by obtaining and processing a certain amount of information about the object). This is a significant difference between the concept of J. Bernoulli and the concept of P. Laplace, in which the principle of the absence of any information about the properties of the object of interest is the main [2]. The second concept is defined by the philosophy of B. Bolzano, which relies on an overabundance of information about the object. This idea is reflected in the doctrine of ideally

existing "objective" truths, sentences and self-representations, acting as a constant opportunity of past, present and future subjective, human imaginable representations and events [1].

In the future, the classification of information about the events of J. Bernoulli was reflected in B. Russell's type theory, which will be discussed later. The methodological basis of the theory of types by J. Bernoulli is the concept of a “probabilistic event”, characterized by a lack of information about the process or phenomenon. This is due to a mismatch between the scientific and intuitive understanding of the phrase "probable event". The concept of "probability" is defined through the "reliability" of information, now understood not in the ontological, but in the epistemological sense. J. Bernoulli defines probability as the degree of reliability of information that differs from the latter as part of the whole. This definition can be interpreted as a definition of informational subjective probability, since J. Bernoulli, inclined to deny the objectivity of the case, argues that the probability of obtaining information does not relate to a thing in itself, but to our knowledge of it [3]. O. B. Sheinin believes that under the “true probability” of obtaining information about the event, J. Bernoulli means the “classical” probability previously defined by him. However, in a number of examples cited by him, the calculation of the “classical” probability is in principle impossible already for the reason that there is no system of equally possible events, i.e. equally probable information. Having defined the probability through the ratio of favorable cases to equally possible (classical definition), we can talk about similarity or congruence, which justifies the principle of insufficiency of bases, which implies the equal possibility, due to certain information about the properties of the studied object [7].

Aim and research problems

There is some problem that poses and solves J. Bernoulli. It consists in the following: with an increase in the number of observations, the statistically calculated probability of an event (similar to probability in information theory) becomes arbitrarily close to the true information probability of the event. Hence, based on the definition of probability as a degree of reliability and calling one of several events more probable, we can talk about subjective information probability. Moreover, the true value of event information can be understood as the objective probability of an event, as well as the subjective probability, corresponding to the level of our knowledge of the phenomenon [4].

An excess of information, as noted earlier, is determined by the concept of B. Bolzano. He distinguishes two kinds of existence of objective information: a) the existence of real information - "directly given"; b) the existence of unrealistic, but possible information - the existence of "in itself." Therefore, an emphasis is placed on the qualitative characteristics of information, and in conjunction: objectivity - subjectivity, reliability - unreliability, completeness - incompleteness, relevance - irrelevance, value - futility, intelligibility - incomprehensibility [8]. The possibility of unrealistic objective information about an object as a form of existence does not depend on subjective knowledge and is created independently of thinking. Since truths arising from pure concepts are objectively possible, and truth-in-itself is a direct object of cognition, purely logical means are the criterion of the truth of information knowledge. Thus, it can be assumed that the criterion of the truth of the event (expected) information is the form of the language within the framework of logical procedures. From here, firstly, the very concept of "intensional information" is clarified, which leads to a revision of our ideas about descriptions of cases (descriptions of states) [15].

It is necessary to dwell on the transfer of true information of logical procedures in communication processes. This is the second aspect of the presentation of logical information. The first is determined by event, internal information and the process of coding it. The second is due to dispositional, external information and the process of its transmission. The methodological basis of the second aspect of information in logical procedures is the philosophical definition of the concept of information, recognizing it as an attribute of matter, equivalent to matter and energy, which allows us to interpret information as a thin material structure with properties unusual for the physical world [5]. However, recently this position has been transformed, and the emphasis is on the existence of information in the world of personal psychology, where there are artistic images, scientific knowledge, myths about the past and dreams about the future. The analysis of logical procedures in

communicative processes shows that the blurring of the line between event and dispositional information is carried out on the basis of a subjective representation of reality as a discourse.

Speaking of personal psychology, one cannot ignore the existence of objective knowledge without a knowing subject. According to K. Popper, this idea is knowledge objectified in books, magazines, etc. Moreover, since the existence of information without a knowing object is recognized, it should be recognized for the subjective knowledge of individual individuals, because it is they that generate the objective information. In the objective world, there are innumerable properties and relationships within matter and energy, as well as between matter and energy. Some of them are perceived by the senses, recognized, that is, converted into an image (semantically transformed into a model of objective reality) and subjectively recognized as information [9]. Within the framework of the logical procedures of consciousness, information is subjective reality, since consciousness is a subjective image of the objective world. Information is the central concept of information communication. It can be objectified if presented in symbolic form and transferred to an external medium. The principles of communication draw attention to such an element of logical knowledge as evidence. The principles of encoding logical information lead to the analysis of only definitions of concepts in statements [14]. Specific intrasystemic interference created by the transmission channel of the evidence by its consumers comes to the fore. Such interference is subtracted in the form of a priori, external consumer attitudes, accompanying or preventing the receipt of evidence. These hindrances are objective in the sense that any subjective thinking in the process of receiving (perceiving) evidence has a priori information that generally does not match (at best, partially coincides) with the original premises of the proof logic and its codes [6]. This information to one degree or another conflicts with the evidence, interferes with its adequate reception, and impermissibly coarsens the input of the receiver, increasing beyond measure the thresholds for detecting and distinguishing signals. With especially intense interference, collisions like “I don’t want to understand”, “I don’t understand, then it’s wrong”, etc. are possible. Under these conditions, the “channel encoder” must take into account the nature and intensity of such interference and introduce adequate redundancy in the proof logic, for example , through the mechanisms of repetition, testing, analogies, etc. If we consider a posteriori uncertainty in the definition of concepts through the unconditional entropy of a statement as a measure of its a priori uncertainty, then the maximum unconditional entropy of the information source and it is achieved at the equiprobability possible states.

Results of the research

Therefore, the source of information is the initial statement, which, from the point of view of proof, has two states: truth and falsehood. But it is impossible to build on only two values because there will be no exact equiprobability, but only a replacement in the semantic meaning of the concept. The finite duration of the proof does not allow to realize the entire possible range of arguments in favor of its reliability. Therefore, the arguments should be selected so that their total information content is, if possible, equivalent to the information content of the vast majority of this spectrum [10]. There is a property of additivity of information. In signal theory, the concept of the width of the equivalent spectrum of a signal is used, which characterizes its hypothetical finite rectangular energy spectrum, equal in area (in the spectrum-frequency coordinate system). Both spectra are equivalent. Often the equivalent signal spectrum is called effective. By analogy, the proof should contain a finite number of arguments, equal in information content (as far as possible) to their real number. Conventionally, such a proof is defined as effective [13].

Thus, the key characteristic of philosophical proof, as, indeed, of any other, is its information content. One can prove something only through mutual understanding, achieved in a certain field interaction through its information component while eliminating the distorting (noisy) influence of the power component. The traditional information-energy, "costly" evidence of how management should give way to a purely informational, resource-saving understanding as a connection. This is precisely the hermeneutic essence of the dialogue of cultures; the implementation is seen in low-energy information processes eliminating the noisy sign transformations of the encoding – transmission – decoding of information that are characteristic of the traditional dialogue. The width of the equivalent spectrum of information transmission indicates a strong "coverage" in the process of discourse of

diverse information, hence the difficulty arises in establishing its truth [12]. Therefore, verbal-logical discourse cannot be a guarantor of reliable evidence. Attempts to find it in the principles of verifiability and coherence of statements are also hopeless. It can be assumed that the cause of this problem should be seen in the discrete nature of the discourse itself, which, due to this genetic discreteness, is incapable of proving substantively the significance (truth / falsity) of statements, the meaning of which is continual in nature. The relevance of this presumption is confirmed by the emergence along with two-valued clear logic (values of "true" or "false") of "fuzzy" logics based on linguistic variables [11]. However, fuzzy logic based on a finite set of values of linguistic variables is discrete, because, like two-valued logic, it can guarantee only the plausibility of the proof. The discourse will be more flexible, adequate.

The justification of the completeness of information as the degree of correspondence of the information received to its true value is expressed as the main categorical-conceptual forms of information: reliability, adequacy, accessibility and relevance

Reliability is the degree of correspondence of the received information to its true value. Information is reliable if it reflects or does not distort the true state of affairs. Objective information is always reliable, but reliable information can be both objective and subjective. She helps make the right decisions. Inaccurate information can lead to misunderstanding or wrong decisions.

Adequacy - the degree of compliance with the real objective state of affairs. Inadequate information can be formed when creating new information on the basis of incomplete or inaccurate data. However, complete and reliable data if inadequate methods are applied to them can lead to the creation of inadequate information. The lack of adequate methods for working with data in many cases leads to the use of inadequate methods, resulting in the formation of incomplete, inadequate or inaccurate information.

Availability is a measure of the ability to receive information. The degree of its availability is simultaneously affected by data availability and adequate methods for their interpretation.

Relevance - the degree to which information corresponds to the current moment in time. Often relevance, as well as completeness, is associated with the commercial value of information. Relevance - importance, materiality for the present. Timely information received can bring the necessary benefits. Outdated information is irrelevant. When working in constantly changing conditions, it is important to have relevant, that is, relevant information, information.

Conclusion

Logical form is the ability of an image to be an image. Logical space is determined by the internal relationships of the totality of characters. The creation of an adequate recording system that would demonstrate that the so-called logical constants (facts), which mean nothing, is necessary. The truth operations, which in terms of language correspond to logical constants, can be reduced to the explication of internal relations between sets of signs through logical following. The information content of logical forms lies not in the field of subjective representations, but in the explication of architectonics of the objective domain of meanings.

Abstract

The paper presents an overview of European Union policy regarding digital inclusion and digital transformation. It describes the impact of the digital skills to rising digital inclusion level. Special attention is required to analyze different types of digital skills within geographical groups of countries – Western Europe, Northern Europe, Southern Europe, and Eastern Europe. The dataset covers 2018-2020, obtained from Eurostat and other sources. The results of the analysis reveal that Nordic countries demonstrate the highest level digital skills, followed by the Western and Southern countries, and Eastern European countries have much lower rates. An exception among these countries is Ukraine, which is developing a digital society, focusing on the Association Agreement between the European Union and its Member States, of the one part, and Ukraine, of the other part (2014). The case study, based on Ukrainian experience, meanwhile, identifies a digital divide among citizens and discovers a set of tools for improving present situation, in particularly from Ministry of Digital Transformation of Ukraine. The paper concludes with the need to provide the targeted government decisions in European Union countries, as well as Ukraine.

Keywords: digital skills, digital inclusion, European countries, Ukraine.

Introduction

Digital inclusion are highly important for citizens` engaging in economic, social, cultural, civic and others areas of state and personal life. And digital skills decidedly are one of determinative indicators for evaluation of digital inclusion in different countries. The importance of this indicator was stressed in a number of official documents and research publications. Thus, Pillar 6 of the Digital Agenda for Europe directly related to digital skills in the context of enhancing digital literacy and inclusion. It denotes that on 2010 150 million Europeans (30%) have never used the Internet and emphasizes on the digital skills necessity for innovation and growth [1].

The new Skills Agenda for Europe adopted by the European Commission in 2016. It indicates that almost half the European Union population lacks basic digital skills; with around 20% of people having none at all. Thereby, digital skills are lacking in Europe at all levels, though the rapid digital transformation of the economy and society in general requires adequate digital skills [2]. So, the European Union made digital literacy and skills a priority of its policies, launched the Digital Skills and Jobs Coalition, and leading to the need for every citizen to have at least basic digital skills in order to live, work, learn and participate in the modern society. Regulations and digital inclusion practice have been spread out across Europe, as well as digital skills have been distributed amongst different socio-demographic groups of citizens within European countries.

According to Helsper (2014), the main definitions of digital inclusion are 'access', 'skills', 'motivation', 'engagement' and 'content'. Moreover, they can be linked to particular social outcomes for particular socio-demographic groups in particular countries. Helsper stressed, that digital skills should be thought of at a basic technical, operational level, as well as in relation to the critical, social and creative literacies [3].

There are different approaches to classify digital skills. For instance, in survey, conducted in the United Kingdom by Helsper and Eynon, they determined technical, social, critical, and creative skill types and divided them for two categories: 1) operational (creative and technical) and 2) strategic (social and critical) [3]. Another arguable question is measuring the level of digital skills. Helsper and Van Deursen (2015) noted, that the Eurostat indicators measure different types of use rather than skills. And regarding the achieving certain digital literacy goals, a number of European countries have digital skills initiatives that focus on schools or libraries or community centers training and assist to increase digital literacy in vulnerable groups [4].

This paper attempts to reveal the present level of digital skills in European countries, compare Ukrainian data, and find out what relevant decisions the governments need to make to increase digital inclusion in their countries.

The paper applied empirical methods, historical methods, relevant legislation and literature analysis, statistical methods (mostly descriptive statistics – tabular, numerical methods, and grouping for summarizing and describing data), comparison, and other research approaches. Data for the international comparisons are obtained from the European Commission, e.g., Key Indicators of the European Information Society [5], Worldometer [6], Hootsuite [7], and Ministry of Digital Transformation of Ukraine [8].

Data gathering and Analysis

The European Commission regularly overviews how digital literacy is distributed across European households and individuals, such comparative data are collected yearly by Eurostat. Table 1 reveals digital skills level in European countries according to statistics 2019. The authors grouped European countries using the regional principle, since the results of many studies indicate that within the group there are similarities and groups are often compared.

Table 1: Digital skills level of European countries citizens in general

**not available*

Source: Authors – based on the data of Eurostat, 2019, Worldometer, 2020, Ministry of Digital Transformation of Ukraine, 2019

As we find out from Table 1, the Nordic countries demonstrate the highest level digital skills (43% average), followed by the Western (40% average) and Southern (26% average) countries, and Eastern European countries have much lower rates (21% average). The situation in the latter group is explained by the fact that some countries have joined the European Union recently and some ones are not members of the European Union. Therefore, the European Union digital programs and standards are not implemented in these countries. Besides, there are the lack of assessment of digital skills level

of their citizens. An exception among these countries is Ukraine, which is developing a digital society, focusing on the Association Agreement between the European Union and its Member States, of the one part, and Ukraine, of the other part (2014).

Whether a person has digital skills is determined on the basis of his or her performance in four areas. These are: 1) information (e.g. looking up information on the internet, transferring files, and saving photos in the cloud); 2) communication (e.g. sending emails, making internet phone calls, and using social networks); 3) problem solving (computers/online services, e.g. online shopping, installing apps, and taking online courses); 4) software skills (e.g. using software to edit photos, videos, or files).

An official data 2019 Eurostat are presented in Table 2, last update: 15.04.2020. For every country 'Information skills' includes 'Individuals who have basic and above basic information skills'; 'Communication skills' – 'Individuals who have basic and above basic communication skills'; 'Problem solving skills' – 'Individuals who have basic and above basic problem solving skills'; 'Software skills' – 'Individuals who have basic and above basic software skills'. General data calculated for 28 European Union countries.

Source: Authors – based on the data of Eurostat, 2019, Ministry of Digital Transformation of Ukraine, 2019

Analyzing the digital skills level in order to find out the competence characteristics, we note that most countries in Northern and Western Europe are above the average European Union dimension. The exceptions are Latvia, Lithuania, and Ireland (regarding software skills). Southern Europe countries demonstrate both rather low digital skills level and big difference within group. The lowest digital skills level have Eastern Europe countries. An exception is Czech Republic – its digital skills level corresponds to the level of Northern and Western Europe countries.

Different EU countries conduct special advanced research and share additional information about digital literacy level their citizens. Thus, according to statistics, the Netherlands is one of the countries in Europe with the largest number of citizens with proficient digital skills. In 2019, half of the Dutch population aged 16 to 74 years had 'above basic' overall digital skills, versus an average 33 percent in the European Union. In the area of information, the share of Dutch people with above basic digital skills was 89 percent, while the EU average stood at 71 percent. The Netherlands` citizens were also showed above basic skills in 'communication' and 'problem solving': 83 and 81 percent respectively, and the EU average was 67 percent for 'communication' and 59 percent for 'problem solving' [9].

The OECD Survey of Adult Skills in Austria (2017) defines digital problem-solving skills as the capacity to solve problems using a computer. These skills include writing an e-mail and browsing the web (level 1), implementing more advanced tasks involving multiple steps (level 2), and the capacity to use both generic and specific software applications with inferential reasoning (level 3). It was emphasized that job tasks change due to digitalization – almost all jobs need interaction with

computers and basic or above-average digital skills, or a combination of professional skills and IT skills [10].

Table 3: Digital behavior in Eastern Europe, 2018

10	Ukraine	44,12	58	29

Source: Authors – based on the data of Hootsuite, 2018

Table 3 presents survey data Digital in 2018 in Eastern Europe [7]. Six of the 10 analyzed countries are Member States of the European Union, and Ukraine is considered together with three other countries, which are not Member States (Belarus, Moldova, and Russia).

The biggest amount of Internet users is in Czech Republic – 88%, Slovakia – 83%, Hungary – 79%. Ukraine takes the last rank – 58%. The biggest amount of Active social media users is in Hungary – 60%, followed by Bulgaria – 52%, and Romania – 51%. Ukraine takes penultimate rank – 29%, and the last is Moldova – 25%.

In the last years in Ukraine we sight such growing occurrence as a digital divide – widening gap between elderly and young, with high and low income, urban and rural habitants with regard to access to and the using of the Internet, as well as digital technologies. So, digital divide includes basic digital skills and media literacy, access to digital technologies, digital inclusion, and digital participation [11].

As we already mentioned, Ukraine doesn`t gather statistic data in accordance with Eurostat indicators. However, the newly established Ministry of Digital Transformation (2019) conducted a comprehensive study the digital literacy in collaboration with partners, including UNDP, the Eastern Europe Foundation, EdEra and others [12]. To determine the level of digital skills was used the methodology of the European Commission – the Digital Economy and Society Index, and all four digital literacy indicators – information, communication, problem solving, and software skills were calculated.

The research shows that: 1) 53 percent of Ukrainians (aged 18 to 70) have a 'below average' level of digital skills; 2) 15.1 percent of Ukrainians do not have any digital skills at all; 3) of digital skills, communication skills and information skills are the most developed among the population of Ukraine; 4) problem solving and software development skills require the most improvement.

With the aim of bridging this digital divide, the Ministry of Digital Transformation of Ukraine announced their ambition plan to involve 6 million citizens in digital skills development programs in partnership with Ukrainian Library Association and public libraries. Thereby, in January 2020 was

launched the National Digital Literacy Platform 'Diia: Digital Education' [8]. Nowadays it presents a number of educational videos (series), which are accessible to everyone, are designed to bridge the digital literacy gap and provide people with more opportunities to develop [11]. Facing the coronavirus COVID-19 pandemic, a new training video about mechanical (artificial) ventilators has been filmed for Ukrainian doctors use.

Conclusion

To be on time in digital era means to go ahead from digitization, through digitalization towards digital transformation. The stage of digital transformation implies doing things differently, and digital skills are first steps on this way. Because as soon as possible we should at least feel free and friendly in interacting with robotics, artificial intelligence, big data etc.

According to Ukrainian experience, to raise the digital skills level and digital literacy level of citizens in general is possible through development the infrastructure, education, and informing component. In our opinion, the biggest challenge will be engaging residents to use the digital learning platform.

There need more effective and efficient government policies, that links different digital skills and indicates how this relates to the needs of particular groups. We should fully understand, that inequalities in digital skills will not automatically disappear, unless clearly targeted government decisions are implemented. It is important to keep in mind that finally it is not the matter of digital skills or digital inclusion, but the facing and overcoming everyday challenges.

Abstract

The functional real estate market and housing have an impact on the economy at almost all levels and via each aggregated variable in the marketplace. It creates conditions to utilize an area potential as well as to attract a qualified workforce into an urban area. Low work mobility, high indebtedness, missing institutional environment in Slovakia is also related to the utilization of housing stock in which housing occupied by owners dominated while rental housing sector compared to developed European countries is significantly undersized. The authors aim to point to functional institutional environment related to insufficient rental housing in Slovakia.

Keywords: Housing associations, rental housing market, institutional environment in Slovakia

Introduction

Markets work the same way for housing as other goods in the economy, determining value based on supply and demand. It is both a good, being consumed by the consumer, as well as an investment, based on its re-sale value. The real estate market belongs to the most critical sectors of the national economy. Its independent development and the value of real estates markedly influence the development of national economy and long-term growth of gross domestic product (GDP). Fundamental quantities of the real estate market, demand and offer form a cyclic development of the real estate market, which subsequently have an impact on macroeconomics and GDP. The long-term practice of developed European countries with market-oriented economy shows that the best tool for the global solution of the housing problem is the creation of functional market with real estates for housing, the part of which must be the sector of rental housing. Its lack prevents people from the easy movement at searching for work opportunities.

A crucial institutional condition for the development and functioning of the housing market mainly in the segment of rental housing is housing organizations, which are an essential part of its institutional environment.

The housing market in Slovakia

The significant transformation (privatization|) of the housing sector performed after the year 1990 in the Slovak Republic, still more confirms a visible lacking development in the field of the rental housing at present. According to the census in the year 2011, the overall housing stock presented in Slovakia 1,994,897 housing units, 205,729 of them are not occupied. It consisted of 90.5% of apartments in private ownership, 6% were rental flats (out of them there were 3% of council rental flats and 3% private rental flats), and 3.5% flats were owned by housing cooperatives (Housing Europe, 2017).
On the other hand, Slovakia significantly has moved in the structure of ownership housing within the last twenty years (Fig. 1), which undoubtedly contributed to already low mobility of the Slovaks.

Fig. 1: Distribution of population by tenure status
(% share of the total population, Eurostat, 2019)

In this context we can assume that there is an existing relationship between an increase in ownership of flats and growth of unemployment, i.e. the purchase of housing units restricts its owner's possibility to search for work outside of his domicile. The study of Andrew Oswald (1996) brought impressive results where he points out that each ten additional percentage points of the ownership of flats mean the growth in unemployment by two percentage points. The study says that owners of apartments are in case of lost occupation less willing to move to rental flats due to higher cost of movement (there is also implemented the cost related to the sale of the flat and payments for two apartments until the sale of the original one). Thus, owners of flats are in case of lost occupation longer without work than tenants. Oswald, based on his research, remarks that regions with a higher share of home ownership usually have a more rigid adjustment of territorial planning and land legislature, which restricts the development of entrepreneurial activities. Oswald's analyses were the subject of investigation for other authors who confirmed the correlation between ownership and unemployment; however, with significantly lower impact (Green, Hendershott, 2001).

Another significant problem is high credit indebtedness of Slovak households which might lead on the one hand up to executions and loss of home ownership and on the other hand to disruption of the stability of the bank system. Moreover, growing household indebtedness is a problem exceeding the field of the financial sector. In the most crucial age groups already more than 70% of the workforce have credits. At the same time in several age groups, many clients have an instalment to repay the debt higher than 50% of their income, which means they have just low capacity to apply for additional credits. In this connection, it needs to be said that in the pre-recession period 2007 to 2008 Slovakia belonged to countries with a relatively lower increase in indebtedness and at the same time the year-to-year decrease of the household consumption in the year 2009 was quite mild. At present, the situation is different; the growth of Slovak household indebtedness has been for several years the

fastest in the EU (Fig 2). Therefore, it might be expected that also implications on their consumption will be higher in the case of the economic cycle change (Kalman, 2019).

Fig .2: Growth of Slovak household indebtedness belongs among the fastest in the EU (in %l) (Kalman, 2019)

Among European countries, several programmes were created to support vulnerable households. For example in Italy and Spain to solve this issues there were created programmes to support the households that were not able to repay the credits for housing with the help of solidarity founds, in Hungary and Ireland there were created schemes for the remission of mortgages. (Cár, 2015).

Cár further states that at present many European countries try to make rental housing more attractive and to create it as functioning and affordable, where also the European Union gets significantly financially involved. In the Netherlands, they try to implement the system which will be based on the division of the rental sector to the regulated social sector and non-regulated rental sector, which should also attract private investments. It needs to be emphasised that the effort of several countries to reform and make rental housing more attractive encounter the significant tendency of households to own real estates for housing.

Excessively indebted households might have in bad times the problem to repay the credits or might be forced to significantly restrict their consumption, which will worsen the process of repeated renewal of economic growth (Kalman, 20190. Negative impact on the present worldwide pandemic COVID-19 is also confirming it, which has a significantly negative impact on all economies. Moreover, growing indebtedness of households in Slovakia is a society-wide problem, which might have besides the impact on economic growth also the impact on the social position of households. Several analyses show that 10% of Slovak households did not have any financial reserves before this crisis. Twenty per cent have reserves maximum for one month; thirty per cent have reserves maximum for a month and 60% of households for less than six months. It means that the problem of growing indebtedness of households needs to be solved on several levels.

Several legislative measures were adopted, which should have helped to indebted households to repay the mortgage to reduce the negative consequences of the pandemic in Slovakia. In the wording of the adopted equitable adjustment (the act No 75/2020 Coll. as amended) it is the deferment of repayment of the mortgage for the period which is not longer than nine months since the day of

maturity of the nearest unpaid credit instalment. Unpaid interests for the period of the postponement of the mortgage repayment will be arranged into the remaining instalments of the credit, which are due after the expiry of the postponement of credit repayment.

It needs to be emphasised that the situation of a long-term indebted household will not be solved by present legislative about the postponement of repayment of mortgages which was adopted concerning pandemic COVID-19. Any postponement or lowering of instalments has an impact on the future instalments of the credit in already highly indebted households.

We might assume that those who nowadays finance housing through mortgages will stop being able to repay them, and they will lose their present housing. In the horizon of several years, there will be a new group of people who will have a problem with availability of housing not only because of the chance to gain a mortgage but also due to quite a high market rent in bigger towns. In the Slovak Republic, it is predominantly the capital city Bratislava, where the price of rent is in the long term high - at the level of mortgage instalments.

(Non) Functional Institutional Environment

The residential market (construction of a block of flats) nowadays in big metropolises oligopolies and divides among big players who concentrate on big developer projects. An important part of the developed institutional environment of the real estate market in the developed countries is flat organizations. These organizations work mainly in the field of rental housing, and their activities are the most important in the European countries as the Netherlands, Austria, France, Sweden, Denmark and the USA. The built flats are mainly for inhabitants with middle or low incomes. A dominant role among these organizations is played by flat associations, flat co-operatives and flat societies of natural entities. They also act as public trading societies with limited liability, flat co-operatives, joint-stock companies (at which there is for example forbidden the payment of dividends) or non-profitable organizations. Gradually there are also organized new types of housing societies that have the potential to utilize the gaps in the market, which is otherwise ruled by oligopoly - e.g. smaller or vacant sites. At the same time with this, they increase the demanded, and oligopoly-limited competition. So, new types of housing companies might support the origination of urban communities with a positive impact on social and economic sustainability, safety and genius loci locations (Spirkova, Stepanek, Machajdikova, 2019). The authors also state that these new forms of housing corporations might also bring new forms of the interconnection between the interest of flat users with public interest. The public sector (municipalities, state, public institutions) might be involved in the form of a share in the block of flats, project (e.g. Baugruppe), which they supported in advance for example with providing a building site under favourable conditions, to influence the functioning and sustainability of the project, to prevent its undesirable transformation (e.g. to Airbnb business).

International experience from the development of non-profitable housing sector is undoubtedly interesting also for Slovakia, where just this part of the institutional environment is missing. At present in Slovakia, there are just two such non-profitable housing organizations. One of them was created as PPP project of a financial institution and the capital city Bratislava (2004), and in case of the second one, the 100%-founder was the town (2005). Their priority interest should have been the development and increase in the share of rental flats for those inhabitants who have a regular income. Still, this income is not high enough to buy the flat or to cover all costs in a rental flat with market rent. We have to say that despite partial legislative support for the origination of such new types of organizations in the SR as well as the support and experience of Dutch partners at the foundation of the mentioned housing societies, the state support and interest is not felt for the more dynamic origination and development of such societies.

Uneven economic development also causes a significant disproportion in the field of prices of housing, which naturally negatively influences the availability of housing for lower and middle-income groups of inhabitants. Until now, the development of the housing market has not covered and probably still a long time will not cover the needs of all income groups of inhabitants. In this frame, it

looks as that non-profitable organizations might contribute to the solution of the housing problem mainly for young people who do not have accumulated sufficient sources for the purchase of a flat into the ownership, or for those who travel for work and use the rental housing as a temporary one.

Data and theoretical basis

In the paper, there were used statistical data and analyses done by Eurostat and the Statistical Office of the Slovak Republic. Further, there were analysed the selected documents and regulations of the Ministry of Transport, Construction and Regional Development of the Slovak Republic (Information on housing construction in the Slovak Republic within the years 2005 - 2019) etc. From the in-depth analysis of the documents of the EU states related to the housing policy results that at the EU level, a common definition of social housing is absent. The individual states have different definitions related to a different level of public interventions in this sector. The common feature is the fact that the purpose of social housing is the general interest, the increase of affordable housing supply for disadvantaged groups of the population. And that concrete social housing objectives are based on the socio-economic status and risk factors present.

Result and Discussion

The indebtedness of Slovak households presents a high risk which would also reflect the prices of real estates, the year-to-year growth during the last year (2019) reached the level close to 10%. Thus, the growing indebtedness of households stays one of the important risks. Generally, we might state that:

- The problem of growing indebtedness of households is still impossible to see in the perception of the ownership of the real estates as an evaluation of the social status of a human being,
- High prices of commercial rentals of flats - at the level of mortgage instalments,
- Low-interest rate induces a high interest in available mortgages - the interest rates at the end of the year 2019 decreased from 1.5 to 1.3 per cent. With the lower monthly instalment, they opened even bigger opportunity to grant credit for a low-income group, which s very sensitive in worse time and in provided tests it looks like the one with the highest probability of failure.
- The on-going fast growth of credits for housing (prevailingly for the purchase of a flat into the ownership) is supported by the supply and well as the demand side of the credit market.
- The non-functional institutional environment in the field of rental housing in the Slovak Republic,
- Almost not existing available rental housing has an impact on the mobility of workforce - ownership of a flat restricts the possibilities to search work out of the permanent address and so on.

Conclusion

In the paper, we aimed to point to selected problems related to almost non-existing available rental housing in the Slovak Republic. The mentioned fact is one of the causes of high indebtedness of Slovak households. The issue of the Slovak Republic is also (non)functional institutional environment, which we consider as an essential determinant in the development of the rental housing and mature market of the real estate market. Creation of the space and more prominent state support for the origination of housing societies in the Slovak Republic should contribute to the increase in the share of rental housing not only from the view of the social rental housing but also with the creation of further levels of rental housing for groups of inhabitants with the middle and higher income. Finally, we could say that the accommodation is one of the basic human needs and the quality of

housing and its availability is often perceived as the determinant for the evaluation of the standard of living of the society.

Abstract

The circular economy presents a complex system which tries to keep raw materials and materials in the marketplace for the longest possible time to save natural resources and lower the human waste on our planet. Non-renewable natural sources are gradually becoming exhausted, which reflexes in the increase or fluctuation of prices of raw materials. Thanks to circular principles, the number of material entries into the production might be lowered. Then the risk of this might be avoided. The circular economy is one of the significant ways how to secure the economic growth of the society. It might be approached as a scientific model concept of a sustainable development of the economy, which we might also call a type of green economy. The paper focuses on the examples of the circular economy in the automotive industry, which has a dominant place in the Slovak Republic.

Keywords: Circular economy, technologies, automotive industry

Introduction

The circular economy is one of the significant ways how to secure the economic growth of the society. It might be approached as a scientific model concept of a sustainable development of the economy, which we might also call a specific type of green economy. Thus, it is an economic model, in which are some of unused natural sources in any available form, either from recycling or repeated utilization returned to the production process. As natural sources are not permanent and inexhaustible, they are becoming a global problem for the member states of the European Union. The countries are preparing the measures for the most effective utilization. They are developing strategies for implementation of the circular economy. In the strategy, it probably looks as that the models, imaginations or simulations will be created. They consist of incoming raw material, production. After the production there follows the consumption of raw materials, origination of waste and assessment of the amount of produced waste. Just with elaborated models, the concrete steps and measures might be subsequently implemented, which then create a system of the circular economy. These models might help to work on analyses and identification of narrow places, to avoid the origination of waste and to support waste management. The circular economy is an integrated set of activities which prevent the origination of waste and vice versa - supports the repeated return of materials or ready products, sometimes recycled or repaired, into the life cycle (Cséfalvayová et al., 2017, Kanianska et al., 2017).

Jurišová (2017) states that the circular economy aims to save and effectively utilize limited natural sources, to streamline the production of highly effective products and low consumption of sources and low emissions. It involves prevention and lowering of waste production and subsequently the sources of pollution up to recycling when the sources return to the economic cycle. It is still more urgent from the practical point of view. Thus, the wastage is minimized as well as the cost of entry of

material and energy needed for the production of new products lowers. From a practical point of view, the circular economy is a strategy of sustainable development, which creates functional and healthy relationships between nature and human society. It is essential to mention in this paper that the pillar for the laying the foundation of the circular economy for the states and also enterprises in the countries are following the three principles '3Rs' (Reduce - Reuse - Recycle), which are an economic codex of behaviour:

- *The principle of lowering* - presents the orientation of economy to scientific and technological progress and innovation with the aim of the most effective utilization of sources with the lowest consumption of raw materials and energy.
- *The principle of reuse* - it means to require the production of reusable goods and packaging materials. It becomes still more inevitable that producers and designers concentrate on the creation of durable and reusable products, and so to prolong their life cycle.
- *The principle of recycling* - it means that after the end of life of the product, it is reused as an available source. There is the need to build and support the development of the recycling industry, which brings waste and scrap (created inter-mediate products, raw materials and other materials) again to the production or for various use. It is either the reuse in the frame of the process, through which the material in another form has already gone once or several times, or their use in the frame of the completely different sector, field or process.

Circular Economy and Ecology

The relation between the circular economy and ecology means the provision of opportunities for all. 'It is necessary to regurgitate the myths that there is a discrepancy between the economic and ecological status of society. Thanks to intelligent policies and well-targeted investments the countries might protect the environment with the growing economy, to create suitable work opportunities and to speed up the progress in the society' (Šimo-Svrček et al., 2017).

Many professionals and specialists make comment on and assess the system of circular economy as a new phenomenon. According to them, its priority is saving and effective use of restricted natural sources, streamlining of goods production at high effectiveness and lower consumption of sources and low (or even zero) production of emissions. It involves prevention and lowering of waste production and subsequently the sources of polluting materials up to recycling when the sources return to the economic cycle, which has still more urgent practical importance.

Circular Economy

The circular economy presents a complex system which tries to keep raw materials and materials in the economy for the longest possible time to save natural resources and lower the human waste on our planet. Circular economy (CE) is a concept currently promoted by the EU, by several national governments including China, Japan, UK, France, Canada, the Netherlands, Sweden and Finland as well as by several businesses around the world. The European Commission recently estimated that circular economy-type economic transitions could create 600 billion euros annual economic gains for the EU manufacturing sector alone (Korhonen, Honkasalo, Seppälä 2018).

The concept 'the circular' economy involves goods of a wide spectrum of origination and subsequent utilization. The only products which are not at present part of the circular economy and probably they even cannot become potential adepts for the circular economy are foods. In the countries where the circular economy does not function, the process of lifespan runs as follows: After gaining necessary raw materials taken from natural sources there follows the production of a concrete product. The product is distributed to sales places. When the product gets to a customer who utilizes it somehow, it subsequently becomes, in most cases, a waste. It is taken to waste disposal sites and places for waste collection.

On the other hand after the process when the product or good fulfilled its aim and should according to the original scenario become waste, but it is not carried away to waste disposal site but to in advance agreed place, where after a certain treatment/processing becomes raw material again. That could be used for production of the same or different product. We speak about recycling of the waste or possibly about its repeated utilization for the same, i.e. primary or secondary purpose. The secondary purpose means associated process to the primary process, in the frame of which the product was used, until it becomes waste. The reuse of the waste in any suitable form might also be realized within a completely different process. If the given material or product in the frame of the given process fulfils all requirements. Concerning the final manufacture, a new product might have or does not have to have the same design. It strongly depends on the process of production - whether the process of the production is the same as the process of the production of the primary product or it is different - adjusted to the fact that the product will be used for a secondary purpose. It also depends on the type and material pliability from which it consists. In the process of production, it goes through re-processing and the ready product is designed for reuse and consumption at a customer or is used in the frame of the exact process or it performs another purpose. If the situation requires, a customer is informed about it.

Fig. 1: The principle of the circular economy (The European Parliament)

In Fig 1 a model is explaining the system of the circular economy step by step - after the entry of materials or raw materials to primary production process (it means into the process, the result of which is the product in the form for which was primarily determined). After the production, there might be running refurbishment. After the production of the product, there follows its distribution either directly to a customer or the sales chain from were either immediately or later gets to the end-user. Then its utilization, use and consumption follow, or possibly already in this stage with the contribution of a customer after the end of the functionality, the product could come to their repair and subsequent reuse. Failing that after the end of the functionality, such products are collected, at the best sorted out and collected. Some products as, e.g. paper, glass and so on are recycled which ensures their reuse for the same purpose. Other products due to their quality after processing cannot be used for the same purpose, in the same or another sector. If it is not possible to place the product into the life cycle, it becomes waste and is not part of the circular economy of the country.

Result and Discussion

Appreciation and utilization of the waste

Correctly chosen way to dispose of the waste or its return to the circulation is an absolute basis in the fight against the increase in the amount of produced waste. In Slovakia, e.g. we can sort the cans based on plastics. However, for experts is not too good solutions as cans decompose significantly shorter time and it might be considered if also cans besides recycling might be classified among materials belonging to the circular economy and after their processing undergoe heat and hygienic process. It would ensure their reuse. Cans, tin containers, barrels or other products have their place in the frame of a wide spectrum of their use. Decomposition of mentioned products made of plastics or PET bottles is between 100 up to 1000 years. However, separation of plastics in most more developed countries and already in Slovakia is at a high level. Their processing for reuse also has its drawbacks. Until now the circular economy of plastics might be provided just with cleaning, disinfection and provision of classical circulation of reuse. We talk mainly about PET bottles. At various plastic packages it depends on their condition or damage after usage, which in most cases did not fulfil the conditions of further use and therefore they often end in waste immediately after the first use. Recent years in Slovakia, we can still more frequently find collecting vessels for batteries and electro-scrap. As a dangerous product (freely dropped in nature or as a part of common waste) we might also consider a little battery with the decay time approximately 200 up to 500 years. Their presence in communal waste will destroy the entire content, in which it occurs, and so the waste which could go to compost cannot be used. At the processing of such destroyed waste, there are released dangerous materials, which pollute the air, groundwater, soil and act toxically to all surrounding living organisms. Separation and subsequent processing of electro-scrap and used and non-functional batteries, chargers, cables and so on is significant and inevitable.

The most common processing of waste, which is neither dangerous nor polluted with dangerous materials, but at the same time cannot be separated, recycled or possibly proceeded to reuse is incineration. In Slovakia, many companies have already been engaged in this field; it means to catch and utilize the heat, or any other type of energy originated at the activation of a process. At incineration, it is a system of recuperation, where gradually created heat is caught. Subsequently, this heat might be utilized in many ways, e.g. for heating of the nearest buildings. It might be heat collection, which is subsequently with the help of recuperation unit processed and transformed in a needed form into the same or similar facilities or for other purposes. In lifting equipment, there is used electric energy gained with recuperation during the descent of lifting platform from above to down (Blažiak, 2017).

The examples of a functional system of the circular economy in the automotive industry in Slovakia

In the Slovak Republic, the automotive industry has a dominant position - in per capita, it is the biggest producer of passenger cars worldwide. The share of the automotive sector in the overall GDP of the country is about 5% and when considering the industries related to the automotive industry is even 13% of the Slovak GDP. Its share in export is up to 26% of the overall export. In the automotive industry, there are about 400 companies that deliver components for finalization of the final product. Several of these companies gradually implement concrete measures related to the system of the circular economy, and subsequently, the amount of produced waste is continually lowering. It is mainly in these fields:

Material appreciation of synthetic textile waste (textile creates about 2.5% of the overall weight of a car) from automotive industry the company PR Krajné patented technology *Stered.* The production is 3 to 5 times energetically more economical than the production of traditional insulating materials made from stone or glass. The final products have several usages. Besides other, they might serve as heat and acoustic insulations, railway absorber of noise or pavements, car parks and green roofs able to retain rainwater and not to accumulate heat. The mentioned company is known as functional according to the principles of the circular economy 3R. One of the initiatives was also a

reconstruction of the disused production area for the seat of their new factory. The latest research proves that textile fibres can be recycled again and again without their weakening, but these technologies have not been spread, yet. A good local example in this field is the company SK-Tex with the seat in Senica, which yearly return approximately 4,500 tonnes of textile waste and changes them to materials determined for cleaning in the industrial companies or various types of insulation with extraordinary parameters. These products are suitable for automotive, furniture and construction industry and after the end of lifespan are again recyclable.

Processing of old tyres might have various forms of final products as, e.g. quality granulated material from rubber with the fraction 0-4 mm, which is at the same time an input raw material into a technological line, which produces the final goods from quality rubber granulated material (Fig. 2). Other input products might be pressed rubber mats suitable as noise walls or areas for sports grounds, playgrounds and stables.

Fig. 2: Rubber granulated material: Backfill into artificial lawns, the fraction 1.0 - 3.0 mm (the company AVE SK)

A unique example and the same time topic of one of the studies originated from the field of the chemical industry. Components of several waste which originates in the frame of automotive production might be also interesting for many companies. For example, newly found element cryolite or in other words bauxite originating in the process of varnishing of cars, might serve as one of the essential construction elements to produce aluminium and so also aluminium products. The companies which might be interested in the purchase of this element are also in Slovakia.

Conclusion

In Slovakia, there are in case of the circular economy and primary topic wastes. It results from the whole situation, the main problem of which is a high rate of waste disposal and low rate of sorting and recycling. The solutions in the shape of avoiding the origination of waste and are gradually penetrating the daily practice. However, they are still a minority way of solutions to problems with waste. At present minimum in Slovakia, compared with other developed European countries it comes more likely to prefer to use new products with high quality. Insufficiently in the world, we repair, recycle or utilize the components from used materials or even from the waste to produce other, not new products but products with the same quality. Recycling at the same time does not represent final, and at the same time attractive solution, as its processes are energetically demanding and in general they mean the degradation of materials - all this leads to increase in demand after genuine original materials and frequently discourages the end-users

As Matiova and Musova issues (2016), the circular economy is more than just recycling as it goes behind the borders of recycling being based on renewing industrial system leading to the extinction of waste. It should be taken as one of the basic principles of functioning.

Human Capital as seen from the Level of Education – the EU Perspective

Ewa MAZUR-WIERZBICKA

Institute of Management, University of Szczecin, Szczecin, Poland,
E-mail address: ewa.mazur-wierzbicka@usz.edu.pl

Abstract

The development and modernization of economy result in increased demand for high quality human capital. The main aim of the paper is to assess human capital in the EU countries from the perspective of the level of education. The following detailed objectives are adopted in the paper: assessment of education as a factor shaping human capital in the EU countries and assessment of the "human resources" factor included in the SII. The reflections presented in the paper showed the existing diversity in the sphere of education between the European Union countries. They pointed to egalitarianism of education in the EU states, to an increase in the degree of tertiary education and to an unsatisfactory level of lifelong learning in the EU countries. The paper is based on a critical literature review and analysis of secondary data.

Keywords: human capital, education, EU countries

Introduction

Determinants of knowledge-based economy as well as social and economic transformations caused intangible resources to gain importance in the context of economic activity. In the conceptual age, increasing rank is attributed to (in the international and national scale and in the scale of individual entities) human capital, whose essential elements include knowledge, skills and qualifications acquired in most part in the course of education. The condition of human capital is determined by i.a. the state of the level of education. It is assumed that an increase in the level of education positively affects the quality of human capital and vice versa. Therefore, states, striving to create knowledge-based economy and wishing for their economies to be more competitive, must focus particularly on the effectiveness and efficiency of their education and training systems.

Given the above, the main aim of the paper is to assess human capital in the EU countries from the perspective of the level of education. The following detailed objectives are adopted in the paper:

1. Assessment of education as a factor shaping human capital in the EU countries.
2. Assessment of the "human resources" factor included in the SII.

Implementation of the main aim dictates the paper's layout. Part one introduces theoretical concepts of the subject-matter of human capital and education. Part two presents the state of the level of education in the EU countries. The paper is based on a critical literature review and analysis of secondary data.

Education as an element of human capital - introductory issues

The concept of human capital has been appearing in scholarly papers since the second half of the 20th century. It needs to be emphasized that even before that researchers had pointed to this type of capital. In the 1950s and 1960s the term "capital" began to be used to specify the "the role of education and expertise in generating prosperity and economic growth" (OECD, 2007). Whereas the 1980s showed the real force of the impact of human capital on the development of contemporary economy.

The literature is not consistent as to a single approach to the definitional term "human capital". For instance, T.W. Schultz treats it as a resource of knowledge, skills, health and vital energy in a given society/knowledge. Human capital is a resource which is a source of future satisfaction, earnings or generally speaking services of some value. It is part of an individual and is associated with him. It is human because it is embodied in an individual, and it is a capital because it is a source of future satisfaction and future earnings, or both of those (1971). T. Listwan in turn assumes that it is a collection of properties inherent in people, such as knowledge, skills, professional experience, psychological features, health and behaviours (2005) (cf. Tittenbrum 2017, Herbst 2007).

However, there are a few common points in various approaches to "human capital". It is, inter alia, pointed out that this capital, contrary to other types of capital, cannot be separated from an individual. Human capital cannot, moreover, change owners since it is created by a given person, therefore it is inextricably linked with them. It is not an object of market transactions either, but it can (and even should) be subject to continuous development which is dependent not only on individual talents, skills, qualifications or genetic features, but also on the contexts in which individuals operate. This capital can be constantly enhanced and development by investment in expanding knowledge, advancement and raising skills and qualifications (Milewski, Kwiatkowski, 2005).

The literature identifies two basic approaches to it, namely a narrow and broad approach. In the first case it refers to qualitative features of the resource of knowledge available in the economy, which is an effect of investment in education and training. Whereas in the broad approach, the outlays that form or increase the resource of human capital include not only investment in education and training, but also investment in health, culture and environmental protection because they do or may affect the improvement of qualitative features of human work (Janoś-Kresło, 2002). Additionally, when analysing human capital, it is essential to point out to which level this term refers. Authors of various studies point to three different areas, that is the macro-economic scale, an organization and an individual.

For the need of reflections included in this paper it is assumed that human capital means "the knowledge, skills, competencies and attributes embodied in individuals that facilitate the creation of personal, social and economic well-being" (OECD, 2001). The above definition points to a multidimensional structure of the concept of human capital. The concept of knowledge, included in this definition, may be divided into theoretical (abstract) knowledge and empirical, technical and practical knowledge. These classifications may in turn be divided into professional, managerial, social and international classifications. Competences and "other attributes" (for example those concerning professional orientation) also play an important role and include awareness and responsibility on the one hand and creativity, innovativeness and entrepreneurial spirit on the other.

Some economists, as for example T. Shultz, have noticed that "people invest in their education and training to build up a stock of skills and abilities (a capital) that can bring a long-term return. This investment can also benefit national economies and help fuel economic growth" (Human Capital…, 2007). S. Domański also points out that human capital may be gathered, used or wasted, but it can also be increased by investing in it (cf. Perechuda, 2005) by, interalia, (1993):

- expanding broadly understood health care-related services,
- training at various levels, also training adults,
- migrations in order to find better employment or adapting to changing conditions,
- searching for information about the economic situation of companies and professional perspectives,
- scholarly research, leading to expansion of knowledge and opportunities of applying it.

It also needs to mentioned that investment in human capital may be done under various organizational forms. Therefore, there is a possibility of advancing people's skills through a national education system, the system of employment agencies or the system of scholarly research, conducted both by universities and private companies. Another form involves all personally undertaken steps by individuals in order to advance their knowledge, skills and qualifications (Domański, 1993). In addition, it is important to emphasize that human capital (in reference to an individual) continues to

develop throughout one's life. Hence the importance of the element of effort to continue education throughout one's life, i.e. lifelong learning.

In addition, it is important to emphasize that human capital (in reference to an individual) continues to develop throughout one's life. Hence the importance of the element of effort to continue education throughout one's life, i.e. lifelong learning, the idea of which was present as early as in the works by Dewey or Lindeman at the beginning of the 20th century (Jarvis, 1995). Lifelong learning is based on the principle of systematic gaining of knowledge, keeping it up-to-date and education in terms of new practical skills and enhancing qualifications as a response to the changes occurring in daily life of a contemporary society, with emphasis on the individual's self-actualisation. It emphasizes individual's motivation for self-training. Lifelong learning is understood also as preparing an adult to direct their own life, developing a habit of constant pursuit of knowledge and identifying one's experience with reception of knowledge (Bagnall, 1990).

One also needs to take into account the occurrence of barriers that hinder a part of society's making investment in human capital or preventing them from doing so, namely social inequalities. They are often accompanied by circumstances such as persistent unemployment, poverty or marginalisation, all encouraging loss of human capital, as a result of which the real level of accumulation of human capital is lower than possibly attainable. These phenomena, observable on many labour markets in the spatial plane, inhibit people's access to knowledge, which negatively affects the development of human capital. The learnt helplessness of certain groups is called negative human capital. The decrease of human capital is also impacted by migrations of highly-qualified staff away from these areas (Mikuła, 2006).

The literature, both from past and at present, demonstrates the existence of dependencies between the level of economic development and the level of education and training. Breakthrough significance to the analysis of these relationships was brought by the emergence of the theory of human capital and human investment by T.W. Schultz (1961, 1971) and G.S. Backer (1962, 1975). They demonstrated profitability of investment in education in their studies. Similar findings came from research by F. Haribson and Ch. Meyers (Research on the impact of training and development of education on economic growth. Their results allow an assessment of interrelations between the level of economic development and the education level in individual countries. The authors pointed out the existence of an essential interrelation between the human capital index which included mainstreaming secondary and higher education and national income per capita. They also demonstrated a significant relationship between national income and popularization of higher education. They also proved that investment in human capital is necessary for a country to be able to develop) (1964), by M. G. Kaser (He identified a correlation between gross national income and higher education development indexes. The higher the level of development of education in a given country, manifested by the length and achieved levels of education and the number of people in training, the higher the correlation.) (1966), by F. Edding (He demonstrated a relationship between investment in education and economic growth. He concluded, inter alia, that most often, though not always, the relationship between investment in education and an increase of the gross national income is positive, that there is a positive relationship between the wealth of a country and its investment in education, where less well-off countries in reality allocate more and more resources to education, that the amount of funds allocated to education from the budget is not always strictly related to the expenditure on education of one learner (1963) or from research conducted at the turn of the 20th and 21st centuries by e.g. Saxton (2010). However, one needs to note that at the turn of the 20th and 21st centuries research findings began to emerge on the basis of which it was possible to conclude that raising the level of education does not unequivocally have to influence the economic growth in a positive way. Certain determinants are necessary for a productive use of human capital. They include an adequate quality of human capital, efficient institutional-governmental environments, large demand for educated persons, adequate quality of teaching, size of corruption and migrations (Rogers, 2008).
To conclude, one can ascertain that education is one of the main elements affecting the state of human capital. It is in its course and through improved education systems by individual countries that obtaining and developing knowledge, skills and qualifications (which are the main components of

human capital) occur. In the age of striving for knowledge-based economy, improving the quality of human capital by i.a. the process of education seems priceless, indispensable or even necessary.

The level of education in the European Union

In the context of the targets set by the European Union for itself, the Europe 2020 strategy shows its visible direction towards i.a. increasing competitiveness (especially in relation to highly-developed countries or emerging economies such as China or India). It is significantly associated with the observable trend to direct the UE labour market towards an increase in the demand for employees with higher qualifications, which is directly related to the undertaken activities that serve to improve the state of education. Examining the level of education in the EU one needs to pay attention in particular to two issues, namely: the EU-28's population's level of education and the level of lifelong learning.

This is reflected in, inter alia, the goals concerning education adopted in the Europe 2020 strategy. A target on educational attainment which tackles the problem of early school leavers by reducing the drop out rate to 10% from 15%, whilst increasing the share of the population aged 30-34 having completed tertiary education from 31% to at least 40% in 2020.

Data analysis shows that in 2019 16 Member States reached their national targets already in terms of early leavers from education and training. In needs to be noted that an individual target level was set for each of the EU countries, taking into account their circumstances (the established national targets hover from 4% for Croatia to 16% for Italy). For the EU states, the percentage of early school leavers continued to drop steadily from 13.9% in 2010 to 10.3% in 2019. Among the EU countries there is an observable differentiation in terms of the development of the said indicator (Table 1).

Table 1: Target indicators for early education leaving and the degree of their implementation in the EU-28 in 2010, 2019 (%)

Country	TARGET	2010	2018	2019	Country	TARGET	2010	2018	2019
EU-28	**10**	13.9	10.5	10.3					
Belgium	**9.5**	11.9	8.6	8.4	**Lithuania**	**9.0**	7.9	4.6	4.4
Bulgaria	**11.0**	12.6	12.7	13.2	**Luxembourg**	**10.0**	7.1	6.3	6.8

The second educational target of the Europe 2020 strategy, that is increasing the share of the population aged 30-34 having completed tertiary or equivalent education to at least 40%, was achieved in 2018 (40.7%) (Table 2). Also in the case of this target its level was set individually for separate EU countries on the basis of national determinants. Most countries adopted a target indicator equal to or higher than the one proposed by the EU. An analysis of statistical data shows that in 2019

18 countries achieved their targets, two countries, i.e. Croatia and Hungary, approached their national targets by less than one percentage point.

Table 2: Percentage of people who have completed tertiary education aged 30-34 in the EU-28 countries in years: 2010, 2018 and 2019

Country	TARGET	2010	2018	2019	Country	TARGET	2010	2018	2019

Reflecting further on the level of education in the EU, one needs to additionally point to a number of essential issues in particular, namely:

- establishing the level of school enrolment for various levels of education (thus universality of education)[1],
- the level of education of the EU-28 population,
- the level of lifelong learning.

A growing educational activity of the societies of EU countries is noticeable in the analysed period. This trend is maintained mainly by the progressing promotion of education at the secondary level and the more and more frequent undertaking of studies in higher education institutions. The data presented in Table 3 shows that the majority of EU countries have seen an increase in enrolment indexes at the secondary and tertiary levels, though differences in the scale and time frames in individual countries are noticeable. An interesting situation is observed in Finland and Sweden (an increase in the gross enrolment index for ISCED levels 2-4, and a decrease for ISCED levels 5-8).

[1] Gross enrolment index was adopted for the analysis due to the wish to point to the number of people in education at a given level (regardless of their age) against the number of people in the age group specified as corresponding to the level of education.

Table 3: Gross enrolment index at the level of primary, secondary and higher education in the EU countries in 2005/2006, 2010/11, 2016/17

Country	Years	Pupils and students as % of a given age group

Source: compiled on the basis of GUS data.

The pace of changes in education at the tertiary level observed recently in the countries of the European Union entitles one to state that it is becoming increasingly egalitarian in the EU states (this generally applies to highly-developed countries). It can be assumed in the near future that it will have the character of mass education in the Union countries, similar to primary and secondary education. Without a doubt it is a beneficial situation, since education at the higher level is extremely important for a modern economy because increasing specialization- and competence-related requirements, as well as the technological progress and the advancing globalization force the undertaking of efforts to supply the market with adequate staff. Additionally, appropriately constructed and implemented study programmes should equip students with qualifications and competences that will enable them to find employment in line with their field of education, and effects of education and professional training which the students obtain in the course of studies should be evidence to how gifted they are in order to be competitive on the labour market after graduation.

Another aspect directly related to the enrolment index that should be noted when assessing the level of education in the EU countries is the level of education of the population.

The data in Table 4 shows that in all countries that currently make up the EU-28 in 2019 there was a drop as compared with 2010 in terms of the percentage of people at the lowest level of education - the greatest for Portugal, by 19.3 percentage points and for Malta, by 18 percentage points. In 2019 the countries leading in terms of the lowest value of this indicator included the Central and Eastern European states (the former Eastern Bloc) - Lithuania11.4%, Czechia 12.2% and Poland 13.3%. In turn, the highest percentage of people with only lower-secondary education was observed for Portugal 48.0%, Malta 42.3%, Spain 39.9% and Italy 39.9% - with the UE-28 average of 25.0%.

Table 4: Percentage of population according to the level of education for people aged 15-64 in the EU-28 in 2010, 2018 and 2019

Source: compiled on the basis of Eurostat data.

The percentage of people with education at levels 3-4 in individual countries of the EU-28 was very diverse. In 2010-2019 there was no noticeable rising or falling trend for all EU-28 countries as it was the case of the analysis of the percentage of people with education at levels 0-2. There was a noticeable falling trend for Austria (a drop by 10.1 p.p.), Luxembourg (a drop by 7.9 p.p.), Slovakia (a drop by 6.1 p.p.), whereas a rising trend was observed for Portugal (an increase by 9.5 p.p.) and Malta (an increase by 6.4 p.p.). The group of countries with the highest percentage of people with education at levels 3-4 in 2019 comprised Czechia (66.2%), Slovakia (62.6%), Croatia (59.4%) as well as Romania and Poland (58.7%). The lowest value of the analysed indicator in 2019 was noted for Spain (25.2%), Portugal (28.3%) and Malta (32%) – with the EU-28 average of 45.7%.

In the analysed period, an increase of the percentage of people with higher education was noted for all EU-28 countries (an increase for the EU-28 from 22.8% in 2010 to 29.3% in 2019). The greatest increase was noted for Austria (from 16.2% in 2010 to 31.0% in 2019), Malta (from 14.2% in 2010 to 25.7% in 2019) and for Lithuania (from 26.9% in 2010 to 37.4% in 2019). The greatest values for this indicator in 2019 were noted for Ireland (40.7%), the United Kingdom and Cyprus (40.2%) as well as for Luxembourg (40.1%). The lowest for Romania (15.9%), Italy (17%) and Czechia (21.5%).

The growing level of education observed in recent years is the effect of i.a. an increase of education-related aspirations of young people and their parents, which result primarily from the wish to ensure the best possible position on the labour market but also social prestige associated with a better education level. Unfortunately, this conceals the so-called "paradox of overstated educational aspirations" (Bondyra, 2008), which is proof to the discrepancy between social awareness and labour market reality. Unfortunately, despite a general rising trend of the level of education among the EU-28 citizens (especially levels 3-8), some of them do not refresh, improve or advance their general and professional qualifications throughout their entire lives. It is a worrying phenomenon especially given the changes occurring in the labour market (especially technological ones).

The data included in Table 5 shows that the percentage of people aged 25-64 in the EU-28 in 2019 who participated in lifelong learning was 11.2% and was only 1.9 p.p. higher than in 2010. The greatest increase in the analysed indicator in the investigated period was observed for France (from 5.0% to 19.0%), Sweden (from 24.7% to 34.1%) and Estonia (from 11.0% to 20%). The greatest drop, in turn, was noted for Denmark (from 32.7% to 24.8%) and the United Kingdom (from 20.1% to 14.6%). Throughout the analysed period Romania was the country where the percentage of people aged 25-64 who participated in lifelong learning was very low, even worrying (1.2% in 2019). Whereas the countries where the value of the analysed indicator was the highest were the Scandinavian countries: Sweden (34.1% in 2019), Finland (28.6% in 2019) and Denmark (24.8%) - despite the visible falling trend for this country.

Table 5: Lifelong learning of people aged 25-64 in the EU-28 in 2010, 2018 and 2019 (%)

Country	2010	2018	2019	Country	2010	2018	2019

Source: compiled on the basis of Eurostat data.

Wanting to obtain an adequate quality of human capital, in needs to be ensured that i.a. adequate educational outlays are made. It is worth remembering that there is a direct link between long-term economic growth and the growth of educational potential. Thus it is worrying that at the level of the EU-28, government expenditure on 'education' as a ratio to GDP decreased over the 2010-2018 period (Eurostat database) . Only for three countries, that is Belgium, Croatia and Cyprus, a growth of the percentage of GDP allocated to expenditure on education was noted in 2018 as compared to 2010 (Table 6).

Table 6: Total general government expenditure on education, 2010, 2018 (% of GDP)

Country	2010	2018	Country	2010	2018
EU - 28	5.2	4.7			
Belgium	6.0	6.2	**Lithuania**	5.9	4.6
Bulgaria	3.6	3.5	**Luxembourg**	5.7	4.6

Total expenditure on education of the government and local government sector broken down into pre-primary and primary education, secondary education, pre-primary and primary education, post-secondary non-tertiary education, tertiary education, education not definable by level, subsidiary services to education (e.g. expenditure on providing school busses), R&D education (i.e. R&D related to education not all R&D undertaken for example in universities) and education not elsewhere classified in 2018 is presented in Figure 1.

Fig. 1: Total general government expenditure on education, 2018 (% of GDP)
Source: (Eurostat, 2020).

As a percentage of GDP, the highest amounts were reported by Sweden (6.9 % of GDP), Denmark (6.4%), followed by Belgium and Estonia (both 6.2 % of GDP) and Latvia (5.8 % of GDP). In 2018 Romania and Ireland spent least on education (3.2%), Bulgaria (3.5%), Greece (3.9%), Slovakia, Italy, Spain (4.0%) and Germany (4.2%).

Due to the fact that increasing innovation of economies of the Member States was considered one of the fundamental tasks included in the Europe 2020 strategy one needs to pay special attention to the level of human capital which is dependent to a great extent on the level of education. For this reason the level of the "human resources" factor was assessed, where this factor is an element of a synthetic indicator - the European Innovation Scoreboard (EIS), used for the assessment of the level of innovation mainly in the European Union countries.

The human resources dimension comprises 3 indicators. Their characteristics is presented in Table 7.

Comparing the change between performance in 2018 relative to the EU average in 2011 and performance in 2011 relative to the EU average in 2011 in the development of the value of the human

resources composite indicator it is noticeable that the situation is poorest for Romania, Slovakia and Hungary, whereas it is best for Spain, Estonia and Bulgaria (Table 8).

Table 7: Partial indicators for the human resources indicator taken into account in the EIS

Indicator	Definition numerator	Definition denominator
New doctorate graduates per 1000 population aged 25-34	Number of doctorate graduates	Population between and including 25 and34 years
Percentage population aged 25- 34 having completed tertiary education	Number of persons in age class with some form of postsecondary education	Population between and including 25 and 34 years
Lifelong learning	The target population for lifelong learning statistics refers to all persons in private households aged between 25 and 64 years. The information collected relates to all education or training, whether or not relevant to the respondent's current or possible future job. Data are collected through the EU labour force survey (LFS). The reference period for the participation in education and training is the four weeks preceding the interview as is usual in the LFS.	Total population of the same age group, excluding those who did not answer the question concerning participation in (formal and non-formal) education and training

Source: compiled on the basis of Eurostat data.

Analysing the level of partial indicators, the situation is as follows. For the "New doctorate graduates" indicator in 2018 compared to 2011 the least beneficial change occurred for Slovakia (as much as -92.2) and Romania (-66.9), the most beneficial for Denmark (82.1), Spain (107.2) and among the countries of the Central and Eastern Europe: for Bulgaria (70.5). For the "Population completed tertiary education" indicator the least beneficial change occurred for Hungary (-11.9) and Romania (-2.2), the most beneficial for Malta (52.2) and Slovakia (49.3). For the "Lifelong learning" indicator, the least beneficial change occurred for the United Kingdom (-60.4) and Slovenia (-45.8), the most beneficial for Estonia (64.6) and Finland (45.8).

Summary

Human capital is one of the elements in contemporary social and economic reality (rapid technological progress, increasing level of global competition, observed increase in demand for specialized and educated employees on the labour market who mainly have technological skills) that is attributed a great rank. Its quality and condition depends i.a. on the level of education - particular importance is attributed to tertiary education.

The reflections carried out in the paper show that there is a noticeable differentiation in the area of education between the EU countries, which is determined by economic, social and cultural differentiations. It needs to be emphasized, that in the last dozen or so years popularisation of education has been observed (that is its egalitarianism) at all levels throughout the EU. In can be assumed that this process will carry on and it will accelerate in some of the EU countries. However, it needs to be borne in mind that egalitarianism of education may result in educational inflation or over-education of society. The analysis of data has also shown that in the last decade all Member States have advanced in raising the level of tertiary education (noticeable mainly in the implementation of their education-related targets included in the Europe 2020 strategy), where best results were achieved by the countries of Northern and Central Europe. The increase in the percentage of people with higher education is a trend characteristic not only to the EU countries, but also to a majority of countries throughout the world. Due to the constant increase in the level of education in the recent years, the younger generation has higher qualifications than the older generation.

The quality of human capital is also effected by the level of lifelong learning. The conducted analyses show that the awareness of the need for continuous learning, improving skills and extending one's knowledge is growing, though very slowly. Intensified action needs to be taken in this areas striving to boost performance and to increase the competitiveness of economies.

The European Union, striving to create the knowledge-based economy in which a high quality of human capital is important, should pay particular attention to the operation of the education and training systems in its Member States - supporting their improvement (taking into account i.a. observed trends on the labour market), to expenditure allocated to education and to the sources of these investments.

In the end it is worth suggesting some questions to be considered in the analysed areas. For instance, in what direction should changes in the education system go so that they can best contribute to raising the level of quality of human capital in the EU countries? What models is it best to adopt? What main criteria should be adopted when establishing them?

Simulation Approach in Queue Management at Supermarkets in the COVID-19 Era

Jacek ZABAWA

Faculty of Computer Science and Management, Wroclaw University of Science and Technology, ul. Ignacego Lukasiewicza 5, 50-371 Wroclaw, Poland, jacek.zabawa@pwr.edu.pl

Abstract

How to prevent and control of epidemic spreading of diseases (for example COVID-19) in supermarkets? To answer this question, a simulation approach was proposed. A number of simulation experiments were performed. The likelihood of close contact with carrier in different ticket queue configurations was compared. Based on the results, several tips and advices were developed for customers and market managers.

Keywords: COVID-19 infection prevention, simulation-based approach, discrete event modeling, queue management, supermarket checkout.

Introduction

COVID-19 and Managers' Reactions

How to behave during the COVID-19 pandemic, described in the FAQ of NJHealth (2020)? How to reduce the risk of a pandemic spreading? How to avoid infection? These are also questions posed by customers and sellers in self-service stores today. The widely proposed solutions include: the use of disinfectants, the use of gloves, masks, helmets, plastic curtains, the requirement to apply social distance rules, preferring to pay bills with a payment card, determining the range of hours in which only older people can stay in the store, and finally limiting the number customers in the store (proportional to the number of checkouts or store space). Managers are wondering how to increase safety in supermarkets and the following solutions were implemented, mentioned in the ITV Report (2020): reducing opening hours (to help staff clean and fully restock shelve), reducing the number of checkouts, introducing screens to protect staff (installing protective screens on checkouts), drawing new floor markings in the checkout (or other key) areas, introducing one-way aisles, queuing systems outside stores, limiting the number of people in store, outlining two meters between customers, bringing in special hours for NHS workers (or giving NHS staff priority checkout service), introducing contactless drop-offs, access to facemasks and hand sanitizer for staff, employing marshals to monitor and observe social distancing.

Research Motivation

The inspiration to study the impact of factor not accounted for in legal restrictions, i.e. the configuration of the queue of customers in supermarkets, were visits to various shops. The following queue configurations were noted: separate queues for checkouts (cash registers) served by cashiers, a common queue for checkouts served by many cashiers (each cashier serves one checkout) and shared queues for a self-service checkout (and their multiples). The last variant will not be considered in this study due to the strong relationship between the hypothetical model and the specific spatial configuration and specific checkout devices. We are interested in organizing the queue and not in setting up checkout devices. Similarly, we do not take into account the time of arriving from the queue to checkouts.

Close, Unsafe Contacts and Supermarket Queues

It has been assumed that information about the danger of infection due to staying too long in the vicinity of the infected person are true (to be precise, it is about breathing the same air and, above all, being within the range of a cloud of droplets excreted by a coughing and sneezing person). Being within the range of the pathogen is treated as "close contact" or "unsafe contact": Yong et al. (2020) wrote: “A close contact was defined as anyone who had prolonged contact within 2 m of the case.”. Author of NJHealth FAQ (2020) mentioned that “In general, close contact means being within 6 feet of a person for longer than 10 minutes “. Sometimes this concept is extended to 15 minutes and 2 meters, for example in Public Health Blog (2020). We see precise warnings like: “face-to-face contact in any setting within two meters of a case for 15 minutes or more”, written by Ministry of Health, 2020). It was also assumed that it is possible to determine the percentage of infected people in a given period of time, for example in Galgelt, Germany or New York City (above 15% symptomatic and asymptomatic carriers, according to Carvalho (2020)). Calculations about the frequency of infections are also available: “We found that the attack rate does not differ significantly by age, with on average 7% of close contacts becoming infected, around 80% of these contacts showing any symptoms, and 3% of infections manifesting severe disease at initial assessment”, according to Bi et al (2020) but sometimes seem smaller, as claimed by Otto (2020): “The transmission rate of coronavirus disease 2019 (COVID-19) was 1%-5% among 38,000 Chinese people in close contact with infected patients”. We assume that in similar places people can visit a supermarket.

In our current research it has been assumed that individual checkouts are sufficiently separated from each other as well as sufficient protection of cashiers against infecting customers and against infecting the customer from the cashier. We do so because of the fact that in a given store configuration every customer must appear sooner or later in front of the checkout. We assume that each client (customer) can be involved in a maximum of two contacts: We assume that dangerous/unsafe contacts (meetings) start in the following situations: when an infected client arrives in the queue and takes a place behind the client who is not infected. Unsafe contact also begins when the last person in the queue is an infected client and the next place is occupied by a person who is not infected. Dangerous contact ends when the source of the "threat" or the "endangered" person goes to the checkout. Note that each infected client can pose a threat to two people: preceding and following. Any client who is not infected can be threatened by two people: one preceding and one following the client.

Simulation-based Approach and the Model

Simulation-Based Approach

We want to answer the question: is the probability of dangerous contacts different for a shared queue and a set of separate queues for the same number of checkouts? And if it's not equal, which configuration seems more secure? Will the recommendation always be the same? A simulation-based approach and the Extendsim tool, created and presented by Krahl (2012) were used to consider the answers to the above questions. The simulation-based approach (and more precisely: discrete event simulation) is often used to verify the suitability of queue system configurations. For example, Wenjie et al (2015) compared the single-queuing system and the double-queuing system. Xian et al. (2016) based on simulations with Arena software recommended changes in the organization of the examined system by introducing shifts and adding another payment counter in the morning. Zhang (2012) studied (with NetLogo software) the impact of introducing dynamic control of the number of checkouts in a supermarket on the waiting time in queues.

The model

It has been assumed that the model will apply to a supermarket with a number of checkouts from 1 to 10. However, the model can be expanded with additional checkouts, this requires the declaration of additional tables in the database. The model was designed with a modular structure. The main events

and activities in which the customer participates are implemented using standard blocks, whose equivalents are available in most simulation tools (generator, writing and reading attribute values, queue, service station, exit). However, in some places of the model blocks whose operation is defined by the ModL code (an example is given below).

The model has the following modules:

- input stream generation module (objects = clients) and their attribute values (Carrier: 0 or 1), (Exposed: 0 or 1 but always equal to 0 at the beginning), Index (object number given in the order of arrival to the model) and Delay - time of payment transaction (a random distribution of assigned parameters). We have two sources of objects: the stream of objects (random distribution of intervals) and object generator at the initial state (occupied checkout, initial length of queues)
- module for multiplication of objects; it was used to observe the behavior (path) of individual objects in model branches, identifiable on the basis of the value of the index attribute, in individual queue configurations, represented by model branches,
- module with a common (shared) queue in front of the multi-channel service station (checkouts). Its purpose is to control the correct operation of other branches implemented in the hierarchical blocks technology,
- a module with a hierarchical block representing a group of checkouts: it could be any number of separate checkouts or a common queue for many checkouts,
- a module with a repeated hierarchical block; blocks work in parallel mode. It is a representation of individual queues in front of individual ticket offices. It was assumed that the client chooses the queue of the shortest length. To increase the even use of checkout, a queue draw has been added when there is more than one queue of the smallest length. A fragment of the module is shown in Fig. 1.

The generalized point of sale (checkout) module consists of the following elements:

- individual index submodule for a given cash register: InternalIndex,
- a submodule whose task is to mark the attributes of Carrier = 1 objects and their surroundings (it's about detecting if a given person can be assigned the value of the Exposed = 1 attribute) and also organizing the calculation of contact time between successive objects in the queue,
- queue submodule with blocks counting the contact time between successive objects in the queue.

Fig .1: Part of the module showing checkouts with separate queues

The model also contains a database, which consists of a set of tables (one table per checkout). Each table contains information about the object (client): arrival_time, departure_time, queue_lenght, IntervalWithPrev, IntervalWithNext, Wait, Carrier (0/1), PrevIsCarrier (0/1), NextIsCarrier (0/1). Changes in the value of record fields in tables are made as a result of the appearance of a given record in a specific place of the system but also depending on the state of the objects in its vicinity. The model is equipped with the ability to communicate with MS Excel sheets. In a separate MS Excel application it is possible to view and analyze the results of simulations regarding individual cash registers as well as perform sensitivity analysis, e.g. examining the dependence of the number of actually dangerous contacts on the limit of contact time with infected persons determined by epidemiologists. It should be noted that a person who is not infected can get infected from his predecessor and successor, so contact times should be added together. In this way, we take into account the intensity of pathogen exposure.

The following is a piece of program code (ModL language, very similar to C) responsible for identifying the host environment. This code is executed immediately after joining the queue.

```
if                                                    (Carrier==1)
 {
        if                                            (IntIndex>1)
         {      outExposedPrev=1;
                outIntIndexPrev=IntIndex-1;
         }
        else

         {
                outExposedPrev=0;
```

```
                    outIntIndexPrev=1;
            };
          outExposedNext=1;
          outIntIndexNext=IntIndex+1;
  }
else
  {
          if (IntIndex>1)
            {
                    outExposedPrev=0;
                    outIntIndexPrev=IntIndex-1;
            }
          else
            {
                    outExposedPrev=0;
                    outIntIndexPrev=1;
            };

          outExposedNext=0;
          outIntIndexNext=IntIndex+1;

  }
```

Description of the Research Procedure

Preliminary Experiment

The first part of the experiments concerns determining the value of the intensity of the stream of incoming customers and the distribution of service time at checkouts. We want to keep the queue relatively stable (Fig. 2). The length of the queue should also be proportional to the number of cash registers. Thanks to this, we will be able to reduce any significant impact of queue length variation on the epidemiological effects of various cash register configurations. It was assumed that no more than 800 objects will be observed. The running time is 800 minutes.

It was assumed that the intensity of the stream of objects is described by an exponential distribution with an average of 1 or 2 minutes.

Based on the research of Mielczarek (2009), it was assumed that the service time distribution can be described by a triangular distribution and tends to be more likely to be close to the maximum (non-isosceles triangle). It is known that the mean value for a triangular distribution can be calculated using the formula mean = (a + b + c) / 3 where a = minimum b = most likely and c = maximum.

It is assumed that there are 7 cash desks in the supermarket and that at the start of the simulation in the queue (immediately 7 will go to the open cash desks) 21 = 7 * 3 people will wait, so after starting the simulation there will be 14 = 7 * (3-1) people . We care about maintaining this queue length (as we expect, the long-lasting interpersonal contacts are particularly dangerous). Note that in an equivalent time-waiting situation for configurations with separate queues, 2 people will wait in each queue.

Interpretation of results (Tab. 1). We will select parameter values for further research so that the desired queue lengths belong to the smallest width confidence intervals, have the largest width (maximum-minimum), i.e. that they take into account the largest percentage of transactions. Therefore, we choose the combinations: Mean (Input) = 2, triangular distribution (7; 20; 15) and Mean (Input) = 1, triangular (5.5; 8; 7.5) (in minutes).

Table 1: Results of the initial experiment: the impact of the parameters of the triangular distribution and the intensity of the customer input stream on queue length statistics

Mean (Input) [min]						Expected Queue Lenght	
2						is in conf. interval	
minimum	most likely	maximum	mean	std.dev.	conf.interval +/-	21	14
11	15	16	21,1	14,6	6,8	Yes	
10	15	17	20,8	14,0	6,4	Yes	
9	15	18	22,1	13,6	6,4	Yes	
8	15	19	27,7	19,5	9,1	Yes	
7	15	20	18,9	13,7	6,4	Yes	Yes
6	15	21	26,7	18,1	8,5	Yes	
5	15	22	23,7	15,6	7,3	Yes	
4	15	23	25,1	16,6	7,8	Yes	
Mean (Input) [min]							
1							
minimum	most likely	maximum	mean	std.dev.	conf.interval +/-	21	14
5,5	7,5	8	16,7	7,9	4,6	Yes	Yes
5	7,5	8,5	16,1	8,3	3,9		Yes
4,5	7,5	9	15,9	7,6	3,5		Yes
4	7,5	9,5	14,2	7,7	3,6		Yes
3,5	7,5	10	17,5	8,0	3,8	Yes	Yes
3	7,5	10,5	16,9	9,4	4,4	Yes	Yes

2	7,5	11,5	17,0	10,1	4,7	Yes	Yes
1,5	7,5	12	16,9	10,1	4,7	Yes	Yes
1	7,5	12,5	18,7	10,9	5,1	Yes	Yes

Fig. 1: Part of the module showing checkouts with separate queues

Main Experiment

Issues to consider: how the frequency of unsafe contacts are affected by: the intensity of the customer stream, service time schedules. How does the degree of infectivity affect the frequency of dangerous contacts? Which configuration: common queue or separate queues to checkout is safer depending on the contact time we consider to be dangerous?

Assumptions. Based on reports of the percentage of people showing SARS-CoV-2 antibodies, we assume that (Gangelt, Germany) 15% of customers may pose a threat to other people waiting in the queue. Information is also available that you should avoid people-to-people contacts that last over 15 minutes and relate to distances below 2 meters. However, this may be the case for SARS-CoV-2.

Perhaps these warnings should be modified for other infectious pathogens.

We carry out an experiment for 7 active cash registers. We check the frequency of dangerous contacts in an experiment lasting 800 minutes (12.5 hours) during which 400 or 800 customers can be served to the tested system (the intensity of the input stream is Mean (Input) = 2 minute or Mean (Input) = 1 minute, respectively).

Table 2 *:* Comparison of the number of dangerous contacts for Mean (Input) = 1 and Triangular (5.5; 8; 7.5), in minutes. Case: high input stream but short service time

COMMON QUEUE		SEPARATE QUEUES											
			Queue ID										
Boundary Contact Time	Unsafe Contacts	Boundary Contact Time/Unsafe Contacts	1	2	3	4	5	6	7	8	9	10	SUM
0	188	0	18	20	33	25	17	22	23	0	0	0	158

As we can see (Tab. 2), it is possible that the number of unsafe contacts for a common (shared) queue is greater than for configurations with separate queues, regardless of the time limit above which danger exists.

We also examined other configurations. In most cases, in terms of security, a configuration with separate cash registers is better. Slightly (at most 3 contacts out of almost 200) a shared queue is better when queues are of considerable length (high intensity of the stream of customers and long service time). The shared queue has a significant advantage when it is sufficient to infect (deem a dangerous contact) relatively short time (less than 15 minutes) assuming that the variability of service time at cash registers has been reduced to zero (a constant service time).

Table 3*:* Results for high infection level (15%). In left and right cases separate queues are better (smaller)

Discussion and Conclusions

We assumed that cash registers and individual queues do not interact (as for epidemiological issues). It seems that this can be ensured by installing physical barriers between checkouts and passageways where customers are waiting for service.

In the light of the experiment results presented above, we recommend configuration with separate queues. Thanks to the right choice, we can reduce the frequency of dangerous contacts from as much as 75 to 52 (out of 800 clients) even with a half reduction in the number of infected people known from Gangelt (for example). If we additionally assume that there are customers whose service time is short, close to zero, then we can observe a reduction in the number of dangerous contacts from even 26 to 11.

Recommendations for customer: When you see a very large crowd - choose a common queue. When you know that there is high infectivity and you buy little, choose self-service checkout (or you belong to a high risk group) but be careful with the neighbor (at another self-service checkout) and the checkout panel (put on gloves). This work did not investigate the impact of the queue organization on the safety at self-service checkouts. It seems that in this case the spatial configuration of this cash register module has the greatest impact. Observation shows that in that case it cannot be assumed that the individual checkout are separated from each other and the time of potential unsafe contact with a customer from a neighboring checkout should also be taken into account. In this situation, it seems

that you should choose checkout located extreme, closest to the exit, to protect against meeting clients from both neighboring checkouts registers (and clients still waiting in the queue).

Suggestions for further research: it seems that the research can also be extended to consider the use of store space provided for queuing customers. It is also worth considering the possibility of getting infected from a greater distance (e.g. 2-3 people preceding us in the queue). It seems that organizational changes could be considered in the case of a common queue: let people approach the computer separating customers to the checkouts from both sides (left and right) and be invited sequentially. Another problem is emerging: how will the cash register failure affect the epidemic in individual configurations?

Evidence Before this Study

Prevention of COVID-19 infections is a serious challenge. Managers try to secure store staff and customers. Queue management in supermarkets was supported by a simulation-based approach.

Added Value of this Study

The scope of applications of the simulation-based approach was expanded to include the study of the impact of the frequency of close contacts between customers in store queues, including pathogen infectivity. Two main configurations were tested: a common and separate checkout queue. The presented research shows that in most cases it is safer to organize separate queues to checkouts.

The Circular Economy in the Context of the Green Economy and Sustainable Development: A Theoretical Approach

Elena Sinziana BUTNARU

The Bucharest University of Economic Studies, Faculty of Agro-Food and Environmental Economics, Bucharest, Romania
sanziana_butnaru@yahoo.com

Abstract

The circular economy has the potential to generate new resources, to create new opportunities and sustainable business models. In a society where we are constantly searching for new sources of self-sustaining economic growth, the current paper illustrates that the circular economy can be the answer. Identifying sustainable solutions for optimizing resource consumption for closing loops is an important goal at European level. Capitalizing on products and secondary resources are vital aspects for the circular economy to take place in optimal parameters. In this regard, the development of this new market has an important role in the practical implementation of resource efficiency. In the first part, the author presents a current overview of sustainable development whereas the second part underlines the concept of circular economy, its main implications and its urgent necessity. In the last part of the paper, the author underlines the main directions in which the sustainable development should be approached such as sustainable production and consumption models, development of new skills etc. emphasizing on the circular economy.

Keywords: Circular Economy, Sustainability, Green Economy

Introduction

Currently, there is a consensus that sustainable economic and social development requires adequate management of raw materials, waste, by-products, energy to conserve the planet's limited natural resources and protect the environment.

The consumer society emerged at the end of the twentieth century, along with the global population growth trend, intensification of the urbanization process development and dissemination of information and communication technology, continuous increase in living standards, reduction of product life cycle have contributed to increasing the volume and diversification of waste streams.

Given the sharp decline in natural resources, the rapid deterioration of air, water, soil quality and the deterioration of natural ecosystems, international concerns about waste management have become dynamic in identifying the best solutions and technologies. In this context, waste management has become a fundamental problem of future socio-economic evolution, a direct result of a present linear economic development. (Lacy, P., Long, J., Spindler, W., 2020).

The transition to a circular economy, in which the value of products, materials and resources is kept in the economy for as long as possible and the production of waste is kept to a minimum, has gained special attention, being on the agenda of public authorities, of the business environment, research institutes and non-governmental organizations. Lately, the concept of circular economy has experienced an exponential development through the active involvement of all stakeholders.

The Circular Economy concept in the framework of Green Economy and Sustainable Development

The European Commission defines the circular economy as the economy in which "the value of products and materials is maintained as much as possible. Waste and resource use are kept to a minimum, and when a product reaches the end of its life, it is used again to create added value; this can bring major economic benefits, contributing to innovation, growth and job creation".

The circularity concept is very close to the concept of efficient utilization of natural resources on system level, on the full life cycle of the products also with transformation of the waste in new resources for other industries.

The circular economy it is not applicable only to one of the activity levels or only to some of the resources, it can be extended to all the activity levels using different synergies associations, which can generate positive or negative cumulated effects.

We believe that anticipation and adaptation processes can be useful approaches for minimizing the risks associated with negative synergies at economic, social and environmental levels. Identifying the emerging aspects of the circular economy is the first step in establishing the types of synergies and associated measures that are required.

The challenges associated to the circular economy are also involving the necessity of a political commitment related to circular economy, to develop standards for the efficient use of resources on each waste stream or other types of resources, to finance innovation and research in the development of new technologies, but also to promote initiatives in the field of information technology.

Achieving a circular economy, which blends harmoniously with green growth, brings to the fore the need to implement a sustainable approach to economic activities.

The transition to a circular economy promotes sustainable production and consumption patterns that can be implemented in a society in constant search of new sources for self-sustaining economic growth. (Lacy, P., Long, J., Spindler, W., 2020) The process of transforming the classical-linear model into a circular one involves reconsidering unsustainable aspects in order to identify future development opportunities.

The circular economy is part of sustainable development, bringing to the fore the need to optimize resource consumption to prevent, reduce waste and promote reuse.

The development of a circular economy needs new approaches to the life cycle, which will allow to overcome the barriers associated with the takeover at the level of the consumer market of the latest technological innovations in this field.

The circular economy and the green economy are an integral part of the concept of sustainable development, as formulated by the Brundland Commission (1987), as "meeting today's needs without sacrificing the ability of future generations to meet their own needs".

The circular economy and its potential to generate new resources, to create new opportunities and sustainable business models, has gained special attention, being on the agenda of public authorities, the business environment, research institutes and non-profit organizations.

The preservation, respectively the recirculation of raw materials, of the secondary resources in as many production circles as possible is an objective included in the policies and strategic plans of the private and public environment.

From a simplistic approach, the implementation of the circular economy mainly targets two areas, with specific problems: industrial/professional and residential/municipal. At some level, they are interdependent and synergistically influenced (e.g., designing for better reparability / reuse of products can make both reuse and recycling easier at the end of use).

The circular economy it is connected to the aspects of increasing competitiveness. Achieving an optimal use of resources implies the existence of an interoperable electronic system for traceability and reporting of data based on an efficient collection infrastructure.

At the same time, this concept brings with it a series of benefits, but also challenges to which all stakeholders must respond, both private and public, or ordinary citizens. The impact of waste on the environment has recently received special attention at international and European level, including marine litter.

The circular economy applies to all sectors of activity with the capacity to achieve synergies, which by cumulating can determine new development opportunities. That is why there is a need for active involvement not only at the level of public policy, but also at the level of implementation in the territory. In this respect, local public authorities have an important role to play in designing an efficient collection system, including at source, for all types of waste. "Pay as you throw" schemes allow the implementation of the "polluter pays" principle in practice.

The concept of circular economy, it is a derivation of other concepts used before it, the most important being sustainable development and the green economy.

The concept of sustainable development had as its starting point the global ecological crisis 1929-1933 and was later developed by encompassing all economic, social, and human spheres, reaching that today, sustainable development is the new path of humanity. The idea behind this concept is to ensure a better quality of life for all the inhabitants of the planet, both for the present generation and for future generations.

The principles of the Circular Economy

The circular economy offers multiple value creation mechanisms, which are decoupled from the consumption of finite resources. (OECD 2018) In a true circular economy, consumption only happens in efficient bio cycles. Resources are regenerated in the biological cycle or recovered and restored in the technical cycle. In the biological cycle, natural processes regenerate matter with or without human intervention. In the technical cycle, with sufficient energy available, human intervention recovers the materials and recreates the product. Maintaining or raising capital has different characteristics in the two cycles. The principles are:

1. Preservation and enhancement of natural capital by controlling finished stocks and balancing the flow of renewable resources.

2. Waste is a raw material. The biological and technical components of a product are designed to fit into a material cycle where they can be disassembled / disassembled and used for other purposes. The circular system intelligently selects and chooses technologies and processes that use renewable resources, with better performance, where possible. Technical components: plastics, polymers, alloys, glass and other manufactured materials are designed so that they can be reused with minimal effort and energy consumption.

3. Optimizing resource yields by circulating products, components and materials with the highest utility and priority. This means that remanufacturing, reconditioning and recycling of circulating components and materials can effectively contribute to the economy. Circular systems are distinguished by extending the life of products and optimizing reuse. Sharing increases the use of the product. Circular systems maximize the use of biodegradable materials as basic materials, with the use of biochemical materials being used less and less.

4. Promoting the efficiency of the system by denouncing and combating the harmful effects of the current industrial economic system, also called system-level thinking. Thus, the ability to understand how the parties interact and influence each other is essential. This means reducing the negative effects that some products and services have on humans. We are talking about food, transportation, shelter, education, health, entertainment, and the effects of mismanagement, such as misuse of land, air, water, and noise, the release of toxic substances, and climate change.

5. Diversity is strength. Versatile systems with many connections are more elastic in the case of external shocks, unlike those whose only creative object was efficiency. Sustainable development is the form of economic growth that meets the needs of society in terms of welfare in the short, medium and long term it must meet current needs, without endangering those of future generations. This notion reconciles between the environment and the economy, representing a path of development that supports human progress for the entire planet and for a long future. This approach aims at the interaction of the compatibility of four systems: economic, human, environmental and ecological, so as to ensure the satisfaction of the needs of the present, without compromising the ability of future generations to meet their own needs. The sustainable development strategy includes simultaneous progress in all four dimensions.

Global development has the general goal of improving human life and ensuring the necessary conditions for people to reach their full potential. Achieving this global goal requires the fulfilment of the following objectives: the analysis of the present through the prism of the future, by introducing ecological security instead of maximizing profit. This being the true goal of sustainable development; changing consumption and production trends; establishing population growth; distribution to the entire population of the benefits of economic development; achieving effective governance, i.e. developing a political system that ensures respect for human rights and freedoms; the permanent and safe compatibility of the man-made environment with the natural environment.

Sustainable development cannot be ensured without environmental protection. Sustainable development includes environmental protection, while environmental protection conditions sustainable development. The European Union requires a new approach to global environmental issues, related to the effects and pressure on the environment, of all the consequences of socio-economic development. Aware of the need to continue economic and social development, it is imperative to protect and improve the state of the environment as the only possibility for creating and maintaining the welfare of both present and future generations, this balance being the factor that can and must ensure the development of society as a whole. . This is the key issue for sustainable development. (European Commission, 2017).

The green economy results in improved social welfare and equity, while significantly reducing environmental risks and ecological deficit. The transition to a green economy means policies and investments that will decouple economic growth from increasing current intensive consumption of raw materials and energy. A green economy can be thought of as a low-emission economy, through the efficient and sustainable use of resources and ensuring social inclusion. In a green economy, revenue growth and employment should be driven by public and private investment that reduces carbon emissions and pollution, increases energy efficiency and resource efficiency, and prevents the loss of biodiversity and ecosystem services.

Conclusions

Potential for improving the degree of recycling on each waste stream exists, and identifying the best ways to act in this area is the key to growth resource use productivity.

One of the challenges is to minimize resource losses, which could re-enter the economic circuit through excessive use of storage and incineration. In this regard, it is necessary to change the mentality of all stakeholders for promotion of ecological behavior.

Encouraging the development of new skills and jobs for the reconversion of the unemployed and among young people can make it easier to prepare the market for the circular economy. Another area that can be considered is the consultation of stakeholders in the promotion of the transfer of human capital taxation to the taxation of resource consumption which can be a signal positively transmitted to the economic environment.

The promotion and implementation in practice of sustainable production and consumption models bring in the foreground the need to identify and support economic development niches in order to be able to obtain social and environmental benefits. Increasing consumer awareness of placing on the market new products obtained from waste has a key role to play in promoting sustainable business models. (De Angelis, R., 2018)

The place on the market of new recycled or recovered products can only be done in compliant safety and human health standards and product-specific legislation. At these add the aspects related to the re-labeling of new products, as well as the degree of openness of consumers to them.

Health communication in Poland: Barriers Precluding Hope For Good Physician-Patient Communication

Agnieszka PIASECKA-ROBAK

University of Lower Silesia, Wroclaw, Poland
agnieszka.piasecka-robak@dsw.edu.pl

Abstract

The article describes the specificity of health communication in Poland. A qualitative analysis of the relevant literature, legislation and regulations for the education of doctors was carried out. The text identifies barriers that prevent effective doctor-patient communication: (1) legal anchoring in the paternalistic model, (2) a patient treated as a legally undefined, subordinate element of the system, (3) (still) limited education of physicians in social skills, (4) no tradition of health communication in Poland.

Keywords: Health Communication, Barriers, Physician, Patient

Introduction

In education and other social sciences, health is defined as a value that gives the highest meaning to individuals' lives and profoundly affects their actions (Piasecka, 2008). Nearly three hundred definitions of health have been coined so far (Woynarowska, 2013). They are divided into biological, functional and biological-functional classes. Over the years, a range of categories, such as *realist*, *nominalist*, *ontologist*, *physiologist*, *normativist, descriptivist, subjectivist* and *objectivist*, have been invented and applied to classify concepts of disease (King, 1954; Nordenfelt, 1993; Sundström, 1987; Lennox, 1995; Kovács, 1998; Hofmann, 2001). However, the theoretical discourse on communication about health, illness and treatment is still not compatible with the practice of health communication. The paradigms prevailing in therapeutic practice do not keep up with changes in scientific perspectives and social expectations.

In defining health, we usually rely on the terminology constructed by global and/or national opinion-leading organisations, such as the World Health Organisation, and, in doing this, we tend to neglect social interpretations of health (Pallai&Tran, 2019).

Although the internationally recognised categories listed above are common currency in Polish scientific theory, the images of health, illness and treatment, as well as attitudes to people with diseases or complaints, are formed above all socially in Poland. The "scientific paradigm" is systematically shaped by the prevalent social worldviews and the public perceptions of the actual role of physicians in the treatment process (cf. Domaradzki, 2013). In this way, the scientific paradigm becomes part of the social paradigm – of the context in which scientific research is conducted (Fleck, 1980). As a result of this "extension" of health-related thinking beyond the academic world, definitions of health, illness and treatment are inherently culture-dependent and culture-specific (Payer, 1988). Given this, they should be constructed and modified in relation to the changing political and economic situation, environmental and social conditions, and the legal and educational systems in place (Sokołowska, 1980). The models of communication concerning health, illness and treatment should evolve accordingly. Therefore, health communication should be explored in and take into account a comprehensive context. Specifically, factors to be considered include not only individuals' physicality and psyche, but also their social entanglements (Parsons, 1991) and "spiritual well-being" (Chirico, 2016, 11-16), as well as the relevant legal guidelines, cultural norms and

cultivated traditions, complete with social perceptions of patients and health care professionals (Pallai&Tran, 2019).

There is a lack of consistency in communicating about health, illness and treatment in Poland. This results from divergent social paradigms, incoherent legal principles imposed by the authorities and varying instructions on medical practice modelled (and sometimes directly verbalised) by decision-makers of medical facilities, who fall back on medical education-instilled intervention patterns, which are often at odds with the expectations of the public increasingly aware of their rights. This article discusses such educational, communicational and legal inconsistences in the context of patient care in order to capture the main barriers to communication about health, disease and treatment in the Polish health-care realities.

Specifically, the aim of this article is to describe the realities of Polish communication about health, illness and treatment in health care institutions and to establish whether such circumstances preclude hope for good physician-patient communication (Piasecka, 2015). The article addresses the problem of mixed paradigms which the staff of Polish medical facilities apply in their work with patients. Another purpose is to show which paradigms are instilled by education, which are imposed by the legislation, and which are usually used by physicians in their daily work.

Materials and Methods

The first stage of the study involved a systematic review of the literature to assess the viable definitions of health, illness and treatment in order to outline the background of health communication in Poland. Subsequently, a qualitative analysis of medical education programmes and curricula was carried out, including the current legislative provisions relating to the training of medical practitioners (education) and to the performance of the physician's professional responsibilities (legal regulations). The research study was capped by an analysis of theoretical and practical models of physicians' work in Poland, indicating the main causes behind barriers in health communication in Poland.

Results and Discussion

The culture in which people grow up determines the way they perceive and understand concepts. The phenomenon of health communication in Poland is discussed below in the context of the legislative, educational and mental barriers that affect the process of communication.

Barrier 1: Legal anchoring in the paternalistic model

Polish physicians are legally embedded in the paternalistic model. Legal guidelines for the patient-physician relationship are developed in the directive paradigm. How are doctors supposed to communicate about health, illness and treatment?

The Polish law does not contain any official definition of the medical profession. The term "medical profession" was officially introduced in the Law of 30 August 1991 on Health Care Facilities (Journal of Laws 1991 No. 91, item 408). This document describes a person performing the physician's job as someone who **is qualified and licensed to provide medical care in a particular scope**. This definition was restated in the Act of 15 April 2011 on Medical Activity (Journal of Laws 2011 No. 112, item 654). Although legally binding, this definition is quite inconsistent. The document defines and authorises a person practising the medical profession as having professional medical qualifications **to provide health services** in a specific scope or a specific field of medicine.

The work and behaviour of this person are governed by the legal stipulations for the medical profession, which set the standards of its performance. For the profession of the medical and dental surgeon, this is regulated by the Medical Doctor and Dentist Profession Act of 5 December 1996 (Journal of Laws 1997 No. 28, item 152; Journal of Laws 2018, item 617, 650, 697, 1515, 1532, 1544, 1629, 1669, 2435; Journal of Laws 2019 No. 69, item 60), while for the profession of the

psychiatrist, this is standardised by the Act of 19 August 1994 on the Protection of Mental Health (Journal of Laws 1994 No. 111, item 535). The Acts put medical doctors, dentists and psychiatrists under an obligation to undertake interventions with a view to maintaining, saving, restoring or improving health, to engage in other medical procedures necessitated by the treatment process or by other regulations governing the implementation of these procedures, and even, in the case of psychiatrists, to apply direct coercion measures, such as the immobilisation or isolation of the patient, under certain circumstances.

In Polish publications on the medical profession and the medical work ethics, the physician is described as a person who "is qualified and licensed to systematically (...) **undertake and perform medical** interventions that affect **the patient's body** and meet the current medical standards" (Karkowska, 2012, 72). The medical professional ethics is sometimes described as **actions focused on protecting the life and the health** of the sick and/or the suffering. The physician abides by "a certain code of morality and ethics that affirm particular values" (Nawrocka, 2008, 23). He or she is obligated to provide medical assistance and information about the patient's health status, but he or she also has the right to invoke the Conscience Clause (Article 39), i.e. **to refrain from providing health services that are incompatible with his or her conscience**. However, he or she must inform the patient about the viable possibilities of obtaining this service from another doctor or in another medical facility, register and justify this fact in the medical records and notify his or her superior about the decision in writing.

Although the Polish Constitutional Tribunal recognised the provision on the use of the conscientious objection clause to be partially incompatible with the principle of correct legislation stemming from the Constitution of the Republic of Poland (Article 2, Article 53 paragraph 1, Article 31 paragraph 3; Journal of Laws of 16 October 2015 item 1633. Ruling of the Constitutional Tribunal of 7 October 2015, reference number K 12/14), the clause is still used in practice and **empowers the physician to be a decision maker** in the area of the patient's life and health.

The terminology of the definitions provided by Polish laws which regulate the work of physicians represents health in a highly reductionist fashion by scaling it down to biological categories. It does not embed health in a broader social context and severs the "body/organism" from the values endorsed by the individual and the norms to which he or she adheres. This dissociation is supposed to guarantee medical professional values, such as objectivity, impartiality, the repeatability of analyses and the comparability of results, which are prerequisite for precise diagnostic, therapeutic and research procedures. This understanding of the role of the medical practitioner puts him or her in the position of a powerful and dominant agent who holds all the strings.

Therefore, possessing expert knowledge translates into an asymmetry of social positions, with the physician being invested with power over others (patients) who do not have this knowledge (and, consequently, power). For its part, power furnishes the physician with the mandate and opportunities for top-down interventions. Thus, the Act obligates physicians to work within the directive paradigm, to implement so-called positive control and to modify patients' behaviour. Doctor are required to follow the paternalistic model and develop effective action templates, as evidenced by the vocabulary of the medical legislation, which focuses on the form of delivery: giving, leading, guiding, undertaking, etc., relegates patients to the object-position and presupposes the possibility of refusal to provide health services. This is in contradiction both to "personalised medicine" – as promoted by the experts of the European Science Foundation (ESF) and the European Medical Research Council (EMRC) in European health systems (Wagner, 2015, 213-223; ESF, 2012) – and to human rights, such as access to information, decision-making and self-determination, as well as to a comprehensive concept of patient subjectivity (Malmgren, Törnvall, Jansson, 2014, 143-150).

Barrier 2: The patient is a legally undefined, subordinate element of the system

Since the Polish legislation does not define patients' rights, it is difficult both to respect them and to indicate who actually communicates in the communication process in the first place.

The Act of 6 November 2008 on Patients' Rights and the Patients' Ombudsman (Journal of Laws of 2009 No. 52, item 417; Journal of Laws of 2019, item 1127) defines the patient as a person who applies for health services or uses health services provided by a facility which offers medical services or by an individual who practices the medical profession. Regarding the rights of the patient, the same Act does not specify what these rights actually are. Instead, it focuses on stipulating how these rights should be respected and cautions what violations of these rights are compensable in money (based on Article 448 of the Civil Code).

With the reductionist approach combined with the lack of the definition of patients' rights in the Polish law (Paszkowska, 2018, 1239-1244), paternalism in the doctor-patient communication relationship seems to be a legally expected and desirable state. I**nvolving an ambiguous and imprecise entity**, with an unclear legislative status (i.e. the object of medical interventions), in matters related to treatment and decision making is after all hardly feasible. It is particularly difficult when the status of the medical staff, their organisational structure and their mandate to control and exercise power (and knowledge) over patients are legally codified and structured. The privileged position of the medical personnel is additionally secured and strengthened by a number of mechanisms, among which the key role is played by their command of goods (health, pharmaceuticals, knowledge about the treatment process and the capacity to apply therapies to patients, who cannot do without them), patients' dependence on the public health services and impeded access to (a small number of) specialist physicians (Wagner, 2015; Biesaga, 2005).

The latter of these mechanisms is probably especially pernicious. Impeded access to specialists results from staff shortages in health care facilities. As of 31st October 2019, the Central Register of Physicians of the Republic of Poland, kept by the Supreme Medical Council, listed 178,693 individuals as performing the profession of a physician and/or a dentist in Poland. Thereof, 140,273 were physicians, 37,973 were dentists, and 447 were people with a double licence to practise both professions (Supreme Medical Chamber in Warsaw, Central Register of Physicians of the Republic of Poland, 2019, Online). Given that the population of Poland is 38,386,000 people (as of 30 June 2019), there are 272 patients per one doctor (regardless of his or her specialty) and over 999 patients per one dentist. This means that there are 3.66 physicians and... just 1 dentist per 1,000 inhabitants of Poland. Even lower figures are cited in the OECD report *Health at a Glance 2018*, developed in collaboration with the European Commission. According to this report, Poland has the third lowest ratio of doctors per capita in Europe (just behind Great Britain and Romania). The data in this report indicate that there are only 2.4 doctors for every 1,000 Poles (4.6 according to the estimates of the Supreme Medical Chamber in Warsaw).

For Polish patients to be treated as conversation partners and to make informed decisions about the kind and course of treatment, they would have to have physical access to the medical staff. If this condition is not met, the process of communicating about health, illness and treatment may not be achieved. The medical staff should devote to patients enough time for their decisions to be made consciously and thoughtfully. The above statistics alone suggest that the modicum of time that the medical staff are actually able to devote to a patient is by no means sufficient for judicious decision-making on his/her part. This is additionally aggravated by the fact that the medical staff's time is also consumed by other duties, such as keeping medical records, participating in medical case conferences and consultations, performing medical procedures, etc.

The patient as a person is not a legally defined concept. In addition, patients usually have no university-level medical training. Therefore, they are not able to decide with full responsibility on health and life. The legislator has assessed that this is the competence of physicians as people who undertake treatments. Consequently, in legal terms, "top-down communication" without any need for feedback (other than the requisite consent to treatment) perfectly suffices to conduct the therapeutic process.

Barrier 3: The Polish medical staff receive a limited education in social skills

The long and noble tradition of Polish medical history, ethics and philosophy is barely reflected in the current medical curricula. Until 2019, the combined bachelor's and master's degree course for medical **doctors** included the total of 120 hours of the humanities (e.g. Psychology for Doctors – 30 hours; Sociology in Medicine – 30 hours; Ethics for Doctors – 30 hours; and The History of Medicine – 30 hours). The minimum required for the basic training was 1,635 classroom hours. The humanities made up just above 7.34% of all the subject courses in this group. The entire course of study, including both the basic and the specialist training, comprised the total of 3,990 coursework hours, in which the humanities accounted for a mere 3.01% of all the subjects (Annex No. 54, Ministry of Science and Higher Education). Due to the budget cuts, the amount of training provided by medical universities did not go beyond the legally required minimum, which well represented the real situation of medical education (Ministry of Science and Higher Education, Training Standards). More training in the humanities was offered to **nurses**. The bachelor's degree course in nursing comprised 4,605 hours of training, whereof 285 were in the humanities (6.19%). The basic training (the total of 810 hours) included 195 hours devoted to the humanities (24% of all the coursework): Psychology (60 hours), Sociology (45 hours), Pedagogy (60 hours) and Law (30 hours). The specialist training (the total of 3,795 hours) included 90 hours of Philosophy and Ethics for Nurses (2.37%). The master's degree course offered Psychotherapy (30 hours out of the total of 45 hours of the basic training, i.e. 66.67%) and Management in Nursing (45 hours out of the total of 285 hours of the specialist training, i.e. 15.79%). All courses in the humanities included in the nursing degree programme added up to a total of 360 hours of classes, which was 7.29% of all the coursework (Annex No. 80, Ministry of Science and Higher Education). The students of **dentistry** received the least training in the humanities. The dentistry programme included only 30 hours of training in Clinical Psychology (out of the total of 1,500 hours of basic training) and 30 hours of Work Safety and Ergonomics in Dentistry (part of specialised training, the total of 2,480 hours). So the total of 60 hours (1.5% of all the courses) covered the entire training in the humanities which a dentist had to do to obtain a degree (Annex No. 55, Ministry of Science and Higher Education).

These figures may be astonishing. Doctors can hardly be expected to embrace a personal approach to their patients, as a mere 30 hours of psychology training at the medical school will not substantially improve their communication skills or enhance their intra- and interpersonal competencies.

Despite the transformation of Polish Medical Schools into Medical Universities and despite the fact that educational systems around the world are withdrawing from teaching the content that "can be readily obtained through an advanced ITC system if one knows how to use it" (Brzeziński, 2007, p. 36; Suchorzewska, Olejniczak, 2011, pp. 7-9), the humanities in the Polish medical training system remain in a didactic recession. At the same time, patients' expectations are growing as they acquire "world class medical knowledge" by watching TV series and documentaries, where "doctors," or actors, with excellent humanistic and sociological training, showcase their therapeutic methods.

The current situation may be slightly altered by the recent Regulation of the Minister of Science and Higher Education of 26 July, 2019 on the standards of education preparing for the professions of a doctor, dentist, pharmacist, nurse, midwife, laboratory diagnostician, physiotherapist and paramedic (Journal of Laws 2019, item 1573). The new standards make it mandatory for medical university authorities to increase the number of course hours devoted to the social sciences and the humanities to 420 hours. Yet the same document also specifies that medical students should receive at least 120 hours of English instruction and earn no less than 5 ECTS credits for the humanities or social sciences module (fixing the lower ECTS limit and apportioning a considerable proportion of coursework to English encourage medical universities to reduce their humanities modules to a bare minimum). How medical students' social competences will develop with the new principles in place will be shown in the near future.

Barrier 4: There has been no tradition of health communication in Poland

Health communication is a robust subdiscipline of social communication in the world. HC is a field of science and practice that is developing very vigorously in the US and Western Europe. In Poland, the role of HC is still being established. However, there is a long tradition of related fields, such as preventive medicine, school hygiene, health education, environmental medicine, health education and medical history (Demel, 1972; Szotowa, Serejski, 1976; Więckowska, 1984; Woynarowska, 2000).

Until the end of the 1960s, the concept of health in Poland was dominated by the category of disease (as the lack of health). It was only in the 1970s that scientists began to focus more closely on the concept of health and its social dimensions. The following decade also saw appeals and attempts to study health and the health condition of Poles in the context of social structures and lifestyles (Piątkowski, 2002, 19). In the 1990s, health-related categories were redefined, emphasising the importance of research into health-promoting behaviours instead of, as had been the case before, the social consequences of illness and treatment (Nosko, 2005, 5-6). Yet even though the social context raised an increasing interest, further exploration of the historical and cultural aspects of health behaviours and public health proved inspirational predominantly to historians, anthropologists and ethnologists (Płonka-Syroka, 1994, 497-512).

The new millennium has brought about a scientific shift as a result of which health in the aspect of positive health communication has come into the orbit of social communication (Hofman, 2019), which encompasses both direct interpersonal (face-to-face) communication as well as media-mediated communication and communication in organisations (Jacennik, 2010; Jacennik & Hulewska & Piasecka, 2012; Goban-Klas, 2014; Piasecka & Hulewska, 2015). It was then that health communication started to be explored within a broader theoretical framework of the social sciences. Attention was paid to the practice of communicating about health in health care institutions and to the urgency to change communication modes in the doctor-patient relationship (Hulewska, Kozłowski, 2012; Hulewska, 2015), moving away from a strictly biomedical approach to health and disease in favour of sociomedical and psychomedical models (Nowina-Konopka, 2016). Such an interdisciplinary approach to the health and well-being of patients still poses a considerable challenge to the medical community in Poland, channelling changes in the doctor-patient communication relationship.

Conclusions

1) The definition of health most frequently quoted in the Polish literature is the definition adopted by the WHO. In the years 1980-2019, the Polish version of this definition was referred to in 761 publications. It was invoked nearly 19.5 times a year (Harzing's Publish or Perish resources, 2020);
2) Although the popularity of the holistic model of health is gradually increasing, “health communication” in Polish medical practice is limited to the biomedical paradigm. Physicians’ professionalism continues to be measured primarily by their knowledge and professional skills as well as the apt construction of patients’ clinical pictures;
3) Polish psychiatry exhibits a more pronounced tendency to conceptualise disease in subjective terms as a sense of discomfort (illness).
4) In Poland, patient-physician communication is regulated by a number of laws and regulations. However, many of these directives are methodologically contradictory, which causes chaos in the legislatively acceptable “health model” and in educating and communicating about health. It also hinders healthy doctor-patient relationships.

Polish medical practitioners (physicians, nurses and other medical professionals) are doomed to navigate a legislative and practical dissonance. They are placed at a crossroads between the official directive definition of the medical profession and other provisions and stipulations of the medical legislation which, residually yet unmistakably, insists on patient-doctor partnership. This uneasy position is made even more precarious by the necessity to negotiate the WHO’s expectations and popular visions of dedicated, self-sacrificing doctors. At the same time (in the same acts of law),

medical professionals are exhorted to extend "an older brother's" tolerant help and support, characteristic of the liberal approach underpinned by the ideas of humanistic psychology (Cf. Kozielecki, 1997). This is in line with social expectations regarding the humanisation of medical professions and the popular understanding of their work.

In Polish culture, the ethos of medical professions specifically envisions their work as an activity focused on protecting the life and health of sick and/or suffering people. Doctors should epitomise morality and "significant moral and ethical attitudes that are an affirmation of certain values"; as such, they should embody and display the humanistic view of people and the world (Nawrocka, 2008, p. 23). This definition of the work of medical professionals has little in common with actual Polish realities. Although the interpretative research paradigm and doctors' humanistic perception of patients preclude defining health as an abstract concept dissociated from specific conditions (Sokołowska, 1980), Polish physicians still prioritise reflecting an objective reality rather than understanding the meaning of social activities. A doctor assuming the role of an interpreter of patients' behaviour and a humanist focused on understanding patients' feelings, emotions and experiences, analysing patients' mental states, anticipating the future and determining the stimulators and inhibitors of the implementation of future plans, would not stand much chance of surviving under the current legal status in Poland. Asking questions such as *Who is my partner in the process of medical advice? What is he or she experiencing? What is he or she guided by when entering into dialogue with me (doctor)? What are my motives for action? What are we both bringing into this relationship? What facilitates and what limits our communication?* would involve discarding the systemic approach, characteristic of the positivist paradigm on which the medical and natural sciences have been based for years.

Such a physician would abandon the strict formulation of cause-and-effect laws and consciously dismiss quantitative research, rationalism and instrumentalism in order to treat patients as unique cases, being the sums total of equally unique meanings, senses and values. Such a doctor would leave behind what he or she was taught in medical school. He or she would renounce the impartiality and objectivity that have so far governed his or her conduct to the limits of precision and protected him or her from ... a medical error, which is as a matter of fact undefined in the Polish legislation.

Abstract

The world economic crises of 1998, 2008 and 2014 form the phenomenon of asymmetry in understanding of academic and applied concepts of economic growth since the middle of the 20th century. Content and comparative analysis show that these views have not been transformed into a universal economic policy designed to solve the problem of recession either in developed or developing countries, and also sufficiently able to take into account the particularities and limitations of a certain social and economic system. The article contains a theoretical rethinking of theories of economic growth from the point of view of the knowledge generation systems, areas of diffusion of innovation and processes of absorption of new technologies, as well as an empirical verification of the modern understanding of the concept of the technological gap for E7 and G7 countries.

Keywords: innovation, knowledge, growth, factor of production, productivity, gap, E7, G7, diffusion, labour, capital, ratio.

Introduction

Since the middle of the 20th century within the theory of economic growth the research focus has seriously changed several times. For a long time, the explanation of the rate of capital accumulation has been put at the forefront. Little bit later, researchers focused on the actual mechanisms, which determine the process of technology development and accumulation of the human capital. And after that, researchers' interest shifted to the discussion of institutional growth factors. So, the economic growth is a steady annual increasing in production and consumption. In the leading countries of world development economic growth turned out into the one of the most spread phenomena of recent centuries and became a subject of constant interest of economists.

Growth diagnostics is an applied static approach to identifying the most serious constraint that slows down growth in a certain economy at a particular point in time. This approach doesn't involve the preparation of long-term development plans due to its implicitly that argues that the plan may not make sense at all. Indeed, according to the growth diagnostics it should be marked that after successfully weakening the restriction, the next steps are to search for new restrictions and to focus on them. At the same time, it is extremely difficult and even if at all possible, to foresee the role of this or another limit of growth in the future. Recognizing the importance of progress in the fundamental factors of development, we assume that the consistent solution of individual tasks to identify and remove the most serious constraints will ultimately lead to progress on the side of such factors.

The article is devoted to analyze the methodology and conceptual provisions of various theories that form the growth basis of socio-economic systems, which are based on the use of basic factors of production (labor, capital), their proportions (also known as productivity and capital ratio) in order to determine the role of innovation as a way to overcome the technological gap between countries with its subsequent empirical verification.

The main debate regarding the factors of global growth slowdown and current recession focused on studying the degree of influence of new technologies on the level of labor productivity and total factor productivity (TFP) in national economies under the influence of a technological factor. One popular approach [15; 19] affirms that all the basic innovations of human civilization that led to technological revolutions (steam energy, electricity, an internal combustion engine, microprocessors, etc.) are all done, so in the next 25 years the dynamics of the efficiency of production factors in developed countries will not exceed 0.4% per year. The domino effect, in turn, will determine the recession of the global economy as a whole. The opposite point of view is proved by the paradox of productivity, which is explained only by the imperfection of statistical measurements [7; 27]. It should be noted that the primarily restrictions are associated with the rapid emergence of new types of economic activity and even the formation of new industries. They are beyond the traditional statistics approaches. Trying to evaluate the beneficial effect of using artificial intelligence and other the newest digital technologies, proponents of this theory predict labor productivity growth in developed countries at a level of at least 2% per year [11].

Methodology and Research

The output of finished goods is determined by the increasing of basic factors of production - labor, capital and total factor productivity, i.e. the technological factor which represents the extrema of production function. We must remember that it can maintain a stable maximum in the long term only with positive non-decreasing returns rate. The trajectory of the actual output relative to potential one is determined by the combination of fundamental and market (short-term) factors. The approach of the economy to the level of its potential output is observed during periods of “overheating”, the situation when the potential output corresponds to the maximum possible (for the economy) approximately to the conditions of full utilization of production capacities and complete usage of existing labor resources. Moreover, it is noteworthy the situation of the time factor inclusion in the analysis. It this case there three types of situations arise that can describe the continuity of the functions extremum sets: sequence, parallelism and the gap.

If the first two situations are quite academically predictable and partly described from a theoretical point of view and in some measure verified in practice, the phenomenon of “technological gap” has not yet received a modern rethinking and empirical verification, taking into account the modern challenges of overlaying cycles N. Kondratiev, J. Kitchin and C. Juglar.

Based on the usage of the general philosophical method of dialectical cognition (to understand the essence of the scientific and technological progress influence on the dynamics of economic growth in their integrity, development and inconsistency), methods of abstract logical analysis (to study the categories of “productivity”, “cost”, “innovation”, “growth”, “gap”) and system-structural and economic-statistical analysis (to assess the vectors of formation and development of the technological gap phenomenon, to decompose the imperatives and pragmatics of knowledge forms and technological gaps, as well as to characterize the crucial features of the integrated system criteria for construction of a knowledge economy as one of the applied tools for overcoming mentioned previously technological gaps).

Thus, here arises the requirement to search for theoretical and applied tools for combining the links of the “total factor productivity - technology - labor productivity - technological gap” chain, which will provide either rethinking of the existing sluggish recession or formation of the predicting economic growth basis for the system of technological transformations within the framework of human civilization. This aspect becomes extremely important in the context of digitalization of a significant part of socio-economic relations during the transition to the next technological mode and the rapid formation of new business opportunities within the framework of Industry 4.0.

Results

Two years ago, Paul Michael Romer of New York University and William D. Nordhaus of Yale University were awarded the Nobel Memorial Prize in Economic Sciences for researching theories of long-term and sustainable economic growth. Before them, in 1987, Robert Merton Solow, a professor at the Massachusetts Institute of Technology, also was awarded the Nobel Memorial Prize in Economic Sciences for fundamental research in the theory of economic growth. More than thirty years gap in research in this area actualizes the problem of searching for the future model for achieving economic growth. On the other hand, modern economic sciences have to identify the causes of cross-country technological gaps as an actual trigger for economic growth.

Many theories of the growth of socio-economic systems experienced two peaks during their evolution: the first peak was observed in the 1950s and 1960s, when the theory of exogenous economic growth was created by the model of R. Solow, Ramsey –Cass – Koopmans model and the model of overlapping generations. The second peak came in the 1980s, when the theory of endogenous economic growth appeared, which over the next decade was transformed into several separate areas.

Up to now, there are a lot of scientific papers devoted to the analysis of the directions and cause-effect relationships between technologies, total factor productivity, labor productivity and the availability of factors of production in general have been already published. But one general conclusion should be done: there is no universal model that describes the technological policy of all (or at least the most) countries - they differ significantly in the nature of such a connection. Moreover, the results of the analysis for one country may vary depending on the chosen time period, step of observations and even the method of econometric analysis of the data. This is hardly surprising - economic policy may change over time, taking into account the accumulated successful or unsuccessful experience, as the overall priorities of the technological policy are adjusted, etc. In this case, it is very interesting to look thought the set of research where the direction cause-effect relationships is studied for a group of triggers within the same model over the same time period.

In general, the complete set of theoretical and methodological approaches and concepts that describe economic growth can be grouped into two blocks depending on the factors origin nature and the way of influence in order to achieve the positive dynamics in the development of socio-economic systems, namely: external - exogenous and internal - endogenous (fig. 1).

Fig. 1: The set of the economic growth theories

The R. Solow model is basic on, therefore its logic is extremely simple. It represents the ratio of the accumulation of capital capacities in the economy producing the final product *Y*, which can be used either for savings (*S*), which over time are transformed into investments or the consumption (*1 - S*). The final product *Y* is the result of the interaction of two basic factors of production - capital and labor. If, as an axiom, we assume that the labor factor is characterized by constant returns, then economic growth can be achieved solely through an increase in capital accumulation capacities due to an increase in the level of investment.

It should be noted that R. Solow proved that investment should be considered as a limited source of growth. In this case, the statement about the diminishing marginal utility of capital investments becomes obvious. If the accepted axiom of labor constancy is valid, then as the capacities accumulate and the economy grows, but there a recession appears. The economy loses the only source of growth and goes into a stationary state i.e. recession [36].

It becomes apparent that technological progress transforms into the link between the declining returns on capital investment and labor. It's only one source of labour efficiency increasing in the conditions when the formation of the basis for bridging the innovation gap appears, which is internationally represented as technological one. In this case, technological progress allows the labour to interact with a large number of capital capacities. In these conditions, a dualistic concept of the influence of technological progress and capital-labor ratio (the ratio of capital capacities to labor force) on economic growth is being formed. If the first aspect justifies slow growth in developed countries, the second one becomes the trigger for the faster growth in developing countries. It becomes the basic dilemma of the technological gap concept within the cross-country analysis of the levels of innovative development.

Thus, actually in the frames of the basic theory of economic growth, at the least two, in our opinion, objective elements are still there and don't lost their relevance up to now, namely: technological progress and country stratification of the technology influence on achieving high level of productivity and economic growth in general.

The following problem arises at the next stage of analysis that deeply interdepends with the basis of the Ramsey model: to find the optimal ratio between of savings and consumption that helps to understand the dynamics of investments better [32]. The modern version of this model was adapted by D. Cass and T. Koopmans in the 1960s [12; 25] as an applied tool for cross-country comparison.

The Ramsey – Cass – Koopmans model takes into account the savings rate as an eventual criterion of the labour, which is formed on the basis of maximizing one's utility from consumption throughout whole life. For example, the overlapping the technological gap in a poor country with low capital – labour ratio, where the returns on capital are larger brings additional benefits for individuals. This benefits argues the individuals to reduce current consumption and increase the savings rate, which through investment increases the growth of industrial capital. By and large, the theoretical and methodological basis of the F. Ramsey model is identical to the R. Solow model, since it doesn't explain the nature of economic growth. Consequently, either exogenous or endogenous nature of the savings rate ensures that the economy enters a stationary condition where the future growth is possible only due to technological progress.

Nobel Prize in Economic Sciences winner Peter Diamond from Massachusetts Institute of Technology proposed a model of economic growth, which is based on two synchronous stages of labour as a factor of production - economically active population and pensioners [16]. The labour stages substitute each other, but at the same time a new young generation appears in each period, and the previous young generation retires. Thus, at each moment of time, within the framework of the economic system, there are two generations of people, which have a different tendency to consume and to save, i.e. to invest. At a working age, individuals earn money from existing facilities and save some of their earnings in retirement, which are invested in the economy. This situation allows increasing the flow of industrial capital, and therefore allows the next young generation to work more efficiently, i.e. to increase labor productivity. In this way, economic growth take place and the rate of savings is determined endogenously, based on the maximization task of an individual who is trying to maintain approximately the same level of consumption during both life periods.

There appears a need for a more detailed understanding of the technological factor influence due to its cyclical nature. The main idea of P. Romer's theory consists on thesis that the company making investment in new technological development temporarily obtains the status of a monopolist in the market within one technological cycle. This monopoly condition is guaranteed either by the complexity of the technology for copying, or by secrecy, or by patent law. At the same time, it must be borne in mind that after some time this technology becomes a public domain, increasing the overall technological level in the economy in general [33].

The Dynamic Integrated Climate-Economy model (DICE) [28] became the basis for studying the paradox of the primacy of economic growth and global temperature changes. It should be noted that this model is a computer-based integrated assessment model developed by 2018 Nobel Laureate William Nordhaus that "integrates in an end-to-end fashion the economics, carbon cycle, climate science, and impacts in a highly aggregated model that allows a weighing of the costs and benefits of taking steps to slow greenhouse warming. This model has been highly criticized by the economists. Harvard Kennedy School of Government economist R. Pindyck summarized criticisms of this type of model in 2013 [31]. The main field of criticism consists of a large number of assumptions, which are actually arbitrary and this fact destroys the possibility of highlighting the "discount factor" - an obligatory indicator for making possible to compare the benefits and losses by using new technologies at present and in the future. It means that the technological gap begins to form not only in space, but also in time.

Ph. Aghion and P. Howitt model of growth through creative destruction [6] describes the replacement of the old technology by the new one. Each inventor who has created an innovation raises not only the overall technological level in the economy, but also force out a company producing an obsolete product or an actual one but by means of old technology, i.e. at lower level of labor productivity. Obviously, this theory repeats the idea of J. Schumpeter about «creative destruction". Note that within the framework of endogenous growth theories (P. Romer, Ph. Aguillon and P. Howitt), the key

triggers of innovative activity during the 20th century were the same and did not differ between countries. This fact highlights the problem of the technological gap between countries.

O. Galor and D. Wile [17] put forward a theory in order to prove two conjectures: economic growth is endogenous and cyclical. The logic of the theory affects not only the quantitative, but also the qualitative characteristics of labor as a factor of production. Given that technological progress changes exponentially and is rather slow but albeit at non-zero level, this circumstance allows the population to grow, and the individual income remains unchanged at a low level. As technology spreads and penetrates into the sphere of material and intangible production, a lot of families have started to improve the quality of their labour. These families reduced the number of children and increased investment in human capital, first of all in primarily education. Cumulatively, we have met a variation in two trends: the first - population growth slowed sharply down, but the quantity of educated people who are able to generate new ideas highly increased, accelerating technological progress at new level like the theory of P. Romer explains. It should be recognized that the shift of mentioned previously trends did not occur simultaneously in different countries, in other words, it was formed a new «gap» in the technological gap theory.

The next theory of economic growth involves the institutional environment ("rules of the game" or restrictions) as the triggers. The main idea of this theory lies in the process of differentiation growth paths in different countries, which are explained by the different functional purpose coexisting institutions - catalysts and inhibitors of economic growth. The main authors of this theory are D. Asemoglu, S. Johnson and D. Robinson [3].

In the framework of the theory, all institutions are classified into inclusive (creative) and extractive. Inclusive institutions form a motivation for creative activity, help to create a new product, to innovate and to generate profit. These institutions are inherent in all models of endogenous growth, which were described earlier and contribute to economic growth. In turn, extractive institutions are inhibitors of innovation and investment at any level of management. As a result, investment dynamics in research and development (R&D) reduced and, as a result, there is no scientific and technological progress and economic growth.

Thus, the models of exogenous growth, in turn, could not explain the observed facts because of the assumption of diminishing returns on the main factors of production, including capital capacities and labour. Indeed, there is hardly an industry where would be no decrease in returns when a certain level of capital is reached. The key idea of the second-generation theories was that the skills and technologies that created in one industry are transferred to others, and in this way the return on investment in innovation ceases to be diminishing for the economy as a whole. At the same time, cross-country movement of technologies is not taken into account, and therefore it becomes the object of both theoretical understanding and applied analysis.

So, here it is the theoretical basis of economic growth models, especially the concepts that generically forms the so-called neo-Schumpeterian direction of economic science [2; 5]. Within the framework of this trend, it is advisable to note that the free transfer (diffusion) of new technologies, innovations and knowledge between firms at the state level can be a factor in achieving growth only in case if lagging behind technological leaders will be proportionally dependent on the growth rate of those working at the technological border, i.e. at the borders of the technological gap.

OECD outlook [30] on global trends in labor productivity as a factor in achieving economic growth, argued that there are a number of reasons for the slowdown in the case of the spread of new technologies from global leading firms to national leaders, as well as lagging enterprises in national economies. Analysis of OECD countries statistical data shows that over the past 15 years, world leaders have shown steady growth, while the gap in technology used between global leaders and other enterprises becomes wider [8]. The lag of national leaders and especially the least productive firms in separate countries leads to a general slowdown in average productivity growth rates, and therefore highlights the second block of conditions for the emergence of technological gaps.

At the same time, national statistical agencies show a widening gap between global leaders and less efficient enterprises. Especially large technological gaps are formed in the labor productivity of human resources. This case in first approach be explained by the differentiation of total factor productivity. It underlines the fact that the diffusion of new technologies does not occur freely and that there are obstacles to lagging behind in the absorption of new technologies that are already being used by global leaders.

It means that the productivity paradox is caused in many respects by the weak functioning of the market mechanism of "creative destruction" according to the ideas of J. Schumpeter. The creation of a new and more productive good accompanies by competitive processes of forcing out the old and less effective one [35]. The insufficient efficiency of the redistribution of the basic factors of production and the weak dynamics of the innovations spread regarding to the challenges of the technological revolution can restrain productivity growth even in conditions of intensive technological progress, which also emphasizes the technological gap relevance.

Traditionally, labor productivity is defined as the ratio of GDP (in US dollars at PPP) to labor costs (the annual number of hours worked by all people employed in the economy or the total number of employees). The capital-labor ratio is the rate of the value of the fixed capital stock (it is measured in dollars or at PPP for capital) to labor costs. Thus, multifactorial productivity can be contrasted with total factor productivity (Solow Balanced Growth Path) and be defined as the gap in labor productivity between countries beyond the differences in capital-labor ratio and quality of human capital [1].

It becomes obvious that the gap situation occurs when a significant supply level is not covered by real demand. This context leads to the situation when the accumulated human capital leader country moves to the set of outsider countries in terms of labor productivity, i.e. the rate of its use efficiency. Skilled human capital supply encourages production by providing an important productive resource. In other words, the supply of skilled labor creates demand for it, and it, in turn, adjusts the supply. As a result, both processes run in parallel, but they are in a race mode [18].

The next criterion of the technological gap between countries is the heterogeneity of the total factor productivity dynamics. Researchers identify a persistent productivity gap between technology leaders and lagging enterprises either in developed or developing countries [10]. The positive TFP dynamics is defined as the growth in output of the finished product, which is observed in a certain period and which cannot be associated only with increasing in the use of basic factors of production in the same period [36; 24; 21].

Any enterprise uses an individual combination of basic factors of production (labor and capital) to produce the final product. If we reduce the final product cost to the costs of labor and capital, then the residue will determine the part of the growth of the final output, which can't be explained by the increase in the quantity of labor and capital. This explains the possible improvement of technology in the industry or to a more optimal combination of labor and capital uses in a particular enterprise in particular [22; 23]. The logic of understanding can be formalized by the following formula:

$$\Delta TFP = \frac{Y_1 - Y_0}{Y_0} - \alpha_1^K \frac{K_1 - K_0}{K_0} - \beta_1^L \frac{L_1 - L_0}{L_0} = \frac{\Delta Y_t}{Y_0} - \alpha_1^K \frac{\Delta K_t}{K_0} - \beta_1^L \frac{\Delta L_t}{L_0}, \quad (1)$$

where ΔTFP – is the dynamics of total factor productivity; ΔY_t – increment in the output of finished goods; ΔK_t – increment of fixed capital; ΔL_t – increment of labor; ; α_1^K and β_1^L – are the rates of the cost of fixed capital and labor in period *t*.

Thus, the TPF dynamics is empirically defined as the unexplained remainder of the growth of the final product. On the one hand, the effects of technological and organizational innovations fall into this remainder due to its diffusion or transfer of knowledge, which determine technological progress

in the industry and affect the shift in the production function. On the other hand, the statistical errors of measurements and a shift in the production function caused by the system's ability to absorb new innovations, knowledge and technologies may fall into this residue.

The widening of the technological gap leads to an increase in cross-country inequality not only within the framework of TFP, but also differentiations in welfare due to different dynamics of economic growth. A special role in the framework of national innovation systems is acquired not so much the diffusion of new technologies, as the quality of the labour as the main knowledge generator. The labour quality as an ability the ability to generate new knowledge can be regarded connecting link in endogenous and exogenous theories of economic growth. The economic growth achievement depends at the least on the nature of the source of technology's origin, and the technological gap will be determined by the ability of the core elements of the economic system to generate and absorb knowledge.

The role of technological knowledge and access to them for the improving of innovative development is described in detail in the scientific literature and papers [34; 29; 20; 13; 14].

However, in the framework of the modern rethinking of the technological gap concept, there are theoretical problems that impede a sufficiently complete description of economic phenomena associated with the processes of creation, dissemination and use of knowledge. At the same time, the role of knowledge (explicit and implicit) as a key imperative of the assumption of the homogeneity of production factors, primarily human capital, remains out of sight. The existence of various types of knowledge and sources of their origin narrows the possibilities of analyzing the processes of knowledge absorption.

At the micro level, the absorption capacity is the firm's ability to "identify, assimilate, and use knowledge from the external environment" [13]. These abilities are associated not only with the potential of employees engaged in the R&D, but also with the results of intra-company interactions that can affect not only aggregate, but also multi-factor productivity.

A lot of studies promotes that the absorption capacity is correlated with the transfer and subsequent use of external knowledge in the processes of creating and diffusing innovations, which determines the endogeneity of theoretical approaches. However, despite the fact that a number of authors indicate the existence of different types of knowledge [14; 26], absorption capacity is often understood as an attribute of homogeneous economic agents, and knowledge absorbed by them is considered as a homogeneous resource. But this makes it impossible to explain the formation of competitive advantages of firms [9] in various models of their innovative behavior depending on the absorption of such a heterogeneous resource as external knowledge, and as a result - to establish complex processes of transfer / flow of knowledge at the level of either firms or the state.

So, the mentioned previously concepts, scientific directions and theories have formed a theoretical basis for identifying cause-effect relationships in understanding the economic growth of complex hierarchical systems including the national economy. The cornerstone of the proposed comparative studies is the comparison of labor productivity and capital-labor ratio of the national economies, which are defined as the ratio of GDP and fixed capital increment to the number of labour. This allows us to carry out the first stage of verification of the technological gap concept within the framework of well-known groups of countries E7 and G7, which are stratified by GDP per capita (fig. 2).

The next step of verification the technological gap concept is a cluster analysis of the efficiency levels of the generating and absorbing new knowledge, technologies and innovations systems in E7 and G7 countries.

Fig. 2: The logic of empirical verification of the technological gap concept

The core of the analysis is based on indicators of high-technology exports, value added in the industry (including construction) and R&D expenditure per one scientist – researcher for the period from 1990 to 2018 (fig. 3).

a) GDP (PPP, current international USD) per capita

b) Gross fixed capital formation (USD) per labour force (capita)

c) Gross domestic product (USD) per labour force (capita)

d) High-technology exports (current USD) per researcher (capita)

e) Industry (inc. construction), value added (current USD) per researcher (capita)

f) R&D expenditure (current USD) per researcher (capita)

Fig. 3: Cluster analysis of key indicators of E7 and G7 countries [37]

In our opinion, it will allow us to assess the degree of effectiveness of the knowledge generation system, the diffusion of innovation and the absorption of new technologies.

The obtained values of the Euclidean distance within the framework of the clustering process allowed us to form the following subsets of clusters according to the corresponding criteria (table 1).

Table 1: Country E7 and G7 clusters by series of technological development of national economies

Series	Cluster	CHN	IND	BRA	MEX	RUS	IDN	TUR	CAN	FRA	DEU	ITA	JPN	GBR	USA
GDP (PPP, current international USD) per capita	1st	+	+	+	+	+	+	+							
	2nd								+	+	+	+	+	+	+
Gross fixed capital formation (USD) per labour force (capita)	1st								+	+	+	+		+	+
	2nd												+		
	3rd	+	+	+	+	+	+	+							
Gross domestic product (USD) per labour force (capita)	1st			+	+	+		+							
	2nd	+	+				+								
	3rd								+	+	+	+	+	+	+
High-technology exports (current USD) per researcher (capita)	1st	+								+	+	+		+	
	2nd				+										
	3rd		+	+		+	+	+	+				+		+
Industry (inc. construction), value added (current USD) per researcher (capita)	1st							+				+			
	2nd	+	+	+		+	+		+	+	+		+	+	+
	3rd				+										
R&D expenditure (current USD) per researcher (capita)	1st	+	+			+	+								
	2nd										+	+			+
	3rd			+	+			+	+	+			+	+	

For next step of analysis, it seems necessary to study the homogeneity and degree of variability of the country representation according to the indicated clustering criteria, which was implemented within the framework of the presented study using the indicator of cross-country matrix of Euclidean distances.

As was noted, the study of the homogeneity of the clusters of the E7 and G7 countries according to the select indicators of macroeconomic statistics becomes obvious, namely: firstly, checking the density of ties within the analytical groups according to the declared features and identifying the core of a homogeneous set; secondly, comparing the results of cluster analysis according to the indicated signs within the samples of E7 and G7 countries with identifying the most effective models of the impact of technology on economic growth; thirdly, a comparison of the best examples of the functioning of knowledge generation systems, areas of diffusion of innovation and processes of absorption of new technologies outside the boundaries of the general sets of E7 and G7 countries in order to determine the foundation for the formation of an applied understanding of the concept of technological gap (table 2).

Table 2: Homogeneity of clusters and the formation of technological gap boundaries

An analysis of the general set of E7 countries suggests that the degree of homogeneity, and therefore the identity of the development of the knowledge generation system, the diffusion of innovation and the absorption of new technologies are very high. At the same time, India (25 common clusters), the Russian Federation (26 common clusters) and Indonesia (25 common clusters) are as similar as possible in these areas, since they take the first place in terms of the number of common clusters with the formation of the core "India - Indonesia", which all clustering indicators for the specified period of time are as identical as possible. It should be noted that in all these countries the degree of similarity with the principles of the functioning of the knowledge generation system, the diffusion of innovation and the process of absorption of new technologies of E7 countries is 38.75%, which may indicate the formation of the prerequisites for the emergence of a technological gap.

Attention should be paid to the higher level of homogeneity of the connections of G7 countries according to the principles of the functioning of the knowledge generation system, diffusion of innovation and the process of absorption of new technologies than E7 - 180 countries to 160 common clusters, but at the same time the full similarity of the intergroup identity of 62 common clusters in the E7 → G7 direction and vice versa. It should be noted that among G7 countries the degree of similarity with the principles of functioning of the knowledge generation system, diffusion of innovation and the absorption of new technologies is 34.4%, which may indicate the development of technological autarky.

The results of homogeneity in countries such as Brazil, Canada, France, and the United Kingdom are interesting. First, these countries demonstrate the maximum "cross-cutting" identity in terms of the effectiveness of the functioning of the knowledge generation system, the diffusion of innovation and the absorption of new technologies. Secondly, they are at the bifurcation point, which is characterized by the uncertainty of the direction of the bias towards maximizing the production of new technologies as a driver of economic growth or absorption of old technologies, but with maximum marginal utility. Thirdly, these countries open a clear technological gap, which becomes decisive for further economic growth of both E7 and G7 countries.

Despite the obvious technological gap, the driver of future economic growth has not been determined yet for each of the subset of countries of these groups: there will be a transformation of the knowledge generation system in E7 countries under the influence of the quality of labor resources, and the scope of innovation absorption in G7 countries will change under the influence of reaching the maximum value marginal utility of TFP.

Thus, in the next decade, a new paradigm of achieving economic growth will emerge, for which the determining factor will be the way to bridge the technological gap not only between countries, but inside their socio-economic systems.

Discussion

In order to create the scientific value of the proposed methodology, it's proposed to introduce some imperatives, which can be regarded as the anchor characteristics of the technological development of the socio-economic system:

within the framework of the research, it is proposed to consider a new technology as the result of revolutionary rather than evolutionary transformations with a high level of uncertainty and turbulence of consequences;

the life cycle of innovations and introduced technologies, especially in the last decade, caused the appearance of the Fourth Industrial Revolution prerequisites with their inherent technological lag, which accompany the formation of bifurcation points at any time at any point of the Foster's S-curve;

the comparative cross-country analysis of the knowledge transfer and its derivative - technologies, based on a comparison of macroeconomic indicators of labor productivity and the complexity rankings determine the possibility of coexistence of technological solutions related to different structures, provided that the economic efficiency of their application is maximized;

ceteris paribus, a fundamental feature of Industry 4.0 is the symbiotic interaction of digital and physical technologies with the support of machine learning tools and artificial intelligence unlike the previous ones, which affects the ability to separate and specify the parameters of the S-shaped curves set that describe technological gap.

Paradigm Shift – Heterodox Perspective on Economic Transformation in Poland

Wiktor SZYDLO

Wroclaw University of Economics and Business, Wroclaw, Poland
wiktor.szydlo@ue.wroc.pl

Abstract

At the turn of the 1980s and 1990s Poland underwent spectacular socio-economic transformation from real socialism to capitalism. This systemic shift is analysed through the lens of institutional and heterodox economics. The study shows that the shock therapy followed the rules of the Washington Consensus. The pendulum has swung from one extreme (inefficient collectivism) to the other: neoliberal turbo-capitalism.

Keywords: systemic transformation, real socialism, neoliberalism, heterodox economics, Poland

Introduction

The meeting of Communism and Christianity in a country such as Poland presents incredible spectacle (Tischner 2018: 231). Competition or even the battle of ideologies does not mean that they do not share various similarities. For example, both real socialist regime and a new neoliberal turbo-capitalist (Szahaj 2017) system whose creation was started in 1989 encompass many spheres, structure new set of values and ambitiously crave for totality. Both arrangements also, at least in theory, had a noble aim – human liberation. Freedom, however, has many definitions and types. For example, Isaiah Berlin differentiates between two kinds of freedom. In popular discourse often dubbed negative and positive freedom. The first one is referred to as “freedom from”, i.e. from government interference and coercion, while the second is also dubbed “freedom to”. It seems that new liberalism or neoliberalism concentrates solely on negative freedom. Positive freedom – freedom to – with its emphasis on fulfilment and upward mobility is hardly recognized by neoliberals. Similarly, according to left wing Italian political philosopher Domenico Losurdo (2005), the views expressed by a number of distinguished classical liberal thinkers (such as John Locke, Alexis de Tocqueville, Edmund Burke, John Calhoun, Jeremy Bentham, Thomas Jefferson, Benjamin Franklin, Abbe Sieyes, John Stuart Mill) could be labelled "anty-liberal" not only from current perspective, but also in comparison with progressive standpoints of their time. According to Moll (2018: 112) Losurdo (2005) claims that "liberals had the tendency to protest in the first place against abstract, not concrete suppression. It enabled them to promote such vision of freedom which safeguarded their own profits and profits of their social class".

Paradigm Shift

The characteristic feature of Polish neoliberalism has been its idealization and deification of freedom. As noted by a Polish scholar Andrzej Szahaj (2017: 170) this enthusiastic and indeed crude promotion of “freedom” is “very typical of neoliberalism and often takes the form of a blackmail: if you do not like the current form of capitalism or globalization, thus you are the enemy of freedom in itself, most likely a hidden Bolshevik.” It is really an unfounded rhetoric as those who opposed neoliberal shock therapy were usually ardent anti-communist and anti-Soviet members of Solidarity. Neoliberals, in turn, wanted to preserve Round Table status quo with Communist elite, fiercely opposed de-communisation and did not object (and even advocated) the “nomenklatura” privatization. In fact, such tricky (and simply misleading) metaphors were not solely typical of Poland. They were used in other CEE countries: "socialism - as a zombie and ghost - is important in the production of neoliberal monoglossia and guilt by association for those who challenge the dominant wisdom of trickle-down economics, thus supporting the worldview and, ultimately, the interests of the winners of post-1990 transition. (...) Zombie socialism arguments have become a

convenient and strategic ideological device for furthering social dumping, increasing inequalities, and reducing support for redistributive policies" (Chelcea and Druţă 2016: 522, 537).

The hierarchy of values promoted by neoliberals is clearly visible even in the title of economic books. There is a clear contrast between two books by Leszek Balcerowicz (one of the architects of shock therapy in Poland): "Freedom and development. Economics of free market" (1995) and "Freedom, development, democracy" (2017) and, on the other hand, "Development as freedom" by Amartya Sen (1999) – a Nobel prize winner in economics from India. For A. Sen the poor lack many kinds or forms of freedom, which are perceived as obvious for the rich. "Development is something more than economic progress measured by the quantity of goods produced. (...) It is a social development: i.e. the increase of the number of people experiencing freedom springing from gaining the abilities indispensable to reach adequate standard of living" (Kishtainy 2017: 226). The idea of freedom was so powerful that Democratic Union (a party comprising many former top Solidarity activists) after its merger with KLD (Liberal-Democratic Congress) (comprising economic liberals, especially from Gdańsk) formed a new party Freedom Union with Tadeusz Mazowiecki as a leader and Donald Tusk as a vice-leader.

Every ideology creates its specific language. Some words are created, other gradually disappear. There is, however, another possibility that some concepts are not properly or even not at all defined. Curious at is may seem, it is the case of "neo-liberalism". This entry cannot be found in a number of economic dictionaries such as: (Black 2002), (Bannock, Baxter, Davis 1992). Even sizeable "The New Palgrave Dictionary of Economics" did not include its proper and separate entry. Here, under the entry "Latin American Economic Development" the Washington Consensus is treated as synonymous with 'neo-liberalism'. Certainly, Washington Consensus and neo-liberalism cannot be limited to Latin America as they were very much present in Poland and many other CEE countries.

Paradoxically, for most right wing conservatives and a group of younger left wing activists (with no communist background, sometimes referred to as a new left) it is clear that Poland undertook a neoliberal transformation. The bulk of mainstream, technocratic policymakers and the proponents of the shock therapy would not share this view. They would often use the formula: "there is no definition of neoliberalism" ergo neoliberalism does not exist and they cannot be dubbed neoliberals. Senior mainstream technocratic economists and policymakers prefer to be called free market economists/advocates or liberals.

Philip Mirowski (2013: 37) is well aware of this phenomenon: "most people whom outsiders would identify as neoliberals would reject the label outright, and indeed, deny the position exists as a coherent doctrine. For them, it is just another swearword bandied about by their opponents, rather like "fascism" or "equality." Some go further, adopting the nominalist position that if "we refuse to call ourselves neoliberal, then no one else has the right to do so, either." Daniel S. Jones (2012: 7) notes that "the people associated with the doctrine *did* call themselves "neo-liberals" for a brief period lasting from the 1930s to the early 1950s, but then abruptly stopped the practice." It was a very clever decision as it is rather difficult (if not stupid) to criticize something that does not exist. Similarly, it is very problematic, if not groundless, to criticise something that is coined "natural" such as the term "natural rate of unemployment" or "natural rate of interest". Neoliberalism would act as an invisible veil or matrix which tightly structures lives of individual humans and capitalist societies.

Vague definition of neoliberalism and its modest understanding by the public (at least in Poland) does not mean that it is a term with positive connotations. In some spheres of the society disillusioned by transformation (consisting of many former "Solidarity" activists) neoliberalism is evidently connected with painful shock therapy and crony turbo capitalism. It is worth noting that famous postulates of "Solidarity" included various social demands.

However, in the first half of the 1980s some people in communist Poland started their fascination with liberalism and neoliberalism. Some intellectuals such as Janusz Lewandowski and Jan Szomburg studied works by Friedrich August von Hayek, Raymond Aron, Ludwig von Mises and Walter Lippmann already in the 1970s. Particularly, the liberals from Gdańsk gained importance and formed the so-called Gdańsk liberal school. In spring 1983 they set up and started publishing in

underground liberal paper "Przegląd Polityczny". As noted by libertarian economist Witold Kwaśnicki in the foreword to the book by the eminent figure of Gdańsk liberal school – Janusz Lewandowski (2013b: 7) the paper reprinted many works by Popper, Friedrich August von Hayek, Milton Friedman, Raymond Aron and Walter Lippmann. Kwaśnicki also adds that liberals from Gdańsk distanced themselves from Solidarity. They did not distinguish Solidarity as a trade union, they would rather treat it as a civic movement which aimed to change communist status quo (Lewandowski 2013b: 8). Liberals such as Donald Tusk and Jan Krzysztof Bielecki sticked with Wałęsa and less with Solidarity (Zaremba 2010: 43). Therefore, active support of this pro-democratic trade union by liberals from Gdańsk seems to be rather instrumental.

As noted by Janusz Lewandowski (2013a: 64) "the University of Gdańsk, then a newcomer among Polish universities, was probably not too prolific scientifically, but it proved to be remarkably fertile in terms of educating various personalities who back then did not know they were carrying a mace in their rucksacks, but subsequently had a major impact on the fate of the reborn Polish statehood." Indeed, a number of liberal and free market oriented politicians made great political career. Both Jan Krzysztof Bielecki and Donald Tusk became Prime Ministers, Janusz Lewandowski was a minister dealing with privatisation.

In 1991 Tusk noted in the foreword to the book by Lewandowski: "Five years ago fascination with neoliberalism, free market and individualism seemed exotic and slightly pretentious for many of our friends. Today the canon of liberal virtues in many circles became obligatory, even self-evident" (Lewandowski 2013b: 16). In light of the above, one has to agree with Hall and Elliott (1999: 306) who claim that "the intellectual antecedents of shock therapy include neo-liberal thinkers such as James Buchanan, Milton Friedman, and Friedrich Hayek".

Balcerowicz views changed since he gave lectures to Solidarity in 1981. His views evolved in strong liberal direction so that in 1985 they were very close to that expressed by Stanisław Gomułka (Gomułka 2016: 76). Already in the mid 1980s Balcerowicz was well acquainted with Anglo-Saxon liberal or rather neoliberal version of capitalism when he conducted seminars at leading Polish university of economics – SGPiS in Warsaw (currently called SGH). Both Balcerowicz and Gomułka expressed negative opinion on the book "Economics of Shortage" by Janos Kornai and Kornai's stance on soft budget constraint (Gomułka 2016: 76). A couple of years later Balcerowicz's career gained enormous momentum as he became one of the architects of the shock therapy, the Deputy Prime Minister of Poland and Minister of Finance (September 1989 – December 1991 and October 1997 – June 2000) and President of the National Bank of Poland (January 2001 - January 2007).

The careers of both Leszek Balcerowicz and Jeffrey Sachs developed very fast. Balcerowicz, holding a PhD degree and having participated in several stipends, at the age of 34 became Deputy Chairman of the Polish Economic Society (1981-1982), while Sachs in 1983 at the age of 28 became a tenured professor at Harvard. Both economists were ardent proponents of neoliberalism. Jeffrey Sachs got acquainted with the works of the leading members of the Mont Perelin Society – Friedman, Hayek, and Von Mises (Wilson 2014: 306) when he "was placed under the tutelage of Abram Bergson, a neoclassical economist and an expert on the Soviet economy" (Ofer 2005). Bergson was not a doctrinaire neoliberal, yet he "considered his work on Russia to be a confirmation of Hayekian theory" (Wilson 2014: 317) (Ofer 2005). In 1985, a 30 year old Sachs assisted in the managing hyperinflation in Bolivia.

Four years later Sachs became the economic advisor to Solidarity. Interestingly, as prices in Poland were rising fast J. Sachs was invited by the Polish embassy in Washington to provide advisory assistance (Ancyparowicz :253). According to Kowalik (2012: 47) "in early 1989, most probably during the Round Table negotiations, a messenger of the Polish embassy in Washington, Krzysztof Krowacki, was sent to Sachs. He suggested a visit to Poland to discuss the problems of reforms." Therefore, the communist government was looking for the Western expert in fighting hyperinflation when inflation rate in Poland still remained well below hyperinflation threshold. Initially, Sachs declined the invitation and started visiting Warsaw usually with David Lipton when "the Round Table Agreements foretold the legalization of Solidarity" (Kowalik 2012 :47). "These visits were paid for by the American billionaire George Soros" (Kowalik 2012 :47).

Already on August 24 1989 appeared a text in influential opposition newspaper "Gazeta Wyborcza" with a photo of Jeffrey Sachs which informed that "after the Big Bang price changes will stabilize within several months, shortages on the market will be eliminated, real incomes of factory workers will be protected and carefully prepared program does not have to lead to the fall in the standard of living" (Kieżun 2013: 213). It seems that leaders of both democratic opposition and communist party in Poland sought neoliberal solution to economic woes and hyperinflation. This clearly resembles the situation in Bolivia where both Banzer and Estenssoro turned out to be the advocates of the neoliberal shock therapy. Both in Bolivia and Poland the hyperinflation episode proved instrumental to undertake decisive and broad change of economic system without serious revamping of the political scene. In both countries the implementation of drastic program was preceded by the behind the curtain negotiations and was actually conducted by the pro-democratic side of the political scene. In a sense, Bolivia and Poland experienced passive revolution.

Passive Revolution

Partly democratic Parliamentarian elections in Poland (also dubbed contract elections) that took place in June 1989 are a sign of the aforementioned "passive revolution". The coalition government (with Tadeusz Mazowiecki from "Solidarity" as a Prime Minister) that was formed on September 12 1989 comprised 12 ministers from civic opposition ("Solidarity"), 5 from the Polish Communist Party (PZPR) and 7 from communist satellite parties (ZSL – a peasant party and SD).

Already on 3 July 1989 Adam Michnik an influential "Solidarity" activist and chief editor of leading pro-democratic newspaper "Gazeta Wyborcza" expressed a proposal to Communists: "your president and our prime minister". Shortly after this declaration on July 19 1989 communist leader general Wojciech Jaruzelski was elected president of the Peoples Republic of Poland by both chambers of Parliament. It was a victory by a very slim margin (two votes) and would not be possible without direct support of some pro-democratic parliamentarians. He was the only candidate for this post.

Poland, once a leader of democratic transformation, was overtaken by several post communist countries such as: Hungary (free parliamentarian elections took place in March 1990), Czechoslovakia (Vaclav Havel became the President already in December 1989), Bulgaria (totally free and democratic parliamentarian elections were conducted in June 1990) (Dudek 2016: 67), while the fate of the Romanian dictator was tragic. To put it into perspective, in Poland free presidential election took place in December 1990, while first totally free parliamentarian election was conducted as late as October 1991.

Accidental course of transformation in Poland and neighbouring countries could be the consequence of this cautious politics (Korzycki 2018: A26). The victory of post-communist SLD in parliamentarian elections in 1993 and subsequent triumphs of Aleksander Kwaśniewski in presidential elections in 1995 and 2000 was a sign that post-communist social group could not be marginalized (Matyja 2018: 99). It is worth stressing "the far-sightedness of communists in USSR and Poland who with great imagination dealt with programming changes that would safeguard their safety during the process of radical systemic reforms at the turn of the 1980s and 1990s" (Zenderowski, Rudowski 2018: 21).

This "revolution without revolution" in Poland, however, describes only the situation in the political elite sphere. First, fully democratically elected government in Poland was formed in December 1991 by Jan Olszewski (anti communist Solidarity dissident and lawyer). This right wing government preferred gradualist economic transformation. It dismissed shock therapy and reduced the speed of privatisation. On the other hand, it wanted to intensify (what turned out to be politically premature) the process of de-communisation. Therefore, Olszewski's government proved short lived and was toppled six months after its formation on June 4 1992 by a broad coalition of parties including free-market liberals, peasant party (PSL), post-communists and the President of Poland Lech Wałęsa.

Some commentators claim that the contract with communists elite enabled peaceful and bloodless turnaround. It is worth stressing that the Soviet Union collapsed on December 25 1991 and first unit

of Soviet troops started leaving Poland on April 10 1991 while the last Russian soldiers left the country on 18 September 1993.

In the light of the above, one may question that Poland's early transformation experience complies with the following diagnosis put forward by Bernard Chavance: "The first step in dismantling socialism can be either the introduction of democracy - as in Eastern Europe or the attenuation of economic control by the state as in China". For over two years the shock therapy in Poland was conducted by governments formed by contract (not-fully democratically elected) Parliament. The changes in the social and economic domain were definitely more robust and, in some cases, even revolutionary in comparison with cautious and gradual political shift.

It is highly surprising how Solidarity - the 10 million people strong social-democratic movement - so quickly and systematically turned into marginalized extension of right wing (i.e. not communist) parties. Kowalik (2009: 192) identifies four main causes of this decline: the martial law, the exodus of most active Solidarity leaders and its advisors to the top government positions, the opinion expressed by Lech Wałęsa that strong trade union is an obstacle to reforms and, finally, ideological and political invasion of Reaganomics and Thatcherism. It seems that also substantial emigration of well educated pro-democratic activists in the 1980s (after the martial law) allowed relatively smooth and fast installation of neoliberal system.

Solidarity charm and popularity markedly diminished as it acted as a “political umbrella” or “protective umbrella” against public anger during the implementation of drastic free market reforms. This ungrateful role was intelligently allotted to Solidarity by Communists in 1989. In consequence, “the union’s efforts to expand its ranks were proving abortive even in the private sector. With a reported membership of only around 1.6 million by 1993, including many workers who were no longer active as well as elderly employees who had been kept on the rolls after retirement, Solidarity was just a shadow of its former self” (Kramer 1995: 95) (Rzeczpospolita 1993: 1). Similar function was fulfilled by Solidarity (or rather its Parliamentarian offshoot - AWS) in late 1990s when L. Balcerowicz was again the Deputy Prime Minister and the Minister of Finance.

According to Kowalik (2009: 193) "Wałęsa supported anti-trade union and anti-labour Balcerowicz program without even knowing its contents (...) and in December 1989 proposed to equip the government in very vast prerogatives (...) what meant a complete retreat of the trade union to the benefit of authoritarian rule". This behaviour of the iconic leader of Solidarity and the Peace Nobel Prize winner seems puzzling, just as the accusations of his improper relations with the Communists in the 1970s (Economist 2016).

Terms such as ‘passive revolution’ and a ‘revolution without a revolution’ (Adamson 1980: 186) evoked by Shields (2012: 80) perfectly fit into Poland’s transformation.

According to Gramsci „accumulation strategies remain elite-engineered, failing to garner or form hegemonic consensus from wider society” (Shields 2012: 80).

“Poland’s revolution, passive or otherwise, has sought to co-opt and assimilate post-communist elites into a broader neoliberal historical bloc sharing the assumptions and class interests of dominant fractions of capital in the global political economy, to the detriment of those who struggled most to establish freedom and democracy” (Shields 2012: 80). Paradoxically, Gdańsk turned out to be the cradle of both massive, social, democratic, patriotic and bottom-up labour movement and, on the other hand, the transplant of individualistic and elitist neoliberal school of thought into Poland, i.e. Gdańsk liberals.

The question remains whether there was a choice to conduct more gradualist and balanced transformation. For example, Tadeusz Kowalik opted for Swedish model. According to Krzysztof Jasiecki (2018: 10) it was problematic how to practically undertake this third road in the initial condition - if we conduct neoliberal model 50% of our debt would be cancelled, if we do not do it, it will not happen (...) Alternative, left wing propositions did exist, but they lacked capital and institutional support." Consultation group (Polish government advisory body) prepared 700 page

report which analysed the possibilities of making use of Swedish experience (the result of a study trip to Stockholm at the turn of January and February 1989). Kowalik (2009: 110) is not sure whether the report was available to the participants of Round Table talks as it was published as late as June 1989.

In a sense the shock therapy may also refer to the idea of creative destruction by Joseph A. Schumpeter. Witold Kieżun (2013: 210) agrees with Waldemar Kuczyński (1992) that George Soros treated Polish economic transformation as an experiment before the more challenging reform in the Soviet Union. This ambition of G. Soros could explain the pressure to conduct the Polish experiment fast (Kieżun, 2013). It needs to be stressed that Kuczyński was the chief advisor to the Prime Minister Tadeusz Mazowiecki.

Bałtowski and Miszewski (2006: 192) acknowledge that already at the beginning of 1990 in the socio-economic publications appeared critical views on the way the stabilization program was prepared and conducted. It was stressed that the restrictiveness of the program and, in consequence, the scale of economic depression in 1990-1991 was excessive. Both conceptual mistakes and mistakes made during the implementation of the stabilization program were pointed out. Bałtowski and Miszewski (2006: 192) enumerate critical voices from left-wing (P. Bożyk, J. Kaleta, R. Bugaj) and ring-wings economists (S. Kurowski and R. Krawczyk), and also a few Polish economists working at West European and US universities (K. Łaski, K. Z. Poznański).

Of course, the list of the critics of the shock therapy should be extended by other well known Polish economists: Grzegorz Kołodko – former minister of finance in the government formed by post-communists and peasant party), Tadeusz Kowalik – one of the advisors to workers on strike in Gdańsk Shipyard in 1980 and the founder of socially oriented party Unia Pracy (Labour Union) in 1992 and Witold Kieżun – the member of International Academy of Management in the USA, former director of UN projects in Africa and brave participant in the Warsaw Uprising in 1944). Kowalik (1995) stance on the transformation was very harsh:"The most massive labour movement conducted the turnaround from which emerged one of the most unjust social system in the post-war Europe."

It is worth noting that the design of shock therapy was also criticized by right wing (conservative) parties. For example, on 10 June 1991 Christian-democratic and later more conservative party "Porozumienie Centrum" (PC) (with Jarosław Kaczyński as a leader) harshly criticized politics of Leszek Balcerowicz and suggested his resignation (Roszkowski 1992: 422). In 1991, according to Jan K. Bielecki (the Prime Minister at that time), Kaczyński perceived three ministers (that dealt with financial, rural and informational politics) as inadequate and suggested their resignation (Gomułka 2016: 236-237). Balcerowicz, however, stayed in office and continued his politics as the minister of finance, despite general strike that broke out in May 1991. Also, conservative politician Adam Glapiński (the vice-lider of PC in 1990-1993) together with Sławomir Dąbrowski numerously criticized the neoliberal course of Polish transformation already in the first half of the 1990s (Glapiński, Dąbrowski 2000). In June 2016, A. Glapiński was appointed by the Sejm of the Republic of Poland as President of NBP (the central bank in Poland).

In the light of the above the first part of another powerful diagnosis expressed by Kowalik (2009A: 193) is not precise: "starting with the victory in the election on June 4 1989 a right wing turnaround took place, in consequence of which emerged one of the most unjust socio-economic systems in Europe in the second half of XX century."

Liberal and socialistic way of thinking, a least in theory, means that one thinks of perfection and social ideal. Conservatives are more down to earth and state: "it s better to take shorter steps, and do not think of any revolution" (Glapiński 2016:123-124)."

Interestingly, accoding to Bałtowski and Miszewski (2006: 192) "there were few leading Polish economists among the defendants of the method and way chosen by L. Balcerowicz. The list, among others, includes: S. Gomułka, A. Lipowski, W. Wilczyński, J. Winiecki and to some extent C. Józefiak". The most influential among them is probably Stanisław Gomułka who was a lecturer at LSE in 1970-2005 and one of the top economic advisors to L. Balcerowicz at the turn of the 1980s

and 1990s. Already in mid 1980s Gomułka and Balcerowicz knew each other and exchanged visits in their hometowns in London and Warsaw (Gomułka 2016).

With the triumph of the Washington Consensus and the new neoclassical synthesis, the dominance of neoliberal perspective was overwhelming. Parties with different socio-economic perspectives lacked funds and broader access to mass media. In the absence of serious debate on socio-economic issues (such as income inequality and unemployment) the public disputes revolved around biopolitics and issues that do not require much social spending from the central government. "On the basis of extensive literature, it could be stated that neoliberalism is an ideology which was purchased and paid by big capital, big business and financial markets" (Oręziak 2016: 352).

Growing unemployment greatly increased the competition between workers. Mounting tension led to predatory behaviour. The have-nots and unemployed were treated with contempt and often unfairly stigmatized. The idea of freedom even in its narrow sense (the equality of opportunity) turned out to be an empty phrase.

Summary

The so-called big bang or shock therapy was engineered to rapidly impose neoliberal economic system in Poland. More cautious methods of transformation lacked support from influential circles and were rejected. Collectivism and social security was replaced by hyper individualism and a dog-eat-dog world. Poland with its vast and relatively well-educated labour force was hit hard by consecutive neoliberal reforms.

Economic policy was especially focused on fighting inflation and paid little attention to unemployment. This is a typical bias in neoliberal systems both in developed and developing countries. The hyperinflation that started in the second half of 1989 was prompted by liberalization (i.e. hikes of regulated and administered prices). At least some of them were unnecessarily high. Inflation was partly driven by excess demand. In 1989 it was led by food price deregulation and generous indexation (engineered by policymakers).

Therefore, hyperinflation was intentionally created to reduce the excess amount of money (excess demand and supposedly excess savings) in the socialist economy stricken by shortages of consumer goods and even food products. Sudden outburst of hyperinflation necessitated the implementation of fast and irreversible economic transformation (shock therapy).

The changes in the political sphere were far from revolutionary. This passive revolution was bloodless but, on the other hand, cemented the neoliberal orthodoxy in the coming decades.

Fit or Stretch – Organisational Adaptation Strategies In the Time Of COVID-19 Pandemics

Anna WITEK-CRABB

Wroclaw University of Economics and Business, Wrocław, Poland
Anna.Witek@ue.wroc.pl

Abstract

COVID-19 pandemic is redefining the economic reality. Disruption resulting from the global lockdown led to a reevaluation of business models and business routines. There are two main adaptation strategies that organisations take on to respond to the environmental change. Strategic fit in which a company seeks a match between opportunities and resources and strategic stretch when a company follows their aspiration (strategic intent) despite insufficient resources and/ or opportunities. The gap is closed through innovation and leverage. The main goal of this paper is to examine theory and examples of strategic fit and strategic stretch as a way of adaptation to the pandemic reality. Examples of organisations such as Red Noses International, Decathlon, Ford, Tesla Motors or schools and Universities are used to illustrate strategic stretch. GAP, Zoom, Teams, Uber Eats, Veclaim and PKN Orlen are illustrating strategic fit.

Keywords: Strategic Fit, Strategic Stretch, Exploration, Exploitation, COVID-19

Introduction

The COVID-19 pandemic is going to redefine our lives both in social and in economic terms. Disruption resulting from the global lockdown has led to a redefinition of business models and business routines, with more changes yet to come. There is no more "business as usual" – purchasing patterns and consumer behaviour are changing (Jones, 2020), past distribution channels are becoming irrelevant with significant growth in e-commerce (Columbus, 2020) and supply chains are restructuring to deal with the international lockdown (Barua, 2020; Fernandes, 2020). The pandemic has affected all major economies (Baldwin, di Munro, 2020) and the outbreak spread is likely to lead to a global recession (Fornaro, Wolf, 2020).

Such a dramatic shift in business environment is rarely precedented. Lockdown has led to a stall in consumption and some industries, such as transport, tourism or culture experienced an overnight plummet of transactions. The change was not only sudden, but also long-lasting. It created conditions in which spontaneous business adaptation under extreme environmental distress can be observed and researched.

There are two main adaptation strategies that companies take on to respond to the environmental change. *Strategic fit* is a strategy in which a company seeks coherence between the environmental conditions and the organisational skills and assets. Matching resources with opportunities is the main underlying logic of strategic fit. *Strategic stretch* happens when a company follows the ambitious strategic intent disregarding the lack of resources and/ or opportunities, hence having to innovate or leverage the discrepancies (Hamel, Prahlad, 1993).

In the time of COVID-19 pandemic businesses and non-profit organisations have been confronted with the environmental distress and in order to survive in the new reality – had to undertake one of the two adaptation strategies. **The main goal of this manuscript is to examine theory and examples of strategic fit and strategic stretch as a way of adaptation to the pandemic reality**. The main research question is how organisations manage change and what kind of *fit* or *stretch* solutions are present and effective.

In the first section of the paper we present an overview of the strategic fit and strategic stretch theory and juxtapose it with exploration vs. exploitation theory in search for synthesis. In the following section we present two bigger and a few smaller cases – exemplifying strategic stretch and strategic fit as a way adaptation to the COVID-19 pandemic and then conclude with the final remarks.

Theoretical background – strategic fit vs. stretch, exploitation vs. exploration

The main assumption underlying the concept of fit and stretch is that strategic choices result from the interplay of 3 components (Hamel, Prahlad, 1993): resources, opportunities and aspirations (strategic intent). Resources refer to the company's internal environment – assets, capabilities, competences or strengths. Opportunities refer to the external environment and could be described as trends and factors with potentially positive impact on the organisation. In strategic fit a company seeks such an allocation of recourses that matches the observed opportunities. This leads to a fit and coherence between the external needs and the company's internal potential. However, in search for strategic fit between resources and opportunities the aspirations may suffer. The ambitions may need to be trimmed to match what the market is ready for and already needs. Hence, strategic fit is a conservative and realistic approach, which limits the risk. It is characteristic to positioning school of strategy (Porter, 1985). The adaptation happens through market analysis, searching for the niches and responding with the company's current resources.

The alternative approach is strategic stretch (Hamel, Prahlad, 1993). Stretch happens when there is a misfit between the company's resources and its aspirations (strategic intent) or between the opportunities and the strategic intent. Stretch is a result of a gap between the ambitious intent, a great vision and the scarcity of resources or lack of market readiness. It's experienced as tension and since, it drives motivation. A combination of a vision with the scarcity of resources requires innovation and leverage. Stretch strategy encourages introduction of new business models and changing the rules of the market game. A company lacking resources appeals to resourcefulness instead. This type of adaptation strategy is considered idealistic, even impossible and risky. Rather than looking for a fit between resources and opportunities, strategic stretch directs a company towards exceeding its limitations in order to realise the ambitious strategic intent. A good example of strategic fit is McDonald's re-branding its restaurants to respond to the healthy lifestyle and ecological interests trend among its potential customers. On the other hand, SpaceX is using strategic stretch while following the intent to move humanity to Mars, despite the gap between the available resources, opportunities and aspirations. In the further part of the paper examples of strategic fit and strategic stretch in the time of COVID-19 pandemic will be considered.

Strategic fit and strategic stretch could also be explained with the reference to exploitation-exploration theory of learning (March, 1991). Exploitation – similar to strategic fit, is founded on such priorities as: refinement, efficiency, quality improvement and implementation. In exploitation the competitive advantage is sought through efficient improvement and refinement of the current activities and products. Exploration, on the other hand, is similar to strategic stretch and captures terms such as: variation, risk taking, experimentation, flexibility, discovery and innovation (March, 1991). Competitive advantage comes from the ability to boldly innovate in new areas.

In strategic fit/ exploitation, a company adapts through existing skills and technologies, further meeting the needs of the current customers (Harry & Schroeder, 2000) and penetrating the customer base (He, Wong, 2004). Processes, including market analysis and decision making, are usually formalised and there is a top-down knowledge flow (Benner & Tushman, 2003; Jansen et al., 2006; Mom, Van den Bosch, & Volberda, 2007; Zollo & Winter, 2002). Strategic fit is about commitment to quality improvement, product positioning and fine-tuning in the way, that responds to the market opportunities and customers' expectations (He, Wong, 2004). The prevailing mental model is narrowing the attention and concentration on finding the fit (Laureiro-Martínez, Brusoni, & Zollo, 2010).

In strategic stretch/ exploration however, the company proactively responds to the environmental changes by seeking revolutionary innovations (Harry & Schroeder, 2000). Innovation is often driven

bottom-up, and senior managers are persuaded to abandon their old routines and make a commitment to a new course of action (Wooldridge &Floyd, 1989). Decentralisation enhances creativity (Cardinal, 2001; Jansen et al., 2006). This approach is based on the resources stretch, so it requires development of new skills. Strategic stretch is about exploration of new technologies and new markets, about novel ideas "outside the box" and creative ways to satisfy customers' needs and actively addressing new customer groups (He, Wong, 2004). The prevailing mental model is broadening attention in search for alternatives and creative solutions (Laureiro-Martínez, Brusoni, & Zollo, 2010).

Strategic fit and stretch under COVID-19 – method and cases

COVID-19 outbreak turned out to be the environmental disruption for most businesses. Many had to close down or drastically reduce operations. However, other started adaptation processes to secure business' survival. Among the observable approaches there are examples of both fit and stretch strategies. In strategic fit – the companies are looking for a match between their existing resources and the opportunities resulting from COVID-19 socio-economic situation. In strategic stretch, however, there is a gap between the organizational skills and assets and their vision. The companies are looking for innovation in order to leverage lack of resources or destroyed opportunities and follow their strategic intent. This happens through innovation, new business models or redefining the markets.

In this part of the manuscript we are giving an overview of two main case studies from Polish context – one of strategic stretch and one of strategic fit in the times of the pandemic. The case studies are complemented with a few smaller examples. This is work in progress – the first stage of the research project which will include qualitative analysis of multiple case studies, aimed at understanding organisational behaviour in the time of environmental disruption. The goal of the whole research project will be to understand individual and organizational antecedents of strategic decisions and explore how strategic fit and strategic stretch processes are managed. This paper however presents concise examples of how companies managed the three strategic components: resources, opportunities and aspirations, in their adaptation to change resulting from the COVID-19 outbreak. The descriptions are based on secondary resources, companies' publications and personal interviews.

Strategic Stretch

Red Noses Clowndoctors International (www.rednoses.eu) – the case of the Polish division (Czerwone Noski Klown w Szpitalu). Red Noses was founded in 1994 in Austria as a non-profit artistic organisation, bringing humour and laughter to people in need of joy. Today, Red Noses Clowndoctors is one of the largest clown doctor groups in the world with almost 400 clowns in partner organisations in 10 countries. In Poland the organisation is present since 2012 and their main beneficiaries are sick children undergoing hospital treatment. Red Noses are present in children wards in 4 major cities in Poland where they perform regular visits. COVID-19 outbreak brought a sudden stop to the Red Noses operations. All the hospital wards were locked down due to epidemiological concerns. Also, all the patients who didn't require life-saving treatment were released home. In these circumstances the functioning became impossible. However, Red Noses employees brainstormed and developed innovative ways of adaptation through leveraging their resources and addressing new beneficiary groups. The adaptation strategy included two directions: (1) changing the medium of contact from direct visits to online and indirect visits with patients, (2) exploring new groups of beneficiaries, unavailable within the "old" model of functioning. In the first weeks of the pandemic lockdown the organisation developed a program of videoconferencing visits, sketches and films supporting children in hospitals. This adaptation led to the biggest innovation. Videoconferencing clown visits opened new possibilities with regards to the target beneficiary groups. Red Noses started developing a new network of contacts with geographically dispersed foster home families in which they are supporting children in distress. This was only possible due to the leveraged resources and newly developed remote contact possibilities. Red Noses adaptation in Poland is an example of strategic stretch.

Other examples of strategic stretch in the times of the pandemic include engineers at Italian ***ISSINOVA*** teaming up with ***Decathlon*** to convert full-face snorkeling masks into medical emergency ventilator

masks through 3D printed valve adaptation. Also, ***Ford*** and ***General Motors***, as well as ***Tesla Motors*** or ***Volkswagen*** initiating cooperative ventures with medical device producers to start ventilators and respirators production. ***Schools*** and ***Universities*** in the lockdown, moving all their teaching activities online, without much previous preparation, technical equipment and tools, trying to leverage lack of resources and lack of readiness of their students with innovativeness and fast learning – is another example of stretch strategy.

Strategic fit

Matching resources with the unveiling opportunities is the main logic of strategic fit. This is a common adaptation strategy in the time of COVID-19. The first example of strategic fit is ***PKN Orlen*** (www.orlen.pl) – a state owned major Polish oil refiner and petrol retailer. At the outbreak of the epidemic in Poland there was an overwhelming shortage of personal protection materials. The company decided to change their production lines in one of the factories from windscreen washer, grease and coolant to disinfecting sanitiser. The adaptation of the machines and preparation of the workers took only 10 days. The biggest challenge was the acquiring of the certificates and permissions for biocidal product development. Soon the factory established 24/7 production, stabilising at 1.2 mln liters a week. PKN Orlen used their existing resources (machine lines, workers' skills) to respond to the environmental needs and opportunities as a way of adaptation.

Strategic fit can be observed when companies use their existing resources to respond to the changing customer needs due to the pandemic. One of the examples are online communication companies such as ***Zoom*** or ***Microsoft*** (Teams) expanding their server base and targeting free versions of their products to education, in the same time expanding their future customer groups. ***Grocery shops*** developing home delivery services or ***Uber Eats*** offering no contact drop off are another good example. Clothing companies such as ***GAP*** starting the production of face masks, which are turning into a fashion item is also an example of strategic fit. Mass scale lockdown gave an inspiration to clothes producers – for example ***Veclaim***, elegant garment company announced their new line of casuals to be comfortably worn at home.

Conclusions

The time of the pandemic is changing our lives. A new order will appear as a result of this distressing period both for societies, businesses and non-profit organisations. Disruption of this magnitude is enforcing major redefinitions of how all of them function. Industry standards, customer needs, people's lifestyles are changing so organisations are trying to adapt to the new emerging normal.

Many organisations will not survive the change, but the ones that will – are likely to use one of the two adaptation strategies: strategic fit or strategic stretch. Strategic fit, with the logic of matching resources with the new opportunities, seems like a more easily available strategy. It is a strategy of incremental adaptation in which existing resources are used to match the new opportunities. All the organisations that are adjusting new distribution channels (online) or following the needs of a lockdown population through exploitation of the existing resources – are a good example of fit.

Some organisations though will also use a more demanding approach of strategic stretch. In this case the lack of resources or market opportunities is leveraged through innovation and bold, risky and creative actions. The driving force here is an aspiration, ambitious strategic intent. Companies that overcome their limitation through innovation and exploration of new products and markets are likely to rewrite the rules of the new game.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN

The Evolution of the Publishing Industry – the Impact of Vanity Publishing

Mikolaj KLIMCZAK

Wroclaw University of Economics and Business, Poland
mikolaj.klimczak@ue.wroc.pl

Abstract

Publishing industry has a long history, and its impact on human history is unprecedented. It has a reputation of a stable and conservative industry. Recently, however, since the birth of the Internet and the digital economy, the publishing industry has become vulnerable to considerable fluctuations. Moreover, other phenomena take place, changing the shape for the whole industry. The purpose of the paper is to present the emergence of the new phenomenon in the studied industry – vanity publishing and present its economic significance. A vanity publisher is a company which would publish any book in exchange for a payment from the author, and the procedure usually employs little or no selection. The author of this paper will attempt to study this phenomenon for various stakeholders: vanity presses (a company offering vanity publishing), authors of vanity publications, readers, commercial (traditional) publishers and other authors (mainly from the same literary genre). The primary method of analysis in this paper is a case study; the author supplemented it with direct interviews with experts to assess problems emerging from the vanity publishing for various groups of industry's stakeholders. The main finding is that vanity publishing, becoming an increasingly popular phenomenon, leads to the emergence of a new market within the publishing industry. Such a process, in turn, changes the competitive constraints upon commercial publishers and might lead to some unexpected outcomes for readers. Vanity publishing shifts significantly the balance of power within the publishing industry, which leads to noteworthy changes for all stakeholders.

Keywords: Publishing, Opportunism, Vanity, Competitive Constraint, Book

Introduction

The publishing industry has a long history. Its origins can be traced back to Gutenberg's invention of the movable (interchangeable) type around 1440. Over the second half of the 15th century, around 8 million books were published thanks to this invention, probably more than the scribes in Europe had managed to rewrite since Constantinople was founded in 330 (Clapham, 1957, p. 377). Although the above statement is challenging to be substantiated, and its author does not support it with evidence, E. L. Eisenstein cites the example of the printing a translation of Plato's "Dialogues" in 1483 by the Ripoli Press. While the submission and publication cost three times more than hiring a scribe for this work, the printer printed 1025 copies, and the scribe delivered one at the same time (Eisenstein, 1979, pp. 45–46).

Apart from its long history, the publishing industry is characterised by conservatism. It happens primarily because of the specificity of the process and the fact that the whole procedure of publishing a book has not changed significantly since the Renaissance. This process involves several activities in which various actors may be required, intending to provide the reader with a publication. It consists of creation (a creative process of writing a manuscript), acquisition (buying the rights to publish by a publisher), editing (refining and improving a work), production (proofreading, designing and typesetting), printing (or preparing for digital publication), advertising and distribution.

Moreover, the publishing industry in the 21st century is undergoing several significant changes related to economic, social, and cultural developments. Firstly, computerisation, digitisation, and the emergence of new media and equipment (computers, game consoles and mobile devices) have forced the publishing industry to adapt to new substitutes, among others. Secondly, the development of the

Internet posed both a threat and an opportunity for the industry. On the one hand, it can be treated in a broad sense as a substitute as well as the mean of the distribution of substitutes. On the other hand, it can be a new distribution channel or platform for the development of innovation. Thirdly, the places where readers buy books are changing. The Internet distribution mentioned above has appeared, but books are also distributed in supermarkets, press kiosks, as supplements to magazines or in huge chain bookstores. Fourthly, many new and innovative substitutes have emerged. In a broad sense, any activity aimed at spending free time, including cinema, television, radio, streaming services, video and mobile games, or even sports or watching them, can be identified as a substitute. In a narrow sense, a printed book could be substituted by its electronic or audio version (audiobook). However, since the content of all three goods is the same, it must be assumed that they are simply various forms of the same product distributed differently from an author to a reader.

It all means that the publishing industry might be caught up, entangled in innovations in other areas: software and hardware related but also related to the situation of other leisure industries. Such phenomena are well explored, and studies of such changes are well-grounded in various disciplines.

Within this broadly described environment, a relatively new phenomenon emerges. Vanity publishing is a process which is performed by a vanity publisher (or vanity press), a company which publishes books in exchange for payments from authors of publications. In the traditional process of publishing, manuscripts undergo rigorous selection, the process which is generally absent in the vanity publishing (Strauss, 2019).

There is no effortless way to estimate the scale of vanity publishing in comparison with the publishing industry. However, to make the reader aware of the extent of this phenomenon, it can be pointed out that one of the publishing houses offering "co-financing" in Poland publishes about 170 new books each year in this model, and additionally 30, which are financed only by the publishing house (Tenderenda-Ożóg and Waszczyk, 2017). Vanity publishing seems to have become an increasingly popular phenomenon all over the world. To further substantiate the widespreadness of vanity publishing, one can find a plethora of guides for debuting authors circulated in various media (newspapers, Internet), which warn against this model of publishing. Moreover, librarians are also voicing their strong concerns against vanity publishing, as they struggle to keep consistency and integrity in their collections (Laquintano, 2013).

Scientists from various discipline supply scarce analysis of vanity publishing. The author of this publication is not familiar with any scientific article referring to this subject and analysing it within economic sciences. The purpose of the paper can be summarised in three goals which form the logical sequence of research:

- to present vanity publishing and show its place within the publishing industry,
- to describe the plausible outcome for various groups of stakeholders,
- to show the consequences of this phenomenon in markets, industries, and the economy.

Modern Publishing Process

As it was said above, the publishing procedure can be divided into several subprocesses. The root of the publishing lies in the creative process performed by the author, who invents and realises the concept of a publication, creating the manuscript. Later comes commercialisation, it is the stage, where publishers purchase the right to publish the work of an author. It might seem inconsequential; however, publishing houses employ strict procedures of selection to ensure the quality and therefor sellability of the book – very few submitted manuscripts get published. When the publisher acquires the script, the editing starts. The most important task on this stage includes refining and improving the publication, in the process of making it more legible and potentially interesting for readers. Then comes production, which consists of proofreading, designing, and typesetting, among others, and printing. In the world, where digital distribution is available, printing can be substituted by digital processing. The last part of the publication process is as important as the others. To be able to talk about sales at all, advertising and distribution must be adequately prepared.

In general, the commercial publishing process may take three forms. The first one consists in preparing a traditional printed version of the publication. The second one includes publishing in electronic version: e-books, or audiobooks. The third one involves self-publishing, where the author takes over all or part of the roles and responsibilities of the parties involved in the publication.

With vanity publications, a new, completely different model of book publishing has appeared in the industry. In this model, the author hires a publishing house to publish his book. It differs from self-publishing in that the author receives a part of the profits from the sale (if any). Moreover, the author usually loses (by the power of the contract) her or his economic copyrights to the publisher. Besides this, the flow of money is different, and the intentions of the vanity press are usually predatory.

Within the whole ecosystem of the publishing industry, the development of digital distribution is beginning to play a leading role. This phenomenon is manifested firstly by the development of two new book forms: e-books and audiobooks, and secondly by the emergence of new methods of publication distribution. The diagram of the connections and individuals taking part in the publishing process is presented in fig. 1.

Between the author and the readers, there are several entities whose aim is to enable the latter to familiarise themselves with the work of the former. The most vital individuals involved in this process can be distinguished: apart from authors and readers, these are publishers, distributors, and retailers. However, there are several ways to configure this process depending on the choice of the author and the scope of expertise of the companies involved in the publishing.

Fig. 1: Simplified procedures and entities involved in the publishing process
Source: own elaboration

The first and the most common way of publishing is when the author hands over the manuscript to the publisher, and the latter, when the decision to acquire it is made, prepares its printed form (editing, designing and ordering it from a printing house). The printed publication goes to a distributor (wholesaler) who, through his contacts, places it at diverse types of retailers, where it is bought by readers. There are two additional variants of this procedure. The first variant is when the publisher and wholesaler are vertically integrated, which might simplify the process, cutting some of the transaction costs and avoiding double marginalisation. The second variant is when the publisher tries to bypass the

distributor and decides to place the publication in retail on its own. In fig. 1 this way of a publication is marked with solid red lines with triangular arrowheads.

The second type of publication process relates to the preparation and selling the electronic version of the manuscript, as either an e-book or audiobook. Here, the publisher usually distributes the publication through hosting services which include various channels of reaching the readers. It can be done by offering it via Internet bookstores or doing it directly from the hosting platform. The method of delivery might also differ, it can either be a direct sale of the electronic file in multiple formats (EPUB, AZW, PDF, MP3 or other) or provision of the digital version through streaming or paid subscription lending services. In fig. 1 this way of a publication is marked with blue dashed lines with triangular arrowheads.

The third type of reaching the readers is through self-publishing. Here, the most crucial part is that the author of the manuscript takes over the roles of various individuals in the first two, above mentioned types, bypassing them and organising the components or the whole of the process as she or he pleases. The author may replace the publisher, distributor, retailer or any combination of the three, as the broadest form of self-publishing assumes that the author does not use any intermediaries, takes care of the whole process himself and sells his work directly to readers. Here, a small exception is made for the digital versions of a book, since the author will typically use a file hosting to a greater or lesser extent. In fig. 1 this way of a publication is marked with yellow solid (for printed version) or dashed (for digital version) lines with double arrowheads.

In addition to the three general types of production and distribution of publications mentioned above, there is a fourth type, different from the others, which is the subject of this analysis: vanity publishing.

A "new" phenomenon in the publishing industry – vanity publishing

Very few authors supply a full and complex scientific analysis of vanity publishing. However, it should be noted that vanity publishing has been noticed by many, including those who have issued warnings against them. Among others, the Advertising Standards Authority, together with the Committee of Advertising Practice in the United Kingdom, a non-governmental organisation with the task of self-regulating the advertising industry, gives a very concise and straightforward definition of vanity press. According to them, vanity publishing "is a service whereby authors are charged to have their work published" (Committee of Advertising Practice, 2014, para. 1). ASA identifies vanity publishers as the ones who "generally offer to publish a book for a specific fee or to include short stories, poems or other literary or artistic material in an anthology, which the authors are then invited to buy" (Committee of Advertising Practice, 2014, para. 1). They advise advertisers to be aware while providing advertising to such companies, because, in broad terms, there might be "four areas where ads for vanity publishers have the potential to run into trouble: merit; costs; financial gain; and marketing and promotion" (Committee of Advertising Practice, 2014, para. 2).

Even though vanity publishing seems to be developing very dynamically recently, this phenomenon is not as new as it may seem. It must be said that there is a thin line between vanity publishing and self-publishing. In both ways of publishing, it is the author who decides to publish and bears the costs. The difference lies in areas of control over the publishing process and intellectual property rights. In the case of self-publishing, all copyrights remain with the author as well as the control over the publishing process; in the vanity, the economic rights are transferred to the publisher, so in addition to the payment from the author, he is entitled to some or all of the profits from sales – the author theoretically receives production and distribution services. However, even pricing might not be under his or her control, let alone the way the publication is distributed.

In the nineteenth century, self-financing was a relatively popular form of publishing one' s literary and scientific works. Many noted writers and poets either financed the publication from their funds or collected donations or private scholarships. This way, some of their masterpieces were published by Virginia Woolf, Allan Poe, Mark Twain, Jane Austen, George Bernard Shaw, Marcel Proust, Emily Dickinson, Ezra Pound, Laurence Stern and Walt Whitman.

Contemporary authors also choose self-publishing as a form of publication of their work. Such was the case of E. L. James, the author of the erotic romance novel entitled "Fifty Shades of Grey", who in 2011 published it in the form of e-book and the print-on-demand system, to later sign a contract with a traditional publisher (Balson, 2013). The same thing happened with Andy Weir's novel "The Martian", which was similarly published in 2011, to be re-released in 2014, already in a traditional publishing house (Dickerson, 2015). Both novels have already been adapted as motion pictures.

It is easy to distinguish self-publishing from vanity publishing if the author assumes all responsibilities in the former form of publication. It becomes significantly harder to it if one looks at the publication from the perspective of time. We might not have enough data to find out how the nineteenth-century book was financed, published and distributed.

Nowadays, the term "vanity publishing" is considered pejorative, and the name itself suggests that the author of the manuscript publishes it out of vanity, self-admiration and against the opinions of others who may think that the work will not achieve commercial success. Such an author may also not have sufficient skills and knowledge to engage in self-publishing. Then a vanity publisher appears. Commentators point out that such publishers use deception against often unaware writers. They may pose as "traditional publishers", but those who have a "lower acceptance threshold" and are open to young and talented authors (Castillo, 2011; Lundin, 2009). Vanity publisher may use various psychological techniques, aiming at awakening and further using conceit, egocentrism and megalomania of its authors-clients (Clifford, 2014; Rue, 1994, pp. 151–152).

Based on the analysis of offers, vanity publisher provides de facto a slightly extended printing service to ignorant authors. The service mentions editing and proofreading, which is very low in quality, resulting in abysmal reviews of the publication. Usually, books published in this way are not adequately prepared in terms of editing and content and do not undergo qualitative verification. Additionally, such a publisher organises the dispatch of obligatory copies to libraries and indicates its marketing and distribution potential. In the process, the importance of obtaining an ISBN is emphasised, in which of course such a publisher can help. Thanks to this, the publisher retains control over the publication and its possible reissues by strengthening power over the copyright of the work (Strauss, 2019). Very often, when in contact with a prospective client, vanity publishers mention profit, however, it is very rarely for authors choosing this form of publication to recoup their costs, let alone gain financially from book sales (Committee of Advertising Practice, 2014). The fee that is paid by the author to the vanity press already includes the profit for the publisher and any premium for the risk. However, it should be stressed that this form of publication leaves the entire risk to the author by definition and the risk to the publisher is minimal, since even the payment for the service is made in advance. Traditional publishers behave like investors in the process: they offer to publish the acquired book in exchange for fees to the author and part of the revenue. The rest of the sales revenue is used to recoup the money invested and what is left is the publisher's profit.

Stakeholders involved in the vanity publishing

It is necessary to identify the main stakeholders in this process, their possible actions in this context and the likely consequences of this process on them to give a full picture of how vanity publishing can affect the publishing industry. There are six essential groups of stakeholders: vanity publishers themselves, authors of vanity publications, readers of books in general, commercial publishers, distributors and retailers and other authors not using vanity publishing. The following analysis was carried out based on the author's direct interviews with industry professionals, discussions on literature held on various sites and in groups in social media, and the study of comments and reviews on popular literature websites.

Vanity Publishers

As it was mentioned above, the term "vanity publisher" is pejorative. For this reason, publishers of this type use different terms for what they do: subsidy publishing, joint-venture publishing, co-operative publishing, shared responsibility publishing, (incorrectly) self-publishing, publishing with co-financing or even pose as traditional publishers. They use various psychological techniques to increase the conceit and false self-appreciation for the manuscript. At the same time, they demonstrate an interest in the

publication of the work, pointing to its (unsupported) potential for commercial success, promising quality and professional help. In reality, what they offer is a slightly extended printing service (Clifford, 2014).

Interestingly, the vanity publishing for the untrained eye looks similar to traditional publishing. However, looking at it closely, significant differences begin to emerge. Firstly, the cost of publishing in the vanity model exceeds the actual cost of publishing the book. As mentioned above, the fee (which is absent in traditional publishing) already includes the publisher's profit, and given the poor quality of service, an author can get much more for the same money (Kasperek, 2016; Zwierzchowski, 2015). All of this together might result in higher than average prices of vanity books.

Secondly, the vanity press is not interested in selling the books it publishes, as it earns money from fees of authors (hence the overpricing). Sometimes it merely sends the whole circulation to the author (at his expense). The interest of the vanity publisher is simple: to maximise the profit by increasing the number of published books. In this situation, it is not a matter of quality, but quantity. Vanity publishers benefit from increasing (or constant) returns to scale, and the quality of the publication is irrelevant – the more books titles they publish, the higher the profit. Traditional publishers are interested in books of high commercial potential – the more copies of one particular book they sell, the higher the profit, where the number of sold copies is a function of, among others, quality. Improvement of quality requires additional cost spent on editing, which will diminish profits of a vanity publisher and possibly increase the profits of a commercial publisher. Books published by the vanity press are often ridiculed because of the number of linguistic, factual or logical errors that appear in them. The quality of the idea itself might also be subpar, which may indicate the reason for the author's failure to publish through a commercial publisher (Cambridge Scholars Publishing, 2015). If by some chance, the book will sell, revenue from the sales will increase already elevated profit of the publisher. The activities of vanity publishers are practically risk-free. All costs are covered by an author, and a publisher does not invest significant amounts of money in this process.

Concurrently, such publishers aggressively promote their activities through various channels, also using the Internet and social media - mainly due to the possibility of better reaching the target group and lower costs of such activities. For example, they organise competitions in which the main prize is the publication. Hundreds of participants can enter such a competition, the best of whom will be able to cover the costs (sometimes not even the whole) of the publication. The rest will receive a "consolation prize" in the form of the possibility of publishing the work in return for a fee. Vanity publishers also promote books by maintaining a "book blog culture", where people who are usually young, inexperienced, incompetent and not familiar with literature and publishing industry receive copies of books for review from the publisher (at the expense of the author, of course). The quality of reviews leaves a lot to be desired; often, bloggers feel honoured and "repay" with good appraisals.

The appearance of such publications is a consequence of opportunism on the part of publishers and the asymmetry of information to the detriment of authors, which results in moral hazard, both in the aspect of hidden activities (in the form of refraining from acting - e.g. marketing actions) and hidden information (e.g. the real value of the published "work").

Authors of vanity publications

Publishing books with self-financing by vanity press also has some consequences for authors. Such authors are perceived as talentless hacks. Due to the sub-par quality of the process, published books are often ridiculed. Initially, the vanity presses pose as publishers who provide the realisation of dreams and quick satisfaction of needs. After some time, when a book published in this way is not widely distributed, and the sales are usually minimal (if any), there comes a reality check. An author will experience the effect of "pulling the rug from under his feet", it might be a disappointment, and this situation could build frustration with failure (Crump, 2010).

Because of these relationships, publishing a vanity publication is unprofitable and seldom brings profits to the authors. Moreover, it also seems to be the most expensive method of publishing work, and the works published in this way are usually of inadequate quality.

Some also point out that the author who used vanity publishing in the past has a significantly reduced chance of publishing traditionally in the future. It creates the effect of being "locked-in-vanity", where no traditional publisher is interested in the author's work, and what is left is another vanity publication. What can happen is also the situation, when an author, often unconsciously, does not try to publish in a traditional publishing house. Vanity publishers maintain good PR campaigns where they try to discredit traditional publishers, by presenting them as conservative, closed to innovations, blocking the access to young and fresh authors. It is quite frequently possible to read in the internet discussions statements like: "do not even bother sending your work to a traditional publisher, they are not accepting new authors, your only choice is Publisher XYZ". Vanity publishers tend to maintain friendly and frequent contacts with prospective authors. In the experiment conducted by Pawel Pollak, where he sent a sample of the specially prepared very poor quality manuscript to several vanity publishers, the fastest acceptance letter came after two hours (Zwierzchowski, 2015).

Readers

There are also some consequences for readers. Firstly, books published in this way may not be available in broad distribution. Thus the readers might have difficulty purchasing it, even if they wanted to. Secondly, it is difficult to distinguish a vanity publication from commercial one (either self or traditional). There is a higher probability that the former is potential "lemon" as compared with the latter being potentially a "peach", subject to a rigorous selection and intensive work of editors. Thirdly, encountering a sub-par vanity publication (sometimes by accident or by a recommendation of vanity publisher's "befriended" reviewer) may cause discouragement to literature.

Each of these effects hurts the condition of the industry and the readership level (Doonan, 2017). Through selection, publishers provide literature that meets specific minimum quality criteria. The activities of vanity publishers can cause a drop in trust in literature and other long-term effects, e.g. in literacy level.

Commercial publishers

It is also possible to show some potentially significant outcomes of vanity publishing on commercial publishers. Firstly, vanity publishers are new, strong competitors in the industry whose actions influence the mark-up. They use a different revenue model, which is, due to the asymmetry of information, quite successful for them. Traditional publishers maintain some quality criteria, which makes the whole process more exclusive and less accessible to new authors (Strauss, 2019). Secondly, by decreasing the demand for literature due to a large amount of low-quality publication, traditional publications will also lose out. Thirdly, there may be an adverse selection phenomenon present, where low-quality literature will crowd out higher-quality literature. Due to the information asymmetry and the inability to assess the quality of work before consumption, writing books might gradually become less profitable, when a talented author could be overwhelmed by the vanity authors and resign from writing. It will, of course, only occur if the vanity publications appear in the distribution, which unfortunately happens.

Distributors and retailers

Similarly to the traditional publishers, also distributors and retailers might see some adverse effects on their financial result. In the presence of vanity publishing, they might be forced to use additional selection methods to maintain the consistency and integrity of the assortment they sell. Also, the number of low-quality books being distributed might reduce sales revenue, as buyers, disillusioned by the quality of the literature, would turn to different methods of spending their free time.

Other authors of non-vanity publications

This group of stakeholders might also be influenced significantly by the vanity publishing. One of the problems, which was already mentioned, is a thin line between vanity and self-publishing. As a result, self-publishing can be identified with vanity. Through the actions of the vanity publishers, the whole of self-publishing can be seen as an inferior way of publishing. The growing bad reputation of vanity publishing might pull self-publishing down. There is an increasing opinion that all books published by authors on their own are of inferior quality to those published traditionally (Strauss, 2019). As it is also hard to distinguish beforehand which publishers use the vanity publishing model and which are

traditional ones, there might be a decline in interest in literature (in general) or specific genres (in detail).

Moreover, young authors, through increased pressure on traditional publishers, will have even greater difficulty with their debut in the traditional model. The effect of reinforcement (snowball effect) may start to appear in the whole industry, as such young authors would be pushed in the hands of vanity publishers.

Vanity Publishing as a Market

J. D. Macdonald, who warns against vanity publishers in his educational campaign, coined a rule: "money should always flow toward the author" (Nielsen Hayden, 2003). In the case of vanity publishing is the opposite – "publisher" is being paid by the author, instead of the author being paid by the publisher. D. Bricker compares it with the situation of "paying someone to take a vacation for you so you can get more work done" (Bricker, 2013).

In the traditional multi-staged[1] market for non-scientific literature, regardless of the form in which the publication is provided, the good that is supplied is, simplifying, a book. In such market authors create the supply, it is the author who ensures the stream of manuscripts for which the demand in the production chain is created successively by publishers, distributors, retailers and finally readers. Therefore, the good, book, reaches the buyer through a series of intermediaries which produce and distribute it. The self-publishing model is analogous to the traditional model, so it should be included together in the same market. The author is simply a publisher here.

In the case of vanity publishing, the situation is different. What is being sold is a service of preparing the publication, ordered by an author, who creates demand and is offered by a publisher, which creates supply. The money equivalent for the service is transferred in the traditional direction, from buyer to supplier, so there is nothing special about this relationship in terms of the trade relations.

Due to the reversed flow of money as compared with the traditional publishing process, it has to be assumed, that vanity publishing (treated as a service provided to an author) and traditional publishing (treated as a process of book production) do not belong to the same market. Even though the same publisher can engage in both, we have to presume that with the vanity presses (and imprints) a new market is beginning to emerge within the publishing industry, where the service of publishing a book is a product. Vanity publishing is simply a new revenue model for a publisher. The company engages in similar activities in the same industry; however, the way the revenue is generated is different.

Concluding Remarks

The intensification of vanity publishing, judged by the increasing number of publishers which engage in such activities have created the motivation for more in-depth study.

The development of vanity publishing has been overlapped by the development of modern media, which seems to intensify this phenomenon. In this process, authors create demand for the service of book publishing, and publishers provide such a service. Such interaction is a reversal of the traditional publishing process, in which a publisher invests in the work of an author, which is rewarded by him. Usually, in vanity publishing, only the publisher benefits, because his profit is already included in the fee paid by the author. On the other hand, there are potentially many negative consequences for other stakeholders in the process. The authors of the vanity feel a painful clash with reality when they understand that they have fallen victim to the scam and will not get their money back. Readers may be deterred from literature by the inability to distinguish between vanity and commercial publications. Commercial publishers must face falling demand and adverse selection among authors. Distributors are losing sales volume. Other authors, with falling demand, may see their revenue fall and the increased difficulty of traditional publishing. All this allows vanity publishing to be assessed as a detrimental practice in the publishing industry.

Endnotes

1. Such market consists of at least three stages: production, wholesale and retail. Depending on the scope of the analysis, it might be suitable to delineate market differently, e.g. studying the market for retail distribution of non-scientific literature, if we are interested in how bookstores operate. Here, because the whole process is in the scope of the analysis, it is not necessary to make such distinctions.

Abstract

The paper refers to the problem of delays in the starts of project activities and their influence on project completion time. This problem has been hardly treated in the literature, while it is important in some project types, where there occur frequent problems related to the launching of individual activities. The problem of the risk of delay of project activities start times is considered and related especially to the construction sector. The delays in project activities starts are modelled by means of type 2 fuzzy numbers and project activities durations by type 1 fuzzy numbers. An algorithm for calculation of the influence of the risk of delaying project activities start times on the total project duration is proposed. The resulting estimation of the total project duration is a type 2 fuzzy number. It can be analyzed for various risk events and compared with the estimated non-fuzzy project duration. The proposal is illustrated by means of a real-world construction project.

Keywords: Project Critical Time, Risk, Type 1 Fuzzy Number, Type 2 Fuzzy Number, Project Delay

Introduction

Serious delays of projects – of construction projects, but not only - are a common phenomenon which each citizen is often a witness of (e.g. in one of countries 75% of construction projects are delayed (Alsuliman 2019), in another one (Senouci et al. 2016) 72% of public projects) and the deviations are considerable (project are delayed on the average by as much as 44% (Urgilés et al. 2019). It is needless to say that these delays create considerable cost for the society. The consequences linked to project delays are not only the delays itself, but numerous other phenomena (e.g. for construction projects cost overruns, dispute and claims, arbitration, litigation and even total project abandonment (Mukuka et al. 2015)), which inevitably create social, human and obviously financial cost. That is why the objective of this paper is to propose a method which would facilitate the estimation and management of the risk of project delay.

The problem of project delays has been studied in the literature for many years. The focus is almost always put on project activities features, above all their forecast duration and the resulting duration of the critical path(s) of project networks, e.g. (Mukuka et.al. 2017), (Kogan and Shtub 1999), (Sireesha 2012), (Guida and Sacco 2019). However, all the existing approaches to modelling project activity features in terms of duration refer to the total activity duration or to the finish time of activities. The finish time of individual activities is of course of primordial importance, as it is decisive for the length of the critical path(s) and thus the project duration. However, in our opinion concentrating on the total duration of project activities or on their finish time obscures one important aspect: the difference between an activity which started immediately once all its predecessors had finished and took more time than planned (thus, whose duration was longer than planned) and an activity which did not start even if all its predecessors have finished. In the literature the latter case is not explicitly analysed.

Of course, in both cases the final activity finish time may be the same, but the management of both situations will be fairly different. If an activity has started, it means that all the procedures, permissions, signatures and other conditions enabling its start have been performed or fulfilled and the resources necessary for the activity performance are, at least for the moment, available. Then, the management of the activity duration covers the management and the maintenance of the conditions and resources which are already there. But the management of a situation when an activity cannot start even if all its predecessors have finished is different. Such a situation means that the starting conditions for the activity have not been fulfilled: either there is no permission for the start or the resources are missing or some other starting conditions have not been satisfied. Here, other measures are necessary: no continuous processes like motivating and maintaining are required here, but rather abrupt and very intensive actions are needed in order to attain the starting conditions for the activity (searching for access to the responsible authority, looking for resources substitute etc.). That is why our aim is to propose a model which would help the decision maker to manage the risk of project delays due, among others, to the delay in the starting moments of individual activities. Here lies the main novelty of the paper, as we have not identified any other paper treating this problem.

Modelling of risk, variability and uncertainty of activity features is performed by means of stochastic concepts (e.g. (Pontrandolfo 2000)) or fuzzy ones (e.g. (Chanas and Zieliński 2001), (Gładysz et al. 2015)). The discussion on the difference and superiority of one approach over the other has been going in on the literature for many years (e.g. (Sun and van Kooten 2009), (Cheeseman 1986)), but there is an almost general consensus that both approaches complement each other and that the fuzzy approach is superior in the case of vagueness (defined as the lack of statistical data) and of experts who are not familiar with mathematical concepts. There exist methods of dialogue with experts which help to translate their knowledge and opinions into fuzzy information (Türkşen 2011). That is why we have chosen to use fuzzy representation for risk and uncertainty. Thus, to make our objective more precise, we are aiming at proposing a new method of project delay analysis and management based on fuzzy modelling, focused on the management of project activities starting times delays.

Fuzzy sets (and their special case, fuzzy numbers) have been intensively used since their invention in the 60s (Zadeh 1965) and have been subject to numerous modifications, which have enhanced their modelling potential. The basic idea of fuzzy numbers is that experts can assign the degree of possibility or plausibility or truth to certain values or objects. And it is normal that experts may disagree or simply have different opinions. That is why so called type 2 fuzzy numbers were introduced (Mendel 2002), where the above mentioned degrees can differ among experts. Type 2 fuzzy numbers have already been applied to the project delay problem (see e.g. (Dorfeshan et al. 2018), (Dorfeshan et al. 2019), (Gładysz 2020)). In our approach we have decided to use both traditional (so called type 1) and type 2 fuzzy numbers. In this paper, type 2 fuzzy numbers are used to model the most important and original element of our paper (the delays in the starting times of individual activities) and type 1 fuzzy numbers - to model the duration of individual activities. It should be mentioned already in this moment that also the latter aspect can be modelled by means of type 2 fuzzy numbers, which we dropped here for simplicity reasons.

To sum up, the goal of our paper is to propose a method of managing the risk of project delays due to the delays in the start times of individual activities in conditions of risk and uncertainty. Due to limited space, we are not entering deeper into the discussion on the differences between the two, which can be found in the literature (Wyrozębski 2016). The uncertainty will generally be understood as the lack of knowledge as to the precise value of a magnitude, e.g. an activity duration or a starting time. The model will take into account so called risks (understood as events which may, but do not have to occur, and if they do, they will have a negative influence on activities starting times).

The outline of the paper is as follows: In Section 2 we present the definition of type 1 and type 2 fuzzy numbers, in Section 3 we describe our approach, in Section 4 we apply the approach to a real world example. The paper terminates with some conclusions and research perspectives.

Basic Notions

In 1965 Zadeh proposed his concept of possibility theory (Zadeh 1965). We will present the basic notions of this theory. First, we will present the concept of a trapezoidal fuzzy number (type 1 fuzzy number). A type 1 trapezoidal fuzzy number $\tilde{A} = (a_1, a_2, a_3, a_4)$ is defined by four crisp numbers $a_1 \leq a_2 \leq a_3 \leq a_4$ and a so called membership function μ_A, defined on the set of real numbers with values in the interval [0,1], depicted in Fig. 1 for $a_1 = 1, a_2 = 4, a_3 = 6, a_4 = 11$.

Fig. 1: The membership function μ_A of the trapezoidal type 1 fuzzy number $\tilde{A} = (1, 3, 6, 11)$

Trapezoidal fuzzy numbers may be interpreted in many ways, but here we will follow the following interpretation of μ_A: each element of the *x* axis represents a possible actual value of a yet unknown magnitude (for example, the duration or the starting moment of a project activity), and $\mu_A(x)$ represents the degree of possibility, given by an expert or a group of experts who have arrived at a consensus, to which x will be the actual value of the magnitude in question. Thus, in case of Figure 1, the expert(s) think(s) that the values in the interval [3,6] are most possible to be the actual values of the magnitude in question, the values over 11 and under 1 are impossible to occur in this role and the occurrence possibility of the other values is between 0 and 1: the smaller, the bigger the distance from interval [3,6].

There exist easy to use definitions of arithmetical operations (addition, multiplication, maximum, minimum) on trapezoidal fuzzy numbers (Vahidi and Rezvani 2013), which among others have allowed to work out fuzzy counterparts of critical path algorithms (see e.g. (Chanas and Zieliński 2001).

The following notion will be useful too:

<u>Definition 1</u>: For a trapezoidal type 1 fuzzy number $\tilde{A} = (a_1, a_2, a_3, a_4)$ the interval $[a_1, a_4]$ is called the support of $\tilde{A}$.

The problem with all type 1 fuzzy numbers, among them trapezoidal fuzzy numbers, is that we can consider only one expert or all the experts have to arrive at a consensus as to the possibility degrees represented by the membership function. The problem is that experts, by their very nature, may have different opinions. That is why type 2 fuzzy numbers have been introduced ((Mendel and John 2002), (Ngan 2013)), where the possibility degree $\mu_A(x)$ can be a fuzzy number itself (e.g. a trapezoidal one). It represents then the opinion on the possibility degree of many experts.

For practical purposes, it is useful to consider a simplified representation of type 2 fuzzy numbers, called fuzzy footprint of type 2 fuzzy number (Wang 2014). It considers only the support of $\mu_A(x)$ (for all x's). We will consider here the case of type 2 trapezoidal fuzzy numbers whose footprint is a couple of two trapezoidal fuzzy numbers, the so called upper membership function *UMF* and the so called lower membership function *LMF*. Figure 2 presents the footprint of a trapezoidal type 2 fuzzy number $\tilde{A}$.

Fig. 2: The footprint of trapezoidal type 2 fuzzy number $\ddot{A} = \big((2,3,4,5),(0,3,6,7)\big)$, defined by $LMF = (2,3,4,5)$ and $UMF = (0,3,6,7)$

The type 2 trapezoidal fuzzy number $\tilde{A}$ presented in Figure 2 in the form of its footprint allows to reflect differences in the perception of the possibility degree of the occurrence of individual values on the x axis. These differences are shown by the grey area between the two trapezoidal membership functions (*LMF* and *UMF*): for example, number 1 is perceived by some of the experts as possible to the degree 0 and by some as possible to the degree 0,3, and number 5 is perceived by some of the experts as possible to the degree 0 and by some as possible to the degree 1. All the experts agree only with respect to the numbers in the interval [3,4]: they are seen by all of them as being possible to the degree 1.

Arithmetical operation on type 2 trapezoidal fuzzy numbers can be defined on the type 1 fuzzy numbers *LFM* and *UFM* which determine them. If *LFM* and *UFM* are identical, we are dealing with a type 1 trapezoidal fuzzy number. Thus, each type 1 trapezoidal fuzzy number is a special case of a type 2 trapezoidal fuzzy number.

Analysis of the duration of a project in function of the starting times of selected activities

Let a project be represented as set of nodes (events) $N = \{1, \dots, n\}$ and let $A \subset N \times N$ be the set of arcs (project tasks, activities). Let us denote the fuzzy duration of task $(i,j) \in A$ as $\tilde{T}_{ij}$. The exact form of these fuzzy durations is chosen on the basis of expert opinions. For example, we can ask the expert, for each task $(i,j) \in A$, to determine the optimistic duration t_{ij}^{opt}, the most possible duration m_{ij} and the pessimistic one t_{ij}^{pes}. Then the durations of the activities would be represented as trapezoidal type 1 fuzzy numbers in the following form:

$$\tilde{T}_{ij} = \left(t_{ij}^{opt}, m_{ij},, m_{ij}, t_{ij}^{pes}\right) \tag{1}$$

Let us denote the resulting project network as PRN.

Now we come to the main novelty of the paper: the uncertainty of activities duration times is one aspect, widely treated in the literature, but, as we justified in the introduction, we think it is important to consider separately the uncertainty related to the times when the activities will start, because this issue requires a special managerial approach. Let us assume that experts determine a list of risks $\boldsymbol{R} = \{R_1, .., R_K\}$ whose actual occurrence may delay the start of individual activities. For each risk they also indicate which activities start it will influence in case of occurrence and estimate the delay in the start of activity (i, j) as a consequence of the occurrence of the *k*-th risk. Let us assume that the possible delay in the beginning of task (i, j) is a trapezoidal type 2 fuzzy number of the following form:

$$\tilde{L}_{ijk} = \left(\left(0, \Delta t_{ijk}, \Delta t_{ijk}, \Delta t_{ijk}\right)\left(0, 0, \Delta t_{ijk,} \Delta t_{ijk}\right)\right) \text{ for } (i, j)\epsilon A, k = 1, \dots, K \tag{2}$$

Figure 4 presents the footprint of number (2) for Δt_{ijk}=5.

Fig. 2: The footprint of a trapezoidal type 2 fuzzy number $\tilde{A} = \left((\mathbf{0}, \mathbf{5}, \mathbf{5}, \mathbf{5})(\mathbf{0}, \mathbf{0}, \mathbf{5}, \mathbf{5})\right)$

Thus, we assume that the highest difference in the experts opinions regards the occurrence possibility of low values of the delay of the activity start: some experts think they are little possible, some think they are highly possible. Generally here all the experts are rather pessimistic: the high delays of the activity start (5 or close to 5 in Figure 2) are considered to be possible to the highest degree.

We assume here that we have at our disposal an algorithm which determines the length of critical path(s) for a project in which the activity durations are represented by type 2 trapezoidal fuzzy numbers (we can take e.g. the algorithm from (Y. Dorfeshan et. al. 2018) or extend the algorithm from (Chanas and Zieliński 2001) to the case of type 2 fuzzy numbers). Let us call the selected algorithm *ALG*. $ALG(PRN)$ will stand for the result of the application of the algorithm to the project network PRN, which may have type 1 or type 2 trapezoidal fuzzy numbers as arc lengths. $ALG(PRN)$ contains at least the (fuzzy) duration of project critical path(s), thus the fuzzy project duration.

Then for each risk R_k $(k = 1, \dots, K)$ we propose to modify the project network according to the following procedure: For each $(i, j)\epsilon A$, if $\Delta t_{ijk} > 0$, replace arc (i, j) with two arcs (i, i') and (i', j)

such that the length of arc (i, i') is equal to $\tilde{L}_{ijk} = \left((0, \Delta t_{ijk}, \Delta t_{ijk}, \Delta t_{ijk})(0, 0, \Delta t_{ijk}, \Delta t_{ijk})\right)$ and that of arc (i', j) is equal to $\tilde{T}_{ij} = \left((t_{ij}^{opt}, m_{ij}, m_{ij}, t_{ij}^{pes})(t_{ij}^{opt}, m_{ij}, m_{ij}, t_{ij}^{pes})\right)$. Arc (i, i') represents the delay in the starting time of the activity due to the considered risk, arc (i', j) the activity duration.

Let us denote the resulting network as $PRN_k, (k = 1, \dots, K)$. This network takes into account the risk of the delay in activities start times. This risk is separated from the uncertainty linked to the activities duration, which is a novelty with respect to the literature. Applying *ALG* to the modified network gives us the result $ALG(PRN_k)$, which shows the influence of the delay in the starting times of project activities, caused by the *k*-th risk, on total project duration. Various risks can be then analysed from the point of view of their influence on the project duration.

Example

Let us consider a real world project whose objective was "the construction of a sales and service center" (Gładysz et al. 2015). The building was designed as a 2-segment, 4-storey, non-basemented construction, with vertical communication through 2 staircases and 2 external passenger-cargo lifts. The project was composed of 18 tasks, see Figure 3.

Fig 3. Networks of the project "the construction of a sales and service center"

Their duration was estimated in the form of trapezoidal fuzzy numbers, thus they were judged as uncertain, but additionally to this uncertainty experts have listed risks that may influence the starting times of individual activities: computational errors in the design (R_1), errors in the bill of quantities (R_2), imprecise formulations in the contract (R_3), incorrect fieldwork (R_4), technological changes (R_5), equipment breakdowns (R_6), delays in the delivery of materials (R_7), construction disaster or accident (R_8), low quality of the work on site (R_9), low quality of materials (R_{10}), disadvantageous weather (R_{11}). An AHP analysis was performed for these tasks and the following indicators of hierarchy were determined: $w_1 = 0.183$, $w_2 = 0.092$, $w_3 = 0.092$, $w_4 = 0.061$, $w_5 = 0.046$, $w_6 = 0.037$, $w_7 = 0.061$, $w_8 = 0.184$, $w_9 = 0.092$, $w_{10} = 0.092$, $w_{11} = 0.061$.

Table 1: Fuzzy duration of the tasks in the project and the risks influencing individual tasks

Name of task	Symbol	Predecessors	Risks	Time
Preparation work	P	-	11	(9,10,10,11)
Ground work	G	P	1,4,6,8,9,10,11	(14,15,15,16)
Fundaments (stage 1)	F1	G	1,3,4,6,7,8,9,10,11	(19,20,20,21)
Fundaments (stage 2)	F2	F1		(7,9,9,11)
Ground floor (stage 1)	GF1	F1	1,2,3,5,7,8,9,10,11	(28,30,30,32)
Lift shaft (stage 1)	L1	F1	1,2,3,5,7,8,9,10	(16,17,17,18)
Ground floor (stage 2)	GF2	F2, GF1		(9,11,11,13)
1st floor (stage 1)	FF1	F2, GF1		(21,23,23,25)
Lift shaft (stage 2)	L2	F2, GF1		(16,17,17,18)

1st floor (stage 2)	FF2	GF2, FF1, L1		(14,16,16,18)
2nd floor (stage 1)	SF1	GF2, FF1, L1		(29,30,30,31)
Lift shaft (stage 3)	L3	GF2, FF1, L1		(18,19,19,20)
2nd floor (stage 2)	SF2	FF2, SF1,L2		(14,16,16,18)
3rd floor (stage 1)	TF1	FF2, SF1,L2		(38,40,40,42)
Lift shaft (stage 4)	L4	FF2, SF1,L2		(16,17,17,18)
3rd floor (stage 2)	TF2	SF2, TF1, L3		(4,6,6,8)
Drainage on the roof above the 3rd floor	DhR	TF2, L4	2,5,7,8,9,10,11	(11,12,12,13)
Roof above 3rd floor	R	SF2, TF1, L3	5,7,11	(18,19,19,20)

Applying *ALG* to the project from Table 1 (without taking the risks influencing the starting times of individual activities into account), we obtain the project duration as equal to (176,187,187,199).

Fig. 4: Fuzzy duration of the example project without taking into account the risk of delays in project activities starting times.

The project will take most possibly (if delays in project activities starting times are not taken into account), about 187 days, however, all the values between 175 and 199 days are to some extent possible. Two critical paths occur here:

I. 'preparation work' (P), 'ground work' (G), 'fundaments' (stage 1) (F1), 'ground floor' (stage 1) (GF1), '1st floor' (stage 1) (FF1), '2nd floor' (stage 1) (SF1), '3rd floor' (stage 1) (TF1), 'roof above the 3rd floor' (R);

II. '3rd floor' (stage 2), 'drainage on the roof above the 3rd floor' (Dhr) instead of 'roof above the 3rd floor (R)'. The rest of the tasks are the same in both paths.

Then an analysis of the influence of the risks which may delay project activities starting times on the project duration was performed. Here we limit ourselves to three selected risks:

- computational errors in the design (R_1)
- incorrect fieldwork (R_4)
- delays in the delivery of materials (R_7)

In Table 2 estimations of their influence on the project activities starting times are given (determined by experts, here as a percentage of the activity duration). Each risk's influence was estimated separately, thus we assume that at the most one of the three risks will actually occur. Each influence estimation has the form $\left((0, \Delta t_{ijk}, \Delta t_{ijk}, \Delta t_{ijk})(0, 0, \Delta t_{ijk}, \Delta t_{ijk})\right)$ (see (2)) thus only the parameter Δt_{ijk} is given in the table.

Table 2: Fuzzy delays in project activities start times caused by risks R_1, R_4, R_7 (represented by the parameter Δt_{ijk}, see (2))

Symbol	R_1	R_4	R_7
P			
G	1.47	0.48	
F1	1.93	0,63	0,6
F2	101	0.33	0.32
GF1	2.93		0.92
L1	1.65		0.52
GF2	1.19		0.37
FF1	2.29		0.72
L2	1.65		0.52
FF2	1.65		0.52
SF1	2.84		0.89
L3	1.83		0.57
SF2	1.65		0.52
TF1	3.85		1.21
L4	1.65		0.52
TF2	0.73		0.23
DhR			0.37
R			0.57

Let us now apply the procedure from Section 3 to the project network for each of the three risks and compare the resulting project duration estimation with that without the risk of delays in project activities starting times, from Figure 4.

Fig. 5: Fuzzy duration of the example project with risk R_1 influencing delays in project activities starting times.

We can see that risk R_1 prolongs the pessimistic possible project duration with respect to the situation when its influence on the starting activities times was not considered (Figure 5). There is a grey surface in Figure 4, showing the difference in opinion among the experts: according to the more optimistic experts project durations close to 180 days are highly possible even taking into account risk R_1 and its influence of project activities starting times, other experts estimate their possibility lower.

Fig. 6: Fuzzy duration of the example project with risk R_3 influencing delays in project activities starting times.

Risk R_3 prolongs the pessimistic project duration much less than risk R_1, and in the estimation of the total project duration the disagreement among experts is absent.

Fig. 7: Fuzzy duration of the example project with risk R_7 influencing delays in project activities starting times.

We can see that risk R_7 also has a small effect on the pessimistic project duration (smaller than R_1 and bigger than R_3), but there is a disagreement among experts as to the possibility degree of lower project duration times (similarly as in case of R_1).

In all the three cases we have two critical paths, the same as the ones listed above. But generally of course each risk, causing a delay in the start times of some activities, may change critical paths.

Conclusions

In this paper we have proposed to analyse separately the risk of delaying project activities starting times. According to our knowledge, this problem has not been considered in the literature so far, in spite of a large number of literature items covering the problem of risk and uncertainty of project duration. All the contributions take into account the total duration of activities, without separating the time lost due to the lack of the possibility of starting individual activities. And the management of non-started activities is fairly different from the management of activities which have already started, but for some reason are dragging on.

We proposed an extension of critical path algorithms for the case when project activities durations are given in the form of fuzzy numbers, which allows to analyse the influence of selected risks on the delay in the start times of selected activities and then on the total project duration. The algorithm was applied to a real world construction project. The construction sector is especially sensitive to delaying activities starts: the lack of a formal permission, the protest of local ecologists, bad weather, an unexpected discovery of archaeological remnants: all this may make it impossible to start certain project activities. Thus, further research will have to encompass new case studies and interviews with project managers from the construction sector in order to verify the proposed approach and extend it so that it covers the practical issues encountered in practice. Certainly, the gap has to be crossed between the practitioners and the researchers language: the modelling of expert opinions in terms of type 1 and type 2 fuzzy numbers may be not evident to practitioners, but it is only them who have the practical experience and intuition and may deliver close to reality models.

The usage of type 2 fuzzy numbers allows to take into account (and visualise graphically) different opinions of experts and lead to fruitful discussion among them. In our opinion the development of formal dialog procedures with experts and making them get acquainted and accept this modelling tool might contribute to a better management of all types of delays in projects.

Abstract

The article presents an analysis of the functioning theories of optimal locations for agricultural and industrial activities. He also describes the spatial theory of substitution according to Predöhl, which defines the factors determining the location of an enterprise in general and the so-called general theory of spatial management according to Löschema. As part of this analysis, an attempt was made to identify problems and development perspectives for the field of knowledge which is spatial management. The theories presented in the article allow to optimize the location of power plants. This is of great importance for the economy. It allows to use local resources and receive renewable raw materials and process them will take place at an appropriate distance from suppliers due to the high costs of direct delivery to the power plant. At the same time, it will increase employment and create a new sales sector as well as introduce innovations, for example more modern and ecological processes of energy production.

Keywords: Spatial Management, Location Theories, Socio-Economic System.

JEL classification: A13, E61, H42, J08, O11.

Introduction

When planning a business, you should first consider the location of your business so that it is positioned in the best possible way, i.e. at the best possible distance from customers and suppliers. Spatial management deals with this problem. This science comes from urban planning, economic sciences, regional studies and economic geography. Spatial management has developed as an independent current in economics since the 19th century.

The research scope of spatial management is very wide and complex. That is why it is difficult to formulate a clear and simple definition. Secondly, also because spatial management is both a field of knowledge and a field of practical activity. Both areas are not autonomous, but are interrelated. The development of spatial economy results from the demand reported by practitioners, which is why science provides the necessary tools and knowledge to undertake the so-called spatial decisions. Dębski pointed out the link between practical and theoretical aspects of spatial management, which built a three-step definition of spatial management as (Dębski, 2001):

1. Practical activities aimed at creating spatial order in existing development, bearing in mind the good of the individual and society in the widest possible time perspective.
2. Reality covering all phenomena occurring in space, from the natural environment, settlement, technical infrastructure and the national economy.
3. Science dealing with the past and current state of spatial development of specific areas and looking for their hidden and complex structures that determine the functioning of the whole.

This way of defining spatial management aims to match different views on its essence. It also results from the fact that it concerns various aspects of social and economic life, taking into account the elements of space and methods of controlling and planning the development of the reality that surrounds us.

Theories in economic sciences appreciate the huge role of space in the economy (distance, transport costs, land value). Since the spread of classical theory, attempts have been made to organize the principles of management in space. Certainly the first of these was the theory of Johann von Thünen (first half of the 19th century).

Literature Review

The theory of von Thünen

The theory is related to the nineteenth-century economist Johann Heinrich von Thünen, who was the first to lay the groundwork to appreciate the role of space in the economy and to organize the principles of space management. Thünen pointed out how the disseminating classical economy functions in the agricultural area surrounding the city.

Thünen was looking for an economically rational distribution of agricultural zones around the city that would be the outlet for their products. This arrangement occurs when each scrap is utilized and gives the largest possible rent, i.e. the difference between the revenue from sales and the cost of transport (Borsa, 2004). The concept has the following assumptions:

• agricultural space with equally fertile soil is undifferentiated,
• there is one consumption center consuming agricultural products from the surrounding area, not having links with other centers and areas,
• transport costs are a function of distance and weight of loads,
• sales prices are uniform for all products of a given type.

Agricultural production is the closest to the market, because it bears the highest production cost (Gołębiewski, 2001). Then according to production per hectare. The problem is complicated by real assumptions, e.g. assuming that the intensity of land use and production per hectare changes within one type of production and one zone, and different products are transported at different transport costs per tonne-kilometer, and rent gradients change from the line straight on the curve. Therefore, they can intersect not only once, but twice or more times. With these assumptions, the layout of the zones changes.

Thünen model formula:

$$LR = E\,(p - a) - E\,(f * k) \qquad (1)$$

where:

E - production,
p - price received (gross income),
a - production cost for a given location,
f - cost of transport ($ / ton-km),
k - the region's distance from the market.

Thünen pointed out that clean income will fall as you move away from the city where the product must be sold (Baldwin et.al, 2003). Net profit was falling because of the cost of transport. A more complex case occurs when we deal with many agricultural products. In this case, the market price and transport rate differ for each product. The market price depends on the supply and demand for a given product, and the transport price depends on the impermanence, size and ways of transporting the products. W. Launhardt (1882) and A. Weber (1909) formed the principles of location selection for industrial enterprises. A. Lösch included the foundations of the theory of spatial management in his work in 1940.

Location of an industrial enterprise according to Weber

Weber's theory is based on the following assumptions:

• the subject of the theory is the location of a single enterprise producing one product in a given quantity,
• the location of consumption places and sources of raw materials is determined,
• transport costs per tonne-kilometer are taken as uniform,
• technical production indicators are accepted as fixed,
• Location is considered optimal when it minimizes transport costs.

Thanks to the above assumptions, Weber solved Varignon's problem (Figure 1).

Fig. 1: Varignon location triangle

Source: (Domański, 2006, p. 160).

When we know the point of consumption, i.e. point C and sources of supply with raw materials, i.e. points M1 and M2. Combining these points, we form a triangle, and from the vertices of the triangle we make threads that correspond to the product of the weight of the load (purchased or received at a given point) and the unit cost of transport, i.e. the cost per tonne-kilometer. Then the node is located at the point of balance of forces, which is also the point of optimal location of the industrial enterprise, assuming that the criterion of optimality is the minimum transport costs (Jones, 2017). We can increase the number of supply sources and outlets, provided that the drawn polygon is always convex. When setting wages for the location of an industrial enterprise, Weber assumes that wages are spatially variable and for this reason may cause a deviation or deviation of the location from the point of minimum transport costs. If the company's goal is to minimize the total costs of transport and labor, the spatial diversity of labor costs is an indicator of the optimal location. Weber uses the isodapan technique to determine the minimum cost point and optimal location for the enterprise (Kirsch, 1996). When the optimal location P0 has been pre-determined, which corresponds to the point of minimum transport costs.

Fig. 2: Izodapany - lines of equal total transport costs per production unit

Source: (Parysek, 2007).

The first isodapane connects points around P0 for which transport costs due to deviation from the minimum increase by one unit. The second isodapana connects points for which transport costs increase by two units. Similarly, you can plot isodapana 3 and later. We then compare the increase in transport costs with the level of labor costs, which may decrease with the distance from the point of minimum transport costs. The line connecting the points where the increase in transport costs is equal to the decrease in labor costs is called critical isodapped (Figure 2). Location costs at each of the points located on this line are equal to the costs at the initial point of P0 minimum (Krugman, 1991). These points are therefore relative to the starting point minimum indifferent. The second factor, apart from labor costs, is the so-called The deviation factor, i.e. moving the company away from the point of minimum transport costs are the benefits of agglomeration. It can more than cover the increase in transport costs and labor costs, attracting industry to places with transport costs and labor costs higher than the optimum P0 at the beginning. At point P1, higher transport costs are offset by lower labor costs. When a new optimum is determined, it is graphically complex and opaque. To this end, other computational methods (techniques) are used, e.g. linear programming.

Spatial substitution according to Predöhl

In the case of Predöhl's theory, it has been shown that there is no connection between the spatial theory of economics and location, because logical connections and constructional principles have not formed. This is because both these areas of research have developed separately and there is no relationship between the general theory of economics on the one hand and the specific theories of agriculture and industry on the other. This gap can be filled by the theory of location derived from economic methods from economic theory. Predöhl used the concept of substitution to introduce space into general economic theory and developed the general theory of location. He showed that production and location are two sides of the same study. Location is then a case of a general economic problem, i.e. a problem of rational choice (Tabuchi and Thisse, 2011). He believed that the same approach as for spatial analysis of an enterprise could be used for location analysis.

Changes in the location of the enterprise attributed to the substitution of factors of production located in different places (Snell, 1992). Substitution is a function consisting of the price of factors of production and the cost of transporting them. Factors located in different places have different properties and prices. As a result, the factors used to obtain the same production in different locations have different proportions. In enterprises, you can replace the less efficient factors with more efficient factors and reduce production costs in individual places. Where land area is determined and all other factors are merged, land substitution for these factors or vice versa can be measured for each location. Other substitution effects can be measured identically. The substitution process may continue until a state where further improvement of the ratio of factors is impossible, i.e. a change in the use of factors

will bring more losses than benefits. After obtaining the most effective combinations of production factors for given places, one can calculate the total costs of obtaining specific production in each place. Places with equal costs are connected by lines of indifference (indifference). In these places, the location is equally beneficial for the enterprise. In this way, a spatial balance is established.

Predöhl not only created a bridge between the theory of equilibrium and the general theory of location. He also presented the connection between his general theory and the earlier location theories of Thünen and Weber. He sees the main difference in the assumptions of both theories in the different nature of the space in which business is conducted. In the case of Thünen, where the activity is continuous, the location factors and transport costs are the factors determining the location. However, in the case of Weber's theory, space is discontinuous with the centers of consumption, work and obtaining resources scattered on it. Location factors include additional factors such as different location factors, and capital and labor costs. In both cases, location factors are matched differently, both Thünen and Weber studied the same, i.e. a combination of different factors. Both theories take into account the principle of substitution, and differ only in the selection of factors due to the difference in agriculture and industry. According to Predöhl, the theories of Thünen and Weber are special theories of his general theory of location. Critics of this theory pointed to its limitations. Assuming the principles of substitution, this theory only applies to a single enterprise and a short period of time, and is based on the assumption of constancy of technology.

General theory of spatial management according to Löschem

The researcher developed a general theory of location assuming profit maximization in contrast to Weber, who was looking for a point of minimum cost. This difference has location consequences. In the case of demand for industrial products, it is not permanent and presents flexibility in terms of prices and income. Then the production and location are different with the criterion of minimizing costs and maximizing profits. According to Löschema, competing enterprises are interdependent. Given the free competition, the number of companies on the market will increase. Each subsequent one will reduce the market area of its competitors until the extraordinary profits disappear. As a result of free competition, there is a desire to maximize the number of business entities. The location results from two opposing assumptions:

• maximizing individual profits,
• maximizing the number of business entities.
Decisions based on these assumptions are to lead to a spatial balance of economic activity. He introduced several real premises to Thünen's theory, namely:
• unit cost of production per hectare,
• production volume per hectare in natural units,
• market prices for agricultural products.

With the above assumptions, the distribution of agricultural production will differ significantly from the arrangement of Thünen zones. It is possible to obtain a more realistic system of mixed farming. He analyzes the advantages of agglomeration from the production and consumption side. Connects with this concept the problem of location of business units with the problems of location of human settlements. The merits of Lösch's work is the theory of the economic region (economic landscape). He derived it from purely economic premises. Apart from the notion of a region, or an administrative and political point of view (Hall, 2009). These reasons are:

• the existence of a large homogeneous plain with an evenly distributed agricultural population and equal transport conditions in all directions,
• occurrence of economies of scale in production and agglomeration benefits,
• moving products involves transport costs,
• tastes and preferences of the population are the same, while flexible demand,
• the price system is used as a manufacturing warehouse,
• enterprises strive to maximize their profits,
• the whole system should be spatially organized so that the total transport costs are minimal.

Economies of scale appear in production, which allows raising profit per unit of production (Karwińska, 2008). As a result, the spatial layout of production is the result of economies of scale and agglomeration, and the cost of transport.

According to Lösch, the economically suitable shape of the market area is a regular hexagon, which of all regular polygons differs the least from a circle. Thanks to this, it minimizes transport costs in meeting the demand. In other words, it maximizes the demand of the population living in the area thus designated. The size of the hexagons forming a network of market areas is different for goods of all kinds (Stabryła, 2006). After superimposing these networks, you'll get a chaotic picture. This chaos can be sorted out with the help of two treatments. First, all networks should be arranged to have one common center point. At this point, the conditions will be created for the development of a big city thanks to the advantage of agglomeration. Secondly, networks around this center should be rotated until six sectors with numerous production locations are obtained. This arrangement has the following properties:

• the largest number of locations converges at the same points,
• the largest number of purchases can be made on the spot (local market),
• the sum of distances between industrial locations is the smallest and as a result, not only transport, but also the length of transport lines are kept to a minimum.

Results of the Research

Optimization of power plant location based on the theories presented is possible due to the use of agricultural raw materials for energy production. The reasons why it becomes possible to use agriculture for the production of energy resources are:

1. The use of production surplus in agriculture that can be used as an energy raw material (waste, inferior quality raw material),
2. Waste from the agri-food industry,
3. Unused land (fallow land, fallow land, meadows),
4. A significant share of arable land with low productivity,
5. High share of excessively contaminated (locally) land that can be used for energy crops,
6. The need to apply the principle of sustainable development and use of renewable energy in the primary energy balance.

In Poland, various forms of renewable energy sources can be used depending on regional and local conditions. The greatest importance is attributed to the possibility of using biomass, because in the case of other renewable sources there are situations limiting their use. The use of biomass from energy crops in the process of combustion (or gasification) contributes to the ecological balance at zero level, i.e. the CO_2 emitted during combustion is equal to the amount of CO_2 absorbed during photosynthesis during the plant growth period. It should be remembered that Poland has the majority of energy imports for energy exports, in particular covering the deficit in oil (18.8 million tons) and natural gas (10.3 billion m3) (Central Statistical Office of Poland, 2019). It should also be remembered that Poland relies mainly on hard coal and brown coal contributing to the greenhouse effect. The West Pomeranian Voivodship has particularly favorable conditions for biomass production for energy purposes, without damaging the country's food security. The use of biomass in Poland already reaches 11.5% (Official Publications of the European Communities, 2019). Combustion technologies are of the greatest importance for biomass such as wood or straw. Combustion is understood as the oxidation reaction of a fuel substance, which is accompanied by the release of energy contained in this fuel. The power sector plays a special role in the development of renewable energy because:

• access to energy allows for dynamic development of the country's economy,
• electricity generation will increasingly be associated with reducing emissions of harmful compounds into the atmosphere.

The above points are important for forecasting the development of the power industry and including this sector to co-create the principles of the green energy market as well as for legal and organizational solutions allowing the effective use of biomass, which at the same time contributes to ensuring the energy security of the country (Healey, 2009). Due to belonging to the European Union and the implementation of the National Development Plan, the Sectoral Operational Programs associated with it, constituting a program of using structural assistance funds also related to environmental protection, allow using instruments to increase the importance of renewable energy in the production of energy and heat (Hejduk, 2016). Rural development should be sought through direct contact with an energy producer, where local governments play a large role (Korenik S., Słodczyk, 2005). As a result of these measures, the use of undeveloped areas for agricultural purposes will increase. Thanks to the production of plants, especially for energy production, it will contribute to increasing the economic efficiency of their use (Duranton and Puga, 2000). Thanks to the synergy of activities related to the cultivation of energy crops as well as techniques and technologies, it will reduce the areas excluded from agricultural use, increase the number of jobs and encourage local communities to do business (Kabus and Nowakowska-Grunt, 2016). From the side of energy producers, the most important is the increase in biomass used in energy production as a result of expectations of an increase in the share of "green" energy generated. It is also required to improve the biological balance of local ecosystems and material flows in the economy by using local energy resources (Stępień and Miciuła, 2016). To strengthen the relationship between energy producers and renewable fuel producers, promote:

• development of technologies for the production and energy use of biomass in the regional aspect,
• development of new technologies and launching pilot biomass production facilities, as well as preparation and use of its final products,
• education, consulting and computerization.

Thanks to the ecological policy and strategy for the development of renewable energy in Poland, you can count on the efficient production and use of biomass as well as providing professional power industry with prospective development and meeting your needs.

Ecological benefits:

1. Reduction of emissions of substances harmful to the environment, including SO2, NOx and organic pollutants, heavy metals,
2. Reduction of CO2 emissions, responsible for the greenhouse effect (correlation with the amount of biomass released for combustion),
3. Limitation of environmental degradation as a result of fossil fuel extraction and deposit of biomass waste in the environment,
4. Reduction of environmental degradation as a result of unorganized, bio-degradation processes of deposited biomass.

Economic and social benefits:

1. Saving fossil, non-renewable fuel resources,
2. Utilization of biomass energy potential,
3. Reducing the cost of energy resources,
4. Stimulating the development of modern technologies,
5. Development of local labor markets,
6. Development of many sectors of the economy,
7. Improving the living conditions of the population, increasing the country's energy security,
8. Implementation of international obligations to reduce emissions of harmful substances into the atmosphere.

The situation of the energy sector in Poland within the country and abroad is not entirely comfortable. The slow pace of reforms contributes to this as well as the departure of the state from the role of the owner of the above sector. It was only the consolidation of state-owned companies, producers and distributors, and the creation of four energy holdings that gave a financial injection to plan the expansion of production capacity. Following consolidation, competition has deteriorated because

companies in their markets are a monopoly by placing customers dependent on supplies under the price dictate wall (Figure 3).

Fig. 3: Percentage market share among energy companies.
Source: own study based on data: (GUS, 2019).

Technologies enabling co-firing of biomass with coal enjoy the most common interest of domestic power and heating companies. There are approximately twenty energy installations co-burning biomass with basic fuels in the country, of which fifteen are system power plants. When co-firing, the most commonly used fuel is wood biomass in the form of sawdust, wood chips, dust and biogas, and also classified as biomass - waste from animal and plant production, e.g. rapeseed pomace, or cereal coffee pomace. Co-combustion of biomass with conventional fuels used as the primary fuel such as hard coal, lignite or peat is carried out in parallel in approximately 150 energy installations in the world, of which 100 co-firing installations operate in Europe and the rest are in the United States. Co-firing contains various fuel configurations for different types of basic fuels as well as biomass and technological fuels including grate, dust and fluidized bed boilers. The electrical power of energy facilities performing the co-firing process is in the area of 50-700 MW. Within ten years, co-firing technologies will have a large share in the implementation of European and international commitments:

- conventional fuels,
- biomass,
- biogas.

The main barriers to the use of biomass resources in co-firing processes in the power industry are technical limitations resulting from currently existing boiler installations. In the case of technological restrictions, they relate to:

- transport and fuel supply installations,
- mill installations because they are prepared for other nominal fuel, e.g. hard coal or lignite. The development of renewable energy based on biomass co-firing requires an impulse consisting in connecting biomass producers with energy producers and priority should be given to the development of energy crops.

Thanks to the increasing production of energy from renewable energy sources, Poland will be able to fulfill its commitment to the European Union and reduce its independence from foreign supplies (Miciuła and Stępień, 2019). This process will also contribute to the development of regions. To this end, it is necessary to find the optimal location for the power plant so that it functions efficiently and the process is beneficial and economically efficient (Miciuła & Nowakowska-Grunt, 2019). Due to the fact that the cost of transporting biomass to an energy company is high and in order to develop regions, the company should build power plants as close as possible to suppliers (selection of suppliers through tenders) or as close as possible to areas of at least the average area with energy crops (Figure 4), because from these areas delivery will last for a long time.

Fig. 4 : Scheme of cooperation between power plants and farms.

The use of biomass for energy purposes should be an absolute priority in the economic development strategy due to:

• lack of local fossil raw materials in large quantities,
• existing heating infrastructure located in small towns and rural settlements,
• environmental conditions enabling comprehensive use of biomass from agriculture and the agri-food processing industry as well as sludges from sewage treatment plants and organic municipal waste,
• predispositions of agriculture with favorable agrarian structure, dominance of large-scale farms,
• unused arable land (fallow and fallow land), unused areas of meadows and pastures,
• significant areas of low quality land, not suitable for consumption crops,
• significant amounts of industrial biomass waste (distilleries, slaughterhouses, agri-food production plants, sugar factories) that require utilization of organic waste, and at the same time are an excellent raw material for biogas production (Ministry of the Environment, 2019),
• activation of rural areas,
• neutralization of problems of overproduction of agricultural agricultural raw materials,
• creating local and regional energy security,
• creating many new jobs in rural areas,
• creating a safe region in terms of energy and implementing modern technologies (intelligent energy),
• creating a self-sufficient energy region with full food security in the medium term,
• in the medium term, energy (agro-energy) agriculture can ensure sustainable profitability of agricultural production, resulting from the extension of sales possibilities to two large independent markets, ie food and energy.

With the help of the theories discussed in the article, the question can be answered about the distance from the factory to places for biomass processing and in what form it should be supplied to obtain the most energy (TJ). This will allow assessing the efficiency of the biomass supply chain to power plants and will enable a favorable selection of biomass suppliers (maximizing energy production with economic efficiency).

Summary

Spatial management as a young scientific discipline does not yet have a general superior theory. That is why she uses many methods, borrowing them from many other scientific disciplines. Spatial management is not part of macroeconomics, as its scope is broader and includes, apart from economic issues, environmental issues as well as demographic, cultural, settlement and technical infrastructure problems. In addition to these fields, a new field appeared, i.e. regional studies, whose initiator and organizer was Isard (Parr, 2014). He created a methodological and theoretical construction for it, which combined economics with geography. Economic geography belongs to the disciplines that pay special attention to the analysis of the location of the phenomena in question, i.e. their spatial aspect.

We can talk about effective and effective spatial management when regulatory systems and intervention of public authorities in spatial management markets take into account specific mechanisms

and laws governing user behavior. The economic rationality and economic effects of spatial policy are the subject of scientific research and analysis as well as practical activities. Location factors have an impact on attracting investors and then on the effectiveness of invested capital. The relations between economic efficiency and the organization of space are indisputable. On the one hand, the interdisciplinary nature of problems of spatial management causes the interest of scientists and practitioners in this subject, and on the other hand results in problems of a classification, methodological and practical nature for this field of knowledge. It also results in the impact of many other areas of regulation and social and economic activities. Spatial management requires further research and the classification and definition of theories at the interface of many sciences, but possible to apply in this science.

Safe-Deposit Services in The Reality of The Banking Crisis of Confidence. The Case of The Polish Market

Rafal PLOKARZ

WSB University in Toruń, Toruń, Poland
rafal.plokarz@wsb.torun.pl

Abstract

The subject of the study is the analysis of safe-deposit services available, the importance of which increases during periods of market turbulence and less confidence in storing money in bank accounts. Excluded from the analysis are storage services of dematerialized financial instruments (cash, deposit, trust and brokerage accounts), escrow and custody accounts for dematerialized securities. The issue was analyzed on the example of the Polish market. The problem is rarely present in studies on banking services. However, the significance of the topic is considerable and still increasing, along with the increasing demand and increasing wealth of the society, as well as the decreasing confidence in banks and fiat money during crisis periods. Banks underestimate the problem, and at the same time an offer of non-banking entities remains insufficient. The aim of the study is to show a widening supply gap in the offer of Polish banks. Paradoxically, this is one of the few examples of services scarcity on the banking services market. Due to the nature of the subject matter and the poverty of professional literature, the author bases the analysis on banking information, media communications and his own expert knowledge as a long-time private banking manager at renowned international banks.

Keywords: Safe-Deposit Services, Banking Crisis, Vaults Operators.

Introduction

Safe and deposit services have been gaining in importance in recent years, especially during financial crises. In the era of digital services and money, increased demand for so-called safe haven assets, also in material form (gold coins or bars, US dollar or Swiss franc banknotes, valuable collector's items, etc.) occur during periods of increased uncertainty or even panic on the financial markets and growing distrust of banks. This took place especially both in autumn 2008 and in early spring 2020 and certainly will repeat from time to time.

Vast quantitative and qualitative easing monetary programs introduced by many central banks and governments make fiat currencies depreciate. National Bank of Poland (NBP) implemented it for the 1st time in history in mid-March 2020, starting to buyback through next 2 months some PLN 90 billion of Treasury or Treasury-guaranteed bonds. In the 1st quarter of 2020 NBP issued a record value of banknotes (30 billion PLN, +13,1%), beating the previous record of the 4th quarter of 2008 (+12,6%). At the same time Poland had record negative official real interest rates among all OECD countries (-4,1% in March 2020 vs. March 2019). It really does not stimulate savings.

Deponents are increasingly asking themselves questions about the security of funds accumulated on bank accounts. Negative real interest rates on deposits last years do not encourage saving term deposits, and the memory of the partial nationalization of some cash deposits in some even European countries (Poland - 1950, Cyprus - 2013) is still alive.

The analysis covers the segment of safe-deposit services in the Polish market in the context of market turbulences. Instruments in place are insufficient while demand arises. Inflexible bank offer is decreasing, while non-bank institutions' offer is still insufficient, but with a hudge growth potential.

In the situation of market imperfection, an important role, both positive and negative, may be played by the legislative and the regulatory bodies.

The aim of the study is to show a widening supply gap in the safe-deposit services offer of Polish banks. Paradoxically, this is one of the few examples of services scarcity on the banking services market. The problem of safe-deposit services, even if well-known and described in the scientific literature on private banking services, is quasi absent in the context of its scarcity. This analysis tries to fill the gap.

The paper consists of 4 sections. In the first one the scope and specificity of treasury and depository service is analyzed. In the second section, the question of security of deposited valuables is presented. Next two sections go deeper into the issue of safe-deposit services availability and analyzes existing constrains in Poland, then going into some alternative solutions in neighbouring countries.

Scope and specificity of treasury and depository services

Growing number of people are looking for a safe place to store valuable movables, including non-financial ones. The main motives for specific search are:

- maintaining 'iron' reserves for a 'rainy day' in assets traditionally considered certain (precious metals and precious stones, collector's valuables);
- protection against loss (destruction, takeover by third parties) of extremely valuable movable property, especially of a personal nature: family souvenirs, important documents, even of not necessarily high objective value; keys.

Safe and deposit boxes are used to store small valuables, paper or electronic documents (on data carriers), valuable souvenirs and personal items. It is forbidden to deposit illegal, dangerous items (e.g. explosives), perishables or animals.

Vaults have many benefits:

- security, through an appropriate physical and electronic security system, including 24-hour supervision;
- discretion and anonymity, by placing the vault in a separate, solidly reinforced and protected room, often underground, reminiscent of a treasury, out of reach of bystanders; however the anonymity is not absolute, because the safe operator knows the customer;
- flexibility, by offering several different sizes of lockers: from small, book size, to larger, cube sizes with sides of about 40-60 cm long, and even the size of a wardrobe; the latter available only abroad (outside Poland), costing up to several thousand euros a year;
- availability, during the bank's working hours or - in some institutions - even 24 hours a day.

There are 3 types of safe-deposit services:

- Safe deposit boxes permanently embedded in a bank safe, with two variants:
  - Vaults opened in the presence of a bank employee and only during the office's business hours; opening / closing a locker requires the use of two keys (or cards) at the same time: one permanently in the customer's possession, and the other - the so-called closing device - at the disposal of the banker, who, however, has no insight into the vault;
  - Self-service safe deposit boxes, available 24 hours a day, 7 days a week, served by the client, without the presence of a banker.
- Safe boxes - unlike the more common boxes, the boxes are not permanently fixed in the bank safe, but are given to the bank for storage; they are usually smaller and cheaper than lockers;

- Bank deposits (in value or in kind) - bank deposits in special boxes or envelopes are subject to, for example, material securities (bonds, shares, savings vouchers), other documents, keys, magnetic storage media.

Modern vaults use multi-level access. In addition to (or instead of) physical keys, electronic keys (codes) and / or magnetic cards are used. The key should be supervised because there is only one copy. Any loss will expose the tenant to the high price associated with the need to obtain a duplicate or forcibly opening the box.

Security of Deposited Valuables

Confidence in bank accounts is limited, especially when the client deposits assets larger than those guaranteed, in accordance with EU directives, by the national deposit guarantee systems that cover deposits of the equivalent of up to 100,000 euro only. During periods of greatest panic on financial markets, in autumn 2008 and spring 2020, there were also cases of withdrawing banknotes from a bank account and depositing them in bank safes, also in Polish banks, to avoid the risk of a possible bankruptcy of the bank or money seizure by the State. A case of deposits ‘haircut’ in Cypriot commercial banks in spring 2013 might be recalled…

Some conceal their property not only from the tax office or creditors, but also from family members. Hiding valuables at home (in a safe or other vault) or buried in a garden (in a "land bank"), although (not necessarily) cheaper, does not guarantee security, due to e.g. the risk of losing location coordinates or (accidental) discovery by unauthorized persons, e.g. a thief.

The bank is responsible for the integrity of the vault, i.e. keeping it whole. The liability of the safe operator is excluded or limited in the event of the deposit being lost as a result of force majeure, e.g. fire, military or terrorist activities. In the event of a burglary into a bank locker and its contents being taken away, the bank should compensate for the resulting losses, provided however that the customer authenticates the loss, i.e. presents bills for the purchase of e.g. lost jewelry and proves that it was in the locker. The very word of the client may not be enough, which can lead to litigation. It is difficult for the bank to refute the testimony of the injured customer, because due to the requirements of discretion, the bank's monitoring cameras do not reach a separate place where the boxes are opened by customers. That was also the meaning of the judgment of the Polish Supreme Court of 27 June 2014.

The deposited valuables, despite the bank's complex physical and electronic security features, are not absolutely secure. Unlike bank cash deposits, the contents of the safe are not covered by guarantees of deposit protection systems in the event of loss or destruction. Instead, they are covered by insurance bought by the bank, but only up to a certain sum insured. The customer may, however, purchase additional insurance to protect the deposited items.

Items deposited in a vault are also not completely safe from being taken by law enforcement authorities. At least two scammers found out about it, extorting PLN 16 million from tens of thousands of users of the Polish online auction site Sknerus.pl. They were arrested in February 2020, and in their flats and deposit boxes the police found EUR 2 million and over PLN 3.5 million, as well as gold bars.

Unlike funds deposited in bank accounts, items stored in safes do not become the property of the bank, seen in its balance sheet. The contents of the safe, as well as securities registered on fiduciary or brokerage accounts, are not included in the bankruptcy estate of a bank or other trustee, unlike cash on accounts. However, a temporary inconvenience in the event of the bankruptcy of the bank operating the boxes may be a temporary lack of access to them, in the event of the bank's branches closing.

Unlike similar solutions in offshore banks, bearer boxes in banks are not allowed, e.g. in Poland. The tenant's anonymity is not absolute. Admittedly, access to the contents of the locker is limited only to

its tenant and any representative, excluding bank employees, and even more so to third parties, but the tenant's identification data is known to the bank. As a consequence, data about the possession of the cache (but not about its content!) can be transferred to authorized entities, e.g. court, police, customs officers or border guards, special services agents, or a prosecutor, as part of criminal proceedings, or - bailiff - in the event of enforcement proceedings. However, 'hunters' must first come to such a vault, and knowledge of its existence may not be easy to obtain if the tenant does not leave information about it.

In Poland, the anonymity of safe users may have decreased after the introduction of the Central Account Database (CBR) Act, which luckily did not finally come into force. The agreement on the provision of a safe deposit box was to be treated as any other bank account (*sic!*).

Identification and contact details of the vault holder and any proxies, in the case of opening / closing / modifying the account, were to be provided by the so-called 'institutions obliged' to the CBR, administrated by the Ministry of Finance. Access to information gathered in the CBR was to have: judicial institutions, police, special and tax services, bailiffs, SEC, etc. Officially, this was to facilitate the fight against crime and money laundering, but also to increase the level of surveillance of all citizens. By oversight (?), Obligated institutions include only banks and other financial institutions, but not non-financial entities, which also offer safe-deposit services. Due to the greater level of discretion, this could open up great opportunities for non-financial vault operators in Poland...

Safe-deposit services offer. A case of the Polish market

Traditional banking safe-deposit services

The storage of items and securities and the provision of safe deposit boxes are included in banking activities, provided they are performed by banks, although they are not restricted to banks, as stated in the Article 5 § 2 point 6) of the Polish Banking Law of August 29th, 1997. As public trust institutions, banks have naturally been devoted to provide these services for many centuries.

Boxes or cassettes are rented for various sub-periods: for several days (from several zlotys a day), for months (from several dozen zlotys) or for a year (approx. 300-500 zlotys annually, depending on the bank). Some banks also charge for a magnetic card or magnetic lock. Agreements are usually concluded for 1 year and usually renewed after each year for the next. If the customer does not empty the box after the contractual period, the bank may open the box and transfer its contents to a deposit less protected than the safe.

The level of fees depends on: the length of the rental, the bank, the size of the box and the demand on the micro market. The fees are not low, but for people depositing valuable things, the costs are still lower than the independent purchase and installation of a home safe, monitoring, insurance, installing gratings on windows, door locks, etc.

In turn, the storage of so-called standard (documents or keys) deposit is carried out in so-called secure envelope or cashier's box. The fee is fixed (on the item, e.g. keys), e.g. several dozen zlotys at once or monthly. For securities and valuables, banks charge a commission (e.g. 1%) on the value as per the bank's fees and commissions table. The cost of storing a small item other than valuables (e.g. duplicate keys) in the deposit is usually lower for the customer than renting a safe box. Non-standard deposits are charged with non-standard fees, sometimes determined by individual negotiations.

At present, safe-deposit boxes or deposit boxes are available in only few larger Polish banks and only in selected branches of these banks. Usually these are large facilities with appropriate housing and technical infrastructure. The conditions are usually met by 'old' branches, existing for several dozen years, located in large, already outdated, but solid and often basement buildings, most often with treasures, mainly in larger cities. New, 'light' facilities, for economic reasons, are usually deprived of such amenities due to housing restrictions.

As a result, banks offer this service only in one or at most few of their flagship branches (Banks: mBank, Alior, ING Bank Śląski, Getin, BGŻ BNP Paribas, Millennium). Only the 3 largest 'old' banks: PKO BP, Pekao SA and BZ WBK each have over 100 branches with safe deposit boxes, i.e. in approx. 10% of their branches, sometimes also in smaller cities. In total, there are approx. 400 bank branches with safes throughout Poland. If in each of these branches there are on average several hundred lockers, and their occupancy reaches about 90%, it means that in Poland 100-200 thousand customers use safe services, i.e. approx. 1% of bank clients.

Safe deposit boxes are also offered by around 10 smaller cooperative banks, but they are rather single branches in smaller towns, physically less well protected than large branches of large banks from large cities. Access to the lockers is usually limited to few hours of branch's working day.

Virtual bank safe and deposit services

As part of electronic banking, few banks offer an electronic (virtual) safe. It is a space available only for the client on the bank's disk on which the client can store his digitized documents. Unlike publicly available virtual disks (e.g. Dropbox), the virtual safe is located in the bank's secure IT environment, ensuring an appropriate level of secrecy and security.

The first electronic safe in Poland was introduced by one of the smallest commercial banks in Poland, Toyota Bank, in March 2007. It was mainly used for archiving correspondence between the client and the bank, statements, etc. However, the client could also use a separate, private disk space to store his private documents, contracts, etc.

As part of the so-called IdeaCloud service for smaller entrepreneurs, virtual safe has been offered by Idea Bank since February 2015. To remove a file from the safe, you must provide a one-time code received by SMS, which also protects against accidental loss of data.

In 2017, a virtual safe was introduced for ING Bank Śląski customers. In addition to the ability to store files in popular formats (doc, pdf, jpg), it is also possible to save e.g. receipts or bills of sale.

Non-bank safe-deposit services in Poland

The gap that arose after the banks left the safes segment is being developed by non-banking companies. There are only few of them on the market, and only for several years.

For example, the ephemeral Skarbiec77 company, operating in 2014-2015, offered a professional, armored deposit vault in Pabianice, central Poland.

Similar services have been offered since the beginning of 2015, mainly to Polish and Ukrainian clients, by the Lublin-based company Twojskarbiec.pl, administering 400 lockers in a tenement house with a converted former treasury facility, bought from Bank Handlowy.

The safe offer of the Śląskie Sejfy company (Silesian Safes Ltd.) operating since 2017, which uses the secure and stylish premises from the pre-war Katowice branch of State-owned Bank Gospodarstwa Krajowego (BGK), is also appreciated among clients.

Discreet and 24-hour deposit boxes have been offered since 2017 by Wrocław Safe 24, which is operated by NPS S.A. company. Deposit boxes are of different sizes and the price of the smallest starts from 55 PLN per month. A large box (400 × 400 × 190 mm) for rent costs PLN 2,670 a year. The facility and assets held therein are protected by insurance provided by the largest Polish insurance company, PZU SA.

At the end of 2020, Skarbiec Warszawa, a branch of the European safe industry giant, the British network of vaults, Merrion Vaults, is supposed to start operating in Warsaw. Due to the pandemic crisis and as its result – a global gold rush – year 2020 seemed to be nearly a perfect timing for the opening, however unplanned. But it proved also to be slightly premature, because initial opening date had to be postponed by half a year, probably due to the crisis lockdown.

Despite the use of professional collateral (and insurance), non-bank safe operators remain ordinary commercial law companies, with relatively small equity, and as such more susceptible for bankruptcy. They are of shadow banking sector, with all kind of risks that it may entail. Banks are supervised by the Polish Financial Supervision Authority (KNF) and as such enjoy greater credibility that is crucial in that kind of business.

In Poland, trade and storage of metals and precious stones are also provided by specialized non-banking mints (in Polish a mint means *mennica*): Mennica Polska, Mennica Wrocławska, Mennica Małopolska, and Mennica Złota. However, gold is not stored there in individual boxes (except for the Gold Mint), but on the shelves of collective warehouses. Investors have also access to the global companies offer, also operating via the Internet. For instance, in the world's largest physical gold, silver and platinum BullionVault website (https://zloto.bullionvault.pl/), one can trade these metals, but also deposit them (gold - for 0.01% of the value per month) in secure vaults, e.g. in Zurich or London.

Warehousing and luggage storage

The storage service as such, even for many months, can be provided by professional companies dealing with the transport and storage of furniture, e.g. for people moving out and temporarily looking for a place to store their belongings. There are rooms of various sizes, usually up to a dozen square meters, as well as mini-boxes, with a cubature of up to several cubic meters.

One can find self-service luggage lockers and lockers that are cheap, or free, at railway stations, in malls, large-format stores or large cultural / sports facilities. Luggage storage facilities are also available at large stations and airports.

Service regulations do not allow long-term storage of items (up to a few days), neither more valuable items. They are poorly protected and barely monitored. The advantage, however, is the wide availability and low or no price.

To some extent, post office may play a role of a safe, but in the short term (up to 2-4 weeks) and rather only for parcels. Additional insurance should be required from the owner to protect any valuables left.

Bank safe-deposit shortage as a manifestation of a market gap

In Poland, the supply is decreasing and the demand for safe-deposit services is growing, especially during periods of high economic and political instability in the world, which is particularly evident in recent years. The vault is also useful in areas threatened by natural disasters, e.g. floods. Like in any other country, demand also increases during the holiday season, when depositors want to secure their valuables for trips.

Most boxes are rented for years and new safes are not being built. These are expensive investments in banking infrastructure, whose profitability is relatively low. The cost of building a large treasury facility can be demonstrated by a failed National Bank of Poland's (NBP) investment, which wanted to rebuild the Polish equivalent of the Fort Knox, near Fort Zegrze, to the north of Warsaw. The main treasury facility of the NBP was supposed to be located there, moved from the cramped and outdated treasury facility at Świętokrzyska Street in Warsaw. The assumed cost of the investment was to

amount to PLN 264 million, but the 2007 tender offers were twice as high (PLN 470 and 568 million). As a result, the NBP abandoned the investment, thus unsuccessfully trying to sell the plot and losing about PLN 30 million on the entire investment.

Commercial banks lockers already rented are rarely released, and the informal waiting queue is usually long. Rental prices are rising and lockers are becoming a rare, even luxury, good. A director of the bank branch (e.g. at Pekao SA) has great freedom in determining the price of such a service. Banks rather prefer investing in mobile banking innovations and would prefer to give up archaic and not very profitable vaults. However, customers will still need them probably for a long time, if not always.

It is more and more common for a bank branch to be liquidated as a result of network restructuring, and then users of safes in this branch, to their dissatisfaction, must empty the safe and move the valuation to another location, found on their own.

Other reasons for banks' lack of interest in creating new safes include: the reluctance of banks for potential reputational risk of storing dangerous or illegal items. Moreover, banks also encourage customers to keep cash on bank accounts which can be transformed into loans, or to keep money in securities (bonds, stock, investment funds units sold with high up-front fees) held in bank's paid custody accounts, rather than in alternative investments (gold, valuables etc.) stored in safes, but purchased usually outside the bank.

Paradoxically, demand does not increase supply. The non-banking offer is small, and even absent in some regions of the country. Luggage lockers do not solve the problem, and foreign solutions are distant and expensive. Starting new vaults is capital intensive and credibility is gained over the years. Activities are not facilitated by the other shadow banking entities scandals last years, and lack of supervision of state institutions (KNF). Although, this lack promotes greater discretion.

Foreign institutions' offer of safe-deposit services

Safes that are hard to reach in Poland can easily be found abroad at the southern and western neighboring countries. Safes facilities are located in the underground, professionally secured, electronically and physically, against burglary, fire, flooding. Temperature and humidity monitoring is provided.

Each box is insured as standard: in Viennese companies, for EUR 35-40,000. Czech safes are insured for about 4 times smaller amounts, but the customer is free to buy additional individual insurance. Some safes are available 24 hours a day, others - during business hours only, e.g. at 10-20.

Vaults may be rented for a week, a month, several months or a year, with the option of extension. In practice, most of them are usually rented for many years. The price is relatively lower for longer tenors, although the annual rental costs from approx. 300-400 to even over EUR 6,000 per box, depending on the company and size of the box.

For example, Vienna has Das Safe company (www.dassafe.com), Palais Coburg company (https://palais-coburg.com/) and Sparta Safe Services company (www.spartasafe.com). At Sparta Safe, renting the smallest safe box costs EUR 70 per month, the largest - up to EUR 1,050.

Safes in Prague are cheaper, where prices, in the case of the smallest safe deposit boxes, start from approx. 400 CZK per month (www.24safe.cz; www.praguesafedeposit.com/).

In Germany, companies of this type usually engage in trading in precious metals, also offering a natural complement to their offer - safes in which one can store bought gold bars and coins. Many Hamburg-based gold brokers are available, e.g.: Hameko (https://hameko.de/schliessfaecher/), Goldkontor Hamburg (https://feingoldhandel.de/schliessfach) or Pro Aurum (https://proaurum.ch).

The range of safes in the United Kingdom is also very rich, with several dozen safes operators, including more than a dozen in London agglomeration, not to mention bank safes.

Safe services are also offered by almost every respectable bank in Western Europe (especially in Switzerland and Luxembourg) which offers private banking services for wealthy individuals.

Comparing with Polish banks, in addition to absolute discretion, operators of foreign safes also offer larger dimensions of lockers. Services are not cheap, which does not bother affluent people, for whom property protection is a priority.

Conclusions

Deposit and safe services in Poland constitute an unused gap, which is widening as banks gradually withdraw from this segment, and a poor offer on the part of non-banking entities. Limited supply does not respond to growing market needs. In a more and more wealthy society, the role of deposit services is growing. The group of collectors and safe haven valuables owners for whom lockers are an essential protective element is expanding. This reduces the security of potential depositors who are forced to invest in home safes and other security measures (monitoring tools…), which, however, does not necessarily eliminate the personal risks associated with burglary.

In addition, in the era of market turbulence, such as the 2008 financial crisis or the 2020 pandemic crisis, the demand for deposit services and the ability of deposit gold, 'hard' currencies, important documents and various valuables are rapidly increasing.
Forthcoming years should bring an increase in the supply of this type of services, although, on the other hand, restrictive legislative initiatives aimed at combating crime can channel the demand and supply rather towards non-banking solutions, including foreign ones. The legislator should consider extending the operation of such national entities to the supervision of the regulatory body. This would increase the level of security of valuables deposited by customers and reduce systemic risks, although it would reduce the level of anonymity.

The paper explores the situation on the Polish market. Further research should be taken under consideration for other markets. Also further and deeper study should be also conducted inside some chosen banks or even within the banking sector as a whole, in order to detect economic and financial constrains that make this kind of services so unattractive for contemporary banks to develop.

Abstract

The paper addresses sustainability concept implementation in the context of investment decisions maked on modern financial markets. The starting point of the research is theoretical analysis of sustainable investment as a scientific category. It creates required methodological prerequisites for the characteristics of the world market for sustainable investment. The research is based on a systems approach. In the framework of this approach, general scientific and special financial research methods are applied including methods of systematization, classification, and descriptive statistics. Major research results contains: a) revealing the content of the sustainable investment concept in relationship with categories of socially responsible investment (SRI), responsible investment (RI) and social or socially directed investment (SI or SDI); b) providing a systematic view on the market segment of the sustainable investment system; c) considering the global profile of sustainable investment decisions on financial markets. The reported study was funded by RFBR according to the research project № 19-010-00526.

Keywords: Sustainable Investment, Responsible Investment, Sustainable Finance, Financial markets.

Introduction

The sustainability concept is a debatable issue and its financial perspective is not the exeption (Lvova et al, 2019a). In the context of investment decisions, its content can be revealed from a position of the theory of public goods, presuming that investment make certain contributions to their formation (Ivanova

2013, p. 32). It is also common to draw parallels between resposible investment behaviour and sustainable financial solutions that in a first approximation allows to divide traditional investment decisions from those of responsible investment. In the first case (traditional investment), the expected profitability, risk, liquidity are the determining guidelines for the investor's decision to invest. In the second case (sustainable investment), sustainability is added to the listed characteristics (Wallis, Klein, 2015, p. 63). Thus, sustainable investment can be considered as investment, decisions about which are made taking into account the sustainability factor. Todate, sustainability in the context of investment decisions on modern financial markets covers three related terms: socially responsible investment, responsible investment and social investment. Misunderstanding of the relationship between these terms leads to an erroneous assessment of market dynamics. Another important gap concerns the characterization of the sustainable investment system, the knowledge of which is to some extent fragmented. To fill these gaps, we turn to theoretical analysis of the sustainable investment concept and the sustainable investment system and then provide the characteristics of the world market for sustainable investment.

The Sustainable Investment Concept

The content of the sustainable investment concept addresses financial decisions in field of socially responsible investment, responsible investment and social investment. Consider the relationship between these related terms in more detail.

In the strict sense, the term 'socially responsible investment' (SRI) is more suitable for such a broad definition, while 'responsible investment' (RI) suggests that the principles of responsible financial behaviour appeal to Economic, Social and Governance Principles (ESG-principles) (UNEP FI 2007, p. 59, 63, 65; UNEP FI and UN Global Compact 2019, p. 4). However, the ESG principles are not clearly defined (UNEP FI and UN Global Compact 2019, p. 4). Therefore, the line between 'responsible' and 'socially responsible' investment is rather blurred. As a result, two opposite trends can be observed in academic and professional practice. The first consists in combining terms related to the concept of responsible investment. For example, the US Forum for Sustainable and Responsible Investment (US SIF) combines sustainable, responsible, impact (also referred to as SRI) into one thematic area of investment decisions. Besides, it notes that these terms are used in some cases as synonyms, along with such as 'ethical investment', 'value-based investment', 'green investment', etc. (US SIF 2019). The second trend is to identify the specifics of the discussed terms content, which allows a more detailed analysis of the structural component of the concept (inter alia, Miroshina, Golubev 2018, p. 250-251).

A significant body of scientific research is devoted to a comparative assessment of the return on traditional and responsible investment at a given level of risk. The results obtained cover all potential alternatives. Some authors argue that the returns are comparable. Others believe that traditional investment is more effective or demonstrate the benefits of responsible investment. A detailed literature review on this subject is given in the work of M. Wallis and C. Klein (2015). An example of a comparative assessment of traditional and responsible investment according to data on Russian companies is presented in the article by N. E. Annenskaya and E. V. Kiselyova (2018). The authors conclude that the asset portfolio, compiled on the principles of responsible investment, has comparative advantages. However, these advantages are realized only when the formation of the portfolio takes into account the basic principles of eliminating undesirable investment assets.

The problem of comparative profitability at a given risk level brings us the question of the relationship between the categories 'responsible investment' and 'social investment'. The second category is also commonly referred to as 'socially directed investment' (SDI). The difference between them lies in the fact that responsible investment is focused on market profitability, while social investment initially assumes a return below market (Wallis, Klein 2015, p. 70). Note that, a complete rejection of profitability does not allow, in principle, to talk about investment. Correspondingly, non-financial motives are more significant for social investment, than financial ones, or, perhaps, the investor expects a delayed and not

completely obvious economic effect. Combining the above, corporate social responsibility (CSR) programs are more appropriate to link with socially directed investment (not responsible or socially responsible). The concepts of SRI, SDI, and RI form the sustainable investment universe and can be represented as the following chart (fig. 1)

Fig. 1. The sustainable investment universe

The market segment of the sustainable investment system

For research purpose, we suggest that main elements of the sustainable investment system are the subjects (investors) and objects (recipients of financial resources) of investment process, as well as financial mechanisms providing redistribution of financial resources. While considering sustainable investment it is difficult to ignore schemes with state participation. It couses the question of a wider representation of the sustainable investment system, in which, of course, there is a room for budgetary financing, legislation, supervision, and regulation (Damianova et all 2018, p. 35). Nevertheless, within the research framework we turn to the sustainable investment in the context of market relations (the sustainable investment market). This prerequisite defines the perception of market volumes and development drivers.

The main subjects of the sustainable investment market include individuals, credit unions, public funds and development banks, venture funds and specialized real estate funds, hospitals and medical educational institutions, religious organizations, etc. (US SIF 2019). Depending on the mechanism and threshold of investment, these entities are usually divided into private and institutional ones. In order to characterize the global market for sustainable investment, it is assumed that private investors (qualified and unqualified) mainly use collective investment mechanisms. This, in particular, allows investing relatively small amounts of money. Qualified institutional investors (pension funds, insurance companies, universities, etc.) – mainly use direct investment mechanisms and, therefore, investment products with wholesale characteristics (GSIA 2018, p. 11).

Institutional investors are actively involved in developing and promotion of sustainable investment standards. In particular, at the initiative and with the support of the UN, institutional investors developed Principles for Responsible Investment – 'PRI' (UNEP FI and UN Global Compact 2019, p. 5,7).

According to the PRI, sustainable investors are obliged to: 1) include the ESG issues in investment analysis and decision making process; 2) be active owners and incorporate ESG issues into ownership policies and practices; 3) seek from the investment objects proper disclosure of information on the ESG issues; 4) promote the adoption and application of PRI in the investment sector; 5) To work together to increase efficiency in the application of PRI; 6) report on their activities and progress in applying the PRI. The PRIs were first introduced on the New York Stock Exchange in 2006. Today, this initiative is supported by more than 2,000 investors accumulating over USD 80 trillion in their assets (UN PRI 2020).

The main objects of the sustainable investment market are represented by companies and projects that meet the criteria for sustainable investment. An approximate list of these major criteria appeals to ESG principles and, accordingly, can be detailed in three components (tab. 1).

Table 1: Major criteria of sustainable investment

Groups of criteria	Corresponding criteria
Environmental (E)	• Climate change • Greenhouse gas emission • Depletion of natural resources (including water) • Waste and environmental pollution
Social (S)	• Working conditions (including the use of slave and child labour) • Relations with local communities (including indigenous peoples) • Health and safety • Employee relations, diversity in the composition of the staff
Governance (G)	• Payments to top managers • Bribery and corruption • Management structure and diversity • Tax strategy

Source: UNEP FI and UN Global Compact 2019, p. 4.

Interaction between subjects and objects of sustainable investment market can be organized using various traditional and innovative financial instruments. Sustainable investment with the participation of financial intermediaries may consist in purchasing a share of a specialized investment fund, in providing a bank loan to a target company, in opening a deposit at a financial institution financing the corresponding companies or projects. Besides, multi-instrumental schemes, which are characteristic for financing large investment projects (project financing), are applied as well as different forms of alternative investment (including without the participation of financial intermediaries). However, main financial flows on the sustainable investment market are mobilized by institutional investors applying financial market instruments. They include investment units, stocks, bonds and other securities that meet the requirements of special investment strategies. These strategies are classified differently. In particular, the GSIA classification includes seven basic types of such strategies – they are marked in gray (see: tab. 2).

Table 2: Key sustainable investment strategies

Strategy groups	Strategy subgroups	Basic types of strategies	Description of basic types of strategies
1 Passive ownership strategies	1.1 Investment portfolio management strategies	1.1.1 Negative screening	Exclusion of specific sectors, companies or practices from the fund or portfolio based on individual ESG criteria
		1.1.2 Positive screening	Investing in sectors, companies or projects, the choice of which is the result of a positive assessment by ESG criteria, compared to peers in its class
		1.1.3 Norms-based screening	Verification of investment for compliance with the minimum requirements of international standards of

			business practice
		1.1.4 ESG integration	A systematic and clearly traceable inclusion of environmental, social and managerial factors in the financial analysis conducted by investment managers
		1.1.5 Sustainability themed investing	Investments in activities or assets that are directly related to sustainability (e.g. clean energy, green technology or sustainable agriculture)
	1.2 Impact investing		Targeted investment aimed at solving social or environmental problems, including investment in community development, in which capital is provided to individuals or groups of people traditionally experiencing financial services deficit, as well as direct financing of companies that implement specific social or environmental goals
2 Active ownership strategies	1.3 Corporate engagement and shareholder action		Using the powers of shareholders to influence corporate behaviour according to the ESG principles, including through direct corporate participation (for example, negotiations with senior management and/or companies boards of directors), preparing and participating in the preparation of shareholders' proposals, voting by proxy

Source: GSIA, 2018, p. 7; Wallis, Klein, 2015, p. 68; authoring.

As it shown in the table 2, the basic types of strategies can be combined into three subgroups depending on the mechanism for implementing responsible investment behaviour. Notably, impact investing (as one of subgroup and simultaneously a basic strategy) is a rather controversial issue for unambiguous characteristics. Some authors consider them to be a hybrid of RI and SDI since they can be applied at different levels of expected profitability, including a below market profitability (Babenko, Bik, Postnova 2018, p. 16). Finally, two first subgroups of strategies are commongly contrasted with the third one in order to evaluate sustainable investment results (both financial and non-financial).

Sustainable investment decisions in Global Market Practice

According to the Global Sustainable Investment Alliance (GSIA), at the beginning of 2018, the total volume of the five largest markets for sustainable investment exceeded USD 30 trillion. The United States, accounting for an average of about 41% of professionally managed assets (for comparison, two years earlier, the values of similar indicators were about USD 23 trillion and 31% of the assets, respectively) (GSIA 2018, p. 3, 9). The leaders in terms of financial assets in the market are the developed countries of Europe and the United States, followed by Japan, Canada, Australia and New Zealand (fig. 2).

Fig. 2: Geographical structure of the world sustainable investment market, % of total financial assets

Source: GSIA 2018, p. 8, 9; authoring

According to the GSIA methodology, the following countries are included in the list of the analysed European countries: Austria, Belgium, Great Britain, Germany, Denmark, Spain, Italy, Netherlands, Norway, Poland, France, Sweden, Switzerland. The share of other countries in the global volume is not so insignificant. Thus, the total volume of financial assets in the market for sustainable investment in African countries (Botswana, Ghana, Zambia, Zimbabwe, Kenya, Mauritius, Namibia, Nigeria, Rwanda, Swaziland, Tanzania, Uganda, South Africa) is estimated at USD 428.3 billion for the same period) (GSIA2018, p. 19). Asian market size excluding Japan (Bangladesh, Vietnam, India, China (excluding Hong Kong and Taiwan), Hong Kong, Taiwan, Indonesia, Malaysia, Pakistan, Singapore, Thailand, Philippines, South Korea) in 2016 amounted to USD 52.1 billion (GSIA, 2016, p. 16, 25) (for a later period, data on the methodology of the commented global report are not presented).

The structure of investors is dominated by institutional ones, but their share in the market for sustainable investment is gradually decreasing. Thus, in 2012 they accumulated 89% of the market, while at the beginning of 2018 their share decreased to 75% (GSIA 2018, p. 12). The main assets in the sustainable investment market are represented by equity (including private equity, venture capital and, predominantly, public equity) as well as fixed income securities. The share of other assets (shares in hedge funds, deposits, commodities, investment in infrastructure and real estate) is less significant (fig. 3).

Fig. 3. Instrumental structure of the world sustainable investment market, % of financial assets

Source: GSIA 2018, p. 12; authoring

Most often, for the purposes of sustainable investment, negative screening is used, which is the leading strategy only in Europe, while ESG integration is mostly typical to the USA, Canada, Australia and New Zealand, and the involvement of shareholders to Japan, (GSIA, 2018, p. 10). However, the profile of applied strategies is changing. It can be expected that it will gradually become more diversified (fig. 4).

Fig. 4: Application of sustainable investment strategies, % of total financial assets

Sources: GSIA, 2018, p. 10; GSIA, 2016, p. 8; authoring

A generalization of studies on the direct impact of sustainable investment on business practice allows us to conclude that a significant expected effect is achieved by the strategy of involving shareholders, while the results of implementing strategies aimed at redistributing capital are uncertain and depend on specific conditions (see more details: Kölbel et all 2019). Regarding the indirect effects of sustainable investment (effects of condemnation, support, best practices, demonstrative) (Kölbel et all 2019, p. 12-14) its results are even more unobvious. Do these findings affect the popularity of the strategies? As a matter of interest, international practice says the opposite. In general, the market for sustainable investment is at a stage of active growth, which creates new challenges and opportunities for the common financial market of the EAEU.

It should be noted that the instrumental structure of the sustainable investment market, as a rule, does not include a credit component. However, the share of sustainable lending in comparison with the total market size is not so significant. The global volume of loans related to ecology and sustainable development (the interest rate on such loans is tied to the borrower's ESG indicators) reached almost USD 100 billion in 2018. (Fig. 5).

Fig. 5: The total volume of loans issued related to the ESG indicators of the borrower, USD bln

Source: Linklaters LLP, p. 11; authoring

The activity of sustainable lending is clearly growing, and the growth rate is increasing from year to year. This may be of interest in developing a strategy for sustainable segments of emerging financial markets, since the financial systems of these countries are primaraly debt-oriented and generally bank-based. For instance, it is the case for the Russian financial market and the future common financial market of the Eurasian Economic Union (Lvova et al, 2019b).

Conclusion

Sustainability deserves close attention in the context of investment decisions and financial markets' development. The concept of sustainable investment continues to transform, reflecting the trends on financial markets, where more and more impressive volumes of assets are managed by the ESG

principles. The research allow revealing the content of the sustainable investment concept, providing a systematic view on the market segment of the sustainable investment system, considering the global profile of sustainable investment decisions on financial markets. There is clear evidence that the studies of the theory and international practice of sustainable investment are relevant, especially in countries where the corresponding market segment is just being formed (as in the Eurasian Economic Union). This determines the prospective directions of further research.

Analysis of Contagion in Financial Markets Using Conditional Correlation Coefficient and Conditional Copula Functions – Polish Stock Market Versus Other Markets

Daniel PAPLA

Wroclaw University of Economics and Business, Wroclaw, Poland
E-mail: daniel.papla@ue.wroc.pl

Abstract

Our definition of contagion in financial markets is a significant increase in cross-market linkages after a shock to one or group of countries. Contagion occurs if cross-market co-movement increases significantly after the shock. In this article, the author attempt to answer the question whether the selected world stock exchanges and economies are infecting each other within the meaning of the definition provided. Conditional copula functions and conditional Spearman's correlation coefficient will be used as a tool. Main goal of this paper analysis of changes in dependence between Polish stock market (WIG20) and chosen groups of world stock markets using conditional copula function and conditional correlation coefficient and dynamic correlation coefficient.

Keywords: contagion in financial markets, conditional measure of concordance, conditional copula function

JEL: C43, C58, G100

Introduction

Financial crises are an important phenomenon for the economy because in time of the crisis the cost of intermediation and the cost of credit increases, access to credit is also more difficult. This results in a reduction in activity of the real sector which may lead to the crisis in this sector.

The quite high incidence of financial crises may lead to the conclusion that the financial sector is particularly sensitive to various types of disturbances. In particular, the crisis of recent years has shown how the global economy is sensitive to disturbances in the era of globalization (BIS, 2009; Brunnermeier, 2009; Coffee, 2009; Guillen, 2009; Kolb 2010; Shiller, 2008). For the purposes of examination of determinants of the spread of the financial crisis, one of the methods to analyze the linkages between global capital markets was used in this paper. They should give an answer to the question whether the crisis is a significant increase in the relationship between markets, which in part explains this rapid spread of the crisis.

In literature on contagion most of authors analyses relationship between stock market indices (e.g. see Baig and Goldfajn, 1999; Forbes and Rigobon, 2002; Bae *et al.*, 2003; Baur and Schulze, 2005; Bekaert *et al.*, 2005; Boyer *et al.*, 2006; Chandar *et al.*, 2009; Horta *et al.*, 2010; Markwat *et al.*, 2009 and Dungey *et al.*, 2010 among others). Baur (2012) analyses connection between stock and real markets but he used data only from financial markets, divided on sectors. In our paper we analyse dependence between financial market.

A tendency to increase the relationship between financial markets during the crisis, compared with dependency beyond the crisis was one of the phenomena associated with financial crises that have occurred over the past several years. As already mentioned, this property is called financial contagion and because of its fairly serious effects it drew the attention of many theorists and practitioners dealing with finance. Several methods to check the contagion were proposed. Most of these methods focus on

finding changes in a multi-dimensional distribution of the return rates in times of crisis and beyond these periods. The basics of this approach and further literature on the subject are presented in papers (Forbes and Rigobon, 2002; Bae, *et al.* 2003; Pericoli and Sbracia, 2003; Dungey et al., 2005; Rodriguez 2007).

Another approach was introduced a few years ago in papers of (Bradley and Taqqu, 2004; 2005a; 2005b]. The authors have assumed that market contagion from market X to market Y occurs when the dependence between the market X and Y is greater when the market X is in period of above-average declines than when the market situation X is normal. In other words the dependence is greater when the market X returns are in the left tail of the distribution than in its central part. Since this definition does not focus on the period in which there is a crisis, but the manner in which "place" of distribution we are, contagion defined in this manner is called spatial contagion.

Most often, it is assumed that the contagion in financial markets occurs when in the crisis period correlation between price movements in various financial markets is much greater. In this article, the authors attempt to answer the question whether the selected world stock exchanges and economies are infecting each other within the meaning of the definition provided. Conditional copula functions and conditional Spearman's correlation coefficient will be used as a tool.

Main goal of this paper is to analyze changes in dependence between Polish stock market (WIG20) and chosen groups of world stock markets. The problem of the rising dependence between the markets in the periods of financial turmoil is already very well-known, proved in many empirical studies and with the application of several econometric methods (multivariate GARCH models, Dynamic Conditional Correlation models (DCC), copula-based models (see Marçal, *et al.*, 2008; Naoui, *et al,*. 2010; Lim 2013)).

The methodology of Empirical Research

The definition of the copula function is as follows: *2*-dimensional function C: $[0, 1]^2 \rightarrow [0, 1]$ is referred to as the copula function if it meets the following conditions (Joe, 1997; Nelsen, 2006):

a) $C(u, v)$ is an increasing function regarding u and v,
b) $C(u, 0) = 0$, $C(0, v) = 0$,
c) $C(u, 1) = u$, $C(1, v) = v$.

The importance of the copula function in the multivariate analysis stems from Sklar's theorem (Sklar, 1959; Schweizer and Sklar, 1974):

Let H be the two-dimensional cumulative distribution function whose marginal distributions are respectively denoted by F and G. Then there is a relationship C where

$$H(u, v) = C(F(u), F(v)). \tag{1}$$

If the F and G are continuous, then C is uniquely determined. In addition, if F and G constitute cumulative distribution functions, the function H defined by the above equation is the two-dimensional cumulative distribution.

In other words, this function gives the full dependence structure between the marginal cumulative distributions, creating along with these distributions a multidimensional one, of course subject to the assumptions set forth above.

Let $C_{(U,V)|S}(u,v)$ be a two-dimensional conditional copula function, conditioned on a subset S of the set $[0, 1] \times [0, 1]$ where U and V are cumulative distributions of returns of two stock market indexes: $U = F(X)$, $V = G(Y)$. X is distributions of returns of first stock market index, Y – of the second market. In the remaining part of the paper X and Y will also mean the first and the second market.

To explore the concept of contagion, we can consider the following subsets S (Durante and Jaworski, 2010):

$$
\begin{aligned}
S_L &= [0, \alpha] \times [0, 1] \\
S_R &= [1-\alpha, 1] \times [0, 1] \\
S_D &= [0, 1] \times [0, \alpha] \\
S_U &= [0, 1] \times [1-\alpha, 1] \\
S_{LD} &= [0, \alpha] \times [0, \alpha] \\
S_{RU} &= [1-\alpha, 1] \times [1-\alpha, 1] \\
S_V &= [\beta, 1-\beta] \times [0, 1] \\
S_H &= [0, 1] \times [\beta, 1-\beta] \\
S_M &= [\beta, 1-\beta] \times [\beta, 1-\beta].
\end{aligned}
\tag{2}
$$

Sets S_L, S_R, S_D, S_U, S_{LD} and S_{RU} are called tail sets, and S_V, S_H, S_M are called central sets. Conditional copula functions are defined as conditional on the domain, which in this case is one of the above sets, and are labelled for example C_{S_L}.

Comparing in a certain way the conditional copula function based on one of the tail sets with a function based on one of the central sets, you can examine whether the phenomenon of contagion between the two analysed variables exists, in this case between the chosen indices rates of return.

In this paper, for the purposes of comparing the two copula functions so-called positive quadrant dependence PQD is used (Durante and Jaworski, 2010). We define $C_1 \ll_{PQD} C_2$ if for all pairs $(u, v) \in [0, 1]$ $C_1(u, v) \leq C_2(u, v)$, in other words C_2 is greater than C_1 with regard to PQD, if for each pair (u, v) C_2 has higher values than C_1. This means that the dependence between u and v is stronger in the case of the function C_2 than C_1. Using this fact, the construction of sets S and the notion of contagion, you can define such cases:

Market X is contagious to Y, if $C_{S_V} \ll_{PQD} C_{S_L}$.
Market Y is contagious to X, if $C_{S_H} \ll_{PQD} C_{S_D}$.

In case $C_{S_M} \ll_{PQD} C_{S_{L,D}}$, we have symmetrical contagion.

Contagion is defined here as an increase in dependence on the lower left tail of the cumulative distribution, compared with the central region of the distribution. This definition does not need to determine directly when we are dealing with a period of crisis, and when with a normal period, but indirectly it is assumed that the crisis occurs when the marginal cumulative distribution function of return rates is lower than the present level α on one or both markets.

There are at least two ways to analyse empirically the relationship between the given conditional copula functions. The first is an attempt to fit a copula function to the data and estimate its parameters. On this basis, you can try to determine the conditional copula functions, and thus determine whether the contagion conditions are met. This approach, however, involves two major problems. Firstly, the fitting of the copula function to the real data usually results in estimation errors which may be multiplied in the process of fitting the conditional copula function. Secondly, determination of the conditional functions can be difficult, especially if you fail to get an explicit formula of this function (Durante and Jaworski, 2010).

Therefore, in this study other non-parametric approach was used following the work of Durante and Jaworski. They proof that it is possible to estimate of the correlation coefficients without using any knowledge about the type of the copula function (Durante and Jaworski, 2010). As we have seen, all the definitions of contagion are based on the comparisons among copulas in the PQD ordering. This ordering is also known to be a concordance ordering in the sense that if $C \ll_{PQD} D$, then $\kappa(C) \leq \kappa(D)$,where κ is any measure of concordance, such as Kendall's τ or Spearman's ρ (Nelsen, 2006; Scarsini, 1984).

Using this fact, one can examine the occurrence of contagion, checking the occurrence of the following relationships:

Market X is contagious to Y, if $\kappa(C_{S_V}) \leq \kappa(C_{S_{I.}})$.
Market Y is contagious to X, if $\kappa(C_{S_H}) \leq \kappa(C_{S_D})$.

In case $\kappa(C_{S_M}) \leq \kappa(C_{S_{LD}})$, we have symmetrical contagion.

A measure based on Spearman's rank correlation coefficient ρ is used in the remaining part of the paper. Because this ratio is calculated for the conditional copula function, it is referred to as the conditional correlation coefficient (Dobric, Frahm, Schmid, 2007).

$$\rho_S = \frac{12}{n_S} \sum_{i \in I_S} \frac{r_S(u_i)}{n_S} \frac{r_S(v_i)}{n_S} - 3, \tag{3}$$

where: ρ_S – conditional Spearman's rank correlation coefficient,
n_S – number of observations in set S,
I_S – index of observation belonging to set S,
r_S – rank of observation in set S.

To assess the statistical significance of the results, a bootstrap method was used (Schmid and Schmidt, 2006; 2007).

There were five steps in calculations of conditional Speraman's ρ:
1. Choose pair of measures/indexes
2. Specify subsets S for $\alpha = 0.05$ and $\beta = 0.1$, for a given lag
3. Compute ρ_S for the subsets S
4. Compute confidence intervals of ρ_S (Schmid and Schmidt, 2006; 2007) with confidence level 0.05, 10 000 iterations.

Data Description

To validate financial contagion hypothesis we used logarithmic weekly returns from 19 chosen world market indexes, and split them into 6 groups. One of the main criterion of choosing these particular markets was availability of data for the longest possible period January 1998 – April 2020, encompassing several normal and crisis times:

1. Leading European markets: Germany, France, United Kingdom.
2. Smaller European Markets: Greece, Spain, Italy.
3. Emerging European Markets: Poland, Hungary, Czech Republic.
4. North America: USA, Canada, Mexico.
5. South America: Brazil, Argentina.
6. Asia: Japan, China, India, Hong Kong, Singapore.

Table 1 reports summary statistics of stock market indices' weekly returns for all 19 countries. The statistics are based on the entire sample period and show significant differences in mean and variance. From results of Augmented Dickey-Fuller test (ADF) (Dickey and Fuller, 1979) we see that all-time series are stationary.

Empirical Results

In this section we present results of estimating contagion from and to Polish stock market. First part of results are presented in table 2 where in row S_H ρ_S values are provided for set S_H, columns S_{Hd} and S_{Hu} contain respectively lower and upper boundaries for confidence intervals of ρ_S for set S_H. In column S_D ρ_S values are provided for set S_D, Columns S_{Dd} and S_{Du} have analogical meaning. If $S_{Dd} - S_{Hu}$ is greater than zero, the dependence between markets in times of distress in the second market is significantly (significance level is 5%) greater than dependence in normal times, which can be acknowledged as a proof of contagion from second market to Polish market. These situations are marked in bold.

Source: Own analysis.

As we can see, in most cases there is symmetric reaction to distress in Polish and second market, contagion works in both ways. This can be said in case of markets in Greece, Spain, Hungary, Czech, Argentina, China, India and Singapore. Only in case of Japan there is only contagion from market in Japan to market in Poland.

Those results were tested for robustness using bootstrap methodology not reported for brevity, which positive return.

Conclusions

We have positively verified hypothesis of existing of financial contagion using conditional correlation coefficient methodology. But very interesting is fact, that this methodology failed to uncover for example contagion from US market to Polish market, instead there is present contagion from smaller markets. This phenomenon of this methodology deserves more research, including tests with other methods, like dynamic correlation or copula functions with dynamic coefficient. This will be future pursuits of author.

Acknowledgment

Abstract

In 2015, the 40th anniversary of the cohesion policy was established by the European Union. During this period, this policy has evolved along with the changing priorities of the European Union. The main goal, however, remained unchanged–reducing disparities in the development of regions. Changes in cohesion policy have been reflected in research conducted by various groups of scientists. One of the most important problems in the literature is to determine the impact of funds on socio-economic development. The paper, using the Theory of Grey Systems, examined the impact of funds under regional operational programs on selected variables characterizing socio-economic development. The study covered all provinces in Poland in 2007-2013, is during the financial perspective under which the European Union allocated a total of 308 million euros for cohesion policy, of which Poland received 20%. The results of the analyses carried out in the paper are of practical nature and can be used to shape the distribution of funds from the European Union.

Keywords: Regional Development, Regional Operational Programs, Grey Systems Theory, Grey Incidence Analysis

Introduction

Structural funds are divided into two groups: the European Social Fund created in 1958 and the European Regional Development Fund founded in 1975. The ERDF is currently the most important instrument of the European Union (EU) regional policy and at the same time the most focused on supporting regional development. However, empirical research indicates that the effects of the ERDF go beyond its main goal of strengthening economic and social cohesion in the EU (Tosun, 2014, p. 371). Additionally, in literature on the subject, various positions related to the impact of structural funds on the economic development of regions can be found. For example, Dall'erba and Le Gallo (2008) stated that financial transfers from the EU do not affect regional growth and development. Puigcerver-Penalver (2007), Ramajo and MárqEUz (2008), Becker, Egger, and von Ehrlich (2010) concluded that structural funds helped regions develop faster. Torres, de Freitas, and Pereira (2003) stated that the impact of financial transfers from the EU did not affect the economic growth of regions (Pinho, Varum and Antunes, 2015, p. 3).

The objective of the study is to examine the relationship between funds under regional operational programs with socio-economic development of provinces (regions at NUTS-2 level) in Poland between 2007–2013. In order to characterize the socio-economic development of regions (provinces), various indicators can be adopted that can be associated with regional policy.

To achieve the assumed objective, the Grey Incidence Analysis, derived from the Grey Systems Theory, was used. The use of the indicated method resulted above all from its wide range of applicability, especially in the case of short time series analysis. For a small-scale data set, the use of classical statistical and econometric methods is essentially unjustified. The study is divided into four main parts - the first part describes the concept of socio-economic development and presents the results of selected studies on the impact of structural funds on regional growth and development. The second part covers the characteristics of the Grey Systems Theory; the third part presents the research method used, while the fourth part presents the results of empirical research.

Essence of Socio-Economic Development

Socio-economic development is a concept that appeared in literature relatively recently. For a long time, only concepts of economic development and economic growth were used in economics. However, over time, new categories that characterize the degree of prosperity began to be recognized and used. Socio-economic development includes not only issues related to industrialization, income growth, employment growth, but also other determinants such as educational and health services (Louzano, Abrantes, Ferreira, & Zuccolotto, 2019, p. 612).

Economic development is a broader concept than economic growth, as it includes not only quantitative, e.g. related to production, but also qualitative changes (Jones, 2016). The concept that covers both economic growth and development is the aforementioned socio-economic development. Parysek (2018, p. 39) indicates that socio-economic development is "the entirety of changes or transformations that both society and the economy undergo. It is a complex and lengthy process". Additionally, as emphasized by Parysek (2018), one of the most important distinguishing features of socio-economic development is complexity, which should be understood as changes in specific properties of given components of the socio-economic system, i.e. its distinguished elements that affect the formation of appropriate structures. Examples of socio-economic development measures are presented in Figure 1.

Fig. 1: Selected measures of socio-economic development

Source: (Parysek, 2018).

There is an intense discussion in literature on the subject about theories explaining socio-economic development of regions. Jańczuk (2013, p. 123) lists polarization theories, neoclassical growth model and demand-side theories.

Analysing research on the impact of EU funds on socio-economic development, one can see that there is no clear position on the issue of its direction (positive, negative, or neutral) (Table 1).

Table 1: Summary of studies on the impact of structural funds on regional growth and development

Author/authors	Results	Period	Sample
(Llussa & Lopes, 2012)	Structural policy tends to increase convergence within Member States, contributing to regional convergence	1989	194 regions at the NUTS-2 level (EU-14)
(Rodríguez-Pose & Novak, 2013)	Improving return on investment with structural funds. Returns are higher in richer and more developed regions of the country	1994-1999 and 2000-2006	133 regions at the NUTS-1 and NUTS-2 level (EU-15)
(Fiaschi, Lavezzi, & Parenti, 2011)	The impact of structural funds on efficiency gains is positive, but the most important role is played by the funds under Objective 1.	1980-2002	173 regions at the NUTS-2 level (EU-12)
(Mohl & Hagen, 2010)	Only payments under Objective 1 affected regional growth	1995-2005	126 regions at the NUTS-1 and NUTS-2 level
(Becker, Egger, & von Ehrlich, 2010)	Increasing payments under Objective 1 per capita did not have a positive impact on employment growth	1989-1993,1994-1999 and 2000-2006	3301 regions at the NUTS-3 level (EU-12/25)
(Dall'erba & Le Gallo, 2008)	Convergence occurs, but the structural funds have no impact on this	1989-1999	145 regions at the NUTS-2 level
(Esposti & Bussoletti, 2008)	The impact of policies within Objective 1 on regional growth is limited	1989-1999	206 regions at the NUTS-2 level (EU-15)
(Puigcerver-Peñalver, 2007)	Structural funds have a positive impact on regional growth and development in regions covered by Objective 1 of Cohesion Policy	1989-1999 and 1989-1993	41 regions at the NUTS-2 level (EU-10)
(RodrígEUz-Pose & Fratesi, 2004)	Limited impact of structural funds; only investment in education and capital is profitable	1989-1999	152 regions at the NUTS-2 level (EU-8)
(Cappelen, Castellacci, Fagerberg, & Verspagen, 2003)	EU regional support has a significant and positive impact on the performance of European regions. Structural funds have been more effective since the 1989 reform. Stronger influence of funds can be observed in more developed regions	1980-1997, 1980-1988 and 1898-1997	105 regions at the NUTS 1 and NUTS-2level (EU-9)

Essence of Grey Systems Theory

The beginnings of the Grey Systems Theory date back to the 1980s. In 1989, J. Deng published the first study of the Grey Systems Theory in English, entitled "Introduction to Grey Systems Theory". The subject of the Grey Systems Theory is modelling information uncertainty (Liu, Forrest 2007). The Grey Systems Theory is particularly applicable when uncertainty manifests itself through a small information base, incompleteness of data and the use of qualitative data with a low level of precision (Więcek-Janka et al. 2019). Whether a given method belongs to the Grey Systems Theory determines the use of one of the grey operators - grey numbers or the function of weight whitening or distributive understanding of grey systems (Mierzwiak, et al. 2018).

Within the Grey Systems Theory, a number of methods can be distinguished that can be assigned to one of three main groups (Liu et al. 2017):

- GIA models (*grey incidence analysis*) – group of models enabling the analysis of relationships between data sets (in particular time series),
- GP models (*grey prediction model*) - group of forecasting models based on differential equations, the main advantage of which is the possibility of forecasting from very short time windows,
- GDM (*grey decision making*) - group of decision models based on one of three grey constructs, i.e. grey numbers, weight whitening functions and distributive understanding of greyness.

In recent years, the Grey Systems Theory has found a number of applications - in relation to economic, social, technical, and natural systems. Grey models have been used, among others in:

- diagnosis of industry development (Su et al. 2017),
- defining policies regarding numerous aspects of sustainable development (Bouzon et al. 2018), (Wu et al. 2018),
- assessing the satisfaction of customers of public services (Javed et al. 2019),
- occupational risk assessment (Nowak et al. 2020), (Tabor, Cioca 2019),
- health care management (Song et al. 2018),
- comparing results of the banking sector (Yüksel et al. 2017),
- managing labour migration (Liu et al. 2017).

Research Methodology

The objective of the study is to examine the relationship between funds under regional operational programs with socio-economic development of provinces (regions at NUTS-2 level) in Poland between 2007–2013. The diversification of the development of regions on the economic and social level is a common phenomenon and an area of interest for representatives of various fields of science, as well as institutions, including the European Commission or Statistics Poland. Various indicators can be used to characterize socio-economic development of regions, however, to link them to regional policy, the following set of variables proposed by Skrzypa was adopted (2009, p. 13):

- gross domestic product (GDP) *per capita* (in PLN),
- investment outlays *per capita* (in PLN),
- internal expenditure on research and development *per capita* (in PLN),
- gross value added per employee (in PLN).

To achieve the objective of the study, the Grey Incidence Analysis was used. By using the indicated method, it is possible to examine the relationships between variable sets (and also special cases of sets, which are time series). The main advantage of the GIA over statistical and econometric methods is the possibility to conduct research of small-scale time series. In addition, in the GIA method both quantitative and qualitative variables can be used. The indicated premises make the GIA a reliable tool for examining the relationship between the amount of funds under regional operational programs and socio-economic development of provinces in Poland.

The essence of the Grey Incidence Analysis model is to determine the geometric similarity between two vectors defining time series. The higher the similarity, the higher the relative degree of grey incidence indicator (in Grey Incidence Analysis, it is also possible to use other indicators than the relative degree of grey incidence). The similarity of vectors can be a premise for a cause-and-effect relationship, although it does not have to be so. The determined relative degree of greyness indicator is an analogy to the correlation indicators used in statistics reflecting similarity in the behaviour of two time series. The advantage of the relative degree of greyness indicator is, however, the possibility of analysing the similarity of two short time series. The model for determining Grey Incidence Analysis using the relative degree of grey incidence indicator between two time series can be presented as a 4-step procedure.

Step 1. Determination of the set of vectors (time series) subject to Grey Incidence Analysis

In the proposed model, the analysis is carried out for *m* decision-making entities. For each of the decision-making entities a reference vector (time series) is defined. The reference time series has the following form:

$$X_k^{\text{ref}} = [x_{k1}^{\text{ref}}, x_{k2}^{\text{ref}}, \dots, x_{kj}^{\text{ref}}, \dots, x_{kl}^{\text{ref}}] \tag{1}$$

X_k^{ref}– reference vector for the *k*-th decision-making entity, where $k = 1,2,..,m$
j – j-th value in the reference vector for the *k*-th decision-making entity, $j = 1,2,\dots,l$
The set of remaining vectors for a given decision-making entity is as follows:

$$X_k^{\text{i}} = [x_{k1}^{\text{i}}, x_{k2}^{\text{i}}, \dots, x_{kj}^{\text{i}}, \dots, x_{kl}^{\text{i}}] \tag{2}$$

X_k^i– i-th empirical vector for the *k*-th decision-making entity, where $i = 1,2,..,n$
j – j-th value in a time series for the *k*-th decision-making entity, $j = 1,2,\dots,l$

Step 2. Normalization of time series

Normalization of time series takes place in two stages. The first is to divide all elements of the series by the initial value according to formulas (3) and (4).

$$Y_k^{\text{ref}} = \left[\frac{x_{k1}^{\text{ref}}}{x_{k1}^{\text{ref}}}, \frac{x_{k2}^{\text{ref}}}{x_{k1}^{\text{ref}}}, \dots, \frac{x_{kj}^{\text{ref}}}{x_{k1}^{\text{ref}}}, \dots, \frac{x_{kl}^{\text{ref}}}{x_{k1}^{\text{ref}}}\right] = \left[y_{k1}^{\text{ref}}, y_{k2}^{\text{ref}}, \dots, y_{kj}^{\text{ref}}, \dots, y_{kl}^{\text{ref}}\right] \tag{3}$$

$$Y_k^{\text{i}} = \left[\frac{x_{k1}^{\text{i}}}{x_{k1}^{\text{i}}}, \frac{x_{k2}^{\text{i}}}{x_{k1}^{\text{i}}}, \dots, \frac{x_{kj}^{\text{i}}}{x_{k1}^{\text{i}}}, \dots, \frac{x_{kl}^{\text{i}}}{x_{k1}^{\text{i}}}\right] = \left[y_{k1}^{\text{i}}, y_{k2}^{\text{i}}, \dots, y_{kj}^{\text{i}}, \dots, y_{kl}^{\text{i}}\right] \tag{4}$$

The second is to reset the initial elements of the series according to formulas (5) and (6).

$$\begin{aligned} Y'^{\text{ref}}_k &= \left[y_{k1}^{\text{ref}} - y_{k1}^{\text{ref}}, y_{k2}^{\text{ref}} - y_{k1}^{\text{ref}}, \dots, y_{kj}^{\text{ref}} - y_{k1}^{\text{ref}}, \dots, y_{kl}^{\text{ref}} - y_{k1}^{\text{ref}}\right] \\ &= \left[y'^{\text{ref}}_{k1}, y'^{\text{ref}}_{k2}, \dots, y'^{\text{ref}}_{kj}, \dots, y'^{\text{ref}}_{kl}\right] \end{aligned} \tag{5}$$

$$\begin{aligned} Y'^{\text{i}}_k &= \left[y_{k1}^{\text{i}} - y_{k1}^{\text{i}}, y_{k2}^{\text{i}} - y_{k1}^{\text{i}}, \dots, y_{kj}^{\text{i}} - y_{k1}^{\text{i}}, \dots, y_{kl}^{\text{i}} - y_{k1}^{\text{i}}\right] \\ &= \left[y'^{\text{i}}_{k1}, y'^{\text{i}}_{k2}, \dots, y'^{\text{i}}_{kj}, \dots, y'^{\text{i}}_{kl}\right] \end{aligned} \tag{6}$$

Step 3. Determination of parameters for $|s'_{\text{ref}}|$, $|s'_i|$, $|s'_{\text{ref}} - s'_i|$ model

Model parameters, i.e. $|s'_{\text{ref}}|$, $|s'_i|$, $|s'_{\text{ref}} - s'_i|$ are determined in accordance with formulas (7)-(9).

$$|s'_{\text{ref}}| = \left|\sum_{j=2}^{l-1} y'^{\text{ref}}_{kj} + 0.5 \cdot y'^{\text{ref}}_{kl}\right| \tag{7}$$

$$|s'_{\text{i}}| = \left|\sum_{j=2}^{l-1} y'^{\text{i}}_{kj} + 0.5 \cdot y'^{\text{i}}_{kl}\right| \tag{8}$$

$$|s'_{\text{ref}} - s'_i| = \left|\sum_{j=2}^{l-1} \left(y'^{\text{i}}_{kj} - y'^{\text{ref}}_{kj}\right) + 0.5 \cdot \left(y'^{\text{i}}_{kl} - y'^{\text{ref}}_{kl}\right)\right| \tag{9}$$

Step 4. Calculation of the relative degree of grey incidence $r_{\text{ref}-i}$

The relative degree of grey incidence $r_{\text{ref}-i}$ is determined using formula (10).

$$r_{\mathrm{ref}-i} = \frac{1 + |s'_{\mathrm{ref}}| + |s'_{\mathrm{i}}|}{1 + |s'_{\mathrm{ref}}| + |s'_{\mathrm{i}}| + |s'_{\mathrm{ref}} - s'_{i}|} \tag{10}$$

The scope of values that can be assumed by the relative degree of grey incidence is in the (0-1) range. The lower the value of $r_{\mathrm{ref}-i}$ the lower the geometric similarity of two time series. The higher the value of $r_{\mathrm{ref}-i}$ the higher the geometric similarity of two time series.

Results of Empirical Research and Discussion of Results

The purpose of empirical research was to determine the relationship between the amount of funds under regional operational programs per capita in Poland in 2007-2013 for Polish provinces and selected parameters of socio-economic development, i.e.:

- Gross domestic product per capita between 2007-2013 in a given province,
- Investment outlays per capita between 2007-2013 in a given province,
- Internal expenditure on research and development per capita between 2007-2013 in a given province,
- Gross value added per employee (in PLN) between 2007-2013 in a given province.

The research was carried out in accordance with the procedure presented earlier.

Step 1. Determination of the set of vectors (time series) subject to Grey Incidence Analysis

In empirical research, the developed model was used for 16 decision-making entities - Polish provinces. The reference vector for each province was a time series determining the amount of funds under regional operational programs per capita between 2007-2013 that a given province obtained (X^{ref}). Table 2 presents set of reference vectors for Polish provinces.

Table 2: The amount of funds under regional operational programs *per capita* between 2007–2013 – regional perspective

Province	2007	2008	2009	2010	2011	2012	2013

Tables 3-6 present the remaining sets of empirical vectors for Polish provinces, specifying the following variables:

- Gross domestic product per capita between 2007-2013 in a given province (X^1),
- Investment outlays per capita between 2007-2013 in a given province (X^2),
- Internal expenditure on research and development per capita between 2007-2013 in a given province (X^3),
- Gross value added per employee (in PLN) between 2007-2013 in a given province (X^4).

Source: the authors' own elaboration based on https://bdl.stat.gov.pl/BDL/dane/teryt/jednostka.

Gross domestic product *per capita* was at the highest level in the Masovia province (at the end of 2013 GDP *per capita* amounted to PLN 69,028) also in terms of the average annual growth rate, the situation in this province was the best. The lowest values were observed in the Lublin province (at the end of 2013, GDP *per capita* amounted to PLN 30,449), while in terms of the average percentage increase the lowest results were observed for the Holy Cross province - an increase of 4.03% year-on-year.

Table 4: Investment outlays *per capita* between 2007–2013 – regional perspective

Province	2007	2008	2009	2010	2011	2012	2013

Source: the authors' own elaboration based on https://cohesiondata.ec.europa.eu/.

The analysis of the amount of investment outlays *per capita*, similarly as in the case of GDP *per capita*, indicates that the highest values occurred in the Masovia province (at the end of 2013, the GDP *per capita* amounted to PLN 8,908). Taking into account the pace of changes, investment outlays *per capita* occurred fastest in the Subcarpathia province, where the increase occurred on average by 9.0% year on year. The slowest average annual rate of change occurred in the Pomerania province - 1.16% year on year.

Table 5: Internal expenditure on research and development *per capita* (in thousands PLN) between 2007–2013 – regional perspective

Source: the authors' own elaboration based on https://cohesiondata.ec.europa.eu/.

Considering internal expenditure on research and development *per capita*, it can be generally noted that the pace of change was the fastest in the least developed provinces (Subcarpathia, Holy Cross, Podlaskie, Lubusz). In economically underdeveloped provinces, the slowest increase in R&D expenditure was also noted. As in the case of previous indicators, the highest values in absolute terms occurred in the Masovia province (at the end of 2013 over PLN 5.6 billion).

Table 6: Gross value added per employee (in PLN) between 2007–2013 – regional perspective

Source: the authors' own elaboration based on https://cohesiondata.ec.europa.eu/.

In terms of value added *per capita*, the fastest growth rate was recorded in the Łódź, Lublin and Masovia provinces (over 6.2%), while the slowest in the Opole, Holy Cross and Lubusz provinces (below 5.21%).

In each of the next steps of the empirical procedure, an example of calculations in the Masovia province is presented. The method of determining the relative degree of grey incidence is analogous for each voivodeship. Collective results of the entire procedure for each province are presented at the end of the article.

Step 2. Normalization of time series

Normalization of time series was carried out according to formulas (3) - (6). For the Masovia province, the effect of the first stage of time series normalization is as follows:

Y^{ref} = [1.00, 1.02, 1.04, 1.02, 1.03, 1.02, 1.05]
Y^{1} = [1.00, 1.07, 1.15, 1.23, 1.33, 1.39, 1.43]
Y^{2} = [1.00, 1.14, 1.09, 1.03, 1.08, 1.09, 1.11]
Y^{3} = [1.00, 1.21, 1.28, 1.55, 1.71, 1.78, 2.07]
Y^{4} = [1.00, 1.04, 1.13, 1.23, 1.32, 1.38, 1.44]

The effect of implementing the second stage of normalization of time series for the Masovia province is as follows:

Y'^{ref} = [0.00, 0.02, 0.04, 0.02, 0.03, 0.02, 0.05]
Y'^{1} = [0.00, 0.07, 0.15, 0.23, 0.33, 0.39, 0.43]
Y'^{2} = [0.00, 0.14, 0.09, 0.03, 0.08, 0.09, 0.11]
Y'^{3} = [0.00, 0.21, 0.28, 0.55, 0.71, 0.78, 1.07]
Y'^{4} = [0.00, 0.04, 0.13, 0.23, 0.32, 0.38, 0.44]

Step 3. Parameter determination for $|s'_{\mathrm{ref}}|$, $|s'_i|$, $|s'_{\mathrm{ref}} - s'_i|$ model

The parameters of the grey incidence analysis model were determined on the basis of formulas (7) - (9). The following model parameter values were obtained for the Masovia province $|s'_{\mathrm{ref}}|$, $|s'_i|$, $|s'_{\mathrm{ref}} - s'_i|$: $|s'_{\mathrm{ref}}| = 0.16$; $|s'_1| = 1.40$; $|s'_2| = 0.48$; $|s'_3| = 3.06$; $|s'_4| = 1.32$; $|s'_1 - s'_{\mathrm{ref}}| = 1.24$; $|s'_2 - s'_{\mathrm{ref}}| = 0.33$; $|s'_3 - s'_{\mathrm{ref}}| = 2.90$; $|s'_4 - s'_{\mathrm{ref}}| = 1.16$

Step 4. Calculation of the relative degree of grey incidence $r_{\mathrm{ref}-i}$

The relative degree of grey incidence indicator was determined in accordance with formula (10). For the Masovia province, the results of the relative degree of grey incidence calculations are as follows: $r_{\mathrm{ref}-1}$= 0.67; $r_{\mathrm{ref}-2}$= 0.83; $r_{\mathrm{ref}-3}$= 0.59; $r_{\mathrm{ref}-4}$= 0.68. This means that for the Masovia province, the largest geometric similarity occurs between the series determining the amount of funds under regional operational programs per capita between 2007-2013 and the time series determining investment outlays per capita between 2007-2013.

Table 7 presents the designated indicators of the relative degree of grey incidence between the reference vector determining the amount of funds under regional operational programs per capita between 2007-2013 for all Polish provinces and selected parameters of socio-economic development at the regional level.

Table 7: Designated indicators of the relative degree of grey incidence $r_{\mathrm{ref}-i}$ for all Polish provinces

Province	Gross Domestic Product per capita between 2007-2013	Investment outlays per capita between 2007-2013	Internal expenditure on R&D per capita	Gross value added per employee (in PLN) between 2007-2013
Lower Silesia	0.731	**0.947**	0.596	0.755
Kuyavia-Pomerania	**0.790**	0.721	0.565	0.767
Lublin	**0.737**	0.638	0.616	0.730
Lubusz	**0.796**	0.700	0.574	0.790
Łódź	0.682	**0.773**	0.596	0.675
Lesser Poland	0.766	**0.972**	0.644	0.789
Masovia	0.673	**0.834**	0.592	0.681
Opole	0.712	0.706	0.582	**0.719**
Subcarpathia	**0.733**	0.627	0.539	0.730
Podlaskie	**0.745**	0.719	0.564	0.731
Pomerania	0.988	0.913	0.663	**0.999**
Silesia	0.723	**0.825**	0.599	0.737
Holy Cross	**0.782**	0.635	0.528	0.761
Warmia-Masuria	**0.888**	0.867	0.662	0.871
Greater Poland	0.706	**0.750**	0.596	0.709
West Pomerania	**0.788**	0.713	0.633	0.761

According to the conducted research, it turned out that as many as eight provinces showed the strongest relationship between the amount of funds under regional operational programs per capita between 2007-2013 and gross domestic product. These provinces are: Kuyavia-Pomerania, Lublin, Lubusz, Subcarpathia, Podlaskie, Holy Cross, Warmia-Masuria, and West Pomerania. Considering the wealth of a given province measured by GDP, this group includes the five poorest provinces in Poland. Of the

three remaining provinces, none are in the top five of the wealthiest provinces. For six provinces the strongest relationship between the amount of funds under regional operational programs per capita between 2007-2013 and investment outlays per capita was demonstrated. This group includes the wealthiest Polish provinces, i.e. Masovia, Lower Silesia, Greater Poland, Silesia, Lesser Poland and Łódź. In two cases, the strongest relationship was found between the amount of funds under regional operational programs per capita between 2007-2013 and the gross value per employee - i.e. for the Opole and Pomerania provinces.

The obtained results of research indicate that:

- there is a significantly greater relationship between European funds obtained and economic growth measured in GDP for poor provinces than for rich provinces,
- for rich provinces there is a strong relationship between the value of European funds and investment expansion,
- it has not been reported that the amount of European funds for any of the provinces was strongly linked to internal expenditure on R&D.

The results obtained reflect the situation that was observed in Poland between 2007-2013. European funds obtained by poor provinces constituted an important element of their economic growth. This resulted from the large scale of funds obtained in relation to the very low level of the size of economies. For rich provinces, the funds obtained did not play such a large role in the context of the scale of their regional economies. In addition, it was demonstrated that European funds from the financial perspective 2007-2013 did not significantly affect the increase in the level of R&D of Polish enterprises, regardless of the region.

Summary

The objective of the study was to examine the impact of funds under regional operational programs on the socio-economic development of provinces (regions at NUTS-2 level) in Poland between 2007–2013. In order to characterize the socio-economic development of provinces, regional policy indicators were adopted (GDP per capita, internal expenditure on R&D, investment outlays, gross value added). The GIA was used to conduct the impact analysis, which is an extremely useful tool to study short time series (Cempel, 2014).

The results of the conducted analyses indicate that funds under regional operational programs have the smallest impact on GDP per capita, while the largest on internal expenditure on R&D. Such results may indicate that the effectiveness of European Union policy in terms of innovation and supporting research and development activities is high.

The conducted research indicates that it is justified to undertake analyses regarding the impact of funds from the European Union on the broadly understood socio-economic development. In the future, similar research and comparative analyses can be carried out at the regional level across the European Union.

Abstract

The current debate in corporate governance is about the fundamental purpose of business, shareholder value maximization versus meeting stakeholder claims. Proponents of the value maximization principle say that a firm exists to maximize shareholder value. Proponents of the stakeholder theory say that a firm exists to satisfy the claims of its all stakeholders. The concept of corporate directing describes the integrative process of governing and leading in action, i.e. the enacting of directors' roles both individually and collectively. It is a relational concept, only known and brought about through other people, and includes all aspects of directors' symbolic actions. Pfeffer (1981) described management as symbolic action: it is argued here that directing is symbolic (en)acting. However, there are several tensions underlying this concept, which will be outlined in this discussion.

Keywords: Corporate governance, leadership, stakeholder

Corporate Governing

The idea that top management is somehow different to ''other'' management has been around for a long time. Hambrick and Mason (1984) identify and distinguish characteristics and values of these ''higher echelons'' (see also Nadler & Tushman, 1990; Tichy & Charan, 1995; Finkelstein & Hambrick, 1996). The general view is that not only are they different to other managers but also that they make a difference to their organizations (Pye, 2001). According to agency theory, the separation of ownership and control that characterizes the modern corporation creates many situations in which the interests of managers and owners may be expected to differ (Berle & Means, 1932). Owners must either seek to align interests through compensation contracts with managers or rely on monitoring to ensure that managers act in the owners' best interest (Fama, 1980). Proponents of agency theory have identified the board of directors as a primary monitoring mechanism (Fama & Jensen, 1983). Miller and Friesen (1977) have argued that without strong, unified leadership firms may be unable to take the decisive actions that set strategic direction. This unity also confers legitimacy on the organization to those who hold the belief that strong leadership and clear sense of direction are necessary to success (Maccoby, 1976; Pfeffer & Salancik, 1978).

Hence, this paper draws together these three themes of governing - power, learning and organizational knowledge - and leading together into the concept of the processual view of leadership towards building stakeholder relations.

Before we describe our view, which was tested in the study, we discuss the definition of corporate governing, in which stakeholder aspirations may play the main role in increasing the performance of the corporate board decision making process. As the discussion of the basic theoretical background in the following section will make clear, the connection of stakeholder aspirations to the learning process and knowledge management and effectiveness depends on the relations, which are being examined. Corporate governance is mostly studied within the framework of agency theory, where the modern corporation is perceived as contract agreement between principals/shareholders and agents/managers,

and various mechanisms are needed to align the interests of principals and agents (Fama, 1980; Fama & Jensen, 1983; Jensen & Meckling, 1976) due to the potential separation of ownership and control (Berle & Means, 1932). Agency theory is derived from Berle and Mean's (1932) work on the separation between ownership/shareholders and control/management. Separation of ownership and management provides the opportunity for managers agents - to act in their own self-interest by maximizing their own wealth and power at the expense of the owners - principals (Fama, 1980; Jensen & Meckling, 1976). Agency costs result when managers pursue their own interests to the detriment of the interests of shareholders (Fama & Jensen, 1983). From an agency theory perspective, corporate governance is put in place to monitor managers on behalf of shareholders (Eisenhardt, 1989; Jensen & Meckling, 1976). The idea of the stakeholder approach to corporate governance, suggests that managers must formulate and implement processes which satisfy all and only those groups who have a stake in the business. The central task in this process is to manage and integrate the relationships and interests of shareholders, employees, customers, suppliers, communities, and other groups in a way that ensures the long-term success of the firm. A stakeholder approach emphasizes the active management of the business environment, relationships, and the promotion of shared interests. The relation among stakeholders is used to determine and control the strategic direction and performance of organizations. At its core, corporate governance is concerned with ensuring that strategic decisions are made effectively (…) can also be thought as a means corporations use to establish effective relationships between parties whose interest may be in conflict (…) reflects and reinforces company values. (Hoskinsson, Hitt & Ireland, 2003: 342). Pye (2002: 156) also indicates the distinguishing difference between governance and governing: governance implies something static and a box that can be ticked, whereas governing implies a social process and collective phenomenon, i.e. done with and through relationships with other people.

Therefore, for this study, we define the working definition of corporate governing as a process, which influences the broad strategic decision-making process used to reconcile different stakes and aspirations among several groups of stakeholders to improve organizational performance. It is similar to definitions proposed by Kooiman (2003:4), while aforementioned, the mainstream definitions of corporate governance within the framework of agency theory focus on separate organizational ownership and control. This also illustrates the key point in appreciating the process of governing, which is that there are two sides to this relationship. It is not simply enough to say that companies have to widen their reporting function to include, for instance, corporate social responsibility and the like, but they must actively manage the information, knowledge flows in ways that are credible and informative for other stakeholders.

The link between stakeholders and knowledge management, organizational learning and power towards effective leadership.

In this formulation, stakeholder aspirations management is part of the corporate governing process but in no way drives that strategy. The firm's relationships with its stakeholders enter into its strategic calculus, and the types of relationships that produce the best prospective outcomes for the firm are pursued. Thus, our first overall proposition states the strategic stakeholder management model: Managers will attend to stakeholders' interests to the extent that those stakeholders can affect effectiveness. But very little research has been done to help identify which stakeholders really count to managers. Mitchell, Agle, and Wood (1997) developed a theoretical model that advances the idea that managers proportionately value stakeholders in the context of stakeholder three attributes power, legitimacy, and urgency. Agle, Mitchell and Sonnenfeld (1999) test Mitchell et al. (1997) model and discover that the three stakeholder attributes, power, legitimacy, and urgency, significantly increase stakeholder salience.

Donaldson and Preston (1995) argue that stakeholder interests have intrinsic worth. Therefore, certain claims of stakeholders are based on fundamental moral principles unrelated to the stakeholders' instrumental value to a corporation. These claims cannot be ignored because they are against the company’s strategic interests. Stakeholder interests should be perceived as independent of and crucial to corporate strategic consideration and essential to the corporate strategy itself. Mitchell et al. (1997) suggest that researchers might identify stakeholders by applying sorting criteria to the field of

possibilities. In order to narrow the definition of stakeholder, it is essential to define the legitimacy of a claim on a firm, based upon, for example, contract, exchange, legal title, legal right, moral right, at-risk status, or moral interest in the harms and benefits generated by company actions. Moreover, to keep the definition broad, stakeholders' power to influence the company's behavior must also be taken into account. Therefore, the two main attributes defining stakeholder salience are power and legitimacy and when combined, they constitute authority. (Weber, 1947). The attribute of urgency is the degree to which a stakeholder's claim calls for immediate attention. The inclusion of urgency adds a catalytic/dynamic component to the process whereby stakeholders attain salience in the minds of managers (Mitchell & Agle, 1997; Mitchell et al., 1997: 864).

For the purpose of this paper, we accept the definitions of these three attributes, power, legitimacy and urgency presented by Mitchell et al. (1997): "(1) that stakeholder power exists where one social actor, A, can get another social actor, B, to do something that B would not have otherwise done (Dahl, 1957; Pfeffer, 1981; Weber, 1947), (2) that stakeholder legitimacy is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions (Suchman, 1995; Weber, 1947), and (3) that stakeholder urgency is a multidimensional notion that includes both criticality and temporality, with a stakeholder claim considered to be urgent both when it is important and when delay in paying attention to it is unacceptable (Mitchell & Agle, 1997; Mitchell et al., 1997)." Further, Freeman (1984) observed that managers' priority perceptions might attach to stakeholder groups as well as to specific stakeholder claims. And, in addition to arguing that stakeholder attributes function as variables--not as steady states--and can change for any particular group or stakeholder-manager relationship, Mitchell et al. (1997: 868) argued that the existence (or the degree present) of each attribute as a matter of managerial perceptions is a reality constructed over time rather than an objective reality. The outcomes of corporate activity matter. Clarkson (1995) wrote that performance counts because it can be measured and evaluated, whether a corporation and its management are motivated by enlightened self-interest, common sense, or high standards of ethical behavior. However, as noted in the quotation from Selznick (1996) at the beginning of this article, the only conventional measurement of corporate success has been the satisfaction of and creation of wealth for one stakeholder--the shareholder--although it has been demonstrated that the pursuit of this single measure is self-defeating (Clarkson, 1988). Further, a significant relationship has been found between profitability measures such as return on equity and corporate social performance (CSP) measures such as employee relations, product innovation/safety, environmental stewardship, and community relations (Waddock & Graves, 1997). Thus, as we attempted to include the construct of corporate performance in our research model, we were led to consider those variables as indicators.

According to the problems mentioned above, in our opinion, a fundamental problem in many collaborations relates to the transfer of knowledge. Knowledge transfer is costly. Indeed, Hayek (1945) treats knowledge as so idiosyncratic that most specialized knowledge may not be transferable or is only transferable at a prohibitive cost. Knowledge transfer costs arise because of cognitive limitations. For instance, Simon (1945) argues that human minds are limited in the rate at which knowledge can be assimilated, in the amount of knowledge that can be accumulated, and in the amount of knowledge that can be applied. In collaboration, knowledge sets from the various partners must be transferred among each other in order to collaboratively choose trials; else, different knowledge sets held by the different actors are likely to either diminish the likelihood of finding a valuable solution or lead to conflict in trial selection. This would slow and possibly halt progress towards finding a solution. As a problem increases in complexity so too does the number of distinct specialized knowledge sets and, because of cognitive limitations, the number of actors involved in transferring and receiving knowledge But in terms of the levels of analysis, several authors in the organizational learning and knowledge management fields (e.g., Kogut & Zander, 1992; Nonaka & Takcuchi, 1995) have proposed that learning occurs and that knowledge exists at the individual, group, organizational, and inter-organizational or network levels. This fourth level of analysis has attracted a great deal of attention from researchers interested in the role of learning in alliances, joint ventures, strategic groups, and inter-firm relationships in general (e.g., Doz, 1996; Inkpen & Crossan, 1995; Lyles & Salk, 1996). However, other scholars associate learning and knowledge with only the individual level or with a specific subset of these four levels. The debate in the literature mostly focuses on the organizational

level because of concerns about anthropomorphism. On one side, Simon (1991: 176) states that "all learning takes place inside individual human heads; an organization learns in only two ways: (a) by the learning of its members; or (b) by ingesting new members who have knowledge the organization didn't previously have." On the other side, Hedberg (1981: 6) argues that "although organizational learning occurs through individuals, it would be a mistake to conclude that organizational learning is nothing but the cumulative result of their members' learning... Members come and go, and leadership changes, but organizations' memories preserve certain behaviors, mental maps, norms and values over time."

Researchers are not unanimous in their views on the impact of learning and knowledge on firm performance. Cangelosi and Dill (1965), Fiol and Lyles (1985: 803) demonstrate a positive link between these constructs, underlying the positive impact of learning on performance. Similarly, according to Barney (1991) only valuable, rare, inimitable and non-substitutable knowledge could result in an advantage over competitors. Argyris & Schon (1996), March & Olsen, (1975), Levitt and March (1988) present the opposite approach and claim that there is no direct relationship between learning, knowledge, and performance. Moreover, Huber (1991) notices that if during the learning process incorrect content is learned correctly, or correct content is learned incorrectly, this learning process does not increase learner's performance. Leonard (1992) argues that inflexibility in thinking inherent to knowledge sets stifle innovation and creativity.

Summing up, company's good scope of knowledge may result in increased competitive advantage, while the poor scope of knowledge may deteriorate company's advantage over competitors. Crossan et al. (1995) conclude that in some cases, learning may have negative implications on performance and that good performance not necessarily originate from learning. Since many studies support the direct impact of learning and knowledge on performance (Appleyard, 1996; Bontis et al., 2002; Decarolis & Deeds, 1999; Hitt et al., 2001; Yeoh & Roth, 1999), it should be underlined that the relevance of this learning and knowledge is the most essential for the positive effects on performance. (Crossan, 1991).

Theoretically, corporate governing is concerned with the strategic process of influencing by which organizational participants and stakeholders recognize, interpret, and enact opportunities using common purpose, shared values, and commitment to keep new wealth creation in a proactive, innovative and risky way. The way of governing is viewed in practice, underpins the dimension in our view of leading. Leadership is reflected in just about everything an organization does, not just in what the executive team does, although there is still a curious assumption that the further up the organization you go, the more leadership you do. And somehow, the assumption goes, this kind of leadership is different from other kinds of leadership as you might find elsewhere – usually lower down – in an organization. What is important about the leadership at this level that might distinguish it from other kinds of leadership? If you could actually define what you meant by (other kinds of) leadership, it might make it a bit easier to answer this question! Generally, it is taken to mean leadership performed by those in a director role, which is then differentiated between the executive and non-executive directors. When put like this, it is hardly surprising that traditional views of leadership appear more appealing, as it is much simpler to rely on an inspiring and energizing figurehead than to try to identify shared or collective leadership. For example, ''motivation, alignment, cohesion and the ability to focus followers on goals, values and visions are the central features of good leadership'' (Kotter, 1988) is somehow more palpable than ''a process of transformative change where the ethics of individuals are integrated into the mores of a community as a means of evolutionary social development'' (Barker, 2001).

Finkelstein and Hambrick (1996) in their strategic leadership theory suggested that information processing and strategic decision making are reflections of the psychological make-up (e.g. values) of the top manager and the top management team. From our point of view, it is clear that leading – effective leadership - at this level happens through communication as well as through a host of organizational processes that support particular strategic initiatives. That is, while leading is usually thought of through face-to-face social influence, there are multiple ways in which organizational structures and systems influence the actions stakeholders take and the direction in which the collective goes. Leadership is a dynamic process that does not reside solely within a given person or a given situation; rather, situations create an interplay of needs, and effective leaders work to continually

identify and meet them (Kozlowski, Gully, Salas, & Cannon-Bowers, 1996; Pierce & Newstrom, 2000). Taxonomies of leader behavior like Yukl's (1989) provide information about what leaders do. Yet there exists little theory or research providing information about how these behaviors combine to create the dynamic process of leadership that meets situational needs. In this study, our goal was to develop a model of effective external leadership that reveals the process through which leader behaviors combine to facilitate team self-management and team effectiveness. The benefits of such an approach lie in the questions it can answer about effective leadership and in the new questions it can surface.

Conclusion

The concept of corporate directing describes the integrative process of governing and leading in action, i.e. the enacting of directors' roles both individually and collectively. It is a relational concept, only known and brought about through other people, and includes all aspects of directors' symbolic actions. Pfeffer (1981) described management as symbolic action: it is argued here that directing is symbolic (en)acting. However, there are several tensions underlying this concept, which will be outlined in this discussion.

The impact of stakeholders' approach on corporate governance theory is difficult to establish. Much of contemporary debate and commentary is trapped in the rhetoric of stakeholders versus shareholder debate. So, what are the critical issues facing the stakeholders' approach to corporate governance? Discussion about the nature of stakeholders' approach focuses on how stakeholders redraw the picture of the enterprise. This idea of stakeholders' approach with corporate governance interpretation, suggests that managers as leaders must formulate and implement processes which reflect the creation, enhancement, realization, and renewal of value for all stakeholders. This stakeholder approach encourages leaders to develop organizational strategies, identify and invest in all the relations that will ensure long term success. From this perspective, it becomes clear that there is a critical role of values and value-based management within the corporate governance process.

Based on our considerations, there are a few questions that appear: Does the group have a moral, ethical or legal claim on the enterprise? Does the stakeholder group have the power to affect the enterprise? Is the stakeholder making a claim for urgent action? Is the group demanding immediate attention from the enterprise? These and other questions should be asked for characteristic influence, whether a manager will pay attention to the stakeholder group or not. It may show that managers thinking about building a competitive advantage should use them together. Some would argue that we are again on the threshold of a major shift in perspective from a stakeholder theory to shareholder theory of corporations in society. We can conclude that the corporate governance process should be considered as an integrated approach, which treats the corporation as embedded in a network of interdependent stakeholder relationships that are evolving and that a business ecosystem consists of multiple stakeholder relationships. Within that business ecosystem, corporate decision-makers and stakeholders cooperate, compete, and co-evolve, as each develops new capabilities and forces others to grow and change. The findings of this study suggest that corporate governance does matter and that it is possible to identify the proper relations employed for different types of stakeholders. Beyond the obvious theoretical implications, both practitioners and consultants may benefit it to improve corporate governance.

A New Method for Planning Needs in Terms of Security

Bartosz KOZICKI

Military University of Technology, Warsaw, Poland, bartosz.kozicki@wat.edu.pl

Abstract

The article deals with a research problem that focuses on the process and method of planning needs in the Polish Institution in terms of security, based on expenditure forecasting in the retrospective aspect. The study was started by comparing retrospective data on planned needs and expenses incurred to secure them in dynamic terms. The obtained results became the premises for further analyzes and evaluations of retrospective data of expenses incurred to cover planned needs in the procurement department. Results obtained gradually became the premises for the use of further research tools and then for the choice of method and forecasting for the future. The obtained forecasts were subjected to empirical verification through the use of comparative analysis and mean absolute percentage error.

Keywords*:* Management, Expenditure, Planning Of Needs, Forecasting, Security.

Introduction

The needs planning process plays an important role in terms of the role and importance of management of such an organization as the Polish Institution in the context of security. It should be emphasized that nation security is often defined as a state of equilibrium of a sovereign entity which includes existing threats and the defense potential of the state [12]. In theoretical terms, issues related to the process of planning needs in the Polish Institution have not yet found, apart from the authors' publications, an appropriate place in scientific research and they are only regulated by laws, regulations, guidelines and instructions. On the other hand, the practical approach has many disadvantages associated with the planning process currently used in the Polish Institution which result from the lack of an effective method of calculating needs which so far nobody has formulated.

The main goal of the study is to present a new method of planning needs by applying a forecast for the future of retrospective data in the procurement department in the economic unit.

The subject of research is the process of planning needs in the economic unit. The needs planning process is extensive and consists of subprocesses and activities that must be carried out in a timely manner by designated participants at various levels of command. Visual observation and own experience in the field of needs planning allow to state that defects occurring in the process of needs planning in one economic unit are a mirror image of all others. This phenomenon results from the specificity of the hierarchical organization which is the Polish Institution and the legal basis of the needs planning process. This became a premise for choosing the subject of research. The research object of the work is the Polish Institution. The analysis and evaluation of the planning process of expenditure of supplies were carried out on the basis of a economic unit. The article presents a retrospective study of the currently used method of expenditure planning on empirical material in dynamic approach.

The article uses research methods in the form of literature analysis which deals with issues related to expenditure, needs planning, forecasting, analysis of source documents, computer simulation method and comparison. Furthermore, the following research tools were used: quartile chart, autocorrelation, partial autocorrelation, multiple regression, histogram, Shapiro-Wilk test.

The article consists of the introduction, five substantive points, summary and conclusions.

Literature Analysis

As a result of critical analysis of the literature, it was found that the most important issues covering the problem presented in the article can be divided into studies in the field of management and planning [11, 13] of needs.

Analysis of the subject literature indicates that there are different interpretations of the concept of 'management' within the field of management. There are a number of definitions of this term and it is often equated with the term 'direction'. This is understandable because in translations of English-language studies into Polish, the concept of "management" is translated as "management" or "direction". In Polish literature, these two concepts are interpreted differently, although in practice they are similar. Both concepts have their origin in the concept "control", i.e. the interaction of one system with another to achieve a specific result. In Polish literature, direction is basically about people, while management is about organization.

In the Polish Institution there is a concept of leadership. According to L.J. Krzyżanowski [9] leadership is a type of organization management and adopts the formal competences of the manager as the dominant criterion. The author considers the concept of direction to be broader than management and leadership. An analysis of the concept of leadership found in the literature indicates that it is considered on two levels: as power and as a process. Leadership is most often assumed to be a specific form of direction.

Analysis of the literature on the subject indicates that certain functions can be identified in hierarchical activities. Most often they include: planning, organizing, motivating and controlling. Planning is the first and most important management function. It is the beginning and the basis of all activities of the organization including the Polish Institution.

Extremely important issues related to the planning of needs in the Polish Institution relate to matters related to expenditure. In the Polish Institution, expenditure is defined as cash expenditure spent from the bank account of the organization, which is the Polish Institution, on the implementation of goals and tasks. There are differences in the interpretation of costs and expenses in the literature. Costs are incurred to generate income [7]. Table 1 summarizes the definitions of the term expenditure.

Table 1: Summary of definitions of the term expenditure

Source of definition	Definitions
E. Nowak [10]	Expenditure means spending of cash from an enterprise's cash or bank account in connection with payment for specific goods or services and in connection with the settlement of various obligations of the entity.
H. Poetschke [6]	Expenditure means any decrease in cash, irrespective of the purpose for which it is incurred.
K. Czubakowska [3]	Expenditure is a decrease in cash which increases other assets.

Various groups of expenditure are used in the Polish Institution [14] which are regulated by relevant ordinances.

The planning of the expenditure of supplies in the Polish Institution results from the planning of needs and is closely related to expenditure. The calculation of future expenses requires careful estimation [2]. The need is understood as the subjectively reflected discrepancy between the actual and the expected condition [1]. In the Polish Institution, needs are divided into financial and material ones. Financial needs expressed in PLN result from the functioning of organizational units and cannot be secured as

part of material resources. On the other hand, material needs are logistic resources and services necessary to carry out tasks, expressed in units of measurement, sorted by procurement departments.
Forecasting is one of the forms of planning that results from critical literature analysis. According to P. Dittmann, forecasting is a rational, scientific prediction of future events [4]. Forecasting should be based on the correct analysis of time series which is one of the parts of the statistics used in economic practice. It allows to learn about the mechanisms that caused the phenomenon to proceed in this way and to perform simulations related to predicting observed trends in the future. A time series in the literature is defined as a non-random function x (t), which is the implementation of the stochastic process X (w, t) for a given elementary event w_o [8].

Analysis of the current state of the needs planning process in the Polish Institution

The method of examining documents allowed the author to state that planning of material needs is an essential element of the system for financing tasks implemented by the Polish Institution. The process of planning material needs begins after the guidelines regarding the planning of operations in the Polish Institution and the development of activity plans for the planning year at various levels of direction and leadership. The planning process is carried out at all levels of direction and leadership. Planning in the Polish Institution consists in determining the needs to secure tasks carried out in accordance with specific orders and plans. Then, specific needs are verified at individual organizational levels of the Polish Institution. The final product of the needs planning process is verified lists of needs correlated with the financial plan in the aspect concerning budget expenditure.

The study analyzes data regarding planned needs and expenses incurred to secure them in the years between 2014-2018 in the procurement department in the economic unit. For this purpose, Figure 1 summarizes the planned needs in the procurement department in 2014-2018, along with expenditure incurred for their implementation in dynamic terms.

Fig. 1: Line chart of planned needs and expenses incurred to cover them in the procurement department in 2014-2018

The evaluation of Figure 1 is the lack of balancing of the planned needs with the expenses incurred for their supply. The average absolute percentage error of planned needs in the procurement department for years was 10% in 2017 while in 2018 - 16%. This became a direct premise for further research in order to look for a new effective method of planning needs. Research in this matter began with identifying the method used to calculate needs and suggesting a new one.

Method of Planning Needs

Performing the calculation of needs in the Polish Institution currently requires knowledge of the following information

a) numer of staff,
b) the quantity and type of equipment used to carry out the tasks
c) investments.

The basis for the calculation of needs is included in the following documents:

- ✓ training programs
- ✓ exploitation plans
- ✓ purchasing priorities for the financial year
- ✓ plans resulting from perspective tasks (including modernization),
- ✓ tables and standards of equipment quantity, and others

Figure 2 presents the current condition of the method of calculating needs in the Polish Institution.

Fig. 2: Current condition - a method of calculating needs in the Polish Institution

At the moment, the calculation of needs in the Polish Institution is created by comparing the personnel, equipment and investment conditions with standards resulting from branch documents as well as specialized instructions, and others (Figure 2). It is a method that causes the balancing of planned needs with the expenses incurred to secure them.

Figure 3 suggests a new method based on forecasting retrospective data on expenditure incurred in dynamic terms.

Fig. 3: A new method of calculating needs in the Polish Institution

The new method will require recorded expenditure in procurement departments. When there is no time series of expenditure in retrospective terms, the old method will be used. Over time, expenditure will appear and the new method of calculating needs could be applied. The old method will apply to newly created institutions or units. In time, however, it will be replaced by the method based on forecasting expenditure for the future.

The next stage of research is forecasting retrospective data of expenditure in the procurement department in the economic unit. This activity was preceded by a thorough analysis and evaluation of retrospective data of recorded expenditure in the procurement department in question. The obtained evaluation was used to select the method on the basis of which the forecasting was made.

Analysis and forecasting of expenditure

The first stage of the research was to outline retrospective data on expenditure incurred in the procurement department in between 2014-2018, broken down by months in Figure 4.

Fig. 4: Line chart of expenditure incurred in the procurement department at the Economic unit in between 2014-2018 broken down by months

Visual observation of Figure 4 made it possible to detect trends (2014-2016) and its shift in 2017-2018. Critical analysis of literature and evaluation of Figure 4 have become direct premises for the conversion of places in retrospective data in 2017-2018 from March to January. The series after transformation is outlined in Figure 5 and defined as research.

Fig. 5: Line graph of expenditure incurred in the procurement department at the Economic unit in between 2014-2018 broken down by months after adjustment (research series) along with a trend line and its formula

The evaluation of Figure 5 is the detection of a rising linear trend. The trend is outlined in Figure 5 with a red line and described in the footer with the formula. The next stage of the research was the analysis and evaluation of the distribution of the research series. For this purpose, research tools were used in the form of a histogram (Figure 6) and a normality chart with the Shapiro-Wilk test (Figure 7).

Fig. 6: Histogram of the research series

Fig. 7: Normality chart of the test series with the Shapiro-Wilk test

The evaluation of the distribution analysis performed in Figures 6 and 7 is that the distribution is not normal. The premise of a lack of normality may be the occurrence of outliers and extreme values.
The next stage of research was the search for the existence of outliers and extreme values. For this purpose, a box plot chart was used along with the outlined median and raw data.

Fig. 8: The box plot chart along with the outlined median and raw data of the research series

The evaluation of Figure 8 is the indication of the existence of two outliers: March 2016 and 2017. The extreme value was March 2018.

Then, the relationships in the delays of the analyzed research series were examined. For this purpose, research tools were used in the form of: autocorrelation (Figure 9) and partial autocorrelation (Figure 10).

Fig. 1: Autocorrelation of the research series

Fig. 2: Partial autocorrelation of the research series

The evaluation of the research tools used in the form of: autocorrelation (Figure 9) and partial autocorrelation (Figure 10) is that the analyzed research time series is non-stationary. It shows seasonality and a slight trend.

This became a direct premise for building a zero-one model of multiple regression to confirm the existence of seasonality and trend. For this purpose, fourteen predictors were used in the form of variables: t, t^2, lnt and eleven months as zero-one variables. Based on the analyzes and their evaluation, January was omitted. The built matrix had 900 elements. Significant predictors are summarized in Table 2.

Table 2: A zero-one model of multiple regression

N=60	R= ,95341381 R^2= ,90899788 Adjusted R^2= ,89042602 Standard error of estimation: 1882238,93158296					
	b*	Standard error	b	Standard error	t(49)	p
Word free			20 607 120,4670	652 935,6135	31,5607	0,0000
t	0,4366	0,0437	142 153,2837	14 218,9128	9,9975	0,0000
February	0,1673	0,0478	3 413 002,1461	974 246,3147	3,5032	0,0010
March	0,9265	0,0477	18 900 764,0303	973 381,2559	19,4176	0,0000
April	0,1408	0,0477	2 872 407,2746	972 723,2967	2,9530	0,0048
May	0,1208	0,0477	2 463 488,2369	972 272,8576	2,5337	0,0145
June	0,2150	0,0476	4 385 664,7032	972 030,2270	4,5119	0,0000
July	0,3174	0,0476	6 475 461,9854	971 995,5605	6,6620	0,0000
August	0,2639	0,0477	5 384 136,6157	972 168,8805	5,5383	0,0000
November	0,1389	0,0477	2 834 550,7165	973 934,9821	2,9104	0,0054
December	0,2839	0,0478	5 792 245,7308	974 937,8091	5,9411	0,0000

The evaluation of a zero-one model of multiple regression is that ten predictors are significant. These include variables: t, February-August, November and December. This confirms the existence of a linear upward trend and seasonality on an annual basis. The built model was well fitted. Multiple R^2 was 0.91. The evaluation of all analyzes carried out is the detection of a growing linear trend and seasonality on a monthly basis. Due to the short research time series (60 elements), the Holt-Winter's exponential smoothing method was used to forecast for 2019 (twelve months). The results of the forecast are summarized in Figure 11 and Table 3.

Fig. 11: Forecast of research time series with Holt-Winter's exponential smoothing method for twelve future periods (2019)

The evaluation of Figure 11 is the indication of an upward trend in the forecast obtained and a continuation of the retrospective phenomenon of seasonality.

Table 3: Forecast of the research time series made with the Holt-Winter method for twelve future periods (2019)

Order number	Forecasting H-W
61	29 464 177,4810
62	33 095 887,1707
63	50 049 974,0360
64	30 560 457,7943
65	31 509 088,4608
66	34 370 320,0967
67	36 601 917,0876
68	35 792 300,9794
69	28 787 671,5724
70	28 919 432,1086
71	31 939 200,8602
72	37 830 426,4401
Sum	408 920 854,09

The data presented in Table 3 indicate that the forecast for 2019 in the procurement department is 408 920 854.09.

The next step was to re-transform the forecast. To this end, the positions of January and March have been exchanged. The results are outlined in Figure 12.

Fig. 12: Forecast of research time series with Holt-Winter's exponential smoothing method for twelve future periods (2019) after re-transformation

The evaluation of Figure 12 is that the highest forecast in 2019 should be visible in January - 50 049 974.0360 and the lowest one in September - 28 787 671.5724. The next stage of research will be empirical verification of obtained forecasts.

Empirical verification of the new method of needs planning

The research in the scope of empirical verification of the new method of planning needs began with the compilation of data on planned needs in the procurement department in the years between 2014-2018 with the forecast presented by economic unit and made with Holt-Winter's method (Figure 13).

Fig. 3: A summary of data on planned needs in the procurement department in between 2014-2018 with the forecast provided by economic unit and made with Holt-Winter's method

Visual observation of Figure 13 clearly shows that the best method for forecasting is Holt-Winter's method because the differences between the empirical values of this forecast and the expenditure incurred are lowest in dynamic terms.

Fig. 4: Summary of data on the average absolute error of the forecast made in between 2014-2018 by economic unit and with the use of Holt-Winter's method

The evaluation of Figure 14 is confirmation that the best method for planning needs in the procurement department is Holt-Winter's method. The mean absolute percentage error (Figure 14) was lowest for

Holt-Winter's method. The decrease of the difference in the average absolute percentage error between the forecast made by economic unit and with Holt-Winter's method in 2017 was 8.19% and 2018 - 15.31%.

Summary, Conclusions and Synthesis

The newly developed needs planning method meets the requirements of the Polish Institution regarding the improvement of the current planning process in terms of national security. This requires a change in the approach to the current concept by implementing effective tools for calculating needs. The work attempts to implement a new method of planning needs. Implementation of the plans began with a review of domestic and foreign literature on the function of planning in management sciences.

The purpose of the work was to develop a new method of calculating needs in the Polish Institution. The goal of the work has been achieved. The method of calculating needs was developed. The application of the new method of calculating needs was preceded by a broad analysis of source materials through the use of existing research tools. In institutions where the current method of planning needs will be used, over time, there will be expenditure forming time series that will be reasonable to forecast using the available models.

The research scope of the work, in which the needs planning process was analyzed and evaluated, covered the years 2014-2019. The forecasting was carried out on the basis of a time series of expenditure in the procurement department for 2019.

Positive empirical verification of the new needs planning method, which was used, justifies its use in the Polish Institution.

Synthesis
The application of the developed method of calculating needs in the planning process explains the phenomena occurring in the management function in question, will lead to an improvement in the results of balancing the needs in terms of supplies in the Polish Institution with the expenditure incurred to secure them and eliminate its current disadvantages in terms of national security.

Abstract

Several solutions ensuring the dynamic detection of malicious activities on Android ecosystem have been proposed. These are represented by generic rules and models that identify any purported malicious behavior. However, the approaches adopted are far from being effective in detecting malware (listed or not) and whose form and behavior are likely to be different depending on the execution environment or the design of the malware itself (polymorphic for example). An additional difficulty is added when these approaches are unable to capture, analyze, and classify all the execution paths incorporated in the analyzed application earlier. This suggests that the functionality of the analyzed application can constitute a potential risk but never explored or revealed.
We have studied some malware detection techniques based on behavioral analysis of applications. The description, characteristics, and results obtained from each technique are presented in this article wherein we have also highlighted some open problems, challenges as well as the different possible future directions of research concerning behavioral analysis of malware.

Keywords: Android Security, Malware detection approaches, Behavior Detection, Dynamic analysis, Malware classification.

Introduction

The year 2019 has witnesses yet again Android dominance by 72.2% (StatCounter Global Stats 2020) of smart-phones worldwide market share. The large adoption of Android sets it as the preferred target of mobile cybercrime (Figure 1).

	2019-03	2019-04	2019-05	2019-06	2019-07	2019-08	2019-09	2019-10	2019-11	2019-12	2020-01	2020-02	2020-03
Android	75.33%	75.22%	75.34%	76.03%	76.08%	76.23%	76.24%	76.67%	75.82%	74.13%	74.30%	73.30%	72.26%

Fig. 1: Mobile Operating System Market Share Worldwide (2020)

Victim of its popularity, Android is an opportunity for hackers to get their hands on a large amount of victim data (SMS, GPS location, etc.) with less effort by taking advantage of free access to the source code of Android (known under the name AOSP). This makes installing and spreading malware easier compared to a closed operating system (iOS, BlackBerry, etc.).
The Android ecosystem also plays a role in the emergence of new vulnerabilities and the spread of hacker attack vectors. Indeed, several mobile manufacturers (Smartphone or Tablet) manage to design and market several products adapted to the needs and financial capacity of the consumer. These products do not host Android as published by Google but adopt a modified version including new proprietary components essential for its proper functioning (device driver for example) or presentation layers to stand out from the competition.

Specific and personalized developments made by manufacturers, and which are subsequently integrated into Android OS, may also contain vulnerabilities whose impact is of serious comparable to those found in applications installed by the user (Wu et al. 2013) or even in AOSP. The detected vulnerabilities affect the preinstalled components of specific manufacturers or specific ranges for a given manufacturer (Farhang, Kirdan, et al. 2020) (Elsabagh et al. 2020). This makes the Android ecosystem and its security segmented more and more (within the same manufacturers), and it only increases the risks associated with any equipment running Android such as Farhang, Laszka, and Grossklags (2018) shown in their study. With the evolution of mobile attacks, which have become increasingly stealthy (McAfee 2020), any flaws introduced by the manufacturer or developers of third-party applications can constitute a gateway for hackers to gain access to sensitive resources and data of hardware and the user by acquiring system privileges and permissions in an illegal manner, and without the consent of the end-user.

To address the various threats, in particular those caused by malware or those intentionally introduced into applications installed by the manufacturers or by the user, several analysis methods and approaches have been proposed by Kouliaridis et al. (2020) and others. In this work, we will focus on existing detection approaches based on malware behavioral analysis and the potential they have for identifying and detecting malicious behaviors that malicious applications may carry once installed in an adequate environment to start their malicious mission.

The rest of this article is organized as follows: Part 2 presents the different techniques for detecting vulnerabilities. Part 3 describes in detail the approach to behavioral malware analysis and the various solutions proposed. Part 4 presents possible future research prospects regarding the behavioral analysis of malware. Finally, Part 5 concludes the article.

Vulnerability Detection Techniques

Several detection approaches and techniques have been proposed to ensure efficiency in the various phases of the analysis and the detection process to decide whether the application analyzed is malicious or not. To identify the functionality and how the malware activates, executes, and manipulates its data or stolen data, two main analysis techniques are used: static and dynamic analysis.

Static Code Analysis

Static analysis of an application consists of reconstructing, scanning, and analyzing the code of the application without executing it. Its advantage is that it tries to cover and explore all possible paths of control and execution and examine the functionalities programmed without invoking them in order to extract, identify and analyze any malicious or legitimate action but which could be used maliciously by malware (system and API call (Aafer, Du, and Yin 2013), permission (Saracino et al. 2016), etc.).

All these processing can consume a lot of time and require resources in terms of calculation and storage without forgetting that the executable of the application must first undergo a treatment of "Reverse Engineering (RE)" (Eilam 2011), the latter is essential to have exploitable source code. However, RE is becoming increasingly unreliable (easily bypassed) and expensive because of the obfuscation techniques (Dalla Preda and Maggi 2017) (Suarez-Tangil et al. 2017) that the creator of malware adopts when compiling its source code. In several studies (those based on Machine Learning, such as Xi et al. (2019)), the static characteristics extracted from the analyzed applications which will be normalized, processed are used as input data to machine learning algorithms to decide whether the application is malicious or benign.

Dynamic Behavior Analysis

Unlike static analysis, dynamic analysis of an application consists of observing and studying the behavior and actions taken by this application during its execution. It consists of listing and examining all activities related to the file system as Cabau, Buhu, and Oprisa (2016) proposed, to the network (Nari and Ghorbani 2013), to the sequences of API and system calls (functions, parameters, instructions, associated data flows) (Martinelli, Marulli, and Mercaldo 2017) (Egele et al. 2008), etc. Dynamic analysis is generally carried out in a controlled and virtual test environment where several monitoring software components are installed. This customization of the test environment can influence the normal and natural execution of malicious applications because it can generate a completely different behavior compared to a similar execution in a real environment. This will weaken the effectiveness of dynamic analysis in reducing the probability of the malware detection since the verification of rules and models already classified will be based on system calls and data generated by artificial behaviors that do not reflect the reality. Dynamic analysis requires continuous monitoring, adaptation, and updating for effective automation in the analysis or classification of malicious behaviors to follow the continuous evolution of the techniques used in malware. The complexity and the transformation capacity of a certain type of these malware (Polymorphic and Metamorphic malware) allow it to escape from the various traditional detection methods, thanks to the self-adaptation of malware functionalities according to the environment in which they are executed.

There are also hybrid detection techniques that try to merge the strengths of static and dynamic analysis (Anderson, Storlie, and Lane 2012) to improve the assessment and classification of the applications analyzed based on the collection and analysis of the functionalities detected via machine learning. Other approaches monitor the application during its execution to report any malicious behavior that may occur in the Smartphone (Faiella et al. 2017).

Analysis of Behavior Detection Techniques

Because of the integration of advanced techniques in the design and development of malwares (Wazid, Zeadally, and Das 2019), the detection of the latter is now more and more difficult despite the various works done in this direction. Its algorithms can be effective in specific cases for a context Well-defined. However, analyzing the behavior of malware in a real execution environment can be an important factor in identifying and detecting the impacts associated with the malicious behavior of malware and its future targets.

For an effective analysis of the integrated vulnerabilities in the applications or in AOSP itself, implicitly or explicitly (security flaws in the code), the behavioral analysis of the launched processes must be implemented and remain in active listening in order to control the various flows and interactions between its processes and the resources (of which they have access or not) from Smartphones. The data provided by these can contain information on behaviors that can be considered inappropriate or malicious, even if the resources used can already be made available to the applications, the source of their behaviors, thanks to the permissions granted upon installation or they are, in one way or another, put within its reach because of a security breach (following an elevation of privileges for example).

Techniques for Detecting and Analyzing Malware

To minimize human intervention in understanding and analyzing new malware, it is essential to automate its tasks in order to “robotize” their detections so that the potential risks associated with their malicious behavior can easily be identified. Despite the increase, diversification, and complication of the technics of malicious applications, the analysis, extraction, and sample classification processes of these applications must be capable of extracting models or images representing the identity of its malware. Its representations can then be used for the classification of any new application whose behavior is likely to harm the security and normal functioning of the end user’s devices.

Fig. 2: Malware detection schema

The detection of a malicious application is mainly based on four steps (Figure 2):

- Analysis of the application: after receiving the executable of the application to be analyzed, the system begins the analysis step, which can be dynamic, static, or both:
    - Dynamic analysis: consists of the execution and monitoring of the application in a real or virtual machine. The observation of the activities of the application can relate to the launched processes, the network requests, the modifications made on the system files, the registry, etc.
    - Static analysis: consists of applying "Reverse-engineering" to the application to be able to decompile the executable and reconstruct its source code so that it can be used in the following steps.
- Data Extraction and Transformation: data mining techniques (Graph model, n-tuple, n-gram, etc.) can be used in this step to extract data that may contain characteristics, specifications, and functionalities (unitary or combined). This is geared towards determining the benign behaviors (representing the normal functioning of applications) or malicious behavior which could constitute a potential risk for the security of system resources and the integrity of sensitive user data. The extracted data can undergo transformations in order to eliminate unnecessary data (noise-tolerant) and then generate signatures, behavioral models, graphs representing the image of the extracted functionalities.
- Feature Classification: uses the Machine Learning to classify the characteristics of the analyzed application by referring to the generic rules and models previously built based on the characteristics already extracted from the application samples (benign and malicious) during the training phase of the system.
- Evaluation/Decision: in this step, the characteristics extracted from the analyzed application are compared with the signatures or behavioral model previously-stored the system database, and following this comparison, the system can deduce whether the analyzed application is malicious or not.

Malware Behavior Detection Approach

Several studies have been elaborated to describe the different malware detection approaches based on their behavioral imprint extracted during their interaction with the environment on which they are hosted. The nature of the latter, which can be a real environment, Sandbox, or a virtual machine, and its architecture play a decisive role in identifying the different application execution paths (malicious or not).

1) MADAM:

Saracino et al. (2016) proposed Madam, which is an Android malware detection system based on behavior monitoring at the level of the user (their activity/inactivity), the application (critical APIs), the package (permissions requested), and the kernel (system calls, etc.). After having classified most of the behavioral characteristics of real and known malware in misbehavior classes, the system ensures the extraction, analysis, and correlation of the functionalities of installed applications with behavioral models, previously generated, in order to be able to effectively detect and block any malicious activity. This system has shown its effectiveness in detecting more than 96% of malicious applications with a low rate of false alarms.

2) M0droid:

This technique about detecting Android malware had been proposed by Damshenas et al. (2015). It consists of two elements: a light client agent and an analyzer server. The client agent is installed in mobile devices that communicate with an analysis server, the latter analyzes the behavior of Android applications (invoked system calls) and creates signatures representing the malicious activities that malware can carry out; its signatures are used by client agents to identify and detect any vulnerability threatening users. The client-server architecture of this framework allows the end-user to minimize the consumption of resources and phone energy. The latter runs the client agent in the background and transmits to the analyzer server the various data collected regarding the installed applications. The analyzer server takes care of the analysis of the applications in an emulator by injecting it with random events both to invoke the system calls corresponding to the processing, and to cover the maximum of the possible paths of execution of the analyzed application. The behavior of the latter is captured and then used to create a standardized signature that will then be classified and compared with the blacklist of signatures that are previously constructed by this framework. Outsourcing the detection functionality to the cloud overcomes the limitations related to the performance of the end user's mobile device. 60.16% is the malware detection rate with 0.4% false negatives and 39.43% as a false positive rate.

3) DroidDetector:

The functionalities of dynamic and static analysis of Android applications have been combined in Droiddetector (Yuan, Lu, and Xue 2016), this hybrid solution is based on a Deep Learning method based on the Deep Belief Network (DBN) to extract, investigate and classify static characteristics (calls system, permissions, ...) and dynamics (behavior categories) of benign and malicious applications analyzed. The result of these treatments is used to feed the DBN network so that it can be used afterward by the DroidDetector mobile application previously installed on the end user's device. With a sample of 1,760 malicious applications, 192 static and dynamic characteristics were extracted, which allowed the level of detection accuracy to reach 96.76%.

4) Andromaly:

Andromaly (Shabtai et al. 2012) is a Host-based malware detection system that continuously monitors and classifies the various events dynamically generated by the mobile device while applications are running. Other features (related to network traffic, battery level, number of running processes, etc.) are also monitored by this system. Using Machine Learning algorithms, the behavioral characteristics collected are classified according to their nature (malicious or not), and then used to assess the level of infection of the mobile device. The alert history is also used and combined with the results obtained to reduce the rate of the false positives that are obtained. Even if the experiments are not done on samples of real malicious applications, the obtained results confirm that their solution is effective on the applications analyzed.

5) ServiceMonitor:

With the system proposed by Salehi, Amini, and Crispo (2019), malicious behaviors are identified using Machine Learning algorithms. Indeed, ServiceMonitor consists of generating a precise representation of the behavior of applications based on its different interactions with the service and system resources. The use of these resources is classified and represented by a statistical model (in the form of Markov chains) making it possible to monitor their exploitation by the various running applications. With a sample of 18,058 applications processed (10,024 benign and 8,034 malicious), ServiceMonitor was efficient and precise in detecting malicious behavior with an accuracy rate of 96.7%.

6) ***HIDROID****:*

Ribeiro et al. (2020) developed a novel Host-based IDPS for Android (HIDROID), which is a standalone Intrusion Detection and Prevention Systems that runs entirely on a mobile device without the need for a remote server. The behavior of applications with the device's resources (battery, CPU, memory, etc.) is monitored using a detection engine, which collects data in real-time and builds up a model representing benign behaviors by using a combination of statistics and Machine Learning algorithms that will help detect vulnerabilities (known or not). Any suspicious behavior is communicated to the user in the form of an alert, and countermeasures are taken to reduce the risk of an attack or intrusion. HIDROID has the ability to analyze, learn, and classify behaviors without the need for any malware data.

The summary of behavioral malware detection techniques described in this section is presented in Table 1.

Table 1: Comparative behaviors analysis of existing techniques

Techniques	Features	Accuracy of detection
Madam	Behavior monitoring is carried out at the user, application, package, and kernel level.	The detection accuracy is 96.9% on a sample of 2,784 malicious applications, with a low false-positive rate.
M0droid	The Framework is composed of an analyzer server and a lightweight client. The analysis and detection are based on the system call invoked by the analyzed application.	60.16% is the malware detection rate with 0.4% false negatives and 39.43% as a false positive rate.
DroidDetector	This hybrid solution is based on a Deep Learning method (Deep Belief Network - DBN-) to extract, investigate, and classify the static and dynamic characteristics of the analyzed application.	With a sample of 1,760 malicious applications, the detection accuracy reached 96.76%
Andromaly	For better efficiency, the alert history is combined with the analysis results made on the dynamic characteristics of the monitored applications	Achieve accuracy in between 87% and 99%
ServiceMonitor	Static models representing the use of resources, and call systems are made based on the behavior of applications with the different used resources.	Malicious applications are detected with an accuracy rate of 96.7%
HIDROID	Learning and classifying behaviors are performed without the use of any malware data.	Detection accuracy reached 0.91 with a false positive rate limited to 0.03.

Despite the multitude of methods for observing, analyzing, and investigating the applications analyzed, some malicious behaviors can remain undetectable. This can be due to: (1) non-satisfaction of the conditions required for its triggering (Smartphone brand or a specific version of Android for

example). (2) the difficulty of identifying similarities between the characteristics previously extracted with those detected during the analysis of a behavior; this is due to the complexity linked to determining clearly and exhaustively the different functionalities of behavior and its associated characteristics. (3) or it is because of the nature of the runtime environment. Indeed, the use of a virtual environment (emulator) can be easily detectable thanks to the methods already implemented in malware. This will give malware the opportunity to mask their malicious behavior and remain undetectable.

Possible Future Research Prospects

Cybersecurity researchers have the interest of improving the effectiveness of current approaches to detecting malicious applications and especially those interested in behavioral analysis of malware. This type of analysis has shown its effectiveness in several studies; hence the need to concentrate efforts in improving the capacities of this component.

The use of a few features by benign and malicious applications creates some confusion in the classification of these features and increases the false positive rate. To overcome this malfunction and improve detection performance, it is necessary or even essential to add other layers of analysis using other detection techniques (static or heuristic for example) in order to confirm or reverse a decision before communicating it. These layers will have the mission of verifying the suspect functionalities and characteristics, and not redoing a new independent analysis as suggested by some hybrid approaches. This will also help to ensure an adaptation to the different reactions and transformation that malware (normal, polymorphic or other) can undergo depending on the deployment environment (real, virtual device, etc.), the version of Android or even according to the nature of overlay added by the manufacturer.

The approaches based on Deep Learning have given satisfactory results and may also be an area of research that can be explored by experimenting all the algorithms proposed by this method in order to improve the classification of the characteristics and functionalities processed and, thus, improve the performance of the decisions taken.

Having complete coverage of the execution and control paths of an application is considered a major challenge to reveal and block any activity likely to harm the security of devices; and this requires the adoption of a new distributed architecture allowing a better inventory of the different behaviors of the analyzed application. The launching of several simultaneous dynamic analyzes of the latter in different environments will allow the identification and capture of new behaviors (data flow, system calls, etc.). Ouaguid, Abghour, and Ouzzif (2018) had already proposed a similar architecture based on the Blockchain (ANDROSCANREG) but intended only for the static analysis of Android applications. Adopting such an architecture in the dynamic analysis will help improve the detection of malicious behavior which activates if specific conditions are satisfied.

Conclusion

In this article, we have presented some techniques for detecting malicious applications and we have specifically examined some dynamic approaches based on malware behavioral analysis. These malware are increasingly sophisticated and difficult to detect in the real world despite the integration of Machine Learning and Deep Learning methods in the classification of generic characteristics, rules, and models identifying the behaviors captured.

We believe that the solution to these limits is to have a hybrid method based on a hierarchical combination of different analysis techniques in a distributed environment (based on Blockchain technology for example). Such solution will allow better accuracy in the classification of functionalities extracted during the dynamic analysis of an application or from application samples (benign and malicious) that are analyzed during the training phase of the system. This direction deserves an in-depth study and could open up other opportunities to improve the detection of

malicious behavior from more sophisticated malware (polymorphic for example) which changes its representations, its behavior and it is triggered if specific conditions are satisfied.

Abstract

The paper undertakes the issue of challenges carried by demographic changes for the functioning of local government units. The review portion of the paper discusses the concepts of silver economy as responses to population ageing. The empirical part comprises an analysis of results of research which covers diagnosis and assessment of problems that affect the elderly in the context of development of the silver economy. Research was conducted using the CAWI method and concerned local government units in Poland. Nevertheless, it must be pointed out that the undertaken problem has not been a subject of in-depth analysis so far. Hence, the article fills the identified research gap in this field.

Keywords: Silver Economy, Local Government, Ageing, Public Policy

Introduction

The demographic changes (population ageing) which have occurred over the several past decades have complicated implications at a socio-economic level. These changes are observed in numerous areas of operation of the state and society (Błędowski at el., 2012). Nevertheless, it seems that in the current policy and long-term development strategies, the significance and consequences of these changes are often underestimated, and it is observed by documents and studies which tackle this issue in the context of problems and threats rather than in the category of opportunities and challenges. Furthermore, the main emphasis in considerations on the implications of population ageing is put on the national dimension (e.g. pension policy, health policy, education policy). Meanwhile, the local aspect is at least as important. In accordance with the principle of subsidiarity, it is communes that bear the greatest burden of tasks which will be particularly affected by population ageing. It is also noted that in accordance with the concept of the silver economy, the growing percentage of older people in the population translates into an increase in the aggregate purchasing power of older consumers, which can be used as a stimulus for local development.

The main objective of research was defined as the diagnosis and assessment of problems affecting the elderly in the context of the development of the silver economy. Realisation of this goal is achieved by verifying three research hypotheses formulated in the methodological part of the study.

The source of data for analyses presented in the study is an investigation conducted among the communes of the Malopolska Voivodship in September-December of 2018 in cooperation with the

Regional Chamber of Audit in Cracow. Research methods used in the review portion include demographic analysis, as well as critical analysis of the literature and the synthesis of conclusions drawn from it. The empirical portion comprises an analysis of survey results, which involves the use of statistical tools, including descriptive statistics and methods of statistical inference.

Demographic changes in Poland and the silver economy

The demographic changes taking place in the European Union countries in the coming years will be more strongly felt. The effects of these changes are particularly noticeable in Poland, which for many years has ranked amongst the top 30 demographically old countries in the world. Demographic forecasts for Poland prepared by both international (UN, OECD) and national (GUS, 2014) institutions point to three significant effects of the ageing of society. First, there will be a decrease in population, which will be accompanied by a change in its structure (Figure 1). With a view to 2050, the total population of Poland will decrease by over 4.5 million compared to 2018. People in the post-working age will constitute an increasing share, while the percentage of people in the pre-working and working ages will drop. The demographic dependency ratio calculated as the ratio of the number of people in non-working age (0-19 and 65+) to the number of those in working age (20-64) is used to assess the advancement of population ageing. For example, in 2018 it was 60.12% in Poland, and in 2050 it will be at a level of 96.03%.

Secondly, in the group of people in post-working age an increasing share will be constitute by people over 80 years of age (Figure 1). This phenomenon is referred to as *double ageing* and it consists in a faster than usual growth rate of the share of population aged 80 and over (Błędowski *at el*., 2012). In 2025-2050, the percentage of people aged 80 and over in the elderly group (60 years and more) will increase from 16.1% to 25.8% in 2050. This process is a result of the third observed demographic trend, i.e. duration of life. Still in 1950 the life expectancy for males was slightly above 56 years, while for female it was almost 62 years. Currently, males in Poland live 17.7 years longer than in the middle of the last century while the life of women has been extended by 20 years (GUS, 2019).

Fig. 1: Projected population changes in Poland across age groups in the years 2018-2050
Source: prepared by the authors based on data of GUS (Population forecast for 2014-2050, Studies and statistical analysis, Główny Urząd Statystyczny, Warsaw 2014)

The observed ageing of society is now impacting the design of political sciences; whereby as a rule its implications are treated mainly as threats for chosen areas of the state's functioning, and in particular pension systems, healthcare, social policy or education, often overlooking the new opportunities created by demographic change. Rapid demographic changes are not only a major challenge of public spending, workforce and consumptions patterns but also a substantial opportunity for new jobs and growth. Hence, public policies should on the one hand target limiting the negative implications of population ageing, while on the other take into account activities that will allow the use of new conditions for the implementation of public tasks to raise the level of economic development, and thus the quality of life of people, in particular the elderly.

The literature on the subject does not lack examples confirming the thesis that the ageing of the society is treated as a threat, or an obstacle for economic growth. Already in 1939, Hensen named the negative implication of population ageing on growth and development a "secular stagnation," claiming that older people generate a surplus of savings relative to investment (Barković Bojanić and Erceg, 2017). Bloom et al. (2011), Creedy and Scobie (2002), Alders and Broer (2004), Sobotka et al. (2010) indicate lower productivity, smaller labour force participation and fewer investments in human capital as a result of demographic change. Maestas at el. (2016) emphasise that the increase in the percentage of the 60+ population reduces the GDP growth rate per capita, which in more than 60% stems from a slower increase in the work efficiency of older workers, and in 30% from a slower increase in the size of labour force. Feyrer (2007, 2008) showed that the relationship between worker age and total factor productivity has an inverted U shape; i.e. productivity raises as the percentage of employees aged 40-49 increases and decreases as the percentage of older people increases. Lindh and Malmberg (1999) analysed 1950–1990 data for OECD countries and found that workers aged 50–64 years help increase productivity, workforce members aged 65 years and above negatively impact productivity, and the younger workforce has no significant impact on productivity. Batini at el. (2006) suggest that while population ageing may reduce growth in industrialised countries, in the case of developing countries, the increase in the share of people of working age contributes to boosting economic growth. In turn, Lisenkova at el. (2012), Brooks (2003) see threats to economic growth as a result of the ageing of society as a change in the economic structure of expenditure, consisting of a predominance of public expenditure on social security and the medical system over expenditure on education and other forms of development. On the other hand, Gordon (2016) notes that an older population means a decreased activity and productivity of labour force and indicates it as the reason for inhibited economic growth.

It should be noted however that literature also includes views opposite to those discussed, according to which demographic changes are also a major opportunity for new jobs and growth. Prettner (2013) conducted studies on the impact of demographic changes on long-term economic growth prospects. He indicates, among other things, that population ageing is favourable to long-term economic development, and the occurring demographic changes do not necessarily inhibit the growth of economic prosperity. Concurrently, the reduction in the number of births and deaths may even lead to an increase in the rate of economic growth. A similar stance is presented by Aksoy at el. (2019). In turn, Bloom et al. (2008) suggest that the key role as for the impact of ageing on economic growth can be seen in an institutional context, i.e. pension policies, healthcare, and labour market efficiency. Moreover, many studies stress the need for a multifaceted view on the effects of ageing. In this context, Barković Bojanić and Erceg (2017) cite Barković and Nedić (2015) on ageing and discrimination in the labour market, or Mansfield and Biddison (2007) on ageing and gerontechnology. Rogelj and Bogata (2019) presented an interesting review of the literature on specialised housing solutions and dwellings for the elderly and a further research agenda to develop optimisation models and paradigms supporting optimal planning, operations and control of services for the elderly based on the intelligence of the environment.

The discussed studies accentuate the need to remodel the economy associated with its adjustment to a new demographical structure fit into the broader concept known as *silver economy.* In a broad sense, the *silver economy* is defined as a sector of the economy focused on satisfying the needs emerging from an ageing population (OECD, 2014), or one of the contemporary megatrends and may be recognised as the third world economy after USA and China (Gordon, 2017). Selected definitions of *silver economy* are presented in Table 1.

Table 1: Selected definitions of silver economy

Author	Definition
Borzaga et al., 2017	Silver economy is defined as the sum of all economic activity serving the needs of those aged 50 and over including both the products and services they purchase directly and further economic activity that this spending generates.
Radvanský and Páleník 2011	Silver economy is an adaptation of the economy to future needs of growing population of those over 50 years. This phenomenon creates new market possibilities, which are not sensitive to economic crisis.
Urbaniak, 2016	Silver economy is an abstract concept, which is to impress the scale of socio-economic transformations caused by ageing of societies and the related possibilities and limitations of the development of economic systems.
Kryńska 2012	The concept of silver economy is rather a bottom-up initiative to tackle the conventional approach to ageing modern societies of highly developed countries.
Rudnicka and Surdej, 2013	A broad system of services and creation of goods focused on using the purchasing potential of older people, and satisfying their consumption, living and health needs.

Source: prepared by the authors based on (Maj-Waśniowska at el. 2018).

The concept of the silver economy treated as a response to demographic challenges is also extensively discussed in Poland. The vast majority of research concentrates on the development of the concept of silver economy and its implications on the economic development. In recent years, however, chances and new opportunities emerging in the era of ageing societies are increasingly recognised (Majewska and Przybylczak, 2018; Bieńkowska, 2018; Sobolewska-Poniedziałek, 2016, 2017; Klimczuk, 2016; Urbaniak, 2016; Niewiadomska and Sobolewska-Poniedziałek, 2015).

Attention is drawn to the fact that the majority of previous studies does not take into account the local aspect of the development of silver economy linked with the impact of society's ageing on the implementation of tasks by local government units. A few studies discussing the implications of society's ageing in the local dimension include one by Zimnoch (2013), in which the author elaborates on the chances resulting from the concept of silver economy for the development of regions considering their level of prosperity. Kubejko-Polańska (2017a, 2017b, 2017c) also addressed these issues by examining the extent to which local authorities of individual cities and communes undertake specific actions regarding the direct elimination or reduction of the negative effects of society's aging and exploiting the potential of the silver economy. In turn, Warwas and Wieczorek (2018) analysed interest in the elderly and care for their broader development, social and professional activity, and well-being at the local level.

Research Methodology

The presented empirical analyses are supported on a survey realised by the authors in cooperation with the Regional Chamber of Audit in Cracow in September-December 2018 as part of the project "Problems and challenges of local government units in the era of an ageing society". The subject research was the opinion of communes regarding the chances and opportunities carried by society's ageing and the development of silver economy for the realisation of tasks.

The study was conducted using the CAWI[1] method among all communes of the Malopolska Voivodship. Complete answers were provided by 131 units, which gives a level of participation in the

[1] In a few cases, given the technical conditions, it was also possible to provide a questionnaire survey on a paper form containing a set of questions identical to the electronic version. During the research, it turned out that in some communes, answering individual questions required the exchange of

study at over 71.9% (cf. Figure 2). On behalf of individual communes, answers were mainly given by the treasury (49.62% of all respondents), office secretaries (16.79%), heads of relevant departments or papers (13.74%), heads of local government units (6.87%), as well as persons acting as inspectors (3.05%) and deputy heads of local government units (1.53%) and deputy treasurers (1.53%).

Fig. 2: Age structure of communes in Malopolska Voivodeship and communes participating in the survey (percentage of people over 65 years of age).

Source: prepared by the authors on the basis of a survey and Local Data Bank database (https://bdl.stat.gov.pl/BDLS).

With a view to the considerations outlined in section 2 on the society's ageing and the development of silver economy, three research hypotheses were formulated which were then subject to empirical verification.

H.1: *The degree of performance of individual tasks of municipalities that meet the needs of older people is varied,*

H.2: *Problems affecting the elderly create a field for silver economy development in the local dimension,*

H.3: *Actions aimed at improving the situation of the elderly taken by communes are a stimulus for the development of silver economy.*

Furthermore, as part of the research we also verified whether the obtained outcomes are impacted by the demographic type and structures of analysed communes. Due to the type, the division of communes into urban communes (7 communes participating in the research), urban-rural communes (33), rural communes (88) and cities with poviat rights (3) were taken into account. In turn, with a view to demographic structure, all communes of the Malopolska Voivodeship were divided with the k-means cluster analysis into two subgroups - "old" communes and "young" communes. The first group included 74 communes, in which the percentage of people over 65 years of age exceeded 15.2% (the average percentage of people over 65 in this group was 17.2%). The second group included 108 communes with an average share of people over 65 years of age at 13.2%. Referring the

information between physically distant departments and the survey available at one computer station hindered the formulation of credible answers.

applied division to communes participating in the study, 49 old communes and 82 young communes were subjected to detailed analysis.

As part of the test procedure, the research hypotheses were verified on the basis of analysis of the distribution of answers to individual questions in the survey where responses "I don't know" or "I have no opinion" have been omitted. The analysis of results involved the use of statistical tests to study significance of differences - Chi-square and Mann-Whitney U tests, which are one of the most commonly used techniques of statistical data analysis (Aczel 2000). In the case of each test, relevant p-values were calculated, whereby when making the decision about rejecting a given hypothesis, the significance level $\alpha = 0.05$ recognised in social sciences was adopted. Conclusions formulated during the research are based primarily on inductive reasoning based on the synthesis of conclusions from the analysis of provided answers and the statistical inference carried out.

Results and Discussion

Verification of hypothesis H.1. was based on the distribution of answers given by the surveyed units to the question: *How do you assess the degree of implementation of tasks by the commune in selected areas?* Respondents representing municipalities answered this question on a 5-point Likert-type scale (very bad, bad, medium, good, very good). In order to provide a synthetic graphical presentation of the obtained results, individual answers were assigned numerical values (from -2 to 2) and arithmetic means of response values were calculated (cf. Figure 3). Beside a summary of the answers given by all surveyed units, the figure presents the obtained answers broken down into two sections taken into account in the study (demographic structure and type of commune). In-depth analyses, including the statistical verification of hypotheses, were conducted on raw data.

The obtained results indicate that the surveyed communes assess the degree of implementation of all analysed tasks relatively well. Interpreting this result, we must bear in mind that the respondents were individuals who represented particular communes, and therefore the obtained outcomes can be burdened towards positive answers. However, regardless of the possible burden on the response, there must be a large variation in the assessment of the implementation of individual tasks. The studies concluded that communes have particularly low assessment of the implementation of tasks in the field of housing and healthcare. On the other hand, against the background of other tasks, a noticeably higher grade is seen in the degree of realisation of tasks such as: public safety, education, social assistance and family policy. Therefore, referring to the posed research hypothesis (H.1.) it should be stated that there are grounds to claim that the degree of implementation of individual tasks of communes that addresses the needs of older people is varied.

Fig. 3: The degree of performance of communes' tasks in selected areas
Source: prepared by the authors

The analysis of obtained results per young and old communes leads to the conclusions that, with a few exceptions (Internet access, culture and entertainment, education and tasks in the scope of public utility), the commune's demographic structure does not affect assessment of the degree of performance of tasks in the investigated areas. Whereby, Mann–Whitney U tests confirm the statistical significance of the observed differences only when assessing the performance of public service tasks. The obtained test statistics dictate rejection of the hypothesis about the equal distribution of answers in both groups of investigated communes (cf. Table 2). This observation is all the more surprising as against the background of deliberations on this issue in previous sections of the paper, it is difficult to justify why demographically older communes realise precisely such tasks as supply of water, gas, electricity, sewage access and waste management more extensively. This topic seems of current interest in further research using other investigative techniques, such as in-depth interview.

Table 2: Diversification of the degree of performance of communes' tasks in selected areas

	Commune structure	**Type of commune**
	p-value (U Mann–Whitney test)	p-value Kruskal–Wallis test
Public security	0.7991	0.1042
Internet access	0.4187	0.3349
Culture and entertainment	0.2279	0.6348
Education	0.2536	0.9786
Housing	0.6347	0.6464
Social assistance	0.5379	0.6571
Spatial order and environmental protection	0.9810	0.1157
Healthcare	0.8342	0.3510
Condition of road systems and local transport	0.6790	0.1984
Family policy	0.7973	0.5939
Public utility tasks	**0.0317**	0.5700

Source: prepared by the authors

A broad range of variation in the degree of performance of tasks is observed in the classification of communes by type. The largest units (cities with poviat rights) are more strict than other types of communes in assessing the level of performance of tasks in the field of culture, housing, spatial order and environmental protection, as well as the road systems and local communication. One can suppose that this assessment stems from the specificity of the needs of communities living in large cities, and in some areas also from the more stringent requirements set for local government units by urban communities. It is also worth highlighting the fact that the assessment of the performance of tasks such as Internet access, culture and entertainment, social assistance, health care and the condition of the road systems and local communication carried out by municipalities stands out among other types of communes. This observation appears consistent with intuition, which suggests that municipalities focus more on this type of task in their policies. They also typically have larger budgets, which allow the redirection of some funds for the implementation of tasks in the field of culture, spatial order and environmental protection. It should, however, be noted that none of the discussed differences in the distribution of responses were confirmed statistically (cf. Table 2). To conclude this part of analysis, it should be stated that the type or demographic structure of the commune has not been shown to significantly affect the degree of implementation of its tasks in the examined areas.

In the second part of the study, to verify hypothesis (H.2), we analysed the answers to the question: *What problems most often affect older people in your commune?* The respondents provided answers on a three-point scale, where 1 meant that the phenomenon was not a problem and 3 meant that it was a serious problem. As before, for the purpose of synthetic presentation of data, Figure 4 shows arithmetic means of response values, while in-depth analyses and statistical verification (cf. Table 3) were carried out on raw data.

For an explanation of symbols, see Table 2.

Figure 2: Selected problems affecting the elderly in different types of communes.

For an explanation of symbols, see Table 3.

Fig. 4: Selected problems affecting the elderly in different types of communes.

Source: prepared by the authors.

The obtained results indicate that the three greatest problems affecting older people are elderly diseases, disability and loneliness. The surveyed communes go on to indicate poverty, architectural barriers and a lack of family support. Interestingly, the results of the study suggest that the cultural offer and access to sports and recreation infrastructure are a much smaller concern for the elderly. Referring the above observations to the verified research hypothesis (H.2), it is concluded that it finds partial confirmation in empirical observations. Certainly, the need to solve some of the indicated problems of older persons will be an important stimulus for the development of silver economy in the local dimension. These are primarily: the problem of loneliness, disability and the need to overcome architectural barriers, followed by adjusting the cultural offer and expanding recreational infrastructure. It should be noted, however, that not all identified problems can be solved at the local level (e.g. old age diseases, the issue of poverty). Therefore, they will have an impact on the development of the silver economy, but mainly in the national dimension.

Table 3: Differentiation of problems of the elderly in communes

	Commune structure	**Type of commune**
	p-value (Chi-square test)	p-value (Chi-square test)
[1] Architectural barriers	0.0510	0.0527
[2] Lack of family support	0.0679	0.6240
[3] Elderly diseases	0.4635	0.8198
[4] Unsuitable cultural offer	0.5317	0.7277
[5] Disability	0.3130	0.2825
[6] Limited access to sport and recreation infrastructure	0.1693	0.5194
[7] Loneliness	0.3707	0.2835
[8] Poverty	0.1686	0.0519
[9] Hindered access to care services	0.4181	0.8482
[10] Hindered access to healthcare	0.2698	0.1748

Source: prepared by the authors

The analysis of the occurrence of individual problems in older and younger communes demonstrated that older communes to a greater extent understand the importance of problems linked with a lack of family support, loneliness and poverty of the elderly, as well as those resulting from hindered access to care services and to health care. Statistical verification did not show, however, that the observed differences in the distribution of responses in any of the analysed problems were significant (see Table 3).

Preliminary analysis of the occurrence of individual problems in different types of communes appears to indicate their varying severity in the studied groups. For example, cities with poviat rights to a greater extent identify problems related to architectural barriers, poverty and hindered access to health care. On the other hand, in urban centres (cities with poviat rights and municipalities) much less often than in other units there is a problem with limited access to sports and recreation infrastructure. Yet, similar to the analysis based on the demographic structure of communes, the results of statistical verification did not show that the observed differences were statistically significant (Table 3). Therefore, it is not accurate to say that the demographic structure or type of commune significantly impacts the problems affecting the elderly.

Hypothesis (H.3) was verified on the basis of the answer to the question about what actions aimed at improving the situation of the elderly are undertaken in the examined communes. Based on the given answers, a simple indicator of the intensity of undertaking actions aimed at improving the situation of the elderly in the commune (IUA) was created. This indicator was calculated as an arithmetic mean of numerical representations of individual answers (no data on activities in the commune - 1; activities undertaken to a moderate extent - 2; activities undertaken in its full scope - 3). Values of the indicator calculated for individual analysed activities in all the examined communes, as well as broken down by the demographic structure and type of commune, are presented in Table 4. The table also contains a summary of the statistical verification of the significance of differences in the distribution of responses provided by individual types of communes and communes with different demographic structure.

Table 4: The indicator of intensity of activities aimed at improving the situation of the elderly undertaken by the surveyed communes

Activity		Demographic structure			Type of commune				
	All communes	Old communes	Young communes	p-value (chi square test)	Cities with poviat rights	Municipalities	Rural-urban communes	Rural communes	p-value (chi square test)
Adaptation of housing for the elderly to their needs and fitness	1.37	1.38	1.36	0.4140	2.00	1.40	1.25	1.38	**0.0006**
Computerisation and dissemination of access to new technologies	1.96	1.93	1.97	0.9404	2.33	2.00	1.97	1.94	0.9722
Popularisation and promotion of a healthy lifestyle	2.06	2.13	2.03	0.3656	2.33	2.33	2.19	1.99	0.5007
Promoting the involvement of volunteers and community organisations to help the elderly	1.81	1.84	1.78	0.7671	2.33	2.17	1.93	1.71	0.2228
Staff trainings of the commune's organisational units in the scope of support for the elderly	1.89	1.94	1.86	0.5411	1.33	2.00	1.91	1.89	0.8260
Support for institutions and organisations working for the elderly by transferring subsidies to foundations and associations	1.92	2.04	1.84	0.2823	2.67	2.33	2.07	1.80	**0.0641**
Non-monetary social support by	2.32	2.29	2.33	0.4638	2.67	2.00	2.38	2.31	**0.0278**

municipal units									
Payment of additional cash benefits for older people	1.87	1.93	1.84	0.6884	1.67	1.80	1.90	1.88	0.8100
Providing access to day-care centres	2.02	2.35	1.83	**0.0008**	2.67	2.00	2.17	1.95	0.3759
Providing support in emergencies	2.34	2.29	2.36	0.7592	2.00	2.00	2.48	2.32	0.2385
Improving the accessibility to health care and rehabilitation services	1.84	1.89	1.81	0.8103	2.00	2.33	1.71	1.84	0.1531

IUA values indicate that in order to improve the situation of the elderly, communes most often implement activities consisting in providing support in situations requiring assistance, and the highest intensity of this type of activities is observed in the case of urban-rural and rural communes. Almost equally often, the surveyed communes provide them with non-monetary social support as part of improving the situation of the elderly. In this case, there is also a diversity of the examined types of communes - urban communes are the least willing to provide this type of assistance. The least popular activities include adapting dwellings of the elderly to their needs and fitness, with such activities being increasingly undertaken by cities with poviat rights and municipalities (differences in the distribution of responses are statistically significant here). It is also worth noting the diversification of the intensity of support provided to institutions and organisations working for the elderly in different types of communes. In general, the more urbanised a commune, the more attention is paid to such activities. Interestingly, a similar situation, although to a lesser extent and not confirmed statistically, also takes place in the case of other analysed activities (computerisation and dissemination of access to new technologies, popularisation of healthy lifestyles, promotion of the involvement of volunteers and social organisations to help the elderly). On the other hand, rural and urban-rural communes more frequently declare the payment of additional cash benefits for the elderly and provide direct assistance in emergencies. Therefore, claims about the diverse nature of support provided to older people in different types of municipalities seem justified.

From the point of view of the issues raised in the paper, the analysis of actions taken to push for an improved situation of the elderly by old and young communes is especially interesting. The survey results have indicated accuracy of the claim according to which old communes take greater measures to improve the situation of the elderly. The exceptions are only computerisation and dissemination of access to new technologies, non-monetary social support and providing support in emergencies, where the IUA values for young communes are slightly higher. When analysing IUA values, it is also worth noting that old communes provide access to day-care support facilities much more often than young communes. Furthermore, old communes more often declare support for institutions and organisations working for the elderly and popularise and promote a healthy lifestyle.

The synthesis of results obtained in this part of the study leads to a positive verification of the statement according to which communes with older demographic structure are taking more actions to improve the situation of the elderly. Extrapolating this statement, it can therefore be assumed that the progressing ageing of society will increase the intensity of this type of activity in individual LGUs, and on the scale of the whole country. In the light of these considerations, it should be concluded that there are no grounds for rejecting hypothesis (H.3). It can therefore be assumed that actions aimed at improving the situation of the elderly taken by communes are a stimulus for the development of silver economy.

Conclusion

Population ageing as a challenge of the 21st century implies a necessity to redefine public policies to take account of new conditions for the implementation of public tasks. In this context, the concept of the silver economy seems to be a response to the threats arising from demographic change. The

results of the conducted research already indicate a large diversity in the degree of implementation of tasks that meet the needs of older people. At the same time, it is pointed out that these tasks are mainly performed by local government units, and thus the concept of silver economy in the public sector should be implemented to the greatest extent at local level. Our belief is that it should be treated as a stimulant of local development. It is also worth noting that in the countries of Central and Eastern Europe the concept of silver economy is less developed (Maj-Waśniowska at al. 2018), which creates extra chances for its proper targeting and optimal use of its potential by implementing appropriately designed public intervention

Forecasting Sales Volume by Minimizing the Expected Forecast Error Cost

Konstancja PORADOWSKA

Wroclaw University of Economics and Business, Wroclaw, Poland
konstancja.poradowska@ue.wroc.pl

Abstract

Forecasting sales volume is an important element of a company's operations. When forecast that are used for making further decisions turn out to be incorrect, a company incurs additional costs. Costs resulting from forecasting error may be caused by either over- or underestimation. In each of these cases, the costs may be different. Managers' knowledge and intuition along with observations of the past allow for estimating the cost function, whose independent variable is the size of the error.
This article proposes the forecast to be taken as the value from the given range which minimizes the costs of an incorrect decision. This approach is in accordance with the forecasting according to minimum loss rule. For solving this problem, Savage's minimax regret criterium was used, generalizing it for continuous variables. The error cost was described by the use of an asymmetrical loss function, known from confidence theory.

Keywords: Sales Forecasting, Asymmetrical Loss Function, Savage's Criterium

Introduction

Forecasting demand and sales is an extremely important aspect of a company's operations, whose correctness affects every aspect of operations, i.e. purchasing processes (raw materials, semi-finished goods), human resources, production, logistics, finance, sales and customer service. If a forecasts turn out to be incorrect, many undesirable effects take place. When an overestimation takes place (i.e. the forecast exceeds the actual amount), the following may occur: excess inventory, excess storage costs, cash freezing, loss of liquidity, increased credit costs, deviations from pricing strategy (necessity of price decreases) and loss of profitability. Other direct losses for companies in cases of forecast overestimation take place when forecasts are used for making decisions regarding supply of products with a short period of usefulness, and unsold inventory must simply be utilized. Consequences of underestimation (when the forecast value turns out to be lower than the actual) may include delays in deliveries, customer dissatisfaction, exhausting of budgets and lack of operational continuity, and problems with timely customer service and complaint handling.

Forecast under- and overestimation are both connected with costs, which may be estimated and presented as a forecast error function. This does not have to be symmetric or continuous. In general, the higher the absolute value of the forecast error, the higher the costs connected with the error. This dependency is not proportional, and its shape may be different for positive and negative errors. For example, insufficient supply generates different costs then oversupply.

This article aims to present methods for finding the optimum forecast from the perspective of the decisions that are to be taken, i.e. a forecast for which the error cost is at a minimum. The forecast error cost is presented in this article as a loss function as described by Thomson and Basu (1996), and for finding the optimal forecast, Savage's minimax regret criterium was used.

Loss Function – Review of Literature

In classical statistical forecast theory, it is assumed that overestimating and underestimating an unknown parameter by the same amount for making a decision has the same effect, and the loss function is a quadratic function of the form (Granger, 1969):

$$L(d) = d^2,$$

where d is the error amount.

However, since many years, research has indicated the necessity of using asymmetrical loss functions with regards to decisions taken in the real world (Varian, 1974; Christoffersen, 1996; Metiri et al, 2016; Yamamoto et al, 2017).

The first to indicate this problem was Varian (1974). In researching losses caused by incorrect real estate valuations, he noticed that underestimating real estate value results in an approximately linear profit loss, while overestimating results in roughly exponential losses. Zellner (1986) on the other hand noticed that underestimating and overestimating the water level in water reservoirs results in different economic and social consequences. He introduced a non-symmetrical loss function, asymptotically exponential from one side of zero and linear on the other side. Also, in insurance, under and overestimating the premium by the same amount may result in different financial consequences for the insurer (Ferreira, 1977; Denuit and Dhaene, 2001). When the insured is underestimated, the insurer losses money, while if the premium is overestimated, the insurer may lose the policy.

A family of asymmetrical loss functions was defined by Thomson and Basu (1996). The loss function $L(d)$, where d is the error size, has the properties:

(1) $L(0) = 0$,
(2) $L(d) > 0$ for $x \neq 0$,
(3) $L(d)$ is convex,
(4) $L(d)$ is increasing on one side of zero, and decreasing on the other side,
(5) the rate of change of function values on both sides of zero is different
The sales forecast error may be presented as a function from the asymmetrical loss function family.

The forecast error cost function as a loss function

When forecasting the sales volume, a manager may often determine with an almost 100% certainty that the actual value x_0 will be contained in the interval $[a, b]$. The final sales forecast x^* which will be used by a company for e.g. supply planning, must be one value from the given interval. Knowing the character of forecasted variable and having information about its past, the costs connected with estimating x^* as a value lower or higher than the actual may be estimated.

Determining the sales forecast x^*, in accordance with the minimum loss rule, may be reduced to the following problem:

An interval $[a, b]$ is given, to which the unknown actual value x_0 of variable X belongs. From this interval, one x^* value (an estimate of x_0) must be chosen so that costs due to the differences between x_0 and x^* and the incorrect decisions that were made as a result are minimized. The optimal solution is that $x^* = x_0$, which is however impossible due to the uncertainty of the actual value.

The forecast error in estimating x_O may be expressed as the difference:

$$d = x_O - x^*; \; d \in [a - b, \; b - a] \qquad (1)$$

Every error is connected with a cost K, which may be determined using an asymmetrical convex function:

$$K(d) = \begin{cases} f(d)\ for\ d < 0 \\ g(d)\ for\ d \geq 0 \end{cases} \tag{2}$$

where:

function $f(d)$ is decreasing and function g(d) is increasing,
$f(0) = g(0) = 0$,
$f(d) > 0$ and $g(d) > 0$ for $d \neq 0$.
Function $K(d)$ therefore fulfills the properties of an asymmetrical loss function according to the definition of Thomson and Basu (1996). A graph of an example K function is shown in figure 1.

Fig. 1: An example of graph of function *K*(*d*) with respect to the size of the error
Source: Own work.

The form of function $K(d)$ may in practice be estimated based on experts' opinions, for example sales managers in a company. It is just necessary to determine the additional costs generated by underestimating sales by a chosen number of units, and also what costs are connected with overestimating this value.

Determining the sales forecast according to Savage's criterium.

In order to solve the above-formulated problem, Savage's criterium (the minimax regret criterium) was used, generalizing it for continuous variables. Savage's minimax criterium is a decision making criterium first presented in 1954 by Leonard Savage. This criterium minimizes the loss expected by the decisionmaker connected with making a non-optimal decision for a given state of nature. Therefore, during the decision-making process a strategy for which the relative loss is lowest is chosen. According to this rule, the forecast must be chosen for such an x^* value so that the maximum losses with respect to the optimal decision $x^* = x_0$ are minimized.

Assuming that the decision maker has chosen an arbitrary value from the interval $[a, b]$, the maximum error in overestimating value x_{O-} (negative error) is $a - x$, while the maximum error in underestimating (positive error) is $b - x$. Therefore, for each x the maximum loss (error cost) may be determined as

$$L(x) = \max\{K(a - x); K(b - x)\} \tag{3}$$

Therefore, according to Savage's criterium the solution x^* must therefore be lowest value of the $L(x)$function in the interval $[a, b]$, or:

$$x^* = \min L(x) = \min \max\{K(a-x); K(b-x)\} \quad (4)$$

To obtain functions $K(a-x)$ and $K(b-x)$, the function $K(x)$ must undergo the following linear transformations:

1. $K(x) \rightarrow K(a-x) = K(-(x-a))$ (5)
2. $K(x) \rightarrow K(b-x) = K(-(x-b))$ (6)

As a result of transformation 1., the graph of function $K(x)$ is shifted to the right by a units and symmetrically reflected across the y axis. As a result of transformation 2., the graph of function x is shifted to the right by b units and also symmetrically reflected across the y axis. This has been shown on figure 2.

Fig. 2: Transformations of the graph of function K(x) and solution x^* that has been found
Source: Own work.

The properties of function (2) and transformations (5) and (6) show that the graphs of the transformed function have one common point. Solution (4) determines the intersection point of functions $K(a - x)$ and $K(b - x)$. Therefore, to obtain the forecast x^*, knowing the error function $K(d)$ of the form (2), the following equation must be solved:

$$K(a-x) = K(b-x) \quad (7)$$

In the interval $[a, b]$.
This solution is in accordance with Savage's criterium, and minimizes the forecast error cost.

Practical Example

A certain company that sells IT equipment must plan the number of units of a new notebook of a certain brand that is to be ordered. The managers of this company have estimated with almost a 100% certainty that in the near future the company may sell 10 to 100 of these notebooks.

This company will incur a loss both when it orders too many notebooks relative to sales volume as well as when there will be not enough to cover demand. The losses incurred in both cases will be different. If not enough notebooks are ordered, the company will lose sales profits of around 120 euro per unit. In the case of an excess amount of units ordered, cash will be frozen and storage costs will be incurred. It has been estimated that in the case of ordering one unit too many, the costs will be of the order of 25 euros, and with increasing amounts of unsold notebooks the losses will increase quadratically.

Based on the information above, the sales forecast error cost function may be presented as:

$$K(d) = \begin{cases} 25d^2 & for\ d < 0 \\ 120d & for\ d \geq 0 \end{cases} \tag{8}$$

Let us take x as the sales forecast that is to be found. The actual sales value will belong to the interval [10; 100], and therefore the cost of maximum positive and negative error is respectively:

$$K(10 - x) = 25(10 - x)^2$$
$$K(100 - x) = 120x$$

To find the solution in accordance with formula (4), which minimizes the forecast error costs, the following equation must be solved in the interval [10; 100]:

$$K(10 - x) = K(100 - x),$$

or

$$25(10 - x)^2 = 120(100 - x)$$

The equation has two solutions, $x_1 = 28{,}52, \quad x_2 = -13{,}32$, where only x_1 belongs to the interval in question.

Therefore, the best decision for this company, which generates the lowest losses if it is incorrect, is be to order 29 notebooks.

Discussion and conclusions

Sales forecasting is a necessary source of information for creating plans concerning for example supply, production, and distribution. A forecast is usually associated with some error, and ideal forecasting methods that would avoid these errors do not exist. Therefore, the fact that forecasts may be incorrect has to be accepted, and a method of planning should be found which would allow for minimizing the costs of differences between actual and assumed sales volumes.

This article presents one of the possible solutions of this problem. It has been proposed that planning should be based on such a sales forecast for which an error generates the lowest losses. Having a given interval [a, b] which contains the future sales value, it has been shown how to choose one forecast value. To this end, Savage's minimax regret criterium has been used, generalized for continuous variables.

For choosing the forecast, the probability that the forecasted variable will have a given value from the interval [a, b] has not been taken into account. Therefore, it was assumed that each value from the given interval has an equal probability of occurring, or that the forecasted variable has a uniform distribution. This is of course a simplification. Introducing other, also asymmetrical, distributions for describing the probability distribution of sales volumes would certainly be more justifiable. An interesting solution for determining the final forecast would be taking into account both the distribution of the forecasted variable as well as the forecast error costs. Such an approach would simultaneously use two forecast rules: prediction based on the expected (or modal) value, and prediction according to the minimum loss rule. Proposing such a „hybrid" approach is a goal of further research for the author.

The forecast error costs have been described in this article with the help of asymmetrical loss functions from the family proposed by Thomson and Basu. In the presented example, the costs of a negative error

were described by a quadratic function, and the costs of a positive error by a linear function. In practice, the error cost function may have an analytically more complicated form. It may not be a continuous function outside of zero. For different error intervals, their costs may be different – they may have different rates of increase, and for some intervals they may be constant. The minimax solution proposed here may be found also for such cases.

Another problem which may be an inspiration for further research is determining the analytical form of the forecast error cost function. Historical data may be used to this end – information concerning the accuracy of earlier forecasts and costs connected with incorrect forecasts. Expert opinions, such as a company's management or employees connected with sales, may also be useful in finding the forecast error costs function. To this end, questions to experts should be formed in such a way so that answers would allow for determining the parameters of the function

There are many directions of research which may be a continuation of this topic. This article presents one of the possibilities of solving the problem of determining sales forecasts for minimizing the costs of the expected error. This solution was based on generalizing for continuous variables one criteria for making decisions in conditions of uncertainty. From the point of view of maximizing a company's profits, utilizing a prediction based on the minimum loss rule may be more justified that forecasting according to the expected value. The approach presented here may be a useful tool for decision making, particularly for forecasting and planning sales volumes

Acknowledgments

I would like thank Professor Paweł Dittman for giving the inspiration to write this article, for his meritorical support and for his valuable comments.

Influence Of Innovation And Cost-Cutting Strategies In The Competitive Advantage - Impact In The Production Industry In Romania

MĂIŢĂ Nicolae Daniel, PhD Candidate[1]

Abstract

One fundamental problem in the field of management and also technology is how generally, SMEs develop and sustain competitive advantage in the markets through innovation and cost-cutting strategies. In the last decades, there are many ways in which the firms' competitiveness can be understood in the related literature. Nowadays, the small and medium enterprise (SME) represent a very important segment of the Romanian economy. The SME sector, together with the ITC sector represents in Romania, one of the most important pillars of the economy, starting with the last 10 years. This paper aims to redefine the influence of innovation and cost-cutting strategies on the Romanian SME's in the production sector and also shows a systematic review of how information together with technology has a powerful impact on how competitive advantage was obtained. The main purpose of this study is to identify the relationship that may occur between certain strategies, processes, and the competitive advantage of the production sector from Romanian SMEs. The article is based on a survey conducted between some SMEs of the big cities from Romania and provides the readers with an overview of the competitive advantage and how the innovation impacts it, while also highlighting several opportunities for the business sector in Romania.

Keywords: competitive advantage, innovation, market competitiveness, cost-cutting strategies

Introduction

The economic growth is closely linked to the SMEs and to their ability to provide some jobs opportunities to the society, especially in the less developed areas from Romania. Many researchers have already studied the success and failure factors of SMEs to sustain and gain competitive advantage but no study was 100% convincing. Some researchers may suggest that the linked key to obtaining the competitive advantage is the capability of the SMEs to develop some unique products and services and last but not least their flexibility in implementing future technologies. In order to obtain a competitive advantage in the Romanian marketplace, some researchers suggest that it's necessary to involve the SMEs directly into the field of technology.

There are so many different papers that suggest different things about the competitive advantage of the SMEs. In general, small companies, as SMEs, are facing so many barriers in order to innovate such as internal funds problems, lack of managerial skill, and lack of market access, but this is the key to success. Knowing their weaknesses, they will be able to find a different solution in order to adapt to a stormy market, through innovation and cost-cutting. (Lynchm R, 2000)

Even if it is an easy area to approach, only a limited number of studies have been focused on the relationship between presented strategies and competitive advantage in the SME sector. In Romania, this type of study on the influence of the innovation on competitive advantage was conducted just in the retail industry, using only large brands as samples. Even if this bond between innovation and competitiveness can be much better materialized, just 44% of the Romanian SMEs, with 15% less than the EU average, are sustainable and have a direct impact on the national GDP, in 2018.

[1] Bucharest University of Economic Studies, 6, Romana Square, District 1, Bucharest, daniel.n.maita@gmail.com

Despite knowing the direct impact of the economic system, the innovation process in SMEs is still on hold in Romania, due to political problems and poor knowledge of the market economy. Several market economy adjustment measures were attempted, because in Romania, especially in the urban area, there are so many SMEs with an increased potential to became regional and global players in the UE western market. (Visconti, 2019)

Thus, research related to the influence of innovation on competitive advantage has never been done in a certain area of the SMEs, especially in the local production sectors. Such a connection between innovation and competitive advantage is even rare, therefore, this study attempt to fulfill the research gaps. This paper aims to explore the influence of innovation on competitive advantage in manufacturing SMEs in Romania and also to investigate what effect is on this relationship from a managerial perspective. (Zhan, 2016) The main questions to be answered are: Is there a positive effect of innovation on competitive advantage? Are Romanian SMEs based on a cost strategy or a development strategy? To what SMEs the influence of the innovation on competitive advantage will work? For those who embrace a managerial ideology or for those who rely more on instinct? Understanding that topic of the article will help us to understand to whom innovation support should be emphasized and how this will works. (Ong, 2008)

Literature Review

The technical definition of the micro, small, and medium-sized businesses present differences from a country to another. According to the European Commission, SMEs are divided as:

Criteria	Micro	Small	Medium
Maximum number of employees	< 10	10 - 49	50-249
Maximum annual turnover	≤ 2 million EUR	≤ 10 million EUR	≤ 50 million EUR
Maximum annual balance sheet total	≤ 2 million EUR	≤ 10 million EUR	≤ 43 million EUR

Figure 1 : Criteria for defining the SMEs in Europe

Source:– Adapted from European Commission

SMEs are very important for economic and social details. In Romania, as in the EU, small and medium-sized businesses (SMEs) are defined as businesses that provide services or products to manufacturing, that employ less than 250 people and have a net annual turnover of up to 50 million euros and/or also hold assets of up to 43 million euros. Globally, SMEs were described as the engine of the economy which encompasses innovation and growth processes and also helps to eliminate the phenomenon of poverty due to its stimulating nature of job growth. (Beck, 2013)

The SMEs' definition is based on some different theories as well, studied over time. They are defined as businesses that have all the assets, the characteristics, the capabilities, the knowledge, and the information controlled, that enable the firm to implement different strategies that will improve the efficiency and effectiveness of the sector in which it operates but also to develop their future. The (Barney, 1991) model relies especially on the fact that competitive advantage is not directly dependent on market and industry structural characteristics, but it directly depends on superior internal resources in a firm. Generally, a business is said is going to have a competitive advantage if it can offer quality products at lower prices than its competitors, and be able to offer the best services for the same amount of money. (Porter M. , Competitive Advantage., 1985)

The construction of competitive advantage in a competitive market through the development of a competitive strategy implies the direct comparison of the competitive position of one's own company with that of competitors in the market itself. In a certain period of time, (Porter M. , Competition in Global Industries, 1986) manages to formulate a new ideology, where managers of the companies themselves should be able to identify competitors in their market by their own means of analysis and determination. These theories have been developed and analyzed in several papers through time, however, there are still some problems in identifying the particular industry where companies are struggling to integrate. Besides that, there is no reason to assume that the managers of the companies use the same particular elements of analysis, as researchers, in defining direct competitors of companies. (Clark, 1999)

However, perspective has been changed over time and many companies managed to adopt a customer-focused or competitor-centered perspective with central management consideration. While the balance of these two perspectives is good to be considered, research has already shown that most of the companies will make a statement regarding one of these two perspectives and that tilt is generally towards a supply-based or a competitor, rather than a customer ideology. (Chursin, 2015)

In order to be competitive, the past literature suggests that managers or owners need a significant period of time for analyzing the other competitors, this thing greatly delays decision-making in terms of competitive advantage. Generally speaking, (Ireland, 2003) study highlight that an important relationship exists between competitor firm involving directly so different perspective, such as economics, business strategy, and marketing processes. However, papers confirm that, in reality, managers simplify the process of analyzing by general grouping together the competitors that have similar performance and results. On the same page, the research shown also the idea of identifying the competitor as a process of categorization, where the manager of a particular firm, which is the core of the whole analyzing process, make some observations about other firms, which are namely “target firms”, in order to determine which or the target firm are the competitor of the core firm. (Shan, 2013)

Often, it is said that strategic management is very important just for the big companies, as they are known as “corporations”, due to lack of attention of this entire process of management from the SMEs. The concept of the competitive advantage was a mix of different theories from Barney and Michael Porter, based on the firm sustainability of the competitive advantage when it is implemented with the strategy of the value creation that is not implemented by the other competitors. (Porter M. , Competition in Global Industries, 1986) Competitive advantage is in the fact, the ability of an organization to do their activity in a way or another, different than the other competitors on the market, in a way that cannot be realized by them. (Kotler, 2000) Competitive advantage is the starting base for a good strategy for the company itself, and a good strategy creates a competitive advantage. As can be seen, is a strong relationship between these two. Competitive advantage has been increased these last decades, together with the theories linked to Michael Porter and it is considered as an objective of a strategy itself.

According to (Porter M. , Competitive Advantage., 1985), who managed to popularise the term “competitive advantage”, the idea of competitive advantage is mainly to measure the firm’s success relative to competitors. The relative success could also be measured by his economic value that the company can generate in order to obtain attention on the market. By economic value, it can be understood as the difference between the apparent benefits of the final supplier and the economic cost of the company itself, in order to achieve the proposed objectives. Thus, the competitive advantage focuses all its attention on the relative success of companies in the market, it is not necessary to be the player with the greatest potential in the market in order to achieve a competitive advantage. (Porter M. , Competition in Global Industries, 1986)

In the same line with Porter's philosophy, the competitive advantage can be described by the context of a resource-based vision, where the actual cost must be achieved through lower cost or a differentiation advantage on the profile of their product or service. Lowering the cost means a stable vision of efficiency of the company in producing goods or services, near the same quality of the competitors but to a net lower price, to be able to transfer the difference in cost into a superior return.

The differentiation advantage is the phase where a company produces something unique, a superior value item or service which is intended for the premium price in the market, for the premium market class, in which the difference between them can be sent into superior return as well for the company itself. (Porter M. E., 1998)

Constantly, changing customer preferences make a statement that leads to continued research for new products and services, that may help their clients. As a consequence, SMEs, and especially the Romanian SMEs needs to be engaged in more innovative activities to achieve some superior performance and competitive advantage, in order to have more clients. Value, inimitability, and nonsubstitutability together with rarity, are the commonly cited characteristics that provide the core logic making a competitive advantage the main core of the managerial process. Based on several types of research that have been made over the years, the conclusion that it can be drawn represents, in fact, the characteristics of the firm performance. (Sirmon, 2011)

Some research strongly suggests that SMEs can get even better if they managed to develop and make a strong communication between their systematized processes, in order to embrace the innovation orientation. Innovation is defined, by the greatest researchers as a mental process through which, a series of new concepts and new phenomenons, in the form of new services, products, and even new techniques can appear, ready to be embraced by the world. Statistically, there are different types of innovations suitable for the SMEs, which include:

- product innovation – applicable to goods, services and different ideas
- organizational innovation – applicable to marketing, sales and purchasing, management and administration sectors
- market innovation – applicable to different territorial areas, different market segments (Nurul, 2015)

Even if, generally, SMEs are more flexible in innovation and have a positive response to the change in customer demand, they have no ability to innovate compared to the biggest companies in the markets. The most likely answer to this appointment is that the large companies have bigger financial availability and capability, thus, provide a better environment to change and exploit new technology as well as have the capability to benefit from the real economy. (Kraja, 2013)

Research Methodology

This research intends to identify the relationship that may occur between some certain innovation and cost-cutting strategies and the competitive advantage of the production sector from the Romanian SME market. Firstly, the main objective of this paper is to find out if the business area from Romania, particularly the SME industry, is concerned about the ability of the Romanian SMEs, to adapt to the new requirement of the market itself through innovation or cost-cutting, in the uncertain period of time. This study is trying to implement a philosophy of innovation in the practice of production businesses through competitive advantage and the impact of the innovation itself on this uncertain market, where businesses need to be more sensitive to the efficient use of all resources globally.

In order to obtain an accurate result, for this research, a questionnaire was used as a research instrument. The questionnaire was randomly sent from February to April 2020 via e-mail and different online platforms, to a number of 116 companies with an average number of 22 employees. The answer rate was 66% is a relatively low response rate due to the pandemic situation. All the answers were processed via Microsoft Excel and IBM SPPS 20 software, and the questionnaire also included different other methods of proceeding like, Likert Scale type of questions.

A various number of rating scales were developed in order to measure different things directly. Worldwide, the most used rating scale that is used by many researchers is the Likert Scale. The Likert Scale is created as the simple sum of different answers from a questionnaire on different several Likert items. Likert Scaling assumes that the distance between every answer (each choice) is equal and together with the items itself, it can create an eloquent answer of the statement. Likert item is a simple

and chronological statement, where the interviewees are asked to evaluate by giving a quantitative value on any kind subjective or objective dimension, with five or seven levels of agreement/disagreement. The most usual variable is represented by the statement with 5 levels of agreement/disagreement. In order to obtain a perfect level of agreement, the Likert Scaling can be measured in various ways, such as frequency, quality, importance, and so on. (Wikipedia, 2018)

The format of the typical five-level Likert Scale used in this questionnaire is the following:

Value	Importance
1	Unimportant
2	Slightly Important
3	Moderately Important
4	Important
5	Very Important

Figure 2: Likert Scale Survey

Source:– Adapted from WIKIPEDIA

A higher score will indicate a positive attitude and a lower score will indicate a negative attitude regarding the trial. This paper uses the standard version of scaling with values from 1 to 5 with the standard ratio base. Based on the questionnaire submitted, the research targets to obtain relevant information about the impact of the innovation on competitive advantage in the Romanian business. Similarly, the second objective of this paper is to find if the Romanian production market is open to embrace the implementation of innovation processes in order to obtain a competitive advantage through a sustainable philosophy by using reusable products with the smallest cost on the market.

The model that it was made, contains Romanian SMEs, older than 10 years on the market, with a big experience in the production industry, but with lack of innovation system actively. Making a short review of the respondents, the questionnaire was framed in 4 grading system, as is follow:

- The active respondents - the response rate was 47%, actively identified in business with an average of 40 employees, and with an average profit ratio of 15%.
- The stable-increasing respondents – the response rate was 13% actively identified in business with an average of 33 employees, and with an average profit ratio of 22%.
- The stable respondents – the response rate was 29% actively identified in business with an average of 18 employees, and with an average profit ratio of 2-3%.
- The declining respondents – the response rate was 11% actively identified in business with an average of 10 employees, and with an average profit ratio of 7%.

All the businesses were chosen randomly from an international database of the Romanian production SMEs with an active business around the country.

Type of Analyses and Interpretation

Analysis

Firstly, the questionnaire is basically created and designed for the Romanian SMEs, to highlight the perception of these businesses regarding the impact of the innovation on the competitive advantage all over the country, especially how it these characteristics influence the activity of the companies itself and how they can resist in a competitive market in those days. Essentially, the problem in Romania with the innovation amongst SMEs it is an old problem, since the end of the communist regime, trying different stabilization solutions to stabilize the market competitiveness.

To be more specific, the lack of an economic vision together with the lack of involvement of the authorities has made the innovation among the SMEs to be at a historical minimum, and this thing is the best observed in times of crisis. The health crisis that Romania is going through, had a direct impact on all the companies in the country, particularly in the loss of some material resources which affected the flow of development and innovation. As is shown in Figure 3, a succession of three economic variables with particular importance for the production business itself but also for the Romanian economy was selected: economic innovation, technological innovation, and services innovation.

The information that was collected from the questionnaire was carefully analyzed and as a conclusion, it could be noticed that company management considered that all three variables were directly involved in the development of the companies and have a powerful impact on their competitive advantage in the market. The variables that were selected have obtained an average score above 4.34 out of the maximum 5 possible. The most important variable of the three of them from the perspective of the analyzed companies was the technological innovation with a value of 4.96 which was very close to hitting the maximum value of 5.

Assumed these results, it can be quantified that the Romanian SMEs considered that the most important variable between these three for their businesses is the technological innovation value, although the other values are a point of interest for them. These results put in good light the interest in creating a competitive advantage in the Romanian market because all the interviewed companies answered positively to market changes.

Figure 3: Economic variables with the most influence on the Romanian SMEs
Source: survey responses - author

The second statement approached in this questionnaire was the respondent's opinion about which is the best strategy that is involved in the development of the company, in order to obtain a competitive advantage in the Romanian market. The purpose of the statement was to identify which strategy in the Romanian market it's more reliable for obtaining a competitive advantage and by what methods it may influence the future development in the actual market situation of the SMEs.

A total of 55% of the company management considered that the strategy of cost reduction is more reliable for the actual condition market, due to the economic uncertainties caused by the global crisis situation. In a world where cost-cutting is boundless, Romanian SMEs believe that the entire process of cost-cutting is most effective in gaining competitive advantage, although this method involves

several risks factors for the businesses. The most common types of cost-cutting are reliable especially to big companies, who have big development budgets, which have several long-term management strategies, and also who know how to use efficiently the time management. The only way for the Romanian SMEs to keep pace with the big companies is by innovation. Even if, it's a technological innovation, a product innovation, or a service innovation, this is the simplest method by which SMEs can obtain competitive advantage without losing their market share in the grey times.

The other percentages of the analysis were randomly divided to the other processes from the questionnaire, because the owners or the managers that were interviewed, consider that these variables cannot have a direct impact on their competitive advantage and especially on the profit rate on a short time range.

Figure 5 : Involving strategies of the businesses

Source: survey response – authors

Gathering all the ideas together, it could be concluded that Romanian SMEs are directly interested in obtaining a competitive advantage through a strategy of cost-cutting, even if, above, the answers also showed a direct relationship with the innovation strategies, especially with the technological innovation. This idea shows up that companies understand the potential development in the market and the achievement of competitive advantage through innovation, but the primary intention is to cut the costs, in order to obtain a better position in the market. The next two issues addressed in our questionnaire were meant to identify how the Romanian SMEs will treat the future. Through innovation strategies or through cost-cutting strategies? Can SMEs keep up with the accelerated changes in their market? Can their products or services be sustainable through cost-cutting or through innovation?

For a different result, it was used a Likert Scale, as it can be noticed in Figure 6. The two questions highlight, the managers' interest in the Romanian market development and in resolving the actual problem by different managerial strategies. Results show that the managers are completely aware that the actual crises can affect their longer-term plans regarding the strategic development process.

Thus, for the first statement, the score was 0.66 which means that the users totally agreed that their businesses could use cost-cutting strategies in order to be more competitive on the market in the long term situation. For the second statement, the score was -0.23 which means that the managers that have answered this questionnaire, disagree that the product or service they are currently offering may provide a long-term competitive advantage for their business through innovation. They feel slightly unprepared

regarding their products or services since they do not want to be involved in a development process through innovation.

Figure 6 : Liker Scale Graphic

Source: survey response – authors

As a short conclusion, respondents believe that a cost-cutting strategy is the best way to make an impact directly on the market, especially in a long period of time in the Romanian market. Though, this market underwent major changes during this uncertain period of time, at least declaratory, the managers do not agree with the idea of implementing a product innovation strategy.

Correlation

In order to obtain more accurate and valuable results, Pearson's correlation was conducted for this questionnaire. This correlation helps the questionnaire to make some tests, whether there is or isn't an interdependence relation between the variables in the test questionnaire.

For the statistic population of the research, the critic value R, in Pearson's correlation was equal to 0.232. In order to go the further direction of the questionnaire with the data analysis, the identified values need to be at least equal or greater with 0.232, regardless of whether the values are positive or negative.

Table 1: Bivariate correlation of a number of certain variables

		O1	O2	Q3	O4	O5	O6	O7	O8
O1	Pearson Correlation	1	.153	.232*	.064	.361**	.106	.191	.109
	Sig. (2-tailed)		.187	.044	.582	.001	.364	.099	.347
	N	76	76	76	76	76	76	76	76
O2	Pearson Correlation	.153	1	.463**	.142	.137	-.208	.010	-.173
	Sig. (2-tailed)	.187		.000	.221	.239	.072	.935	.135
	N	76	76	76	76	76	76	76	76
Q3	Pearson Correlation	.232	.463**	1	.155	.226*	-.106	-.022	-.196
	Sig. (2-tailed)	.044	.000		.181	.050	.362	.848	.089
	N	76	76	76	76	76	76	76	76
O4	Pearson Correlation	.064	.142	.155	1	-.074	.034	-.017	-.056
	Sig. (2-tailed)	.582	.221	.181		.524	.771	.886	.632
	N	76	76	76	76	76	76	76	76
O5	Pearson Correlation	.361**	.137	.226*	-.074	1	.251*	.131	.087
	Sig. (2-tailed)	.001	.239	.050	.524		.029	.259	.454
	N	76	76	76	76	76	76	76	76
O6	Pearson Correlation	.106	-.208	-.106	.034	.251*	1	.238*	.240*
	Sig. (2-tailed)	.364	.072	.362	.771	.029		.039	.037
	N	76	76	76	76	76	76	76	76
O7	Pearson Correlation	.191	.010	-.022	-.017	.131	.238*	1	.136
	Sig. (2-tailed)	.099	.935	.848	.886	.259	.039		.242
	N	76	76	76	76	76	76	76	76
O8	Pearson Correlation	.109	-.173	-.196	-.056	.087	.240*	.136	1
	Sig. (2-tailed)	.347	.135	.089	.632	.454	.037	.242	
	N	76	76	76	76	76	76	76	76

In order to obtain a better result for this questionnaire, Pearson's correlation was used to determine if it is a strong or a week relationship between 76 companies' thoughts regarding the influence of the innovation to the competitive advantage of their entire business. Based on the analyzed information, the identified values from the table showed a total of 7 correlations, none of which are strong or very strong. From these 7 correlations that we identified in the questionnaire, just four correlations are with a moderate impact, and two of them with a week impact on the statistical sample. In this analysis, it can not be identified a strong or a very strong correlation which means there is not a direct impact factor in the final result.

The rest of the correlations presented in Table 1 are very week correlation with no impact factor on the final result, so that means the statistical samples are not relevant to this questionnaire. Also, the p-values for the correlations presented between types of global strategies are more than 78.55% upper than the significance level of 0.05, which indicates that the correlation coefficient is not significant.

Making an optimal analysis of the results, it can be said that only a small part of the local companies consider that innovation represents the vital process in the sustainable development of the Romanian market. Even if, the respondents thought that the key to innovation is by technology, few of them consider that the adoption of an innovational strategy through technology or products as a real solution to the long term period. But the real question in general, is why do some companies choose product innovation while others go for cost-cutting as their main long-term business strategy? Why Romanian SMEs, especially the production companies, try to use cost-cutting as a long-term business strategy? As a short conclusion based on the answers in the questionnaire sent, it was identified that managers of the Romanian SMEs are generally scared of what the innovation process itself means and how it

should proceed in their future, as a company. Managers cannot understand how innovation strategies and the entire process of the implementation of these strategies can directly impact their competitive advantage and their rise in the Romanian market. Generally, young firms were more likely to go with cost-cutting strategies than with technology innovation because they may receive easier acceptance on the market through this strategy of cost-cutting, by a short period of time. Afterward, there is a necessity for a change in the strategic system and a more careful identification of management solutions and the best way to do it it's through innovation. – even if it's product, service, or technological innovation.

At the last conclusion, it was identified that managers who participated in the questionnaire directly, have a lack of confidence in the innovation strategy of the products or services that they offer, especially in terms of the lack of knowledge in the managerial field together with the fear of losing the market share that has already built in the past.

Conclusions

In the new economic environment following the last financial crisis of the last decade, strategic management has become, a pillar in the competitiveness of a firm, especially of small and medium-sized businesses that are trying to make a great impact on the market in order to obtain a competitive advantage. The major reproach of this decade, especially for the Romanian SMEs, is that businesses are more and more disposed to a reactive attitude regarding the market and allow themselves to be directly controlled by all the events around them. Unfortunately, they have not reached the maturity to control their own destiny through their own decisions, regardless of the current situation in the market.

This study has nuanced these statements by clarifying how the Romanian SMEs will improve their market share and how they will obtain a competitive advantage by clarifying their long-term strategies and the impact of these strategies on their products and services. The long-term strategies that were involved in this discussion are the technological innovation strategies and cost-cutting strategies. It was made a short story about how the business itself is ready to implement these types of strategies in order to obtain a competitive advantage by maintaining and developing a better market share system.

Technology and productivity, together with innovation are inseparable and impenetrable. Technology innovation improves productivity, and productivity is one of the most important forces of competitiveness. Without productivity, companies cannot obtain a competitive advantage at an optimal level of direct market participation. Unfortunately, this research has confirmed the opposite. Mostly, the Romanian SMEs are feared of adopting long-term business strategies that imply innovation, relying in particular on cost-cutting strategies, because as they said, it's easier to adopt and implement in their managerial system. But will this thing work on a long-term idea?

Despite the idea that Romanian SME has already developed, it's unknown if this type of strategy will work on a business for a long-term period or it's just something temporarily. Despite, the innovation strategies are more present in the other economic sector in the western European Union countries, in Romania, this term it's still as unknown as ever. For big companies, in Romania, it is a must to develop these innovation strategies, because they came with an occidental mindset and with a different managerial culture. But this is not generally true for small and medium-sized companies, despite their age, structure, and employee number.

The results indicate, that the Romanian small and medium-sized companies managers consider that they work in an unstable environment and the only way for them to obtain competitive advantage is by a strategy of cost-cutting. In Romania, the opportunity to grow in an unstable market is literally huge, the companies being able to test all the strategies in order to obtain a competitive advantage. Best practices shared by them can be taken as reference, adapted, and implemented by the local companies in order to have a safer and healthier growth. As a future direction for research, given the complexity of the topic, we would suggest looking more into the innovation strategies by companies involved in the production, focusing on the Romanian market and trying to identify, whether or not this type of strategy will be developed and adopted in the near future.

It in Management and Functioning of Enterprises in A Coronavirus Pandemic Situation - Advantages and Dangers

Tomasz LIS and Aleksandra PTAK

Faculty of Management, Czestochowa University of Technology, Częstochowa, Poland
tomasz.lis@pcz.pl, aleksandra.ptak@pcz.pl

Abstract

It is hard to imagine the functioning of modern man without IT elements. They allow to speed up and improve work. The development of computer networks, telephony and especially the Internet gives the opportunity to work remotely. Currently, it seems that this functionality is the best tool in counteracting negative, not only economic effects of the coronavirus. It allows to carry out previous tasks in a way that does not require direct meetings of employees, employees with clients or students with teachers. However, the scale of the phenomenon and the immediate necessity to switch to this style of operation suggest that this is not easy for many enterprises. IT is not only tools used at work. It also includes all devices enabling people to receive and transfer information. In this regard, everyone gets a huge amount of information about the coronavirus every day. This is the vast majority of information about negative emotional background. As research shows, it has an impact on human effectiveness. The purpose of the publication is to show undeniable advantages of using IT tools in the age of coronavirus. The goal is also to present risks associated with it. The paper presents results of surveys carried out by the author after the spread of the virus. Other authors' research was also used. In addition to the survey results, the author's participating research results and information obtained during his interviews will be presented. Correlations between the results allow to better analyze and understand the essence of the problem under consideration. Due to the complexity of the subject, research areas have been proposed, which should now be of interest to researchers in the field of management sciences, but not only. A feature of the current threat is, according to the author, the need for multicriteria analysis, looking from many points of view - interdisciplinarity. Only this allows to understand the real essence of the problem and propose solutions for the future.

Keywords: Management, IT, Teleworking, COVID-19

Introduction

At the end of 2019, first cases of new virus in China were reported, which is referred to as COVID-19. Due to physical distance in many countries of the world, this threat was treated for a long time as a problem "which will not reach us". As the following weeks showed, these opinions were completely wrong. The virus, which is a real threat to life, as a result of lack of recognition, exceptional ease of transmission, lack of medicine and vaccine, "hit" the basis of human functioning - freedom of action. The only real way to protect people in threatened areas (now almost all over the world) is isolation. People were forced to lock themselves in their homes, limiting mutual contact as much as possible. The situation concerns private and professional life.

Thanks to the development of ITC, these restrictions apply only to the sphere of life in the physical dimension - real contacts. At the same time, they do not concern the sphere of functioning which is based on the transmission of information at a distance. New, completely unpredictable challenges have emerged before the unit. Among many of them one can indicate the need for remote work. This is a problem with many dimensions, one of the most important elements of which are: the transition from stationary to remote performance of duties, simultaneous remote work of all who are isolated from the outside world and remaining in the same limited physical place, the need to adapt the company infrastructure to this type of work, the limitations of IT tools that allow to carry out professional tasks properly (this applies to working people and students at every stage of education), overwhelming everyday life, overwhelming negative information, attacking people from all sides.

Many enterprises, especially their management, faced the necessity of adapting to new realities practically immediately. The problem is not just technical adjustment, it seems even the smallest challenge. The basic problem is the complete reorganization of employees' functioning, limiting the impact on their professional functioning, and the inability to limit external factors disrupting work.

In the above aspects, the subject of this paper is the importance of IT in the management and functioning of enterprises during the epidemics. The basic guiding idea of the paper is that IT is one of the most important elements conditioning the ability of enterprises to operate in times of the epidemic crisis.

Considering that human is the basic element of IT and the fact that all known technical elements of this technology affect his professional functioning, which is noticeable especially now, a detailed assumption was adopted, according to which: there is a number of factors affecting the reduction of productivity and comfort of work using IT in crisis situations. The study is based on a survey sent electronically, which was carried out during the epidemic. As it is shown, the author's participating research as well as conversations and interviews conducted by him during the pandemic are also of particular importance.

IT and conditions of its use during the COVID19 pandemic

The key factor, never before unprecedented, affecting the companies are now conditions of their functioning. Virtually all European countries and very many around the world have introduced mobility restrictions. In this way, humanity has been to a large extent closed in homes. Many companies cannot carry out their tasks normally. The only means of communication, which has always been the basis of every action, are technical means: telephone and computer with appropriate software. Another important element of the work is a computer connected to the Internet with installed software dedicated to specific duties. It should not be forgotten that the same tools (except for work-dedicated programs) serve everyone as the basic means of interpersonal communication that is the basis for the normal and proper functioning of societies. An important factor affecting ability, productivity and, ultimately, the quality of work, is the close proximity of people of very different ages in close relationships - families. Each of them has its own habits and needs, including those related to the use of IT tools. Due to the organization of life, they usually occur at the same time.

IT and in particular ICT information and communication technology, are closely related to the technological development of humanity. This applies especially to the area of information and information management, which has always been the basis for human functioning (professional and private life) (Bigi et al, 2018). Information technology consists of information processing methods and tools related to their identification, selection, collection, registration, storage, processing, transmission and deletion. The key element of IT is human. He decides about the effectiveness of its use. In this regard, IT can be defined as "the ability to effectively use means and tools and sources of information, to analyze, process and present information, to model and measure devices and events, and to control them"(Michałek, 2011).

IT is therefore a basic element of work and study (Zovko, 2016), and as a result of the development of the Internet also everyday life. Research has shown that over 80% of citizens use the Internet in Poland (Ponad, 2020). As weighed at the Polish Ministry of Digitization, "Poles, which results from our study, do not use the Internet only when they are sleeping. They want to be online all the time. And they use the Internet as the tool that improves the quality of life" (Ministerstwo, 2020). This situation applies to the entire world. (Raport, 2020)

This widespread use of IT in virtually every area of life, while limiting leaving home, with limited technical resources of work-enabling stations, combined with interpersonal conflicts and constant stress, are a great challenge for a person living in the time of COVID-19. This problem is particularly important because of the continuity of the functioning of communities, countries, which is strictly dependent on the ability of normal human functioning. It consists of two basic levels: professional and private. In the epidemic, they are constantly intermingling, like never before. At the same time, they heavily rely on IT.

IT in the pandemic - benefits and threats

The development and introduction of IT in enterprises was caused by the desire to improve the area related to the acquisition, transmission, collection and use of information. In general, with the decision-making process (Kadiria et al., 2016). The basic benefits of IT in management are (Nisa et al., 2019): effective management of employees' time, task allocation, organization of processes, document circulation, availability of documents and information, reduction of costs associated with traditional paper circulation of documents, greater level of data security, better organization of information disposal and allocation of rights, reduction of office space, better possibility of supervision and information control, improving the quality of the customer service process - both external and internal, the ability to perform many tasks and duties from places with Internet access. From the point of view of the topic discussed in the paper, the benefit of distance work should be considered as the key one.

Teleworking is defined as "the way in which work is organized and carried out using IT techniques under an employment contract or employment relationship, where work that could be performed in the workplace is regularly performed outside the workplace" (Wiśniewski, 2014). This way of performing duties is different from the traditional one. Providing remote work capabilities requires organizational adaptation. Among advantages of this way of working in times of pandemic there should be indicated: isolation (prevention of infection), emphasis on the effects of work, the possibility of employing employees living even at the considerable distance, adjusting the workplace to the individual needs of the employee. It is assumed that remotely employed employee is more efficient than a full-time employee (de Viries, 2019). This advantage, however, occurs only in enterprises and in positions adapted and dedicated to this style - organized and introduced earlier. In a coercive situation, it is unlikely to occur, although it is not excluded that this may occur. Considering general chaos, stress, fear and coercion, performance degradation should be expected, especially in the initial period (Cewińska, 2016). This is indicated by the author's research results, which are presented later in the publication. This is also indicated by research carried out in this respect by other researchers (Jak, 2020). Considering the issue of IT in business management in the time of COVID-19 it should be stated that the basic benefit is safety, health and the possibility of further functioning. All other factors that make up pros or cons are of minor, secondary importance.

The disadvantages of telework include: difficulties in managing human resources, high initial costs, the phenomenon of isolation and limited cooperation with superiors, limiting the level of security and confidentiality of information, increasing the impact of equipment failures on work efficiency, increasing stress resulting from the lack of clear boundaries between working time and rest, family relations, earnings dependence from the effects, social isolation, lack of organization and supervision of work (may cause limitation of competences), limitation of ties with the company, extension of the time needed to carry out specific activities, communication problems within the team (Oleksiejczuk and Oleksiejczuk, 2009). Considering the benefits and disadvantages of teleworking during COVID-19, it should be noted that benefits are reduced while disadvantages are increased. The disadvantages are compounded by additional factors, among which are: job insecurity, fear for one's own and loved ones' health, rapidity of the phenomenon, family conflicts in the situation that is unprecedented in most cases of the necessity of being in the same company constantly, the amount of negative information provided from each source, organizational chaos, higher than normal initial costs (resulting e.g. from lack of experience, including real needs), limited rest options, the need to work in positions that often have insufficient tools to protect privacy and data security (COVID-19, 2020). Many of issues related to benefits and disadvantages of teleworking in the current pandemic are analyzed in the research part of the paper.

Among the most important factors facilitating and improving the transition to remote work, the structure of the organizational structure should be mentioned. It is much easier to switch to new conditions and meet the challenges of those enterprises that previously had a flexible structure (Nordbäck, 2017). It is much more difficult for entities with previously formalized structure. The new "reality with a virus" has shown the undeniable advantage and advantages of a flexible structure. It also showed the importance of knowledge, experience, cooperation skills, trust, reliability and ethical approach to employees and the client. A flexible structure is rightly associated with doing business in

times of globalization, uncertainty and dynamic change. It is considered in this regard as something indispensable.

The concept of flexibility is multidimensional. It is associated as something contrary to stability and rigidity, and as a synonym of adaptation. Fitting speed plays a very important role in flexibility (Flaszewska and Zakrzewska-Bielawska, 2013). The appearance of COVID-19 in relation to economic effects was a very sudden phenomenon, practically unpredictable, requiring immediate, huge scope of activities. Flexibility as a feature was a necessary factor for adaptability, based in most enterprises entirely on IT.

One of the most important problems in functioning during the pandemic, including in the professional area, is stress. From the technical point of view, its basis is information. Importantly, there is a lot of it every day. This is directly influenced by the widespread use of IT tools and an innate tendency to search for and obtain information related to everyday life. COVID-19 is the main area of interest. Information about it is provided by every news program on TV or radio, it is the basic issue in printed messages and placed on the Internet. It is one of the most important topics raised in everyday conversations among people forced to remain in seclusion.

A remote working unit, using the computer for this purpose, often "rests" browsing news pages. COVID-19 is present everywhere in every area of IT use. In the information society, in which IT is the basis of functioning, stress is considered in the context of information stress.

In the information stress, the main excitation factor is the excess (in relation to the possibility of processing, delivered to the unit) information that is delivered to the recipient at a high speed and from every possible source. As the result, there is a cognitive impairment and individual response to external factors. The basis of information stress is the amount of information received. Currently, during COVID-19 there is also the factor of negative significance of the majority of information received and uncertainty of the future in every aspect of life, both professional and private. This obviously intensifies effects of stress, negatively affecting work efficiency (Morin et al., 2017).

Performing work remotely requires computerized position. Not all companies had the opportunity to provide the employee with the necessary technical facilities. That's why many people work on their own computers. Their level of security is not always sufficient (Praca, 2020). This increases the risk of important data being lost or leaked. According to research results during the pandemic, hacker attacks have intensified. As results of the research show, the concern about the possibility of losing confidential data during COVID-19 is expressed by 71% of specialists and 95% of people working remotely (Koronawirus, 2020). Awareness of the often top-down disposition of important data at home and awareness of leaks in the data protection system are the natural concern for employees. Thus increasing their stress.

IT in the professional life of employees during COVID-19 - results and analysis of the conducted research

The study uses following research methods: traditional survey (PAPI), individual in-depth interviews (IDI) and participatory observation study. The survey was conducted in the initial period of introduction of the epidemic emergency in Poland from March 14, and ended on April 4, i.e. two weeks after the introduction of the epidemic. The study was conducted on the group of 183 people who the author reached by sending an electronic survey form. Due to the topics taken up, the study involved persons working between ages of 18 and 65. The survey was sent to 178 people, with a request to spread it among friends. Given the age at which the author of the publication is influencing the target group of the study, it was assumed that in the family remaining in the place of residence, in most cases there are at least two working people and at least one remaining in compulsory education. Some sources have given more than one completed questionnaire. Given the general chaos, fear and uncertainty, the survey was not long and complicated, it consisted of 11 questions related to the use of IT during the epidemic. It was carried out during the rapid transition to the remote work of employees in many companies. Although the study was started before the epidemic was introduced, it

was widely known that it was only a matter of time - action to enable adaptation measures (this time was very limited). The presented research sample results from the author's limited possibilities to reach people who may have been interested in completing the survey. It also results from the approach of people to participate in the study in the period in which it was conducted. General stress, uncertainty, fear and chaos were factors that negatively affected the willingness to engage and express their opinions. Therefore, the author considers obtaining 183 answers a success. Due to restrictions on the research sample, this part of the study, which is related to participant observation and the author's conversations / interviews, becomes particularly important. It seems that this way of research in the issues raised in the work and especially the time of their implementation, allows the collection of information free of distortions arising from the awareness of the individual in the process of completing the survey. The factor that negatively influenced the number of surveys, i.e. fear, stress, uncertainty and chaos, was also important. In such a state, people behave more naturally, express honest opinions, do not have time to distort and blur their daily reactions. The most valuable seem to be the information that is not subject to analysis processes by the source when it is expressed. At the same time, the author is aware of the limitations of participant observation resulting from operating conditions during COVID-19.

The analysis of the results was carried out in a logical order resulting from the publication layout. The following main hypothesis was formulated in the paper: IT is one of the most important elements conditioning the ability of enterprises to operate in times of the epidemic crisis. Considering the reality of functioning during COVID-19, in order to verify the main hypothesis, the following detailed hypothesis was put forward: there are a number of factors affecting the reduction of efficiency and comfort of work using IT in crisis situations.

Among participats of the survey, 3.28% said that as a result of actions taken in companies in connection with COVID-19, they lost their jobs. Only the traditional, stationary way of working at that time was declared by 39.89% of respondents. 56.83% of them confirmed the remote work. The research currently available on the Internet indicates that in Poland, about 33% of citizens perform remote work in connection with coronavirus (Praca, 2020). The difference between the results of the author's research and those cited may be due to the environment in which the author operates - being an academic teacher. Although it should be pointed out that remote work in the author's research also applies to people working in (state) administration, judiciary, wholesalers (administration). The results of the survey are confirmed by interviews / conversations conducted during the pandemic. 83.65% of respondents who declared remote work are between 27 and 60 years old. 8.65% - 18 to 26 years, 7.69% over 60 years old.

One of the most important questions about IT at work in coronavirus was about remote work performance. 64.42% of respondents said that this performance is lower, of which 13.46% much lower. 25.96% did not notice the difference in this respect. 9.62% believe that their productivity through remote work has increased.

Work without leaving home requires access to appropriate IT tools. In the next step of the study, it was checked whether employers were able to technically secure their employees in such a short time and in such a difficult situation. 13.46% of respondents said that the employer did not provide them with hardware and software. At least to the limited extent, this was done for 86.64% of employees. Therefore, the situation is not very bad, although it should be noted that 59.62% of people said that their hardware and software were guaranteed only to a limited extent. This is probably due to organizational difficulties in enterprises.

Since it was stated that employers provided elements of the necessary IT infrastructure with a limited number of employees, it was necessary to check their availability in places of residence during retreat (fig. 1). Only according to 10.58% of respondents (working remotely) the number of available positions is fully sufficient. At the same time, according to 26.92%, there are definitely too few of them. The largest percentage of respondents - 62.50% believe that accessibility problems are noticeable in their places of residence, but they expressed the view that they are somehow dealing with this problem. Among the reasons for the relatively low assessment of the availability of IT infrastructure one should mention the number of people staying together in a place of seclusion who

during their daily existence in COVID-19 have to use it. It should be noted that they are not only adults and working people. A very large group that have to connect remotely every day are students who acquire knowledge at all levels of education. Since all classes take place in the morning hours, this group occupies a significant number of equipment. At the same time, it should be assumed that in not many families the number of computer workstations is the same as the number of people forced to use them at the same time. In response to the question about the number of people living together whose work and / or school duties require the use of IT infrastructure, the respondents indicated that in 8.65% of cases there is only one, 20.19% two, 62.50% to 4, and 8.65% even more. This clearly shows that this is a real problem of remote work performance during COVID-19.

Fig. 1: Is there a sufficient number of (IT) positions at your place of residence during the pandemic to allow all interested persons to complete their duties (professional, school) without conflicts?

Source: Own elaboration

Experience in remote work is also influenced by experience. Of the survey participants who were faced with the need for this type of work, as many as 43.27% did not have any experience in this area. 35.58% of people declared little experience. Only 19.23% did this often before, and 1.92% work this way every day. As shown, 78.85% of respondents did not have any experience in remote work, or it was very limited. Analyzing the impact of this fact on the efficiency of remote work, one can use the distribution of answers obtained in the question about the assessment of the initial stage of work - after such a need arises. Only 23% of respondents said that the transition (including 2 people to continue) to remote work was easy or very easy. According to 11.54% of people, it was very hard for them. The largest group of people, 61.54% believe that it was difficult process for them. 4.81% were unable to determine this. It should be presumed that these problems were mainly caused by fear of the future, stress and chaos. It is characteristic that older people suffered transition to remote work the worst. Only one in eight people over the age of 60 marked the answer “difficult to answer”, for the rest it was a very hard or heavy process. These types of answers also often appeared in the group of people aged 46 to 60. The explanation may be the fact that, as research shows, the percentage of people using IT on this Internet decreases with age (Aktywność, 2020).

The transition to remote work in connection with COVID-19 was caused by a threat to human health and life. It was treated as a voluntary action of employers, but also resulted from the relevant provisions of law. In this regard, the respondents were asked about the factor that in their opinion is the most important advantage of teleworking during a pandemic (Fig. 2). As expected, the largest percentage of people gave an answer related to ensuring health - reducing the possibility of infection

- 60.58%. This tendency is confirmed by the results of other studies (Praca, 2020). In second place in terms of the number of selections there was an answer related to the possibility of work, the alternative of which would be temporary (unpaid leave) or permanent (job loss) loss of earnings - 25.00% of responses. The smallest number of people in this regard indicated the possibility of staying at home - more time for the family - 14.42%. It is characteristic that with the inflow of completed questionnaires one can notice a certain regularity. In the initial period, most people indicated the health protection factor and more time for the family, but over time the opportunity to earn for living became more important than family contacts. At the same time, the difference between the number of answers health and earning decreased.

Fig. 2: Which of the following factors do you think is the most important advantage of being able to work remotely during COVID-19? (only one answer can be given)
Source: Own elaboration

The next question deals with the subject of defects and / or problems related to the use of IT during COVID-19 (more than one answer could be given). Placing this question in the survey resulted, among others from the analysis of statements of people during the author's conversations / interviews. The respondents often pointed to broadly understood stress, problems with the distribution of work (due to the number of people remaining locked up), or the lack of appropriate equipment. Another reason for this question was that IT is just one of elements used at work. Its part is everything that serves human activities based on information. And modern human, who is the most important part of IT, in large part, thanks to IT, is constantly receiving large amounts of information (Przeciążenie, 2020). Too many of them cause information stress. Its scale and strength of impact during the pandemic is very large and compounded by the amount of negative (stress-generating) information.

The respondents stated that the biggest disadvantage of using IT elements during COVID-19 were difficulties in determining the daily work schedule of individual people (remote work) - 79.81% of responses. In second place in terms of the number of selections was: stress related to switching to remote work - 75.00%. Lack of appropriate hardware and software was indicated by 61.54% of people, and stress resulting from too much information reaching, 45.19% of respondents. At the same time, it should be pointed out that, according to over 94.23% of respondents, COVID-19 is important, very important or even the most important topic of talks and / or seeking information.

Conclusion

As shown in the results of the research presented in the publication, the use of IT, as predicted, turned out to be an important issue in human functioning during COVID-19. It has contributed to increased security, limiting the speed and scope of spread and the possibility of continuous earning. The scale

of the problem associated with COVID-19 was so large and dynamic that it exposed many of problems of modern human. They also did not bypass the IT sphere. It turned out that the same technology that can help the person, is able to negatively affect everyday life. The huge amount of information reaching the individual, which in itself is the cause of information stress, supplemented by their unequivocally negative effect on humans. And it is IT elements that increase its information capabilities. Unpreparedness of most organizations to such a rapid action in the field of remote work resulted in chaos and the stress associated with it. At the same time, this problem does not concern only the professional sphere, but the second main sphere of human life outside private life - education. The need for widespread use of IT, often at the same time, has caused organizational problems in many isolated families, adding to the general stress and uncertainty of tomorrow. In addition, hackers have become very active on the network, who, using the general chaos, have intensified activities aimed at unauthorized access to sensitive data, phishing, access to accounts. It all happens in the IT area. These are problems, the solution of which for the future is, according to the author, the necessity. The more that, as reported (provided thanks to IT), the appearance of further unknown viruses can be expected.

Issues presented in the paper have been described only to the limited extent. Accordingly, the author believes that it should be continued. In particular, all individual areas that reduce the efficiency of work, but also the life of the remote person should be examined. How to prepare yourself organizationally (work, education, everyday life), how to limit the severity and impact of stress (on various levels), how to secure data, access to accounts, are questions that modern man will have to answer. Science plays an extremely important role in this respect. Due to the fact that it is difficult to identify the specific field that completely deals with such diverse problems, it is necessary to conduct interdisciplinary research from the beginning. Only extensive research teams are able to propose timely solutions that will allow modern people to hope that they are "reasonably" prepared for new threats. This applies, among others, to the sphere of IT application in he company management as one of the related particles in the general structure called human life.

Abstract

The purpose of the paper was to assess the quality of the intermodal terminals in Poland. The essence of the operational quality of the technical objects being the intermodal terminals was justified. The next part of the paper defines the measures of the operational quality and the technical parameters of the Polish terminals. On this basis, the nominal parameters of the intermodal terminals were determined together with justification of these values. For the purposes of assessment of the potential of the terminals, the Servqual method modified by the authors was proposed. Its applicability is shown on the example of 38 Polish terminals with reference to 12 criteria based on the available characteristics. In this way, the possibility to differentiate the level of the operational quality of the terminals was confirmed.

Keywords: Assessment of Operation Quality, Intermodal Terminals

Introduction

The key goal of the European transport policy in the light of the need to reduce the greenhouse gas emissions is to shift one-third of the road transport (300 km and longer distance) to rail and inland waterway transport by 2050. The Eurostat statistical data [7] indicates that the level of share of the long-distance container road transport in Poland in tonnes-kilometres in the total container transport (75%) was much higher than the European average (41%). It still means a low level of use of the intermodal transport. The necessary system changes and greater use of the reloading terminals should be expected in the near future. According to the data of the Central Statistical Office (2018), reloadings at the intermodal terminals in 2017 increased by over 26% compared to the last year, which proves this direction. In this context, it is therefore important to assess the readiness of the operation of the Polish intermodal terminals for meeting of the needs associated with the increase of the land reloadings. Assuming that operational efficiency is one of the most important features of the operational quality of a vehicle and can be a criterion for assessment of its operational usefulness [13], an analogous assessment may be attempted for the reloading terminals.

The purpose of the paper is to assess the quality of the intermodal terminals in Poland. For the purposes of this assessment, the Servqual method was used. This method was modified and adjusted to the needs of the assessment of the intermodal terminals as well as to the scope of the available data on the terminals.

Intermodal Terminals as Technical Objects

The systematic increase of the exchange of goods in the international trade determines the development of the transport technologies and the role of the individual transport branches in cargo movement. Therefore, the intermodal terminals play a special role in the cargo transport systems. These terminals provide the reloading & storage services for the intermodal transport units as well as other services connected with operation of these units.

According to the definition adopted by the European Conference of Ministers of Transport (ECMT), the United Nations Economic Commission for Europe (UNECE) and the Organization for Economic Community and Development (OECD), a terminal is an area intended for warehousing of intermodal loading units, which is equipped with machinery and reloading devices for handling of the intermodal loading units. According to another definition [10], an intermodal terminal is a spatial object with its proper organisation and infrastructure enabling reloading of the intermodal transport units: containers, swap bodies and semi-trailers between the means of transport belonging to different modes of transport as well as performance of operations on these units in connection with their storage and use.

In addition to handling of the intermodal units, the terminals also perform the function of a kind of an empty container warehouse to enable quick service of a customer reporting their demand for transport of goods in a container. Additionally, they may perform functions related to the logistic service of the cargoes delivered in the intermodal units. The scope of service of the intermodal units depends on the size of the terminal, its location and the needs of the customers in its catchment area. The main tasks of the intermodal terminal include:

- acceptance and dispatching of the intermodal trains,
- performance of the manoeuvres connected with replacement of the wagon groups in the transit trains,
- acceptance of the wagon groups waiting for incorporation in the appropriate intermodal train for a halt,
- reloading of the intermodal units in various relations (wagon - wagon, wagon - road vehicle, wagon - yard, yard - wagon, yard - road vehicle),
- ordering and grouping of the intermodal units on the storage yard and storage lanes,
- delivery and removal of the intermodal units by the means of road transport in the terminal service area,
- commercial clearance of the shipments in the intermodal units,
- repairs and washing of the containers.

The above-mentioned tasks should include the possibility to service vessels in case of sea and inland terminals.

The scope of the functions performed by the terminals is determined on their designing stage. Different methods oriented on the needs of the stakeholders are developed [2], [10], [16], [5], [11], [12]. In the recent years, research both on the attempts to assess and improve the operational efficiency [3], [17], [6], [1] and to expand of the scope of the services of the terminals [14] has been conducted [15].

Due to the area of impact of the intermodal terminals, their location is important. As the points of cargo reloading and changing of the means of transport as well as the points of concentration of service activities, the intermodal terminals are located in the places that provide access to the linear transport infrastructure (rail network and public roads) and provide the opportunity to combine transport within various modes of transport in accordance with the rules applicable to the combined intermodal transport. From the point of view of the location of the terminals as well as of the serviced means of transport, they can be basically divided into intermodal land and sea terminals.

In addition to the intermodal terminal infrastructure ensuring performance of its tasks, the reloading devices which allow for moving of the intermodal units between the distinguished zones are also important. In the intermodal sea terminals, cranes and quay cranes, track cranes, road cranes,

reachstackers, mast trucks, forklifts, straddle carriers, terminal tractors with terminal trailers and automated guided vehicle (AGV) systems are used. Due to the serviced means of transport, the intermodal land terminals (rail & road and rail & road & river ones) usually use container cranes as well as various types of container wagons (jib, mast and fork-lift trucks) [10].

The number of the devices as well as the variety of their applications requires in-depth analyses from the technologists in order to plan the resources in an optimum way to ensure the best possible process efficiency [8], [4].

Technical Parameters of Intermodal Terminals in Terms of Operational Quality

According to the Office of Rail Transport, in 2018 there were 38 intermodal terminals in Poland, of which 6 are sea terminals [9]. The location of intermodal terminals is shown in 0.

Fig. 1. Location of Intermodal Terminals in Poland

Source: file:///C:/Users/user/Downloads/9.-t.-bochenski-transport-intermodalny-w-przewozachrozproszonych-w-polsce-technologie-transportowe-09.03.2017%20(1).pdf

The selected technical parameters of the Polish terminals are presented in table 1.

Pilot Assessment of Operational Quality

The varied values of the characteristics describing the terminals initiated an attempt to assess their potential in terms of the operational quality.

Taking into account the previously specified quality assessment criteria and the availability of the data, the research was limited to the following criteria:

- Y_{PW} - ability to receive and dispatch the intermodal trains with the train length of 600 m;
- Y_{PP} - possibility of parking of the road vehicles waiting for acceptance of the intermodal unit,
- Y_{OT} distance of the terminal from the national road;
- Y_{LK} - number of isothermal containers simultaneously connected to power sources;
- Y_{TK} - number of railway tracks;
- Y_{RE} - number of reachstackers;
- Y_{WK} - number of other container wagons;
- Y_{ST} - number of cranes;
- Y_{NW} - service of swap bodies;
- Y_{NS} - service of semi-trailers;
- Y_{NJ} - repair of intermodal units;
- Y_{MJ} - washing of intermodal units.

The trial assessment of the operational quality of the intermodal terminals using the given criteria will take the form of the following function:

$$\beta_n^E(t) = f[Y_{PW}(t), Y_{PP}(t), Y_{OT}(t), Y_{LK}(t), Y_{TK}(t), Y_{RE}(t), Y_{WK}(t), Y_{ST}(t), Y_{NW}(t), Y_{NS}(t), Y_{NJ}(t), Y_{MJ}(t)] \quad (1)$$

The pilot assessment of the operational quality was carried out with the use of the *Servqual* method. The terminal characteristics are divided into two main areas: terminal infrastructure, terminal suprastructure (reloading machines) and rendered services. Application of this method to assessment of the characteristics of the intermodal terminal required definition of their nominal values. The nominal values of the parameters of the intermodal terminals will not be the same for every terminal. A good example here is lack of the need to install the quay cranes at the intermodal land terminals or lack of the need to use the container cranes in the terminals with very low daily rotations and a small storage area, which consequently results from the subordinate nature of such a terminal.

In addition, weights indicating significance of the characteristics should be assigned to the individual terminal characteristics (Table 4). It is necessary to calculate the Servqual weighted mean.

The individual values of the nominal parameters of the intermodal terminals, together with justification of these values, are presented below. Additionally, these parameters are compiled in table 2.

Characteristics of Intermodal Terminal Infrastructure

The characteristics of the terminal relating to terminal infrastructure and analysed as *meeting* the *requirements* (1) / not *meeting the requirements* (0):

- Y_{PW} - ability to receive and dispatch the intermodal trains with the train length of 600 m - 600 m length of the rail tracks in the intermodal terminal allows one-time acceptance of the entire train composition. Terminals equipped with shorter tracks must separate the train into wagons of the total length corresponding to the length of the loading tracks in the terminal.
- Y_{PP} - possibility of parking of the road vehicles waiting for acceptance of the intermodal unit - parking spaces for 30% of road vehicles bringing/taking the intermodal units within a working day should be provided for in the intermodal terminals. The number of the needed parking spaces will vary from terminal to terminal. In connection with availability of the data on the annual reloading capacities of the individual terminals (expressed in TEU) as well as the number of working days in a year (250 days in 2018), daily terminal turnover of the terminals was determined. Due to the fact that the road vehicles bring/take various types and sizes of the intermodal units, the calculations assumed (according to the data of the Office of Rail Transport) that the share of 20', 40', 45' and 30' container units in the daily turnover would be 35%, 58%, 7% and 1% of the daily turnover respectively. In addition, it was assumed that in the case of the sea terminals, due to the specificity of the container transhipments carried out there, only half of the daily turnover of the terminals would be subject to road transport. The remaining part of the daily turnover are intermodal units transported in rail and sea transport.
- Y_{OT} - distance of the terminal from the national road - the guidelines for the location of the intermodal terminals indicate the need to build the terminals near the public roads. When analysing the distance of the terminals from the public roads in Table 1, it was assumed that the nominal distance should not exceed 1 km.
- Y_{LK} - number of isothermal containers simultaneously connected to power sources - based on the determined daily terminal turnover and share of the isothermal containers in the transport, the number of the necessary storage places equipped with power sources was determined. According to the data of the Central Statistical Office, 4.5% of the weight of the cargoes carried in the containers is food, drinks and tobacco. On this basis, for the purposes of the research it was assumed that 3% of the cargoes were the cargoes transported in the isothermal containers. In addition, it was assumed that a standard for storage of this type of containers at the terminal was 2 days.
- Y_{TK} - number of railway tracks - for the purposes of the research it was assumed that the nominal number of the railway tracks (allowing the train to wait for unloading and possible shunting work) was 2, with the assumption that the terminal would meet this condition if the length of a single track was at least 600 m.

Characteristics of the Superstructure (Reloading Devices in the Terminal)

Terminal characteristics relating to availability of the reloading devices and analysed as *available* (1)*/unavailable* (0):

- Y_{ST} - number of cranes.
- Y_{RE} - number of reachstackers.
- Y_{WK} - number of other container wagons.

Characteristics of Services Provided by Terminals

Terminal characteristics relating to availability of the services provided by the terminals and analysed as *available* (1)*/unavailable* (0):

- Y_{NW} - service of swap bodies
- Y_{NS} - service of semi-trailers
- Y_{NJ} - repair of intermodal units
- Y_{MJ} - washing of intermodal units

Table 2. Summary of the nominal values *N* of the analysed technical parameters of the Polish terminals

Comparison of the expected (nominal) and current values of the individual characteristics of the intermodal terminal allows to answer the question about the operational quality of this logistic facility (table 3). When for the individual characteristics of the terminal the nominal values of the parameters are lower than or equal to the values of the current parameters, it should be assumed that the expectations towards the terminal are met. Otherwise, the quality of this object in the analysed scope does not meet expectations.

For the purposes of the research carried out in this paper, a modification of the Servqual method was proposed. The modification consists in the fact that the value of the assessment of the individual characteristics of the terminal will be 1 if the terminal meets the specified requirements (indicated in table 2) or 0 in the opposite case. The results of the comparison are summarised in table 3.

Table 3. Results of comparison of the current values of the characteristics of the terminals (table 1) with the nominal values (table 2)

First, according to the Servqual method, the total unweighted result was calculated for the characteristics of the groups (*infrastructure, suprastructure, services*). Consequently, the arithmetic mean for the results from the individual groups of the characteristics was determined, which as a result allowed for determination of the unweighted Servqual result by adding together the previously determined mean values and dividing the result by the number of the analysed groups of the characteristics (table 5).

After determination of the arithmetic measures of the individual types of the characteristics (*infrastructure, suprastructure, services*) for each of the terminals (table 3), it was necessary to determine the weights. Due to the fact that the reloading capacities of the intermodal terminals are basically decided on by their infrastructure (loading tracks, storage yards) as well as the used equipment, it was found that it was these groups that would be assigned the highest values of the weights. According to the guidelines of the Servqual method, the sum of the weights cannot exceed 100. The weights of the individual groups of the characteristics are summarised in table 4.

Table 4. Set of weights for the analysed groups of the characteristics of the intermodal terminals

Group of the characteristics of the terminal	Weight
Infrastructure	40
Suprastructure	40
Services	20

For the purpose of determination of the total weighted measure of the quality of the intermodal terminals, the arithmetic values of the examined groups of the characteristics obtained in the previous step were multiplied by the weights assigned to them. The obtained result is called the Servqual weighted mean. Then, the Servqual weighted means for the individual groups of the characteristics were divided by the number of these groups to obtain the total measure of the quality of the intermodal terminals (table 5).

Table 5. Values for the overall unweighted Servqual result and the overall measure of the quality of the intermodal terminals

Assuming that the intermodal terminal meets all of the criteria considered in this paper (the values of the individual characteristics assume the value of 1), the **total quality measure of such intermodal terminal would be 33.3**.

The schematically obtained results are shown in the figure below

Fig. 2. Results of the assessment of the intermodal terminals

The pilot assessment of the operational quality of the terminals based on 12 criteria confirmed on one hand the possibility to differentiate its level and on the other hand the diverse level of the potential of the assessed terminals. In this way, the following elements were distinguished:

a) 4 terminals that significantly meet the operational quality requirements (with the minimum score of 22.2),
b) 25 intermediate objects (with the score of 11.1-22.1),
c) 9 weakest terminals (with the score below 11.1).

The obtained result shows preparation of the terminals to an unsatisfactory degree, since only 10% of the terminals perform their functions and 20% of the terminals perform them at the lowest level.

These results allowed to draw a conclusion about the purposefulness of further work on the assessment method and its particularisation by further criteria corresponding to the operational quality features. To this end, referring to the individual elements of the infrastructure, suprastructure and services as well as the operational quality features, an extended assessment model may be developed.

Conclusions

Using the author's criteria, the available data and the modified Servqual method, the intermodal terminals in Poland were assessed in terms of their operational quality. It allowed for determination of the state of adjustment of the Polish intermodal terminals to performance of deliveries within the last mile. The presented assumptions show that only 4 terminals meet 70% of the conditions of the presented standard, which constitutes about 10% of all terminals in Poland. On the other hand, as many as 7 terminals achieved a result below 30% of the standard, which is approx. 18% of all terminals.

Considering the dynamic development of the intermodal transport and the current potential of the Polish terminals it may be concluded that this transport segment will be intensively developing in the coming years.

The author's pilot assessment in terms of 12 criteria confirmed the possibility of quantifying the level of the operational quality of the intermodal terminals. It may turn out to be useful for the overall assessment of the potential of the Polish terminals in the light of the challenges of their future development. In order to analyse the specific terminals thoroughly and to specify the directions for

improvement, it is necessary to take into account more criteria, which is the direction for further research in this area for the authors.

Abstract

This research examines the process of tax policy formulation for trade transactions through e-commerce in PMK Number 210 / PMK.010 / 2018 where this provision is revoked before implementation. The results of the formulation analysis in this study provide input on the design of tax treatment policies that can accommodate e-commerce activities in Indonesia. The research methodology was conducted with a qualitative approach and descriptive objectives. Data collection is done with literature studies and field studies through in-depth interviews. The policy formulation process is carried out in accordance with the available stages, but the policy formulator is not profound in formulating the problem, pragmatic in setting the policy agenda as well as in selecting alternative policies and does not conduct a public test before making the policy. In the future the government must issue regulations that are more binding or maximize the dissemination of tax knowledge to improve the taxpayer compliance.

Keywords: Digital Economic, E-commerce, Policy Formulation

Introduction

One of the advantages of globalization is the economic activities become smoother because of reducing of tariff and non-tariff barriers in trade and investment. (Setyowati, 2015) The development of world internet usage is very rapid, in 2018 it is known that 55.1% of the world population has used the Internet, especially in Indonesia there are predicted to be around 143 million internet users (internetworldstats.com, 2018). From a number of internet users, it is known that they spend an average of 531 minutes each day to access the internet where the average number occupies the fourth position in the world (wearesocial.com, 2018). Furthermore, if you look at data from Alexa (2019) and SimilarWeb (2019), among the top 20 sites most frequently accessed by Indonesian people are Tokedia, Bukalapak, Shopee and OLX, and social media, namely Facebook, Instagram, and Twitter. The behaviour of modern society which prioritizes practicality which is also supported by the rapid development of information technology has an impact on the shifting tendency to conduct conventional trading transactions to be online. This is one of the factors triggering the development of trading business through e-commerce as a new business platform. Based on data released by Statista, the number of e-commerce consumers in Indonesia in 2018 was 106.96 million people and is predicted to increase to 113.42 million in 2019. In addition, the value of e-commerce retail sales transactions in Indonesia in 2018 will reach USD9.536 billion and is predicted to increase to USD11.445 billion for 2019. These statistics place Indonesia as the country with the largest number of consumers and e-commerce transaction values in Southeast Asia (Statista, 2019).

The potential of e-commerce into activities that can drive the Indonesian economy going forward is quite high by looking at the behaviour of the people who strongly support the development of e-commerce activities. Therefore, the government began to pay more attention in supporting e-commerce activities in Indonesia by issuing Presidential Regulation (Presreg) 74 of 2017 on the Roadmap of an Electronic-Based National Trading System that functions to optimize the potential of electronic-based economies and one of the concerns in this provision is in the taxation field. The government through the Directorate General Taxation (DGT) has issued a circular letter SE-62 / PJ / 2013 concerning affirmation of tax provisions for e-commerce transactions and SE-06 / PJ / 2015 concerning withholding and collecting income tax on e-commerce transactions and to respond to the development of e-commerce activities In this commerce the government issues PMK 210 / PMK.010 / 2018 regarding the policy of tax treatment of trade transactions through e-commerce. PMK 210 / PMK.010 / 2018 is issued by the government with the aim of providing a level playing field between e-commerce actors and conventional traders, providing convenience in fulfilling tax administration obligations, as well as government efforts in collecting data related to e-commerce activities. However, on March 29, 2019 this regulation was revoked by the Minister of Finance before it was put into effect which was supposed to be on April 1, 2019. Therefore, this study wanted to analyze the process of formulation of PMK 210 / PMK.010 / 2018 to review the process of formulating these provisions as well as the design of policies that if possible, to accommodate e-commerce activities in Indonesia.

Literature Review

1. Policy Formulation

According to Anderson (Winarno, 2007, p.93), the formulation of policies involves efforts to answer questions about how alternatives were agreed upon for the problem being developed and who participated. In this process, this will help policy analysts find hidden assumptions, diagnose the causes of policy problems, combine conflicting opinions, map out possible goals, and design possible new policies (Dunn, 2003, p. 26), so that public policy formulation must done correctly, because it will have an impact on the implementation of the policy. As stated in Directorate General of Taxation's Vision has been updated to be "to be a trusted tax administration institution that treats all taxpayers fairly and delivers excellent service technology." It can be interpreted as moving towards trusted tax administration institution by treating taxpayers fairly and by providing best technological-based services. (Salifida, 2019) The public also believed that any government acts are always be based on the aim to achieve common goods or to protect public interests. This indicator would come up only when the government always acts on behalf of public interests in formulating policies. (Andika, 2019)

Winarno (2012) divides the stages of public policy formulation into four stages that must be passed, consisting of (Winarno, 2012, p.122-126):

a. Formulation of The Problem

At this stage, an attempt is made to determine the identity of a policy problem by understanding the nature of the problem that will facilitate policy formulation in the policy formulation process of the problem. In this case, the policy formulator must identify the problem to be faced by finding, recognizing, and formulating a problem first and then making the formulation of the problem as clearly as possible - the problem in society.

Patton, Sawicki, & Clark (2012, p.140) suggest there are basic methods that can be used by analysts and policy makers in interpreting or translating a problem, namely (1) back-of-the-development calculations to estimate how massive a problem is; (2) quick decision analysis to identify key components or the nature of a problem; (3) creative operational definition to reduce the ambiguity of a concept; (4) political analysis which aims to not exclude non-quantitative factors; and (5) the issue-paper concept for us to decide whether further studies are needed.

b. Policy Agenda

In this regard stated that not all the issues included in public affairs and in the policy agenda. Issues that are public and entered at this stage will be discussed by policy makers and have fulfilled the requirements that require special handling to be resolved and implemented immediately based on their level of importance.

c. Alternative Policy Choices

The selection of alternative policies is a stage after several public problems formulated by policy makers agree to include the problem in the policy agenda, resulting in several policy alternatives to solve the problem. In this stage, the policy makers choose the best policy to solve the problems that have entered the public agenda. This stage also involves the process of drafting regulations for each alternative policy that includes sanctions, prohibitions, rights and obligations, and other policies or rules, and articulates to whom the provisions will apply and have an impact. In the process of choosing alternatives to be recommended as a policy, policy makers must consider technical, economic and financial aspects, political aspects and administrative aspects (Patton, Sawicki, & Clark, 2012, p.194).

d. Policy Setting

This stage is the final stage of the policy formulation process in making decisions aimed at solving problems. Determination of policies chosen by making policies that have binding legal force and are the result of compromise of the various interest groups involved. The four stages of policy formulation above can be summarized in Figure 1.

Fig. 1: Policy Formulation Stages

Source: Processed from Winarno, 2012

In general, a policy aims to bring about fundamental changes to the current policy which, in policy formulation, according to Anderson (2006), policy formulation does not always end with the issuance of laws and regulations, however, policy makers often decide not to take action on a problem and let it be solved by itself. Policy formulation involves the process of developing proposals for related and acceptable actions (can be referred to as alternatives, proposals, or options) to deal with public issues (p.103-109).

2. *E-Commerce*

Brynjolfsson and Kahin (2000) as quoted by Shaw (2015) say that the term "digital economy" is actually an economic transformation in both the national and international sectors that are driven by economic activities based on e-commerce. Zwass (1996) defines E-commerce as a business activity, which business activities with an internet network as the main container for the conduct of this business. This business activity includes the dissemination of business information, maintenance of business

relationships, and implementation of business transactions by means of internet networks as an intermediary. E-commerce is not only a type of business with new infrastructure, but e-commerce also changes everything in aspects of the business as a whole and encourages traditional types of businesses to adapt to this new type of business.

Steinfield, Bouwman and Adelaar (2002) argue that the influence of e-commerce changes aspects of the business that were previously in the form of brick-and-mortar or there is a physical place that is seen in carrying out its activities into a click-and-mortar whose business activities focus on the internet network but still has a physical domicile as its main office or even carry out all its activities virtually or purely virtual commerce that can provide various facilities to its business actors. Bidgoli (2002) says that e-commerce can be interpreted as buying and selling activities via the internet as its main foundation. If e-commerce is defined as buying and selling activities, then what is interpreted as those who carry out business activities through e-commerce is e-business. E-business includes all activities carried out by a party related to buying and selling activities through communication technology and computers, namely the internet as its main channel.

Mitchell in Bhalekar, et al (2014) explained that e-commerce refers to the transfer of paperless business information using electronic data transactions or internet-based technology. E-commerce is defined as the automation of processes that previously used manual labor and the use of paperwork. Namehkaran (2013) defines e-commerce as the process of offering goods and services, business management and business transactions, as well as the process of maintaining business relationships both with vendors and with consumers that are carried out by utilizing telecommunications networks. There are three important components in e-commerce, including them:

1) Infrastructure, is the first component in e-commerce that includes hardware, software, databases and communications that can be used in information exchange.
2) Service, is the second component in e-commerce that can support the ability to find information related to business partners, negotiations and approvals.
3) Products and Structures, this last component includes the supply of goods, services and other information related to trade to consumers and business partners as well as the organization's internal and external cooperation activities in regulating the supply of goods.

3. Tax Treatment of Trade Transactions through e-Commerce

There are three basic principles developed in the taxation of e-commerce transactions according to Dunahoo (1998, p.5-6) in Sahetapy (2015), namely:

1) The taxation treatment of transactions conducted electronically must not be treated differently from transactions carried out not electronically.
2) When there is a possibility to apply to e-commerce transactions, then this is the condition that is applied.
3) There is an agreement between the tax regimes of each country to avoid double taxation conflicts.

The OECD (1998) also provides a reference to the principles of tax treatment that must be applied to e-commerce like conventional trade. These principles are:

1) *neutrality*, where the taxation treatment must be neutral or balanced between the e-commerce business itself and between e-commerce and conventional business. Taxpayers who conduct business in the same conditions must get the same treatment.
2) *efficiency*, where costs incurred by taxpayers and by the Tax Administration must be minimized.
3) *certainty and simplicity,* where tax regulations must be clear, simple, and easy to understand so that taxpayers can easily anticipate the consequences of taxation and their transactions.
4) *effectiveness and fairness,* where taxes must be able to determine the amount of tax at a particular time, so that the potential to darken and avoid taxes can be reduced.

5) *flexibility*, where the taxation system must be flexible and dynamic so that it can accommodate changes caused by technological developments.

Research Method

This research was conducted with a qualitative approach that has descriptive objectives because this study aims to analyze the tax treatment policy formulation of trade transactions using e-commerce as stipulated in the Minister of Finance Regulation (PMK) No. 210 / PMK.010 / 2018 by first describing the stages of policy formulation. This research is purely academic in nature because it is carried out for the development of knowledge in the aspects of taxation in e-commerce, especially for the basic tax treatment of e-commerce transactions. Researchers provide an analysis of the process of policy formulation of trade transaction tax treatment using e-commerce. The time period of this research was carried out at one time from January to June 2019. Data collection was carried out with literature studies and field studies through in-depth interviews.

Discussion

The development of community activities in cyberspace has led to the emergence of digital economic phenomena. One form of this digital economy is the rise of e-commerce, which allows the sale and purchase transactions and the delivery of goods and services easily via the internet. The potential of the velocity of money that occurs in e-commerce trading is very large so that it has the potential to become a pillar of the economy. For the great potential generated from the economic aspect, e-commerce activities in Indonesia received great attention by the government, which was marked by the issuance of Presreg. No. 74 of 2017 concerning Road Map of Electronic-Based National Trading System (Road Map e-commerce) for 2017-2019. Presreg. No. 74 of 2017 contains the direction of government policy in regulating e-commerce in various aspects including funding programs, taxation, consumer protection, education and human resources, communication infrastructure, logistics, cyber security.

In the context of implementing Presreg No. 74 of 2017 in terms of taxation, the government needs to make policies related to tax treatment of e-commerce. This is necessary because the potential for tax revenue for e-commerce activities itself is very large looking at the money circulation that occurs. The Government through the DGT in 2013 actually issued a Circular Letter of the Directorate General of Taxation Number SE-62 / PJ / 2013 concerning Affirmation of Taxation Provisions for E-commerce Transactions. However, the regulation only confirms that there are no new types and tariffs for e-commerce transactions and explains in general that the tax applicable to e-commerce transactions is the same as the tax for conventional trading actors so that the same provisions apply under the tax laws. Then in 2015 the Directorate General of Taxation Circular Letter No. SE-06 / PJ / 2015 was also issued, which was also in the form of an affirmation regarding the obligation to withhold and / or collect income tax on e-commerce transactions. Still related to SE-62 / PJ / 2013, SE-06 / PJ / 2015, and Presreg No. 74 Year 2017, on December 31, 2018, the government through the Minister of Finance issued PMK 210 / PMK.010 / 2018 in order to further regulate aspects taxation treatment of e-commerce where in this regulation the most spotlight is a new obligation for e-commerce actors in the form of a marketplace platform.

There are obligations for the marketplace platform listed in Article 7 paragraphs (2) and (3) in PMK 210 / PMK.010 / 2018. The obligation is to report a recapitulation of trade transactions conducted by traders and / or service providers conducting e-commerce activities through the marketplace platform. The recapitulation of the trade transaction must then be reported by attaching it in the VAT Period SPT of the marketplace platform provider. In addition, there is also an obligation for traders and / or service providers under the marketplace platform to notify the Tax Identification Number (TIN) or mostly known as NPWP in Indonesia, or Population Identification Number (NIK) to the marketplace platform in accordance with Article (7). This then made the mainstream media noisy due to different interpretations of the public regarding the issuance of this regulation. But a few days before the date of

implementation, PMK 210 / PMK.010 / 2018 regarding the policy of tax treatment of trade transactions through e-commerce was revoked based on the decision of the Minister of Finance.

An ideal policy is not made immediately, according to the opinion of Dye (2005) which states that how a policy is made is to consider a number of activities or processes that occur in the political system. Therefore, the stages of policy formulation have four stages, namely the formulation of the problem, the policy agenda, the selection of alternatives in solving a problem, then the final stage, namely the determination of the policy. This research focuses on the policy formulation process of tax treatment of trade transactions through e-commerce that is regulated in PMK 210 / PMK.010 / 2018. Those who should be involved and influential in the process of policy formulation according to Theodolu and Kofinis cited by Rahmi (2013, p.23-24) include the bureaucracy (the bureaucracy), interest groups, think tanks and policy entrepreneurs.

1. Fornulation of The Problem

In the stage of problem formulation there are five issues raised namely related to level playing field demands between online and offline trade transaction actors, the government does not yet have data related to e-commerce activities in Indonesia, there is still a lack of VAT administration compliance in retail, tax administration arrangements are required in the field of e-commerce which has different characteristics from conventional trading, as well as the need to regulate tax obligations on import transactions through the marketplace platform.

A public policy aims to resolve a problem that arises in the community (Thoha, 2003), so that the PMK 210 / PMK.010 / 2018 was made because the government assesses there are problems related to tax treatment of e-commerce that needs solutions to solve. The identification process is the initial stage in the problem formulation process which becomes the stage of the policy formulation process. In this discussion, there are a number of issues that are being considered by regulators in formulating PMK.210 / PMK.010 / 2018, even though previously regulations have been issued relating to e-commerce, namely SE-62 / PJ / 2013 related to affirming aspects of the provisions General and Tax Procedures, Income Taxes, and Value Added Tax and Sales Tax on Luxury Goods for e-commerce transactions, then two years after it was published SE-06 / PJ / 2015 which is a special affirmation related to the obligation to withhold and / or collect taxes income from e-commerce transactions. Both regulations are considered not able to answer the existing problems related to taxation treatment of e-commerce, so PMK 210 / PMK.010 / 2018 was issued.

2. Policy Agenda

The next stage is the stage of the policy agenda where the policy agenda process is carried out by all stakeholders who have direct interests with PMK 210 / PMK.010 / 2018. In this stage, various problems that have been previously formulated will be sorted out in advance by policy makers to distinguish which are indeed public problems that are urgent enough to be continued on the policy agenda.

In the process of formulating this policy, Fiscal Policy Agency or mostly known as BKF as a leader because in the formulation of PMK 210 / PMK.010 / 2018 the DGT and Directorate of Customs and Excise (DJBC) both have an interest to regulate so there is a need for BKF as a harmonizer so that the formulation of this regulation goes well. BKF became the coordinator then DGT and DJBC more formulated related substances in accordance with BKF's own authority which was more general policy such as related to subjects, objects, and tariffs, while DGT and DJBC were more related to administrative issues. In the process of formulating this policy, BKF, DGT and DJBC as well as from the Ministry of Finance and stakeholders namely idEA together as the main team in the formulation of PMK 210 / PMK.010 / 2018 held a meeting to discuss the formulation of this policy together with. After an agreement is reached, then the BKF submits the provisions to the Minister.

In the formulation of PMK 210 / PMK.010 / 2018, several parties from the DGT internal are also directly involved in the formulation of tax treatment policies for e-commerce. DGT internal parties who have the biggest role in the formulation are the Directorate of Taxation Regulations I (Dit. PP I) which is even the initiator of this provision. Part of Dit. PP I, which has the responsibility for the

formulation of this regulation, is held by the PPN and Trade Regulations Section II. Furthermore, DGT internal parties directly involved in the formulation of this policy in addition to the Directorate of Taxation Regulations I, include the Directorate of Business Process Transformation (Directorate of TPB), Directorate of Technology, Information and Communication Transformation (Directorate of TTKI), Directorate of Taxation Technology and Information (Directorate of Taxation). TIP), and the External Data Processing Office (KPDE).

Directorate's involvement. TPB in the formulation of tax treatment policies for e-commerce aims to make it easier for taxpayers to meet tax obligations without disrupting existing business processes. Then Dit. TTKI has the duty to develop applications due to the need for data reporting media by the marketplace, which is then when data enters will be handled by the Directorate TIP so that they also make preparations in the process of this formulation. Then the last is the KPDE which is tasked with managing electronic data received from external parties such as BI and BPS. KPDE acts as a mouthpiece from the DGT to receive data related to taxpayers from external parties. Other parties involved in the formulation of PMK 210 / PMK.010 / 2018 include Bank Indonesia, the fintech association, and BPS in discussing policy alternatives. Then the Ministry of Trade to discuss the retail process. As well as the Ministry of Communication and Information as the party responsible for the ITE Law.

Factors supporting the formulation process of PMK 210 / PMK.010 / 2018 are the existence of encouragement from the public who demand clarity of regulations on tax treatment in e-commerce, in addition to the government's efforts to reach the playing field level, it is felt that this regulation can be achieved. Then the inhibiting factor of the formulation process is the resistance in the process of aligning interests between the government and stakeholders.

3. *Alternative Policy Choices*

In the process of policy formulation, the government should have several policy alternatives in an effort to solve a problem and then the selection is made to determine the best policy which can then be implemented as a solution to solve the problem. According to Jann and Wegrich (Fischer, 2007), the choice of alternative policies will be determined by a number of substantial basic parameters including economic resources and political support in the policy making process. In addition, the allocation of competencies held by various actors also plays an important role in determining policy.

The third stage is the alternative policy selection stage where in this stage there are several alternative policies including policies that only regulate purely administration, the collection of VAT and Income Tax through the marketplace platform, the collection of VAT and Income Tax by the payment gateway, and only reporting data for the marketplace platform. From these alternatives, the alternative policy chosen will be implemented is only reporting data for the marketplace platform. In the process of selecting alternative policies, there is no public test conducted by the government.

In the process of formulating PMK 210 / PMK.03 / 2018, there are several alternative policy options considered by the policy makers, namely:

a. Pure Administration, namely the provisions that only regulate administration related to taxation in e-commerce. The regulation in question is related to the procedure of collection and does not cause a new tax object.

b. VAT and Income Tax collection via the marketplace platform
This second alternative arises because at first the DGT aimed to simplify where the shipper who took shelter in the marketplace platform did not need to carry out tax obligations on Value Added Tax (VAT) and Income Tax. For Income Tax referred to in this concept is related to business entity who use the final income tax with Government Regulation / PP Number 23 tariff. This concept was adopted by the DGT from the regulations implemented by other countries in taxing cross-border transactions. The problem that is found when cross border transactions is where the tax authority is difficult to reach the seller, so asking for the help of the marketplace platform to become a tax collector.

c. VAT and Income Tax collection by payment gateway

Policy makers had considered the option to appoint payment gateways such as Doku and Ovo as third parties to collect VAT and Income Tax. The reason why this alternative occurred to them was because they were money traffic which logically, they could carry out tax collection in a systemic manner. However, this option was not continued because it was felt to be too burdensome for the payment gateway.

d. Only data reporting for the marketplace platform
The last alternative which was then chosen to be applied in relation to the taxation treatment of e-commerce is as follows:
   a) For marketplace platform providers and sales / service providers such as marketplace platform providers, they must have a NPWP and be confirmed as VAT Enterprises;
   b) The Trader or Service Provider is required to notify the NPWP or NIK to the Marketplace Platform Provider;
   c) Marketplace Platform Providers are required to report recapitulation of trade transactions conducted by Traders and / or Service Providers through Marketplace Platform Providers to the Directorate General of Taxes;
   d) Marketplace Platform Providers submit applications for registration to the Head of Customs Office which has a high frequency of imported goods whose transactions are carried out through the Marketplace Platform Providers;
   e) Marketplace Platform Providers must submit e-invoices for each shipment of goods and e-catalog transactions;

   This alternative was chosen because it was considered to be able to accommodate the policy agenda set out in the formulation of PMK 210 / PMK.010 / 2018. The main concern in this chosen alternative is the marketplace platform because BKF feels that the marketplace is generally a fairly large company and has a better system than other e-commerce actors. On the other hand, the advantage of supervision that will be obtained by the government is to be able to oversee many taxpayers collected in the marketplace platform through the marketplace platform.

4. Agenda Setting

The final stage in this formulation process is the stage of determining the policy. PMK 210 / PMK.010 / 2018 promulgated on 31 December 2018 where the purpose of the issuance of PMK 210 / PMK.010 / 2018 for taxpayers is to confirm the level playing field between conventional traders and e-commerce and in the context of collecting data on e-transactions commerce through the marketplace platform. The provisions of PMK 210 / PMK.010 / 2018 should have been implemented on April 1, 2019 but there were many protests from stakeholders, especially the e-commerce association (idEA) after this regulation was issued. The protests continued until finally this regulation was revoked by the Minister of Finance.

The government has the option to issue Government Regulations / PP as a basis for taxation arrangements related to e-commerce which are then followed by the issuance of implementing regulations to regulate technical matters such as data collection, confirmation of taxation treatment of certain activities carried out by e-commerce actors, as well as fulfilment of tax administration obligations through electronics. Another option is to keep implementing existing provisions without issuing new PMK nor PP but maximizing socialization activities to increase the knowledge of e-commerce taxpayers in order to increase tax compliance.

For a series of stages in the formulation of the tax treatment policy for e-commerce to produce a decision agreed upon by the policy makers, the final stage is that the results of this policy formulation must be ratified so that the policy can be immediately implemented and run effectively because it has a clear legal umbrella. Determination of the tax treatment policy for trade transactions through the electronic system (e-commerce) in PMK 210 / PMK.010 / 2018 carried out after prior approval by the Minister of Finance and subsequently enacted by the Ministry of Law and Human Rights. PMK 210 / PMK.010 / 2018 was promulgated on December 31, 2018, but for its entry into force on April 1, 2019. The provision of PMK 210 / PMK.010 / 2018 aims to provide a level playing field between conventional business actors and e-business actors commerce by asserting that the taxation treatment between conventional traders and e-commerce is equal.

Conclusion

The government in conducting the formulation of PMK 210 / PMK.010 / 2018 has fulfilled the stages in policy formulation. However, there are several things that cause the formulation process at each stage of formulation to be less than optimal, including in the policy formulation stage the attention of the government is still too narrow. BKF and DGT do not have reliable data related to e-commerce activities in Indonesia, so that in the process of formulating this policy is still not supported by real data and facts. At the alternative policy selection stage there are no public tests conducted by the government. As well as the latest in the policy making phase there are indications that no agreement was reached as seen from many protests from stakeholders, especially the e-commerce association (idEA) after this regulation was issued. In the end, this provision was revoked through a direct decision from the Minister of Finance even though the implementing regulations in the form of the Director General had been formulated.

Furthermore, the design of a tax treatment policy for e-commerce that can be applied is to issue a Government Regulation / PP governing e-commerce where the provisions must prioritize the principle of self-assessment and intensify the socialization related to taxation rights and obligations where the government cooperates directly with stakeholders. Indonesia can also provide clarity and fairness of taxation treatment to e-commerce actors in applying the provisions of tax treatment of e-commerce by making comprehensive tax liability guidelines for various types of e-commerce activities that precisely describe the obligations that must be fulfilled by taxpayers such as those done by Singaporeans. Then in the framework of the government's efforts to support the development of the e-commerce industry where one of them is to collect data on the e-commerce industry which can then be used as a consideration for the government to be able to issue good taxation regulations, the government can imitate China which makes new laws which regulates e-commerce as a basis for the tax treatment regulations for e-commerce going forward.

Diversity Management: Employees 50+ and the Achievable Benefits – the Case of Polish Enterprises

Elwira GROSS-GOLACKA

Faculty of Management, University of Warsaw, Warsaw, Poland
elwira.gross-golacka@wp.pl

Abstract

The article determines whether diversity-management-oriented activities addressed to employees above 50 years of age, which are carried out at enterprises, have an impact on obtaining certain benefits with regards to managing human resources. The formulated research hypothesis assumes that the implementation of the concept of diversity management on behalf of employees above 50 years of age does not provide the particular benefits stemming from the implementation of such solutions. Two groups of enterprises have been compared. The first group, consisting of 49 enterprises, was that of enterprises, which did not carry out activities in the scope of diversity with regards to older employees. The second group, consisted of 60 enterprises, which contained in the scope of diversity efforts, *inter alia*, the group of older employees above 50 years of age. For the purpose of verifying the research hypothesis the Mann–Whitney U test (also called the Wilcoxon rank-sum test) has been applied, at an assumed level of significance of p=0.05.

Keywords: Diversity Management, 50+ Employees, Benefits of Diversity Management

Introduction

The article determines whether diversity-management-oriented activities addressed to employees above 50 years of age, which are carried out at enterprises, have an impact on obtaining certain benefits with regards to managing human resources. The formulated research hypothesis assumes that the implementation of the concept of diversity management on behalf of employees above 50 years of age does not provide the particular benefits stemming from the implementation of such solutions.

The main goal of the article is determining whether diversity-management-oriented activities addressed to employees above 50 years of age, which are carried out at enterprises, have an impact on obtaining certain benefits with regards to managing human resources in Poland. For this purpose, the Author has utilized the results of the research entitled "The state of diversity management at Polish companies". The awareness of the potential impact in the scope of diversity management undertaken with regards to particular groups of employees have an educational and promotional value. The Author intends that the analysis results presented in the article will contribute to promoting efforts furthering the concept of diversity management – especially those addressed to employees over 50 years of age – among managers, which could later translate into implementing the necessary tools for managing diverse teams of employees at organizations, which allow for obtaining additional benefits.

Diverse Human Resources - The Essence and Challenges

Modern organisations today, have to face challenges such as globalisation, competition and changes on the labour market. The society changes rapidly and demographic changes taking place in the world at large and in Poland can potentially influence multiple aspects of managing organisations. Hence, organisations are increasingly characterised by diversity, both in terms of their external and internal surroundings. Maximising and tapping into diversity in the workplace is an important issue for the quality of managing human resources (and not only) today (Gross-Gołacka, 2016, p. 28).

Similarly to the trend worldwide, one of the most important challenges facing Europe and Poland, comes in the form of demographic changes and in this part of the world the population will continue to age (Global Population Procpects, 2019). Today's median age (30 years) will increase to 36 years in the year 2050 and 42 years in the year 2100, while today one fourth of the people in Europe is 60+ years old. These changes are being observed in all European countries and the aging of the population constitutes one of the most significant socio-economic challenges for Europe and Poland.

The phenomenon of aging influences different spheres of the public discourse. The main spheres of impact of the process of an aging population are social security, the labour market and employment, education, health service, income and savings distribution, and finally, the relations between different generations. The research concerning the phenomenon of aging, focuses increasingly more on its influence on the labour market and managing diversified human resources. These changes are, and will be, a challenge primarily for domestic labour markets, since they could cause a decrease of human resources and increase the share of older people in the production age. Forecasts indicate that this trend will prevail at least until the year 2060. The population of the Poland will admittedly be slightly smaller compared to the year 2015 and also significantly older.

Demographic changes will have a key impact on the labour market over the next two decades (and later) in Poland (and in the rest of Europe), which creates a bigger challenge for HR management (HRM) specialists – as they employ, train, manage and maintain a completely new generation of employees in an organisation. Thus, the discussed trends have a large impact on HRM policy, since the workforce is becoming increasingly more diversified, which forces organisations to make meaningful changes to their approach to human resources management. In reality, soon the "average employee" of today will cease to exist, whereas workplaces may become diversified in terms of gender, age and culture. Meanwhile, today's strategies employed by HRM departments may become redundant and obsolete.

Based on the above, the fundamental challenge facing the Polish economy is filling the gap, left behind by the people born in the 1950s and mid-1960s, who are withdrawing from the labour market (Bukowski, 2008). Even now, employers are met with problems while managing age and – more broadly – different generations of employees. These problems will surely intensify in the case of human resources shortages (Kołodziejczyk-Olczak, 2014, p. 20). Moreover, contrary to the mythologised opinion, older people do not have to become a burden for the economy, but a source of accumulated knowledge and experience, as well as an increasing purchasing power on the labour market and in the workplace (Rudnicka, Surlej, 2013).

The progressing socio-economic changes cause the following:

- The labour market is changing and so are the working conditions, lifestyles and employment profiles;

- Traditional models of employment, consumption and ways of thinking are becoming less relevant. This is influenced by whom we employ, to whom goods and services are being delivered to and who delivers them;

- Multicultural and ethnic communities are being formed. The relevance of so-far marginalised groups – such as people over 50 and women – is increasing on the labour market and on the goods and services market. Managers, increasingly more often, manage people from all over the world, who speak different languages, have different sets of values or have a different view on what is good teamwork, how to organise work or how to solve problems.

Managing Human Resources Diversity in an Organisation

The demographic trends presented above will have serious consequences for organisations and managers in the decades to come. Implications include: the need for a better understanding and awareness of different social groups and appreciating how diversity can bring benefits for organisations. Although, this does require elasticity at work, while ensuring quality work through

creating non-discriminating environments inside organisations and a better integration between work and life.

Classically, (see e.g.: Mor Barak, 2017, pp. 136-145; Thomas, 1999; Thomas 1991; Loden & Rosener, 1991) diversity has been defined as a mosaic of characteristics brought to the organisation by employees; characteristics such as gender, age, race, ethnicity, religion, family conditions or physical abilities. Diversity among employees can also be concerned with the diversity of functions in a given organisation. It also includes lifestyle, sexual preferences, origin, work experience at an organisation, the status of being let go or employed. Diversity, in its broad definition, can relate to any perceived difference and similarity between people, both observable and otherwise (the effect will be a wide and universal approach). Furthermore, the aspect of diversity should be perceived from the perspective of its influence on the unit and the organisation. Diversity is generally connected with approval, understanding, acceptance and appreciating differences between people. The effect of said diversity in an organisation is a valuable and diversified team, which inter alia contributes to: the conception of diversified experiences, a different point of view contributing to teamwork, creative problem-solving, innovation and creativity. Whereas managing diversity should be defined as broadly as possible, and understood as systematic efforts of a company, aimed at involving diversified human resources in the activity of a company and treating it as a strategic advantage. Fundamentally, managing diversity concerns (Gross-Gołacka, 2018):

- utilising all talents available in an organisation, without making references to ethnocentrism and stereotypes,

- with regards to a group of employees – conducting policy on behalf of diversity, contributing to the growth of innovativeness and creative activity, decreasing shortages in the workforce with specific abilities and improving the quality of customer service,

- with regards to the company – satisfying the needs of different clients, widening the market, in terms of individual clients, as well as employees and stakeholders.

The concept of age management is mentioned in the literature on the subject. Nonetheless, it is worth taking into consideration that the notion of age management, although related to different dimensions of HRM, does have a clear relation to aging (Walker, 2005, p. 685), including the fight against age discrimination, based on stereotypes and prejudices. According to I. Kołodziejczak-Olczak (2013, p. 43), managing age means a company utilising solutions friendly to senior employees – usually people above 50 years of age. All of this suggests that age management is one of the aspects of the diversity management strategy, where the latter includes not just the age of the employees, but also their gender, race and religious beliefs. Thus, human resources diversity management strategies are utilised in order to make age diversity an asset and obtain the most benefits for the company and its employees. The HRM instruments employed in this regard are implemented consciously with regard for teams of employees, which are diversified in terms of age. They are primarily aimed at concentrating on what is most important for the company, i.e. qualifications, competences and skills of the employee without discriminating against age, creating an environment that allows for taking full advantage of the employee's strengths and neutralising their weaknesses related to age, allowing to take full advantage of opportunities and perspectives, resulting from the cooperation of employees of different ages and minimising threats resulting from this, creating an environment enabling stable, integrated, motivated and loyal working teams (Schimanek, Kotzian, Arczewska, 2015, p. 7).

Benefits of Implementing the Diversity Management Concept

A review of the literature on the topic and experience of practitioners allows one to observe that the implementation of the concept of diversity management ensures the ability to improve the operational results of an organisation the short and medium -term perspective as well as strategic assets of the company in the long-run. Investments made towards managing diversity contribute to creating and reinforcing human and organisational capital, which today is an important element influencing effectiveness. It therefore seems that diversity in an organisation carries many benefits, including those in a macroeconomic perspective – which contributes to increasing efficiency, increasing

innovativeness and creative activities, or gaining new markets and maintaining current ones. Whereas the improvement of goods and services for the benefit of the clients, attracts talents from the widest possible group of potential employees, reduces any lacks of human resources and limits fluctuations of employees – these are all benefits from a micro-economic perspective. Fundamentally, in the topic literature and in the presented points of view of practitioners, it is pointed out that managing diversity contributes to benefits, which can be assessed from a perspective of the time needed to attain them (Table 1).

Table 1: Benefits stemming from implementing the concept of diversity management based on the time needed to attain them

Benefits stemming from implementing the concept of diversity management	
Short-term	**Long/medium-term**
• Influence on managing talents • Increasing innovativeness and creativity • Forming a culture based on tolerance • Reinforcing the image and reliability of the company externally, among clients and business partners • Good reputation among employees • Ensuring loyalty from employees, clients and business partners • A better understanding of phenomena occurring on the inside of an organisation • Creating a diverse environment, making learning and experience exchange easier • Increasing the flexibility of the organisation • Breaking through known schemes and routine activity	• Reaching new groups of candidates on the labour market • Increasing the ability of recruitment and retention of talented employees • Conquering new markets • Development of new products and services • Better response to the needs of (new) diversified customers • The ability to reach a larger number of recipients of products and services • Better response to the needs of diversified customers • Lowering the costs associated with fluctuations of employees and their absence • Reducing the number of lawsuits and legal costs

Source: author's own research, based on E. Gross-Gołacka (2018,2019), G. Kirton, A.M. Greene (2017), M.E. Mor Barak (2017).

Diversity within human resources can potentially lead to the creation of conflicts, however if well-managed, it can result in a synergy effect, as the results of working together are improved, even if compared to the sum of individual activities, which has been proven in the '80s by an American researcher M. Belbin. The ability to manage teams comprising of diversified employees in terms of their age, race and gender, is beginning to amount to common practice in global firms. As pointed out by A. Pocztowski, a crucial role in the context of diversity among human resources is played by building a leadership sensitive to cultural differences (and not only), one that is able to focus employees coming from different cultural circles and having different preferences in terms of leadership behaviour.

The benefits outlined above can be measured quantitively and their relationship with investments in diversity management policy can be established. However, this relationship only remains partial. At the same time, there is a lack of transparency with regards to the employed indicators used in research, as both in managing human resources and in managing diversity, it is difficult to indicate a direct and singular dependency of the activities on the financial profit of the firm.

According to the author, it seems that the character and reach of the undertaken activities in organisations can depend on the size, scope and character the company's activities. Organisations employ diversity management policies for more than one of the aforementioned reasons, which interact with each other and are considered collectively and reflect strong impulses to meaningful

internal changes within an organisation. But the relative importance of each of these reasons has changed also depending on the organisation and its characteristics.

Research Methodology

The goal of the analysis was determining if activities from the scope of diversity management addressed to employees of 50 years of age influence achieving certain benefits with regards to managing human resources in enterprises located in Poland. The analysis took into account the opinions of representatives of enterprises (HR and staff department employees, as well as those dealing with managing human resources). The opinions were collected in frames of a nation-wide survey entitled "The state of diversity management at Polish companies" – which was completed in Q1/2019 – the aim of which was determining the state in which diversity management is found at Polish companies as well as determining the state of activities undertaken in companies in frames of health policy oriented efforts as well as those aimed at improving employees' well-being and WLB policy. The study has been realized by the Forum for Responsible Business (Forum Odpowiedzialnego Biznesu – FOB), an NGO, which deals with coordinating the implementation of the Diversity Card in Poland. The size of the research sample was 200 enterprises. Due to the topic of the research, companies employing fewer than 10 employees were omitted. In the analysis of the results, analytical weights have been applies, in order for the structure of the firms to reflect the characteristics of the general population. In the Poland-oriented module, the first part of the research pertains to the awareness of the diversity management policy. The next stage was identifying the engaged companies, which are conducting activities in the scope of diversity management – these companies were asked the same questions, which were asked of the Signatories of the Diversity Card. The unengaged companies, on the other hand, were asked questions aimed at determining the reasons why they were not interested in the topic.

The article compares two groups of enterprises. The first group, consisting of 49 people, was that of enterprises, which did not carry out activities in the scope of diversity with regards to older employees. The second group, consisted of 60 enterprises, which contained in the scope of diversity efforts, *inter alia*, the group of older employees above 50 years of age. The research hypothesis stated that the implementation of the concept of diversity management on behalf of employees above 50 years of age does not provide the particular benefits stemming from the implementation of such solutions. The analysis included, seven potential benefits stemming from implementing this concept at enterprises:

x1 – employee loyalty,

x2 – attracting and retaining talented people,

x3 – innovativeness and creativity of employees,

x4 – the effectiveness and cooperation of employees,

x5 – motivation and engagement of employees,

x6 – satisfaction of employees,

x7 – knowledge, abilities and competences of employees.

Statistical Analysis Result

Measuring the individual benefits stemming from diversity management at enterprises (x1-x7) has been conducted with the utilization of a 5-point ordinal scale (1-definetely no, 5- definitely yes). Due to the scale of measurement of the variables, for the purpose of the verification of the research hypothesis, the Mann–Whitney U test (also called the Wilcoxon rank-sum test) has been applied, at an assumed level of significance of p=0.05.

x6	1270.5	0.666	Accept
x7	1212.5	0.2426	Accept

Source: own calculations using the R program.

In none of the cases has the zero hypothesis been rejected. Therefore, according to the entrepreneurs, implementing activities in the scope of diversity management on behalf of employees above 50 years of age does not provide the particular benefits.

However, observing the distribution of the frequencies of answers of respondents, it should be underscored that implementing activities in the scope of diversity management on behalf of employees above 50 years of age, to the greatest degree has a positive impact on the level of knowledge, abilities and competences of all employees (x7). Carrying out initiatives on behalf of diversity management aimed at employees above 50 years of age, according to employers, should also have a positive impact on retaining talented employees and contribute to the effectiveness and cooperation of employees (x2). Enterprises have, however, not observed a positive impact on activities undertaken in the aspect of diversity management on behalf of employees 50+ years of age on the level of loyalty of employees (x1). Similar results have been also observed in relation to creativity and innovativeness of employees (x3). It should also be underscored that in both of the mentioned cases (x1, x3), an increase in the number of answers suggesting a lack of benefits from the undertaken activities has been observed.

Conclusion

Competition, globalization and five generations working alongside each other are obvious elements of today's reality. The key to success of an organization is applying proper motivation techniques for a diversified employee base. It is therefore worth aiming at awakening strong internal motivation amongst employees, which will allow them to feel an emotional loyalty towards the organization and with regards to each other. However, such an approach demands awareness of the needs and expectations of employees at an organization, for instance, in certain age groups or based on gender. Whether this multi-generational workspace makes employees feel productive and engaged or stressed and disengaged, to a large degree depends of the management policy or organizational culture and workplace atmosphere. These challenges are addressed by the concept of diversity management. With relation to the goal of the paper, namely the attempt to determine whether diversity management activities aimed at employees above 50 years of age carried out at organisations have an impact on achieving specific benefits with regards to managing human resources. The conducted studies show that the aforementioned activities have a positive impact on the level of knowledge, skills and competences of all employees as well as the issues pertaining to talented employees and the effectiveness and cooperation of employees. Certainty, in today's times an employee above 50 years of age is an experiences employee, who is able to share their extensive knowledge with the younger generation. Moreover, in return for stable employment conditions, they are loyal towards their employer on a scale far greater than in the case of other generations. They are more flexible time-wise, as more often than in the case of younger co-workers, their private life is settled and more predictable. Therefore, a diversified work environment offers benefits not only from the perspective of the employer, but also all employees. Age diversity means several points of view, which give the ability to create better products and services. Thanks to friction between different points of view, it is possible to make more informed decisions, which take into account many factors, perspectives and experiences. For instance, younger colleagues, who are only at the beginning of their professional career, can feel more confident, when learning from experienced co-workers. They have the ability to take on new responsibilities faster and have the ability to discuss choices made in the workplace in advance. A further benefit, which is worth mentioning in the context of employing experienced employees, is a significant engagement in the work they carry out and the need to stabilize employment, which directly translates to a reduced rotation of employees at a firm. This is one of the main benefits for employers, who are challenged by today's labor market. Generally, experienced employees have their soft skills developed and the experience they have is often missing among younger employees on the labor market. For many younger employees they can act as a mentor and offer rational support, for instance in a crisis situation. Many organisations attempt to make the workplace more attractive and respond to the expectations of applicants. While the quality of the application is extremely important, the scope of seeking new employees should also be developed.

On the other hand, research has confirmed that enterprises have not observed a positive impact of activities undertaken in frames of diversity management on behalf of employees above 50 years of age, when it comes to creativity and innovativeness of employees. Different comments can be made regarding this, but in many instances they are determined by stereotypes. Employees over 50 years of age often, but unfairly, are perceived as people who struggle with absorbing new knowledge and taking command of new technologies. In some cases, they are viewed as ones, which are unable to think beyond fixed patterns, which translates to the inability to find new and non-standard solutions.

To summarize, diversity-based activities at enterprises can differ, as can the potential benefits from activities aimed at diversified groups of employees. In light of the above, it is worth recommending that organizations study the needs and expectations of their employees or simply the motivating factors relevant for specific social groups at an organisation, for instance, young people, older people, women, people of different nationalities or beliefs. From the point of view of employers and managers, it is necessary to possess knowledge about managing a diversified workforce. As such, research priorities on diversified human resources at an organisation emerge, specifically in the scope of the benefits, which an enterprise can obtain from diversity management, which is also in the interest of science. Hence, future research should determine, how situational factors can influence relations between age and managing diversity. Secondly, to what extent can solutions aimed at

diversity management impact creativity, innovativeness, loyalty or obtaining and retaining talented people.

Abstract

The modern world is on the verge of the fourth industrial revolution. The massive introduction of information and communication technologies has contributed to the formation of a new type of economy – the digital one. The digital economy is an economy that is based on the introduction of innovative digital technologies. Today, the share of the digital economy is from 15% to 30% of the traditional one. One of the leaders in the development of the digital economy is the financial sector, which ranks second after telecommunication companies in introducing modern innovative digital technologies. Today, a new development direction has been formed in the financial sector, which is called Fintech. This direction is a fusion of financial and digital technologies, which allow to form not just innovative banking products but to form completely new types of financial institutions, providing both innovative forms of management and new channels of interaction with clients. One of the innovative forms within the Fintech area is the emergence of challenger banks, which represent a completely new organizational form of a financial institution, to a greater extent based on the technological approach to building a company based on the introduction of digital technologies, and on its basis, the possibilities of providing financial services are considered. The digital forms of financial institutions are analyzed in this article, various types of their classifications are examined, the types of neobanks are defined, and approaches to their formation are considered. A full-scale analysis of the global market of challenger banks is carried out in this study, both quantitative and financial indicators are defined that determine the number of neobanks in the world, the pace of development, quantitative indicators of the client base, as well as the size of their assets. The Russian market is paid special attention in this study, its specificity is analyzed compared to global trends in the implementation of neobanks, the nature of the interaction of challenger banks with traditional financial institutions is determined, the dynamics of the introduction of neobanks in the Russian financial sector are analyzed, their financial indicators are examined, service delivery formats in innovative financial institutions are considered. Based on the analysis, the prospects for further implementation and use of neobanks in the Russian financial sector are determined.

Keywords: Information Technology Management, Digital Economy, Innovation, Challenger Banks, Global Market, Russian Market, Specifics, Development Prospects

Introduction

Today's economic development cannot be imagined without the full implementation of innovative digital technologies. The introduction of information and communication technologies has contributed

to the digital transformation of the global economy. Digital technologies have used in all economic sectors without exception, which contributed to the formation of a new type of economy, called digital. The digital economy is one of the fastest-growing areas in the world. This is an important engine of innovation and enterprise development. Its influence has become noticeable in the scale of the competitiveness of countries with the transition to the age of digital technology. The digital economy is an economic activity focused on digital and electronic technologies. The growth of the digital economy has a huge impact on the economy as a whole. With globalization and the active development of innovative technologies such as blockchain, artificial intelligence and cloud computing, the digital economy has become an integral part of the global and national economies.

One of the drivers of the digital economy is fintech. Fintech is an industry consisting of companies that use technology and innovation to compete with traditional financial institutions represented by banks and intermediaries in the financial services market. Currently, numerous technology startups, as well as large established organizations trying to improve and optimize the provided financial services, include themselves as fintech. (Arslanian and Fischer, 2019)

One of the innovative forms of financial institutions formed within fintech is challenger banks, which represent a completely new form of financial organization, radically different from classical financial institutions. This innovative form of financial institution appeared recently. In the UK, the first challenger bank - Atom bank - appeared in 2014, which began operations in early 2015. In a relatively short period, the number of neobanks has grown significantly and today amounts to more than 150 such financial institutions around the world. (Lu, 2017)

Such an innovative form of credit organization has implemented in many countries of the world, both with developed and developing economies. In the Russian financial sector, the first bank of this format appeared in 2015 and received the name Tochka Bank, which appeared on the basis of Bank 24.ru. This date can be considered a starting point in the formation of a new format of a financial institution in the Russian market. (Rudskaya, 2018)

The development of the new innovative form of financial institutions is at the initial stage. Many researchers have not yet developed a clear understanding of what needs to be understood as a challenger bank: some see it as like Internet banking, others see it as a type of digital bank, not taking into account such a point that today there are different types of digital banks, which have a completely different nature of formation and completely different configurations in architecture. It should also be noted that in recent years there has been a dynamic implementation of such innovative financial forms, which requires careful analysis and study.

Key Research Findings

Definition of a challenger bank

Today, the concept of digital banks covers a wide range of banking forms, for example, Internet banking is considered one of the forms of digital banking in some studies.

IBM formulated the definition of a digital bank in its Designing a Sustainable Digital Bank report, representing not just the introduction of a mobile application or abandonment of branches, but a bank that has most of its products and services in digital form. At the same time, clients use digital channels for everyday banking activities. The infrastructure of such a bank is optimized for real-time digital interactions, and the internal culture implies a high rate of change in digital technologies.

According to IBM, digital banks can be divided into four groups (Dermine, 2017):

1. Model A. It is a classic bank with a huge number of legacy systems and business processes that are constantly trying to get closer to a new digital client, who wants the brand to be digital and meet new requirements. Such banks open up new brands with unique offers and products created specifically for

the younger generation - and, as a rule, these brands use the existing banking infrastructure. Examples of such banks: FRANK Bank OCBC in Singapore and LKXA from CaixaBank in Spain.

2. Model B. Model B banks build an organization aimed at improving the user experience, use the back office and bank license of existing banks and resell their products through a more convenient user interface. Examples of such banks: Moven in the US and Rocketbank in Russia.

3. Model C. It combines two approaches: digital user experience and new business processes. Large banks may find that their systems have too much inertia and are too closed to start a digital bank. Model C banks organize a separate division - a practically separate organization with a more flexible and modular back-end, which allows for better customer experience. Examples are Hello Bank from BNP Paribas.

4. Model D. Banks of this model build their entire product offer on digital technologies. These are not necessarily banks without branches; however, customers of such banks expect interaction primarily through digital channels, for example, Fidor Bank in Germany and TKS.

According to this classification, digital banks are considered in relation to the classical form of a financial institution. Digital Bank in this sense is considered as a classic financial institution, which is modernized through the introduction of digital technology.

Challenger bank is a financial institution that is built on completely different principles. It is based on the construction of a technology company that provides financial services. In fact, the architecture of the challenger bank is different from the architecture of the classical financial institution; the construction of the neobank is carried out without reference to the structure of the credit institution and is built from scratch, which is a distinctive feature of this financial institution. This credit organization is built immediately without physical offices and its operation is fully carried out on the Internet.

Challenger bank is a small financial institution that operates in the retail business, creating a competitive environment for traditional credit organizations, very often specializing in areas that are not part of the business of traditional financial institutions. A distinctive feature of the challenger bank is the introduction of modern innovative technologies in the field of information and communication technologies, such as online operations, which help to avoid the costs and difficulties of running a banking business. (Bril, et al, 2018; Han, et al, 2017)

Analysis of approaches to formation of challenger banks

Today, there are three main approaches to creating a challenger bank, because the main problem of this is to win enough customers to conduct their business.

The first approach can be called traditional. It include financial institutions such as Atom Bank, Starling Bank and Tandem Bank, which gave priority to the presence of the bank's charter capital before it began to operate and offered an appropriate set of services that require a certain level of cash to ensure the reliability of the functioning of the financial institution. For example, Atom Bank launched a savings account service and lending to small and medium businesses after approval by regulatory authorities.

The biggest drawback of this approach is too long procedure for obtaining a license, without which it is impossible to start banking, and therefore not the ability to develop a client base.

Another disadvantage of this approach is the need to maintain authorized capital at a certain level, a decrease in which may lead to the revocation of a banking license. For example, Tandem Bank lost its license after it was unable to provide the necessary level of capital after the acquisition of Harrod Bank. Another approach to the formation of a challenger bank is an approach called the semi-traditional bank. It includes the financial institutions Monzo and N26, which, in order to develop their customer base, provided incomplete banking functionality, which allowed to provide quick access to the market that

does not require capital adequacy financial institution. In particular, they offered credit cards for possible quick recruitment of customers and achieved impressive results when the growth of customers amounted to about 60 thousand new customers per month. (Kidwell, et al, 2016)

This model has its disadvantages relating to the transition to a full banking functionality and obtaining a full banking license, it is possible to limit customer growth due to the need to re-register current customers.

Another drawback of this approach is that the financial institutions that are formed with this approach have to cooperate with credit organizations that have full licenses to carry out transactions, and therefore pay for these operations, which generally reduces the profitability of the business.

The third approach to creating a challenger bank is the fast-lane model, the essence of which is to win the market and attract customers, not through banking products, and products related to the financial sector, but not requiring a banking license. Revolut Financial Institute received a license for electronic money and was engaged in currency exchange operations, in particular for people traveling to different countries.

The next step in the development of the financial institution was the creation of an application that allows working with digital currencies, which significantly expanded the client base to 1.5 million people in 2017 and provided the opportunity to obtain a banking license to provide full banking functionality for its customers.

The most promising model is the fast-lane approach, which does not have the drawbacks of the two previous ones and allows building up a client base before starting a full-fledged banking activity, as well as achieving the necessary financial results to obtain a full-fledged banking license.

Analysis of the global challenger banks market

Challenger banks have been developing quite rapidly around the world. In 2015, there were only about 15 credit organizations, however, the number of such banks would reach more than 200 by 2020 (Fig. 1). (Saunders, 2019)

Fig. 1: Changes in the number of neobanks in the world, units

The average annual growth rate of the number of challenger banks worldwide is about 29.3%, which is a high indicator.

The leader in the global market for neobanks is the United Kingdom, where this form of financial institutions come from. In 2019, their total number in this country was about 59 credit organizations (Fig. 2). (Okunevych and Hlivecka, 2018)

Fig. 2: Leader countries by the number of challenger banks, units

The UK accounts for about 38.1% of all challenger banks in the world. Such leadership is explained by quite liberal legislation in the country, as well as by a not very high degree of coverage by the branch network of banks. The second place is taken by India, which accounts for 14 such financial institutions. Neobanks are introduced and developed in countries with developing economies primarily because the costs of introducing and using neobanks are relatively small compared to the classical financial institution. The United States is in the third place, whose figure is 10 challenger banks. As for Russia, it is among the five leaders in this indicator with a value of seven credit organizations of this type.

Challenger banks' client base is growing with the increase in their number all over the world. By 2020, the client base of neobanks will exceed 22.2 million people worldwide (Fig. 3). (Ketterer, 2017)

Fig. 3 : Challenger banks' customer base growth in the world, millions of people

If to look at the growth rate of the client database of financial institutions, it can be noted that from 2015 to 2020, the number of customers is expected to increase by 44.4 times, which is an unattainable result for the classical forms of financial institutions.

An increase in the customer base of challenger banks and a growth of the number of operations performed by their customers increase the profit of neobanks. In 2019, it amounted to around 0.71 billion dollars worldwide (Fig. 4). (Martin, 2019)

Fig. 4: Key financial indicators of challenger banks in the world, billions of dollars

According to forecasts, by 2020, the total cost of assets of challenger banks in the world is expected to reach $ 5.9 billion.

Despite the high growth of challenger banks compared to financial institutions, the volume of the market segment they occupy is less than 0.1%. Today, challenger banks are only trying to establish a niche in those areas that are not very attractive to traditional financial institutions. Nevertheless, classical banks see a new form of organization of a financial institution as their competitor and try not to let them squeeze themselves in the financial market. One of such methods is the affiliation of a challenger bank with a traditional financial institution. Today, only about 30% of all challenger banks in the world are independent credit organizations, the remaining 70% in one form or another are managed by classic banks. (Yang, et al, 2017)

Thus, in the near future challenger banks will continue developing at a fairly rapid pace around the world, while investments in traditional financial institutions that do not want to lose such an attractive direction will be invested in their development. The number of challenger banks that currently occupy an independent position will be reduced in the future and only those who managed to occupy a stable position in the financial market remain.

Prospects of challenger banks' implementation in Russia

In Russia, credit institutions have been reducing over the past ten years. The number of financial institutions decreased from 1,136 in 2008 to 561 banks in 2019. The number of bank branches decreased by 11 thousand over the past five years since 2014. Such a sharp decline is primarily due to the tightening of the financial policy of the Central Bank, imposed Western sanctions against the financial system of Russia and the introduction of information and communication technologies for providing services to customers of financial institutions via remote channels. (Akatkin, 2017; Khayrallah, 2015)

If the implementation of Internet banking is widely used in most Russian banks. According to recent data, more than 80% of credit organizations have such a service system, but the introduction of digital banks is not widely used nowadays, despite the advantages that they give:

- minimization of costs for the construction of the main office and a wide branch network, as well as for maintaining paper workflow;
- flexible online customer service;
- cheap banking fees compared to classic financial institutions;
- personal approach to each client;
- convenience of obtaining banking services.

It should be noted that Russia has all prerequisites for the implementation of challenger banks. (Soloviev, 2018)

First, the average Internet connectivity in Russia is over 78%.

Secondly, over 60% of Russians use mobile communication devices (smartphones and tablets).

Thirdly, a high level of competition of traditional banks for a client, although in recent years this indicator has significantly decreased due to a decrease in the number of Russian financial institutions. Fourth, the high level of applied technologies, which make it possible to provide flexibility and personalization in customer service.

Fifth, a rather high level of digital literacy of the population, more than 28% of Russians own modern information technologies.

Nevertheless, despite the above possibilities, the number of challenger banks is small in the Russian financial market. In 2019, only seven credit organizations functioned on the territory of Russia, which can be attributed to challenger banks (Fig. 5). (Komkov, 2017; Mamrayeva, 2018)

Fig. 5: Changes in the number of challenger banks in Russia, units

The number of neobanks in Russia is growing at a slow pace, about one financial institution of such a formation per year. For example, in 2019, a basic banking license was issued for operations to a financial institution called Bank 131, which is registered in the city of Kazan.

Nevertheless, despite the low dynamics of the number of neobanks in Russia, their client base is growing and is projected to reach almost 1.9 million people by 2020. (Fig. 6). (Sigova and Khon, 2017)

Fig. 6: Challenger banks' customer base growth in Russia, millions of people

In 2019, the profit of all Russian challenger banks amounted to about ten million dollars (Fig. 7). (Budanov, 2017)

Fig. 7 : The main financial indicators of Russian challenger banks, billions of dollars

By 2020, the total value of the assets of all Russian challenger banks is expected to be about 0.14 billion dollars.

Such low indicators are explained by a number of reasons, the main of which is the lack of legal regulation in this area (Fig. 8). (Terlizzi, 2016)

Fig. 8: Barriers to the implementation of challenger banks in Russia, in percent

On the other hand, a number of reasons, primarily due to the distrust of potential customers in such financial institutions, hinder the growth of the client base of challenger banks (Fig. 9). (Glushchenko, 2019; Fedotova, et al, 2018)

Fig. 9: Barriers hindering the growth of the customer base of challenger banks in Russia, in percent

The combination of these reasons significantly slows down the large-scale implementation and use of neobanks in Russia, despite all the advantages they provide.

Conclusions

In the modern world, there is a large-scale introduction of information and communication technologies that led to a digital transformation in all economic sectors. This led to the formation of a new direction - the digital economy, which in some economic sectors occupies up to 30% of the traditional economy;
One of the main drivers of the digitalization of the economy is financial institutions, which take second place after telecommunication companies in introducing innovative digital technologies. It is no coincidence that a new direction of Fintech has appeared in the financial sector, which is a synthesis of financial and information and communication technologies;
Not only innovative banking products are formed within the Fintech area, but completely new organizational forms of financial institutions are created. They are able to provide not only new formats

of customer service, but also form unique ways of managing created credit organizations, which allow new business developments;

One of such innovative forms of a financial institution created within Fintech is recently challenger banks, whose configuration is fundamentally different from the traditional banking model. This type of financial institution is a technology company, the core of which is the IT department, which uses innovative digital technologies for banking services for the organization. A distinctive feature of neobanks is their architecture, which is fundamentally different from the classical financial institution. This type of credit organization is a direct competitor for traditional banking organizations, primarily in the field of small and medium enterprises, occupying niches that are not very attractive to ordinary financial institutions;

Despite challenger banks appeared less than five years ago, their number in the whole world is growing quite rapidly. In 2019, there were more than 150 credit organizations, while the average annual growth rate of neobanks is about 30%. At the same time, the growth dynamics of the client base of neobanks shows impressive results: for the period from 2015, when the number of customers was less than 0.5 million people, and according to the forecast, their number is supposed to exceed 22 million people by 2020. At the same time, financial indicators of challenger banks also show fast dynamics. Over the past five years, the total profit of these financial institutions has grown from $ 50 million to $ 1.02 billion, and total assets have changed from $ 0.6 billion to $ 5.9 billion. In connection with such high rates, this type of credit organization has become a competitor to traditional banks, which are currently trying to either create affiliate forms of challenger banks or absorb existing neobanks. Today only 30% of such financial institutions are completely independent;

The implementation and use of challenger banks is a promising direction for countries with developing economies, because they do not require high costs for opening. However, they allow getting quite high dividends. It is no coincidence that the second place after the UK, which has 59 credit organizations of this kind, is in India with 14 challenger banks, Russia closes the top five with 7 neobanks;

Despite there are all the possibilities for introducing and using challenger banks in Russia, for example, the average Internet prevalence is over 78%, and the population of mobile communication devices exceeds 60%, the dynamics of development of such credit organizations are small. On average, one challenger bank appears within one year, which is relatively small for the Russian financial sector. At the same time, indicators on the growth of the client base are low. According to forecasts, the number of clients of such financial institutions is expected to reach about 1.9 million people by 2020, and the total profit of all Russian neobanks will be $ 20 million, while the total value of assets amount to 0.14 billion dollars. Relatively low indicators are explained primarily by the lack of legal regulation in this area. This is indicated by 62% of experts in this field, lack of investment is in second place, as indicated by 53% of experts, and security problems in this area are in third place, as indicated by 42% of experts. Besides, the growth of the client base of challenger banks is imposed by the psychology of people who in Russia do not yet trust virtual financial institutions that do not have real branches. This is one of the main reasons that accounts for 71% of experts' opinions, in second place financial illiteracy of the population, which cannot independently deal with the services provided online, accounts for 63%. And the third place in terms of limiting the growth of the client base is associated with increased risks when working with credit institutions, it accounts for 54% of the opinions of experts in this field. In connection with all of the above, rapid growth of challenger banks in the Russian financial sector cannot be expected; it is even possible to slow down the existing growth rate due to restrictions in the field of financial and legal regulation by the Central Bank.

Abstract

The current development of the global economic system cannot be imagined without the widespread introduction and use of innovative digital technologies, which have led to the complete transformation of some economic sectors. The innovative potential of some modern information and communication technologies enables us to radically modernize the entire economic system, allowing it to move to a new stage of development. Today many experts are talking about the fourth industrial revolution, which should provide a new qualitative leap in creating a "smart economy" based on innovative potential to meet the needs of each individual in accordance with his or her requests. One of such revolutionary technologies that enable changing the economic landscape of entire areas of economic development is blockchain technology, which originally appeared as part of the Fintech area in the financial sector, but currently has been used in many other economic areas. It is no coincidence that many countries with developed and developing economies pay attention to the development and use of these technologies, investing huge amounts of money both from the private business and through government support through various programs. In Russia, the implementation and use of these technologies are at the initial stage, however, over the past few years, blockchain technologies have become used in the Russian economic sectors. The innovative potential of blockchain technologies was considered in this study, the basic principles of blockchain technology as a distributed database capable of functioning within the information network space were analyzed. This analysis identified the features of this technology, from the standpoint of its formation and development as a new entity within innovative information technologies. The Russian potential for the development and application of blockchain technology has been analyzed; the Russian market for this technology has been evaluated: the volumes of the Russian market, growth rates and its key players have been determined. The main areas of using blockchain technologies in the Russian economy are analyzed in this paper, the main barriers to their implementation are revealed. Based on the analysis, the prospects for the introduction and use of blockchain technologies in the Russian economy are estimated.

Keywords: Information Technology Management, Digital Economy, Innovation, Blockchain Technology, The Russian Market, Growth Rates, Prospects for Use.

Introduction

The beginning of the twenty-first century was marked by the rapid introduction of innovative digital technologies into the global economic system, forming a new direction of development - a digital economy based on the introduction and use of the most advanced information and communication technologies.

The digital economy has caused the emergence of completely innovative directions in areas traditional for the economic system - this is Industry 4.0 in industry and fintech in the financial sector. The main drivers of the digital economy development were cyberphysical systems, the Internet of things technologies, the introduction of industrial robots with artificial intelligence, big data and much more. A blockchain was one of the breakthrough technologies that was used in 2008 to create a new form of money within the fintech direction, on the basis of which the world's first cryptocurrency - Bitcoin - was created. It has received circulation in more than 110 countries along with other traditional types of currencies. Today there are more than two thousand types of cryptocurrencies around the world.

Blockchain technologies are not used only in the financial sector. Today these technologies are used in industry, healthcare, and there is great potential for the development and use of blockchain technologies in the public sector. It is no coincidence that currently, the governments of many countries invest a lot of money in studying and the possibility of using blockchain technologies for state information systems.

Today the leaders in using blockchain technologies are the United States, which occupy more than 43% of the global market, and the American companies, IBM and Microsoft, are leaders in the research and implementation of these technologies, taking together more than 32% of the global market.

In the past few years, countries in Western Europe, China, Japan, and Canada have joined the race for the development and use of blockchain technologies. Japan is the leader in terms of growth in investment in blockchain technology, whose rate is about 23% per year. (Tsvetkova, 2018)

In Russia, blockchain technologies began to be introduced with a large delay compared to other countries and their development is quite slow. However, it should be noted that it was in Russia that the world's second largest cryptocurrency was capitalized, Ethereum, which indicates a sufficiently high potential for the introduction of blockchain technologies to the Russian economy.

Today, there are very few qualitative studies in the field of development and use of blockchain technologies in Russia, they mainly relate to the study of using these technologies in the field of cryptocurrencies, while blockchain is used in other areas. So, it is necessary to conduct comprehensive analysis in the implementation and use of blockchain in the Russian economy, which allow to evaluate its innovative potential for the modernization of the entire economy as a whole.

Key Research Findings

The Innovative Potential of Blockchain Technology

Innovation does not stand still; in the age of rapid development of high technologies, the emergence of such a breakthrough development as blockchain was predictable. In 2008, Satoshi Nakamoto proposed introducing a concept from a blockchain in which security was to be laid at the level of database protection. However, it first appeared only in 2009 and was used as a component for digital currency - bitcoin. Initially, the blockchain played the role of a data registry for all transactions with digital currency. Bitcoin introduced the world a new technology of fast, inexpensive and guaranteed transaction system, which, of course, interested many Internet users.

Blockchain is a distributed database in which storage devices are not connected to a common server. This database stores an ever-growing list of ordered records called blocks. Each block contains a time stamp and a link to the previous block.

Blockchain technology is currently used in many systems. Many high-tech companies strive to implement it due to its great innovative potential.

Blockchain technology is secured by a decentralized server that establishes network connections of the same rank with specific timestamps. As a result, an autonomous database is formed, which does not have a single head center. All information that is updated in the database changes throughout the

system. In this regard, a whole chain of blocks is formed, which registers, records and processes events with data. For greater reliability, the system introduced the ability to confirm the authenticity of the source and identification of a person.

A few years ago, the future of the blockchain seemed uncertain, today it is taking on ever-clearer outlines. Traders, investors and venture funds are already trying to master the young market for investments in blockchain technology by introducing the system into production, trading on the cryptocurrency market, creating and maintaining projects based on ICO.

It is necessary to formulate the essence of this innovation in order to understand the potential of technology. In essence, blockchain is a publicly accessible, decentralized and guaranteed reliable database.

This technology, of course, has become a popular tool for companies working in different fields. Firms seeking to implement innovative technologies have already paid close attention to blockchain. Together with the largest blockchain laboratories, various ways are developed to adopt the innovative potential of the new technology. Now there are protocols for the implementation of this technology in various fields, such as:

- secure network administration;
- digital certificate storage;
- secure bilateral transactions without involving a guaranteeing third party;
- fixing the time of placement of documents, allowing to solve issues of patenting, copyright;
- product authentication confirmation;
- proof of ownership;
- creation of public electronic business cards, information on which is automatically updated.

The substantial potential for further growth and connectivity of technology into all new sectors of the economy and field of application is obvious. The most characteristic segments within the technology are separately investigated: distributed registries, smart contracts, mining, consensus algorithms, and cryptocurrencies.

The innovative potential of blockchain technology is confirmed by a huge number of patents in this field (Fig. 1). (Anderson, 2018; Soloviev, 2018;)

Fig. 1 : Countries by the number of blockchain technology patents

The leading positions in the number of patent publications are held by China and the United States; activity indicators are significantly higher in this area in these countries than in others. Market leaders are conducting large-scale and expensive work on patenting a wide range of blockchain technologies, while the process of forming regulatory bases is not a stopping factor for the further development of blockchain technologies and creating new application concepts.

Analysis of the Russian blockchain technology market

In 2019, this study was conducted to assess the possibility of the development and use of blockchain technology in certain countries. The study was conducted on the basis of a methodology that includes an assessment of the legal, political and infrastructural conditions in various countries from the standpoint of friendliness to a business using blockchain technology. First of all, the study focused on the changes that the economies of different countries underwent under the influence of the blockchain and related technologies. Russia took 18th place from 23 countries in this rating (Table 1). (Bogdanov et al, 2018)

Table 1: Rating of countries with the best conditions for the development blockchain projects

India	7	1,3	6,61	4,97	22	Neutral
Ukraine	6	1,25	7,17	4,81	23	Neutral

It is worth noting that in Russia there are big problems with legislative initiatives in the legal regulation of blockchain technologies, many government programs in the field of digitalization do not have sufficient funding. At the same time, China, which is ranked lower than Russia, occupying the 21st position, allocated over $ 6 billion for the development and use of blockchain technology under the state program, while the entire Russian market was estimated at 24.3 million dollars in 2019 (Fig. 2). (Babkin et al, 2018; Vovchenko et al, 2017)

Fig. 2: The Russian blockchain technology market, millions of dollars

The volume of the Russian market is about 2.3% of the world, while the average annual growth rate of the Russian market with an indicator of 12.1% is inferior to the global market, which has this value of about 16.1%. The low dynamics is explained by the Russian market is quite small and is in the initial state, and as mentioned earlier in Russia, there are no favorable conditions for investing in these technologies.

A global trend aimed at developing a public blockchain is also present in the Russian market, occupying over 85.7% (Fig. 3). (Biktimirov et al, 2017)

Fig. 3: The Russian blockchain technology market by segments, millions of dollars

Russia is significantly inferior to global market leaders in terms of its performance, for example, the United States whose market size is 18.1 times greater than the Russian one. Today, we have to admit that Russia is not even in the top 10 countries that implement and use blockchain technologies.

About 100 companies operating in one form or another of blockchain projects operate on the Russian market today (Fig. 4). (Chernov and Chernova, 2018)

Fig. 4: Russian companies involved in the development and implementation of blockchain projects, units

Represented Russian companies mostly work in the financial sector related to the development and implementation of cryptocurrencies.

Nevertheless, at present there exist Russian companies that are developing blockchain projects in other areas. For example, the Orbit Blockchain Practical Application Center is involved in many projects related to the public sector, in particular in real estate transactions.

According to experts, about 490 large blockchain projects were launched in Russia in 2019 (Fig. 5). (Chakraborty, 2018; Prusty, 2017)

Fig. 5 : Blockchain projects in the Russian market, units

For example, the Russian Ministry of Education and Science has become a customer of a digital platform for knowledge sharing and copyright management. This project should be implemented in 2019; the company Neolant is engaged in its development. The agency has allocated over one million dollars for development.

The attractiveness of the development of blockchain technologies in Russia is also confirmed by the increase in the salaries of relevant specialists. In 2019, the average salary of a developer was about ten thousand dollars a month, which is comparable to the average salary in the USA, which was about 130 thousand dollars a year (Fig. 6). (Arslanian and Fischer, 2019; Shvetsova, 2018)

Fig. 6: Dynamics of salaries of developers of blockchain projects in Russia, dollars

Despite such high salaries in the Russian market, there is a shortage of specialists in this area, which greatly affects the prospects for the development and application of blockchain technologies.

Areas of using blockchain technologies in the Russian economy

The main users of blockchain technologies in the Russian market are financial institutions, which account for more than 64% of all investments (Fig. 7). (Bril, 2017; Savrukov, 2018)

Fig. 7: Areas of implementation and use of blockchain technologies in the Russian market, in percent

According to many banking experts, blockchain technology will allow financial institutions to make transactions as transparent, fast and efficient as possible, and most importantly - safe. In addition, using blockchain technology significantly saves operating costs, regulatory reports, real-time interbank settlements, customer identification and other benefits.

Today, the leading banks of the country, Sberbank and VEB, are implemented large projects using blockchain technology. For example, Sberbank, together with the Federal Antimonopoly Service, prepared a pilot project for document management on the blockchain. Its innovation lies in the fact that various organizations will have the opportunity to refuse the services of telecom operators in the exchange of documents, which reduces the costs of companies.

Using blockchain technologies in the public sector allows for the efficient and transparent implementation of all operations related to the storage and ensuring reliable data protection in state information systems. In 2019, Rostec State Corporation, together with the Russian government, signed an agreement of intent on the participatory development of four high-tech areas - distributed registry technologies, quantum sensors, and the latest generations of narrow-band wireless communications for the Internet of things and short- and medium-range communications, as well as the latest generations of mobile wireless communications (5G). This agreement states the fact that the introduction and use of blockchain technologies is one of the priority areas in the development of the information space of Russia for the further digital transformation of the economy.

Payments and settlements prevail among the main operations used in systems based on blockchain technology, which account for more than 34% of all operations (Fig. 8) (Nikolova, 2017; Rodionova, 2018)

Fig. 8: The main operations in systems based on blockchain technologies in the Russian market, in percent

Further development and application of blockchain technology will significantly expand the range of operations performed in various fields, including production, for which it is also possible to use these technologies, for example, in the field of supply control.

Prospects for the development and use of blockchain technologies in Russia

Despite blockchain technology is one of the breakthrough areas in the field of innovative information technologies today, it should be noted that the development and use of these technologies in the Russian economy are quite difficult. The main obstacle to the implementation of this technology in Russia is the lack of a legal framework (Fig. 9). (Lebedev, 2018)

Fig. 9 : Barriers hindering the implementation of blockchain technologies in the Russian economy, in percent

At present, the players of the Russian market take a sort of wait-and-see attitude and wait for the successful implementation of blockchain projects abroad, so that later they can apply it in domestic conditions. This position may be losing because the lack of investment in these technologies may ultimately lead to a lag in the race for blockchain technologies.

Despite all the difficulties associated with the development and application of blockchain technologies in the Russian economy, nevertheless, it is expected that the Russian market for blockchain projects will increase and reach over 75 million dollars by 2025 (Fig. 10). (Du, 2019; Komkov, 2017)

Fig. 10 : Forecast for the development of the Russian blockchain technology market, millions of dollars

At the same time, the average annual growth rate of the Russian market is expected to almost double to 24.1% from 2020 to 2025, this dynamics can be achieved by expanding the area of application of blockchain technologies, including in the Russian manufacturing sector, which is also starting to undergo digital transformation.

Conclusions

The wide-scale introduction of innovative digital technologies has contributed to the formation of a new type of economy - the digital one, based on the latest achievements in the field of information and communication technologies, in this area innovative directions have appeared in traditional economic fields, in industry - Industry 4.0, in the financial sector - Fintech;

One of the breakthrough technologies in the field of information storage formed within the Fintech was the blockchain technology used to create the first cryptocurrency in the world of bitcoin in 2008. This was the starting point in the development and application of this technology;

Today, many countries participate in research on blockchain technologies, both developed and developing economies. Many countries have adopted programs at the state level that promote the introduction and use of blockchain technology. Annual government investment is about $ 6 billion a year in China, while the entire Russian blockchain technology market amounted to about $ 24 million in 2019, with an average annual growth of 12.1%, which is lower than the global growth rate of 16.2%;

The Russian blockchain technology market is at the initial stage of its formation and so far, there has been no significant progress in its development. This is primarily due to the low attractive investment opportunities, lack of a legislative base, and lack of specialists, so, it is no coincidence that Russia takes 18 position from 23 countries that can introduce blockchain technology;

The main area of application of blockchain technology is the financial sector, which accounts for over 64% of the entire market, and the second place is occupied by state-owned companies and ministries, which account for about 9% of all investments;

On the whole, the Russian market takes a wait-and-see attitude related to obtaining information about the success of blockchain projects abroad for their possible use in Russian conditions. Nevertheless, despite such conditions, the growth of the Russian market will be continued and, according to forecasts, reach over 75 million dollars by 2025, while the average annual growth rate compared to the current ones will double and reach a value of 24.1%. This is explained by the expansion of the development

and application of blockchain technologies in many other economic sectors in addition to the financial one.

Abstract

Tax Holiday is one of income tax incentives that is being intensified by the Government of Indonesia to be able to increase foreign investment in Indonesia, which is included in the policies listed in the Economic Policy Package XVI. This study will discuss regarding implementation of tax holiday policy in PMK Number 150 / PMK.010 / 2018. This research was a qualitative approach and descriptive research. The results showed that there were three factors that caused tax holiday policy in previous regulations to not run optimally, namely the uncertainty factor in granting tax holiday decisions, bureaucratic factors and difficult requirements, and other factors besides tax, in the form of legal certainty, economic stability, and availability of infrastructure. The rules set forth in PMK No. 150 of 2018 are better compared to previous regulations, which are indicated by tax holiday policy that prioritizes certainty, convenience, and trust in taxpayers.

Keywords: Policy Implementation, Tax Incentives, Tax Holiday, Income Tax.

Introduction

Investment is one of the most important factors in increasing economic growth and development in a country. The emergence of globalization drives a country to pay attention to the tax system by making adjustment through tax reform in order to intensify fiscal climate which has implication on investment. (Setyowati, 2015) Based on economic development theory it is said that between investment and the level of economic growth has a reciprocal principle, where the greater the level of investment of a country, the higher the level of economic growth in the country. Indonesia as one of the developing countries, of course, also urgently needs investment to support the country's economic growth and development. There are several main driving factors that can influence investors in making investment decisions. In terms of benefits, the factors affecting investors are market reach, human resources, operational activities, property, and accessibility. In terms of risk, factors that are considered by investors are economic, political, environmental and security risks. While in terms of costs, the main considerations of investors are labor costs, taxation fees, incentive packages, and property costs. (Capital Investment Coordinating Board, 2018) Of the various factors that influence investment, the factors that also influence investment is the taxation cost and incentive package, therefore the Indonesian government is currently seeking to increase investment through a policy of providing tax incentives. There are many countries that drive tax incentives to attract more capital inflow to their countries. (Setyowati, 2018)

Many developing countries offer income tax incentives to encourage investment. Most often incentives are given to direct investors rather than portfolio investors. (Hardianti, 2019) One of tax incentives given by the Government of Indonesia is a tax holiday. Tax holiday is a form of tax incentive in the form of reducing Corporate Income Tax. Currently the tax holiday policy is regulated in the Minister of Finance Regulation (PMK) Number 150 / PMK.010 / 2018 concerning the Provision of Corporate Income Tax Reduction Facilities. PMK Number 150 Year 2018 was just issued on November 26, 2018,

which regulation is the result of revision of PMK Number 35 Year 2018 which was also actually just issued on April 4, 2018 to amend the tax holiday provisions from those previously stated in PMK Number 103 2016 which is a change from PMK Number 159 of 2015.

However, in fact the tax holiday policy stated in the previous provisions has not been able to fully meet the initial objectives of the establishment of the tax holiday policy. There are still many shortcomings and weaknesses contained in these provisions, where one of them can be seen from the lack of interest in investors who take advantage of the tax holiday policy. The reason is that tax incentives are not necessarily one of the main things needed by investors in investing in Indonesia. Therefore, considering that there are still many deficiencies in the previous tax holiday regulations which cause the main objective of providing tax incentives cannot be achieved, in 2018 the government made a major revision of the tax holiday provisions which resulted in the form of PMK legal product No. 35 of 2018 which came into force on April 4, 2018, where the regulation was made in such a way by the Government to be truly effective in attracting investors to invest in Indonesia. The existence of this policy is expected to increase investment enthusiasm in Indonesia, especially for basic and upstream industries. which is currently still very weak because it requires a large investment.

But not long after the enactment of The Tax Holiday policy as outlined in PMK Number 35 of 2018, recently the government revised the tax holiday provisions by issuing PMK Number 150 Year 2018. Whereas the tax holiday provisions in PMK Number 35 Year 2018 only lasted for 6 months , and the level of efficiency and effectiveness cannot yet be assessed considering the very short implementation period of the regulation. The latest tax holiday provisions listed in PMK No. 150 of 2018 are part of the XVI Economic Policy Package which is intended to encourage increased investment in Indonesia. In this regulation, the pioneering industry which has an investment value of at least Rp. 100 Billion is entitled to a reduction in corporate income tax on the income it receives. A tax reduction of 100% will be given to new investment companies with a value of at least Rp. 500 Billion, and a tax reduction of 50% will be given to new investment companies with a value of at least Rp. 100 Billion and less than Rp. 500 Billion. Through this provision the government has re-expanded the sectors entitled to receive tax holiday facilities, simplified the process of filing tax holiday facilities through a new method, and also introduced a mini tax holiday arrangement scheme. (Directorate General of Taxation, 2018)

Therefore, it is expected that the issuance of PMK No. 150 of 2018 is one of the Government's real efforts to revise the tax holiday provisions from what has been regulated in previous regulations. However, the question that still needs to be examined here is whether the revision of the regulation by the Government can really answer all the challenges that still exist in the previous regulation and whether the existence of this latest regulation can increase the interest of business actors to utilize the facilities. In consequence, this study will analyze what factors make the tax holiday policy before the issuance of PMK Number 150 Year 2018 is still not optimal and also the analysis of the implementation of the tax holiday policy contained in PMK Number 1150 Year 2018.

Literature Review

One of the fiscal policies provided by the government is the provision of tax incentives. According to Gunadi (2013), tax incentives are deviations from general tax provisions that reduce the tax burden on companies in order to encourage investment in certain projects or sectors. UNCTAD (2000) classifies tax incentives into several types, namely: *Reduce Corporate Income Tax Rate*, *Loss Carry Forward*, *Tax Holiday*, *Investment Allowance*, *Investment Tax Credit*, *Reduce Taxes on Dividend and Interest Paid Abroad*, *Presential Treatment of Long-Term Capital Gains*, *Deduction for Qualifying Expenses*, *Zero or Reduce Tariffs*, *Employment Based Deduction*, *Tax Credits for Value Addition*, dan *Tax Reductions/Credit for Foreign Hard Currency Earning*.

This research used policy implementation theory of Grindle (1980), theory which states that the success of the implementation of public policy is influenced by two main variables namely the content of the policy (content of policy), and the implementation environment (context of implementation). Both of these variables also include things such as the extent to which the interests of a group or targets or

target groups are contained in the contents of the public policy, the types and benefits that will be received by the target groups, as well as the extent of the desired changes from the public policy.

Fig 1. Research *Framework*

Source: Grindle, Marilee S. (1980)

In conducting research on the implementation of tax holiday policy in PMK Number 150 of 2018, researchers analyzed what factors made the tax holiday policy before the issuance of PMK Number 150 of 2018 was not running optimally. As well as analyzing how the policy implementation process runs by outlining each of the indicators contained in Grindle theory, namely content of policy and context of implementation. Factors that caused previous tax holiday policy to be still not optimal are (1) Uncertainty in granting tax holiday decisions; (2) Bureaucracy and difficult requirements, and (3) Factors other than taxes, such as legal certainty, economic stability, and the availability of infrastructure.

The following is a table of research results regarding the implementation of the tax holiday policy which is described based on each indicator:

Table 1: Matrix of Indicators of Content of Tax Holiday Policy in PMK Number 150 / PMK.010 / 2018

Indicators	Discussion
Interest Affected	The implementation of the tax holiday policy is in accordance with the interests of industry players who expect policies that are easier and more certain and is in accordance with the interests of policy makers who want this policy to be a factor driving investment.
Type of Benefit	Provides many benefits in the form of optimization and improvement of company feasibility and can increase the contribution of tax revenue in sectors other than corporate income tax.
Extent of Change Envision	Tax Holiday can provide a change in the form of increased investment in Indonesia, which can be seen in the long term.

Indicators	Discussion
Site of Decision Making	The decision to award a tax holiday is appropriate because it was carried out by the Director General of Tax on behalf of and for the Minister of Finance.
Program Implementer	The implementation of the tax holiday program has not been able to run optimally, because there are still some weaknesses such as the OSS system that is not ready to be directly used by taxpayer.
Resources Committed	Policy makers have succeeded in designing a tax holiday policy that is much better, but in fact the implementation process is still not as good as previously planned.

Table 2: Matrix on Environmental Indicators for Tax Holiday Policy Implementation in PMK Number 150 / PMK.010 / 2018

Indicators	Discussion
Power, Interest and Strategy of Actor Involved	The power, interests, and the strategies set forth in the implementation of the tax holiday policy can already be implemented properly, so to create a policy that is far better than before.
Institution and Regime Characteristics	The characteristics of Indonesian government institutions and regimes show that the Indonesian government still has weaknesses in the form of a difficult bureaucracy and licensing system.
Compliance and Responsiveness	The response of the industry players is quite good as evidenced by the increasing number of parties utilizing the tax holiday policy, but the industry players also still have criticisms related to weaknesses found in the process of implementing the tax holiday policy.

Research Method

Research on tax holidays conducted by researchers focuses on analyzing implementation of tax holiday policies as set out in PMK Number 150 of 2018 and also analyzing the factors that cause tax holiday policies before the issuance of PMK Number 150 of 2018 is not optimally utilized. In the process of qualitative analysis, the researcher will develop understanding and generalization that is close to concrete data or contexts, the author also usually uses fewer abstract theories. In general, the data analysis stages in this study include conceptualization, data coding / codification, and data interpretation. Qualitative data analysis begins by organizing data into categories based on themes, concepts, or other criteria. This stage includes making interview transcripts, scanning all available material, typing field notes, cataloging all visual material, and sorting and organizing data into various categories according to the source of the information. (Creswell, 2014) The next stage is to codify the data we have, that is, the researcher will organize the raw data into conceptual categories and form a theme or concept. This stage involves taking all data or images obtained at the data collection stage, making sentence segmentation or making categories of images, and making labels for those categories with a term.

In this study, researchers will use data collection techniques in the form of field research by in-depth interviews or qualitative interviews. Field research is a data collection technique, where the writer will conduct direct research and record records of human behavior in a natural background for a certain period. The author will conduct in-depth interviews with several industry players listed in 18 pioneering industry sectors in PMK Number 150 Year 2018 so that the author can dig up information about how the process of implementing the tax holiday policy in PMK Number 150 Year 2018 from the perspective of industry players. In addition to further supporting the analysis, in-depth interviews will also be conducted with tax holiday policy makers to find out how the tax holiday policy implementation

process is in PMK Number 150 of 2018 from the point of view of policy makers and implementers and to find out how their views related to policies this tax holiday.

The final stage in qualitative data analysis is to interpret the data that has been organized and codified in the previous stage. This interpretation can take the form of a personal interpretation of the researcher, the understanding that the researcher brings to the research that comes from personal culture, history, or experience, and can also be a meaning obtained from a comparison of research results with information obtained from a theory or literature.

Discussion

Factors That Cause Tax Holiday Policy Before PMK Number 150 Year 2018 Are Not Utilized Optimal

Before the issuance of the tax holiday policy in PMK Number 150 of 2018, the tax holiday policy had been implemented in Indonesia starting in 2011 as outlined in PMK Number 130 of 2011. However, tax holiday policy adopted in PMK Number 130 of 2011 had not been able to attract the interest of investors to take advantage of these policies. So that in 2015 the Government of Indonesia finally tried to improve the provisions on tax holidays by issuing PMK No. 159 of 2015. But in fact, the results obtained are still the same, the tax holiday provisions still cannot attract investors. Based on the data obtained there are only 5 companies that utilize tax holidays based on PMK Number 130 of 2011, whereas after the Government launched the revised tax holiday policy in PMK Number 159 of 2015 there were still no companies interested in utilizing the facility.

Departing from this fact, the Government of Indonesia finally in 2018 decided to make a radical change regarding the tax holiday policy as evidenced by the issuance of PMK Number 35 of 2018 which was then followed by the issuance of PMK Number 150 of 2018. Then after the publication of the latest provisions on this tax holiday little by little many investors began to look at the policy. Only in the period of 6 months since the issuance of PMK No. 35 of 2018 there have been 10 Taxpayers who have utilized the tax holiday facility. This certainly shows that the renewal of the tax holiday policy carried out by the Government was quite successful to begin to increase investor interest in utilizing the policy. So, there are many factors that cause the tax holiday policy in the previous provisions are still less attractive to investors and are still not running optimally. The following will be explained about these factors:

1) Uncertainty in Granting Tax Holiday Decisions

One of the factors that made the tax holiday policy in the previous provisions still not optimal and did not have many enthusiasts was due to the uncertainty factor in granting facility decisions. This uncertainty is caused because in the previous tax holiday provisions, namely in PMK No. 159 of 2015, the amount of tax reduction provided was not a fixed percentage and period. In Article 3 of PMK Number 159 Year 2015 it is stated that the reduction of Corporate Income Tax can be given at most 100% and at least 10% of the amount of Corporate Income owed. In addition, the period for reducing Corporate Income Tax is also given in a period of no longer than 15 tax years and a minimum of 5 tax years.

From these provisions, there is uncertainty for taxpayers who have applied for a tax holiday to get a reduction in corporate income tax. Because the deductions provided are in the range of 10% to 100%, a case may occur where two taxpayers with the same investment value get a different percentage of corporate income tax reduction. This is because in PMK Number 159 Year 2015 there are no special provisions that explain the amount of the percentage reduction in Corporate Income that will be obtained by the Taxpayer for investment invested. The provisions only state that taxpayers who can get a tax holiday are taxpayers who have a new investment of at least 1 trillion Rupiah. But there is no stipulation on what percentage the taxpayer will get if he invests 1.5 or 2 trillion Rupiah. In addition, the time period given also ranges from 5 years to 15 years, there is no definite provision that states that taxpayers with a certain amount of investment will get a reduction in a period of years. In the absence of a standard amount of reduction of Corporate Income Tax and a definite period of

reduction of Corporate Income Tax, it will automatically affect the interest of Taxpayers in utilizing the facility.

2) Bureaucracy and Difficult Requirements

The tax holiday provisions in the previous regulation do have a very long filing mechanism. In PMK 130 of 2011 taxpayers who wish to submit tax holidays must first submit an application to the Ministry of Industry or BKPM, which later on the request the Ministry of Industry and BKPM will first study the availability of infrastructure, absorption of domestic workers, fulfillment pioneering industry criteria, technology transfer plans, and tax sparing fulfillment in domicile countries. Only after the study is completed will the Ministry of Industry and BKPM then submit a proposal to the Minister of Finance to facilitate taxpayers to get a tax holiday. After the proposal is accepted by the Minister of Finance, a Verification Committee will be formed to verify and research the suitability of the business of the Taxpayer with the pioneering industry category. Only after the research has been completed and the Taxpayer is deemed to have met the requirements to obtain a tax holiday, the Verification Committee will then make a recommendation to issue a Minister of Finance Decree that the Taxpayer has the right to receive a tax holiday.

In addition to the complicated and time-consuming tax holiday submission process, one of the factors that also makes tax holiday applications even more difficult is the Verification Committee meeting must be held first. In the previous regulation, taxpayers can not directly determine that the industry belongs to the category of pioneers, although in its provisions it has been explained what industries are categorized as pioneering industries. So that taxpayers must go through the stages of the verification meeting in advance to find out whether it is true that the business is included in the type of pioneer industry that can get a tax holiday. This certainly provides uncertainty for taxpayers; the article is not necessarily the results of the verification meeting agreed that taxpayers are included in the category of businesses that can get a tax holiday. Seeing the tax holiday submission process, which is very difficult, it is only natural if this becomes one of the factors that is very influential why the previous tax holiday policy attracted only a few interested people.

3) Other Factors Than Tax

In addition to the two factors mentioned earlier, it turns out there is also one other factor that makes the tax holiday policy not yet run optimally, namely the non-tax factor. Which means that the main point of the issuance of the tax holiday policy is to increase investment and also to encourage investors to want to invest in Indonesia. Therefore, the Government of Indonesia issues a tax holiday policy in the hope that the facility can make investors more interested in investing in Indonesia. But another thing that actually must also be considered is, there are many other factors that can actually influence investors in investing their capital in a country other than the tax factor itself. The tax factor is not the only thing that investors consider in investing in a country.

There are other factors besides tax such as legal certainty, where legal certainty is one of the most important factors considered by investors to invest in a country other than the presence or absence of a tax incentive. In addition, there is also an economic stability factor, where investors will certainly prefer to invest in a country that has a high level of economic stability, because it can affect the sustainability of the business being run. As we know that economic conditions in Indonesia have not been able to show high stability. This of course also affects investor interest, where they would prefer to invest in countries that have high economic stability compared to countries that provide tax incentives but with low levels of economic stability. Another factor that also influences is the availability of infrastructure, with the existence of good infrastructure in a country will certainly be an attraction for investors to invest their capital. The current condition of Indonesia's infrastructure is also not yet fully adequate. Investors are still complaining about the poor quality of Indonesia's infrastructure, which is one of the main obstacles for Investors in investing in Indonesia. The tax holiday policy offered by the Government of Indonesia is meaningless for investors if the condition of Indonesia's infrastructure itself still has many weaknesses.

a. Implementation of Tax Holiday Policy in PMK Number 150 of 2018

Departing from the problems in the form of factors that made the previous tax holiday policy not optimal, in November 2018 the Government of Indonesia re-issued the latest regulation on tax holidays as outlined in the Minister of Finance Regulation (PMK) Number 150 of 2018. The latest provisions for this tax holiday expected to improve the previous tax holiday provisions and make it more optimal. Therefore, in this section we will explain how the tax holiday policy implementation process as set out in PMK No. 150 of 2018 will also be analyzed using Grindle's implementation theory (1980). In addition, the author will also explain about any fundamental changes contained in PMK Number 150 of 2018.

1) Basis for Amendment to Provisions in PMK Number 150 Year 2018

The first amendment, which is again expanding the scope of the pioneering industry to 18 sectors, where in PMK 35 of 2018 there are only 17 pioneer industry sectors. The second amendment, namely the introduction of a new scheme, namely a mini tax holiday, for investments with a value of 100 billion to less than 500 billion Rupiah, will still be able to obtain a 50% reduction in corporate income tax for a period of 5 years. The third amendment, namely the mechanism for filing a tax holiday in PMK No. 150 of 2018, has also been made through the Online Single Submission (OSS) system. The fourth amendment is to uphold the principle of certainty with a list of pioneering industrial sectors and a detailed list of KBLI for industries that are entitled to a tax holiday. So that for the Taxpayer whose business is already listed in the pioneering industry list and his KBLI is already listed in the KBLI details, if he submits a tax holiday, he will automatically get a reduction directly in accordance with the amount of investment he proposed if all his requirements have been met. The fifth amendment, namely there is a mechanism for filing tax holidays for industries that are not included in the pioneering industrial sector. The last change is, giving trust to WP to design investment plans according to the desired premises and will only be examined when it starts entering the stage of Beginning of Commercial Production (SMB).

Content of Tax Holiday

Based on Grindle's theory, one of the variables that can influence the implementation of public policy is the content of the policy itself or the content of policy. Therefore, in this section the researcher will analyze how the contents of the tax holiday policy set forth in PMK Number 150 of 2018 correspond to the matters covered therein as stated by Grindle (1980).

a) ***Interest Affected***

The interests of parties involved in a policy can certainly affect the implementation process of a policy. Same thing with the tax holiday policy set forth in PMK Number 150 of 2018, in the process of implementing the tax holiday policy, of course there are the interests of many parties who can influence the course of the implementation. The implementation of the tax holiday policy in PMK No. 150 of 2018 is influenced by the interests of the policy makers and the industry players. The interests of industry players demand that a tax holiday policy is easier and more certain. In addition, there are also interests of policy makers who indeed expect that this policy can be one of the factors that can encourage investment growth.

b) ***Type* of *Benefit***

In implementing a policy, there are certainly benefits that can be generated from the policy. One of the types of benefits generated by implementing the tax holiday policy is to help the development and growth of the industry. The benefits of the tax holiday policy for the company can also be in the form of increasing the feasibility or feasibility of the company itself. In addition to Indonesia's own taxation conditions, the tax holiday policy can provide benefits in the form of tax contributions in other sectors. With the tax holiday policy indeed, tax revenue from the Corporate Income Sector will be reduced, due to the exemption of Corporate Income Tax. However, the decrease in income from this income tax can be substituted with increased tax revenue from other sectors, for example revenue from the VAT or Income Tax article 21 sector.

c) *Extent of Change Envision*

One of the changes to be achieved by implementing the tax holiday policy is to increase investment growth in Indonesia. With the provision of tax holiday facilities, the Government of Indonesia hopes that the policy will become an attraction for investors to invest their capital in Indonesia. In addition, the tax holiday policy itself is intended to attract investors from the upstream industry, where the government hopes that the provision of these facilities can help the growth and development of the upstream industry. Providing facilities to the upstream industry is also carried out considering the upstream industry is a capital-intensive industry, which means that there will be a lot of labor absorbed, a lot of raw materials used, as well as a lot of capital goods invested, so this will hopefully have an impact on economic growth in Indonesia.

d) Site of Decision Making

In PMK No. 150 of 2018 the decision regarding the granting of reduction of Corporate Income is in the hands of the Minister of Finance. Article 6 of PMK No. 150 of 2018 states that the granting of a reduction in Corporate Income Tax is decided by the Minister of Finance after receiving a proposal for reducing the Corporate Income Tax submitted through the OSS system after the Taxpayer has completed all the application requirements. The authority to reduce the Corporate Income Tax is then delegated to the Director General of Tax to act on behalf of and for the Minister of Finance.

e) *Program Implementer*

The process of implementing the tax holiday policy in PMK No. 150 of 2018 especially for the implementation of the OSS program has not been able to run optimally. There is still a gap between when the policy is issued and when the OSS system can be fully used by the taxpayer. The OSS system could finally be completed and ready to be used around March or April 2018. This is certainly very detrimental for taxpayers who immediately want to apply for a tax holiday at the time the policy was issued. Taxpayers who should have been able to get a Decree granting the reduction of Corporate Income tax for a long time, must experience delays considering the OSS system cannot be fully used.

f) Resources Committed

HR involved in the process of implementing tax holiday policy consists of the policy makers as well as the industry players as the party that utilizes the policy. In the implementation of the tax holiday policy in PMK No. 150 of 2018, many parties played a role in the successful implementation of the policy. Policy makers have indeed succeeded in designing tax holiday policies that are far better than previous regulations, but in fact in the process of policy implementation there are still many shortcomings or problems that make the implementation of these policies cannot be as good and as good as what was previously planned.

2) Context of Tax Holiday Implementation

According to Grindle's theory, other indicators that also influence policy implementation are the implementation environment or the context of implementation. Therefore, in this section the researcher will analyze how the environment of the implementation of the tax holiday policy as set forth in PMK Number 150 of 2018 in accordance with the matters included in it as stated by Grindle (1980).

a) *Power, Interest, and Strategy Involved*

The highest authority in the implementation of the tax holiday policy is in the hands of the Minister of Finance, where the Minister of Finance will give the decision to grant the Corporate Income Tax reduction facility through the Director General of Taxes. In addition, in terms of interests, the tax holiday policy is certainly one of the tools or weapons used by the Government to encourage investment in Indonesia. With the growth of investment in Indonesia, it is certainly expected to help economic growth in Indonesia. So that the tip of the benefits targeted by the Government in implementing the tax holiday policy is for revenue productivity. Whereas for the strategy carried out by the Government, it is stated in Article 12 paragraph 3 of PMK Number 150

Year 2018 that for the income received and obtained by the Taxpayer from the main business activities, then there will be no deduction and collection of Income Taxes during the use period of the reduction of Corporate Income Tax without having to issue Free Certificate (SKB) withholding and collecting income tax.

b) ***Institution and Regime Characteristic***

As we know, the current Indonesian Government still has weaknesses in the form of a bureaucracy and a difficult licensing system. So, this also affects the process of implementing the tax holiday policy. Where in the implementation of the tax holiday policy in PMK No. 150 of 2018, although currently the mechanism for filing tax holidays has been increasingly shortened and carried out through the OSS system, but the requirements requested often still complicate taxpayers and the submission process is also often still beyond the term predetermined time. So it can be said that the successful implementation of PMK No. 150 of 2018 is very dependent on the conditions of the current Indonesian Government. All regulations that have been updated by such a way as to create a good and ideal regulation will be in vain if in its implementation the Government of Indonesia cannot commit to implementing the policy in accordance with the regulations.

c) ***Compliance and Responsiveness***

Since the issuance of PMK No. 35 of 2018 in April 2018, the number of companies utilizing tax holidays has increased significantly compared to the previous provisions. Only in a period of about 6 months, there have been 10 companies that managed to get a tax holiday facility. Then in November 2018, the Government renewed the tax holiday policy by issuing PMK Number 150 Year 2018. With the renewal of this reform, an increase in parties utilizing the tax holiday policy based on PMK Number 150 Year 2018 was also seen again. Until now the tax holiday policy set forth in PMK Number 150 of 2018 has been successfully utilized by 6 taxpayers. Therefore, tax holiday policy reform carried out by the Government by issuing PMK 35 of 2018 and PMK Number 150 of 2018 in fact was able to attract investors to take advantage of the policy. The reason is that only within 1 year of the issuance of changes in the tax holiday policy provisions, there have been 16 taxpayers who succeeded in getting the decision to grant a tax reduction. This is certainly far different from the policies set forth in PMK Number 130 Year 2011 and PMK Number 159 Year 2015, which within 5 years the policy only attracted 5 investors to take advantage of the policy. This shows that the tax holiday policy in fact can bring enough investment value to be invested in Indonesia.

However, with the increasing interest of the tax holiday policy in PMK No. 150 of 2018 it does not mean that the implementation of the tax holiday policy has been carried out perfectly and has no shortcomings. There are still many criticisms and suggestions from industry players regarding the implementation of the policy. Some criticisms that are still made by industry players include criticism about the implementation of the OSS system itself which often still makes it difficult for taxpayers and critics about the demands of taxpayers who want investment not only for new investments but also for their industrial activities.

Conclusion

Factors that caused the tax holiday policy before the issuance of PMK Number 150 Year 2018 did not run optimally include, the uncertainty factor in granting tax holiday decisions, bureaucratic factors and difficult requirements, and other factors besides tax, in the form of legal certainty, economic stability, and the availability of infrastructure.

The implementation of the tax holiday policy in PMK No. 150 of 2018 has been done quite well. Where the rules set forth in PMK No. 150 of 2018 are far better compared to the previous regulation, which is indicated by the tax holiday policy that prioritizes certainty, convenience, and trust in the taxpayer. The tax holiday application has also been carried out with the OSS system which makes the submission process shorter and more practical. But there are still some weaknesses in the implementation of the current tax holiday policy, such as the OSS system that is not immediately ready for use, and the time period for filing a tax holiday that cannot be completed within 5 working days.

Abstract

Modern businesses need to continuously improve their operations. Of course, they have many quality management instruments at their disposal, but they do not always know when and how to use them. The purpose of this paper is to prepare universal guidelines for companies introducing improvement activities. The paper presents a possible way to conduct research that enables easy diagnosis of the areas of operation of a company that require improvement, determination of their importance, and proceeding with their improvement. Moreover, it stimulates employee involvement in the process of improving the functioning of the company, which is consistent with the concept of continuous improvement. For these purpose, qualitative research (survey) was carried out among the personnel of the selected production company. The survey was carried out in few stages (initial and in-depth - regarding selected areas) using appropriately constructed questionnaires. Furthermore, there were carried out analyses of areas that were considered to be improved (information flow and quality of manufacturing processes). The analyses were conducted using quality management tools, such as: process mapping, pFMEA, Pareto-Lorenz diagram and System Utility Scale index. The presented analyzes confirm the need of introduction changes in the areas indicated by the employees.

Keywords: Improvement, Management, Quality

Introduction

In the modern economy, due to the processes of globalization and the growing competition, the importance of quality in all spheres of business management is increasing. Quality may relate to the product, the processes, the management and its methods, the functioning of company's departments, etc. The level of quality is constantly increasing. This is related to the improvement of offered products and implemented processes, which enable more effective use of owned and acquired resources in order to meet the growing needs of the market. Improvement of the entire organization can be achieved using specific quality management standards developed by ISO. However, some studies confirm that the operating efficiency of companies certified for compliance with the ISO 9000 standard deteriorates significantly, even though their sales revenues steadily increase (Chris et al. 2018). Moreover, the need for improvement may vary in different areas of a company. The question that arises is: How can one in an easy way diagnose the areas that need improvement in the first place? The authors considered this to be an interesting research area. Therefore the adopted goal of the paper was to present universal guidelines for companies concerning implementation of improvement measures. In addition, the justification for introducing changes in the indicated areas of enterprise functioning, according to the proposed method, was verified on the basis of analyses carried out on the example of a specific enterprise.

The structure of the work includes literature review, research questions, research subject characteristics, research methods and research results, followed by a discussion and conclusions.

Literature Review

One should bear in mind that quality is an essential element that determines a company's position on the market, its organizational development, and its ability to acquire new customers. It is impossible to imagine a company that operates on the market without meeting basic customer requirements and does not improve its functioning or the products it offers. However, only those companies that consider quality as a philosophy that constitutes a basis of their development have a chance to thrive in the market (Čiarnienė and Vienažindienė 2015). For example, Adam et al. (2001) treat quality as a vital component of the business strategy, while quality improvement is, according to them, a strategic variable in a highly competitive economy. In every business, regardless of its size, there are quality problems, which may concern its core business or supporting processes (Bozarth and Handfield 2019). In order to maintain the level of quality required by the market or to stay ahead of the competition in a given area, companies should implement the continuous improvement model proposed by Deming (1952). M. Imai (1986) also drew attention to the importance of small steps in the pursuit of perfection. Continuous improvement is a part of comprehensive quality management (TQM). According to Konecny and Thun (2011) TQM is a kind of management philosophy that helps manage the organization in order to improve its effectiveness and performance. There is a lot of research proving that continuous improvement affects the quality, innovation of enterprises, employee participation, customer satisfaction and other areas of enterprise functioning (e.g. Zehir et al. 2012, Besterfield 2009, Ahmad et al. 2012 etc.). Effective management of the improvement process is becoming a problem for managers making decisions regarding the areas of the enterprise's operation that should be improved, as well as the scope of required changes. Moreover, Stashevsky and Elizur (2000) suggest that participation in decision-making is the most important component of the TQM process that affects the improvement efforts and individual performance of enterprises.

The scientific literature on quality management includes multiple studies on improvement methods and instruments available to companies (Ślusarczyk 2016, Baskiewicz 2017). However, there are no specific guidelines for a simple diagnosis of the functioning of company's individual areas that require improvement. One of the most interesting studies in this area is the study by Sanchez et al. (2020), who prepared and tested a method for studying quality management systems by analyzing key performance indicators of sustainable scorecards in production environments. Another example is the roadmap for industrial practitioners with a diagnostic tool for companies, presented by Bastas and Liyanage (2019*),* combined the principles of quality management, supply chain integration, and sustainable development of an organization. However, the path of improvement presented in this paper is universal and can be applied in any entity present in the market.

Research Questions

The achievement the purpose of this paper, which was to prepare guidelines for companies concerning implementation of improvement activities, required posing several research questions:

1. How else can one diagnose the areas which need to be improved?
2. How can one determine the importance of these areas in terms of the need for improvement?
3. What are the benefits of implementation of the proposed improvement path?

Answers to the above questions were found during the implementation of a study conducted using the example of a specific company, in which the proposed path of improvement was implemented.

Research Design and Methodology

Characteristics of the studied entity

For the purpose of this study, a furniture industry company was selected that operated in the Łódź Province and manufactured various types of kitchen furniture sets for both individual (85%) and business customers (15%) from Poland and abroad. The number of its customers in 2010-2018 is shown in Figure 1.

Fig1: Number of customers of the studied company in the years 2010-2018
Source: own elaboration

The fulfillment of orders from business clients (developers, public institutions) brings about 55% of the company's revenues. Currently, the company is one of the largest manufacturers of kitchen furniture in central Poland. In addition to its production plant, the company has branches in Romania, Ukraine, Slovakia, and the Czech Republic, where some of the orders are fulfilled. The company had to increase its workforce from 15 in 2010 to 184 in 2019.

Methodology

Table 1 shows one of the possible procedure of the decision-making process to obtain information on the functioning of processes taking place in a company and the need of improvement.

Table 1: Procedure of the decision-making process regarding the improvement of enterprise functioning

Phase I. Preparation for design of a study
– Getting initial management approval; – Definition of the main objectives of the study; – Education of mid-level management and other staff concerning the conduct of the study; – Preparation of a continuous improvement program.

Phase II. Design of the concepts of the study - preliminary diagnosis
– Separation of information sources (forecasts, recovery programs, expertise, strategies, audits, annual reports, business plans, knowledge and experience of internal stakeholders, executives, specialists, and employees; knowledge and experience of external stakeholders, supervisory board, shareholders, and others); – Analysis of the collected empirical material and indication of initial directions of improvement or areas for improvement.
Phase III. Design of the study
– Definition of the objectives and results of the study; – Development of the rules for evaluation of specific phenomena; – Development of the scope of the study; – Development of the instruments to be used in the study; – Definition of problem areas, i.e. who influences the study and who is to be influenced by it; – Formulation of requirements for the studies to be carried out; – Determination of the time and date of the study; – Determination of the outlays and costs of the study.
Phase IV. Performance of the study
– External environment of the company; – Internal environment of the company.
Phase V. Analysis and evaluation of the results
– External analysis (experts); – Internal analysis (managers).
Phase VI. Use and implication of the results
– Control of the processes of the study; – Continuous restructuring of the study.

In fact, the people responsible for making decisions on improvement activities can adapt these guidelines to their needs. So it was in this case – using the guidelines a study was conducted, which consisted of several stages.

In the first stage of the study, there was conducted a survey among the personnel of the selected enterprise. The study concerned the areas of the company's operations that, according to the staff, needed to be improved. The research tool used was a questionnaire addressed both to superiors (managers) and operational staff (the so-called first-line employees). The respondents answered questions about the functioning of the enterprise, i.e. the need to introduce changes, areas in which changes should be introduced, the involvement of their and superiors in the process of improving the functioning of the enterprise, the frequency, legitimacy and effects of introducing changes in the area of operation of the enterprise in which they participate, etc. In the survey, a total of 7 main questions were asked, most of which were closed and 1 semi-open - allowing to add own answer (in this question the option of selecting more than 1 answer was also used). In some questions, the Likert scale was used. During this part of the study, 124 questionnaires (including 11 from superiors) were collected.

On the basis of the results obtained, an in-depth study was prepared to determine the impact of these areas on the functioning of the company. As a result of the in-depth study, 164 questionnaires were

collected, including 149 from the so-called lower-level employees and 15 from superiors. The respondents had to assign the rank (Likert scale) to individual area types (AT) in the context of their importance for improving the functioning of the enterprise. The following scale was adopted: 1- area currently the least important for improving the functioning of the enterprise to 6 - the most important area in the context of improving the functioning of the enterprise. The data collection process in both surveys was very short - 2-3 business days, because each employee was given a survey, which took no more than a few minutes to complete.

Then, in the AT of greatest importance, analyses based on the company's internal data on the share of non-compliance in these areas were carried out. Available quality management tools - process mapping, pFMEA, as well as System Utility Scale - were used to examine these areas to indicate the legitimacy of introducing changes and possible directions of these changes.

Results

As a result of first survey, many areas for improvement were identified and grouped into six AT: quality of manufacturing processes (QMP), costs (C), order fulfillment lead time (OFLT), occupational safety (OS), information flow (IF), and environmental impact (EI). A graphic interpretation of the importance of AT is shown in Fig. 2.

Fig2: Structure of importance of the opinions for the following factors: QMP, C, OFLT, OS, IF, and EI

Source: own elaboration

On the basis of the study conducted with the participation of the company's employees, the areas which are priorities for its operation improvement were identified, namely:

"IF" > "QMP" > "OFLT" > "C" > "OS" > "EI."

Due to the fact that the quality of manufacturing processes (QMP) and the information flow (IF) turned out to be the priority areas in the operation of the company in the opinion of the employees, a decision was made to analyze them in more depth. The other areas were considered as ones that did not require major changes at the time of the study.

The quality of manufacturing processes

In the studied case, only the main manufacturing process is presented. However, in order for it to begin, it must be preceded by the design phase which includes measurement, design creation, and ordering and storage of materials and semi-finished products. Then, there was performed an analysis

of the company's documentation concerning the existence of non-conformities and the reasons for their occurrence in the production process. Figure 3 shows the percentage share of non-conformities in the years 2010-2019.

Fig. 3: [%] Share of non-conformities in production in the years 2010-2019
Source: own elaboration

In order to assess the course of the manufacturing process, a generalized model was developed (fig. 4).

Fig. 4: Diagram showing the technological process pertaining to the product
Source: own elaboration

The most important operations (fig 5) include:

1. Taking boards from the materials and raw materials warehouse.
2. Transportation of boards to the board saw stand.
3. Board cutting operation.
4. Transportation of waste to the place of storage.
5. Storage of waste.
6. Checking the dimensions of the boards.

7. Interdepartmental transport to the grinding station.
8. Grinding operation (dusts and fumes are produced).
9. Transport to the painting (veneering) station.
10. Painting operation (dusts and fumes are produced).
11. Transport to the drying station.
12. Drying operation.
13. Inspection of components.
14. Interdepartmental transport to the inter-departmental warehouse.
15. Storage in the inter-operational warehouse.
16. Transportation to the assembly station.
17. Taking other components (handles, feet, screws, drawer and cabinet mechanisms) from the materials and raw materials warehouse.
18. Transportation of finished components to the assembly station.
19. Pre-assembly operation.
20. In-process control.
21. Finishing + packaging.
22. Transport to the warehouse.
23. Storage of finished products.
24. Transport to the customer.
25. Final assembly + control.

The activities comprising the production process selected on the basis of the process diagram (Fig. 5) became the starting point for the pFMEA. The pFMEA was used to indicate the type, place and causes of non-conformities. The pFMEA was performed in the following manner: each non-conformity assessed was assigned a number on the scale of 1 to 10 according to the following three criteria:

- frequency of the defect (risk of defect occurrence – O);
- importance of the non-conformity to the customer (S);
- level of detection (probability that a given non-conformity will not be detected by the manufacturer and will reach the customer – D).

Based on the estimated criticality figures, the Risk Priority Number (RPN) was calculated. In the production process covered by the study, it was assumed that the level of the RPN that is considered acceptable is 100, and if it is reached or exceeded, appropriate corrective action must be taken. The results of the pFMEA (Tab. 2) were also compared to the opinions of the employees supervising the analyzed process.

Table 2: Results of the pFMEA

Stage of the process	Type of non-conformity	Effect	Cause	O	S	D	RPN	Corrective actions
Board cutting operation	Achieving the wrong dimensions	Lack of ability to continue the process, Increase in costs, Increase in time	Haste, Incorrect design, Incorrect machine settings	9	8	4	288	Design control, Coordination of machine settings
Grinding operation	Achieving the wrong surface	Destruction of material, Increase in costs, increase	Incorrect machine settings, Haste	6	4	7	168	Design control, Information flow control, Materials control, Human

		in production time						resources coordination
Painting operation (veneering)	Achieving the wrong surface	Destruction of material, Increase in costs, increase in production time	Incorrect machine settings, Haste	6	4	7	168	Design control, Information flow control, Materials control, Human resources coordination
Drying operation	Achieving the wrong surface	Destruction of material, Increase in costs, increase in production time	Inappropriate drying conditions	5	4	7	140	Design control, Information flow control, Materials control, Human resources coordination
Taking materials from the warehouse	Taking the wrong materials	Lack of ability to continue the process	Haste, Wrong design	8	1	1	8	Design control, Information flow control, Materials control, Human resources coordination
Assembly operation	Achieving the wrong end product	Increase in costs, Increase in production time	Haste, incorrect design, lack of appropriate tools	2	8	1	16	Information flow control, Design stage control, Human resources coordination
Control	Accepting an incorrectly made product	Customer dissatisfaction, increased costs, Increased production time	Lack of employee focus, Haste, Wrong design	1	7	2	14	Design control, Information flow control, Materials control, Human resources coordination
Finishing	Achieving the wrong end product	Increase in costs, Increase in production time	Haste, incorrect design, lack of appropriate tools	3	7	2	42	Design control, Control of finished items, coordination of human resources
Storage of finished products	Damage to the finished product	Increase in costs, Customer dissatisfaction	Haste, improper packing, improper storage	2	9	3	54	Control of the storage stage, coordination of human resources
Installation at the customer's house	The finished product does not meet expectations	Increase in costs, increase in production time Loss of customer’s trust	Haste, improper design, improper storage of the product	4	10	1	40	Design control, Control of finished items, coordination of human resources

Source: own elaboration based on the company's source data

The pFMEA demonstrated that the highest risk of non-conformity occurs in the board cutting process (RPN = 288). Another important mistake is to achieving a surface that does not conform to the accepted process description, both during the grinding process (RPN = 168) and the painting process (RPN = 168). Repairing errors that occur during the grinding and painting operations requires a considerable amount of time and delays the next stages.

Information - flow

An important element indicated by the respondents is the information flow, which is largely responsible for the proper functioning not only of the manufacturing process, but also of the entire company. The following ways of information flow in the company were distinguished: correspondence (C), information board (IB), newsletter (N), electronic information flow (EIF - messenger software, filling in data in the IT system), consultations (CN), and meetings (M). Due to fact that EIF is used to implement the company's basic activities, a study was conducted on the generation of non-conformities arising in the course of its use. Fig. 5 shows the percentage share of non-conformities generated with the use of the EIF system in the company.

Fig. 5: Pareto-Lorenz diagram showing the percentage share of non-conformities and their cumulative share for the adopted test period: 1-non-conformities with regard to the quantity of stock in the warehouse, 2-non-conformities with regard to the type of stock in the warehouse, 3-missing materials accepted into the warehouse, 4-incorrect scheduling of production time, 5-incorrect cost calculation 6-incorrect planning of semi-finished products for work in progress, 7-overload of working nodes.

Non-conformities generated by the EIF system result mainly from incorrectly conducted inventories, mainly due to the haste of the employees and disruptions in the communication between organizational units, and from incorrectly entering data concerning the amount of materials, components, and semi-finished products in the warehouse into the system. Another common issue is failure to record the use of materials, components, and semi-finished products in the IT system.

In view of the results concerning the non-conformities arising with the EIF system, a decision was made to take a broader look at the specific method of communication by simply method - System Usability Scale (SUS) created by J. Brook. There was developed a questionnaire consisted of ten deliberately designed and appropriately organized questions, which concerned the effectiveness of the IT system in the company's production activities. The survey involved 40 employees who directly used the analyzed system. In their assessment, the respondents used a 5-point Likert scale. For questions 1, 3, 5, 7, and 9, the respondents awarded from 0 points, if they strongly disagreed, to 4 points, if they strongly agreed, and for questions 2, 4, 6, 8, and 10, the reverse scoring method was applied. On the basis of the results, the value of the SUS (System Utility Scale) index was calculated.

The value of the SUS index was calculated in this case by adding the points obtained and multiplying the result by 2.5, and then calculating the average. When interpreting the result obtained, a rule was adopted according to which the higher the value of the SUS index, the higher the usefulness of the IT system in the production activity of the company. In the case covered by the study, it was assumed that the value of the SUS index exceeding 68 would be a satisfactory indicator.

Table 3: Evaluation of the effectiveness of the IT system used in the company covered by the study

No.	Aspects of effectiveness of the system	evaluation					Score according to the SUS
		0	**1**	**2**	**3**	**4**	
1	*When working on a project, I often use the system*	0	0	6	10	24	138
2	*I use the system to generate all data necessary for performance of individual project tasks*	0	0	18	4	18	120
3	*For tasks related to the implementation of individual technological operations, I often use other sources/applications that are not a part of the IT system*	0	10	5	5	20	115
4	*I need additional technical support while using the system*	31	4	5	0	0	14
5	*System functions are easily accessible*	27	12	0	1	0	15
6	*There are many inconsistencies in the system I use*	24	11	5	0	0	21
7	*I am afraid that using only the current IT system for production activities may provide incomplete data on the technological processes being carried out*	0	5	1	17	17	126
8	*The system is cumbersome to use*	0	18	15	7	0	69
9	*The use of the IT system improves the course of the production processes in progress*	0	16	16	8	0	72
10	*Using the system makes it possible to manufacture high quality products that are always in line with the design objectives*	0	0	1	25	14	133
							SUS=51.44

Source: own elaboration

According to the study, the main aspects that need to be corrected or improved are the functions of the system, its lack of coherence, and the use of additional tools due to the lack of their inclusion in the system. According to the SUS at the level of 51.44, it was found to be unsatisfactory for the company and, therefore, targeted action should be taken.

Discussion and Conclusion

In order to meet the customer's requirements, modern company is forced to manage its processes so as to respond to the growing changes in the environment and the individualization of customer needs and expectations. Management of the processes taking place in a company is defined as the control of

the information and decision-making system implemented at different levels of the organization, which is intended to ensure elimination of existing and potential threats detected in the environment, as well as taking advantage of emerging opportunities. Information in an organization and in management of processes taking place in a company can be used for the purpose of a thorough analysis of production structures and the principles and effectiveness of their activities, as well as for developing concepts for improvements and development forecasts. Thanks to the information and the design of its flow, the company can better adapt to the requirements of its environment. However, in the event of excessive quantities of data, which an average manager finds difficult to process, a particularly valued functionality of information systems is a way of performing the process of data acquisition and development that, after appropriate processing, is a source of knowledge used, among others, in the processes of improvement of the organization. The main contribution of this paper is proposal of a path related to making decisions on improving given areas of the enterprise. This path involves all employees in the decision-making process, which is important for the company's achievements (Stashevsky and Elizur 2000). Moreover, it is distinguished by its simplicity and ease of implementation, because it consists of collecting information from employees involved in given processes. Using a simple ranking assessment made by employees, the importance of areas for improvement can be determined. Furthermore, it is noted that it does not require consultation of industry specialists to help improve the management system, as is the case with the methodology proposed by Sanchez-Marquez et al. (2020), which focuses on efficiency management. In addition, the study presented herein contains an example of the application of the proposed path of improvement, which is lacking, for example, in the study of Bastas and Liyanage (2019) which links quality management, supply chains, and sustainability.

An additional advantage of the study is the verification of the legitimacy of introducing changes in the areas indicated by the respondents, which was carried out by analyzing the share of non-compliance. In the case of the QMP, share of non-conformities in production in the years 2010-2019 is presented. The pFMEA for this area showed that the greatest risk of non-compliance occurs in the board cutting process (RPN = 288). The corrective actions recommended during the aforementioned operations include design control, coordination of the work of employees, and development and adaptation of the information flow for the process. An appropriate division of responsibilities can help to eliminate the rush which, according to the opinions expressed by the employees during the consultations, is the cause of most of the mistakes made.

However, in the case of the IF, the share of non-compliance with their types was presented over a period of one year - 2019. The most frequent non-compliance were errors in data regarding the quantity (41.2%) and type of inventory in the warehouse (19.6%). In turn, thanks to the use of the SUS tool, it was possible to indicate the aspects in which changes are needed (system functionality and the need to use technical support).

Of course, there are some limitations to this method of determining the improvement needs. The survey is based on the respondents' answers, which are employees of the company. One can imagine a situation when an employee directed by his own motives assesses well the process in which there are many errors. Therefore, it becomes important to make employees aware of the importance of continuous improvement for the functioning of the enterprise.

The proposed path for determining the directions of improvement includes both qualitative and quantitative research (survey and quality management tools). However, the proposed path must be repeated to contribute to continuous improvement. This raises new research questions - regarding the frequency of its use, the choice of whether it is to be used periodically or only after making changes in processes, and regarding the risk of routine adversely affecting respondents in completing the necessary surveys. Nevertheless, the effects of corrective actions taken in the surveyed enterprise should be checked by repeating the research.

On the basis of the study conducted for a specific company, it was proved that the recommended path of improvement is feasible. Following the guidelines provides valuable information on the areas of the company's operations that need to be improved. A simple ranking can be used to determine the importance of areas that require improvement. What is more, this method engages all employees in the improvement process, which is the basis of quality management in a modern company.

Abstract

The provision of high quality, safe, effective and patient-oriented health services requires a comprehensive and coherent approach to the management of processes implemented in the health care system. It is particularly important to cooperate at all levels of the system to engage patients in decision-making regarding health services. The involvement of patients, their families and communities is a broad concept of capacity building of the patient to actively participate in managing their own health and care. The result of such an approach are the benefits relating to the quality of health services, focusing on the patient, better health outcomes and effectiveness of the health system. In order to ensure the effectiveness of undertaken actions, it is necessary to manage processes of patient engagement, which means a comprehensive, continuous and systematic use of methods and tools for influencing the processes undertaken to meet the needs of patients and the system in terms of increasing participation. The issues discussed in the article concern the key issues of process management of patient engagement. The purpose of the article is to present and analyse the essence and role of patient involvement and to identify the premises, conditions and ways of managing engagement in a process approach. The article is a conceptual and research and was developed based on an in-depth analysis of literature, documents and interviews. Based on the analysis, a conceptual model of process management of patient involvement was proposed, taking into account the main tasks and participants responsible for their implementation at the organisational level.

Keywords: Patient Engagement, Health Care System, Health Care Management, Process Management.

Introduction

The smooth functioning of the health care system is a challenge for policy makers responsible for social policy. In the face of globalisation challenges, especially of a social, demographic, environmental, technological, economic, as well as political and legal nature, health care systems are forced to search for new concepts, approaches and methods of action to ensure effectiveness. According to the World Health Organization, the health care system includes all activities whose main purpose is to promote, restore or maintain health (WHO, 2000). In this context, the system's activity has a wide, complex and multi-faceted scope and requires the participation of many entities at various levels: macro (system level), meso (inter-organisational) and micro (institutional - directly related to the performance of activities). In a broad sense, "health care system is a whole of political, economic and cultural, technical and organisational factors, relations, processes and elements, in which individuals, groups and communities interrelate, having the goal to satisfy their health needs" (Kovacic and Jaksic, 2013, p. 101). The main components of the effectiveness of the health care system include patient health status, patient satisfaction and access (availability, utilisation, timeliness) and quality of care (efficacy, safety, continuity) (Kruk and Freedman, 2008). In a well-functioning health system, the provision of services should have the following features: comprehensiveness, accessibility, coverage, continuity, quality, person-centeredness, coordination, accountability and efficiency (WHO, 2010).

High-quality health services, ensuring patient satisfaction, require proper definition of the role of patients and the use of their potential in the treatment process by engaging them in decision-making and organisational (communication) processes. The primary premise should be focus on the patient and his needs, strengthening the role of the patient, conducive to ensuring efficient communication enabling active participation of the patient in the decision-making process regarding care.

Research Procedure

The starting point in the research process was the assumption that patient engagement is an important component of health services, covering a wide area of activity at the system and organisational level. In this context, it should be assumed that for the smooth functioning of the health care system, a comprehensive and coherent approach to engaging patients in decision-making about care, directed at conscious and active cooperation for the health condition, is necessary. To ensure effectiveness, a process-based approach to patient engagement management is necessary, which means targeted, comprehensive, continuous and systematic action, integrated within the entire health system and coherent with the objectives of the implemented health policy. In the article, the authors attempted to answer the following research questions:

- what is the essence of the patient engagement and his role in the health care system,
- what are the premises and conditions for managing process of patient engagement,
- what activities are key aspects of managing patient engagement in the process approach.

The article is a conceptual and research and aims to analyse the essence of patient engagement and its role in the functioning of the health care system, and to identify the premises and determinants of management aspects of involvement in a process approach. To achieve the adopted goals the following research methods were used: literature study (a review and in-depth analysis of scientific literature), document analysis (review and analysis of documents, reports and legal acts), and to explore the research problem - preliminary individual semi-structured interviews with experts (hospital managers). Based on the analysis, a conceptual model of process management of patient involvement was proposed, taking into account the main tasks and participants responsible for their implementation at the organisational level. During the analysis and evaluation of the examined process, mapping methods were used, enabling the development of graphic form of the model. For this purpose, iGRAFX software was used. The final stage of the research procedure is the formulation of conclusions and recommendations relating to the conditions for managing patient engagement in a holistic, integrated and consistent manner at the system level.

The Essence and Role of Patient Engagement in The Health Care System

One of the fundamental functions of health systems is the provision of patient-centred care. The World Health Organization defines this concept as services that are organised around the person, not the disease or the financing, which are perceived by people (being partners in their own health care) as responsive and are accepted by them, and the target population takes part in service delivery design and assessment (WHO, 2010). Patient focus is not just a guideline for health care providers on pro-quality activities. It means a way of thinking based on treating service recipients as equal partners and recognising their rights to participate in planning, developing and monitoring care to ensure that their needs are met (Health Innovation Network, 2016). This approach requires strengthening the patient's position in the system and engaging to actively participate in deciding on the treatment process. Strengthening the patient's position (patient empowerment) involves undertaking a range of activities including: facilitating patient communication with medical professionals, educating and providing access to health knowledge (promotion, raising awareness and stimulating self-criticism), enabling access to personalised medical information, supporting self-care and commitment to health management , helping them make informed decisions regarding the choice of care options (defining the problem, presenting options and consequences, value elicitation and referral to support services) and providing contacts with other patients (supporting self-education and individual responsibility, encouraging to take initiatives to help other patients) (Alpay et al, 2011).

As a consequence of this approach, the position and role of patients in the system changes radically. They become not so much recipients of health services but above all conscious participants in the treatment process. To make this possible, there must be a number of changes in the system that will enable the patient to be involved in making decisions about his own health and medical care. The concept of patient engagement means the "process of building the capacity of patients, families, carers, as well as health care providers, to facilitate and support the active involvement of patients in their own care, in order to enhance safety, quality and people-centredness of health care service delivery" (WHO 2016, p. 3). In general, it is "a broad concept that combines a patient's knowledge, skills, ability and willingness to manage his or her own health and care" (Strudwick et al, 2019, p. 4). The broad context of this concept refers to the significant scope of impact. Engagement applies to the patients themselves, as well as their families and representatives, health professionals, operating under active partnership at various levels throughout and also to the entire health care system (direct care, organisational design and governance) to improve health and care health (Carman et al, 2013). Such multilateral cooperation is necessary because engagement is a complex concept; it can involve various aspects of care such as participation in the decision-making process, self-treatment, self-monitoring, patient education, goal setting or participation in the treatment process (Longtin et al, 2010).

This inclusive approach to patients, giving them subjectivity generates benefits for both the patient and the health system. In the individual dimension, it contributes to the improvement of treatment results, while in the institutional and systemic dimension it is a source of benefits in the areas of management, organisation (organisational culture), and economic and educational. Patient engagement in their own care, as a function of improving communication between the patient and the provider and facilitating information transparency, fills the gap between patients' expectations and the services provided (Birkelien, 2017).

This concept is recognised as a critical part of the continuously learning health care system or a necessary condition for the redesign of health care systems, the implementation of which are supported by aspects such as: a) benefits of work related to patient- and family-centred care and joint decision-making reflecting and accelerating the changing roles of patients and families in health care (patients become more active, informed and influential), b) effects in the form of better health outcomes (quality and safety of patients), as well as c) control of health care costs (Carman et al, 2013).

It is pointed out that the engagement of patients, their families or communities is the foundation of effective management practices, and approaches to increase community members' perspectives are widely promoted in management education and professional standards (Linnander et al, 2017). In addition, it is one of the strategies that allow achieving a triple goal of improving health outcomes, better patient care and lower costs (James, 2013). Taking into account the multidimensional nature of the patient engagement, it is considered as a "meaningful and active collaboration in governance, priority setting, conducting research and knowledge translation" (SPOR, 2014, p. 5).

In conclusion, it should be emphasised that patient engagement, being the immanent feature of health services characterised by high quality, focus on the patient and effectiveness, can play an important role in improving the health system and developing health services. However, in order for the benefits of this approach to be felt by the patient, as well as participants and stakeholders of the health system, a systematic management approach is necessary, focused and collaborative, taking into account the specificity of processes involved in engaging patients.

Premises and Conditions of Process Management of Patient Engagement

Restoring or maintaining the health of patients, as the goal of health systems, requires state efforts to define a framework for action and provide resources according to the policies of health, which is part of social policy. In this sense, economic efficiency and clinical effectiveness of the health system are important, but at the same time the attitudes of people using the services of this system are particularly significant (Nojszewska, 2011). Designed healthcare management systems should

therefore take into account the special role of patients, their changing needs and the impact of their attitudes and behaviours on the effectiveness of medical processes.

In a systemic approach, health care management is defined as “the process of achieving health care objectives through human, financial, and technical resources – includes strategic and operational management activities such as supply chain management, human resources management, performance management and improvement, financial management, and governance, without which resources cannot be effectively deployed to maximise health outcomes” (Linnander et al, 2017, p. 555). The goal of care management is to assist patients and improve their functional health status, enhance care coordination, reduce costs, eliminate duplication of services, and reduce the need for medical services (Bodenheimer and Berry-Millett 2009).

Management of patient management includes a number of processes necessary for building capacity of patients to a conscious and active participation in decision-making related to health care. The complexity and multidimensionality of these processes is related to three critical aspects of patient engagement such as: engagement activities range along a continuum (from consultation to partnership and shared leadership), engagement occurs at different levels and many factors affect patients' willingness and ability to engage (Carman et al, 2013). Patient engagement is a “process-like and multi- dimensional experience, resulting from the conjoint cognitive (think), emotional (feel), and conative (act) enactment of individuals toward their health management" (Graffigna et al, 2014, p. 1).

Taking into account the safety aspect of health care, the World Health Organization identifies five main categories of factors affecting patient engagement, relating to: patient (demographic characteristics, health literacy), health conditions (disease severity), health care professionals (knowledge and attitudes), tasks (degree difficulties, competence challenges) and the health care setting (e.g. primary or secondary care) (WHO, 2016). Among the factors related to medical professionals that negatively affect the patient's engagement are: willingness to maintain control, time needed to train the patient and respond to his opinion, type of disease, personal beliefs, specialisation, ethnic origin and insufficient training in the concept of increasing patient engagement (Longtin et al, 2010). Therefore, at the institutional level, it becomes necessary to support workers, improve their communication skills, establishing rules, standards strengthen the organisational culture oriented on the active cooperation of the patient, his family and surroundings.

The ability and willingness of patients to engage in health matters is also significantly influenced by the cultural context of the country or community, including social norms, legal regulations, beliefs and social determinants of health (Edgman-Levitan et al, 2013). Factors with a broader impact that affect the participation of patients and their families and caregivers in health care decision-making processes include: development of patient-centred health care systems to ensure the improvement of the quality of treatment for all patients, the possibility of individual therapeutic treatment for each patient, better understanding of diseases and treatment effects, promoting scientific research and communicating results to the public, participation of caregivers in representing the charges and increasing awareness about health and diseases in the whole society (ELF, 2020).

The multiplicity and complexity of tasks related to patient engagement justifies a process-based approach to management, manifested in the purposefulness, coherence and wide range of activities, integrated into the entire health care management system. Process management is "comprehensive, continuous and systematic application of appropriate concepts, methods and tools for influencing the processes taking place in the organisation, aiming at achieving the organisation's goals and the best satisfaction of the needs of its external and internal clients" (Nowosielski 2009, p. 75). For the process approach in management, the systematic treatment of the organisation, which is a set of interrelated and interpenetrating processes, is characteristic (Hammer and Champy, 1996). In process organisation, the client is in the centre of attention, and therefore the key to management are those activities that allow quick and effective identification and satisfaction, as well as creating the needs and expectations of clients (Grajewski, 2016).

By adopting this approach to managing patient engagement, it is possible to achieve the goals of the health system. This involves enabling the necessary changes such as (A Leadership, 2013):

- at the individual level - changes aimed at encouraging and supporting patients and their families to be active participants in care and decision making;
- at the level of health care teams - changes ensuring preparation and support of teams for cooperation with patients, families and other members of the care team;
- at the organisational level - changes aimed at assigning accountability, encouraging partnerships and incorporating the patient and family perspective in all aspects of provider planning, implementation and evaluation of programs and services.

In this context, process management of patient engagement is a comprehensive impact on processes implemented at the system level (regulatory, supervisory, educational, research and development) and the organisational level (service, management, communication, training and education).

Key Aspects of Process Management of Patient Engagement

The adoption of process orientation for managing patient engagement is a multi-stage activity involving a number of participants and stakeholders of the health system, including patients, their families, communities, social organisations, government and public institutions performing tasks under health policy, health service providers, research institutions (universities) and the media. Management of engagement as a multidimensional concept requires consistency of goals and functioning at the system, institutional and direct patient relationships. The concept of process management implementation includes the following stages (Grajewski, 2016):

1. determination of the organisation's purpose,
2. identification of processes in the area of mega processes distinguished according to the client (recipient) criterion,
3. designing reference processes - creating process maps,
4. development of process measures and internal market relations principles,
5. development of an IT system to support the operation of the organisation.

The goal of patient engagement management is to support the functioning of the health system, rationalise the number and effectiveness of health services, and increase the role of prevention and health promotion to reduce the need for inpatient, highly specialised treatment, which consequently improves the performance of service providers and patient relationships. Therefore, patient focused quality interventions are needed to improve health literacy, clinical decision-making and patient safety (Coulter and Ellins, 2007). They form the basis for identifying the main processes focused on creating value for the patient. The main areas of impact of patient engagement management are: knowledge, skills, ability and willingness of patients to manage health and care for themselves and family members; a culture of health care organisation that prioritizes and supports patient involvement and active cooperation between patients and health care providers to design, manage and achieve positive health outcomes (5 Elements 2014). Patient engagement relates to six key options for building relationships between individuals, families, communities, health care professionals and decision makers, which include: education (stimulating changes in behaviour at various levels of engagement, learning new partner communication skills), research (a key factor shaping health policy, professional practice and patient results), community health, direct care, organisational design and governance, and public policy (Edgman-Levitan et al, 2013).

After identifying the processes, it is necessary to develop their course (preparation of maps). For this purpose, graphic methods are used, including: activity flow cards, Clark charts, Bernatene-Grün charts, Gantt charts, schedules, classification schemes, Sankey charts, Ishikawa diagram and relationship diagram (Starbyła, 2012). Due to the complexity, variability and dynamic nature of health care processes, process mapping is not limited to the visual presentation of the analysed process, but should include social aspects such as interaction between participants (Antonacci et al, 2018).

To assess the effectiveness of implemented processes, a measurement system should be developed, under which reporting structures using multiple communication channels will be created, and the value of engagement initiatives will be evaluated, using measures related to a given process (e.g.: level of patient and/or family member representation or patient, family and project team satisfaction) and its results (e.g.: overall satisfaction with engagement activities, clinical/patient outcome improvements, number of engagement goals or objectives achieved or level of knowledge or information obtained) (Strudwick et al, 2019).

To ensure the efficient implementation of processes related to patient engagement, an IT management support system is required. E-health plays a special role in multilateral communication processes. The European Commission defines eHealth as "the use of ICT in health products, services and processes combined with organisational change in health care systems and new skills, in order to improve health of citizens, efficiency and productivity in health care delivery, and the economic and social value of health. eHealth covers the interaction between patients and health-service providers, institution-to-institution transmission of data, or peer-to-peer communication between patients and/or health professionals" (European Commission, 2012, p. 3). Information and communication tools and techniques form the basis for the efficient conduct of main processes such as: education, communication and training.

Modelling of Patient Engagement Management Process

Modelling activities are helpful in process design. Process models used in process management have an analytical function and support the rationality of decision making. The purpose of modelling management systems is, in particular, to recommend a specific decision, to forecast system behaviour, and to train and improve staff in decision making (Grudzewski and Wilimowska, 2017). The components of the process model are design decisions regarding the identification of actors involved in operations, operational activities, performers of individual activities, inputs and outputs of activities, determination of the sequence of activities (dependence of activities, the possibility of parallel implementation) (Pietroń, 2011).

As a result of the analysis of the nature and conditions of process management of patient engagement, a conceptual model was developed, taking into account the identified specific features, determinants and requirements of this concept. The process management model includes main actors of the process involved in processes at the institutional level – health care providers (decision makers and performers: management, medical personnel in direct relations with the patient (medical professionals, care coordinators), and support personnel: IT specialists, administration, etc.). This model presents the sequence of the main tasks and activities of processes implemented in the area of patient engagement management in two phases: preparation (Figure 1) and executive (Figure 2).

Figure 1: The conceptual model of process management of patient engagement - preparatory phase

Source: Authors analysis.

Input data was determined as the need to implement process management of patient engagement in the organisation. Input data was determined as the need to implement process management of patient involvement in the organisation. The expected result (output) is to achieve patient engagement - readiness and participation in decision-making about care. To present the course of activities, a flowchart diagram was developed, using the iGRAFX program. The following stages have been distinguished in the model:

- preparation of patient engagement strategy, arrangements with employees and patients (representatives, community, patient organizations, etc.),
- strategy approval and transfer of information to all participants,
- designing standards, norms and procedures necessary to implement the strategy,
- division of tasks and activities, creation of interdisciplinary teams, appointment of leaders, care coordinators,
- preparation of an IT system to ensure communication and information and knowledge transfer,
- staff training, creating an organizational culture that supports engagement,
- preparation of programs, tools and channels of communication with the patient, education, providing ongoing personalised consultations, advice,
- strategy implementation at all levels,
- measurement and evaluation of the effects, the study values, benefits, satisfaction of patients and staff, identification of irregularities,
- implementation of adjustments and streamlining the process.

Figure 1: The conceptual model of process management of patient engagement - executive phase.

Source: Authors analysis.

The proposed model is simplified and requires detailed modelling of sub processes associated with the identified main processes, but it can, however, be a starting point for designing a patient engagement management system. It should be emphasised that the usefulness of modelling, and consequently the correctness of analysing, designing and implementing the proposed systems depends on a number of factors, including the modelling methodology itself. One of the critical factors is the acceptance by all participants of the process, its goals, implementation method and measurement methods. Therefore, the participation of employee representatives, patients, their families, the community and decision-makers is necessary in modelling the process of patient engagement management.

Conclusions

Patient engagement is an interesting concept in the scientific and practical dimension, which can contribute to increasing the quality, safety, focus on people and the effectiveness of health care services provided. However, the implementation of this concept is a challenge for health systems due to its complex, multi-entity nature. To ensure the integrity of the principles and practices necessary to implement the concept of patient engagement in all levels (the health system, health care providers, and medical professionals), a process-based approach to management is necessary. Considering the issue of patient engagement in the context of processes allows you to focus on creating and delivering value to patients and the health system. A prerequisite for engagement is patient orientation throughout the process at all levels of interaction. The organisational efficiency of service providers requires support from decision-makers in the area of legal regulations regarding norms, standards, information systems, data security, acidification and training requirements, community-wide health education campaigns, health-promoting behaviours and the possibility of influencing health care. Another important factor is the understanding and acceptance of the patient's role in the health system and a strong awareness of employees regarding their responsibility in terms of building value. In the organisation it is necessary to build strong relationships that facilitate the integration of solutions, transfer of knowledge and information, a flexible approach to the structure, creation of interdisciplinary teams and continuous improvement of processes taking into account the changing needs of patients and external conditions. Patient engagement is a complicated and lengthy process, but due to the specificity of health and its social and economic health value, the role of this concept will increase.

The article is valuable to identify, systematise and emphasise the role of the process approach to managing patient engagement and is the starting point for further, more detailed research.

Abstract
The 2007/2008 global financial crisis highlights the need for an extensive business cycle fluctuation research. The study examines business cycle fluctuations in selected African countries. It establishes and characterises business cycles in Africa countries by the investigation of business cycle synchronisation across African countries using the Hodrick-Prescott filter to verify the existence of business cycles in Africa as well as the cyclical characteristics. The results indicated that business cycles exist in Africa. The cyclical features are also described using the Hodrick-Prescott filter. The pair-wise correlation matrix was utilised in investigating the existence of business cycle synchronisation in Africa. From the results, it is discovered that the business cycle synchronisation exists in Africa. The degree of synchronisation, however, varies across different countries. The existence of a strong procyclicality between government spending and real GDP indicates the strong influence of government spending on macroeconomic fluctuations. Therefore, the study recommends that the government and its institutions should carry out a proper fiscal policy plan alongside monetary policy to stabilise the economy in periods of recession and expansion. Furthermore, the study highlights the need for diversification of the export base of most Africa countries from agricultural raw materials to consumer goods.

Introduction

The economic behaviour in terms of growth and fluctuations, has been a major concern for economists and policymakers in recent decades. Such swings in macroeconomics may be referred to as business cycles. Business cycles may exhibit unusual characteristics depending on economic fundamentals. Nonetheless, it has some simple common features such as fluctuations in aggregate economic activity, which simultaneously affect all economic indicators such as GDP, interest rate, and unemployment rate. Such cyclical patterns are not the same as any other period-like seasonal cycles or regular cycles. Although seasonal and annual cycles are attributed to variations happening within a year typically due to weather changes or business practices, business cycles are not regular. The length, scope, and intensity of each phase in the cycle vary greatly (Burns, 1969). It, therefore,

becomes difficult to predict how long a particular phase can last, and its effect on the economy as a whole.

Studies on the business cycle usually apply to the perception of cyclical boom times and deflation. The knowledge of business cycles is thus key to a thorough study of economic trends and to predict potential developments. Considerable attention is now being given to long-term growth with the need to reduce economic fluctuations. This is apparent because long-term policy interventions (structural policies) most often have as their primary objective economic growth. Conversely, short-term policies (stabilisation policies) have as a primary objective the reduction of these economic fluctuations (European Commission, 2003). These are policy issues in developing economies due to the convergence of business cycles across all economic sectors, especially the banking, industrial and commercial sectors, in particular (Burns, 1969). This suggests that shocks can easily be transmitted to other economic sectors within one sector, which could affect the economy as a whole.

After the global financial crisis of 2007/2008, the stability of macroeconomic factors became a highly important policy priority in several developed countries in Africa. The global economic and financial slowdown witnessed in 2007/2008 that started as the 2007 U.S. sub-prime mortgage chaos transformed into a financial crisis that caused an economic decline in developing economies by 2008 and further triggered a growth crisis in Africa by 2009. The unprecedented nature of the crisis has resulted in a continuous and significant downward trend in Africa's major macroeconomic indicators (Osabuohien et al, 2018; Asongu et al, 2019).

Besides, owing to globalisation, the RBC principle has been used to demonstrate a type of market cycle synchronisation through countries (McGrattan & Prescott, 2014). It means that identical variations in macroeconomic aggregates can occur in other countries. The synchronisation of these business cycles was evident from the wide-spread effect of the US-born global financial crisis of 2007/2008. Consequently, African countries have been significantly affected by international economic events. These are evidenced by the effects of the financial crisis, economic depression and shocks resulting in declining investments, collapse of commodity prices, decline in the capital market, increase in the unemployment rate, which has led to the economic contraction of most countries on the continent (Asogwa, Ugwuanyi, Obidike & Eze, 2014; Beecroft et al, 2020).

Stemming from the foregoing, this study examines business cycle fluctuations using the case of in selected African countries. The main objective of the study is to establish and characterise business cycles in African countries. Furthermore, it underscores the kind of business cycle synchronisation that exist in the selected countries. The rest part of the study is organised in sections as follows: next to this introductory section is the insight from the literature, which is followed by the method of analysis. The discussion of results and conclusion are contained in sections four and five, respectively.

Insights from the Literature

This section highlights insights and reviews relevant literature, which examine the characteristics of business cycles in Africa as well as synchronisation of these business cycles across the African countries. The empirical review shows a few existing research work findings in Nigeria, Africa, and other industrialised countries. Fiess (2007) in his study titled Synchronisation of the Business Cycle and Regional Integration, for Central America. The analyst tests the degree of synchronisation of the business cycle between the United States of America and Central America. This was to consider the need to assess macroeconomic cooperation risks and benefits.

Business cycles are short-run fluctuations around the long-term growth which have expansionary and contractionary behaviour and by implication, have costs on the economy. Hence, the ability of the governments to properly manage countercyclical and procyclical macroeconomic policies would contribute to the growth that economy. Alege (2008) explained that in many less developed countries, macroeconomic policies are procyclical (exacerbating rather than alleviating the adverse impacts of the boom and depression on the long-term growth. Alege (2008) further emphasised on the cost of a procyclical policies in these developing countries, which include: imprudent fiscal spending that leads to inefficient resource allocation, which further leads to macroeconomic instability.

Business cycle literature predates as far back as Kyland and Prescott (1982) with the introduction of the Real business cycle (RBC) model built on the rational expectation hypothesis, Kyland and Prescott (1990) using atheoretical methods, while Kydland and Zarazaga (1997) following suit, applied the atheoretical methods to a study carried out in Argentina. Artis, Kontolemis and Osborn (1997) also examined the international characteristics of the cyclical movements of the business cycles across different countries. Within the same period, Gregory, Head and Raynald (1997) investigated where the similarities and co-movements in aggregate fluctuations for the G7 countries lie (Canada, United States of America, Japan, France, Italy, Germany and the United Kingdom).

Agenor, McDermort and Prasad (2000) documented the business cycle (macroeconomic fluctuations) for 12 developing economies using quarterly time-series data. The study was based on the cross-correlation between other macroeconomic variables and industrial output. The result of the study showed the existence of similarities in the macroeconomic fluctuations in the developing and developed economies. Additionally, Output volatility was observed to be greater in developing countries compared to the developed economies. In contrast, the terms of trade and output were strongly correlated, and there was no consistent relationship between the balance of trade and fluctuations in output.

As regards empirical studies on synchronisation of the business cycle, Calderon, Chong and Stein (2003) studied whether trade intensity and synchronisation of the business cycle are different in developing countries. They used information from 147 countries from 1960 - 1999 using 33,676 pairs. The researchers found that countries with higher bi-lateral trade exhibit higher synchronisation of the business cycle, and countries with asymmetric production structures exhibit a lesser synchronisation of the business cycle. They also discovered that trade integration has a greater impact on business cycles across industrial countries compared to developing ones.

Rand and Tarp (2002) attempted to find out if business cycles in developing countries are any different. The authors stated that the nature and characteristics of business cycles in developing countries differ from that of developed countries. The authors went further to state that cycles are shorter and more diverse across developing countries than that of industrialised countries. The study relied on 15 developing countries from Africa, Latin America and Asia, using five countries in each region. The results influenced claims that shocks from developed countries are essential drivers of macroeconomic fluctuations in developing countries. Also, on business cycle synchronisation, Fidrmuc and Korhonen (2009) analysed the sources and causes of business cycle convergence and divergence between the two largest emerging economies in Asia (China and India) and the Organisation for Economic Cooperation and Development (OECD) countries. The study found that the dynamic correlation analysis was low in Asia relative the findings from the OECD countries.

Coleman (2011) investigated business cycle synchronisation in West Africa, as a result of the sustainability of the West African Monetary Zone (WAMZ). The author examines the degree of business cycle synchronisation in order to understand better the level of economic and monetary integration in West Africa. Five individual countries were utilised with data spanning 30 years. The results obtained showed an inconsistent pattern of synchronised business cycles. The author, therefore, opined that this raises a form of concern on the economic sustainability of the WAMZ. Tatomir and Popovici (2013), presents a picture of the degree of synchronisation across the European Union. The authors utilised the Hodrick-Prescott to capture business cycle trends and the Pearson correlation coefficient to measure the degree of synchronisation. It was discovered that the Euro-area exhibited varying degrees of synchronicity.

Diallo and Tapsoba (2014) investigated the extent to which Africa's business cycle is synchronised with that of the rest of the world. The study employed Hodrick-Prescott filter to examine business cycle correction covering periods from 1970 to 2010. Their findings suggest that Africa's business cycle has not only moved in the same direction as that of the rest of the world but has also gradually drifted away from the G7. The increase in aggregate import demand as a result of international trade was presented as an argument for their findings. However, the cyclical characteristics in African countries and the test for synchronisation across the region have not sufficiently been addressed and discussed. Hence, this study makes a contribution to the literature by filling this observed gap.

Method of Analysis

Technique of Estimation

In this study, the cyclical characteristics of the selected African countries are observed using an atheoretical method which utilises the Hodrick-Prescott (H.P.) filter. The atheoretical methodology establishes the need for no theory or no empirical model to carry out the analysis. The cyclical behaviour of real GDP and its main components are examined, presented and discussed as it is fundamental in the analysis of real business cycles. This is carried out by examining the relationship between aggregate output volatility and its major components, namely: consumption, investment, government expenditure, import and export. The approach used in achieving this objective was influenced by Agenor *et al*. (2000). It consists of obtaining a detrended series, the cross-correlation between the trend in aggregate output and the trend in the main components of aggregate output, and a correlation coefficient to measure the cyclical behaviour of the variables.

Other statistics were also utilised in explaining the cyclical characteristics of the business cycles. The volatility and relative volatility are derived and are used in explaining the level of fluctuation of GDP and its main components. The direction of movement of the variables is also taken into account in explaining the cyclical components of business cycles. The study applies a bi-variate cross-correlation analysis to determine the degree of association between two different variables. Agenor *et al*. (2000), documented that the degree of co-movement of two different time series data set can be measured by the cross-correlation coefficient δ_j. The decision rule for interpreting the co-movement of variables is stated as follows:

Procyclical if $\delta_j > 0$

Countercyclical if $\delta_j < 0$

Acyclical if $\delta_j = 0$

Lastly, the phase shift is also observed in explaining the cyclical characteristics of business cycles. This shows that if the variables change prior to the changes in real GDP or if these changes in the variables occur preceding the changes in the real GDP. In determining the phase shift, the cross-correlation coefficient (δ_j) is used in the decision rule. In order to determine the phase shift of y_t, relative to the cycle in x_t,

y_t leads the cycle if δ_j is maximum for the positive value of j

y_t is synchronous with the cycle if δ_j is maximum for j = 0

y_t lags the cycle if δ_j is maximum for negative value of j

Data, Data Sources and Measurement

This study utilises annual time series data for the selected macroeconomic variables to examine the characteristics and the synchronisation within selected African countries. The time dimension for the dataset spans 15 years (2001 – 2015) while the country dimension spans 15 countries which include: Botswana, Burundi, Kenya, Liberia, Malawi, Mauritius, Mozambique, Namibia, Nigeria, Rwanda, Sierra Leone, South Africa, Swaziland, Tanzania and Uganda. The selected variables, measurements, as well as the data source, are found in Table 1.

Most of the variables including Real GDP, gross fixed investment, total import, total export, government expenditure and household consumption are measured in millions of constant (2010) U.S. dollars as sourced from the World Bank database. This ensures unison and uniformity of data. Agricultural materials and terms of trade are measured as indexes calculated by the various credible data sources. More details are shown in Table 1.

Table 1: Variables Definition, Mean, and Source of Data

Data	Data Source	Measurement
Real Gross Domestic Product (RGDP)	World Bank (2018)	Million at Market Price Constant 2010 (US$)
Gross Fixed Investment (GFI)	World Bank (2018)	Million at Market Price Constant 2010 (US$)
Total Import (IMP)	World Bank (2018)	Million at Market Price Constant 2010 (US$)
Total Export (EXPT)	World Bank (2018)	Million at Market Price Constant 2010 (US$)
Terms of Trade (TOT)	World Bank (2018)	Price Index
Agricultural Raw Materials (COMP)	IMF (2016)	Price index (2005 base year)
Government Expenditure (GEXP)	World Bank (2018)	Million at Market Price Constant 2010 (US$)
Household Consumption (HCON)	World Bank (2018)	Million at Market Price Constant 2010 (US$)

Results and Discussion

Cyclical Characteristics in Africa

From Tables 2(a), 2(b) and 2(c), it is observed that volatility of real GDP for the majority of the countries was greater one which indicates high volatility. Only two countries, namely Mozambique and Tanzania exhibit real GDP volatility of less than one, with 0.92% and 0.81percent, respectively. As shown in Tables 2(a), 2(b) and 2(c), consumption expenditure can be observed to exhibit a higher volatility than that of real GDP for most of the countries presented on the table. This is not in line with theoretical expectation. The contemporaneous correlation between consumption expenditure and the cyclical component of real GDP showed that nine countries were procyclical while six countries were discovered to be countercyclical. The procyclical nature of consumption expenditure is in line with theoretical expectation as consumption levels tend to increase with income levels but not in the same proportion according to the absolute income theory of consumption. These statistics show that shocks to income level have a significant effect on consumption level. In terms of phase shift, consumption expenditure was found to be a lagging indicator for ten countries which conforms to theory as a change in income precedes a change in consumption levels. However, the cross-correlation coefficient showed consumption expenditure as a leading indicator for Botswana, Burundi, Liberia, Nigeria, and Rwanda.

Investment is more volatility than real GDP across all the selected countries. In Tables 2(a), 2(b) and 2(c), it can be observed that the contemporaneous correlation statistic indicated a procyclical relationship between investment and the cyclical component of real GDP for most of the countries. Which is in line with expectation as increased levels of income is expected to increase savings and investment. However, a countercyclical relationship was discovered for three countries, namely Botswana, Mozambique and Nigeria. Liberia and South Africa have a strong level of procyclicality with contemporaneous coefficients of 0.90 and 0.88, respectively. The phase shift also shows conflicting results across the countries. Investment leads in Botswana, Burundi, Liberia, Namibia, Nigeria, South Africa and Tanzania. This result is in line with theoretical expectation, as investment generally induces economic growth. Investment, however, lags for the other countries, and this may be as a result of the nature of financial markets in Africa, it is then rational for investors to act when the economy is in prosperity (Ejemeyovwi, Osabuohien, & Osabuohien, 2018; Ejemeyovwi, Osabuohien, Johnson & Bowale, 2019).

Table 2(a) : Cyclical Behaviour of Real GDP and its Main Components

	Botswana	Burundi	Kenya	Liberia	Malawi

Tables 2(a), 2(b) and 2(c), show that a majority of the selected countries have a procyclical relationship with real GDP. These countries include Botswana, Burundi, Liberia, Malawi, Nigeria, Sierra Leone, South Africa, Swaziland, Tanzania and Uganda. The procyclical nature of the variable in these countries could be explained by the high level of government involvement in economic activities. Government expenditure in most African economies is a major component of real GDP, the high contemporaneous correlation attests to this statement. This is also consistent with the opinion of Keynes, which advocated for increased Government participation in clearing markets and restoring equilibrium conditions. Kenya, Mauritius, Mozambique, Namibia and Rwanda all exhibit a countercyclical relationship between government expenditure and real GDP. Government expenditure exhibits a leading phase shift in eight countries; this confirms that government policies influence changes in output levels. From observation, seven other countries exhibit government expenditure as a lag indicator. This shows that government policies are not yielding the proposed benefits (Ejemeyovwi & Osabuohien, 2020).

Total import also exhibited both procyclical and countercyclical relationships across the countries. Total imports are expected to be countercyclical according to theory. However, not all the samples countries exhibited counter-cyclicality. Botswana, Kenya, Liberia, Mauritius, Rwanda, Sierra Leone South Africa, Tanzania and Uganda all showed a procyclical relationship between total imports and real GDP. This could be explained by the import-dependent nature of most African countries. Furthermore, total imports is a lagging indicator in seven countries while it leads in eight countries, as seen in tables 2(a), 2(b) and 2(c).

Total export is procyclical with the cycle for all the selected countries except for Malawi and Rwanda. This result of a procyclical nature of total export is in line with theoretical expectation, and it indicates that income has a positive relationship with the exportation of goods and services. The low contemporaneous correlation of Nigeria at 0.14 is not consistent with other studies as Nigeria regarded as an oil export-dependent nation. In addition, the variable leads in seven countries while it lags in eight countries, as shown in tables 2(a), 2(b) and 2(c).

Business Cycle Synchronisation in Africa

In order to document stylised facts on business cycle synchronisation in Africa, the study used a sample of selected African countries. A pair-wise correlation matrix is used to achieve this objective. The real GDP data for 15 African countries was transformed using the Hodrick-Prescott filter to compute the pair-wise correlation. The degree of co-movement is measured by a standard correlation coefficient. The correlation coefficient ranges from -1 to +1. A negative correlation coefficient indicates the existence of a negative relationship between the variables, while there exists a positive linear relationship when the correlation coefficient is positive. However, if the correlation coefficient is 0 (zero), this indicates that no relationship exists between the two variables.

A country's cyclical component of GDP with a correlation coefficient above 0.50 with that of another country indicates that their business cycles are highly synchronised. This means that both countries experience similar co-movements in macroeconomic fluctuations. Whereas a less than 0.50 correlation coefficient even though it indicates a presence of co-movement, it is, however, a weak one.

From Table 4.4 it can be observed that the cyclical component of GDP for a majority of the selected countries are positively highly synchronised or shows strong signs of correlation. The correlation coefficient was 0.9 for a majority of the selected countries indicating a presence of similar co-movements overtime. All the coefficients are also observed to be statistically significant. This implies that business cycles are highly synchronised in Africa. Some countries, however, exhibit signs of weak positive correlations with correlation coefficient less than 0.50. This confirms the existence of business cycles in Africa as well as a form of synchronisation across the selected countries.

Business Cycle Synchronisation across Africa

The cyclical components of GDP for the selected countries presented in table 4 was presented using real GDP data for the selected African countries from 1980 to 2015 in order to observe the

fluctuations over time. The data were tested for stationary and was ascertained of being stationary before computing for the business cycle statistics. In accordance with the cross-correlation statistics presented in Table 4.4, it can be seen from the figures that there is no much distinction from each of the country's cyclical component of GDP. This confirms that a form of business cycle synchronisation exists across Africa. It can be observed that there are similar upturns and downturns in the fluctuations for all the countries over the period covered.

Based on the analysis, the summary of the findings with respect to achieving duo objectives, some regularities based on the results discussed above are highlighted as follows: (a) Real GDP is highly volatile in the majority of the selected African countries. Liberia exhibited the highest real GDP volatility of about 10.4%, followed by Sierra Leone with 7.98% and Nigeria with 5.34%. (b). Private consumption is also highly volatile across Africa and is procyclical in the majority of the selected African countries. It is also a lagging indicator in most of the countries. (c). Investment across Africa is more volatile than real GDP. Investment if also seen to be procyclical in 12 of the 15 counties considered for this study. This implies than there is increased investment during expansion and reduced investment during a recession. (d). Government expenditure is also procyclical in most of the selected countries; this confirms the active involvement of Governments across African countries in economic activities. It is also highly volatile and a leading indicator in most of the countries considered. (e). Total import and total export are procyclical in the majority of the selected African countries. This also confirms the high import-dependence of African countries and mono-cultural export dependence on either agricultural produce or oil in the case of Nigeria. Imports and exports are also seen to be highly volatile. (f). Business cycle synchronisation exists across the selected countries, although the strength of association may vary between countries. This shows that business cycle synchronisation exists in Africa.

Conclusion

Based on the results, the existence of business cycle has been established in Africa. Real GDP variability around the selected African countries was found to be strong, and this supports observational results from other scholars (Alege, 2009; Alege & Ogundipe, 2016; Adu, 2017). There was also a type of correlation between the observed cyclical features and the evidence from the literature defined the business cycle. Also discovered was the presence of business cycles in Africa and the presence of a type of business cycle synchronisation throughout the selected African countries.

The existence of a form of business cycle synchronisation across the selected African countries was investigated using the pair-wise analysis. This was carried out by computing the cross-correlation between cyclical components of GDP for the selected countries. In order to capture the fluctuations over an adequate period time, real GDP data was compiled from 1980 to 2015 for all the selected African countries. Haven certified that the data were all stationary. The results from the correlation analysis indicate a presence of similar business cycle fluctuations across the selected African countries. The strength of the correlation, however, varies across the countries. The correlation matrix showed the existence of a regional business cycle in Africa, although the correlation coefficients varied across countries. Most countries exhibited a correlation coefficient of above 0.5, which is indicative of a positive co-movement.

In conclusion, the study has established that business cycles exist in Africa, showing the cyclical characteristics of GDP and its components. GDP and its main components were observed to be highly volatile across African countries. The cyclical characteristics of the macroeconomic variables provide a better understanding and useful knowledge for policymakers. It has been observed that African countries experience more frequent fluctuations explained by the high volatility of their real GDP and its main components. In addition, these contributions of the study provide relevant information with the aim of influencing proper stabilisation policies. The main components of GDP were also observed to be highly procyclical across most of the countries considered. However, the phase shift differed across countries and variables.

Government spending shows signs of strong procyclicality across most of the selected African countries. This explains the active involvement of the government in economic activities across Africa; total imports and exports are also observed to be procyclical in nature across the selected Africa countries. The observed cyclical characteristics of total imports and exports are accredited to the import-dependent nature of African economies to consumer goods and mono-cultural export dependence on either oil or agricultural raw materials.

The Structure of Human Capital and Its Assessment Methods

Yuliya G. BALASHOVA

E-mail: balashova.ostu@mail.ru

Abstract

With the onset of era of instability and constant changes related to rapidly developing e-learning, the rapid expansion of social networks boundaries, the introduction of cyborgization, as well as the approach to technological and economic singularity, the human role in social and labor relations and social and economic mechanisms of labor management is changing. The achievement of competitive advantages by economic entities today is not carried out at the expense of raw material resources, but through human capital, which accumulates experience, abilities and personal skills embodied in people. Due to the fact that human capital is proclaimed one of society economic development factors, the study of man, his competences, is one of the current problems that modern science is faced with. In order to effectively manage human capital, generally accepted methods of measuring, accounting and economic assessment are necessary, which are currently lacking. In this regard, the study of scientific and methodological problems of managing human capital, namely its measurement and economic assessment of individual human capital, attracts theoretical and practical interest.

Keywords: Individual Human Capital, Corporate Human Capital, Regional Human Capital, National Human Capital, International Human Capital.

JEL Classification: E24, J24, O15.

Introduction

One of the strategically important directions of the state economy development in the twenty-first century will be a smooth transition to the innovative development economy, the basis for which will primarily be knowledge, professionalism of employees, creativity and innovation. The development of innovative society directly depends on investments in human capital. Exploring this term, we proceeded from the basic conceptual provisions of the theory, founded by the American economist, the Nobel Prize laureate of 1979, Theodore Schulz. He substantiated his idea that human capital, like any kind of capital, should be fueled by investments, for example, in education and vocational training. Another American economist, Gary Stanley Becker, developed the concept of human capital, justifying the effectiveness of investments in human capital, and formulated an economic approach to human behavior. Thanks to the active development of the human capital theory, investments in employee began to be considered as a source of economic growth (Fix, 2018, p 16).

Human capital is similar to physical capital, but it has clear differences. Such kind of capital is a long use benefit, but with a limited service life. The depletion can occur due to professional skill disruption. Due to the rapid development of technology, not all employees have time to improve their professional level. Human capital, as well as physical one, is an exhaustible resource and requires special expenses for its "maintenance". Its distinguishing feature is that it becomes obsolete faster than physical capital. Its value can grow and fall depending on changes in the complementary production factors supply and in the demand for their joint products.

The term "human capital" was proposed in the 1960s by economist T. Schulz to show the value of human potential. He considered that in human capital, as in any kind of capital, it is possible to make investments, for example in education and training (Simeonova-Ganeva, 2010, p. 131). He composed the definition of "human capital": "Human capital is a form of capital in general, because it contains within itself a source of future income. The peculiarity of this capital form consists only in the fact that it is inseparable from the human being. According to this approach, it is education that

appropriately influences the production process of goods and services, accelerating and optimizing it, therefore education is a capital."

In order to manage human capital effectively, it is necessary to use established practices of its measuring, accounting and economic estimates which are currently lacking. In this regard, studies of scientific and methodological issues associated with human capital in its measurement and economic estimates are of theoretical and practical interest (Kim, 2018).

The main objective of the study is the development of theoretical principles and practical recommendations for assessing human capital.

In accordance with the objective set in the study, the following tasks are outlined:

- to research, specify and structure the conceptual apparatus, meaning to reveal the concept of human capital, and clarify its classification;
- to analyze the assessment methodology in relation to individual human capital in enterprises.

Methodology

General scientific methods, such as analysis, induction, and deduction, acted as methodological tools.

In the course of the study, a balanced model for the classification of human capital and a methodology for its assessment were proposed.

To date, there is no clear definition of the notion "human capital". After analyzing numerous authors definitions of domestic and foreign researchers, we came to the conclusion that all scientists consider human capital at one of five levels:

- at the level of the individual;
- at the level of the work collective or organization;
- at the level of the region;
- at the level of the state;
- at the level of several states.

Results and Discussion

Human Capital

The structure of human capital in the modern sense is as follows: micro-level – individual human capital, meso-level – corporate human capital, macro-level – regional human capital, meta-level – national human capital, mega-level – international human capital (Fig. 1).

The largest element of human capital is mega-level, or international human capital. *International human capital* is the average value of the intellectual potential index between all countries. This indicator began to be studied with the globalization development in the second half of the XX century. Let us specify that international human capital is able to influence macroeconomic indicators, which, with the advent of globalization, began to take on completely different forms, and this is connected with the smoothing of territorial boundaries. There is a merger of banks with financial institutions, as well as the absorption of one by another. Such behavior of the banking sector contributes to the development of a single financial and credit space and the deregulation of financial institution activities. Decrease occurs in the level of control over the movement of financial and intellectual capital both within one state and between countries (Bontis and Fitz-enz, 2002).

One of the most significant advantages of modern globalization is the creation of a fundamentally new human-oriented international economy aimed at raising international human capital, improving social conditions, as well as increasing human development index (HDI). Such capital has the ability for creativity and creation of innovative society. At the same time, this indicator development rate directly depends on international financial values (GDP, international investment).

Fig. 1: Human capital structure

During the USSR existence period, in most countries that were part of this alliance, a powerful scientific and technical potential was formed. Excellent results were achieved in scientific fields. At the time of the Union collapse, the human development index was 0.920. About 7% of GDP was allocated to education and health care. At the same time, GDP itself was the highest in the world. After the Soviet Union collapse until the beginning of the 2000s, there was a strong economic downturn in the countries of the Union, and international human capital also declined (IPUMS International, n.d.).

Let's note that among countries that formerly were part of the USSR, a single scientific space has been created, which has contributed to the internationalization and globalization of education and health care. The goal of creating a single scientific space is to make countries competitive and successful on the world stage.

The meta-level refers to the national human capital, which refers to the human capital of a single state, which is an integral part of its national wealth. *National human capital* consists of national health capital, intellectual capital index, national and social capital, national competitive advantage capital, national political capital (Institute of Education Sciences, n.d.). Each type of capital has its own methods of influence, which help to effectively manage the country's national capital:

1. National health capital:
- improving the quality of medical services;
- organization of motivating events at the level of sports and recreation complexes;
- impact on environment.

2. Intellectual capital index:
- increase in expenditure on education;
- increase in expenditure on culture.

3. National social capital:
- increase in the life expectancy index;
- improvement of living standards through public institutions.

4. National competitive advantage capital:
- professional training for managers at the national level;
- professional training for staff at the national level.

5. National political capital:
- maintaining ideological views at the national level.

Macro level is a regional human capital. It consists of regional health capital, intellectual capital index, regional social capital and regional competitive advantage capital. The following exposure methods can be distinguished:

1. Regional health capital:
- improving the quality of medical services in region.

2. Intellectual capital index:
- increase in expenditure on education.

3. Regional social capital:
- improvement of living standards through public institutions.

4. Regional competitive advantage capital:
- professional training for staff at the regional level (Filmer *et al.*, 2018).

Meso-level is a corporate capital, i.e., a set of knowledge, skills, abilities of a group of individuals that make up the collective of an organization. *Corporate human capital* is a kind of organization's value, and it should be given not less attention than to other resources of the organization. By multiplying this type of savings, high labour productivity can be ensured. Corporate human capital includes following elements:

1. Intangible capital:
- knowledge of individual workers, especially specialists;
- system of formal and informal relations of the organization.

2. Management capital:
- management decision-making system;
- production process decision-making system;
- design decision-making system.

3. Patent capital:
- intellectual property protection.

4. Corporate political capital:
- maintaining ideological views at the corporate level.

At the micro-level, human capital considers an individual person. It follows that human capital must be reduced to the size of individual human capital. According to the author, considering the classification of human capital, it is impossible not to pay attention to the industry in which it begins to develop from a professional point of view. There are the following methods of influence to the elements of individual human capital:

1. Satisfaction capital:
- methods of influence through motivation and stimulation.

2. Intellectual capital:
- knowledge audit.

3. Health capital
- analysis of the health level of the individual;
- maintaining a health level.

4. Cultural and moral capital:
- management of the economic totality of costs associated with the development of the cultural characteristics of the individual.

5. Venture capital:
- costs for the development of entrepreneurial abilities.

Let us consider in more detail the individual human capital, since it is the basis for the formation of all human capital. The definition "*individual human capital*" is interpreted as a set of inherited abilities of a person, as well as a general stock of professional knowledge and skills of an employee, that allow him to receive super-profit that a person who does not possess the same stock of knowledge, skills and professionalism cannot receive. The cost for investments in individual human capital is usually attributed to: expenses for the maintenance and upbringing of children before the age of majority or up to working age; expenses for special (professional) education; expenses for maintaining a professional level to ensure social mobility, i.e., ensuring competitiveness in the labor market.

Individual human capital is one of the components of human capital. Individual human capital forms in its totality corporate human capital, and that, in its turn, forms national human capital. These three components are the human capital of modern society (Jankalova and Janka, 2017). Thus, individual human capital is an objective component of human capital. As the key evidence, the author presented an updated definition, namely: *Individual human capital* is the accumulated knowledge, experience, as well as the inherited advantages of an individual, which help transform intelligence into financial capital to meet their needs. The formation of such capital occurs from birth and lasts until the end of life. There are a number of indices that capable to assess the human capital of an individual: intellectual development index and health capital index. The criteria for determining intellectual capital will be a maturity certificate, a diploma in the specialty, certificates and awards testifying to the achievements of a person. The health capital index can be traced through a medical record, a medical history, and disability lists.

Individual human capital is particularly liquid if compare it to other types of capital. It is absolutely inseparable from the physical person and cannot exist without him. The peculiarity of this type of capital is also in the fact that by sharing his knowledge and experience with other individuals, a person does not lose his individual human capital.

One of the main problems in the management of human capital is its specific form. It does not have its reflection, since it cannot be the property of the organization. Human capital "comes" by 9 am to work and leaves at 6 pm. This is a kind of property that is transferred for temporary possession and use, that is, for rent. All costs for staff training and raising its human capital are borne by the organization. At the same time, there are no guarantees that a person who has received additional education at the expense of the organization will not quit the next day. Human capital management can not be viewed from the position of capital as a direct asset of the organization (Juneja, n.d.). You can put human capital on the balance by changing the concept of management accounting. The cost of maintaining and increasing this type of capital can be attributed to investment costs. Often, the management of the organization, in order to avoid employee turnover and bind employees to a given place, resorted to such tricks as selling a share of the shares to its own employees. Both the manager of the organization and its staff benefits from this incentive method. Since the payment of dividends directly depends on the profits of the organization, each of the employees can influence the remuneration, increasing the quality of their work. This method of stimulation resorts to one of the richest companies in the world – Apple. To retain valuable personnel and to improve the quality of their work, the main bonus is the sale of own shares at preferential prices. Even after the dismissal, former employees are in no hurry to part with Apple shares, as the value of shares has been growing at an incredible rate over the past few years.

It is difficult to assess human capital because of the integration of people. The anthropological component of this capital characterizes a person as a separate individual, as a person belonging to a particular social group and country. Integration or combination of human knowledge should be considered at macro- and micro-levels. Integration of human capital of employees within one firm can increase labor productivity by several times. Combination of knowledge, skills and experience of several employees increases the overall productivity level. G. Becker transferred human capital to the micro-level, where human capital of an enterprise was primarily defined as a combination of knowledge and skills of all employees of the company. As an investment in this type of capital, he assessed the upgrading of workers through additional courses. G. Becker assessed the economic efficiency of education primarily for the worker himself. The integration of individual capital forms the total turnover of the firm's total human capital.

Considering this issue at the macro-level, it can be noted that when the mind is integrated in transnational companies such as Microsoft Corporation, Coca-Cola, IBM, Nokia, Toyota, this leads to the fact that they become leaders in their market. To preserve the leading position among competitors, great attention is paid to the department for the development of know-how, image and brand of the company. For such departments, special ways of raising human capital are created. Special training of employees forms the competitive advantages of the company (Table 1).

The combination of human capital of employees within one company in a creative interaction gives a programmed synergistic effect that promotes the development of intra-company trust and teamwork.

Table 1: The most expensive brands in the world (2018)

Rating position	Brand	Market value ($/billion)	Change in market value in relation to 2017 (in %)
1	Coca-Cola	70.452	+2
2	IBM	64.727	+7
3	Microsoft Corporation	60.895	+7
4	Google	47.800	+36
5	General Electric	42.808	-10
6	McDonald`s	33.578	+4
7	Intel	32.015	+2
8	Nokia	29.495	-15
9	Disney	28.731	+1
10	Apple	21.143	+37

The residence place of a person has an impact on human capital. An example is a person whose mental abilities allow him to develop and increase his human capital, but his place of residence will inhibit its development. Suppose a person has directorial skills. He lives in a small town, which does not prepare specialists of such kind of profession. Consequently, his residence place will not allow a person to develop his abilities, and even the opposite, the effect of the accumulation of human capital will be negative.

Perhaps a person already has the necessary education, work experience, skills, but, changing his residence place, he is not able to find a job. Consequently, the development of its human capital will not occur. The residence place of a person is an external factor that can have both positive and negative effects on the development of human capital.

In connection with the large-scale increase in environmental pollution as a result of industrialization, we are faced with a number of environmental problems affecting human health. Today, in almost every country, the issue of environmental safety is regulated at the international level. Cancer incidence is largely determined by the concentration of carcinogenic substances in the atmosphere. One of the important causes of diseases of the upper respiratory tract (the death rate for which is still high in our country) is dust. Poor environmental conditions in the country or region, as a result, destroy the health infrastructure due to migration to other areas more comfortable for living.

Study of Human Capital Assessment Methods

Modern views on the human capital assessment have a mathematical justification. Thus, today the human capital assessment through the indicator "goodwill" is one of the most popular. Initially, the goodwill indicator included only the territorial location of the object, which used to be one of the strongest advantages over competitors. To date, there is no clear interpretation of this concept. At the same time, the entire scientific community is united in the fact that goodwill is a key factor for successful business, since it allows you to extract extraordinary profits without attracting additional assets.

Goodwill combines the intangible benefits of organization. With proper use of such resources by management, the company can guarantee a competitive advantage, as well as profit growth for a long period. To mathematically analyze this indicator, consider it on the example of three employees – S_1, S_2, S_3. Suppose that the knowledge, experience and qualifications of each must be assessed on a 10-point scale: Z_1= 9; Z_2= 6; Z_3= 3.

Make the ratio of indicators of the first employee to the third:

$$A = \frac{Z_1}{Z_3} = \frac{9}{3} = 3. \tag{1}$$

The employee S_1 is three times more important at the enterprise than the employee S_3. Most likely, the qualification experience of the first is several times greater than the experience of the latter, therefore, the significance of the work performed will be distributed depending on the experience. The more qualified the specialist, the more difficult the work. Therefore, the more important he is for the organization.

$$\mathbf{A} = \begin{pmatrix} \frac{Z_1}{Z_1} & \frac{Z_1}{Z_2} & \frac{Z_1}{Z_3} \\ \frac{Z_2}{Z_1} & \frac{Z_2}{Z_2} & \frac{Z_2}{Z_3} \\ \frac{Z_3}{Z_1} & \frac{Z_3}{Z_2} & \frac{Z_3}{Z_3} \end{pmatrix} \tag{2}$$

For any *i*-th value, the equality is $a_{ii} = 1$, true, that is, $a_{11} = \frac{Z_1}{Z_1} = 1$. It should be noted that when $a = \frac{Z_1}{Z_3}\frac{Z_3}{Z_1}$ value will also be equal to 1. That is, when two specialists with different levels of qualification work together, the result will also be achieved, and the work will be performed qualitatively. In collective work, a specialist with a low level of human capital will increase his knowledge, and consequently, in the future will be able to perform this work independently, then his indicator equals the value $\frac{Z_1}{Z_1}$.

There is an easier way to calculate human capital through goodwill indicator. The following indicators are included in the basis of the methodology for human capital assessment: Z – estimated or paid wages; *I* – investment in education; t – time; S – employee cost assessment; G_{HC} – goodwill of human capital.

$$G_{HC} = \frac{S}{Z*I*t}. \tag{3}$$

Another modern way of finding human capital mathematically is using a discount coefficient. To find the minimum level of future income, at which the costs of human capital formation will be compensated, that is, the acquisition of professional knowledge and skills, the following formula should be followed:

$$\sum_{i=1,\dots,n} E_{t+i} \geq \sum_i I_{t+1}(1+r)^{n-I}. \tag{4}$$

where: I_t – investment value;

E_t – income received in the same year;

r – future period discount coefficient;

$\sum_{i=1,\dots,n} E_{t+1}$ – total income earned over n years of investment.

As follows from formula 4, the lower bound indicator should show the justification of investment risk. It should also be noted that the human capital formation is based not only on financial costs, but also on labor, as well as personal qualities of a person. The effectiveness of the investment spent may be unjustified in the event of a banal decrease in the health level (loss of health capital), therefore this method of human capital assessment cannot be objectively accurate.

Lets analyze one more method of mathematical finding of human capital – through the discount coefficient. Human capital assessment can be calculated by the following formula:

$$HC = \frac{(1+r)^n - 1}{r} * Cst, \quad (5)$$

where NK (HC) is human capital, monetary valuation of labor costs;
r – discount coefficient;
Cst – the cost of life support;
n – number of years.

Investigating the question of the methodology for human capital assessment, the author proceeded from the basic conceptual provisions described in the works of many domestic and foreign authors. But as we could see, none of the methods can provide an accurate assessment of the human capital level of an individual or organization as a whole.

Analyzing the above methods and substituting data of real people, we identified inaccuracies and errors in the calculations, since many indicators are impossible to calculate, or the calculations did not take into account inflation, unemployment, geographical location and many other factors.

Lets clarify, that human capital can be assessed on a 10-point scale. We single out four components of this concept – age, education, professional experience and health. These categories should be converted to coefficients that will help determine the human capital level.

To determine the age indicator, it is necessary to divide the employees by age groups: from 14 to 25 – 0.5; from 26 to 35 – 1; from 36 to 45 – 0.9; from 46 to 55 – 0.8; from 56 to 75 – 0.6; from 76 and up – 0.5. The quality deterioration of the product produced (during physical labor) for women occurs after 50 years, and for men after 55.

The health coefficient (K_z) is an indicator responsible for the employee's health capital.

The education coefficient K_o begins to form from the birth of a person. Basic knowledge is laid during school years. On the basis of this knowledge, the employee's professional knowledge will then be formed. We formulate specific values for finding the education indicator:

- 1.00 – for persons with higher education, working in the specialty;
- 0.80 – for persons with secondary technical and incomplete higher education;
- 0.70 – for persons with secondary vocational education;
- 0.60 – for persons with elementary vocational education;
- 0.30 – for persons with complete secondary education.

The professional experience coefficient K_{PO} should take into account work experience in the position held, providing for professional development once every three years. This indicator begins to decrease with the age of the employee, since with the advent of new technologies, problems may arise with the qualification level of the employee.

Human capital can be found by the following formula:

$$ЧК = (O * K_o) + (V * K_v) + (Z * K_z) + (\frac{C}{2} * K_{pO}), \quad (6)$$

where: ЧК (HC) – human capital;
V – age indicator in the group;
C – indicator of work experience in the group;
Z – health indicator in the group;
O – education indicator.

We calculate the human capital of a twenty-five-year-old worker with a higher education, working in the specialty for three years. During this time, the employee did not miss work due to illness.

$$HC = 1 + 0{,}5 + 1 + \left(\frac{3}{2} * 3\right) = 7 \text{ points.} \quad (7)$$

As it was mentioned earlier, the maximum point for the accumulated capital can be equal to 10. For this example, 7 points is also a very high indicator, and it is due to the ideal health capital. At the same time, the experience of an employee is small, and this, on the contrary, reduces his professional qualities. With age, his capital will grow.

Such methods of calculation are among the most accurate. This is due to the large number of indicators that are defined by criteria. Errors in the calculations may be due to K_z, which should be given special attention.

Conclusion

Summarizing the above, it should be noted that among the many theories of human capital value assessment and the developed mathematical models there are common elements that unite the data of the theory. The author identifies four basic elements that will allow a more accurate human capital assessment in practice (Formula 6).

To date, in all developed countries, it is human capital that predetermines the pace of economic development and scientific and technological progress. The role of human capital, human knowledge, skills and training has increased.

Human capital is an important factor of production and has a direct impact on the well-being of the individual, company and state. Improving the quality of human capital training can lead to a reduction in the share of production costs and sales growth. Thus, the marginal costs of the enterprise are reduced, the company can further sell its product at lower prices and with better quality. Human capital is a mean of labor in production. As a result of studying various sources, we came to the conclusion that such a definition as "human capital" should be considered as an economic category with a multi-level structure.

In conclusion, let us clarify the author's concept of human capital.

Human capital is a combination of such elements as knowledge, professional experience, health and inherited qualities of an individual, as well as a person's ability to increase their income, material and spiritual ones, and share their capital in the form of professional experience with other people without reducing knowledge and without reducing accumulated capital (Kobzistaya, 2016, p. 155).

The author also undertook a study that allowed to offer a balanced model to practitioners to calculate the cost of human capital, which will allow as follows:

- to improve information and analytical support for the management processes of the intangible component of the company;
- to increase justification and quality of decisions made regarding intangible capital;
- to provide the possibility of rational redistribution of intellectual resources.

Moreover, the above indicators can be used as guidelines in developing the company's strategy for the development of corporate capital.

Immigrants in Polish Economy – The Quantitative Analysis

Mariusz Urbański

Faculty of Civil Engineering, Częstochowa University of Technology, Akademicka 3, 42-200 Czestochowa, Poland, murbanski@interia.eu

Abstract

The paper presents the definition of immigration and its positive and negative effects. The problem of immigration in Poland has also been described here. It has been shown that the main reason for immigration to Poland is the economic aspect, i.e. economic migration. Based on the data provided by the Office for Foreigners and the Ministry of Family, Labour and Social Policy, it has been outlined how trends related to the presence of economic immigrants on the Polish labour market are shaped. The aim of the article is also to prove that there has been a growth of foreign workers in Poland in the last six years and that a large group of them is doing all the formalities for their employment in companies. The data collected allowed analysing information on the nationality and gender of foreigners in Poland. It has been proved that the most numerous group are people in the age category from 20 to 39, and the majority of immigrants entering Poland come from Ukraine. It has also been shown that in the last six years most documents entitling to stay in Poland and work permits have been issued for immigrants from Ukraine, which proves that foreigners from this country are increasingly visible on the Polish labour market and are willing to undertake work, which may help to make up for staff shortages. A report has also been presented to show that the main reason for Ukrainian citizens to come to Poland is higher earnings and the desire to improve their standard of living. The report also showed that their work often diverge from their qualifications and level of education, which means that the potential of immigrants coming to Poland is not fully exploited.

Keywords: Economic Migration, Barriers, Labour Market, Work Permits,

Introduction

Human migration is a social and political phenomenon and has accompanied humanity virtually from beginning. The current reality is to a large extent the result of migration processes and their consequences. Nowadays, the main factor that encourages migration is the desire to find a better place for oneself and one's family to increase the chance for personal growth and to raise the standard of living. The course of migration processes contributes to the improvement of the material situation of many social groups and the economic development of entire countries. This increases national income and investments (Suduł, 2013). Migration has many positive aspects, but also negative ones, such as illegal migration, thus migration can also be divided into legal and illegal. There can be many reasons for migration to a country, for example, for political or economic or religious aspects. Immigration is generally understood as the arrival of people in a given territory. It is commonly called an arrival in a country for a long-term residence, which may last more than three months. This concept is also closely related to emigration, which means the departure of people from a given country (Kaczmarczyk, 2015). An influx of people where the stay lasts more than three months, if the purpose of arrival is tourism, visit, religious pilgrimage or military mission does not count as immigration. The remaining cases can be considered as immigration. This phenomenon can also be divided into long-term or short-term immigration. Immigration can be called economic if a citizen of a given country comes to another country in search for better living conditions or job opportunities (Bińkowski, 2017; Kilic, Yucesan & Ozekicioglu, 2019). This type of immigration is most often mentioned when people come to another country to earn a living (Skoczyńska- Prokopowicz, 2018; Tvaronavičienė, 2018). In many countries, the immigration phenomenon leads to numerous conflicts. Local people often see foreigners as a threat to the labour market. Foreigners who have not found a job may also require financial support. It also happens that illegal employment of foreigners leads to

large financial losses in the economy (Valaskova, Kliestik, & Kovacova, 2018). The growing conflicts between foreign cultures are also a negative phenomenon. Immigration also has positive aspects, such as profitability in employing foreigners by companies, as well as increasing competitiveness on the labour market, which makes employees more efficient and entrepreneurial. Mixed teams also lead to the exchange of experience between employees. Many foreigners also assimilate quite fast in new conditions. A positive phenomenon of immigration is also the fact that it significantly affects economic growth, which is a key factor increasing the level of wealth in a country. Immigrants can be divided into two main groups.

The first of them are people with higher education, who may affect the growth in the number of highly skilled workers, e.g. engineers and physicians (Klimek, 2015). Educated foreigners are an extremely valuable human capital, which may lead to an increase in the number of qualified people on a given labour market. This is related to the difference in the quality of education obtained in another country, the level of knowledge and the speed of acquiring foreign languages, different than for natives, which may affect the integration process and employment of foreigners in a given country (Sharaf, 2013, Kurowska-Pysz, Szczepańska-Woszczyna, Štverková, Kašík, 2018). The second group involve people with a lower level of education, e.g. warehousemen or construction workers as well as other professions that require intensive labour (Peri, 2013). The reasons for such economic migration may be an increase in the minimum wage and better social benefits in a country for such workers (Boffy- Remirez, 2013; Krutova, 2019; Haque & Oino, 2019). The fact that immigrants are diverse in terms of education and skills on the labour market means that they can be delegated to various tasks. However, the earnings of foreigners may be lower than those of native citizens and the achievement of a satisfactory income for immigrants may extend significantly over time (Arigna, Lucifora, Pagani, 2015). The reason for the difference in earnings is the occurrence of the occupational mobility phenomenon and its consequences, because many immigrants often experience negative changes in their career status when looking for new jobs and rotation between companies during their stay in another country (Javdani, McGee, 2018). For many groups of foreigners the difference in remuneration is significant and the reasons may be their skills, origin and language level (Myślicki, 2016). It is therefore necessary to support countries and political changes which will facilitate the adaptation of immigrants, may reduce entry barriers and facilitate the process of cultural assimilation (Anderson & Huang, wol.IZA.org), as a result attracting foreigners. Different countries have numerous programmes to support immigrants in their mobilisation due to their unfavourable situation on the labour market. It is often the case when immigrants have less chance of being employed than native citizens and are often listed as unemployed. To facilitate the situation of immigrants on the labour market, European governments use Active Labour Market Programmes, which can include language courses, job search assistance and numerous training programmes, which are an effective tool to support both working as well as job-seeking immigrants, effectively reducing the number of unemployed immigrants (Butschek, Walter, 2014). Such support programmes can also contribute to improving cultural assimilation increasing their overall level of satisfaction and sense of belonging to a country (Kóczán 2016).

Characteristics of Immigrants Entering Poland

Although foreigners are increasingly visible on the Polish labour market (Matkowska, 2013), the demand for foreigners in Poland is constantly growing. This proves that employing foreigners is not only a current and dynamic trend, but even a necessity in the context of maintaining the current growth pace of the Polish economy, taking into account current demographic trends (Chorągwicka - Majstrowicz, 2018).

Figure 1: Number and type of valid documents held by foreigners entitling to legal residence in Poland in 2018.

Source: Own study based on: https://migracje.gov.pl/statystyki

In 2018, the number of persons holding valid documents entitling to stay in Poland was 367,225 figure 1 In 2019, the statistics of persons holding valid documents entitling to stay in Poland increased slightly. The number of persons holding documents authorising temporary stay in 2019 was 244.544, i.e. over 44 thousand more than in the previous year. In 2019, the number of persons entitled to permanent residence also increased by more than 10 000 compared to the previous year.

Most people have documents entitling them to temporary residence or EU citizenship registration. More than 77,000 people in 2019 also had documents authorising permanent residence. The smallest number of people has documents entitling them to stay in Poland for humanitarian reasons or only proving their refugee status.

Figure 2: Age of foreigners holding valid documents entitling them to stay in Poland between 2014 and 2019.

Source: own study based on: https://migracje.gov.pl/statystyki

From the data presented in figure 2. it appears that mainly young and middle-aged people have come to Poland over the last 6 years. In 2014, the age structure of people with valid documents was shaped in such a way that over 16 thousand people under 20 years of age had valid documents entitling them to stay in Poland, and in the age category from 20 to 39 years of age, nearly 70 thousand. In the age category from 40 to 59 years of age, there were about 38,000 foreign citizens with valid documents. The least numerous groups were persons over 60 years of age, with a total of 10 thousand people in 2014. In 2019, the age structure was similar, but the number of immigrants with valid documents increased significantly. The number of foreigners under 20 years of age was over 52 thousand, and in the age category from 20 to 39 nearly 245 thousand. In 2019, the number of people from 40 to 59 years old was over 110 thousand. (migrations.gov.pl) an increasing trend can be observed among immigrants entering Poland over 6 years under study, from 2014 to 2019. The most numerous group was the group of people between the age of 20 and 39.

Figure 3: Gender and number of foreigners holding valid documents entitling to stay in Poland between 2014 and 2018.

Source: own study based on: https://migracje.gov.pl/statystyki

Analysing statistical data figure 3 which concern the gender of immigrants entering Poland, it can be observed that much more men than women enter. In 2015, there were over 109,000 men with valid documents and only nearly 65,000 women. In both cases, the trend is increasing; however, the gap is increasing by the year. In 2019, the number of women reached 165,000 and men over 260,000. (migracje.gov.pl, 2019) As can be seen, in 2019, the gap between women and men is higher than in previous years. The number of men holding valid residence documents is nearly by 95,000 more than the number of women.

Figure 4 shows that the structure of foreigners holding valid documents by nationality.

Figure 4: Nationality and number of foreigners holding valid documents entitling to stay in Poland between 2014 and 2018.

Source: own study based on: Country, charts, https://migracje.gov.pl/statystyki

The data presented in the figure 4 show that most immigrants with valid documents entitling to stay in Poland came from Ukraine. In 2019, their number was over 21 thousand people, i.e. 40 thousand more than in the previous year. Nearly 684 thousand citizens from Ukraine had valid documents entitling them to stay in Poland over six years, from 2014 to 2019. It should also be taken into account that not all immigrants have such documents, so the actual number of immigrants in Poland may be much higher. Another nationality with a growth in the number of persons holding valid documents entitling to stay in Poland are Belarusians. Between 2014 and 2016, the number of holders of valid documents totalled over 20,000, but in the following years the dynamics increased significantly. In 2019, over 25 thousand people from Belarus had valid documents. The remaining countries had a small share in the people entering Poland. For example, more than 20 thousand Germans came to Poland over 6 years from 2014 to 2019. The total number of German citizens with documents entitling them to stay in Poland is about 130 thousand people. In 2019, their number also decreased slightly compared to the previous year. In 2015, a visible group of immigrants with valid documents were Italians, whose number was over 6 thousand, but since 2017 such interest in Poland is no longer observed by Italian citizens. Since 2016, however, immigrants from Vietnam are noticeable with nearly 12 thousand people holding valid documents entitling them to stay in Poland in 2019.

According to the data of the Ministry of Family, Labour and Social Policy concerning work permits for foreigners in Poland, the employment of immigrants is becoming increasingly noticeable nationwide.

Figure 5: Work permits for foreigners issued in 2017 by 10 most represented citizenships in a given year [%].

Source: own study based on: Work permits for foreigners, https://archiwum.mpips.gov.pl/analizy-i-raporty/cudzoziemcy-pracujacy-w-polsce-statystyki/

In 2017, most work permits figure 5 were issued to foreigners from Ukraine. Their share in all permits issued was almost 82%. Belarusians come second with less than 5%. Nearly 3% of permits were issued to Moldavian citizens and 2% each to nationals of India and Nepal. Other countries with a low score are China, Turkey, Uzbekistan, Russia and Bangladesh. Only 1% of the citizens of these countries get work permits in Poland. The above data from 2017 showed that foreigners entering Poland from countries other than Ukraine are of marginal importance.

The figure 6 shows a list of declarations registered by poviat employment agencies in 2015 - 2017.

Figure 6: Number of declarations and number of work permits registered/issued between 2015 and 2017. Source: own study based on: Work permits of foreigners, https://archiwum.mpips.gov.pl/analizy-i-raporty/cudzoziemcy-pracujacy-w-polsce-statystyki/

In 2013, nearly 236 thousand declarations of intent to work in Poland were submitted by foreigners, however, in 2015, this number increased to nearly 783 thousand. In 2016 and 2017, this number exceeded one million. In 2016, 1,314,127 declarations of intent to work were submitted, and in 2017, 1,824,464. However, significantly fewer work permits were issued in relation to the number of declarations. In 2017, only nearly 236 thousand work permits were issued for immigrants entering Poland. (mpips.gov.pl) Most work permits were issued to Ukrainian citizens, who are the most numerous group of immigrants among other immigrants entering Poland.

To sum up, it is currently impossible to accurately estimate the number of foreigners entering Poland, especially from Ukraine, but it is estimated that there are already over a million immigrants from this country. Immigrants systematically fill the personnel gaps and contribute to the decrease in unemployment in Poland.

A study analysing the general level of satisfaction of immigrants from Ukraine working in Poland shows that the main reason for coming to this country was higher earnings. Such an answer was indicated by 76% of the respondents, 37% responded that the main reason was also a higher standard of living and 22% a lack of appropriate work in Ukraine. 21% of respondents also replied that the reason for leaving the country was better social conditions and 10% that the reason for emigrating from Ukraine was the fact that it is safer in Poland. When asked about the compatibility of their education with their work, more than 66% of the respondents answered that their work does not match their education and works below their qualifications. Only a small group of 6% replied that their work was above their qualifications. This applies to people with higher and secondary education. When asking the respondents about the general level of satisfaction with work in Poland and the quality of cooperation with Poles, the majority of citizens from Ukraine answered positively. 79% of people answered that they were satisfied with their work in Poland and 85% answered that the cooperation with Poles is going well (workservice.com)

Summarizing the above study, it can be concluded that the majority of Ukrainian citizens, despite the lack of personnel in Poland, work below their qualifications. This is especially true for people who have higher education. This means that the potential of people entering Poland is not fully exploited, especially that there is still a shortage of specialists on the labour market.

Summary

Summing up the analysed research problem, it can be concluded that, over the past few years, the growing immigration trend has caused that a large group of workers from Ukraine are currently living and working in Poland and their presence is becoming increasingly noticeable not only by ordinary citizens but also by entrepreneurs . The increase in the number of employees from Ukraine on the labour market is also an opportunity for the Polish economy and for improving the demographic situation in the country. Citizens from Ukraine enter Poland to improve their quality of life and to earn more; however, most of them work below their qualifications, which may also affect their lower earnings. Despite the fact that there is still a shortage of workers on the Polish market for specialists, Ukrainian citizens often perform professions incompatible with their education. Although currently the level of job satisfaction among immigrants is quite high, there is a risk that immigrants who decide to change will find employment in another country, which may result in a growing shortage of workers on the Polish market. It is also worth remembering that immigrants are extremely valuable due to the unfavourable ageing society trend. Poland should pay more attention to the arriving immigrants and provide more assistance by offering aid programmes for foreigners.

Compared to immigrants from Ukraine, immigrants from other countries coming to Poland are of marginal importance. However, statistics show that more and more immigrants of different nationalities are arriving each year.

Abstract

This study is devoted to assessing the possibilities of financial support for achieving strategic guidelines in the development of science and technology. The article analyzes the dynamics and structure of one of the most common indicators that make it possible to assess the country's scientific and technological development - an indicator of research and development domestic expenditure. The transformation of the goal-setting that has been carried out in relation to the development of science within the framework of strategic planning has been revealed - a shift in emphasis from the quantitative determination of established absolute values to relative values, which allows us to evaluate not only the dynamics, but also the structural changes in the observed phenomenon. The impossibility of achieving the established values of one of the main strategic indicators of the development of science in the conditions of preserving the existing trends of its financing is shown.

Keywords: development of science, research and development domestic expenditure, gross domestic product, state program.

Introduction

The choice of directions of scientific and technological development of the country is impossible without an assessment of the scientific and scientific-technical potential, which, in turn, is objectively determined by the logic, dynamics and regular trends of world scientific and technological progress. The competitiveness of such a potential of any country is characterized, first of all, by competitive advantages in comparison with the corresponding potential of a competing country. Unfortunately, the scientific and scientific-technical results are not sufficiently demanded by the real sector, and the solution to the task of creating a “smart” economy is determined precisely by the need for the advanced development of science and technology and increasing the efficiency of using the results. In this regard, the study of the possibilities of financial support for achieving strategic guidelines becomes particularly relevant.

Methodology and Research Methods

In the course of the study, the transformation of the goal-setting system carried out as part of the strategic planning for the development of science was assessed, and the structure and dynamics of the main indicator, which is used to evaluate the country's scientific and technological development, are analyzed, including taking into account international comparisons, conclusions are formulated

regarding the possibility of achieving the set target value of the ratio of research and development domestic expenditure to gross domestic product.

Such scientific methods as analysis, synthesis, generalization, induction, comparison, formalization, as well as methods of comparative, statistical and economic analysis were used for research purposes

Results and Discussion

One of the most common indicators to assess the scientific and technological development of the country is a figure of the volume of domestic expenditure on research and development (RosStat, no date).

By volume total R&D domestic expenditure in absolute terms Russia hold a position in the top ten leading countries of the world (Fig. 1).

Fig. 1: R&D domestic expenditure, billion US dollars on a purchasing power parity basis of national currencies, 2016 (or the coming years for which data are available) (Gokhberg *et al.*, 2019)

However, in order to carry out a comparative analysis at the intercountry level, this indicator is used in relative terms, for example, relative to population size. Most often, to take into account when measuring the differing economic power and potential of individual countries and to increase objectivity, indicators are used reflecting the size of R&D domestic expenditure in comparison with the gross domestic product (GDP) of the corresponding national economy. Thus, in terms of the volume ratio of R&D domestic expenditure to GDP Russia is ranked 34th in the world (1.1%) between Ireland (1.18%) and Greece (1.01%) and significantly inferior to the leaders (Israel - 4, 25%, the Republic of Korea - 4.23%, Switzerland - 3.37%, Sweden - 3.25%, Japan - 3.14%) (Vlasova *et al.*, 2018; Gokhberg *et al.*, 2019).

Over the past few years, the program documents of the Russian Federation have been declaring the importance and necessity of outrunning scientific and technological development; in this regard, such a serious delay leads to increased attention of the authorities to the need to increase the volume of R&D domestic expenditure in relation to GDP and to include the corresponding indicator in program and strategic documents

It was determined by the concept of long-term socio-economic development of the Russian Federation for the period until 2020 (approved back in 2008), that R&D domestic expenditure s should rise to 2.5–3 percent of gross domestic product in 2020 (2007 - 1.1 percent of gross domestic product) with a dramatic increase in productivity. At the first stage (2012) R&D expenditure (private and state expenses) accounted 1.4 - 1.6 percent of gross domestic product (Government of the Russian Federation, 2018).

Strategy of innovative development of the Russian Federation for the period until 2020 (from 2011) (Government of the Russian Federation, 2011) envisaged that by 2020 the value R&D domestic expenditure should be 3% of GDP, with 43% of which should be provided from the budget, and 57% from extrabudgetary sources.

Decree of the President of the Russian Federation of May 7, 2012 No. 599 (President of the Russian Federation, 2012) determined the need to increase by 2015 the volume of R&D domestic expenditure to 1.77 percent of the gross domestic product.

The 2016 Russian Science and Technology Development Strategy set a target for the development of science - increasing research and development costs and bringing them to at least two percent of the gross domestic product, including a proportional increase in private investment, the level of which should not be lower than state ones by 2035 (President of the Russian Federation, 2016).

One of the most important strategic tasks defined by Decree of the President of the Russian Federation No. 204 of May 7, 2018, was the task of pro-active increase in R&D domestic expenditure from all sources compared with the growth of the gross domestic product of the country (President of the Russian Federation, 2018).

It is necessary to note the transformation of goal setting that has taken place in recent years: a change of emphasis from the quantitative determination of established absolute values towards relative values, which make it possible to evaluate not only the dynamics, but also the structural changes in the observed phenomenon.

Unfortunately, in the case of Russia, the shift to relative R&D domestic expenditure indicators doesn't indicate a transition to a qualitatively new level of assessment of the phenomenon, but rather an attempt to find out the reasons for the failure to reach the previously established values of the indicator and, as a consequence, the transition to the formulation of the problem of increasing extrabudgetary funding for research and development. This thesis is indirectly confirmed by the fact that the new state program "Scientific and Technological Development of the Russian Federation" provides four indicators related to R&D domestic expenditure (Government of the Russian Federation, 2019).

Fig. 2 visually characterizes the failure to achieve the set goals for the share of R&D domestic expenditure in GDP: neither 1.4% - 1.6% by 2012 ("The concept of long-term social and economic development of the Russian Federation for the period until 2020"), nor 1.77% by 2015 (Decree of the President of the Russian Federation of May 7, 2012 No. 599) was never achieved. It is also unlikely that the planned value of 2.5% - 3% will be achieved in 2020 ("Strategy for the innovative development of the Russian Federation for the period until 2020"). There is no obvious positive dynamics of volume indicator in the R&D domestic expenditure as a percentage of GDP in recent years, the indicator value has a stable run at about 1.1 percent.

In this regard, the objective of increasing the growth rate of R&D domestic expenditure for Russia remains to be relevant. At the same time, in order to accomplish the objectives set, it is necessary to change the structure of the economy, which is characterized by the growth rate of R&D domestic expenditure significantly exceeding the GDP growth rate.

It should be noted that, for example, in 2013-2016. Only the China (only up to 2015 - the USA, Germany, Great Britain) was able to solve the problem of the growth of R&D domestic expenditure

with rates exceeding GDP growth (Fig. 3). Thus, the world practice of recent years testifies to the high complexity of the task, and in the notation "a significant excess of the growth rate of R&D domestic expenditure in relation to GDP" - it makes it practically unsolvable in the framework of the existing paradigm of the development of science in Russia.

Fig. 2: Volume dynamics of R&D domestic expenditure and the share of R&D domestic expenditure in GDP in the Russian Federation (RoStat, 2019b)

Fig. 3: Volume dynamics of R&D domestic expenditure and the share of R&D domestic expenditure in GDP in the Russian Federation Indicators of the dynamics of GDP and the volume of R&D domestic expenditure in some national economies (Authors' calculations; Ditkovsky *et al.*, 2018; World Economic Outlook, 2018; Gokhberg *et al.*, 2019)

The emergence of the corresponding task for Russia is due to the need to form a “knowledge economy” and a powerful scientific foundation that will help make the transition to a new technological structure. Consider the possibilities available for this.

In the structure of R&D domestic expenditure in Russia in recent years (2012-2017), state funds have consistently dominated, accounting for more than 66%, which is significantly higher than similar values for other leading countries in scientific and technological development (Fig. 4), including and China. Funds from universities make up only about 1%, private NPOs from 0.1% to 0.3%, funds from foreign sources decreased from 4% to 2.5%. The funds of the business sector, although slightly increased, make up only about 30% of the total volume of domestic costs (Gokhberg *et al.*, 2019).

Fig. 4: The share of public funds in R&D domestic expenditure for selected countries, 2017 (or the coming years for which data are available) (Gokhberg *et al.*, 2019)

At the same time, state funds are considered as mainly federal budget funds. The Law "On Science" (Government of the Russian Federation, 1996) establishes a plurality of sources of financing for scientific activity both at the expense of budgets and at the expense of individuals, but it is specifically stipulated that the main source of funding for basic and exploratory research is the federal budget, as well as funds support of scientific, scientific-technical, and innovative activity (Dmitrishina *et al.*, 2018). The interconnection of forecasting, goal-setting, planning and programming is the most important condition for increasing the effectiveness of the entire strategic system, including its regional component (Klimanov, Budaeva and Chernyshova, 2017), which emphasizes the requirement to improve the system of strategic documents both at the regional (Budaeva and Klimanov, 2016) and at the industry level (Dmitrishina and Uskov, 2016). For more information about the coverage of science and the technical policy of modern Russia in strategic planning documents see, for instance, the references (Dmitrishina and Uskov, 2015; Ministry of Science and Higher Education of the Russian Federation, 2015).

In this regard, the Russian Federation aims not only to switch to faster growth in GDP of R&D domestic expenditure, but also to change the structure of R&D domestic expenditure itself, reduce the share of budget financing and significantly increase the share of extra-budgetary. Thus, the equally traditional task of increasing the share of extrabudgetary sources of financing for science

(Mikhaylova and Uskov, 2017), which has also been on the agenda of recent decades, is becoming even more difficult for the economic and scientific authorities of the Russian Federation and requiring new approaches and methods to solve it.

A data analysis in shows that the Government of the Russian Federation is aware of the complexity of the task: the solution of the problem of financing science, mainly at the expense of state funds, is being postponed to a more distant future of the year 2035. In accordance with the Strategy for innovative development of the Russian Federation for the period until 2020, a balance between state and non-state sources of financing should have been achieved between 2016 and 2020, but now we can talk about the failure in fulfilling of this task. Let us consider, however, the dynamics of growth in the volume of federal budgetary financing of science as one of the sources for the formation of of R&D domestic expenditure.

Table 1 shows the GDP growth rates and the comparative growth rates for financing science at the expense of the federal budget. However, the task set on outstripping growth of R&D domestic expenditure in relation to GDP even in terms of budget financing is performed only for the year 2018 and at the project level for 2020. The growth rate of budgetary funding for science doesn't exceed the planned GDP growth rate, which indicates an insufficient amount of budgetary funding and, in fact, "planned" failure to fulfill the objectives of the Decree in 2019 and the projects planned for 2021-2022.

Table 1: Comparative GDP and budget financing of science growth rates

Year	Financing of science at the expense of the federal budget, billion rubles	Annual growth, %	Volume of GDP, billion rubles	Annual growth, %	The share of budget financing in GDP, %
2013	375,8	117,4	73 133,90	107,3	0,51
2014	372,3	99,1	79 199,70	108,3	0,47
2015	366,2	98,4	83 387,20	105,3	0,44
2016	366,3	100	86 148,60	103,3	0,43
2017	355,2	97	92 037,20	106,8	0,39
2018	407,9	114,8	98 234,00	106,7	0,42
2019	422,1	103,5	105 820,00	107,7	0,4
2020*	506,2	119,9	112 863,00	106,7	0,45
2021*	518,9	102,5	120 364,00	106,6	0,43
2022*	540,7	104,2	128 508,00	106,8	0,42

*Note: * – in accordance with the federal law "On the federal budget for 2020 and for the planning period of 2021 and 2022".*
Source: Authors' calculations; Ministry of Finance of the Russian Federation, no date; RoStat, 2019a)

The data indicate a planned decrease in the growth rate of federal budget expenses on science (except 2020), thus, the share of budget financing in GDP as a whole will undergo a decrease. However, substitute and outstripping growth of extra-budgetary expenses is required for a positive assessment of this phenomenon, which is not confirmed by statistical data. The main reasons for the low growth rate of extrabudgetary funding in science include the following:

1. Lack of motivation for investment in science, high risks of non-return on investment, poor development of technologies for commercialization.

2. Skepticism about science in society caused, among other things, by the reputational losses of the Russian Academy of Sciences, a long campaign in the media to discredit the Russian Academy of Sciences.

3. Underdeveloped mechanisms for attracting private investment in science. The concentration of a significant part of the scientific potential in state scientific institutions, which are largely confidential and closed.

4. Lack of an effective state economic policy aimed at stimulating innovation and scientific activity.

However, when deciding on the choice of measures to stimulate the involvement of extrabudgetary sources in financing research and development, it is necessary to take into account that, despite the more realistic goal setting (Klimanov and Safina, 2017) at present, such decisions will undoubtedly increase the burden on economic agents. Moreover, an increase in administrative regulation and/or pressure in order to attract additional amounts of extrabudgetary funds may cause other problems in the economic system (for example, massive concealment of profits and, consequently, a decrease in the tax base for this tax, in case mandatory deductions from corporate profits and organizations for research and development are confirmed). To avoid a disbalance in the economic system, it is necessary to make balanced and thoughtful decisions. The main direction of changes should be an increase in the share of industries with high surplus value in the Russian economy. A possible solution to the problem may be to improve the statistical tools for accounting for R&D costs, as well as to stimulate enterprises and organizations of various forms of ownership to classify expenses as research and development and to reflect them in statistical accounting.

Conclusions and Scientific Novelty

During the research, a transformation of the goal-setting that has been carried out in relation to the development of science in the framework of strategic planning has been identified. A shift in emphasis from quantitative determination of the absolute values established to relative values, which make it possible to evaluate not only the dynamics, but also the structural changes in the observed phenomenon. An analysis of the dynamics and structure of one of the most common indicators that make it possible to assess the country's scientific and technological development, which is the indicator of R&D domestic expenditure, showed the impossibility of achieving the established values of one of the main strategic indicators of the science development in the context of maintaining existing trends in its financing, including due to the lack of replacement and outstripping growth of R&D extrabudgetary costs. Moreover, we identified the main reasons for the low growth rate of extrabudgetary funding in science and proposed directions for stimulating the involvement of extrabudgetary sources in financing research and development.

Abstract

This short paper surveyed undergraduate students' consciousness and the application of social media for the business of learning. In this introductory study, respondents were accounting students of universities in Nigeria. We used a survey questionnaire to gather data for this ongoing study. Preliminary results affirm that accounting undergraduates use social media for many purposes but rarely for online learning. Instagram and YouTube are the most patronized social media outlets, determined mostly by the student's age. The conclusion, for now, is that beyond expectation, the majority of accounting undergraduates in Nigeria do not use social media for learning. Therefore, we recommend that scholars should conduct similar researches in other academic disciplines and regions of Africa.

Keywords: Social Media, Internet, Accounting, Business, University Undergraduates

Introduction

Subject area	Business Communication
More specific subject areas	Social Media Learning, Marketing Communication, Advertising, Public Relations Execution of the study
A s	urvey carried out with the use of a questionnaire.
Study format	Quantitative methodology
Experimental factors	For this study, we gathered data from 294 undergraduates of accounting studies. We collected answers to research questions from the instrument of the questionnaire. Objectives and problems of the study focused on undergraduates' awareness and application of social media applications for learning purposes. Tables and bar charts represent the preliminary results. We used Analysis of Variance (ANOVA) other statistical tools of the Scientific Package for Social Sciences (SPSS) for this initial study.

Experimental features	These include information on the business of academic and professional accounting, use of social media, and undergraduates disposition towards online learning.
Preliminary study location	Nigeria
Data accessibility	Original data is available to compare with similar investigations in other African countries.

Value of Study

1. This preliminary study lays the foundation for similar studies in as many African countries as possible. It will show whether results identical to that of Nigeria could come out of other African countries.
2. The study would generate massive data which the whole world could use to understand the teaching, learning, and practices of accounting business undergraduates.
3. The multifaceted platform of this study consist of the following:
    a. Business accounting scholarship and professionalism as well as social media application. Sample in
    Boyd, *et al.* (2014), Iyoha, *et al.* (2013), Makinde, and Adesopo, (2006), van Mourik, and Walton, (2014), Kommers, *et al.* (2015), Noor Al-Deen, and Hendricks, (2012), Patel, (2019), Saunders, *et al.* (2015), Shrivastava, (2013)**.**
    b. Fundamentals and applications of integrated marketing communication. Sample in Odiboh and Oladunjoye (2019), Odiboh, *et al.* (2020a), Odiboh and Ajayi (2019), Odiboh, Ezenagu, and Okuobeya (2019).
    c. Public relations actions of institutions of education, accounting, and universities. Sample in Adelua, *et al.* (2020a), Adelua, *et al.* (2020b), Adelua, *et al.* (2020c), Adelua, *et al.* (2020d), Aiyende, *et al.* (2020a), Aiyende, *et al.* (2020b), Fayemi, *et al.* (2020a), Fayemi, *et al.* (2020b), Fayemi, *et al.* (2020c), Fayemi, *et al.* (2020d), James, *et al.* (2020a), James, *et al.* (2020b, James, *et al.* (2020c), James, *et al.* (2020d), Ndubueze, *et al.* (2020), Ndubueze, *et al* (2019), Nejo, *et al.* (2020a), Nejo, *et al.* (2020b), Nwosu, *et al.* (2020a), Nwosu, *et al.* (2019), Nwosu, *et al.* (2020b), Olabanjo, *et al.* (2020a), Olabanjo, *et al.* (2020b), Olabanjo, *et al.* (2019), Omokiti, *et al.* (2020a), Omokiti, *et al.* (2020b), Salau, *et al.* (2020a), Salau, *et al.* (2020b)

Experimental Design, Materials and Methods

Survey method provided the data used in this short length paper. We applied a questionnaire to 294 undergraduate students of accounting business in Lagos, Nigeria. The respondents were selected using the multi-stage sampling technique. Below are some of the preliminary results of the survey.

Preliminary Study Results

Table 1 shows that accounting business undergraduates are aware of the innate purpose of social media.

Table 1: Awareness of social media by accounting business students

S/N	Items	Yes		No	
		Freq.	(%)	Freq.	(%)
1	Are you aware of the use of social media for academic purpose?	285	96.9	9	3.1
2	Do you see social media as a personal online learning environment?	201	68.4	93	31.6
3	Are you aware of the educational discussion and collaborative work done on the platform?	208	70.7	86	29.3
4	Can you rely on the information received from these bodies?	294	100.0	-	-
5	Are you aware of the use of social media to gather data?	291	99.0	3	1.0

Source: Computed Data (2019)

Table 2 revealed that the respondents do contribute to comments on informative academic and professional posts on social media.

Table 2: Cross-tabulation of subscription and application of social media by accounting students

S/N	Items	Yes		No	
		Freq.	(%)	Freq.	(%)
1	Do you have a social media account?	276	93.9	18	6.1
2	Do you share learning resources on your social media account?	169	57.5	125	42.5
3	Do you pay attention to educational discussions shared on the platform?	265	90.1	29	9.9
4	Do you request for comments or ask questions on an educational post?	197	67.0	97	33.0
5	Has any of the platforms introduced you to professional bodies in accounting?	201	68.4	93	31.6
6	If yes, do you use your social media platforms to gather professional data?	291	100.0	-	-

Source: Computed Data (2019)

ANOVA results on Table 3 showed that the differences in respondents' perception of media usage by levels ($\lambda 2 = .651$, $P>0.05$) was not statistically significant while gender ($\lambda 2 = .037$, $P<0.05$), and age ($\lambda 2 = .017$, $P<0.05$ are high.

Table 3: Gender, age and levels of the respondents' usage of social media for learning.

ANOVA						
		Sum of Squares	df	Mean Square	F	Sig.
GENDER	Between Groups	1.059	1	1.059	4.375	.037
	Within Groups	70.642	292	.242		
	Total	71.701	293			
AGE	Between Groups	1.518	1	1.518	5.733	.017
	Within Groups	77.285	292	.265		
	Total	78.803	293			
LEVEL	Between Groups	.226	1	.226	.206	.651
	Within Groups	320.699	292	1.098		
	Total	320.925	293			

Conclusion

The first findings of this study confirm social media addiction among Nigerian undergraduates of accounting business studies. Also, the study affirmed the popularity of Facebook, Twitter, Instagram, and YouTube over other social media. The gap in accounting students' application of social media for learning is also exposed. This study raises the concern about whether the same trend applies in other African countries. Managers of accounting training and researchers in social media, marketing communication and public relations studies need to pay attention to the disconnection between undergraduates' attachment to social media and their lack of interest in channelling its application for learning purposes. African continental collaborators on this study are needed.

Abstract

Public relations tools and practices are the backbones of every organisation. Publishing industries have different sectors working to achieve organisational goals. Nevertheless, is the practices of the PR typical in the publishing industry? This study examines the organogram and internal functions of the public relations unit and the causes of bootlegging, including its effect on distribution and price. The study also focused on the damages bootlegging cost publishers and how public relations tools can tackle bootlegging. However, the Two-Symmetrical public relations model by James E. Grunig was adopted. The study focused on Stirling-Horden, HEBN, Safari books publishing industries, public relations agency and booksellers which were selected purposively. The population which is in Ibadan was selected based on the proximity it has to publish productions. The publishing firms were selected based on publications of Education, Academic and General Books. Results further indicate that both public relations practitioners and agencies are uninterested in educational, academic and general publishing. Therefore, this study recommends that publishing organisation should be encouraged to have a PR department, and the government support them with protective laws.

Keyword: Public Relations, Piracy, Bootlegging, Publishing Industry

Introduction

Public Relations (PR) is a term with different definitions. It is a management function which need recognition in organisations. The Mexican definition of PR states that it is the art and science of analysing trends, predicting their consequences, counselling organisation leaders, and implementing planned programmes of action. These actions serve both the organisation and public interest (Ndubueze, Odiboh, Nwosu, & Olabanjo, 2019). It also evaluates public attitudes and behaviour, including working towards the organisational goal and policies in order for better understanding and relationship between the publics and the organisations. Public relations practices are the catalyst for a healthy organisation. The PR should always have an effective plan in line with the organisational goals for the better functioning of an organisation (Chizobam & Obinna, 2018).

In the publishing industry, public relations practices are limited even though they are suffering from bootlegging. Bootlegging or piracy is the reproducing of published books without authorisation from the author or publishers.

Statement of the Problem

The publishing industries provide people with knowledge, information and entertainment. It is essential in building a nation because it is a powerful tool. The challenge this study focuses on is the problem of bootlegging, which has eaten up the publishing industries. Pirates in Nigeria now have a very lucrative business due to public patronage. Even though there are associations under the publishing industries to regulate and help to curb bootlegging, pirated books are everywhere in the country. While focusing on the practices of the PR in publishing industries, the study will find out the causes of bootlegging, the effects, and how PR can use their tools to achieve a pirate free sector.

Research Objectives

The following are the purposes of this study:

1 Examine the organogram and internal functions of the public relations unit.
2 To find out the causes of bootlegging and its effect on distribution and price.
3 Examine the damages bootlegging cost publishers.
4 To find out how public relations tools or practices can help to tackle bootlegging.

Literature Review

Public relations (PR) as a management function, has so many engagements towards achieving the goals and objectives of the organisations (Odiboh & Oladunjoye, 2019). The PR engages in press releases activities in order to inform the public through the media about the organisation's operations. A PR maintains the policy of an organisation, create mutual understanding, and attain the goals of the organisation. Relationship building together with effective communication and the power to listen are practices of the PR.

However, the publishing industry produces books, periodicals, newspapers through the use of ink, paper, gum and machines. Publishing industries like Education, Academic and General books are the various genres of the publications done in such industries. Education books are those books for secondary schools, and academics are basically for tertiary education. General books consist of fictions and religious books. With the advent of different publishing industries, bootlegging has joined and is causing severe havoc for the industry (Odiboh, & Ajayi, 2019).

Bootlegging

Bootlegging, which is a synonym of piracy, is illegal to manufacture, distribution or sale of goods (Oxford living dictionaries). It is an unauthorised reproduction or distribution of materials which is under the protection of Nigerian copyright commission (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). When music, movie, books, broadcast, painting or other copyrighted works lack authorisation is also called piracy or bootlegging (Waziri, 2011). In this context, publishing industry is the focus because the reproduction of books by pirates is massive (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende, *et al.*, 2020a).

The Nigerian Copyright Commission is one of the significant legal bodies established to protect intellectual materials from unauthorised users (Nwosu et al., 2019). Copyright covers all kinds of literary works for over 50 years after the death of the author. In case of more than one authors to a work, the duration starts counting after the death of the last surviving author (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). The protection of intellectual works is paramount for the advancement of the publishing industry. Such protections will encourage authors to write more and equally enjoy the profit of their hard work (Onoyeyan & Awe, 2018). Section 1 (1) of the Nigerian Copyright Act (1999) states that the categories of works protected are books and other literary documents.

Copyright law states that a work must be creative and in a permanent format. Also, it is necessary to

seek the consent of the author or creator of a work before using it. However, in the case of using an author's work for educational purposes, consent is not needed. In July 2003, the Nigerian Commission revealed the arrest of over 143 book pirates. Involved in this piracy were about 3000 copies of textbooks worth 3 million Naira belonging to various publishing firms across the country (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a)

Bootlegging works on two significant factors, which are the price of the books and their demand. The books in low demand will not face too much bootlegging like the highly demanded ones' (Ndubueze et al., 2019). Such books which are high in demand and suffering piracy are the educational books such as; secondary school textbooks and novels in schools curriculum (Ahmadu, 2017).

Additionally, according to Ndubueze, Odiboh et al., (2019), New general mathematics, Junior English project, Business Accounting, New Method English dictionary, Brighter grammar, student companions, Romeo and Juliet, Hamlet, Merchant of Venice, Commercial typewriting, Pitman new Eva shorthand, Animal Farm, Tales from Shakespeare, New school physics for senior secondary schools, new chemistry for SSS among so many others have excess pirated copies. 'The depreciation of Naira made Nigerians purchase cheaper products not minding the quality. Such a behaviour boosts increased bootlegging of school books at low prices' (Ahmadu, 2017).

Causes of Bootlegging

According to James *et al.* (2020c), bootlegging in publishing industries is high because of the high price of books. Thus, so many factors engage bootlegging in Nigeria:

1. Due to lack of employment in Nigeria, the poverty rate is high which makes people to soughing for income to indulge in producing pirated books and selling them at a lower price (Ndubueze *et al.,* 2019).
2. Most people indulging in the crime do not know about copyright law and bootlegging to be a criminal offence because of ignorance.
3. The high cost of books makes Nigerians patronise sellers of a cheaper alternative. Cheaper ones are mostly the pirated copies because people tend to be more interested in the content and not its originality.
4. High in demand of a particular book which is limited can encourage more pirated copies (Ahmadu, 2017).
5. Inadequate funding makes the copyright commission to be inactive (Omeiza, & Lanre, 2019).

Curbing Bootlegging

Bootlegging affects publishers, cinemas and other media industries, designs, artworks (Olabanjo *et al.,* 2019). The following suggestions will help to curb this menace:

1. A campaign should be carried out by both government and professional bodies to enlighten the public on the dangers of piracy (Adelua *et al.,* 2019).
2. Every author should register their works with Nigerian Copyright commission, National Library of Nigeria as well as Association of Nigerian Authors.
3. Printers should also be encouraged not to print pirated books but to work with diligence.
4. The Nigerian lawmakers should implement a more severe punishment for pirates and make the public see how serious the crime is (Odiboh, Olonode, Adesina & Yartey, 2018).
5. Most people who engage in producing pirated books are jobless; therefore, with the alleviation of poverty in the country, bootlegging will eventually subside (Nwosu, Odiboh, Ndubueze & Olabanjo, 2019).
6. Advanced technology that can detect pirated books is available. Also, the Internet can monitor pirates' activities (Omeiza & Lanre, 2019).
7. The public should be discouraged from patronising street booksellers and those bookstores not approved by the government. Most of the street booksellers sell pirated books (Odiboh, Adeyeye & Ekanem, 2018).

Theoretical Framework

We adopted the two-way symmetrical model of public relations for in this study. Grunig propounded it, and the theory focuses primarily on the interest of an organisation towards its publics. An organisation makes decisions which will benefit both the organisations its audiences (Grunig, 2001). This theory embraces negotiation between the organisation and its publics, and one that also fosters mutual understanding (Severin, 1997). Therefore, organisations (publishing industries) should make decisions that will interest the public and not only themselves. When the organisations' priority is the publics, satisfaction and interest are protected. Bootlegging, which is an issue for both the industry, authors and audience should be the priority for publishing industries to tackle because the interest of both the public and the authors is at stake. With a solution, there will be a mutual understanding for both the organisations and its publics (Odiboh, Ezenagu & Okuobeya, 2019). However, effectiveness in solving the problem of bootlegging needs public relations expertise accordingly as the middle man.

Research Design and Methodology

The researcher adopted a qualitative method of gathering data through the use of an interview guide. Here, the respondents give their opinions and comments directly (Converse, 1987). An in-depth interview was adopted, and the population were selected purposively. Stirling-Horden publishing (Educational books), HEBN publishing (General books), Safari books publishing (Academic books) were purposively selected. They cover the three genres of books. Also, Booksellers and Public Relations agency were purposively selected and interviewed. The results of the interviews were analysed by a critical discussing the findings based on the research questions.

Results

Based on the results from the interview, all the three publishing firms Stirling-Horden, HEBN, Safari books, have an organogram. However, the title of each of the offices or departments is different. Nevertheless, they have similarities in functions. One of the participants stated that "each publishing house has a structure hardly will you find two publishing houses that have the same structure".

The participants acknowledged that publishing firms do not have a public relations department. One of the publishing firms stated that it is rare for a publishing firm to own one. "The reason is that the publishers are close to so many teachers".

All the participants have a different title for departments that deals with reaching out to the public. Therefore, they distribute their books through marketers, and they reach their readers through schools, booksellers and teachers because they do not deal with the public directly. Common to all the three publishing firms, and booksellers who also deal with the customers directly without the help of Public Relations.

Similarly, the public relations agency interviewed agreed with the above-stated findings that they do not deal with publishing firms. However, one of the participants added that a few big publishing houses could have a Public Relations department. Also, the Nigerian copyright commission is the body responsible for curbing piracy and not Public Relations in this regard.

Thus, two participants agreed that pirates have no business with books that are not selling. Most of the participants agreed that the high demand for money made people become pirates. One of the participants stated that the high cost of publishing materials makes original books unaffordable to average Nigerians who would prefer a cheaper book. Mostly pirated are the cheaper books. A bookseller said that "customers will feel that well, our books are too expensive, so they prefer to go outside, for pirate books".

However, all the interviewees agreed price of books encourages piracy. However, one of the participants made a more detailed comment by stating that "when a book is pirated, instead of 10,000 copies, one ends up selling only one". If a book sells for 5,000 Naira in the bookshop and the same content is in a pirated copy; the counterfeit could sell for 500 Naira. That is 10% of the price of the original". When a publishing firm has books which are popular and in high demands, it attracts pirates who reproduce the books, sell them, and take over the market because theirs' is cheaper. Therefore, the

publishers do not benefit from their production, and they will be unable to pay their employees and also unable to pay authors royalties. All these are damages which harm the publishing firm.

"Some years ago in Nigeria, without pirates, the education system of Nigeria would have collapsed because the publishers could not buy papers to meet rising demands for books". So, there was this kind of gap which the pirates filled" was opined by one of the five participants. While other participants were looking at the negative aspect of piracy, one of them chose to bring out one of the positives. However, he stressed that the point was not to support piracy in Nigeria.

Conclusion

This study which is an in-depth interview with three publishing firms, booksellers and PR agency, shades more light on piracy in the various genre. Based on the response from the publishing industries, booksellers and Public Relations, it is seen that public relations practices are limited. More robust policy and actions by government agencies should curtail piracy. The marketing department should perform the functions of PR to deal with piracy using other communication (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Also, the Nigerian Copyright Commission, together with other bodies related to publishing curb bootlegging. Therefore, all the publishing industries' interviewed did not see a need for PR practices in the workplace. Therefore, it is clear that they underrated PR practitioners. The booksellers also suffer from bootlegging but equally lack the practices of a PR.

Recommendation

Based on the outcome of this study, PR practitioners should seriously consider helping the curb piracy and bootlegging in the publishing industry. All kinds of publishing industries, be it small for a large company, there should be a PR department, or they should hire the services of a PR agency.

Secondly, despite the suggestion of having a PR department, the government should make laws regarding copyright more strict and compromised publishers should receive severe punishment.

Finally, the Nigerian Copyright Commission should be more active, more than just being heard. Because of the importance of PR in any organisation, their presence will provide solutions in a time of crisis. Therefore, the PR department should be in place or hire a PR practitioner to curb bootlegging and maintain the goodwill of the industry.

Abstract

This research reviews the viewpoints of public relations professionals in the Nigerian automobile industry. The study involved three interviews using a qualitative method of data collection. Each interview was from two Nigerian automobile manufacturers and a public relations agency. Companies sampled were Coscharis Motors Limited, Honda Manufacturing Nigeria Limited and SoulComms Limited, which is a perception and reputation management subsidiary of SO&U, an integrated marketing communication consultancy. The study is rooted in Grunig and Dozier's Excellence Theory. It shows that despite the challenges in acceptance of these domestic products, the automobile industry players sampled continue to make calculated and concerted efforts to improve the relationship with their different stakeholders. Also, the sampled PR professionals suggest increased advocacy to stimulate stakeholders and policymakers in the creation of an enabling environment to encourage more production and acceptance of Nigerian-manufactured automobiles.

Keywords*:* public relations, automobile industry, professional practice, vehicle manufacturing

Introduction

Public relations performs a vital task of connectivity in the relationship which links an organisation with its stakeholders. PR practise aims at creating a two-way communication, attempting to create a common ground or situations of mutual interest and understanding based on truth, knowledge and complete information (Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019). Organisations, no matter how carefree they may be, are aware that they need to build strong relationships with their publics. However, it is clear that no matter how hard an organisation tries to project an image, internal and external relationships could threaten its survival (Odiboh, Adeyeye and Ekanem, 2018; Odiboh, Ezenagu and Okuobeya, 2019). In as much as crises warranting strategic public relations actions are unavoidable, it is essential to develop well-planned methods to avoid the occurrence of crises. In crises, how public relations managers use their training and knowledge for intervention and resolution is crucial (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a).

Many people are concerned about the place of PR practitioners in growing the manufacturing industry (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019), with the automobile industry not left out. It is therefore beneficial to examine direct responses from professionals in order to explore the problems or difficulties encountered in contributing to a holistic import substitution industry. This research work assesses the position of public relations in the automobile industry in projecting the image and management of the relationship with stakeholders and potential stakeholders in order

to influence the acceptance of made-in-Nigeria automobiles. The study also looks at the opportunities and areas for improvement in the performance of the automobile industry, as stated by the public relations professionals examined.

Statement of the Problem

The 2014 National Automobile Policy meant to licence indigenous auto manufacturers has not fully yielded increased production of cars (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020). There is also a challenge of gross importation of fairly used automobiles, despite the availability of local manufacturers. This situation has affected the indigenous manufacturing industry, which started running again after its previous failure, prompting the new policy. There is, therefore, the need to assess the positions of the automobile industry's public relations practitioners and public relations agencies regarding their advocacy for general acceptance locally assembled cars.

Olabanjo *et al*. (2019) note that emerging indigenous industries have a challenge of acceptance which affects their productivity as a result of issues like piracy and poor quality control. The success of every manufacturing industry depends mostly on its reputation for making quality outputs in the eyes of stakeholders. However, the realisation of the quality standard has been a problem to indigenous manufacturers (Aiyende, *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Strong emphasis on the maintenance of quality control policies of the indigenous industry is however indispensable at this time to bring about acceptance and good relationship with stakeholders (Adelua *et al*., 2019; Fayemi *et al., 2019*).

Study Objectives

This study seeks to examine the roles of PR practitioners of automobile manufacturers and consulting agencies for the automobile industry in bringing about the acceptance of their automobile products. In doing this, the study would examine the tools of these professionals, their target publics, their evaluative measures for assessment of campaign effectiveness, and how they engage their stakeholders. Following the objectives mentioned above, the following research questions are as follows:

1. What activities and tools does the PR set ups of Nigerian automobile manufacturers use?
2. How effectively does the Nigerian automobile industry ensure it executes its PR activities by?
3. How do Nigerian automobile manufacturers ensure engagement in their public relations campaigns?
4. How can public relations practice in the Nigerian automobile industry be improved?

Literature Review

The Nigerian Automobile Industry and Public Relations Actions

Some private companies spearheaded the Nigerian auto industry in the beginning of the 1960s after they set up automobile assembly lines which utilised semi-knocked down (SKD) or completely knocked down (CKD) components. Notwithstanding, it is noteworthy that the initial production scale of automobiles were minimal. The era saw the industry make a yearly roll out of 108,000 cars, 56,000 commercial vehicles and 6000 tractors (Abiodun and Omosule, 2015).

United Africa Company Limited (UAC) pioneered the assembly of Peugeot 404 pickup trucks. This move was then succeeded by Federated Motors Industries and SCOA Motors which was set up for the assembly of buses and Peugeot 404 pickup trucks. Sequel to the realisation of the essential position which the infant auto industry had in the growth of the Nigerian economy, the Nigerian Government came into the sector at the end of the Nigerian Civil War in the beginning of the 70s. Within 1975 till 1983 however, Nigeria was resident to six vehicle assembly plants. Among the

companies that were involved in assembly comprised Peugeot Automobile Nigeria (PAN), Kaduna, Volkswagen of Nigeria (VON) in Lagos, Anambra Motor Manufacturing Company (ANAMMCO), Enugu, Steyr Nigeria Limited, Bauchi, National Truck Manufacturers (NTM) in Kano and Fiat Leyland Nigeria, Ibadan (Oigiagbe, George and Owoyemi, 2012). Howbeit, out of these assembly plants, two were acquired, while the other four were at the brink of bankruptcy as at the end of 1990 (Aminu, 2016).

At the close of 2010, four plants had shut down, and in two more years (2012), no single assembly line was in operation (Oigiagbe *et al*., 2012). Low production scales, high costs as well as uncontrolled importation of Fully Built Units (FBU) failed the assembly plants (Aminu, 2016). However, as a result of increased vehicle importation, most of which were second-hand automobiles, the Nigerian economy incurred costs of $4.2 billion in 2010 and $3.4 billion in 2012 (Nigerian Bulletin, 2013). The harmful effect of greenhouses gases from vehicle emissions was also a big problem of second-hand vehicles (Jaja, 2010). In response to the dwindled industry, the Federal Government of Nigeria, in 2013 renewed its efforts at attracting investors who would set up assembly lines to roll out vehicles once again and bring to a halt vehicle importation. In an attempt to achieve this, the National Automotive Policy was brought to bear (National Automotive Council, 2013).

Through the new policy, the Nigerian Government accredited 35 organisations to assemble automobiles (Oga, 2016). A few of the licensed vehicle manufacturing industries include Briscoe Nigeria, Richborn Nigeria, Toyota, General Appliance West Africa, Honda and Perfection Motor Company. Sinotruk, Nigeria-China Manufacturing Company, Coscharis Motors, Globe Motors Nigeria, Century Auto-Assembly Nigeria and DAG Motorcycles Industry Nigeria were also licensed (Premium Times, 2015).

African Business Central (2015) notes that the refreshed auto production policy of creating an enabling environment for vehicle production lines created a 35% cut rate in terms of duties for fully built units. Other incentives included, a twenty per cent (20%) duty reduction rate for indigenously produced commercial automobiles; tax exemption and non payment of duties for production equipment; a restriction on vehicle importation and smuggling. However, with the introduction of these incentives, the Federal Government projects an increase in available and functional vehicle assembly lines in Nigeria to 80 by the year 2023 from the current figure of 48 production plants (Premium Times, 2015; Udodiong, 2015).

In spite of these benefits and motivating factors as well as the enthusiasm of policymakers, the projected performance has not been realised. Beyond the four years of implementation, just a few of the authorised production companies have begun rolling out new automobiles into the Nigerian market (Oga, 2016). Some of the vehicles now successfully assembled include Nissan (Stallion Group), Ford (Coscharis Group), Kia (Dana Motors), among others. Low production was the outcome of an unfavourable climate for policy realisation (Oga, 2016). However, for a successful realisation of the policy, there is the need create an investor-friendly environment like Brazil, China, South Africa and Mexico did in the past (Harrison, 2011; Ambe and Badenhorst-Weiss, 2010). In those countries, automotive and electronics assembly plants have successfully attracted other investments in the value chain and contributed to these countries' economic development.

Concerning public relations in the automotive industry, some issues have contributed to the limitation of the industry. These are inadequate support in terms of patronage from private Nigerians and procurement from government, weak as well as unhealthy climate for production, little available capital, low output of local service providers or suppliers as well as outdated methods and technologies (Abiodun and Omosule, 2015). Abiodun and Omosule opine that the attitude of Nigerians towards indigenous automobiles, resulting in low patronage linked to quality perceptions in comparison with foreign automobile manufacturers in recent times. Also, the low level of embrace of Nigerian-assembled vehicles can be attributed to the insufficient faith in the level of innovation of the industry. Many Nigerians choose to acquire an automobile from foreign auto manufacturers regardless of the high expenditure and cost of clearing the vehicle due to trust and faith in the technology of the foreign industry.

Public relations actions carried out by indigenous automobile manufacturers/assemblers in recent times have included advocacy. Investors in the indigenous manufacturing industry, backed by the National Automotive Council (National Automotive Design and Development Council, 2013) and National Automotive Design and Development Council (NADDC) have continued to advocate for a drastic reduction in vehicle importation and also increased tariffs on imported vehicles (Ezeoha, Okoyeuzu, Onah and Uche, 2018; Ndubueze *et al.*, 2019).

It remains unclear how these PR functions ought to change the negative general perception of indigenous automobiles. (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Hence this study examining the public relations actions of the made-in-Nigeria automotive industry and its effects on awareness and perception of the Nigerian public.

Theoretical Background

The theoretical basis in this study centres on the Excellence theory of public relations. It is an encompassing theory of PR that stemmed from a 15-year study of professional practice in communications and organisational studies sponsored by the International Association of Business Communicators (IABC) Research Foundation. The PR theory propounded in 1985 integrates several PR theories, theories of the publics management and organisational theories.

The Excellence Theory postulates that the effectiveness of PR functions lies in the organisation or efficient handling of such public relations functions. A worthy relationship linking an organisation with its publics is helpful for an entity or corporate body to establish and accomplish mutual interests, regulate needless and unhealthy corporate information; and raise organisational income (Grunig, 2013).

Grunig and Dozier (1992) explained that the importance of PR to organisations and the society rests on the level of accountability to the society as can be seen from the quality of corporate decision making and the value of relationships within stakeholders or publics. This theory suggests that an active organisation must solve relationship issues and manage the expectations of its publics and its management. If the contrary is the case, the publics will force the corporate entity to alter the approach to the fulfillment of its expectations or would outrightly reject it in such a manner that may prove costly to the organisation and affect its existence.

With regards to the Excellence theoretical principles about the essence and value of PR, professionals ought to function in such a way that their value is maximised. Primarily, Grunig and Dozier's research portrayed strategic communication management is an essentially critical constituent of excellent public relations. According to Grunig and Dozier, PR managers perform a tactical management and administrative function. They also suggest that PR executives ought to act out their management role as they ought to have an input in top organisational decision-making.

With respect to the tenets of the theory, for PR in the automobile industry to be effective, manufacturing organisations must integrate PR that incorporates the public. The public must be given due consideration in planning public relations programmes. With proper public relations strategy, mutual relationship between organisations and their strategic publics would vitally serve as a yardstick for measuring PR effectiveness in the automobile industry. Proper public relations would also help in advancing organisational targets and objectives anticipated by the automobile industry and stakeholders alike as well as lower the effect of negative publicity. Excellent public relations in the automobile industry requires automobile manufacturers to act responsibly with acceptable moral standards. In other words, the automobile companies must reassess their industry, pinpoint and distinguish the particular stakeholders adversely impacted by corporate policies. In achieving this, auto industry players ought to interact in line with stakeholders in order to develop satisfactory feedback mechanisms which would lead to enduring connections and partnerships.

The principles of Grunig and Dozier's Excellence theory imply that for PR to be worthwhile in the automobile industry, PR personnel ought to observe a tactical administrative function. They would do

this by ensuring that PR personnel express their technical know-how in major administrative policies and decision making. Excellence Theory, in ensuring the effective use of public relations in administration sees PR as a unique role in corporate communication and management.

Method and Materials

This study adopted the qualitative method of data collection. An interview guide instrument provided questions used in in-depth interviews. Question and answer sessions held with professionals who provided expert answers to the stipulated research questions. Two indigenous automobile manufacturers with significant output and reach were selected, viz.: Coscharis Motors Limited and Honda Manufacturing Nigeria Limited. A public relations agency, SoulComms Limited, was randomly selected for expert opinions. The in-depth interview was backed by an interview guide with well-structured questions to allow the sampled PR professionals to be as expressive as possible. The results appeared in reported speeches, quotations and summary statements, after which followed by a discussion of findings.

Results

In terms of PR activities, all three interviewees from Coscharis, Honda and SoulComms state that they engage in media relations, government relations and diplomatic relations. For Coscharis Motors, their most significant relationship is with the media. They said 'it is the media that bring us closer to our stakeholders". Also, Coscharis, Honda and SoulComms agree that their public relations activities ensure that their media selection cuts across both the traditional and new media. 'For our traditional media selection, we relate with motoring editors across all traditional media. They help us to put out our brand offerings. They are also our gatekeepers. They guard against bad and unwholesome bad press; not the kill-the-story type.' These were the standard submissions of the interviewees.

All the interviewees also stated that they leverage the new media to build their relationships by working with blogs and auto-related platforms, websites and e-mail services. The same also goes with the British with their Jaguar-Land Rover and Rolls Royce brands and also the American mission that resonates with their Ford dealership. The Sixt vehicle rentals franchise is also Coscharis' German affiliation, proving them to be veritably involved in diplomatic relations. Honda Manufacturing Nigeria Limited also engages in diplomatic relations with the Japanese mission as completely knocked down (CKD) and semi-knocked down (SKD) parts get shipped in from Japan. Concerning governmental relations, both Coscharis and Honda say that they relate with regulators such as the National Automotive Council, Ministry of Transportation, the Finance Ministry as well as the Nigerian Customs Service. SoulComms, on another other hand, stated that they help automobile manufacturers such as Coscharis and Peugeot Automobile Nigeria Limited to gain social media presence.

The automobile manufacturers examined also state that they also engage in customer relations. 'Customer relations for us is all about organising goodwill campaign messages relating to aftersale service.' Those mentioned above was a common denominator of the automobile manufacturers studied. They explained that customer relations is the act of 'communicating an organisation's offering or a portfolio, such as repairing and replacement of non-warranty car parts for certain target customers.' All three interviews further stated that they conduct audience research and survey through corporate social events to know customers' feedback or response to improved or new products. Shedding more light on their public relations activities, both Coscharis and Honda revealed that they sponsor government and educational events. Honda states that they have a training school, for their personnel and partners nationwide. They also provide in-house workshop and counselling to members of staff on how to uphold the vision and reputation of the organisation. They learn about customer relationship management as well as handling and settling issues to prevent crises.

In terms of public relations tools used by the Nigerian automobile manufacturers studied, Coscharis state that they use 'luxury or high-class magazines to target our high net worth individuals.' These magazines they say 'can be found in top grade hotels, first-class cabins of airlines and private jet hangars.' They add that they also 'use displays, exhibitions and experiential pitching to bring about

awareness of our organisation and brand offerings.' Coscharis states that it also integrates digital media to pitch its stories to its target publics while also consulting PR agencies for some of the PR solutions.

Honda Manufacturing Nigeria Limited, on the other hand, also makes use of both the traditional and new media. Honda states that it uses newspapers, magazines, radio jingles, phone calls, electronic mails, short message services, social media handles and websites.' Meanwhile, SoulComms public relations agency also state that they use social media platforms heavily because every endeavour today has gone digital. SoulComms work with 'Instagram handles, Facebook, Twitter, blogs and also the traditional media.' They, however, point that electronic and print media also appeal to automobile brands.

In an examination of evaluation of PR effectiveness, both Coscharis Motors and Honda Manufacturing Nigeria state that their 'feedback system serves as the evaluation mechanism.' They go on to reveal that their websites, e-mails, phone lines, service centres all over Nigeria are centres for feedback and evaluation of their activities. Coscharis explicitly stated that when it makes inroads into organisations and other government parastatals, it is a measure of its effectiveness. At the same time, Honda added that online ratings, traffic of clients to their showrooms or workshops and primary level of sales determine the accomplishment of their PR activities. Also, the PR agency, SoulComms opined that it uses audience 'talkability' as a yardstick to evaluate engagement. SoulComms cautioned that social media impressions do not guarantee an effective campaign. The reason is that 'people see brands or organisations online every day, but the way to evaluate is by social media debate and engagement.'

In an assessment of how Nigerian automobile manufacturers ensure engagement in their PR campaigns, Coscharis Motors revealed that it embarks on partnerships, collaborations, sponsorships. Coscharis explicitly stated that it once sponsored the Gulder Ultimate Search, where it gave out the Ford Explorer to the winner. 'The Explorer signifies toughness, strength, ruggedness and off-road capabilities. We did this so our Explorer brand would resonate with the rugged expeditionary contest.' 'We also sponsored the Knorr Cooking Contest organised by Unilever. There, we introduced the Ford EcoSport, which appeals to the female gender, which in turn also gets reported in women magazines, thereby engaging more women.' These were the submissions of the Coscharis campaign executive regarding engagement and experiential public relations. Coscharis noted that as an organisation, all its offerings appeal to what resonates within its audience; 'during showroom activations or exhibitions, we do not put our vehicles on a ramp. We put them on the ground, we give experiences, and we make people see that these cars are meant for them and not just to show them from afar.' Coscharis' campaign executive stated that his organisation offers test drives. This action showcases interior vehicle components, and lets stakeholders have their feel while letting them describe their personal experience. .

Honda stated that they are deliberate in their campaign messages which are handled by their media team. In contrast, the public relations agency SoulComms opined that since in the society, people see but might not ask, they go on to integrate experiences in their public relations activities. 'We involve them online, ask for their opinions and create a debate for opinions' was a denominator SoulComms upheld. The agency also added that they launch ideas or offerings in the minds of their stakeholders to resonate with their needs and is the best way to ensure engagement.

The Nigerian automobile manufacturers interviewed had significant suggestions as to how public relations in the automobile industry can be improved. All interviewees agree that it is the dream of all automobile industry players in Nigeria to have local assembly plants. They also concur that indigenous manufacturing, especially in the automotive sector, brings economic growth in which Nigeria is a very fertile market. They spoke about the new need for better infrastructure; electricity primarily. The interviewees revealed that due to the reduced power supply, it is tough to produce and sell automobiles at the same price as imported automobiles. The result is an extremely high cost of production.

The three interviewees sampled revealed that there is an increased need for 'advocacy'.Coscharis, Honda and SoulComms agree that if they could remove importation and boost local industry, they will reduce the prices of brand new cars. Coscharis Motors specifically called on other members of the automobile industry to lobby policymakers to ratify a policy that can sustain the auto industry. Coscharis added that it needs to improve it is after sales communication. Also, Coscharis Motors suggests that better feedback mechanisms, more training for personnel, social networking are the areas needing improvement.

Honda, on the other hand, stated that PR in the automobile industry might need improvement through the training of more PR practitioners. At the same time, SoulComms PR agency upholds the need for PR managers in the automobile industry to continue advocacy while creating more awareness. Also, SoulComms suggested that it would be highly beneficial for the automotive industry to provide credit facilities for the public. That way, people would afford brand new cars, which would consequently boost the sale of indigenous vehicle brands.

Discussion of Interview Results

Results indicate that the Nigerian automobile industry has low public trust. Despite the challenges of public rejection of these indigenous vehicles, the public relations activities of the selected automobile companies did not stop. However, their level of resolve is another area that can be studied. It is interesting to see that the interviewees recognise the relevance of social media and audience engagement in excellent public relations and relationship building with stakeholders. Coscharis Motors Limited sees the value of consulting PR agencies which goes a long way in effective activations. One may attribute that to the global premium automobile brands for which they have succeeded in obtaining a franchise. Honda Manufacturing Nigeria Limited, however, does not say much about outsourcing PR functions. They seem geared towards the marketing aspects of the business than public relations. Coscharis Motors Limited seem more grounded in handling activations such as showroom and facility tours, government relations and media relations.

However, current feedback mechanisms seem ineffective. An example is Honda Manufacturing Nigeria Limited, where public relations feedback is solely through phone calls, correspondence and volume of sales. Honda Manufacturing Nigeria Limited stated the importance of research which is remarkably essential to successful performance of any PR campaign or programme. An absence of research would mean that objectives for programmes or campaigns would be inappropriate; and accomplishing audience engagement would be an uphill task (Odiboh, Olonode, Adesina, and Yartey, 2018; Olabanjo, Odiboh, Nwosu and Ndubueze, 2019).

Ultimately, the PR professionals sampled continue to call on government and the advocacy of relevant groups to create an enabling environment to encourage more production. If the government does not step in, the auto industry may go moribund again. It would be more challenging to resuscitate, given the rate of inflation in the economy that continues to scare investments.

Conclusion and Recommendation

The results of the interview established that despite the challenges and apathy towards their industry, automobile manufacturers continue to make efforts to improve the perception of their industry. However, public relations does not operate in a vacuum but with the support of stakeholders. PR with good government policy is the only way the automobile industry can gain prominence. It is therefore mandatory for the automobile industry to build their relationship with the government for the mutually-beneficial automobile industry.

Abstract

The significance of a manufacturing company's image lies in how it underpins its brand's market power and risk exposure to counterfeiting. The beauty and cosmetics industry is one of the fastest-growing industry in the world right now because of its massive blow to the image of the industry. In building a sharp brand image that can survive the enormous storm of counterfeiting, the application of public relations is essential. Therefore, this study examined the public relations activities of the industry and how the applications of public relations tools can deal with counterfeits in the beauty and cosmetics industry. The study anchors on the two-way asymmetrical theory of PR. The in-depth interview used elicited responses from our subjects. Hence, the responses were analysed and used to answer the research questions. Findings from this study show that public relations applications are essential for successful anti-counterfeit measures in the beauty and cosmetics industry.

Keywords: Beauty, Cosmetics, Counterfeits, Public Relations.

Introduction

Public relations is the lifeline of any company whose brand offerings gums with its image (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). For counterfeiters, a strong brand is a moving target, particularly if it serves social-adjustive rather than value-expressive roles according to Hamelin, Nwankwo and El Hadouchi (2005). In building a sharp brand image, public relations remains a veritable tool for the beauty and the cosmetics industry. A corporate image should be positive and unique. Most of the time, consumers purchase products or services based on their perception of the manufacturer (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). Public relations helps the public to understand a company and its products. Thus, public relations is the most valuable tool of communication for countering the problem of piracy in the beauty and cosmetics industry (Odiboh, Ezenagu, & Okuobeya, 2019).

Public relations is the management role which assesses public attitudes.It defines the practices and procedures of a person or association for the public interest, and introduces an intervention plan for public awareness and acceptance (Miller and Dinan 2007; Siriramesh and Vercic 2003; Gruing 1992, Hailu, 2018). Public relations is one of the primary tools used by the beauty and cosmetics companies. Thus, public relations is a management function that deals with organisational communication activities. It evaluates public attitudes, analyses strategies, implements action programs, and maintains a public interest in order to gain public attention and recognition. In sum, PR is imperative and highly significant (Olabanjo, Odiboh, Nwosu, & Ndubueze, 2019).

From the above premises, one can understand that counterfeit is an impediment to the growth of the of the beauty and cosmetics industry and the application of public relations is an indispensable and inevitable part of the industry. Hence, public relations in this aspect becomes very essential(Nwosu, Odiboh, Ndubueze, & Olabanjo, 2019). The current research is a laborious endeavor to examine the effectiveness of public relations tools in curtailing the menace of piracy in Nigeria's beauty and cosmetics industry.

Statement of The Problem

Counterfeiting is a heavy burden in the beauty and cosmetics industry. As the industry continues to rise, accounting for up to 2.5 per cent of world trade, a look at the counterfeit beauty industry is particularly apt (The fashion law, 2017). As pointed out by Ojo and Ojo (2012), the issue that is counterfeiting could damage a company's reputation (Bosworth and Yang, 2002). The stylised model, however, argues that without counterfeits, the customer is better off. This trademarks and other IPRS are necessary to guarantee competition on a level playing field (Bosworth and Yang, 2002; Nwosu et al., 2019). However, the major problem this paper seeks to address is the issue of counterfeits concerning the organisational image. It would examine how the application of public relations activation could tackle the issue.

Objectives

1. To examine the PR activities and the organogram of the selected beauty and cosmetics companies in Nigeria.
2. To assess the PR tools and objectives used by the selected beauty and cosmetics companies in Nigeria.
3. To ascertain the effectiveness of PR activities in curtailing the menace of piracy in the selected beauty and cosmetics industries in Nigeria.
4. To recommend PR and its positive effect on the beauty and cosmetics industries in Nigeria.

Research Questions

1. What are the PR activities and the organogram of the selected beauty and cosmetics industries in Nigeria?
2. What are the public relations tools and objectives used by the selected beauty and cosmetics industries in Nigeria?
3. How practical is the public relations activities in curtailing the menace of piracy in the selected beauty and cosmetics industries in Nigeria?
4. What are the public relations solutions and effect on the beauty and cosmetics industries in Nigeria?

Beauty and Cosmetics: An Overview

Cosmetics include skin-care creams, lotions, powder, perfumes, lipstick, fingernails and toenail polish, eye and facial makeup, permanent waves, coloured contact lenses, hair dye, hair sprays and gel, deodorants, baby products, bath oils, bubble baths, bath salts, butter and many other types of products. Nowadays, the beauty and body care industry is a critical industry which makes a significant contribution to the world Gross Domestic Product (GDP) (Kumar, 2005; James et al., 2019). Cosmetics are a multi-billion-dollar industry today.

As such, the development of beauty products, perfumes and body care items can also be dated back to the ancient Egyptian, Greek and Roman era. Used at that time were components such as butter, sugar, lemon juice, stone, mud and even arsenic for visual enhancement (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Here are few historical instances. The neanderthal man painted his face with red, brown, and yellow colour substances gotten from clay, mud, and arsenic. Bones were used for curling hair. Makeup, tattoos, and ornaments were used to express the necessary social knowledge. Ancient Greek surgeon, Galen formulated the cold cream. The Romans used oil-based perfumes on their bodies, in their baths and fountains, and applied them to their weapons. Thirteenth-century crusaders took fragrances from the Far East back to Europe. During the 16th century the perfumes produced were powders or thick pastes. Natural fragrances have originated from a range of aroma-bearing components (Kumar, 2005).

The cosmetics industry is highly creative, fast-paced and science-driven. Cosmetic products are an integral part of people's daily lives and bring significant functional and emotional benefits (Cosmetics Europe- the personal care association, 2016; Odiboh and Oladunjoye, 2019). The USA is the world's largest economy yet France is the world's largest beauty products exporter. Market expansion has moved from the Western world to emerging areas in South America, Eastern Europe, and Asia in particular China; consuming over 10.4% CAGR per annum over the last five years. In spite of the global economic downturn, the cosmetics and perfume sector continued to perform excellently with an average growth rate of nearly 5% across the sector. (Kumar, 2005; Odiboh & Ajayi, 2019).This industry, also known as Beauty and Toiletries or Body Care Products, has demostrted both its ability to achieve steady and sustainable growth and its durability potential under adverse economic circumstances. Sales of beauty and personal care grew steadily during the first decade of the 21st century, reaching the average of 4.5 % (CAGR) in the initial half and 4.4 % (CAGR) in the second half.. As for everything else, the cosmetics sector was affected by the global financial crisis in 2009 but nevertheless strengthened as the economy changed(Lopaciuk & Loboda, 2013; James et al., 2019).

The performance of the Nigerian beauty and personal care market during 2014 recorded impressive growth over that of previous years. This rise was led by a increasing middle class, demographic rise (especially among young people and children), urbanisation and an increase in informal jobs (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi, *et al.,* 2020c; Fayemi, *et al.,* 2020d; Olabanjo, *et al.,* 2020a; Omokiti *et al.,* 2020a). In formal jobs, men and women are more likely to opt for makeup and personal care products of a higher standard. They strive to improve their reputation and self esteem (Bank of Industry, Nigeria, 2018; Adelua et al., 2020c). Some of the notable players in the Nigerian cosmetics and beauty care products include Procter and Gamble, Unilever, PZ Cussons, House of Tara International, Zaron cosmetics, and Soulmate Industries Ltd.

Industrialisation of African market preferences, shifts in general economic conditions and projected decrease in dependency ratios (the proportion of the total number of dependents in the world – i.e. those under the age of 15 to those aged 65 to older – to the working-age population) all result in a possible growth factor of demand for luxury products such as hair care, beauty care, cosmetics and so on in the east African market (Beauty Africa, 2016; Ndubueze, Odiboh, Nwosu, & Olabanjo, 2019). So many women are facing the terror of applying makeup on their faces in the East African research region and have thus welcomed the use of makeup for their maintenance. Men have also followed suit and turned up for manicure, pedicure and haircuts in beauty salons.

Public Relations and Its Application

Grunig and Repper (1992) stress that, in order for PR to be reputable and utilised effectively by senior managers, it must function expediently. It has to give the company real meaning and help it meet its corporate goals. They argue that practitioners should examine the features of their target groups in order to better understand how they can react and respond to the communications of the company.(Fayemi et al., 2019). PR professionals will then identify target audiences more efficiently, and customize communications activities based on specific characteristics.

Theoretical Framework

This paper will sit on the two-way asymmetrical model of public relations. This type of PR is rooted in persuasive communications. This aims at creating consensus between the company and its audiences by putting them in the way of thought of the company. This paradigm utilizes analysis techniques in the social sciences to improve the influence of messages (Laskin, 2009). This theory emphasises the persuasive power of effective public relations practice, and how to persuasive communication can be used to gain the trust of the public and in turn, build the image of the organisation. The ability to get feedback from the public also makes the theory a useful model of public relations. Professionals in public relations use surveys, conferences, and focus groups to evaluate audience interactions and plan campaigns that would attract critical public support.

Research Methodology and Design

The qualitative sample approach is the data collection tool used for this research. The survey allows the use of objective methods for selecting applicants, gathering data and reporting findings (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). In this study, the interview method was the method of data collection. Drawn up interview questions, focused on study questions, elicited answers from the interviewees. They expressed their opinion on the issue of counterfeiting. They spoke about how public relations actions could curtail counterfeiting in the beauty and cosmetics industry.

This study focussed on leading players in the beauty and cosmetics industry. Leading public relations professionals also participated in the study. Purposive sampling method produced the subjects of the interview in order of their importance and credibility. The interviewee public relations professional was selected based on their work experience and relationship within the beauty and cosmetics industry. Zaron cosmetics company was selected. Zaron is a reputable indigenous manufacturer of beauty and cosmetics product in Nigeria.

Results

Findings from in-depth interviews conducted among the two interviewees revealed that the companies execute significant public relations actions. One of the interviewees also mentioned that they also carry out digital campaigns. The major points from the responses is that organisation majorly carry public relations to drive sales promotion.

According to the responses deduced from the interviewees, the crucial public relation tools used by the industry are the digital media, speaking of the social media, blogs and online influencers. Others include, the traditional media and the interviewees also mentioned the fact that they partner with external regulatory bodies to help drive their communication actions. Accordingly, digital media is the most utilised public relations tools.

According to one of the interviewee, the organogram of the organisation is as follows. She said " the business development department, with one of many departments that comes under managements. Furthermore, within this department, we have a team that handles our partnership while another team handles the new market. We have a team that handles digital marketing, and another that handles public relations. We have a team that manages our foreign market, and then all of these work hand in hand with the marketing department". Simply put, different roles are delegated at different levels to guarantee a seamless and effective running of the organisation.

When asked about the effectiveness of public relations in aiding the beauty and cosmetics industry, both respondents answered in the affirmative. According to both respondents, the use of public relations is very, very important and very useful in every organisation. Sustained use of public relations tools is highly encouraged. Public relations is not as effective in curtailing piracy as it seems but through proper education, and proper utilisation of the tool.

The interviewee answered a question on recommended ways to enhance corporate reputation in the beauty and cosmetics industry. One of the respondents said, "the best way to ensure sustainability is for organisations to continue doing a good job and keep putting it out there. While doing a good job, organisations need to partner with good public events and social engagements to promote their brand. While doing a good job, they also need to amplify it to promote their brands". The other respondents also said "focus on the positive and not negative. It does not mean not trying to improve on the negatives but a more focus on the positive".

Conclusion

This study reaffirms that public relations are a useful tool for creating awareness for the beauty and cosmetics industry in Nigeria and also a veritable tool in fighting piracy in the industry. When we talk about building a strong relationship between industry and a brand, public relations takes the upper hand. So the importance of public relations in the beauty and cosmetics industry can never be overemphasised. Thus, in order to curtail piracy in the beauty and cosmetics industry, public relations tools must be used consistently by the manufacturers and distributors of the products. Companies and organisations need to know that they need to make use of public relations constantly. Organisations need always to put their excellent work out there for people to see.

Recommendations

Proper considerations should be given to the following findings based on the study;

- Beauty and cosmetics industry must properly utilise the use of public relations tools in order to fight piracy.
- Industries must learn to build a mutual relationship with their key publics through feedbacks.
- The government should enact bodies that will penalise offenders.

Abstract

This study aims at examining Public Relations practices by professionals in the banking industry. It also examines areas of improvement which the public desire of selected banks. This study employs the qualitative research method via the In-depth interview approach. The public relations professionals in the banks and agencies were interviewed to get their insights on stated problems. This paper reveals that despite the professional's claim of ensuring a joint advantageous relationship between the Bank and its public, a lot still needs to change. The paper concludes that banks need to focus more on public relations especially in the areas of public trust, empowerment activations, educational programmes, and customer relations.

Keywords: Banks, Public Relations, Professionals, Trust

Introduction

To remain unique, companies generally want to have something that helps achieve this goal as the business world is intensely competitive. These companies desire to possess a factor or a tool that makes them stand out as the best to the media and their public (James, Odiboh, Adelua and Fayemi, 2020a; Ndubueze, Odiboh, Nwosu and Olabanjo, 2019; James, Aiyende and Salau, 2020b; James, Nwosu and Fayemi, 2020c; Ndubueze, Odiboh, Adelua and Fayemi, 2020; Nejo, Odiboh, James and Fayemi, 2020a; Olabanjo, Odiboh, Nwosu and Ndubueze, 2019). Having a positive image is beneficial to any organisation as it helps with their sales as well as aiding the avoidance of negative publicity which could ruin the good standing of the organisation and reduce their sales. To ensure that the media and the consumer public of an organisation has proper knowledge of the operations of the organisation, public relations (PR) is of utmost importance (Aiyende, odiboh, Adelua and Omokiti, 2020b; Fayemi. Odiboh, James and Olabanjo, 2020a; Fayemi, Odibo, James and Aiyende, 2020b; Fayemi, Nejo and Salau, 2020c; Fayemi, Oyesomi, Nwosu and Olabanjo, 2020d; Olabanjo, Odiboh, Nwosu and James, 2020b; Omokiti, Odiboh, Salau and Nejo, 2020a).

In time past, Banking was quite easy and people kept their accounts as well as their loans in local banks which are in close proximity to their homes. The Banking world was less competitive at the time and as such, Public Relations was not so important. However, in recent times, things have evolved contrary to the times when Banks could hold on to customer loyalty based on the personal interactions it had with its customers. There has been a reduction in day-to-day human interaction with customers as Automated Teller Machines (ATMs) have been put in place as well as online platforms for banking applications. To this end, a personal touch to interact with its public has been lost by the Banks (Ndubueze, Odiboh, Nwosu and Olabanjo, 2019). No matter how large their existing and target customers are, Banks must implement all necessary measures to remain unique as there is an increasing domination in the banking industry as well as a requirement for a continued creation of new products and services (Adelua, Odiboh, Aiyende and Omokiti, 2020a; Adelua, Odiboh, Nejo and Fayemi, 2020b; James, Odiboh, Olabanjo and Adelua, 2020d; Nwosu *et al.,* 2019; Adelua, Odiboh, Olabanjo and Ndubueze, 2020c; Adelua, Odiboh, Oyedepo, Olabanjo and James,

2020d; Aiyende, Odiboh, James and Salau, 2020a). Therefore, Banks are utilising Public Relations to promote their products and services (Fayemi, Nejo and Salau, 2019).To excel in banking, Public Relations professionals are needed and the reputation of the Bank in the eyes of the public rests on their hands. Public relations professionals of banks have to use their tools to educate the public on how their products and services stand out. To this end, the paper seeks to address and explain how Professionals in the banking industry carry out their PR activities, measures put in place to ensure a positive perception of the banks by the publics.

Statement of the Problem

The image of an organisation lies within the PR professionals. There is a general misconception about banks in Nigeria, which is avoidable if the PR professionals carry out their PR activities effectively. A school of thought holds that professionals generally do not carry out enough PR activities to ensure that the public sees banks in a positive light.
This paper looks at the PR activities carried out by the banks, the PR tools used by the organisational structure of the banks.

Research Objectives

This research aims at examining the PR practices in the banking industry, the PR tools and objectives of the banks as well as the organogram and internal functions of the PR unit banks and public relations agency.

Literature Review

Modern Banking in Nigeria was as a result of the African Banking Corporation created in 1883 (Nwosu, Ndubueze, and Olabanjo, 2019). This corporation gave way to the British Bank of West Africa which was established in 1884.The British Bank of West Africa has had name changes over the years including Standard Bank of West Africa and its current name the First Bank of Nigeria PLC. Union Bank of Nigeria PLC was among the other foreign Banks that were created soon after the British Bank of West Africa. These Banks in their initial creation stages were governed by policies that only protected the foreign owners and discriminated against the indigenous business people. The mainstream of the economy saw indigenes not being able to obtain credit facilities from these banks and as such, a feeling of alienation was created among the nationalist of these Banks in Nigeria (Olabanjo, Odiboh, Nwosu, and Ndubueze, 2019)

Bank of Industry

There are several development financing institutions in Nigeria, however, The Bank of Industry Limited (BOI) is Nigeria's oldest, largest and most successful. It faced a reconstruction in 2001 as before then it was called the Nigerian Industrial Development Bank (NIDB) Limited, which was incorporated in 1964. With an available authorised share capital of 2 million (GBP), the Bank started business in 1964. It was made up of several private foreign and domestic investors as well as the International Finance Corporation which held about 75% equity and put in place its first Chief executive.

The Bank was successful and was able to be in charge of addressing the country’s economic profile as its authorised share capital increased from N50 billion in 2001 to 250 billion. The Bank has since then been put in charge of the provision of long term financing loans to the Nigerian industrial sector due to the success of its previous institutional, operational and financial reconstructing in 2002. The Bank has become efficient and very effective in carrying out its primary mandate.

Banking Public Relations

The perception of the public about the banks is often times predetermined by previous contacts, biased notions and false beliefs. It is therefore necessary for the banks to build an image that is well respected through the use of its Public Relations professionals to change such perceptions (Odiboh and Oladunjoye, 2019).

Public Relations management is made up of incomplete research analysis, putting in place measures and steps to provide more understanding and build specific relationships (Odiboh, Ezenagu, and Okuobeya, 2019). Public Relations services help to build the Bank's image by deepening good traits like integrity, consistency, trustworthiness, goodwill and efficiency.

The public is not satisfied with the Banks due to different reasons. Some of these reasons were listed by (Olasore, 1979) during the conference held alongside the 20th anniversary of the Central Bank of Nigeria titled "Why banks are unpopular", one reason is the herculean process of getting bank credit. The other reasons are poor information on the guiding principles around banking services, the assumption that banks make large profits due to high tariffs collected, poor coordination of customers to keep them informed about the condition of their accounts as well as errors made when their bank statements are sent. The last reason given is the despotic demeanor of the Bank staff as well as the difficulty in opening bank accounts.

The wrong notions held by the Bank's public need to be corrected and fully concentrated on by the Public Relations professionals to help the Bank excel. The traits mentioned earlier must be emulated by the Bank's management team to ensure that the views of the public towards the Bank are positive. Public Relations activities in line with integrated marketing communication are required to change the wrong notions of the public about the banks (Odiboh, Amodu, and Ekanem, 2020a; Odiboh, Fasanya, Adegoke, Afolabi and Ofor, 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).

Theoretical Framework

The Two-way symmetrical Model was employed in this study. The model is the best of all the other models. In this case, both the communicator (the organisation) and the receiver (the public) are mutually communicating. The messages take into account the needs, demands and interests of the public.

This model is supports this study in not only designing or packaging a message but also in helping an organisation to adjust concerning the needs of the public. The argument of the two-way symmetrical model is that the Public Relations expert should serve as a connection between the company and its public, rather than as a persuader (Odiboh and Ajayi, 2019).

In this model, experts are arbiters and employ communication to ensure that all participants are beneficiaries. The term "symmetrical" explains the model's attempt to establish a joint beneficial situation. Professionals should aspire to utilise the two-way symmetrical model in their daily operations and strategies, as it is the most ethical of all models (Simpson, 2014).

This model is relevant to this study because it clearly states how the banks' consider the messages relayed to the public. Here the professionals are made to act as a link between the company and its public, which will in turn, sharpen how the public views them.

Methodology

The researcher adopted the qualitative method of gathering data through the use of an interview guide. Here, the respondents gave their opinions and comments directly. An in-depth interview was adopted, and the population were selected purposively. The selected interviewees are Bank of Industry, Covenant Microfinance bank and Red Gecko PR agency. Bank of Industry is the first and

only financial institutions purposely established to support business organisations at all level. Covenant Microfinance Bank is the financial institution of the leading university in West Africa. Red Gecko is the most decorated young PR company in Nigeria.

Results

Findings from the In-depth interviews conducted among three interviewees revealed that the PR tools the banks adopt have been useful over the years. However, two of the interviewees agreed that there are not so many negative perceptions about the banks from their end. At the same time, one noted that there might be some challenges sometimes. However, they have been continuously educating the public on specific issues they might be facing. Also, two of the interviewees said they use social media as their primary tool for creating awareness. In contrast, the other said the bank use fliers to create awareness about its activities.

However, one of the interviewees said the bank usually research to find out the deficiencies of the clients they work or. "We create solutions that fit the need of the client's deficiencies, and we advise them on ways to improve". On measures being put in place to build the relationship between the bank and its publics, an interviewee stated that they build a relationship by creating awareness. Another interviewee highlighted that they build relationships by solving the problems of the customers. However, the other said the bank consistently create solutions to meet the needs of its clients. By that, they build an everlasting relationship.

Interviews conducted with Bank of Industry, Covenant Microfinance Bank and Red Gecko PR agency show a low level of their PR activities. Especially Covenant Microfinance Bank, there is little or less effort to activate its PR activities.

Results indicate that CMFB does not have a well-structured PR department. The bank relies majorly on its website for PR activations. Human resources for PR activations do not exist. The organisation can do better by establishing a well-structured Public relations department. The organisations adopt electronic, print, and social media to reach their publics. The exception is Covenant Microfinance bank which uses only one means to create awareness. Another exception is the Bank of Industry which relies only on electronic media. To this end, it will be necessary for banks to focus on better managing their public misperception. They need to improve their tools of trust by professionally activating their Public relations programmes.

Conclusion

The message that a Bank sends out to its public must be as convincing as possible as well as remaining unwavering. This can only be achieved through effectual Public Relations which is characterised by confidence, proper communication and well explained messages. Through Public Relations, the Bank is able to reach its target audience in a manner that builds trust and allows for the proper delivery of its well created messages. The best means to achieve this is through Public Relations which help to create a brand, improve awareness and build customer base.

Banks offer similar services and as such an average customer is torn between making the decision of choosing the Bank to follow. The Public Relation campaign is therefore necessary to help the client by differentiating its brand from that of the competing Banks. Over the last five years, the Banking industry has experienced at least 60 mergers. As such, customers become frustrated and confused as they do not know what their Banks really are. The Bank and its competition will always have a few factors that distinguish them. However, it is the job of the Public Relations initiative to find these factors.

This study concludes that Bank of Industry must balance its PR tools and adapt them to specific public activities. The bank needs electronic and traditional media for successful PR actions. Covenant Microfinance bank, on the other hand, must improve on its PR activity and what it carries is low and not efficient.

Recommendations

Guarantee Trust Bank should be more open to public interviews to correct the misperception of the public. Bank of Industry should adopt the PR 2.0 model of digital media as well. Covenant Microfinance Bank must endeavour to restructure its PR department, adopt more tools to reach out to its public, carry customers along in its dealings. Organisations generally should contribute to the development of society and better the lives of its customers by providing excellent and maximum service.

Abstract

Professional public relations allow institutions like schools to easily recognize their strengths, shortcomings, and connect when they succeed and when they don't. This research explores the views and experiences of high school public relations practitioners in Southwest Nigeria about their activities in the field of public relations. Three interviews were conducted using 10-question interview guide to assess the validity of this research's conclusion and recommendations. The first interview was conducted in the sampled schools with a PR firm and the other two with staff in charge of the public relations activities. The Principle of quality has been used as the theoretical basis for this research. However, findings show that there is no department / unit for public relations in high schools, most directors of secondary schools are yet to accept and participate in their activities with PR tools; this clearly means that there are no formal activations in high schools for public relations. In the meantime, non-professional PR tasks conducted by subject teachers are added to the teacher's responsibilities. In addition, given the appreciable degree of frustration, members of public relations in these high schools are still making efforts to strengthen the situation with their limited working information of how PR activities should be performed. In conclusion, however, given the level of competition and trust of current and prospective employers, public relations is not only about rhetoric, but about practice. Therefore it is proposed that secondary school administrators have some responsibilities to perform better in order to generate a good picture for their schools. They need to generate the support of parents and the happiness of the students. They will strive to set up successful divisions for public relations, or work with experts to help do things right.

Keywords: High Schools, Professional, Public Relations, Practices in Nigeria.

Introduction

The digital age has dramatically increased the level of communication and has made public expectations become more complex (Komlos, 2014). The evolution of western education has introduced the world to various stages of tutelage and fosters learning in its entire sphere. As a result of this, high schools in Nigeria are limitless, and over one thousand (1,000) high schools established globally and at local regions (Fayemi *et al*., 2020). This however, suggests the needs for professional PR personnel who will develop and execute its communication plans through both print/electronic media and face-to-face communication (Schraeder, 2019). To also afford Professionals to handle relationship with the organization's (school) publics and with the multitude of media that calls for information to be disseminated about the organization (Vajda, 2017). Publicizing positive news about student/staff achievements and programs attract public's interests. According Sandl, (2016), It is necessary to develop a coordinated proactive, rather than a reactive approach that anticipates

problems before they develop; when there are no positive communication provided by the schools managements, the critics' voices will take over. Public relations help define professional practices.

Public relations is not limited to one definition, it is primarily a management function. It performs a leadership role of maintaining relationships, through communication practices, between the institution and its many publics (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020c; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Public relations has much impact in the molding of an institution's image and promoting them in a positive light to their target audience (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). Public relations is intentional, consistent communication which encourages mutual, positive beneficiary relationships (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). Homby and Richard (2010) public relations are practices of organizations to provide public information so as to create good impression about such organization. Scott (2010) posited that in order to create relationships with the public, essentially, institutions should encourage feedbacks. PR should not just be encouraged only during crisis because of its important when there is good news to share.

Moore (2009), explains that the responsibility of PR professionals are not to cover up information, but provide the publics with the school's positive news, these don't only serve as effective, two-way communication but helps schools succeed; these professionals play an essential role in secondary schools by identifying target publics which include government officials, host community, students, Chief executive officers (CEOs)/ directors of industries (DOIs), employees, employers and alumni associations. (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019; Galloway and Swiatek, 2018).

Statement of Problem

The essence of professionalism in public relations in the services of high schools is a significant duty that managements should engage. Professionalism is vital because it enables them to remain relevant in today's competitive environs. This way, it creates a better understanding of what such schools stand for and the values they place on their publics. Professional public practitioners understand that assumptions do not help the image of an institution. Schools and parents are not supposed always to assume the activities, the standard of qualities and relevance of a school. Most of the time, the social expectations from high schools, are not just limited to the parent but also, the public. Unmet expectations lead to problem, especially image challenges. Also, schools' management teams can be the ones assuming they are doing well in the eyes of their publics; meanwhile, the public does not even see these good works.

A public relations programme that is adequately communicated and effectively implemented can help correct such negative assumptions and misconceptions for the good of the general public. Professional public relations (PPR) enable feedbacks on how the public's sees the school and their level of knowledge. According to Ozioko and Usman (2019), good public relations programmes/practices can help high schools to gain continued goodwill, patronage, as well as financial and emotional support. With the rate at which high schools in Nigeria is fast-growing, high school that wishes to remain in business will need to embrace professionalism at all cost. Therefore, this study investigates professional public relations practices in high schools in Nigeria. From these perspectives, this study will seek the opinions of professional public relations practitioner.

Objectives

1. To scrutinize public relations practices in private and public high schools in Ota, Nigeria.

2. To determine what tools are used by private and public high schools, Ota, Nigeria.

3. To study the internal functions and practices of public relations agencies working for private and public high schools in Ota, Nigeria.

4. To find out the organogram of the school system.

Literature Review

Good schools' public relations planning and activations rely on two-way communication between the institutions and stakeholders (Nwosu *et al.,* 2019, 2020b). Public relations practices keeps expanding greatly; from the various forms of written communication, to an increased need for face-to-face communication (Odiboh, Ezenagu, & Okuobeya, 2019). Public relations professionals gives organization the opportunities to put the public's interest first, this way, common misconception are avoided such as; PR in the secondary school setting is structured to handles crisis (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). However, PR Professionals don't just handle crises but establish good relationships with publics by building a good relationship between schools which helps publics overcome the issue of trust and negative perception. (Adelua, *et al.,* 2020a; 2020b).

Public Relations as an Operational Tool in any institution

In order to for an institution to move forward, PR professionals as part of their duty should encourage transparency and effective communication with the internal and external publics; co-operation of all employees is vital. According to Smith (2007), Public relations needs to an integral part of any managerial operation and to produce better result, institutional workforces are to be kept informed and engaged with the goals which the institution seeks to achieve; this way, emphasizes are laid on the part they play (p2). The role of PR is to connect with communities and the publics in general, typically using the media to deliver messages. However, Gilheany (2006) observes that professional PR practices might go beyond most school's budget, so it is important to devise a more appropriate media strategy of building a local media network, sending out regular press releases, drafting a crisis management plan. Mr. so so… argues that if school managements are doing it right, there should be no need for public relations practices in secondary schools. Contrarily, Mr. so so… explains that PR professionals are consist of individuals in the school system uniquely positioned to influence decision makers which affect both the internal and external publics of the institution. Educational sectors are increasingly competitive, therefore it is more important to ascertain that the public's perception of the school matches the reality (n.d). It is ensuring that they build a relationship between the public and itself to overcome the issue of trust and negative perception. PR professionals should as well focus more on areas that will benefit the public, such as empowerment programs (Adelua*, et al.* 2020a: 2020b)

Professional Public Relations in Secondary Schools

According to Hazlett (2005), Professional PR practices can improve the quality of the school as a brand; this way, the school's identity is promoted and supported. Branding (mascot, colors, chosen typeface for materials, and the school's communication tone) presents the overall look of the institution to the world. Paswan (2008), posited that schools should create a distinct and memorable impression which enhances communication efforts of establishing long lasting trust with the identified publics, giving such school an edge in the community. A standout amongst the most significant concerns for PR practitioners in the management of the institutional image made by its diverse publics; based on this image, consumers settle on their choices, when they have needed to satisfy, and the public develops altruism or hesitance toward the institution, considered as a social element. Based on this image which the public will establish contact or pursue transactions with the institution, or not. (Ndubueze, *et al.,* 2019)**.**

However, Thompson, Warren, and Carter (2004), opines that Professional PR practices connect the school and its community; especially the school's primary publics who needs to be aware and understand their connection to the school. The professional PR tools are the key to reach these

publics; Parents of existing and prospective students, community members government agencies and so on. School's communications are being encouraged and meetings should be accessible so that more than just, parents of existing students can attend. This way, the school is well connected to the community which gives room for favorable publicity; allow publics adjust their schedules for productive discussions and get a chance of presenting the school's financial needs to those who can support. Bradshaw (2009), in his own research explains that Professional PR practices impact school's marketing efforts; marketing are great tools in public relations, it helps professionals focus on promoting the school whereby, increasing students enrollment. Professional PR practitioners give ears to their customers and provide services based on their preferences and needs (Bradshaw 2009). However, Marketing and PR efforts are cyclical processes that work together to bring in new students and retain existing students. School marketing consists of the information the school is giving to its publics, meanwhile, word-of-mouth is what the publics are saying to each other behind the school's back which can be positive or negative. When schools uses PR to listen and respond to their publics, then, marketing and things they are saying will start to align. (Olabanjo *et al.,* 2019).

Theoretical Framework

Excellence Theory by James Grunig in 1985; 2008 gives further theoretical insight on the importance of professional PR practices in an organization, these means every institution should embrace the practices of public relations in promoting a well structure relationship with the publics. This also explains that basics organizational values lie in the roles PR plays in secondary schools which brings about a two-way communication strategic. As described by this theory, secondary schools need to make effort toward identifying and building intentional relationship with publics who can easily affect the school's policies; the practices of excellence theory as a Professional public relations representative in secondary schools in Nigeria helps to reduce the level of unfriendly relationships and replace it with a more sustainable one. Because for institutions to be capable, it must empower public relations as a critical management function this way, public relations executives play managerial roles as well as administrative roles. However, useful institution communication function must build both internal/external communication and relationship on excellence theory.

Research Design and Methodology

This study analyses the discourses in In-depth interviews conducted with a practicing professional of a Public Relations agency and a public relations representative of a private and public high school each in Ota, Nigeria. The interview questions were based on the research objectives using a pretested interview guide. In the Interview guide, were ten (10) questions for the public relations agency practitioner and eleven (11) questions for the high schools' public relations persons. These help to show how public relations activities in high schools.

Results

All interviewers in this session generally agreed that public relations play an essential role in high school; because "it aid relationships with the public and it quickens both Parents and relevant/targeted audience's actions in some matters". Subsequent agreements include that high schools should establish a strong public relations departments or consult experts alternatively. PR works directly with the members of the public. Thus, getting public relations tools right is pertinent. Providing gadgets that help with prompt dissemination of information is crucial. Also important is a timely passage of information from management to the P.R.O's office, easy access to the internet, stable power supply. These were the majority of the suggestions which the interviewees pointed out.

Findings show that high schools do not have formal public relations departments. Therefore, subject teachers act as public relations personnel. As amateurs, the teachers could only do little since they are untrained for additional responsibility.

Of duty could only identify few out of various activities that should be carried out by a P.R professional in their schools, such as, Seminars, Parents Meetings and Community relation, whereas,

public relations activities should not be limited to all they mentioned but other activities such as; Press release, Press conferences, Community relations activities and activities through various practical and well-selected communicating platforms, which can also be public relations tools and they include; Television, Radio, Newspapers, Social media, Billboards, flyer, Posters, Press Conferences, Seminars.

Also, the majority mentioned at least two to three targets audiences (majorly parents, teachers and the host community) out of several high school publics. According to an interviewee, the schools should establish a PR monitoring and evaluations system. Also, there should be regular and frequent researches. Provide suggestion and opinion boxes provided at strategic places in the school building area". Moreover, the majority also agreed that getting feedbacks from the parent and other target audiences is an effective way of evaluating.

The interviewees provided the organograms of the school system.

Conclusion

The interview results established that there is no public relations department/unit in high schools. Moreover, the PR activities are executed by subject teachers, thereby giving them additional daily routine, about which most of them are not happy. However, despite the level of dissatisfaction Public Relations representatives in high schools are still making efforts to improve the situation with their little working knowledge of how public relations activities should go. However, public relations are not just about rhetoric but action. It is, therefore, obligatory for high school managements to perform better in order to continue to build a positive image of their schools to foster co-operation and satisfaction. Public relations activities can improve in high schools by establishing public relations departments; alternatively, consulting experts in the field that will work directly with the public to the benefit of the educational institutions.

Recommendation

The study recommends that high school managements get professional public relations practitioners to handle their schools' affairs and public related activities. There is a need for the creation and improvement of the public relations departments/units. Moreover, from the experts' view, establishing public relations departments or consulting experts in the field will bring more significant goodwill to the schools. That will work directly with the members of the public this way, getting the public relations tools right because parents are the most critical stakeholders of the schools. Therefore, School(s) needs to do more is building substantial relationships with the public by communicating their healthy activities, facilities and expertise always. Public relations in secondary schools should provide the messages to be communicated to the publics and relationships should also be established with the public of the school. As soon as secondary schools directives practice public relations, they will improve their school brand, connect with the community, and definitely boost their marketing efforts.

Abstract

Public Relations is an important sector which operates in organisations due to its power to promote an organisation, manage crisis and maintain goodwill among others. However, this study finds out the perspective of students and teachers on the practices of Public Relations in publishing firms. The study also examines how bootlegging affect pricing, distribution of books. In the study, Two-symmetrical Public Relations model of James E. Grunig was adopted with a random sampling method using survey design. Two hundred fifty copies of the questionnaire got to respondents, and only 200 were retrieved. Also, the results were processed using SPSS (Statistical Package for the Social Sciences). Therefore, the study indicates that both the teachers and students lack knowledge about Public Relations practices in publishing firms.

In contrast, few of the students and teachers made mention of public relations. The respondents failed to state Public Relations responsibilities. Instead, the government was mostly mentioned as the agent to curb bootlegging in publishing industries. Thus, because of the limited functions of the public relations in publishing industries, the publics lack knowledge of the possible responsibility or how public relations can help in curbing piracy. Therefore, this study recommends that publishing industries should always seek the counsel of public relations experts to assist in managing public goodwill. They should hire public relations agencies to help in maintaining a good relationship between them and readers in order to curb piracy.

Keyword*:* Perspective, Publishing, Public Relations, Bootlegging

Introduction

At the mention of a publishing company, the first thing which comes to mind is books. Books have been an old existing source of documented history. Book are multi-faceted, dynamic product and great assets of every society (Oyeyinka, Aganbi & Adebayo, 2016, p 1). It enlightens scholars, teachers and students as a catalyst for knowledge, pleasure and development in a society. These made so many scholars conclude that books have a significant impact on people. Therefore, a developed society is that which reads (Oyeyinka *et al.,* 2016). Book publishing plays a vital role in the development of a country. Great intellectuals of the world such as Aristotle, Socrates, Plato, and so many other works would not be known if unpublished. As much as publishing is for intellectual purposes, it is also a social responsibility. Likewise, it is a medium of mass communication because it aids in disseminating information to an audience.

Moreover, publishing is an old business in Nigeria traceable to the first printing press established in Calabar in the year 1846 by Rev. Hope Waddell of the Presbyterian Church of Scotland mission mainly for the production of bible lessons and later instructional materials for schools (Omeiza & Lanre, 2019, p. 5). Publishing deals with a printing works for distribution and sales to people, mostly the learned who can read and write. The process of publishing includes: having an idea of what to write, submission of manuscript, proofreading, editing, typing and printing which is done mainly for profit by the publishers based on Nigerian context (Omeiza & Lanre, 2019).

With the advent of publishing, bootlegging followed to destroy creativity and diminish writing talents; subsequently resulting in the intellectuals not benefiting from their works, therefore, causing more concern by the authors and publishers. Bootlegging is a constant, prevalent, worldwide phenomena that have for long challenged organisations especially publishing firms (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). Due to bootlegging, the Nigerian Copyright Commission (NCC) emerged to protect the intellectual properties of individuals; and penalise violators. The International Intellectual Property Alliance (2006) reports that bootlegging level in Nigeria is nearly 85% for all sectors with estimate among the highest in the world (Ahmadu, 2017, p.104)

Public Relations has many definitions. However, it is a management function with the leadership role of maintaining relationships through communication practices, between the organisation and its publics (Nwosu *et al.,* 2019). The functions of the Nigerian Copyright Commission are substitutable with that of Public Relations. Because the P.R. department or agency would focus on only one organisation at a time in order to tackle the problems. However, Public Relations has to do with an effective and a two-way communication system (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Therefore, Public Relations can be a department or an agency representing a publishing firm. Both ensure that a publisher has an excellent public image by preventing the excess flow of pirated publications. Additionally, it is paramount for an organisation to know the central goal of its publics to satisfy them. Moreover, this goal is achievable by the presence of the Public Relations practitioners who engage in relationship building with stakeholders (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019).

Statement of the problem

Even though Nigerians may not be too obsessed with reading, there are yet publishing industries which are at the disposal of the people. Ibadan is Nigeria's city of publishers of various genres of books. In this regard, the assumption is that publishers only have readership problems. However, on the contrary, the most faced problem is that of bootlegging. Bootlegging is a synonym for piracy which tampers with the price and distributions of books. Public awareness and knowledge of public relations in publishing firms are central to this study. Public relations support and build a healthy relationship between the public and the organisations. Also, the goals and objectives of Public Relations must be tied directly to organisational goals and objectives in order to achieve success (Adelua, *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020c; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). Therefore, this study will focus on the perspectives of both students and teachers regarding Public Relations practices in publishing industries in the middle of the piracy crisis.

Objectives of the study and research questions

This study will find out the perspectives of both students and teachers regarding public relations functions in publishing industries. The study will examine the patronage of pirated books. It would also find out the reason for bootlegging and its effect on distribution and price and to establish a solution to curb bootlegging.

1) What are the perspectives of the public regarding Public Relations functions in publishing industries?
2) Which books are more patronised? Originals or pirated?
3) Are there reasons for bootlegging? How does it affect price and distribution?

4) What is the solution to the problem of bootlegging?

Literature Review

Overview of Books and Publishing Industries in Nigeria

In every discussion concerning the publishing industry, books come to the mind. Books have been existing for many years. Books have a different name in various parts of the world when it first emerged. Books are non-periodicals; printed and published. The Greeks and the Egyptians around 3000 B.C. used the papyrus roll as books and kept in libraries. The Romans were also not left behind in the discovery. However, in this case, only the rich had books in their possession. All this show the gradual evolution of books to what it is today. The first book to be printed was a bible by Johannes Guttenberg who invented the first movable printing press. This invention paved the way for printing and publishing (Oyeyinka *et al.,* 2016).

Gradually, the invention reached Nigeria through the Presbyterian Missionaries who established a printing press in 1846 at Calabar, Cross Rivers state. The publication was not for educational purpose but was basically for religious purposes. Also, another printing press evolved in Abeokuta. Since then, more printing firms commenced with newspapers and books in circulation (Oyeyinka *et al.,* 2016). Since then, many Nigerians venture into the publishing business, which is growing at a fast pace.

Publishing and Piracy

Publishing industries are significant in the development of a nation because books inform, educate and also entertain people. Publications can be periodicals, newspapers, books, magazines including electronic media. Despite the fast growth of the publishing, the rate of piracy or bootlegging and lack of funding is affecting the industries massively. Piracy as the unauthorised use or reproduction of an author's work. Also, bootlegging, which is synonymous to piracy, means the activity of selling books illegally.

Piracy or bootlegging affects the publishing industries by limiting the circulations of their books. Pirates sell more than publishers because it is cheaper and always available in the market. The high cost of Ink, Paper and gum reduces the original books expensive and sometimes scarce. The government needs to implement laws that are effective enough to stop pirates from operating (James *et al*., 2019).

In safeguarding publishing industries, different bodies have emerged to help curb the challenges faced. The regulatory bodies are Nigerian Publishers' Association (NPA), Nigerian Booksellers Association, Association of Nigerian Printers, Association of Nigerian Authors and Nigerian Library Association (Olabanjo *et al.*, 2019). The mentioned associations make sure that publishing industries and the authors disseminate protected information. The Nigerian Copyright Commission serves as the body which enforces copyright laws in order to prevent piracy (Ubogu, 2018). Despite all the bodies mentioned, bootlegging is still a severe issue faced in publishing industries. What could be missing?

Public Relations and Publishing

Public Relations is the deliberate planned and sustained effort to establish and maintain mutual understanding between an organisation and its publics (Odiboh & Oladunjoye, 2019). Public relations is concerned with or devoted to creating mutual understanding among groups and institutions. Public relations monitors, surveys and researches issues and happenings in the environment (Odiboh & Ajayi, 2019). Public relations are the creations of the establishment of mutual understanding between an organisation and its publics. It suggests that public relations are not a haphazard process (Ndubueze *et al.,* 2019). Also, about counselling and implementing planned programmes to serve an organisation and its publics. The three main elements of public relations are to inform people, persuade people and integrating people with people (Adama & Okechukwu p.3, 2019). Apart from the mentioned elements, Public Relations communicates basically through social media, the traditional media and the new media (Olabanjo *et al.,* 2019). The publics are to be fully aware of the responsibilities of Public Relations in

all fields (Nwosu, Odiboh, Ndubueze & Olabanjo, 2019). The public mostly considers the Nigeria Copyright Commission (NCC) as the main body for regulating the publishing firms. However, the definitions of Public Relations shows that it is beneficial in dealing with all kinds of organisations (Odiboh, Ezenagu & Okuobeya, 2019). Publish relations practices extend to different works of life. Creating awareness about their roles and services can make other organisations such as publishing firms value and trust their expertise in tackling bootlegging. Therefore, it will be necessary for organisations to focus more on managing the public misperception of public relations itself (Adelua *et al.,* 2019). The missing link in most studies is the disconnection between publishing and public relations. Thus, looking at the functions of a public relations practitioner; this study will attempt to close the gap between the two by finding out the perspective of the public regarding public relations functions in the publishing industry.

Theoretical Framework

James E. Grunig conceptualised two-way symmetrical model of public relations. This model deals with the concern a company has about its customers or publics' interest without only bothering about its own needs (Grunig, 2001). Decisions are to be mutually beneficiary to both parties that is, both the organisations and the public. In this case, the company is responsible for meeting the interest of its stakeholders, employees, the public, and society. It is also essential to be transparent and accountable towards the public to maintain trust between the two parties. Therefore, this theory applies to this study by confirming publishers' responsibility towards authors, booksellers and its publics. Public relations can help the publishing industry to keep the public interest at heart. Public relations can help build a relationship between the public and the industry so that publishers can work towards the goals and interest of its publics. The public relations focuses on the needs of the public by making the needs of the clients a goal for the organisation in order to maintain the public image of the company (Odiboh, Olonode, Adesina & Yartey, 2018).

Research Design and Methodology

This section discusses research design, population, sampling technique/ sample size and the data collection instruments (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh & Oladunjoye, 2019; Odiboh & Ajayi, 2019; Odiboh, Ezenagu & Okuobeya, 2019). This study adopts the survey method. Survey research design has an unbiased representation of the population of interest and by gathering of the same information from each participant (Owens, 2002).

In order to get responses from the respondents, the researcher formulated a questionnaire out of the research questions. It is about the perceptive of the publics toward Public Relations in publishing industries and how to curb bootlegging. The questionnaire consisted of open and close-ended questions whereby, the copies of the questionnaires were administered to the population by the field assistants to the researcher. After the administering of the questionnaires to the students and teachers, the data gathered was coded into the Statistical Package of the social science software and tabulated for easy understanding of data collected. The population was selected based on a random sampling technique because the school population cannot be all selected due to a large number of students. Therefore, the random selection gave a chance for different categories of students and teachers to fit into the study. The school in Ibadan was selected because Ibadan is the home of publishing firms and students are more often the consumers of books. The sample size for the study is 250 respondents, but only 200 questionnaires came back from the field.

Results

After the collection of data, it was analysed through frequencies and percentages by the use of SPSS (Statistical Package of the Social Science) software. The tables interpret the findings.

Statistics

		Gender	Have you bought pirated books?	Religion	Which one do you prefer?	Is Public Relations responsible for bootlegging control? State why	Age bracket	What do you think is the reason for bootlegging/piracy?	Suggest a solution for tackling bootlegging	Why do you think there are pirated books?	Why do you buy poorly bond or poorly printed books?
N	Valid	200	200	200	200	199	196	179	178	163	143
	Missing	0	0	0	0	1	4	21	22	37	57

The statistics table shows that all the 200 respondents answered the question regarding gender, 200 respondents answered the question on religion, preferences and 196 answered the question regarding age bracket. On the poor patronage of poorly bonded books, 57 did not respond. Thirty-seven did not respond to why there are pirated books. One failed to answer if public relations is responsible for bootlegging control, 21 left the question to the reason for bootlegging/piracy. Lastly, 22 out of 200 failed to suggest a solution to bootlegging.

Table 1: Gender

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Female	115	57.5	57.5	100.0
	Male	85	42.5	42.5	42.5
	Total	200	100.0	100.0	

Table 1 shows that 115 (57.5%) are females while 85 of the respondents (42.5%) are males, while. These show that majority of the respondents are females.

Table 2: Age bracket

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	15-18	132	66.0	67.3	67.3
	19-22	27	13.5	13.8	81.1
	23-25	16	8.0	8.2	89.3
	25-above	21	10.5	10.7	100.0
	Total	196	98.0	100.0	
Missing	System	4	2.0		
Total		200	100.0		

Table 2 indicates the age bracket of the respondents stating that 67.3% are between the ages of 15-18, 13.8% are between the ages of 19-22, the lowest which is 8.2% consist of ages 23-25. In comparison, ages 25-above has a percentage of 10.7%. Therefore, the highest age bracket which engages in this exercise is ages 15-18 (67.3%) with 4 (2.0%), non-respondents.

Table 3: Religion

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Christianity	121	60.5	60.5	97.5
	Islam	74	37.0	37.0	37.0
	Traditionalist	5	2.5	2.5	100.0
	Total	200	100.0	100.0	

Table 3 indicates the different religion engaged in filling the questionnaire. Christians have the highest respondents of 121 (60.5%) followed by Islam with 74 (37.0%) and the list in the respondents were the traditionalist who consists of only (2.5%) 5 of the population of 200 respondents.

Table 4: Why do you buy poorly bond or poorly printed books?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	The high price of the original	89	44.5	62.2	62.2
	Unavailability of original	37	18.5	25.9	88.1
	Poor quality	17	8.5	11.9	100.0
	Total	143	71.5	100.0	
Missing	System	57	28.5		
Total		200	100.0		

Table 4 indicates that 89 (62.2%) of the respondents, which is the highest agreed that the high price of original books makes them buy poorly printed books which turns out to be pirated copy. Thus, 57 (28.5%) of this question was unanswered. Also, 37 (25.9%) responds that the unavailability of original books in circulation compels them to purchase pirated books whose features are mostly poor printing. More so, 17 (11.9%) agrees that they purchase pirated books despite the low quality because it is affordable. This study indicates that most of the respondents go for pirated books because it is cheaper for them to afford.

Table 5: Have you bought pirated books before?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	100	50.0	50.0	50.0
	No	100	50.0	50.0	100.0
	Total	200	100.0	100.0	

In table 5, 100 respondents (50%) agreed that they had bought pirated books before subsequently, the other 100 (50%) disagreed by stating that they have never bought a pirated book before.

Table 6: Why do you think there are pirated books?

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	No idea	55	27.5	33.7	97.5
	Cheap	41	20.5	25.2	25.2
	Poverty	36	18.0	22.1	47.2
	Unemployment	15	7.5	9.2	56.4
	Greed	12	6.0	7.4	63.8
	Unavailability of originals	4	2.0	2.5	100.0
	Total	163	81.5	100.0	
Missing	System	37	18.5		
Total		200	100.0		

Table 6 indicates the reasons why bootlegging exists. Majority of the respondents 55 (33.7%) said they have no reason for the piracy of books. In comparison, 41 (25.2%) stated that pirated books are cheap, unlike the expensive originals, this makes the pirates produce more books because of the high demands of cheaper books. 36 (22.1%) of the respondents said poverty makes youths to indulge in the act. Likewise, unemployment 15 (9.2%) is also a factor which pushes people into the act. Greed 12 (7.4%) and unavailability of original books 4 (2.5%) are also factors which bring about piracy. Pirates only go after books which are high in demand. That means, if the pirates produce the same book at a cheaper rate, the public will rush for it. Then demand will shift from publishers to pirates.

Table 7: Is Public Relations responsible for bootlegging control?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	No	101	50.5	50.8	71.4
	Not sure	57	28.5	28.6	100.0
	Yes	41	20.5	20.6	20.6
	Total	199	99.5	100.0	
Missing	System	1	.5		
Total		200	100.0		

According to table 7, Most of the respondents 101 (50.8%) stated that Public Relations have no responsibility in controlling bootlegging in publishing firms. When analysing this result, 57 (28.6%) of the respondents have no idea of the responsibilities of a Public Relations, especially in a publishing firm. Public Relations is as responsible for curbing bootlegging by 41 (20.5%) of respondents. Lastly, 1 (0.5%) respondent failed to respond to if Public Relations is responsible for bootlegging control.

Table 8: Which one do you prefer?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	An original but expensive book	172	86.0	86.0	100.0
	A pirated but low price book	28	14.0	14.0	14.0
	Total	200	100.0	100.0	

In this table, the respondents responded to the question of their preference. Asked if they prefer a low-priced pirated book to high-priced original book; 172 (86.0%) respondents said that they prefer an original book no matter the price. Rather than purchase a pirates book of lower price. 28 (14.0%) respondents prefer pirated books because of the cheap rate.

Table 9: What do you think is the reason for bootlegging/piracy?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	High price/no access to originals	58	29.0	32.4	59.8
	Quick money/ unemployment	42	21.0	23.5	27.4
	No idea	25	12.5	14.0	100.0
	Poverty	22	11.0	12.3	86.0
	Greed	15	7.5	8.4	68.2
	Poor government policies towards publishing	10	5.0	5.6	73.7
	Ignorance	4	2.0	2.2	3.9
	Laziness	3	1.5	1.7	1.7
	Total	179	89.5	100.0	
Missing	System	21	10.5		
Total		200	100.0		

Majority of the respondents 58 (32.4%) agrees high price and lack of access to original books causes bootlegging because the public purchase the cheap books. In comparison, 42 (23.5%) states that quick money-seeking and unemployment are some of the reasons. Also, 25 respondents (14.0%) said that they have no idea what the reason for bootlegging is, 22 respondents (11.0%) outlines that poverty results in people doing anything to survive without thinking of the damages it might have on others while 21 (10.5%) respondents failed to respond to the question. Greed on the side of the pirates to earn double of what they did not produce is a reason for bootlegging, which was identified by 15 (8.4%) of the respondents. Likewise poor government policies 10 (5.6%) towards publishing is a serious issue as

the government neglects the industry. If the government takes the publishing firms serious, it is possible to curb piracy. The 4 (2.2%) respondents' said many Nigerians are ignorant of bootlegging being a crime which makes it a reason why they indulge in the act. The 3 (1.7%) respondents in table 9 stated that Laziness is a factor or reason which encourages bootlegging as many people are not hardworking enough to earn for a living.

Table 10: Suggested solutions to bootlegging

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid					
	Penalty	80	40.0	44.9	60.1
	Job creation	27	13.5	15.2	15.2
	Effective laws	24	12.0	13.5	92.1
	Make it affordable	17	8.5	9.6	78.7
	Awareness	16	8.0	9.0	69.1
	No idea	14	7.0	7.9	100.0
	Total	178	89.0	100.0	
Missing	System	22	11.0		
Total		200	100.0		

Table 10, which is the last table, answered the question suggestions on how to tackle or curb bootlegging. Majority of the respondents 80 (44.9%) stated that in order to solve bootlegging, the piracy should have a penalty. In comparison, 27 (15.2%) respondents suggested that when there are jobs, crimes like piracy will reduce correspondingly. Some of the respondents, 24 (13.5%) suggested effective laws by both government and publishing firms and 22 respondents failed to respond. Also, 17 (9.6%) said that when original books are affordable and in circulation, piracy will reduce. Some of the respondents, 16 (9.0%), suggested that people should be made aware of the serious implication of bootlegging and the damages it causes both publishers and authors. In comparison, 14 (7.9%) respondents said they have no idea about how to tackle bootlegging,

Discussion of findings

RESEARCH QUESTION 1: To find out the perspectives of both Teachers and Students regarding Public Relations functions in publishing industries

This study shows in Table 7 that the majority of the public do not know the responsibilities of public relations in publishing companies when it comes to piracy. When analysing this result, 57 (28.6%) of the respondents are unaware of P.R. control of bootlegging. One hundred and one respondents (50.8%) stated that public relations practitioners have no responsibility in bootlegging control in publishing industries. While bootlegging control is seen as the responsibility of PR by 41 (20.5%) of the respondents. Also, the respondents who said that P.R. is responsible for bootlegging control failed to state what the responsibilities are. This result shows that the respondents do not know the responsibilities of P.R. in publishing firms regarding bootlegging.

RESEARCH QUESTION 2: To find out if there is more public patronage of original or pirated books.

In answering this research question, Table 8 indicates more patronage for original copies of books more than the pirated ones. Therefore, the publics are ready to spend more in order to get an original book in circulation than having a pirated copy. Another study opposes the findings of this study by stating that educational books are the most pirated books. Therefore, the high price of the original books and scarcity makes the publics to patronise pirated books encouraging pirates to keep producing pirated books in the market. This very act affects the distribution of the original books, thus, affecting the development of publishing businesses in Nigeria (Ahmadu, 2017). On the other hand, majority of the respondents (33.7%) in table 6 said they do not know the reasons for bootlegging. In comparison (25.2%) responded that pirated books are cheap and accessible.

RESEARCH QUESTION 3: To find out the reasons of bootlegging and its effect on distribution and price

Table 9 shows the number of factors responsible for causing bootlegging. The high level of unemployment (23.5%) in the country causes the youths to indulge in different criminal acts such as bootlegging. However, (12.3%) respondents agreed that bootlegging is the product of poverty in the country. While some of them are fully aware of the wrong they are engaging in by selling other people's work, (2.2%) respondents agreed that some are ignorant. That reproducing of any literary work, sculpture, painting or any kind of creation under the protection of the Nigerian Copyright commission if not authorised, is a crime. The government should take the publishing firm seriously as they are the backbone to the educational sector in Nigeria. Because the original books are not in access in the market like the pirated, people rush for the pirated because it is cheaper, therefore, reducing the circulation rate of the books and the price drops. After all, no one is buying. Furthermore, another study supports these findings by stating that poverty, ignorance, the high cost of books, inability to gain access to original books, inadequate funding of regulatory agencies such as Nigerian copyright commission. Its effect is the economic, social and intellectual damages it causes the country (Emmanuel & Folorunsho, 2019).

RESEARCH QUESTION 4: To establish a solution to curb bootlegging

Table 10 answers this objective question. In order to curb bootlegging/piracy, (44.9%) respondents stated that both the government and the publishing firms should establish an enforceable law. Piracy and bootlegging need legal punishment. The two crimes affect not only the publisher but also the authors of the publications. Also, the study found out that when original books are sold at an affordable price and in circulation, the rate of piracy will reduce because some buyers only purchase cheap books. Most of the cheap books are the pirated ones. According to Onabajo (2017), the tools public relations should use are; news release, advertisement, the favourable public image of the organisation as well as award programmes for the staffs. The tools can be a starting point for reducing the rate of piracy. Likewise, the perspective of the public will change towards the responsibilities of public relations in the publishing industry. Emmanuel and Folorunsho (2019) support that professional bodies such as the media should be involved in solving the problem of bootlegging. In this regard, public relations is utilisable in the publishing industry to curb piracy and bootlegging. On the other hand, the Nigerian parliament should enforce strict laws and severe punishments for pirates and discourage the street selling of books.

Conclusion

The study concludes that bootlegging is a severe issue which some of the public is ignorant. About while most of the population buy pirated books because of how cheap it is and always available for distribution, unlike the original copies. Pirates operate based on the books that are high in demand. The respondents suggested awareness programmes, offenders' punishment and legal protection of the industry in order to curb piracy and bootlegging. Most of the respondents failed to state the responsibilities of the Public Relations, which shows that they are unaware of how useful and essential

public relations in the publishing industry could be. This finding also indicates that public relations activities in publishing industries are limited.

Recommendation

An important recommendation is that the government should give the publishing industry priority attention in order to reverse the dwindling reading culture among Nigerians. Because it is the backbone of the educational system of Nigeria. By the same token, if the publishing business crumbles to bootlegging, students will not have books to read, and young author's creative talents will disappear.

Also, the policies of the Nigerian copyright commission should be strengthened and made capable of curbing bootlegging in Nigeria.

Finally, the respondents failed to mention a public relations responsibility as a means of solving bootlegging and piracy problems. Since the copyright commission has not tackled piracy and bootlegging, publishing firms should create a public relations department to do the job. Publishers could hire P.R. agencies and consultants to help alter public dispositions towards the industry. Also, public relations will help publishers to acquire an excellent public image. Furthermore, customers will not patronise pirated books.

Acknowledgement

Sincere appreciation goes to the competent and ever-supportive Covenant University Centre for Research, Innovation and Discovery (CUCRID) for the financial support for this publication.

Abstract

Nigeria's automotive policy aimed to turn out locally produced vehicles for public purchase and usage. However, haemorrhaging importation of automobiles retains the policy as a dream rather than reality. This study examined the public relations angle of the Made-in-Nigeria auto conversation. Specifically, it surveyed public awareness and perception of corporate activities within the country's auto industry. It also assessed the level and implications of extant public relations strategies towards creating mutual understanding, trust and goodwill between assemblers and the motoring public. Built on the theoretical framework of Grunig's Two-way Symmetrical public relations model, stratified sampling technique was employed with the aid of the survey research design. We administered a structured questionnaire to elicit public opinions of residents of Lagos metropolis. Findings show that the awareness level of PR actions in the indigenous auto industry is low, with a significant percentage of respondents expressing a negative perception of the industry. The study concluded that despite the government's imposition of restraining tariffs on imported vehicles, docile public relations of local manufacturers had not helped the public to accept indigenous automobiles patriotically. The study recommended that Nigerian automobile manufacturers should outsource their PR programmes and undertake engaging productions of motoring documentaries. Moreover, the organisations should create public acceptance advocacy for locally assembled vehicles.

Keywords: Made-In-Nigeria, Automobiles, Indigenous Industry, Public Relations, Awareness, Perception, Manufacturing

Introduction

The automobile industry is a catalyst for development and industrialisation globally. The PR industry is a critical tool for advancing the transportation sector of any economy (Olabanjo *et al*, 2019). It facilitates the value chain of allied manufacturing activities such as production of iron and steel, electrical equipment, manufacturing of rubber, plastics as well as construction of roads which would subsequently make for development in terms of urban and rural advancement (Agbo, 2011; Black and McLennan, 2016). The auto industry could help establish a vibrant economy which is essential for an increased standard of living of the people. Not many industries command a massive range of technologies and production methods or the use of as various unfinished products, machinery and tools as the automotive industry (Black, Makundi and McLennan, 2017).

The Made-in-Nigeria automobile industry is more than four decades old, three-quarter of which was infancy. At the onset, the industry was controlled by privately owned organisations that set up assembly lines shortly after Nigeria's Independence in the 1960s. The growth in the global motoring industry resulted in many leading manufacturers to start joint-venture partnerships with indigenous automobile manufacturers (Adebanjo, 2008). The continued desire for a fully indigenous automobile industry led to the creation of Innoson Vehicle Manufacturing (IVM) Company Ltd, located in Nnewi, South-Eastern Nigeria in 2007. It was subsequently commissioned by 2010 via a Sino-Nigerian auto manufacturing partnership (PwC, 2016).

In an attempt to consolidate an import-substitution strategy, Nigeria, like other developing economies, decided to develop and localise the automobile industry in order to achieve total indigenous production within specific time frames post-commencement. The National Automotive Policy of the 1970s and 1980s was to midwife the idea of domestic vehicle manufacturing. However, after the initial successes, subscribing assemblers in the country have experienced a steady decline since the year 2000. Many automobile assembly plants that of the 70s and 80s have shut down. Approximately 75% of existing automobile companies in Nigeria today deal only on sales; while about 80% of automobiles used in the country fairly-used imports (PwC, 2016).

The decline in automobile production and public patronage influenced the government of Nigeria by 2013 to introduce the National Automotive Industry Development Plan (NAIDP) to revive the industry. However the revitalisation has increased production activities in the local industry. The National Automotive Design and Development Council (NADDC) approved 35 automobile manufacturers' licences to manufacture cars. Broad-based communication provides platforms for the automobile industry to thrive. One of these platforms is public relations (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a).

With the National Automotive Policy in active implementation since 2015, this study aims to assess the public relations actions of the made-in-Nigeria automobile industry in bringing about general acceptance and utilisation of indigenously produced automobiles given the continued importation of fairly used automobiles and slow adoption of these indigenous brand new vehicles even at the corporate level. This study will also assess public awareness and perception of the local vehicle manufacturing industry. Many factors affect public affinity with the industry. The primary factor is organisational behaviour and reputation, especially in the automobile industry (Hagan, 2003; Fayemi *et al.*, 2019). This study looks at public relations as a relevant factor.

Statement of the Problem

Consolidating local manufacturing sector, policies encouraging indigenous manufacturing companies to thrive now exist in Nigeria further to enhance the import substitution plan of the Nigerian economy. However, the automobile industry is facing setbacks in production and public acceptance of products as a result of gross importation of fairly-used automobiles. This development has significantly challenged automobile companies which are already unsettled by high product pricing. Reduced public trust to deliver world-class after-sales services and existing negative perception of indigenous products are other challenges. This study, therefore, seeks to examine how automobile companies are applying public relations tools to increase public awareness and change the negative perception of Nigeria-made vehicles.

Study Objectives and Research Questions

This survey assesses the awareness levels and perception of stakeholders to the PR activities of indigenous automobile companies. It investigates the public relations tools and actions of indigenous automobile assemblers. Also, this study aims to obtain public opinion on the way forward for local auto assemblers towards the delivery of acceptable made-in-Nigeria automobiles. In tune with the foregoing objectives, these research questions were drawn:

A. To what extent are Nigerians aware and perceive the public relations practices of indigenous automobile companies?
B. What are the public relations tools and actions of indigenous automobile manufacturers?
C. What is the opinion of the public on the way forward for local auto assemblers towards the delivery of acceptable made-in-Nigeria vehicles?

Review of Related Literature

This study examines public relations actions of the local vehicle manufacturing industry. It compares public awareness and perception so as to explain how PR as a strategic organisational function, performs an essential task in the acceptance and attitude towards domestic automobile products. An underlying issue causing this indifference is the issue of trust and low confidence in products locally manufactured (Olabanjo *et al*., 2019).

There is inadequate literature on Nigeria's vehicle manufacturing and the in public relations actions. However, there are published researches in the automobile industry. These researches come under crisis communication and customer relations management. Excellent public relations is thoughtful, truthful, open, strategic, and symmetrical communication with stakeholders (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). In this case, current and potential customers of automobile manufacturing. Though public relations is not limited to one definition, it is primarily a management function with the crucial role of maintaining relationships, through interaction and information sharing amongst organisations and stakeholders.

The Public Relations Concept and the Importance of its Practice in the Automobile Industry

Public relations is the process of analysing the character, actions and perceptions of stakeholders, distinguishing the policies and methods of a person or an entity in relations with the satisfaction of stakeholders. It is about coming up and implementing an actionable programme to elicit mutual support and empathy (Wilcox, Cameron and Reber, 2015; Odiboh and Oladunjoye, 2019). It is the information-sharing administrative role of management whereby organisations evolve, adjust or sustain their ecosystem to achieve organisational goals (Abitbol, 2017; Fayemi *et al.,* 2019). From those as mentioned above, public relations is expediently relevant in an organisational setting, especially in the context of the automobile industry. One aspect of an industry like the automobile industry is production and sales. However, the relationship that ensues before and after transactions such as after-sale services, vehicle recalls and other communication aspects of the administration is of the utmost importance.

In the automobile industry, product quality, as well as the industry-public relationship in every aspect, influences the organisation's reputation (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). Likewise, excellent product quality and functional interactions within an organisation and its sphere of stakeholders help to build as well as sustain an admirable stakeholder perception or at the least counteract or mitigate the adverse impacts on the perception of such organisation (Hagan, 2003; Odiboh, Olonode, Adesina andYartey, 2018). Given the importance of relationship and communication, public relations ought to have a direct role in managing and communicating to the Nigerian public about the importance of embracing indigenously manufactured automobiles which in turn would boost economic growth and development (Nwosu *et al.*, 2020; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020).

Issues Faced by the Automobile Industry Involving Public Relations Actions

The scandalous situation German auto manufacturer Volkswagen (VW) got into is an avid case in point of how players in the automobile industry face issues of trust, reputation and acceptance that necessitates public relations actions. VW hitherto aspired to become the renowned auto manufacturer by 2018. However, the scandal resulted in the company losing a third of the company's market capitalisation (Ayiteh, 2019).

In a move to bring about restitution as a result of the infringements, VW facilitated a vehicle recall, tendered an open apology which also saw the resignation of the Chief Executive Officer and top directors. Volkswagen was also hounded with legal actions, and indicted with illicit behaviour. This threatened the existence of the auto giant. On the affirmative, policy formulators and regulators, as well as worldwide customers, expressed shock as to how an organisation could commit such ethical violations for a prolonged period on such a magnitude. However, with the introduction of a new line of electric and hybrid vehicles, they are starting to rebuild trust (Zhou, 2016). For an industry where reputation depends on the quality of the vehicles it produces, safety-related recalls can quickly diminish an automaker's reputation and shareholder value and even destroy a brand (Hagan, 2003; James *et al*., 2019).

Another portrayal of good public relations was in the Toyota scandal of 2009. Toyota Motor Corporation is renowned as one of the largest in the automotive industry, located in, Aichi Prefecture, Japan. Decades after the Japanese corporation was founded in 1937, there has been a lengthy record of manufacturing dependable, cost-effect and premium standard automobiles. Currently, the auto manufacturer rolls out automobiles and vehicle spares from 53 manufacturing locations in 27 nations and territories over the world, also possessing a number of flagships such as Lexus and Scion as well as models like the saloon Camry, sport utility Rav4, and light duty Tacoma truck. Toyota is also renowned for the first hybrid vehicle (the Prius). Toyota was forced to call back nine million automobiles around the world with its flagships and models affected. This was a result of throttle defects which caused affected vehicles to speed up inadvertently. The Toyota crisis escalated as a result of an initial dilly-dallying. When Toyota finally spoke up, it was unsatisfactory (Feng, 2010). Nevertheless, when Toyota stepped up to the challenge to sustain its reputation it took no more than a quarter of a year to bounce back to its leading status in the automotive sphere. Relatively, Toyota's vehicle carpets and defective gas pedal recall are in tandem with methods widely known to manage crises. Nevertheless, Toyota went on to employ few crisis communication tenets while also coming up with its own approach (Stewart, 2010). Toyota leveraged on its track record which was a focal point in its defence that sustained confidence in restoring its publics' trust. Although, in handling the situation, Toyota took advantage of rhetoric renowned with maintenance of identity which may not be associated with crises (Knoespel, 2011).

To some PR executives and administrative personnel, a relationship exists between the function of PR, reputation and public perception, mainly at times of crisis (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). Roschwalb (1994) once interviewed 259 chief corporate communication officers at large corporations in the United States. When they asked the chief corporate communication officers what the primary mission of their corporate communication programme was, they most often rated reputation as expedient to success. Of the chief corporate communication officers interviewed, most said they would turn to a public relations expert first if their business had a problem of perception.

Theoretical Framework

This survey is built on James Grunig's (1984) Two-Way Symmetrical model of public relations. Grunig proposed the framework, together with other modern-day models, that seeks to incorporate all models and theories in public relations. This model explains the operations and purpose of PR, as it seeks to achieve shared values, support and partnership within organisations and their stakeholders. The framework, suggests that PR managers use research and information exchange to come about the shared interest for both organisations and stakeholders (Grunig, Grunig and Dozier, 2002). Strategies required in this model include negotiation, accord and conflict resolution to obtain mutual understanding and to alter behaviours and attitudes of both the publics and the organisation (the made-in-Nigeria automobile industry, in this case). The theorists posit that the model is the most efficient, as well as accepted professional standard and guiding principle for public relations as communication and feedback, are achieved. This fact, however, points out the need for symmetrical public relations strategies in the Nigerian automobile industry to change the attitude of Nigerians towards locally manufactured vehicles and raise the level of trust as well as reduce the apathy between the Nigerian motoring industry and members of the society.

Research Design and Methodology

This study incorporated a survey research design aided by a well-structured questionnaire with both open-ended and close-ended questions for data collection. We processed the data results using Statistical Package for the Social Sciences (SPSS). We selected two hundred seven respondents using stratified random sampling. Stratified random sampling is a sampling technique that entails the distribution of a population into strata or smaller groups. This sampling technique is utilised based on similar attributes or characteristics shared by individuals constituting the study as Denzin and Lincoln (2017) justifies. Lagos metropolis was selected because most of the made-in-Nigeria automobile manufacturers coagulate in metropolitan Lagos. Another reason is that vehicle assemblers in other parts of Nigeria have dealerships and sales offices in Lagos. Examples are Innoson Vehicle Manufacturing and Peugeot Automobile Nigeria (Nwagwu and Oni, 2015; PwC, 2016). Individuals sampled their own, drive or had general or specific knowledge about the indigenous motoring industry from the different strata of the population.

Data Presentation and Discussion

Table 1: showing if respondents are aware of Nigerian-made automobile manufacturers

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	154	74.4	74.4	74.4
	No	37	17.9	17.9	92.3
	Not Sure	16	7.7	7.7	100.0
	Total	207	100.0	100.0	

Table 1 shows that most respondents (74.4%) are aware of Nigerian-made automobile manufacturers. In comparison, 17.9% and 7.7% indicate that they are not aware or not sure about Nigerian-made automobile manufacturers, respectively.

Table 2: Showing if respondents are aware of public relations activities or programmes of Nigerian automobile manufacturers

Variable	Frequency	Percentage	Valid Percent	Cumulative Percent
Yes	79	38.2	38.2	38.2
No	27	13.0	13.0	51.2
Not Sure	101	48.8	48.8	100.0
Total	207	100.0	100.0	

Regarding awareness of public relations activities or programmes of Nigerian automobile manufacturers, Table 2 shows that 38.2% are aware of the PR activities of indigenous automobile manufacturers. In comparison, 13% indicate that they are not aware of the PR activities. However, 48.8% constituting almost half of respondents sampled indicate that they are not sure if they are aware.

Table 3: Specific public relations activities are known

	Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
	After-sale services	15	7.2	20.8	20.8
	organising children's competitions and educational support activities	4	1.9	5.6	26.4
	Free maintenance and servicing	19	9.2	26.4	52.8
	Festivity gifts	10	4.8	13.9	66.7
	Community development projects such as partnering with the Federal Road Safety Corps	3	1.4	4.2	70.8
	Career Mentorship programmes	1	.5	1.4	72.2
	Auto maintenance tips	4	1.9	5.6	77.8
	Facility tours/showroom invitation and the inauguration of car clubs	16	7.7	22.2	100.0
	Total	72	34.8	100.0	
Missing	System	135	65.2		
Total		207	100.0		

A small section of the public is aware of the PR activities in the made-in-Nigeria automobile industry. The result shows that 7.2% of respondents say they are aware of communication and information dissemination regarding after-sale services. Another set of respondents constituting 1.9% indicate that they are away from activities revolving around children's educational support and competitions. 9.2% indicate that they are aware of free vehicle maintenance and servicing. In comparison, 4.8% say they are aware of gifting activities during festivities. Respondents constituting 1 .4% of respondents say they are aware of activities such as community development projects such as partnering with the Federal Road Safety Corps. In contrast, 0.5% and 1.9% indicate career mentorship programmes and auto maintenance tips, respectively. Finally, 7.7% of respondents indicate that they are a way of facility tours, showroom invitation and the inauguration of car clubs as PR activities of Nigerian automobile manufacturers.

Table 4: How respondents became aware of public relations activities of made-in-Nigeria automobiles

	Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
	Facebook	15	7.2	10.3	10.3
	TV	12	5.8	8.2	18.5
	Newspaper	21	10.1	14.4	32.9
	Twitter	24	11.6	16.4	49.3
	Instagram	11	5.3	7.5	56.8
	Billboards	2	1.0	1.4	58.2
	Relatives/friends	11	5.3	7.5	65.8
	Press conferences and seminars	2	1.0	1.4	67.1
	Word of mouth	31	15.0	21.2	88.4
	Radio	6	2.9	4.1	92.5
	Others (involvement of employers in activities, posters, personal experience of activities)	11	5.3	7.5	100.0
	Total	146	70.5	100.0	
Missing	Missing System	61	29.5		
	Total	207	100.0		

Table 4 shows the media through which respondents became aware of public relations activities of made-in-Nigeria automobile manufacturers. The majority (7.2%) indicate Facebook, 5.8% say television, 10.1% indicate newspapers, and 11.6% choose Twitter. Another 5.3% reveal that they got aware via Instagram, while 1% chose billboards as a channel of awareness. Relatives and friends were choices of 5.3%. In comparison, another 1%, 15%, 2.9% and another 5.3% achieved awareness via press conferences and seminars, word of mouth, radio, and other means (involvement of respondents' employers in PR activities, posters and witness of activities personally) respectively.

Table 5: if public relations activities/ programmes influenced respondents' decision to purchase a made-in-Nigeria vehicle

Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
Yes	70	33.8	33.8	33.8
No	102	49.3	49.3	83.1
Not sure	35	16.9	16.9	100.0
Total	207	100.0	100.0	

Table 5 shows that 33.8% concur that it was these PR activities that prompted them to purchase a Nigerian made vehicle. Almost half of the respondents constituting 49.3% of respondents say PR activities of these home-based manufacturers have not prompted them to purchase a vehicle. In comparison, 35% of respondents are not sure if PR activities have caused them to purchase one or not.

Table 6: If the survey participants are pleased with the PR activities of Nigerian automobile manufacturers

Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
Yes	56	27.1	27.1	27.1
No	83	40.1	40.1	67.1
Not sure	68	32.9	32.9	100.0
Total	207	100.0	100.0	

From Table 6, which measures respondents' satisfaction with public relations activities of local automobile manufacturers, 27.1 % say they are satisfied. In comparison, 40.1% say they are not satisfied with the PR efforts of the manufacturers, while 32.9% admit that not sure if they are satisfied.

Table 7: showing if public relations activities/programmes of indigenous vehicle manufacturers have added knowledge about the local automobile industry and its potentials

Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
Yes	86	41.5	41.5	41.5
No	78	37.7	37.7	79.2
Not sure	43	20.8	20.8	100.0
Total	207	100.0	100.0	

Table 7 shows that 41.5% of study participants agree that they have gained new knowledge from the public relations activities/programmes of indigenous vehicle manufacturers.

Table 8: Showing how public relations activities of indigenous automobile manufacturers have added to knowledge about the indigenous industry

Variable		Frequency	Per cent	Valid Percent	Cumulative Percent
	Automobiles are adaptable to Nigerian terrain and road conditions	11	5.3	14.7	14.7
	Patronage helps boost the Nigerian economy	7	3.4	9.3	24.0
	Succeeded in creating belief in the potentials of the Nigerian industry	24	11.6	32.0	56.0
	Being instrumental in the reduction of the economic effects of importation	3	1.4	4.0	60.0
	Mirrored the challenges of production while showing that local production is attainable	8	3.9	10.7	70.7
	The automobile industry aims to be the biggest in Africa	19	9.2	25.3	96.0
	Sheds more light about the National Automotive Policy	3	1.4	4.0	100.0
	Total	75	36.2	100.0	
Missing	System	132	63.8		
Total		207	100.0		

From Table 8, 5.3% of respondents admit that the PR activities of indigenous manufacturers revealed to them that their vehicles are suited to Nigerian terrains and road conditions. 3.4% said that the PR activities showed them that patronage of the domestic industry vehicles helps boost the Nigerian economy. In comparison, 11.6% opine that the PR activities of the local industry have caused them to believe in the potentials of the Nigerian automobile industry. Also, 1.4% of respondents said that PR activities have added to their knowledge by attempting to advocate for the reduction of the economic effects of importation. In comparison, 3.9% said the PR activities of the indigenous automobile industry have helped to mirror the challenges of local production as well as showing that local production is attainable. Finally, 9.2 % of respondents say they discovered that the automobile industry aims to be the biggest in Africa. In comparison, 1.4% of respondents admit that they got to know more about the National Automotive Policy.

Table 9: showing how respondents rate the frequency of information dissemination and other public relations actions of indigenous vehicle manufacturers?

	Frequency	Per cent	Valid Percent	Cumulative Percent
Excellent	7	3.4	3.4	3.4
Above Average	46	22.2	22.2	25.6
Average	73	35.3	35.3	60.9
Below average	48	23.2	23.2	84.1
Very poor	33	15.9	15.9	100.0
Total	207	100.0	100.0	

Table 9 indicates that a meagre 3.4% of respondents believe that the frequency of information dissemination and other public relations actions of indigenous vehicle manufacturers is excellent. However, 35.3% think that frequency of information dissemination is average. In comparison, 23.2% and 15.2% believe that it is below average and very poor, respectively.

Table 10: Showing how respondents think local automobile manufacturing companies can improve their information dissemination and other public relations functions?

Variable	Frequency	Per cent	Valid Percent	Cumulative Percent
Partnership with government and agencies, sponsorships and continuous advocacy for import substitution	28	13.5	14.4	14.4
Focusing on engagement across all major social media for products to be at the fingertips of Nigerians	129	62.3	66.2	80.5
Advocating for the creation of packages and schemes to facilitate the easy acquisition of made-in-Nigeria vehicles	1	.5	.5	81.0
Outsourcing their public relations functions for quality performance	9	4.3	4.6	85.6
Better customer relations	10	4.8	5.1	90.8

	Production of motoring documentaries with placement both on traditional media and on social media as done in developed climes to better engage and create an online followership	18	8.7	9.2	100.0
	Total	195	94.2	100.0	
Missing	System	12	5.8		
Total		207	100.0		

Table 10 shows that 13.5% of respondents suggest that indigenous automobile manufacturers should improve their information dissemination and public relations functions. They also advocate for an increase in sponsorships and continuous advocacy for import substitution, which would increase production and acceptance. Moving on, 62.3% of respondents want local vehicle manufacturers to focus more on engagement across all major social media platforms for products to be at the fingertips of Nigerians. However, one respondent (0.5%) suggested that the creation of packages and payment schemes to facilitate easy acquiring of made-in-Nigeria vehicles should bring about support and a trickle effect of acceptance. Some respondents (4.3%) think an improvement in public relations functions of the local automobile industry would come by outsourcing their public relations functions for quality performance. In comparison, 4.8% think that the focus should be on better customer relations management in order to get more referrals and acceptance of indigenous products. Finally, 8.7% of respondents think that the made-in-Nigeria motoring industry should take on the production of motoring documentaries and shows with placement both on traditional media and on social media.

Discussion of Findings

The results above are as a result of this discussed in line with the research questions:

Research Question 1: To what extent are Nigerians aware and perceive the public relations practices of indigenous automobile companies?

Table 1 confirms that most respondents (74.4%) are aware of Nigerian-made automobile manufacturers. However, from Table 2, 38.2% are aware of PR activities or programmes of indigenous automobile manufacturers. In comparison, 13% indicate that they are not aware of the PR activities. Furthermore, 48.8% constituting almost half of respondents sampled indicate that they are not sure if they are aware. This result means that many Nigerians; making generalisations from the Lagos metropolis drawn as a sample, do not have much awareness about the made-in-Nigeria automobile industry. The reason is not farfetched because, in the last three decades, Nigeria has experienced up to 80% rate of importation of fairly-used automobiles, hence the obscurity of indigenously manufactured automobiles (Ezeoha, Okoyeuzu, Onah, and Uche, 2018).

In terms of perception, most Nigerians do not perceive the PR activities of indigenous vehicle manufacturers as satisfactory as seen in Table 6. Only 27.1 % say they are satisfied while 40.1% say they are not pleased with the PR programmes of manufacturers, while 32.9% are not sure if they are content. Also, Table 5 reveals that 33.8% concur that it was these PR activities that prompted them to purchase a Nigerian made vehicle.

Examining specific knowledge Nigerians have gained from the PR activities of the local automobile industry, only 36.2% of respondents hold a positive perception. In this regard, the local industry has to step up in consumer satisfaction, engagement on the online space, in sponsorships and partnership with the government for more support.

Research Question 2: What are the tools and acts of indigenous automobile manufacturers in terms of public relations?

From the results in Table 12, the major platforms for information dissemination by indigenous auto manufacturers as selected by respondents were relatively marginal. However, the social media (Twitter especially), mainstream media (predominantly newspaper), and word of mouth communication (constituting 15% of respondents' choice) were selected by respondents as the primary channels of communication. The activities of these manufacturers on social media especially Twitter is commendable because it possesses one of the highest levels of engagement (Cortado, Chalmeta and Ntim, 2016; Odiboh, Ezenagu and Okuobeya, 2019; Ndubueze, Odiboh, Nwosu, Olabanjo, James, Adelua and Fayemi, 2019). There should, however, be an increase in social media engagement and experiential PR to keep up the debate in these virtual communities until there is a general awareness of the social space.

Activities such as after-sale services, organisation of children's competitions and educational support activities, free vehicle maintenance and servicing, and festivity gifts should be regular. Community development projects such as partnering with the Federal Road Safety Corps, career mentorship programmes, auto maintenance tips, facility tours/showroom invitations and the inauguration of car clubs are recognisable PR actions of indigenous automobile manufacturers. Though these actions can be said to be commendable, only a limited number of respondents are aware of these activities (34.8%) of respondents. After-sales service, free maintenance and servicing, facility tours and showroom visits, as well as festivity gifts, are mostly known by these respondents.

Research Question 3: What is the opinion of the public on the way forward for local auto assemblers towards the delivery of acceptable made-in-Nigeria automobiles?

From Table 10, most respondents (62.3%) would rather indigenous vehicle manufacturers focus more on engagement across all major social media platforms for products to be at the fingertips of Nigerians. Reasons for their choice are not farfetched as social media has made the world not only a global village but a source of engagement (Öksüz and Genç, 2018; Odiboh and Ajayi, 2019). Respondents also suggest that indigenous automobile manufacturers should improve their information dissemination and public relations functions. They also call for an increase in sponsorships and continuous advocacy for import substitution strategies which would increase production and acceptance (Aminu, 2016).

Some respondents also think an improvement in public relations functions of the local automobile industry would come by outsourcing their public relations functions for quality performance. In contrast, others think that the focus should be on better customer relationship management in order to get more referrals and embrace indigenous products. Outsourcing PR functions to agencies and consultancies most of the time is the best bet for corporate organisations. It would help them to focus on more on core business responsibilities. Consultancies and agencies are also vast inexperience as a result of their dealings with so many diverse clients in different industries and understand different audiences and how to maximise reach (Igbinoba and Olukunmi, 2014; Olabanjo *et al*., 2019). Respondents also suggest that PR handlers of local automobile assemblers should take on the production of motoring documentaries and shows with placement both on traditional media (Suzor, 2016).

Conclusion

This study established that though most Nigerians are aware of the made-in-Nigeria automobile industry, most are not in tune with the information and public relations actions of the industry. However, a lot still needs to be done in order to bring about acceptance of made-in-Nigeria automobiles. The study also establishes that increased tariffs on imported new and used vehicles call public relations practitioners in the industry to action.

It is, therefore, obligatory to encourage policymakers to exercise political will in providing a conducive environment, thereby consolidating the automobile industry. On this note, the indigenous automobile industry must not only start paying more attention to good and professional public relations but also partner with the government continually in order to achieve tremendous support. However, beyond government policy and political will, the private industry is expected to change the narrative by utilising the media to brand the indigenous automobile industry in order to bring about acceptance and joint public advocacy for full indigenisation of the automobile industry.

Recommendations

In relations to the review of the literature and the results of this study, the following recommendations will be of immense benefit.

1. Nigerian automobile manufacturers should outsource most of their public relations planning, research and activities to public relations agencies and consultancies in order to exploit their vast experience and understanding of different audiences and how to reach them as a result of their dealings with so many diverse clients in different industries.

2. It would be beneficial local automakers to initiate engaging PR organisation of motoring documentaries and shows such as Amazon Prime's 'The Grand Tour' or the British Broadcasting Corporation's 'Top Gear'. Electronic public relations on social media would help to engage better and create online followership, debate and bring about advocacy for locally assembled vehicles.

3. It is beneficial that the government does not relent in the implementation and enforcement of protective policies to enable the attraction of investors and the overall growth of the indigenous automobile industry. Alongside, the National Automotive Council (NAC) and National Automotive Design and Development Council (NADDC) should continue
4. PR advocacy to reach government and other essential stakeholders.

Abstract

This study examines the application of public relations in the beauty and cosmetics industry and how usable it is to curb piracy. Cultivation theory forms the fundamental basis of the study. The purposive sampling method is adopted using the survey design. Thus, a questionnaire is used to gather respondents' opinion; and the data gathered is processed with the Scientific Package for the Social Sciences (SPSS). Key findings show that product launch and makeup are the top public relations activities of beauty and cosmetics companies with which the public is cognizant. Billboards, Instagram and Twitter, are the predominant media of public awareness of public relations activities of the beauty and cosmetics industry. Public relations is confirmed as a useful tool in influencing the thoughts of the public and curbing piracy in the beauty and cosmetics industry. Accordingly, the study recommends that the government should establish regulatory bodies to monitor and punish perpetrators of piracy in the beauty and cosmetics industry.

Keywords: Beauty, Cosmetics, Piracy, Public Relations.

Introduction

Counterfeiting and piracy are chronic, widespread, trends that have long puzzled administrators and researchers throughout the world. As noted by the International Chamber of Commerce (ICC), Counterfeit and pirated goods are endangering public health and safety worldwide. It is robbing tax revenues, incomes and legal jobs from states, companies and communities (Nwosu *et al.,* 2019). Other comments are in Olabanjo *et al* (2019). The adverse effects of counterfeiting and piracy could sap US$ 4.2 trillion from the world economy and threaten 5.4 million legal jobs by 2022(Bascap, 2019). The ease of copying and sharing electronic data over the Internet has contributed to an outbreak of piracy. As a result, counterfeiting and piracy have drawn tremendous interest from academics, thus causing great fear for managers (Bush *et al.* 1989; Yang *et al.* 2004; Berman, 2008; Wilcock & Boys 2014; Cesareo, 2016).

Counterfeiting and piracy have long been an enticing target market for organized criminals, with particular focus on lucrative fields such as consumer goods, clothing, pharmaceuticals, digital media, and luxury items such as handbags and perfumes. Over the past two decades, however, the illegal practice of counterfeiting and piracy has expanded to cover nearly every commodity market, including fake food and beverages, books, electrical appliances, additives, mobile phone batteries, spare parts and toys (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). The worth of this underground economy has erupted Commensurately (Bascap, 2013). This illegal practice has also penetrated the beauty and cosmetics industry. Moreover, it is causing an incessant loss and danger to the industry and the consumers. It affects the profit of the businesses and the health of the consumers. Counterfeit goods are rapidly entering the supply chain and placing producers at risk. The prevalence of counterfeits is a concern for almost any commodity, organization, supply chain, government and industry; and the problem is aggravating. (Basu, Basu & Lee, 2015). Potential investment in research and technology is

at stake because of the unfair competition arising from counterfeits (Maldonado & Hume, 2005; Olabanjo *et al.,* 2019).

From the above premises, one can understand that counterfeit is an impediment to the growth of the beauty and cosmetics industry and application of public relations is an indispensable and inevitable part of the industry. Hence, public relations in this aspect becomes very important. The current research makes an industrious attempt to examine the efficacy of public relations tools in curtailing the menace of piracy in the beauty and cosmetics industry in Nigeria.

Image quality exposes many factors which influence public awareness and perception of corporate organizations. Negative image, for instance, is poor image quality (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Proper image management through positive public relations actions helps to control public perception of organizations.

Statement of The Problem

The beauty and cosmetics industry has grown but still faced with many challenges. One of the significant challenges faced by the industry is the problem of piracy, and it has posed many threats to the continuous growth of the industry. This problem has affected both the industry and their publics. Piracy damages the free market economy significantly, and it also damages intellectual property rights such as trademark laws, copyrights, patents. It takes businesses many years to move from the introduction stage to the maturity stage.

Moreover, after efforts of the company's employees, a firm builds a brand. However, counterfeits destroy their achievements by creating a negative image of a company. The major problem which the research seeks to address is piracy. The importance of public relations cannot be underrated as it poses to be an essential tool in curtailing the impending threat of piracy in the industry. Hence, the survey will examine the effectiveness of public relations in addressing the threats. It will also provide solutions to the identified problems.

Research Objectives

1. To examine the PR tools and objectives used by the selected beauty and cosmetics companies in Nigeria.
2. To investigate public awareness and perception of the PR practices in the selected beauty and cosmetics companies as well as the industry in Nigeria.
3. To determine the effectiveness of PR activities in curtailing the menace of piracy in the selected beauty and cosmetics industry in Nigeria.
4. To recommend solutions to maintain and enhance PR and its positive effect on the beauty and cosmetics industry in Nigeria.

Theoretical Framework

The cultivation theory forms the fundamental basis for this study. Cultivation theory was proposed by George Gerbner, who tried to determine the influence of media advocacy on viewers' understanding of the environment they live in (Littlejohn, 2002). Gerbner realized that the dominance of television created a standard view of the world and made all cultures to have conventional thinking (Ndonye, 2014). Cultivation theory contends that persuasive content over time imbues symbols, messages, images and meanings that dominate and eventually absorbed as truth. Also, public relations practitioners must keep their message consistent and persistent until the target audiences achieve behavioural change.

Beauty and Cosmetics: An Overview

Since ages the term "cosmetics" has been known to the human race; it is human nature to desire beauty. At the same time, the need to appear practical and desirable for each person may also be a psychological requirement despite the top position for ages in hierarchy. Nevertheless, knowing the precise meaning of the term "cosmetic" at the beginning would be important from multiple sources.

Cosmetics are products to be rubbed, painted, powdered, sprayed, added or otherwise applied to some portion of the human body in order to convey attractiveness. They are meant to scrub, cover, embellish, encourage appeal or change appearance (Ali, 2018; Odiboh, Ezenagu, & Okuobeya, 2019). Cosmetics are substances used to improve or protect human body appearance (Manikandan & Ramshida, 2014). European Regulation 93/35/EEC describes cosmetic products as any material or treatment meant to be placed in contact with the different external sections of the human body (Aziz, Taher, Muda & Aziz, 2017). These definitions are quite comparable in that they all classify cosmetics as products that enhance appearance but have no therapeutic advantages in contrast to drugs.

The fast rise in online makeup purchases can be convincing. In 2010, internet sales were worth more than 11 billion US Dollars. As technologies develop, the cosmetics industry is also seeking to take advantage of the new developments and to engage more effectively with customers. Organic beauty products are becoming ever more visible on the global market (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Other comments are in Odiboh and Oladunjoye, (2019). They arose from a niche that a small number of companies had previously occupied and integrated into the mainstream market. Such goods meet regular outlets, such as department stores and supermarkets (Lennard, 2011).

As pointed out by Lennard, (2010), Lopaciuk and Lobodo, (2013), Colour cosmetics (makeup) are the world's third-largest beauty market, measured by sales. Their share remains steady at 12-13% and is aligned with the competitive growth of the market. This segment is fueled mostly by developments to which it managed to achieve market growth of 8% in 2008, even in the competitive and developed industry of Western Europe. It may also be that this traditional market is the only position where the lipstick hypothesis can be affirmed - even a 3% growth was reported in the recession year of 2009. The cosmetics industry further boosts sales by introducing items that meet the needs and preferences of diverse people with specific ethnic backgrounds, skin and hair types, and genetic features (James *et al.,* 2020a).

Sub-Saharan Africa, dubbed as the next business hot-spot, is witnessing the world's second-fastest economic growth. As a result, there are about 821 million customers in the African economy scrambling to purchase a wide variety of cosmetics and beauty products. Because of its high birth rates and rising middle class, Africa could be the next significant growth region. The market leaders – South Africa and Nigeria – will be followed by five key frontier markets: Kenya, Ethiopia, Tanzania, Ghana and Cameroon (Beauty Africa, 2016).

Counterfeit or Piracy in The Beauty and Cosmetics Industry: The Big Issue

With counterfeiting the beauty and cosmetics industry has evolved hand in hand. Cosmetics counterfeiting represents a loss in income for the owners of the counterfeit products, and therefore decreased their share of investments. This includes job losses, opportunities for illicit jobs and a rise in emissions, not to mention the serious damage to public wellbeing (Economic Development Ministry, Rome). Counterfeiting is an act of making a product by copying or imitating an actual product's physical appearance in attempt to mislead consumers that it is the product of another Group. Items that violate patents, violations of copyright and advertising, naming and brand laws are accused of counterfeiting (Tommy, 2012; Nwosu *et al.,* 2019).

Counterfeit products range from twisted brand names, look-alikes and unconvincing imitations (Harvey, 1987). Thus, counterfeiting can be either deceptive or non-deceptive based on the quality of the replica (Grossman & Shapiro 1988; Nwosu *et al.,* 2019). In the former, when the products sold are falsified, the falsified deceives the buyer, and in the latter, and the deception spreads to customers who

intend to make a transaction. Consumers willingly choose the false alternative and become the counterfeiters' accomplices (Cesareo, 2016). The issue of piracy is an intellectual property crime that is infiltrating the beauty and cosmetics industry in Nigeria. A transitional approach is needed to address the transitional problem of intellectual property crime, locally and internationally.

Public Relations As A Tool For Limiting The Problem Of Piracy

Public relations is the practice that looks after the image of the organization and seeks to gain understanding and respect and control sentiment and action (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020; Olabanjo *et al.,* 2019). Many scholars have a public relations understanding and are often in agreement about what it is. In all, it's a discipline that deals with an organization's interaction with its publics. That is, what the organization is communicating to its public and what they are reacting to or responding to it (Odiboh & Ajayi, 2019). Because it creates a better perspective and transforms negative perceptions to beneficial (Samson, 2018). Grunig and Repper (1992) emphasize that, in order for public relations to be valued and used efficiently by senior managers, it must work carefully. It must deliver real value to the organization and help it attain its corporate objectives (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). Public relations is a veritable tool in building an organizational image. Its application in the beauty and cosmetics industry will address the issue of piracy.

Research Design and Methodology

This research applied the survey method of data collection. A survey is the compilation of information from a number of people through responses to questions (Check & Schutt; 2012, Olabanjo *et al.,* 2019). This type of research method allows the use of various methods for recruiting participants, collecting data and using the different information methods. Survey research may either be quantitative (using numerically graded questionnaires), qualitative (using open-ended questions) study approaches, or using both techniques. The questionnaire is the type of data collection instruments used in the survey method.

The questionnaire was drawn from the research questions to deduce from the respondents their awareness and perception of the public relations activities of the beauty and cosmetics industry. The survey instrument provided both open and close-ended questions about how piracy in the industry can be combated with public relations. The researcher self-administered the questionnaires to the population size through the application of the google form. The researcher used the google form because that is the easiest way of getting across to our study subjects.

Sampling

This study was conducted among 200 randomly selected people through purposive sampling. The study subjects included career women, distributors, makeup artists, and personal makeup shoppers. Also, the top five beauty and cosmetics industry in Nigeria qualified for proper study. They included House of Tara, Zaron cosmetics, BM Pro, Kuddy Cosmetics and Lise Beauty.

Results

The data were analysed and presented in tables through frequencies and percentages. The tables show how exposed the publics are to the public relations activities of the beauty and cosmetics industry. And their level of awareness of these public relations activities, opinion about piracy in the beauty and cosmetics industry. Also, what they suggest to curtail the threats piracy has on the industry.

Table 1: Respondents shopping for cosmetics

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Very often	104	52.3	52.3	52.3
	Often	76	38.2	38.2	90.5
	Rarely	19	9.5	9.5	100.0
	Total	199	100.0	100.0	

Out of 199 respondents, 104, which represents 52.3% of the respondents said they shop for beauty and cosmetics very often, 76, which represents 38.2% of the respondents affirmed that they often shop. In contrast, 19, which represents 9.5%, affirmed that they rarely shop for beauty and cosmetics product. The above information illustrates that the respondents shop for beauty and cosmetics at one point or the other, hence, only a few of the respondents affirm to shopping rarely, while none affirmed to never shopping.

Table 2: How often respondents shop

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Monthly	65	32.7	32.7	52.8
	Twice a year	49	24.6	24.6	92.5
	Quarterly	30	15.1	15.1	67.8
	Bi-monthly	27	13.6	13.6	20.1
	Yearly	15	7.5	7.5	100.0
	Weekly	11	5.5	5.5	6.5
	Daily	1	.5	.5	.5
	Bi-weekly	1	.5	.5	1.0
	Total	199	100.0	100.0	

The table shows that majority (32.7%) of the respondents stated that they shop monthly for beauty and cosmetics product. On the other hand, 24.6% of the respondent said they shop for beauty and cosmetics product twice a year. However, 15.1% of the respondents stated that they shop quarterly. In comparison, 13.6% affirm that they shop bi-monthly.

Table 3: Awareness of the beauty and cosmetics industry in Nigeria

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	195	98.0	98.0	98.0
	No	3	1.5	1.5	99.5
	Not sure	1	.5	.5	100.0
	Total	199	100.0	100.0	

As noted in this table, 195 which represents 98.0% of the respondents are aware of Nigeria's beauty and cosmetics sector, three which represents 1.5% of the respondents are not aware of Nigeria's beauty and cosmetics sector. This result shows that almost all respondents are aware of Nigeria's beauty and cosmetics sector.

Table 4: The beauty and cosmetics industry respondents are familiar with

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	House of Tara	93	46.7	46.7	46.7
	Zaron cosmetics	70	35.2	35.2	81.9
	BM pro	13	6.5	6.5	88.4
	Kuddy cosmetics	12	6.0	6.0	94.5
	Others	11	5.5	5.5	100.0
	Total	199	100.0	100.0	

Table 4 reveals that 46.7% of the respondents agree that they are familiar with the House of Tara as a beauty and cosmetics industry in Nigeria. On the other hand, 35.2% of the respondents are aware of Zaron cosmetics as a beauty and cosmetics industry in Nigeria. In comparison, 6.5% are aware of BM Pro as a beauty and cosmetics industry in Nigeria. From this outcome, it is obvious that the respondents are more aware of House of Tara and Zaron cosmetics as a beauty and cosmetics brand in Nigeria.

Table 5: Awareness of public relations activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	180	90.5	90.5	90.5
	No	14	7.0	7.0	97.5
	Not sure	5	2.5	2.5	100.0
	Total	199	100.0	100.0	

Table 10 shows 90.5% of respondents agree that they are aware of the beauty and cosmetics industry's public relations activities of the in Nigeria; 7.0 % responded in the negative. By contrast, 2.5% said they were not certain. Based on this finding it is clear that the respondents are aware of the beauty and cosmetics industry's public relations activities.

Table 6: Respondents familiarity with public relations activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Product launch	98	49.2	49.2	96.0
	Makeup fair	74	37.2	37.2	37.2
	Press conferences	19	9.5	9.5	46.7
	Others	8	4.0	4.0	100.0
	Total	199	100.0	100.0	

According to this table, 49.2% of the respondents agreed that they are aware of a product launch as the public relations activity of the beauty and cosmetics industry. Meanwhile, 37.2% of the respondents mentioned that they are aware of makeup fair as the public relations activity of they carry out. Only 9.5% of the respondents mentioned press conferences. In comparison, 4.0% of the respondents mentioned others which means, makeup fair and product launch as the significant public relations activities they know.

Table 7: How respondents became aware

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Billboards	36	18.1	18.1	78.9
	Instagram	35	17.6	17.6	37.7
	Twitter	23	11.6	11.6	49.2
	Seminars	18	9.0	9.0	60.8
	Friends	18	9.0	9.0	95.0
	Relatives	14	7.0	7.0	85.9
	Word of mouth	13	6.5	6.5	16.6
	Newspaper	8	4.0	4.0	10.1
	Facebook	7	3.5	3.5	20.1

	Television	5	2.5	2.5	2.5
	Others	10	5.0	5.0	100.0
	Total	199	100.0	100.0	

According to this table, 18.1% of the respondents listed billboards as a means by which they became aware of the beauty and cosmetics industry's PR practices On the other hand, 17.6% mentioned Instagram, 112% said through twitter, 9.0% said they became aware through friends, 9.0% also mentioned seminars, 7.0% through relatives, 6.5% mentioned word of mouth. Which means the primary tools through which people become aware is through billboards and Instagram predominantly.

Table 8: Exposure to public relations actions

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	1-3 times a year	86	43.2	43.2	43.2
	4-6 times a year	62	31.2	31.2	74.4
	7-9 times a year	35	17.6	17.6	92.0
	More than ten times a year	16	8.0	8.0	100.0
	Total	199	100.0	100.0	

From this table, 43.2% of the respondents mentioned that they are only exposed to these actions 1-3 times a year. Meanwhile, 31.2% mentioned 4 - 6 times a year; 17.6% mentioned 7 - 9 times a year, while only 8.0% only mentioned that they are exposed to these actions more than ten times a year.

Table 9: How respondents rate the success of public relations activities in fighting piracy in the industry

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Excellent	92	46.2	46.2	46.2
	Above average	75	37.7	37.7	83.9
	Average	18	9.0	9.0	93.0
	Below average	8	4.0	4.0	97.0
	Very poor	6	3.0	3.0	100.0
	Total	199	100.0	100.0	

This table shows how the respondents rate the success of public relations in fighting piracy. 46.2% stated that the activities are excellent; 37.7 % stated that it is above average, 9.0% stated that it is average. In comparison, 4.0% and 3.0% respectively, stated that it is inadequate.

Table 10: To know if quality public relations activations change respondents perception about the beauty and cosmetics industry

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	163	81.9	81.9	81.9
	No	24	12.1	12.1	94.0
	Not sure	12	6.0	6.0	100.0
	Total	199	100.0	100.0	

Table 10 indicates that 81.9 % of respondents believe that high-quality public relations efforts have improved their view of the beauty and cosmetics industries; 12.1 % responded negative. By comparison, 6.0 % said they were not certain. From this result it is clear that the beauty and cosmetics industry's public relations efforts go a long way towards improving consumer image.

Table 11: Respondents satisfaction with the activities carried out by the beauty and cosmetics industry

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	141	70.9	70.9	70.9
	No	44	22.1	22.1	93.0
	Not sure	14	7.0	7.0	100.0
	Total	199	100.0	100.0	

As shown in the table, 70.9% answered in the affirmative that they were satisfied with the beauty and cosmetics industry's public relations activities, 22.1% answered in the negative. In comparison, 7.0% stated that they are not sure if they are satisfied or not.

Table 12: Whether the respondents want improvement in the delivery of public relations activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	108	54.3	54.3	54.3
	No	80	40.2	40.2	94.5
	Not sure	11	5.5	5.5	100.0
	Total	199	100.0	100.0	

According to table 12, 54.3% agreed that they would want the beauty and cosmetics to improve in the deliveries of their activities, 40.2% said no. In comparison, 5.5% of the respondents said they are not sure.

Table 13: Respondents area of improvement in the delivery of the public relations actions

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	publicity/adverts	23	11.6	11.6	39.2
	use of social media	18	9.0	9.0	20.1
	use of traditional media	15	7.5	7.5	27.6
	use fliers	14	7.0	7.0	7.0
	invest in PR	12	6.0	6.0	95.0
	Every area	10	5.0	5.0	100.0
	use bloggers/influencers	8	4.0	4.0	46.7
	promotional sales	8	4.0	4.0	11.1
	Use of registered suppliers/distributors	7	3.5	3.5	42.7
	not sure/nil	84	42.2	42.2	88.9
	Total	199	100.0	100.0	

The respondents listed some of the areas they would want the beauty and cosmetics industry to improve in the deliveries of their public relations activities.42.2% mentioned that they are not sure. However, 11.6% mentioned publicity/adverts; 9.0% mentioned social media, 7.5% traditional media, 7.0% mentioned the use of fliers, 6.0 mentioned that they should invest in more public relations.

Table 14: How respondents identify fake beauty and cosmetics products.

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Packaging	56	28.1	28.1	28.1
	quality of the content	35	17.6	17.6	100.0
	relatively cheap	25	12.6	12.6	49.7
	ease of access	18	9.0	9.0	37.2
	black marketing	14	7.0	7.0	64.3
	does not last on the skin	12	6.0	6.0	57.3
	sometimes difficult to identify	6	3.0	3.0	67.3
	gives skin reaction	3	1.5	1.5	51.3
	not sure/nil	30	15.1	15.1	82.4
	Total	199	100.0	100.0	

This table shows how the respondents can identify fake beauty and cosmetics companies. A majority, 28.1% said through the packaging. However, 17.6% said through the quality of the content., 15.1% are not sure, 12.6% mentioned price, 9.0% ease of access, 7.0% mentioned black marketeering, 6.0% indicated that it doesn't last on screen, 3.0% said sometimes it is difficult to identify while only 1.5 said it gives skin reaction. This table shows that the principal way through which the respondents identify counterfeits products is through the packaging.

Table 15: Measures respondents think can be taken to curtail the threats

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	re-branding	32	16.1	16.1	34.2
	create awareness/customer sensitization	30	15.1	15.1	74.9
	authentication code	28	14.1	14.1	18.1
	government intervention	27	13.6	13.6	47.7
	regulatory bodies formulation	24	12.1	12.1	59.8
	refer customers to their website	17	8.5	8.5	88.9
	punish offenders	11	5.5	5.5	80.4
	trademarking	8	4.0	4.0	4.0
	not sure/nil	22	11.1	11.1	100.0
	Total	199	100.0	100.0	

These tables show us the measures which the respondents suggested in curtailing the threats of piracy in the beauty and cosmetics industry. A majority (16.1%) of the respondents suggested re-branding; 15.1% mentioned that companies should create awareness and sensitize consumers, and 14.1% suggested the use of authentication code. Meanwhile, 13.6% suggested government intervention. Furthermore, 12.1% suggested regulatory bodies; 11.1% said they are not sure, or they do not know; 8.5% said to refer customers to their official website. Lastly, 5.5% said to punish offenders, while 4.0% suggested trademarking. The use of the authentication code remains the leading measures suggested by the respondents in curtailing the menace.

Discussion of Findings

The tables above show the findings from the respondents. We will be using the tables above to analyse and answers to the research questions guiding this study. It would show our respondent's awareness of the public relations tools used by the beauty and cosmetics industry. Moreover, the public relations tools of the beauty and cosmetics industry are aware of and their suggestions on ways to reduce the rate of piracy in the beauty and cosmetics industry. The findings from this study will be discussed based on how it has answered the research questions posed for this study.

RESEARCH QUESTION 1: *What are the PR activities of the selected beauty and cosmetics companies in Nigeria?*

This research question attempts to deduce the respondents' awareness of the beauty and cosmetics industry's public relations practices in Nigeria.Based on the survey results, the analysis showed that the respondents are well aware of the beauty and cosmetics industry's public relations practices. Findings in this regard are available in table 5. The public relations activities that the respondents are cognizant of include; product launch, which was identified by the majority and makeup fair. See findings in this regard can be found in table 6. Deduced from this is the fact that the respondents are fully aware of these public relations activities, and they can identify these activities.

RESEARCH QUESTION 2: *What are the PR tools and objectives used by the selected beauty and cosmetics companies in Nigeria?*

This research question tries to identify the public relations tools through which the respondents became aware of the public relations activities of the beauty and cosmetics industry in Nigeria. From the data generated from in table 7, essential tools through which the respondents became primarily aware of the PR activities are traditional billboards and social media Instagram.

Means that the primary tools through which respondents get awareness are through billboards, followed by Instagram and Twitter. Two of these tools are social media which means social media is a vital tool in creating awareness and also the use of the billboards is vital.

RESEARCH QUESTION 3: *What are the public awareness and perception of the PR practices in the beauty and cosmetics companies in Nigeria?*

Tables 10 and 11, respectively, shows how the respondents perception of the PR practices of the beauty and cosmetics industry in Nigeria. From the outcome of Table 10, it is clear that the beauty and cosmetics industry's public relations efforts go a long way towards shifting consumer attitudes. Also, as shown in table 11, 70.9% answered in the affirmative that they were satisfied with the beauty and cosmetics industry's public relations activities, 22.1% answered in the negative. In comparison, 7.0% stated that they are not sure whether or not they were happy.

This result denotes that the PR activities of the beauty and cosmetics industry are effective in influencing the thoughts of the public. If PR does not warn and affect public actions and decisions, then the primary goal of establishing a mutual relationship has failed to be achieved.

RESEARCH QUESTION 4: *Are PR activities effective in curtailing the menace of piracy in the beauty and cosmetics industry in Nigeria?*

Based on the data generated from the survey in tables 8 and 9, the table shows how the respondents rate the success of public relations in fighting piracy. 46.2% stated that the activities are excellent; 37.7 % stated that it is above average, 9.0% stated that it is average. In comparison, 4.0% and 3.0% respectively, stated that it is inadequate. Means that the respondents see public relations tools as a useful tool in fighting piracy; hence, the importance of public relations in fighting piracy is essential. Therefore, public relations tools are necessary for the war against piracy in the beauty and cosmetics industry, and the result will help in building a favourable image of the industry.

RESEARCH QUESTION 5: *What to do to maintain and enhance PR and its positive effect on the industry?*

Based on the data from the survey, in tables 13 and 15, respectively, the respondents gave insights into the areas of improvement in the beauty and cosmetics industry in Nigeria. That is the area of improving the delivery of their activities. The tables, as mentioned earlier, show the suggested areas of improvement. Hence, the primary area mentioned by the respondents is the use of publicity/adverts and the use of social media. Also, the use of authentication code and government intervention are significant measures in order to win the battle against piracy. Also, it is a need for customer sensitizations about how to tackle piracy in the industry.

Conclusion

This study informs that PR is essential and necessary in creating awareness for the beauty and cosmetics industry in Nigeria and also a veritable tool in fighting piracy in the industry. When we talk about building a strong relationship between an industry and a brand, public relations takes the upper hand. So the importance of public relations in the beauty and cosmetics industry can never be overemphasized. Thus, in order to curtail piracy in the beauty and cosmetics industry, the use of public relations tools must the order of the day in the beauty and cosmetics industry. Companies and organizations need to know that they need to make use of public relations always.

Recommendations

The following recommendations are sufficient, based on the aims, findings and conclusion of this study:

1. The beauty and cosmetics industry needs to avail itself the social media for public engagement and interaction. It will bring them closer to their consumers. That way, they can begin to

sensitize them about the side effect of using a fake product on their skin and the side effect on their health in general.

2. The government need to enact regulatory bodies that will watch the activities of the beauty and cosmetics industry and fight the issue of piracy. Through these bodies, the government can always do market raids and destroy any shop that sells counterfeits products.
3. Companies need to undergo a severe rebranding and make sure they do a constant rebranding of their product. They also need to trademark their brand; that way, it will be easier to punish perpetrators.

Abstract

United Nations' Sustainable Development Goal four is about quality education. This goal is significant partly because of the humongous numbers of stakeholders and investors in secondary school education all over the world. In Nigeria, there are half a million public and private secondary schools catering to the instructional needs and future careers of 42 million pupils. Parents and guardians, educational agencies and tertiary institutions, among several other groups are interested in the image and reputation of secondary schools. Public relations provides the best communication platform for projecting and affirming the image and reputation of any secondary school that offers quality education. The study aims to investigate the public awareness/perceptions of public relations actions of selected public and private secondary schools in Ota, Ogun State, Southwest Nigeria. Built on a theoretical framework of Grunig's Two-way Symmetrical public relations model, stratified sampling of two hundred and fifty (250) respondents is applied using the questionnaire instrument. Findings indicate that the public relations activities of secondary schools are known majorly through the word-of-mouth channel of communication and during Parents-Teachers' Associations meetings. The study recommends the creation of public relations departments /or engagement of professional PR consultants in order to connect positively with parents and guardians, teachers and several other relevant stakeholders and investors in secondary schools in Nigeria.

Keywords: Public Relations, Secondary Schools, Private, Public, Teachers, Parents and Guardians

Introduction

As described by Galloway, (2018); Hong, (2014), Public relations actions involve the process of transparency in communication which maintains an honest, meaningful, long-term working relationships with an identified publics of an organization. It is an act of communicating mutual assurances and benefits between an organization and its publics (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu

et al., 2020b). Public relations moulds an organization's image, portraying it in a positive light to their target groups of people (James *et al.,* 2019). Excellent public relations stand on thoughtful, truthful, open, strategic, and symmetrical communication of an organisation's real state of affairs (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). As opined by Adelua *et al.,* (2020a, 2020b) and Fayemi (2020), everyone's actions (words, impressions, views) about schools, helps to create the images that forge the relationships which end up building the reputation of such schools. Communication helps schools welcome outsiders in meaningful ways; it accommodates the diverse communication needs communities have and ensures that they build a relationship between the public and themselves in order to overcome mistrust and negative perception.

Significant public relations actions include public enlightenment and empowerment programmes (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). Also, typical and tangible tools of public relations media such as brochures, newsletters, websites and others help in disseminating critical institutional information. However, successful communication involves both listening and talking, teaching and learning and giving and receiving between schools and communities. (Shircliffe, Dorn & Cobb-Roberts, 2006). In secondary schools, the target publics are parents and guardians, guardians, government, communities, pupils, operators of tertiary institutions, employees, employers, governing boards and old students' associations. Carrying all these along all the time could be arduous yet profitable for secondary schools (Galloway & Swiatek, 2018).

Statement of the Problem

Public Relations entails deliberate actions which actively deal with image building and establishing mutual relations with publics. However, secondary schools need to consistently and adequately communicate effectively to their publics. Engagement of schools' PR activities will help them to gain the trust and goodwill of their publics; this could also enable publics to support and get involved in public relations actions actively. Rick (2018) opined that though school district leaders often overlook PR, it is important to understand that it serves as an incredibly role in the positioning of the school in the community.

Parents and guardians expect their children's schools to be safe and secure while providing quality education. These expectations are not only from parents and guardians but also the public. Lacuna occurs with unprofessional communication of these expectations between the public and the schools. Secondary schools which are meeting these expectations but not able to organize public relations actions to communicate their achievements, unknowingly create room for public misunderstanding. Schools which are unable to meet the expectations but lack public relations actions to communicate it are even worse. It is one thing to execute public relations actions; it is another matter if the public is involved and value the actions. The study is to investigate the public awareness/perceptions of public relations actions of selected public and private secondary schools in Ota, Ogun State,

Southwest Nigeria to determine whether such programmes exist to the best of their knowledge. From these perspectives, this study seeks the opinions of parents and guardians and teachers, because they are critical operational stakeholders in secondary school education anywhere in the world.

Research Objectives and Questions

This study examines the public relations actions of private and public secondary schools in Ota, Southwest Nigeria**.** Also, the study seeks to discover the level of public awareness and public relations activities of schools in the selected scope. This would investigate the public's perceptions of these selected schools to highlight areas for improvement. Based on these objectives, this study answers the following questions:

1. What are public relations practices in selected private and public secondary schools in Ota, Nigeria?
2. What are the sources and level of public awareness of the public relations practices of private and public secondary schools in Ota, Nigeria?
3. What is the public perception of secondary schools' public relations tools used to communicate with target stakeholders?
4. What can secondary schools do better to handle their public image through appropriate public relations actions?

Literature Review

Public relations do not operate in a vacuum but with the support of stakeholders (Nwosu *et al.,* 2019). It involves an intentional, consistent communication plus active attention toward audiences in such a way that establishes, nurtures a positive, mutually beneficial relationships (Handley 2011). Public relations monitors, surveys and researches issues and happenings in the environment for the promotion of organizations in public minds (James *et al*., 2020a, 2020b). John (2007) argues that in order to establish mutually beneficial relationships with the public, it is essential to provide them with opportunities to give feedback and engage them in two-way conversations that establish connections. Well-structured public relations activities in a secondary school setting basically rely on listening as well as communicating. It helps to allay the fears and concerns of customers. In marketing communication which houses public relations, the customers have options for every service imaginable because of this, they are considered Kings; including school's customer service which is no exception (Odiboh & Ajayi 2019, Odiboh 2020a).

Parents/Guardians when faced with decisions about the choices of schools for their kids; they ask friends, family, look at schools' websites for reviews and recommendations. Public relations gives organization the opportunities to put the public's interest first, this way, common misconception are avoided such as; PR in the secondary school setting is structured to handles crisis (Adelua *et al*., 2020a; James *et al*., 2020d; Nwosu *et al.,* 2019; Aiyende *et al.,* 2020a) However, if schools make the efforts of building trust and respect with publics when times are good, they are going to create room for the benefit of the doubt when a crisis hits. The school will have established habits of consistency

and transparency that is key in dealing with crises. Public relations for schools is just as important, if not more important when there is good news to share (Brooks, 2016).

The Role of Public Relations in Secondary Schools

Public relations serve an educational and rhetorical role by providing the media with suitable materials, packaged in a form that facilitates media consumption. The symbiotic relationship with the media is crucial and of great communicative significance. Useful P.R information is the bedrock of every growing organization today because such information can affect the existence of an organization. PR activities can be carried out through the media which helps to position the organisation as an information source on issues relevant to its operations. Today, society has moved into an age in which one cannot control all of the messages about an organization, especially schools. If organizations do not provide positive messages and a strong impression, they would be vulnerable to crisis. It can be said to be negligent if an organization fails to recognise the need for PR (Ball, 2006). According to …. Experts in the field believe commitment or the lack of it on the part of senior management and their willingness to devote time and resources to the internal communication function will determine their organisation's success. L'Etang (2004) corroborated this when he posited that P.R practices present to the public the real image of an organisation and the articulation of its aims and objectives.

Smith (2007) suggests that public relations are all about recognising performances, being kind, and then letting people know about the organization goodwill. His position also dismisses any impression that PR is a device to mask organisational shortcomings. Effective PR depends on the worth of an organisation or individual. Thus, the role of PR practitioners is to increasingly work out the success of the organisations to develop more honest and transparent policies which will be easily able to promote; This will enable them reach larger publics of the organization with whom they must communicate effectively, and emphasis the necessity of an open, transparent and positive image, however, schools have been slow to appreciate the benefits of developing a PR strategy (Clark, 2013). Furthermore, a well planned P.R gives an organisation the possibility of being proactive to respond to situations with a more coherent message(s). P.R roles also encourage building positive public perception which is an everyday process that involves the entire working comprehensive plan of the school.

Why Public Relations in Secondary School?

McClellan and Gann (2002) highlighted some of the changes in attitude and pressure on schools to be publicly accountable for their policies; McClellan and Gann (2002) pointed to technological advances of free information which has impacts on organisations such as schools. Schools and media organisations need each other to afford them with a symbiotic relationship; this can be achieved through the help of P.R engagement in secondary schools. According to …. Doing nothing leads to negative misconceptions, difficulty in recruiting staff and lack of motivations among both staff and pupils which can also deter guardians from sending their children to that school. As opines by Gilheany, (2006) "A good reputation raises expectations about the organisation's success, and the

organisation's success will enhance its reputation". Also, organizations cannot buy or bribe their way to a good reputation, or advertise for it; except through relationships with publics (Gregory, 2010). Public relation enhances the reputation of secondary schools which is critical in developing the public perception of the schools; more so, image, identity and reputation are closely linked. Identity contributes to the image and both conditions the reputation, however, schools with strong track records in these areas have a head start in projecting a favourable image, and even schools with 'unfavourable' characteristics can improve their image through a targeted campaign (Odiboh, Ezenagu, & Okuobeya 2019, Odiboh, 2020b).

Image Branding in Public Relations

According to Olabanjo, *et al*. (2019, 2020b), brand images should be positive and unique, because consumers are not only purchasing the product or service but also the image associated with that product or service built over time with the function of public relations. Danesi (2006) opines that branding is ultimately a social act, it is the product, service or company inserting it as an element of the web of meanings that constitute a culture (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). It is equivalent to the process of bringing human beings into the social order by giving them a name. Moorhead (2011) adds that appropriate branding in schools; it boosts confidence makes a school unique to the people outside it. These heightening of awareness over the importance of a school's image co down to several factors. However, one competition for students' enrolment in overlapping catchment areas can affect school's finances. Secondly, the need to disallow negative reputation, which could further damage the schools' chances of attracting potential students.

One of the most significant concerns for PR practitioners in the management of the organizational image is what the public thinks about the institution. Based on this image, the public settles on their choices, when they have information to clarify. Existing public relations culture of connection influences public altruism or hesitation towards an organization. Image attracts or repulses, connecting or disconnecting depending on how an organization transacts with it in the open (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a).

Theoretical Framework

The Two-Way Symmetrical model of public relations developed by James Grunig in 1984 gives backing to this study. With regards to the historical development of public relations practice in the United States of America, Grunig and Hunt (1984) proposed the model, among others, to encompass all models and theories in public relations. The P.R model describes the role and function of modern-day public relations, as it aims to achieve mutual understanding between an organisation and its publics. In this model, public relations practitioners use research and information interchange to bring about mutually beneficial changes for both an organisation and publics. Negotiation, accord

and conflict resolution are some of the strategies used to obtain understanding and change behaviours of both the public and organisations such as secondary schools. Grunig and Grunig (2002) opined that the two-way symmetrical model is the most effective as well as the most ethical framework for public relations. It tells a lot about the need for the two-way symmetrical public relations strategies in the secondary schools in Nigeria to possibly reduce the level of unfriendly relationships between the political class and members of the society.

Research Design and Methodology

A quantitative methodology with a survey design applies in this study. Thus, a questionnaire was the instrument used to collect data processed with the Scientific Package for the Social Sciences (SPSS) software. Olufemi (2012) posited that "a questionnaire gives a good opportunity for the researcher to collect raw data, especially if the questions are well worded and the questionnaire well administered" (pg.46). Two hundred and fifty respondents received copies of the questionnaire. The respondents were selected using the stratified random sampling procedure. However, only 200 copies returned adequately filled. Stratified random sampling is a technique that involves the distribution of a population into smaller groups or strata. For the selection of the representative sample. This sampling technique is utilised based on members' shared attributes or characteristics, as Onabanjo (2010) justifies.

Two hundred and fifty teachers and parents and guardians of pupils in four (two private and two public) secondary schools form the strata of participants in equal proportions. The study took place in Ota, a town of mixed industrial and residential areas housing 41 public and private secondary schools. The questionnaire contains two sections (A and B). Section A queries the respondent's awareness and perceptions of secondary schools' public relations activities; while elicits the demographic attributes of the respondents.

Data Presentation and Analysis

Table 1: Awareness of public relations

Option	Per cent
Yes	95.0%
No	4.5%
Missing system	.5%
Total	100.0%

Table 1 illustrates that (95.5%) respondents knows about Public Relations, while (4.5%) respondents does not know about it.

Table 2: Awareness of public relations activities in the selected schools

Option		Per cent
	Yes	62.5%
	No	35.5%
	Missing system	2.0%
Total		100.0%

Table 2 indicates that (63.8%) respondents are aware about public relations activities in the selected secondary schools; while (36.2%) respondents are not aware about public relations activities in the schools.

Table 3: Schools' public relations activities which the respondents know

Option		Per cent
	PTA Meetings	12.5%
	Seminars	7.0%
	Open day events	2.5%
	Cultural day events	2.5%
	Social media platforms	4.5%
	Newsletters	2.0%
	Pamphlets or newspapers	5.5%
	Billboards	2.0%
	12 Others	16.0%
	Missing System	45.5%
Total		100.0%

Table 3 shows the type of PR activities respondents are aware of. 22.9% respondents knows PTA Meetings; 4.6% respondents knows Open day events, 4.6% respondents knows Cultural day events, 12.8% knows Seminars, 8.3% respondents knows Social media platforms, 3.7% respondents know

Newsletters, 10.1% respondents know Pamphlets or Newspapers, 3.7% respondents know Billboards. In comparison, 29.4% respondents stated others.

Table 4: Media through which the respondents become aware of those activities

Option		Per cent
	Word of mouth	29.5 %
	TV	17.0%
	Newspaper	8.5%
	Billboards	7.0%
	Radio	6.5%
	Facebook	4.5%
	Seminars	4.0%
	Press conferences	2.0%
	Twitter	1.0%
	Instagram	.5%
	Friends	.5%
	23 Others	14.0%
	Missing System	5.0%
Total		100.0%

The media through which the respondents became aware of the schools' public relations activities feature in Table 4. The table shows (17.9%) respondents said through TV; (6.8%) respondents said through Radio; (8.9%) respondents said Newspaper; (31.1%) said Word of Mouth; (4.7%) respondents said Facebook; (.5%) respondents said Instagram; (1.1%) respondents said Twitter; (2.1%) said through Press Conferences; (4.2%) respondents became aware through Seminars; (7.4%) respondents said Billboards; (.5%) said through Friends, and (14.7%) respondents said others.

Table 5: Whether PR plays an essential role in the schools' image

Option		Per cent
	Yes	90.5%
	No	3.5%
	Not sure	5.5%
	Missing system	.5%
Total		100.0%

According to Table 5, (91.5%) respondents think that public relations play an essential role in the schools' image, (3.5%) believe it does not; while (5.5%) are not sure if it does.

Table 6: To find out whether the respondents are satisfied with the public relations activities of the schools

Option		Per cent
	Yes	56.0%
	No	43.5%
	Missing System	.5%
Total		100.0%

Table 6 illustrates that (56.3%) respondents are satisfied with the public relations activities in the school, while (43.7%) respondents are not satisfied.

Table 7: The contribution of P.R activities to the respondents' knowledge about the schools' image

Option		Per cent
	Yes	59.0%
	No	22.0%
	Not sure	15.5%
	Missing System	3.5%
Total		100.0%

Table 7 shows that public relations activities have added to what (59.0%) respondents know about the schools and what they stand for. meanwhile, it has not added to what (22.8%) respondents know about the schools. Nevertheless, (16.1%) respondents are not sure if it does.

Table 8: Ways which public relations has added to the respondents' knowledge about the schools.

Option		Per cent
	Gives knowledge about happenings around the school	29.5%
	Gives a better understanding of the student-teacher relationship	5.5%
	It has helped to improve communication and interaction with others	6.0%
	Others	18.0%
	It has not added to my knowledge	.5%
	Missing System	40.5%
Total		100.0%

Table 8 states ways public relations have added to respondents' knowledge of the schools. (49.6%) respondents said it allows them to know happenings around the school; (9.2%) respondents said it allows them to understand the student-teacher relationship better. (10.1%) respondents said it had improved their communication and interaction with others; (30.3%) said others. Meanwhile, (.8%) respondent said it has just added to their knowledge.

Table 9: Whether the respondents get updates on new policies, activities and general information about the schools

Option		Per cent
	Yes	75.0%
	No	23.0%
	Total	98.0%
	Missing System	2.0%
Total		100.0%

From Table 9, (76.5%) respondents claim that the schools update them with new policies, activities and general information about their programmes. However, (23.5%) respondents said that the schools do not update them.

Table 10: Rating the information received through the schools' public relations activities

Option		Per cent
	Average	36.5%
	Above average	26.5%
	Excellent	21.5%
	Below Average	10.0%
	Very Poor	5.0%
	Missing System	.5%
Total		100.0%

According to how respondents rated the frequency of information they get about the school's public relations activities in Table 7, (21.6%) said Excellent, (26.6%) said Above average, (36.7%) said Average, (10.0) said Below Average while (5.0%) said is very poor.

Table 11: Respondents' perception of the schools

Option		Per cent
	Above Average	35.5%
	Average	30.5%
	Excellence	24.5%
	Below Average	5.0%
	Very Poor	5.0%
	Missing System	2.5%
Total		100.0%

Table 11 reveals the perceptions of respondents about the school which (25.0%) responded Excellent; (36.2%) responded Above average; (31.1%) responded Average; (5.1%) responded Below average; and then (2.6%) responded very poor.

Table 12: Areas to improve in the information dissemination and other public relations functions of the schools

Option	Per cent
Creating of or improvement of the public relations office	40.5%
Embarking on PR & Information dissemination programmes	11.0%
Social media	9.0%
Use of a communication book	4.0%
12 Others	17.5%
Missing System	18.0%
Total	100.0%

The following are ways respondents think the schools can improve in Table 12, (11.0%) said they should make use of Social media; (4.9%) said the use of Communication books; (13.4%) said Embarking on PR & Information dissemination. In comparison, (49.4%) respondents said Creation of or improvement of the public relations office, and (21.3%) said other means of improvement.

Summary of Findings

According to the findings of this survey, Table 3 shows that 25 (22.9%) respondents are only familiar with PTA Meetings as PR activities in the school apart from 32 (29.4%) respondents which indicated others and were not specific enough. However, in Table 4, the more significant number of these respondents, which are 59 (31.1%) in number became aware of those activities by Word of Mouth.

According to Table 5, 181 (91.0%) respondents think public relations play an essential role in the school because Table 7 shows that public relations activities have added to what 118 (59.0%) respondents knows about the school and what they stand for. Furthermore, 59 (49.6%) respondents said it allow them to know about happenings around the school in Table 8. Nevertheless, in Table 6, 87 (43.7%) respondents were not still satisfied with P.R activities in the school.

From Table 9, 150 (76.5%) respondents think the school keep up to date with new policies, activities and general information about their programmes, on the other hand, Table 7 indicates that 73 (36.7%) respondents rate the information frequency about the school's activities as being average. While Table 11 reveals that the perceptions of 71 (36.2%) respondents about the school are Above average.

The following are ways respondents think the school can improve in Table 12, 18 (11.0%) respondents suggested Social media, 8 (4.9%) respondents said they use of Communication books, 22 (13.4%) said Embarking on PR & Information dissemination. In comparison, 81 (49.4%) respondents said Creation of or improvement of the public relations office.

Discussions of Finding

RQ1: What are public relations practices in private and public secondary schools in Ota, Nigeria?

The public relations practices in secondary schools include; PTA meetings, cultural day events, social media platforms engagements, seminars, the use of newsletters, the use of Billboards. According to Table 3, respondents are mostly familiar with PTA meetings. The reason is that some are not enlightened enough to know what public relations activities are and how public relations activities are to be carried out. It also means that the secondary schools' Public Relations' practices are majorly limited to Parents-Teachers meetings. Whereas, other practices, mainly social media engagement should be one of the most prioritize since the world is now a global village (Mcluhan, 1992).

RQ2: What public relations tools do private and public secondary schools in Ota, Nigeria use?

The findings in Table 4 identified the tools; Television, Radio, Newspaper, Word of Mouth, Facebook, Instagram, Twitter, Press Conferences, Seminars, Billboards, Friends. However, here, majority of respondents become aware of PR activities or get to know about a school through Word of Mouth; word of mouth can also be in the form of testimonies (speaking the goodwill of the school) and public's satisfaction. All the public relations tools listed above serves a very crucial role in setting the image and building goodwill for the school. Publics do not need to struggle for information about the school if the tools of information dissemination are used adequately.

RQ3: What is the level of public awareness and perception of public relations practices in private and public secondary schools in Ota, Nigeria?

As mentioned previously, some respondents are not enlightened enough to know what public relations activities are and how public relations activities are to be carried out. This assertion does not imply insufficient information about activities but as a result of apathy from field observations and also from submissions of public relations personnel in secondary schools. The ones that are quite familiar with public relations activities thinks public relations play an essential role in the school, and this shows in Table 5. Consequently, in Table 6, specific percentages of these same respondents are not satisfied with the public relations activities in the school. As such, public relations in secondary school need to keep up to date with new policies, activities and general information about their programmes. These updates will help improve the level of awareness and create a healthier mutual relationship with publics.

Conclusion

The research has shown that successful school's PR and communication programs help schools earn the trust of the public, their support and the involvement of the communities. If secondary schools can get their public relations activities right, it would be beneficial to the point of receiving immediate feedback, because it is one took that enhances the development of the school. This way, secondary schools that takes proactively defined P.R approaches benefits great images and reputation. The study also shows that majority respondent's advice that there should be creation and improvement of the public relations office as well as consulting experts in the field that will work directly with the members of the public. The most important stakeholders are parents/guardians of the school's pupils; however, they are the ones whose word of mouth can create most positive benefits for the image and reputation of a school. Improved newsletters and well-designed website can create essential points of contact, therefore, more than anything else, PR is secondary schools can establish a more open and transparent attitude toward targeted publics.

According to National School Public Relations Association (2018), Students do better when guardians (parents) and community gets involved with schools activities. Reliable communication is essential to creating the foundation for effective partnerships with parents/guardians and the community. Schools and educators need to carefully talk and listen as they build the collaborative environment that meaningful engagement needs to work genuinely. Excellent schools need great teachers, dedicated administrators, safe facilities and responsive programs. Nevertheless, all of these components combined can fail to produce successful students and schools if the mix is missing of vital ingredient: the active involvement of parents and guardians and the community. Parents and guardians to have particular expectations for school communication. Furthermore, those demands have been expanding as changing media and greater access to information-on-demand places more pressure on schools to be open, responsive and transparent.

Recommendations

The study recommends the creation and improvement of the public relations office in secondary schools. Establishing public relations departments or consulting experts in the field that will work directly with the members of the public is necessary. This way, getting public relations tools right becomes easy. It would boost relationships with relevant stakeholders, especially the parents and guardians of pupils. Therefore, School(s) needs to do more is building substantial relationships with the public by communicating their healthy activities, facilities and expertise always. Public relations in secondary schools have to do with the messages communicated and the relationships established with publics. More of PR activities in secondary schools will promote school's brand, associate with the community, then, boost marketing efforts. The consistent, deliberate messaging coupled with the end goal of creating and nurturing relationships with the public are keys to school's success. And secondary schools needs to do better job at keeping their publics informed about their daily engagements.

Abstract

This paper seeks to evaluate the image of the food and beverage industry in the eyes of the public in Nigeria. The intention is to find out how food and beverages customers in the Festac Town, Lagos, Nigeria, perceive the corporate image of the industry. In order to achieve this objective, we adopted a survey research design with the use of a questionnaire as the instrument for data collection. Two hundred buyers of indigenous foods and beverages were randomly selected in four markets surrounding Festac Town. Copies of the questionnaire operated on the respondents provided the data which was processed with the Scientific Package for the Social Sciences. The findings show that the majority of the public have a positive perception of the industry. However, one primary barrier is that the public is not aware of the PR activities of the industry.

Keywords: Public relations, image management, awareness, perception, food and beverage

Introduction

The image of an organization corresponds to the psychological model that its several distinct publics conjecture. It resembles an idea or a description, containing intellectual, emotional and sensorial data. An image emerges through the data that individuals get about the organization, which they first get and then sort out in their 'information bank', in a personal way.

Image management insinuates the moves made to make, keep up, and when essential, package a perfect image as per organizational stakeholders (Willi, Nguyen, Melewar and Dennis, 2014). An organization's image "is a sweeping and clear impression held by an individual or a specific social event towards an organization and is an eventual outcome of sense-production by the get-together and correspondence by the organization" (Hatch and Schultz, 1997, p. 359). Research exhibits that organizations must support a charming image to be successful (Fariaa and Mendes, 2013). Besides, organizations that do not partake in successful image management increase the odds for disappointment (Gilpin, 2010; Seeger, Sellnow, and Ulmer, 1998).

Organizations must manage their image to earn a good reputation. They need to understand that it is their good reputation that boosts brand patronage as well as sustain brand loyalty. Most organizations participate in various advances and systems to ensure that they keep up a positive image, as demanded by their stakeholders. This reality is proof that without a doubt, there is a stable constructive relationship between the way by which individuals see an organization and the intended corporate picture, then there is no brand patronage.

Each organization has its image whether the organization takes care of business or not. This image is reliant on the stakeholders' impressions and public conversations (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). An organization's image to an immense degree impacts stakeholder's response to corporate activities. Images are the psychological photos of an organization. It is the entire of these explicit attributes of the enterprise that we suggest as the corporate image.

Oxford Advanced Learner's Dictionary (2000) describes a corporate existent as an organization with a business concern. Formbrun (1996) describes a corporate image as a broad estimation of an organization in the eyes of its friends and foes. As shown by Rayner (2003), the corporate image presents distinct central points and benefits on organizations. It demonstrates that it is hard to impersonate. Meanwhile, it performs its normal duties irrespective. Consequently, organizations proceed with their corporate image through stable and steady relationship with most of their constituents. Examples of such constituents are clients, providers, monetary specialists, arrangers, and government (Formbrun, 1996).

Also, as opined by Villanova, Zinkhan and Hyman (2000), image is a general impression of the organization held by various sections of individuals all in all. It is the mental picture an individual form about an entity. An organizational image is the product of discourse among individual and group stakeholders (Erdem, 2013). Because of the dialogic idea of organizational images, organizations must strategically speak with stakeholders to foster specific images and discourage others. As Garbett (1988) argues, even though the image is real, it is entirely possible as well as desirable to select and promote those characteristics that fit with the strategic plans of the organization. Improvement of a firm's image requires a regular reassessment of the organization in all ramifications of marketing communication (Odiboh & Ajayi, 2019).

Statement of The Problem

The quality of the image of foods and beverages companies is of great value and importance to the industry in any country, worldwide. Nigeria is not an exception. There are regular complaints about the environments, packaging, tastes and communication deceptions about some foods and beverage products. These complaints directly and indirectly touch on the image of the manufacturers and marketers of such products. The argument in public spaces is that only a bad organization will produce and offer the public bad food or poorly beverages. Proper image management through positive public relations actions helps to control such public perception of organizations. An image is "something projected" by the organization, and "something saw or interpreted by others" (Cheney and Vibbert, 1987, p.176; Willi *et al*., 2014). Subsequently, this work takes a look at public mindfulness and impression of selected food and beverage organizations in Nigeria and what their different "publics" think about the industry. It additionally takes a gander at the control instrument connected by organizations in dealing with their image.

Research Objectives

The following are the objectives of this study:

1. To examine the image problems in the food and beverage industry in Nigeria.
2. To determine the PR tools applied to control the image problem of the food and beverages industry.
3. To find out the public understanding of image quality of food and beverage companies in Nigeria.
4. To investigate public awareness of the PR activities of food and beverage companies in Nigeria.
5. To examine the public perception of the food and beverage industry in Nigeria.
6. To find out if the public knows and understand the image control actions of food and beverage companies in Nigeria.

Literature Review

Students of history differ on the first date of public relations (PR) practice. Generally, Americans are known to concoct PR. However, Chinese researchers have called attention to their rulers who practised something akin to contemporary PR, over 5,000 years ago. Although the simple primary practice of PR may have started thousands of years prior, it has been an occupation just for around 100 years within marketing communication umbrella (Odiboh, Ezenagu, & Okuobeya, 2019). It is as of late, in any case, that PR has formed from occupation into a profession in numerous nations. In other words, PR has been something that individuals did to acquire monthly salary.

There was no formal instruction in PR (The International Public Relations Association, 2003). PR is an occupation that has been characterized more by its procedures than by its hypothesis. As indicated by Reddi (2009), most PR practitioners have been the experts of various systems. They have realized

how to ensure media inclusion, prepare press releases, and compose and plan leaflets. They also produce video news syndication, arrange special corporate occasions, or prepare annual general meetings (James *et al.*, 2019). Notwithstanding being an occupation characterized by methods, PR practitioners have likewise given the vast majority of their endeavours to imparting through the broad communications. Most have trusted that they could influence enormous quantities of individuals through publicity alone.

The Role of PR in the Food and Beverage Industry

In Nigeria, the food and beverage industry is one that is image-focused. Numerous individuals buy the brands of most food and beverage organizations dependent on their mental picture about the manufacturers. In any case, public relations is one extraordinary apparatus that helps shape the image of this industry. An image is what individuals think, and a great many people have an independent perspective (Reddi, 2009). PR practitioners help various publics to develop constructive images about the organization when they counsel the organization to carry on in manners that individuals outside the organization need (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). Refined PR practitioners understand that they should serve the interests of individuals influenced by organizations (Grunig, 2001).

Public Relations departments help organizations become progressively powerful by structured relationships with publics that influence the organizations or are influenced by the organization's exercises (Grunig, 2001). Grunig further shows that a food and beverage organization with excellent relationships with its key publics may need to consolidate the public nutrition into its central goal. Over the long haul, it will almost certainly seek after its objectives more viably than it would on the off chance that it disregarded or battled the objectives of publics. Subsequently, high PR enables an organization to make a superior image by providing better administrations to clients (Aiyende, *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a).

At the point when the PR division enables an organization to construct significant relationships with publics, it increases the nutritional and healthcare value of the society just as to organizations' profitability. Grunig avers that PR ought to be a necessary piece of the management of each organization. PR capacity enables the organization to connect with the partners in its condition both to achieve its central goal and to carry on in a socially capable way. An astounding PR staff cannot serve this job, be that as it may, except if research and estimation are an essential piece of the capacity (Fayemi *et al.*, 2019).

Developmental research is vital to distinguish what the public wants to eat or drink and decide how to create and keep up relationships with them to meet this need. Evaluative research is essential to build up the adequacy of PR programs and their commitment to organizational viability. PR works all in all can be evaluated by contrasting them with a hypothetical benchmark and by their commitment to the moral and socially capable conduct of the organization.

Regularly, the food and beverage industry continues creating new offers, and this draws in more shoppers to the organizations. However, realizing how to support the feeding enthusiasm of these individuals is what is fundamental. When we talk about continuing interest, it is the job of the PR practitioner to comprehend what to do about these individuals (Nwosu *et al.* 2019). They recognize what to impart and how to convey to these individuals to support their advantage. It is consequently no uncertainty that each organization needs a PR office on the off chance that they expect to keep going for quite a while. Organizations exist in a domain, and that condition comprises of numerous gatherings numerous vital publics. Organizations include relationships inside their group of workers and with networks, governments, purchasers, financial specialists, and the media. Organizational scholars call these gatherings' essential bodies electorate. PR scholars call them partners or publics (Odiboh & Oladunjoye, 2019). Critical bodies electorate or publics make up the earth of an organization. These publics can bolster or restrict the objectives of an organization. They need organizations to seek after

objectives that are critical to their survival. However, not really to the organization, for example, occupations for labourers, safe products, less contamination, and a sheltered network.

Publics have a stake in organizations, and they endeavour to impact the missions and objectives of these organizations. Organizations are compelling, when they pick and accomplish objectives that are imperative to their circumstance and public interest (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). When an organization disregards or contradicts the interests of the public, the groups concerned usually become restive, ready to challenge the organisation. Subsequently, PR serves society by working with groups of people to determine the contentions that destroy corporate existents (Grunig, 2001).

According to Grunig (2001), PR ought to be arranged, and overseen by experienced practitioners; it should fit into a social order (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). Publics comprise of social gatherings who react to the outcomes that organizations have on them and thus, endeavour to take an interest in management choices in manners that serve their interests. PR professionals are specialists in utilizing communication to manufacturing relationships. PR staff draws out the problems and perspectives on publics both representative publics and outside publics, to the consideration of different supervisors in making pivotal choices.

Theoretical Framework

The theory of organizational image management is the foundation of this study. It holds that an essential objective of an entity is the creation and support of an organization's image (Massey, 2011, 2010). Organizations discuss deliberately with partners to support alluring images and dishearten bothersome ones. Organizational image management theory is from the speculations of image management and self-introduction at the dimension of the individual (Goffman, 1959; Tedeschi & Riordan, 2013). Even though organizations are not the same as people in significant ways, organizations can be and are treated similarly as people by numerous scholars and practitioners. The view here is that an organization's image is the recognition that partners have about it (van der Merwe & Puth, 2014). So it is adjusted most intimately with the "imparted image" of Gioia and Thomas (1996). This view is a significant refinement in that it recommends that discourse is essential for the formation of an organizational image. In particular, an organizational image is grown dialogically by the organization and its partners after some time.

Method of Study

This study adopted the survey method because of the reliability and validity of its outcomes. A survey is the best method of collecting data for the description of a population too large to observe directly. According to Asika (2004), the survey technique focuses on population characteristics and its representative sample.

Population of Study

The population for this study refers to the individuals, items or subject examined. They are the population of interest to the researcher, and they are the objects that possess the information sought by the researcher Asika (2004). The population consists of buyers and traders of food and beverages products. The researchers selected four markets in Lagos, where products of this industry are highly patronized. The food and beverages markets include National Trade Fair (Aspanda), Mile 2, Okokomaiko and Featac which serve the 697,000 people living in Festac Town in mainland areas of Lagos State (National Office of Statistics, 2006). Festac Town was chosen because it is the largest residential estate in Nigeria housing virtually all the tribes in the country. A huge population translates into a large daily demand for food and beverages. Hence, based on the high demand for the products in these various markets, the researcher seeks to find out the image the public has about the manufacturers of the foods and beverages which they consume.

Sample size and Sampling Technique

For sample size, the researcher picked 200 respondents from all the markets to be a representative of the Festac Town population. The 200 respondents were evenly distributed in the four markets at 50 each. Hence, the sampling technique used here was the simple random sampling which gives every item in the population the likelihood of being selected.

Results

Through frequencies and percentages, the data were analyzed and presented in tables. The tables show the extent to which publics are aware of the public relations activities of tertiary institutions.

Public Awareness of Public Relations Activities

Table 1 through to table 6 answered question 1 to 4 and 6 in the questionnaire that seeks to know if the public is aware of the food and beverage industry in Nigeria and the public relations activities carried out by the industry.

Table 1: Awareness of the food and beverage industry in Nigeria

Options		Per cent
	Yes	43.5%
	Not Sure	29.%
	No	27.5%
	Total	100.0%

Out of 200 respondents, 43.5% said they are aware of the food and beverage industry in Nigeria. However, 29% of respondents said that they are unsure, while 27.5% said they are not aware of the food and beverage industry. The above information illustrates the respondent's awareness of the food and beverage industry in Nigeria.

Table 2: Food/beverages company they are familiar with

Options		Per cent
	Cadbury	47.7%
	Nestle PLC	18.1%
	UAC Foods	8.8%
	CWAY Foods	5.7%
	Rite Foods	6.7%
	Missing System	13.0%
	Total	100.0%

When asked to tick the companies they are familiar with, 47.7% said they are more familiar with Cadbury, 18.1% said Nestle, and 8.8% chose UAC foods. However, 5.7% went for CWAY foods, 6.7% said Rite foods. Hence, they are most familiar with Cadbury. However, there are other companies in Table 3 which the respondents listed that they know.

Table 3: Other companies known to the public

	Options	Per cent
	Golden Penny	10.90%
	Givens	8.30%
	Honeywell	4.70%
	Dufilprima LTD	3.60%
	CHI Foods	3.10%
	Real Milk	2.60%
	PZ limited	2.60%
	Glaxosmith LTD	2.10%
	Dangote	1.60%
	Others	60.60%
	Total	100.00%

Although there was a section for respondents to tick the companies, they are familiar with, and many respondents listed other companies that were not in the box. As seen in Table 3, 8.3% mentioned Givanas, 10.9% said Golden Penny, and 4.7% of the respondents mentioned HoneyWell. Meanwhile, 3.6% says Dufilprima LTD, 2.6% says Real Milk and PZ LTD, 1.6% says Dangote, 3.1% says CHI Foods and 2.1%, Glaxosmith LTD. This result contributes to the knowledge that they are indeed aware that Nigeria has a large food and beverage industry.

Table 4: Awareness of their PR activities

	Options	Per cent
	No	54.97%
	Yes	33.7%
	Not Sure	3.1%
	Missing System	8.3%
	Total	100.0%

Table 4 illustrates that the majority of the respondents are not conscious of the PR practice of the industry, because only 33.7% said that they are aware of the PR activities of the industry. More respondents (54.9%) say they are not aware, and 3.1% are not sure if they even know about PR in the industry. Therefore, from the data obtained, we can say public relations practice is not recognized.

Table 5: PR activities they are familiar with

Options	Per cent
Repair of bad roads	17.6%
Provision of Water	13.5%
Building of Schools	13.5%
Press Conferences	12.4%
Seminars	7.8%
Provision of a recreational centre	4.1%
Others	31.1%
Total	100.00%

Table 5 shows that 17.6% said repair of bad roads, 13.5% said they are aware of their provision of water and building of schools, 12.4% say one of the PR activities they are aware of is Press Conferences, while 7.8% says it is award seminars. However, 4.1% of the respondents said provision of recreational centres. There are several other PR activities mentioned which are insignificant to this result.

Table 6: How they became aware of these activities

Options	Per cent
Newspapers	16.60%
Radio	11.90%
Press Conferences	8.80%
Word of Mouth	7.30%
Television	5.20%
Instagram	5.20%
Twitter	3.60%
Seminars	3.60%
Billboards	2.60%
Friends	2.60%
Facebook	1.60%
Relatives	0.50%
Others	30.60%
Total	100%

Table 6 shows that 16.6% say they became aware of the PR activities of the industry through Newspapers, 11.9% became aware through Radio, 7.3% mentioned Word of mouth, 5.2% through Instagram, 5.2% through Television. However, 1.5% became aware through Facebook, and 3.6% through Twitter. Others are 8.8% through Press conference, Seminars have 3.6% respondents, 2.6% of

the population became aware through Billboards, 0.5% became aware through relatives, and 2.6% became aware through friends while 30.6% were missing systems.

Public Perception of Public Relations Practice

Questions 7, 8 to 16 in the questionnaire determined to identify the perception of the public to the public relations activities carried out in the various institutions.

Table 7: PR influence on thoughts about the industry

Options	Per cent
Not Sure	72%
No	20.2%
Yes	7.8%
Total	100.00%

Table 7 demonstrates that out of 200 respondents, 7.8% agree that the public relations activities carried out helped their thinking about the industry, 20.2% disagreed to this while 72% said they are not sure. Table 7, affirms that the public relations activities of the industry do not in any way shape the thinking of the respondents.

Table 8: The success of their PR activities in building the image of the industry

Options	Per cent
Above average	19.7%
Average	17.6%
Below Average	11.9%
Excellent	8.8%
Very Poor	6.7%
Missing System	35.2%
Total	100.0%

Table 8, shows that 19.7% rate the activities above average, 17.6% rated it average, 11.9% says it is below average, 8.8% of the respondents rate the success of the activities focused on building the image of the industry excellent, while 6.7% say it is deplorable.

Table 9: Food and Beverage Industry in Nigeria have the right image

Options	Per cent
Strongly Agree	66.3%
Agree	14.5%
Undecided	5.2%
Disagree	5.2%
Strongly Disagree	5.2%
Missing System	3.6%
Total	100.0%

Table 9 shows that majority (66.3%)of the respondents strongly agree that the food and beverage in Nigeria have the right image. However, 14.5% agree that the industry has the right image, 5.2% are undecided, disagrees and strongly disagrees. Therefore, we can say that the PR activities in the industry are compelling.

Table 10: Purchase decision is influenced by the image of the industry

Options	Per cent
Agree	45.6%
Strongly Agree	20.2%
Undecided	17.6%
Disagree	2.6%
Strongly Disagree	3.1%
Missing System	10.9%
Total	100.0%

Although 66.3% of respondents from Table 10 strongly agree that the industry has the right image, 45.6% agree that the PR activities of the industry also influence their purchase decision. On the other hand, 3.1% strongly disagrees, 2.6% say they disagree. In comparison, 17.6% say they are undecided. Therefore, the result affirms that the image has a lot to do with the purchase decision of the public.

Table 11: Food and beverage industry has a clear structure

Options	Per cent
Undecided	39.9%
Strongly Agree	23.8%
Agree	19.2%
Disagree	6.7%
Strongly Disagree	2.6%

	Missing System	7.8%
	Total	100.0%

39.9% of the respondents from the table says they are undecided if the industry has a clear structure, 23.8% say they strongly agree, 19.2% say they agree, 2.6% strongly disagrees, and 6.7% disagree. This result signifies that they do not know or they are not sure, and this is not a positive statement.

Table 12: Food and beverages companies in Nigeria have the right image

	Options	Per cent
	Strongly Agree	26.4%
	Disagree	21.2%
	Undecided	14.5%
	Agree	14.5%
	Strongly Disagree	4.1%
	Missing System	19.2%
	Total	100.0%

While Table 10 seeks to address the image of the industry in general, Table 12 addresses the image of the companies in the respondents' mind. It shows that 26.4% of the respondents, which is the majority strongly agree that the companies have the right image, 14.5% say they merely agree. Meanwhile, 21.2% disagree, while 4.1% say they strongly disagree.

Table 13: I can vouch for the food and beverages industry in Nigeria

	Options	Per cent
	Strongly Agree	26.4%
	Undecided	21.8%
	Agree	19.2%
	Disagree	10.4%
	Strongly Disagree	9.3%
	Missing System	13.0%
	Total	100.0%

This table shows the percentage of respondents that can boldly vouch for the industry and it shows that 26.4% would do that, 21.8% are undecided if they would, 19.2% agree that they would, 10.4 % disagrees, and 9.3% of the respondents strongly disagree that they can vouch for the food and beverages industry in Nigeria.

Table 14: I will be inclined to defend the food and beverage industry

Options		Per cent
	Strongly Agree	26.4%
	Undecided	21.8%
	Agree	17.1%
	Disagree	15.0%
	Strongly Disagree	6.2%
	Missing System	13.5%
	Total	100.0%

When allowed to say something about the industry, 26.4% says that they will defend the industry, 21.8% are undecided, 17.1% agree, 15.0% disagrees to this and 6.2% strongly disagrees. This result shows the respondents' level of loyalty and trust for the industry.

Table 15: Food and beverages companies have a bad image

Options		Per cent
	Strongly Agree	22.3%
	Disagree	18.7%
	Undecided	18.7%
	Agree	13.5%
	Strongly Disagree	9.3%
	Missing System	17.6%
	Total	100.0%

Table 12 asked whether the food and beverages industry has the right image. The answer provided was mainly yes. Nevertheless, Table 15 shows the contrary with 22.3% of the respondents saying they strongly agree that the companies have a terrible image, 13.5% agrees, 18.7% are undecided and also disagrees while 9.3% strongly disagree.

Table 16: The communications platform of the industry is good

Options		Per cent
	Strongly Agree	24.9%
	Undecided	17.1%
	Disagree	17.1%
	Agree	16.6%
	Strongly Disagree	9.3%
	Missing System	15.5%
	Total	100.0%

Communication is paramount in every organization and based on this table. It seems that organisations in the industry communicate well with their publics because a majority of the respondents (24.9%) say that they strongly agree that the industry communication platform is excellent. Both 17.1% of the respondents say they are disagreeing and at the same are undecided if the communication platform of the industry is good leaving 9.3% saying they strongly disagree that the communication platform is good.

Areas of Improvement on PR Activities

Question 23 and 24 in the questionnaire seek to find out about the improvement of the public relations activities in the food and beverages industry. Tables 17 and 18 show the response of respondents to this question.

Table 17: Satisfied with the PR activities carried out by the industry

Options		Per cent
	Not Sure	33.7%
	No	28.0%
	Yes	10.4%
	Missing System	28.0%
	Total	100.0%

Table 17 shows that many of the respondents (33.7%) are not sure if they are satisfied with the PR activities in the industry**,** 28.0% said they are not satisfied. **Nonetheless,** 10.4% said they are satisfied.

Table 18: Suggestions on how activities can be improved

Options	Per cent
Engage in Scholarships	8.3%
Repair roads	8.3%
More Publicity	4.7%
Donate to schools	4.1%
Engage in electricity projects	4.1%
Health care services	3.6%
Social amenities provisions	3.6%
Cleaning roads projects	3.1%
Waste disposal projects	2.1%
Skill and acquisition programmes	2.1%
Others	56.0%
Total	100.0%

Table 18 lists suggestions of PR activities for the industry. Two significant suggestions are the provision of educational scholarships and the creation of more publicity. A majority (8.3%) says the industry should engage in scholarships as well as repair bad roads, 4.7% suggested the industry engage in more publicity, 4.1% said they should engage in electricity projects and donate to schools, 3.6%

respondents said health care services and also provide social amenities, 2.1% said waste disposal projects and put into consideration organizing a skill and acquisition program.

Discussion of Findings

Public relations is an integral part of any organization to take seriously. Here, the discussion part of this study focuses on the research questions in line with the objectives. This research aims to find out the awareness of the public to the public relations activities carried out in tertiary institutions.

RESEARCH QUESTION 1: ***What is the image problem faced in the Food/Beverages industry in Nigeria?***

Image is everything to both an individual and an organization. It has a lot to do with how people relate to the organisation in every aspect. In respect to this question, Table 10, which answers the question on purchase decision, go further to show that when an organization has an image problem, consumer's purchase behaviour is affected. Hence, from Table 11, it shows that one major challenge the industry could face is from its structure. It is essential to know that the structure of the organization also affects the image of the organization. If the structure is unorganized, then the services of the organization will stagger, which will lead to image problems. It is, therefore, necessary that the industry considers structure when it comes to its operations, and this is the role of the PR practitioner. To ensure that there are no fluctuations in the structure of the organization.

RESEARCH QUESTION 2: ***What are the tools used to control the image problem in the industry?***

Table 6 shows the importance of newspapers as an appropriate medium for disseminating information in the food and beverages industry. To add to this, Table 16 supports that this tool has been very active as many of the respondents strongly agree to the fact that the communications of the industry are generally good. This result is fair enough, although other various platforms can be useful for image management. The PR practitioners in the industry must exhaust all channels of media in this aspect.

When addressing the need for awareness, the PR tools used is a contributing factor to how the publics get informed about the organisation's PR activities. Thus, just relying on bulletins is not enough. As a PR practitioner, it is crucial that we exhaust all PR tools when reaching across to our audience, especially a broad audience. The tools used and their application will go a long way to enhance as well as boost the image of the institution. A PR practitioner needs to know that tools of information are essential to creating awareness. Every PR department in any organization is the foundation of that organization. We can either make or mare an organization. Every information about an organization is dependent on us, and we are always the first people our audience come to when they need any information. Pressing on the need to exhaust every PR tool during communication, it is important to first identify the interest of the audience. Grunig (2001) agrees to this saying a refined PR practitioner is one who understands that they should serve the interests of individuals. Therefore, the practitioner must access the tools of communication and exhaust all media to help strengthen not only the image of the organization but also the relationship with identified publics as well sustain their interest.

RESEARCH QUESTION 3: ***What is the public understanding of Image quality in the industry?***

Table 12 answers this question as it shows that the public strongly agrees that the industry has the right image, and this is a very positive response. Table 13 shows that based on the excellent image of the industry, the public can vouch for the reputation of the industry at any point in time. Public relations is said to have reached a high point of excellence if the public can vouch for the organization at any point in time. This result means that the organization is working had to build a stable relationship with its publics.

RESEARCH QUESTION 4: ***How do the public become aware of the PR activities carried out in the industry?***

Low public awareness of the PR activities in the food and beverage industry causes concern according to the results of this study. Majority of the respondents says they are not aware of the PR activities, yet the industry has a positive image. Furthermore, this is not a suitable response that contributes to the image of the industry. Sales and other communication elements contribute more than PR to the image

under focus. For the respondents that say they are aware of the PR activities, Table 7 shows how they become aware of the activities of the industry where most of them said through Newspaper. The table shows the media which provide the majority of the publics of the industry with information about the executed PR activities. From the table, it shows that many PR practitioners have not well consumed online media. The responses on the public's awareness through the online platform is shallow. There is a need to use traditional media. However, online media is one of the aggressive ways to get across to a broad audience. It is not only the faster but also one of the most convenient ways to reach a wide audience at the same time. Through using the online media, everyone has quick access to the organization messages and this also creates a big room for quick feedback from the audience regarding any subject matter.

RESEARCH QUESTION 5: ***What is the public perception of the Food/beverages industry in Nigeria?***

Perception indeed leads to the image people have about an organisation. From the tables presented above, one of the tables that address the question of perception is Table 7. The table shows that the respondents are not sure if the PR activities carried out by the industry have anything to do with what they think about the industry. This result shows that the PR activities of the industry are not one of the factors that make them have the right image of the organization.

One of the significant aims of public relations is to influence the decisions of the public., and build a strong relationship between an organization and its publics. However, if corporate activities do not influence the identified publics, then the primary purpose of public relations is lost.

RESEARCH QUESTION 6: ***Do the public know and understand the image control actions of the industry?***

Based on all Tables from Table 9 to Table 16 and the responses, it clearly shows that the industry has done a lot for the respondents to have a positive response about them. This is very necessary. When an organization audience can identify positive efforts towards sustaining their interest, it builds loyalty and trust. They begin to trust the organization to always have their best interest at heart. Besides, Table 5 shows contribute to the image control actions of the industry. From the table, it indicates that the public knows some of their image control actions. This is very relevant in terms of crisis management and it also shows transparency on the part of the industry.

Conclusion

This study exposes the fact that although the public is not aware of the PR activities carried out by the organization, they still have a positive response in terms of the image of the industry. Hence, when we talk about image management, the PR practitioners in the industry has done an excellent job in sustaining the image of the industry. This study shows the need for every organization to have a PR department that will, in one way or the other help in promoting the image of the organization, both consciously and unconsciously. Nevertheless, it is still essential for organizations to know that engaging in PR activities is very necessary. This study further shows that PR practitioners do a lot in managing the image of the industry. However, they must engage in more publicity to make their public aware of the PR activities they carry out.

Recommendations

Ohaja (2003) purport that research is not only done for academic purposes. One of its primary goals is to understand social and physical phenomena to proffer solutions to problems where they exist. Based on the literature review and the findings of this study, the following recommendations will be of great value to:

- PR practitioners should engage in public evaluation on the PR activities carried out in their respective industry, identify those loopholes and carried out activities and fill those loopholes. By so doing, the public will start feeling the impact of the PR activities and therefore, become aware of the activities.

- Image management is a big deal; hence it essential that PR practitioner should exhaust forms of communication is building the image of the industry. Newspapers as much as they are well detailed, it is also limited. Therefore, the industry should move to other channels to communicate their PR actions. This action will help to build public awareness of the public as well as promoting the image of the industry.

Abstract

This study aims at examining public consciousness and the view of public relations projects in banking services. This study employed the quantitative survey design, using the questionnaires to gather the opinion of the banking public. The paper adopts the two-way symmetrical theory. In this paper, it is revealed that the public generally has the issue of trust with their banks which has tried but still unable to solve this problem over the years. They should as well focus more on areas that will benefit the public such as more empowerment programs, more educational programs and better customer relations. The paper concludes that the bank needs to ensure that they build a relationship between the public and itself in order to overcome the issue of trust and negative perception. It recommends that Covenant Microfinance Bank should adopt a PR activity, adopt the social media tool, e-banking system, and be proactive in its dealings. More awareness by Banks in correcting the negative perception of the public is needed.

Keywords: Banks, Public Relations, Covenant Microfinance, Guarantee Trust Bank, Trust

Introduction

The Banking Industry is of the most critical sectors of the economy. The origin of the industry can is traceable to the colonial era when the colonial banks met the commercial needs of the colonial government. Public relations tools must be the order of the day in every industry. Companies and organisations must always make use of public relations (Nwosu, Odiboh, Olabanjo and Fayemi, 2020a; Nejo, Odiboh, Omokiti and Adelua, 2020b; Olabanjo, Odiboh, Adelua and Fayemi, 2020a; Omokiti, Odiboh, Aiyende and James, 2020b; Salau, Odiboh, Adelua and Fayemi, 2020a; Salau, Odiboh, Omokiti and Nejo 2020b; Nwosu, Odiboh, Oyedepo, James and Adelua, 2020b).

According to Herth (2011), Public Relations, being a management function, puts in place and sustains a two-way complementary relationship and communication between a firm and the public. The management function in Public Relations includes research in progress, data analysis, provision of measures and the evaluation of these measures to create, understand and advance specific relationships (Odiboh, Ezenagu, and Okuobeya, 2019). The dimensions of Public Relations are investor relations, soliciting/lobbying, relations with the government and general public, media/blogger relations, employee relations as well as crisis management and international relations.

Trust is the foundation of the banking business. Thus, its success is dependent on how much trust it earns from its publics or customers. Trust in banks determines how professionals and customers perceive them. It is noteworthy that without Public Relations, successful banking is nearly impossible (James, Odiboh, Adelua and Fayemi, 2020a; Ndubueze, Odiboh, Nwosu and Olabanjo, 2019; James, Odiboh, Aiyende and Salau, 2020b; James, Odiboh, Nwosu and Fayemi, 2020c; Ndubueze, Odiboh, Adelua and Fayemi, 2020; Nejo, Odiboh, James and Fayemi, 2020a; Olabanjo, Odiboh, Nwosu and Ndubueze, 2019).

Public Relations are deliberate and congruous communication. Fully engaging the audience and listening to them builds and nurtures positive mutually advantageous associations (Aiyende, Odiboh,

Adelua and Omokiti, 2020b; Fayemi, Odiboh, James and Olabanjo, 2020a; Fayemi, Odiboh, James and Aiyende, 2020b; Fayemi, Odiboh, Nejo and Salau, 2020c; Fayemi, Odiboh, Oyesomi, Nwosu and Olabanjo, 2020d; Olabanjo, Odiboh, Nwosu and James, 2020b; Omokiti, Odiboh, Salau and Nejo, 2020a). Over time, image management has been the concern of organisations. They participate in various advances and systems to ensure that they keep up a fair image, as indicated by their stakeholders. Without a doubt, there is a stable constructive relationship between the way by which individuals see an organisation and corporate identity. (Ndubueze, Odiboh, Nwosu and Olabanjo, 2019).

Most times, it is the views of the banks' public and staffs that earn them public trust. As such, it is usually a herculean task to have successful banking without Public Relations. The Public Relations department of the Bank is in charge of polishing the Bank's image in a way that earns the trust and confidence of the public. Public Relations builds beneficial joint understandings between the organization, its staff and the public (Adelua, Odiboh, Aiyende and Omokiti, 2020a; Adelua, Odiboh, Nejo and Fayemi, 2020b; James, Odiboh, Olabanjo and Adelua, 2020d; Nwosu, Ndubueze and Olabanjo, 2019; Adelua, Odiboh, Olabanjo and Ndubueze, 2020c; Adelua, Odiboh, Oyedepo, Olabanjo and James, 2020d; Aiyende, Odiboh, James and Salau, 2020a).

To deal with extreme situations like impairment, apathy and ignorance, Public Relations is the best tool employed by the Banks. The competition in the Banking industry necessitates the deepened use of Public Relations as this will help the Banks survive with the growing competition. The Banks use the Public Relations tools to educate the public on how special their products are in relation to similar products provided by other Banks. Public Relations tools should always provide explanations on double standards (if any) when dealing with different types of customers. Customers' time is very important and as such, the Banks should always educate the public about the efforts in place to ensure that time remains valued.

Excellent public relations based on thoughtful, truthful, open, strategic, and symmetrical communication of a product's defect or safety-related issues can influence the relationships with stakeholders (Odiboh, Amodu and Ekanem, 2020a; Odiboh, Fasanya, Adegoke, Afolabi and Ofor, 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). This paper would be useful to Banks as it will reveal the perception of professionals and customers as well as the fact that the creation of a good Bank image is not the sole function of the Public Relations department. A joint effort is needed to create a competitive and unique Bank image.

In line with public perception, a corporation is expected to turn Public Relations into a crisis. However, the fact is, Public Relations is of utmost importance when there is pleasant and interesting news (Fayemi, et al., 2019). The bank employees must, therefore, utilize all chances to make a customer happy. This will help energize the Public Relations effort to improve the Bank's image and in turn, position the bank to remain competitive in future.

Statement of the Problem

Banks all over the world deliver financial services and most importantly trust. However, public complaints about banks' service delivery have been mounting in Nigeria. Central to this service delivery challenges is the issue of trust, which brings about the misconception of the public relations actions of Banks.

A significant issue facing the Public Relations operation in Nigeria's banking industry is the management of the publics' view on the Banks. Overtime, efforts by the Bank's Public Relations team to amend some of the misreading of the public have been met with resistance. This work looks at the current public recognition and views of the banking industry, the Public Relations actions of some banks, and what the future holds for the industry.

Research Objectives

This research aims at determining the PR tools and objectives of selected banks. It seeks to investigate public awareness and perception about banking services and also to examine areas the public want selected banks to improve on. In line with the following objectives, the research questions are:

Research Questions

1. What are the PR tools Selected Banks adopt?
2. What are the awareness level and the PR activities of selected banks?
3. What is the view of the public about PR practices in Banking that needs improvements?

Literature Review

An Overview of Banking Business in Nigeria

Banking business as defined by the Banks and Other Financial Institutions (BOFI) Act of 1991 "is the business of collecting current and savings accounts deposits; as well as other similar accounts and the payment and collection of cheques paid by customers. There are other key components of operations through which the Bank makes enormous profits. As such, the description of banking business given by the BOFI Act was criticised by (Abdulai, 1993).These other components could be foreign exchange sale which is the most profitable and important banking business in Nigeria; with authorized dealership up till 1992. The groups of banking business in Nigeria are: Microfinance Banking, Development Banking, Central Banking, and Commercial Banking (Olabanjo, Odiboh, Nwosu, and Ndubueze, 2019).

Corporate images should be positive and unique. Consumers are not only purchasing the product or service but also the corporate image associated with that product or service built over time with the function of public relations. (Olabanjo, Odiboh, Nwosu and Ndubueze, 2019). The objectives of Public Relations in Banks are intended to make changes in the knowledge of the public, and in viewpoints and behaviours relating to an organisation (Wells *et al*., 2003). These objectives normally focus on the creation of trust, the delivery of quality information as well as establishing positive images. Typical public relations objective include: the display of the image of the organisation to the public, provision of explanations to the public on the company's perception on public issues, the creation of legitimacy for the company's operations, educate the company on the publics' opinion on its activities, create and maintain joint understanding between the company and the public, establish corporate brands, put in place products as well as the repositioning of the company.

In general, the goal of Public Relations is to establish a beneficial joint understanding between the company and its public, which will in turn; create goodwill (Odiboh, Olonode, Adesina, and Yartey, 2018). According to Merenda (2004), the improvement of the demand for a company's services will create trust and credibility. When service is being marketed, the best way is through its promotion by advertising and in turn supporting its arguments using Public Relations to create trust and credibility. Another importance of Public relations in the banking system is the help it provides in winning back lost customers. Proper and intense public relations helps in creating positive public image for the banks (Odiboh and Oladunjoye, 2019). Public relations which deal with the public have a much impact in the moulding of an organisations image and promoting them in a positive light to their target audience. (James, Odiboh, Adelua and Fayemi, 2019).

Public Relations is required by Banks to properly sensitise their public. It is very essential to counter the negative effects of the public on their activities. To protect their interest, futuristic and goal driven banks do not just lay in wait for their public image to erode, they put in place necessary measures like Public Relations to protect their interests (Ndubueze, Odiboh, Nwosu, and Olabanjo, 2019). Hon (1998) emphasized that the goals and objectives of Public Relations have to be exact and be connected directly with goals and objectives of the company. The findings of Hutton et al. (2001) corroborate that of Hon (1998). It specifies very different opinions on the use of Public Relations and it maintains that the difference in Public Relations measures is constantly a stagnant problem. At the end of the day, companies require different philosophies and objectives.

Guarantee Trust Bank (GTB)

According to the GTB official website, Guaranty Trust Bank became a limited liability company in 1990 and was given the license to give commercial services as well as other banking services to Nigerians. In February 1991, the Bank started operations and has over the years joined the league of respected and service focused banks in Nigeria. After consolidation, Guaranty Trust Bank plc decided strategically to actively embark on retail banking. This was followed by a major rebranding action in June 2005; which led to the emergence of the Bank as a Bank that offered improved services, driven by an intense expansion technique as well as a vibrant orange identity.

Covenant Microfinance Bank

According to Covenant Microfinance bank official website, CMFB emerged as a private limited company on May 6 2003. It commenced operations on March 15, 2004, as a Covenant University Community Bank Limited (CUCB Ltd). It converted to a microfinance bank in line with the directive of the Central Bank of Nigeria to all community banks. It further commenced business on January 11 2008. It received a license to operate as a State Microfinance Bank in December 2012 having met the prescribed N100 million minimum capital requirements.

In 2014, it became one of the first microfinance banks to provide the 10-digit Nigeria Uniform Bank Account Number (NUBAN) for all its customers after successfully signing up for integration to NCS. (Odiboh, Adeyeye, and Ekanem, 2018).

Theoretical Framework

This study adopts the Two-way Symmetrical Model. The model is the best among all the other models. In this case, both the communicator (the organisation) and the receiver (the public) are mutually communicating. The messages take into account the needs, demands and interests of the public. This model is dependent on research in not only designing or packaging a message but also in helping an organisation to adjust concerning the needs of the public (Sanda 1993).

The argument of the two-way symmetrical model is that the Public Relations expert should serve as a connection between the company and its public, rather than as a persuader. In this model, experts are arbiters and employ communication to ensure that all participants are beneficiaries. The term "symmetrical" explains the model's attempt to establish a joint beneficial situation. Professionals should aspire to utilise the two-way symmetrical model in their daily operations and strategies, as it is the most ethical of all models (Simpson, 2014).

This model is relevant to this study because it clearly states how messages of the public are in consideration. Here, the banks and their publics (professionals and customers) communicate. There is a mutually beneficial relationship between the banks and the public (customers and professionals) which makes it easier for customers to have a perception about the affairs of the bank. The question is whether this is the case with banks in Nigeria.

Research Design and Methodology

This study employed the survey research method of data collection. A survey is the putting together of relevant information from various individual samples based on their answers to asked questions (Check and Schutt, 2012). This type of research allows different techniques for obtaining respondent as well as the collection of data and the employment of different information methods.

The method of data collection used under the survey method is the questionnaire. The questionnaires were directly administered by the researcher to the study population. The questionnaire was used to obtain public answers on the awareness of the Public Relations operations of banks. Specifically, the survey tool provided respondents with open and close-ended questions on applied public relations devices utilised to build the awareness and recognition Banks Public relations operations.

The sample size for this study is 200 respondents living in semi-urban Ota, Ogun State, Nigeria. The respondents were chosen based on the focus of the selected banks, as Covenant Microfinance Bank only operates in Ota, Ogun State. In contrast, Guarantee Trust Bank operates in every corner of Nigeria; for proximity reasons, it is best to gather data at a location. A survey research design with 200 respondents was selected from Ota in Ogun State with focus on people who have an account with Covenant Microfinance Bank and Guarantee Trust Bank, which are a Commercial Bank and Microfinance Bank respectively.

Purposive sampling was employed in this research. This sampling type is made up of a group of other non-probability sampling methods. Also known as judgmental, selective or subjective sampling, purposive sampling relies on the researcher's opinion in the selection of focus units. As applied by Odiboh and Ajayi (2019), these units include people, cases/organisations, events, pieces of data. This sampling technique is utilised based on members' choice of Bank as Wimmer and Dominick (2011) justify.

Results

The data obtained in this research were analysed through frequencies and percentages. They were presented in tables using the Statistical Package of the Social Science (SPSS) software. In the tables, respondents' awareness of the Public Relations operations of selected Banks was displayed. This was followed by the presentation of public level of satisfaction with bank's operation and ideas for improvement. Out of 200 copies of the distributed questionnaire, 182 returned filled without any flaw. Eighteen (18) questionnaire copies failed acceptance due to errors or emptiness. Respondents' account with selected banks was the first poser of the questionnaire. The results obtained are presented in the following tables.

Table 1: An account with any of the following banks:
Guarantee Trust Bank(GTB), Covenant Microfinance Bank (CMFB)

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	179	98.4	99.4	99.4
	No	1	.5	.6	100.0
	Total	180	98.9	100.0	
Missing	System	2	1.1		
Total		182	100.0		

Out of 182 respondents, 179 respondents which represent 98.4% said they have an account with GTB or CMFB while one which represents 0.5% said they do not. The above shows that a lot of the respondents have an account with the bank. 1.1% of the respondents did not answer this question.

Table 2: Banks the respondents have an account with

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	GTB	124	68.1	69.3	69.3
	CMFB	55	30.2	30.7	100.0
	Total	179	98.4	100.0	
Missing	System	3	1.6		
Total		182	100.0		

Table 2 reveals that 124 respondent which represent 68.1% have an account with GTB. In comparison, 55 respondents which represent 30.2% has an account with CMFB, which means that the majority of

the respondent are people who have an account with Guarantee Trust Bank.

Table 3: Public Relations activity that is being carried out by the respondent's bank.

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	129	70.9	71.3	71.3
	No	45	24.7	24.9	96.1
	Not sure	7	3.8	3.9	100.0
	Total	181	99.5	100.0	
Missing	System	1	.5		
Total		182	100.0		

The Table shows that 129 respondents which represent 70.9% are aware of any PR activity being carried out by their bank. In comparison, 45 respondents which represent 24.7% are not aware of any PR activity being carried out by the banks. Also, seven respondents which represent 3.8% said they are not sure if the bank carries out any PR activity. This result shows that a large number of respondents are aware of the PR activity being carried out by their bank. 0.5% of the respondent ignored this question.

Table 4: The activities carried out by the banks that the respondents are aware of

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Birthday messages	83	45.6	61.0	61.0
	Social events	37	20.3	27.2	88.2
	Educational support and empowerment programmes	5	2.7	3.7	
	Giving gifts to customers	4	2.2	2.9	91.2
	Prompt messaging and customer care service	4	2.2	2.9	94.9
	Deposit and saving plans	3	1.6	2.2	97.8 100.0
	Total	136	74.7	100.0	
Missing	System	46	25.3		
Total		182	100.0		

This Table reveals the PR activities known to the respondents. Eighty-three respondents who are 45.7% are aware of birthday messages as the only bank's PR activity. Thirty-seven respondents which represent 20.3% are aware of social events. Five respondents which represent 2.7% also noted that they are aware of the bank's educational support and empowerment programmes. Four respondents which represent 2.2% said they are aware of their bank giving out gifts to customers. Four respondents which represent 2.2% said they are aware of prompt customer care service. In comparison, three respondents which represent 1.6% are aware of deposit and saving plans. This result reveals that the bank focuses more on sending birthday wishes to customers as their significant PR activity.

25.3% of the respondents ignored this question.

Table 5: Trust issues with the bank

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	No	87	47.8	51.2	48.8
	Yes	83	45.6	48.8	100.0
	Total	170	93.4	100.0	
Missing	System	12	6.6		
Total		182	100.0		

Table 5 shows that 87 respondents, which represent 47.8% do not have trust issues with their bank. In comparison, 83 respondents which represent 45.6% have trust issues with their bank. This data proves that there is a thin line margin between those who have trust issues and those who do not, which simply means the issue of trust exist. 6.6% of the respondent ignored this question.

Table 6: Public Relations tools the respondent's bank uses

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Social media	74	40.7	45.4	45.4
	Television	25	13.7	15.3	60.7
	Newspaper	20	11.0	12.3	73.0
	Billboards	20	11.0	12.3	87.7
	Fliers	20	11.0	12.3	100.0
	Magazine	4	2.2	2.5	75.5
	Total	163	89.6	100.0	
Missing	System	19	10.4		
Total		182	100.0		

Table 6 reveals that 74 respondents which represent 40.7% are aware of social media as a vital PR tool adopted by their bank. Twenty-five respondents which represent 13.7%, on the other hand, says television is the banks' PR medium of awareness. Twenty respondents which represent 11.0% variously said that it is newspapers, billboards and fliers. This result shows that a large per cent of the respondent is aware of social media as the primary PR tool the bank uses. 10. 4% of the respondent ignored this question.

Table 7: Perception of the Public relations practice of the bank

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Satisfactory	50	27.5	31.4	31.4
	Good	50	27.5	31.4	62.9
	Poor	31	17.0	19.5	97.5
	Fair	24	13.2	15.1	78.0
	Indifferent	4	2.2	2.5	100.0
	Total	159	87.4	100.0	
Missing	System	23	12.6		
Total		182	100.0		

Table 7 reveals the perception of the respondent about the PR practice of their bank. Fifty respondents which represent 27.5% said the PR practice is satisfactory. Another 50 respondents which represent 27.5% also said the PR practice is good; 31 respondents which represent 17.0% said the PR practice of their bank reduced. In contrast, 24 respondents which represent 13.3% said the PR practice of the bank is fair, and 4respondent, which represent 2.2%, feels indifferent about the PR practice of the bank. While it may seem that a lot of the respondent said the PR practice of the bank is good, more than a quarter still feels the PR practice is weak, which means there is need for improvement. 12.6^ of the respondent ignored this question.

Table 8: Satisfaction with the Public relations practice of respondent's bank

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	YES	112	61.5	63.3	63.3
	NO	65	35.7	36.7	100.0
	Total	177	97.3	100.0	
Missing	System	5	2.7		
Total		182	100.0		

Table 8 shows that 112 respondents which represent 61.5% are satisfied with the PR practice of their bank. In contrast, 65 respondents which represent 35.7% said they are not satisfied with banks' PR and this shows that a more significant part of the respondents is satisfied with their bank's PR activities, while others are not satisfied. 2.7% of the respondent ignored this question.

Table 9: If there are Areas the respondents want the banks to improve on as regards their Public relations practice

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	YES	93	51.1	53.8	53.8
	NO	80	44.0	46.2	100.0
	Total	173	95.1	100.0	
Missing	System	9	4.9		
Total		182	100.0		

Table 9 reveals that despite being satisfied with the bank's PR practice, a substantial number of respondents want them to improve on their PR activities. 51.1% of the respondent said some areas need improvement while 80 respondents which represent 44.0% said there is no need for improvement. 4.9% of the respondent ignored this question.

Table 10: Areas the respondents want the banks to improve on as regards their public relations practice

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Improvement in customer relations	40	22.0	24.4	24.4
	Improvement in the use of social media and communication channels	25	13.7	15.2	42.7
	Community development	6	3.3	3.7	48.8
	Improved use of internet and technological services	5	2.7	3.0	27.4
	Reduction of bank charges	4	2.2	2.4	45.1
	None	58	31.9	35.4	84.1
	Others	26	14.3	15.9	100.0
	Total	164	90.1	100.0	
	Unanswered	18	9.9		
Total		182	100.0		

Table 10 reveals different areas the respondents want the bank to improve on. 58, which represent 31.9% said there are no areas to improve on. In comparison 22.0% of the respondent said there is need for improvement in customer relations. 13.7% said there is a need to improve the use of social media and other communication channels. 2.7% said the internet services need improvement. 2.2% said there should be a reduction of bank charges, and 3.3% said there is a need for community development. 9.9% of the respondent ignored this question. While the majority of the respondents do not see any area needing improvement, other respondents request that there should be an overall improvement on all services.

Discussion of Findings

The tables above show the findings from the respondents. We will be using the tables above to analyse the findings based on the research questions. Therefore, the findings from this study will be discussed based on how it has answered the research questions posed for this study.

Research Question 1: What Are The PR Tools Selected Banks Adopt?

The above research question is to determine the tools through which selected banks adopt in carrying out their Public Relations activities. Findings in this respect are in Table 6. The Table reveals that 45.4% of the respondents know that bank adopts social media for public relations activations. 15.3% states that the banks use television as its principal PR medium. Twenty respondents (12.3%) acknowledge that the bank uses Newspaper as its primary tool. In comparison, 20, which represents 12.3% of respondents says that the bank adopts the use of fliers. Four which represents 2.5 of the respondents said that the bank adopts billboards as its tool to carry out these activities. This finding simply means that social media is the principal tool the banks adopt for its PR practice.

Research Question 2: What are the Awareness Level and the PR Activities of Selected Banks?

The above research question seeks to determine the public's awareness of banks' public relations. From the data generated from the questionnaires, the level of the public's awareness varies.

Findings to this respect can be found from tables 3 and 4, respectively. The data on table 3 reveals that 129, which represent 71.3% of the respondents are aware of the public relations activities of the banks,

45, which represent 24.9% of the respondents are not aware. In comparison, seven which represent 3.9% are not sure if they are aware of these activities. This reveals that a large number of respondents are aware of the PR activities of their bank.

Data on Table 4 shows that 61% of the respondents say that the banks send birthday messages as a PR action. About 27.2% of the respondents say that the bank organises social events as a PR activity. Four respondents say that the banks gift customers. Five which represent 3.7% says that banks carry out educational support and empowerment programmes, four which represent 2.9% respondents says that banks send prompt messages and customer care, three which represent 2.2% says that banks have a deposit and saving plans for its customers. Meaning that birthday messages are the major activities the bank carries out.

Research Question 3: ***What are The Views of the Public about PR Practices in Banking and the Areas of Improvemen*****t?**

This research question focuses on the public's perception about the PR practice in the banking sector as well as areas the public will want the bank to improve on. It was observed based on the findings in table 5 that 87 respondents (51.2%) do trust the bank. In comparison, 83, which represent 48.8% of the respondents have trust issues with their bank. One can see that the margin between those who have trust issues and those who do not is a skinny one; the issue of trust is paramount to Nigerian banks.

In Table 8, 112 respondents which represent 63.3% of the participants are satisfied. Sixty-five respondents which represent 36.7% say that they are not satisfied. Despite this, the respondents, however, states in table 9, 93, which represent 53.8% of the respondents that there are areas the PR in the banking sectors should improve on. In comparison, 80, which represent 46.2% of the respondent said there are no areas. As much as some of the respondents are satisfied, there is still room for much improvement. Based on the data generated from the questionnaires, in tables 10, the respondents gave insights on the areas they would love the banks to focus more and improve in the deliveries of their service.

Conclusion

From the findings of this study, the summary is below:

1. Covenant Microfinance Bank does not carry out any PR activity. So it brought about a low response from customers of Covenant Microfinance Bank, as seen in Table 7, there was more of Guarantee Trust Bank respondents in the findings.
2. Customers generally have issues of trust with their banks.
3. There is a high level of awareness of banks' PR activities. However, more of the activities focus on sending messages than providing live support for educational programmes, excellent customer care, fast response to messages, and empowerment programmes.
4. Although the majority of the respondents see the PR activity as satisfactory, there is always room for improvement.

Public relations does not operate in a vacuum but with the support of stakeholders. (Nwosu, Ndubueze and Olabanjo, 2019). This study concludes that banks should focus more on public relations actions with local content. Furthermore, ensure that they build better public relations profile. Between the public and itself to overcome the issue of trust and negative perception, they should as well focus more on areas that will benefit the public such as more empowerment programs, more educational programs, and better customer relations.

Recommendation

Covenant Microfinance Bank should endeavour to carry its customer is along in its activity. It is not enough to just receive deposit money but necessary to update customers about routine and other

banking essentials. The bank should adopt a PR activity, adopt the social media tool, e-banking system, and be proactive in its dealings. CMFB lacks an evidence-based PR activity, about which the customers complained. The bank should treat its customers rightly regardless of its position. Above all, banks need to correct some of their negative perceptions by the public.

Abstract

This short paper highlights public awareness and behaviours towards herbal products that are marketed and communicated as remedies for men's reproductive challenges. As a pilot study intended for future collaborations, this paper surveys the opinions of men and women living in Lagos mainland, Southwest Nigeria. We operated one thousand copies of a questionnaire on the respondents. Preliminary results show the high level of awareness of men's reproductive problems needing solutions. Facilitating this awareness, according to the respondents, were marketing communication tools used by corporate manufacturers to position their herbs as solutions to manhood problems. This pilot study recommends counter actions against deceptive marketing and communication of herbal aphrodisiacs. It also presents opportunities for collaborations for further researches on the same topic.

Keywords: Marketing, Communication, Herbal Products, Men's Health, Male reproduction

Introduction

Subject area	Marketing Communication
More specific subject areas	Healthcare Marketing, Health Communication, Advertising, Public Relations
Study execution	A survey carried out with the use of a questionnaire.
Study format	Quantitative methodology
Experimental factors	As a preliminary study, 1,000 respondents equally divided among men and women received the questionnaire to fill. Study objectives include assessing the awareness of men and women about male reproductive problems; their knowledge of herbal solutions and the marketing communication tools used by the corporate manufacturers. Bar charts represent the preliminary results.
Experimental features	Data on herbal products, their marketing communication tools and corporate manufacturing activities appear in this preliminary study.
Preliminary study location	Lagos, Nigeria
Data accessibility	Original data is available to compare with similar investigations anywhere in the world

Value of Study

1. Similar studies in different parts of the world could be executed based on the principles, objectives and methodology of this study.
2. Data which similar studies could use as background information are available through this study. The data covers herbal marketing communication, male and female position concerning male reproductive problems as well as companies' activations in different formats and styles.

3. The multidimensional focus of this study consists up of the following:

    a. Men's health. Sample in Ajayi (2017), Akubue (2009), Anucha (2009), Cleveland Clinic (2015), Colker (1999), Fleischer *et al*., (2004), Kilham (2013), Mayo Clinic (2016), Michael (2017), Onana (2017), Oni (2016)
    b. Herbal products. Sample in Odiboh *et al*. (2018a), Odiboh *et al.*, (2018b), Odiboh *et al.* (2017a), Puri and Puri (2011), Roybal and Skowronski (2000), Sahelian (2004), Sanders and Winter (2007), Sharma (2007), World Population Review. (2018)Yoruba (2014), Yusuff (2005)
    c. Tools of integrated marketing communication. Sample in Odiboh and Oladunjoye (2019), Odiboh, *et al.* (2020a), Odiboh and Ajayi (2019), Odiboh, Ezenagu, and Okuobeya (2019).
    d. Public relations actions of manufacturers of herbal products. Experimental Design, Materials and Methods

Survey method generated the data in this short study. Five hundred men and five hundred women totalling 1,000 were the respondents drawn from Mainland Lagos, Nigeria. The respondents were selected using the multi-stage sampling technique. Bar charts below show some of the preliminary results of the survey.

Preliminary Study Results

According to Figure 1, Friends, the Internet, hospitals and relations provide information to the respondents on male reproductive problems. Herb sellers provide lesser information. The traditional media are the least sources of information about male reproductive issues.

Fig. 1: Sources of knowledge of male reproductive problems

Respondents are not sure of why they recommend herbal remedies for male reproductive problems according to Figure 2. However, affordability, availability, efficacy and usefulness are key reasons why they recommend herbal remedies for men's male reproductive problems.

Fig. 2: Reasons for recommending herbal remedies for men's male reproductive problems

Marketing communication tools used in promoting herbal products as male reproductive solutions include Mobile advertising, personal selling, sales promotion, newspaper advertising and publicity. This result shows in Figure 3.

Fig. 3: Herbal marketing communication outlets for men's male reproductive problems

Conclusion

Preliminary results of this study show the people's awareness of the marketing communication tools used by manufacturers to promote male reproductive products in Lagos, Nigeria. There are health implications of encouraging public consumption of unapproved herbal products; more so, where the people openly recommend herbal remedies for men's male reproductive problems. Manufacturers of herbal male reproductive products and their activities need to need monitoring through constant research which this study is at the forefront. More reviews and collaborations are necessary for the achievement of greater success in ensuring better health for men's reproductive property.

Abstract

The most important indicator of the economic efficiency of production is cost which reflects all aspects of economic activity and accumulates the results of the use of all production resources. The rate of expanded reproduction, financial performance and the financial condition of the economic entity depend on its level. Therefore, this indicator remains a tool for accounting assessment and the basis for calculating financial results. Practitioners always needed to know the boundaries of cost in which in a particular market one can get predicted profits. With the beginning of market relations in our country a new concept of accounting system began to take shape; the attitude towards industry regulatory documents reflecting the specifics of the production process has changed in the accounting community. This is not entirely justified since each industry and organization functioning in it has its own specific features. Differences arise in many ways including the formation of the cost of finished products (works, services), the proportion of its economic elements. They are associated not only with the industry specifics of production processes but also with different levels of technical equipment and the peculiarities of objects of labor.

Keywords: Cost, Expenditures, Expenses.

Introduction

At present, the theoretical and practical importance of the economic category of cost is of universal scientific interest. In fact, it exists regardless of ownership and types of economic activity since only its practical purpose, structure and system of assessment are changing, but not the economic nature and impact on the financial result. Quite often in scientific sources the term "cost" is replaced by such categories as "expenditures" and "expenses" which are often perceived as synonyms. Therefore, it is important to understand and distinguish between these economic categories.

Materials and Methods

To achieve this goal it is necessary to get acquainted with the scientific views of academic economists in the field of accounting and analyze various situations. Such an approach will allow a more detailed understanding of the semantic content of the concepts of cost, expenditures and expenses. To understand the concept of cost in modern economic theory and practice it is necessary, first of all, to consider such economic categories as “expenditures” and “expenses”. Very often in the domestic economic literature at the level of an economic entity these concepts are used as synonyms. We do not support this view.

The economic definition of expenses today is given in the Russian accounting standard – Russian Accounting Regulation “Organization Expenses” (RAS 10/99). It recognizes expenses as “a decrease in economic benefits resulting from the disposal of assets (cash, other property) and (or) the emergence of obligations that lead to a decrease in the capital of the organization, with the exception of a decrease in deposits by decision of the participants (property owners)”. The conclusion suggests itself here: all that reduces assets are expenses, in other words, they are flows of values leaving the company.

It can be noted that the criteria for recognizing expenses in Russian accounting standards (hereinafter RAS) are closer to the International Financial Reporting Standards (hereinafter IFRS). The Conceptual Framework for Presenting Financial Statements (http://minfin.ru/) discloses the definition of expenses and the conditions for their recognition in accordance with IFRS. Thus, expenses are understood as “a decrease in assets or an increase in liabilities that lead to a decrease in equity, not related to its distribution in favor of holders of claim rights in respect of the organization’s equity”.

To In accordance with the Conceptual Framework for Financial Statements, in case of sale of an asset expenses may be reflected in the statement of financial performance:

1. In the historical value of the sold (consumed) asset.
2. At the fair value of the asset sold (consumed).
3. At the cost of using the sold (consumed) asset.
4. At the current replacement cost of the sold (consumed) asset.

In this case, the cost estimate directly depends on the accepted valuation of the organization's assets. At the same time, the choice of the assessment method should correspond to the qualitative characteristics of useful information - the relevance and veracity of the presentation:

• The relevance of the information provided on the basis of the assessment depends on the characteristics of the asset or liability and their contribution to future cash flows;
• The faithful representation of information provided using the valuation method depends on the inconsistency and uncertainty of the valuation.

In international accounting there is no single standard governing expenditures and their accounting. Each cost element is reflected in a specific standard. So, for example, IFRS (IAS 2) “Inventories” regulates the assessment of expenditures for materials, IFRS (IAS 16) “Fixed assets” - the expenditures on depreciation. The term “expenditures” is used in IFRS when it comes to the accumulation of spent resources, income from which will be received in the future. It turns out that the expenditures are a monetary estimate of the resources used. In the financial statements they are included in the assets of the organization until they are recognized as expenses or losses.

Today in Russian theory and practice there is no officially fixed concept of expenditures. This gives rise to a variety of interpretations, both in the economic literature and in various regulatory acts. M.S. Koske and Yu.G. Mishuchkova quantitatively described the terms “expenses” and “expenditures” in Russian accounting standards. The frequency of use of the term "expenditures" is equal to or greater than the frequency of use of the term "expenses". Of the 24 current accounting regulations the term “expenditures” is not used in 12.

In the national accounting standards the terms “expenditures” and “expenses”, in our opinion, are used as synonyms. Kaverina O.D. and Lebedeva P.M. rightly note that "the uncertainty of terminology gains even greater importance due to the fact that there is no strict division of expenditures (expenses, costs) based on the principle of conformity, according to which expenses reduce revenues of the same reporting period." This fact prevents the computer formalization of accounting and leads to tax violations. We mean here applying the accrual principle or the cash basis to reflect in the accounting operations related to the calculation of profit.

We systematize different points of view on the economic categories of expenditures and expenses considered in various Russian literary sources (Table 1).

Table 1: Comparative analysis of the terms "expenses" and "expenditures" in scientific and methodological sources

Author / Literary Source	Description of the concept of expenses	Description of the concept of expenditures
1. Conceptual Framework for Financial Statements	a decrease in assets or an increase in liabilities that result in a decrease in equity not related to its distribution in favor of holders of claim rights in respect of the organization's equity	No description
2. RAS 10/99 "Organization Expenses"	a decrease in economic benefits resulting from the disposal of assets (cash, other property) and (or) the occurrence of obligations leading to a decrease in the capital of this organization, with the exception of a decrease in deposits by decision of the participants (property owners)	No description
3. Rumyantseva E.E. New Economic Encyclopedia // 2nd ed. M .: INFRA-M 2006. - 810 p.	1. Consumption of resources in the process of production of goods and services. 2. Cash spendings of the organization during the reporting period as a result of economic activity	Category of accounting, documented expenses actually incurred on a specific date
4. Reisberg B.A. Dictionary of modern economic terms // 4th ed. M .: Rayris-press – 2008. -480 p.	Material and cash resources spent in the production process and for consumption	Spent resources, expenses (including time) for the production, purchase of goods, services
5. Badmaev Ch.A., Badmaeva E.A.	Part of the expenses incurred by the organization corresponding to the income received (products produced and sold in the reporting period) or limited by the end of the reporting period	The monetary value of the used material, labor, financial, natural and other types of resources for the production and sale of products, the value of which must be measured with sufficient reliability
6. Efremova A.A.	A decrease in economic benefits during the reporting period taking the form of an outflow or depletion of assets or an increase in liabilities leading to a decrease in capital, not related to its distribution between shareholders	Something that does not reduce the capital of the organization. Expenditures result in either assets or expenses
7. Druzhilovskaya T.Yu.	Decrease in economic benefits due to a decrease in assets or an increase in liabilities, expressed in a decrease in capital not related to transactions with owners	Material and labor resources consumed in the process of production, provision of services, performance of work, expended in the process of creating or acquiring assets, or aimed at paying off liabilities
8. Konstantinov V.A.,	Part of the expenditures incurred by the	Cash payment for purchased

Ginover M.E., Alimov S.A.	company in connection with income	goods and services, which over time will be deducted from profit (as expenses)
9. Kuvaldina T.B.	A decrease in assets or an increase in liabilities expressed in a decrease in the capital of an organization that is not related to its distribution between shareholders.	Cash payments related to the acquisition of resources (tangible, intangible, labor, financial) that are consumed in the course of the current, financial and investment activities of the organization and are accumulated in the reporting period in the form of assets in the balance sheet or in the form of expenses in the income statement
10. Sokolov Y.V.	Everything that the organization spends. The part of expenses that relates to future reporting periods is capitalized and shown in the asset balance	The part of expenses related to this reporting period

The list of interpretations of the concepts of expenses and expenditures can be continued since a lot of scientific work has been devoted to these economic categories at the present stage of economic development. Obviously, the interpretation of the above economic categories in literary sources is so diverse that today accounting professionals are concerned with the problem of ensuring the terminological accuracy of these categories, since accounting should reflect reliable information about the property status and financial performance of the company.

The absence of a formalized concept of expenditures which would be used in RAS 10/99 “Organization Expenses” and a number of other Russian accounting standards, gives rise to a variety of points of view in the economic literature and regulatory acts. Probably in this situation accounting specialists need to rely on professional judgment, which in essence is a professional assessment of all the available objective factors that can affect decision making in the face of uncertainty. Hence the need for high professionalism of practitioners and their clear understanding of the essence of the considered economic categories.

In foreign publications these economic categories are indeed regarded as synonyms. So, for example, the English word “cost” has many meanings, among which are costs, expenses, price. Words such as “cost” and “expenses” often replace each other. In fact, the English word “expenses” means expenses, expenditures and costs. In the dictionary of accounting terms (J. J. Siegel) it is only noted that when the benefits associated with the acquisition of a good or service are exhausted the cost of their acquisition becomes a loss or expense. The meaning of English words which in essence mean the same thing changes when they are accompanied by other words, e.g. direct cost, administrative expenses.

The question arises: "What is the sequence of expenditures and expenses from the point of view of accounting?" The authors join the opinion of specialists who believe that expenditures are the monetary value of the material, labor, financial and other resources used in the economic activity of the organization for the reporting period. Expenditures arise when a company acquires economic resources. They can be charged either to assets or to expenses. Expenses, in the general sense of the word, are one of the factors that affect the financial result of a company along with incomes that have the opposite direction, and allow to get a result in the form of profit or loss as a result of economic activity, ordinary or other. Therefore, we can assume that the expenditures relate to assets or expenses depending on their implementation target. If the objective is to create a fixed or current asset the expenditures are recognized as assets. If there is no such setting then it is obvious that the

expenditures incurred reduce the economic benefits of the company without creating any property and are reflected as expenses.

An interesting approach is expressed by professor Ya.V. Sokolov to the terms “expenditures” and “expenses”. He believes that "the expenses that are reflected in management accounting should be considered expenditures, while financial accounting is about expenses."

Kiryanov I.V. concludes that “expenses are part of the expenditures but one that did not lead to the formation of an asset.” At the same time putting an equal sign between availability of economic benefits and creation of an object of property seems to us not entirely legitimate. We can disagree with I.V. Kiryanov’s opinion since the following question arises: what about other expenses that will never be expenditures? Indeed, in accordance with RAS 10/99 “Organization Expenses”, expenses are divided into expenses from ordinary activities and other expenses. It is necessary to clarify that part of the expenditures are, after all, expenses from ordinary activities. Expenses are one of the elements of the statement of financial results along with incomes. It turns out that expenses are either reflected on account 90 “Sales” or on account 91 “Other Expenses and Income”.

A.A. Gribanov and M.V. Kudinov believe that “the concept of expenditures cannot be defined unambiguously, it is necessary to study it within the framework of individual business processes and distinguish the following groups:

1) expenditures associated with the acquisition of inventories, their storage, internal movement, etc .;
2) expenditures that arise directly in the production process and due to the manufacturing technology of finished products (works, services);
3) expenditures related to the process of sale of finished products.”

We dare to disagree with the fact that in the process of selling finished products expenditures arise since at the time of sale of finished products expenditures are transformed into expenses.

In our opinion, overhead and general expenses are of particular interest. So in accordance with RAS 10/99 “Organization Expenses” general business expenses can be distributed between types of finished products and reflected in account 20 “Main Production”, or without distribution can be immediately transferred to account 90 “Sales”. These types of expenses have a dual nature. In the first case, general expenses are recognized as expenditures and in the second case as expenses. In accordance with the chart of accounts these expenses are recorded on account 26 "General Business Expenses". In this connection the question begs: "Why only expenses"? It might be more correct to rename it to “General Business Expenses (Expenditures)”. A similar situation has developed with account 25 “General Production Expenses”. General production expenses are indirect expenditures which at the end of the reporting period should be allocated and charged to account 20 “Main Production”. Consequently, the organization incurs expenditures, but not expenses, and it would be more accurate to define account 25 as general production expenditures.

We consider A.V. Zonova’s point of view to be interesting, according to which “general business expenses and expenses of future periods should be excluded from the composition of objects of accounting for the production process, and with a certain reorganization, those serving production and economy should also be excluded. The expenses for these facilities not included in the cost of products (works, services), will be immediately charged to expenses of the period. ” But what if these accounting objects are included in the cost of labor products? Then they will be recognized in the account as expenditures and their exclusion from the structure of objects of accounting of the production process will be unlawful.

Research results and discussion

The interpretation of such categories as “expenses” and “expenditures” will be more understandable and in demand when specifying an equally important economic category of cost. The economic nature of prime cost has always been and still is among the scientific and practical priorities. The term denoting cost is relatively new for Russia. Studies by leading economists indicate that the term appeared in the Russian language in 1912 and is associated with the works of A.P. Rudanovsky, M.P. Ter-Davydov and N.F. Von Dietmar. According to Rudanovsky A.P., “prime cost is a probable value” because it is calculated at actual expenditures and is one-sided due to the difference in the price level for the same materials. Until that time the concepts of “own value”, “value”, “production value”, etc. were used.

Since then various interpretations of cost have appeared in scientific sources on accounting and analysis (Table 2).

Table 2: Description of the concept of cost proposed in the special literature on accounting

Author / Literary Source	Cost is
Vakhrushina M.A.	a set of expenditures of an enterprise for the production and sale of products expressed in monetary terms
Ivashkevich V.B.	
Kiryanov I.V.	objectively necessary connection of the elements of expenditures providing through quantitative indicators the integrity of the implementation object, allowing by the specifics of its formation to uniquely identify the agent of economic relations as an independent business entity
Anthony R., Rhys J.	monetary value of resources used for specific purposes
Needles B, Anderson H., Caldwell D.	production costs for manufactured but unsold products, i.e., as if materialized expenditures, and that is why they can be taken stock of

Each of the above definitions in Table 2 is based on determining the amount of resources spent in monetary terms without specifying that they should operate on the concept of expenditures, not expenses. Expenditures are transformed into expenses from ordinary activities as a result of the sale of a product of labor in the reporting period, and otherwise into company assets. Therefore, expenditures cannot be interpreted as the cost of finished goods. It must be clarified that this position is valid only for the production cost of finished products. The full cost differs from the production cost in the way that it is supplemented by selling expenses which are recorded on account 44 “Sales Expenses”.

Basically, the prevailing opinion among academic economists is that cost is the total expenditures of an enterprise for the production and sale of products, expressed in cash. In the previous Regulation on the composition of the costs of production and sale of products (works, services), and on the procedure for the formation of financial results taken into account in the taxation of profit, it was said that the cost of products (works, services) is considered as a valuation of natural resources, raw materials, fuel, energy and labor resources, used in the production of products (works, services), as well as other costs of production and sales. According to the document, cost can include all expenditures that are of a production nature and the expenditures associated with the sale of labor products. But since 2002 the term denoting prime cost is not officially enshrined in regulatory documents in our country.

In our opinion, the ratio of the categories “expenses”, “expenditures” and “cost” can be represented as follows (Fig 1).

Fig. 1: The ratio of the categories "expenditures" and "expenses"

From the above figure it is seen that in case of capitalization of expenditures fixed assets (accounts 08, 01, 04) or current assets (accounts 10, 43, 20, 23, 25, 26, 28, 29) arise in the organization. In case of decapitalization of expenditures they are transformed into expenses of the reporting period and are reflected in the statement of financial performance. In case of decapitalization of fixed assets they will be written off as other expenses (account 91 "Other Income and Expenses"), upon disposal of current assets they will be reflected as expenses from ordinary activities (account 90 "Sales"). In this case the cost of work in progress is reflected in the balance sheet as the balances of accounts 20 "Main Production", 23 "Auxiliary Production", the cost of finished goods - as balances of account 43 "Finished Products", the cost of sales will be shown in the statement of financial results as expenses from ordinary activities. Thus, the cost of production can be reflected both through the category of expenditures and through the category of expenses. Therefore, the cost of production is probably one of the most controversial economic indicators that accounting specialists deal with in theory and practice. It is very difficult to find the only true definition of cost that would satisfy all its aspects.

In this regard, one can agree with the views of individual researchers who believe that the cost of products (works, services) is a synthetic indicator. In any case, cost is a quantitative indicator in the monetary measure of production expenditures and expenses associated with the sale of product (Fig 2).

Fig. 2: The relation between expenditures, costs and the cost of a product of labor

Conclusion

To summarize the above, we can draw the following conclusions. The concept of cost arises in the production process, it shows a monetary value of the resources spent in the production process, that is, the expenditures incurred. In relation to the manufactured products the prime cost is formed at the end of the production process, and in relation to the sold products at the end of the sales process. It turns out that there is a relation and interdependence between the analyzed categories of expenditures and expenses. Their common features are manifested in the concept of the cost of a product of labor. In this regard, the cost of a product of labor refers to the amount of actual expenditures incurred in its production. The cost of labor products written off as expenses in connection with the sale is a qualitative indicator of the company and reflects the efficiency of its work, as well as the main factor in generating profit. The cost of a product of labor turns into expenses for ordinary activities only when the product is sold. Until the moment of sale products (works, services) are accounted for as part of the company's assets at cost.

Abstract

Increasing the efficiency of the bank and, as a result, strengthening its financial stability requires the implementation of effective management in the field of managing bank profits and profitability, which determines the need and significance of relevant research.
The purpose of this work is to identify reserves for growth in profitability, improve the quality of the income base and, on this basis, formulate recommendations for adjusting the banking policy in the field of passive and active operations. The scientific novelty of the study is as follows: the author's classification of income and expenses is proposed, allowing them to be structured both by categories of banking business types of services in the financial markets, and taking into account the stability of sources of income base.
This makes it possible to identify profitable / loss-making centers by types of banking operations; destabilizing factors of revenue and profit management of leading Russian banks were identified; reasonable recommendations are given to improve the efficiency of this area of banking management.

Keywords: Bank, Financial Management, Analysis, Revenue And Profit Management

Introduction

The issues of improving the analysis methodology, developing the theory and practice of managing financial results of banking activities in order to identify reserves for increasing profits and ensuring profitable activities are very relevant in the financial management of the bank and strengthening its market position. Without a competent analysis of the financial results of the bank and identification of both driving and destabilizing factors affecting income and profit, it is impossible to ensure the necessary level of bank profitability and its steady growth.

Management of income and profit of the bank is a complex multifunctional mechanism, consisting of individual links that are closely related. In this article, from the perspectives of development and improvement, we consider such elements of the methodology of the above management as the

analysis of the income and profits of a commercial bank, the use of methods to assess the quality of the income base, structure and level of stability of banking profit, the development of recommendations on the current regulation of the bank's income and profits (Yanikkaya H., 2018, Aydemir R., 2016, Meijer E., 2017).

Materials and Methods

The study involved teachers and students of the Chuvash State Agricultural Academy. The scientific problem was studied using data from PAO 'Sberbank of Russia' as the largest bank in the banking system of the Russian Federation, and other banks that are leading ones at the federal and regional levels.

The studied methods of the analysis of income and profit of the bank record that the analytical work necessary to be conducted should include the following blocks: the analysis of the structure and dynamics of income and expenses, calculation and analysis of indicators of profitability of assets, including their constituent elements; calculation and analysis of cost indicators of resources attracted for investments; analysis of the structure and dynamics of profit, calculation and evaluation of profitability and bank margin indicators, factor analysis of profit and profitability indicators (Alekseeva N.V., 2017).

We believe that the analysis and assessment of the optimality of the structure of the bank's revenue base is a determining unit in the management of profit and profitability of the bank. At the same time, the effectiveness of this work and the validity of the conclusions directly depend on the rationality of the applied income classification, the correct choice of the methodology for their analysis. According to the authors in the field of banking financial management, it is advisable to classify bank income for the purpose of subsequent analysis according to the criteria listed below (Alekseeva N.V., 2017, Starodubtseva E.B., Markova O.M., 2018, Gilyarovskaya, L.T., 2012, Scherbakova, G.N., 2007, Ahamed M.M., 2017, M. Chen, 2017): by a type of business (lending, operations with securities, settlement services, etc.); by nature income is divided into operating (related to banking operations and transactions) and others; operating income is classified according to the form of income on interest and non-interest ones; according to the form of income (interest, commission, exchange rate differences, etc.); in terms of stability.

At the same time, relatively stable sources of income include interest income and commission income from banking services; unstable - income from operations in speculative financial markets (securities market, foreign exchange market, precious metals market), from unforeseen (one-time) operations (sale of property, fines and penalties, sale of collateral, etc.). The studied methods establish that the desired direction of the bank's development is income growth due to stable sources, the absence of significant influence of unstable sources of income on profit growth (Shcherbakova, G.N., 2007).
The expenses of a commercial bank are classified, in addition to the criteria listed above, by the method of accounting, by the impact on the tax base, by the method of limitation (the possibility of rationing). Based on a generalization of the applied classifications of income and expenses of the bank, it is necessary to develop a structuring that combines the accounting of the basic classification criteria (Alekseeva N.V., 2019).

This new approach to revenue structuring will allow developing and applying in an effective analysis indicators characterizing the quality of the income base and allowing to identify the reserves for the formation of the optimal structure of bank income and profit; eventually this makes it possible to identify profitable / loss-making centers by types of banking operations (Shcherbakova, G.N., 2007, Belousova V., 2018, Djalilov, K., 2016,).

To achieve the goal and objectives of the study, general scientific approaches and methods were used - system analysis, abstract-logical, analogies, generalizations and systematization.

Research Results and Discussion

Based on the results of a generalization of the applied classifications of income and expenses of the bank, we proposed structuring that combines the consideration of classification criteria such as the nature, form of income (expense), type of business from which income (expense) is derived, and the level of stability. According to the results of the recommended classification of incomes, we have accessible, easily identifiable data that allows us to group the income base items by degree of stability and evaluate its level. In general, this differentiation of incomes (expenses) allows us to more fully, comprehensively assess the optimality of the structure of incomes (expenses) and identify the centers of profitable (unprofitable) activities of the bank by business categories and types of operations (Alekseeva N.V., 2017).

To conduct this analysis, we have developed and proposed the following forms of analytical tables (table 1, table 2). PAO "Sberbank of Russia" was selected as the object of income and profit analysis (the analysis was carried out using the data on the financial results report as part of quarterly bank statements for Sberbank of Russia, available on the Central Bank of RF website).

Table 1: Structure and dynamics of income of PAO Sberbank of Russia for 2016–2018.

Indicator	01.01.2017		01.01.2018		01.01.2019		Rate of change%	
	Amount, million rubles	Specific gravity, %	Amount, million rubles	Specific gravity %	Amount, million rubles	Specific gravity %	2017 to 2016	2018 to 2017
I Operating income	105088194	99,9	61627663	99,9	81 859 205	99,9	58,6	132,8
1. Interest income	1 985 375	2,0	1950 211	3,3	2 000 450	2,4	97,7	98,4
2. Non-interest income, including:	103008 428	97,9	59595492	96,6	79 858 755	97,5	57,8	134,0
2.1 operations in foreign currency	94 778 893	90,1	56616873	91,8	74 906 115	91,5	59,7	132,3
2.2 commission, including:	360 619	0,3	443 631	0,7	581 635	0,7	123,1	131,1
- for cash management services	275120	0,2	323 780	0,5	451 402	0,5	117,4	139,6
2. on investments in securities	24 877	0,0	39 550	0,1	38 614	0,1	156,0	97,7
2.4 other operating income	7 844039	7,5	2 495 438	4,0	4 332 391	5,2	31,8	173,6
II Other income	105 194	0,1	24 318	0,1	24 580	0,1	22,8	101,2
Total	105193388	100	61651981	100	81 883 785	100	58,6	132,8

According to the table, the total volume of the bank's revenue base increased in 2018 by 20,232 billion rubles. or 32% and as of 01.01.2019 amounted to 81,883 billion rubles. The basis of the

bank's operating income is non-interest income, their share increased by 0.9 percentage points in 2018 and as of 01.01.2019, it amounted to 97.5%. The largest share in the structure of non-interest income is occupied by income from operations with foreign currency (income from the purchase / sale of foreign currency and positive revaluation) and other operating income (mainly represented by income from the restoration of the amount from reserves).

Interest income makes up a small part of the bank's income; and their share, significance in the revenue base decreases - by 0.9 percentage points for 2018.

It should be noted that interest income for a bank operating in a stable economy, the basis of which is lending, should also determine the basis of the income base - 50-60% of the amount of income in accordance with the recommendations of experts. Low interest income for 2016-2018 indicates that the total income of the bank and the financial result is little dependent on credit operations.

In general, the bank's stable incomes make up a low share, their share was: 2.3% of the revenue base as of 01.01.17, 3.1% as of 01.01.19

Based on the results of the analysis of the structure and dynamics of the bank's revenue base, we will assess its quality according to table 2.

Table 2: Dynamics of income quality indicators for PAO Sberbank of Russia for 2016-2018.

Indicator	2016	2017	2018	Absolute change., +/-	
				2017 year from 2016	2018 year from 2017
The share of stable income in the revenue base,%	2,3	4,0	3,1	1,7	-0,9
The share of interest income on credit operations in the income base,%	1,8	3,0	2,2	1,2	-0,8
The share of income from operations in speculative financial markets,%	90,1	91,9	91,6	1,8	-0,3

According to the table, the share of stable incomes remains extremely low and indicates a high dependence of the income base and financial result on the effect of the bank's activity on speculative markets, which means a low level of quality of the income base and the instability of the bank's performance.

Comparison of income and expenses classified according to the proposed methodology makes it possible to identify centers of profitable (unprofitable) activities of the bank by business categories and types of operations. To conduct this analysis, it is proposed to use table 3.

Table 3: Dynamics of profit indicators of PAO Sberbank of Russia for 2016–2018.

Indicator	Amount, million rubles			Rate of change%	
	2016	2017	2018	2017 to 2016	2018 to 2017
1. Interest income	1201 559	1301 788	1275 961	108,3	98,0
-interest income	1 985 375	1950 211	2 000 450	98,2	102,5
-interest expenses	878 207	730 383	724 489	83,1	99,2
2. The costs of ensuring the activities of the bank	583 937	626 982	688 424	107,4	109,9

3. Profit before tax	647 895	845 885	1 002 587	130,6	118,4
-income	105193 388	61 651 981	81 883 785	58,6	132,8
- expenses	104545 493	60 806 096	80 881198	58,1	133,0
including for individual elements:					
3.1. Profit from operations with foreign currency	42 219	26 348	27 467	61,9	104,2
- income	95 066 976	56 616 873	74 906 115	59,7	132,3
- expenses	95 024 757	56 590 525	74 878 648	61,2	132,2
3.2. Profit from commission operations:	338 961	386 343	433 082	112,5	112,2
- income	381 922	443 631	514 912	115,9	116,2
- expenses	42 961	57 288	81 830	132,5	143,8
Profit for the reporting period	498 289	653 565	782 182	131,1	119,7

According to the analysis, the following main sources (centers) of profitable activities of the studied bank were identified:

- profit from traditional deposit-lending activities (interest income); despite the fact that interest income (expenses) occupy an extremely insignificant share in the bank's income (expenses), interest income is the main source of positive financial result of PAO Sberbank of Russia, which is determined by the size of the margin at the rates of placement and attraction of resources;
- the importance of profit from commission operations of the bank is growing (formed due to stable sources of income);
- during periods of increased instability of financial markets, a significant source of net profit of the bank becomes profit from operations with foreign currency, the income of which is estimated as unstable, negatively affecting the stability of the financial result.

For further growth in the volume of profit and ensuring its stability, the following regulatory measures of financial management in the bank are necessary:
- ensure the outstripping growth of interest income in relation to interest expenses, interest margin;
- ensure the outstripping growth of commission income and bank profits; a determining influence on the dynamics of profit of stable sources of income and profit will determine the stability of its growth, a high level of forecasting accuracy;
- limiting the impact on the size and dynamics of the bank's profit of financial results from operations in the foreign exchange market, the income and expenses of which are unstable, speculative in nature, which determines the element of instability, uncertainty in profit planning.

To assess the results of modern practice of managing income and profits in the banking sector of the Russian Federation as a whole, we consider the relevant data for the leading regional and federal banks (table 4) [3].

Table 3: Dynamics of indicators characterizing the optimality of the structure of income and expenses for individual banks for 2015-2018.

Indicators	Share in the amount of income / expenses, %			
	2015 г.	2016 г.	2017 г.	2018 г.
PAO Sberbank of Russia				
1. Interest income of all, including:	2,1	2,0	3,3	2,4
- on loans	2,0	1,8	3,0	2,2
2. Income from operations with foreign currency	90,3	90,1	91,8	91,5
3. Commission income	0,4	0,3	0,7	0,7
4. Expenses on operations with foreign currency	90,6	90,9	90,8	91,4
PAO VTB Bank				
1. Interest income of all, including:	3,8	5,2	7,2	5,4
- on loans	3,6	4,9	6,8	5,0
2. Income from operations with foreign currency	90,7	87,8	81,4	83,1
3. Commission income	0,1	0,1	0,1	0,3
4. Expenses on operations with foreign currency	90,8	87,9	82,6	83,4
PAO AKB CHUVASHCREDITPROMBANK				
1. Interest income of all, including:	23,3	23,5	28,3	26,9
- on loans	22,1	22,9	27,5	26,6
2. Income from operations with foreign currency	45,2	41,2	37,3	43,3
3. Commission income	3,6	4,5	6,1	6,9
4. Expenses on operations with foreign currency	43,9	40,3	32,5	38,5

The analysis of the structure of income / expenses for individual federal and regional banks allows us to state that if the volume and dynamics of the income and expenditure base for the largest, federal banks are determined by non-interest transactions, which are overwhelmingly represented by operations in the foreign exchange market, then the level and change of the final financial result is almost entirely dependent on the bank earned interest income; non-interest income plays the role of an additional element, the effective regulation of which is appropriate, significant for the bank, but not as productive as in relation to interest-bearing operations [2, p. 43].

In the activities of regional banks, the share of stable sources of income is high, close to the recommended rate; dependence on speculative financial markets is assessed as low, and the financial result is determined by the results of the traditional banking business.

Based on the results of the analysis, the following negative, destabilizing problems and factors determining the dynamics of revenues and profitability of PAO Sberbank of Russia and banks in the banking sector of the Russian Federation as a whole were identified:

1. The extremely low interest income in the income base (2-10% for federal banks against the norm of 40-50% for a bank operating in a stable economy);
2. The extremely low level of stable income in the revenue base (3-15% of the revenue base for federal banks and up to 35% for regional banks); however, according to the standards of banking financial management (according to a number of well-known authors and experts in banking), it is stable incomes that should form the basis of the bank's income, and their dynamics should play a

decisive role in the dynamics of the income base as a whole and the bank's profit, and ensure their stability and sustainability. values
3. The extremely high dependence of the volume and dynamics of the revenue base on unstable sources of income, namely income from operations in speculative financial markets (primarily in the foreign exchange market) (up to 90% of all revenues from federal banks and up to 50-60% of income bases for regional banks); the high level and determining value of these incomes negatively affects the stability of the financial result of the bank, determines the element of uncertainty in profit planning.

Conclusion

Thus, the proposed classification of income and expenses made it possible to identify significant centers of profit formation for the bank under study, which makes it possible to assess the quality of profit-generating elements (stable or unstable), determine regulatory measures, and assess the possibilities of forecasting the dynamics of its financial result for the future.

According to the results of the study, the following relevant areas of increasing the revenue base, increasing the level of its stable components, as well as limiting the costs of a modern Russian bank in order to maximize profits can be identified:

- minimization, maintenance of the optimal level of interbank credit, including from the Central Bank of the Russian Federation; a significant share of borrowings on the interbank credit market, including from the Central Bank of the Russian Federation, in the liabilities of the bank balance sheet, according to experts, indicates the presence of reserves to increase its profit and profitability; the formation of a balanced deposit portfolio (term deposits and demand deposits) leads to a decrease in the volume and level of interest expenses on attracted resources, implying a limitation of the share of paid deposits based on the calculation of indicators of the effectiveness of the use of deposit resources;
- measures to regulate credit risk were directed to limit the costs of creating reserves for possible losses on loans; in this case, the recovery from reserves will be balanced or higher than spending funds in reserves; both items occupy a significant share in the income and expenditure base of banks;
- the steady growth and significant place of commission net income in the formation of the financial result positively characterizes the financial management of the bank, testifies to the wide scale of the provision of commission services of settlement-cash, investment nature, the dynamic growth of the clientele.

The results of the study lead to the conclusion that the strategic direction of ensuring the rise in profits and profitability of the bank's activities is currently the outstripping growth of stable categories of income sources, in connection with which the most relevant and promising are commission operations of a settlement and investment-intermediary nature, which determines the need for their further expansion, improvement and promotion within the framework of effective banking marketing.

Abstract

Sustainable development of the agricultural sector of the country's economy is largely determined by the effectiveness of innovation in the industry. The development of innovations provides a systematic update of the organizational, economic, technological and technical base of agricultural production and the production of competitive products.

However, the current socio-economic situation in the agricultural sector of Russia suggests that, due to imperfect technologies based on knowledge of domestic and foreign literature, forms and methods of management in agriculture, the industry cannot compete with foreign exporters of products.

In addition, there is a tendency to increase the dependence of the country's agriculture on other states in relation to varieties, breeding livestock and poultry, and agricultural machinery. Breeding enterprises of the country with an unsatisfactory material and technical base cannot provide the domestic agricultural industry with the necessary amount of breeding material for stable operation.

In this regard, research is needed aimed at improving the innovation management system in the agricultural sector in order to increase the efficiency of investment in innovation, ensuring continuous growth in economic efficiency and expanded reproduction. Based on these provisions, it is possible to determine such tasks of scientific research as determining the main elements of the innovation process in the agricultural sector, identifying and analyzing the factors that determine the transition of the agricultural economy to innovative technologies.

Keywords: innovation, innovation management, innovative technologies, agro-industrial complex.

Introduction

In modern conditions, the development of the agro-industrial complex is closely connected with the introduction of an innovative component in the process of organization and management of an enterprise.

Investments in innovative projects provide an opportunity to develop the competitiveness of the enterprise, improve existing technologies, create new and better products that are in demand by the population.

The indicated problems of activation of innovative processes in the agricultural sector are reflected in the works of V.M. Bautin, K.V. Baldin, Yu.S. Vasyukova, A.A. Golubev, V.I. Nabokov, K.V. Nekrasov, S.A. Sharipov, G.A. Kharisov.

Theoretical and methodological aspects of the innovation management mechanism are reflected in the works of foreign and domestic scientists, such as Archibugi D. (1999), Howells J. (1999), Michie J. (1999), P. Drucker (2012), Koschantzky K. (2000), Sternberg R. (2000), C. Christensen (2014), M. Raynor (2014), S. Sandu (2009),Howell J. (1999) and others.

However the problems of innovative development in the agribusiness sectors are not well understood and require further consideration and resolution. Especially important for the development of the theory and practice of innovation management are issues such as the study and systematization of a combination of factors that determine the transition to an innovative type of development that helps to increase the investment attractiveness of enterprises and the effectiveness of investments in innovation.

It is obvious that the ongoing changes in the investment activity of the agro-industrial complex are closely related to innovations that ensure the necessary quality of investments and the competitiveness of agricultural products based on them.

Materials and Research Methods

The object of research is the process of technological entrepreneurship in the conditions of innovative development of the national economy and its most important investment and design aspects related to the construction of a business model.

The subject of the research is the processes of innovative transformations taking place at enterprises and in the national economy as a whole, causal relationships and consequences of this process, as well as objective and subjective factors contributing to its development.

The theoretical basis of the study was the scientific and methodological works of foreign and Russian researchers, which reveal the essence of innovation and innovation, conceptual approaches to the development of strategic integration of innovation and technological entrepreneurship.

The fundamental principles that reveal the essence of innovation were formulated by the Austrian scientist J. Schumpeter in his work on the theory of economic development, where he highlighted the typical changes characteristic of innovation.

Among modern foreign researchers covering the problems of innovative development in recent decades, it should be noted the works of S. Blanck, E. Ries, M. Johnson, K. Christensen, H. Kagermann, A. Osterwalder, I. Pigne, in which they analyze the scientific methodological approaches to testing innovative ideas and building business models that contribute to their implementation.

A significant contribution to the development of methodological support for innovative management and technological entrepreneurship was made by Russian scientists. Barykin, V.O. Ikryannikov proposed a functional-dynamic model of technological startup management and methodological approaches to business modeling in the management of innovative projects. M.V. Kovaleva, L.V. Silakova, V.V. Shirokovara developed a classification of technological startups by functional areas of activity and proposed managerial approaches to their creation and development. N.N. Ilysheva, S.I. Krylov developed a balanced scorecard for the strategic management of innovation. B.E. Tokarev has developed a startup model with a feedback loop, characteristic of innovative products.

The methodological basis of the study was the historical and logical, formal and substantive approaches, methods of analysis and economic modeling.

Research Results and Discussion

The problem of the transition of the agricultural sector of the economy to an innovative type of development takes on a specific character. The issue of innovative development is introduced into the legal field. The Ministry of Agriculture approved the Concept for the Development of Agricultural Science and Scientific Support for the Agro-Industrial Complex of the Russian Federation for the period until 2025. This Concept provides for the formation of a national innovation system that ensures the effective development of the Russian agricultural sector. A Strategy for the Innovative Development of the Agro-Industrial Complex of the Russian Federation has been developed, in which priority areas are identified.

However, the susceptibility of the agro-industrial complex to innovation is still weak, which determines the need for a transition to a qualitatively new innovative type of development of the agrarian economy.

Innovations are considered from different points of view: some scientists understand innovation as a process, others as a result.

The authors adhere to the understanding of innovation as the end result of research or discovery, implemented in any field of activity.

So, innovation is the result of innovative activity. It should be noted that many authors define innovative activity as the activity of bringing scientific and technical ideas, developments, inventions to results. In our opinion, this definition must be supplemented by a set of measures ensuring the development of innovations.

The development of the innovation process in the agricultural sector is determined by a combination of external and internal factors that directly affect the management of innovation in the industry. Moreover, one of the main external factors is the inclusion of the agri-food market of Russia in the global market system, which contributes to the modernization of the domestic agricultural sector. That is, agricultural enterprises that do not meet international quality standards cannot compete with foreign goods and thereby yield a certain part of the market for imported agricultural products.

Therefore, domestic producers must focus on increasing the competitiveness of the industry, expanding the range of products, creating favorable conditions for the penetration of agricultural products into the world market, which determines the introduction of innovative technologies in the agricultural sector.

Obviously, a qualitatively new approach to high technologies and achievements in the agrarian science of Russia, which are close to the world scientific levels, is necessary. The current government measures and incentives do not contribute to the full-scale implementation of innovations and the expansion of the participation of scientific developments and research in world markets.

Under these conditions, an appropriate state policy is needed to stimulate agricultural producers to switch to innovative technologies. The way out of this situation is primarily possible only through strengthening state support for the agricultural sector of the economy and expanding financial assistance to agricultural producers in technical re-equipment.
The problem of financing innovation in the agricultural sector needs attention. It is necessary to create favorable conditions in the financial and legal sphere for the formation of an effective innovation system.

It should be noted that the creation and implementation of innovations requires not only developed science and production capable of perceiving scientific achievements, but also incentives that encourage people to use these innovations.

For the development of innovative processes in agriculture, it is necessary to determine specific measures to improve the existing regulatory legal acts and the practice of state regulation of innovative activities of agricultural organizations.

The main factor determining the transition to innovative technologies is increased competition with foreign agricultural producers. Countries with large agricultural science potential make large investments in agriculture and strive to maintain their scientific position.

The experience of such developed countries as the USA, Great Britain, Germany, Japan shows that the best results in economic development are obtained by innovation-oriented enterprises.

At the same time, the economic strategy of corporations and firms of these states is not just innovative development, but the optimization of the role and magnitude of innovative investment, which ultimately forms a special attitude of society towards the creation of the country's scientific and technical potential and determines the innovative type of economic development.

At the same time, the world trend of expanding international cooperation in the field of fundamental and applied research and the participation of foreign scientists in national research projects is also obvious. The priority task of states in this case, in our opinion, should be to create favorable conditions for both innovative scientists and investors.

In many countries where agricultural production is low, large areas of agricultural land are not cultivated. These lands are acquired by foreign investors. Such a threat also exists for the Russian agricultural sector.

It is obvious that in the sectors of the agro-industrial complex, the innovation process is a continuous process of turning research and development into innovations: new technologies, improved varieties and breeds of cattle, new forms of organization and management. However, there are a number of features that predetermine the uniqueness of approaches and methods of managing the innovation process.

It should be noted that there is a growing trend in the dependence of Russian agriculture on other states in relation to varieties, pedigree cattle and poultry, and agricultural machinery. For example, in recent years, in Russia there has been a tendency to increase the proportion of poultry of foreign selection, which is most fully displayed in broiler production. The breeding enterprises of the country with an unsatisfactory material and technical base cannot provide domestic poultry farming with the necessary amount of breeding material for stable operation. It is quite obvious that it is necessary to update the country's breeding base using the modern achievements of agricultural science.

The acute problem is the technical equipment of agricultural enterprises. The state of the machine and tractor fleet is deteriorating. In addition, it should be noted that obsolete technological structures dominate in the domestic agricultural sector. The largest share is occupied by agricultural organizations belonging to the third and fourth technological paradigm, requiring modernization. The share of the fifth paradigm, characterized by the introduction of innovations in agricultural production, is minimal. Updating the technical base on a qualitatively innovative basis will increase the efficiency of its use.

The current level of development of the personnel potential of agriculture does not ensure the effective introduction of new methods and technologies in the country's agricultural production. New trends in the technological process on an innovative basis require an increase in the quality of personnel. At the same time, information technologies, being an innovation, make it possible to

achieve compliance of the professional competencies of personnel with the requirements of the innovative development of agricultural production.

Investments in the infrastructure of the company, that is, investments in information and communication technologies, in new work processes and management systems, according to the authors, determine the development of the creative potential of the personnel and the production management process as a whole.

Investing in solving innovative problems and carrying out R&D, as well as the costs of acquiring intellectual property such as patents, know-how, brands, are one of the most important factors ensuring the modernization of the economy.

Investments in building relationships with customers, the business reputation of the company, in the quality system, market forecasting contribute to raising the status of the company both regionally and internationally. These types of investments in client capital are important for building intellectual capital.

Low rates of growth in prices for agricultural products compared with prices for material and technical resources hinder the growth of production efficiency in the agricultural sector. Active development of modern areas of science and technology and their introduction into production will increase the efficiency of the use of labor, technical, energy, natural resources and thereby reduce the cost of agricultural products.

It follows that the introduction of innovative technologies and innovations in the agricultural sector provides an increase in the competitiveness of agricultural products and the economic efficiency of agricultural enterprises.

Conclusion

Thus, innovative activity in the field of agriculture is possible, first of all, if there is a system of external and internal factors that are necessary for its effective implementation, if there is an innovative potential of enterprises, including tools and methods for creating and implementing new technologies, knowledge, products and methods of agribusiness organizations.

Moreover, the totality of factors that determine the transition to innovative technologies in agriculture can be expressed in a systematic way (Fig.).

Fig. Factors determining the transition to innovative technologies in the agricultural sector

The analysis of the totality of factors influencing the innovation process in the agro-industrial complex shows that the successful implementation of innovative activity requires consideration of its features, which predetermine the uniqueness of approaches and methods of managing it. The innovative activity of the agro-industrial complex is represented by the results of the selection and genetic developments of the Russian Academy of Agricultural Sciences, innovations in crop and livestock production technologies, technical and technological modernization of agriculture, and new methods of organizing and managing modern agricultural production.

The above circumstances allow us to define the management of innovation activity as a targeted impact on innovation processes based on their planning, organization and coordination of innovation activity, motivation of its participants, monitoring the implementation of innovation projects in order to increase the return on investment in innovation and the value of the enterprise.

The specific nature of agricultural entrepreneurship, due to biological, soil, climatic and organizational factors, determines a certain discrepancy in the rates of economic growth of industry and agriculture, in the rate of return on investment in innovation, and thereby requires an improvement in the mechanism for managing innovation in the industry in modern economic conditions.

According to the authors, the following areas of improvement of the mechanism for managing innovation in the agricultural sector can be distinguished:

1. Transition to a qualitatively new approach to high technologies and achievements in agrarian science of Russia, which are close to world scientific levels.
2. Creating favorable conditions in the financial and legal sphere for the formation of an effective innovation system.
3. Updating the technical base of agricultural enterprises on a qualitatively innovative basis.
4. Making investments in information and communication technologies, in new work processes and management systems for the development of the creative potential of personnel and the production management process as a whole.
5. Investing in human resources to build intellectual capital.
6. State support for innovation, which may be available both for large enterprises and for small forms of management in the agricultural sector.

Thus, in modern conditions, the development of the agro-industrial complex is closely connected with innovative technologies, knowledge and innovations that contribute to increasing the competitiveness of agricultural products based on them. Despite the complexity of managing innovation in the Russian agricultural sector, there is enormous potential for competitive domestic products to enter the world market.

In a broad sense, the management of innovative activities allows us to solve the problems of increasing resource returns, transforming scientific, fundamental discoveries into practical solutions, and determines the competitive advantages of organizations and manufactured products.

The use of the proposed measures will contribute to the creation of a favorable macroeconomic environment for the development of agricultural enterprises that are actively mastering innovations, which, in turn, will contribute to their achievement of high financial and economic performance.

Abstract

The need for labor market regulation has been the subject of debate since the turn of the century. As studies of this problem in Russia has shown labor market regulation results in numerous negative consequences. First of all, in high hidden unemployment, which affects labor productivity. However, Russian labor market has a number of distinctive features, one of them being high state participation in the economy. This leads to labor market being regulated by the state, not by the need for efficiency. However, this is not the only feature. In Russia the level of corruption is very high. Therefore, the issue of labor market regulation cannot be fully analyzed without this factor being taken into account. The paper analyzes labor corruption in sectors such as public administration, education and healthcare. It gives explanation to the extremely low productivity in these spheres. The paper shows that labor corruption significantly enhances negative impact of the existing labor market regulation in these sectors, especially in public administration.

Keywords: labor market regulation, unemployment, hidden unemployment, public sector, corruption, labor corruption

Introduction

In the previous work by Semenova A. et al (2019), the author examines the assumption of Besley and Burgess applied to the Russian labor market. It shows that in Russia existing restrictions on labor market result in negative consequences. First of all, in high hidden unemployment which affects such macroscopic indicator as labor productivity. In addition, this results in an increase in informal employment, in moving wages and salaries into the shadow economy sector and significant differences in wages. The paper considers mechanisms of this phenomenon and its causes, specific features of Russian legislation which give rise to these phenomena (peculiarities of wage formation, see (2001).

Thus, Russian economy is a good confirmation of Besley and Burgess`s thesis. One of the features of Russian labor market is the following: almost half of working people are employed in the state sector. This primarily applies to state-owned companies, state employees and officials. In addition, Russia is characterized by a very high level of corruption and this factor cannot be circumvented in the issue of labor market regulation.

The paper considers two sectors of economy that are most susceptible to corruption - the public sector and the public administration. It also analyzes the problems of labor market regulation in these sectors and an impact of corruption on this process.

Research Methods

Research sources for the study were the works by domestic and foreign scientists and economists on unemployment, the Federal State Statistics Service`s data, surveys` data and publications in scientific periodicals. The initial data for the analysis are taken from the reports of the Institute of Growth Economics named after Stolypin P.A. (2018) and Rosstat (the Federal State Statistics Service) for 2018-2019 (2019). The analysis of Russian labor market is based on the studies of Analytical Center under the Government of the Russian Federation (2001) as well as on the works by Siebert W.S. (2003).

Research results and discussion

In Russia there is a very high level of corruption. Corruption Perception Index (CPI) is used to assess the level of corruption. According to the international non-governmental organization Transparency International for 2019, Russia is 137 out of 180 in terms of prevalence of corruption in the state and economic sectors. Among countries with such a high level of corruption are Lebanon, Papua New Guinea, Paraguay and Uganda. Moreover, the number of points has not changed compared to 2018 and is 28 points out of 100. This is a very poor indicator.

Corruption naturally, one way or another, affects all areas of economic life including labor market. The analysis of labor market regulation will be incomplete if the effect of this factor is not considered. Therefore, it is imperative to take this factor into account in regulating labor market in Russia.

Directly related to labor market is a kind of corruption such as labor corruption. Note that the topic of labor corruption is currently not enough studied both in Russia and in other countries. However, for Russia this topic is quite relevant, Baitasov R.R. (2016).

In particular, the following are the most common among corruption violations of labor laws.

Protectionism (protection during employment), priority employment of some people at the expense of others (favoritism), promotion of workers on the grounds of kinship and fraternity (nepotism), personal loyalty, friendships, etc.).

Manipulations with wages (illegal deductions from wages, all kinds of offerings for one reason or another, incentive payments to one person at the expense of others, fictitious employment, use of official position for personal gain, etc.).

As shown in the works of Semenova A et al (2019) and (2001) in Russia a very significant part of wages is non-fixed payments and this leads to high hidden unemployment. However, this also creates the possibility of manipulating with wages which is the reason for labour corruption growth.

According to law enforcement reports, the most corrupt are the police, teachers and doctors. Therefore, we restrict ourselves to these sectors. According to statistics, officials and state employees make up a fairly significant part of all employees: 35.22 million people out of 70 million workers. According to the study (2018), sectors with the lowest level of value added generation per one workplace in 2017 were public administration (0.29 million rubles), education (0.37 million rubles) and healthcare (0.47 million rubles). Semenova A et al (2019), based on the analysis of value added generation per job during the crisis of 2014-2015 showed that a decrease in output did not lead to an increase in unemployment. This is due to the fact that enterprises have reduced wages of their

employees. However, the decrease in salaries in the above sectors was even more significant. Thus, hidden unemployment is even higher than in the manufacturing sector.

Let`s consider the public administration sector. According to Rosstat`s (Russian Statistical Agency) data, in Russia there are 1 million 107.3 thousand officials. In addition, according to estimates of the journal Voprosy Ekonomiki (Economy issues), there is one employee of technical personnel per official. So in general, we should talk about two millions involved in public administration. Note that in the US - only 17% officials. There are 2.1 million state employees in the United States. Thus, the number of state employees in the US equals the number of those in Russia, but the US population is 2 times more, so the concentration of officials is less there.

Note the following features of regulation of labor market of state employees.

Under Russian law a number of documents determine career planning. These include:

- qualification requirements;
- creation and effective use of personnel reserve;
- principle of compliance with the position.

In developed countries ethical standards of behavior are widely used. Typical examples are the USA and Singapore.

In connection with the decline in production in Russia the most attractive area in the labor market has become the public administration sector and the budget sector.

If in commercial organizations they find ways to circumvent legislation and free themselves from unnecessary workers, in state institutions there is neither an opportunity nor a motive to do this, because officials are not interested in improving labor efficiency. This explains such a noticeable drop in labor productivity in the public sector. Thus, the public sector is the best confirmation of the thesis of negative impact of state regulation of labor market.

It may sound strange but corruption brings some movement to this frozen picture, one might even say “market elements”. A weak personnel policy of the state allows personnel corruption and career opportunities regardless of the actual results of employees` work. Positions are partially determined by corruption schemes, bypassing labor market regulation laws. Thus, we come to the paradoxical conclusion - market mechanisms penetrate labor market through corruption. And this in a way compensates for the negative effect of law but in the wrong direction. Unfortunately, the result is also negative.

Two trends can be traced: an increase in the total number of officials and an increase in salaries against a lack of salary rise in the economy.

From 2000 to 2008 the number of officials grew 1.7 times. The growth was mainly due to regional employees - their number increased 2.25 times. Salaries are also growing rapidly. Here are indicative data for 2012 (see table).

Table. Salary growth for officials

Categories of officials	Number, thousand people.	Average salary, thousand roubles	Salary growth, %
Federal	38	60.6	13.1
Regional	733.4	30	5.3
Municipal	335.9	29.1	12.4

However, an increase in the number of state employees does not increase the efficiency of public administration. There is a simple expansion of the apparatus which reduces productivity in the public

administration sector. Thus, labor corruption significantly enhances the negative effect of labor market regulation.

Whereas in public administration labor market regulation leads to an increase in the number of officials, the situation in the budget sectors is somewhat different. The budget sphere is primarily education and healthcare.

Reduced funding of education and healthcare has led to fewer jobs in these sectors of labor market. This has led to a sharp increase in labor corruption in both education and healthcare.

Peculiarities of labor market regulation of education and healthcare are marked by the need for highly qualified specialists. The workers here are highly qualified specialists. Therefore, protectionism manifests itself to a lesser extent. In these sectors labor corruption manifests itself more vertically through creation of insignificant and ineffective jobs, as well as significant stratification of income.

Note, that there is no corruption in private healthcare. Corruption occurs in state and municipal healthcare.

According to law enforcement agencies, facts of a direct manifestation of labor corruption are known. In some large and prestigious hospitals managerial positions may be for sale. There are cases when posts are sold to people who are illiterate and simply do not have a medical education.

Doctors who want to work in a number of medical specialties must pay a lot of money for their appointment. By the way, this already gives rise to ordinary corruption, because this practice assumes the presence of shadow income, which allows them to compensate for the invested funds. It is necessary to take into account employment of doctors without proper qualifications, moreover, their admission and study at medical institutes was based on “kickbacks” to teachers.

If in the municipal healthcare sector labor corruption is restrained by medical responsibility, this is not the case with education. Therefore, labor corruption is quite widespread in education and in higher education. As it`s already mentioned, this translates into the creation of practically unnecessary jobs, as well as highly qualified specialists crowding out. All this explains low labor productivity in education. This is one of the reasons for the crisis of higher education in Russia.

The negative consequences of career corruption are very numerous, in general, they lead to a significant decrease in the efficiency of industries. First of all, this is an unreasonable staff increase and even creation of entire departments. Another very alarming result is a drop in professionalism, which is especially dangerous in healthcare.

Conclusions

The above analysis allows to draw the following conclusions. If the commercial sector somehow can circumvent the restrictions of labor market state regulation and reduces the number of workers to the required level, public sectors of economy (primarily public service, education, public healthcare) cannot and do not have any serious motivation for this.

Russia has an extremely high level of corruption. Corruption affects all spheres of society. Labor market regulation and labor corruption combined is the reason for the extremely low efficiency of state sectors of economy. The existing regulatory mechanism, in turn, gives rise to labor corruption.

According to estimates in Russian economy about 25 million workers (35%) are now redundant. First, it is hidden unemployment. Second, it is low labor productivity. Third, it is low salaries. Modern labor legislation is a serious obstacle to the restoration of market relations in the labor market. Note, that labor market regulation in Russia is clearly political in nature. Moreover, the society lacks an understanding of the need to restore market mechanisms in the labor market. Taking into account the widespread labor corruption, the task of labor market restoration is becoming a very

difficult task. Nevertheless, this is the only way to overcome the fall in incomes of working population. To improve the economy, it is necessary to change labor legislation and refer to the labor market model of countries such as the USA, Germany and the UK.

Abstract

The article discusses the improvement of forecasting systems and strategic planning of threats to economic security and public administration. Creating the necessary conditions for sustainable growth of the real sector of the economy. Monitoring the development of the state financial system. Stimulating innovative development in the economy, creating favorable conditions for the development and implementation of advanced modern technologies, improving the regulatory framework in this area. Weighted and balanced development of Russia and the constituent entities of the Russian Federation, as well as the strengthening of a single economic space. Development of competitive advantages of export-oriented sectors of the economy, as well as an increase in their efficiency from foreign economic cooperation. Security безопасности economic activity in the country. Development of civic potential in the country.

Keywords: economic activity, economic security, financial system, public administration, strengthening a single economic space.

Introduction

An analysis of the economic security of the Russian Federation and a number of economically developed foreign countries shows that Russia is faced with a whole range of threats that are absent or insignificant for economically developed states.

The strategic national interests of the Russian Federation in the economic sphere are multifaceted and consist of several important areas:

- sustainable economic development of the country for the long term ahead of global average growth rates;
- increasing the competitiveness of the state economy, obtaining new places in the global commodity-financial market;
- the growth of the welfare and quality of life of Russian citizens, recognition of their role in the global public space.

The experience of various states indicates that threats to economic security for a long time may not appear in an open and acute form, but this does not mean that nothing threatens us or that any crisis can be easily overcome.

Important internal threats to Russia at present are the imperfection of the state's legislation and regulatory framework, poor coordination of the relationship between the real and financial sectors, limited insurance of various risks, poor state of the entire scientific and technical potential of the state, unemployment, and a decline in the well-being of citizens.

Methodological Framework

The research methodology is based on the principles and principles of economic theory, regional economics and optimal management. To solve the tasks in the thesis, methods of systemic, economic, comparative-analytical and statistical analysis were used. The method of expert assessments, as well as methods of linear and nonlinear programming were used. In addition, methods of economic and mathematical modeling were used, including simulation methods and methods of multi-criteria optimization.

Discussions

In the Russian Federation, more than 70 million citizens work in industry, in agriculture, in the service sector, conduct their small businesses, and more than 40 million Russians (state employees, military personnel, non-working pensioners) receive fixed incomes. Due to the fact that there is an increase in the price of goods in the country, it is necessary that their incomes grow no lower than the level of inflation.

Internal threats can also be attributed to the socio-demographic situation, which is associated with various processes of population reproduction, as well as providing citizens of the country with decent conditions for their lives. The main task of reproduction of the population, to which many social projects of the state are aimed today, has come to the fore because of the failure in the demographic sphere in the 90s of the past century and in the early 2000s. In general, according to this indicator, our citizens are in 49th place in the world from 189 countries. However, the average working ability of a Russian worker, as measured by the number of years of work, the loss of working time due to illness and accidents, activity at work, is two times lower than that of a worker in the United States.

A real threat to the economic security of the Russian Federation today is also a low level of production potential due to depreciation of fixed assets of enterprises, low competitiveness of products, export of capital abroad, and a fairly low standard of living of citizens. Potential threats that have a promising possibility of implementation are the country's scientific and technological lagging behind economically developed states, aggravation of various environmental problems that can take on a catastrophic nature of development, as well as corruption in the economy. Almost half of the cases (45 percent) brought against entrepreneurs are terminated before the court. As a result, one entrepreneur, whose business is falling apart in this situation, has an average of 130 employees who have lost their jobs, which is very bad for the development of Russia (Griewald Yu. 2018).

For the country's economy there are direct threats in the form of a decline in production, a low technical and technological level of production, a deterioration in innovative potential, a decline in the professional qualifications of workers, and irrational use of natural resource potential. The low competitiveness of products manufactured by enterprises, the predominance of raw materials in exports, the high level of dependence on foreign machinery and technologies, the low efficiency of the state's monetary and tax policy, insufficient credit and banking support for the entire real sector of the economy, and the export of capital also pose a threat to Russia's economic security abroad.

To date, an integrated system of institutions to ensure the economic security of the state is inextricably linked by the vertical of state power, the general leadership of which is exercised by the President of the Russian Federation. In the modern Economic Security Strategy of the Russian

Federation, internal and external threats to the economic security of the state are defined as a combination of different conditions and factors that create a danger to the various vital economic interests of the individual and society, as well as the state as a whole.

The technological part of economic security presupposes a state of scientific and technical potential of the state that allows, in a short time, to independently develop advanced technological solutions that can provide a breakthrough in the main branches of military and civilian production. The massive use of promising technologies in the economy will create conditions for the country's accelerated transition to an intensive development model, a significant improvement in the export-import structure, and the elimination of its economic dependence on foreign countries.

The main direction of scientific and technical development of industry is the reduction of energy and metal consumption in production. Developed countries have made great progress in this direction, gradually moving to a type of economic growth in which the satisfaction of the production and personal needs of people can occur with less resources allocated to production. The implementation of this direction in the future contributes to the sustainable development of the Russian economy (Ito K. 2017).

Currently, the Russian Federation is forming a huge demand for industrial and high-tech products. The conditions are being created for the qualitative development of Russian business, for machine building and machine tool building, microelectronics, the IT industry and for other industries. As part of the implementation of national projects, it is planned to procure medical and construction equipment, telecommunication devices and equipment, systems for housing and communal services, and transport in the amount of about 6 trillion rubles.

Industrialized countries today pay great attention to the development of information technology. The development of information networks and satellite communications makes it easy to transcend national borders and makes society more and more global.

Globalization is forcing the Russian state to gradually transition from energy and raw materials exports to a more balanced participation by integrating Russian scientific and technological potential into the global economy, exporting high technology products and services, and connecting to strategic associations (Kust G., Andreeva O., Lobkovskiy V., Telnova N. 2018).

An important component of the economic security system is food security, which implies the ability of the agricultural sector of the economy to provide the country's population with food, and industry - the necessary agricultural raw materials. Adverse economic conditions can create a real threat to the loss of food independence of the state if the executive authorities together with business entities do not take active and effective measures to overcome it.

In 2018 alone, the growth of Russian agriculture amounted to 19.4%, exports amounted to about 25.8 billion dollars, by 2024 in the state plans of Russia to increase it to 45 billion dollars. The Russian Federation is today one of the largest wheat exporters in the world, so in 2018 export volumes amounted to 44 million tons. Thanks to the development of Russian scientists, independence was ensured for wheat seeds.

The energy component plays a huge role in the economic security system, which consists in the uninterrupted supply of energy for the needs of the country's economy. In connection with the growth of production, energy consumption is also increasing, and the consumption of fuel is increasing. However, the fuel industry today is not able to significantly increase its output, and the price of fuel remains very high. We need a clear and clear government policy for all participants in the fuel and energy system, which allows us to prioritize the industry, ensuring the economic independence of the state (Thomas S. 2018).

The next component of economic security is information, which involves a procedure for the mutual exchange of military, scientific, technical, economic and social data within the national economic

complex and foreign partners, during which proper secrecy of doing business in the interests of the country, society and the economic entity will be guaranteed. Requirements for the implementation of the information component of economic security is determined on the basis of the need and sufficiency of the information provided to the consumer in accordance with his requests and needs.

In the last decade, the importance of ensuring information security in all areas of the economy, including the public, has increased. This is due to the rapid development of the capabilities of information technology and technology, the intensification of economic confrontation between countries, transnational organizations and corporations, the growing informational impact on the consciousness of various public groups of people.

Automation and informatization in the financial and economic sector creates both positive and negative impacts on its development. The negative effects on the consciousness and actions of our compatriots are shown by the facts of creating financial pyramids for fraud, which, through the promotion of television and radio, as well as via the Internet, allowed fraudsters to rob the money of millions of Russians, and unfair advertising promoted the sale of low-quality goods.

In today's world, the computer is becoming the most used tool in many economic crimes. After all, money in our time is stored in electronic accounts. As elsewhere in the world, Russia actively uses credit and debit electronic cards, which allow you not to carry paper money. Electronic card theft, computer fraud and theft have become critical in the country (Benedictow A., Fjærtoft D., Lofsnæs O. (2013).

Industrial espionage is also developing rapidly. Despite the fact that article 183 of the Criminal Code of the Russian Federation is applicable in our country, this does not stop criminals from stealing valuable information from organizations and enterprises, and therefore they incur enormous losses from their criminal activities. According to experts alone, over the past decade, hundreds of billions of dollars of important information about inventions, discoveries, scientific and technical developments have been exported from the Russian Federation. But nevertheless, in recent years, the level of sovereign debt continues to fall in Russia, the destruction of the industrial foundations of the state economy, the decline in scientific and technological potential, unemployment, the withdrawal of funds abroad, emergencies.

The main problem in the Russian economy is still a high dependence on exports of natural resources. In recent years, our country has done a lot for the development of branches of the processing industry, transport and services, however, the key role in the economy still belongs to the export of oil and gas, other raw materials and metals. As a result of the crisis in the economy, prices and demand decreased for almost all types of goods of Russian commodity exports. In recent years, there has been a significant drop in industrial production, an increase in the number of unemployed, a decrease in wages and inflation, and other negative processes in the economy. This was most noticeable in single-industry towns and regions where large city-forming enterprises are located. Nevertheless, state policy aimed at stabilizing the economic and social situation through the adoption of appropriate programs is bearing fruit in improving the situation in these cities and regions (Popova S., Karlova N., Ponomarenko A., Deryugina E. 2017).

Another problem for the state is the underdevelopment of the financial sector and banks. Many domestic organizations and enterprises, especially rapidly developing in recent years, entering foreign markets, could not count on financial assistance within Russia. Loans to our banking system were much more expensive, and loan terms were much shorter. In this connection, many companies were forced to borrow finances abroad. In recent years, as a result of the imposition of sanctions by foreign countries on Russian organizations, capital markets have become almost inaccessible to them. As a result of these actions, Russia now needs to find internal sources of growth for development.

Results

To overcome the difficulties in the economy, the state should clearly define the responsibilities of the federal executive bodies and authorities of the constituent entities of the Russian Federation to ensure the country's economic security, which must be performed at all stages of state activity, such as in determining the concept and main directions economic policy, transformation of the financial and banking system of the state, analysis of the course and forecast of socio-economic development, times abotke and approving the state budget, the adoption of basic legal acts and government decisions on economic issues, in the preparation and examination of laws.

A fundamental reform of state policy in the field of ensuring economic security is possible only if certain circumstances are met. It must be borne in mind that such a policy is not an independent unit. It is highly dependent on the state of the world economy. In order for the Russian Federation not to be one of the sources of raw materials and natural resources in relation to economically developed countries, it needs a clearly calibrated plan for effective inclusion in the international economy. It should be borne in mind that the effectiveness of public policy directly depends on the economic situation in the state (Galbraith J.K. 2011).

Today, a balanced and thought-out state policy is required to attract foreign investment, and in each specific situation it is necessary to find a balance, a balance between free trade and protectionism in the country. The resolution of this contradiction in the long-term perspective is considered as a search of an economic compromise that would create the basis for further development of accounting processes and compliance with the national and economic interests of the Russian Federation.

It should be noted that currently globalization in the world poses a twofold task for our state. On the one hand, globalization greatly contributes to rapid economic progress, but at the same time, on the other hand, it poses certain threats to its foreign economic security. In this connection, the Russian Federation should always approach gradual connection to world economic relations, taking into account all the features of the economy of our state, and in particular its raw material side.

Gradually, with increasing globalization highly developed countries will increase the competitiveness of their economies. In order not to lose its economic sovereignty, Russia now needs to have sustainable economic development, and this will require substantial investment in our domestic economy (Hellie R. 2011).

It can be noted that today significant investment is observed only for fuel and energy corporations in Russia. However, certain highly competitive organizations can also be formed in the sphere of the modern military-industrial complex (MIC). Today it is necessary to actively create and develop highly competitive enterprises, as well as develop information technologies that have huge advantages in the world market.

In this situation, Russia must implement a package of measures to diversify its economy, which will undoubtedly be a certain guarantee for the country's economic security.

It should be noted that an important condition for achieving the necessary requirements in the field of economic security is the system of projects, programs that have a promising character in innovative and scientific research.

The modern social policy of Russia should ensure a stable economic situation of all its peoples by increasing their standard of living. As for our state, today the wide gap between the poor and the rich in society continues to remain high. This destabilizing factor poses a great threat to the emergence of various social conflicts in the state (Zhao J., Tang J. 2018).

The implementation of modern state policy in the field of economy should always be accompanied by a uniform distribution of social burden between different sectors of the population. In this case, it is necessary to form a sufficiently effective mechanism aimed at constantly regulating the growth of

the population's income. The timely payment of wages as a incentive of productive labor plays a key role in real easing of social tension in the whole society.

It should be noted that in order to maintain the active development of the country's scientific and technical potential, which ensures the necessary strategic interests of Russia, it is necessary to set the priorities of the state scientific and technical policy, which will be consistent with the tasks of ensuring the country's economic security. It is necessary to develop and approve the necessary state programs in key areas basic research, to create the most favorable innovative climate in the state and economy, by using state forms of incentives for the active diffusion of advanced technologies, including the need for protection of Russian manufacturers of high-tech and highly competitive products, which very necessary for the state (Akindinova N., Kuzminov Ya., Yasin E. 2016).

Implementation of state policies to ensure Russia's economic security today will require substantial strengthening of state power, growth of public confidence in its various institutions, and the formation of modern economic policy. At the present time, the central position among the various factors determining the economic security of the Russian Federation is the stability of the entire state economy against internal and external threats caused by the process of globalization. During the economic crisis, the state economy is especially vulnerable to threats to economic security during the implementation of active reforms, the implementation of transformations in the economy and society. As world practice shows, in such periods the instability of the economy increases, its normal functioning is violated. This problem has arisen in our country, in order to resolve it, appropriate measures are needed.

Conclusion and Recommendations

In Russia today, to implement state policy in the field of ensuring economic security, it is necessary to fulfill:

1. Improving forecasting systems and strategic planning of threats to economic security and public administration. For this, Russia will need to take consistent and verified decisions of state policy in the field of ensuring economic security, improving strategic planning systems, improving the rules and standards for the use of innovative technologies and materials in production and economic activities, increasing the attractiveness of Russian jurisdiction for entrepreneurial activity and investment climate, the adoption of measures for the deoffshorization of the state economy, state control over foreign investments placed at enterprises and organizations of strategic importance to ensure the country's defense and security. It is also necessary to improve the mechanisms of budget planning, control in the field of procurement for state and municipal needs, increase the efficiency of budget expenditures and prevent cartel conspiracies, optimize the regulatory and tax burden on the business, taking into account the sustainable growth of the country's economy and modernize its production and technological basis, adoption of quality mechanisms in response to sanctions from foreign countries and international organizations in relation to Russian citizens us and legal entities, improving the quality of public administration in state-owned corporations and companies, as well as in organizations with state participation, improving the work of the control and oversight bodies, regulating labor migration flows in accordance with the needs of the state economy, legal securing the state border of an exclusive economic zones of the Russian Federation and the protection of the rights and interests of Russian organizations operating in this zone; a bitter struggle against misappropriation and theft of state property, corruption, the criminal and shadow economy.
2. Creating the necessary conditions for sustainable growth of the real sector of the economy. In particular, ensuring a safe and necessary level of technical and technological independence of the state economy, including strategically important industries, carrying out a comprehensive modernization of the production and technological basis of the sectors of the real economy taking into account modern environmental and industrial safety requirements, ensuring the stable development of the military-industrial complex, creation and active development of high-tech efficient and promising sectors of the economy, led chenie productivity and efficiency of production processes; state support for high-tech small and medium-sized businesses, the integrated development of transport infrastructure and the creation of modern transport logistics, the development and

production of the latest efficient vehicles, the integrated implementation of promising energy-efficient technologies with developed infrastructure, high-quality energy processing, the creation of strategic state material reserves and reserves to ensure full mobilization needs of the Russian Federation, active use e production and technological base and innovative potential in the military-industrial complex, as well as the production on their basis of products for civilian use.

3. Monitoring the development of the state financial system. It is achievable with a sufficient reduction in the critical dependence of the state monetary system on fluctuations in international commodity-financial markets, with the development of national sources of financial resources, while ensuring a sufficient accumulation rate for sustainable development of the country's economy, by reducing the use of foreign currency in the economic relations of the Russian jurisdictions, improving state support for lending to high-tech and high-tech industries in strategic important sectors of the economy, the development of the national payment system and payment cards, the infrastructure of the national financial market, the improvement of regulation of the activities of financial organizations, the quality of the fight against the shadow turnover of funds and the legalization of proceeds from criminal activities, ensuring the stability and balance of the state budget system Russian Federation, improvements in the management of state financial assets and debt obligations.

4. Stimulating innovative development in the economy, creating favorable conditions for the development and implementation of advanced modern technologies, improving the regulatory framework in this area. To fulfill these conditions, integration of education, science and production activities is needed in order to increase the competitiveness of the state's economy, expand public assistance in scientific, technical and innovative activities, create favorable conditions for attracting investments in this area, including using private state partnership, overcoming critical dependence on foreign supplies of equipment and instruments for scientific, experimental, test and production, components of microelectronics, selection and genetic materials, as well as hardware and software of computing technology. In particular, access to foreign technological solutions is needed to fulfill the tasks of the state economy, develop technologies that make it possible to strengthen the competitive position of the state in world markets with high value added products, stimulate the application of the results of intellectual activity in production, development of legal and administrative systems for the protection of intellectual property and the rights of Russian manufacturers to industrial property objects, improvement of legal regulation and development of markets for the latest high-tech products and the use of tools financing of innovative projects.

5. The balanced and balanced development of Russia and the constituent entities of the Russian Federation, as well as the strengthening of a single economic space. To carry out this development, it is necessary to improve the country's territorial planning system taking into account the challenges and threats to economic security, reduce the imbalance of interregional socio-economic development of the constituent entities of the Russian Federation, improve the nationwide population settlement system, create the necessary conditions for the active development of urban agglomerations, expand and strengthen ties between regions of the Russian Federation and the creation of inter-regional production and infrastructure clusters Active development sea routes, the modernization of the railway system.

6. Development of competitive advantages of export-oriented sectors of the economy, as well as an increase in their efficiency from foreign economic cooperation. To implement this direction, it is necessary to build profitable economic relations in the international legal system that meet the requirements of the national interests of Russia, expand partnerships and integration relations in international and interstate organizations, create and maintain regional and trans-regional integration associations in the interests of the Russian state, and help Russian organizations to introduce advanced technologies, increasing the range and number of exporters and non-primary products, the geography of the use of investment and foreign economic relations in the interests of Russia, support organizations in providing services to promote domestic products to foreign markets and their legal support in representing the legitimate interests of Russian exporters abroad and assistance in the development of Russian non-primary enterprises sectors of the economy, achieving and maintaining the level of global leaders of the global economy.

7. Safety безопасности economic activity in the country. To carry out this activity, it is necessary to increase the security and antiterrorist protection of critical and potentially dangerous facilities to an adequate level, to ensure the necessary counteraction to the activities of foreign special services and organizations, which is aimed at causing damage to the strategically important objects of

the state economy of the country - military-industrial, fuel and energy and transport complexes. It is also necessary to reduce the risks of doing business associated with the possibility of applying formal reasons for stopping them, as well as preventing selective application of legislation in relation to businessmen. We need to prevent and prevent crimes related to raider seizure of enterprises and organizations, state-owned companies and corporations, deliberate bankruptcy, in other criminal and unlawful actions in the economic and financial sector, in which, among other things, control and regulatory employees may be involved and law enforcement. Creation of the necessary conditions to eliminate the likelihood of a merging of interests of business structures with officials and representatives of state bodies, prevention and prevention of organization corruption schemes, their interaction with members of business of foreign countries.

8. Development of the country civic potential. To implement this development, it is necessary to improve the system of general and vocational education with the use of modern scientific and technological discoveries, the development of the state system of qualifications, requirements for employees and their professional orientation, the modernization of the entire system of ensuring environmental safety to preserve the environment. By assisting the population in effective employment and their labor mobility, it is possible to reduce the level of poverty in society and their inequality of property. The priorities of our state policy here are absolutely clear: this is building confidence, combating threats common to the whole society, expanding and developing cooperation in the economy, trade, education, culture, science, technology, removing barriers to communication between people.

Abstract

This study focused on what the PR practitioners think about the perception and awareness of the public regarding their activations in the Ministry of education and its agency Lagos State Universal Basic Education Board (SUBEB). An in-depth interview was conducted to find out what the activations are and how they affect the quality of education in Lagos State. The researcher adopted the SDG 4 (quality education) to support the statement of the problem, which is lack of quality education. Also, the researcher took the Excellent Theory of public relations, which is about embracing negotiation between the organization and its publics, and one that also fosters mutual understanding. The interest of both the organization and the public is of importance in this theory. The sample size was purposively selected. The head of the PR Unit and his Assistant in the Ministry of Education and SUBEB were interviewed. The telephone interview was applied for SUBEB due to the absentee of both Public Relations officers. In conclusion, the interview was analyzed and used to answer each of the research questions. The researcher also recommended that the public relations unit should engage more in PR activations by introducing technology to learning just like other advanced countries.

Keyword*:* Public perceptions, awareness, Public Relations, activations

Introduction

Public Relations (PR) is a profession that has existed for so many years. Public relations involve a two-way communication done to maintain the mutual relationship and good reputation of its organization (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). The profession evolved in Nigeria during the first and the Second World War, where an office called Information Office was established for war information. After some time, the office was used for shaping a positive image for Nigeria. It continued to evolve, and that resulted in the spread of PR offices across the country with the primary aim of information dissemination to the public. In that sense, PR is not a new profession. PR engages in activations, which can also be called PR actions or activities. PR activations are the corporate social responsibility rendered by an organization through a public relations practitioner for public and corporate interests

(Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

However, the presence of PR in the government is not also new. It carries the responsibility of disseminating information to the citizen of a country to make them fully aware of the governments' activities (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). The study seeks to examine the PR practices of both the Ministry of education and SUBEB; using in-depth interviews. The purpose is to know how much PR activations affect the quality of education in the State.

Statement of the Problem

Quality education creates opportunities, promotes timeless learning, and empowers an individual with knowledge and skills. This study focused on sustainable developmental goal 4, which is quality education. It examined the activations employed by the PR practitioners, how the public perceives it, and how it has impacted the education system. It was started by Malala Yousafzai that 'one child, one teacher, one book, one pen can change the world. The statement of the problem is the lack of quality education.

However, sustainable development is that which meets the needs of the present and the future without compromising everyone's access to sufficient resources (Musah & Bah, 2018). Therefore, to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all, the Ministry and agencies responsibilities are of importance to know if the set goal worked. The public relations activations are important in every organisation (Adelua, *et al.,* 2020a; Adelua, *et al.,* 2020b; James, *et al.*, 2020d; Nwosu, *et al.,* 2019; Adelua, *et al.,* 2020c; Adelua, *et al.,* 2020d; Aiyende, *et al.*, 2020a). In this case, the ministry of education and SUBEB stated how they used such activations to tackle lack of quality education.

Research Objectives

1. To find out if the public is aware of public relations activations
2. To examine the public relations tools used by the Ministry of Education and SUBEB in the provision of quality education.
3. To examine the impact of the Public Relations activations of quality education.

Research Questions

1. Is the public aware of public relations activations?
2. What are the public relations tools used by the ministry of education and SUBEB in the provision of quality education?
3. What are the impacts of public relations activations?

Literature Review

Government Public Relations Activities and The Tools Used

The government in every country needs effective communication to function. Public relations practitioners are intermediates between the government and the public (Salau *et al*., 2020). The government makes an effort to disseminate information in the media via PR, and the PR uses various tools to reach the target audience of the government. According to Fairbanks et al. (2007), a working democracy requires an informed public and a government that is transparent and accountable for every action taken.

More so, the government, through public relations, engages in media relations, public reporting and feedback to the citizens of the State (Lee, 2012). The communication strategies are employed either

directly or indirectly (Aiyende *et al*., 2020). When applied directly, it means the government informs the citizens about its activities through public relations activities. Some of the appropriate PR tools are press releases, press conferences and interviews (Goncalves & Santos, 2017).

Public Relations Tools/ Activations

Public relations activations create and maintain the image and reputation of the organization. Also, PR activations are employed to meet the needs or interest of the public (Nejo *et al*. 2020). These activations could, in turn, favour the people, the organization and its products (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). What is more, public relations is powerful enough to influences the attitudes of an organization and its public. It also monitors and provides information about changes in the organization, informs the employees about the situation of the organization inclusive. One of the responsibilities of the public relations practitioner is to avoid a crisis. When it happens, they solve the problems and resolve such a crisis (Adelua *et al.*, 2020). Depending on what kind of situation public relations management deals with, there are numerous tools of communication and activations available to implement. Public relations activations include different aspects such as media relations, customer and community relations to internal communication with the organization's employees and essential and crisis management. (Karczewska & Bsoul, 2017).

More so, the power of the media to communicate to a different number of people makes it the best media to use by any organization. The media have persuasive attributes; the press can help to build or destroy an organization, by exposing its secrets to the public. In other words, every PR professional needs to develop a strong relationship with the media. The reason is that it has a significant influence on the reputation and image of an organization (Karczewska & Bsoul, 2017).

Some of the tools which public relations could use are press releases, press conferences, articles/features writing, interviews, websites, e-mailing and video releases. PR can also engage in community relations such as gifts in kind, direct involvement, sponsorship and donations (Karczewska &Bsoul, 2017).

Ministry of Education

The Ministry of education, which is under the government, is classified into the State ministry of education and the federal ministry of education (Nejo *et al*., 2020). The Lagos State Ministry of education is an arm of Lagos state civil service whose responsibility is the formulation, execution and the implementation policies (Fayemi et al., 2020). The ministry focuses on the educational goals and objectives of the State government (Kolapo & Pope, 2018). The Lagos State Ministry of education has different parastatals working together to provide better education in the State. Under the Ministry are agencies such as the State Universal Basic Education Board (SUBEB), Basic Education Services Department, Private Education and Special Programmes Department, Lagos State Vocational And Technical Education Board, Lagos State Educational Management Systems (LASEGMS), Teachers' Establishment and Pensions Office (TEPO), and others (https://education.lagosstate.gov.ng, 2020).

Therefore, the conduct of the people in power determines the commitment of the staff to work. That is because; the satisfaction or dissatisfaction of the workforce will positively or negatively affect the staff performances (Kolapo & Pope, 2018).

The University Basic Education Board Lagos State (SUBEB)

The Lagos State Universal Basic Education (LSUBEB) is an agency in Lagos State Ministry of education. The body birthed was set up to ensure the attainment of quality education (SDG 4) in every State in Nigeria. Some of the responsibilities of LSUBEB are as follows:

1. The body is responsible for the allocation of funds

2. They engage in projects under the approval of the State government. For instance: the building of more schools, and giving free books to pupils.
3. They offer free education with the help of the government, partners and stakeholders (investors).
4. The body is also responsible for the training of teachers and giving out certificates of service for both teaching and non-teaching staff.
5. Supervise the assessment and funding of salaries and allowances of teaching and non-teaching staff
6. They approve or disapprove Annual Vacation
7. SUBEB also supervise and collects annual reports from schools https://subeb.lg.gov.ng/company-overview/

Quality of education

According to Ololube (2016), Education involves values, ethics, norms and culture, which has been impacted by someone and then transferred to the next generation. A new or renewed idea adds to existing knowledge. That is called education. Education remains one of the tools for the transformation of an individual and society at large. It is one of the most powerful tools for change and nation-building.

Education is vital for people to be intellectually developed. The structure of the Nigerian educational system is in four categories, which are: the early childcare development, primary school, Post-basic education and tertiary education (Suleiman & Abubakar, 2020). Education is an instrument for:

1. Social change and nation-building (Salau *et al*., 2020).
2. Unity among the people.
3. Boosting skills and potentials.
4. Everyone has the right to education regardless of race, gender, religion, background (Suleiman & Abubakar, 2020).

Lack of Quality Education

Shortage of qualified teachers and inadequate remuneration package

Qualified teachers are limited because many people go into the profession due to lack of options. So many factors encourage so many persons who cannot teach to teach because of income (Suleiman & Abubakar, 2020). Therefore, not only are more teachers needed but qualifies teachers are required.

Corruption

The issue of corruption also tempers with the quality of education in Nigeria. When school supervisors, principals, head teachers, school teaching or non-teaching staff involves his/herself in dishonest conduct, it automatically affects the education system. Some of such acts are the embezzlement, mishandling of school funds and absentee teachers (Ololube, 2016). Also, there is the existence of ghost workers and absenteeism in schools aids lack of quality education (Suleiman & Abubakar, 2020). The results of such corrupt activities are schools without walls and roofs, classes without desks, chairs and books, empty laboratories, lack of teaching materials, incompetent graduates, underpaid or unpaid teachers, a decline in standards, overstaffing, exam malpractice and cultism. All these threaten the quality of education which affects the educational goals, deny people their right to access education, weaken social values and the development of the country (Jankur, Tafiya & Danbaba, 2019).

Concept of Quality Education

So many scholars defined quality education in various ways. Quality education comprises of how good academic performance is (Omokiti *et al*., 2020). For learning to take place, schools must have all the necessary materials needed (Jankur, Tafiya & Danbaba, 2019).

Looking at the various works of literature reviewed the gap which exists is the disconnection between public relations and the Ministry of Education and SUBEB. It showed the weak link between the PR activations of the Ministry and that of SUBEB. The profession is more of just an information disseminating body. This gap is what this study fills.

Theoretical Framework

Excellent Theory

Grunig James propounded this theory. The theory deals with the value of public relations to organizations and society. It is about satisfying the interest of both the public and their organization (Omokiti *et al*., 2020). This theory suggested that for an organization to be effective, it must solve the problems and satisfy the goals of the stakeholders. Therefore, both the Ministry and the Agency should act and make decisions that will also benefit their publics to reach the goal of quality education through PR activations (Grunig, 2002).

Research Design and Methodology

The researcher adopted a qualitative method of gathering data through the use of an interview guide. Here, the researcher asked a series of in-depth questions to PR practitioners in the Ministry of Education and SUBEB. In each of the selected units of study, the two highest-ranking public relations practitioners were selected and interviewed. Two of the Public Relations practitioners interviewed in SUBEB were unavailable in office; therefore, the telephone interview was conducted successfully. The sample size was selected purposively. A senior PR practitioner and an assistant PR practitioner from the Ministry and Agency participated as interviewees. The results of the interviews were analyzed and used to answer the research questions.

Results

The four participants interviewed agreed that the public is fully aware of their Public relations activations. The interviewees also stated that the PR department intermediates between the people and the government. The reason is that they are responsible for disseminating information to the public regarding the government's educational plans and programmes.

However, regarding the quality of education in Nigeria, two participants from the Ministry of education posit that “Is not hearsay to say it is not encouraging. There are so many reasons to adduce to that. One of such reasons is that government needs to brace up more in educational service delivery. There are more to provide in terms of infrastructure, teaching aids and curriculum review, which we are trying to do in Lagos State. The education we have now is not encouraging honestly. Rather people tend to see it as an avenue for making wealth in any way either legal or illegal' stated the other participant'.

On the other hand, two other participants form SUBEB (agency) saw no reason to regard the education system as not qualified enough. They only saw the need for the implementation of technology as a way forward. Also, new ideas are necessary for better services.

Furthermore, all the participants agreed that the PR uses the press release, Television, radio and social media platforms to disseminate information and to carry out responsibilities. The participants in the

Ministry of education mentioned the use of leaflets and booklets as a tool for disseminating information.

Participants form the agency has different media in addition to the general media used by all the participants. They employ the use of 'school online' to cover schools events and report online for people to be aware of the happenings.

However, based on the response from the participants', the agencies engage in more PR activations than the ministry. The Ministry of Education focused more on disseminating information through various media. The interviewee from the Ministry said 'From time to time, we distribute communication materials such as leaflets, booklets to acquaint the public with the importance of education. We also have these program called adult education for those who were not privileged to attend in their youths'. The participants from the agency stated that 'we engage in training, infrastructural development and project management. However, presently, we are working on scholarship because we want to do more, we want to give back to society, we want to encourage the pupils on education. We do not want them to relent. You know when you give back to society, wining a child is just like winning a nation, so we are trying to do that'.

The finding on the impact of the Public Relations activations of quality education indicated that students are highly benefiting. The first participant from the Ministry said "we measure the impact of our activities. We realised that pupils tend to read more because we activated the reading culture. There is a specific time to make them go and read. There are specific times that you tell them to do this... So when we monitor it, we realize that there are impacts as regard reading culture and personally and particularly I have paid attention to that. The reading culture is improving". All the participants agreed that the implementation of the use of technology in school would be of significant impact.

However, all the participants' saw themselves as mediators between the government and the public. Through their activations, the public would know the value of education, and they believed that their activations would make a difference in the education system. The Agency is closer to the public than the Ministry. Therefore, its impact on the students is more profound than that of the Ministry of Education.

Notably, the participants from the Agency avoided answering some of the questions in an official capacity. Instead, they stressed the word 'in my opinion' in answering the question. However, the other two participants were open and answered all the questions in full details.

Conclusion

This study shows that the connection between government agencies and the public vary. SUBEB public relations activations are more than the public actions of the Ministry. While the Ministry of Education does not have direct contact with its publics, SUBEB engages in a more direct relationship with teachers, investors, parents and pupils. Both the Ministry and agency use the electronic media, print media and social media to reach its target audience. Additionally, this study shows that the public relations unit in the Ministry of Education is more focused on disseminating of information through the media.

Recommendation

The study recommends that public relations practitioners in government employment should be technology-savvy in order to cope with modern trends in the industry.

The study also recommends that pupils should be motivated consistently with free meals. This way, the pupils would be open to receiving the PR messages of both the Ministry of Education and SUBEB.

The agency should also keep a closer relationship with the parents of the wards and investors to get more funding from organizations or wealthy individuals.

The public should also be motivated more often by providing infrastructure and enough computers that will make them familiar with the technology.

Abstract

This study seeks to determine the Public Relations activations and the tools used to convey these activations by the Lagos State Development and Property Corporation. The Responsible Advocacy Theory, developed by Fitzpatrick and Gauthier in 2001, was used as a theoretical framework for this study. Interviews were conducted from the public relations practitioners/personnel in this Corporation to draw the necessary conclusion on this subject. Findings show that there is a structured and well established public relations department/unit in both the Ministry and the Corporation. Meaning that there is formal public relations activation in the Corporation because they have to be able to professionally identify and defined clearly who the dominant target publics are. In conclusion, professional public relations activations and tools enhance housing development which can likely shape the local social and political environment, the reputation and actions of the developer, and Local expectations of the to represent public. Professionals in this sector who believe their housing plans are affordable or low-income may experience local opposition and may undertake an appraisal and community outreach.

Keywords: Public Relations, Activations, Tools, Lagos State, Development, Property, Corporation.

Introduction

The history of Public Relations (PR) in Nigeria is traceable to the colonial era when a Yoruba newspaper announced deaths, births and marriages. The British colonies seized the opportunity to use the newspaper for propaganda which was information about the evil deeds of the British. As at then, PR was used to gain trust from Nigerians. As note by Cutlip, Center and Broom (2006) that public relations is a feature of management that defines, develops and maintains mutually beneficial relationships between an entity and its audiences. However, the presence of PR carries the responsibility of disseminating information to the members of a country in order to make them fully aware of both governmental and non-governmental activities (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). For example, in order for public relations professionals to work as administrators, they cannot merely insert the decisions taken by others within an organization. They will present themselves as leaders of what is generally referred to as the ruling party, those with the power to make decisions and set policies (Szmukler, 2017).

Public relations practitioners now involve the use of not only the traditional medium of communication but also the Internet, the Internet through social media platforms has many features like photo sharing, video sharing and communication, audio sharing, messages and content sharing amongst many others (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Nonetheless, public relations are the mechanism which ensures the kind of fairness and accountability in communication which promotes positive, long-term working relationships (Hong, 2014). It also plays a vital role in connecting

publics all over the world and enabling them to discuss mutual concerns and solutions (Omokiti *et al.,* 2020).

According to Miller (2005), public relations professionals often do a poor job of explaining how effective public relations can be measured and used effectively. When practitioners respond strategically rather than tactically to problems and challenges, they're far more likely to help organizations meet their challenges. They strive to fix or prevent protracted issues, and change important stakeholders' perceptions in mutually beneficial ways. They are people who work and they are experts in a particular field (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). A practitioner that is unable to use the Internet to communicate with the online community cannot build the right relationship that will shape the image of an organization (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

The creation of LSDPC in 1972 The inherited liabilities and properties of its three predecessors have been fully divested of all their powers of development regulation. They transferred those powers to the Ministry of Works and Planning of Lagos State (LSMWP), which became responsible for planning and control of development in the State. However, after much persuasion, the power to control development on its estates was transferred back to LSDPC in 1978. The current legal instrument governing the operations of the Corporation is the laws of Lagos State 2003 Cap L19 as amended by the Lagos State Development and Property Corporation (Amendment) Law 2006. The enabling edict of the Company set out its duties as providing accommodation for both residential and business / commercial purposes, and retaining the same. The publics of an organization are important in public relations; therefore, the execution of a planned action program must serve the interests of both the organization and its audiences (Nejo *et al.,* 2020).

According to Deji-Etiwe (2019), LSDPC is the commercial entity of the government to make profits and bring returns in a way that enhances the Economy growth. The corporation serves are consultants to the state government. They are like a middle man between the governments and the consumers/buyers. The creation of Lagos state, brought about LSDPC, which was the primary representative of the government when it comes to housing until in the late 1900s during the political era. They created the Ministry of housing to cater for the masses while LSDPC became the commercial entity. Government still owns the Corporation, but at the same time privatized. The Company has a fully commercialized role under the present structure with a managing director / chief executive at the helm of affairs. Among other features, the new LSDPC includes:

1) The creation of land or any estate or interest in land
2) To purchase, construct and retain homes, shopping centers, offices, industrial buildings necessary or suitable for the fulfillment of the Corporation's functions.
3) To acquire, establish, maintain or repair any work plant or equipment required or suitable for the supply of electrical, water or sanitary services or in connection with any building owned, built or constructed by the company;
4) To sell, let or lease any property established or currently operated by the Corporation under this law on terms and conditions as deemed necessary by the Corporation.

Organizational promotions are moving with technological advancement leading to electronic visibility of public relations actions (Omokiti, *et el*, 2020). However, organizations, firms, industries, ministries, agencies to mention a few engage public relations actions and tools to develop and represent themselves to the public in good light hence, the office of the public relations practitioner. Public relations experts are encumbered with the responsibility of the planning, building and maintaining the image and upholding the professional excellence and integrity of the organization (Nejo, *et el,* 2020).

Statement of the Problem

The sales rate of housing and properties is of interest to this study. An average individual wants to own a house or at least a property. However, the process of getting any of these things seems to dissatisfy the public. Getting original documents of any property and the troubles such individual faces in a building is quite discouraging. According to SDG 9, which encompasses industry, innovation and infrastructure, Lagos State Development and Property Corporation must be able to provide their operations/duties under these goals. One of the significant problems public relations faces has to do with assumptions. Therefore; this research seeks to investigate professional public relations activations and tools used by the Lagos State Development and Property Corporation.

Objectives

The study seeks to investigate the perceptions of the public about the activations of the Lagos state development and Property Corporation. Based on these objectives, this study will answer the following research questions:

1. What are public relations tools used by the Lagos State Development and Property Corporation?
2. What are the community relations activities being carried out by Lagos state council for Development and Property Corporation?
3. To what degree is the impact of these PR activations?

Theoretical Framework

This study stands on the Responsible Advocacy Theory developed by Fitzpatrick and Gauthier (2001). The theory focuses on public relations practiser's' duties. It follows some of the main concepts of ethics in public relations, such as regard for autonomy, welfare, non-malpractice and distributive justice. The principle of advocacy emerges from the social obligation of the press, and from Greek philosophy emerged persuasion. Public relation practitioners need to familiarize themselves with this ethical theory in their delivery of duty. The philosophy of activism allows for autonomous public decision-making. It provides an opportunity to bring about positive changes in their attitudes and behaviour. It also discusses ethical persuasion, which is acceptable and important for establishing the truth in a democratic society based on a culture of freedom of speech. Fitzpatrick and Gauthier (2001) It was explicitly mentioned that effective activism seeks to merge two distinct ethical positions of public relations professionals as advocates and social consciences.

Professionals in public relations should uphold responsibility to clients or organisations as advocates, and to the general public as a social conscience. Reber, Cropp and Cameron (2001), advocate activism, taking the gains from both sides into consideration. Motivation is for the benefit of the company of professionals and for public change. According to Martinson (1994, quoted in Fitzpatrick & Gauthier, 2001) basic principles should be the wellbeing of others, the maintenance of justice, self-dignity, serving others and the common good. The following principles for responsible advocacy theory were proposed by Fitzpatrick and Gauthier (2001): (i) the contrast of harms and benefits and (ii) Reverence for individuals.

Research Methodology

Analysis Methodology Research Methodology is the basic procedures or techniques used for defining, selecting, processing and analyzing topic information. The methodology portion, in a research paper, helps the reader to critically evaluate the overall validity and reliability of a study (LibGuides, 2019). This research aimed to find out the public relations tools and the activations used by LSDPC. Therefore, an in-depth interview which is one of the qualitative research methodology based on one on one engagement was used to draw out findings and conclusions on this research effectively. It involves two sections; Section A, this was with two public relations representatives in

the Ministry who answered ten questions each. Section B was with the public relations representative of LSDPC, who also answered ten questions in the guide.

Results

According to the findings, the Corporation has a robust public relations department and can professionally identify their target audiences. According to the interviewees, the audiences include those in the construction industry such as architects, engineers, quantity surveyors, cement producers, and sand/granite suppliers. These are part of our publics. They said "we have buyers of our houses and those who want to partner with us in constructions. All these people are part of our public because we also deal with joint ventures products while we provide the land and we get someone that will finance the project. We also have the off-takers in the sense of people who are looking for products to buy".

The LSDPC interviewees affirmed that their targets are the elites (i.e. middle class and the upper class). Thus, it has been easy overtime to decide on the most appropriate media platforms. So, the Corporations' public relations approach has been corporate promotions; TV adverts, Newspapers adverts, Corporate/Professionals bodies, Events; Professionals events like the annual general meetings, specialized trade fairs. They said "we do bulk emailing/bulk SMSing, and we have Social media platforms. We are on Twitter, Facebook, Instagram, LinkedIn; and then we have a website which is a major plus. If you search the Internet for the number one housing corporation in Nigeria, LSDPC will be between numbers one to five. Besides, we are reconstructing our website so that it can be more user-friendly and easily accessible. We also use flyers (If you have a budget or a certain limit we can be able to work with that)"

Another point to note is that they create room for feedback on the website, which provides a column for feedbacks. Then consumers send mails, once they have any issues, and this allows them to follow up both prospective and existing consumers. Besides, they have to be able to build their public over the years. The advantage they have over competitors is "documentation". The reason is that they have direct access to the government, and their clients are sure of reimbursement at any point in time compared to other private organizations.

Some of them said that their public relations activities are press conferences, social media, stakeholder engagement and town hall meetings. The tools which they use include broadcast jingles, fliers and billboards. However, majority of the respondents said the members of staffs are aware of all of these activities.

Other important information released by the interviewees is the structure of the public relations department. The structure houses a Director, Deputy Director, Principal Officers, Photographer, Cameraman and Admin Officer.

Conclusion

In conclusion, professional public relations activations and tools enhance housing development which could influence the economic, social and political climate, the developer's credibility and behavior and the economic expectations of the citizens to be served. Professionals in this area who feel their housing plans are likely to encounter local resistance may minimize the probability of opposition by undertaking an assessment and community outreach process. It is essential to create a meaningful two ways relationship which comes with a mutual understanding that helps the public's get all of the information of interest to them and vice versa (Fayemi, 2020). Professional public relations also encourages, promotes and attracts employees' involvements and volunteering at other nonprofits and corporate social responsibility in the community and at the same time, becoming well-informed about related issues. After the incorporation of Internet technologies into the messaging project, industry professionals need to determine how the immediate and direct contact influence the message (Salau *et al.,* 2020). Creating awareness and impacting personnel is a paramount function every Ministry should embrace in other to bring diaspora partnerships (Adelua *et al*., 2020)

Abstract

This study is significant because the research will examine the effectiveness of the use of electronic media by LASTMA to propagate its policy. Therefore, detailed information will be made available on the prospect and performance of the agency in Lagos. This research will be useful for the state government to evaluate the performance of the agency. It will also be helpful for the general public to assess the effectiveness of LASTMA within the metropolis. The scope of this study will cover the public; which include some selected motorists, and commuters within and around Lagos.The study examined the effect of e-public relations on the activities of LASTMA. In the survey, Two-way symmetric Public Relations model of James E. Grunig was adopted with a random sampling method using survey design. We distributed two hundred and thirty copies of the questionnaires to the respondents. They returned 200 copies correctly fill. Also, the results were processed using the Statistical Package for the Social Sciences (SPSS) software. A significant finding is that LASTMA's public relations activities are not visible on the electronic media. This study recommends that the public relations department of the agency need to put in more work to propagate its policies.

Keyword: E-public Relations, LASTMA, Traffic management

Introduction

Traffic remains one of the biggest challenges of governance, commuting and living in the populated city of Lagos. With roughly 21 million inhabitants and growing dwellers and, the growing population as a result of the level of advancement and urbanization over the supplies and amenities, the state can provide. It is a highly diligent environment for indigenous and international dwellers.

The road transportation, which amounts to eighty-seven per cent of passengers plying the roads of Lagos and it continues to increase daily and as a result, is the primary cause of congestion on the streets. Before LASTMA came into existence, driving on the roads of Lagos was hectic and frustrating. It would take so much time before motorists can maneuver their way to their various destinations at a regular schedule. This situation worsened during the rains because traffic congestion will be twice times regular. There will be a high rate in a traffic jam which in most times lead to accident and conflict on the road. LASTMA was established as an agency under the Ministry of Transportation, charged with the responsibility of ensuring a free flow of traffic in Lagos. The agency was to help commuters to save time and improve the quality of the driving culture in the metropolis. Also, to make the environment safe and to ensure the reduction in road transportation hazards such as accidents leading to loss of lives and properties to the barest minimum. Delay and congestion will also reduce as the time spent on the roads will be less, therefore ensuring sustainable economic growth in the state.

Statement of The Problem

LASTMA's responsibility is the management of traffic situations in Lagos state. Thereby creating an avenue for more transport infrastructure, according to SDG 9, which evolves around enhancing and building resilient infrastructure and the administration of new models aimed at achieving the safety of lives and properties. Also, the adequate flow of traffic in Lagos State. This study aims to examine the activities of LASTMA and the level of awareness and perception of these activities. Furthermore, to review the process of applying these activities and the channels adopted to develop and innovate the transportation system in the State.

Research Objectives

This study gives insight into the perception and awareness of electronic public relations on the activities of LASTMA as an agency affiliated to the ministry of transportation. However, the following objectives aims:

1. To find out the public's perception about the activities of LASTMA
2. To examine the effect of the approach adopted for the sustainable transportation system for Socio-Economic benefits.

Research Questions

1. What is the Public's perception of the activities of LASTMA?
2. To what extent is the effect of the approach adopted for the sustainable transportation system for Socio-Economic benefits.

Literature Review

Electronic Public Relations

(Odiboh &Oladunioye, 2019) described public relations as the practice of knowing and understanding how to manage all information emanating from the organization and being able to use them for the positive good of the organization. Understand the logic behind getting along with the public is important for an organization, (L'Etang, 2009) describes public relations as the occupation with the responsibility of managing an organization's relationship and reps. (Adelua, *et al.,*2020a; Adelua, *et al.,* 2020b; James, *et al.*, 2020d; Nwosu, *et al.,* 2019; Adelua, *et al.,* 2020c; Adelua, *et al.,* 2020d; Aiyende, *et al.*, 2020a). Explains that public relations practitioners are burdened with the duty of planning, creating, building and maintaining a positive image and integrity of an organization. This practice entails public affairs, corporate communication, stakeholders' relations, issues management and corporate social responsibility. Public relations operate at different levels of the organization, both government and corporate. Public relations practitioners are individuals responsible for the running and success of an organization's reputation (Nwosu, *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

Today, public relations practitioners adopt the use of new media tools to communicate. The Internet has changed the world, especially in communication. The research shows that people place so much importance on the use of the internet, and this suggests that public relations practitioners need to be involved in the trend. (Salau et al., 2020) describes public relations use of digital as an innovative concept that is computer-mediated. It consists of practising public relations in the cyberspace. A practitioner that cannot effectively use the online mediums to communicate with the online community cannot maintain the kind of relationship that will help shape the image of the organization. Fayemi et al., 2020) notes that when practitioners respond to an organizational problem strategically instead of tactically, it helps the reputation of the organization to be positively projected. The perception and

awareness level of the public regarding the public relations activities in the transport sector involves the public relations practitioner managing the website. It also involves other platforms to promote, relate with the local press and interact with the agency. All of these shows that public relations are a two-way communication (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019).

According to Philip and Young, public relations practitioners depend on the idea behind a communication to be able to follow up the public's desire for the media, which is fast becoming Internet-based. The Department of Trade and Industry and the Institute of Public Relations (2003) report that public relations previously involved a careful and tactical tool for influencing media coverage, the need to have an engaging relationship with the stakeholders, and demand for corporate transparency. Having a good relationship with media practitioners is an essential action that a public relations expert must be able to do. Keeping good working contact with the media controller such as radio presenters, journalists and bloggers (Nejo et al., 2020a). Public relations involve the manner at which top management of organizations employ the use of strategic ways to uphold the credibility of their brand, services to gain acknowledgement (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).

In today's world, electronic public relations have become a necessity in representing communication in the community. (Salau et al., 2020) noted that sincere information seekers will always go to an organization's website to get relevant, trending information about the policies and activities of the organization. With this, they refer this platform to others who may need any information about the happenings within an organization. Relationship dimensions define an organization/public relationship, which acts as a predictor of public perception and choice behaviour. The effect of creating a mutual connection is to have a shared understanding with the public, which is an essential responsibility of a public relations practitioner, to ensure a positive perception of an organization (Fayemi et al., 2020).

Overview of Traffic Management in Lagos

Traffic Management

Traffic is commonly referred to as the movement of people, goods, and vehicles within an area, through road, air, or water route. Traffic management shown around the world have proved that drivers are much more careful when there are CCTV cameras, and speed limit monitors on the road. The use of these technologies will only improve the road attitude in the state. However, it will also enhance safety, reduce accidents, reduce the risk of theft. The use of CCTV's will help traffic control managers in the state watch traffic congestion and then work towards controlling it.

Traffic management involves the control of roadworks, that is, the action for improving safety on the road for all its users and also to ease congestion. In another context, it could mean the process of determining modern movement and quick economic delivery. It means tracking logistics in internal and external transportation. The technique for traffic management specializes in creating an environment suitable for customers, employees, and the general public and a safe working zone while ensuring a free flow of traffic. This objective is possible by combining good knowledge of experience with new technologies and approaches to the agency.

This initiative can help keep traffic moving steadily. When large vehicles are using the roads, they cause congestion. Thus, road management would mean preventing congestion effectively. Road traffic control involves guiding cars and pedestrian traffic around a construction area, therefore ensuring safety. Traffic control also allows the use of technological tools like the CCTV and other traffic monitoring devices. Traffic flow is free movement of all the vehicles moving on the road at a given time - statistically expressed as vehicle movement per hour. Traffic flow is the interactions between vehicles, infrastructure and drivers, intending to understand and develop road networks with efficient movement of traffic.

Lagos State Management Authority: LASTMA

LASTMA is established under the ministry of transportation to help manage road traffic. The agency is responsible for road traffic matters and a system of operation that makes it responsive to the demands of traffic, to ease congestion. LASTMA is an autonomous body responsible for improving the conditions and appearance of road movement (Aiyende et al., 2020). Its function is to redirect traffic for a better environment, improved access to commerce and industry, ease congestion, control and enforcement of traffic rules, public enlightenment, driving training and certification. A Chief Executive Officer (CEO) heads the agency. The principal administrative office consists of the public relations expert, the personal assistant, a clerk, secretary, administration and finance, education and training department, logistics departments (responsible for the procurement of auto spare parts and maintenance of agency's vehicles and also the allocation of cars to various zones within the metropolis).

The agency adopts the use of several techniques in actualizing their functions. These range from traffic patrol, vehicles inspection and public enlightenment, t towing of broken-down or accident vehicles good driving culture. All of these activities are through motor park rallies, use of flyers, handbills, posters, radio jingle, newspapers, public lectures, training programs/enlightenment activities, television e.t.c.

Theoretical Frameworks

Two-way symmetric model is an improvement of the two previous models established by professor Grunig as it involves an avenue to ensure feedback. The two-way asymmetric model wittingly employs scientific persuasion. It suggests that by learning more about the public or target audience, messages could be shaped or prepared to change their attitudes in favour of an organization's desired effect.

The practitioners strive to influence public attitude, but no mutual understanding arises from the shared communication. Two-way symmetric model is the most acceptable of all the models. In this case, both the communicator (the agency) and the receiver (the public) are mutually communicating. The messages take into account the needs, demands and interests of the people. This model is dependent on research in not only designing or packaging a letter but also in helping an organization to adjust concerning the needs of the public.

Two-way symmetrical model is described as a part of public relations practitioners daily because it involves the management of social media platforms. Grunig stated that proportional communication projects reality for practitioners regardless of whether or not they are trying to implement it. With digital communication, publics have much more control over their sources of information; and organizations have little choice other than to communicate with them symmetrically.

Research Design and Methodology

This study adopts the survey method. Survey research design has an unbiased representation of the population of interest and by gathering of the same information from each participant (Owens, 2002). In getting responses from the respondents, the researcher formulated a questionnaire out of the research questions. It is about the public consciousness of LASTMA's activities and policies and their effects on the traffic situation in the State.

The questionnaire consisted of open and close-ended questions whereby, the copies of the questionnaires were administered to the population by the researcher. After applying the questionnaires to the public, the data gathered was coded into the Statistical Package of the social science software and tabulated for easy understanding of data collected. The population was selected based on a random sampling technique. The random selection gave a chance for different categories of individuals to fit into the study. The sample size for the study is 230 respondents, but only 200 questionnaires returned from the field thoroughly and correctly filled.

Data Analysis

After the collection of data, it was analyzed through frequencies and percentages by the use of SPSS (Statistical Package of the Social Science) software. The tables interpret the findings.

Table 1: Gender

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Male	114	57.0	57.0	57.0
	Female	86	43.0	43.0	100.0
	Total	200	100.0	100.0	

Table 1 shows that 114 of the population (57.0%) are males, while 86 (43.0%) are females. These indicate that majority of the respondents are male.

Table 2: Age

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	18-25	127	63.5	63.5	63.5
	26-32	49	24.5	24.5	88.0
	33-40	18	9.0	9.0	97.0
	41-47	6	3.0	3.0	100.0
	Total	200	100.0	100.0	

This table indicates the age bracket of the respondents stating that 63.5% are between the ages of 18-25, 24.5% are between the ages of 26-32. Followed by individuals in the ages 33-40 (9.0%) with 41-47 (3.0%) respondents.

Table 3: Marital status

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Single	156	78.0	78.0	78.0
	married	43	21.5	21.5	99.5
	Others	1	.5	.5	100.0
	Total	200	100.0	100.0	

Table 3 indicates the different marital status of individuals that engaged in filling the questionnaire. The single has the highest respondents of 78%, followed by the married 21.5% with the least in the population are individuals under the category of others 5% of the people of 200 respondents.

Table 4: Educational level

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Secondary	9	4.5	4.5	4.5
	First degree/BSc /HND/and	87	43.5	43.5	48.0
	postgraduate/masters, MBA, PhD, others	100	50.0	50.0	98.0
	Others	3	1.5	1.5	99.5
	6.00	1	.5	.5	100.0
	Total	200	100.0	100.0	

This table indicates the educational level of the respondents. It shows that 4.5% fall under the second category and 43.5% are first degree/BSc/ and/ and holders, followed by 50% who fall under the category of postgraduate/ masters/ MBA/ PhD, the lowest which is 1.5% consist of individuals under others.

Table 5: Occupation

		Frequency	**Per cent**	**Valid Percent**	**Cumulative Percent**
Valid	employed	36	18.0	18.0	18.0
	self-employed	48	24.0	24.0	42.0
	unemployed	3	1.5	1.5	43.5
	student	102	51.0	51.0	94.5
	Retired	1	.5	.5	95.0
	Others	10	5.0	5.0	100.0
	Total	200	100.0	100.0	

Table 5 shows that 18.0% of respondents are employed, 24.0% are self-employed, 1.5% are unemployed, 51.0% are students, 5% fall under the category of retired and finally 5.0% others.

Table 6: Awareness of the agency called LASTMA

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	195	97.5	97.5	97.5
	No	5	2.5	2.5	100.0
	Total	200	100.0	100.0	

In this table, 195 respondents (97.5%) agreed that they are aware of the agency called LASTMA. The remaining five respondents (2.5%) are not mindful of the existence of LASTMA.

Table 7: Through which mass medium did you hear of LASTMA

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	TV	37	18.5	18.5	18.5
	Radio	34	17.0	17.0	35.5
	social media	32	16.0	16.0	51.5
	word of mouth	14	7.0	7.0	58.5
	TV, radio, social media, word of mouth	43	21.5	21.5	80.0
	Others	23	11.5	11.5	91.5
	None	17	8.5	8.5	100.0
	Total	200	100.0	100.0	

This Table shows that 37 respondents (18.5%) state that LASTMA is known/heard of through television viewing mass medium. Thirty-four (17%) respondents heard through the radio; and 32 respondents (16%) through word of mouth. However, a majority of 43 respondents (21.5%) said they heard of LASTMA through the combination of TV, radio, social media and word of mouth. Finally, 17 respondents (11.5%) said that they have no idea of the mass medium through which they heard of LASTMA. In contrast, 17 (8.5%) respondents failed to respond to the question.

Table 8: Are you aware of Lagos state traffic radio?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	150	75.0	75.0	75.0
	No	48	24.0	24.0	99.0
	3.00	2	1.0	1.0	100.0
	Total	200	100.0	100.0	

In this table 150, respondents (75.0%) agreed that they are aware of Lagos State traffic radio. In comparison, the remaining 48 respondents (24.0%) are not aware of Lagos State traffic radio. Finally, the remaining two respondents 1.0% are neither aware or not.

Table 9: How effective has the radio program been on your day to day movement

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	very effective	45	22.5	22.5	22.5
	effective	76	38.0	38.0	60.5
	partially effective	26	13.0	13.0	73.5
	not effective	41	20.5	20.5	94.0
	5.00	12	6.0	6.0	100.0
	Total	200	100.0	100.0	

In this Table, the respondents answered the question of the effectiveness of the radio program on their daily commuting. Forty-five respondents (22.5%) agreed that Lagos State radio has been helpful. In comparison, 76 (38%) said it has been active, 26 (13%) said it has been partially effective, and 41 (20.5%) said it has not been effective. However, the remaining 12 respondents (6%) refused to respond.

Table 9: LASTMA since inception has improved infrastructural development

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	yes	77	38.5	38.5	38.5
	No	53	26.5	26.5	65.0
	undecided	70	35.0	35.0	100.0
	Total	200	100.0	100.0	

This table states out that 77 respondents (38.5%) agree that LASTMA has helped improve infrastructural development in the state; 53 respondents (26.5%) said no to the statement. In contrast, the remaining 70 (35.0%) were undecided.

Table 10: Is there sufficient information regarding activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	88	44.0	44.0	44.0
	No	61	30.5	30.5	74.5
	undecided	51	25.5	25.5	100.0
	Total	200	100.0	100.0	

This table indicates that 88 respondents who make up the highest number agree that there is sufficient information regarding activities of LASTMA in the metropolis. Sixty-one respondents (30.5%) are in disagreement with the statement, while the remaining 51 respondents (25.5%) were undecided.

Table 11: Are LASTMA current policies well understood

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	58	29.0	29.0	29.0
	No	86	43.0	43.0	72.0
	undecided	56	28.0	28.0	100.0
	Total	200	100.0	100.0	

This table reveals that 58 respondents (29.0%) are aware that LATMA's current policies are well understood; 86 respondents who made up 43.0% of the total respondents disagree with that statement. In contrast, the remaining 56 (28.0) respondents were undecided.

Table 12: Should the current policies be changed?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	yes	70	35.0	35.0	35.0
	No	42	21.0	21.0	56.0
	undecided	88	44.0	44.0	100.0
	Total	200	100.0	100.0	

This Table summarises that LASTMA's current policies should be changed. Seventy (35%) respondents agree that LASTMA should replace its current policies. In comparison, 42 respondents (21.0%) said disagreed; while the remaining 88 (44%) respondents were undecided.

Table 13: Are you aware of the implementation processes of LASTMA policies?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	50	25.0	25.0	25.0
	No	114	57.0	57.0	82.0
	Undecided	36	18.0	18.0	100.0
	Total	200	100.0	100.0	

According to this table, 114 respondents (57.0%) are not aware of the implementation processes of LASTMA policies. 50 respondents (25.0%) are aware while 36 respondents (18.0%) are undecided.

Table 14: If yes, through which medium did you hear of these policies

		Frequency	Per cent	Valid Percent	Cumulative Percent
	TV	37	18.5	18.5	18.5
	radio	34	17.0	17.0	35.5
	social media	32	16.0	16.0	51.5
	word of mouth	14	7.0	7.0	58.5
	TV, radio, social media, word of mouth	43	21.5	21.5	80.0
	others	23	11.5	11.5	91.5
	none	17	8.5	8.5	100.0
	Total	200	100.0	100.0	

This table shows that 43 respondents (21.5%) of the total respondents hear of LASTMA policies through television, radio, social platforms and word of mouth. While 37 respondents (18.5%) are aware through television medium, 34 respondents (17.0%) through radio program and 32 respondents (16.0%) through social media platforms. Twenty-three respondents (11.5%) did not categorically state the medium, and lastly, 17 respondents (8.5%) did not respond.

Table 15: LASTMA has had a positive effect on the effect on the driving culture in the state

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	agree	141	70.5	70.5	70.5
	disagree	27	13.5	13.5	84.0
	undecided	32	16.0	16.0	100.0
	Total	200	100.0	100.0	

This table reveals that LASTMA has a positive effect on the driving habit/culture of individuals in the state. One hundred forty-one respondents who make up the highest number and 70.5% of the total respondents agree to this, while 27 respondents (13.5%) disagree and lastly, 32 respondents (16.0) were undecided.

Table 16: Has the establishment of LASTMA affected traffic congestion?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	agree	128	64.0	64.0	64.0
	No	25	12.5	12.5	76.5
	undecided	47	23.5	23.5	100.0
	Total	200	100.0	100.0	

The table above shows that 128 respondents (64.0%) agree that the establishment of LASTMA affects traffic congestion. 47 respondents (23.5%) were undecided, 25 respondents (12.5%) said no to the statement.

Discussion of Findings

Research question 1 what is the Public's perception of the activities of LASTMA
Table 11 shows that 70% of respondents agree that LASTMA has affected the driving culture, which is positive on the state. Also, 64% of respondents agree that the establishment of the agency has an impact on traffic congestion within the metropolis.

Research question 2 to what extent is the effect of the approach adopted by LASTMA for sustainable transportation system for Socio-Economic benefits
The last table shows that 128 respondents (64.0%) agree that the establishment of LASTMA affects traffic congestion. Thereby creating an avenue for more transport infrastructure, according to SDG 9, which evolves around enhancing and building resilient infrastructure and the administration of new models aimed at achieving the safety of lives and properties. And also, the sufficient flow of traffic in Lagos State.

Recommendation

The road network situation in Lagos needs to be expanded on with the construction of new roads. The condition of the streets should be improved upon by the ministry of government to avoid slow movement of vehicles, goods and individuals in the streets. Despite the presence of public relations in the agency, there is a need for more awareness. As revealed by the study, the public has little knowledge of the activities and policies of the agency.

Abstract

The study focused on what the perception of the public is regarding the public relations (PR) activations of Lagos State Universal Basic Education Board (LSUBEB). Do they know if such department exist? Are the PR activations helping in curbing lack of quality education? These were the research questions. The respondents are employees of SUBEB. Their selection was based on their positioning to know if public relations operated in schools. The statement of the problem, which is lack of quality education hinges on the Sustainable Development Goal 4 (quality education). Also, the researcher adopted the Excellent Theory of public relations, which is about how the practitioners make the organisation useful, organised and well managed. The sample size was purposively selected. In SUBEB, the teachers (employees) were randomly selected from primary schools because they are under the management of the agency. The Scientific Package for the Social Science (SPSS) processed the data supplied by the questionnaire. Tabulations in percentages expressed the findings, further discussed based on the three research questions of the study. The researcher also recommended that PR activations should be more impactful so that the public can have a satisfactory perception of their duties.

Keyword*:* Public Perception, Awareness, Public Relations, Activations

Introduction

The history of Public Relations (PR) in Nigeria is traceable to the colonial era when a Yoruba newspaper was a medium for announcing deaths, births and marriages. The British colonies seized the opportunity to use the newspaper for propaganda to gain trust from Nigerians ((Ukonu, Anyadike & Okoro, 2018; James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). In 1894, the British established the first public relations department in Nigeria, headed by Mr. D.C Fletcher. The functions of the office were mainly to enlighten the public relating to government activities. Their publics were the Nigerian soldiers who participated in World War II with other selected publics. After Nigeria's independence in 1960, the department moved to the Federal Ministry of information. After the freedom, the first public relations professional body was founded in 1963 by Dr, Samuel Epelle. It was called the Public Relations Association of Nigeria, later changed to the Nigerian Institution of Public Relations, chartered in 1990 (Ukonu, Anyadike & Okoro, 2018). In this study, the PR activations in schools and the perception of the public are the main focus.

According to Ololube (2016) Education involves the imparting of values, ethics, norms and culture in an individual to enlighten and guide the person's behaviour and conduct in the society. Education moves from one generation to another; its continuity increases the development of a community. It is also the process of cultural renewal whereby the process of learning, unlearning and relearning takes place (Adelua, *et al.,* 2020a; Adelua *et al.,* 2020b; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). Education remains one of the tools for change and advancement in society; recognised as one of the most powerful mechanisms for nation-building (Fayemi *et al*., 2020a).

Statement of the problem

A prosperous nation is that which has quality education because education determines the level of development. The problem the researcher seeks to solve is the lack of quality education. Because of the importance of education, the United Nations (UN) included quality education as the 4th sustainable development goal. An educated country is different from one who lacks knowledge. The advancement in technology, in health care sectors and every facet of life, is based on education (Omokiti *et al*., 2020a). This study focused on the perception and the awareness level of the publics' regarding PR activations of LSUBEB. Is the public awareness of the presence of PR in Lagos SUBEB? Is LSUBEB carrying out their activities to meet the goals set by the UN about quality education? The lack of quality education is a severe problem; this study tends to ascertain.

Research objectives

1. To find out if the public is aware of public relations activations
2. To find out the perception of the publics' regarding PR activations in SUBEB
3. To examine the impact of the public relations activations in SUBEB

Research questions

1. Is the public aware of public relations activations?
2. What are the perceptions of the publics' regarding PR activations in SUBEB?
3. What are the impacts of the public relations activations in SUBEB?

Literature Review

Perception and awareness of public relations

Society of America (PRSA) states that Public Relations is a "counselling management at all levels in the organisation concerning policy decisions, course of action, and communication, taking into account their public ramifications and the organisation's social or citizenship responsibilities" (Amodu *et al.*, 2019).

PR practice is broad with essential responsibilities which they are required to discharge effectively. PR establish and maintain a cordial relationship with other persons who they are effecting or effected by due to the activities they release. It engages a two-way communication process of disseminating information and getting feedback. PR maintains the communication and relationship of its organisation in other to preserve the right public image (Amodu *et al*., 2019).

PR is a management function which is needed in schools to foster good relations with its stakeholders (parents, students, investors and teachers). To maintain support and recognition from the stakeholders, the PR department needs to be efficient in discharging their duties. PR plays a role in decision making and also help an organisation to achieve its set goals (Omokiti *et al*., 2020). Also, an organisation needs to maintain effective communication with its publics to maintain a good business relationship (Aw, 2018). Public relations in the education sector tend to work towards placing the activities, accomplishments and efforts of the schools and its personnel in the most favourable light (Bartz, Rice & Karnes, 2018).

Also, the National Schools Public Relations Association defined PR in schools as a management function planned to aid the educational institutions to provide better services and have an improved relationship with their publics (Coruk, 2018).

The Schools' Principals agree that PR activations in the education sector involve the management of their institutions' website to promote the school. Other PR activations, according to the schools' chief administrators are organising meetings, conducting seminars, relating with the local press and interacting with parents (Coruk, 2018). All these showed that PR is a two-way communication process of which the principals are fully aware (Nejo *et al*., 2020a; Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). The employment of PR in schools promotes the vision and mission of the institutions.

The University Basic Education Board Lagos State (SUBEB)

The Lagos State Universal Basic Education (LSUBEB) is an agency under the Ministry of education in Lagos state. It exists in each Nigerian states according to law. The body functions to coordinate, manage, implement the programmes of the country according to the Federal Government of Nigeria's directives. Some of the duties and roles which LSUBEB plays are:

1. Work according to the national policies set by the federal and state government regarding education.
2. They Coordinate, supervise and train teachers and also monitor public primary schools and junior secondary schools in the state.
3. We are assessing the teachers within regular intervals.
4. Recruitment, appointment, promotion of teaching staff and non-teaching staff
5. They advise the State Government on funds and development (Fayemi *et al*., 2020).

Factors responsible for lack of quality education in Nigeria Insufficient budget allocation

It is one of the factors responsible for low standards in Nigerian schools. Even though the Nigerian government has continued to repeatedly state its commitment to the development of the education sector, Nigeria's education receives much lower than 26% of the national budget as recommended by the United Nations Educational Scientific and Cultural Organization (UNESCO). If only the budget allocation is enough, the education system will be more productive than it is. In other words, the insufficient fund is affecting the education system because funds are needed to run schools (Ololube, 2016).

Inadequate infrastructure

Inadequate infrastructure in schools is a severe setback, especially in primary schools. The majority (87%) of classrooms are overcrowded, 12% of pupils sit on the floor to learn, 77% lack textbooks and 38% have no ceilings in the classrooms. Also, schools lack laboratories, hostels, libraries and other facilities which is contradicting the goals of SUBEB and Universal basic UBE. All these are affecting the development of education in Nigeria, especially in the rural areas (Suleiman & Abubakar, 2020). Some students fail not because they are not intelligent, but because of the limited or lack of adequate educational facilities (Ogu, 2016).

Shortage of qualified teachers and inadequate remuneration package

The limited number of teachers in schools, especially secondary schools is a challenge. The total number of teachers available as of 2009 was 466,800, and as of 2015, the country required 688,200 teachers. The percentage of teachers needed should be 6.68% yearly (Suleiman & Abubakar, 2020). But that is not enough as some of the teachers are unqualified to teach.

Activations towards quality education

The training, recruitment, deployment, motivation, retention, as well as continuous training and retraining, are at the heart of education reforms for quality attainment (John, Egunsola & Bashir, 2019). Training is a crucial factor in promoting workers' efficiency in the workplace (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,*

2020b; Omokiti *et al.,* 2020a). Training is a learning or teaching activity to help the employees of an organisation to acquire, develop and apply the knowledge, skills, abilities and attitude required by that organisation to achieve its mission. Also, capacity building is vital because it involves human and infrastructural facilities which enable an individual to realise his/her full potentials of existence, including the goals of an organisation (Anho, 2018).

Newly hired or employed employees (teacher) needs training, to keep them alert, fit and professional at their job. According to Anho (2018), training enables employees to work harder, which means every worker needs training once a while during their carrier phrase.

However, to manage human resources, teachers are to be continuously trained to upgrade their skills, knowledge, aptitude, attitude specified and general educational requirements, Anho (2017). When training is continuous, it increases advantage over others in economic development and increasing productivity. That is to say, that for primary schools to achieve its purposes of quality education, it needs adequately trained and competent teachers to participate in the policies formulation and implementation. Consequently, many teachers, despite their qualification, are teaching with no practice and no experience (Anho, 2018).

Training Steps

1. Diagnosis step: this is the problem identification step.
2. Prescription Step: this means providing a solution to the problem discovered.
3. Construction Step: this is when the instructor implements or execute the training.
4. Evaluation Step: this is when the given solutions are checked for effectiveness to know if the training solved the problem (Anho, 2018).

The quality education the citizens' disposal determines the rate of development of a country. The primary school is vital because when pupils don't have a good foundation, it will be difficult for them to be competent. High-quality education provides the needed human resources that will manage the different sections of a country effectively (Salau *et al*., 2020).

Besides, Daluba (2015) avers that for development to take place in a nation, there must be commitment and resources to provide education. It is in this light that UNESCO recommends that every country should commit 26% of its resources to the education sector to pursue quality education (Anho, 2018).

It is worth noting that the efficiency of quality education as a tool for development depends entirely on how students, parents, teachers, proprietors, policymakers, examination council, Ministry of education and the government collaboratively manage, execute and implement policy on education. In other words, quality education needs an enabling environment to thrive effectively. Development and technology are essentials for every society to advance (Salau *et al*., 2020).

Theoretical Framework

Excellence theory underpins this study. It is a public relations theory which deals with how organisations can conduct excellent public relations in practice. For PR to contribute to organisational effectiveness, the organisation must empower PR as part of the management function because they engage in the decision-making process (Nwosu, *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). The organisation, therefore, interact with the stakeholders in its environment both to accomplish its mission and to behave in a socially responsible manner (Adelua *et al*., 2020). In this case, they manage communication between management and publics to build relationships with the public that are most likely to affect the behaviour of the organisation or that are most affected by the behaviour of the organisation (Grunig, 2008).

The excellence theory was applied to the research topic because it is a public relations theory which deals with the interest of both organisations and the public. When the PR activations are in the interest of the people, it will enhance the image of LSUBEB in the eyes of the public. When such occurs, it will benefit both parties.

Research Design and Results

The researcher distributed 250 questionnaires to employees of SUBEB and only 197 copies of the questionnaire were retrieved. Lagos State was the location for the operation of the questionnaire, which consisted of open-ended and close-ended questions. Data from the retrieved questionnaire was processed with the Statistical Package for the social sciences (SPSS) was used for coding. Result presentation is in tables of frequency.

Frequency Table

Table: 1 Gender

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Male**	51	25.9	26.2	26.2
	Female	144	73.1	73.8	100.0
	Total	195	99.0	100.0	
	Empty	2	1.0		
Total		197	100.0		

Table 1 shows that majority of the respondents are females due to the percentage of 73.1 (144) while male respondents are 25.9% (51) of the sample size. Out of the 250 questionnaires, 195 (99.0%) respondents responded while 2 (1.0%) respondents failed the answer the question about gender.

Table:2 Age bracket

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**21-25**	6	3.0	3.1	3.1
	26-30	17	8.6	8.9	12.0
	31-35	44	22.3	22.9	34.9
	36-40 above	125	63.5	65.1	100.0
	Total	192	97.5	100.0	
Missing	**System**	5	2.5		
Total		197	100.0		

This table 2 contains the age bracket of the respondents. As shown above, 3.0% (6) of the respondents are of ages 21-25, 8.6% (17) are 26-30 years old, 22.3% (44) are 31- 35 years old while 63.5% (125) are from ages 36- above. This result shows that the majority of the respondents are ages 36 and above (63.5%); while the lowest was the respondents between the ages of 21-25 (3.0%). Also, only 192 (97.5%) respondents responded, while 5 (2.5) respondents failed to answer this question.

Table 3: Religion

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Christianity**	132	67	72.1	72.1
	Islam	51	25.9	27.9	100.0
	Total	183	92.9	100.0	
Missing	**System**	14	7.1		
Total		197	100.0		

This table identified the religion of the respondents. It showed that Christians are the highest participants, with a percentage of 67% (132), while people who practice Islam are 25.9% (51). Only 183 respondents responded, while 14 respondents failed to respond.

Table:4 Public Relations Department in SUBEB

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Yes**	99	50.3	59.3	59.3
	No	68	34.5	40.7	100.0
	Total	167	84.8	100.0	
Missing	**System**	30	15.2		
Total		197	100.0		

Table 4 answered the question if the public is aware of the presence of the PR department in SUBEB. The table shows that 99 (50.3%) of the respondents are aware of the public relations department in SUBEB while 68 (34.5%) respondents said they are not aware of such department. The total of 167 persons responded while 30 respondents didn't select either 'yes or no'.

Table:5 Meaning of Public Relations

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Interactive relations with people	55	27.9	41.7	41.7
	Organising school competitions and disseminating information	24	12.2	18.2	59.8
	Assist community and support societal growth	19	9.6	14.4	74.2
	No idea	18	9.1	13.6	87.9
	Brand reputation and image building	16	8.1	12.1	100.0
	Total	132	67.0	100.0	
Missing	System	65	33.0		
Total		197	100.0

However, 19 (9.6%) of the respondents defined PR as 'assisting the community and support societal growth', 18 (9.1%) respondents stated that they had no idea of what PR is. In comparison, 16 respondents (8.1%) said it is a 'Brand reputation and image building'. The total number of the respondents to this question are 132 (67.0%) with 65 respondents (33.0%) who failed to respond to the question.

Table 6: Activations of PR in SUBEB

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Infrastructures**	27	13.7	17.8	17.8
	Organising school competitions	63	32.0	41.4	59.2
	Scholarship	23	11.7	15.1	74.3
	Free books	19	9.6	12.5	86.8
	All of the above	20	10.2	13.2	100.0
	Total	152	77.2	100.0	
Missing	**System**	45	22.8		
Total		197	100.0		

The above table 6 showed the respondents response about PR activations as infrastructure 27 (13.7%), organising school competitions 63 (32.0%), scholarship 23 (11.7%), Free books19 (9.6%) while 20 (10.2%) mentioned all of the four options together. The highest number of PR activations listed is organising school competitions while the lowest is free books distribution to schools. Also, a total of 152 respondents provided answers, while 45 respondents (22.8%) didn't answer the question.

Table: 7 Public Awareness of PR Activations

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Yes**	113	57.4	66.9	66.9
	No	55	27.9	32.5	99.4
	4.00	1	.5	.6	100.0
	Total	169	85.8	100.0	
Missing	**System**	28	14.2		
Total		197	100.0		

Table 7 answered the question about if the public is aware of PR activations. Majority of the respondents 113 (57.4%) said they are aware of the activations carried out by PR in the academic sector while 55 (27.9%) respondents are unaware. 169 (85.8%) respondents attempted the question, while 28 (14.2%) didn't respond.

Table 8: Media for PR Activations

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**Television**	29	14.7	19.2	19.2
	Social media	53	26.9	35.1	54.3
	Newspaper	13	6.6	8.6	62.9
	Radio	12	6.1	7.9	70.9
	Word-of-mouth	43	21.8	28.5	99.3
	All of the above	1	.5	.7	100.0
	Total	151	76.6	100.0	
Missing	**System**	46	23.4		
Total		197	100.0		

Concerning the medium through which the respondents knew about PR activations, 29 (14.7%) said through TV, 53 (26.9%) through social media, 13 (6.6%) through the newspaper, 12 (6.1%) through the Radio, 43 (21.8%) through word of mouth and only 1 (.5%) respondent chose all of the above. The highest media used is social media. 151 (76.6%) while 46 (23.4%) respondents didn't respond.

Table: 9 Rating quality of education

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Excellent	49	24.9	28.0	28.0
	Good	97	49.2	55.4	83.4
	Average	22	11.2	12.6	96.0
	Poor	7	3.6	4.0	100.0
	Total	175	88.8	100.0	
Missing	System	22	11.2		
Total		197	100.0		

This table rates the quality of education in Lagos state. 49 (24.9%) of the respondents said it is excellent, 97 (49.2%) respondents said it is good, 22 (11.2%) responded that it is average while few persons (3.6%) said it is poor. The total number of respondents is 175 (88.8%), while 22 (11.2%) respondents failed to respond. Therefore, most respondents believed that the education system in Lagos government schools is excellent.

Table: 10 Causes of lack of quality education

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Teachers lack training and overpopulated classrooms	42	21.3	29.8	29.8
	Lack of textbooks, infrastructure and lazy students	42	21.3	29.8	59.6
	Lack of teaching materials	27	13.7	19.1	78.7
	Lack of funds	30	15.2	21.3	100.0
	Total	141	71.6	100.0	
Missing	System	56	28.4		
Total		197	100.0		

Table 10 shows that 42 (21.3%) respondents said that teachers lack training and the classrooms crowded. Another set of 42 respondents (21.3%) said there are no textbooks, infrastructure and some pupils are lazy. Twenty-seven respondents (13.7%) which are the fewest stated that the cause for lack of quality education is lack of teaching materials while 30 respondents (15.2%) said lack of funds.

Table: 11 Perception of PR activations in SUBEB

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	**it is impactful**	52	26.4	31.9	31.9
	it is not helpful	45	22.8	27.6	59.5
	more is needed	66	33.5	40.5	100.0
	Total	163	82.7	100.0	
Missing	**System**	34	17.3		
Total		197	100.0		

This table 11 answered the question about the perception of the respondents towards activations of the public relations in SUBEB. Table: 12 Challenges face

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Lack of qualified teachers	24	12.2	13.6	13.6
	Overpopulated classrooms	70	35.5	39.5	53.1
	Lack of funds	28	14.2	15.8	68.9
	Lack of infrastructure	42	21.3	23.7	92.7
	All of the above	13	6.6	7.3	100.0
	Total	177	89.8	100.0	
Missing	System	20	10.2		
Total		197	100.0		

This table shows that the challenges faced by education are lack of qualified teachers 12.2%, the highest number of respondents 70 (35.5%) said overpopulated classrooms, 28 (14.2%) respondents said lack of funds, 42 respondents (21.3%) said lack of infrastructure while 13 (6.6%) said all of the above. The total number of respondents who answered this question are 177 (89.8%) while 20 (10.2%) didn't respond.

Table: 13 PR activations witnessed by respondents

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Infrastructure	36	18.3	20.1	20.1
	Scholarships	32	16.2	17.9	38.0
	Organising competitions	56	28.4	31.3	69.3
	Giving free books	38	19.3	21.2	90.5
	All of the above	17	8.6	9.5	100.0
	Total	179	90.9	100.0	
Missing	System	18	9.1		
Total		197	100.0		

In this table 12, it showed that 36 (18.3%) of the respondents had witnessed the PR activations of infrastructure takes place in schools, 32 (16.2%) respondents said scholarships are provided, 56 (28.4%) respondents have observed competitions being organised in schools by PR, 38 (19.3%) said free books are donated. In comparison, 17 (8.6%) said all the above are PR activations in schools under SUBEB. The total of 179 (90.9%) respondents answered the question while 18 (9.1%) respondents didn't respond.

Table: 14 Impact of PR activations on education

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	More efforts from teachers	18	9.1	14.6	14.6
	Commitment from teachers	23	11.7	18.7	33.3
	Teachers are more motivated and aware of responsibilities	44	22.3	35.8	69.1
	No idea	12	6.1	9.8	78.9
	Scholarships provision, Infrastructures and improved learning process	26	13.2	21.1	100.0
	Total	123	62.4	100.0	
Missing	System	74	37.6		
Total		197	100.0		

The table above presented the impact of PR activations on the quality of teaching. Eighteen (9.1%) of the respondents stated that there is more effort from teachers; 23 (11.7%) respondents said teachers are more committed. Forty-four (22.3%) respondents said teachers are more motivated and are of their

responsibilities, 12 (6.1%) respondents said they have no idea of the impact of PR activations. In comparison, 26 respondents (13.2%) said scholarship provision, infrastructures and improved learning process is part of PR activations.

Table: 15 Satisfaction level of respondents

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	90	45.7	54.2	54.2
	No	76	38.6	45.8	100.0
	Total	166	84.3	100.0	
Missing	System	31	15.7		
Total		197	100.0		

The table showed the satisfaction rate of PR activations of SUBEB. 90 (45.7%) respondents stated that they are satisfied while 76 (38.6%) respondents said they are not satisfied. The total of 166 (84.3%) respondents answered the question while 31 (15.7%) didn't respond.

Table: 16 Suggestions

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Proper scheme of work and seminars and infrastructures	29	14.7	23.0	23.0
	Recruiting more teachers, provide teaching materials and welfare	45	22.8	35.7	58.7
	Training and motivating teachers	32	16.2	25.4	84.1
	Less crowded classrooms and parents involvement	7	3.6	5.6	89.7
	Provide internet facilities for learning	13	6.6	10.3	100.0
	Total	126	64.0	100.0	
Missing	System	71	36.0		
Total		197	100.0		

Table 16 presented the suggestions made by the respondents. 29 (14.7%) respondents suggested that the proper scheme of work, seminars and infrastructures are needed, 45 (22.8%) respondents said that recruiting more teachers, provide materials and welfare as well. 32 (16.2%) respondents suggested that training and motivating teachers are needed, 7 (3.6%) respondents suggested less crowded classrooms and parents involved in education and 13 (6.6%) indicated the provision of internet facilities for learning. The total of 126 (64.0%) gave suggestions while the remaining 71 (36.0%) failed to respond.

Discussion of findings

RESEARCH QUESTION 1: To find out if the public is aware of public relations activations

The results showed that majority of the respondents are first of all aware of what the term Public Relations means. This result is visible in the number of respondents who defined the word in their understanding. The respondents described PR as an interactive relation with people - an appropriate definition since PR deals with two-way communication and relationship building. It shows that the respondents understood what it means.
