The respondents are aware of PR activations and the meaning of public relations. Majority of the respondents are aware of the activations carried out by PR in SUBEB, which they later stated in as provision of infrastructure, providing scholarships, organising competitions for schools and donating books to the students. This finding shows that even those that had no idea about the meaning of PR knew the activations.

RESEARCH QUESTION 2: To find out the perception of the publics' regarding PR activations in SUBEB

The respondents have the understanding that PR activations are needed more than discharged. This finding contradicted research question three, which is about the impact of PR activations. If PR activations are impactful, that means the respondents have a good perception of the responsibilities of PR. But these findings made it clear that the respondents didn't see it that way.

RESEARCH QUESTION 3: To find out the impact of public relations activations by SUBEB

According to the findings, the effect the PR activation is having on the public is massive because the teachers are more motivated and committed. This result shows that the training conducted by SUBEB for the teachers is profoundly impacting them and the students. The PR activations which causes such impacts are scholarship provision, infrastructures and improved learning process. These findings show that SUBEB is responsible for discharging its PR activities to promote a higher quality of education in Lagos State.

Conclusion

This study concludes that the respondents are fully aware of the activations of public relations and could relate it to the quality of education. Their activations are fully known, and they use the right mediums to reach their target audience. Usage of electronic, print and social media showed that both the agency and the Ministry are mixing the media (Aiyende *et al*., 2020). The new media which is used by many people, is a suitable and effective means of targeting the audience. It is noticeable that the publics expect more from the PR activations than what they have experienced.

Recommendation

The study recommends the application of the use of technology-assisted public relations in Nigeria's education system. Meaning that the government should make available computers to all schools so that the pupils will have a quality education.

Also, the government should invest more in the education sector so that there would be an impactful activation through the PR to schools to increase the level of quality education in the country.

The perceptions of the publics' regarding Public relations activations is that they need to do more. Therefore, the PR department should put more effort in discharging their activations so that it will have a positive effect on the quality of education.

Managerialism- Leaders- Leadership in The Organization's Processes

Maria NOWICKA-SKOWRON

Czestochowa University of Technology, Management Faculty, Czestochowa, Poland,
E-mail: maria.nowicka-skowron@wz.pcz.pl

Abstract

The subject of managerialism- leaders and leadership is a key problem in the organization's processes. The aim of this paper is to present the concept of a manager and a leader in the aspect of leadership in organizations. The manager's and leader's activity was referred to the basic managerial functions in organizations. In their function's processes the phenomena of managerialism and leadership were pointed out in the context of achieving the organization's goals. The evaluation of leadership in the dimension of leadership based on the method presented by J. B. Kaplan and R. Kaiser was adopted as a particular area of consideration. The study was based on the analysis of the original data from a survey conducted among a group of managers at various levels based on the Leadership Versatility Test (LVI). The aim of the study was to assess leadership in four dimensions of leadership: forcing, activating, operational and strategic leadership. The study was divided into two phases involving analysis of the relationship between the skills of different types of leadership and estimating the level of balance between business and organizational skills. With this end in view statistical testing was used for qualitative data and an indicator for measuring leadership versatility. The received results allowed to identify various levels of versatile leadership skills depending on its dimensions and indicate the need to improve leadership skills in the area of strategic activities. The theoretical purpose was to analyze selected original views in the field of management sciences, emphasizing the evolutionary nature of managerialism and leadership.

Keywords: A Manager, A Leader, Leadership

Introduction

Theoretical and practical management problems concentrate on many different issues. The most important among them are managerialism, leaders and leadership. Because of the wide range of the issues, only selected processes' aspects of management about managerialism, leaders and leadership were analysed. Managerialism and a manager are the synonyms of phenomena and functions implemented in organizations in decision-making processes. At the same time, it is the widest approach of the problem of the management processes. Leader and leadership correspond to a narrower range of managerial processes and functions in the processes of management in relation to a manager. Leadership is a necessary attribute of a leader, to a lesser extent a manager. For a manager it is important to show some leadership qualities. Undertaking the subject of manager's activity justifies choosing the basis for consideration. In the consideration, most of all, the model approach which integrate organization's goals with the function of a manager was indicated. A manager is responsible for an organization in front of stakeholders who expect a return on invested capital. The manager is required to make the right decisions in the area of impact on employees appropriately motivated to achieve specific goals. The goals of the organization are achieved also by the leader who has a key role in the management processes. The leader is characterized by a particular trait which identifies him with the model worthy of conduct and indicated to follow. Other leaders' features are also important and they were presented by many authors. Particularly important was the indication of a measurable criterion for assessing the competence of a manager and leader with simultaneous indication of leadership. In research of leaders' and managers' activities the leadership was highlighted as: forcing, activating, operational and strategic. The thesis was accepted that there is a correlation in the sphere of forcing and activating leadership. The different types of leadership indicated the level of leadership versatility in the organization's process of operation.

Determinants of the functions of manager and leader in the context of leadership in organizations

Undertaking the issues of managerialism, leaders and leadership directly needs to take into account the place and position of key functions occurring in organizations. Functions in the aspect of the abovementioned issues concern managers and leaders. The group of managers and leaders is a basic human resources in the organization. In the management's activity there is a legitimacy to identify the functions of manager and leader, especially in the context of leadership. The manager is an employee who performs managerial functions. A manager can be called a catalyst who: (Buckingham, Coffman, 2004)

- makes a proper employee selection, who is talented, not only has experience and determination

- specifies expectations along with specific results

- motivates employees, affecting their strengths

- influences employee and organization development

L. Kowalczyk cites the results of the research led by Gallupa Institute and ascertains that in the manager's activity it is necessary to define the model of the workplace in relation to the hierarchy of needs of the organization. (Kowalczyk, 2014) There are then two levels in the models. One of them is the base level, which demonstrates demotivating character. The second, on the other hand, motivates employees, individually and collectively, enabling the organization to achieve its goals through management processes. The manager acts very actively on organizations and the increasing strategic resources cause a further increase of his business-oriented position. (Kościelniak, Skowron-Grabowska, Nowodziński, 2017) The dominant attitude in the work of a manager identified with leadership of employees enables the release of their creative potential to achieve the goals of the organization. (Zawada, Tomski, Kucęba, 2015)

In order to establish the manager's operational efficiency in management, a proper organizational structure of the enterprise is required. The basic condition which must be fulfilled by organizations is a well-defined business purpose along with a strategy adapted to market requirements. Then, managers concentrate on effective implementation of actions enabling achievement of the organisation's goal. What is more, for managers' tasks in the aspect of technical conditions (Baskiewicz, Łęgowik-Małolepsza, Bubel, Sałek, 2016) there are processes of designing which are the answer for constant challenges of a changing market. (Grondys, 2017) Managers are forced to high activity in the area of generating task and system structures and organizational projects that determine the vision and strategy of enterprises. (Łęgowik-Małolepsza, Łęgowik-Świącik 2015) Effectiveness of behavioral actions may then lead to achieve the company's competitive advantage (Bubel, 2017).

According to D. Jelonek, in the managers' operations, analyses with the use of new knowledge based on: data mining, web mining, knowledge maps, big data, the use of social media, visualization to create animations and dashboards for managers are of significant importance (Jelonek, 2018a).

M. Mach- Król (2018) underlines the high usability of maturity models based on Big Data analyses in decision-making processes. Managers who are aware of the potential of Big Data analysis implement other solutions in order to achieve set goals, especially gain a lasting competitive advantage in a strategic perspective (Nowicka-Skowron, Mazur, 2019). A particular challenge in this context is a sustainable development. Indication on a competitive advantage needs from managers integration of ongoing projects with strategic activities. In current activities, the role of a manager in the area of knowledge management should be underlined (Skowron-Grabowska, Jasińska K, 2019).

The function of Knowledge Manager identifies with an Executive Director who co-operate with Knowledge Management Director. Knowledge managers gain and share knowledge in a way that

provides employees with access to knowledge capital (Niedbał, Wrzalik, Sokołowski, 2018). Which, in turn, ensures the development of the organization.

In the time and development perspective, leadership is considered to be the most important element of the manager of the future. The variety of leadership is determined by different types and roles of managers resulting primarily from the creation of a vision creator, financial engineering analyst, creativity (Koźmiński, 2004). It is important to take into account the manager's risk. People performing managerial functions are obliged to constantly monitor the financial situation of the organization.

The outline of the issues of manager's functioning needs similar analysis in relation to the leader. In the opinion of the leader it is necessary to take into account the current and future actions of the organization. In order to explain the role of the leader A. Zerfass i M. Wiesenberg (2016) formulate many questions. It may be accepted that one of them has a key meaning because it concerns the most important attributes of a leader in the functioning of the organization and the professional communication system. The issues of the leader in this context are illustrated in a Fig 1.

Fig. 1: The position of the leader in an organization

Source : Based on A. Zerfass i M. Wiesenberg (2016) Communicating the leadership status of organizations : A cross – national study In 10 European Countries [In:] The Management Game of

Communication, Edited by P.S. Bronn, S.Romenti, A. Zerfass, Emerald Group Publishing Limited, p.129, [p.12-142].

The leader's position influences the effectiveness of the organization's operations in the management processes. Leader's decision- making processes are limited by many different evidence. The basic evidence hindering the activity of leaders in enterprises should be recognized as (Krawczyk-Sokołowska, Korombel, Ziółkowska, 2016):

- inappropriate competences
- wrong incentive system
- inadequate control systems
- lack of effective methods of cooperation of the entire enterprise
- failure to recognize innovation and network potential.

In order to improve the effectiveness and efficiency of leaders, it is important to eliminate or reduce these negative premises. Thus, it is important to a leader to analyse conditions of the organization's activities, aimed at achieving goals including globalization (Kościelniak, Skowron-Grabowska, Grabara, 2017). Selected definitions from an interesting position are presented to determine the leadership position. These include the definitions:

A person is recognised as a leader when he has the capacity to be in charge and stay in the vanguard of efforts to be competitive with other group members. The term leader in relation to the employee holding a managerial post is not clearly identified since leadership is determined by context (Rutka. 2017, p.142).

A leader is someone open to raising awareness, someone who has a responsibility to create conditions for development, entrepreneurship and innovation, and who inspires people to do educational work. The leader must be to a certain degree a dreamer in order to be successful and capable of understanding the changing needs of people. He is supposed to be a role model who should secure good relations with stakeholders (Skrzypek, 2017, p.162).

As seen above, there are two widely differing approaches to identifying persons exercising control in organisations. One of them distinguishes the leader, the frontrunner and the manager implying that their roles and significance vary. The other concept attributes the aforementioned functions to one person (Smoląg, 2013, pp. 51-57)

A leader is a person who stands out in a contemporary organisation, task force or local community. The leader excels at skills and competences which demonstrate themselves in his emotional intelligence and a high level of morality. The leader is accepted by the organisation's members who knowingly and intentionally approve of his leadership and managerial qualities (Stachowicz, 2017, p.164).

The variety of presented definition of a leader is because of the fact of the complexity of characteristics, organizational behaviour and requirements posed to these employees in enterprises.

Presented generalized characteristics of a manager and a leader are the base for the relationship of management and leadership (Bucii, 2016). In the context of a leadership the key meaning has a process of maintaining a balance between management and leadership. Decision- making processes need strong position both of management and leadership. In the functioning of human resources, however, it is necessary to emphasize the special role of the leader who, with his authority, indicates the idea and direction of activities for the organization's employees. The leader is obliged to take on the challenges of the market. Promotional activities are especially a challenge.

For the leader of the 21st century, the particular challenge is an enterprise's functioning in a social media space. (Nowodziński, 2013). This activity needs verification of enterprise's goals in specific communities along with constant adaptation of current solutions to current conditions. The future creates a special challenge for the leader due to the dynamics of changes in the IT sphere. It is thus

necessary to systematize the approach in information addressing. As the first stage, developing and planning strategic solutions resulting from the media potential should be recognized. In the second stage it is important to identify and analyse current trends in social media. The third stage needs setting organizational procedures and standards which arrange planned processes. In the abovementioned context it may be stated that social media also fulfil a very important function of transferring information on corporate social responsibility (Barcik, 2019). The consequences of taking into account the issues of corporate social responsibility (Brzeziński, 2016) are reflected in the issues of managerialism, leaders and leadership. These problems indicate the legitimacy of conducting further research, especially in terms of leadership in the organization.

Key Decision Problems in Both Leaders and Managers Group

The starting point of discussion was the concept regarding the position of a strategic leader formulated by Romanowska. The role of this type of leader involves focusing on the environment of the company, seizing opportunities, and also examining potential risks while being able to make full use of knowledge in the horizontal perspectives and conditions. (Martin, Hauder, Matthes, 2016) When preparing a strategy, the leader must take into account conditions of uncertainty and risk which result in generating the atmosphere of anxiety and stress in the decision-making process. The decisions made in a changing environment necessitate constant analysis of the arrangements completed and the lines of action adopted as well as modifying the targets. A strategic leader's activity is largely determined by information resources. Their proper selection fosters the soundness and adequacy of decisions whereas any deficiencies in information or its contradictory nature leads to hindering decision-making of the strategic leader.(Romanowska, 2017, p. 56)

The author pursues her reflections on the role of leader by attempting to answer the question: "…what competences must a strategic leader be endowed with in order to meet the challenges?' The author makes a list of qualities that a strategic leader should display. They are: (Romanowska, 2017, p. 57)

- managerial expertise in respect of analysis, planning and control methods,
- intelligence, particularly creative thinking skills,
- capability to think and act unconventionally,
- ability to specify ideas, goals and priorities,
- charisma

courage that drives leader's success and, in terms of strategy, is a basis for decision-making in the event of incomplete information, (Jelonek, 2018b) social and business pressure or unconventional solutions. It is courage that lies at the root of decisions about abandoning the strategy in situations in which following it may cause losses.

Against this background, it is possible to refer to trends relating to strategy and the role of leader in literary studies. Based on the overview of research topics between 2014 and 2016 in 'Strategic Management Journal' by Dyduch and Bratnicki, the following conclusions may be drawn (Dyduch, Bratnicki, 2017):

- definition of the role of leader was provided only in relation to break-through innovations as a derivative of knowledge,
- prevailing terms are: leader and manager, notably as regards social values,
- as regards guiding and motivating a group of employees, two positions can be distinguished, namely: board president and director

The conclusions of the discussion about the issues that a leader must deal with are as follows: the problems connected with knowledge management, especially innovation as well as social values preferred by leaders, frontrunners and managers are very up-to-date. The tasks of those in leadership roles are linked to the strategic dimension of decision-making. (Rzemieniak, Knop, Jelonek, 2016)

The material for analysis came from the study of a test group of managers at various levels. A survey was used. The content of the survey was based on the Leadership Versatility Index (LVI). [1] A total of 264 evaluators (i.e. managers, co-workers and supervisors) participated in the study. They evaluated a total of 162 low-, medium- and high-level leaders. The aim of the study was to assess the effectiveness of leadership in four dimensions: forceful, enabling, operational and strategic. The skills of superiors were assessed on a "too little - too much" scale, where - 4 means "far too little", 0 means "the right amount " and 4 means "far too much". Single-person entities were excluded from the study. The first stage was to analyse the correlation between opposing skills in the four areas of leadership based on the category of the assessor (Table 1).

Table 1:The average value of correlations between pairs of leadership types

Category of assessor	Forceful - enabling leadership (I)		Strategic - operational leadership (II)	
	N	r	N	r
Managers	46	- 0.53	35	-0.21
Co-workers	32	- 0.56	25	-0.23
Supervisors	14	- 0.54	11	-0.27

Source: author's own calculations

Where N refers to the number of assessed managers, and r means the average value of correlations

It is assumed that leaders do not maintain a perfect balance between the social and interpersonal aspects (I), therefore a strong negative correlation is observed for this kind of skills, especially in the case of assessment by leaders of equivalent position. The strongest single correlations between variables in the area of forceful-enabling leadership were identified for:

• For r = -0.54, a negative correlation between controlling the situation (forceful leadership) and sharing one's skills (enabling leadership),

• For r = -0.57, a negative correlation between relying solely one's own opinion (forceful leadership) and listening to the opinions of others (enabling leadership),

• For r = -0.61, a negative correlation between exerting pressure on one's subordinates (forceful leadership) and supporting the activities of employees (enabling leadership),

• For r = -0.55, a negative correlation between making decisions alone (forceful leadership) and handing over initiative to others (enabling leadership),

• For r = -0.49, a negative correlation between pressure on achieving results (forceful leadership) and support for jointly achieved results (enabling leadership). (Kaplan, Kaiser, 2010).

On the other hand, business and organisational skills (II) are a lot less strongly correlated. The low average correlation indicator for strategic and operational leadership results from less frequent significant statistical relationships than in the case of the first dimension of leadership. Analysing individual relationships in this area, the following were identified:

• For r = -0.22, a negative correlation between focusing on a long-term strategy (strategic leadership) and centering on current results (operational leadership),

• For r = -0.28, a negative correlation between aiming at long-term development of the company (strategic leadership) and attention to the effectiveness of entity's operating (operational leadership),

• For r = -0.23, a negative correlation between bold decision-making (strategic leadership) and systematic pursuit of goals based on the principle of small steps (operational leadership),

• For r = -0.37, a negative correlation between unconventional solutions (strategic leadership) and using proven methods (operational leadership),

• For r = -0.22, a negative correlation between an aggressive pursuit of development (strategic leadership) and respecting existing restrictions (operational leadership),

• For r = -0.21, a negative correlation between a broad view of the results obtained (strategic leadership) and attention to detail (operational leadership).

The next step of the study was to estimate a versatility measure for each of the leadership pairs. It is understood as the 'right quantity' value which demonstrates the balance between forceful and enabling leadership as well as strategic and operational leadership. For each

leadership pair, grade values and their proximity to zero should be estimated. The value obtained indicates the extent to which a leader can strike a balance between the opposite qualities of balanced leadership. The graphical diagram for calculating the indicator is presented in Figure 1. According to the adopted assumptions, the indicator was calculated using the equation: (Kaplan, Kaiser, 2010, p. 202)

$$\text{Versatilityindicator} = \frac{\text{maximumdistance} - \text{actualdistance}}{\text{maximumdistance}}$$

Where:

actual distance: c2 = a2 +b2 and maximum distance: z2 = x2 + y2

Figure 2: Graphic calculation of versatility indicator

Source: Own elaboration using the method described by Kaplan, J.B. Kaiser, R., (2010) Wszechstronny lider, Wolters Kluwer Business, Warszawa

For the maximum distance, the x and y values assume the maximum value on the scale, while in calculating the actual distance, the actual assessment values marked as a and b should be assumed. The indicator is in the range of 0-100%, where 0% to 20% means no versatility, 21 % to 40% - low

level of versatility, 41% to 60 - medium level of versatility, 61% to 80 - good level of versatility and 81% to 100% - very good level of leader versatility. For each leadership pair, the average leadership versatility index for the assessors was calculated (Table 2).

Table 2: The average index of versatility of the surveyed leaders by category of assessors

Category of assessor	Forceful - enabling leadership (I)	Strategic - operational leadership (II)
Managees	55%	46%
Co-workers	64%	52%
Supervisors	71%	61%
Total average	63.3%	53%

Source: Own elaboration using the method described by Kaplan, J.B. Kaiser, R., (2010) Wszechstronny lider, Wolters Kluwer Business, Warszawa, p.212.

The results obtained show a good level of versatility of the surveyed leaders as for forceful - enabling leadership. The average rate of 63% means that the leaders of the surveyed companies efficiently strive for balance between too limited and excessive use of their interpersonal and social skills. On the other hand, as far as strategic-operational leadership is concerned, the average indicator rating is 53%, which means a low level of versatility in this respect. The surveyed leaders have difficulty striking a balance between business and organisational skills. The leaders were rated the highest in terms of both leadership pairs by their superiors.

Summary

The issue of managerialism, leaders and leadership is the essence of an organization's operation. Employees who create: managerialism means managers, leadership means leaders. Their functions analysed are mainly about leadership in organizations. Managers and leader who have required features to perform those functions is an important condition for achieving the organisation's goals to ensure and increase its competitive position. The complexity of issues of the manager's and leader's functioning causes to its in-depth assessment, pilot empirical research in enterprises was conducted. Its essence was determined in a questionnaire based on the Leadership Versatility Test. This method was presented by J.B. Kaplan and R. Kaiser. Leaders were tested. The assessment was made by employees employed as subordinates and superiors as well as people having equivalent positions. The aim of the research was the assessment of the way of leadership in the following dimensions: forcing, activating, operational and strategic. In addition, a specific scale was adopted. The correlation between opposing skills in the presented dimensions of leadership was analysed.

According correlation analyses the following was found:

- leaders are characterized by a good level of versatility in a pair of forcing - activating leadership
- leaders show a low level of versatility in strategic and operational leadership.

The formulated conclusions indicate the need for leaders to improve their leadership skills in the decision-making area: strategic activity in relation to operational activity. At the same time, this application sets the direction for further research in the areas of managerialism, leaders and leadership.

The challenges considered particularly important are:

- necessity to adapt to dynamic changes in an organisation and the environment

- implementation and improvement of information systems along with appropriate cooperation with social media
- adaptation of multifaceted programmes in respect of corporate social responsibility.

These challenges require ongoing implementation. However, it is the strategic objectives of an organisation operating in a competitive surroundings that determine the importance of decision-making problems for leaders and managers.

The Effect of Outward Foreign Direct Investments on China's Economy

Dmitry DEMCHUK
Moscow State Institute of International Relations, Moscow, Russia
E-mail: demchuk.ieferd@bk.ru

Abstract

The article analyses the influence of China's outbound foreign direct investments (FDI) on its national economy. The author focuses on the application of Chinese experience to the FDI theory. The paper finds that Chinese involvement in FDI has mainly positive effect on its economic growth. Based on the theoretical and empirical research analysis, it is established that several negative outcomes of Chinese foreign investment activity can be levelled for national economy due to the peculiarities of Chinese economic model. Based on the existing approach to FDI analysis the article describes the main impacts of China's FDI on its national economy. The author distinguishes and describes the main types of such effect, which include commercial and financial, as well as connected with transfers of tangible and intangible assets. The author points out that the positive impact of FDI on China's economic growth is connected mainly with the domestic use of tangible and non-tangible assets obtained abroad.

Keywords: foreign direct investments, FDI, China, economic effect, investment theory.

Introduction

Amid the steady rise and global expansion of China's economy, the volume of Chinese FDI surged from zero to over $100 billion in the past decade. According to Chinese Ministry of Commerce, by the end of 2017 China became the second largest investor in the world with total value of FDI of $1,8 trillion. The rise of China as one the main sources of direct investments globally requires special attention as FDI play important role not only for economic growth of recipient countries, but also for development of Chinese economy as one of the largest on a global scale. Thus, it is necessary to research economic effects of China's investment activity abroad on its national economy.

The topic of FDI impact on the economy of certain countries is widely publicized, however, researchers focus on the empirical analysis of their effect in recipient countries. At the same time, according to the author, theoretical aspects of direct investments effect on the economies of donor countries are under-researched in existing scientific publications. From the perspective of China, most of theoretical research is focused on FDI role in recipient countries, and very little attention is paid to China' FDI input to its economic growth at macro-level. The author implies that in spite of impressive amount of publications on the topic of Chinese FDI, modern scientific papers are mainly based on empirical analysis and pay little attention to influence of Chinese investments on the national economy in terms of investment theory.

The scientific novelty of the study lies in the author's analysis of theoretical model of foreign direct investments applicability for Chinese economic model and classification of China's foreign investments activity effects on the national economy.

The purpose of the article is to evaluate the economic impact of Chinese FDI on its national economy. For this purpose, the author researches the existing theoretical and empirical concepts to analyze foreign direct investments (FDI) impact on the donor's economy; defines and describes the main types of China's FDI economic impact on its national economy based on the conducted analysis. The object of the present study is China's FDI.

Main Points

Individual studies, based on the data from developing countries, point out a small positive influence of FDI on donor economies (Herzer, Klasen and Nowak-Lehmann D., 2008). For example, based on research of foreign investments conducted by USA, Herzer notes that FDI stimulates economic growth and increase in production in the home country. Studies, based on data from EU countries, indicate that outward FDI increase competitiveness and efficiency of companies in donor countries (Sunesen, Jespersen and Thelle, 2010) and positively influence their employment rate and industrial output (Hijzen, Jean and Mayer, 2011). Data from ASEAN indicate that increase of inward and outward FDI cumulatively stimulates investments within countries of the region (Goh and Wong, 2014).

In theory, FDI stimulate economic growth in donor country in two ways. Firstly, they spread technology from developed countries to home countries, what in turn increases efficiency of domestic investments. Secondly, companies investing abroad gain access to cheap raw materials, reduce production cost, increase volumes of output and become more competitive both on internal and external markets (Desai, Foley and Hines, 2005). As a result, development of value chains improves efficiency of the national economy in whole. In spite of this, various empirical studies have shown that foreign investments are undertaken at the cost of limited internal financial resources and displace investments in the home country, eventually reducing domestic productive capacity. However, the main drawback of these studies is that they are mostly concentrated on the effect of outward FDI on domestic investments and do not fully estimate economic impact of TNCs' foreign investment activity results.

Within the framework of this theory, China's case is rather peculiar. For example, there are two reasons for poor fungibility between foreign and domestic investments on China's market. Firstly, savings rate in China is one of the highest in the world (You and Solomon, 2015), which is a major spur to conduct both FDI and domestic investments. Secondly, significant part of Chinese foreign investments is financed from external sources and does not cause lack of capital in domestic market. Moreover, Chinese outward FDI contribute to introduction of foreign technologies to domestic production. That has a positive impact on investment performance and stimulates economic growth in China.

The effect of successful Chinese foreign projects significantly exceeds opportunity cost of using capital resources inside the country. In particular, taking into account the significant role of state regulation of investment development in China, negative impacts of outward FDI are minimized at the account of its strategic nature, while risks for national economy are mitigated by state. Empirical studies support this statement. Thus, based on statistical data analysis of China's foreign investments from 1982 to 2015, positive impacts of outward FDI on economic growth appear in the long term and outweigh negative impacts for Chinese capital market (Ali *et al.*, 2018).

In accordance with the approach of J.H. Dunning and S.M. Lundan, investments are divided into 4 types by their purpose (Dunning and Lundan, 2008):

1. access to natural resources and other strategic assets;

2. formation of new markets;

3. improvement of production efficiency;

4. access to strategic assets from abroad.

Each type of Chinese investments is aimed at providing certain advantages for national economy. However, the author notes that one type of investments in accordance with the above classification often leads to different impacts in China's economy, while different types of FDI may lead to the same impact. On the one hand, the fact of investing itself has effect on the financial state of China.

On the other hand, as a result of investment activity abroad, Chinese companies gain access to crucial material and immaterial resources for economic development.

Thus, taking into account peculiarities of Chinese economic model, the author offers to divide economic impacts of outward FDI on China's economy into several categories:

1. financial effects;
2. effects related to intangible assets acquisition;
3. effects related to tangible assets acquisition;
4. trade effects.

The author describes these effects below.

Financial Effects

At the present state of FDI development path Chinese companies lack certain types of specific advantages. That is why China pursues strategy of investment expansion as a way to obtain strategic assets abroad.

According to the balance of payments statistics, Chinese FDI generated $96.5 billion profits in 2018 with average return rate of about 6% (International Monetary Fund, 2019). Some part of the growing FDI revenues are reinvested to foreign subsidiaries, while their major part is returned to national market in the form of internal investments that stimulate economic growth. Even though the repatriated income is not a significant contribution to economy taking into account current Chinese financial capacity, its input to capital formation and development of different economic sectors is substantial. For example, even though the volume of immigrant remittances exceeded TNCs' financial FDI incomes during the early 2000s, most of it was consumed rather than reinvested. Moreover, incomes of Chinese companies' foreign subsidiaries were crucial during the first years of economic reforms, when China was in sharp need of foreign currency.

The financial aspect of FDI is also very important for export-oriented industries taking into account the fact that export volume increase plays important role in China's strategy to promote economic development and support current account surplus. FDI increase incomes of Chinese investors and exporters, as well as related suppliers of goods and services. Thus, financial advantages of FDI for Chinese economy depend directly on the volumes of profits earned and foreign currency inflow.

One more positive financial impact appears in granting access for Chinese companies to financing abroad (Wall, 1997; Deng, 2004). Overseas project demand foreign currency and large scale financing, that are hard to access in China by private firms. State-owned enterprises are major borrowers in China, while the most part of Chinese capital is managed by state banks and funds. These capital market imperfections make small and medium enterprises rely mostly on private loans and export revenues to finance and expand their activity. As a result, outward FDI create alternative funding sources for Chinese companies' business on the national market and abroad.

Effects Related to Acquisition of Intangible Assets

Another important effect of outward FDI for Chinese economy is gaining access to intangible assets that are in low supply in China. Investor companies implement the newly gained assets and thus accumulate specific competitive advantages. These intangible assets may include new technologies, know-hows, management and marketing skills, and so on. These resources flow into Chinese market by transferring from subsidiaries to parent company and assimilate by means of external effects. Through access to innovations, foreign investors and related companies become more effective and

labor productive. As a result, such process reduces the technological gap between China and developed countries.

The described effect is called "spillover effect" (Chen, Li and Shapiro, 2012). It arises mainly as a result of Chinese FDI to developed countries. Chinese foreign subsidiaries acquire technologies and other intangible assets by participating in value chains on recipient market. For example, companies receive new technologies and experience by using high-tech components for production of final goods abroad. Moreover, subsidiaries can hire foreign high-level experts or participate in research projects together with companies in the host country. The skills of Chinese labor force working in subsidiaries is also enhanced. Spillover effect in this case emerges due to the process of staff rotation between subsidiaries and parent companies (Knoerich, 2017). Transactions involving mergers and acquisitions open direct access to high technology for Chinese companies and integrate knowledge and managerial skills into TNCs' international structure.

In spite of significant progress of the past years, the majority of economy sectors in China do not reach technological and innovative level of development comparable to international leaders. Chinese companies are still limited by competitive and technological disadvantages on external and internal markets. China's economy has enormous potential for reducing the technology gap with developed countries; however, its innovation development is almost totally based on acquisition of foreign technologies.

Apparently, strategic intangible assets stimulate economic growth. However, in order to receive positive effect, Chinese companies have to successfully apply them on the domestic market. The two determinants of innovations that are acquired by undertaking FDI are the ability to transfer and implement them. Difficulties in transferring technology are often caused by internal factors, connected with TNCs deficiencies in strategic management, as well as by external factors, connected with cultural, legal and other differences between donor and recipient country. Moreover, in the context of rapid technological growth know-hows acquire new forms and become complicated, that makes them very difficult to implement in technologically underdeveloped countries. Nevertheless, successful examples of Chinese TNCs indicate high level of readiness to apply foreign technologies. For example, after acquisition of the IBM computer technology unit, Chinese company Lenovo acquired status of one of the world leaders in this sphere. Creation of Huawei and ZTE joint research project promoted implementation of 4G technology in China and extended influence of these companies both on internal and external markets. Empirical research also confirms positive correlation between outward FDI and quantity of Chinese patents. That illustrates successful implementation of foreign innovations on the domestic market (Qiang, 2001). Therefore, outward FDI is one of the major sources of the new knowledge for Chinese economy; however, the desired effect is not always achieved due to a number of internal market restrictions.

Impacts Related to Tangible Assets Acquisition

Another important effect of Chinese FDI on its economy is gaining access to tangible assets, including raw materials.

In spite of abundance of natural resources in China, their stocks calculated per capita are significantly below the world average. Fast economic growth in the last few decades, averaging to 10 per cent per year from 1978 to 2010 (National Bureau of Statistics of China, 2018), has further aggravated the shortage: Chinese natural resources are not enough to meet China's growing energy needs and supply Chinese industry. Electricity consumption is closely linked with economic growth in China, and its level has been increasing by about 10% per year between 1991 and 2007 (Liu, Zhang and Girardin, 2014). Moreover, the share of heavy industry, such as steel and cement production, has grown continuously in China's economy during the past decade (Yang, 2012). Thus, the amounts of consumed commodities and energy have increased significantly to meet the growing needs of Chinese and exporters and households.

Investments in search of natural resources, despite being cost demanding, accounted for about 50% of Chinese outward FDI stocks in 2017 (CSIS, 2018). Investment projects in this field are generally large-scale because of high related costs and foreign TNCs competition. Large-scale investments are undertaken mostly by big and state-owned companies and aim for resource-rich countries of Africa, North and South America, The Middle East and other regions. Their purpose is to gain access to foreign reserves of oil, gas, iron, copper, aluminum and other resources for Chinese manufacturing. This type of investment is implemented mainly by acquisition of equities of foreign producer companies, or by conclusion of agreements for share holdings and mutual development (Deng, 2004; Jiang and Sinton, 2011). China's large-scale investments became possible mostly at the account of state support and improving access to capital. Besides, Chinese companies acquire or lease agricultural lands all over the world, including countries of Africa, Latin America and EAEU for logging, to access to water resources or production of wide range of agricultural goods, including grain, palm oil, sugar, tea and meat (von Braun and Meinzen-Dick, 2009). Most of these resources are transferred back to China to be used in industrial and energy production.

FDI may not only contribute to direct access to raw materials for the national economy. Acquiring ownership rights and guarantees in recipient countries may also provide for stability of the flow of these resources to China. Moreover, FDI neutralize volatility impact on the world commodity markets by providing direct access to resources as part of the long-term investment contracts.

Foreign projects in resource extraction do not necessarily provide that all acquired commodities are supplied back to China. FDI of this type also play an important part in external trading strategy making companies able to sell products of the affiliated companies on international market in case it is economically justified or their transfer to the national market is temporarily complicated (Chen, Ge and Lai, 2011). In such cases, oversupply contributes to lower commodity prices, that decreases import costs for Chinese nationals. On the other hand, in case of crisis or resource shortages large Chinese companies, especially owned by state, tend to give preference to Chinese buyers and guaranty the desirable volume of supply for them (Ma and Andrews-Speed, 2006).

Thus, Chinese investments in the area of extraction, exploration and production of resources improve access of the national industry to commodities, agricultural and other intermediate goods. This process supports and expands China's productive capacity regardless of international environment.

Trade Effects

The FDI trade effect lies in the positive influence of Chinese FDI on the volumes of its industrial production and employment through enhanced involvement in foreign trade. Chinese FDI to advanced economies expands markets for lower costs goods produced in China. Moreover, some Chinese FDI in search for natural resources or strategic assets in Africa, South-East Asia and other developing countries often involve related domestic industries in production abroad.

Export-oriented FDI are strategic and find wide support from the Chinese Government. The first reason for that is the necessity to extend business activity outside China due to stiff internal competition, glut in the local markets and excessive manufacturing capacity. According to UNCTAD research, 40% of Chinese companies believe that increase of production capacity inside the country is one of the main reasons for foreign economic expansion, while 36% of respondents note that they undertake FDI as a means to bypass trade barriers in third-country markets (UNCTAD. Division on Investment, Technology and Enterprise Development, 2016).

Export-oriented strategy and economic expansion of China in any case provoke protectionist reaction in many countries of the world. In this case FDI is often used by Chinese companies as an effective means for overcoming such barriers and expanding foreign markets to FDI recipients as well as third countries. Prominent examples of such FDI are demonstrated by known Chinese manufacturers of household electrical goods and electronics like "Haier", "TCL" or "Huawei Technology".

Nevertheless, the described trade effect can be negative if Chinese companies extend foreign investment activity at the cost of production on the territory of China. Because of fast growth of production costs, some Chinese companies may transfer production facilities abroad to the countries with lower labor costs. However, the negative impacts are mitigated in the long term. Thus, new innovative firms outplace ineffective Chinese enterprises while national companies together with their foreign subsidiaries become more integrated into in global value chains.

Conclusion

Findings about the effect of FDI on the donor economy are rather contradictory in modern economic literature. Nevertheless, several scientists mention that with respect to China FDI has mainly positive impact on its national economy due to the peculiarities of Chinese economic model.

There are 4 main effects of Chinese FDI on its economy: trading, financial, related to acquisition of tangible and intangible assets. Financial effect appears in receiving additional currency incomes from abroad by Chinese companies and gaining access to financing from abroad. Trading effect occurs in stimulating foreign trade and overcoming trade barriers when exporting to foreign countries. Access to natural and other resources necessary for development forms the effect of tangible assets acquisition. The effect of intangible assets acquisition displays through application of foreign knowledge and technologies for modernization of the national economy.

The author implies that cumulative effect of outward FDI is generated mostly by utilizing the results of Chinese TNCs' foreign activities on the national market. Chinese companies acquire tangible and intangible assets available abroad but scarce on China's internal market by undertaking FDI. Direct or indirect transfer of these assets to China leads to financial gains, builds up manufacturing capacity and leads to positive macroeconomic effects. Accumulated advantages in turn contribute to China's economic development through their operation on the national market. FDI implemented in accordance with China's strategic needs and addressing specific internal market issues play paramount role in the described process.

The Rationale for Building Up Stockpiles After The Coronavirus Threat in Poland

Justyna Izabela STOCHAJ,
Military University of Technology, Warsaw, Poland, justyna.stochaj@wat.edu.pl

Abstract

The paper presents the rationale for building up stockpiles after the coronavirus threat in Poland. It was divided into three main parts. First contains the concept of stockpiling and characteristics of dissemination and prevention of the risk of coronavirus. Second part is about consequences and problems of stockpiling after the declaration of an epidemiological emergency. Third part contains recommendations on the legitimacy of stockpiling.

Keywords: coronavirus, stockpiles, security.

Introduction

As of March 11, 2020, 31 cases of coronavirus were confirmed in Poland. While on the same day the World Health Organisation announced the outbreak of the pandemic, the Polish authorities decided to close down all educational establishments such as: nurseries, kindergartens, schools, universities for a period of two weeks (this period was extended). It was also decided to close down cinemas, museums and theatres. During the Prime Minister's press conference devoted to the announcement of information about the closure of these institutions, a question was asked by one of the reporters whether stockpiles should be collected in this situation and in what quantity? This is particularly important for those who are subject to a two-week quarantine period during which they cannot leave their homes. The Prime Minister's reply suggested that one should be sensible in the actions taken at that time and there is no need to make stockpiles (Prime Minister's press conference, 2020).

On the same day, the media reports that goods are disappearing from shop shelves. Especially those with a long shelf life, such as pasta, rice, groats, preserves. The shelves in some shops become empty. In the shops, on the other hand, crowds are gathering and long queues of people are queuing up to the cash registers. This article is dedicated to find an answer to the question: Is it reasonable to build up stockpiles in the event of an epidemic? This problem is related to the safety of the population and affects its survival. The prepared editorial has been mainly based on official government announcements and media reports. These data are often analysed in comparison with data from abroad, as well as against the data of international organisations. To assess the validity of stockpile collection, theoretical research methods such as: analytical-synthetic method, inference, comparison, abstraction were mainly used. The period from the 11th of March to the 1st of April was analysed, i.e. the time when people went to the shops most crowded to make supplies. In fact, at the end of this period, the situation with regard to overbooking was already settled.

Already after the first case of coronavirus infection in Poland, there were recommendations on some websites to build up a sufficient amount of stockpiles for 14 days. It was recommended to stock dry and easy to prepare products (rice, pasta, oatmeal, groats, canned food, chocolate, coffee, water), hygiene products (soap, hand disinfectants, toilet paper, wipes, pads, diapers, wet wipes), as well as in the case of people who take permanent stock of medicines (analgesics, antipyretics, for coughing, for stomach, electrolytes) (Coronavirus in Poland. What to buy for an epidemic in Poznań, 2020) (pol. Koronawirus w Polsce. Co kupić na wypadek epidemii w Poznaniu, 2020).

In practice, people went to the shops to make supplies. In Germany, for example, “the inhabitants buy paper towels, toilet paper, tinned food, pasta and flour in bulk (...). In many supermarkets these products are already gone on shelves. A similar trend can also be observed in Poland - antibacterial gels for

hands and masks, the price of which has increased dramatically in the last few days, have started to disappear from online shops at an exponential rate" (Krzymińska, 2020).

In this context, it should be stressed that the recommendation of Centers for Disease Control and Prevention did not include a recommendation on the need to build up stockpiles after the occurrence of coronavirus has been identified. Only for those who need additional precautions one of the recommendations is to stock up (Centers for Disease Control and Prevention, 2020). This means that people in full health are not recommended to stock up. They should be shopping as usual.

The concept of stockpiling and characteristics of dissemination and prevention of the risk of coronavirus

First of all, it should be noted that building up stockpiles has been defined as a technique to remain on standby (Keck, 2017, pp. 117-143) and as a security device (Amicelle A., Aradau C., Jeandesboz J., 2015, pp. 293-306). Stockpiling allows you to prepare for the future and contributes to minimizing the risk of insecurity in certain products and goods.

A brief overview of stockpiling can be presented as follows: "functions as a technology of preparedness because of its unique ontological features. By holding back resources, it freezes time, making it available for future use to bridge disruptions and buffer emergency situations. The temporality of the stockpile is not so much about the 'becoming' of matter that recent process philosophies stress. Rather, it is the effect of a particular moulding of matter that temporarily suspends this becoming in order to make a certain set of its potentialities available for the future. By arresting the processuality and eventfulness of matter, it harnesses the securing features of the stored materials. Stockpiling materializes anticipatory security politics since the stockpile is both an outcome of and a baseline for anticipations of potential threats. Its material persistence can stabilize or even enable expectations. Without ever being used in an actual emergency, it can have a securing effect" (Folkers, 2019, p. 505).

Nowadays, when we live in a changeable, complex and interdependent environment in the so-called global village, it is recommended to accumulate stocks in particular because of possible disturbances in their flows. „Multiple military and economic crises at the beginning of the 20th century challenged the liberal faith in the ability of dispersed private stores and the free circulation of goods to provide security of vital supplies. The liberal system of free-flowing circulations increasingly came to be regarded as a problem rather than a solution to the security and welfare of societies. The ever more intricate networks of progressively more global trade relations and the growing complexity of industrial societies created new bottlenecks in circulatory infrastructures and rendered disruptions of flows potentially disastrous" (Folkers, 2019, p. 498-499). When individual people stock up at home, a large proportion of the products will also be frozen, which means that an electrical energy-powered freezer is needed to maintain a negative temperature. Any interruption in the energy supply may therefore disrupt the stockpiling process and contribute to the spoilage of stored food that is unfit for consumption.

One of the reasons why people stockpile is because of other people's behaviour, and as a result, the thinking whether, if others buy it out, it will be enough of food for me later. This situation is perfectly illustrated by the statement of one of the clients: "I bought mostly meat. I'll freeze and pull out if necessary... I also took two packs of toilet paper, because I see there are only a few packs left" (Kasperska, Buczkowski, Szydłowski, 2020). If we observe in other people that they buy some specific kind of products, then we wonder whether we also should not buy this product. As a result, many consumers decide to buy something that they may not currently need.

The reasons for stockpiling in the face of coronavirus can also be identified as follows: „It can be for profit-seeking or loss avoidance purposes, and the goods may be meant for conventional consumption or unconventional use. Consumer stockpiling in the face of the COVID-19 pandemic can be viewed as unconventional inventory accumulation, mainly meant to minimize a perceived threat of loss or fear of going without" (Pan, Mantin, Dresner, 2020).

The spread of coronavirus is very easy and fast. „The human to the human spreading of the virus occurs due to close contact with an infected person, exposed to coughing, sneezing, respiratory droplets or aerosols. These aerosols can penetrate the human body (lungs) via inhalation through the nose or mouth" (Shereen M., Khan S., Kazmi A., Bashir N., Siddique R., 2020).

In the article by M. Nowak concerning the flattening of the disease curve, the author cites the results of A. Kucharski's research, according to which the spread of the virus consists of the following factors:

- "(duration) - that is how long a given person infects. Kucharski estimates that for coronavirus it is a week or two;
- (opportunities) - the number of contacts, during which the person who is infected could pass on the virus to other people;
- (transmission probability) - the chance that an infection will occur during such a contact (according to current data, the virus spreads up to 2 meters from the coughing person, on the surface - e.g. on a table, handle, etc. - can survive even a week);
- susceptibility - the likelihood that the person, who comes into contact with the ill patient, shall be infected and will start to infect other people" (Nowak, 2020).

People, by going to the shops en masse, particularly influenced the second factor, i.e. created opportunities to transmit the virus on to others.

Special precautions must be taken because the virus is spreading so easily. Selected recommendations for infection prevention include:

- „Frequently wash their hands with an alcohol-based hand rub or warm water and soap,
- Cover their mouth and nose with a flexed elbow or tissue when sneezing or coughing,
- Avoid close contact with anyone who has a fever or cough,
- Seek early medical help if they have a fever, cough and difficulty breathing, and share their travel history with healthcare providers,
- Avoid direct, unprotected contact with live animals and surfaces in contact with animals when visiting live markets in affected areas,
- Avoid eating raw or undercooked animal products and exercise care when handling raw meat, milk or animal organs to avoid cross-contamination with uncooked foods" (McCurry, 2020).

By referring these recommendations to the conditions under which you shop, one of the best ways to avoid infection is to keep an adequate distance and to cover your mouth and nose when someone coughs or sneezes. The first of these conditions cannot be met if the shops are overcrowded.

The World Health Organization has issued recommendations as to when to wear a protective mask:

- "If you are healthy, you only need to wear a mask if you are taking care of a person with suspected 2019-nCoV infection.
- Wear a mask if you are coughing or sneezing.
- Masks are effective only when used in combination with frequent hand-cleaning with alcohol-based hand rub or soap and water.
- If you wear a mask, then you must know how to use it and dispose of it properly" (World Health Organization, 2020).

It is pointed out that "there's no evidence that wearing masks on healthy people will protect them. They wear them incorrectly, and they can increase the risk of infection because they're touching their face more often" (Haelle, 2020). Exceptional circumstances are asymptomatic patients or people in the incubation period who do not yet have symptoms and who may infect other people. In such a situation, one way to reduce the risk of virus spread would be to wear a protective mask. However, given the large shortage of masks available on the market, a better way than to put on a mask, which is best left for people who really and surely need them, is to keep a social distance and to isolate as much as possible.

Consequences and problems of stockpiling after the declaration of an epidemiological emergency

Consideration should be given to the possible consequences for those who would fail to go to the store on 11 March and a few days after that date to make supplies. First of all, it should be noted that it is highly probable that most of the buyers had at least a minimum stockpile of food at home, which would most likely last several days. These people wouldn't be affected in any way. Other people who did not have enough food for a few days had to go shopping because they were threatened with a real lack of food. So they would not be able to secure their basic needs. However, if only these people would go to the shops at that time, there would be no excessive queues and crowds, so the risk of coronavirus infection would be much lower.

Secondly, consideration should be given to the situation where people who had a food supply for a few days did not go to the store to increase the amount of goods collected at home and then became ill (without hospitalisation) or quarantined. These people would not really have the opportunity to go shopping to make up for the shortfall. It was probably one of the reasons why people went shopping. Precisely because they were afraid that they might be sentenced to stay at home any moment. The argument of stockpiling in such a situation for fear of getting sick or being quarantined seems to be irrelevant. Those who did not have a chance to stockpile and were quarantined had the products necessary for survival delivered on an ongoing basis. This was most often courtesy of neighbours or close family members. Those who did not have the opportunity to benefit from their help could report the lack of specific products to the Municipal Social Welfare Centre (pol. MOPS Miejski Ośrodek Pomocy Społecznej).

Thirdly, it should be noted that people have been making stocks most likely for fear of being bought out by others and then not being available in shops for a long time. The Minister of Development Jadwiga Emilewicz reacted to the behaviour of the population during one of the press conferences: “She stressed that the government does not plan to close shops and retail outlets and cut off any large cities with a sanitary cordon. She pointed out that she had held talks with food producers and informed that the capacity is activated at the level of 80%. Food producers are ready to produce more if needed" (Press conference of ministers: Michał Dworczyk and Jadwiga Emilewicz of March 12, 2020). It is important to underline that the public's concerns in this respect have not proved to be true in terms of food and hygiene products. Some shops did indeed experience interruptions in the supply of this type of goods, but these were very short and did not disturb the normal functioning of the majority of the population. A major accessibility problem concerned medical products such as protective gloves and masks and disinfectants. These products were not available for several days in most stationary and online shops. On the other hand, the places where it was possible to buy them were much more expensive than the average. Which made it significantly more difficult for the average citizen to access these funds.

In this context, it should be stressed that no major problem has been identified at national level in terms of food stocks. But in terms of medical protection, yes. In various parts of the world there is a shortage of medical equipment, especially respirators. In Poland, for the time being, this problem has not been known about. However, we are only at the stage of development of the epidemic. Therefore, taking into account other countries, this problem may also occur in Poland. Admittedly, the authorities have taken steps to flatten the disease curve so that it is below the maximum level of health system capacity. Otherwise, there will be a significant reduction in places in Intensive Care Units (Nowak, 2020). However, more medical supplies should be built up for the future. The stockpiling system should not be based solely on accumulating large quantities of goods. The system should be rational. It can be presented as follows: “One lesson is that stockpiling is not just a matter of storing large quantities of supplies and equipment; it also requires considering the larger question of which dangers are most pressing to address” (Lakoff, 2020).

When assessing risks, people make the wrong decisions. The wrong actions resulting from an incorrect risk assessment are described by A. Bernstein. The author noted that people are usually not able to intuitively assess how dangerous a given situation is and, as a result, they take unreasonable actions

which increase the risk of spreading the threat. "Our focus on short-term risks has led to irrational decisions, like stockpiling of goods, that have nothing to do with stopping the spread of coronavirus, and can lead to shortages of necessary medical supplies, like face masks you don't actually need. We end up making decisions, both collectively and individually, that do not help "flatten the curve" but instead contribute to spreading the disease. A good example is hoarding toilet paper rather than practicing appropriate social distancing as recommended by public health officials" (Bernstein, 2020). The author indicates that one of the reasons for this state of affairs is the attention paid to a given event by the media. "Thanks to all that extra social media attention, the risks of coronavirus are at the forefront of our minds, creating a sense of urgency and panic that affects our ability to make rational decisions" (Bernstein, 2020).

A very large observed problem was the purchase of a large batch of goods by individual buyers. Such behaviour not only caused quarrels in the shop between consumers, but also had a real impact on making some products inaccessible to others. A very good example was the purchase of rice or pasta by several customers. It turned out that a few people had a stock for a very long time, and the rest could not do the basic shopping. A very similar situation also occurred with hand disinfectants. Buying these liquids by individuals caused that others had no chance to buy them. As a result, people who perhaps did not have an urgent need to use them, or simply did not need to use them in such large quantities had a stockpile, while others did not have this protection measure at all.

Protective masks and gloves have become in short supply and strongly desired by the population. They cannot be purchased either in stationary pharmacies or online shops. Around April, these goods began to be available again in some online shops, but in very limited quantities and at very high prices. For example, before the occurrence of coronavirus, the cost of a single protective mask was several dozen pennies. While at the moment you have to pay about 10 PLN for the same product.

Consumers should be aware and prepared for price increases in specific situations. "As retail stocks dwindle, prices rise for at least two reasons. Firstly, because lower-priced products are sold out, consumers must purchase higher-priced alternatives, also known as the product substitution effect. Secondly, sellers can capitalize on the imbalance of supply and demand and boost prices. Retailers may also hike prices because their suppliers have, thus driving up costs throughout the supply chain. Overall, under the stress from the coronavirus, scarcity of supply may induce consumers to pay higher prices" (Pan, Mantin, Dresner, 2020).

It should be borne in mind that, as stocks accumulate, there may also be problems related to rising storage fees and their overdue (Chen, 2017). Although this problem was outlined in the context of the establishment of a three-tier framework for the storage of personal protective equipment by the Taiwanese Centre for Disease Control, these problems can and should also be considered for ordinary citizens in Poland.

Large amounts of food are thrown away every day, so there is a high probability that tons of food will be bought this time too, and then will be in the basket. Although this risk is not high, due to the fact that the most frequently purchased stocks include dry and long shelf life products such as rice, groats, flour, canned food.

Nowadays, for many residents, especially in large cities, who have small flats there is a big problem of sleigh lack of storage space. This means that these people have limited opportunities to store food that they could use when needed.

A. Folkers proves, by citing data from the Federal Office of Civil Protection and Disaster Assistance in Germany, that the private sector is identifying a problem with supply chain disruptions and that reducing stockpiles is a threat to human safety. "Traditional distribution in food logistics operated via a multilevel distribution system with stores at each level down to the retailer. In recent years, this multilevel system has given way to a more centralized system, which 'causes the reduction of the amount of stored goods, since each warehouse obtained a security buffer to accommodate fluctuations in demand' (…). In addition, an increasing amount of stocks in the supply chains of contemporary food

logistics are frozen foods and therefore depend on functioning electricity supplies to ensure the integrity of the cold chain" (Folkers, 2019, s. 503).

Recommendations on the legitimacy of stockpiling

Recommendations for accumulating stockpiles have been issued by Federal Office of Civil Protection and Disaster Assistance in Germany. The Office has identified a list of necessary products that citizens should gather in order to survive for up to 10 days (Federal Office of Civil Protection and Disaster Assistance, 2020). These recommendations, on the other hand, were a response to the fact that the Germans went in large numbers to the shops to build up stockpiles. Anyway, recommendations of this type by this institution were not issued for the first time. A. Folkers wrote about it: "28 litres of water; 5.6 kg of grain, bread, potatoes, pasta and rice; 5.6 kg of vegetables and legumes; 3.6 kg of fruit and nuts; 3.7 kg of milk and dairy products; 2.1 kg of meat, fish and eggs; 0.5 kg of fats and oils. According to the emergency stockpile checklist issued by the German Federal Office of Civil Protection and Disaster Assistance (BBK, 2017b), this is the amount of food needed to survive a two-week food shortage" (Folkers, 2019, s. 493). In Poland, no recommendations have been made to accumulate stockpiles. The authorities ensured that the products were sufficient for all and called for rational and reasonable behaviour.

All citizens should have followed the calls for rational and reasonable behaviour. First of all, they should avoid crowds, and such were observed in shops. The problem that there is the lack of supply of food and medical and hygienic products for people who are ill or in quarantine can easily be resolved. Initially, people in quarantine had the opportunity to call the Municipal Social Welfare Centre to report shortages in food, hygiene and medical supplies. Around mid-March, an application called "Home Quarantine" was made available in Poland for people in quarantine, the purpose of which was to facilitate and streamline the implementation of the mandatory quarantine at home. Additionally, it has the feature to use the service to send a form with a request to the Municipal Social Welfare Centre. The reported demand may concern: a meal, groceries, psychological assistance and making a contact (Rules of application "Home Quarantine", 2020). Apart from the possibility to use the services of the Municipal Social Welfare Centre, it should also be emphasized that local communities are very much involved in helping their neighbours, especially the elderly, to make shopping. Initiatives from ordinary people have contributed to significantly reduce the problem of possible stockpile shortages. Therefore, the problem of a possible lack of access to articles necessary for survival should not be a concern and should not be an argument in favour of stockpiling when there is a high risk of being infected from other people. It should be recalled that at the beginning of March, the number of people confirmed to have COVID-19 was not high. As of 11 March, the number of confirmed cases of coronavirus infection was 31 people, the number of hospitalized people was 317, quarantined 1,193, and the number of people under epidemiological surveillance was 11,524 (Newsletter, 2020a). However, the number of people infected at that time may have been much higher. They could have been people who were in the incubation period. So all contacts with other people should have been limited at that time already.

On the 31st of March the Polish authorities imposed, among other things, restrictions on the number of people allowed to shop in shops, the minimum distance to be kept between people. Among other things, the following orders were imposed:

- the order to keep the limit of people staying in the shop - up to 3 people per 1 cash register. At marketplaces - 3 customers per 1 point of sale. In post offices - 2 people per 1 window,
- the order that shops and service outlets have to provide services from 10:00 a.m. to 12:00 p.m. to customers aged over 65 years only (during the remaining hours shops and service outlets are open to all customers, including seniors),
- the order to make shopping with disposable gloves,
- an order to maintain a distance of at least 2 metres between pedestrians. This order also applies to families and relatives (with the exception of children under 13 years of age and persons with disabilities or unable to move around on their own) (Regulation of the Council of Ministers of March 31, 2020 on establishing certain restrictions, orders and prohibitions in connection with the occurrence of a state of epidemic and Regulation of the Council of

Ministers of April 1, 2020 amending the Regulation on establishing certain restrictions, orders and prohibitions in connection with the occurrence of a state of epidemic).

These solutions should have been imposed on the 11th of March when educational institutions were closed, because then most people went to shops to do their shopping, i.e. at a time when they were very vulnerable to infection from other people, at a time when there were no orders to take safe behaviour.

Conclusion

If people felt co-responsible for others and did not look at different things from the perspective of securing their needs, there would be no problems associated with the lack of food products and medical and hygienic supplies. In a situation where a global pandemic has been declared and in Poland an epidemiological threat had to be avoided by not going to the shops and not making supplies. People, on the other hand, went to the shops in very large numbers and the effect was that they met in closed rooms in large quantities without keeping a safe distance. I assume that there will never be a situation in which people would act rationally, because the desire to satisfy their individual needs always prevails. Thus, on the 11th of March, when the educational establishments were closed, restrictions on the number of people allowed to enter the shop had to be introduced at the same time, and recommendations had to be made to keep an adequate distance from other people in public places, as decided by the government at the end of the month.

In response to the research problem posed in the editorial: Is it reasonable to build up stockpiles in the event of an epidemic? The answer is that such actions should not be considered as reasonable. It is therefore not recommended to build up stocks in an epidemiological emergency. It should be noted that the author does not identify with the statement that stockpiles should not be accumulated at all. Stockpiling is very prudent and allows you to prepare yourself, although to some extent, for the possibility of a possible threat. The above position is consistent with the position by A. Folkers The author wrote that “I will, however, argue that techniques of storing, retaining and accumulating things remain crucial security techniques not in spite of but because of the imperative to secure circulations” (Folkers, 2019, s. 493). The author takes the view that it was not wise to gather stocks in a situation when an epidemic emergency was declared and people went to the shops to shop to make stocks, without maintaining the principles of effective prevention of the spread of the virus. Shops were overcrowded, and people didn't keep the right distance. Which is likely to have contributed to the further development of the epidemic. As of the 31st of March, the number of confirmed SARS-CoV-2 cases was 2311, the same day the number of persons hospitalised was 1924, the number of persons quarantined was 171994 and the number of persons under epidemiological surveillance was 50804 (Newsletter, 2020b). In addition, most of the personal protective equipment was not available or was only available in limited quantities, as a result of which a large proportion of people were not wearing protective gloves.

It should be emphasized that by going to the shop in crowds after the 11th of March, people contributed to increasing the probability of coronavirus infection, which was the worst possible consequence.

Moreover, while gathering stocks, some people only took care of themselves by purchasing most of the goods, thus limiting or completely eliminating access to them for other people. Of course, some shops have taken preventive measures and have introduced limits on the purchase of individual products per customer.

Buying out products has also led to a significant increase in prices of those products which remained in shops or were available after replenishment. As a result, some goods had to be paid for several times more than usual.

The mass purchase of products such as protective masks has made them unavailable and sometimes difficult for those who actually had to buy them. As a result, a situation arose that the masks had people who did not need them, and access to them was lost to people who needed them, e.g. people with a cold.

Organisation of Transport Process on The Example of An Enterprise

Monika CHŁĄD

Częstochowa University of Technology, Poland
monika.chlad@wz.pcz.pl

Abstract

Nowadays, transport plays a very important role because it has a significant impact on the degree of communication of society, conditioning its development. The pace of development depends on the ability to move and communicate with other entities. The aim of the article is to present the basic issues related to the functioning of transport processes in the company. Analyse of selected transport areas in the enterprise and show how to make practical use of information on the existing transport processes in the company using selected research methods and tools that allows you to optimize the relevant processes.

Keywords: Transport, Transport Processes, Management of The Company

Introduction

Currently, transport and logistics are among the most important economic elements of the development of countries and regions, including enterprises. The market situation, as these developments in modern technologies contributed to the adoption of the concept, and the condition for profitability in the market is the undertaking of companies to take measures aimed at optimising and rationalizing all processes of their activities (Nowakowska-Grunt, Miciuła 2016). The way to achieve these goals is to implement logistics management, which improves the processes of product flow and storage, thus increasing their efficiency (Strzelczyk 2012). The importance of logistics is therefore reflected both in suppliers of goods and services and their buyers, which results in i.a. possibility to reduce the cost of supplying goods and services, increasing the speed of supply and increasing their quality (Zamkowska 2013).

With the onset of the industrial revolution, there was a radical change in the transport process, the era of mechanized transport began, then for the first time it was used for movement processes - machinery. Initially, they were steam-powered machines that over time turned into turbine-containing devices or a variety of internal combustion engines, electric, hybrid and other engines. New mechanisms appeared with the development of technology (Kabus, Strulak-Wójcikiewicz,Nurzyńska 2016). Thanks to this, humanity began to construct various devices to help transport. The most common and convenient means of transport have become cars, which have completely changed the way millions of people movement. The development of land transport has also had a significant impact on the routing of routes and transport routes. Today, transport is a very important aspect of the activities of various companies (Koch, Kdłubek 2015). Its main objective is the flow of goods necessary for the implementation of production plans, which affects many areas of functioning, i.e.. the quality of service and customer contact, the quality of products and services, as well as the time and level of costs incurred by the company.

The Essence of The Transport Process

Process is understood as following and causally related changes – actions (Twaróg 2016). The process is therefore a set of activities that convert the factors in the initial phase of the process into a result - baseline factors (Twaróg 2016). The transport process according to the literature is understood as a set of organizational, executive and administrative activities carried out in a certain order in connection with the movement of cargo by means of transport (Goździewska 2012). In the subject literature there

are also other definitions of the transport process, the meaning of which is the same as the definition set out above. One of them defines the transport process as a series of coordinated enforcement, organisational and commercial activities to bring cargo from one or more points of delivery to one or more pick-up points, as efficiently as possible by means of transport (Zguta 2015). Transport process can be defined as a string of specific tasks interrelated to each other, as a result of which a particular goods will be delivered to the designated consignee (Starkowski 2017).

Ms Kauf in the work Transport and Storage defined the transport process as a team of coordinated activities related to the temporary spatial transformation of products and information, in accordance with the terms of the contract between the carrier and the customer (Kauf 2016). The transport process consists of three stages – loading, proper transport and unloading, taking into account the complexity of the transport process, these stages may be extended by additional processes, which include: preparation of cargo for carriage, storage, acceptance of goods together with its transhipment also by other means of transport or forwarding services activities (Goździewska 2012). Organisational, executive and commercial activities are the three main activities that make up the transport process. Organizational activities consist in the development of an appropriate route of transport and preparation of the necessary transport documentation(Rydzkowski, Wojewódzki-Król 2010). Enforcement activities include the carriage of goods and additional processes related thereto such as loading and unloading. Each of these processes can be increased by a number of operations related to the type of load, the length of the route, etc.

Transport is a specific category of service activity consisting in the movement of persons and goods from point A to point B, it also provides additional logistics, forwarding, customs services requiring adequate means to form a transport system, which includes (Bujak, Topolska 2018):

- means of transport,
- transport infrastructure,
- human resources,
- rules and rules for the provision of transport services.

The management of transport processes is designed to meet the requirements of customers in the "9W" rule, which is distinguished by the following characteristics (Kubicki, Kuriata 2000):

- the right goods,
- the right quality,
- the correct quantity,
- appropriate packaging,
- the right way,
- the right place of delivery,
- the correct delivery time,
- the correct person (consignee), the correct cost (delivery).

Any company that would like to provide services at the highest possible quality level should take logistical action on behalf of the client during the planning process taking into account the above assumptions (Zamkowska 2013). The person responsible for the carriage must ensure that the cargo is properly prepared for shipment, select the appropriate means of transport, loading, carriage, unloading. That person must perform or assign a number of steps related to these processes. The transport process can be divided into the following stages (Starkowski 2017):

- planning a process related to the shipment of the goods,
- preparation of the cargo for transport,
- organising the process of moving the goods,
- physically moving the goods,
- legal and financial elements of the transport operation,
- analysis of the costs and quality of the transport process.

Proper planning of transport operations is the main element of the proper execution of the transport order by the transport undertaking.

Characteristics of Transport Processes in The Enterprise

The transport of the goods is related to a number of activities to be carried out so that the transport time and its quality are at the highest level. The transport of goods is carried out by the transport company, but in accordance with Article 43 of the Transport Law is the responsibility of the consignor or consignee and it is their responsibility to arrange the consignment in accordance with the applicable traffic regulations, in such a way as not to endanger safety and taking into account the permissible weight of the vehicle and axle pressure. The weight of the material transported shall be adapted to the maximum permissible loading weight of the vehicle used for this purpose (Dz.U. 2020.0.8 i.e.) . Most often, this part of the transport process is dealt with by the sender of the goods, but sometimes, as part of the order, this obligation falls on the carrier. This is most often true for paper transport or tires. Multi-sized loads prepare the payers themselves for the cargo.

In examining the enterprise, it was noted that the company decided to increase its scale of operation by carrying out more transport orders, which caused the number of orders served to increase by 20% per month. This state of affairs caused problems with the punctuality of cargo delivery, resulting in a 13% increase in complaints. It was decided to use quality management tools to determine the causes of the problem - 5 why analysis and fish diagram. 5 why analysis is a method that allows you to find the cause of the problem based on a series of questions that allow you to investigate the causal- effect alcompounds that relate to a particular problem. It consists of five stages. The first stage is the establishment of a working group. The second step is to identify and identify the problem. The third step is the location of the area where the causes may be located. The next step is to task and get an answer to the question "why?" (Kowalska, October 2015). The final step is the analysis and evaluation of the responses, below are the results obtained:

Figure 1: Analysis of the "5 why" of the problem being investigated.
(Own development based on company observations))

As the 5 why analysis shows the main reason for the increase in the level of complaints related to the increase in the scale of the organization is the lack of adaptation to a large number of orders supported. During the meeting, team members pointed out that this is a clear problem because the current order management takes place on the principle of keeping the worksheet in excel. A large number of data causes very often drivers to get an inefficient delivery route plan for executed orders over a given period of time, resulting in drivers often running to one area several times, thereby causing delays in delivery, and increase the organization's operating costs.

To present a wide range of problems that affect job execution delays, it was also decided to perform an analysis using the Ishikawa Diagram. Ishikawa Diagram is a cause-and-effect diagram, which is a tool for graphically illustrating the root causes of phenomena that generate a problem. This tool has allowed you to see a real picture of the problems that occur at different levels in your organization.

Figure 2: Ishikawa diagram showing analysis of the problem being investigated
(Own development based on company observations)

According to the above analysis, there are more problems in the company that affect the increased number of complaints. Team members identified a number of problems, such as a high staff turnover and, consequently, a lack or inefficient training of management. It has again been pointed out that the lack of a proper system for comprehensive order management is a big problem, which affects the supervision of the car fleet. Team members also pointed out that very often cars crash, and the waiting time for repair is quite significantly increased, which negatively affects the timeliness of deliveries. This study has allowed for the identification of areas to be analysed in depth and measures to be proposed to improve the implementation of the transport process

For a detailed analysis, it was decided to use the SMED method to parameterize the implementation of the transport process. SMED (Single Minute Exchange of Die)is a method that allows you to comprehensively shorten the retool times of machines and processes as it turned out also transport processes (Moreira,Pais 2011). It allows you to achieve results in a very fast time, without having to bear a heavy financial burden. It consists of three stages. The first step is to split the operation. The second stage is observation and analysis,trzecim stage is the implementation of changes (Shingo 1985). Time measurements were performed by logistics when handling 2 transport orders on different days. The following are the results of the measurements obtained:

Table 1: Measurement results obtained during the first transport order (Own development on the basis of internal materials ofthe company)

TIME MEASUREMENT SHEET				
Change	1	**Order number**	2345987	
Data	17.01.2019	**Order type**	Recursive

1. Preparatory steps	**06:00**	**10:30**	166	
Enter orders in the registry	06:00	07:18	78	
Setting a daily delivery schedule	07:18	08:15	53	
Forwarding the timetable to the implementation	08:15	08:31	16	
Preparation of transport kits	08:31	08:50	19	No belts and tensioners available (waiting for delivery from storage)
2. Execution of a transport order	**08:50**	**14:20**	330	
Getting to the customer	08:50	09:30	40	20 min refueling
Waiting for loading	09:30	09:40	10	
Loading	09:40	10:00	20	
Transport security	10:00	10:08	8	
Waiting for documents to be issued	10:08	10:30	22	
Transport to target customer	10:30	14:20	230	170 min failure (overheated coolant)
3. Completion of the transport order	**14:20**	**12:20**	85	
Waiting for unloading	14:20	15:00	40	30 min extra wait for late
Unloading	15:00	15:30	30	
Waiting for documents to be issued	15:30	15:40	10	
Close an order	15:40	15:45	5	

Table 4: Sum of times and percentage of individual transport processes obtained during the second transport order (Own development on the basis of internal materials of the company)

Operations	Time [min]	Share [%]
Preparatory steps	166	29
Execution of a transport order	330	57
Completion of the transport order	85	14
Total order lead time	581	100

In both cases, the preparatory work took a similar amount of time of about 160 minutes. It has been clearly observed that the lead time was radically different due to the occurrence of a failure during transport. In both cases, there was a failure, in the first it lasted 25 minutes. This also affected longer waiting times for unloading, and therefore the delay and waste of time has deepened. During the measurements, a number of irregularities were observed which significantly affect the efficiency of the execution of orders, i.e. :

- waiting for information from traders if the order is incomplete or inconsistent,
- refueling of the car ,
- car failure,
- waiting in line for unloading as a result of a significant delay.

In order to reduce the waiting time for orders to be entered into the system and waiting for the creation of a daily supply plan, it was decided to purchase a system for comprehensive management of the transport company. The software is to be comprehensive and be able to remotely enter orders into the system, automatically generate the daily delivery plan based on the most optimal routes. An additional but priority guideline is the possibility of comprehensive management of the fleet. The system is expected to contain information about drivers, running, vehicle condition, current order, combustion level, breakdowns, delays. It is very important that the system must have an advanced GPS system that will set effective routes on an ongoing basis and inform about delays. Completing these tasks will eliminate time waste and unnecessary operating costs. To avoid time losses associated with car failure, it is recommended to introduce prevention in SUR (Maintenance Service). Every day according to the schedule, mechanics are required to perform car fleet inspections and repairs. Such actions will minimize the loss of car failure that is on the road, which is very expensive and causes a lot of problems. Previous failure detection will allow you to respond faster. It has been diagnosed that there is no emergency response instruction in the organisation, when cars are missing as a result of accidents or accidents, resulting in delays in the execution of orders and, at worst, their resignations, adversely affecting the company's image. The created instruction will clearly and clearly inform who, what and when it must perform to maintain continuity of supply. In order to protect your organization from various random events, i.e. lack of available fleet in the event of accidents or accidents, it was decided in relation to point 7 to establish partnership cooperation with the transport company for the occasional execution of orders in the event of various random situations. Doing so will allow the continuity of the execution of orders, and at the same time will allow the company to succeed. Thanks to the rapid flow of information, the problem with transport delays has been minimized. This is evidenced by the fact that in February 2019 there was a decrease in complaints related to too long transport time by 8 percent, which makes it possible to conclude that the change carried out has had an effect.

To see how much the changes affected the execution of orders in March 2019, smed analysis was re-examined, below the results obtained.

Table 5: Measurement results obtained during the transport order after the changes (Own development on the basis of internal materials of the company)

TIME MEASUREMENT SHEET				
Change	1	**Order number**	2609584	
Data	02.03.2019	**Order type**	Recursive	
Operation	Transport	**Driver number**	1298	
Work item name	**Starting point**	**End point**	**Value expressed in minutes**	**Additional notes (non-recurring operations)**
1. Preparatory steps	**06:00**	**06:32**	42	
Enter orders in the registry	06:00	06:05	5	
Setting a daily delivery schedule	06:05	06:10	5	report automatically generated by the system
Forwarding the timetable to the implementation	06:10	06:12	2	report sent automatically by the system
Preparation of transport kits	06:12	06:32	30	
2. Execution of a transport order	**06:32**	**08:30**	118	
Getting to the customer	06:32	07:00	28	
Waiting for loading	07:00	07:10	10	
Loading	07:10	07:30	20	
Transport security	07:30	07:40	10	
Waiting for documents to be issued	07:40	07:50	10	
Transport to target customer	07:50	08:30	40	10 min accident (no alternative route - system alert)
3. Completion of the transport order	**08:30**	**09:16**	46	
Waiting for unloading	08:30	08:40	10	30 min extra wait for late
Unloading	08:40	09:00	20	
Waiting for documents to be issued	09:00	09:15	15	
Close an order	09:15	09:16	1	

Table 6: Sum of times and percentage of individual transport processes obtained during the transport order after the changes (Own development on the basis of internal materials of *the company)*

Operations	**Time [min]**	**Share [%]**
Preparatory steps	42	20
Execution of a transport order	118	57
Completion of the transport order	46	23
Total order lead time	206	100

According to the SMED analysis, after the implementation of the changes, the lead time of orders decreased by about 45% which is an excellent result for the company. The greatest time savings were achieved during preparatory activities where time decreased by 120 minutes thanks to the use of an IT system to manage an organisation which itself automatically based on the data entered schedule and selects the most efficient routes in real mode. The second very important process that, thanks to optimization, brought the greatest time savings was the operation of the execution of the transport order. Thanks to the introduction of fleet supervision through a special IT system and the implementation of daily Trucks TPM, there was a decrease of more than 80% as evidenced by faster delivery times by more than 200 minutes. This state of affairs allowed the research problem to be resolved, as the level of complaints decreased by 8 percent. Thanks to this, the company can develop in the market of transport services. Through the implemented changes, the company recorded significant revenue increases for executed orders. By eliminating losses, the cost of executing one transport order decreased by 30% (less fuel consumption, no penalties for delays, less operational effort of vehicles).

Summary

The transport process is an important link in the logistics chain, connecting customers of companies, suppliers and distribution channel entities. It is a chain of complex executive, organisational and commercial activities. Its purpose is to move the load or people from one or more points of delivery toone or more pick-up points, using the right means oftransport. There is no doubt that transport in a transport undertaking plays an important role in the performance of the basic objective. The formulation of the transport task well formulated is a condition for the undertaking to function smoothly and is the basis for the correct designation of the necessary number of transport measures carrying out the tasks of moving the goods of the undertaking. An important aspect of all activities related to the planning of transport processes in the enterprise is the correct identification of cargo streams, as well as information streams. This ensures that technical, technological and organisational solutions are properly integrated, which makes the implementation of transport processes at a high level.

Abstract
The article substantiates the necessity of using digital technologies in industry. The directions of implementing the concept of the industrial revolution "Industry 4.0" are identified, where the main are Big Data, internet of things, robotics, digital twins, "smart" materials, 3D printing and a distributed registry (blockchain). Based on an analysis of the literature on digital transformation of business, trends in digital transformation in general for industrial enterprises and for enterprises of the fuel and energy complex of the Russian Federation are revealed. It has been established that the Internet of things is the most popular type of digital technology in the energy industry. This is primarily due to the fact that the energy system has traditionally been built around the technological principle of reliability and Smart Grid technologies, which are related to IoT elements and can significantly increase reliability. In addition to improving reliability, IoT technologies can reduce the number of network crashes by providing timely information about abnormal equipment operating conditions and timely preventive repairs. At the same time, the benefits from the digital transformation of the business will be received not only by the energy company itself, but also by other counterparties involved in the generation, distribution and consumption of electricity.

Keywords: Digital Transformation, Digital Technologies, Internet of Things, Fuel and Energy Complex of The Russian Federation, Energy Enterprises.

Introduction

At present everyone recognizes the enormous opportunities for business development through the introduction of digital technologies. Digital technologies contribute to the promotion of new business models, sustainable and efficient use of limited resources, and economical as well as environmentally friendly production of goods. The widespread use of digital technology in almost all areas of socio-economic processes is commonly called the "Industry 4.0".

If we look into history, the transition to mechanized production was carried out more than 200 years ago and radically changed the world forming new industries and ensuring the acceleration of technological development. Since then, four industrial revolutions have taken place in the world, including the designated Industry 4.0. The first revolution, Industry 1.0, is the transition from manual labor to machine labor, the emergence of factory production, and the spread of a steam engine.

"Industry 2.0" was marked by the creation of conveyor production and electrification. Industry 3.0 arose with the development of electronics, the advent of computers, and the success of automation.

The "Industry 4.0" concept was introduced after the international industrial exhibition in Hanover in 2011. Formally, the Fourth Industrial Revolution was one of the ten priority areas in the framework of the state high-tech strategy of Germany until 2020. "Industry 4.0" is a transition to a fully automated digital production controlled by intelligent systems in real time in constant interaction with the external environment, going beyond the boundaries of one enterprise, with the prospect of unification into a global the Industrial Internet of Things. If in the context of "Industry 3.0" we were talking about fragmented automation of individual stages or productions, in the case of the Fourth Revolution, in essence, an online-controlled enterprise is supposed. Some of the technologies that underlie Industry 4.0 began to develop and be introduced in the early 2000s. Today, digitalization is almost synonymous with competitiveness and opens up access to the markets of the future. Digitalization allows you to manage more complex production systems, contributing to the use and development of a wide range of new technologies.

The key technology areas of "Industry 4.0" in industry are:

1. Big data - tools and methods for organizing, storing, processing, working and performing calculations with huge data arrays. This includes areas such as machine learning and artificial intelligence.
2. Industrial Internet of Things (IoT) - a system of integrated computer networks and connected physical objects (things) with built-in sensors and software for collecting and exchanging data, with the possibility of remote monitoring and control in an automated mode.
3. Robotization (including unmanned aerial vehicles) that help automate processes, perform hazardous work, and conduct visual or "tactile" studies of hard-to-reach objects.
4. Digital twins (including visualization) - mathematical models of physical objects are not limited only to the collection of data obtained at the stage of product development or manufacturing, supplemented by data obtained throughout the entire product life cycle. The Digital Twin also significantly expands the capabilities of cloud-based analytics services used in the Industrial Internet of Things (IoT) concept of the fourth industrial revolution.
5. Smart materials (including nanocoatings and smart liquids) - a class of materials with different state of aggregation that retain or acquire specified physical and chemical characteristics when changing external conditions, up to extreme conditions.
6. 3D printing - a technology that allows you to create real, physical objects from a digital model.
7. Distributed registry (blockchain) - a decentralized application for general use, which allows you to keep records and provides a high level of system security.

Existing Literature

An analysis of the literature on the problems of digital transformation of industry in the Russian Federation led to the conclusion that most enterprises use the following digital technologies:

1. Widespread introduction of modern highly intelligent systems for the collection, processing and analysis of information on the state of technological processes (Industrial Internet of Things) (Levina, A.I., Dubgorn and A.S., Iliashenko, O.Y. (2018)).
2. Intensive implementation of robotic technologies - reducing the role of the human factor (Kose, T. and Sakata, I. (2018), Zaychenko, I., Smirnova, A. and Borremans, A.(2018)).
3. Implementation of cloud service technologies to ensure integration into global monitoring and control networks (Cloud services (Russian market)), (Ilin, I.V., Iliashenko, O.Yu., Borremans, (2018)).
4. Providing access to online information on the state of energy facilities in specialized organizations for the purpose of operational control and monitoring (Davidenko L.M. (2019), Lepekhin, A., Borremans, A. and Iliashenko, O. (2018)).

5. Implementation of technology for working with "Big data" for more accurate analysis and forecasting in the field of management and security (Ilin, I.V. et al. (2018), Klimin, A.I. et al (2018).
6. The transition from paper to digital media, updating technical and technological documentation, their archiving and backup, the introduction of digital signatures (Information security).
7. Transition to digital technologies in the development, design of energy complex facilities, the introduction of digital lifecycle management systems for energy complex facilities (Bauer V.P., Silvestrov S.N. and Baryshnikov P. Yu. (2019), Nekhorosheva L.N. (2019), Zharov, V.S., and Kozlov, A.V. (2018)).

A significant part of the theoretical and practical aspects of sustainable development of enterprises of the fuel and energy complex of the Russian Federation in the era of development of Industry 4.0 remains insufficiently studied. Despite the fact that as part of the development of the fuel and energy complex of the Russian Federation, a number of regulatory documents have been adopted (Decree of the Government of the Russian Federation of November 31, 2009 No. 1225 "On requirements for regional and municipal programs in the field of energy conservation and energy efficiency", Decree of the Government of the Russian Federation of December 01, 2009 No. 1830-p. "On approval of the action plan for energy conservation and energy efficiency in the Russian Federation", Decree of the Government of the Russian Federation of March 2, 2019 No. 234 "On the system for managing the implementation of the national program "Digital Economy of the Russian Federation", Decree of the President of the Russian Federation of 05.07.2018 No. 204 "On national goals and strategic objectives of the development of the Russian Federation for the period until 2024", Decree of the President of the Russian Federation of 05.09.2017 No. 203 "On the Strategy for the Formation of an Information Community in the Russian Federation for 2017-2030", Federal Law of November 23, 2009 N 261-ФЗ (as amended on July 26, 2019) "On Energy Saving and on Improving Energy Efficiency and on Amending Certain Legislative Acts of the Russian Federation", Federal State Statistics Service.), they are declarative in nature and do not provide the creation of a legal framework for the regulation and use of modern digital technologies at enterprises of the fuel and energy sector of the Russian Federation.

Only the qualitatively new fuel and energy complex of the country can meet the requirements of the new time which is both financially stable and cost-effective, as well as dynamically developing, meeting environmental standards and equipped with advanced technologies and highly qualified personnel.

In the era of digitalization of all socio-economic processes, energy companies are also actively introducing IT-technologies. This is evidenced by the analysis of the annual reports of the leading enterprises of the fuel and energy sector of the Russian Federation. The types of digital technologies used by energy are presented in table 1.

Table 1: Implementation of digital technologies by Russian energy companies

Business name	Digital technologies that have been introduced
PJSC "Rosneft Oil Com Company" (Consolidated financial statements of Rosneft)	• Cloud computing model. • "Intelligent field". • "Smart well".
PJSC "Gazprom" (GAZPROM PJSC Policy in the Field of Energy Efficiency and Energy Saving)	• Engineering centers (VNIIGaz, Tyumen NIPI Giprogaz, etc.). • "Intelligent field".
PJSC "Rosseti" (PJSC FGC UES (Rosseti FGC UES)	• Devices of intellectual metering. • "Smart networks". • Digital substations.
PJSC "LUKOIL" (Synergy of achievements and responsibility // report on activities in the field of	• Modeling based on Big Data. • Center for spatial visualization. • "Intelligent field". • "Smart well".

sustainable development of the Lukoil Group for 2018)	
PJSC "Gazprom Neft" (Energy Saving and Energy Efficiency // Gazprom Neft)	• Analysis of geological information Geomate. • "Digital double" refinery. • "Smart well". • Automated control center. • Introduction of industrial Internet.
PJSC "T Plus" (Energy Saving // T Plus Group)	• Software package for building energy modes.
PJSC "Tatneft" (Innovation // RITEK LLC)	• Engineering Center. • "Smart well".
"SUEK" JSC (Integrated Report 2018 // SUEK Group)	• "Intelligent quarry". • A set of intelligent systems to ensure work safety.
"RITEK" LLC (Innovation // RITEK LLC)	• Digital system for predicting the state of the equipment of gas power plants.

Based on the analysis of the data presented in table 1 we can conclude that the Internet of goods is the most popular type of digital technology in the energy industry. This is primarily due to the fact that the energy system has traditionally been built around the technological principle of reliability and Smart Grid technologies, which are related to IoT elements can significantly increase reliability.

In addition to improving reliability, IoT technologies can reduce the number of network crashes by providing timely information about abnormal equipment operating conditions and timely preventive repairs. For example, remote monitoring of the oil sensor in the transformer will allow you to notice a leak in a timely manner, prevent overheating and possible failure of the transformer and, probably, even a fire in the substation.

In the generation of the Internet of things, it will increase efficiency in the work of equipping the most important station nodes with diagnostic systems. It is worth noting that most of the modern equipment of the stations is already equipped with built-in telemetry systems and, of course, automation. And automated process control systems are also an integral part of the life support system of generating facilities.

However, a reasonable retrofit of generating facilities and the linking of "new" and "old" data in one system, for example, Supervisory Contro And Data Acquisition (SCADA), that is a software product designed to develop or provide real-time operation of collection, processing systems, displaying and archiving information about the object of monitoring or control.) – and that is what the leading companies in Russia are currently engaged into. Such systems are installed by JSC Inter RAO-Electric Power Plants, Unipro PJSC, Fortum PJSC, Rosenergoatom Concern JSC, Gazpromenergoholding LLC and others (JSC Concern Rosenergoatom, JSC Inter RAO-Electric Power Plants, LLC "Gazpromenergoholding" PJSC Unipro, PJSC Fortum).

At power plants, IoT systems also allow you to receive information about the operation of equipment in real time and make timely decisions on its repair. This technology helps optimize the shutdown times of generating equipment and minimize the risk of accidents. Taking into account the existing regulatory framework, the equipment will be repaired according to the regulations in the foreseeable future. However, at the same time, IoT in the electric power industry makes it possible to understand not the routine, but the real state of the equipment, the parameters of its operation after a scheduled repair.

When used correctly, IoT can help focus operational staff on key functions rather than routine work and, where possible, optimize the number of employees. Considering that more than 700 thousand people work in the electric power industry, their payroll is about 50 billion rubles (Federal State Statistics Service, The Ministry of Energy of the Russian Federation), we can talk about considerable reserves of productivity. The fact is that IoT covers not only "goods", but also employees. And «armed» with knowledge staff can do their job more efficiently.

In the generation, we can talk about simple systems in the form of personal tablets for shift workers in station workshops. However, even these devices can:

- free staff from unnecessary routine work on filling out paper forms;
- control the work of crawlers;
- minimize the influence of the human error factor due to the standardization of the process of filling out forms;
- give an instant hint to the staff about the condition of the devices by downloading retrospective data on the operation of the equipment, which the employee is currently taking readings with a forecast of the device's functioning in the future;
- transmit information in real time to the shift supervisor on the central control desk.

The economic factor is no less important than improving reliability. Due to the high cost of electricity services, in some cases the consumer is ready to reduce consumption himself in order to save. For power grid companies, cost reduction is also an extremely important task. On the one hand, the network component accounts for 67% of the price of electricity for households and about 40% for industry. On the other hand, regulators are increasingly demanding tariff reductions and the associated costs of network companies. Costs can be reduced by improving the observability of network objects.

Understanding the status of substations, power lines, insulators and other network elements will reduce the following cost components:

1. *Repair.* Currently, repairs are being carried out according to technical regulations. In particular, overhaul of lines should be carried out on average once every 12 years. The transition from routine repairs to repairs by state will save more than 8 billion rubles until 2030 (Concept Digital transformation 2030) by managing the sequence of repairs and extending the life of the equipment.
2. *Operation.* To take basic readings from network objects, it is necessary to make rounds and inspections of equipment. For example, to examine a transformer, you need a high-voltage laboratory, which checks the transformer every six months, and the oil used in it for cooling is handed over to the laboratory for examination. Inspections of lines and substations are also carried out by specialists personally. In addition, the manual method often searches for damage in the event of a line outage. Obtaining accurate data using IoT remotely and in a mode close to real will significantly save the time needed to analyze and fix problems, therefore, the associated costs.
3. *Losses*. The size of technological and commercial losses in the networks is quite high and amounts to an average of 9.22%, that is about 60 billion rubles annually (Central Dispatch Department of the fuel and energy complex). Only bringing the level of losses through improved network control will save up to 40 billion rubles a year. At the same time, the solution to the problem of reducing commercial losses may accelerate. So, from the middle of 2018 in Russia, in order to introduce Smart Metering technology, it is planned to legislatively ban territorial network organizations to upgrade old metering devices.

In addition, IoT will increase the resource and throughput (used capacity) of existing assets. This is due to the fact that in modern conditions the development of networks is limited not only by capital intensity, but also by geopolitical (in regions with a high population density there is nowhere to build new networks), climatic (in summer throughput is less given the greater sagging of wires), as well as the legal (according to existing regulations, loading lines and production systems is possible only at a certain level).

In generation, an analysis of optimal operating modes using IoT technologies reduces the amount of excessively burned fuel, which in some cases accounts for more than half of all plant operating expenses. In Russia, the electric power industry consumes about 115-120 million tons of coal and about 200 billion cubic meters of gas annually, which in monetary terms exceeds 1 trillion rubles (Central Dispatch Department of the fuel and energy complex). Even a small percentage of saving these costs

by generating companies in Russia can bring tens of billions of rubles a year to the industry and economy.

At the same time, reliable communication between the consumer and the manufacturer will allow the most efficient loading of production facilities. Today, according to industry representatives, trading in the wholesale market is «impersonal», and in a number of regions the most efficient stations operate half-heartedly while much less efficient capacities in the neighboring region are fully loaded.

At the moment, the most promising technology to solve this problem is the introduction of distributed energy technology. A wide range of technologies is ranked among the technologies of distributed energy (distributed energy resources (DER)) in the world practices, including:

- distributed generation;
- demand management (demand response);
- energy efficiency management;
- microgrids;
- distributed power storage systems;
- electric cars.

The basic property of all these technologies is its proximity to the energy consumer. Distributed generation is a set of power plants located close to the place of energy consumption and connected either directly to the consumer or to the distribution electric network (if there are several consumers). The type of source of primary energy used by the station (for example, renewable energy), as well as the affiliation of the station to the consumer, the generating or grid company, or to a third party. It is the implementation of the capabilities of IoT, Big Data and DER cloud services that will significantly increase both the efficiency of local distribution energy networks in terms of optimizing the producer-consumer path, and increase the environmental friendliness of energy-generating capacities by involving generation through renewable energy sources (solar, wind, geothermal and tidal energy).

Results

Thus, as a result of the study, it can be unequivocally stated that the active use of digital technologies by energy enterprises significantly increases the efficiency of their activities. As a result of the analysis of the use of digital technologies by leading enterprises of the fuel and energy complex of the Russian Federation, it was found that it is possible to maximize the efficiency of doing business in the digital economy within the energy industry using the Internet of goods. At the same time, the benefits of the digital transformation of the business will be received not only by the energy company itself, but also by other counterparties involved in the process of generation-distribution-consumption in the resource market (Figure 1).

It is important to understand that the digitalization processes of networks, generation and the consumer sector should go in parallel. A «smart network» without a «smart consumer» will not work.
Thus, the key areas in all components of the electric power system of the Russian Federation, which will be affected by the implementation of IoT, are:

- technologies, including their reliability;
- profitability, including cost reduction;
- the emergence of new markets, the creation of new properties and businesses.

The economic effect that the introduction of digital technologies in general, and the Internet of goods in particular, can bring about 532 billion rubles (Federal State Statistics Service).

Fig. 1: Benefits from the implementation of the Internet of goods in the activities of enterprises of fuel and energy enterprises of the Russian Federation

Conclusion

In the course of this study, a number of annual reports of the leading energy enterprises of Russia were analyzed and it was concluded that in the future all three links of the electric power industry - generators, networks and consumers - should become «smart». The deep integration of all market participants, to which IoT technologies lead will make it possible to transform the electric power system of the Russian Federation and give it a modern look. The hierarchical system "production - transmission - sales" is being replaced, in which all procedures are strictly defined by regulations, coordination is achieved through state regulation, and participants learn about each other's actions from the news, a flexible system of productive interaction in real time will come. Each element of the system will "see" other elements, understand their capabilities and needs and use their potential to the maximum.

The introduction of digital technologies in the activities of the enterprises of the fuel and energy complex of the Russian Federation will allow reaching a fundamentally new level of reliability and efficiency in the operation of the entire energy system of the Russian Federation.

Abstract

At the present stage of modern technologies development, many companies are focusing on using end-to-end digital technologies (Internet of things, blockchain, big data, machine learning, etc.) to implement their IT strategy. Digitalization is changing the way business is conducted as part of the production of an end product or service based on the use of Internet of Things (IoT) technologies, intensive data exchange and analytical systems. However, the technological application of end-to-end digital technologies alone is not enough. To profit from digitalization, it is necessary to introduce innovative business models, for example, the transition to business models with advanced services. Medical organizations are no exception. The main problems in the digital transformation of medical organizations are the company's unpreparedness for organizational changes, as well as an insufficiently well-developed IT strategy and business model that should precede the start of the implementation of digital projects. Reforming the activities of medical organizations, caused by the need to introduce end-to-end digital technologies, requires analysis and reengineering of the business process system and the formation of the company's IT strategy. To solve these problems, it is necessary to form a reference model of the IT architecture of a medical organization. The methodological basis of the study is an analysis of the literature on the research problem, generalization and systematization of data, and an architectural approach. The result is the construction of a reference model of the IT architecture of a medical organization, taking into account modern digital technologies.

Keywords: IT-architecture, reference digital model, medical organization, digital transformation

Introduction

The digital economy is positioned as a "system of economic, social and cultural relations based on the use of digital information and communication technologies"[1]. Countries that are world economic

leaders are actively using digital technology to increase productivity and efficiency of the economy as a whole and individual enterprises. Digitalization is becoming an integral part of all processes of social life. The digital economy, being the basis of the fourth industrial revolution, determines a change in basic technologies and, as a result, a change in the technical and economic paradigm.

Gradually, digital technologies become a reality in the economies of countries, everyday life, in various spheres of economic activity, in international relations (examples are in the studies of the authors [2-5]). The widespread adoption of digital technologies (the Internet of things, the industrial Internet, big data, blockchain, cloud computing, machine learning, artificial intelligence, mobile communications, etc.) is one of the most important conditions for the development of national economies of all countries [6,7].

Studying the experience of the development of the digital economy in Europe, the USA, China and other countries is of great importance for the development of the digital economy in Russia
The federal project "Digital Technologies" of the state program "Digital Economy of the Russian Federation" (until 2024) [8], adopted in the Russian Federation, and the state program "Development of Health Care" (until 2020) [9] determine the development and process of digital transformation of priority sectors of the economy based on end-to-end digital technology stack. The base objectives of "Digital Technologies" project are:

- support of leading Russian high tech companies, which are develope products, services and platform solutions based on end-to-end digital technologies for digital transformation of priority economy sectors and social sphere mainly based on domestic developments;
- support for projects to scale technological solutions based on "end-to-end" digital technologies in a high degree of readiness in priority economy sectors and social sphere"

One of the way of improvement of health care system is implementation of modern management technologies based on end-to-end digital technologies (service-oriented architecture, process management, e-health) into practical healthcare.

Digital technologies have a significant impact on the quality and cost-effectiveness of medical care into sphere of healthcare. This premise, in particular, underlies in the base of the project in the Russian Federation for the development and implementation of a unified state information system in the field of healthcare in accordance with the Russian Federation government resolution No №555 by 05.05.2018. In modern world, where new technologies are dynamically developing, the focus of enterprises has shifted from the sphere of technologies for the implementation of core activities to the sphere of management technologies. For example, the more quickly and flexible management system responds to external challenges, the more effective the whole enterprise is. At the same time, the business model of the company, the value-oriented and functional models of the company, and the system of business processes are primarily affected by changes. The reengineering of a business process system based on the use of end-to-end digital technologies allows us to further formulate the IT architecture requirements and determine the program of development projects.

Methods

The methodological component of this article is based on the following approaches.

1. Analysis. The article analyzes the current interest of medical companies in the transition to an IT business strategy. Also, the article analyzed existing medical concepts taking into account the introduction of modern digital technologies, for example, IoT, BigData. Moreover, the influence of end-to-end technologies, which are of key importance in the implementation of digital transformation in the medical sector companies, was noted.
2. Architectural approach. The methodological basis of the study is the architectural approach to the design of reference digital model of the IT-architecture of a medical organization. This approach allows to make an alignment between the business and IT development strategies of medical companies. The use of this approach is relevant in connection with the

rapidly growing dependence of doing business with implemented IT support. The architectural approach allows us to reflect in detail various elements such as business processes, functional and organizational structure, the level of information services and applications, as well as the technological layer. At the present stage of development of approaches to designing enterprise architecture, four main approaches are distinguished: Federal Enterprise Architecture Framework [10], Gartner [11], Zashman Framework [12], TOGAF [13, 14]. After analyzing all the main advantages and disadvantages of each of the above incomes, the focus fell on the TOGAF method [15]. The choice of the method substantiated the possibility of its application to focus on the process of managing architectural changes in medical companies, taking into account the introduction of modern digital technologies. Moreover, this approach is flexible in relation to changes in the external and internal business environment. According to our study, we applied this approach to build a reference digital model of the It-architecture of a medical organization.

Results and Discussion

Digital technologies have infiltrated and changed the balance of power in most business areas, and the healthcare industry is no exception. Experts predict that soon the way we, the society, provide and consume medical services will change significantly [16,17]. Breakthrough technologies, such as Internet of Things (IoT), Artificial Intelligence (AI), Blockchain and Cloud Computing, have reached a certain level of maturity and are widely used in the world of healthcare. Today, the attention of investors and corporations is occupied by advances in medical technologies: inventions in the field of genomics, wearable devices for tracking health indicators and telemedicine, as well as inventions associated with various types of sensors. Researches in nanomedicine, robotics, and medical 3D printing is also not neglected and is aimed at helping medical organizations provide targeted, accurate and timely medical services.

Practices for using end-to-end digital technologies in medicine

Artificial intelligence, wearable devices, drones, robots are gradually becoming the usual health care tools. Modern technologies are used to diagnose diseases, treat, monitor, conduct operations, transport medicines and blood. Consider some of the possibilities of using artificial intelligence and the Internet of Things in healthcare. Let's consider examples of the introduction of end-to-end information technologies in various areas of medical activity [18].

Diagnostics

The most advanced diagnostic methods are the use of artificial intelligence. In December 2016, Don Woodlock, senior vice president of GE Healthcare, said that radiography would not require the use of films: images would be sent directly to radiologists via modern communication channels.

Making a diagnosis automatically using machine learning technologies will be the next step in medical transformation. Machine learning will not replace radiologists, but will make their work more efficient.

Also, artificial intelligence technologies will support the work of ophthalmologists. AI can detect eye damage in patients with diabetes. At present, a machine learning algorithm has been developed and passed its first tests, which is able to detect eye damage from photographs of the fundus.

To train the mechanism, it was necessary to use 130 thousand images of the retina. To participate in the project, images of both a perfectly healthy retina and images of diseases were used. Fifty experienced ophthalmologists previously evaluated the quality of the images, the presence and degree of retinopathy.

In September 2016, the Israeli company Beyond Verbal introduced a project of a system based on artificial intelligence. The task of the system is to diagnose diseases by voice. It is about recognizing intonation and other nuances that a person can't recognize by ear. To train the system, the developers proposed AI to analyze more than 2.5 million audio recordings with voices in 40 different languages.

In February 2017, experts at the American University of North Carolina developed a miniature wireless device. The device is able to remotely diagnose the physical condition of soldiers and athletes. A sensor made of elastic polymer material is attached to the wrist or chest. The device controls the electrical properties of the skin. These properties change depending on the level of perspiration of a person. The received data is sent to the tablet or smartphone of the owner. Scientists said that the sensor controls skin hydration, which means it will protect people working in hot conditions, improve the physical fitness of athletes, etc.
In May 2017, Perm scientists announced the creation of a system for the diagnosis of cardiovascular diseases based on a neural network and the method of mathematical freezing. For efficient operation and training of the system, a database was provided from the emergency cardiology department of the local hospital. The network is self-learning and successfully diagnoses. She uses data on previously transferred diseases of patients, medical history of relatives, data on pulse, pressure. The system takes into account 69 indicators.

In August 2017, an AI-based assistive system was presented in China for making a clinical diagnosis. To analyze 100 case histories, the system requires 4.8 seconds or 0.05 seconds for each history. The diagnoses of AI are 98% the same as those made by qualified medical staff. Millions of patient records have been used to create the system. The accuracy of the machine diagnosis is 20% higher than that set by the doctor.

Treatment

In December 2016, a prototype bracelet with an NFC chip was introduced in Israel, which will provide emergency assistance to soldiers wounded in battles. The device stores data on the patient's health, information about the treatment already carried out, photographs of the patient's wounds and GPS coordinates of the places where the soldier was injured. Developers are testing the bracelet to see if mass production is worth it.

Smart shoes are used to help travelers navigate and improve athletes' performance. In November 2016, ABI Research analysts reported that sensors embedded in the shoes themselves, in the insole or socks will be able to improve the condition of patients, and some can be literally put on their feet without the need for regular visits to doctors.

Monitoring

Wearable devices are already tracking physical activity indicators. For example, the Sensor Dot device developed by UCB and Byteflies will notify patients of an impending epileptic seizure. The sensor makes several different measurements to accurately predict the time of an impending attack.

Another device is a patch, a coin-sized one, presented in August 2017, released by Band-Aid. The wireless patch can be connected to the network and attached to the human body. First of all, patches will allow qualified doctors to obtain data on the health status of people in rural and mountainous areas, where, as a rule, medicine is poorly developed.

In May 2017, Apple CEO Tim Cook was spotted testing a device that looked like a blood glucose meter. Now, in order to measure the level of sugar in measles, people with diabetes need to pierce a finger. Wearable devices, if their error in determining blood sugar levels will be minimal, can also be used for monitoring, without having to take a blood sample.

Transportation of medicines and blood

Drones are indispensable for the delivery of medicines and donated blood to remote areas. For example, in Rwanda, Zipline (California) has been supplying blood and medicine with unmanned aerial vehicles since the fall of 2016.

Drivers of Medical Organizations Development

Various studies [19-22] identify three main drivers that push medical organizations to begin the process of digital transformation to increase the value and quality of provided medical services:

- increase of costs and chronic diseases of patients;
- high expectations of digital patients for the quality of medical services provided;
- emergence of digital technologies and modern medical equipment, sensors and wearable devices enabling expansion of the boundaries of decision support systems.

In order to meet these challenges and take advantage of the opportunities that digital transformation provides, healthcare providers must rethink their traditional value chain and consider the possibilities of joining or organizing a Digital Healthcare Network. The goal of such a network is to bring together patients, specialists and suppliers to provide the most efficient and patient-oriented medical service possible. The Digital Healthcare Network is the foundation of a new consumer-oriented healthcare system in which stakeholders are trying to solve common problems through ongoing and continuous collaboration. From an architectural point of view, such a network is an open integrated platform that provides tools for exchange of information within a single network, as well as tools for access management based on the pre-configured rights and roles of users (network participants).

The transition to digital healthcare offers many opportunities for both market leaders and niche companies. However, organizations must adhere to a number of rules and concepts when developing medical services:

- focus on meeting the needs of patients at the lowest possible cost;
- establishment of the maximum possible number of touchpoints between the client and the service as well as the personification of offers and user experience;
- collaboration within the medical network: collaborative research and clinical trials, etc.;
- balancing supply and demand through advanced real-time analysis technologies and predictive analytics.

Reference digital model of IT-architecture of medical organization

Medical organizations investing in digital technologies need an IT architecture that will support the implementation of key business processes and, at the same time, provide an opportunity for the development and integration of innovative scenarios, such as: digital diagnostics, digital boardroom, clinical decision support, patient involvement and many others.

Figure 1 shows a conceptual (reference) model of the IT architecture of a medical organization.

Figure 1 : Conceptual (reference) model of IT architecture of a medical organization

Let us consider in more detail each of the presented layers of the conceptual model of the IT architecture of a medical organization. Often in large medical organizations there is a "zoo" of IT systems of various classes. This is mainly due to the large number of specialized medical systems, but sometimes it is caused by the lack of a well-described IT strategy of the organization. In addition, with the growth of digitalization, medical organizations are forced to collect data from various external systems outside the enterprise's IT landscape: social networks, Industrial Internet of Things (IIoT) systems, various publicly available medical systems and catalogues, etc.

In this regard, in medical organizations the problem of integrating data from disparate sources is especially acute. The architectural solution (proposed within the framework of the reference model) is a comprehensive integration platform that would have functional and technical capabilities for setting up data exchange between all open integrated systems of the organization. Moreover, such an integration platform must be deployed in a cloud or hybrid environment in order to support the integration of cloud and on-premise systems.

The basis of this model is a Medical Digital Platform, which should provide functionality for aggregating heterogeneous data, as well as provide convenient and scalable services used by various applications located inside the platform. In addition, it is desirable that this system would support embedding (as an extension or add-in) of visualization dashboards (created by means of BI-systems), as well as libraries for Machine Learning and predictive and advanced analytics.

Figure 2 shows a conceptual (reference) model of the architecture of a Medical Digital Platform.

Figure 2 – Conceptual (reference) model of the architecture of a Medical Digital Platform

Digital Medical Platform should have technological capabilities for storing and processing large amounts of data. Patient's master data, data sets with clinical information and medical ontologies, data from medical devices and sensors, as well as other relevant data from external sources should be replicated to the medical platform to speed up the processing and visualization of this data.
Four key groups of services have been identified that, from our point of view, should be provided by a Medical Digital Platform:

- **User Management.** This group includes services for managing authentication, authorization, user's roles and privileges. When it comes to personal medical information of patients, it is extremely important to make sure that only attending physicians of patients themselves have access to it by providing protection against unauthorized access.
- **Data Management.** This group includes data quality and life cycle management services, as well as services for anonymizing patient data, which is a prerequisite for subsequent statistical analysis of such data arrays.
- **Interaction.** This group includes services responsible for interaction with the "external world": collaboration within the medical network, creation and automatic distribution of surveys, questionnaires, etc.
- **Development.** This group includes all services for custom development and refinement of the platform: tools for transforming and saturating data, tools for creating new unique client services (Platform SDK), and an integrated development environment for unique web and mobile applications (Mobile SDK).

Platform can be delivered with out-of-the-box boxed applications for solving various business problems. For example: a portal of an employee of a medical organization, a decision support system for clinical cases, a mobile application for a patient, etc.

Conclusions

1. Conceptual model of IT architecture of a medical organization, using IoT tehnologies, has been developed
2. Conceptual (reference) model of the architecture of a Medical Digital Platform has been developed.
3. Four key groups of services have been identified that, from our point of view, should be provided by a Medical Digital Platform.
4. The proposed reference model of IT architecture will allow in the future to formulate a program of projects for the development of IT architecture of medical organizations based on end-to-end digital technologies.

Abstract

The active development of any organization determines the presence in the company of a large number of projects related to various industries. This necessitates the implementation of a corporate approach to project management as temporary structures established to achieve the required results. The discipline of project management allows you to organize structured management of the main constraints of any project - timelines, budgets, functional frameworks, while observing the quality requirements of the final project product. This article discusses the task of organizing a project office for a resource supply organization in order to create a centralized project management apparatus and implement strategic initiatives. As the standard of project management and the basis for creating a model of the project office, the PRINCE2 standard was chosen, while ArchiMate was chosen as a tool for modeling the organization's activities. The model obtained as a result of the study is the basis for creating an existing project office in the organization in question

Keywords: project office, project management, leadership, PRINCE2, ArchiMate.

Introduction

The leaders represent crucial points of communication inside a group. Communication is an important characteristic of groups, together with self-organization, conformity, unity, efficiency etc. The managers are people who “do what they have to do”, while the leaders are people who “do what they do, as they have to do”, that is efficiently. It is a big difference between the manager and the leader. The first faces complexity while the second one faces changes, grouping characteristic activities of management and leadership (Burke & Barron, 2007) (Ilin, Levina, & Lepekhin, n.d.), (Pirogova et al., 2019). Each action system implies taking the decision about what has to be done, creating relations between people, creating relations that can lead to the fulfilment of a common plan, and then the essay to assure that these people do what they have to do. Everyone fulfils these three tasks in a different manner.

This leadership concept is crucial for moving organization towards corporate development (Orlova, Ilin, & Shirokova, 2018), (Mandryka et al., 2019). In scopes of complex organizational structure and scale of the company, the role of corporate development cannot be assigned to one person, it can be performed by project office (Anantatmula, 2010).
This research paper addresses the models of project office for complex organization, which is acting on resource supply sector and has governmental interrelations. The core of the model is PRINCE2

methodology and ArchiMate modelling language (Lankhorst, Proper, & Jonkers, 2009). The results of this research paper are aiming to become a recommendation for the case-company in further realization of project office structure.

Literature Review

To date, a number of approaches to project management are applied around the world. Fundamental and more universal are the PMBOK and PRINCE2 approaches, the more flexible approaches are Agile (in particular, SCRUM), and the highly specialized ones are the NASA Project Management and Systems Engineering Competency Framework (Wideman, 2002). Nevertheless, PMBOK and PRINCE2 can be considered traditionally accepted approaches due to their very widespread use in many countries. It is worth noting that these approaches are considered international standards for project management. As you know, PMBOK is used on all continents in more than 185 countries. It is most popular in the USA, Canada, Mexico, Asian countries, including China and India. PRINCE2 also finds application on all continents in more than 150 states. This approach is most popular in the UK, in many countries of Europe, South Africa, Australia, New Zealand, the USA (in IT projects of oil companies) (Popova et al., 2019). PMBOK defines concepts "related to project management, contains a universally recognized standard and guidance for the project manager". PRINCE2 is "a structured project management method based on experience gained from thousands of projects." Table 1 presents a comparison of PMBOK and PRINCE2 (Siegelaub, 2004).

Table 1: PRINCE2 and PMBOK comparison

Criteria	PRINCE2	PMBoK
Definition	Structured methodology	Standard and Guide
Practical/Complex approach	Practical, focuses on critical areas	Complex approach
Themes/Knowledge areas	7 themes	10 knowledge areas
Processes and actions	7 processes and 35 actions	5 process groups and 47 processes
Principles	7	-
Interpersonal skills	-	+
Focus	Business case and product	Customer requirements
Project Board Role	Encourages the Project Board to provide oversight	Only offers the role that the sponsor should play

PMBOK presents 10 areas of knowledge (Integration, Content, Timing, Cost, Quality, Personnel, Stakeholders, Communications, Risks, Purchasing) and 5 process groups (Initiation, Planning, Execution, Monitoring and Control, Completion), for which they are described in detail 47 project management processes In the case of PRINCE2 there are 7 principles, 7 topics, 7 processes. The following topics are described in this methodology: Business Case, Organization, Quality, Plans, Risk, Change, and Progress. This standard governs the use of 26 management products, 8 roles and responsibilities, 2 methods (Product Based Planning and Quality Audit Technique) (Bentley, 2005, p. 2). It also provides recommendations for adaptation in case of a project in the program, customer / contractor relations, several project owners, use with other life cycle models and standards, and changes in the scale of the project.

Methodology

Project management is an integral component of enterprise architecture and plays a special role in project-oriented companies Project management standards are developed by professional associations or large companies. Any company has the right to develop and use its own corporate standard for project management. Choosing a project management standard, in addition to a well-developed general approach, many companies often seek guidance on specific actions to manage various aspects of the project. The PRINCE2 standard fully meets these requirements: the guidelines are detailed to

specific recommendations to project participants, the standard is scaled and adapted to any specific project.

The PRINCE2 standard was originally developed as a standard for managing IT projects. Currently, PRINCE2 is used in more than 150 countries to manage projects in more than 20,000 organizations. The PRINCE2 methodology is based on a process approach to project management, special attention is paid to the relationship between the Customer, the Supplier and the User (Commerce, 2002, p. 2).
PRINCE2 project management methodology has a number of features and advantages compared to other world standards in this area:

• Possibility of planning;

• Product orientation;

• Project management for individual controlled stages;

• Adaptability and flexibility in relation to projects of various sizes;

• A clearly regulated organizational structure of the project, which allows to increase the effectiveness of project management;

• The principle of deviation management during project management (the determination of the acceptable level of deviation of results at each stage of the project without escalating the problem to a higher level) (Hedeman, Van Heemst, & Fredriksz, 2012).
PRINCE2, due to its structure and key principles, allows to solve such complex projects as:

1. The length of the project

PRINCE2 makes project activities as result-oriented as possible thanks to the principle of "focusing on the project product": the entire project as a whole and each stage separately must end with the creation of a product that has value for the customer.

2. Schedule overruns

During the project, new tasks constantly arise that are built into the previously created plan, other tasks are shifted or completely excluded from the plan, often it takes a lot of time to determine the contractors. The PRINCE2 principle of "exception management" assumes that deviations from the plan are detected at an early stage, when they are only predicted, and corresponding analysis work is carried out with them, identifying and eliminating the causes, adjusting the plan (Ghosh, Forrest, DiNetta, Wolfe, & Lambert, 2012).

3. The inability to quickly identify those responsible for certain tasks

The inability to quickly identify the person in charge often manifests itself in the event of any problems due to inaccurate definition of roles and responsibilities in the project. At the same time, the project is significantly delayed, disagreements arise within the project team, and problems are not resolved promptly. PRINCE2 proclaims the principle of uniquely identifying roles and responsibilities in the project and describes in detail the main roles in the project management team. In particular, the duties of the project manager include daily monitoring of work and resolving disagreements within the project team (Barker, 2013, p. 2).

4. Ineffective communications between project team members

If the information exchange process is not established within the project team, the participants do not have access to critical information for them, this can lead to significant disruptions in the work on the project, a large number of errors, duplication of tasks, etc. PRINCE2 provides the "Communication Strategy" document, which contains all the interactions of the project executives, and also provides a

list of documents that require fixing in them all the information on the progress of the project (Samáková, Sujanová, & Koltnerová, 2013).

5. Inability to respond quickly to unforeseen situations

The problem of the lack of operational response is often associated with the absence of a permanent project manager in the project, who in such situations is the decision maker according to the PRINCE2 methodology. If there is insufficient authority to make a decision, the project manager should contact the senior manager in accordance with the communication management strategy.
The given examples of PRINCE2 tools for solving typical problems in projects determine the potential effectiveness of this standard for use as a corporate standard for project management and the creation of a project office on its basis.

Results

In addition to managing individual projects, it seems advisable to consider the organization of a structural unit that exists on an ongoing basis in the organizational structure of the company in question and is responsible for managing projects and project programs, while taking into account the wider context of the implementation of urban infrastructure development projects in the field of resource supply. Proposals were made on the following aspects:

• Management of individual projects in the company

• Project portfolio management in the company

• Project management (project programs) of urban infrastructure development in the field of resource supply

The management structure of an individual project is a temporary role-based organization. The proposed model of the role structure of managing individual projects proceeds from the assumption that traditional projects with the following properties predominate in the company's project portfolio: approved and conditionally stable cost, terms and volume of work on the project. Best practices for managing such projects recommend a three-level management structure (Fig. 1):

• The project curator is the sole body for managing the strategic interests of the project, responsible for making key decisions in the project (starting a project, providing resources for the project, completing and accepting project results), which should have sufficient authority in the project environment. Appointed from among representatives of the Government of the considered area of the company's functioning. The project's collegial advisory body is the Project Council, which, in addition to the Curator, includes a representative of the customer and the main project executor;

• Project manager - manages the current project work within the framework of his authority, coordinates the teams of performers of various types of work. Appointed from among the representatives of the resource supplying organization;

• Leader of the team of performers - since urban infrastructure development projects are a set of interconnected heterogeneous works (for example, engineering design, equipment supply and equipment, construction and installation works, commissioning), it is advisable to divide the management of various types of work between specialists in a particular area. The head of the team of performers of a certain type of work is responsible for the performance of work in this area and the transfer of the results of work under the guidance of the Project Manager to the performer of interrelated work.

The proposal on the role structure of project management in the company takes into account the requirements of the Methodological recommendations of the methodology.

Figure 1: Role structure of individual project management

If the project is being implemented as part of a program of interrelated projects, then the program management structure can be implemented in the form - see Fig. 2. The program council is formed from among the representatives of the Government and is involved in protecting the interests of the program. The program director is personally responsible for making strategic decisions on managing the project program, and provides resources for the implementation of the program. The program manager, depending on the specifics of the project program, can be appointed: from representatives of the Government - in the case of projects that are heterogeneous in terms of specificity under the auspices of one program, from representatives of the Executive authority of the Region (profile committee) - in the case of a unidirectional project program.

Figure 2 - Role structure of project program management

If in addition to current activities the company regularly implements development projects, it seems advisable to create a permanent unit in the organizational structure responsible for the implementation of project activities - the Project (Program) office. The goal of creating a Project (Program) office is to create a balanced portfolio of projects, manage the company's project portfolio and provide project expertise. To ensure and implement the activities of the Project (Program) office, the following functions should be implemented (Fig. 3):

• Curator of the Project (Program) Office - the person responsible for the allocation of resources for project activities; As a rule, the head of the company;

• Head of the Project (Program) office - a person managing the activities of the Project (Program) office in the interests of the company;

• Administration of project activities - document management of the Project (Program) office and specific projects (project programs);

• Management of project competencies - methodological support for project management and a center for project expertise;

• Portfolio planning and analysis - forming a balanced portfolio of projects, assessing the feasibility of project implementation, analysis of completed projects;

• Resource management - planning, distribution, monitoring, control and analysis of the use of resources of ongoing and potential projects (project programs), including financial (Bril, Kalinina, & Ilin, January).

The listed functions must be presented in the Project (Program) office. Depending on the volume of project activities in the company, the functions can be performed by individual specialists, combined in one position or departments can be formed for the implementation of functions within the Project (Program) office. Depending on the volume of projects of a certain direction, within the framework of the Project (Program) office, units can be created to manage projects of a certain type (for example, infrastructure projects, IT projects, regional projects, etc.).

Figure 3 - Functional model of the Project (Program) office of the company

The team of executors of specific projects (including the Project Manager) is formed by the Project (Program) office from among the company employees (in agreement with their administrative leaders) or external specialists, depending on the competencies required for the project.

Project management (project programs) of urban infrastructure development in the field of resource supply Since infrastructure development and modernization projects implemented by the Organization are carried out, among other things, on the initiative and with the participation of the Government and the city's executive bodies (specialized committees), it is necessary to ensure the correlation of activities and the active interaction of the Project (Program) office of the company with the project units of the Government and authorities . Such interaction, in particular, is reflected in the management structure of individual projects (Fig. 1).

Conclusion

This article has developed 3 fundamental models of the project office for different levels of project management. A model for managing project departments as well as project programs was formed. With some adaptation, the proposed project management structure can be replicated to other resource supplying organizations of the considered geographical area in order to unify the activities of organizations of this type and facilitate communication of all interested parties to infrastructure projects. Further research in this direction may be associated with a more detailed study of individual tasks of project management - risk management, communications management, change management and others, as well as their industry adaptation.

Abstract

Increasing competition in the medical services market necessitates improving the quality of services provided. The use of modern IT technologies and a process approach to management helps to increase the competitiveness of a medical organization through process automation. This study describes the results of improving the ambulance process through the use of the existing medical information system. To justify the effectiveness of the proposed "as it should be" model of the ambulance process, the simulation method and functional-cost analysis were used, which allowed us to assess the impact of the proposed changes on reducing the duration of ambulance waiting time.

Keywords: Business process reengineering, hospital information system, digital technologiesб increasing the effectiveness.

Introduction

Due to the constantly growing demands on quality, service, flexibility and low cost of medical services, improving the efficiency of enterprise management is very important for maintenance and growth of competitiveness of the organization. Process approach to business management according to which activity of the enterprise is considered as a set of processes can be used for these purposes [1–3]. Process approach is applicable to the enterprises of the medical industry as the medical organization can be considered as a production system because it provides according to the established rules the final product – medical services [4,5].

Using a process approach to medical management can lead to a sustainable increase in the efficiency of a medical organization, while the question remains which methodology to choose for improving the processes in a particular case [6–8].

Improvement of processes of the medical organization is inseparably linked with using of modern IT technologies [9]. For medicine, a comprehensive industry solution is the Hospital Information System (HIS). Hospital information systems are systems for the collection, processing, storage and transmission of information designed to automate the activities of medical institutions.

The main objective of introducing HIS in a medical organization is to automate the processes of core activity by reducing the time that doctors spend on filling out paper based patient records [10,11].

The use of HIS provides great potential for medical organizations, subject to the full use of the available functions [12]. Otherwise, the effect of HIS implementation, as in the case with any other information systems, may not meet the expectations of the customer[13,14].

When reengineering business processes, an important issue is which method to use for assessing the effectiveness of the new TO-BE model of process system compared to AS-IS model [15,16]. At the same time, a significant part of research related to business process reengineering in medical organizations focuses only on a qualitative assessment of the business process reengineering results, which makes it difficult to assess the actual effectiveness of the research results obtained by quantitative indicators [17,18].

The purpose of this study is to describe the “Rendering the first medical aid” process reengineering in a medical organization with a preliminary assessment of the effectiveness of the proposed TO-BE model. When providing ambulance services, it is vital to reduce the time between a call and its service. Therefore, the main goal of reengineering in this case is to reduce the average duration of an instance of the “Rendering the first medical aid” process.

Business process reengineering is associated with risks, therefore, before introducing a TO-BE model, it is necessary to assess whether it will really be more effective than the previous one [19].

The main goal of reengineering the “Rendering the first medical aid” process is to reduce the average duration of process instances while maintaining the quality level of the service provided, therefore, to assess the effect of reengineering in this case, the main indicator is the average duration of the ambulance service [20].

Methods

To improve the quality of the ambulance services, the process approach to the management of the medical organization was applied.

Researchers identify five main methods for achieving the goals of improving the business processes of organizations, listed below.

1. The technique of rapid decision analysis. When using this methodology, attention is focused on a specific process during a one- or two-day meeting of the process improvement group to determine ways to improve this process over the next 90 days. The decision of the group may be approved or rejected by the management of the organization.
2. Benchmarking. The method is based on a comparative analysis of the organization's business processes with the reference processes of organizations performing the same or similar processes, but better functioning. The purpose of benchmarking is to determine the reasons for the better functioning of the business processes of "reference" organizations and to prevent undesirable discrepancies with them in the organization that conducts the study.
3. Redesigning the process. This method focuses and efforts on improving the existing process. Redesigning is usually applied to those processes that are successfully working at the moment, but require correction due to changing requirements and the needs of the client or consumer.
4. Process Engineering. This method of designing business processes of newly created organizations or business processes of new types of business in existing organizations, taking into account best practices, is determined by the principle of optimality in process management.
5. Reengineering process. It is aimed at a radical change in the organization's internal business processes to achieve significant improvements in key performance indicators such as costs, quality, level of service and efficiency. It is used as a process management method in large companies, the main purpose of which is dynamic development based on the description of business processes [15].

To improve the process of "Rendering the first medical aid" is the most suitable method of reengineering. The main steps of company reengineering include:

- Choosing the strategic priorities of the company to formulate the goals of business reengineering and define the most important business processes of the company.
- Creating AS-IS model of company's business processes before the start of the changes.
- Analysis of AS-IS model and identification of bottlenecks in the company
- Development of a new structure of the company's business processes taking into account identified bottlenecks.
- The economic rationale for the transition to a new model of business processes.
- Development of supporting information systems. In this case, the required resources should be determined and, if necessary, a specialized information system is implemented.
- The transition of the company to new business processes, that is, the introduction of a new management system in practice [21, 22].

The strategic priority for the medical organization is to improve the quality of services provided. One of the most important indicators of the quality of a medical service is its timely delivery. Thus, the main goal of the "Rendering the first medical aid" process reengineering is to reduce the average duration of process instances while maintaining the quality level of the service.

To create a model of the "Rendering the first medical aid" process, it was decided to use the Cross-Functional Flowchart notation, since in this process it is important to display the process executors in order to visually assess their workload.

For the economic evaluation of the existing process, simulation modeling and functional-cost analysis of the AS-IS model was conducted.

To carry out the functional-cost analysis in the AS-IS model of the "Rendering the first medical aid" process, the following data was received from a medical organization: call frequency, time to complete each operation, and headcount. The simulation period was set to one week.

For the economic justification of process reengineering, simulation modeling and functional-cost analysis of TO-BE model with the same input data were also used.

Results and Discussion

The “First Aid” process consists of three stages: Reception of a call, Departure on a call, Execution of documentation.

The owner of the process is an Ambulance doctor.
Executors of the process are Paramedic on call reception, Ambulance paramedic, Ambulance doctor.

As a result of studying the “Reception of a call” stage, the following AS-IS model was constructed, shown in Figure 1.

Figure 1 - Stage "Reception of a call " AS-IS

The Reception of a call phase begins with the receiving the patient call by Paramedic on call reception. Paramedic on call reception checks the patient for Electronic Medical Record (EMR) and starts it if there is no patient’s EMR in the HIS. Then the Paramedic on call reception enters the HIS information about the call into the electronic schedule and in the paper based Journal of recording ambulance calls, and also transmits information about the call to Ambulance doctor. Ambulance paramedic gives Ambulance doctor a stack with potent substances. An Ambulance doctor makes an entry in the paper based Journal of accounting for the issuance and return of potent substances.

The stage "Departure on a Call" following the stage "Reception of a Call" is presented on figure 2.

Figure 2 – Stage "Departure on a call" AS-IS

At the “Departure on call” stage, upon arrival at the address, the Ambulance paramedic fills out the Paid Medical Services Agreement and the Informed Consent on paper. Ambulance doctor collects complaints and medical history, examines the patient and makes a diagnosis. Next, he fills in a paper based Emergency Call Record and prescribes treatment. If it is necessary to prescribe potent substances, the ambulance doctor prescribes potent substances and fills in the Potent substances prescription sheet. The doctor enters the information about prescribed treatment on the paper based Emergency Call Record. Further, the Ambulance doctor decides whether hospitalization is necessary and, together with the Ambulance paramedic, performs the hospitalization of the patient. Next, the Doctor fills in the Act on the provision of services.

The “Execution of documentation” stage of the process is presented in Figure 3.

Figure 3 – Stage "Execution of Documentation" AS-IS

At the "Documentation" stage, upon arrival at the medical organization, Ambulance Doctor enters the data in the computer based Emergency Call Record and fills in the Patient Visit Log. Ambulance paramedic returns stack with potent substances, Ambulance doctor makes changes to the Journal of accounting for the issuance and return of potent substances. The Paramedic on receiving calls fills in patients' EMRs and the Daily report on the work of the department.

According to the results of the functional-cost analysis of the existing AS-IS model, it turned out that the average duration of one process instance is 2 hours (Figure 4).

Process	Number of instances	Avarage duration	Avarage cost	Total time waiting for resources
Rendering the first medical aid	691	2:03:10	246,98	0:20:00

Figure 4 – Statistics on processes of the AS-IS model

Apparently from statistics on subprocesses, the existing model has subprocesses that cannot start on time, because they are waiting for resources, that is, employees do not manage to carry out tasks right after their receipt.

During the analysis of process "Rendering the first medical aid" the following problems connected with the underutilization of HIS are revealed:

1. Interaction of staff of the medical organization happens without the use of HIS that conducts to excess time expenditure;
2. Part of documentation is not maintained in HIS that leads to duplication of information.

Consider these problems in more detail and provide possible solutions.

The problem of reducing the time between receiving a call and receiving information about it by an ambulance doctor is especially relevant in this business process, since it can be vital for patients to get an ambulance as soon as possible. At the "Reception of call" stage, the Paramedic on call reception first enters information about receiving a call into the Electronic schedule, and then phones Ambulance doctor.

To reduce time between receipt of a patient call and the arrival, a solution is proposed to use the SMS notification function and the comment schedule that is already available in HIS but not used.

This will allow the Paramedic on call reception to enter the information received from the patient immediately into the electronic schedule. Then the Paramedic will not need to additionally transmit information to the Ambulance Doctor, as he will receive it immediately after Paramedic on call reception makes changes to the electronic schedule.

The next problem is that in addition to HIS, MS Word and MS Excel, as well as paper media, are also used for documenting in the medical organization. This leads to the fact that employees enter the same information in different reporting forms, that is, the medical organization irrationally uses the working time of employees.

For example, the Ambulance doctor fills out the paper based Emergency Call Record at the stage "Departure on a Call", and at the stage "Execution of Documentation" enters this information in MIS.

For the solution of this problem, it is offered to use a possibility of HIS to add and adjust the reporting forms. Transfer of documentation in HIS will allow to implement automatic filling of the documents created on the basis of other documents. It will significantly reduce the personnel time spent for maintaining documentation.

So, when transferring documents to MIS for most of the documents that are currently being maintained in MS Excel, MS Word or on paper, it will be possible to configure the automatic filling of fields from other documents that are also filled in this process.

Table 1 lists the documents filled in by the medical organization's employees in the "Rendering the first medical aid" process, indicating the original format of the document and the source documents for automatic completion.

Table 1. Documents used in the process

Name of the document	Document format	Source document for automatic completion.
Paid medical services agreement	Paper based	-
Informed consent	Paper based	-
Electronic schedule	HIS	-
Journal of recording ambulance calls	Paper based	Electronic schedule, Electronic medical record
Potent substances prescription sheet	Paper based	-
Journal of accounting for the issuance and return of potent substances	Paper based	Potent substances prescription sheet
Emergency call record	Paper based, HIS	Potent substances prescription sheet
Electronic medical record (EMR)	HIS	Emergency call record, Potent substances prescription sheet
Act on the provision of services	MS Word template	Emergency call record
Patient visit log	MS Excel table	Emergency call record
Daily report on the work of the department	MS Excel table	Patient visit log

Taking into account all offered changes TO-BE model of "Rendering the first medical aid" process is developed.

The chart of the stage "Reception of a Call" is presented to the TO-BE model on figure 5.

Figure 5 – Stage "Reception of a Call" TO-BE

The stage "Reception of a Call" begins with the receiving the patient call by Paramedic on call reception. Paramedic on call reception checks the patient for EMR and starts it if there is no patient's EMR in the HIS. Further the Paramedic call reception enters the HIS information about the call into the electronic schedule. The information from the electronic schedule is automatically entered in the Journal of recording ambulance calls. Paramedic on call reception checks and complements the Journal of recording ambulance calls with missing information. The Ambulance paramedic reports to Ambulance doctor stack with potent substances. . An Ambulance doctor makes an entry in the computer based Journal of accounting for the issuance and return of potent substances.

Differences from the AS-IS model: the operation "Transmission of information about the call to Ambulance doctor" is excluded from the model as in the offered TO-BE model Ambulance doctor obtains the information on the call through the notification in HIS right after the Paramedic puts it in the electronic schedule. All documents are stored and available for changing in HIS.

The chart of the stage "Departure on a Call" of TO-BE model is presented on figure 6.

Figure 6 – the stage "Departure on a Call" TO-BE

At the stage "Departure on a Call" on arrival to the address Ambulance paramedic fills in the Paid Medical Services Agreement and the Informed consent on papers. Ambulance doctor makes collecting complaints and the anamnesis, survey of the patient and installation of the diagnosis. Further Ambulance doctor fills out the Emergency call record in HIS and appoints treatment. In need of prescribing of potent substances the he appoints strong substances and fills the Journal of accounting for the issuance and return of potent substances in HIS. The doctor enters information on the appointed treatment in the Emergency call record. Further Ambulance doctor defines whether patient needs hospitalization and together with the Ambulance paramedic performs hospitalization of the patient. Then Ambulance doctor checks whether the Act on the provision of services that is implemented as a reporting form in HIS was correctly filled.

Differences from AS-IS model: all documents that were on paper and in MS Word format are now implemented as linked forms in HIS, that is, when they are created, data such as patient information, call address, etc. is automatically filled. In this regard, the duration of the operations “Filling in the Emergency Call Record”, “Filling in the potent substances prescription sheet” decreased.

The “Documentation” stage of the TO-BE model is shown in Figure 7.

Figure 7 – Stage "Execution of documentation" TO-BE

At the “Execution of documentation” stage, upon arrival at the medical organization, the Ambulance paramedic returns the box with potent substances. Ambulance doctor makes changes to the Journal of the issuance and return of potent substances.

Differences from the AS-IS model: the Emergency call record in AS-IS model was first filled in on paper, then the data from there was transferred to HIS. Since in the proposed model at the “Departure on call” stage this document was filled immediately in HIS, the need for data duplication disappeared. The Patient visit log is implemented as a summary report in the HIS, that is, all data in this document is taken from other forms in HIS and is automatically filled out from the instances of the Emergency call record document.

According to the results of the functional-cost analysis of the existing TO-BE process, it turned out that the average duration of one process instance is 1 hour 40 minutes (Figure 8), subprocesses are not waiting for resources.

Figure 8 – Statistics on processes of TO-BE model

Thus, the average duration of the Ambulance Assistance process was reduced by 20 minutes, which led to the absence of subprocesses that were waiting for available resources.

Conclusions

1. AS-IS model of the “Rendering the first medical aid” process allowed us to identify optimization bottlenecks associated with the underutilization of the capabilities of the existing HIS.
2. The functional-cost analysis of AS-IS model showed that the existing model has subprocesses that cannot start on time because they are waiting for resources, that is, employees do not manage to carry out tasks right after their receipt.
3. TO-BE model of the “Rendering the first medical aid” process has been developed.
4. As a justification for the effectiveness of the proposed model, simulation modeling and functional-cost analysis were carried out. They showed that the problem of resource expectation was solved in TO-BE model, and the average duration of the process instance was reduced by 20 minutes.

Abstract

Social media is a phenomenon which has become an important aspect of the marketing mix and revolutionizes the way companies interact with their customers. It is a new field of research and literature quick scan revealed that not many studies exist on social media on SMEs in UAE. However, the few existing studies without scientific proof to SMEs in UAE data, have been rushing to conclude that the emergence of social media has led to the death benefits of social media for SMEs performance. Therefore, this research project is to clarify whether social media is more efficient in the perspective of SMEs performance in UAE. Quantitative methodology was employed in this research and 350 questionnaires were distributed to the target respondents, 263 questionnaires were received back from the respondents and 245 were used for the analysis in this research work. Smart-PLS were employed in data analysis and presentation in this research. The findings indicate that WhatsApp, email and twitter have positive effect SMEs performance while Facebook showed negative effect.

Keywords: Facebook, WhatsApp, Twitter, Email, SMEs' performance.

Introduction

Social media has developed different ways to communicate, collaborate and participate by involving users when creating information; this is making social media a daily part of our lives through the connection of people as stated by McCann and Barlow (2015). Scholars such as Tajudeen, Jaafar and Ainin (2017) have argued that the adoption of social media has helped companies understand the need of customers, therefore, social media has its advantages that contributions to positive impacts while organizations use technology. This phenomenon raised hot discussions and arguments on the influence of social media on SMEs by scholars and industries. Several studies recommend that SMEs should adopt social media tools to transform it to business growth (Culnan, McHugh, and Zubillaga, 2010; Kaplan and Haenlein, 2010).

Online social channels offer connectivity and transparency for SMEs to gain a competitive advantage. Among the 83% of marketers indicated that social media network is very important for their business (Michael, 2015). A report by Orient Planet Research (2016) found that social media channels such as Facebook, YouTube, WhatsApp and LinkedIn are increasingly being used by SMEs and have become major business enablers. The report also revealed that social media in UAE presents itself as an invaluable tool for SMEs due to the range of benefits that it has to offer and at a reasonable cost. Likewise, the report showed that SMEs represent 95 per cent of all local

establishments, accounting for 42 per cent of the workforce and contributing around 40 per cent to Dubai's economy (Orient Planet Research Report, 2016).

Moreover, Other scholars such as Tajudeen, Jaafar and Ainin (2017) have encouraged future research on how social media is used in different countries, the authors of this study decided to use UAE as their area of study since it has not been investigated on how advantageous social media can be to SMEs in UAE's setting, many scholars have conducted research in USA, New Zealand, Nairobi and other areas. Therefore, there is a need for this study since SMEs play a vital role in UAE's economic growth. Tajudeen, Jaafar and Ainin (2017) mentioned that it's important to know this view from other geographical backgrounds. Additionally, as we can see from above discussed articles, most of studies adopt common social media platforms, like Facebook, Twitter, but in this research, we used Facebook, Twitter, WhatsApp and Email, these tools have never been used by any researcher.

Today the penetration of social media network is huge in U.A.E. However, it is not being used for marketing purposes (The global information technology report WEF, 2016). Even though, the U.A.E is among the top countries in the world, with high percent smartphone penetration (78%) and more social media adoption even higher than the United States (Nielsen, 2014). This shows that UAE citizen does not make use full advantages of the social network especially with broad coverage more extensive penetration for the online user, persuade them to become online buyers.

It is evident that the presence of SMEs through social media network is facing big challenges due to several obstacles, whereby 2019, projections estimate that the Middle East “and Africa will have the world’s highest cloud traffic growth rate at 41% (Global Cloud Index forecast, 2016). Large corporations, as well as SMEs in UAE, often struggle to drive innovation from inside the company. Today, many companies have yet to tap into social media opportunities to innovate in business and expand (Muz and Puente, 2015). Hence, social media adaption by firms creates a great network among businesses, customers and suppliers. However, less attention has been paid to the social media marketing values for SMEs performance (Hajli, 2015; Wamba & Carter, 2016). Given that small and medium sized enterprises are economic engine of most of countries, previous studies mainly have focused on the adaption (Durkin, McGowan, & McKeown, 2013; Wamba & Carter, 2016) benefits and barriers (Michaelidou, Siamagka, & Christodoulides, 2011) of social media in SMEs context. SMEs in UAE do not fully make the best use of the potentials and opportunities offered by online marketing.

The application of mobile devices, and social media networks (SMNs) such as Facebook has revolutionised the e-commerce adoption process in SMEs. However, research into this area is still developing and there is a dearth of knowledge on how SMEs in UAE enact and apply this phenomenon. Nevertheless, how to use social media properly and make it useful still needs strategic planning for SMEs. Studies are lacking on how SMEs can implement social media to increase business growth. Culnan, McHugh, and Zubillaga (2010) illustrates on how large companies can obtain business value by identifying those aspects that affect and reward social media implementation, but there is not enough valuable study to show what those aspects are and how they contribute to implementation of social media on SMEs. As Jagongo and Kinyua (2013) states, SMEs can utilize social media to acquire an advantage but they are not properly exploited due to various limitations they are facing. Stockdale, Ahmed and Scheepers (2012) has also emphasized that there is lack of research in the benefits of adopting social media by Small and Medium Enterprises since most of them are known for their caution and views towards information technology.

There is a growing body of academic literature on the use of social media marketing among SME’s. However, most of the existing studies focus on larger enterprises that have a higher propensity for adopting new and innovative technologies. There have been modest studies on social media marketing in the context of SMEs explicitly (Ahmed et al. 2018). It is widely known that SMEs are often less likely to use emerging technologies due to their limited capabilities, lack of resources, absence of technical expertise, unstable organization structure, small number of employees and lack of capacity (e.g., Stockdale et al., 2012; Zeiller and Schauer, 2011; Kaplan and Haenlein, 2010). Additionally, Karjaluoto (2015) found out that SMEs look like not utilizing the social media and

online tools to maximum potential marketing, and therefore SMEs are not getting any benefits offers by these tools. This result is matched with a study conducted by AlaaEldeen, (2016) in U.A.E. They found that SMEs' average sales from online marketing are 32.2% and it is "somewhat very low" due to low attitude of customers to rely on social media ads of SME, he found a positive correlation between sales of SMEs and the efficiency of social media marketing.

Literature Review

Kaplan and Haenlein (2010) describe social media as "a group of Internet based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user-generated content." Web 2.0 technologies on the Social Web permit two-way conversations with consumers enabling brands to listen to consumers and respond (Fournier & Avery, 2011). On the other hand, social media can be described as series of internet-based applications that allow for the collaborative sharing of ideas, experiences and opinions through user generated content (Freeman & Avery, 2011, Ahlqvist, Halonen and Heinonen, 2008).

According to Evans (2008), Social Media relates to a self-generated, authentic conversation between people about a particular subject of mutual interest, built on the thoughts and experiences of the participants. Therefore, Social Media is definitely all about sharing and aiming at a collective vision, often intending to offer a more-appropriated or informed choice at the end. Furthermore, Social Media changes over time as it allows people to generate the content in a participative way whenever they want to add any additional piece of information. Social Media are also evolving constantly as they are part of internet high technologies, which are modified regularly with additional or replacing features (Evans, 2008).

Social Media covers a wide variety of "online and mobile, word-of-mouth forums including social networking websites, blogs, company sponsored discussion boards and chat rooms, consumer-to-consumer email, consumer product or service ratings websites and Celine ARCA Master of International Marketing forums, Internet discussion boards and forums, and sites containing digital audio, images, movies, or photographs, to name a few" (Hollensen, 2011). Social Networks, or Social Media Sites, which are the main actors in the Social Media medium, can be defined as online communities of people who typically share a common interest or activity, providing a variety of ways for users to interact and having the ability to facilitate communication.

Social Media is growing every day. Even if 90% of the 18-24 internet users use social network via any device at least once per month, social media affects every age group with much higher increase rates for the age groups over 35 (Karimi & Naghibi, 2015). Also, when looking at the average hours per week spent on online activities, we can definitely see that the world is becoming more social, with an average of 4.6 hours per week spend on Social Media Sites worldwide. Consumers and organizations alike are increasingly using the web to discuss, share, and collaborate (Jones, 2010). Social media offers an abundance of services on the Internet. This makes it complicated for companies to know which ones to use and how to use them. The types of social media include: social networks (Facebook, Myspace, and LinkedIn), micro- blogs (Twitter, Plurk, and Friend Feed), reviews and ratings (Yelp, Amazon, and Trip Advisor), video (YouTube and Vimeo), and more. Social media is very popular. Facebook has more than 800 million active users with over 50% of active users logging on every day (Facebook, 2011). According to Twitter"s CEO Dick Costolo, Twitter has 200 million registered users with 50 million active users logging in every day. The micro-blogging service hosts roughly 230 million tweets every day (Taylor, 2011). It comes as no surprise that businesses want to embrace the opportunities these services provide. Social media enables firms to engage consumers in a timely and direct manner at relatively low cost and higher levels of efficiency than with more traditional communication tools. This makes social media not only appropriate for large organizations, but for small and medium size companies as well (Kaplan & Haenlein, 2010).

SMEs' Performance

SMEs' performance can be understood from a quantitative perspective: efficiency, financial results, level of production, number of customers (Anggadwita & Mustafid, 2014), market share, profitability, productivity, dynamics of revenues, costs and liquidity (Gupta & Batra, 2016; Zimon, 2018), etc. and also from a qualitative perspective: goals achievement, leadership style, employee behaviour (Anggadwita & Mustafid, 2014), customer satisfaction (Alpkan, Yilmaz, & Kaya, 2007), product and process innovation, organisational and marketing innovation (Sheehan, 2013), etc. Gopang, Nebhwani, Khatri, and Marri (2017), in their work, considered a series of 14 indicators to describe SMEs performance: reputation, productivity, employee satisfaction, profits, sales, prompt order delivery, sufficient working capital, effectiveness in operations of production, product quality, achievement of targets, number of clients, easiness in supervision, reduction in product cost and product diversification.

Email

In the recent past, e-mail marketing quickly became the preferred method of contact for businesses looking to cut expenses, connect with buyers and increase profits. However, as the dynamic world of marketing has progressed, analysts are having encountered some disadvantages to e-mail marketing that have made other alternatives like direct marketing campaigns or text campaigns look more appealing (Hawi, & Samaha, 2017). Recent research shows that for every dollar invested in E-mail marketing, you can expect that according to the Direct Marketing Association, E-mail marketing in 2009, acquired for $ 43.52. So, E-mail Marketing has the highest return on investment than other marketing methods (Allcott, Gentzkow, & Yu, 2019). Email marketing messages can be customized for different customers and provide contents and promotions that are consistent with their profile. Customers acquire what they want and thus they obtain better view about what each section of current business will respond (Davis, 2018).

Facebook

Facebook was launched in 2004 and holds the most promise for retailers, in offering varieties of way to reach and attract new shoppers (Chugh, & Ruhi, 2018). As of 2011, this social networking site was reported to have 750 million active users and, as at second quarter of 2015, had 1.45 billion active users (Galati, Crescimanno, Tinervia, & Fagnani, 2017). It is ranked as the most used social network worldwide. Also, on a daily basis traffic to the network is on the rise (Bellucci, & Manetti, 2017). There is ability to create a Page which serves as an extension of their online shop that can be used to connect with customers, distribute content, promote products offers, services, and brands and attract online shoppers. Facebook can also be used to advertise products and provide a link to a blog post about the business or industry to online shoppers (Assimakopoulos, Antoniadis, Kayas, & Dvizac, 2017).

Twitter

Twitter was launched in 2006, and it gained a lot of popularity because it offered new options, such as micro blogging, and it was also used by some celebrities (Sinnenberg, Buttenheim, Padrez, Mancheno, Ungar, & Merchant, 2017). It had about 200 million users as of 2011 and, as of the third quarter of 2015, the microblogging service averaged at 307 million monthly active users (Chawinga, 2017). Twitter is normally used to lodge complaints about a company's product or services, generate new traffic by promoting product offers, advice, suggestions and new content to a company's followers (Enli, 2017). Twitter can be used to post multiple updates about company products and services, but its real power is its ability to break down the traditional barriers between the company and its customers, by providing insight into customer opinion and allowing the company to respond proactively to customer issues (Duncombe, 2017).

WhatsApp

WhatsApp has introduced WhatsApp Business app for small, medium and large-scale enterprises of all industries. This app enables enterprises to stay in touch with customers and expand their market base by effectively using the app and promoting the business irrespective of where the users reside (Dar, Ahmad, Ramzan, Khan, Ramzan, Ahmed, & Kamal, 2017). Enterprises can use WhatsApp Marketing Tool to promote their business, interact with users by sending and receiving text and media files using the rich interface by requesting early access to the platform (Stone, & Logan, 2018). This can be done by contacting the companies which provide the API integration with WhatsApp and offer their technical support to enterprises in managing the platform (Khatun, & Al-Dhlan, 2017).

Hypothesis of the study

Therefore, four hypotheses are developed;

H1: Facebook positively affects SMEs performance.

H2: WhatsApp positively affects SMEs performance.

H3: Twitter positively affects SMEs performance.

H4: Email positively affects SMEs performance.

Methodology

Methodology of a study is a strategy, plan of action, process or design for the choice and use of a particular method in order to achieve the mandated or stipulated objectives for the desired outcomes of the whole study (Gray, 2004). The study used quantitative method to achieve the objective of the study. Benz (2011) stated that the uses of quantitative approach provide a concrete manifestation of the findings on an actual setting. Thus, in this study items were selected from previously developed instruments and customized in accordance with the context of the present study. For the social media construct, this study adapted and customized items from the scale developed by Becherer, Helms, & McDonald (2012); Hoque et al (2019); Hoque & Awang (2019). Whereas, from the work of Santos & Brito (2012) this study adapted performance for measuring SME performance construct.

The questionnaire was distributed to the population of this study which included the CEOs, Managers and Supervisors. Thus, the population size is 3,623 service SMEs in Abu Dhabi, sample were generated purposefully, and the sample size was 350. Therefore, 35 questionnaires were distributed to 10 selected service-oriented SMEs in Abu Dhabi, the total number of questionnaires distributed was 350 and the number of questionnaires received from the respondents was 263, and the number of questionnaires used for analysis was 245. Thus, quantitative research based on the statistics was used to evaluate the influence of social media tools on the performance of SMEs in UAE. Structural equation modelling (PLS-SEM) software was employed to analyse the data collected from the respondents.

Results

Hair, et al (2014) defined convergent validity as the extent to which the indicators of a latent construct correlate. Hair, et al. (2011) recommended the use of indicator loading and AVE as criteria for judging convergent validity.

Table 1: Construct validity

Constructs	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
Email	0.935	0.948	0.754
Facebook	0.837	0.877	0.593
SMEs' Performance	0.786	0.853	0.593
Twitter	0.918	0.935	0.743
WhatsApp	0.925	0.937	0.748

Table 1 shows the outer loading of the indicators, AVE and composite reliability of the measurement model. All the parameters meet the recommended thresholds for model's convergent validity. Specifically, the outer loadings range from .786 to .935 and they are all statistically significant. Similarly, the AVEs reported values within the acceptable threshold of .50. The composite reliability values also reported values within acceptable benchmark of .70. The CR values range from low of .853 to a high of .948; this indicate that construct validity is achieved.

Discriminant Validity

Discriminant validity is assessed using the Hetrotrait-Monotrait (HTMT) criterion. Henseler, et al. (2015) recommended it as the most conservative measure of discriminant validity. The criterion is to compare the calculated result with a value of .85 and .90 in such a way that any value in the table above the recommended threshold implies that discriminant validity is not achieved. Table 4.10 show the result of the HTMT test. The discriminant validity a result using Fornell and Larker criterion is presents in Table 2. The results shows that all pairwise combinations of all the latent constructs, the correlations are less than the square roots of their respective average variance extracted (AVE); therefore, the Discriminant validity is established.

Table 2: Discriminant validity using Fornell and Larker criterion

Constructs	Email	Facebook	Performance	Twitter	WhatsApp
Email	0.869				
Facebook	0.709	0.770			
SMEs' Performance	-0.093	-0.094	0.770		
Twitter	0.870	0.751	-0.083	0.862	
WhatsApp	0.775	0.783	-0.123	0.885	0.865

Furthermore, the Heterotrait Monotrait ratio criterion was also used to establish discriminant validity. Table 4.9 shows the HTMT ratios for the constructs. The highest HTMT ratio was between inspirational motivation and job performance with a value of 0.898. Discriminant validity is established since all the ratios were below the threshold values of $HTMT_{.90}$ as indicated by Kline (2015) and (Gold, Malhotra, & Segars, 2001) respectively.

Table 3: Heterotrait-Monotrait Ratio (HTMT)

Constructs	Email	Facebook	Performance	Twitter	WhatsApp
Email					
Facebook	0.837				
SMEs' Performance	0.102	0.116			
Twitter	0.946	0.887	0.097		
WhatsApp	0.853	0.927	0.111	0.760	

Also, Table 4.10 shows the results of HTMT inference. The lower and upper confidence intervals do not contain a value of 1 in any of the constructs, thus indicating that discriminant validity is established.

Table 4: Outer loading

	Email	Facebook	SMEs' Performance	Twitter	WhatsApp
em1	**0.797**	0.649	-0.048	0.770	0.654
em2	**0.849**	0.691	-0.103	0.833	0.735
em3	**0.894**	0.668	-0.064	0.764	0.735
em4	**0.903**	0.596	-0.069	0.719	0.641
em5	**0.854**	0.524	-0.088	0.706	0.632
em6	**0.909**	0.584	-0.086	0.739	0.639
fb1	0.621	**0.764**	-0.070	0.712	0.725
fb2	0.560	**0.547**	-0.017	0.644	0.604
fb3	0.572	**0.793**	-0.033	0.578	0.588
fb4	0.594	**0.875**	-0.098	0.625	0.659
fb5	0.515	**0.830**	-0.085	0.506	0.552
pro1	-0.117	-0.132	**0.828**	-0.095	-0.126
pro2	-0.049	-0.043	**0.710**	-0.034	-0.049
pro4	0.015	0.017	**0.784**	0.043	-0.001
pro5	-0.066	-0.056	**0.753**	-0.090	-0.123
tw1	0.789	0.672	-0.055	**0.874**	0.797
tw2	0.792	0.708	-0.078	**0.923**	0.857
tw3	0.706	0.691	-0.084	**0.873**	0.769
tw4	0.790	0.590	-0.079	**0.863**	0.722
tw5	0.724	0.547	-0.014	**0.772**	0.619
wa1	0.725	0.729	-0.049	0.771	**0.821**
wa2	0.659	0.702	-0.037	0.732	**0.779**
wa3	0.663	0.694	-0.164	0.792	**0.939**
wa4	0.750	0.726	-0.110	0.823	**0.933**
wa5	0.680	0.653	-0.048	0.804	**0.842**

Table 2 shows that all indicator loadings loaded highly on their own respective constructs (as indicated by bold text) compared to other constructs, indicating that there was no issue of high cross-loading between other constructs, therefore, discriminant validity is established.

Path Coefficient

The strength of each path leading to endogenous construct from the exogenous constructs is assessed using the path's coefficient. The paths represent the hypothesised relationships. The path coefficients range from -1 to +1 with values closer to 1 showing stronger relationship while values closer to 0 show weak relationships. The + values indicate positive relationships while –values shows negative relationships between models (Hair *et al.,* 2014). The significance of the path model is assessed using t-statistics through resampling procedures called bootstrapping (Wong, 2016).

Table 5: Path coefficients

Path	Std β	Std Error	*t* Statistic	*p-v*alue
Email -> SME's Performance	0.232	0.020	11.513	0.000
Facebook -> SME's Performance	-0.020	0.318	1.248	0.751
Twitter -> SME's Performance	0.232	0.029	7.934	0.000
WhatsApp -> SME's Performance	0.110	0.036	3.030	0.001

Table 5 shows that email; twitter and WhatsApp had a strong positive effect on the SMEs performance. As the t-values exceeding the t-critical value of 1.96 and p-values value less than 0.05. However, Facebook has negative effect on SMEs performance even though the effect is not statistically significant.

Figure 1: Measurement model of the study

Discussion

The findings of this research work show that email has a positive effect on the performance of SMEs in UAE with the path coefficient of 0.017. The findings of this research were buttressed by the research of Sousa and Bradley, (2009) in their work on the effects of export assistance and distributor

support on the performance of SMEs: The case of Portuguese export ventures. Likewise, this research found out that twitter has a positive effect on the SMEs performance with the path coefficient of 0.026, this was in line with the work of Scuotto, Del Giudice, and Carayannis, (2017) in which they investigate the effect of social networking sites and absorptive capacity on SMEs' innovation performance and the work of Ahmad, Bakar, and Ahmad, (2019) in which they conducted a research on social media adoption and its impact on firm performance: the case of the UAE. Also, WhatsApp has a positive effect on the performance of SMEs in UAE with the path coefficient of 0.193, this is in support of the work of Ebrahimi, Ahmadi, Gholampour, and Alipour, (2019) in their research on CRM performance and development of media entrepreneurship in digital, social media and mobile commerce. However, the findings of this research revealed that Facebook has a negative effect of the SMEs performance in UAE with the -0.065-path coefficient. This finding supported the findings of Ainin, Parveen, Moghavvemi, Jaafar, and Shuib, (2015) in their research on the factors influencing the use of social media by SMEs and its performance outcomes, and the work of Öztamur and Karakadılar, (2014) in their research on the exploring the role of social media for SMEs: as a new marketing strategy tool for the firm performance perspective.

Conclusion

The successful implementation of social media tools in general depends on its impact on the SMEs performance in UAE. Based on the survey data using discrete choice models, the researcher has concluded that social media tools have a significant effect on SMEs performance in UAE. This study has addressed a significant gap in the literature pertaining to the social media tools and performance of SMEs in UAE. Hence, the research hypotheses were then tested in the survey conducted. The results of this study indicated that social media tools have a significant effect on the performance of SMEs in UAE.

Directions for Future Research

Although this thesis has developed a model that shows effective social media tools for SMEs performance in UAE, several potential areas for future research remains. Thus, a longitudinal study would be desirable in investigating the causal status of the study variables observed in this research. This may be essential when designed with a panel study, to study the same set of samples over a period of time. This may give the opportunity to monitor the SMEs performance over time where behavioural patterns could easily be observed.

Business Models of High-Growth Enterprises in the St. Gallen Business Model Navigator Conception

Marlena GRABOWSKA

Czestochowa University of Technology, Czestochowa, Poland
marlena.grabowska@wz.pcz.pl

Abstract

The study covers the theoretical-empirical research on the structure of business models of high-growth enterprises. The essence of functioning of those enterprises in the context of the role they play in the economic structure has been indicated. Then, the fundamental definitions of business models and basic approaches to the architecture thereof have been described. The ideas of the business models' structure were considered through the prism of the St. Gallen Business Model Navigator conception. The empirical analysis of the construction of business models of high-growth enterprises has been conducted on the grounds of the survey research piloted on a group of 150 Polish high-growth enterprises. On the basis of the research results, basic attributes of the components of business models distinguished on the grounds of the St. Gallen Business Model Navigator conception have been identified. The analysis results have proven that the studied high-growth enterprises entities are characterised with similar features of business models' elements.

Highlights

- The essence of functioning of high-growth enterprises (HGEs)
- Business model conceptions
- Basic types of business model's elements
- Construction of the St. Gallen Business Model Navigator
- Empirical analysis of the construction of business models of high-growth enterprises based on the Business Model Navigator conception

Introduction

The issue of business models is one of the leading aspects concerning contemporary business entities. Interest in this topic is manifested both in management theory and practice. Recently a lot of scientific publications, as well as scientific conferences and meetings have been devoted to this issue. Furthermore, business models constitute a crucial subject of considerations of the management, as well as management and supervisory bodies of enterprises. This focus on the essence and functioning of business models is related to the role assigned thereto. A model is a simplified reflection of reality. Therefore, it should roughly describe a certain aspect of this reality. In the case of enterprises, it is the aspect of business reality. Thus, business models contribute to the establishment of a schedule of conducting business activities. In consequence, they facilitate learning about the conception of conducted activity and, at the same time, illustrate methods of achieving set business objectives. Therefore, both from a theoretical and practical point of view, it is an interesting issue, an in-depth analysis of which provides knowledge on the logics of the conducted business.

Nevertheless, despite the quickly disseminated theoretical and practical considerations on business models, insufficiently studied research areas can be still indicated. One of such cognitive loopholes is business models of high-growth enterprises (HGEs). The essence of this issue to a great extent results from the significance of this type of enterprises for economic development. In the subject literature, it is indicated that high-growth enterprises are an important factor for well-prospering economy (Pereira, Temouri, 2018). Quoted authors referring to the international research indicate that both during a recession and economic boom, a small part of all enterprises, which can be classified as HGEs, play a disproportionately large role in the economy.

According to the OECD (Eurostat OECD, 2007): "All enterprises with average annualised growth greater than 20% per annum, over a three-year period should be considered as high-growth enterprises. Growth can be measured by the number of employees or by turnover." Therefore, a natural consequence of HGEs' functioning is creating new workplaces, as well as contributing to the increase in the competitiveness and innovativeness of economic entities. Thus, it should be assumed that the more of this type of enterprises in the economic structure, the more it is beneficial for the economic situation of a given country or region.

Due to their characteristics, high-growth enterprises for many years have become a subject of numerous scientific publications describing various aspects of functioning thereof. Among the issues discussed within the HGE-related topic, the following can be distinguished, in particular: human capital, strategy, innovation, Human Resources Management practices, capabilities, (Demiret et al. 2017; Senderovitz et al., 2016; Keen and Etemad, 2012; Ryzhkova 2015; Rindova et al. 2012; Coad et al. 2014; Ensley et al. 2007, Lee 2014, Muurlink et al. 2012, Lopez-Garcia and Puente 2012; Baum and Bird 2010). Considering the significance of the above issues for reliable cognition of drivers of high growth, it should be underlined that there are clear shortages in scientific publications concerning business models of high-growth enterprises. Therefore, this is an aspect which has not been studied in-depth and which is worth further scientific exploration.

A basic aim of the study is to discuss the architecture of business models of high-growth enterprises on the grounds of the Business Model Navigator conception. Achievement of the set aim imposes two significant requirements concerning the research procedure of the issue. In the first stream of research, it is necessary to provide a theoretical interpretation of the essence of a business model and its features, which will allow learning about conceptual assumptions of the construction of a business model and describing basic elements of architecture thereof. Whereas, the second stream will comprise conducting empirical research on the construction of business models of high-growth enterprises based on the Business Model Navigator conception. Furthermore, the research hypothesis assuming that high-growth enterprises are characterised with similar features of business models' elements, will be verified.

Literature Review

The business model, considered as the outline of business reality, is a multi-criteria issue which provokes dispute instantly at the stage of its conceptualisation. The subject literature includes extensive considerations referring to business models. The intensive development of scientific interest in the business models conception started in the 90s of the 20th century. At that time researchers started making numerous attempts to create a defined framework for the discussed concept. Precursors of scientific research on business models include Boulton Libert and Samek (1997), Timmers (1998), as well as Vankatraman and Henderson (1998). These researchers focused on their considerations primarily on discussing the essence of this issue. For example, Timmers (1998) indicated that a business model is an architecture of products, services and streams of information including a description of various business activities and roles thereof.

In the later research on business models, it was indicated that its basic idea is to combine key elements of the enterprise's activity. Such belief is presented in publications by Hamel (2000), Amit and Zott (2001), Mitchell and Coles (2003), as well as Chesbrough and Rosenbloom (2002). Hamel (2000) identifies business models as a multi-aspect conception comprising: relations with customers, compositions of key strategies, strategic resources and value networks. Amit and Zott (2001) assume that a business model presents the essence, structure and management of transactions in order to create value by using business opportunities. In the context of integrating basic aspects of the enterprise's activity, an interesting proposal of learning about the essence of business model was presented by Mitchell and Coles (2003), who stated that it covers combined descriptive elements: "who", "what", "when", "why", "where", "how" and "how long". These elements indicate factors participating in delivering products and services to customers and end- users. Whereas, Chesbrough and Rosenbloom (2002) saw in the business model the heuristic logic combining technical possibilities with the recovery of economic value. The opinion identifying the business model conception with the concept of prevailing logic was reflected in many scientific publications. Linder and Cantrell (2000) notice that it is the core logic of organisation on value creation. Whereas, Shafer, Smith and Linder (2005) believe that the business model is a representation of the core logic of the enterprise and its strategic choices used for creating and maintaining value.

In the subject literature it is underlined that in many definitions of a business model common parts characterising this issue can be identified (Wagner et al., 2015). One of the basic components of a definition of a business model comprises the value category. In this context, Wagner et al. (2005) notice that a business model should be understood as an abstract tool or manifestation of the real business world, which is targeted at creating value by the enterprises with a consideration of the role of stakeholders and external factors in those activities. It is quite a generalised approach. Researchers of the issue of business models (Teece, 2010; Osterwalder and Pigneur, 2010) differentiate the value category and divide it into three characteristic areas: value proposed to current and prospective customers, value created with the enterprise's resources and infrastructure, as well as value returning to the enterprise. The above considerations show that both, customers and the enterprise itself can be considered value beneficiaries.

It should be underlined that the development of the scientific discourse related to the essence of business models has been multi-aspect. The topic of a business model attracts various streams and approaches included in the management sciences. Authors of scientific works dealing with this issue have been considering in a broader understanding not only terminological issues but also attempted to conduct more in-depth analyses of this issue. For instance, studies on the possibility of introducing innovative solutions in a business model can be indicated. It is stressed that the use of these solutions has been to a large extent induced by the evolution of consumers' preferences, as well as changing the competitive environment (Saebi, Lien, Foss, 2017). Whereas, the newest streams include, among others, the research on business models of social enterprises (Joyce and Paquin, 2016). The essence of the issue considered in this case consists in reflecting in a business model not only the economic but also social and environmental platforms.

However, the architecture of business models remains one of the essential research areas thereof. Nonetheless, regarding this issue, the subject literature has not developed a uniform position yet. In the propositions presented by researchers, there are significant discrepancies regarding the specification of the business model structure. These discrepancies result from adopting different areas of business model optics and considering it through a generalised or detailed prism. However, among the vast collection of concepts of business model elements, ~~one~~ (researchers) can differentiate the ones that have received the highest recognition both in scientific works and practice. They include the Value-Based Business Model defined by three elements and developed by Richardson (2008), the Business Model Canvas outlined by ten elements and developed by Osterwalder and Pigneur (2010), the St. Gallen Business Model Navigator defined by four elements and proposed by Gassmann, Csik and Frankenberger (2013).

Taking into consideration the conception of the value-based business model, one can refer to the beliefs represented by Richardson (2008), who distinguished basic business model elements focused on: value proposition, value creation and delivery, as well as value capture. Osterwalder and Pigneur (2010) specified the following as fundamental elements of the Business Model Canvas: customers' segments, value proposition, channels, relations with customers, streams of revenues, key resources, key activities, key partners, and cost structure. Whereas, elements of the St. Gallen Business Model Navigator are based on four key questions: Who? (Who is your target customer?), What? (What do you offer to the customer?), How? (How is the value proposition created?) and Value? (How is revenue created?). While analysing the proposed conceptualisations of the business model structure, it should be underlined that despite terminology discrepancies regarding names of the elements and differing number thereof, there are certain clear logical correlations (Table 1).

Table 1: Correlations between elements of a business model according to the value-based conception, the Business Model Canvas and the St. Gallen Business Model Navigator

The conception of the value-based business model (Richardson, 2008)	Business Model Canvas (Osterwalder and Pigneur, 2010)	St. Gallen Business Model Navigator (Gassmann, Csik, Frankenberger, 2013)
value proposition	value proposition	What?
	customer segments	Who?
	customer relationship	
value creation and delivery	delivery channels	How?
	key partners	
	key resources	
	key activities	
value capture	revenue streams	Value?
	cost structure	

The value proposition usually concerns the offer of products and services of a given enterprise. Therefore, it is related to the answer to the question: *What the enterprise can offer to its customers?* Thus, a collection of products and services, which generate value for specific groups of customers, is specified (Richardson, 2008). Indication thereof is related not only to the specification of customers' needs and interests but also to developing systemic measures related to product delivery and exploitation. Whereas with the answer to the question: *Who is the target customer?* the enterprise indicates groups of people and organisations that it strives to reach and provide services to. In this case, the analysis or relations between the enterprise and representatives of a specific customers' segment is also crucial (Bocken et al. 2014; Davies, Chambers, 2018).

Value creation stipulates the manners and methods of creating value. The task of this business model is to answer the question: *How is the value created?* In this area is specified a combination of resources and capabilities at a disposal of the enterprise and necessary to generate value. Here, fundamental points of reference include partners, key resources and key measures that should be properly configured and mutually adjusted. Furthermore, after value creation, it is transferred via relevant channels of communication with customers and distribution channels (Amit and Zott, 2010). In the business model architecture, it is important to indicate the type of interaction of customers in order to transfer value to them.

Another characteristic area in a business model comprises value capture, which to a large extent is related to the specification of methods and manners of returning to the enterprise the value transferred to customers (Teece 2010). Thus, this business model element can be treated as feedback in value transfer between the customer and the enterprise. Therefore, it comes down to the answer to the question: *How profitable is a/the business model?* In the simplest understanding value transferred to customers returns to the enterprise in a form of sales revenues, yet, the profitability analysis should also include the structural assessment of the incurred costs. Thus, it should be indicated that during value capture both its inflow and outflow occur. It is reflected in the business model's effectiveness.

While referring to the correlations between business models' elements differentiated in compliance with the aforementioned conceptions, it can be stated that basically the architecture of these models differs with the degree of aggregating information included in particular elements. Thus, the basic difference between business model conceptions consists of a different perspective of the degree of specificity of considered elements. However, irrespectively of presented types of business models construction, integrally they are a reflection of identical issues and aspects.

Taking the above characteristics of the business model architecture into account as the basis of the assessment of elements of business models of high-growth enterprises, the St. Gallen Business Model Navigator's assumptions have been adopted in further empirical research. Their basic feature constitutes expressing the business model architecture by questions, which in their form are neither too aggregated, nor too detailed. The original idea of this model can be found in the publication by Mitchell and Coles (2003), who considered the essence of a business model by identification of key questions indicating the factors participating in the business activity. Margretta (2002) considered the business model concept in a similar understanding, as she indicated that a business model should answer the following questions: Who is the customer? What is the value for the customer? How do we make money in this business? What is the underlying economic logic that explains how we can deliver value to customers at an appropriate cost? Therefore, it can be stated that questions asked during the research process (in this case concerning the business model construction) have, due to their nature, a deeper cognitive dimension and serve for inquisitiveness and willingness to learn about a given aspect.

Methods

The empirical research on the structure of business models of high-growth enterprises was conducted on the basis of data obtained from the survey research piloted on a group of 150 HGEs in Poland. The researched entities included: 52 small-sized enterprises employing up to 50 employees, 61 medium-sized enterprises employing between 51 and 250 employees and 37 large enterprises employing over 250 employees. Age of the researched entities in the vast majority did not exceed 30 years. In 28 cases the activity started not earlier than 10 years ago, 84 enterprises have operated for between 11 and 20 years, and 35 entities – between 21 and 30 years. Whereas, 3 entities indicated over 30 years of market experience.

Entities were included in the group of high-growth enterprises according to the OECD nomenclature (Eurostat OECD, 2007), i.e. entities characterised with an increase in sales revenues or employment, on average, by at least 20% per year in the period of three years. In compliance with the above criteria, 141 enterprises indicating an increase in revenues (among which, 113 noted an increase only in revenues) and 37 of enterprises indicating an increase in employment (among which, 9 noted an increase only in employment) were identified. Whereas, 28 of studied entities declared both an increase in sales revenues and an increase in employment.

The assumptions of the business model construction proposed by Gassmann, Csik, Frankenberger (2013) were used for the formulation of survey questions. Four groups of questions corresponding to the St. Gallen Business Model Navigator were distinguished.

Within the element Who? (Who is your target customer?) the following were distinguished: targeting products at specific market industries (WHO1), having a key supplier of products and services (WHO2), having permanent/regular suppliers of products and services (WHO3), having a key customer/recipient (WHO4), having permanent/regular recipients of products and services (WHO5), factors in relations with the key supplier (WHO61 – timeliness of order execution, WHO62 – beneficial payment terms, WHO63 – quality of the product/service, WHO64 – availability of the product/service, WHO65 – quality of the order processing).

In the area of What? (What do you offer to the customer?) the following factors have been identified: activities performed for the customer (WHAT11 – counselling, WHAT12 – design of the product/service, WHAT13 – production of the product/performance of the service, WHAT14 – sales of the product/service, WHAT15 – implementation of the product/service, WHAT16 – training on the product/service, WHAT17 – product-related/service-related services), characteristics of main products/services (WHAT21 – constitute author's solution, WHAT22 – developed on the basis of a licence, WHAT23 – developed on the basis of a cooperation, WHAT24 – are performed according to the principal's plans/designs, WHAT25 – are related to the delivery logistics), features of the enterprise's activity (WHAT31 – systematic increase of the quantity of offered products/services, WHAT32 – offer of original products and services targeted at a specific group of customers, WHAT33 – entry into new industries and markets, WHAT34 – starting new types of activities, WHAT35 – cooperation with universities, research units).

For the business model element How? (How is the value proposition created?) the following have been indicated: resources obtained from key and/or permanent suppliers (HOW11 – knowledge and experience, HOW12 – raw materials, semi-products, components, goods, HOW13 – access to the infrastructure, real estate, HOW14 – licences, trademarks, copyrights, HOW15 – databases), resources relevant for producing key goods and services (HOW21 – technological resources, HOW22 – human resources (employees), HOW23 – other intangible resources (e.g. licences, databases), HOW24 – financial resources), groups of intangible resources (HOW31 – human capital, that is, employees' skills, employees' experience, employees' intellectual potential, employees' specialist knowledge, the management's managerial skills, HOW32 – organisational capital, that is, organisational structure, organisational culture, management methods, in-house relations, HOW33 – intellectual property, that is, patents, licences, trademarks, copyrights, contacts, databases, HOW34 – key competences, that is, know-how, knowledge, specialist knowledge, experience, abilities and capacities, HOW35 – relations that can take a form of formal or informal relations, relations with the environment, in-house relations, relations with customers or suppliers, HOW36 – employee's approaches and behaviours related to loyalty, availability, motivation and engagement in work, HOW37 – position resources, that is, trading brand, customers' loyalty, the company's goodwill and image, knowledge on the competition), forms of communication with customers generating economic benefits (HOW41 – website, HOW42 – social media, HOW43 – business meetings, conferences for customers, HOW44 – e-learning platforms for customers, HOW45 – traditional forms of advertising i.e.: radio, television, posters, leaflets, HOW46 – word-of-mouth marketing).

Whereas for the element Value? (How is revenue created?) the following were identified: diversification of revenues (VALUE1), depending on the origin of resources on the key customer (VALUE2), depending on the origin of resources on the key market industry (VALUE3), basic elements of the cost structure (VALUE41 – remunerations, VALUE42 – outsourcing, VALUE43 – costs of semi-products and raw materials), areas of savings in costs (VALUE51 – remunerations, VALUE52 – outsourcing, VALUE53 –

costs of semi-products and raw materials), stability of the financial result (VALUE61 – in the last 5 years, VALUE62 – in the last 3 years, VALUE63 – in the last year, VALUE64 – was not positive in the last 5 years).

Results and Discussion

The tables below include the characteristics of answers to survey questions referring to each element of the St. Gallen Business Model Navigator. The answers have been presented by categories: Who? – Who is your target customer? (Table 2), What? – What do you offer to the customer? (Table 3), How? – How is the value proposition created? (Table 4) and Value – How is revenue created? (Table 5). Data in particular tables presenting percentage amounts of given answers have been presented with reference to the total number of studied HGEs, enterprises indicating only an increase in revenues, enterprises indicating only an increase in employment and enterprises indicating both, an increase in revenues and employment.

Analysis of the data included in Table 2 allows indicating that 90% of high-growth enterprises target their products at specific market industries. All three distinguished subgroups of HGEs are characterised with high specialisation of production. Furthermore, it can be noticed that almost half of the studied entities have a key supplier of products and services. High-growth enterprises pay particular attention to stability in the supply chain. 84% of respondents have permanent and regular suppliers, and 78% of respondents have permanent and regular recipients. Whereas, at least ¼ of respondents included primarily the timeliness of orders' execution and beneficial payment terms as significant factors in relations with key suppliers.

Table 3 presents the characteristics of the business model element being the value proposition. The studied entities are primarily production-service enterprises. Such a declaration was made by over 90% of respondents. Nonetheless, the vast majority of them perform various activities included in the value chain. 56% of HGEs design products and services, over 51% of them implement products and services, and almost 55% of them provide follow-up services. While analysing the sources of offered products and services, three basic directions thereof can be indicated. Over 63% of respondents indicate that those are the author's solutions. 62.67% state that they were developed on the grounds of a cooperation, whereas 60% declare performance thereof on the grounds of the principal's plans and designs. While characterising the activity of HGEs, over 80% of respondents stated that they were systematically increasing the number of offered products and services. Furthermore, 60.67% of respondents indicate the expansion of new industries and markets.

HOW45	0,00%	0,00%	0,00%	0,00%
HOW46	0,00%	0,00%	0,00%	0,00%

While analysing the manner of value creation by high-growth enterprises, it should be noticed that only 13.33% of respondents assigned to technological resources at least 50 points at a 100-point scale of significance for producing key goods and services. The second place in this classification was taken by human resources, since 50 or more points were assigned thereto by almost 9% of respondents. Verification of the significance of intangible resources' groups allows noticing that over 32% of HGEs indicated human capital as a basic group thereof. Whereas, organisational capital took next place. 22% of respondents indicated it as a priority. Also, important features of resources obtained from key and permanent suppliers were considered in this area. As many as 90% of respondents indicated that they expect from the key supplier only delivering raw materials, semi-products, components and goods, yet, at the same time 70% of high-growth enterprises declared acquiring from these suppliers' knowledge and

experience as well. Whereas, analysing the form of communication with customers, it can be noticed that the studied entities do not find sources of economic benefits in the forms of communication with customers. The most of respondents include business meetings and conferences for customers in such sources.

Table 5: Characteristics of the business model element *Value – How is revenue created?* in high-growth enterprises

	high-growth enterprises			
	In total	**Indicating only an increase in revenues**	**Indicating only an increase in employment**	**Indicating an increase in revenues and employment**
VALUE1	42,00%	43,36%	33,33%	39,29%
VALUE2	20,67%	16,81%	33,33%	32,14%
VALUE3	80,67%	79,65%	100,00%	78,57%
VALUE41	13,33%	13,27%	11,11%	14,29%
VALUE42	12,67%	12,39%	11,11%	14,29%
VALUE43	74,00%	74,34%	77,78%	71,43%
VALUE51	8,67%	9,73%	11,11%	3,57%
VALUE52	74,00%	75,22%	66,67%	71,43%
VALUE53	17,33%	15,04%	22,22%	25,00%
VALUE61	74,00%	78,76%	44,44%	64,29%
VALUE62	96,67%	98,23%	88,89%	92,86%
VALUE63	95,33%	97,35%	100,00%	85,71%
VALUE64	1,33%	0,00%	0,00%	7,14%

The last of the analysed business model's elements indicates the area of its profitability. While conducting research in this direction, it can be indicated that 42% of respondents diversify revenues. Only 20% of HGEs declare that they receive revenues from the key customer, yet, over 80% of them receive revenues from the key industry. The greatest significance in the cost structure is attributed to costs of materials, semi-products and raw materials. Whereas, outsourcing constitutes the biggest source of savings in costs. 74% of high-growth enterprises indicate that they search for savings in this area. While analysing the many years of profitability of the conducted activity, it can be noticed that only 1.33% of respondents indicated the lack of positive financial results in the last 5 years.

Conclusion

To sum up the considerations concerning elements of business models of high-growth enterprises considered in compliance with the St. Gallen Business Model Navigator conception, it can be indicated that characteristic features thereof, represented by the vast majority of studied entities, have been observed. In the case of the element *Who? – Who is your target customer?* it was targeting production at specific market industries and stability of the supply chain. Studied entities attributed a vast significance to the fact of having both regular suppliers and recipients. While analysing the characteristics of the

element *What? – What do you offer to the customer?* it can be stated that a large number of HGEs undertake sequential operations constituting the value chain elements. Nevertheless, production and sales are the most important links of this chain. Furthermore, value proposition characterises with a systemic increase in the offer of products and services, acquiring new industries and markets. Within the analysis of the element *How? – How is the value proposition created?* it should be noticed that studied entities did not significantly distinguish any of the proposed categories of resources. Therefore, it can be concluded that intangible resources are not the most significant in the process of creating value realised by high-growth enterprises. Whereas, while analysing the business model profitability represented by the element *Value – How is revenue created?* a lack of a decisive diversification of revenues is noticed. Studied HGEs do not depend on the key customer, but on the key industry. Furthermore, they show fairly good profitability of conducted activity.

To sum up the above considerations, it should be indicated that the research hypothesis, assuming that HGEs are characterised with similar features of business models' elements, has been verified positively. Confirmation of this hypothesis allows distinguishing basic attributes of business models of high-growth enterprises and thus, indicate the direction of constructing business models of these enterprises. However, it should be emphasized that the above features of the components of business models of HGE have been highlighted on the basis of the concept of St. Gallen Business Model Navigator. From a research point of view, a more detailed analysis of the business models architecture of HGE companies would also be interesting, e.g. based on the Business Model Canvas concept.

Abstract

Contemporary enterprises operating on the market not only affect the development of the national economy but also influence the formation of the nearest social and environmental environment. Although their primary purpose of the activity is economic goals, along with their simultaneous realization, enterprises undertake several numbers of actions focused on the social and ecological environment as well. These activities are part of an increasingly common trend, which is the concept of sustainable entrepreneurship, understood as a continuous commitment of the entrepreneur to ethical behaviour and contributing to economic development while improving the quality of life of employees, society and environmental protection. Thus the purpose of an article was examining whether there is a relationship between economic goals and such activities undertaken by Polish enterprises in the SME sector. Based on the results of the research, the conclusion is that longer the company operates on the market, the more actions it undertakes that fit into the concept of sustainable entrepreneurship.

Keywords: enterprise, sustainable entrepreneurship, c-Pearson coefficient, management

Introduction

Entrepreneurship is a factor conditioning not only economic development but also social and environmental. Striving for constant development, including by inventing new products and services and then taking actions to implement them is the essence of entrepreneurship. Since entrepreneurship manifests itself in almost all aspects of human life, it also makes a significant contribution to the implementation of the concept of sustainable development, which resulted in the appearance of the term "sustainable entrepreneurship". The "sustainable entrepreneurship" term essentially combines two terms' sustainable development' and 'entrepreneurship'. It characterizes some core business aspects that are less oriented on management systems and focus more on personal initiative and entrepreneur's skills in order not only to achieve market success but also to make (positive) changes in society and the natural environment. The appearance of sustainable entrepreneurship is, among others, the effect of actions aimed at taking into account the contribution of entrepreneurship to sustainable development in a more comprehensive manner. It is assuming that this contribution of entrepreneurship to sustainable development was caused by, among others a change in the attitudes of corporate stakeholders that go beyond narrow economic interests and increasingly take into account environmental and social aspects. Thus, they demand, for example, actions to improve the state of the natural environment or social improvements. However, these extended needs have also economic importance, as the actions as a result of the demands of this group can attract a larger group of recipients of products or services, which in turn will translate into measurable economic benefits. Therefore, the essence of this entrepreneurship is to conduct business not only bringing a sure economic profit but also enabling meeting environmental and social goals (Choi, Gray, 2008). Majid and Koe referred to as an entrepreneurial process that innovatively seeks to achieve economic profit

but also strives to achieve social justice, improve the quality of the environment and cultural heritage (2012).

According to S. Graham (2010), sustainable entrepreneurship is the process of maintaining a constant level of entrepreneurship development in order to change the business paradigm to one that assumes unchanged and unsurpassed GDP growth, jobs, capital investment, technological development and quality of life. By implementing such (often radical) actions, entrepreneurs also respond to the unmet needs of particular groups of stakeholders (Shaltegger, Wagner, 2011). The result of its operation is products, processes and services in order to achieve profits, both economic (pure financial profit) and non-economic (improvement of the company's image). A. Gerlach (2003) also emphasizes the role of innovation in sustainable entrepreneurship, because it is the innovative behaviour of private sector enterprises that perceive environmental and social issues as the primary goal and competitive advantage that determines that they operate in the spirit of sustainable entrepreneurship. Sustainable entrepreneurship is an innovative, market-oriented form of creating economic and social values. It is implemented by people and groundbreaking activities (innovations) that bring benefits in economic, social and environmental dimensions (Chodyński, 2014). From the definitions mentioned above, it follows that, in a narrow sense, sustainable entrepreneurship most often concerns an innovative enterprise that provides products and services friendly to the natural environment and society, which will allow achieving market success.

Sustainable entrepreneurship in an enterprise

Sustainable entrepreneurship can also be characterized by an enterprise with an established market position and conducting activities for many years, which, in addition to conducting activities aimed at achieving financial profits, initiates, e.g. social changes or undertakes actions aimed at improving the condition of the natural environment. This broad approach to sustainable entrepreneurship presents the definition given by E. Crals and L. Vereeck (2005). They claim that it is a continuous commitment of business to ethical behaviour and contributing to economic development, while improving the quality of life of employees, their families, local communities, society and, consequently, the whole world and its future generations. Entrepreneurs are not only profit-oriented but are also involved in activities aimed at achieving the goals of sustainable development in economic and environmental terms. Sustainable entrepreneurship is also an innovative, market-oriented and creativity-driven form of creating economic and social value through groundbreaking, environmentally or society-friendly products or services of breakthrough importance (implicitly - innovative) (Pinchot, 1988; Gapp, Fisher, 2007). Contemporary enterprises face a challenge in which they should strive for continuous development while accepting responsibility for actions that affect the immediate social and environmental environment in an increasingly globalized world. There is an assumption that the concept of sustainable entrepreneurship changed the business perspective and strategies of modern enterprises, which departed from the attitude focused on achieving economic and financial profit towards social and ecological order. Still, the financial results of the company are a definite success factor, but next to them it is social and ecological responsibility that has also become critical factors for further development (Santos, Rebelo, Barros, Pereira, 2012; Hubbard, 2009; Zairi, Peters, 2002). Contemporary companies operating on the market in the spirit of sustainable entrepreneurship, take several actions that are part of the concept of sustainable entrepreneurship, in the form of (Doherty, Haugh, Lyon, 2014; Paliwoda-Matiolańska, 2009; Zainon, Ahmad, Atan, Wah, Bakar, Sarman, 2014; Muhamad, Ebrahim, Hami, 2014; Burchell, 2008):

- defining and adopting social or ecological objectives,
- undertaking activities aimed at satisfying the social interest, creating an appropriate organizational culture,
- human resources management through responsible and innovative leadership,
- innovative and ecological management of production processes, through the use of modern, often pro-ecological technologies,
- research and development management
- responsible marketing management, in the form of ethical and social activities or reliable customer service,

- continuous improvement of working conditions of employees,
- involvement in charity
- striving for integration with the social and natural environment
- striving for positive perception and proper reputation,
- increasing the efficiency of employees' activities and work,
- looking for further solutions in the field of sustainable entrepreneurship based on own experience.

However, the organization's main economic goals are, among others making business profits, costs reductions, increased economic efficiency, higher predictability and cost stability, better cooperation with clients and partners, better company's image, increasing the number of customers, better business continuity, ability to run innovations faster and accelerating enterprise's development.
Thus, the conducted literature studies made it possible to formulate two research questions. RQ1: Is there a statistically significant correlation between the implementation of economic goals by organization and undertaking activities by the concept of sustainable entrepreneurship. RQ2: whether there were differences between the dependencies age of the enterprise (time of its functioning on the market)?
Based on the above, the research hypotheses assume that:

H1: There is a significant statistical relationship between the implementation of economic goals by Polish enterprises and undertaking activities by the concept of sustainable entrepreneurship.
H2: Due to the organization's length of operation, there are differences in relationships between the implementation of economic goals by Polish enterprises and undertaking activities in line with the concept of sustainable entrepreneurship.

The verification of accepted hypotheses included a statistical analysis of relationships using the c-Pearson correlation coefficient. Pearson's C contingency coefficient resists on the chi-square independence test. This measure determines the strength of the relationship between the two variables analyzed in the chi-square test. Because we use this test to analyze two qualitative variables, the contingency coefficient is determined by a measure of the relationship between qualitative, nominal and non-measurable variables. The C-Pearson contingency coefficient uses divisible tables with any number of levels of two variables. This coefficient takes values from 0 - which means the independence of two variables, no relationship between them to "almost" 1 - which means a stable relationship between them. Therefore, the coefficient values determine the strength of the relationship between two variables. The closer the value is to 1, the stronger the relationship. The significance of the c-Pearson contingency coefficient is the same significance that we determine for the chi-square test. In the conducted analyzes, the corrected form of the contingency coefficient was calculated in order to unify the maximum values for two coefficients (Kline, 2013).

Research Methodology

Structure of the Research Group

The research procedure assumed surveying randomly selected enterprises of the SME sector. For this article, we accepted the SME definition, provided by EU Recommendation: The category of micro, small and medium-sized enterprises (SMEs) is made up of enterprises which employ fewer than 250 persons and which have an annual turnover not exceeding EUR million, and/or an annual balance sheet total not exceeding EUR 43 million (OECD, 2003). This definition takes into account the following three criteria: staff headcount, annual turnover and annual balance sheet total (fig. 1).

Enterprise category	Headcount: annual work unit	Annual turnover	or	Annual balance sheet total
Medium-sized	< 250	<= EUR 50 mln		<= EUR 43 mln
Small	< 50	<= EUR 10 mln		<= EUR 10 mln
Micro	< 10	<= EUR 2 mln		<= EUR 2 mln

Fig. 1: SME's definition

The critical analysis of the literature made it possible to construct a research tool in the form of a questionnaire, which made it possible to conduct quantitative research. The analysis of the results obtained resists on the analysis of primary data obtained as a result of the completed survey. The questionnaire contained 20 questions divided into three main parts, which made it possible to obtain information on sustainable entrepreneurship in Polish enterprises. The nature of the answers to individual questions took the form of single, multiple choice answers and answers on the 6-point Likert scale. The scale used in the study consists of 6 categories of answers (6 - definitely yes, 5 - yes, 4 - rather yes, 3 - rather no, 2 - no, 1 - definitely no), which create the correct order (Chomeya, 2010). The analysis of measurement data using the Likert scale involves comparing and interpreting the points counted for individual items or individual respondents. Before conducting the main study, a pilot study included a group of 10 companies, the aim of which was to eliminate potential inaccuracies so that respondents had no doubts about the nature of the questions asked. Then, the primary survey among 400 enterprises, a representative sample of the survey, was conducted.

When choosing the study using the representative method, efforts made to minimize the sample size while maintaining the required certainty and accuracy of further inference. The minimum sample size when estimating the probability of success p in the general population calculated based on the sample size formula for a vast population:

$$N_{min} = \frac{N_p\ (\alpha^2 * f(1-f)}{N_p * e^2 + \alpha^2 * f(1-f)} = 384$$

where:

Nmin = minimum sample size,
Np = population size,
α2 = level of significance,
e2 = accepted level of the highest error,
f = the structure index

As the calculations show, the minimum sample size, with an acceptable confidence level of 1-2 = 0.90 and the maximum estimation error e = 5%, should be 384 questionnaires. Because 400 questionnaires were qualified for the research, we assumed that this condition had been met and the sample obtained meets one of the assumptions of the representative method. This value results from the relationship that determines the minimum sample size used when selecting the sample by individual sampling. The primary research was conducted in August 2018, using the CATI and CAWI methods.

The analysis of research results begins with the presentation of characteristics of the adopted research

sample based on its structure, which takes into account the size of enterprises (determined based on the number of employees as well as the profile of activity.

Table 1: The structure of the research sample

Profile	Frequency	Per cent	Valid per cent	Cum. Per cent
Administration	16	4%	4%	4%
Construction	45	11%	10%	14%
Professional, scientific and technical activities	31	8%	8%	22%
Education	6	2%	2%	24%
Trade	98	25%	24%	48%
Information and communication	14	4%	4%	52%
Entertainment and recreation	2	1%	1%	53%
Real estate	12	3%	3%	56%
Healthcare and social care	20	5%	5%	61%
Other services	8	2%	2%	63%
Industry	110	28%	27%	90%
Transport and warehousing	27	7%	7%	97%
Accommodation and gastronomy	11	3%	3%	100%

The answers received from all 400 questionnaires were primary data that we further developed. This study covered two stages: in the first stage, an Excel spreadsheet was used, which enabled the graphical representation of necessary information about the research sample. In the second stage, it was a tool for creating a database containing a set of variables, based on which statistical calculations were carried out at a later stage using selected statistical methods.

The descriptive and Reliability Analysis

Because the nature of the answers to individual questions took the form of single, multiple-choice answers and answers on the Likert 6-point scale, before starting the analysis of the obtained test results, an analysis of the reliability of the measuring scale we used Alpha Cronbach statistics. This statistics is the most often used to measure the internal consistency or reliability of a psychometric tool. It is a factor that tests the reliability of research questionnaires used, and in particular, the internal coherence of the tool used. Alpha Cronbach's statistics base on the correlation coefficients of all questionnaire questions with the overall score on this scale (Taber, 2018). Cronbach's alpha can assume values in the range of 0 to 1, with the assumption that the value of 0.6 is average and commonly accepted, although it is strived for the value of this coefficient to be 0.9.

Table 2: The reliability test of the economic goals items of the total 410 questionnaires

Variable	Mean	Variance	Std dev	Cronbach's alpha
Making business profits (V1)	4,924390	1,761995	1,327402	0,887014
Increased economic efficiency (V2)	3,873171	1,749156	1,322557	0,888089
Costs reductions (V3)	3,885366	1,720323	1,311611	0,886969
Higher predictability and cost stability (V4)	3,758537	1,582140	1,257831	0,885974
Investment risk reduction (V5)	3,587805	1,890804	1,375065	0,886740
The possibility of using technologically advanced IT resources (V6)	3,970732	2,326770	1,525375	0,893529
Better cooperation with clients and partners (V7)	4,756098	1,329119	1,152874	0,884702
Better company's image (V8)	4,819512	1,116489	1,056640	0,882756

Increasing the number of customers (V9)	4,714634	1,201986	1,096351	0,881817
Better cooperation between employees (V10)	4,358537	1,418814	1,191140	0,883250
Improving employees' efficiency (V11)	4,297561	1,490703	1,220944	0,880885
Better business continuity (V12)	4,346341	1,380977	1,175150	0,880408
The possibility to standardize and simplify procedures (V13)	4,204878	1,840563	1,356673	0,878564
The ability to run innovations more faster (V14)	3,934146	2,037217	1,427311	0,880442
Accelerating enterprise's development (V15)	3,965854	1,930372	1,389378	0,880959

As can be seen from the table below, it can be concluded that the scale used is a reliable measurement tool characterized by high consistency because, for all the studied issues, Cronbach's alpha values are above 0.8. Similar calculations we conducted for issues related to activities falling under the concept of sustainable entrepreneurship (table 3).

Table 3: The reliability test of the activities of sustainable entrepreneurship of the total 410 questionnaires

Variable	Mean	Variance	Std dev	Cronbach's alpha
Responsible use the available resources (X1)	4,646341	1,500537	1,224964	0,908345
Reducing the level of raw materials' consumption, semi-finished products and waste (X2)	4,739024	1,474512	1,214295	0,906188
Long-term goals are just as important as short-term goals (X3)	4,758537	1,308301	1,143810	0,905752
Operating according to the law of ethic and justice (X4)	5,117073	1,062055	1,030561	0,905195
While formulating new directions of activities, environmental, social and financial values are taken account (X5)	4,521951	1,262353	1,123545	0,906224
Ecological and social aspects are included in innovative activity (X6)	4,441463	1,694609	1,301772	0,906613
use the information power – acquisition, sharing and transforming (X7)	4,619512	1,248518	1,117371	0,908502
Caring for the well-being of employees and maintaining a balance between work and their private life (X8)	4,868293	1,312684	1,145724	0,903174
Striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (X9)	5,187805	1,037993	1,018819	0,907316
Paying attention to making services/products friendly to the natural environment and people (X10)	4,734146	1,320347	1,149064	0,902888
Implementation of procedures that result in the rational management of available resources (X11)	4,539024	1,378669	1,174167	0,901278
Using the "green technology" solutions (X12)	3,882927	2,240539	1,496843	0,914549

As can be seen from the table below, it can be concluded that the scale used is a reliable measurement tool characterized by high consistency because, for all the studied issues, Cronbach's alpha values are above 0.9.

Research Results

In order to verify the first research hypothesis, a statistical analysis of the significance of the c-Pearson correlation coefficient was carried out (table 4).

Table 4: The results of c-Pearson correlation coefficient analysis for the selected variables

The obtained results made it possible to observe significant statistical correlations between the studied issues:

- enterprises which indicated the realization of the goal in the form of making business profits also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,34228, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,42728, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,34192, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,32604, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,33467, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,35774, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,34595 p < 0,05), and striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,40056, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increased economic efficiency also often indicated taking actions in the form of: reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,3284, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,33807, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,35808, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,38085, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,34524, p < 0,05), and using the „green technology" solutions (Ccor = 0,35019, p < 0,05);

- enterprises which indicated the realization of the goal in the form of costs reductions also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,34127, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,35186, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,35208 p < 0,05), and using the „green technology" (Ccor = 0,3563, p < 0,05);
- enterprises which indicated the realization of the goal in the form of higher predictability and cost stability also often indicated taking actions in the form of: operating according to the law of ethic and justice (Ccor = 0,31939 p < 0,05), and while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,34283 p < 0,05);
- enterprises which indicated the realization of the goal in the form of investment risk reduction also often indicated taking actions in the form of: operating according to the law of ethic and justice (Ccor = 0,33011, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,34127 p < 0,05), and using the „green technology" (Ccor = 0,32171 p < 0,05);
- enterprises which indicated the realization of the goal in the form of the possibility of using technologically advanced IT resources also often indicated taking actions in the form of: use the information power – acquisition, sharing and transforming (Ccor = 0,34568 p < 0,05);
- enterprises which indicated the realization of the goal in the form of better cooperation with clients and partners also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,37205, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,34985, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,4063, operating according to the law of ethic and justice (Ccor = 0,49973, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,4051, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,35936, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,40103, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,36753, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,47477, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,3194 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,33041 p < 0,05);
- enterprises which indicated the realization of the goal in the form of better company's image also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,36129, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,44214, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,51495, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,43283, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,37921, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,45275, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,34788, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,49377, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,39554, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,35168 p < 0,05), and using the „green technology" (Ccor = 0,35534 p < 0,05);
- enterprises which indicated the realization of the goal in the form of increasing the number of customers also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,35874, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,35642, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,4491, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,50774, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,42332, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,3656, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,44236, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,45118, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,34448, p < 0,05), implementation of

procedures that result in rational management of available resources (Ccor = 0,3786 p < 0,05), and using the „green technology" solutions (Ccor = 0,33638 p < 0,05);

- enterprises which indicated the realization of the goal in the form of better cooperation between employees also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,33642, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,32101, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,34807, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,45075, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,39879, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,36781, use the information power – acquisition, sharing and transforming (Ccor = 0,32505, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,38617, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,3756, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,35777 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,37768 p < 0,05);
- enterprises which indicated the realization of the goal in the form of improving employees' efficiency also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,33739, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,33352, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,33891, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,39831, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,375, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,34771, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,34555, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,35829, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,31881, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,36083 p < 0,05), and using the „green technology" solutions (Ccor = 0,33766 p < 0,05);
- enterprises which indicated the realization of the goal in the form of better business continuity also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,32858, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste0,36507, operating according to the law of ethic and justice (Ccor = 0,38004, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,4705, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,35315, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,36413, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,32422, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,36062, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,32175 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,33591, p < 0,05);
- enterprises which indicated the realization of the goal in the form of possibility to standardize and simplify procedures also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,31966, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,3535, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,33942, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,36645, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,37198, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,38366, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,43878, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,37024, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,34204, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,39665 p < 0,05), and using the „green technology" solutions (Ccor = 0,34298, p < 0,05);

- enterprises which indicated the realization of the goal in the form of the ability to run innovations more faster also often indicated taking actions in the form of: operating according to the law of ethic and justice (Ccor = 0,33271, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,39405, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,40672, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,41285 p < 0,05), and using the „green technology" solutions (Ccor = 0,37753, p < 0,05);
- enterprises which indicated the realization of the goal in the form of accelerating enterprise's development also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,35045, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,32893, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,42077, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,34675, while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,38653, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,40226, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,45113, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,32939, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,40003 p < 0,05), and using the „green technology" solutions (Ccor = 0,44351 p < 0,05);

Based on the results, it can be concluded that the first research hypothesis has been positively verified because there were numerous significant statistical relationships between the implementation of economic goals by Polish enterprises and taking actions in accordance with the concept of sustainable entrepreneurship.

In order to verify the second research hypothesis assuming that due to the adopted age of the enterprise, there are differences in the relationships between the implementation of economic goals by Polish enterprises and taking actions in accordance with the concept of sustainable entrepreneurship, the surveyed enterprises were divided into three groups, depending on the number of years of operation on market (table 5).

Table 5: The age structure of enterprises

Group	Qty	%	Cum. %
Up to 10 years	163	41%	41%
10-20 years	207	52%	93%
More than 20 years	29	7%	100%

The first group of enterprises includes enterprises operating for no more than 10 years, in total they accounted for almost half (41%) of the surveyed enterprises. A statistical analysis of the significance of the c-Pearson correlation coefficient was also carried out for this group (table 6).

Table 6: The results of c-Pearson correlation coefficient analysis for the selected variables for the first group of enterprises

The obtained results made it possible to observe significant statistical correlations between the studied issues:

- enterprises which indicated the realization of the goal in the form of making business profits also often indicated taking actions in the form of long-term goals are just as important as short-term goals (Ccor = 0,50961, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increased economic efficiency also often indicated taking actions in the form of striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,48164, p < 0,05), and paying attention to making services/products friendly to the natural environment and people (Ccor = 0,51629, p < 0,05);
- enterprises which indicated the realization of the goal in the form of costs reductions also often indicated taking actions in the form of use the information power – acquisition, sharing and transforming (Ccor = 0,51798, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,53625 p < 0,05), and implementation of procedures that result in the rational management of available resources (Ccor = 0,53894, p < 0,05);
- enterprises which indicated the realization of the goal in the form of higher predictability and cost stability also often indicated taking actions in the form of ecological and social aspects included in innovative activity (Ccor = 0,50327, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better cooperation with clients and partners also often indicated taking actions in the form of operating according to the law of ethic and justice (Ccor = 0,56542 p < 0,05), and striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,46975, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better company's image also often indicated taking actions in the form of operating according to the law of ethic and justice (Ccor = 0,45429, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,5299 and using the "green technology" solutions (Ccor = 0,48315, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increasing the number of customers also often indicated taking actions in the form of: use the information power – acquisition, sharing and transforming (Ccor = 0,48929, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,47175 p < 0,05), and using the „green technology" solutions (Ccor = 0,4913, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better cooperation between employees also often indicated taking actions in the form of caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,50314, p < 0,05);
- enterprises which indicated the realization of the goal in the form of improving employees' efficiency also often indicated taking actions in the form of operating according to with the law of ethic and justice (Ccor = 0,4903, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,50938 p < 0,05), and caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,51112, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better business continuity also often indicated taking actions in the form of operating according to the law of ethic and justice (Ccor = 0,52826, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,59285 p < 0,05), and use the information power – acquisition, sharing and transforming (Ccor = 0,63947, p < 0,05);

- enterprises which indicated the realization of the goal in the form of possibility to standardize and simplify procedures also often indicated taking actions in the form of: operating according to the law of ethic and justice (Ccor = 0,53172, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,54252, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,5037, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,60221 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,53188, p < 0,05);
- enterprises which indicated the realization of the goal in the form of the ability to run innovations faster also often indicated taking actions in the form of use the information power – acquisition, sharing and transforming (Ccor = 0,51279, p < 0,05);
- enterprises which indicated the realization of the goal in the form of accelerating enterprise's development also often indicated taking actions in the form of: ecological and social aspects are included in innovative activity (Ccor = 0,51236, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,52748 p < 0,05), and using the „green technology" solutions (Ccor = 0,52132, p < 0,05);

The second group of enterprises includes organizations that operate for more than ten years but less than 20 years. Together they accounted for more than half (52%) of the surveyed enterprises. A statistical analysis of the significance of the c-Pearson correlation coefficient was also carried out for this group (table 7).

Table 7: The results of c-Pearson correlation coefficient analysis for the selected variables for the second group of enterprises

The obtained results made it possible to observe significant statistical correlations between the studied issues:

- enterprises which indicated the realization of the goal in the form of making business profits also often indicated taking actions in the form of: operating according to the law of ethic and justice (Ccor = 0,54884, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,58585, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,61704 p < 0,05), and paying attention to making services/products friendly to the natural environment and people (Ccor = 0,54537, p < 0,05);
- enterprises which indicated the realization of the goal in the form of investment risk reduction also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,57826

p < 0,05), and while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,57081, p < 0,05);

- enterprises which indicated the realization of the goal in the form of better cooperation with clients and partners also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,59617, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,54804, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,59897, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,57554 p < 0,05), and striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,61728, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better company's image also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,57961, p < 0,05), reducing the level of raw materials' consumption (Ccor = 0,54918, p < 0,05), semi-finished products and waste, long-term goals are just as important as short-term goals (Ccor = 0,60491, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,70347, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,58515, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,5828, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,69299, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,63701, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,81031 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,65689, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increasing the number of customers also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,62518, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,62936, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,69549, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,69946, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,80834 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,64099, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better cooperation between employees also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,57933, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,54065, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,57942, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,65183 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor =0,57005, p < 0,05);
- enterprises which indicated the realization of the goal in the form of improving employees' efficiency also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,59552, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,58165, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,62573, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,60985 p < 0,05), and using the „green technology" solutions (Ccor = 0,5772, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better business continuity also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,56371, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,58171, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,59426, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,59334, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,65553, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,63359 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,58931, p < 0,05);
- enterprises which indicated the realization of the goal in the form of possibility to standardize and simplify procedures also often indicated taking actions in the form of: striving to build lasting and

long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,58904 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,61229, p < 0,05);
- enterprises which indicated the realization of the goal in the form of the ability to run innovations more faster also often indicated taking actions in the form of: striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,57938 p < 0,05), and using the „green technology" solutions (Ccor = 0,60641, p < 0,05);
- enterprises which indicated the realization of the goal in the form of accelerating enterprise's development also often indicated taking actions in the form of: using the „green technology" solutions (Ccor = 0,60488, p < 0,05);
On the other hand, the third group were enterprises that have been operating on the market for more than 20 years, together they constituted 7% of all surveyed enterprises. A statistical analysis of the significance of the c-Pearson correlation coefficient was also carried out for this group (table 8).

Table 8: The results of c-Pearson correlation coefficient analysis for the selected variables for the third group of enterprises

The obtained results made it possible to observe significant statistical correlations between the studied issues:

- enterprises which indicated the realization of the goal in the form of making business profits also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,68514, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,62153, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,54188, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,48526, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,60588, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,61787 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,55695, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increased economic efficiency also often indicated taking actions in the form of: while formulating new directions of activities,

environmental, social and financial values are taken account (Ccor = 0,54407 p < 0,05), and using the „green technology" solutions (Ccor = 0,51962, p < 0,05);
- enterprises which indicated the realization of the goal in the form of costs reductions also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,5236, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,51682 p < 0,05), and while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,50228, p < 0,05);
- enterprises which indicated the realization of the goal in the form of higher predictability and cost stability also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,49765, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,49, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,49667, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,47572, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,55956, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,4792 p < 0,05), and using the „green technology" solutions (Ccor = 0,48413, p < 0,05);
- enterprises which indicated the realization of the goal in the form of the possibility of using technologically advanced IT resources also often indicated taking actions in the form of: while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,54802, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,56027, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,48299, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,48561, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,51611 p < 0,05), and using the „green technology" solutions (Ccor = 0,48356, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better cooperation with clients and partners also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,54277, p < 0,05), reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,48364, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,60888, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,57409, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,5317, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,50146, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,65213, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,53704, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,65964, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,49925 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,55442, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better company's image also often indicated taking actions in the form of: responsible use the available resources (Ccor = 0,54299, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,59168, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,55902, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,53677, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,48356, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,54711, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,53557, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,64532, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,5469 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,50607, p < 0,05);
- enterprises which indicated the realization of the goal in the form of increasing the number of customers also often indicated taking actions in the form of: reducing the level of raw materials' consumption, semi-finished products and waste (Ccor = 0,47781, p < 0,05), long-term goals are just as important as short-term goals (Ccor = 0,58254, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,48085, p < 0,05), while formulating new directions of activities, environmental,

social and financial values are taken account (Ccor = 0,50283, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,58969, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,54702 p < 0,05), and using the „green technology" solutions (Ccor = 0,49549, p < 0,05);

- enterprises which indicated the realization of the goal in the form of better cooperation between employees also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,50828, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,5657, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,50895, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,51066, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,51221, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,49508 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,53911, p < 0,05);
- enterprises which indicated the realization of the goal in the form of improving employees' efficiency also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,56919, p < 0,05), operating according to the law of ethic and justice (Ccor = 0,48626, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,48214, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,49842 p < 0,05), and implementation of procedures that result in rational management of available resources (Ccor = 0,50073, p < 0,05);
- enterprises which indicated the realization of the goal in the form of better business continuity also often indicated taking actions in the form of: while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,53781, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,53968 p < 0,05), and caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,55538, p < 0,05);
- enterprises which indicated the realization of the goal in the form of possibility to standardize and simplify procedures also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,50673, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,49154, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,52807, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,52597, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,53745, p < 0,05), paying attention to making services/products friendly to the natural environment and people (Ccor = 0,50325, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,52477 p < 0,05), and using the „green technology" solutions (Ccor = 0,51462, p < 0,05);
- enterprises which indicated the realization of the goal in the form of the ability to run innovations more faster also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,51984, p < 0,05), while formulating new directions of activities, environmental, social and financial values are taken account (Ccor = 0,48389, p < 0,05), ecological and social aspects are included in innovative activity (Ccor = 0,47747, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,56052, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,4894, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,48931 p < 0,05), and using the „green technology" solutions (Ccor = 0,51499, p < 0,05);
- enterprises which indicated the realization of the goal in the form of accelerating enterprise's development also often indicated taking actions in the form of: long-term goals are just as important as short-term goals (Ccor = 0,53876, p < 0,05), use the information power – acquisition, sharing and transforming (Ccor = 0,55898, p < 0,05), caring for the well-being of employees and maintaining a balance between work and their private life (Ccor = 0,51552, p < 0,05), striving to build lasting and long-term relationships with partners and clients in order to achieve its goals (Ccor = 0,51198, p < 0,05), implementation of procedures that result in rational management of available resources (Ccor = 0,5412 p < 0,05), and using the „green technology" solutions (Ccor = 0,51138, p < 0,05).

In each of the groups of enterprises examined, there are significant relationships between the economic objectives and the activities consistent with the concept of sustainable entrepreneurship. However, the analyzes carried out clearly showed that:
- in the first group of enterprises, these relationships were the least, as we observed only 31 significant relationships,
- in the second group of enterprises, these dependencies were more, as we observed 48 significant dependencies,
- in the third group of enterprises, we observed the most significant number of dependencies - as many as 88 of them.

It can, therefore, be assumed that the second research hypothesis, has been positively verified.

Conclusions

Sustainable entrepreneurship is a concept that is increasingly being implemented and used by Polish enterprises. The main goal of the functioning of every enterprise on the market is striving to achieve financial profits, gaining more and more customers or increasing its market share. However, in recent years, in addition to actions taken by enterprises aimed at achieving economic goals, actions in line with the concept of sustainable entrepreneurship are also being taken more often, e.g. in the form of rational use of resources, reduction of the amount of generated waste or production of environmentally friendly products. The above indicates an increasing environmental and social awareness of enterprises. The research results presented in the article, aimed at identifying statistically significant relationships between the economic goals and activities that fit into the concept of sustainable entrepreneurship undertaken by Polish organizations in the SME sector, demonstrated that along with the implementation of economic goals, activities consistent with the concept of sustainable entrepreneurship are implemented as well. However, differences are depending on the length of the company's operation on the market. Enterprises that have been operating on the market for less than ten years are much less likely to take actions in line with the concept of sustainable entrepreneurship than organizations with more extensive experience. Most of these actions were undertaken by enterprises that have been operating on the market for more than 20 years. It can be caused by the fact, that the so-called young entities, at the beginning of their activity, mainly focus on achieving the adopted economic goals, because only their achievement determines their survival and further development on the market. On the other hand, enterprises with more widespread practice, most often already have an established position on the market and have the appropriate resources enabling them to carry out activities by the concept of sustainable entrepreneurship.

The results obtained may be useful for the development of the policies for enterprises, especially aimed at the young ones, by the national or local authorities. What in turn, may translate not only into facilitating the operations of Polish enterprises, but also contribute to strengthening the concept of sustainable entrepreneurship.

However, the conducted analysis has several limitations, which determine the further directions of research. First of all, the research was limited to Polish enterprises; thus, it limits its generalizability. Moreover, a further direction of consideration may be conducting similar research on a sample of enterprises from other countries, which will allow conducting a comparative analysis on a larger scale.

Abstract

Rural renewal as a tool for influencing local development in the economic and social aspect is a response to the needs of the rural areas in the fields of economy, social life, culture, innovation and agriculture development. It constitutes a challenge for local government units, i.e. equalizing the level of socio-economic development in their area, the ability to diagnose social needs, solving problems with particular emphasis on increasing social activity based on informal potential social bonds. The article concerns the issue of regional support for the idea of village renewal in the context of stimulating social innovation in rural areas. The research focuses on the analysis of the effects of self-government contest "Activities Promoting the Idea of Village Renewal" implemented in Poland in Lower Silesia region in 2009-2018 under the program of the Marshal's Office of Lower Silesia. The program creates many opportunities for the local community development, offering alternative development paths requiring active community attitudes. The article presents bottom-up initiatives and activities, stimulating social innovations and featuring the role of public policy in supporting rural development through the potential of local community.

Keywords: village renewal program, regional development, rural area, social innovation.

Introduction

A wide spectrum of phenomena and social and economic processes included in the category of regional development makes the regional development a result of simultaneous activities undertaken by different entities of public authorities, companies, institutions, and local communities (Crescenz and Iammarino 2017). On the one hand, process identified as regional development is a result of behaviours functioning in the market economy of companies and investors; on the other hand, it results from a conscious and intentional operation of public entities shaping regional policy (Gibbs and O'Neill 2016). Conscious influence of public authorities on the regional development is defined as regional policy. It constitutes one of the policies of the contemporary economic policy which is carried out both, on the level of the European Union,

Member States, as well as regional and local governments (Fratesi and Perucca 2018). European politics has been conducting the development of rural areas for decades, with different results, though. Recently, social innovations have been introduced as a new remedy for the development and growth, guaranteeing at the same time social engagement and counteracting social inequalities (Neumeier 2017). Literature provides a wide selection of applications of social innovations - starting with developing new ideas, products, and services, to streamlining actions and processes, adopting new social practices, opening to creative spaces, innovative and renewed institutional arrangements, more democratic forms of participation, and not only - all strive for creating more fair, efficient, effective, and sustainable society. (Castro-Arce et al. 2019). In the light of the definition of social innovations, the concept of rural renewal is a tool for creating values serving the society (Wronka-Pośpiech 2015), becoming increasingly important against the backdrop of global phenomena and conditions and challenges of post-industrial societies such as aging of the society, changing the structure of households and development knowledge-based economy.

The main objective of this article is to identify the effects and directions of regional support programme promoting the idea of village renewal in the context of supporting social innovations on the foundation of the "Activities Promoting the Idea of Village Renewal" contest (PPIOW). An additional goal is to verify whether the value of PPIOW projects is correlated with personal incomes in the examined communes. In order to achieve the aims of the article the research methods including a review of domestic and international literature as well as analysis of the statistical data were used.

The specificity of the idea of village renewal

The latest approach towards the village renewal emphasises using the endogenous accumulation of local resources and wider internal capital of a village, e.g. social and cultural capital and all kinds of rural institutions. The endogenous concept of the village renewal is based on the bottom-up development - internal resources, especially on social and institutional capital. This model assumes that the bottom-up factors of development are supported by external intervention of public authorities, e.g. local government. (Damyanovic and Reinwald 2014).

"Village renewal" is both the developmental concept and an effective method of developing rural areas releasing communities and entities from demanding thinking and simultaneously shifting the responsibility for the future of rural community to the concept. In the process of village renewal one aspect seems to be intensely emphasised: the need to perform the significant change in the mentality of rural dwellers from the passive perception of processes controlled from the outside to creative attitude and actions including taking responsibility for their immediate surrounding, as well as for the future of their community and implementation of social innovations. Shaping of positive attitudes among rural dwellers generates the development of the bottom-up initiatives which, eventually, leads to general improvement of the quality of life, competitiveness of the Polish countryside, not only in the village - city comparison but also Polish village - European village (Wilczyński 2008). Conferences of the European rural environments - in Cork in 1996 and Salzburg in 2003 - highlighted the role of helpfulness principle in the development of a village and partner cooperation of all entities creating a given social space. The importance of communes in the development of rural areas increased when Poland joint the European Union. Thanks to accession of Poland to the EU, the village renewal could be implemented from the European level in the previous programming period under the "Rural Development Programme" (PROW 2007-2013) and in the current budget perspective (PROW 2014-2020). As Kaleta and Weber (1995) point out, the village renewal programmes are related to an attitude promoted by the European Council for the Village and Small Town (ECOVAST) which in 1991 formulated "The Strategy for the Rural Europe" and presented an integrated and sustainable development of the village. If

balanced development is understood as a concept taking into account social, environmental, and economic aspects (Derlukiewicz et al. 2020) and strengthening equal opportunities between areas of lesser and larger development potential (Minta et al. 2013), the initiatives related to the village renewal shall be regarded as favourable for implementing rules of sustainable development in rural areas (Orboi 2012). Moreover, such initiatives have positive impact on creating social innovations which are currently perceived as solution to various social problems. (Silvestre and Ţîrcă 2019).

On the basis of European experiences (Alesina et al. 2005), numerous initiatives have been undertaken in Poland, which require engagement of local authorities, including the Village Renewal Programme and LEADER Programme which assume that the social and economic development of a given area should be based on a wide social participation. The development policy based on local authority participation improves transparency of actions in relation to a wider group of recipients and influences the engagement of the interested parties (Bębenek 2014). According to Heffner and Gibas (2011) among many economic, social, spatial, and ecological factors determining the level of local development and its competitiveness, the endogenous factors constitute a significant element. Musiał (2009) points out that the reasons some areas operate resiliently and other become economically forgotten, are as follows: traditions of entrepreneurship, skills and knowledge, feeling of identity, being part of a community, and cooperation. Participation of the interested parties in forming and implementing the local development strategy in collaboration with players using three types of knowledge: scientific, managerial, and local guarantees sustainable development of rural areas (Adamski and Gorlach 2007). It is worth mentioning that according to Kłodziński (2007) appreciating the importance of local knowledge means appreciating rural communities themselves. Christopher Ray (2006) emphasises the strength of the local potential and the bottom-up character of the development; on the basis of his experiences related to the execution of LEADER Programme in the European Union, he claims that the key to undertake local initiatives is the role of human capital which combines cultural, social, and educational capital. Thanks to enhancing local potential and making use of the external forces towards the development of the local community it is possible to improve the quality of life in a village. For that reason it is worth creating mechanisms of different kinds of initiatives set to join local communities in the rural areas to come up with new projects and initiatives - social innovations (Mulgan et al. 2007). Both programmes of the local authorities and the EU tools for the policy of developing rural areas are perceived as catalysts of development for regions displaying the needs of the society in the context of culture, social contacts, keeping identity, and improving the quality of life. In order to execute the EU policy more effectively it is crucial that the undertaken actions, as part of the execution, were reinforcing one another (Kazak et al. 2014). There is the need for the implementation of innovative solutions which may contribute to an actual change in the everyday life of people in rural areas. This might be connected to the completion of such projects as: preventing digital exclusion, activating local communities towards rebuilding local structures, ensuring education to special groups (e.g. children from dysfunctional families, people with disabilities, elderly people, etc.), other actions towards building social coherence and civil society, and participation in preparing and implementing local policies. This is the way to common responsibility for the development based on endogenous resources, reinforced by the external support (Potok 2013).

Research Material and Methodology

The aim of this article is to identify the effects and directions of using a regional support programme promoting the idea of village renewal on the basis of “Activities Promoting the Idea of Village Renewal” contest (PPIOW) in the context of supporting social innovations. An additional goal is to verify whether the value of PPIOW projects is correlated with personal incomes in the

examined communes. Time frame of the research includes years 2009-2018. In terms of area, the research covers 102 rural and rural and urban communes located in Poland (the Lower Silesian Voivodship). The selection of the field of research results from the fact that the Lower Silesian Voivodship, as one of the first in Poland, officially accepted the renewal of countryside as a program carried out by the Voivodship Board.

In order to collect source materials documenting method and literature study were used. Empirical material adapted the form of information regarding village renewal projects subsidised from resources of a voivodship government (figures, tables, reports of using the financial resources and information from the Lower Silesian Voivodship Marshal Office). When processing the results descriptive and comparing methods as well as statistical methods: Pearson correlation coefficient and Spearman's rank correlation coefficient were used.

Results

In 2009 in the Lower Silesia region responsibility for execution of community development (activation and development of local communities) was taken over also by commune authorities and local government by launching the Lower Silesian Rural Renewal programme. (Wolski 2018). The Lower Silesian Voivodeship Marshal Office has come up with a contest for execution of promotional projects stimulating activity of dwellers called “Activities Promoting the Idea of Village Renewal (PPIOW)” (Mańkowska et al. 2019) which is thoroughly analysed in this article.

For the purposes of this article the local-based projects were analysed which are subsidised from the resources of the Lower Silesian Voivodship government, taking into account the existence of informal social bonds, self-organisation traditions, sense of solidarity which constitute a drive for social changes carried out as part of the PPIOW contests. The PPIOW contest offers enormous financial support for the execution of tasks which aim is to improve functioning of the village renewal group, boost activity of dwellers to work together for their town, and develop rural identity, keep cultural heritage and specificity of rural areas. As part of the contest, projects related to promotion are subsidies - i.e. executing, updating information boards located in a village describing the town, or so-called “welcomers” informing about the participation of the village administrative unit in the “Lower Silesian Rural Renewal” initiative; publishing materials promoting the village administrative unit; organising events promoting the “Lower Silesian Rural Renewal” initiative (fairs, competitions, contests, tournaments, tours, and bike excursions); holding workshops focusing on the main assumptions of the “Lower Silesian Rural Renewal” (regarding updating the Village Council Office Village Renewal Strategy, craft, pottery, artistic, regarding manufacturing the traditional and regional products); creating recreational places by locating architectural elements and including developing public space. Recipients of the contest are non-governmental organisations, associations, and groups of dwellers with a leader and a submitted project of a task may be carried out only in a town (village administrative units) officially entered and taking part in the “Lower Silesian Rural Renewal” initiative, which has the Village Administrative Unit Development Strategy (SSR) endorsed by the Village Meeting. The minimum value of the project amounts to PLN 3,000; however, the maximum amount of support for the execution of the project may not exceed PLN 5,000 per one village administrative unit, which should constitute not more than 90% of total costs of the project (own share in total costs of the project should be at least 10%). In years 2009-2018, as part of the above-mentioned contests, 757 local projects received support, out of 914 submitted requests (Table 1).

Table 1: Support means granted as part of the open competitive bid called "Activities Promoting the Idea of Village Renewal" in years 2009-2018 (data source: Lower Silesian Marshal Office)

Year (edition)	Number of requests on the ranking	Requested amount of subsidy	Number of offers which received subsidies	Granted amount of subsidy
2009 (1st edition)	39	PLN 144 943	39	PLN 144 943
2010 (2nd edtion)	101	PLN 412 664	101	PLN 412 664
2011 (2nd edtion)	77	PLN 339 430	77	PLN 339 430
2013 (2nd edtion)	152	PLN 704 729	104	PLN 483 339
2014 (2nd edtion)	159	PLN 733 475	129	PLN 597 360
2015 (2nd edtion)	88	PLN 415 910	88	PLN 415 910
2016 (2nd edtion)	127	PLN 596 996	84	PLN 398 510
2017 (2nd edtion)	64	PLN 304 853	51	PLN 245 086
2018 (2nd edtion)	54	PLN 255 110	42	PLN 196 232
2019 (2nd edtion)	53	PLN 253 880	42	PLN 200 000
Total	914	PLN 4 161 990	757	PLN 3 433 474

Despite the fact that the amount of subsidy per one project was low, beneficiaries jointly received PLN 3.4 million for 757 projects (Table 1). In terms of the number of projects executed in communes, significant differentiation should be emphasised.

The scope of subsidy value of actions related to the process of village renewal for individual communes in the Lower Silesia is significantly wide. The share of specific ranges of obtained amounts in the general amount of subsidy in from 2009 to 2018 is presented in Figure 1, and the spatial diversification of using the financial support for individual communes in the PPIOW contest is presented in Figure 2.

Fig. 1: Share of the used funds of the "Activities Promoting the Idea of Village Renewal" contest from 2009 to 2018 by specific ranges of subsidies

Fig. 2: Share of the used funds of the "Activities Promoting the Idea of Village Renewal" contest from 2009 to 2018 by specific ranges of subsidies

Oborniki Śląskie was the commune of the highest usage of the resources; within the analysed period, as the only commune, it obtained financial support in the amount exceeding PLN 200k using 1% of the amount for the region. 5 communes (Radków, Prusice, Osiecznica, Dzierżoniów, and Mirsk) were classified in the range from PLN 100,001 - 200,000 (4.9% of the amount for the entire region). The largest number of communes applied for means from the range up to PLN 50k (80.4% of the contest funds which were used by 82 communes). The remaining 13.7% of the contest funds were distributed among 14 communes which received subsidies in the range from PLN 50,001 to 100,000 per commune.

In order to define the types of projects subsidies as part of the contest, a detailed analysis was carried out of identified undertakings from the point of view of their subject range. The project quantitative structure is presented in Figure 3.

Fig. 3: The number of projects executed as part of the PPIOW contest from 2009 to 2018 by types of undertakings

According to Fig. 3 the majority of means were spent on publishing promotional materials (323 projects). Those actions included mainly publishing leaflets, calendars promoting the idea of village renewal, publishing of books, studies, brochures, or folders regarding history and tradition, as well as innovative undertakings of a given village administrative unit, and also creating local websites. Examples of such actions, mostly related to organising local events, are, among others, projects carried out in Pieszyce commune called "Promotion of the Idea of Village Renewal via Organising Family Fair, Day of Older Persons, and Preparing Promotional Materials", "Promotion of the Idea of Village Renewal via Organising Harvest Festival, Day of Older Persons, and Preparing Promotional Materials", "Promotion of the Idea of Village Renewal via Organising a Harvest Festival in the Village, Day of Older Persons, and Publishing a Folder entitled "Stoneware Now and Then". Other subject groups of large number included project regarding information boards located at an entry to a town or a commune, the so-called "welcomers" (115 projects) and organizing thematic events (104 projects) of incredibly diversified scope. The post popular events included sport events, presentations of local products and festive dishes during fairs, family and sport and recreation events, as well as events promoting rural culinary traditions (e.g. "Pierogi Fest in Paszowice as a culinary way to promote Village Renewal", "Baked Potato Festival in Podlesie", "Promotion of the Idea of Lower Silesian Rural Renewal in Nowa Wieś Wielka via organising an event called "6th Festival of Cep and Prunes"). 60 projects regarded organising thematic workshops, mainly trainings in the scope of developing Village Administrative Unit Village Renewal Strategy, setting up associations and village renewal groups, and obtaining resources or generating common ideas in order to motivate dwellers to take joint actions. Those types of actions constitute a great example of social innovation including common engagement of the dwellers in creating new local initiatives. Social undertakings carried out as part of the PPIOW contest are of social innovation character - they gather local community in the name of a greater idea, e.g. increasing the recognition of their town, boosting its attractiveness. It seems, that the micro grants, despite little financial stimulus, influence the entrepreneurship among the dwellers who feel that they share the responsibility for their place.

The final stage of research comprised an analysis of correlation between the value of obtained means from the PPIOW contest in comparison to own incomes of the analysed communes, calculated per capita from 2009 to 2018 presented in the form of graphical interpretation (wide range diagram). In order to examine the statistical significance between these features, Pearson correlation coefficient and Spearman's rank correlation coefficient were used. The results of those analysis are presented in Figure 4 and Table 2 and Table 3.

Fig. 4: The correlation diagram of wide range between the subsidy obtained in the PPIOW contest and own incomes in the analysed communes per capita from 2009 to 2018

The wide range diagram presents lack of correlation between data, i.g. connection between commune's own incomes and value of projects carried out as part of the PPIOW contest. On the basis of graphical interpretation of correlations one may claim that effective use of support funds by communes is not determined by the value of financial means in the budget.

The strength of correlation between two variables may be expressed with numbers using many parameters. The most popular parameter calculated for measurable variables is the Pearson correlation coefficient which result for two examined variables is presented in Table 2.

Table 2: Setting the value of Pearson correlation coefficient between the value of obtained means for PPIOW and commune's own incomes (per capita) from 2009 to 2018

	Correlation (Calculations for correlation) Marked coordinates of correlation are significant with p < .05000 (Lack of data deleted by cases)										
Var. X & Var. Y	Average	St. deviation	r(X,Y)	r2	t	p	Important	Constant zal: Y	Slope zal: Y	Constant zal: X	Slope zal: X
PPIOW per capita	0.717	1.2256									
PPIOW per capita	0.717	1.2256	1.000	1.000			66	0.000	1.000	0.000	1.000
PPIOW per capita	0.717	1.2256									
own income per capita	1680,990	454,6401	-0.031	0.001	-0.252	0.802	66	1689,349	-11.66	0.859	-0.0001
own income per capita	1680,990	454,6401									
PPIOW per capita	0.717	1.2256	-0.031	0.001	-0.252	0.802	66	0.859	-0.0001	1689,349	-11.66
own income per capita	1680,990	454,6401									
own income per capita	1680,990	454,6401	1.000	1.000			66	0.000	1.000	0.000	1.000

The Pearson correlation coefficient calculated in order to present the correlation between the commune's own incomes per capita and value of resources obtained as part of the PPIOW contest from 2009 to 2018 amounts to r=-0,03, which means lack of correlation and is statistically unimportant (p=0.8021).

A nonparametric equivalent of the Pearson correlation coefficient is the Spearman's rank correlation coefficient used for measuring non-linear correlation and is more adequate in case of analysing that type of qualitative variables. The application of rank correlation coefficient for two analysed variables is presented in Table 3.

Table 3: Setting the value of Spearman's rank correlation coefficient between the value of obtained means for PPIOW and commune's own incomes (per capita) from 2009 to 2018

	Correlation of Spearman's rank order (Calculation for correlation) BD deleted in pairs Marked correlation coordinates are important p <.05000	
Variable	own income per capita	PPIOW per capita
own income per capita	1.000000	-0.253241
PPIOW per capita	-0.253241	1.000000

The Spearman's rank correlation coefficient is statistically significant, it reaches -0.25 (significant with $p<0.05$) which means weak line correlation between the analysed variables. The negative value of correlation shows that increase of one feature is accompanied by decrease of a second feature. It may be assumed that the value of funds obtained as part of the PPIOW contest depends on own incomes of a commune. It seems that lower own incomes lead to greater determination in trying to get funds from PPIOW and also the other way round: the higher own incomes, the lower value of funds obtained as part of local government's programme.

Conclusions

Local resources of a given area are perceived as key elements for village development. Formal and informal citizen structures release human potential and constitute a trigger for active participation in social life and usage of other resources. Social innovations refer to fulfill social needs and carry out common desires and aspirations. (Castro-Arce et al. 2019). Social innovations concern actions, participation processes, and results which cause changes in social relations and lead to improve social system (Moulaert et al. 2013). Social innovations in a village help to solve social problems such as exclusion, mitigating the results of ageing of local communities, lack of access to fundamental services, including medical care, provision and access to internet, but also engagement of local communities in bottom-up initiatives.

One of the most interesting initiatives in the scope of social innovations in rural areas, undertaken in the recent years by EU, is the LEADER programme. Similar projects were completed also in Poland, e.g. in the Lower Silesian Voivodship. The Lower Silesian Rural Renewal programme brings actual benefits for the dwellers of rural areas in the region. Currently, 1200 village administrative units with 127 village and village and town communes participate in the program. What is interesting, over 1000 village administrative units have their own development strategies, which shows enormous engagement of the dwellers in satisfying needs of local communities. It can be also noticed that success in obtaining funds motivates local communities to further work. An important effect of the execution of the contest is establishing natural partnership between the representatives of the local authorities and the non-governmental organisations in the rural areas. The results of contests carried out as part of the village renewal programme in the Lower Silesian Voivodship indicate that the dwellers, thanks to small financial support, took the most important steps in the development process - they perceived the local resources not only through the perspective of its specificity but also through the way of using them for the development of their own area, including the increase of investment attractiveness level.

The range of projects presented in this study mentions numerous needs found in the rural areas. To conclude, relatively small financial support in the analysed promotional contest brings noticeable

results - including also an added value in the form of increased recognition from the dwellers of the analysed communes, emergence of active leaders and local animators, sense of their place, history, tradition, and the need to maintain its specificity. It is worth emphasising the engagement of local communities in creating new initiatives, thematic workshops, or joint ideas for new actions.

Age Management In Polish Companies. Employees' Perspective

Ewa SOBOLEWSKA-PONIEDZIAŁEK

Faculty of Economics and Management, University of Zielona Góra, Poland
e-mail: e.sobolewska-poniedzialek@wez.uz.zgora.pl

Abstract

Demographic transformations towards depopulation and ongoing process of ageing of societies lean to search for solutions that can enable minimisation of negative results of these transformations. Consequences of these transformations can be felt also by enterprises and employees. The concept of age management can be a chance for improvement of the situation of companies as well as whole teams of employees, by building intergenerational labour teams. This can significantly improve the situation of older workers, whose professional situation becomes more difficult along with age. The article presents an attempt to determine whether in entities where respondents are hired use tools of age management and to which extent. For this aim, own studies among employees hired in companies located in Lubuskie voivodeship were conducted.

Keywords: Age Management, The Elderly, Demographic Changes, Company

Introduction

In the recent years, demography and economy emphatically indicate that dependences between them lead to very explicit social and economic effects. The scale and scope of the above mentioned effects are not decreasing as the demographic situation can not be changed day by day. The ongoing process of ageing, depopulation, as well as changes in the age structure are the most visible transformations. Results of such transformations can be especially harmful for the labour market due to a potential deficiency of people in their working age, as well as an increase of the percentage of older people included in the labour resources. Of course, the situation of older employees, even in the conditions of employee market, can be more difficult when compared to other groups of employees. The above results from numerous factors, which may include barriers at the side of employees as well as employers. A remedy for limitations at the side of employers related with hiring older people may be the concept of age management, assuming an approach to a team focused on effective use of age differentiated human resources, considering their needs and capabilities (Liwiński, Sztanderska, 2010a, p. 3).

The aim of this article is to explain the role of the concept of age management in attenuating negative results of demographic ageing of Polish society. The work concerns a study on employees of companies located in Lubuskie voivodeship, who were asked about the knowledge in the field of implementation of assumptions of age management in organisations they work. The accepted research thesis was that in the opinion of employees, there exist numerous advantages of age management but companies/institutions use tools of this scope in practice within a limited scope. The character of the work is theoretical and empirical. The theoretical part describes studies of literature in the field of age management, while in the empirical one, there was used the method of statistical analysis of results of own studies.

Idea of the concept of age management

Age management should be perceived as a balanced approach to management of human resources aimed at increasing work capabilities of employees from various age groups (Ilmarinen, 2001). This approach indicates the aspect of age management focused only on improving the efficiency of work of teams of employees.

Age management in a company leads to using the potential of human resources by enabling work conditions adjusted to age and capabilities of employees and facilitating cooperation between them regardless the age (Rembiasz, 2015, p. 156).

A. Walker (1997) understands age management as activities concerning "(...) various areas where human resources are managed within an organisation, having a focus on the issue of ageing of resources as well as general management over the process of ageing of employees through a state's policy or collective negotiations".

The essence of the concept of age management should be developing a work environment that is friendly for employees of various age groups, considering their needs and expectations. Age management is based on the mechanism of various activities concerning development and professional career of employees, maintaining their mental and physical condition and work efficiency, as well time of being hired, undertaken in a complex way by all interested entities, i.e. a state, companies, and employees, in order to rationally and efficiently use the human capital in companies. These activities should be implemented in all essential areas of human capital management (Adamska-Chudzińska, 2016, p. 337).

The discussed concept should respond to demographic changes by supporting, motivating, and appreciating employees, especially those from groups which situation on the labour market is special. One of such groups includes people who are approaching their retirement age. However, this is not contrary to approach that implemented solutions of age management concerned a whole team of employees, in order to create friendly work conditions regardless the age.

Age management in a company should be based on a new, adjusted to changes, culture of respect and appreciation of older employees, strengthening strong sides of this group of employees, at the same time eliminating and preventing from possible weaknesses. Age management can be focused on an employee and his/her capabilities as well as on his/her environment shaped by an employer, e.g. organisation of a work place, division of labour and responsibilities, creating the atmosphere (Cichorzewska et l., 2015, p. 43). The literature on economical conditions of hiring older employees indicates a series of advantages of such activities. Key of them include e.g. maintenance of the base of skills, regarding activities that are undertaken as necessary as proper, minimization of work costs related with age, reacting to transformation on the labour market, efficiency in struggling with bottlenecks on the labour market (Naegele, Walker 2006).

Age management in the perspective of a company

Regardless the scale of their activity, companies constantly function in turbulent conditions related with the market situation, the competition, and other threats, which are difficult to be foreseen. To a large extent, the above has an influence on possibilities of generating incomes by recognising and using market chances on various planes of the activity. A success of each company is not only customers and profits generated through sales but also engaged employees, who work in advantageous conditions, regardless potential limitations resulting from their age or other factors.

According to the European Code of Good Practice, developed by Eurolink Age in 2000, age management in a company should include seven areas (Good practice in age management and human resources management, especially considering employees aged 50+, 2013, p. 20):

1. recruitment,
2. education, training, development, professional advancement,
3. advancement and internal shifts between posts,
4. flexible forms of employment and modernisation of work,
5. designing work place and health prevention,
6. end of employment and retirement,
7. change of approach towards older employees.

The above fields indicate a complex approach to introduction of assumptions of the concept of age management by implementing them in the process of recruitment, during the period of employment and related activities, until the time of finishing professional career.

A similar classification was proposed by G. Naegele and A. Walker (2006) in their guide on good practice in age management, which includes seven groups:

1. recruitment,
2. learning, training, continuing education,
3. development of professional career,
4. flexible work time,
5. health protection and promotion, designing workplaces,
6. shifting between posts,
7. end of employment and retirement.

Companies have numerous approaches to the idea of age management. Some of them develop strategies of age management, while other use in practice only selected elements or use the assumptions but solely in respect to specific areas. Regardless the fact whether a company has a developed strategy or uses only selected aspects, advantages from its implementation are real for a company to such extent that it decides to bear expenditures and engage own resources.

As observed by K. Rembiasz (2015, p. 161), implementation of an age management strategy in a company brings measurable advantages for older as well as young employees. A good example can be activities related with protection and promotion of health, and work ergonomics. Following the rules of ergonomics can contribute to a longer life and a better health condition of all employees. Age management assumes enabling older employees, also those with the right to retirement benefits, continuation of employment and a full participation in the social life. Unfortunately, professional deactivation is most often related with lower incomes and a loss of a social status or a position in one's family.

Most often, age management is perceived at three levels (Jamka 2009, p. 42; Mendryk 2013, p. 103):

- Individual level – model of development of personal career,
- Organisational level – concerns all employees; adjusting aims and techniques of management according to age, with a special focus on older employees,
- Level of organisation environment – concerns interventional activities of a state, which the major aim is to improve the situation of older employees on the labour market.

Implementation of an age management strategy can bring a company several advantages, which include (Liwiński, Sztanderska 2010b, p. 75-76):

1. Greater flexibility in the field of age management,
2. Using numerous tools at the same time can increase the efficiency of each of them (synergy effect),
3. A comprehensive age management strategy can be easier implemented in a general strategy of HR management in a company in comparison to single activities,
4. Use of individual tools of age management is better accepted by the staff when they are elements of a comprehensive strategy.

Proper and complex age management increases the potential of employees, not only the older ones, and leads to its effective use (e.g. thanks to a cooperation of employees of various age, competences and be supplemented and exchanged). It also increases the motivation of older persons to maintain work and execute it in the most efficient way (Skibiński, Ławińska 2016, p. 425). In turn, the above determines other potential advantages, individual for employees, for an employer, but also for public finances.

Methodology of own studies

The aim of conducted research is to determine:

1. whether employees have knowledge about activities in the field of age management undertaken in their organisation,
2. why, according to employees, age management in a company is justified,
3. what advantages for a company resulting from implementing solutions related with age management are observed by employees,
4. what problems related with implementation of age management solutions are observed by employees,
5. whether companies have a special program of employment of persons aged 50+ and to what extent,
6. in what areas there are conducted activities aimed at supporting older employees.

The research was conducted among employees of companies and organisations located in Lubuskie voivodeship, whereas, a research sample included one employee representing a single company/institution. The research sample consisted of 63 respondents who were selected for the study using the targeted selection method. The study was conducted using the indirect measurement method, while the research tool was direct survey. The period of research was two months, January – February 2020. The results of the study have no representative features for the entire general population. Their purpose is only to describe the situation concerning the sample being tested.

The group included 48 women and 15 men; people aged below 26 were the most numerous in the sample (over 55%), while 35% were persons aged 24-45, and the remaining ones were those aged 46-60 (Tab. 1).

Table 1: Respondents participating in the survey by age and gender

Age	Gender					
	Female		Male		Sum	
	n	n [%]	n	n [%]	n	n [%]
up to 26 years old	25	52,1%	10	66,7%	35	55,6%
27 – 45 years old	18	37,5%	4	26,7%	22	34,9%
46 – 60 years old	5	10,4%	1	6,7%	6	9,5%
Sum	48	100,0%	15	100,0%	63	100,0%

Source: own research results.

Respondents represent various branches of economy. Employees of the services branch constituted the largest percentage (30%), next, there were public administration and public sector workers (27%), while persons working in the educational or cultural entities were the least numerous group (4,8%) (Tab. 2).

Table 2: Sector of economy in which the respondent works

Sector of economy	n	n [%]
Działalność usługowa	19	30,2%
Administracja rządowa, samorządowa, sfera budżetowa	17	27%
Działalność produkcyjna	11	17,4%
Handel	9	14,2%

Transport	4	6,4%
System oświaty lub kultury	3	4,8%
Sum	63	100,00%

Source: own research results.

Research Results

A key issue to be determined is the awareness of the existence of solutions in the field of age management at respondents' work places. 32 among 63 persons under this study state that there are no studies in age management conducted in their organisation, while only 15 declared such activities (Tab. 3).

Table 3: Knowledge of respondents in the area of existence of solutions in age management in their work places

Functioning of age management solutions in enterprises	n	n [%]
No	32	50,8%
I don't know	16	25,4%
Yes	15	23,8%
Sum	63	100,0%

Source: own research results.

Respondents were asked about reasons why, in their opinion, it is justified to use the concept of age management from the perspective of a company implementing such activities. The most often explanations concerned advantages of having an age diversified team of employees (40 responds), maintaining competences of employees at a proper level and a supremacy of older employees as far as experience and competences are concerned (24 responds each), as well as a reaction to changes on the labour market, e.g. ageing society (20) (Fig. 1).

Figure 1: Reasons justifying age management in a company in the opinion of respondents

Source: own research results.

Advantages of implementing solutions in the field of age management observed by respondents most often included the possibility of sharing experience, skills, and knowledge within a team (56 answers), developing a stable team of employees thanks to age differentiation (27), and inter-generational cooperation in teams leading to development (21) (Fig. 2).

Figure 2: Advantages of implementing solutions in the field of age management in the opinion of respondents

Source: own research results.

The most often problems related with introduction of solutions for age management in the opinion of respondents included: concerns about changes (30 responds), lack of knowledge of management about potential advantages for a company (27), lack of competences of management in the field of implementing solutions (23) (Fig. 3).

Figure 3: Problems related with implementing solutions in the field of age management in the opinion of respondents

Source: own research results.

55 of 63 respondents declared that their employers do not run any activities to have a special program of employing persons aged 50+, while in the entities where such program exists, it concerns cooperation with labour offices/employment agencies (4 responds) or participation in programs of professional activation of persons aged 50+ (4) (Fig. 4).

Figure 4: Functioning of an employment program addressed to persons 50+ in an organisation in the opinion of respondents

Source: own research results.

Persons under the survey were asked about potential fields of support for older employees at their companies/organisations. According to the answers, a half of them (31) do not have any knowledge in this subject. Other responds most often included: Flexible time and character of work (15 answers), possibility of changing a profession and changing a work post (12), education, training, and continuing education (10) (Fig. 5).

Figure 5. Declaration of respondents concerning fields of support for older employees in their companies/organisations

Source: own research results.

Conclusions

The research results indicate that the majority of entities where our respondents work, according to their knowledge, either do not run any activities in the area of age management (32 entities) or respondents do not have enough knowledge to state whether their employers conduct such activities (16). The above is confirmed by answers given to the question about an existence of an employment program addressed to persons aged 50+. As many as 55 respondents stated that their employers do not run such programs at all. On the one hand, this may indicate that despite the fact that the situation on the labour market is not favourable for employers due to existence of employee market and more often difficulties in finding employees because of demographic problems, employers still do not see the necessity to focus on activities which can support their efforts in acquiring valuable workers. On the other hand, it is also possible that it results from stereotypical perception of older employees and a lack of interest to keep them in a company. These observations are in a sense confirmed by M. Grzesiak (2012, p. 15) who stated that "in Poland, the awareness of the necessity of engagement in the problem of the society ageing, [……]. However, it must be stressed that an employer will decide to implement age management only when he/she is properly motivated, can properly determine what tools are best adjusted to needs of his/her company, and be able to implement them efficiently".

Persons taking part in the study observe the necessity to use age management tools and most often justify it by advantages of having an age diversified team of employees. Advantages of age management most often stated by respondents include the possibility of sharing experience, skills, and knowledge within a team (89% responds), while nearly a half of them stated that a problem in implementing tools for age management is employees' fear of changes.

Interesting conclusions in this scope can be drawn from studies conducted by K. Stankiewicz (2017, p. 335), according to which, employees from SMEs in Poland negatively evaluate activities of their employers as far as recognition of competences and skills of older workers is concerned.

To conclude, one can state that in the group of companies under this study, employees most often do not observe any policy of age management in their organisations or declare a lack of knowledge in this field. However, when asked about the reasons justifying, in their opinion, using age management tools and potential advantages, they most often emphasize a great value of an age diversified team of employees, what creates a chance of sharing experience, skills, and knowledge.

Cultural Values in Online Advertising – Implications For E-Customer Experience Management

Aleksandra RADZISZEWSKA

Czestochowa University of Technology, Czestochowa, Poland
E-mail: radz_a@wp.pl

Abstract

The intensification of international exchanges involves a growing need for intercultural communication. Advertising is now one of the areas of activity that most often need a cultural sensitivity. This study attempted to investigate how the society's culture is related with online advertising content. Literature review suggests that the differences between different cultures in terms of Hofstede's framework can be related to the differences in advertising appeals.
The purpose of this study is to examine the influence of Hofstede's culture dimensions on consumers' attitudes towards online advertisements. On example of Polish customer experiences the influence of cultural values connected with Hofstede's framework on online advertising perception and its acceptance level has been examined. The understanding of cultural implication for marketing communication is the main factor conditioning successful and effective international marketing activity.This study describes factors connected with cultural aspects of international marketing communication and emphasizes the significance of cultural differences and their influence on effective e-marketing communication on global market.

Keywords: online advertising, e-customer experience management, culture dimension, cross-cultural marketing.

Introduction

The online channel is especially important in the context of international advertising. When a company posts an advertising message online, the message becomes automatically available to a worldwide audience of Internet users, therefore companies are increasingly using this medium to reach their target audiences. This medium has facilitated the globalization of business and has reduced the time, cost, and effort required to reach consumers in other countries. Although the Internet is particularly suitable for international advertising, devising and implementing an effective international advertising strategy. Similar to traditional advertising, companies need to answer the questions of whether to standardize or localize their messages across geographic boundaries, how to manage the large number of consumers from different countries, and how to remain culturally sensitive and at the same time reach international consumers in a cost-effective way. Addressing these concerns, advertising researchers have been paying more and more attention to cross-cultural issues in online advertising.

When a product is marketed at an international audience the same domestic advertising campaign abroad will in most cases be ineffective, but cultural barriers may hinder effective transmission of the message and result in miscommunication (Kumar and Mittal, 2002). The cultural heritage, values and habits of a country influence perceptions of communication and reactions to different form of advertising. Each country has social habits or values that influence the expression of emotions, gestures, facial expressions, body language and even verbal communication (Dahl, 2000).

The globalization leads companies to communicate with consumers from different cultures. International marketing is the application of marketing principles to more than one country (Doole and Lowe, 2001). International advertising can also be viewed as a business activity through which

a firm attempts to inform target audiences in multiple countries. An important issue in determining international advertising strategy is whether or not to develop a global or regional advertising campaign, or rather tailor communication to differences in local markets (Peebles and Ryans, 2004). Marieke de Mooij (2004) argues that cultural differences are obstacles in standardized advertising, because the cultural background determines how a member from a particular culture interprets an advertisement. In cross-cultural marketing communication, advertising must be adapted to meet the cultural norms and values, as a message is interpreted differently depending on the recipient's cultural background. In addition, some products are sensitive to cultural values and can be connected with different associations in different cultures, which again emphasizes the necessity of adaptation (de Mooij, 2005). Communication is the primary key to international advertising. The essence of successful advertising is convincing people that a product is meant for them. By purchasing it, they will receive some benefit, whether it be lifestyle, status, convenience or financial. However, when an advertising campaign is taken abroad different values and perceptions as to what enhances status or gives convenience exist. These differences make the original advertising campaign defunct (Onkvist and Shaw, 2009).

The purpose of this study is to examine the influence of Hofstede's culture dimensions on consumers' attitudes towards online advertisements. On example of Polish customer experiences the influence of cultural values connected with Hofstede's framework on online advertising perception and its acceptance level has been examined.

The understanding of cultural implication for marketing communication is the main factor conditioning successful and effective international marketing activity.This study describes factors connected with cultural aspects of international marketing communication and emphasizes the significance of cultural differences and their influence on effective marketing communication on global market.

This study is structured as follows. After this introduction, the theoretical foundations and hypotheses that support the study have been described. Next section details the methodology of research. Than the results of research have been presented and discussed. Finally conclusion and suggestions for the continuation of the research have been presented.

Literature Review

Appropriate cross cultural communication aims to help minimize the negative impact of cross cultural differences through building common frameworks for customers from different cultures (Triandis, 1995). National differences are often cited as the source of intercultural communication conflicts and breakdowns. Geert Hofstede tends to focus on miscommunication or differences in intercultural communication (Hofstede, 2001).

Cultures can be described according to specific characteristics or categorized into value categories or dimensions of national culture. The anthropologist Edward Hall distinguished patterns of culture according to context, space, time and information flow. This concept relates to the balance between the verbal and the non-verbal communication. The concept of context is useful for understanding differences in communication across cultures because it explains the degree of directness of communication. Information in a low-context communication message is carried in the explicit code of the message. In a high context culture verbal communications tend not to carry a direct message. In a high-context communication message most of the information is either part of the context or internalized in the person. So with a high context culture hidden cultural meaning needs to be considered (Hall et al., 1990).

Low-context communication cultures are characterized by explicit verbal messages. Effective verbal communication is expected to be direct and unambiguous. Low-context communication cultures demonstrate positive attitudes towards words, argumentation and rhetoric, whereas high-context communication cultures can be characterized by symbolism or indirect verbal expression (de Mooij, 2004). High-context cultures are usually collectivistic cultures. As regards to advertising, high-

context cultures base their advertising on symbolism or indirect verbal expression. This means that these cultures are more visually oriented. Individualistic cultures are low-context cultures. Advertising in low- context cultures is then characterized by argumentation and rhetoric, because information is here found in the words rather than in the visuals (de Mooij, 2005).

Gert Hofstede developed a model of five dimensions of national culture that helps to explain basic value differences. This model distinguishes cultures according to four dimensions: Power Distance, Individualism-Collectivism, Masculinity-Femininity, and Uncertainty Avoidance. This dimensions can be used to explain differences in consumers' needs, behaviors, communication styles, metaphors and concepts used in advertising across different countries (Hofstede, 2001).

Marieke de Mooij (2005) points out that cultures with a small power distance often use humor in their advertisements. In low power distance cultures youth is seen as independent and individualistic which is why it is made an ideal. In addition, in large power distance cultures status symbols are often used in advertisements. Individualistic cultures often emphasize individuality in their advertisement by only showing one person and by the use of first person singular, because an individualistic motive is self-actualization through personal success and independence. However, in collectivistic cultures more people are shown together in advertisements to emphasize the community, family and harmony. Cultures dominated by masculine values make use of the hard sell approach. This approach is very informative and product-oriented, as it intends to sell the product by pointing out product advantages and characteristics. Feminine cultures, however, prefer the soft sell approach, where there is less focus on argumentation. Here, elements such as humor and word-play are highly used. Success, status or dominance is highly valued in masculine cultures, which is also frequently highlighted in their advertisements. However, feminine cultures favour quality of life, softness and caring. According to de Mooij (2005), strong uncertainty avoidance cultures have a need for explanations, structure, test reports, scientific proof and advice, and testimonials by experts, but also into high regard for technology and design, which is reflected in their advertisements. Cultures with strong uncertainty avoidance tend to include a lot of information in their advertisements, in particular technical details about a product and how it works. In addition, in weak uncertainty cultures the focus is on what the product or the service does, rather than what it can (Mooij M., 2005). The typical features of advertising in different cultures have been presented in table 1.

Table 1: Advertising features in different cultures

Culture dimension	Advertising features
High-context	- symbolism - indirect verbal expression - visual orientation
Low-context	- argumentation and rhetoric
Small power distance	- humor
Large power distance	- symbols of status
Individualism	- independence and individualism - personal success
Collectivism	- community, family and harmony
Masculinity	- informative character - product orientation (characteristic, advantages) - success, status and dominance
Femininity	- receiver orientation - argumentation - humor - mood and dreams of receiver - quality of life - softness and caring
Strong uncertainty avoidance	- explanations - test reports - scientific proof and advice - testimonials by experts,

	- a lot of information - technical details about a product
Weak uncertainty avoidance	- the focus is on what the product or the service does

Source: own elaboration on basis De Mooij, M. (2005) Global Marketing and Advertising: Understanding Cultural Paradoxes, Sage Publications Inc., London.

The advertisement is not only a means of economic activity, but also of cultural communication. The inter-cultural advertisements transmission is to communicate with the consumers from different regions, different nations, different countries and different societies.

The cultural context also impacts the effectiveness of communication. In high context cultures, such as the collectivist Asian cultures of Japan and China, the context in which information is embedded is as important as what is said. In low context cultures, which include most Western societies, the information is contained in the verbal messages. In these cultures, it is important to provide adequate information relating to the product or service in order to satisfy their need for content. Conversely, people in high context cultures are often more effectively reached by image or mood appeals, and rely on personal networks for information and content (Hall, 1976).

Each company wishing to enter and promote their products on foreign markets has to deal with the necessity of preparing an advertising campaign suited to the particular needs of the target receivers. Despite numerous voices claiming that cultural homogenization and standardization of markets and customers' needs enables using international advertising campaigns, it turns out that it is rarely possible to advertise a product worldwide without adaptation to the local socio-cultural and political conditions. Not adjusting the campaign to the local environment can result in a failure and have serious financial repercussions (Usunier and Lee, 2005).

International advertising can, therefore, be viewed as a communication process that takes place in multiple cultures that differ in terms of values, communication styles, and consumption patterns.

Research Methodology

The purpose of this study is to examine the influence of Hofstede's culture dimensions on consumers' attitudes towards online advertisements. On example of Polish customer experiences the influence of cultural values connected with Hofstede's framework on online advertising perception and its acceptance level has been examined.

Poland is considered to be a country with an individualistic culture (with a score of 60). At a score of 68, Poland is a hierarchical society with high power distance . A high score of masculinity (64) indicates that the society will be driven by competition, achievement and success. Poland scores 93 on uncertainly avoidance dimension and thus has a very high preference for avoiding uncertainty. Poland's low score of 38 in long term orientation dimension indicates that people prefer a short-term orientation focusing on personal stability (Hofstede, 2020).

Based on the literature review and the characteristic dimensions of Polish culture the following hypotheses for the causal relationship between the cultural values in online advertising and their influence on advertising messages acceptance have been proposed:

Hypothesis 1 **(H1)**. Online advertisements that emphasize individualistic values have positive influence on advertising message acceptance among Polish customers.

Hypothesis 2 **(H2)**. Online advertisements that emphasize high power have positive influence on advertising message acceptance among Polish customers.

Hypothesis 3 **(H3)**. Online advertisements that emphasize masculine values have positive influence on advertising message acceptance among Polish customers.

Hypothesis 4 (**H4**). Online advertisements that emphasize high uncertainly avoidance have positive influence on advertising message acceptance among Polish customers.

In order to test the hypotheses, a questionnaire survey will be carried out to collect empirical data.

The research was conducted on a group of Internet users in January 2020. The data was collected in the form of a survey carried out on the e-learning website. A questionnaire was developed and distributed to the 80 respondents among students, aged from 19 to 24. The questionnaire gathered information about the acceptance level of advertising message related to all independent variables: individualism, high power distance, masculinity and high uncertainty avoidance.

In questionnaire, respondents determine the acceptance level and their attitudes to the assessed advertising message with a five-point Likert scale. Each measurement variable varies from 1 to 5, among which 5 means very positive, 4 positive, 3 neutral, 2 negative, 1 very negative.

To ensure the participants have the same type of banner advertisements in their mind when answering the questions, a sample banner advertisement will be given at the top of the questionnaire. Additionally, the banner advertisements reflecting each of four culture dimensions will be mainly selected according to the banner text.

After viewing the banner advertisements, participants will complete a questionnaire containing several scales to indicate their responses. Since the objective of this study is to explore the role of cultural differences in effectiveness of online advertisements, the attitudes towards the advertisements will be measured by mentioned five-point scale. Regression analyze was used to estimate the unique effect of cultural values in online advertisements on consumers' attitudes to advertising messages.

The reliability test used was Cronbach's alpha. For all research variables values were higher than 0,8. Cronbach's alpha for individualism was 0,846, high power distance 0,837, masculinity 0,831, and high uncertainty avoidance 0,872. Cronbach's alpha showed high internal consistency, what implies that the measures are reliable and the evaluation instrument is appropriate for use in research.

Results and Discussion

Multiple regressions were used to identify the relationship between the independent variables (individualism, high power distance, masculinity and high uncertainty avoidance) and dependent variable – level of online advertising acceptance. The results of regression analysis have been shown in the table 2.

Table 2: The results of regression analysis

Independent variables	**Standardized coefficients**	**t**	**Significance level**
	Beta		
individualistic values	0,487	4,275	0,000
high power distance	0,327	4,261	0,000
masculine values	0,351	3,943	0,000
high uncertainly avoidance	0,569	4,358	0,000
Dependent variable: level of online advertising acceptance $\mathbf{R^2}$ = 0,816 **F** = 29,457			

Source: own elaboration.

The result shows that R-square was 0,816, which demonstrates that independent variables explain 81,6% of the variance in customers' acceptance of advertising messages. The linear relationship between all considered culture dimensions and customers' advertising acceptance is significant with an F-value of 29,457 at the 0,01 significance level. Therefore, the model is appropriate for this study.

In individualistic society, advertisements that reflect individualistic values can influence positive customers' attitudes. Thus, the hypothesis below:

H1. Online advertisements that emphasize individualistic values have positive influence on advertising message acceptance among Polish customers.

Since the significance level of dependence between individualistic values and advertising message acceptance was 0,000, which is less than 0,05. Therefore Hypothesis 1 is accepted. Individualistic values in online advertising have a significant positive influence on customers' acceptance level (beta = 0,487). The high level of advertising acceptance in case of individualistic values shows the specific expectations of surveyed customers, because they prefer, characteristic for Polish culture, individualistic values. The high acceptance of online advertisements that emphasize individualistic values is the consequence of customers' expectations, because they are created in cultural context.
Also advertisements, which emphasize high power distance values can influence positive attitudes and high acceptance level among surveyed consumers. Hence, the hypothesis below:

H2. Online advertisements that emphasize high power distance have positive influence on advertising message acceptance among Polish customers.

The significance level in case of high power distance values was 0,000, therefore, H2 is accepted.
The beta value for this variable was 0,327. Therefore, values connected with high power distance have a significant positive effect on customers' acceptance level. Advertisements that reflect such values can effective influence purchase behaviors of surveyed customers.
Also masculine values reflected in advertising messages can cause increasing acceptance level of online advertisements among surveyed customers. Thus, the hypothesis below:

H3. Online advertisements that emphasize masculine values have positive influence on advertising message acceptance among Polish customers.

Significance level in this case was 0,000, hence, H3 is accepted. The beta value for this variable was 0,351. Therefore, masculine values in advertisements have a significant positive effect on advertising acceptance and customers' attitudes.
The last considered culture dimension, which can influence customers' attitudes towards advertising is uncertainly avoidance. The surveyed customers represent culture with high uncertainly avoidance.
Thus the hypothesis below:

H4. Online advertisements that emphasize high uncertainly avoidance have positive influence on advertising message acceptance among Polish customers.

The significance level of dependence between high uncertainly avoidance and advertising message acceptance was 0,000, which is less than 0,05. Therefore Hypothesis 4 is accepted. The test also showed that high uncertainly avoidance had the highest coefficients (beta = 0,569) compared to others. In other words, this variable has the highest impact on increasing of online advertising acceptance level. Online advertising, which consists values connected with high uncertainly avoidance causes positive customers' attitudes and better advertising effectiveness.

According to conducted analysis, consideration of cultural values, which reflect culture dimensions typical for particular customers group have positive influence on customer experiences, online advertisements effectiveness and their acceptance level. The difference in acceptance level, customers' positive attitudes and advertisements effectiveness is especially considerable in case of uncertainly avoidance. Poland is country with very high level of uncertainly avoidance and this fact

has its manifestation in research results. The highest acceptance level among surveyed Polish customers have online advertisements that emphasize values connected with strong uncertainly avoidance.

Internet offers companies more ready access to the global market. With the Internet, even small companies can establish a website to sell directly to consumers in other countries. This favors a cost-effective standardization approach in online advertising. Secondly, the Internet also makes access to information much faster and easier for consumers in different countries. The globalization has homogenized consumer tastes, but international companies decide create a standardized campaign or make varied advertisements for select countries.

Though the above arguments suggest that online advertising may follow a more standardized approach, empirical research findings seem to suggest otherwise.

Comparison of websites and online banner ads across countries also reveals significant cross-cultural differences on at least some content and design elements. Furthermore, studies of online consumers show that Internet users in different countries exhibit diverse online behavior, and that their response to online advertising is dependent on elements of their home culture (Paek et al., 2009).

Localization of international advertising campaigns consists of adapting the company's communication to the specificities of the local environment of the hosting countries. While use of uniform advertising appeals offers a number of advantages, differences in customer perceptions and response patterns across countries and cultures are major barriers to use of a standardized advertising campaign.

Conclusions

This study investigated the impact of Hofstede's culture dimensions on consumers' attitude towards online advertising. On example of young Polish customer group the significant influence of cultural values connected with Hofstede's culture dimensions on online advertising perception has been confirmed.

Online advertising is still subject of cultural influences and consumers in different countries may still require communication messages that are targeted toward their specific culture. Localization of international advertising campaigns consists of adapting the company's communication to the specificities of the local environment. The consequences of not considering all the hidden meanings can be quite serious and lead, first of all, to the failure of the advertising campaign which does not fulfill its function and instead of attracting customers has a reverse effect.

Cross cultural communication solutions are also critical to effective cross cultural advertising. There will never be a common transfer code for all cultures. International marketing involves recognizing that customers all over the world have different needs, requirements and expectations.

The globalization also means that companies nowadays are addressing an incredibly varied target audience, with many different cultures. New technology development, increasing competition and consumer expectations have enforced substantial changes and new targets that can only be achieved through an adaptation approach. Consumers have also become very demanding, and new media, in particular the Internet, have become new communication channels but have also introduced new customers' requirements connected with online advertising and its cultural content.

There are some limitations in this study, connected with a limited study sample. Additionally, the empirical data were gathered only in Poland. A future study should try to validate and generalize the findings of this study by using a wider sample and taking into consideration customers' expectations from other countries.

Determinants of Logistic Service Quality in Omni-Channel Retailing

Aleksandra RADZISZEWSKA
Czestochowa University of Technology, Czestochowa, Poland
E-mail: radz_a@wp.pl

Abstract

Today's customers expect an integrated shopping experience where they can combine the different channels according to their preferences and omni-channel is a way for retailers to meet this need. Omni-channel retailing allows to connect the benefits of different retail channels integration. The paper describes the notion of omni-channel retailing and the concept of logistics service quality. Customer satisfaction is dependent on the difference between customers' expectations and the real service experience. Logistics service quality (LSQ) influence customer satisfaction and has a positive impact on fulfillment of customers requirements in omni-channel shopping The changes in consumer requirements and purchase behaviors in omni-channel shopping environment have been characterized. In this context the factors influencing consumer satisfaction level and determinants of logistic service quality have been indicated. This study aims to explore the concept of omni-channel retailing in the context of logistic service quality determinants. The study successfully verified the positive relationship between logistic service quality and customers' satisfaction in omni-channel retailing. Analysis of the collected data answered the study's hypotheses, contributing to the knowledge about dependency between customer satisfaction, and the considered dimensions of logistic service quality, related to product searching, order and product choice, product delivery, after sale service and shopping channel integration. Understanding the most influential elements for customers' decision-making is not only beneficial for future logistic development but also for increasing customer satisfaction in omni-channel retailing and successful improvement of quality management in retailing companies.

Keywords: logistics service quality (LSQ), retail logistics, consumer satisfaction, omni-channel retailing.

Introduction

Today's customers expect an integrated shopping experience where they can combine the different channels according to their preferences. Therefore many companies operate in numerous online and offline channels. This new form of retail is referred as omni-channel retailing (Rigby, 2011). The essence of this concept assumes that the retailer is able to reach and interact with its customers through combining all its established sales channels in an integrated manner (Frazer and Stiehler, 2014). In contrast to traditional retailing, omni-channel retailing has a major advantage in terms of product availability, customer service and the reduction of the company's management, operational and coordination efforts. Channel integration enable consumers to select the most advantageous distribution channel in terms of proximity, convenience, price, kindness of personnel, store ambience, products and information availability, delivery speed and channel transparency and accessibility (Moussaoui et al., 2016).

Customer can choose to use any of the available channels during any phase of their buying process depending on their needs. With increasingly complex ways to purchase, companies want to be present in as many channels as possible to give customers the ability to interact and purchase where and when they want.

The most important aspect of customer needs providing is fast delivery and high quality of service. Shopping channel integration has not only an important impact on consumers' ordering processes, requirements, expectation and shopping behaviors, but also creates new opportunities for companies. Customer satisfaction is dependent on the difference between customers' expectations and the real service experience (Zeithaml, 2003). Researchers suggest that logistics service quality (LSQ) can influence customer satisfaction and indicate that the quality of the logistics service can have a positive and significant impact on fulfillment of customers requirements in omni-channel shopping (Saura and Ruiz-Molina, 2011). Therefore, the exploration of this research problem is necessary in order to provide a suitable and measurable framework for evaluation of logistic service quality in omni-channel retailing.

This study aims to explore the concept of omni-channel retailing in the context of logistic service quality determinants.

Understanding the most influential elements for customers' decision-making is not only beneficial for future logistic development but also for increasing customer satisfaction in omni-channel retailing and successful improvement of quality management in retailing companies.

This study applies the following research methods: analysis of scientific literature, online survey, and statistical analysis of data (correlation analysis).

The study is structured as follows. After this introduction, the theoretical foundations and hypotheses that support the study have been described. Next section details the methodological procedures, followed by an analysis of data and defines the dimensions of the proposed framework and its indicators. Than the results of research have been presented and discussed. Finally conclusion and suggestions for the continuation of the research have been presented.

Literature Review

Omni-channel retailing has developed as an extension of multi-channel retailing. The difference between the concepts is the level of integration, where an omni-channel requires optimal and complete channel integration compared to a multi-channel where the level of integration varies from non-existing to high. Omni-channel retailing strategy can have a positive effect on retail, because a consumer's experience is properly enhanced through the simultaneous use of all available distribution channels (Chopra, 2016) as well as through social media, games, applications for portable devices which make the experience unique and encourage customers to buy (Verhoef et al., 2015). A major objective of retailers is to provide consumers with positive and unique experiences when they gather information for decision-making and look for the best ways to satisfy their needs and requirements (Gong and Janssen, 2015). Customers have high expectations for receiving great experiences across all of the channels they use. In an omni-channel context, the consumer expects to be able to buy desired products from a variety of channels, including websites, mobile devices and physical stores according to individual preferences. Omni-channel retailers can for example allow the customer to place an order online with the possibility of collecting the products in the physical store. They can also install online terminals in the physical stores and join the benefits of the online sales channel with the direct contact, help and assistance of salesperson. In addition to this, in order to make the website more omni-channel oriented the retailer can provide information on in-store product availability as well as store location as a way to connect the website with the physical stores (Kumar et al., 2012).

Logistics services are closely connected with customer's satisfaction in omni-channel environment and logistics processes management significantly influences customer satisfaction. The quality of logistics services is one of the most important elements that helps to satisfy completely the customers' needs in omni-channel retailing (Campos and Nobrega, 2009). Perception of logistics service quality is not only oriented towards the physical distribution, but is especially related to the after-sales service. It is determined by the following factors: customers' perception of the after-sales

services, quality and relevance of information provided by sales, order and delivery procedures (Rafiq and Jafar, 2007).

In order to deliver superior service quality, it is necessary to understand how consumers perceive and evaluate logistic service during all stages of purchase process (Marimon et al, 2010). Traditional service quality assessment is based on the well-known SERVQUAL model and proposes five dimensions of quality evaluation: Responsiveness, Assurance, Tangibles, Empathy, and Reliability (Pasuraman et al., 1988). But this service quality assessment model is focused on the traditional buyer-seller interaction. Therefore, this model should be extended by other dimensions, which are specific for omni-channel retailing. From customers' post-purchase evaluation, it can be seen how much customers value logistics service quality. Studies have shown that service quality is an important factor which influences customer satisfaction ((Rafiq and Jafar, 2007). Two core elements of omni-channel shopping are Logistics and Customer Service – ensuring that customers can receive the products ordered as soon as possible and that they can receive information and assistance during purchase process (Querin and Göbl, 2017).

The customers perception on logistic service quality is not only oriented towards the physical distribution, but is especially related to the after-sales process. Logistic service quality is determined by the following factors: customers' perception of the after-sales services, quality and relevance of information, order and delivery procedures, order release quantity, timeliness, order accuracy, order quality, error handling and staff communication (Mentzer et al., 2001). Another factors indicated as logistics service quality determinants are: customers' perception of the after-sales services, quality and relevance of information provided by sales and customer care representatives, order and delivery procedures (Bienstock et al. 2008). Customer concerns about several important elements with a close relationship to the customer value: time, dependability, communication and flexibility. Those elements indicate the requirements and expectations from customers, because they expect to gain the chosen products in easy and convenient way and as less time as possible (Rushton et al., 2010).

Research findings indicate that to increase the level of customer satisfaction companies should provide a high level of service quality (Meidutė-Kavaliauskienėa, 2013). With the rapid development of different shopping channels, customer demand for diversity and timeliness has also increased. Channel integration and implementation of omni-channel strategy lead higher requirement for logistics service (Wang, 2015). The quality of service is directly correlated to customer expectations. In today's competitive environment, satisfaction of customers' expectations regarding service quality affects business performance and encourages customer loyalty (Huang and Huang, 2012; Kilibarda et al. 2012).

According to studies conducted in retail companies, unified customer experience is a key factor for success in omni-channel strategy. On basis this studies the factors that influence customer experiences have been indicated: unified product information and pricing across different channels, flexibility of purchase systems, high quality logistics service, and customer communications. Unified pricing and product information across channels is a fundamental requirement for unified customer experience. If prices or information vary from one channel to another, it is very difficult to offer customer a unified and intuitive links between channels. Pricing and product information variation decrease the predictability for the customer, and might cause the customers to reconsider their purchase decision. Flexibility in systems and logistics is very important in omni-channel strategy development. E-commerce platform and traditional store integrated with logistics systems provide the flexibility in channel choice and high quality logistics customer service, where customer can freely choose and change their preferred delivery or pickup method from any service channel. The next important factor is unified communications to customers, which have a significant impact on omni-channel shopping experience. New channels and communications processes require the unity of marketing messages (Peltola et al., 2015).

Logistics services appear to deeply contribute to the general satisfaction for purchases. The availability of a product and its delivery times, the returns and warranty conditions are critical aspects of customer service quality. Increasing competition, turbulent business environment, changes in

consumers' behaviors, and new distribution channels cause that the ability of companies to understand their customers and ensure their satisfaction with high quality product and services is becoming more and more significant. The integration of shopping channels provides the retailer with more possibilities to satisfy the customer's requirements and expectations and customize its products and services according to each customer's needs. The increased interactions between different online, mobile and traditional shopping channels in all phases of customer buying process have forced the retail companies to change the management of their customer logistics services. A growing number of customers visit company's online channels before coming to the physical store, and a significant increase the use of mobile services during shopping. This omni-channel behavior becoming more common among customers.

Methodology of Research

The core element of online, mobile and physical channel integration is high logistics service quality on each phase of buying process, but customer satisfaction depends on various factors. This paper reviews the most recognized evaluation criteria of logistic service quality assessment in the context of omni-channel retailing. Based on the review of the collected literature, the following hypotheses have been developed for this study:

Hypothesis 1 (H1): Convenient conditions of product searching determinates e-logistic service quality assessment in omni-channel retailing.

Hypothesis 2 (H2): Suitable conditions of order and product choice determinates e-logistic service quality assessment in omni-channel retailing.

Hypothesis 3 (H3): Product delivery conditions determinates e-logistic service quality assessment in omni-channel retailing.

Hypothesis 4 (H4): After sale service determinates e-logistic service quality assessment in omni-channel retailing.

Hypothesis 5 (H5): Appropriate shopping channel integration determinates e-logistic service quality assessment in omni-channel retailing.

The empirical sample was the young customers, that make purchase with help of different shopping channels. The respondents were asked to indicate the dimensions which influence their evaluation of shopping quality and satisfaction in omni-channel environment. The study population was members of academic community. The data was collected in the form of an online survey. The online questionnaire applied in this study included two sections. The first section collected information about respondents, their shopping habits and behaviors. The second part collected the information required for running the main analyses. All survey participants were young people, aged under 25. Each participant of the study was asked to answer the survey questions. Among 92 respondents, that replied the online questionnaire, 3 of them indicated that they have little or no experience of omni-channel shopping, and 9 questionnaires were uncompleted. The remaining 80 questionnaires were the basis of the study and have been used in the analysis of data, by using correlation analyze. (V-Cramer's coefficient) analysis. Respondents included 35% males and 65 % females. All surveyed respondents, that have been taken into consideration, browse regularly e-commerce sites, have experience of online shopping and shopping in omni-channel environment. They confirm that they often join different shopping channel, for example make an order online, watch the product in physical store, use recommendation and suggestion of salespeople, and search for online opinion and recommendation of others consumers.

The reliability test used was Cronbach's alpha. For all research variables values were higher than 0,8. Cronbach's alpha for conditions of conditions of product searching was 0,847, conditions of order and product choice 0,829, product delivery conditions 0,856, after sale service 0,832, shopping channel

integration 0,841. Cronbach's alpha showed high internal consistency, what implies that the measures are reliable and the evaluation instrument is appropriate for use in research.

In questionnaire, each respondent determines the importance of every factor with a five-point Likert scale (very unimportant, unimportant, neutral, important, very important). Correlation analyze was used to estimate the unique effect of each factor typical for shopping in omni-channel environment on consumers' satisfaction levels.

The main limitation of this research is sampling. Therefore, results of the online questionnaire and all findings can be applicable only to the study sample.

Results and Discussion

Based on previous literature study, five logistic service quality attributes influencing customers' satisfaction in omni-channel shopping were selected and then subjected to examination (Table 1). The distribution of attributes related to: product searching, order and product choice, product delivery, after sale service and shopping channel integration was divided on the basis of consumers' gender.

Table 1: Arithmetic mean of the satisfaction level in omni-channel shopping

Arithmetic mean		**Conditions of product searching**	**Conditions of order and product choice**	**Product delivery conditions**	**After sale service**	**Shopping channel integration**
	women	4.75	4.91	4.87	4, 62	4,71
	men	3.79	4.78	4.42	3,87	4,29

Source: own elaboration.

In order to get a better look at which factors are related to each other, a data analysis was carried out, which determined the correlation between the level of satisfaction between selected factors with the division of groups with respect to gender. The analysis of the correlation of individual factors affecting the satisfaction level was carried out at the 0,05 level of significance. The results of the correlation matrix are presented in tables 2 and 3.

Table 2: Correlation matrix for men

Variables	**Correlations (men)** **Marked correlation coefficients are significant from p < 0.05**					
	Mean	Conditions of product searching	Conditions of order and product choice	Product delivery conditions	After sale service	Shopping channel integration
Conditions of product searching	4.75	1.000	0.624	0.612	0.625	0.347
Conditions of order and product choice	4.91	0.572	1.000	0.531	**0.947**	**0.761**

Product delivery conditions	4.87	0.617	0.543	1.000	0.423	0.534
After sale service	4, 62	0.541	**0.947**	0.463	1.000	0.000
Shopping channel integration	4,71	0.369	**0.761**	0.528	0.000	1.000

Source: own elaboration.

The factors considered as determinants of omni-channel retailing quality directly affects the level of customer satisfaction (table 1). The selected delivery factors have been chosen properly, which shows average satisfaction weights from 3,79 to 4,91 on a five-point scale. It should be noted that men and women declare different expectations and preferences. For both women (4,91) and men (4,78) the most important features, connected with omni-channel shopping are conditions of order and product choice. Very important factor for both gender is shopping channel integration. But women pay more attention to this factor (4,71) as men (4,29). Other considerable factor influencing customer satisfaction level in omni-channel shopping are product delivery conditions. They play an important role in creation of shopping experience for both women (4,87) and men (4,42). The significant factor of omni-channel shopping satisfaction is after-sale service. This factor has the higher value in case of women (4, 62) than in case of man (3,87). It exists the visible difference between men and women preferences in regard to quality of after-sale service. The differences are visible also in case of product searching conditions, were women pay more attention to this phase of buying process in omni-channel environment (4,75) as men (3,79).

The correlation analysis gave the possibility to explain some phenomena. In the case of male customers (table 2), the after sale service is strongly correlated with the conditions of order and product choice (0,947) and with shopping channel integration (0,761). In the case of female customers (table 3), the after-sale service is strongly correlated with the conditions of order and product choice (0,579).

Table 3: Correlation matrix for women

Variables	**Correlations (women)** **Marked correlation coefficients are significant from p < 0.05**					
	Mean	Conditions of product searching	Conditions of order and product choice	Product delivery conditions	After sale service	Shopping channel integration
Conditions of product searching	3.79	1.000	0.000	0.047	-0.147	-0.453
Conditions of order and product choice	4.78	0.000	1.000	0.287	**0.579**	0.189
Product delivery conditions	4.42	0.063	0.342	1.000	0.492	-0.241
After sale service	3,87	-0.172	**0.579**	0.454	1.000	-0.052
Shopping channel integration	4,29	-0.437	0.168	-0.263	-0.046	1.000

Source: own elaboration.

Shopping in omni-channel environment is connected with requirements of appropriate shopping channel integration, unified shopping conditions and easy switching of shopping channel according to present customer's requirements. Therefore customers are interested in unified information, price

and marketing communication across different shopping channels, information accessibility and relevance, effective communication with staff, customer support service and help by product choice. Omni- channel shopping can reduce risk connected with online transaction, but customers are interested in suitable after-sale service, the returns and warranty conditions, error handling and staff communication.

The significant role of all considered factors connected wit assessment of logistic service quality in omni-channel shopping has been discussed and empirically proven. This study confirms also the differences between gender in assessment of different dimensions e-logistic service quality in omni-channel environment. Men and women have different preferences related to product searching, order and product choice, product delivery, after sale service and shopping channel integration. Thus, all research hypotheses was supported. Furthermore, the findings of this study are beneficial from the practitioners' perspective, because they indicated considerable differences in omni-channel retailing quality assessment between male and female customers.

Conclusions

Omni-channel retailing allows to combine the benefits of different retail channels. Integrated logistics processes across particular channels provide various shopping possibilities, availability of diverse purchase and delivery options and different information sources. Suitable shopping channels integration enables flexibility and convenience connected with purchase process and creates unified purchase experience. The crucial determinant of this unique experiences and customers' satisfaction is high quality logistics service on each phase of purchase process across all accessible channels.

The study successfully verified the positive relationship between logistic service quality and customers' satisfaction in omni-channel retailing.

Analysis of the collected data answered the study's hypotheses, contributing to the knowledge about dependency between customer satisfaction, and the considered dimensions of logistic service quality, related to product searching, order and product choice, product delivery, after sale service and shopping channel integration. The conducted study enables the indication of the most important and visible differences between female and male customers in evaluation of particular quality dimensions. It can contribute significantly to the improvement of quality management in omni-channel retailing and increasing customers' satisfaction.

The relatively small size of the research sample does not allow generalization of results. Future research should be based on a larger sample and, in addition, increase the number of features describing the level of customer satisfaction in omni-channel retailing. In addition, other demographic variables, such as age, culture, education level, and income should be considered in future study. Possible future research should also take into consideration data, collected from customers, who have experiences not only with traditional, online and mobile channels, but also with social commerce. Future research would offer useful knowledge for retail companies and improvement of their omni-channel strategy.

Abstract

The purpose of the paper is to assess the impact of public expenditure on education as a percentage of GDP on educational effects, measured using indicators included in the Education and Training Program 2010 and 2020 in European Union member states in the years 2010-2018. There was also an attempt to determine the desired directions of educational indicators in the context of Industry 4.0, which is the novelty factor in the paper. Models for panel data (longitudinal data) were used in the research. The results of the research suggest that an increase in public spending on education does not improve the effects of education. What is more, educational indicators used in the European Union do not adequately measure the results of education desired from the perspective of the Fourth Industrial Revolution. The occurring socioeconomic and civilization changes impose the shaping of new competences, both cyber-technical, which allow work with artificial intelligence, and social. Therefore, there seems to be a necessity for a comprehensive redefinition of educational policy, both in terms of its subjects, goals and content of teaching and recipients, which cannot be equated with an increase in public spending on education.

Keywords: Education and Training Program 2010 and 2020, public expenditure on education, Industry 4.0, panel research.

Introduction

Education is one of the main issues being in the area of interest of the European Union (EU). Although the EU does not pursue a common educational policy, it is very significant for the community, which is reflected in the Europe Strategy 2020. Amongst five of its goals, one is directly related with education (decreasing the percentage of early school leavers to less than 10% and increasing the number of people with some form of higher education by at least 40%), and three more have an indirect link to education policy (reaching at least 75% employment rate for people aged 20 to 64, investing 3% of Gross Domestic Product (GDP) in research and development and reducing the number of people at risk of poverty or social exclusion by 20 million). Specific educational objectives of EU member states were determined in a strategic framework for European cooperation in Education and Training 2010 (ET 2010) and Education and Training 2020 (ET 2020) (Council of the European, Union 2009).

The occurring socioeconomic changes, and in particular the Fourth Industrial Revolution (Industry 4.0) and society's aging have put new challenges before educational policy. The Fourth Industrial Revolution is based upon smart technology. Its essence lies in transferring most decisions remaining with people to the competence of machines and obliterating the border between what is biological and what is digital. The main source of these changes is, among others, the Internet of Things, artificial intelligence, blockchain, autonomous vehicles, 3d printing and advanced robotization (Schwab, 2016). The aforementioned changes impose the realization of educational processes based on new educational models which will allow not only to raise foregoing skills and qualifications of employees, but to develop new ones as well. As the global economy arrives at the common use of artificial intelligence (AI), the demand for employees having limited skills required for the

implementation of new technology, and managing and working with it, decreases (Butler-Adam, 2018).

This means certain effects for educational institutions. Firstly, the aim of the work of, among other things, scientists, policymakers, educators should be striving for sustainable development so that everyone can benefit from sophisticated AI solutions. The second effect concerns the program for teaching and learning. To achieve success as an employee on the labor market in the era of the Fourth Industrial Revolution, literacy and numeracy skills are necessary, but also understanding how the world is functioning. In practice, this entails the necessity of a greater interdisciplinarity of curricula, in the context of including artificial intelligence, which will allow future employees to work effectively with new technology and with each other.

The Fourth Industrial Revolution requires the shaping of competences, which permit the separation of the work of humans to that of IT systems or artificial intelligence. These competences can be divided into three groups: digital and technical, cognitive as well as social (Śledziewska & Włoch, 2020). Social competences, including emotional intelligence, are associated with building the social capital necessary to work in a team and the ability to work in diverse cultural conditions (PwC, 2017). Cognitive competences (called thinking skills) include creativity, logical reasoning, and solving complex problems. These will be particularly important in the era of the Internet due to the torrent of information because they allow to assess their credibility. As part of this group of competences, also relevant is adaptability and flexibility, which are important due to the changing expectations of employers. Krzanowski and Trombik (2018) indicate that the Fourth Industrial Revolution may lead to the disappearance of not only professions requiring repetitive manual operations, but also such based on the use of advanced skills and long years of education. Hence the importance of readiness to participate in the learning process for the entire life, which will guarantee the possibility of adjusting to the upcoming changes. The third type of competence, i.e. digital and technical, includes not only programming skills, data analysis and machine operation, but also knowledge of cybersecurity and the ability to solve digital problems (Śledziewska & Włoch, 2020). The analysis of digital competences in the aspect of Industry 4.0 was conducted by Murawski and Bick (2017) and Sun et al. (2018).

Considering the above premises, a research problem was undertaken, which was formulated in the form of questions: Does the increase in expenditure on education result in improved efficiency and effectiveness in education? Are the currently used indicators adequate to measure the competences required in the era of the Fourth Industrial Revolution? On the basis of such a specific problem, a research hypothesis was made, according to which the increase in public spending on education improves efficiency and effectiveness in education.

Data sources and research methods

The study used figures from 2010-2018 for 28 EU countries from Eurostat databases. The indicators of the Education and Training Program 2010 and 2020 (Table 1) were analyzed, which were the explained variables in the models. In the estimated models, explanatory variables were public expenditure on education as a percentage of GDP ($\beta 1$), GDP per capita ($\beta 2$) and people at risk of poverty and social exclusion rate ($\beta 3$). The choice of such variables was dictated by the dominant in literature approach to the economic aspect of education research based on the analysis of costs and benefits. This approach is also used in the EU, where both effectiveness and efficiency are tested. The effectiveness of education and training systems refers to the output which they generate (e.g. the number of graduates, the level of skills mastered by them when leaving school). Hence, attention is drawn to long-term benefits of education and training both of the individual as well as the entire society. In contrast, efficiency of education and training systems is measured by comparing their effectiveness (learning outcomes and long-term benefits) to the monetary input made to generate these outcomes. Therefore, the impact of public expenditure on education on the level of indicators which are currently used in the EU to measure the degree of achievement of the objectives set by individual member states (European Commission 2012) was analyzed. Furthermore, the model

involves two variables related to the level of society's affluence, to see how changes in per capita GDP and the extent of poverty affect various aspects of education.

Table 1: Indicators of the Education and Training 2020

Indicator	Description	Target
Early childhood education – [Model 1]	The share of children aged 4 to the age of compulsory primary education who are participating in education	At least 95%
Tertiary educational attainment – [Model 2]	The share of 30 to 34-year-olds having successfully completed ISCED level 5-8[1]	At least 40%
Early leavers from education and training – [Model 3]	The share of 18 to 24-year-olds having attained ISCED level 0-2[2] and not receiving any formal or non-formal education or training in the four weeks preceding the survey	Less than 10%
Adult participation in learning (lifelong learning) – [Model 4]	The share of 25 to 64-year-olds who received formal or non-formal education or training in the four weeks preceding the survey	At least 15%
Employment rate of recent graduates – [Model 5]	The share of employed 20 to 34-year-olds having successfully completed ISCED 3-8 one to three years preceding the survey and who are no longer in education or training	At least 82%
Underachievement in (a) reading, (b) mathematics and (c) science – [Models 6a, 6b, 6c]	The share of 15-year-olds failing to reach level 2 in the OECD's PISA for reading, mathematics and science	Less than 15%

Source: Council of the European Union (2009)

Due to the nature of analyzed data (panel data with a balanced panel), models relevant to panel data were used. General notation of the panel model (Maddala and Lahiri, 2009):

$$y_{it} = \beta_0 + \boldsymbol{\beta}\mathbf{X}_{\mathbf{it}} + \alpha_i + v_t + u_{it}, \text{ i= 1,…, N, t=1,…, T}, \quad (1)$$

where: β_0 – absolute term; $\boldsymbol{\beta}$ – vector of structural parameters of the model; $\mathbf{X}_{\mathbf{it}}$ – matrix of values observed on explanatory variables; α_i – individual effects, part of the variability of *y* variable, typical of *i*-th unit (*N* effects); v_t – periodic effects, part of the variability of *y* variable, typical of *t* period (*T* effects); u_{it} – purely random distortion component.

Results of Research and Discussion

In the first step, parameters of a pooled model were estimated. The model assumes that all units in it are similar; therefore, they can be described with a simple total regression model. Next, diagnostic testing was performed to determine whether there were any significant effects that would suggest the choice of a fixed effects model (FE) or a random effects model (RE). Tables 2 and 3 present the results of pooled model estimation.

Table 2: Estimation results of parameters of pooled models for models 1-5

In the case of all the models considered, residual variance test results as regards the significance of individual effects provided the basis for rejecting a null hypothesis that assumes correctness of the OLS panel model in favor of an alternative hypothesis that recommends the use of a fixed effects model. Verification of the assumption about the constancy in variation of the random component of objects by the Breusch-Pagan test allowed the researcher to reject the null hypothesis in accordance with which the OLS panel model is correct in favor of the alternative hypothesis which takes that the random effects model is more appropriate. In the end, in the case of each of the models, the Hausman test confirmed the correctness of the choice of the fixed effects model (Kufel, 2020). Estimation results of model parameters are presented in Tables 4 and 5.

The analysis of data included in Table 4 indicates a decrease in the indicator of the participation of children in pre-school education with an increase in the level of explanatory variables (Model 1). The lack of a positive correlation between spending on education, and the share of children participating in pre-school education points to the occurrence of other factors impacting the level of this indicator. Identification of those factors is significant, because organized programs for the care and education of young children prior to enrollment in the primary school system affect children's later success at school (Dobbelsteen et al., 1999; Currie, 2001). Magnuson et al. (2004), Loeb et al. (2005) and Wong et al. (2008) in their research indicated that children who attended a center or school-based pre-school program in the year before school entry perform better on assessments of reading and math skills. Anthony et al. (2005) believe that pre-school education supports children's preparation for school and later academic success. Berlinski et al. (2008) consider pre-school education as an effective and viable policy to prevent early school leaving. In turn, the European Commission (2014) stresses two important elements related to pre-school education. Firstly, education brings the greatest economic and social returns over the lifecycle and helps to avoid later, more expensive and often less effective remedial actions. Second of all, a good quality pre-school education is highly beneficial to educational achievements and limits the risk of early school leaving.

Factors determining participation in pre-school education include both systemic and cultural dimensions. As part of the first group, of particular relevance may be the manner of organizing pre-school education, and what follows the availability of places in centers. It should also be mentioned that the demographic processes occurring in the recent years, including the decrease in the number of births, means the increase of availability of this form of education with given inputs (Łobodzińska, 2011). On the other hand, as for cultural factors, of particular importance is the family model and the occupational activity of parents; the higher it is, the greater the interest of parents in institutionalized forms of childcare (Spieß, 1997). Furthermore, professional activity reduces the risk of poverty and social exclusion. This is evidenced by the outcomes of research which indicate that the increase in poverty results in a decrease in the participation rate of children in pre-school education. Inequalities in access to pre-school education have been studied, among others, by the UNICEF Office of Research (2018).

The analysis of panel data in the case of indicator of people aged 30-34 with higher education shows that with increasing public expenditure on education, the percentage of people with such education decreases (Model 2). Concurrently, the increase in the at risk of poverty and social exclusion rate is accompanied by a decrease in the share of people with higher education. That may be because in the case of most European Union countries, higher education is paid and involves the necessity to incur financial expenses from private funds. Of the 43 higher education systems examined, only in 9 countries (including 6 belonging to the EU) higher education is free and therefore fully financed from public funds , while in the remaining countries studies are paid or paid partially (European Commission/EACEA/Eurydice, 2018b). A natural consequence of this situation is the lower percentage of people with a higher education in countries in which the level of poverty and social exclusion is higher. Furthermore, in the case of countries where higher education is paid, the rise in public spending on education does not mean a possibility of engaging smaller private resources, and what follows does not translate directly into an increased share of people with higher education.

Research on economic, social and demographic factors determining the probability of youth participation in higher education was conducted by Türk (2019), Chakrabarti (2010) and Sá et al. (2004).

The above-mentioned rules for the financing of educational systems from public resources mean that, as in the case of the previously analyzed indicator, an increase in public spending on education results in an upshift in the rate of early leavers from education and training aged 18-24 (Model 3). Being over 18 years old, and sometimes even 16 years in some European Union member states, means the end of the period of compulsory and free education, which can be continued in the form of various types of courses, training and university studies (European Commission/EACEA/Eurydice, 2018a), which is tantamount to the need to finance further education from private funds. Certainly, this is only one of the reasons for which young people do not choose to continue education (Van Caudenberg et al., 2017, Nairz-Wirth 2014, Tomaszewska-Pękała et al. 2017). More on micro-, meso- and macro-factors influencing the decision to continue learning can be found in (Van Praag et al. 2018). Moreover, what is worth highlighting, early school leaving can pose a significant threat to human capital resources, especially in the face of the Fourth Industrial Revolution and new competences that will be required of employees.

As in the case of the above discussed indicator, the level of the rate of participation of people aged 25 to 64 in the process of lifelong learning is also important from the point of view of the challenges related to the Fourth Industrial Revolution. Karaman stated that the importance of lifelong learning has increased as a result of rapid change in the world (Kaplan 2016). Klug et al. (2014) described lifelong learning as a process that includes a rapid change through which individuals acquire competencies in different areas during their lives. In the case of the analyzed indicator, amongst the explanatory variables of significance is GDP per capita (Model 4). With the increase of this indicator upshifts the value of the analyzed rate. The level of affluence determines the possibility of financing additional education both from individual incomes and the scope of financial support provided by the private and public sectors. Similarly to pre-school education, also with the analysis of this indicator we should consider the occurring demographic changes, which in the coming years will affect the shape of formal, non-formal and informal education. Future labor resources in Europe will be recruited from a population significantly older than at present, while at the same time completely new competences will be expected of it (Schwab 2016). This will require a change of training systems, especially of adults, from which a significant part of employees will be recruited, and further socio-economic development will depend on the effects of their employment.

In turn, the estimated model for the employment rate of recent graduates indicates that the increase in GDP per capita causes an upshift in the employment rate among people aged 20-34. Concurrently, the growth of the at risk of poverty and social exclusion rate results in a decrease in the level of employment in the studied group (Model 5). As part of the ET 2020 program, an objective was established for EU member states in the scope of the share of employed graduates (aged 20-34 with at least upper secondary education attainment and having left education 1-3 years ago) at a level of at least 82%. According to OECD (2006) surveys, particularly younger people with low human capital and skills are more vulnerable to long-term unemployment, unstable and low-quality jobs and possibly social exclusion. In the light of the cited research, the increase of poverty among young people limits, as a result of too low financial resources, their possibility of raising professional qualifications and thus makes them less competitive on the labor market. These rationales provide clear evidence for the significance of education, but of relevance from the preceptive of the labor market is also professional experience. Caroleo and Pastore (2007) conducted research in this area; they pointed out that the "gap in experience" is a key factor explaining a higher unemployment rate among people entering the labor market, and thus a higher level of poverty, compared to people with longer seniority. Moreover, the "school to work transition" institutions are also of great importance when undertaking the first job (Ryan, 2001). More on this topic can be found in Brunello et al., (2007), the European Commission (2008), Perugini and Signorelli (2010a, b), Nunziata and Staffolani (2007), Kolev and Saget, (2005), Bassanini and Duval (2006) and OECD (2006). The literature also indicates difficulties associated with entering the labor market after graduation (Sciulli and Signorelli, 2011). The problem of youth unemployment was described in detail by Choudhry et al. (2012).

Interesting conclusions are provided by the analysis of the impact of explanatory variables on underachievement rates in reading, math and science (Models 6a, 6b and 6c). It goes without saying that the increase in spending on education causes a decrease in the percentage of fifteen-year-olds experiencing learning difficulties, nonetheless it is puzzling that the increase in the rate of poverty and social exclusion also causes a decrease in the percentage of underachieving students. Only the results of the naive analysis (pooled) (Table 3) indicating that the increase in poverty is accompanied by an upshift in the percentage of teenagers with school failure are as expected. This is confirmed by the research of Magnuson and Votruba-Drzal (2009), which demonstrates that poor children perform worse than those from wealthier families at the beginning of education, and poverty in early childhood shapes the results in children's learning. Reardon (2011) shows that the difference in performance between the wealthy (90th percentile of income) and the poor (10th percentile of income) increased over time. The upshift in inequality in performance is likely due to the fact that wealthier parents invest more resources in the development of their young children. Magnuson and Waldfogel (2016) elaborated on this subject more widely. However, it must be remembered that the mentioned research results refer to studies at the micro level (the statistical unit is the student).

With respect to the results of panel studies (Table 5), it should be noted that they are conducted at the level of countries. In the first place, it must be mentioned that in EU member states primary education is compulsory and financed by the state, and therefore the individual's level of poverty does not directly affect the availability of education (European Commission/EACEA/Eurydice, 2018a). Moreover, a thorough analysis of the results of Programme for International Student Assessment (PISA) 2015 indicated that students from socially and economically disadvantaged groups and those with a migrant background are over-represented in the low-performing group. In most countries, students with migrant background perform worse than students without it. For example, the probability of underachievement in science among migrant pupils is twice as high as for non-migrant ones (European Commission, 2019). At the same time, it should be remembered that countries with a high proportion of students with migration roots have low levels of the people at risk of poverty and social exclusion rate. Therefore, it is not the increase in poverty that causes the school failure rate to fall, but the demographic structure of society in individual countries, including the proportion of migrants.

Academic performance is also affected by the shape and mechanisms of functioning of education systems, including the curricula. EU member states have complete freedom in shaping both the school system and the teaching contents. The development of indicators related to underachievments also depends on other factors, e.g. parental involvement. Epstein (2011), Epstein et al. (2009), Rafiq et al. (2013) and Grace et al. (2013) demonstrated a positive relationship between children's involvement and academic success.

Summarizing the results of the conducted panel research, it can be noticed that not all the considered explanatory variables turned out to have statistically significant influence on indicators included in Education and Training 2020. Generally, with the ceteris paribus assumption, higher spending on education results in an increase in early leavers from education and training rate, a drop in early childhood education rate, a decrease in tertiary educational attainment rate and a decrease in underachievement in science rate. Therefore, we should reject the hypothesis that the increase in public spending on education improves efficiency and effectiveness in education.

Conclusion

The results of the research suggest that an increase in public spending on education does not improve the effects of education. Similar conclusions were reached by Noss (1991), Mingat and Tan (1998), Flug et al., (1998) and Hanushek (2020) indicating that there is currently no clear, systematic relationship between public expenditure for education and measures of education attainment. In turn, Gupta et al. (2002) showed that greater public spending has a positive impact on widely used measures of education attainment, but only in the case of spending on primary and secondary education.

The occurring civilization changes and the Fourth Industrial Revolution call for the need to search for new models of education, on the basis of which educational processes should be implemented and which will enable the acquisition of key competences for entities of the education system. According to the results of the Deloitte (2019) report, 55% of respondents noted a significant mismatch of the current scope of employees' competences to the requirements of the future, and 57% of respondents believe that the current education system is not sufficiently preparing young people to function in the conditions of the Fourth Industrial Revolution. The deficit in employee competence indicated in the report is not reflected in the level of indicators and the degree of achievement of ET 2020 objectives. This points to the inadequacy of educational indicators used for measurement of competences required in the era of the Fourth Industrial Revolution. Seeing this problem, and in particular the deficit of digital skills, the European Commission (2018) has adopted a Digital Education Action Plan which includes 11 actions to support technology use and the development of digital competences in education. It aims to make better use of digital technology for teaching and learning, developing digital competences and skills as well as improving education through better data analysis and foresight. However, the actions undertaken in this scope regard only digital competences, while omitting social and cognitive ones.

Therefore, there seems to be a necessity for a comprehensive redefinition of educational policy, both in terms of its subjects, goals and content of teaching and recipients, which cannot be equated with an increase in public spending on education. What is apparent from the conducted research, increased public expenditure on education does not translate into an increase in the participation of children in pre-school education, an increase in the percentage share of people with higher education, an increase in the percentage share of lifelong learners, or an increase in the employment rate of recent graduates. What is more, increasing public spending on education does not contribute to a decreased share of 15-year-olds failing to reach level 2 in the OECD's PISA for reading, mathematics or science. Considering the educational challenges stemming from the Fourth Industrial Revolution, in the light of investigations carried out, the main focus should be on development of non-compulsory education, improving the qualifications of people of working age, as well as financial support for training these people from the public budget. Taking these aspects into account will help improve the level of participation in lifelong learning rate and early leavers from education and training rate, which is particularly important from the point of view of the challenges of Industry 4.0. Modeling of education policy must also take into account demographic changes and be aimed at opening education systems to new audiences. With the change of elements of policy, the set of educational indicators should be extended so that they are also oriented towards measuring digital and technical, cognitive and social competences. The socioeconomic and civilization changes occurring in the era of the Fourth Industrial Revolution mean than both cyber-technical competences allowing to work with artificial intelligence as well as soft skills will soon be widely demanded from employees. Educational policy must be directed towards shaping these competences. If not, the next few years may bring an exclusion of a certain number of employees from the labor market due to a deficit of digital competences. This will result in a decrease in labor productivity, which will have an impact on the level of economic growth.

Acknowledgement

The Project has been financed by the Ministry of Science and Higher Education within "Regional Initiative of Excellence" Program for 2019-2022. Project no.: 021/RID/2018/19. Total financing: 11 897 131.40 PLN.

maciej.pienkowski@ue.wroc.pl

Abstract

The article presents results of empirical research regarding relationship between two leading management concepts: Lean Management and Industry 4.0. It investigates answers to two research questions: how do Industry 4.0 technologies support companies, which operate according to Lean Management principles and in what directions can application of such technologies develop? Conclusions of the paper provide detailed description of Industry 4.0 solutions application within Lean companies and explaining complementarity of their relationship.

Keywords: Lean Management, Lean Manufacturing, Industry 4.0.

Introduction

Lean Management is currently considered to be one of the leading management paradigms in the world. Gaining popularity from 1990s, the concept has proven to provide significant competitive advantages like quality improvement of products and processes, cost reduction through waste elimination, delivery time improvement, increase of customer satisfaction, productivity growth and many more. Thanks to so many potential benefits, Lean Management principles are nowadays applied in all kinds of companies, from small local factories to big global corporations, regardless of their profile and volume.

In parallel to the growth of Lean Management, a new management concept is becoming increasingly popular, starting from beginning of XXI century – Industry 4.0. Basing on dynamic development of new manufacturing technologies and increase applicability of automatization and digitalization, this new approach has found a lot of appeal in an industrial environment (Wilkesmann, 2018). Industry 4.0 can be defined as an attempt to use various types of new manufacturing and IT technologies in industrial environment, in a comprehensive manner, both inside and outside of an enterprise. It can be used for communication / integration of various solutions between supply chain stakeholders, providing a broad scale of efficiency and competitiveness improvements, while reducing the costs of using them (Balasingham, 2016).

Industry 4.0 and Lean Management, despite being two separate concepts, share similar principles and targets, as both aim at improving productivity and flexibility of processes (Gerbert, et al., 2015). Due to this fact, increasing number of companies have made attempts to apply both approaches, hoping to rise potential business benefits even further. As the practical application of Lean Management and Industry 4.0 has developed, also a lot of researchers and scholars started to gain interest in the relationship between both concepts. One of key questions in this field relates to how both approaches support each other and in what direction can their relationship develop. This paper seeks to investigate this subject and answer stated above questions.

Lean Management and Industry 4.0

Due to the fact, that "smart factories" seem to be an unavoidable future of manufacturing in 21st century, Industry 4.0 has become one of the most-discussed management concepts, both in industry and academia (Klingenberg, et al., 2017). However, its growing popularity creates not only new opportunities, but also a lot of challenges for the companies, which decide to implement its principles. One of the subjects, which is yet to be fully understood and explored, is the integration of Industry 4.0 with other well-established management concepts, as Lean Management.

Lean Management, originated from Toyota Production System, in its purest form is totally independent to any kind of Industry 4.0 technologies (Buer, et al., 2018) However, as the two approaches share the same common goal of increasing productivity and flexibility, over the years, many manufacturing companies tried to simultaneously implement solutions specific to both concepts. First such attempts have been evidenced in early 1990s and were named as "Lean Automation" (LA), as they focused mostly on simple automation of production and information processes within a company. With the recent emerge of Industry 4.0, the subject of integration Lean with Information and Communications Technologies has gained more momentum. Figure 1 shows number of articles related to Lean Management and Industry 4.0 within a period between years 2015 and 2018 (Bittencourt, et al., 2019).

Fig. 1: Number of articles covering Lean Management and Industry 4.0 between years 2015 and 2018

Despite growing interest of this research area, there are still no conclusive findings regarding mutual interaction between both concepts. Some authors advocate, that Industry 4.0 conflicts with the ground principles of simplicity, continuous and small improvements typical to Lean Management and others claim that both approaches can be positively related (Rossini, et al., 2019).

One of more comprehensive theoretical studies, regarding the interaction between Lean Management and Industry 4.0 was performed by Sven-Vegard Buer from Norwegian University of Science, who analyzed 21 academic articles covering this subject. He identifies four theoretical lenses regarding the relationships between both concepts:

Industry 4.0 supports Lean Management

The first identified category, focuses on a question, how Industry 4.0 can support and further develop well-known Lean practices. It explores influence of new technologies on both implementation phase of Lean Management, as well as on already well-established Lean systems. According to Buer, this research area is covered in the most comprehensive way, with identified 18 academic papers. Majority of the studies focus on "hard" Lean practices, investigating, how the new technologies can improve existing Lean tools and methods. Findings of most of the papers confirm the statement, that Industry 4.0 does support companies in achieving the higher level of Lean Management. New information and communication technologies can reinforce effectiveness of such Lean tools and practices as Valve Stream Mapping, Poka-Yoke, Kanban, Heijunka, Andon, Total Productive Maintenance or Statistical Process Control. Despite these findings, the author points out, that a question regarding more detailed influence and optimal integration of both concepts seem to still be unanswered.

Lean Management supports Industry 4.0

The second identified perspective, focuses on Lean Management facilitation effect on Industry 4.0 implementations. This research category investigates, if already improved and waste-free processes can simplify introduction of new information and communication technologies. According to Wang (2016), a production process that already has implemented Lean is more likely to be modelled and controlled, which creates an easier foundation for building a "smart factory". Similar findings are also visible in other empirical studies. Research performed by Matteo Rossini, based on survey covering 108 European manufacturers, indicates, that EU manufacturers, which aim to adopt higher levels of Industry 4.0, should simultaneously implement Lean Management to support continuous improvement of organization (Rossini, et al., 2019). The study emphasizes, that companies which aim at achieving higher levels of Industry 4.0 must previously achieve a certain level of Lean maturity. This conclusion is also confirmed by survey on 179 industrial companies, which was conducted by Staufen AG (2016). It infers, that Lean Management seems to be an ideal foundation for companies shifting toward Industry 4.0 implementation.

1. Performance implications of an Industry 4.0 and Lean Management integration

The third research category investigates how integration of Industry 4.0 and Lean Management affects performance of the production system. In his article, Buer identifies eight studies covering this area. Their findings confirm, that integration of both concepts can have positive effects on cost, flexibility, productivity, quality inventory levels and reliability. It is stated however, that all of studies conducted so far, focused only on operational metrics of the companies, leaving a room for follow up researches.

2. The effect of environmental factors on an Industry 4.0 and Lean Management integration

The forth research perspective covers environmental factors, influencing the potential to integrate Industry 4.0 and Lean Management. No papers related to this subject has been identified. However, analysis of environments and sectors in which the integration of both concepts is the most beneficial and successful, remains very valuable and does require further exploration.

Apart from above mention categories, Victor Bittencourt, who conducted literature review of 26 different papers regarding Lean and Industry 4.0, identifies one more theoretical perspective, which is visible in existing studies (Bittencourt, et al., 2019). It is:

3. Barriers, constraints and difficulties in integrating Lean Management and Industry 4.0

As most authors confirm positive correlation between Lean and Industry 4.0, the last research perspective investigates potential barriers which may limit and impede their integration. The most important constrains, which are identified in the existing papers, include excessively complex manufacturing environment, lack of understanding of current architecture of production systems and mass customization of products.

To conclude, despite growing number of studies and papers related to Lean Management and Industry 4.0 integration, this research area still remains relatively immature and leaves plenty of room for further investigations. Some of the most commonly identified future research ideas are (Buer, et al., 2019; Cattaneo, et al, 2017; Mayr, et al. 2018):

- Investigating how to incorporate a human factor in Lean Management and Industry 4.0 integration model.
- Understanding the performance implications of an Industry 4.0 and Lean Management integration.
- Understanding environmental factors on the integration of Industry 4.0 and Lean Management.
- Creating holistic concept on Industry 4.0 and Lean Management integration.
- Defining the machine-human interaction and understanding how to integrate new professional functions such as data scientists in the current manufacturing environment.

- Understanding at what stage of the production process/ product lifecycle usage of Industry 4.0 is the most beneficial.
- Understanding interest conflict and trade-off of implementation of Lean Management and Industry 4.0.
- Understanding of pairwise relationships between specific Lean tools and Industry 4.0 technologies.

Research questions and research method

Considering areas stated above, there is a significant need to expand the current knowledge of Lean and Industry 4.0 integration. To address this need, research questions of this paper are as followed:

1) How do the Industry 4.0 technologies support companies, which operate according to Lean Management principles?
2) In what directions can application of Industry 4.0 technologies develop in companies, which operate according to Lean Management principles?

In order to answer such stated questions, a research method consisted of two steps was applied:

1) Literature review on existing Industry 4.0 technologies and their application to Lean companies.

The first step of the research was to analyze the existing literature related to Lean Management and Industry 4.0 technologies linkage. In order to do so, a systematic literature review was performed, using following criteria:

- Search on EBSCO, Emerald and Science Direct databases.
- Keywords used:
  "Lean Management" OR "Lean Manufacturing" OR "Lean Automation" AND
  "Industry 4.0" OR "Smart Factor*" OR "Digitalizat*".

As a result of such a search, 32 articles were identified. After further review based on abstracts, a final list of ten paper was selected for more in-depth analysis. Each article was then reviewed, focusing on answering the research questions. Based on the first research step, initial findings were developed.

2) Interviews with ten Lean and Industry 4.0 experts through the Delphi method.

The second step of the research method aimed at validation of initial findings through interviews with experts. The selection of experts was deliberate and included 20 Lean experts who are involved in the implementation or use of Industry 4.0 solutions in their enterprises.

As a first part of the interview, the experts were asked to answer specially designed questionnaires and describe how each of 14 defined Industry 4.0 technologies support Lean companies. As the second part of the questionnaire, the experts were asked to grade the influence of each technology with 0-5 scale (0 – no influence, 1 – very little influence, 2 – little influence, 3 – medium influence, 4 – strong influence, 5 – very strong influence).

The results of the study are presented in the next chapter of the article.

Research Results

Results of the carried out research, are summarized in the Table 1.

Table 1: Industry 4.0 technologies supporting Lean companies.

	Industry 4.0 technology	How does the technology support Lean companies?
1.	Cloud Computing	The technology closely supports Lean Management companies. Cloud computing provides "just-in-time" access to information, enabling employees to get the right information at the right time and the right place. Thanks to this, people can make faster and better decisions, which consequently increases their empowerment - key element of the Lean concept. The technology can also support real-time calculations for such important Lean metrics as WIP, OEE or productivity, enabling real-time problems resolution and eliminating waste in information flow.
2.	Big Data	Similarly as with the cloud computing, the big data supports better and faster decision making process within a company. It serves as an "engine", which processes complex and big-volume data enabling presenting them in condensed and more user-friendly form. This functionality goes hand-in-hand with fundamentals of Lean concept, which puts a lot of emphasis on real-time and visualization of results. The big data can also be used to improve problem solving processes, enabling using more data-oriented approach, which consequently supports more accurate root cause identification. Additionally, it is worth noting, that the importance of this technology will only increase, as the level of automatization within companies is growing bigger and bigger.
3.	Virtual Reality and digital simulations	Virtual reality is strongly connected with so called "Lean prototyping" approach, which supports faster and more efficient design of products or processes. Application of virtual reality enables visualization of future state concepts and performing functional tests in simulation of real-life conditions. Thanks to this, the design process can take less time and money - reinforcing Lean targets of cost and delivery reduction. Another application of virtual reality within Lean company is improvement of training process. The technology can improve both quality and time of new employee onboarding, by presenting real-life simulations and creating more visual training materials.
4.	Vertical and Horizontal Integration	Smooth information and material flow between suppliers and customers is one of key aspects of Lean Management, therefore horizontal integration technologies can constitute a significant support to Lean companies. By reinforcing better communication and real time status updates, they enable more accurate planning and real time problems resolution. Therefore, the technologies allow approaching to a Lean target state of just-in-time deliveries and shipments. On the other hand, vertical integration technologies support better information flow within company. They can be especially beneficial within escalation processes (Andon), visualization of results and quick problem solving.
5.	Augmented Reality	The technology can be really useful to such Lean tools as Training Within Industry (TWI), standardized work and Poka-Yoke. Regarding the first tool, Augmented Reality (AR) can accelerate training of new employees, by providing real-time instructions during actual performance of a work. Therefore, it supports also standardization, providing the best possible method of completing particular task in very user-friendly way. Additionally, the AR can have a strong quality significance. Right application of the technology prevents nonconformities from occurring (Poka-Yoke) or at least allows quick identification and correction of mistakes. Finally, the Augmented Reality is often used in warehousing processes, improving visualization of product location and speeding up pick-up times.
6.	Industrial Internet of Things	Application of this complex and powerful technology can be seen in two ways. On one hand, the IoT can strongly influence control of the whole production process within company. Applied in Lean organization, it can support better

		KPI control, maintenance of machines, faster problem identification and resolution. Collected real-time and big volume date, it can be used for further improvement of processes. On the other hand, some experts suggest, that Lean organizations, which traditionally focus on low cost and simple solutions, my find this technology excessively complex and too expensive to implement.
7.	Additive manufacturing technologies (for example 3D printing and rapid prototyping)	Additive manufacturing can have constitute a significant support to Lean companies. First, basic application can be 5S, where the technology is often used to create shadow boards and other visual supports. Second application can be seen as an emergency method of creating missing or broken units, to quickly fix machine breakdown. Nextly, additive manufacturing is important element to the Lean prototyping concept. It allows fast and cheap development of a prototype product, the perform visual checks or performance tests. Finally, the technology supports more customization of products, eliminating need for batch production and enabling better flexibility of a Lean company. It is worth noting, that according to surveyed experts, in order to apply these technologies on a industrial scale, it is necessary to decrease it manufacturing cost.
8.	Autonomous robots (for example cobots and AVG)	Based on surveyed experts, this technology has one of the biggest impacts on Lean companies. Autonomus robots can support elimination of wasteful activities, mainly within logistics and production processes. Automatic Guided Vehicles (AVGs) can optimize material flow by utilizing unmanned milk-runner cycles. The vehicles, which autonomously move on designated routes within defined hours, can support just-in-time deliveries of needed products. Additionally, the technology can used to apply one of key Lean principles, which is build-in quality. Machines with artificial intelligence can "draw conclusions" from previous mistakes and "learn" to prevent them from happening in the future. Autonomous robots can also be applied to eliminated un-ergonomic activities, improving employees safety and comfort of work.
9.	Cybersecurity	Most experts and Lean practitioners agree, that while cybersecurity is a necessity for modern organizations, it does not have a direct connection to Lean Management concept. Protecting stored and transferred data should be a must for every company, no matter if implementing Lean concept or not.
10.	Identification and sensor technologies (for example RFID and QR codes)	Due to relative simplicity, these technologies can be easily implemented to Lean companies. They can support organizations in multiple areas like warehousing, logistics, quality control, mistake proofing prevention, work standardization or visual management. Solutions such as RFID, provide excellent traceability of products by providing real-time data. This consequently enables better control of the process and faster reaction to problems, which is one of important Lean principle. Also, implementation of QR codes allow companies to eliminate wasteful processes and minimize manual mistakes.
11.	Mobile technologies (for example smartphones, tablets, etc.)	According to surveyed experts, mobile technologies can constitute one of the most relevant supports to Lean companies. Similar as for the previous solutions, these technologies are simple to introduce and are already quite available in the market. Being in line with Lean simplicity, supports like smartphones or tablets provide better access to information, enable better data collection and provide mistake proofing solutions. They can also significantly improve information and material flow within organization by introducing such tools as e-Kanban. Finally, mobile technologies strongly improve visual management, ensuring better tracking of metrics and enabling faster reaction to problems.
12.	Machine to machine (M2M) communication and Machine Learning	The M2M communication and Machine Learning technologies are directly connected to Jidoka pillar of Lean Management, which means "intelligent automation" or "humanized automation". According to this principle, Lean companies should aim a having automated processes, which are sufficiently "aware" of itself so that they will detect process malfunctions or product defects, stop itself and alert the operator. Machine Learning is therefore a perfect solution to achieve this target. Additional function of this technology can be

		also self-adjustment of parameters in case a machine detects any dangerous variations in a process.
13.	Artificial Intelligence	Artificial Intelligence can be considered as an integral part of Machine Learning technology, therefore its application in the Jidoka principle is also very significant. Compering to previously described technology, its application within Lean organization can be ever wider. Apart from Jidoka, the AI can also be used to ensure mistake proofing in all processes, both production and supporting like planning, purchasing or logistics. Additionally, it can be used during a design phase of product or process, by computing big-volume data and finding the optimal parameters or design. Interesting application of the AI can be also seen in call centers, to identify inicial problems of customers, however it is worth noting that traditional Lean companies should not allow leading customer service processes to robots.
14.	Blockchain	Most of the surveyed experts agree, that blockchain does not have much application within Lean companies. The reason for that may be still very little knowledge of this technology and not much practical application within production companies, The extend of blockchain application in Lean companies will be therefore proportional to its general application in industry.

Sources: (Buer, et al., 2018; Bittencourt, et al., 2019; Rossini, et al., 2019; Wang, 2016; Cattaneo, et al., 2017; Mayr, et al., 2018; Tortorella et al., 2018; Rüttimann, et al., 2016; Sanders, et al., 2016; Mrugalska, et al., 2017).

Based on opinions of the surveyed experts, it can be stated, that application of Industry 4.0 technologies within Lean companies will be steadily growing, as long as these technologies can support implementation of Lean Management principles within companies processes. The new information and communication solutions should therefore support increase of value added activities for products or services provided by company (e.g. increase in flexibility, innovation and quality of production), increase of customer service quality (including increased reliability and acceleration of information processing), reduction of processes duration time (including design, production and logistics), increase of work safety and contribute to reduction of costs by eliminating all kinds of waste in enterprises (muda). However, both authors and the surveyed experts agree, that as the Industry 4.0 technologies should promote rationalization of company's costs. It means, that in case where investment needed to apply them is too high, the implementation of such solutions should not be justifiable. Therefore, the difference of Industry 4.0 technologies usefulness between Lean and other companies, will be primarily based on the rationality of application based on the principles of Lean Management. This predictions, however, relate to a medium period of time (ten to twenty years), because of impossibility to predict directions in which humanity and technology will develop in a longer time frame.

As the second part of the questionnaire, the experts were asked to grade the influence of each Industry 4.0 technology to Lean companies with 0-5 scale (0 – no influence, 1 – very little influence, 2 – little influence, 3 – medium influence, 4 – strong influence, 5 – very strong influence). The summarized results of such an exercise are presented in Table 2.

Table 2: Industry 4.0 technologies based on their impact on Lean companies

Technologies	Average	Median	Standard deviation
Autonomous robots (for example co-bots and AVG)	4	4	1,05
Mobile technologies (for example smartphones, tablets, etc.)	4	4	1,05
Additive manufacturing technologies (for example 3D printing and rapid prototyping)	3,88	4	0,87
Identification and sensor technologies (for example RFID and QR codes)	3,77	4	1,39
Artificial Intelligence	3,77	4	0,92
Augmented Reality	3,55	4	1,57
Industrial Internet of Things	3,55	4	0,83
Virtual Reality and digital simulations	3,44	4	1,64
Vertical and Horizontal Integration	3,33	3,5	1,49
Cloud Computing	3,33	3	1,05
Machine to machine (M2M) communication and Machine Learning	3,12	3,5	1,36
Big Data	3,11	3	0,99
Cybersecurity	1,42	0	1,98
Blockchain	0,33	0	0,47

Analysis of above presented results was mainly conducted based on median, as in such a small sample size, the authors considered it to be the most reliable. It reveals, that nine out of 14 technologies have strong influence on companies, which are using Lean Management concept. The highest rated solutions, with average grade and median of 4, are autonomous robots and mobile technologies. Both of them were described as constituting the greatest support, due to two factors. First – they have very wide application within Lean company, enabling waste elimination and automation of many production and supporting processes. Second – both technologies are relatively simple to implement and already quite well established in production companies. Due to this fact, interviewed experts were able to give detailed examples of use to autonomous robots and mobile technologies supporting Lean principles.

Four out of 14 technologies were graded with median 3 or 3,5. These are Vertical and Horizontal integration, Big Data, Cloud Computing and Machine to Machine communication with Machine Learning. Within the surveyed experts there was quite a discrepancy in ratings, as each of these technologies got at least one grade of five and at least one grade of one or two. However, one thing in common for all four solutions is high level of complexity and time needed to introduce them in companies. Unlike the technologies rated the highest, those four are much more ambiguous in interpretation, being more general and high-level. This comprehensiveness does not go in line with general Lean rule of simplicity, hence the slightly lower grades.

Finally, two out of 14 technologies, which were rated the lowest are cybersecurity and blockchain. Both with different reasons. The first one, due to lack of clear relation to Lean Management concept, as the experts emphasized, that cybersecurity is a must have, no matter if company follow Lean rules or not. The second technology – blockchain, was assessed as the least influential, due to low practical applicability. It was stated, that this technology is yet to immature to have a significant impact on managing all production companies, not only the Lean ones.

Summary

As a result of conducted research, the authors obtained initial answers to previously formulated questions:

1) How do the Industry 4.0 technologies support companies, which operate according to Lean Management principles?
2) In what directions can application of Industry 4.0 technologies develop in companies, which operate according to Lean Management principles?

The research concludes, that technologies of Industry 4.0 do support companies, which operate according to Lean Management principles, however, the impact of each solution is varied. It can be stated, that both concepts can be complementary and support one another, as they share similar goals and objectives.

Detailed conclusions from the paper are:

1) There are two main conditions to successfully apply Industry 4.0 technologies in Lean companies: clear purpose of application and right financial justification. Following Lean principles, implementation of new information and communication solutions make sense only if they serve elimination of certain waste and their implementation is cost-efficient. If those conditions are not met, it is recommended to implement more traditional solutions.
2) Technologies, which constitute the biggest support to Lean companies are characterized by simplicity of use and easiness of implementation. Organizations, which operate according to Lean Management should always be economical, focusing on small and incremental improvements, rather than big and expensive. The preferred simplicity of Industry 4.0 solutions goes also along with flexibility principle, as less complex technologies tend to be more adjustable.
3) Preference should be given to eliminating waste within processes and only then automating them. Building on this observation, it can be stated, that the recommended order of implementation should be first Lean Management and then Industry 4.0, as the first concept lays foundations for easier implementation of the second one.
4) One of the main challenges of applying the Industry 4.0 concept in Lean companies will be maintaining the willingness of employees to solve problems and continuously improve their work. With a large share of automated processes, people can have perception of decreased autonomy and empowerment. Maintaining of people engagement should be therefore a critical task while implementing Industry 4.0 solutions.

With such presented findings, the paper contributed to current knowledge of Lean Management and Industry 4.0 relationship. It provided descriptive and comprehensive answers to how main Industry 4.0 technologies support companies operating according to Lean principles. The paper established also a list of most impactful information and communication solutions. For further studies, it is recommended to extend the empirical part of the research, by performing interviews with bigger number of experts and confirming the results through case studies.

Urban Voids in The Context of Sustainable Development of Housing Estates

Agata PLUTA

Wroclaw University of Economics and Business, Poland
agata.pluta@ue.wroc.pl

Abstract

The basic objective of the study is to identify stages of implementation of sustainable development for the purposes of urban void management. Moreover, the article contains a proposal for land use indicators of sustainable development of housing estates in five different areas: settlement, social and cultural, economic, environmental, and functional and spatial.

Keywords: Sustainable Development, Spatial Order, Urban Void, Sustainable Development Indicator

Introduction

The characteristic and particularly undesired feature of contemporary urbanisation in the spatial aspect is its spontaneous and uncontrolled nature (Jedwab et al., 2017; Kowalewski et al., 2014). Dynamic and sudden changes in urban densification cause radical dwindling of empty spaces in cities, especially those of a high urbanisation level. Thereby, the significance of open, undeveloped space, defined by the author as urban void, increases. In the face of the challenges that contemporary cities are facing, it is therefore essential to find solutions that will compensate for the pace and intensity of urban transformations and dwindling of space.

With regard to the phenomenon of inability to multiply land as a rare good, but also a constitutional requirement of sustainable development, containing chaotic urbanisation process should be subject to more efficient land use control, and the size of investment areas should result from real needs and developmental abilities of cities. Therefore, the continuous control over the use of urban space, and, moreover, the monitoring of urbanisation processes, are necessary actions.

In this study a comprehensive review of the literature was used in order to establish the existing state of the studies on sustainable development at a local level, and to identify previous attempts to devise indicators of spatial development. The descriptive and interpretative approaches were applied with an emphasis placed particularly on the attempt to identify the stages of sustainable development implementation for the purposes of urban void management. Furthermore, on the basis of the conducted literature review and available databases, the land use indicators of sustainable development were suggested. Their structure was based on the level of spatial units as inherent elements of city structure. An optimal direction of development of urban voids should be considered in the context of the conditionings and needs of the surroundings. In the study housing estates were accepted as the surroundings. While formulating the criteria of sustainable development of housing estates, the following groups of criteria were regarded as significant from the perspective of the issues of the study and the assumed objective: settlement, social and cultural, economic, environmental, and functional and spatial.

It needs to be highlighted that while discussing the stages and indicators of sustainable development of housing estates, the starting assumption was made that the study will only present the most significant, in the opinion of the author, areas of their occurrence. It is a necessary condition if one takes into consideration the multitude of issues included in the analysis. The article with regard to space limitation does not exhaust the comprehensive and interdisciplinary subject of sustainable

development. However, it indicates the most significant determinants and barriers of sustainable development of urban voids.

Urban void as a subject of studies

Urban voids are an area that concerns both neglected, abandoned and forgotten areas in cities. These are the terrains which were created in contemporary cities as a result of urban processes. i.e. urban sprawl, decentralisation resulting from demographic changes, deindustrialisation, housing exclusion (Johnson et al., 2014). These are also areas abandoned due to internal migrations of the population, speculative investment practices, inappropriate municipal policy, lack of financial resources for their redevelopment, or lack of ideas for new development. Such areas negatively affect urban landscape while undergoing the process of degradation both in the sphere of space and function. In turn, this condition may become a reason that will make sustainable development of the whole urban centre impossible or to a large extent hindered.

In the era of current urbanisation tendencies, empty spaces are gaining more and more significance. However, only in few cases is the problem addressed in a comprehensive manner, analysing the importance of use of urban voids in city management, social life, and improvement of the quality of environment. With regard to insufficient awareness concerning potential use of void areas, they are frequently overlooked and not fully appreciated as a part of the urban landscape in spite of their potential social end ecological values (Kim et al., 2018). Furthermore, there is a dominating approach according to which the transformation of abandoned or void urban areas is concentrated on economic benefits in a narrow sense (Greenstein, Sungu-Eryilmaz, 2004). Long-term consequences of the conducted investments are also not taken into consideration.

The way of using urban voids has a direct influence on the changes in the functional and spatial structure of a housing estate. There are many possibilities for redevelopment of void areas with regard to their social and ecological value, therefore many designers, urban planners and scientists are interested in the potential offered by urban voids, in particular, however, within the scope of their planning and designing (Gunwoo, 2016; Johnson et al., 2014; Németh, Langhorst, 2014). In the studies (Gobster et al.,2020) it was empirically confirmed that the change of the intended use of abandoned and neglected urban voids in dense urban districts strengthens social cohesion and the sense of belonging to the place. Whereas (Anderson & Minor, 2017) suggest that successful implementation of the strategy of greenery establishment in urban voids helps to stabilise the population loss and improve social and ecological values.

The existing studies of literature show that the issue of use of urban voids is addressed mainly from the point of view of urbanisation and architecture, and it is regarded as a spatial element. In economic sciences, shortcomings in the approach towards urban voids can be noticed, among other things, insufficiency of studies, both of theoretical and empirical nature, regarding the impact of urban voids on socioeconomic development of contemporary cities. The available scientific works focus mainly on urban post-industrial areas (contaminated industrial areas), whereas relatively few studies or urban policies refer to an enormous unrealised potential of small vacant and abandoned plots that are most frequently located among the poorest urban districts (Goldstein et al., 2001). The loss of the potential described above is escalated by urban policies that are often concentrated on the establishment of new infrastructure, new development, instead of rehabilitation and redevelopment of the existing areas (Kim et al., 2018).

Sustainable development in local analyses

Sustainable development of the city

In the light of the Polish law, enforcement of sustainable development or principles of such development is a requirement that needs to be taken into consideration on socioeconomic planning and spatial development. On the one hand, it results from the provisions of the Constitution of the Republic of Poland, “The Republic of Poland […] ensures environmental protection guided by the principle of sustainable development”. On the other hand, sustainable development (beside spatial

order) is one of the main principles of planning of spatial development and management of cities, which directly results from the principles of the Spatial Planning and Land Development Act. The need to take into consideration the idea of sustainable development in creating urban policies may also be supported by, regardless of the above-mentioned legal regulation, the need for rationalisation of actions with reference to the existing suburbanisation processes (Parysek, 2013).

With reference to the definition of sustainable development that functions in the Polish legal system (Environmental Protection Law), it may be assumed that it is a process of socioeconomic development in which integration of political, economic and social actions takes place, with the preservation of natural equilibrium and persistence of basic natural processes, the objective of which is to guarantee the ability to satisfy basic current and future needs of the inhabitants. With reference to the city, the pursuit of equilibrium should concern one more significant subsystem, namely the urban area. The city is a specific spatial system composed of the social and tangible (anthropogenic) layers, as well as cross-systemic relationships between these elements and natural environment. It may be therefore assumed that sustainable development of a city, on the one hand, signifies a model of socioeconomic development, and, on the other hand, a spatial structure model (Parysek, 2013).

An important issue to discuss remains how the principle of sustainable development should be considered in the practice of planning and spatial development, and in a broader context: how planning and spatial development may contribute to more sustainable development (Mierzejewska, 2015).

Sustainable development of a city, following Parysek (2013), may be considered from the perspective of two categories of equilibrium: partitive and general. In the first one, equilibrium within the scope of each of the distinguished subsystems is pursued, that is the equilibrium in the following subsystems: (1) natural, the reflection of which are pro-environmental actions leading to the equilibrium in urban ecosystems and to healthy biophysical environment; (2) social, which should be related to civilizational and cultural development, social progress and cross-generational justice; (3) economic, which is indicated by the stability of economy and diversification of its components; as well as (4) spatial, which finds its reflection in spatial order. The general equilibrium is expressed by harmonisation or equilibration of the economic development with the social one, and with environmental conditions.

Determinants of spatial order

Following Zbierska, it is assumed that rational management of space and natural resources, through appropriate planning decisions, constitutes one of the cheapest and most effective ways that lead to the optimum use of space and increase of its value, and harmonious coexistence of the human and nature (Zbierska et al., 2015).

Preservation of the spatial order is one of the basic requirements that urban planners are faced with in the Spatial Planning and Land Development Act. According to the legal definition of the spatial order, it is such “lie of the land that creates a harmonious whole and takes into consideration in ordered relationships all and any conditionings and functional socioeconomic, cultural and compositional and aesthetic requirements” (Spatial Planning…). Spatial order is also one of the objectives of spatial development on all levels of planning (national, regional, local, and functional) included in the National Spatial Development Concept 2030. Furthermore, satisfying the collective needs within the scope of spatial order was mentioned in the Act on Municipal Government, as one of the first own tasks of a commune.

Therefore, spatial order may be regarded as a desired state of spatial development in which the arrangement of structures and services in space should correspond to the existing layout of the settlement network, social and natural conditionings, and serve the purpose of satisfying various present and future social needs. The main factors of preserving spatial order include optimal spatial arrangement of various functions, peaceful and most profitable proximity of functions arrangement (Zbierska et al., 2015) and harmonious topography of spatial elements and structures.

Indicators of sustainable development in spatial management

The instruments of implementation of sustainable development may be divided into the following ones: organisational and legal, financial, and information and educational. At a local level, land use studies and environmental impact assessments play the most significant role in space management (Zbierska et al., 2011). In Poland there are two systems of assessment of the quality of life and realisation of sustainable development that may be helpful in determining indicators to be applied in space management.

The first system operates within the framework of the European programme Urban Audit. It is a common initiative of the European Commission and Eurostat that is an answer to increasing information needs about cities. The main objective of the programme is the provision of objective and comparable statistical data concerning European cities, among other things, within the scope of demography, structure of households, housing industry, health care, crime, labour market, economic activity, income, social engagement, education, environmental protection, culture and tourism (Statistics Poland, https://stat.gov.pl/). At a city level, Urban Audit contains over 170 variables and more than 60 indicators. The indicators include 68 Polish cities. They come from the variables gathered by the European Statistical System (Eurostat, https://ec.europa.eu/eurostat/).

The second system of indicative monitoring is a Polish initiative called the Self-government Analysis System (SAS) initiated by the Association of Polish Cities. The module of indicators of sustainable development against the background of other systems of indicators stands out due to the possibility to calculate synthetic measures of sustainable development for particular orders (divided into the following groups: social 85, economic 68 and environmental and spatial 66) and fields. The module of this system amounts to 219 indicators altogether. The system of indicators is presented on the basis of the resources of the Local Data Bank of the Central Statistical Office, and the information is updated directly by the local government units that participate in the project.

The above-mentioned systems provide plenty of comparative data and they may be successfully applied also at a level of spatial units. However, it should be remembered that the above-mentioned indicators are used to compare communes between one another, and not for internal analyses. Therefore, for the purposes of space management they should be completed with analyses of spatial diversification within a particular city. Majority of features and criteria concerning urban development that the above-mentioned systems use, find their reflection also on a scale of a district or housing estate (Zaniewska et al., 2008).

Urban void in the context of sustainable development

The appropriate use of urban voids may become an important tool that supports the realisation of the assumptions of sustainable development of a city, as well as transformation of the hitherto applied urban practices. According to the author, it should be considered from the perspective of a spatial unit in which it is located (e.g. district, housing estate, urban unit or statistical region) so that a realistic assessment of development opportunities of urban voids can be made. The choice of spatial function should depend on the existing economic and natural conditionings, and it should serve the purpose of satisfying various social needs, including forecast changes within the above-mentioned scope.

Due to the complexity of factors of spatial order, an assumption was made that for local administration to manage void urban areas it is necessary to have a uniform and functional tool for spatial analyses within this scope (Zbierska et al., 2015). The author of the article suggests the following stages of implementation of sustainable development and development of indicators of sustainable development for the purposes of urban void management.

The first step in urban void management consistent with the principle of sustainable development should be the **identification of the resources of urban voids** in the area of a high level of urbanisation. The objective of the review of void urban areas is to identify undeveloped, unused, degraded areas and uninhabited buildings which do not have any precise intended use, or which remain unused for the purpose specified in the local zoning plans for a long time.

The second step should be the **inventory of urban voids**, that is the identification of the present state. The diagnosis of the area should be conducted in respect to its individual physical, biological, social and cultural, institutional and legal features (e.g. surface, present state, number and condition of trees, significance, function and value of the terrain). The purpose of inventory is to distinguish urban voids from the urban area where some limitations exist regarding the development opportunities that have an impact on the choice of function of the area. The limitations may result, among other things, from legal protection of nature or culture, property right, surface and landform of the terrain, unfavourable proximity of function (e.g. emission of pollution or noise). The diagnosis of the territory may be conducted through an indirect method (on the basis of the existing documentation) and through a direct method (inventory in the field).

In the next step the **valorisation of urban voids** should be conducted that consists in the assessment (in a point-like form) of usefulness of particular urban voids for specific functions of development or a way of use of the terrain. The final effect should be a map of valorisation of empty spaces. At this stage, it may be helpful to use Bajerowski's matrix method for optimum use of the terrain which consists in the choice of a physically possible and legally acceptable function of the terrain that causes the highest land value (Ogryzek, 2007).

An appropriate and reliable diagnosis of urban voids is of great significance due to practical actions that can be undertaken in the area as well as reasonable land use space management. The obtained results may contribute to the establishment of a local base of urban voids as an interactive tool for monitoring void areas. In the process of inventory and valorisation, GIS (Geographic Information System) programmes constitute a useful tool. They make it possible to conduct spatial analyses on maps and their presentation with the use of visualisation of results, and guarantee fast access to public data from many sources (presented as vectors, rasters and statistical data). Mapping such data may provide information about the location of void areas, their ownership structures, forecast period of lasting of an uninhabited building as well as plans for their use in the future. The aim of the presented base of void urban areas is to support the management of the urban area in a more reasonable and optimal manner, and to initiate and test the persistence of temporary urban solutions.

Another step should be a content-related **functional and spatial interpretation of terrain diversity** together with **quantitative establishment of the conditionings and development needs of a spatial unit.** The current situation of housing resources, labour market and spatial resources for the analysed housing estate should be collated with demographic and economic forecast, and with the projected needs. Then, on their basis, **land use indicators of sustainable development** should be determined (in the settlement, social and cultural, economic, environmental, functional and spatial areas) for particular spatial units where the studied urban voids exist. The indicators should take into consideration the developmental objectives included in the study of conditions and directions of spatial development of a commune. The above-mentioned measures can be concentrated both around the whole spatial unit and developed or completed with direct reference to the studied urban voids (e.g. measures of availability of the studied plot for urban public utility facilities). Following Śleszyński (2013), it is assumed that the number of indicators shall not exceed 30-40.

The source of baseline data could be the information available directly at the commune office or a subordinate unit, in public statistical databases (the level of local administrative units) as well as on the basis of the land and property register, maps and data from spatial information systems (e.g. topographic data, orthophotomaps), and on the basis of the information gathered during the inventory in the field.

In order to structure the above-mentioned land use indicators, the review and assessment of application possibilities of various indicators of spatial order were conducted at a local level, which constitute the result of the existing studies. The indicators suggested by, among others, T. Borys (2008), P. Śleszyński et al. (2013), A. Zbierska et al. (2015) as well as the Self-government Analysis System and Eurostat (Urban Audit) turned out to be particularly helpful. The above-mentioned indicators were analysed with respect to the possibility for their implementation at a level of a spatial unit and extended by the author's own list. In particular, the author focused the attention on the indicators that have spatial reference and result from the commune's own tasks.

The list presented below shows only a proposal for several land use indicators, which is a subject of discussion in scientific, expert and practical communities. The indicators may be specified for specialist needs in the context of space management.

Table 1: Proposal for land use indicators of sustainable development for an exemplary spatial unit (housing estate), with particular consideration of urban voids*

INDICATOR	FORMULA	
SETTLEMENT FACTORS		
(1) Population density of a housing estate [P_d]	$P_d = \frac{i}{s}$	i – total number of inhabitants of a housing estate s – total area of a housing estate [ha]
(2) Build-up density [B_d]	$B_d = \frac{b}{s}$	b – number of buildings in a housing estate (all or particular types of development) s – total area of a housing estate [ha]
(3) Urbanisation intensity [U_i]	$U_i = \frac{s_{ua}}{s}$	s_{ua} – total urbanised area s – total area of a housing estate [ha]
SOCIAL AND CULTURAL FACTORS		
(4) Pedestrian accessibility of the facility [P_a]	$P_a = \frac{i_i}{i}$ $P_a = \frac{i_e}{i}$	i_i; i_e – number of inhabitants of a housing estate in an isochrone[1] or equidistance[2] of pedestrian access to the facility (e.g. basic services, cultural services) above the specified time/distance limit from the facility (e.g. 10-minute walk to the public transportation stop) i – total number of inhabitants of a housing estate
(5) Availability of flats (F_{a_1} – average number of persons per 1 flat; F_{a_1} – average living area per person) [F_a]	$F_{a_1} = \frac{i}{f_1}$ $F_{a_2} = \frac{f_2}{i}$	f_1 – total number of flats f_2 – total area of flats i – total number of inhabitants of a housing estate
(6) Availability of cultural facilities [Cu_a]	$Cu_a = \frac{Cu}{i}$	Cu – number of cultural facilities i – total number of inhabitants of a housing estate
(7) Crime level [Cr_l]	$Cr_l = \frac{Cr}{i}$	Cr – average number of crimes per year i – total number of inhabitants
ECONOMIC FACTORS		
(8) Level of entrepreneurship (number of business entities per 100 inhabitants) [E_l]	$E_l = \frac{e}{i}*100$	e – number of business entities i – total number of inhabitants of a housing estate
(9) Unemployment level (the unemployed per 100 working-aged persons) [Ue_l]	$Ue_l = \frac{i_{ue}}{i_{wa}}*100$	i_{ue} – number of unemployed inhabitants of a housing estate i_{wa} – number of working-aged inhabitants of a housing estate
(10) Average price of land [L_p]	$L_p = \frac{p}{s_l}$	p – total value of purchase/sale transactions in a given period in PLN s_l – area of land in m^2 which the transactions concerned
(11) Investment conditionings [I]	$I_g = \frac{s_g}{s}100\%$	s_g – area of land (plots) where development is possible (gross)

[1] Isochrone – lines of equal availability of time.
[2] Equidistance – lines of equal availability of distance.

	$I_n = \frac{s_n}{s} 100\%$	s_n – net area, that is gross area less the area of land (plots) legally excluded from development (environmental protection, restoration protection, enclosed areas, protection zones etc.) s – total area of a housing estate
ENVIRONMENTAL FACTORS		
(12) Greenery availability [G_a]	$G_a = \frac{s_p}{i}$	s_p – area of parks designed for walking and leisure i – total number of inhabitants of a housing estate
(13) Share of greenery in the total area [G]	$G = \frac{s_g}{s} 100\%$	s_g – area of greenery in a housing estate, i.e. parks, lawns, garden squares, forests, allotment gardens s – total area of a housing estate
(14) Accepted level of pollution emission [Pe_l]	$Pe_l = \frac{p_e}{s}$	p_e – accepted level of pollution emission (e.g. gaseous, dust) s – total area of a housing estate
FUNCTIONAL AND SPATIAL FACTORS		
(15) Share of area of a given function in the total area [F_x]	$F_x = \frac{s_x}{s} 100\%$	s_x – area occupied by the x use function s – total area of a housing estate
(16) Share of urban voids in total area [V]	$V = \frac{s_v}{s} 100\%$	s_{uv} – area of urban voids (e.g. undeveloped, degraded areas, uninhabited buildings) s – total area of a housing estate
(17) Land use coverage (share of areas included in the valid local zoning plan) [L_u]	$L_u = \frac{s_{lu}}{s} 100\%$	s_{lu} – area of housing estate included in a valid local zoning plan, s – total area of housing estate

** Formulas in the table applies to a housing estate.*

Source: own study.

The discussed indicators concern various aspects of spatial development of a spatial unit. According to the assumed definitions, spatial order is a particular and desired state of this development. Therefore, after determining a content-related value and validity of the assumed indicators, the scope of this target framework should be established. It regards especially the adoption of appropriate limiting ranges (lower and upper ones) that position spatial order (Śleszyński, 2013).

However, it should be remembered that not all the issues can be measured with the use of the indicators. Attention should be paid so that they do not become a tool of "mechanisation" of urban void management, since they are based on the simplification and generalisation of phenomena and processes that cannot be always recorded mathematically (Zbierska et al., 2015).

The proposed indicators of spatial development and spatial order of spatial units should take into consideration the results of the diagnosis of urban voids. It should be emphasised that the optimal use of urban voids does not always need to be related to the transformation of the area towards anthropogenic functions. From the point of view of the principles of sustainable development, it may turn out to be more justified to apply ecological solutions, modernisation and rehabilitation actions or even temporary development for the purposes of space protection as a space reserve for the future.

Summary

The significance of spatial order as an inherent attribute of sustainable development causes the rationalisation of spatial processes to become nowadays one of the most important tasks for local governments.

In the conducted study urban voids were assumed as an area of the implementation of the assumptions of sustainable development. Adjustment of the directions of use of these areas to the natural conditionings as well as socioeconomic needs requires the development of a functional tool for spatial analyses. For this purpose, the author suggested a process of sustainable development implementation which consists of four stages: (1) identification of resources, (2) inventory and (3) valorisation of urban voids, and then, with reference to the surroundings, (4) functional and spatial interpretation of terrain diversity, and (5) quantitative establishment of the conditionings and developmental needs of a housing estate.

The implementation of the suggested procedure in future empirical studies will help to determine development potential of void areas, and, consequently, an optimum direction of their use in accordance with the principles of sustainable development. The presented tool, and the suggested indicators, may be helpful in verification of efficiency of the undertaken actions with regard to the intended results (e.g. increase of the economic value of a housing estate as a result of investment actions).

Due to the phenomenon of urban densification, the actions which to the largest extent guarantee the protection of open, undeveloped urban areas should be undertaken. These actions frequently require transformation of the existing urban practices and the engagement of decision-makers. The conducted analysis may contribute to the development of recommendations for the use of urban voids towards sustainable development and constitute an inspiration or a warning during developmental research on the effective management of limited spatial resources.

Corporate Governance Mechanisms and Disclosure Compliance Practices in Emerging Economies: The Case of Listed Banks in Romania

Delia DELIU

West University of Timişoara, Faculty of Economics and Business Administration, Timişoara, Romania, delia.deliu@e-uvt.ro

Abstract

The fallout from the financial crisis back in 2008 has placed a heavier focus on best practices for corporate governance principles, Boards of Directors feeling more pressure than ever before to be transparent and accountable. In the same background, given the current socio-economic context, due to the crisis generated by the new Coronavirus (CoVid-19) pandemic, banks may find themselves under similar levels of scrutiny, being subject to similar regulatory backlash. In this context, their behaviour should not once again fail to fulfil the expectations of policy makers in particular, and society in general. The Code of Corporate Governance issued by the Bucharest Stock Exchange (BSE) aims at creating an internationally attractive capital market in Romania, based on best practices, transparency and trust – pillars that encourage companies to build a strong relationship with their shareholders and other stakeholders, by an effective and transparent communication, as well as openness towards all potential investors. This paper aims to highlight the degree of compliances of bank listed on the BSE with the principles and provisions stipulated by the Code of Corporate Governance in force. In this context, we assessed bank corporate governance in Romania, by measuring the corporate governance quality and effectiveness in the main Romanian banks. Evaluating corporate governance eminence is constructed by using the score function method in regards to disclosure and transparency practices, as proposed (but not imposed!) by BSE. The sample consisting in the 4 Romanian banks currently listed on Bucharest Stock Exchange: Banca Transilvania, BRD, Erste Group and Patria Bank. In this respect, we performed an investigation of the mode in which the principles enforced by the BSE are respected in four top Romanian banks. We consider our goal important due to the current sensitive socio-economic environment, which, undoubtedly, makes the corporate governance in banking sector a controversial subject. In this framework, we reached valuable conclusions regarding a satisfactory compliance level with the Code of Corporate Governance issued by BSE regarding Romanian banks, the research emphasizing a high level of adoption of the best practice doctrines.

Keywords: corporate governance; Bucharest Stock Exchange; Code of Corporate Governance; disclosure; transparency; compliance; banks.

Introduction

Given the background of globalization and "the new economy", corporate governance's particularities within the bank system increase awareness of both practitioners and world organizations, concerned in advocating worldwide soundproof doctrines – whichever we talk about the **Organisation for Economic Co-operation and Development (O.E.C.D.)**, **Basel Committee's** or **the community law**. The first delineation of the concept dates back to the 1970s, when the **Securities and Exchange Commission (SEC)** brought the issue of corporate governance to the forefront when it was brought a stance on official corporate governance reform, the term appearing for the first time in 1976, in the Federal Register, the official journal of the Federal Government.

Corporate governance is defined by the **O.E.C.D.** as the set of relationships between a company's management and its stakeholders, respectively the "procedures and processes according to which an organisation is directed and controlled". The corporate governance structure specifies the distribution of rights and responsibilities among the different participants in the organisation – such as the Board, managers, shareholders and other stakeholders – and lays down the rules and procedures for decision-making.

Correspondingly, through the **M.E.N.A.-O.E.C.D. Initiative (2019)**, drafts some guidelines regarding the effectiveness of corporate governance structures in banks, depicting: "given the prevailing role of banking institutions as a source of finance for the corporate sector. Improved board structures, administrative procedures and disclosure requirements could result in better governed banks, which are more likely to allocate capital efficiently".

We see, therefore, that corporate governance incorporates managerial accountability, Board structure ad shareholder rights.

High standards in the governance of banks and companies are essential for emerging markets and economic growth, banks having a critical position in the progress of economies due to their major role in running the financial system.

Moreover, the banking industry is distinctive since it is concurrently consolidating and diversifying. Therefore, robust bank corporate governance is, indeed, an essential constituent for promoting a more resilient financial system (**Deliu, 2019a**).

Previous research highlights the consequences of banks' specific traits on their corporate governance framework, emphasising two foremost aspects: higher opaqueness and imperviousness and, of course, higher regulation.

Furthermore, unfortunately, over the last years, consequent to the 2007-2008 financial crisis, we observe that Boards have not thrived in actually comprehending specific risks in banks, so that there have been encountered not only several discontinuity gaps, but also a sturdy lack of authority in terms of decisional issues, the instantaneous result consisting in *the spawn of a substantial trust deficit in credit institutions in general*. This situation may repeat, as we speak, due to the turbulences, instability and volatility in the socio-economic environment, all spawned by the crisis generated by the current Coronavirus (CoVid-19) pandemic.

No one can accurately predict what will happen in the future, but we need to keep in mind some of the "changes that are probably waiting for us:

- ✓ *Corporate governance needs to be integrated into the business strategy of companies and not just as a mere compliance obligation;*
- ✓ *Effective corporate governance depends on management success;*
- ✓ *The fundamental objective of the management body must be built on sustained growth of the company;*
- ✓ *Shareholders must have a long-term responsibility and economic interest in making decisions dutifully and responsibly;*
- ✓ *Well-governed companies must ensure good transparency towards all stakeholders"* (**Deliu, 2019b**).

The way in which corporate governance systems will evolve in the future is hard to anticipate, however, the socio-economical revolutions in the business environment will make banks resort to changing processes, approaches, attitudes, as well as the stakeholder interaction models. The main scope of a corporate governance system is to ensure the sustainable growth in the current context of globalization. In this context, as **Fülöp and Pintea (2015)** observe, BSE should focus on one main priority: developing a Corporate Governance Index in order to efficiently assess the degree of applying and aligning with the Code's principles and provisions, as well as to measure the *corporate governance performance*. **Vintilă and Moscu (2014)** also deliberate that a respected legal framework of corporate governance regulation is necessary in Romania, considering that corporate governance principles should be implemented through the development of legally binding framework.
Through this study, we do not aim investigating exhaustive topics associated with corporate governance in banks during crisis, since previously tremendous researches already portrayed these – **Mehran et. al (2011)**, **Mehran and Mollineaux (2012)**, **de Haan and Vlahu (2013)** – but we rather aim to outline an *exploration of the capability of the Romanian bank system to stand by the corporate governance*

principles in the context of an imminent socio-economic crisis, that may be generated by the current CoVid-19 pandemic.

A critical feature of the Corporate Governance Codes is that they are implemented on the basis of the "comply-or-explain" norm which provides disclosures of clear, accurate, relevant and up-to-date information regarding the compliance of the listed economic entities with the corporate governance principles.

In other words, a qualitative corporate governance finds its correspondent in efficient rules, policies and procedures of business management, administration and control.

The primary sources of corporate governance legislation in Romania are the Companies Law, the Accounting Regulation, the Capital Markets Law, the Government Emergency Ordinance on Credit Institutions and Capital Adequacy, and the Government Emergency Ordinance 109/2011 on state owned enterprises (amended by Law 1112016).

In 2008, the **Bucharest Stock Exchange (BSE)** adopted a corporate governance code addressed to listed companies, to be implemented as "comply-or-explain", the *Code of Corporate Governance* being revised in 2015, whereas a new Code entered into force in January 2016. Along with the Code, BSE also published a *Compendium of Corporate Governance Practices* and a *Manual for Reporting Corporate Governance*, in order to assist companies to implement the Code. The BSE has committed to have a leading role in monitoring the Code's implementation, as the **European Bank for Reconstruction and Development** (hereafter, **EBRD)** observes (**ERBD, 2016**).

A corporate governance code comprises a set of principles and recommendations for economic entities whose shares are admitted to trading on the regulated market, hence, by emphasizing best practices and by based on transparency and trust, it aims at building an internationally attractive capital country in the region. Henceforth, it encourages companies to build a strong relationship both with their shareholders and stakeholders, through an effective and transparent communication and by showing openness towards all potential investors.

BSE has taken a significant step towards better, more qualitative corporate governance at Romania's listed economic entities, by adopting in 2015 a new corporate governance code, developed together with **EBRD**. This new Code replaced the original Code which was issued in 2001 and revised in 2008. The new corporate governance framework promotes higher standards of governance and transparency through a new system of compliance and enforcement **(BSE, 2015)**, aiming to "improve confidence in listed companies through promoting positive developments in the corporate governance of these companies", by:

- putting emphasis on the value of establishing a continuous relationship with investors,
- highlighting the quality of disclosure, respectively
- deploying new measures so as to lay down a solid base for the capital market in Romania.

This paper aims to measure the degree to which the banks listed on the Bucharest Stock Exchange (BSE) comply with the principles and provisions of the Code of Corporate Governance issued by the BSE regarding the:

A. *Responsibilities* of the Board (either the Board of Directors – in a one-tier system, either the Supervisory/Management Board – in a two-tier system) vs. the responsibilities of the executive management,
B. Reliability and efficiency of the *risk management system and internal control system*,
C. *Fair rewards and motivation* of the members of the Board; respectively the
D. *Added value created through the relationship with the current and potential investors*.

By means of the Corporate Governance Statement, included in the Annual Report in a separate section, the listed banks perform a self-assessment of how the provisions to comply with are respected and, subsequently, outline the measures taken to abide by with the aspects that are not yet fully met.

Bunea (2013) and Manea (2015) both conclude one some key features that are "pertinent for *analysing and testing the degree of enabling corporate governance principles in banks"*, these comprising: tasks and duties of both governance structures and control structures (with an emphasis on the Supervisory Board's responsibilities); monitoring structures' role (and possible contiguous conflicts of interest); minority shareholders' and interest owners' status; corporate governance risks and the amendments made to the internal control function (in order to prevent and detect these risks); role of internal audit; and importance of ethics.

We consider banking governance – and particularly the banks' non-executive directors – must recognize the clear and present danger to the sector, and use this crisis as an opportunity to transform banks into respected corporate citizens rather than the perennial corporate villain.

Research Methodology

This study seeks to explore the degree to which the key concepts, principles and techniques typical to corporate governance are spread and enabled, by taking the four banks that are currently listed on BSE as a reference. The research methodology used, the observation, was based mainly on *the analysis of the Annual Reports* and of the *"Comply-or-Explain" Statement* published by the banks analysed in 2018. The analysed sample is consisting of four banks that are currently listed on BSE: Banca Transilvania (TLV), BRD (BRD), Erste Group (EBS) and Patria Bank (PBK), included in the Monthly Bulletin drawn up by the BSE in December 2018.

Since this paper's purpose is to assess the degree of applying sound corporate governance principles by the significant players in the Romanian banking system, research methodology was fundamentally based on *non-participating observation*, respectively an analysis of the disclosed documents published on the websites of the analysed banks. Moreover, a *scoring method* was used (**Spătăcean and Ghiorghiţă, 2012**; **Manea, 2015**; **Deliu, 2020**), so as to assess the degree of smearing corporate governance principles and transparency disclosing elements, which permitted transforming assertive and qualitative data into numerical quantitative data.

Data collection finds its correspondence in developing methods of mediated information collection from examining the Code of Corporate Governance issued by the BSE, Corporate Governance Codes made public on the official websites of the analysed banks, as well as their published Annual Reports as at 31 December, 2018, respectively the "Comply-or-Explain" Statement. Therefore, the research required both a qualitative and a quantitative approach, on the basis of the empirical data collected out of the sample of the four banks that are currently listed on BSE.

The qualitative approach is enlightened by the fact that the research has prerequisite *interpretations, clarifications, explanations and deep understanding of the analysed phenomena*, while the quantitative method has concentrated on quantifying through numerical expressions by using the score system for each bank from the sample.

Data

According to **BSE (2015)**, the purpose of the Code of Corporate Governance Code is to create in Romania an internationally attractive capital market, based on best practices, transparency and trust, respectively to determine listed entities to comply to a great extent with all the principles and provisions.

As stated by the **BSE's Code of Corporate Governance**, the general principles and the provisions to comply with provisions and principles to be observed, applied and accounted for by the listed companies, are structured in four sections, as follows:

Fig. 1: Bucharest Stock Exchange Market's Code of Corporate Governance

Source: own projection, after B.S.E.'s Code of Corporate Governance (2015) (https://www.bvb.ro/info/Rapoarte/Diverse/ENG_Corporate%20Governance%20Code_WEB_revised.pdf)

On one hand, the *principles* postulated in BSE's Code of Corporate of Governance are the following:

Table 1: Corporate governance – general principles, as per BSE's Code of Corporate Governance (2015)

Section	General principles
Section A – Responsibilities	i. The role of the Board of Directors in a one-tier board system and the role of the Supervisory Board/Management Board in a two-tier board system should be clearly defined and documented in the company's articles of association, internal regulations and/ or other similar documents. The Board should ensure that company's articles of association, the resolutions of the general meeting of shareholders, and the internal regulations of the company include a clear distinction of powers and competencies between the general meeting of shareholders, the Board and the executive management. ii. The Board should be structured in such a way that allows it to diligently fulfill its duties. The Board should meet sufficiently regularly to discharge its duties effectively iii. The Board should ensure that a formal, rigorous and transparent procedure is put into place regarding the appointment of new members to the Board. iv. There should be a clear division of responsibilities between the Board and the executive management. v. The Board and its committees should have the appropriate balance of skills, experience, gender diversity, knowledge and independence to enable them to effectively perform their respective duties and responsibilities. It is recommended for the majority of non-executive members of the Board of Directors or Supervisory Board to be independent. All members of the Board should be able to allocate sufficient time to the company to discharge their responsibilities effectively. The Board should ensure that it is appropriately informed to enable it to discharge its duties. vi. Board members must strictly observe the secrecy of the proceedings, debates and decisions taken, unless otherwise decided by the Board or unless regulations in force require the appropriate disclosure.
Section B – Risk management & internal control system	i. The company should have in place an efficient risk management and internal control system. The Board should determine the principles of and approaches to the risk management and internal control system in the company. ii. The company should arrange for internal audits to independently evaluate, on a regular basis, the reliability and efficiency of the risk management and internal control system and the corporate governance practices. The Board of Directors or Supervisory Board, as the case may be, should set up an independent audit committee capable of ensuring the integrity of financial reporting and of the internal control system, including the internal and external audit processes. iii. The company will ensure that all related party transactions are considered on their merits in a manner that ensures independence and the protection of the interests of the company, compliant with the restrictions set out in related legislation and fairly disclosed to shareholders and potential investors. The definition of related parties follows that of International Accounting Standard 24.
Section C – Fair rewards & motivation	i. The level of remuneration should be sufficient to attract, retain and motivate skilful and experienced people as members of the Board and the management. The Board should ensure transparency related to remuneration matters. The shareholders should be provided with relevant information in order to understand the principles applied by the company regarding the remuneration policy, which is based on fair rewards and motivation for Board members, and for the CEO or Management Board. ii. A company should have a remuneration policy and rules defining that policy. It should determine the form, structure and level of remuneration of members of the Board, the CEO and when applicable, members of the Management Board.
Section D – Building value through investors' relations	i. The company should disseminate the most important information both in Romanian and English, to enable Romanian and foreign investors to have access to the same information at the same time. ii. A company should do its best to enable its shareholders to participate in general meetings, aiming at using electronic communication means through (a) live broadcast of general meetings and/or (b) live bilateral communication where shareholders may express themselves during a general meeting from a location other than that of the general meeting, as long as this is in line with legislation regarding data processing. iii. A company should aim to provide for an electronic voting system at general meetings, including remote electronic voting.

Source: B.S.E.'s Code of Corporate Governance (2015)
(https://www.bvb.ro/info/Rapoarte/Diverse/ENG_Corporate%20Governance%20Code_WEB_revised.pdf)

We observe the fact that, through enunciating these 14 general principles, BSE maintains a mechanism based on the "comply-or-explain" principle which gives the market clear, accurate and actual information about listed companies' compliance with corporate governance rules.

On the other hand, the *provisions* stipulated in BSE's Code of Corporate of Governance are, as follows:

Table 2: Corporate governance – provisions to comply with, as per BSE's Code of Corporate Governance (2015)

Section	General principles
Section A – Responsibilities	A.1. All companies should have internal regulation of the Board which includes terms of reference/responsibilities for Board and key management functions of the company, applying, among others, the General Principles of Section A. A.2. Provisions for the management of conflict of interest should be included in Board regulation. A.3. The Board of Directors or the Supervisory Board should have at least five members. A.4. The majority of the members of the Board of Directors should be non-executive. At least one member of the Board of Directors or Supervisory Board should be independent, in the case of Standard Tier companies. Not less than two nonexecutive members of the Board of Directors or Supervisory Board should be independent, in the case of Premium Tier Companies. A.5. A Board member's other relatively permanent professional commitments and engagements, including executive and non-executive Board positions in companies and not-for-profit institutions, should be disclosed to shareholders and to potential investors before appointment and during his/her mandate. A.6. Any member of the Board should submit to the Board, information on any relationship with a shareholder who holds directly or indirectly, shares representing more than 5% of all voting rights. This obligation concerns any kind of relationship which may affect the position of the member on issues decided by the Board. A.7. The company should appoint a Board secretary responsible for supporting the work of the Board. A.8. The corporate governance statement should inform on whether an evaluation of the Board has taken place under the leadership of the chairman or the nomination committee and, if it has, summarize key action points and changes resulting from it. The company should have a policy/guidance regarding the evaluation of the Board containing the purpose, criteria and frequency of the evaluation process. A.9. The corporate governance statement should contain information on the number of meetings of the Board and the committees during the past year, attendance by directors (in person and in absentia) and a report of the Board and committees on their activities. A.10. The corporate governance statement should contain information on the precise number of the independent members of the Board of Directors or of the Supervisory Board. A.11. The Board of Premium Tier companies should set up a nomination committee formed of non-executives, which will lead the process for Board appointments and make recommendations to the Board. The majority of the members of the nomination committee should be independent.
Section B – Risk management & internal control system	B.1. The Board should set up an audit committee, and at least one member should be an independent non-executive. The majority of members, including the chairman, should have proven an adequate qualification relevant to the functions and responsibilities of the committee. At least one member of the audit committee should have proven and adequate auditing or accounting experience. In the case of Premium Tier companies, the audit committee should be composed of at least three members and the majority of the audit committee should be independent. B.2. The audit committee should be chaired by an independent non-executive member. B.3. Among its responsibilities, the audit committee should undertake an annual assessment of the system of internal control. B.4. The assessment should consider the effectiveness and scope of the internal audit function, the adequacy of risk management and internal control reports to the audit committee of the Board, management's responsiveness and effectiveness in dealing with identified internal control failings or weaknesses and their submission of relevant reports to the Board. B.5. The audit committee should review conflicts of interests in transactions of the company and its subsidiaries with related parties. B.6. The audit committee should evaluate the efficiency of the internal control system and risk management system. B.7. The audit committee should monitor the application of statutory and generally accepted standards of internal auditing. The audit committee should receive and evaluate the reports of the internal audit team. B.8. Whenever the Code mentions reviews or analysis to be exercised by the Audit Committee, these should be followed by cyclical (at least annual), or ad-hoc reports to be submitted to the Board afterwards. B.9. No shareholder may be given undue preference over other shareholders with regard to transactions and agreements made by the company with shareholders and their related parties. B.10. The Board should adopt a policy ensuring that any transaction of the company with any of the companies with which it has close relations, that is equal to or more than 5% of the net assets of the company (as stated in the latest financial report), should be approved by the Board following an obligatory opinion of the Board's audit committee, and fairly disclosed to the shareholders and

	potential investors, to the extent that such transactions fall under the category of events subject to disclosure requirements. B.11. The internal audits should be carried out by a separate structural division (internal audit department) within the company or by retaining an independent third-party entity. B.12. To ensure the fulfilment of the core functions of the internal audit department, it should report functionally to the Board via the audit committee. For administrative purposes and in the scope related to the obligations of the management to monitor and mitigate risks, it should report directly to the chief executive officer.
Section C – Fair rewards & motivation	C.1 The company should publish a remuneration policy on its website and include in its annual report a remuneration statement on the implementation of this policy during the annual period under review.
Section D – Building value through investors' relations	D.1. The company should have an Investor Relations function – indicated, by person(s) responsible or an organizational unit, to the general public. In addition to information required by legal provisions, the company should include on its corporate website a dedicated Investor Relations section, both in Romanian and English, with all relevant information of interest for investors. D.2. A company should have an annual cash distribution or dividend policy, proposed by the CEO or the Management Board and adopted by the Board, as a set of directions the company intends to follow regarding the distribution of net profit. The annual cash distribution or dividend policy principles should be published on the corporate website. D.3. A company should have adopted a policy with respect to forecasts, whether they are distributed or not. Forecasts means the quantified conclusions of studies aimed at determining the total impact of a list of factors related to a future period (so called assumptions): by nature, such a task is based upon a high level of uncertainty, with results sometimes significantly differing from forecasts initially presented. The policy should provide for the frequency, period envisaged, and content of forecasts. Forecasts, if published, may only be part of annual, semi-annual or quarterly reports. The forecast policy should be published on the corporate website. D.4. The rules of general meetings of shareholders should not restrict the participation of shareholders in general meetings and the exercising of their rights. Amendments of the rules should take effect, at the earliest, as of the next general meeting of shareholders. D.5. The external auditors should attend the shareholders' meetings when their reports are presented there. D.6. The Board should present to the annual general meeting of shareholders a brief assessment of the internal controls and significant risk management system, as well as opinions on issues subject to resolution at the general meeting. D.7. Any professional, consultant, expert or financial analyst may participate in the shareholders' meeting upon prior invitation from the Chairman of the Board. Accredited journalists may also participate in the general meeting of shareholders, unless the Chairman of the Board decides otherwise. D.8. The quarterly and semi-annual financial reports should include information in both Romanian and English regarding the key drivers influencing the change in sales, operating profit, net profit and other relevant financial indicators, both on quarter-on-quarter and year-on-year terms. D.9. A company should organize at least two meetings/conference calls with analysts and investors each year. The information presented on these occasions should be published in the IR section of the company website at the time of the meetings/conference calls. D.10. If a company supports various forms of artistic and cultural expression, sport activities, educational or scientific activities, and considers the resulting impact on the innovativeness and competitiveness of the company part of its business mission and development strategy, it should publish the policy guiding its activity in this area.

Source: B.S.E.'s Code of Corporate Governance (2015)
(https://www.bvb.ro/info/Rapoarte/Diverse/ENG_Corporate%20Governance%20Code_WEB_revised.pdf)

We observe the fact that the new Code is much precise and more focused in what is required form listed companies, providing a clear list of functions that are expected from the corporate governance structures, therefore, complementing the law in force.

Method

The aim of the paper is to assess the degree of compliance of the Romanian banks that are listed on BSE with the Code of Governance issued by BSE. Hence, by using a scoring system, we succeeded in transforming the enounciative (and qualitative) data into numerical (and quantitative data), revealing,

henceforth, the extent to which they align with the principles and comply with the provisions presented above.

Taking into consideration the fact that in the "Comply-or-Explain" Statement the banks, by performing a self-assessment, have four options that reflect either full compliance, satisfactory compliance, unsatisfactory compliance or non-compliance, the following table presents the used scoring system, consistent with the response disclosed by the banks:

Table 3: Significance of the conformity score given to the collected and interpreted information

Conformity score	Compliance degree	Significance
0	Non-compliance	The analysed bank has not disclosed any relevant document or report concerning corporate governance (*The Statement Enforce or Explain*, *Annual Reports*, etc.).
1	Satisfactory	The analysed bank has disclosed ***satisfactory information*** (partial data, outdated information) which does not permit settling the cases regarding the soundness of corporate governance and/or making any recommendations.
2	Unsatisfactory compliance	The documents regarding corporate governance are publicly disclosed on the official websites in a proportion of ***70%***, the information available allow for settling the issues related to corporate governance at a medium level.
3	Full compliance	Information dissemination meets the maximum of ***100%***, by offering complete, accurate, transparent and exhaustive disclosed reports, in total accordance with the principles of an effective corporate governance.

Source: own projection, after Deliu (2020)

Considering this scoring system, as well as all 4 sections of the Code of Corporate Governance issued by BSE, comprising 11 provisions to comply with (in section A), 12 provisions (in section B), 1 provision (in section C) and 10 provisions (in section D) a bank can obtain:

- for section A – a maximum of 33 points,
- for section B – a maximum of 36 points,
- for section C – a maximum of 3 points, respectively
- for section D – a maximum of 30 points.

Hence, in total, a bank can sum up 102 points, which reflects absolute full compliance in all sections of the BSE's Code of Corporate Governance. Henceforth, for the studied banks, the maximum score that can be reached is 408 points.

Results and Discussion

By analysing the "Comply-or-Explain" Statement disclosed for each of the 4 banks and in accordance with the proposed scoring system, we calculated the level of conformity with the principles and provisions depicted in the Code of Governance issued by the BSE:

Table 4: Quantitative determinations regarding the level of conformity with the BSE's Code of Corporate Governance

Category / *Level of conformity*	**Maximum score** [pts]	**Compliance**	
		Obtained score [as at Dec, 31, 2018]	*Degree of compliance* [%]
TOTAL CGC.c score	408	357	87.50%
Section A score	132	130	98.48%
Section B score	144	118	81.94%
Section C score	12	10	83.33%
Section D score	120	99	82.50%

Source: own projection

From the analysis carried out it was revealed that the banks analysed in the sample comply to a great extent with the provisions of the Code of Corporate Governance.

However, the lowest result was obtained, unsurprisingly, in section B, which refers to risk management and internal control. Over the last years, subsequent to the 2007-2008 crisis, the bank practitioners seem not to actually understand risks and, therefore, banks do not periodically review and make amendments to the internal control function in accordance to the bank's risk profile.

Section D also acquired low result, due to the fact that banks should adopt a policy with respect to forecasts, whether they are distributed or not. Moreover, banks, even if they may have an Investor Relations function, they do not make the adequate disclosures and do not have a dedicated Investor Relations section on their website, both in Romanian and English, as advised by BSE.

Graphically, the scores obtained by the studied banks regarding the level of compliance with the provisions of sections A, B, C and D are reflected as follows:

Fig. 2: Level of conformity with the BSE's Code if Corporate Governance
Source: own projection

The analysis of the level of compliance with the principles and provisions depicted in the Code of Governance issued by the BSE in each section is presented in the descriptive statistics below:

Table 5: Descriptive statistics

	Section A	Section B	Section C	Section D	Total CGC.c
Mean	32.5	29.5	2.5	24.75	92
Standard Error	0.2886	0.5	0.2887	0.25	0.4082
Median	32.5	29	2.5	25	92
Mode	32	29	3	25	92
Standard Deviation	0.5773	1	0.5774	0.5	0.8164
Sample Variance	0.3333	1	0.3333	0.25	0.6666
Kurtosis	-6	4	-6	4	1.5
Skewness	0	2	0	-2	0
Range	1	2	1	1	2
Minimum	32	29	2	24	91
Maximum	33	31	3	25	93
Sum	130	118	10	99	368
Count	4	4	4	4	4

Source: own projection

Section A's provisions seem to be the most banks comply with (98.48% compliance), especially in terms of:

- ⊕ internal regulation of the Board in regards to terms of reference and responsibilities for Board and key management functions of the banks;
- ⊕ managing conflicts of interest;
- ⊕ composition of the Boards;
- ⊕ policies regarding the evaluation of the Boards;
- ⊕ disclosed information regarding the number of meeting of the Board and of the committees;
- ⊕ appointing of a nomination committee (all banks being part of the Premium Tier entities).

However, some deficiencies are observed, most of them being related to:

- ⊗ insufficient information on the precise number of the independent members of the Boards.

The highest score and the maximum of the section (33) is obtained by 2 banks that fully comply with the provisions of the Code in terms of the responsibilities of the Boards. Within this section, the model's amplitude is 27 and it reflects the difference between the maximum and the minimum score obtained by the companies under study.

Conversely, *Section B*'s provisions seem to be the one banks do not comply with (only 81.94% compliance), especially when it comes to:

- ⊗ the audit committee's assessment regarding the effectiveness and scope of the internal audit function;
- ⊗ the adequacy of risk management and internal control reporting to the audit committee of the Board;
- ⊗ management's responsiveness and effectiveness in dealing with identified internal control failings or weaknesses and their submission of relevant reports to the Board;
- ⊗ lack of cyclical or ad-hoc reports.

The strong points refer to:

- ⊕ monitoring of the application of statutory and generally accepted standards of internal auditing;

- ⊕ existence of separate structural division (internal audit department) within the bank/ an independent third-party entity.

It is relevant to notice that within this section, the model's amplitude is the highest (2), reflecting the higher differences, respectively the variance between the maximum and the minimum score obtained by the banks under scrutiny.

In regards to *Section C*, there is only one provision that must be respected by the listed banks which refers to the fair reward and motivation regarding the remuneration policy of the members Boards. The lowest score obtained is 2, while the highest score is 3, this revealing that:

- ⊕ some banks fully comply with the provisions regarding the publication of the guidelines and arguments underlying the remuneration policy of the members of the Boards.

while some banks still do not provide a full disclosure of the aforementioned aspects. Thus, the obtained results indicate the above average compliance of the banks with the provisions of the Code (83.33%). *Section D* is another problematic section, with a total degree of compliance of 82.50%. The lowest score obtained is 24 points (out of maximum 30 points), which reveals that out of the 4 banks some do not comply with the provisions of the Code of Governance regarding building the value through relationships with investors, especially when it comes to:

- ⊗ having an Investor Relations function;
- ⊗ adopted a policy with respect to forecasts;
- ⊗ including specific information in the quarterly and semi-annual financial reports regarding the key drivers influencing operational revenues.

The strong points relate mainly to the external auditors, respectively to:

- ⊕ the presence of external auditors in the shareholders' meetings.

In conclusion, overall, from a global perspective, the level of compliance with the principles and provisions of the Code of the 4 studied banks is reasonably high (87.50%).
Weaknesses those charged with governance may have to address, in future, requiring efforts for revision, enhancing and improvement, may relate to:

- ⊗ lack of diversity in the composition of the Supervisory Board and Executive Board and a lack of a clear and concrete policy on gender balance, social and cultural origin, professional profile and education;
- ⊗ no real evaluation of the performances of the members of the two boards of management;
- ⊗ unsatisfactory supervision of risk management and risk exposure framework;
- ⊗ lack of authority from the risk management function, so that high risk activities can be stopped in time;
- ⊗ lack of diversification in risk management, often limiting only to those categories of risk which are considered as priority and, implicitly, the loss of sight of the overall picture, i.e. the totality of risks to which the credit institution exposes to;
- ⊗ unreasonable and disproportionate directors' remuneration, based on short-term value of bank's action, as being the only performing criteria (**Deliu, 2020**).

Conclusions

Corporate governance creates a "brave new world", in which entities have to either comply or explain. The "Comply-or-Explain" Statement reflects the extent to which the corporate governance guidelines are applied and enforced by the listed entities, through a self-assessment that reflects the either full compliance, satisfactory compliance, unsatisfactory compliance or non-compliance with the provisions of the Code.

The purpose of corporate governance is to facilitate effective, entrepreneurial and prudent management that can deliver long-term success for an entity activating in the banking sector
It's the system by which banks are directed and controlled, providing a measure for shareholders regarding the appropriateness of the governance structures.

Therefore, a cornerstone of the Code Corporate Governance issued by the BSE is the principle of "comply-or-explain", banks in Romania having to report each year how they have applied the principles of the Code, so that investors can evaluate the actions taken.

In this framework, we reached valuable conclusions regarding a satisfactory compliance level with corporate governance requirements in regards to Romanian banks that are listed on BSE. In this sense, the research emphasized, to some degree, a high level of adoption of the principles and provisions.

We emphasize the fact that it would be timely and beneficial that BSE would develop a Corporate Governance Index in order to efficiently assess the degree of applying and aligning with the Code's principles and provisions, as well as to measure the *corporate governance performance* of the entities listed on the BSE Market.

The Impact of a Socio-Economic Crisis on Corporate Governance Effectiveness and Sustainable Development. Acumen: The Current New Coronavirus (Covid-19) Pandemic

Delia DELIU

West University of Timişoara, Faculty of Economics and Business Administration, Timişoara, Romania, delia.deliu@e-uvt.ro

Abstract

The World is in a pandemic crisis at the moment, states, multilateral organizations and citizens being in urgent need for strategies to fight, cope with and ease the pandemic as well as to protect their societies and economies during and after this socio-economic crisis. The challenge (and struggle!) is global and huge – for many societies, the current crisis generating the largest turbulences in the environment since the Second World War. As we are all aware, as a result of the CoVid-19 pandemic, things are shifting and fluctuating quickly and the effect, enforceability and interpretation of laws may be affected by future events. As the practice of hindsight becomes emboldened, the "enterprise risk" preparedness of governance may be subjected to a more rigorous scrutiny that is less forgiving than what the law currently requires, boards being advised to anticipate this and take immediate measures. Boards may be considered "scape goats", therefore they must approach their enterprise risk evaluation. Risks such as business disruption, workforce turmoil and supply chain breakdown, but also risks that are existential in nature (e.g. global economic depression, national political upheaval, environmental/climate change disasters and public health catastrophes) must be taken into consideration. The issue of the quality and relevance of financial-accounting information in a sensitive socio-economic context such as that characterized (and influenced!) by an economic-financial crisis generated by certain turbulences in the socio-economic environment (such as the events generated by the CoVid-19 pandemic, events that are unfolding right now, under our eyes) is a topic of actuality and interest in the context in which the financial-accounting information largely bases the economic decisions of the users, and its quality is increasingly questioned in the context of an effective corporate governance imposed on companies around the world. Therefore, the emphasis on governance quality has expanded exponentially over the last two decades, corporate governance reform becoming a crucial global issue. Managing resources at the level of the economic entity and not only, including the resource represented by information, is extremely important in order to mitigate the effects of this global financial crisis; all the more so since the studies carried out on the causes that generated the global financial crisis in 2008, as well as the carried out research in the specialty literature that show how to manage the resources during the crisis period are current consequences of the economic life around the world. The recommendations set forth in this paper do not comprise an unequivocal statement of law, but instead represent the results of our exploratory and observation research, respectively our best interpretation of where things stand as of the date of publication.

Keywords: economic-financial crisis; turbulent socio-economic environment; Coronavirus; CoVid-19 pandemic; efficient corporate governance; sustainable development.

Introduction

Donald Rumsfeld, George W. Bush's secretary of defence, offered a declaration, statement that is revelatory – especially in these times of uncertainty, turbulences, insecurity, volatility, shakiness, unstableness, fluctuation, uncertainty, precariousness, imbalance, panic and disorientation: *"As we know, there are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns—the ones we don't know we don't know"*.

According to **Investopedia**, *Enterprise Risk Management (ERM)* is a "plan-based business strategy that aims to identify, assess, and prepare for any dangers, hazards, and other potentials for disaster – both physical and figurative – that may interfere with an organization's operations and objectives".

As ambiguous as enterprise risks may be, the failure to acknowledge them may henceforward attract the sharpest finger pointing, most of the time those charged with governance (hereafter, TCWG) being considered the "scapegoats" of the entity's failure.

Boards' role in corporate governance, in general, is "to plan and strategize goals and objectives for the short- and long-term good of the entity and to put mechanisms in place in order to continuously monitor progress against the objectives", as **Price (2018)** depicts. In relation to this, Boards must understand, assess and debate the company's goals.

In this context, we have to assess *the manner in which the Boards are taking and will take into account*, in the most serious way, all these risks. *Did they manage to evaluate them? Did they prepare a plan to diminuate their effects?* To alleviate "blame game" apprehensions and to prepare for the next crisis, Boards may reflect on taking into consideration some measures.

Businesses are suffering an unprecedented disruption. Every corporation is consumed with issues arising out of the CoVid-19 pandemic, which has put their relationships with each of their stakeholders – employees, creditors, suppliers, regulators, shareholders – in stark relief. During this period of turbulence, stakeholders are looking to Boards of Directors to address the impacts of the coronavirus. How Boards *balance and prioritize those stakeholders* has to swing with shifting circumstances, just as Boards are forced to think about the *"long-term sustainability of their business"* (**Idowu et al., 2013**).

Considering the particularities of the current CoVid-19 pandemic, management – in general – and Boards of Directors – in particular, will need to answer many complex questions:

Fig. 1: Aspects the management and those charged with governance (TCWG) should consider during the CoVid-19 pandemic

Source: own projection

Without having the claim that the problems raised will be exhaustive, in the following we will try, through a *systematic approach*, to outline the aff*ected areas regarding corporate governance*, the *causes of these situations*, as well as the *sustainable directions of action*, likely to emerge from this general crisis.

Recent developments in crisis management increasingly demand that scientific rigor be useful and efficient in practice, through the form, background and considerations embraced by researching the extremely complex concept of effective corporate governance and sustainable development.

Research Methodology

This paper comprises a *fundamental research*, containing a number of debates and standpoints about the socio-economic crisis as a fundamental concept, respectively its impact on corporate governance practices, and also standpoints about the mission on the Boards in the context of the current new Coronavirus (CoVid-19) pandemic, in order to induce an effective, sustainable corporate governance. Being part of the *positivist research trend*, this paper encompasses broad *interpretative approaches*, intertwining harmoniously with a number of *critical elements* and *personal opinions*. In terms of generated information, this research focuses on a *qualitative research* (most investigated items being of qualitative nature). The research follows a *transverse direction* through the used *observation, comparison* and *conceptual analysis* techniques. Thus, the qualitative research valued specialty literature by processing it with various *methods specific to socio-human sciences*, such as *document analysis*, *non-participating observation* and *comparison*. The non-participating approach is due to the research field and the current state of knowledge in the field of interest, although comparisons made and opinions and conclusions expressed show certain participating aspects of the research, respectively the relevance of transmitted information. In our opinion, the dynamics of analysing scientific literature is extremely relevant in the analysis of the factors implying an effective, sustainable corporate governance, and consequently for increasing complexity of tasks and responsibilities attached to the Board of a company, the more that we talk about a sensitive, turbulent, socio-economic environment.

The CoVid-19 Pandemic as a Current Socio-Economic Crisis and its Impact on Practices in Corporate Governance

The pivotal concept that is found throughout the paper is the ***socio-economic crisis*** that captures the concerns of all societal actors (stakeholders), "calling for fundamental reconfigurations of economic philosophies and of the dominant action logic. Therefore, it needs *strategies* (to break out of economic weakness) and *tactics* (to control the effects of entrainment, immobilization, and contribute to restoring of stimuli)" (**Deliu, 2019**).

Obviously, this particular situation – this socio-economic crisis that captures the concerns of all societal actors – "calls for fundamental reconfigurations of economic philosophies and of the dominant action logic". Therefore, Boards need strategies – to break out of economic weakness, respectively tactics – to control the effects of entrainment, immobilization, and contribute to restoring of stimuli.

The crisis is analysed from many points of view, researchers insisting on: the multidimensional reverberations of the crisis processes, the reconfiguration of the elements of optimal nature, but also of the effectiveness under conditions of pronounced economic asymmetry, the new level of sustainability in the current economic development, imminent and long-term changes to the fundamentals of competitiveness.

At the moment, everyone is talking about crises and deficiencies, regardless of whether they are crises and deficiencies at the individual, family, economic entities, nations, regions, different currencies, financial systems or worldwide.

In this context, the global socio-economic crisis is a very complex, profound and topical process, which affects the fundamental elements of the economic system and to which the great economists of the world cannot find the antidote. Any socio-economic crisis usually has devastating effects on both the

highly industrialized and the least developed countries, whose economies are largely dependent on exports of raw materials. In times of economic recession, the volume of world trade is rapidly declining, as personal incomes, corporate profits and budgetary revenues also decline. The effects of economic crises are manifested in many forms, such as: decreasing the volume of trade, reducing consumption (and, implicitly, production), resounding bankruptcy, decreasing population incomes, increasing unemployment, depreciating national currencies, inflation, decreasing public budget revenues, diminishing public revenues, increasing budget deficits, etc. Although, overall, global economic crises affect all entities in a country, large units have more possibilities and greater strength to withstand its effects. In contrast, small and medium-sized enterprises are the most affected by the crisis, with most of them going bankrupt.

The generalized economic crisis manifested on a global scale brings into attention the *quality and credibility of financial-accounting information*, as well as the *efficiency of corporate governance* and, implicitly, the efficiency of the measures taken by the Board of Directors in this regard.

The paradox of the current crisis is that liquidity is generally plentiful, but is no longer in the right place. The crisis surprised all the participants by its size and the speed of penetration in the national economies, which was due in large part to the level of transformation determined by the securitization methods and especially due to the effects of globalization on some highly sensitive markets from the public trust point of view.

The problems of globalization of the world are also reflected in the *evolution of the concept of corporate governance*. The globalization of the world economy against the backdrop of a global socio-economic crisis generates *new circumstances* and raises *question marks* in everything pertaining to the economy of each country. These changes in the economic-social environment have been linked, most often unfairly, with TCWG. At present, Boards of Directors are the most exposed to the virulent criticisms of the users of information in the financial reports, being considered *"scapegoats"*, as guarantors of the quality and credibility of the data disseminated by the economic entities. Sometimes it goes even deeper and further, considering that they are the only ones accountable for the failures faced by the companies. In this context, the *role of Boards of Directors increases*, especially in the context of *efficient, sustainable corporate governance*, their value having to acquire *new valences* by "providing additional elements related to the transparency of operations, through the need for increased vigilance towards complex financial products and the need to better understand both individual and systemic risks" (**Deliu, 2018**).

Fig. 2: Reshaping corporate governance – as a way of mitigating turbulences generated by the CoVid-19 pandemic and the socio-economic crisis phenomenon

Source: own projection

The financial crisis leads to important changes in the behaviour of the parties directly interested in the activity of a company. The reactions differ depending on the role of the participants in the life of the economic entity.

Hence, in order to avoid bankruptcy and conflicts of interest, managers must adopt a flexible attitude, adapt to the requirements of the stakeholders involved and, last but not least, they must ensure a permanent *communication* between the company and the stakeholders.

Henceforth, we see how most financial crises lead to rumours, perception distortions, confusion, stress, lack of control, panic, disorientation and even major imbalances across society. The affected ones (entities, owners, managers, other stakeholders) may have reactions of denial, avoidance of accountability, lack of guilt or justification. Ultimately, reactions must turn into positive feedback, acceptance, optimism, confidence, remedial and corrective action.

This means uncertainty, lack of security and major imbalances can only be controlled and removed when society's panic and disorientation are diminished. Therefore, in a crisis context, the liaison that makes the transition from a negative attitude to (at least!) a survival-oriented behaviour or even a more optimistic one, is the *communication* between the organisation and the stakeholders.

Fig. 3: Rethinking communication – as a way of survival and exit from the crisis
Source: own projection

On one hand, in order to avoid bankruptcy and conflicts of interest, managers, as prime movers for corporations, will need to cultivate survival strategies and prevailing risk management tackles. They need to adopt a malleable approach, must adapt to the stakeholders' requests, and last but not least, must ensure a permanent communication with them.

On the other hand, in this context, a company's managers *may intervene in applying accounting policies and methods* to benefit from the different interests of users of accounting information.

Corporate Governance Considerations During the CoVid-19 Pandemic

Lately, the concept of *governing an entity* or *corporate governance* has become more and more popular. Specifically, the concept was imposed in the early 90s, although it was used much earlier. Generally speaking, it refers to the process of managing an entity, the pursued objective being to establish rules of interaction between managers and shareholders so as to provide a framework for the protection of shareholders' rights.

As stated in the ***Principles of Corporate Governance*** issued by the **Organization for Economic Cooperation and Development (O.E.C.D.)**, corporate governance is defined as „the system (the totality of procedures and processes) by which a corporation is directed, managed and controlled". According to O.E.C.D., the "corporate governance structure specifies the distribution of rights and responsibilities among different participants in the corporation, such as, the board, managers, shareholders and other stakeholders, and spells out the rules and procedures for making decisions on

corporate affairs. By doing this, it also provides the structure through which the company objectives are set, and the means of attaining those objectives and monitoring performance".

Implicitly, corporate governance is *the set of links that arise between the management of a company and all stakeholders interested in its business*.

Worldwide, according to the "traditions" of each national economy, the "artisans" of corporate governance systems have identified three major models: American/traditional /"outsider" model (based on the extremely close link between shareholders and the company and defining best the model of European companies, a long-term orientation of the company's strategy and stability); the Continental-European/deterministic/German/"insider" model (implying a massive concentration of capital) and the Japanese extended/assumed risk model (bringing cohesion to the company and holding structures).

Therefore, the concept is understood somewhat differently in the two "accounting worlds": from the *Anglo-Saxon perspective*, the governance of the company takes into account the *primacy of the shareholders*, starting from the idea that the company belongs to the them and its purpose is to serve their best interests; while the *Continental-European perspective* is more generous in this direction, in the sense that the entity's governance takes into consideration the interest of *all parties involved* in the operation of the organization and not only of the shareholders.

The outbreak of the current crisis, followed by its global expansion, but – especially – the persistence of its effects, have led to broader debates on the *causes and optimal policies needed to overcome the difficulties*. Inevitably, these debates brought back to the discussion – a fact that has already become a cyclical phenomenon – *the role of the companies' management and of the corporate governance structures* both *in the credibility of the financial reports of the companies, as well as in the continuity of their activities*.

Thus, in view of the above, we consider the initiative useful that the *role and scope of the measures taken by TCWG be discussed and analysed in the general context of the financial market regulatory reform*. Corporate governance, together with external audit, should contribute to financial stability and reduce the risk of distortion, in order to reduce bankruptcy cases.

The question is *how should TCWG act*, *how will they go through the crisis* and *what will they learn from it*? The answer lies, in our opinion, in:

- caution in *evaluating the continuity of the company's activity*, respectively the *appropriateness of the use of the going concern basis of accounting*
- the *transition from effective corporate governance to sustainable corporate governance*.

A Sustainable Development Framework: From an Effective Corporate Governance to a Sustainable Corporate Governance

Acting in the interest of the corporation sounds simple, but it is far from simple. It requires a Board that is knowledgeable, diligent and willing to use its best efforts to treat all stakeholders fairly. Boards that use this challenge as an opportunity to drive innovation will create the greatest success for the companies they guide.

Therefore, currently, when only a few economies of the world remained unaffected from the global economic crisis that befell, corporate governance has become a vital solution for the economic growth and sustainable development to which every economy aspires.

It is renowned, in this framework, that management in general and qualitative, effective corporate governance in particular – are of critical significance for sustainable development.

The question that inexorably arises at this point is *how does effective corporate governance affect sustainable development?*

The answer may find its correspondent in the figure below:

Fig. 4: Effective corporate governance
Source: own projection

At this point, it should also be emphasized what a "s*ustainable development framework"* embodies. In conjunction with global practices, it "covers three dimensions of economy, society and the environment, with corporate governance as an overarching principle" (**Jukka, 2020**):

Fig. 5: Reshaping corporate governance by taking into consideration factors related to economy, society and environment
Source: own projection

With all these in mind and also taking into consideration today's sensitive socio-economic environment, Boards must understand that *economy* creates values not exclusively for profitability, but creates *mutual benefits for all stakeholders* through two directions: on one hand by contributing to national economic growth by means of value generated by company's operations, respectively, on the other hand, through income distribution between company's stakeholders.

Boards must also pay attention to *society* as a whole, therefore they should conduct business with integrity and concern for *Corporate Social Responsibility (CSR)*. Therefore, in what follows, as **Jukka (2020)** outlines, companies should redirect their attention to: "community investment and donation, labour practices and human rights, human resources and human capital development, health and safety, but also to stakeholder engagement".

Regarding the *environment*, companies should commit more than ever to preservation of the environment and natural resources, consuming all resources astutely and upholding ecological balances, and being alert to aspects such as: energy and climate change, biodiversity and ecosystems, environmentally friendly products and services, water and waste management, respectively logistics management.

Therefore, a not only *effective*, but also *sustainable corporate governance* – as an overarching principle – must supervise all activities in order to warrant transparency, fairness and accountability, uniformly with the business philosophy and mission, as well as business strategy, this implying:

- ✓ good, effective corporate governance practices;
- ✓ efficient risk management; respectively
- ✓ adequate disclosure and fairness in reporting.

Even though one cannot straightforwardly classify and disperse environmental, social and economic aspects, respectively and the relationship of corporate governance in regards to them, one can illustrate their conjoint associations, this being appropriate simply because they exist neither independently nor side by side. There is no perceived linear relationship, but a vertical relationship (relations of superiority and inferiority, i.e. we provide their hierarchy).
In this context, we provide the figure below:

Fig. 6: Sustainable corporate governance – a framework
Source: own projection

As a result, only an effective, qualitative and sustainable corporate governance can contribute to sustainable economic development by improving company business results, increasing operational efficiency, facilitating and improving access to capital markets – especially in a sensitive socio-economic context, like the one generated by the current CovId-19 pandemic.
With the purpose of warranting a proactive approach to sustainable development, as noticed through the prism of effective sustainable corporate governance, it is necessary for the Boards of Directors to understand that their role and scope must expand.

Key Sustainable Corporate Governance Points for the Board of Directors Relating to the CoVid-19 Pandemic. Discussion

The current socio-economic crisis has rolled back the hard earned development gains of the past several years, since the last crisis in 2008.

In this context, **Heyzer (2009)** draws attention to the fact that sustainable development is "under threat with fewer resources available to deal with both development threats and challenges, the human costs of this crisis being incredibly high as millions lose their jobs and even more fall into poverty and income insecurity".

Thus, now, more than ever, corporate governance structures need to commit to inclusive and sustainable development.

Corporate governance in as many companies must now be built on *sustainable development principles*, involving:

- the recognition of corporate social responsibilities (CSR), and the
- stakeholders' legitimate interests in corporate activities.

CSR values should be integrated into corporate values, by also taking into consideration all four features of a company: moral, organizational, cultural and strategic (**Farcane and Deliu, 2019**).

Sustainability must be considered as a healthy dynamism and not as the spasmodic search for a single point of balance. In this framework, in order to achieve high levels of sustainability, "it is necessary for there to be a widespread sharing of values between those declared by the organization and those that guide the behaviours and attitudes of its employees, contributing to generating positive effects in the socio-economic environment" (**Farcane and Deliu, 2019**).

The following table comprises a *summary of key corporate governance points* that, in our opinion, *the Board of an economic entity should consider in connection with the ongoing COVID-19 pandemic*. We refer mainly to the manager or the Board of a limited liability company of privately held companies.

Table 1: Summary of key corporate governance points to be considered by the Board of a company

1. The Board's role in a crisis	As a general matter, the board is charged with overseeing the business and affairs of the company. This includes setting the goals, policies and objectives for the company and overseeing the management's execution of the company's business plan. During times of crisis, including a pandemic, the board may need to adjust its level of oversight over the company and its business to ensure that the board is properly monitoring the risks facing the company and to evaluate, on an ongoing basis, the effect the pandemic has on the company's business, its ability to continue as a going concern, and its strategic and business plans. To assist the board in monitoring the effect of the pandemic on the business or to assess or address one or more risks to the business posed by the pandemic, the board may form one or more committees of the board – composed of a subset of the members of the board – to oversee certain aspects of the pandemic. A committee composed of a select number of board members may be more efficient in evaluating, overseeing or addressing certain risks to the company caused by the pandemic. In discharging its responsibilities, the board must implement measures to ensure that it is reasonably informed of the business and operations of the company, including the risks facing the company and its business as a result of the pandemic. This requires that the board receive relevant information from the company's management and outside advisers on a timely basis. In times of heightened risk, the board should evaluate whether more frequent updates from the company's management and outside advisers are necessary, and whether the board should implement additional policies and procedures to ensure that the necessary information is reported to the board in a timely and complete manner.
2. Crisis response team and plan	If the company has a crisis response plan in place, the board, together with the company's management and outside advisers, should evaluate whether the plan is sufficient to address the risks posed by the pandemic and whether the plan or the crisis response team should be modified to address the specific risks to the business caused by the pandemic. If the company does not have a crisis response plan, the board should consider whether to implement a plan and whether a crisis response team – composed of members of the board, members of management and outside advisers – should be formed to assess and respond to the pandemic. The crisis response team should include individuals with diverse backgrounds and expertise to ensure that all aspects of the pandemic and its effect on the business are covered.
3. Evaluating the financial position of the company	The board should understand and evaluate the impact of the pandemic on the financial strength of the company. For instance, the board should monitor the company's cash flow and anticipated cash needs for (i) working capital, (ii) future debt payments, and (iii) maintenance of financial covenants in loan documents, and consider whether changes to the business or policies of the company are necessary in response to such anticipated cash needs. The board should consider whether it is appropriate to delay declaring a dividend or, if the dividend has already been declared, whether the payment of such dividend can be delayed under applicable law. It is important to note that if the company becomes insolvent or enters the "zone of insolvency," the obligations and duties of the members of the board may shift or broaden to include creditors and other constituents of the company.

4. Meetings of the Board of Directors	The board should consider whether it is advisable for it (or a duly constituted committee of the board), for the duration of the pandemic, to meet on a more frequent basis to ensure that the board is properly overseeing the business and affairs of the company. Due to social distancing and other measures imposed by many states and the federal government, it may not be possible for the board or a board committee to meet at a physical location. The corporate laws of many states expressly permit boards and board committees to meet telephonically or by other means of electronic transmission. Prior to holding a telephonic meeting or a meeting by other means of electronic transmission, the company must ensure that the laws of the company's state of formation and the organizational and governance documents of the company permit the board or board committee to meet telephonically or by electronic transmission. The board should also be mindful of notice and quorum requirements imposed on meetings of the board and board committees. The need for the board or committee to assemble quickly to address issues relating to the pandemic may come into conflict with notice requirements for board or committee meetings. In many instances, members of the board or board committee may waive notice requirements by attendance at the meeting or by signing a written waiver. However, it is generally not possible to waive a quorum requirement for board or board committee meetings.
5. Annual Meetings of Shareholders	Due to social distancing and other measures imposed by many states and the federal government, it may not be not possible for the company to hold its annual meeting of shareholders at a physical location. In response, a company may change its meeting date or, if the applicable law allows, hold a virtual meeting of shareholders. Prior to holding a virtual meeting of shareholders, the company must ensure that the laws of the company's state of formation and the organizational and governance documents of the company permit a shareholder meeting to be held virtually. Note that the corporate laws of many states have been amended in response to the pandemic to expressly permit companies to hold virtual shareholder meetings. If a company that desires to hold a meeting of shareholders virtually already has provided notice for an annual meeting of shareholders, careful consideration should be given to the notice and corporate laws of the company's state of formation to ensure that the virtual meeting is properly noticed, perhaps with a supplement to the original notice. However, in many instances, it will be necessary for the company to provide a new notice of the meeting. Instead of holding a virtual meeting, a company may elect to push out the meeting date. A change in meeting date may require a new notice obligation under applicable state law, or an adjournment process could be used. Instead of holding a shareholders meeting at all, most jurisdictions permit shareholders to act by written consent. However, some jurisdictions impose restrictions on the ability of shareholders to act by written consent in connection with the election of directors and/or impose a higher voting standard on actions taken by written consent of shareholders. Applicable state laws and governing documents of the company should be reviewed to ensure that shareholders are permitted to act by written consent and to determine the minimum voting requirements.

Source: own projection

In evaluating the appropriate actions to take in response to the pandemic, the Board should consider consulting with the company's management and outside financial and legal advisers, and other advisers (such as cybersecurity consultants). However, the Board should be mindful that it is the ultimate authority in connection with responding to the pandemic – the Board is the ultimate decision-making and goal-setting body of the company, charged with the protection of the interests of the
The rapidly evolving Coronavirus is triggering all kinds of risks impacting multiple aspects of an organization. Unfortunately, we are seeing first-hand how a single-root cause event can trigger interrelated consequences for almost all economic entities.

While strong risk management practices can't stop the spread of the coronavirus or prevent other pandemic risk events, enterprise risk management processes can help organizations anticipate the impact of these kinds of unforeseen, extraordinary events.

Conclusions

The current CoVid-19 pandemic may cause managers to rethink what an "effective sustainable corporate governance" might be.

Historically, the determination of whether a Board is discharging its duties responsibly has been assessed with reference to whether its actions would be consistent with general common practice. However, the current pandemic highlights that common practices, such as payment of extraordinary dividends or buying back shares that favour the shareholder, may have disadvantaged many other stakeholders in the past.

What does it mean to treat all stakeholders fairly and equitably? And how then does the corporation organize itself to respond to these unprecedented circumstances? We believe that companies should come up with a set of principles and practices to help them navigate these Especially at this moment of pandemic, we argue that main priority finds its correspondent in the sustainability of the corporation. However, at the extreme, the current crisis may cause some corporations that are overleveraged to "hit the wall." Even with the government supports being proposed, long-term sustainability may not be possible. Even here, the Board should give serious consideration to human issues, such as stability of employment for workers. Also, another recommendation would be that those charged with governance should create "social responsibility committees" – much like audit committees and compensation committees that are already in place, to dissect the relationship of their corporations to their stakeholder groups – research suggesting that companies with better performance on corporate social responsibility are also those that weather crises more successfully Also, Boards will likely have to engage directly with stakeholders to understand their needs and work collaboratively to generate resolutions to trade-offs. In the short term, these committees should enable corporations to be nimble and to move quickly to deal with the volatility generated by the pandemic. At a time of crisis, trust from stakeholders is primordial, being earned over time, since they may prove to be a better lifeline than any government crisis subsidy.

These principles and practices would enable boards to see this crisis as an opportunity to explore innovative solutions that might be better for everyone, or for many.

Configuration Management As A System Tool To Support Product Quality For Safety And Business

Dorota KRUPNIK. EngD.

Military University of Technology, Warsaw, Poland
dorota.krupnik@wat.edu.pl

Abstract

The increase in demand for products from various product groups raises questions about their quality. Quality is understood as the degree, to which a set of inherent properties meets the requirements of the customer (ISO 9000 2015). Research shows that the product quality problem is perceived as a threat to safety and business. Meeting the quality requirements of products determines the level of safety of the military and civil market, in the global dimension. Customers on the global market are looking for products having the quality that comply with their requirements, while manufacturers, perceiving a quality problem, are looking for methods and tools to provide customers these quality requirements for products at a appropriate level. Can we find universal tools to support manufacturers in their pursuit to provide quality of products? The objective of the paper is to analyze and indicate one of such systemic tools supporting the quality and safety of products/services. It is configuration management, which plays a very important role in ensuring quality requirements for products/services, in providing full information about the compliance of the product/service with its requirements and about the achieved functional and physical properties of the product throughout its life cycle. Empirical research was carried out in 2016-2017 on a group of 120 Polish enterprises holding the ISO 9001 and AQAP 2110 certificates of quality management systems. The methods used have been adapted to the conducted research consisting of: analysis of normative documents, system documentation of the assessed enterprises, audit assessment by means of direct and indirect interviews with authorised specialists and experts, observation of processes and activities, conclusions and generalisations based on the collected data. The solutions contained in this paper may have a practical dimension for enterprises. Configuration management implemented in the design and production processes can help to ensure the quality requirements of products in relation to, among others: stages of realisation, formulation of requirements, methods of their confirmation and use of documents.

Keywords: Quality, Product, Configuration Management, Safety, Product Life Cycle,

Introduction

It is assumed in the literature that configuration management is used in the processes of realisation of products/services, mainly for national security and defence. Empirical research carried out in 120 companies shows that it can be successfully applied also in other sectors and industries, as one of the important elements of quality management for each type of product/service, e.g. in logistics. In order to ensure that processes, e.g. design, production and service processes are not ad hoc, partial, inconsistent with requirements, based only on technical documentation, solutions integrated with all stages of product/service implementation should be implemented, such as: definition of customer requirements, planning, development works, operation, service, purchases. This is of particular importance in global markets, in cooperative ventures carried out by many enterprises. Lack of implemented configuration management in accordance with specific reference documents may result in the delivery of a product/service not meeting the quality requirements. Can configuration management really affect the quality of the product/service? The research confirms the relationship between quality management and configuration management in various scopes of documentation in accordance with the ISO 9001 and AQAP 2110 requirements. Those organizations that implement a quality management system in accordance with the AQAP 2110 requirements should implement a

configuration management process. The effectiveness of configuration management is conditioned by the repeatability of realisation processes, ensuring the quality and safety level established in individual stages of the product/service life cycle. Configuration management is fundamental for organizations that offer products/services that affect safety, reliability, interoperability. First of all, it concerns organisations providing products and services, e.g. for the army. Configuration management becomes important for products/services with a high degree of technical and technological complexity. This does not mean that in case of other sectors or services, e.g. construction, medical, transportation, etc. we can exclude the application of configuration requirements. The adopted NATO quality policy clearly states that the basis for operation is an integrated systemic approach to achieve the quality of products/services in the full life cycle. This approach takes into account many factors from the area of organizational and technical-technological activities, including configuration management. It is understood as a continuous maintenance of the product's compliance with the requirements specified in the individual phases of realisation, i.e.: with customer requirements, concept, design, development, production or exploitation, including renovation, possible modernization and liquidation, the need to make and supervise changes. The lack of supervision over the changes made makes it difficult or even impossible to achieve certain functional and physical properties of the product/service. An important problem to ensure the quality requirements of a product/service is the assessment of configuration management. This problem requires effective methods based on modern techniques and scientific tools. In ensuring the quality requirements of the product/service there has been no uniform approach to configuration management so far. To this day, many Polish companies, having clearly formulated requirements, have not taken the trouble to implement them, risking that they fail to meet customers' requirements, subjecting themselves to non-compliance and complaints. The paper is addressed not only to enterprises planning to conclude contracts for products/services for security and defence purposes, but also to those organisations that want to have proof that their product meets certain quality requirements.

Configuration Management In Terms of The Analysis of Normative Documents

In the processes of realization of products/services, there is usually a need to make organizational, technological and technical changes. They result from customer requirements and unforeseen external and internal situations in an enterprise. If, in such situations, the lack of supervision over the implemented changes this makes it difficult to achieve the expected quality characteristics of products/services. This is a problem that requires the use of effective methods based on modern management tools, such as the configuration management.

Until the allied document on mutual acceptance of the Government Quality Assurance process was implemented and the allied AQAP quality assurance publications, STANAG 4107 was used, in the process of the assurance of quality requirements for products/services, no uniform approach to the configuration management had been applied under industrial conditions. The situation changed after the implementation of NATO standardization publications on AQAP quality assurance, which such publications implemented configuration management as the critical process managing product life cycle (Pokora 2016).

The basic document used in configuration management is the AQAP 2110 standardization publication on quality assurance (AQAP 2016). Configuration management as described in item 5.4.1.2 of this document is intended to implement planning, identification, supervision of changes, description of configuration status and configuration audits in accordance with the requirements of ACMP 2100 (ACMP 2017). Configuration management is one of NATO's requirements for quality management, which is why it was STANAG 4427, 3rd edition that introduced allied ACMP configuration management publications. Detailed requirements and guidelines for configuration management are the part of the ACMP publications and other additional clauses being the part of contracts or other equivalent national documents. One of them is the ISO 10007 quality management series standard, which contains configuration management guidelines (PN-EN 2018). It is referenced for use in the requirements of AQAP 2110:2016 (including ACMP 2100:2017). It should be noted that ACMP 2100 contains NATO's contractual requirements for configuration management in all stages of the product/service life cycle. When considering documents relevant to product/service

configuration management, we cannot omit ACMP 2000 and ACMP 2009 because of their detailed information on NATO policies and requirements relating to the scope of the subject matter. The information contained in ACMP 2009 (2017) is important for the development of the configuration management life cycle plan, i.e. for planning the provision of the required resources for ongoing contracts. This document is the adaptation of the requirements of ISO 10007 and additional directives and requirements specific to NATO. This publication helps to identify processes and define needs for configuration management. In addition, this paper supports the organization in planning configuration management activities throughout the full product life cycle. ACMP 2000, on the other hand, highlights the importance of NATO's Systems Life Cycle Management (SLCM) policy by making configuration management a mandatory management process for NATO programmes and systems over the full life cycle of a product/service, in order to achieve interoperability, risk reduction and effective use of NATO capabilities in joint operations. If these requirements were insufficient in relation to actual needs in all stages of the product life cycle, they may be further specified by means of an appropriate guide and added to the order. Documents indicate that the configuration management system should be established, documented, used, maintained, evaluated and improved. The publications have been developed to provide requirements for configuration management with regard to the quality of products/services in joint NATO international projects and national programmes. They provide detailed guidance on planning, configuration identification, control, status and audit, measuring and evaluating performance for executives and managers at different organizational levels. Although they have been developed with security quality requirements in mind, they should also be used by the civil sector due to the increasing quality requirements of its customers.

While reviewing normative documents in this subject matter area we cannot omit basic standards from the ISO family such as: ISO 9000, ISO 9001. AQAP standardization publications containing contractual requirements for the quality management system of suppliers of products/services use international standards from the ISO 9000 family, in terms of:

- terminology and definitions compliant with ISO 9000:2015,
- quality requirements compliant with ISO 9001:2015.

Based on ISO 9001, AQAP 2110 requirements have been developed to complement the basic requirements in quality management. This is particularly important for the design and development of a product/service and the need to establish configuration management procedures. In such processes there is generally a need for changes resulting from reviews, verification and validation (ISO 9000 2015). Then the lack of supervision over the introduced changes makes it difficult or even impossible to achieve certain functional and physical properties of the product/service. However, at the stage of production processes, configuration management is limited to the supervision over execution and to introducing deviations or changes not affecting the functional and physical properties of the devices.

Scope of application of configuration management with regard to safety and product quality

Configuration management requires a different view of the essence of management, especially with regard to product decomposition by degree of its complexity and innovation (Pokora, Świderski 2006). This is a concept that applies to comprehensive customer service in networks. Such networks can be formed by: product manufacturers, suppliers of components, spare parts, exploitation packages and training centres for operators of products on site. Such a way of customer service causes changes in the technical preparation of the product, which boil down to a different look at the product and documentation of knowledge than before (Pole 2007). In order to ensure proper identification and traceability of products or services, in accordance with the requirements of AQAP 2110, a configuration management procedure should be implemented in order to continuously maintain the compliance of the product/service with the requirements set out in the documentation created at individual phases of the implementation process. The conceptual meaning of the essence of configuration management is shown in Figure 1.

Fig. 1: The essence of configuration management (the in-house elaboration).

How can we read the essence of configuration management by using ACMP documents? Figure 1 shows a simple relationship which defines that, in classical terms, configuration is the functional and physical characteristics of a product/service as defined in the technical documents and obtained in the final product. On the other hand, product/service configuration management is understood as organisational, technical-technological and administrative activities consisting in supervising the compliance of functional and physical characteristics of manufactured products/services with the requirements specified in the documents. The observation and direct interview of the device/service configuration management organizations shows that the configuration defined in this way has its reference in the practice of manufacturing processes. Due to its nature, it is an instrument supporting quality management of products/services. In the quality management system they provide up-to-date information on the status of product realization at particular stages in relation to the quality requirements of the customer.

We must remember that configuration management applies at various stages of the product/service life cycle. This approach should be highlighted and promoted among organisations. Figure 2 indicates at which stages of the product/service life cycle we should refer to configuration management.

Fig. 2: Configuration management at individual stages of the product/service life cycle (own development).

An analysis of configuration management applications in organisations has shown that it should be implemented and cover such phases of the life cycle of a defence product as:

- definition and review of a product's requirements,
- design, research and development of a product,
- production of a product,
- use of a product,
- end of life.

Each of these stages is important in the configuration management process. From the point of view of determining the customer's requirements, failure to document quality requirements, their incompleteness or ambiguity may lead to many misunderstandings with the recipient and the internal customer at the stage of handing over the product/service to the next stage. On the basis of an unambiguously identified configuration resulting from the requirements review phase, the documentation of the design work (if applicable), in relation to the relevant physical and logistical functional characteristics, is essential. It is about determining the reference configuration and decomposition, i.e. extracting the objects of configuration from the structure of the designed product. It should be remembered that design is not necessarily part of every order. Orders for serial production or a finished product, e.g. on entrusted documentation, do not require configuration management in the design area. The next stage of research and development should involve the assessment of the design input data through the verification or validation of a model, prototype or first unit of a manufactured object of configuration or the entire product/service. The stage of execution (production) of a product/service in relation to configuration management is a consequence of design and development works. Includes production of the product on the basis of approved technical documentation. In the case of unit production, carried out as part of design and development work, proof of fulfilment of the quality and safety requirements shall be the specified reference configuration, including the results of configuration audits carried out, and in the case of series production, proof of fulfilment of the requirements shall be the relevant inspection and test records. Lack of configuration management at this stage may lead to uncontrolled deviations and changes to the previously approved reference configurations (Pokora 2006). The manufactured product/service, including all systems, assemblies and parts, has a built-in configuration. At this stage, a properly defined configuration should ensure that the product can be used, operated and repaired properly, including the distribution of necessary parts. The user relies on properly identified configuration in earlier phases of the product life cycle. A specific area that applies to all phases is a purchase. Configuration management is required in terms of ordered products as configuration objects, in the form of a finished product coming from the market or a product designed and manufactured by a co-operator (Pokora 2006). It follows that configuration management has a scope of application, determined by phases of the life cycle and the nature of application related to the specificity of the product or service. In accordance with the requirements of AQAP 2110, configuration management should function according to the principles, e.g. present in the form of a documented configuration management procedure. Although formally there is no requirement to implement a documented configuration management procedure, good practice observed in the organisations under investigation indicates such a need, even due to the rotation of personnel and many other factors influencing the disturbance of manufacturing processes, negative for the quality and safety of the device/service.

It is good if such a procedure describes actions concerning e.g:

- responsibility for configuration management, including parties involved in the organisation and beyond,
- identification of the configuration, i.e. description of the product/service taking into account functional and physical characteristics, applicable phases of the product/service life cycle, designation of the objects of configuration and reference configuration, introduction of the principle of numbering or marking, with reference to the necessary principles,
- configuration control with consideration of particular stages of execution,
- characterisation of the configuration status, which can be included in the description of configuration identification, control or audit,

- configuration auditing, including the rules of their execution,
- the configuration management planning.

Please note that this is not a closed list. In addition to the description of these basic areas of activity, its individual elements can be developed and clarified. It depends on the specificity of the organization and the degree of complexity of the product/service. Configuration management in the various phases of the product life cycle is designed to prevent incompatibility of functional and physical characteristics of the product/service only in the final phase of a product receipt or at the product usage phase. The costs of removing the causes and effects of customer complaints are disproportionate to the costs incurred in order to implement additional requirements in the quality management system securing the quality and safety of the product/service. The studies and analyses carried out (Szkoda 2002, Hordyniak 2007) support the thesis that changes should be implemented at the design stage, as the effects resulting from these changes are still disproportionate in relation to losses at the production stage or the use stage for a given product. It is estimated that the cost of error elimination is 1 : 10 : 100. The cost of error elimination in the analysis and design phase is one unit. The cost to eliminate the same error in the production phase is 10 units. If an error is identified in the course of use, e.g. of a machine, device or service, it can be expected that its removal will imply 100 times greater costs than repair after the error is detected in the initial production phases (Hordyniak 2007). These relationships are shown in Figure 3.

Surveys carried out in 2016-2017 on a sample of 120 audited companies indicate a similar relationship to that described in the cited works.

Fig. 3: Dependencies of the costs of error elimination in the product/service life cycle (Hordyniak 2007).

The analysis of incurred costs of non-compliant products/services was carried out on the basis of the organisation's complaint documentation, actions eliminating the causes of non-compliance, in order to avoid their recurrence and on the basis of reviews of the effectiveness of corrective and remedial actions taken. The results were collected and compiled in the auditor's reports. The effectiveness of the quality management system, including processes generating the highest costs, can be ensured in the process of quality planning and implementation monitoring in terms of compliance with the planned activities.

Systemic approach to configuration management affecting product/service quality and safety

Can we present configuration management in a system perspective? If the system is defined as a set of interrelated elements, tasks, activities functioning as a whole, for which borders, inputs and outputs and processing processes can be defined, then we definitely can present the configuration management in a system perspective. When identifying processes in the quality management system in accordance with the AQAP requirements (item 4.2), configuration management shall be included in the system documentation. Is this approach respected in organizations? Do you see the importance of this requirement in terms of product quality and safety of customers? Out of 120 surveyed organisations, which believe that they have a quality management system in place, 30% have not implemented configuration management in practice. There was only formal system documentation. It is not enough just to formally map the identified processes (example in Figure 4), define their sequence and interaction, establish criteria of the method to evaluate these processes, and even develop a configuration management procedure if this is not implemented in practice.

Fig. 4: Sample map of processes in the organization including configuration management (the in-house elaboration)

If the formal documentation is not followed by ensuring that the technical, technological, organisational and logistical characteristics of the products/services comply with the agreed technical documentation and by preventing unauthorized changes to this documentation, according to the implemented documented procedure, the configuration management process does not work, it is fictional.

An effective configuration management process ensures that the manufactured product/service conforms to requirements that are described in sufficient detail to allow interchangeability, safe use and maintenance, as well as modifications, repairs and upgrades during the product life cycle. What does that mean in practice? In practice, it means implementing the four basic elements of configuration management (ACMP 2100):

- identification of a configuration that includes a product as a configuration object and its subdivision into further configuration objects, against which activities related to the necessary tests and controls and the marking, documentation, review and approval are undertaken at specific stages,
- configuration control regarding the definition of a uniform system for monitoring changes to objects and descriptive documents,
- characterization of configuration status, which includes a system for informing and reporting the current status of configuration objects in the life cycle,
- configuration auditing, which concerns the formal assessment of the conformity of configuration objects with the requirements of the designed product before production.

Figure 5 illustrates, in an conceptual way, the elements of configuration management that should be included by an organization in its management system for the safety and quality of the product/service during its life cycle.

The basis for configuration management is to determine the necessary reference configurations, i.e. approved sets of documents that characterize a product or service at a given stage. What kind of documents are they? These are the ones that practically define the client's requirements when confronted with the organization's performance capabilities. The order/contract will not be properly executed if the configuration is not clearly documented at this stage. Important elements of configuration identification include the definition of product/service structure. Based on the proper structure of a product or service, it is possible to select the objects of configuration. It should be determined by decomposition taking into account the division into: product (systems, installations, assemblies, sub-assemblies, devices, aggregates, details, parts; service (implementation stages, methods used, equipment used). Making the right selection of objects allows for efficient configuration management. The configuration objects should be determined according to specific selection criteria.

Fig. 5: Basic elements of configuration management for safety and quality of the product/service in the life cycle (the in-house elaboration).

The criteria for the selection of configuration objects are primarily defined in the contract but may also result from the application of the product. Criteria may concern e.g.: technology, safety of use, reliability (harmlessness, durability). Depending on the type of project being implemented, it is possible to select one configuration object or as many as necessary for efficient configuration management taking into account the adopted criteria. What is configuration control used for in practice? It serves to ensure that no unauthorised changes or deviations are made to the approved configuration (reference configuration) documentation. A distinction is made between pre-execution deviations, called authorisations, which may constitute an approved reference configuration or post-execution deviations applicable to a non-compliant product or service (Pokora 2016). Configuration control may concern configuration objects with regard to change proposals generated from three sources: from the customer, from the supplier, from the organization.

Another element of configuration management is the status characterization, i.e. formal registration and information about established documents, status of proposed changes and status of approved changes (ISO 10007). It should be determined at the product/service design stage what will be the form of records and registration of documents. Of course, it is important to agree this form with the customer or contractors of other configuration objects. Configuration management as a tool ensures full identification and traceability (Dutkiewicz 2016). This is especially important for an organization in case of a complaint, when we have the possibility to reconstruct the history of a product/service. Therefore, documents used in configuration management should include, among others: identification numbers, names, date of entry into force, release status, changes, change history, unambiguous designation of documents, part numbers, etc.

It is important for the security of the organization that, as part of the characterization of the configuration status, the following documents are kept, among others: lists of documents defining necessary reference configurations, lists of configuration objects and their decomposition, registers of changes, permissions and/or deviations, configuration audit reports and others. Arrangements to characterize the configuration status end with the approval of the documentation describing the product or service after their validation and positive results of configuration audits. Configuration audits are a formal verification of the product's compliance with the functional and/or physical characteristics of the products. Configuration audits should be planned as part of the project at the product or service design stage. They do not replace verifications, reviews, studies and controls, but concern the results of these activities.

If an organization has the ambition to build and implement a correct quality management system based on the AQAP requirements, it should obligatorily use all the basic configuration management elements described above (Figure 6). If it does not do so (30%), it potentially allows for unauthorized changes in the established product/service configuration and configuration documentation. This may affect the inefficiency of processes supporting the use of the product.

Fig. 6: Structure of the configuration management model in relation to the product life cycle (own elaboration).

Lack of effectiveness may result in the delivery of products/services that do not meet the quality requirements, potentially affecting the process of use and user safety, i.e. customer complaints. The requirements oblige to implement such a system so that each identified process can be monitored and supervised (AQAP 2110). The quality management system according to AQAP allows for a comprehensive approach to the planning and execution of operational processes necessary for the execution of products and/or services and is an important business element in correlation with the needs and requirements of the customer.

Example methodology for assessing the effectiveness of product/service configuration management

Ensuring quality requirements in product/service implementation processes is achieved through effective configuration management. It should be assumed that where manufacturers of products/services cannot effectively manage the configuration, they cannot ensure that quality requirements are met. One of the very important scientific and practical problems is the knowledge and ability to assess the effectiveness of product/service configuration management as part of the

evaluation of processes in the organization. In systems, an important problem in ensuring the quality requirements of a product/service is the assessment of the effectiveness of configuration management (AQAP 2110). It is generally accepted that configuration management is effective if the final product is accepted by the contracting authority. This is too simplistic a qualitative method. According to analyses, about 70% of the surveyed organisations apply such simplification. And yet, if we refer systematically to the product/service configuration management model (Figure 7), the assessment problem is more complex. Each of the elements of the model contains a set of activities with different degrees of differentiation and suitability in relation to the requirements. Configuration management is one of many processes in organizations and should be subject to the same procedure for effectiveness assessment procedure based on the adopted model. Figure 6 illustrates the concept of a model for assessing the effectiveness of configuration management process, which such concept is used in audit research.

where: WG i,n(t) - i-th determined requirements of the nth process of CM
WG i,s(t) - s-th determined requirements of the nth process of CM
Oaw i - the indicator evaluating the fulfilment of the requirements of the i-th process of CM at organisation level
Wsk i(t) - the indicator of the degree of compliance of the i-th process of CM
Oaz(CM)(t) – external auditor to assess the level of compliance with CM
Sw(CM)(t) - Systemic indicator of compliance with CM
Ko(CM)(t) - criterion of performance of CM
Wo(CM)(t) - result of the effectiveness assessment of CM

Fig. 7: Model of evaluation of the effectiveness of the configuration management process (the in-house elaboration on the basis of: (Szkoda, Wojciechowski, Dębicka 2011).

In the assessment model of the configuration management process, the proper selection of assessment criteria and assessment indicators plays a special role as it clearly influences the effectiveness of the assessment. In addition, we can assume that the improvement actions taken will not have a positive impact on changes in configuration management if the assessment of effectiveness is not based on the substantive basis (requirements, knowledge, resources, procedures, methods and others).

To assess the configuration management process we can identify a set of requirements (WG) according to the product/service configuration management model (Figure 5).

WG={wgn} (1)
Where (wgn) - n^{th} subset of configuration management requirements.
The collection consists of the following requirements:
WG = {wgpk, wgik, wgsk, wgcsk, wgak} (2)
where:
wgpk - configuration management planning,
wgik - configuration identification (configuration object selection, information,
wgsk - configuration steering (supervising the changes),
wgcsk - characterizing the configuration status (description),
wgak - auditing the configuration.

The number of the set of established requirements (1), (2), concerning configuration management is determined on the basis of reference documents (ISO 9001, AQAP 2110, ACMP2100, other contract documents), while the quantity of the set of fulfilled requirements can be determined on the basis of an audit. The [Oawi] organisation and the external auditor [Oaz(CM)(t)] on the set of requirements [WG i,n(t)] at the time t, determine the quantity of the collection [WG i,s(t)] at the time t, according to a specific relationship (3).

$$Ni\,[Wg\ i,\ n(t)] \xrightarrow{Oawi;\ Oaz(CM)} Si\,[Wg\ i,\ s(t)] \qquad (3)$$

An example of an audit analysis to assess the effectiveness of the configuration management process is presented in Table 1.

Tab. 1. An example of an audit of the configuration management process in an organization

Quantity of the N collection	Wg configuration management requirements	Audit assessment Oawi, Oaz(CM)	Quantity of the S collection
1	The design and construction process should start with a decision of the Technical Director and the work should be carried out according to a permanent, plant-based phased design plan.	Requirement met	1
2	Stage I - of studies and analyses (configuration identification) should cover: conceptual and study issues; analysis of standards, requirements of the ordering party, of user, market requirements. The result of this work should be the product development (WZTT).	Requirement met	2
3	Stage II - As part of the preliminary design (model), the plan of the stage should be complemented by developing a schedule - arrangements which defines and secures the organizational and executive conditions of the model or the model batch.	Requirement met	3
4	Verification should be carried out during the execution and testing of the model batch, documented by the records in *the Book of Arrangements and Approvals* (F-PJ-04/02) signed	Requirements not met	-

	by the constructor and in the judgments, protocols and reports on the execution and testing of the model.		
5-29	. . .	**11 requirements not met**	4 . . 17
30	During the realisation of stage II, the identification of the configuration should be carried out, i.e.: – determination and separation of the objects of configuration (elements of the product) based on the analysis of the whole product, – documentation of physical (size, weight, shape, etc.) and functional features of the configuration objects (elements of a product).	Requirements not met	-
31	The input material for the implementation of Stage II plan should be: - the results obtained from the verification and validation of the previous stage, - construction documentation of the previous stage, and the output should be technical documentation for serial production.	Requirements not met	-
32	Design validation (configuration audit) should be carried out - validation by means of in-house testing, acceptance testing, type testing, periodic testing for compliance with the requirements of the ZTT.	Requirements not met	-

The analysis of the sample taken in the selected example shows that the company did not meet as many as 15 requirements out of 32 ones. Corrective or correcting actions are required in relation to the identified non-compliant areas. Assuming that the effectiveness of configuration management is the extent to which the achieved results of the configuration management process at time t correspond to certain evaluation criteria for the n^{th}requirements of the configuration management process at time t, we can determine the value of the effectiveness indicator by relationship (4):

$$Wo(CM) = Wsk\ i(t), Sw(CM)(t), [Oaw\ i\ (t), Oaz(CM)(t)] = Ni(Wg\ i,n(t)\ \text{result} \rightarrow Si(Wg\ i,s(t)/ \quad (4)$$

of 32 requirements 15 not met

A formally defined assessment of the effectiveness of configuration management, including an indicator (4), consists of a positive or negative statement based on the following principle:

If Wo(CM) is ≥ 1 then the configuration management process is effective

If Wo(CM) is < 1 then the configuration management process is ineffective

The assessment of configuration management efficiency is graphically interpreted in Figure 6.

Fig. 6: Graphical interpretation of an example of the effectiveness of the configuration management process

The assessment of the effectiveness of the configuration management process is a prerequisite for the rational management of the entire quality management system, particularly in accordance with the AQAP requirements. The results of the effectiveness assessment are important information for managers as to whether the system works or needs to be improved. It is important that the assessment of effectiveness is carried out systematically and according to a plan.

Conclusion

The use of AQAP standardisation documents as part of the management system should be a basic quality requirement for products/services in which safety risks have been identified. All participants in the life cycle of a product, and especially organizations that manufacture products, e.g. for national security and defence, should be prepared to meet the AQAP requirements. They must adapt their quality management systems and have the necessary experience to ensure the expected quality. The quality management system standards compliant with ISO 9001 and AQAP have become the basic instrument for meeting the quality requirements of products/services and competitive-marketing activities of enterprises. Implementation of the quality management system requires the organisation to comply with the established requirements in accordance with the reference documents. The NATO requirements for quality assurance of products/services purchased e.g. for the military can be used by all organisations and industries. Fulfillment of the AQAP requirements is not conditioned by the size, legal status and ownership structure of the entity realising a given product. They can also be used to improve the quality management system for all organizations with implemented quality management systems. The AQAP document requires the establishment, documentation, implementation and improvement of a quality management system, including configuration management. Only the AQAP-compliant system in operation increases confidence in the organisation in terms of product/service quality.

The main objective in the NATO quality management is to obtain a product that is safe and meets the customer's requirements. Empirical research carried out in 120 companies shows that configuration management generally enables efficient execution of processes, ensures identification and traceability, access to accurate information, although not in all companies. 30% of them did not implement configuration management in practice, while 24% implemented ineffectively, e.g. did not identify the product, did not manage changes (controlling), etc.

Since configuration management problems are solved in different ways, not always satisfying customers, the proposed solutions aim to unify the approach to configuration management in the actions taken by product/service manufacturers. Organisations interested in providing quality and user safety requirements may use the test-verified assessment model to assess the effectiveness of configuration management.

The presented model proposal and methodology for assessing the effectiveness of product/service configuration management is not perfect, but may be used to correct or improve the process.

Attention should be paid to the practical aspect. The configuration management process is intended to increase the efficiency of the entire quality management system, not generate incompatibilities.

Configuration management is a new look at the product, its features, properties and development. Identification of the configuration is becoming particularly important today, as the products offered are characterized by increasing complexity. Customer service is changing and new decision-making centres are being set up: the supervision centre and the execution centres.

Generally, configuration management in the product/service life cycle allows for:

- process standardization,
- ensuring product/service repeatability,
- systematic supervision, monitoring and control,
- support of the usage process.

The article provides a basis for further research to solve practical problems of product/service configuration management. It recommends, in order to improve the efficiency of systems, that configuration management should be one of the basic requirements in a quality management system. A modern approach in quality management systems should be related to the design of validated configuration management models that would be the basis for ensuring the required level of safety and quality of products/services.

Resumen

La implementación de infraestructuras digitales constituye una tarea central para que las sociedades logren conectarse a las redes de la sociedad de la información, en el entendido del acceso a internet como condición necesaria para avanzar hacia el desarrollo. En el caso de la ruralidad, la situación histórica de atraso respecto a los niveles de desarrollo urbano, evidencian disparidades en términos de acceso a los objetos digitales. Las políticas que apuntan a la masificación tecnológica no son suficientes para disminuir la brecha digital y el servicio prestado por el sector privado no garantiza una calidad suficiente para la conectividad de las poblaciones rurales. En este sentido, el papel de las comunidades adquiere relevancia como alternativa para paliar las dificultades que se presentan en términos de acceso a las redes técnicas y de conocimiento. El presente documento analiza estas circunstancias, argumentando que la organización comunitaria puede representar un factor clave para la democratización digital y el desarrollo local. El enfoque metodológico cualitativo se basa en una fase de revisión documental de política pública y en la indagación sobre la percepción de los pobladores del borde rural-urbano de Usme en Bogotá, respecto al acceso y la relevancia sobre las redes digitales.

Introducción

La presente reflexión hace parte del proyecto de investigación "La politica tecnológica como estrategia para la inclusión y el desarrollo de comunidades rurales", desde el cual se abordó el análisis de la política pública en materia de masificación tecnológica y su implementación en el sector del borde rural-urbano de Usme en Bogotá. El proceso metodológico presentó una fase de revisión documental sobre textos de política pública, lo cual permitió un seguimiento de las articulaciones entre masificación tecnológica y desarrollo rural, además, una fase de trabajo en campo, en la que se indagó a pobladores del sector -mediante la aplicación de instrumentos de entrevista semiestructurada- respecto a sus percepciones frente a las tecnologías digitales y sus experiencias en el marco de la sociedad informacional.

El punto de partida del análisis fue la consideración sobre la relativa importancia que han adquirido las tecnologías digitales en los discursos gubernamentales (Sourbati, 2011; Eckardt, 2014), aspecto que se evidencia en los textos de políticas públicas sobre el desarrollo regional y nacional. Desde allí se pretendió evidenciar el alcance de estas políticas en las zonas rurales ubicadas en sectores periféricos de la ciudad, caracterizados por un acceso limitado a los recursos digitales y la precariedad en la implementación de infraestructura digital (Salemink, Strijker & Bosworth, 2017).

A pesar de que las directrices globales sobre el desarrollo sostenible y la política pública sobre el desarrollo en Colombia consideran que la ampliación de la infraestructura digital es una tarea fundamental para el alcance de los beneficios sociales y económicos al total de la población, la brecha digital permanece en el sector rural, de manera que se evidencian profundas disparidades en el acceso a los objetos digitales, por tanto, en la democratización del conocimiento y la información (De Greiff, 2017). Vale destacar que, si bien las tecnologías digitales no son consideradas, por parte de la población del borde rural-urbano de Usme, como un factor determinante para su desarrollo, se reconoce -de manera creciente- que el uso de recursos tecnológicos facilita el acceso a la información necesaria para mejorar procesos educativos y productivos en la comunidad.

La relativa importancia que los pobladores del borde rural-urbano de usme le otorgan al uso de dispositivos y redes digitales se ve limitada por las dificultades de acceso. Ni el Estado ni los proveedores privados ofrecen la infraestructura requerida para garantizar la interconectividad a niveles aceptables de calidad. Como resultado del trabajo realizado en el contexto del proyecto surgen cuestiones sobre la necesidad de acciones alternativas que faciliten la democratización digital. En este sentido, la organización comunitaria puede promover iniciativas para mejorar la vinculación de la ruralidad de Bogotá a la sociedad de la información. Este documento invita a la reflexión sobre las relaciones entre la infraestructura tecnológica y el desarrollo de las comunidades rurales, planteando la posibilidad de organización comunitaria como estrategia para movilizar oportunidades de acceso a la infraestructura digital.

Infraestructura Digital para el Desarrollo

La infraestructura digital comprende un factor clave para la movilización de los objetos digitales (De Greiff, 2017), por tanto, el acceso al conocimiento por parte de los diferentes sectores sociales. La infraestructura no solo permite la movilidad de los objetos sino que también la restringe (Star, 1999) definiendo su distribución. De esta manera la planificación de la implementación de infraestructuras digitales comprende una posibilidad de acceso para algunos sectores y, a la vez, un proceso de exclusión para otros, determinando desventajas en el disfrute de los beneficios que se supone provee la información, dado que se afirma que la digitalización y la conectividad son fundamentales para la economía y la sociedad digital (Intenational Telecommunications Union, 2019).

Para el Banco Mundial (2019) internet promueve la inclusión, la eficiencia y la innovación, dado que facilita la generación de nuevas actividades económicas -caso del comercio electrónico- así como la disminución de costos en transacciones y otras operaciones mercantiles, además de la creación de una economía particular de los mercados de internet (Levin, 2011). Además, se afirma que las tecnologías informaciones aportan posibilidades para la inclusión educativa, tanto en términos de acceso como de calidad (Zappalá, 2013). Las tecnologías digitales son dotadas de capacidades para renovar y motivar cambios a nivel social (Pérez & Sarrate, 2011) y para movilizar la democratización de la información por vía del acceso a la infraestructura digital, de manera que el uso de tecnologías digitales promueve la reivindicación de la libertad de expresión (Ladrón, 2009) y los derechos ciudadanos.

Los aspectos mencionados hacen parte de un discurso que justifica la vinculación de tecnologías digitales como factores esenciales en la planificación del desarrollo. De tal modo se justifica la necesidad de masificación tecnológica como estrategia para la disminución de las brechas en materia de desigualdad, distribución del ingreso, acceso a beneficios y disparidades entre lo rural-urbano. Las infraestructura digital es entendida, por tanto, como mecanismo vinculante de las poblaciones periféricas al conocimiento, de manera que apunta la democratización de la sociedad de la información.

Experiencias Sobre Implementación Tecnológica En Contextos Rurales

La fase de revisión documental sobre política pública en materia tecnológica en Colombia permitió evidenciar la rápida adopción de las tecnologías digitales como mecanismo para movilizar el desarrollo. Las políticas en torno al desarrollo rural han incluido, entre sus principales líneas de atención, la ampliación de la infraestructura digital (MinTic, 2018), de manera que la conectividad rural se plantea como uno de los puntos principales de la agenda de Reforma Rural Integral y, por tanto, la política de desarrollo rural. Las acciones planeadas hacia la ruralidad, en el contexto de las políticas del desarrollo, se sostienen en los objetivos de disminución de las disparidades existentes entre lo rural-urbano y, de manera particular, en la atención a la brecha digital (Brunereau, Chuctaya & Vega, 2016), en este sentido, la dotación de infraestructura digital en los sectores rurales se establece como estrategia clave.

Las discusiones sobre la masificación del acceso a internet y la conexión de calidad para las poblaciones tradicionalmente periféricas adquieren una gran relevancia en el sector rural, dado el papel secundario que ha ocupado la ruralidad en las políticas tradicionales sobre el desarrollo (Pérez, 2001). Esto puede evidenciarse, particularmente, en el limitado acceso a las redes digitales por parte de las comunidades

del sector rural y el borde rural-urbano de grandes ciudades como Bogotá. Bajo estas condiciones es preciso reflexionar sobre diversas experiencias que muestran una tendencia hacia el mejoramiento de las capacidades de conexión por parte de las comunidades rurales, más allá de las políticas del Estado. En este sentido Mathur & Ambani (2005) afirman que la superación de la brecha digital, como oportunidad a las personas que viven en la ruralidad, plantea una revolución esperada.

Salemink *et al* (2017) establecen una conexión entre el desarrollo digital y el desarrollo rural en países desarrollados. Afirman que las políticas genéricas en materia de implementación tecnológica usualmente descuidan las necesidades locales, circunstancia ya tradicional en términos de las políticas que apuntan al desarrollo, en las cuales se ha hecho evidente la comprensión de la dicotomía rural-urbano, respecto a las disparidades y diferenciación existente entre ambos contextos. Los autores muestran que, dada la periferización de la ruralidad, estos lugares requieren mayor conectividad digital pero, paradójicamente, se encuentran menos conectados, dada su relativamente menor importancia en la forma en que se ha entenido el desarrollo.

Para Philip & Williams (2019) las posibilidades de acceso a redes de banda ancha pueden promover la inclusión de personas, familias y pequeñas empresas domésticas de las zonas rurales en la economía digital. La interacción con la infraestructura tecnológica puede representar oportunidades para movilizar pequeñas iniciativas relacionadas con las lógicas productivas y económicas de la ruralidad. Aunque en este caso se puede tratar de incrustar prácticas económicas exógenas en las comunidades, también puede promover la competitividad en actividades tradicionales relacionadas con el arraigo cultural de los sectores rurales. Esto puede ocurrir en el caso estudiado por los autores en Reino Unido pero tener sus propias particularidades en otros contextos locales por analizar, como en el caso de América Latina.

Ashmore, Farrington & Skerratt (2017) presentan el caso de las iniciativas de banda ancha lideradas por la comunidad en Reino Unido. Estas propuestas surgen como respuesta a la falta de acceso a la infraestructura digital, provista por el Estado, expresando una mirada local al desarrollo. Si bien pueden facilitar el acceso de comunidades rurales a las redes digitales, pueden promover un desarrollo rural desigual. Esta reflexión es clave si se consideran las particularidades de sectores rurales en Colombia -y América Latina- en los cuales las comunidades rurales, a pesar de su compromiso con el desarrollo local pueden tener pocas probabilidades de establecer propuestas autónomas para el acceso. Quizás las alianzas con el sector privado pueden ser alternativas para vincular el papel de la comunidad en los esfuerzos por articularse con la sociedad de la información.

Acceso Digital En El Borde Rural-Urbano De Usme

El trabajo realizado en la segunda fase de ejecución del proyecto "La política tecnológica como estrategia para la inclusión y el desarrollo de comunidades rurales" permitió el acercamiento a las comunidades del borde rural-urbano de Usme en Bogotá mediante la implementación de entrevistas semiestructuradas y la técnica de grupos focales. La observación del escenario ha puesto en evidencia la profunda brecha digital existente, expresada en la ausencia de una infraestructura que soporte el acceso a las redes digitales para las comunidades rurales y en el uso limitado a los recursos tecnológicos por parte de los pobladores. La precaria infraestructura es expresión de la implementación parcial -o nula- de las políticas de promoción de conectividad digital e implementación tecnológica.

Los pobladores del borde rural-urbano de Usme han expresado, de manera recurrente, su interés por las tecnologías digitales en tanto posibilidades para acceso a la educación o información relevante a sus prácticas productivas (Registro de Campo), sin embargo, la capacidad de ingreso económico de estas personas determina sus posibilidades de conectividad digital. El servicio de conexión a internet, en el sector, es ofrecido por empresas privadas a costos relativamente altos para las comunidades. Incluso, en la mayor parte de la región, la infraestructura móvil privada ofrece un servicio de baja calidad con velocidades de conexión lentas. La prestación de servicio de internet en el borde-rural de Usme constituye, en muchos casos, un bien de lujo determinado por la capacidad de pago. Esto reafirma que la desigualdad en términos de acceso a la infraestructura digital refleja, a la vez, las amplias disparidades en términos de desarrollo (Alva, 2015) en la ruralidad.

Un aspecto a resaltar en el sector rural de Usme es la organización comunitaria, movilizada en defensa del territorio y la identidad. Estas prácticas han enfatizado en aspectos como la resistencia frente a las políticas de urbanización de la ruralidad y la transformación de sus prácticas productivas tradicionales hacia actividades de explotación económica del recurso ambiental (Pereira-García & Ramírez, 2019). Sin embargo, a pesar de que el interés por las tecnologías digitales es un asunto menos urgente que las dinámicas del ordenamiento territorial, que pone en peligro la conservación del medio ambiente y los modos de vida tradicionales de las comunidades, los habitantes del borde rural-urbano de Usme tienen una percepción positiva sobre las TIC (Registro de Campo). Una proporción significativa de los pobladores considera relevante el uso de internet, como forma de acceder a la información, en tanto soporte de los procesos educativos de niños, niñas y adolescentes, así como en las relaciones con el Estado por vía del gobierno digital.

El interés secundario por las tecnologías tiene como una de sus explicaciones la ineficacia del Estado para proveer la infraestructura necesaria que permita conectar digitalmente las periferias del borde rural-urbano con los centros de la ciudad en donde el uso de internet se ha masificado. En el sector de Usme rural el uso de recursos digitales es limitado dada la baja disponibilidad de dispositivos tecnológicos (computadores y equipos móviles), además de las condiciones de la infraestructura de redes ya mencionada, no obstante, existe un uso generalizado -aunque no masivo- de aplicaciones como las redes sociales por parte de los habitantes (Registro de Campo). Las comunidades, pese a los problemas de acceso, ingresan de maneras periféricas a las dinámicas de la sociedad de la información, promovidas desde la política pública nacional durante varias décadas.

Las políticas sobre el desarrollo en Colombia han planteado, como parte de sus más relevantes directrices, ampliar el acceso a las TIC por parte de todos los sectores de la población. Una de las principales tareas proyectadas es la implementación de infraestructura digital en las zonas rurales (MinTic, 2018), al entenderse como regiones que históricamente han experimentado el atraso y la periferización en términos de desarrollo económico y social, respecto a los centros urbanos. A pesar de que se homogeniza la noción de ruralidad, existen realidades diferenciadas que se agrupan en dicha categoría (Matijasevic & Ruiz, 2013). Los sectores del borde rural-urbano de Usme se caracterizan por una naturaleza híbrida, dada la cercanía a la influencia de la ciudad y los intentos de urbanización propuestos por la planeación de la administración pública de la ciudad, sin embargo, conservan sus caracteres rurales en torno a las actividades productivas que realizan y a sus estilos de vida.

La provisión de Banda Ancha en el borde rural-urbano de Usme es bastante pobre. Aunque durante varios años las iniciativas propuestas por entidades gubernamentales como el Ministerio de las Tecnologías de la Información y la Comunicación y la Alta Consejería para las TIC en Bogotá han intentado acercar a la comunidad a la sociedad del conocimiento, las acciones reales no son suficientes para conectar a la población y disminuir la brecha digital. Los proyectos como Vive Digital y Computadores para Educar no han impactado el sector, aunque este aparece referido en los documentos proyectados para las iniciativas. Se hace referencia, en los informes públicos, que Bogotá logró la meta de remover las barreras de acceso a la tecnología (Impacto TIC, 2019), no se ha garantizado la provisión de infraestructura digital suficiente para asegurar el acceso por parte de la población.

Por otro lado, el Proyecto Nacional de Fibra Óptica plantea un plan de ampliación de la infraestructura de fibra óptica, como alternativa de provisión de conectividad de banda ancha para todas las regiones del país (MinTic, 2020). No obstante, el borde rural-urbano de Usme depende de las políticas distritales de conectividad, de manera que queda fuera de los planes nacionales. En el mismo sentido, el Plan Nacional de Conectividad Rural constituye uno de los planes para la Reforma Rural Integral, en el contexto del acuerdo de paz en Colombia. En este documento se proyecta la instalación de nodos de conexión de alta velocidad para todas las cabeceras municipales y los sectores priorizados, con el fin de promover la masificación digital. La reforma rural, no obstante, no ha sido ejecutada por el gobierno actual, por tanto, la posibilidad de acceso digital para las comunidades rurales se encuentra aplazada.

Reflexiones Finales: Organización Comunitaria e Infraestructura Digital

Si el acceso a la infraestructura digital es un factor clave para la democratización del conocimiento, esto debe constituirse en un factor clave para la política pública. Sin embargo, dicha tarea se ha propuesto como una responsabilidad particular del Estado, como proveedor de soluciones en términos de masificación tecnológica y ordenamiento del ámbito tecnológico. Las políticas públicas en materia de tecnologías digitales disponen de un discurso bienintencionado que pretende vincular a toda la población en el desarrollo económico y social. Sin embargo, la ejecución de las políticas públicas queda sometida a las proridades de los gobiernos y en muchos casos quedan como objetivos secundarios en la agenda política.

La dependencia de las poblaciones rurales a las políticas de Estado y las dificultades para el cumplimiento de las expectativas del alcance del desarrollo local, plantea reflexiones frente a la construcción de alternativas que faciliten la vinculación de la población rural en la sociedad del conocimiento. Algunas experiencias de organización comunitaria sobresalen por el papel que cumplen en el direccionamiento sobre la implementación de la infraestructura digital (Ashmore, et al, 2017), en el caso europeo algunas iniciativas locales que promueven el acceso a banda ancha en zonas rurales surge de la voluntad de las comunidades, como respuesta a la incapacidad gubernamental. No obstante, los arreglos comunitarios para influir en las políticas de implementación digital no son suficientemente efectivos en algunos sectores, a pesar de la larga tradición en materia de organización comunitaria.

La población del borde rural-urbano de Usme se destaca por una importante trayectoria de organización comunitaria en la defensa del territorio y los derechos ambientales y culturales de la comunidad , sin embargo, no se evidencia una consideración de relevancia suficiente, por parte de los pobladores rurales, sobre los derechos digitales, como parte de una estrategia para la disminución de las brechas en materia de desarrollo. La organización comunitaria puede constituirse en un factor clave para la democratización del conocimiento por vía de la implementación de infraestructura digital en el borde rural-urbano de Usme. Por otro lado, las iniciativas comunitarias pueden apostar a la articulación de sus intereses con el sector privado, como mecanismo para promover iniciativas que faciliten la conectividad y el desarrollo de alternativas económicas, como las empresas familiares (Philip & Williams, 2019). Como afirman Mathur & Ambani (2005), las instituciones privadas con fines de lucro pueden elaborar soluciones para captar mercados, hasta ahora no reconocidos, obtener beneficios y, al mismo tiempo, ayudar a las sociedades rurales a mejorar sus capacidades de articulación con la sociedad del conocimiento.

Trust as the Determinant of Innovative Development of Economy on the Example of Poland, Czech Republic, Germany and Finland

Anna RYBAK

University of Technology, Czestochowa, Poland
anna_rybak@wz.pcz.pl

Abstract

The purpose of this paper is to analyse the impact of social trust on the creation of innovative economy. In order to achieve that purpose, countries of different level of innovation were selected. Then, different levels of trust in interpersonal relations were determined and correlation matrixes were calculated taking into account the SII and OECD II indicators. Based on these analyses, conclusions were drawn, which suggest strong correlations between the examined determinants. An attempt was made to identify the indicators that are the most affected by trust. The paper is analytical and it may be used in innovation-related modelling.

Keywords: Trust, Innovations, Economics Development

Introduction

The present times are characterised by rapid changes. The instability of the economic environment is conductive to various social and economic turbulences, which causes a sense of threat and uncertainty about the future. In order to better prepare for changes and competition, it is important to build durable trust in social and economic relationships. Trust is a vital factor of interpersonal relations, giving a sense of security and predictability (Turner, 2002). According to Fukuyama (1997), the prosperity of a country and its ability to compete are dependent on the level of the culture of trust in a given society. Also, he emphasises that growth in trust is accompanied by growth in economic efficiency – due to the fact that people are more willing to take risks and engage in productive social exchange. In innovation-oriented economies, trust produces a new dimension of social engagement in building and creating economic competitiveness both in the domestic and international dimensions. To quote Drucker (1999), in present times "organisations are not built on strength, but rather on trust", which should lead us to relevant conclusions. Trust creates opportunities for development, because it is founded on the rationality of evidence, without the need to verify or prove the evidence. A simultaneous combination of trust for an organisation, governance and social order and for fellow citizens is conductive to innovative economic development of a country. It should be noted, however, that trust is uncertain and volatile. Each manipulation may trigger a state of uncertainty and suspicion. Thus, trust should be carefully and consistently promoted and should not be influenced by trends and fashions associated with "creating" the reality.

The purpose of this paper is to examine how trust affects the innovation of economies on the example of Poland, Czech Republic, Germany and Finland. The research sample was selected taking into account the country's position in the ranking, the Summary Innovation Index (SII) used to evaluate the innovation of EU Member States and the OECD Innovation Indicators (OECD II) presented in the Oslo Manual. The following research questions were asked:

1. Does trust affect the level of country's innovation?
2. How large is the impact of interpersonal trust on economic innovation?
3. How does trust affect the creation of innovative enterprises?

Answering these questions will make it possible to evaluate the role of trust in building an atmosphere conductive to the innovative development of a country. The paper is of analytical nature and its results

will make it possible to take measures that will provide for the trust determinant in future pro-innovation activities.

Trust as social capital - review of the literature

Trust is an interdisciplinary concept that combines numerous areas of science. Trust is variously defined in terms of the benefits it provides (cooperation, political cohesion, reliability, social order, etc.), or the dispositions of those who give trust (affective, calculative, moral, pragmatic, etc.), or the character of the relationship between the trusting and the putatively trustworthy (contractual, dependent, exploitative, reciprocal, etc.). Indeed, the importance of trust to social relationships and exchanges, and therefore its wide application and appeal, means that experience of it will be varied and that not only in common usage but in a large and growing specialist literature there will be multiple understandings of the term (Barbalet, 2006). Sztompka (2006, 2007) believes that "trust and distrust are in a way bets about future, uncertain activities of other people... trust is conviction plus action based on that conviction". Others (Clarke and Payne, 1997; Kramer, 1999; Mayer, et al, 1995) think that it is a mental state that is of key importance for maintaining interpersonal relationships. Meanwhile, in relationships within an organisation (Colquitt, et al, 2007) and business (Zieliński, 2019) relations, trust is the key factor of success. Trust may be based either on affection or on experience (Wang et al) and it may be associated with expectations of other persons (Barbalet, 2006) or a form of building civic attitudes (Deluga, 1994).

Many authors have contributed to this literature. For example, Knack and Keefer (1997) find that a one-standard deviation increase in a survey-based measure of country-level trust increases economic growth by more than one-half of a standard deviation. LaPorta et al (1997) find that across countries, a one-standard deviation increase in the same measure of trust increases judicial efficiency by 0.7 of a standard deviation and reduces government corruption by 0.3 of a standard deviation.

Sztompka (2007) systematised knowledge about trust and identified the following types of trust: personal (in specific individuals), positional (in specific social roles, professions, positions), commercial (in products, brands, companies), technological (in various kinds of technological systems: transport, energy, information technology), institutional (in complex organisations that engage numerous, anonymous stakeholders, e.g. a bank, stock exchange or university), system (in the entire social system and its stakeholders – the political system, civilisation or economy). All the abovementioned objects may be reduced to human activities, which is why "in the end, we always have trust in such activities, and consequently, their effects and products". The above types of trust suggest that it is not only a personal attitude, but it concerns the entire contemporary society, becoming an element of its culture (Kort and Lewicka, 2016). According to Sztompka (2007), trust is the most precious type of social capital, while Putnam (1999) believes it to be an element of social capital that "relates to such features of the organisation of a society as ethics, norms and connections that may increase the efficiency of a society, making it easier to coordinate activities". Woolcock (2001) noted that "…'trust' is better understood not as social capital per se, but rather as a measure of it".

Trust as a factor determining human activities stimulates development. Both social trust and trust in a system make it possible to create a climate of innovation not only in an organisation but also in the cultural dimension. The subsequent part of the paper analyses the impact of trust on the innovation of the examined economies.

Methodology of the Research

The paper uses data collected by the European Innovation Scoreboard (2019), Oslo Manual 2018 (2019) and the European Social Survey (Round 9) (2018-2019). Such approach was considered reasonable, because it enabled objective attitude to information sources. The first part of the study used the Statistica programme to identify the states that would represent groups of different levels of the innovation of economy. Next, the SII indicator components were correlated with trust values in two groups, namely trust in interpersonal relationships and trust for employers. Interpersonal trust was

examined using the 11-point Likert scale, and the respondents from the respective countries answered the following questions:

1. In general, do you thing that most people can be trusted, or rather that you can never be too prudent in contacts with people? (P1)
2. Do you think that, if they had a chance, most people would try to take advantage of you, or rather that they would try to act honestly? (P2)
3. Do you think that people mostly try to help others, or rather they mainly look after their own business? (P3)

Since the responses differed depending on the level of education, they were analysed respectively for all the respondents (total) and for the respondents with higher education.

Interpersonal trust in Poland, the Czech Republic, Germany and Finland

Trust in interpersonal relationships is a vital element of the social capital. The more people trust one another, the easier it is for them to unite around common ideas and to cooperate.

Fig. 1: Distribution of responses to question P1 in the respective countries.

When analysing the data presented in Figure 1, it is worth noting that persons with higher education are more trusting towards others. Another interesting fact is the significant difference between the examined countries. The most trusting are Finns and as many as 57% of them trust on another on the level of 7-8 points. The least trusting in interpersonal relationships are poles (as many as 12.3% declare that you can never be too prudent). Germans and Czechs have an average level of trust in interpersonal relationships (between 5 and 7 points). The next question concerned interpersonal trust concerning honest conduct (Fig. 2). Also in this case, Finns stated more frequently than most people would behave honestly (57% persons assessed this trust on the level of 7-8 points), while 47% of Czechs and 48% of Germans, respectively, assessed it on the level of 5-7 points. Poles thought that they should neither trust nor distrust and 28% of them assessed this trust on the level of 5 points.

Fig. 2: Distribution of responses to question P2 in the respective countries

Research on trust should also take into consideration the intentions that guide individuals. Accordingly, the following question was asked: Do you think that people mostly try to help others, or rather they mainly look after their own business? (Fig. 3)

Fig. 3: Distribution of responses to question P3 in the respective countries.

Concerning he assessment of trust as regards the willingness to help another person, Finns were once again the most trusting and as many as 40% of them assessed it on the level of 7 or 8 points. In the other countries, the respondents assessed it on the level of 5 points. (23% of Poles, 24% of Germans and 17.2% of Czechs).

To sum up, the level of trust in interpersonal relationships differs between the examined countries. Persons with higher education are more trusting, but they keep a certain distance (the distribution of answers ranges between 4 and 7 points). The most trusting group are Finns with higher education and the least trusting are Poles. Czechs and Germans have a similar level of trust.

Trust vs the innovation of economies taking into account the SII and OECD II indicators.

A research on trust and its impact on the innovation of economies requires certain criteria to group countries depending on their level of innovation. This will be done using SII and OECD II indicators, and the groups will be based on an analysis of k-mean clustering. Such approach enables objective classification of countries taking into consideration latent variables.

Fig.4. Diagram of k-means clustering of SII indicators.

When presenting models of the distribution of clustering according to the SII indicator (Fig. 4), major differences between the respective groups should be noted. The biggest difference is between the clustering groups 2 and 3, in the point of the Research Systems variable (values 0.16 and 0.79), i.e. the international competitiveness of the scientific base, focusing on scientific publications and quotations, and the number of international PhD students in those groups is on different levels. The countries clustered in groups 1 and 3 have the same level of the Sales Impacts variable. This indicator measures the export of medium and advanced technology products, exports of services requiring extensive knowledge and sales with respect to innovative activities.

Table 1: Clustering elements and distances from their centre for the countries regarding the SII

Elements of clustering 1	N=14	Elements of clustering 2	N=11	Elements of clustering 3	N=11
	Distance		Distance		Distance
Czechia	0.08452	Bulgaria	0.12495	Belgium	0.12565
Germany	0.17606	Croatia	0.11461	Denmark	0.12651
Estonia	0.11458	Latvia	0.14986	Luxembourg	0.16331
Ireland	0.18494	Hungary	0.12666	Netherlands	0.08625
Greece	0.16667	Poland	0.13970	Austria	0.16857
Spain	0.13376	Romania	0.14932	Finland	0.11740
France	0.14729	Slovakia	0.13895	Sweden	0.10081
Italy	0.12283	North Macedonia	0.14057	United Kingdom	0.15241
Cyprus	0.13547	Serbia	0.11348	Iceland	0.16979
Lithuania	0.16649	Turkey	0.20976	Norway	0.14662
Malta	0.24769	Ukraine	0.16689	Switzerland	0.18657
Portugal	0.16221				
Slovenia	0.11400				
Israel	0.22984				

Table 1 presents elements of each of the examined clustering. The purpose of this paper is to examine the impact of trust on the innovation of economies; the clustering analysis shows that each country is in a different group. Finland represents the most developed group 3 (the variables are between 0.58 and 0.8). Germany and the Czech Republic are in the 1st clustering group and Poland - in the 3rd, least innovative group. Such distribution of the groups suggests that trust influences the level of country's innovation (the distribution of trust measurements coincide with the clustering groups of the SII indicator).

Another approach to measuring the innovation of economies was proposed in the Oslo Manual (2019): the k-mean clustering analysis used the OECD II indicator measuring innovation-active firms in product, process or ongoing, abandoned or organisational and marketing. In this case, too, the k-mean clustering analysis was used (Fig. 5).

Fig. 5: Diagram of k-means clustering of OECD II.

In this clustering division, too, the groups differed significantly in terms of distribution levels. Clustering 1 has the most innovative operators, while clustering 3 - the fewest. Meanwhile, the trends in every clustering are the same (the differences concern only the values of the variables). Only the R&D variable, i.e. operators with a Research and Development department, is on a similar level for all the groups (between 92 and 98).

Table 2: Clustering elements and divergences from the centre.

Elements of clustering 1	**N=16**	**Elements of clustering 2**	**N=9**	**Elements of clustering 3**	**N=6**
	Distance		Distance		Distance
Austria	2.95903	Czechia	3.70332	Chile	10.59088
Belgium	2.90602	Denmark	5.15670	Hungary	2.39968
Canada	12.82882	Spain	5.17718	Korea. Republic of	6.38015
China	12.10455	Estonia	6.14854	Latvia	4.03756
Germany	6.24280	United Kingdom	13.80958	Poland	3.69576
Finland	6.79962	Japan	4.33870	Slovakia	4.19035
France	3.23125	New Zealand	10.27429		
Greece	4.05444	Slovenia	8.98013		
Iceland	8.31438	Turkey	6.79282		
Itally	5.18515				

Lithuania	6.51834				
Netherlands	7.07395				
Norway	3.04083				
Portugal	3.13790				
Sweden	5.97490				
USA	4.74311				

The clustering elements table (Table 2) confirms the right selection of representatives with different levels of economic innovation. Finland and Germany are in clustering 1, the Czech Republic in clustering 2 and Poland in clustering 3. The division into 3 clustering groups is sufficient considering the distance from the central point of the examined variables, since all the examined countries are on the peripheries of their respective groups. In this case, too, the variables characterising the level of innovation behave in the same way as the levels of trust in the examined countries, which confirms the thesis that the level of trust influences the innovation of their respective economies.

Knowledge of the determinant that influences the innovation of economy will also make it possible to examine the intensity of its impact. Subsequent analysis uses correlations between the levels of trust and selected SII and OECD II indicators. For this purpose, indicators examining the level of trust in the respective countries were identified and associated with appropriate weights - product of the level of point assessment and percentage of persons declaring such level.

Table 3: Correlation matrix for the trust indicator and SII indicator on significance level $p < 0.1$

Variable	P1 (Total)	P1 (higher education)	P2 (Total)	P2 (higher education)	P3 (Total)	P3 ((higher education)
Sales of new-to-market and new-to-firm innovations	0.47589	0.42520	0.56985	0.29060	0.76485	0.61809

Trust has major impact on the examined indicators associated with the innovation of economies. Trust in interpersonal relationships influences the most international scientific co-publications (0.99), SMEs with product or process innovations (0.97), SMEs innovating in-house (0.96), Lifelong learning (0,96), Enterprises providing ICT training (0.94), Innovative SMEs collaborating with others (0.93), Employment in knowledge-intensive activities (0.94), Public-private co-publications (0.91), Trademark applications (0.9). Meanwhile, trust associated with opportunities influences the most: employment in knowledge-intensive activities (0.98), SMEs with product or process innovations (0.98), Public-private co-publications (0.98), SMEs innovating in-house (0.97), Enterprises providing ICT training (0.97), Trademark applications (0.96), PCT patent applications (0.95), International scientific co-publications (0.93), Scientific publications among top 10% most cited (0.93), New doctorate graduates (0.92), SMEs with marketing or organisational innovations (0.91). Trust concerning the philanthropy of the respondents has the strongest impact on: enterprises providing ICT training (0.99) and it is the highest among the examined variables, SMEs with product or process innovations (0.99), SMEs innovating in-house (0.99), Employment in knowledge-intensive activities (0.99), SMEs with marketing or organisational innovations (0.97), R&D expenditure in the public sector (0.97), Public-private co-publications(0.95), New doctorate graduates (0.93).

There are also interesting dependencies between trust declared by persons with higher education and the SII indicators. Declared trust influences scientific publications among top 10% most cited (od 0.9 do 0.96), public-private co-publications (od 0.92 do 0.97), PCT patent applications (od 0.92 do 0.97), trademark applications (od 0.93 do 0.99) and employment in knowledge-intensive activities (od 0.93 do 0.99). These dependencies give grounds to the interpretation that activities that require cooperation must be founded on mutual trust, also thanks to the possibility of securing intellectual property (patent or/and trademark applications). The negative values in the correlation are also interesting (in two cases, this concerns the employment fast-growing firms innovative sectors indicator), which suggests that trust is lower in the case of growing employment in fast-growing companies. This suggests distrust to innovative operators, whose development might results from the fact that they take advantage of intellectual property, especially among persons with higher education.

The next step is to analyse of the impact of trust on the establishment of innovative operators. For this purpose, the correlation matrix of selected OECD II data will be used.

Table 4: The correlation matrix of trust and selected indicators concerning innovative solutions in companies on the significance level p< 0.1.

Indicators	Variable	P1 (Total)	P1 (higher education)	P 2 (Total)	P 2 (higher education)	P 3 (Total)	P3 (higher education)

	SMEs	0.80578	0.77130	0.86340	0.64263	0.96733	0.89470
	Large	0.85779	0.85967	0.93608	0.79197	0.97666	0.94838
	Manufacturing	0.80105	0.76112	0.85334	0.62318	0.96425	0.88709
	Services	0.80779	0.78021	0.87270	0.66351	0.96858	0.90101

The correlation matrix (Table 4) presents the dependencies between the number of innovative (depending on the type of innovation) enterprises, broken down into size (large, small), industry (production, services), having the R&D department and the indicators of the level of trust in interpersonal relationships (the responses of persons with higher education are singled out). An analysis of the matrix shows that trust influences the number of innovative companies. The most influential is the philanthropy of approach (P3) in interpersonal relationships (from 0.76 to 0.98). The least influential (from 0.51 to 0.76) on the number of innovative enterprise is trust for another person (P1). The dependence between the level of trust and the number of enterprises that have, or do not have, the R&D department is low (from -0.3 to 0.85). This suggests that having a separate R&D unit causes

limited changes in the level of trust. Trust does not have a major impact on the size of innovative operators.

Meanwhile, the type of innovative activity is dependent on the level of trust. The trust factor is the most significant in establishing product innovative firms (od 0.83 do 0.99), where correlations with all the forms of trust are the highest. Future research should take this fact into consideration, as using instruments that stimulate the development of innovative products must be accompanied by increased trust in interpersonal relationships. There is also a significant dependence between trust and process and organisation innovative firms (od 0.96 do 0.72).

Innovative services (although to a limited extent) are more dependent on the level of trust than innovative manufacturing (the difference concerns marketing innovative firms).

When analysing the level of trust among persons with higher education, it it is worth noting that there are no significant correlations in question P2. This means neutral perception of trust in the category of the integrity of conduct with respect to the establishment of innovative operators.

The level of trust among persons with higher education is significant in the development of organisational innovation, especially in SMEs, large and manufacturing firms (from 0.9 to 0.97). The intangible nature of those innovations and their easy penetration means that trust is a key factor stimulating the development of those innovations.

Conclusion

The innovation of economies has a direct impact on sustainable growth and economic stability. Research concerning innovation and their impact of interpersonal relationships is, in the author's opinion, insufficient. The goal of this paper is to contribute to the knowledge of the impact of trust in interpersonal relationships on the innovation of economy. In order to achieve that goal, the following countries of different level of innovation, according to the SII and OECD II indicators were selected: the Czech Republic, Germany, Finland and Poland. An analysis of trust also revealed different levels of social trust in those countries, and the levels of trust corresponded to the degree of innovation of their respective economies. The correlation matrices between the level of trust and the SII and OECD II indicators revealed significant (from the perspective of statistical significance $p<0.1$) dependencies. The research results presented in this paper may be used to model the innovative development of a country, taking into account latent data, and trust in interpersonal relationships will determine the accuracy of such models. The author is aware that empirical data are limited to four cases only, but nonetheless, they may set the direction for future research concerning innovation climate on the level of regions and economies.

Abstract

The world tendencies of organic production development are revealed and their influence on the formation of the domestic market of organic products is determined. The basic tendencies of development of organic sector in Ukraine are characterized. The structure of agricultural lands certified in accordance with organic standards is given. Areas of organic crops are clarified, according to which Ukraine is the world leader. The place of Ukraine in Europe and the world is determined by the area of individual crops certified according to organic standards.

Keywords: Organic Production, Agriculture, State Support, Agricultural Crops, Organic Products Market.

Introduction

The agrarian sector of Ukraine's economy is intended to provide food security and food independence of the country. Recently, however, there has been a decrease in the quality of agricultural products, due to the deterioration of the ecological state of agricultural land and the decline of soil fertility- an indispensable source of life support for the country and the basis for the welfare of the population. The fertile soil layer is lost, the humus content is reduced, the area of acid and saline soils grows, 38% of the country's arable land is re-densified by soil erosion. Such processes negatively affect on the ecological quality and in some cases on the safety of agricultural products. A significant part of the produced agricultural products and foodstuffs do not meet the world standards.

At the same time, it is rapidly developing organic production aimed at improving public health through the production of high-quality food, raw materials and other products, the preservation of soil fertility and the environment in the EU and in the world as a whole. At the end of the last millennium, the global era of world agrarian strategies has begun and existed currently. The living agricultural model "more and cheaper" has been replaced by a new model "better and safer". Large areas of land are used under organic production in the world. Only in EU countries, the number of "organic" farms over the past 15 years has increased by more than 20 times.

Analysis of Research and Publications

Challenges of the formation and development of organic agriculture and its impact on economic, social and environmental components of agricultural production in Ukraine are highlighted in

scientific works of such national researchers as V. Articles [6], R. Bezus [7], E. Milovanov [14], O. Prutskaya [18], O. Skydan[15], M. Fedorov [21], O. Shkuratov [23] and so on.

However, due to various reasons, Ukraine has not fully realized yet the natural, economic and resource potential of the organic sector that necessitates a retrospective review of its development in national and world practice as well as the determination of global trends and developmental patterns.

Presentation of the Material

The term "organic farming" generally means a special system of agriculture, which has no chemically synthesized fertilizers and pesticides. However, this is just one of the hallmarks. Researchers of the US Department of Agriculture once suggested that organic production should be defined as a system of agricultural production that does not allow or substantially limits the use of chemically synthesized fertilizers, plant protection products (PPP), growth promoters and various synthetic fillers in fattening animals. The specified system is based as much as possible on the use of crop rotation, the use of plant remains, manure, compost, beans and legumes, siderates, organic waste products, mineral raw materials, mechanical and biological methods of combating weeds and pests and aimed at improving soil fertility, improving their structures with simultaneous provision of complete nutrition of plants [4].

In general, in the process of formation and development of world organic production different approaches to the definition of its essence have been formed. In particular, in 1995, the Board of National Standards of the United States proposed a proper interpretation of organic production. It is a "system of ecological management, aimed at preserving biodiversity, maintaining biological cycles, and improving the biological activity of soils. It is based on the minimal use of unnatural (artificial) raw materials and the widespread use of agrotechnical techniques that regenerate, support and improve ecological harmony ", according to this definition [2]. Due to this determination, the key principle of organic production is the use of such techniques, means and technological solutions that do not lead to a violation of the ecological balance in agroecosystems, and, on the contrary, provide an increase in their sustainability. At the same time, its main goal is to maintain the proper level of human health, optimize the productivity of soil fauna well as preservation of the plant and animal world.

The International Federation of Organic Movement proposes to consider "organic farming" as a set of diverse agricultural practices that provide ecologically safe, socially oriented and economically viable production of agricultural products and raw materials. The basis of such systems is the use of locally-specific soil fertility as a defining component of effective production. These agrification models are based on maximizing of the full use of the natural potential of plants and animals. Organic farming substantially reduces the use of third-party factors involved in the production process due to restrictions on the use of chemically synthesized fertilizers, pesticides and pharmaceuticals. Instead, agrotechnological measures and a variety of natural factors are used to increase crop yield and plant protection [3].

In Ukraine, under the production of organic products (raw materials), it is proposed to understand the "production activity of individuals or legal entities (including cultivation and processing), where during such production it is prohibited to use chemical fertilizers, pesticides, genetically modified organisms (GMOs), preservatives etc., and at all stages of production, the methods, principles and rules for obtaining natural (environmentally friendly) products, as well as the conservation and restoration of natural resources, are applied. "Such definition is determined by the Law of Ukraine "On the Production and Circulation of Organic Agricultural Products and Raw Materials " and identified the legal, organizational, economic bases of production and circulation of organic agricultural products and raw materials, measures of control and supervision of such activities, aims at ensuring fair competition and proper functioning of the organic products market, improvement of the main indicators of the state of health of the population, preservation of the natural environment, rational use of soils, sustainable use and restoration of natural resources as well as guarantee consumer confidence in products and raw materials labeled as organic. [12]

In general, organic production is based on the principles of local socioeconomic, climatic, historical and cultural peculiarities, among which it is rather difficult to identify the priority ones, since they are equally important and complementary.

Basic principles of Organic Production

Principles of organic production reflect ecologically directed perspectives that open up to humanity and outline ways of development of ecologically oriented agricultural production on a global scale.

The principles of organic agriculture developed by IFOAM should be considered as a whole. They regulate the process of developing programs and the development of standards for organic production as well as providing the following principles [1]:

- healing - organic farming should maintain and improve the state of the soil, plants, animals, humans and the planet as a single and indivisible whole;
- ecology - organic agriculture should be based on living ecological systems and cycles, working, co-existing and supporting them;
- justice - organic farming must be built on relationships that guarantee equity, taking into account the general state of the environment and its potential;
- care - the management of organic agriculture is aimed at a preventive and responsible nature to protect the health and well-being of present, future generations and the environment.

The principles of organic production at the macro-economic level include [9 , 22]:

- improvement and reproduction of the natural landscape and the agricultural ecosystem;
- prevention of processes of depletion and pollution of natural resources;
- minimizing the need for non-renewable energy and resources;
- production of high quality food, raw materials and other products in sufficient quantity to meet existing demand;
- restoration of a normal, safe and healthy environment;
- use of local knowledge and traditional agricultural systems.

The principles of organic production at the micro level include [19 , p. 11 , 21]:

- conservation and reproduction of soil fertility and biological activity through the widespread use of biological and mechanical methods characterized as nature conservation and energy saving;
- promotion of rational use and conservation of water resources with all their living organisms;
- preservation of agro-and biodiversity in farms and the environment by using a sustainable production and protection system of wildlife;
- provision of nitrogen demand by nitrogen-fixing plants cultivation;
- the introduction of biological methods for plant protection, aimed primarily at prevention, rather than treatment;
- expansion of plant varieties and animal breeds adapted to local conditions;
- livestock farming taking into account the physiological and biological needs of animals and creating the most favorable conditions for their maintenance;
- the prohibition of the use of chemically synthesized fertilizers, plant protection products, hormones and growth regulators;
- the prohibition of genetic engineering and its products;
- harmonization of the process of production with natural cycles and living systems of soil, flora and fauna;
- a significant impact on the system of organic production and processing of raw materials of social and environmental factors;
- use in the process of agricultural production and its processing, as far as possible, of domestic resources, prevention of their losses and pollution;

- stimulation of domestic production of organic products and promotion of it to consumers;
- satisfaction of livestock needs in ecologically safe forages;
- the use of packaging materials and containers to be re-biologically or decomposed;
- the focus on the formation of the social-oriented chain "production - processing - realization" on the basis of compliance with environmental standards;
- recognition of the importance and necessity of studying local experience and traditional forms of management [19 , p. 11] .

Subsequently, ukrainian researchers proposed another classification of principles for the production of organic products (general and special principles), which further laid the foundation for the formation of domestic "organic" legislation [8, c. 4; 13 , p. 415; 11 , p. 45]. Thus, the principles of the ukrainian legislative are the general principles of the production, storage, transportation and sale of organic products (raw materials) [12]:

voluntary

equality of rights of economic entities that produce, store, transport and sell organic products (raw materials);

rational use of natural resources, ensuring their proper use and reproduction;

refusal to use genetically modified organisms and products from them;

refusal to use chemically synthesized external resources, except in cases established by law;

long-term maintenance of soil fertility;

the use of living organisms and methods of mechanical production;

ensuring a high level of biological diversity;

use in the production of processes that do not harm the environment, health and well-being of people, plants and animals.

The special principles of the production, storage, transportation and sale of organic products (raw materials) are [12]:

ensuring the preservation and reproduction of soil fertility, soil stability and biological diversity by methods that optimize biological activity, ensure a balanced supply of nutrients for plants;

minimizing the use of non-renewable and external resources;

processing of waste and related products of plant and animal origin for further use in the production of products of plant and animal origin;

taking into account the local or regional ecological status of the territories when choosing the type of production for production;

plant protection through preventive measures such as the selection of appropriate species and varieties resistant to diseases and pests, crop rotation, mechanical and physical methods, and protection against natural pests;

animal health by promoting natural immune protection, selection of the breeds;

taking into account when selecting the breeds of the degree of adaptation of animals to local conditions, their viability and resistance to diseases;

adherence to a high level of animal maintenance that meets the needs inherent in each individual species;

obtaining organic livestock products from animals that have been grown in organic farms since birth throughout their lives;

feeding animals with organic fodder;

the exclusion of the use of artificially derived polyploid animals;

preservation of biological diversity of natural water ecological systems, continuous protection of the water environment and the quality of the surrounding water as well as surface ecological systems in the production of fishery products.

Now it's obvious that the material well-being of humanity, achieved at the expense of degradation of the natural environment the environment threatening existence man as a biological kind, its physical and mental health and, especially, the health of future generations. There is humanity civilized way out in this situation that is keeping up with the dynamic equilibrium between welfare and preserving friendly (supportive) living environment and thus get out on trajectory sustainable (balanced) development. Organic agriculture provides prospects for the development of economic systems because of significant environmental benefits over traditional.

The United Nations Food and Agriculture Organization (FAO) outlines following advantages of organic agriculture: a) long-term environmental sustainability; b) preservation and reproduction of soil fertility; c) rational use of water resources; d) conservation of biodiversity; e) refusal to use genetically modified organisms (GMOs); e) maintaining ecological balance in agroecosystem and its assimilation abilities [16].

Consider them in detail.

a) Long-term environmental sustainability. Numerous changes and processes occurring in the natural environment are of a long-term nature. Organic agriculture provides medium- and long-term positive ecological stabilizing effects on agroecosystems. It prevents depletion of soil fertility and the spread of diseases and pests due to the aim of producing ecologically safe food products. Organic farming is based on a philosophy that is understandable for society - it's cheaper to warn, to prevent anxieties than to eliminate them after they have already harmed.

b) Preservation and reproduction of fertility of soils. Such elements of agriculture as crop rotation, the use of intermediate crops, sideration, the use of organic fertilizers (compost, high-quality humus, by- products of plant growing and plant remains) and minimal soil cultivation are the most affordable methods of organic agriculture. They promote the development of soil flora and fauna, improve the composition and structure of the soil, promote the formation of more stable ecosystems, have an important role in combating water and wind erosion. The soil's ability to retain moisture and nutrients increases in aggregate interaction, which compensates for the refusal of the use of mineral fertilizers and ensures the preservation and reproduction of soil fertility.

c) Rational use of water resources. A serious environmental problem for rural areas is the pollution of groundwaters with nitrates and pesticides. Since their use in organic farming is prohibited, the risk of groundwater contamination by hazardous and harmful substances is significantly reduced. An important advantage of applying organic production technologies under irrigation is the widespread use of drip irrigation and micro-irrigation, which ensure the economical and rational use of water resources, prevent the formation of salt mints, reduce the cost of crop cultivation technologies, thereby increasing their competitiveness in the markets.

d) Preservation of biodiversity. Conservation of natural areas around the fields and the refusal to use agrochemicals creates the necessary conditions for the existence and development of wild flora and fauna and ecosystem-friendly organisms, such as pollinators and entomophages.

e) Refusal to use genetically modified organisms. Use in organic farming of GMOs is prohibited at all stages of the production, processing and circulation of organic food products. The presence of organic labeling on the product indicates that in the process of its production and processing, genetic engineering products were not used.

e) Maintaining ecological balance in agroecosystem and its assimilation abilities. Organic agriculture has a positive impact on the environment, contributes to maintaining ecological balance in agroecosystem and its assimilation abilities. It follows that the fundament of the technologies of organic agriculture includes two basic principles: the desire to maximize the use of natural biological processes and adapt to them the technology of agricultural production; do not to harm the environment (mainly due to the reduction of the use of chemically synthesized mineral fertilizers, chemical plant protection products and more rational use of natural resources).

Ukrainian researchers are proposing to determine the benefits of organic farming by environmental, economic and social characteristics (picture № 4.1).

Picture № 4.1 The main advantages of organic production

Source: own research and summary based on scientific works .

World trends in the development of organic production

According to the International Organic Federation (IFOAM) and the Research Institute of Organic Agriculture (FiBL), the area of organic farming in the world is steadily increasing. For the past fifteen years, their size has increased by 4.6 times and by 2015 amounted to 50.9 million hectares. Statistical information on organic farming comes from 179 countries [5] . The organic sector is represented in almost all countries in Europe. (Table № 1)

Table № 1: Classification of countries with the organic sector by continents (2015)

Continent	Number of countries with organic farming	Number of countries on the continent	Share of countries with organic agriculture,%
Africa	41	56	73
Asia	41	49	84
Europe	48	49	98
South America	33	46	72
North America	3	5	60
Australia and Oceania	13	25	52
World in general	179	230	78

Source: FiBL, IFOAM and SOEL, 2017.

2.4 million organic producers are certified in the world, more than three quarters of which are in developing countries. Organic production accounts for 1.1% of the world's agricultural land area in 2015. Organic farming accounts for 6.2% of all agricultural land in the countries of the European Union.

Features of the Global Markets of Organic Products

Organic food markets function successfully in many countries. First of all, in the USA and the EU, where the necessary market infrastructure is formed [18] .

According to experts, the organic products market in the world is constantly growing. In particular, in 1999 he was valued at 15 billion $, in 2006 was about 30 billion $ and in 2015 it reached 81.6 billion $. Growth rates are 10-15% annually. Most of the organic products sold in highly industrialized countries. In particular, about 90% of its total consumption falls on the countries of Western Europe and North America. The most developed organic products markets are concentrated in the US, Germany and France. The leader in the sale of organic products is Germany among the countries in Europe (more than 8,6 billion Euros per year) [5] .

Switzerland is the world leader in organic food consumption per capita with average annual organic food costs per capita of 262 euros per year. The second position is Denmark - 191, Sweden is third - 177 euros per year.
The main reasons for the consumption of organic products: ecological safety of food; higher taste of organic produce; preservation of the natural environment in the process of production; the absence of genetically modified organisms.

Analyzing the peculiarities of foreign experience, we come to the conclusion about typical consumers of organic products. These are mainly urban residents with high purchasing power, who belong to the middle and upper social classes, take care of family health and focus on high-quality products [21] .

European Experience

The rapid growth areas of farmland occupied by organic production in Europe started in 1990 and lasted until 2002. Currently, this trend persists, but the growth rate has declined markedly.

Spain reached the first place (1.9 million hectares) in accordance to the area of land occupied by organic production in Europe, (Picture № 1), Turkey is the leader in the number of organic producers (70.0 thousand). Russia has the largest average organic farming area (4.7 thousand hectares), Malta has the smallest ones (2.7 hectares). The average area of organic farming in Europe is 36.4 hectares.

Picture № 1: The top ten countries in Europe for agricultural land occupied by organic production by 2015, thousand hectares

Source: FiBL & ZMP Survey 2017 .

Liechtenstein (30.2%) is in the first place, Austria (21.3 %) is in the second place in accordance to the share of land occupied by organic production in the total area of agricultural land.

45% is arable land, 42% are pasture lands and 11% are perennial plantations in accordance to the structure of agricultural lands of Europe (Picture № 2).

Cereals (39%) and crops on green fodder (36%) predominate in the structure of crops (Picture № 3). Among perennial plantations the largest share is occupied by olive (38%), vineyards - 21%, nuts - 16, fruits – 12% and citrus fruits - 3% (Picture № 4).

Picture № 2: The structure of agricultural land occupied by organic production in European countries,% (2015)

Source: FIBLE & ZMP Survey, 2017.

Picture № 4: Structure of perennial plantations certified as "organic" in European countries,% (2015)

The share of land occupied by organic agriculture has increased significantly in recent years. This was promoted by an active EU policy aimed at supporting farms moving from traditional to organic production. For example, during 2001 in Poland "organic" farms received subsidies of 108 $. per 100 hectares of arable land, 38 $ per hectare of pasture and about 150 $ per hectare of perennial plantations. In addition, the state also partially offset the cost of certification of farms according to organic standards. Subsidies per hectare of arable land in Poland increased to 202 euros per hectare, meadows and pastures - up to 66 euros per hectare, perennial plantations - up to 395 euros per hectare in 2013. The subsidies allocated to support organic agriculture during the transitional (conversion) period in some cases amount to 950 euros per hectare in Germany and France (Table 2) .

Table 2: Direct payments (subsidies) to organic producers in individual member states of the EU , EUR per hectare (2013)

Administration of agricultural land		Poland	Germany	France
Meadows, pastures	Transition	85	220	100
	Certified organic production	66	190	80-151
Arable land	Transition	215	220	200
	Certified organic production	202	180	100-151
Vegetable farming	Transition	397	575	350-900
	Certified organic production	333	350	150-160
Gardening and berry growing	Transition	461	950	100-900
	Certified organic production	395	750	590-900

Ukraine's Experience on the Development of Organic Production

The development of organic production is becoming more widespread every year in Ukraine. This is primarily due to the active position of public institutions, associations, international projects, whose activities are aimed at popularizing this area of production.

The presence in Ukraine of a significant number of public organizations and producers-enthusiasts contributes to the development of the domestic organic sector. Thanks to them, Ukraine became one of the top 20 world leaders in the field of certified agricultural land and in dozens of countries in the world - in terms of harvesting wildlife. More than 420 producers of organic products have been certified in Ukraine till June 2017. 421.5 thousand hectares of land is under certified organic production and 550 thousand hectares of land are occupied under certified wildlife (herbs, berries and mushrooms).

Annual domestic consumption market reached 21-22 million. The export potential of the sector is estimated at 100 million euros at the same time.

The area of land occupied by organic production and the quantity of certified producers is gradually growing every year (Picture №5). 110 processing plants, 50 importers and 30 exporters of organic raw materials and food are certified in Ukraine also.

Picture 5: Agricultural land occupied by organic production in Ukraine

Source: according to the Federation of Organic Movement of Ukraine (2017).

Most of the farms engaged in the production of organic products are located in the Kyiv, Odesa and Kharkiv regions. In the structure of certified agricultural lands 82% falls on arable land. Pastures are about 12%. Perennial plantations are 2% (Picture №6).

Picture №6: Structure of agricultural lands of Ukraine, certified by organic standards, % (2015)

Source: According to Institute Organic Agriculture FiBLE, Ackerstrasse (2017) [22] .

Picture № 7: Areas of organic crops where Ukraine is a world leader, thousand hectares (2015)

Source: NSC Research Institute of Agrarian Economics according to FiBLE (2017) [22] .

About 60% of the crops are occupied by wheat, barley, sunflower and corn. The rest of the cultivated area is appointed for peas, rape, buckwheat, soya, rye, oats, sorghum, millet, mustard, sugar beet, esparset and others. Consequently, the supply of ukrainian organic products for export is mainly represented by grain, oilseed and leguminous crops as well as berries, fruits and wild herbs. It should be noted that Ukraine ranks first place in the world due to the certified organic standards of sunflower and buckwheat. Ukraine is among the first ten world leaders in terms of organic grains (barley, corn, wheat) (Picture №7) as well as vegetables and legumes [22].

Despite the fact that organic production is a relatively new direction for Ukraine in separate groups of cultures, it has a leading position both in Europe and in the world as a whole. In particular, it owns 26% certified organic standards world space sunflower, 49 % of buckwheat, 43 % of millet, 11 % of spill, 9 % of barley, 8 % of corn, more than 5% of wheat and rye. Ukraine is turning into a very powerful producer of organic products and raw materials in Europe gradually. There are 75% of European organic buckwheat, 70 - millet, 28 - sunflower, 24 - corn, 11 - barley, 9% - wheat, etc. (Table 3).

Table 3: Ukraine's place in Europe and the world in the area of crops certified organic standards in 2015

Culture	Area of land certified by organic standards, thousand hectares			Ukraine's share,%	
	Ukraine	Europe	world	in Europe	in the world
Wheat	81.8	950.5	1516.9	8.6	5.4
Barley	35.1	325.6	391.1	10.8	9.0
Buckwheat	5.2	6.9	10.6	75.4	49.1
Corn	33.9	138.4	433.0	24.5	7.8
Millet	6.3	9.0	14.7	70.0	42.9
Rye	9.4	161.6	172.3	5.8	5.5
Spill	5.5	40.7	48.2	13.5	11.4
Sunflower	33.9	119.8	132.4	28.3	25.6
Soy	6.3	83.6	604.2	7.5	1.0
Vegetables	8.1	158.0	353.4	5.1	2.3
Oat	4.8	290.4	413.8	1.7	1.2
Berries	0.6	31.6	49.9	1.9	1.2

Source: NSC Research Institute of Agrarian Economics according to FiBLE (2017) [22] .

Organic production is recognized as one of the priority directions of development of the agrarian sector in Ukraine currently [10, 20]. However, the provisions of the current Law of Ukraine "On the production and circulation of organic agricultural products and raw materials" do not ensure the proper functioning of the organic products market. As a result, the counterfeit organic products takes place, the lack of effective tools for prosecuting violations of legislation in this area, which provokes unfair competition. In this regard, it is necessary to improve the regulatory framework for production and circulation of organic products, which led to the need to elaborate on the draft Law of Ukraine " On Basic Principles and Requirements for Organic Production, Circulation and Labeling of Organic Products " [17].

An important step was the introduction of economic incentives for organic producers, in particular, by providing on a turn-based basis financial support to farms in the amount of up to 500 thousand UAH. for the assessment of the conformity of production of organic products. In accordance with the Resolution of the Cabinet of Ministers of Ukraine "On Amendments to the Procedure for using the funds allocated from the State Budget to support farmers" No. 609 of September 8, 2016, on other equal terms farms have an advantage to other households that claim the financial assistance applying for conversion to organic production.

An important shift in stimulating the development of the organic sector is the introduction of specialized land auctions where commodity producers will be offered land for organic production at preferential rental rates. Thus, organizational and economic mechanism of supporting the organic sector is gradually being formed in Ukraine which will facilitate its development in the near future.

Conclusions and Perspectives of Further Research

1. Organic production is rapidly developing in the EU and in the world as a whole, aimed at improving the health of the population by producing high-quality food, raw materials and other products, preserving soil fertility and the environment. At the end of the last millennium, the global era of global agrarian strategies has begun and proceeded currently. The existing agricultural model "more and cheaper" has been replaced by a new model "better and safer". The large areas of land are used under organic production in the world.

2. The production of organic products is at the primary stage of development in Ukraine. The area of land under organic production is about 1% of the total area of agricultural land, there are over 420 "organic" farms. Gradually, the regulatory framework for organic production regulation is being developed, the national certification system, market infrastructure, and information support are developing.

About 60% of the crops are occupied by wheat, barley, sunflower and corn. The rest of the cultivated area is appointed for peas, rape, buckwheat, soya, rye, oats, sorghum, millet, mustard, sugar beet and espaces. Consequently, the supply of Ukrainian organic products supplied for export is represented mainly by grain and oilseeds crops. In addition, Ukraine is among the first ten world leaders in terms of organic vegetables and legumes.

3. It should be noted that the organizational and economic model of organic agriculture is constructed in such a way that it promotes the development of social infrastructure, supports the development of rural green and agro-tourism, aims at ensuring sustainable (balanced) development of rural areas. As the incomes of rural households increase, the level and quality of life in the village increases, self-employment, social infrastructure develops and the dependence of the budgets of territorial communities from the budgets of the state and regional levels decreases.

4. Implicitly eco-socio-economic benefits of organic agriculture is the simultaneous achievement of increased productivity of agriculture, improving the quality of ecosystem services and preserve the health of present and future generations that fully satisfies the concept of sustainable (balanced) development . At the same time, access to world agro-food markets is opening up. For Ukraine organic production means the ability to supply agricultural products to European markets, to create new, more perspective jobs, to open new businesses, to mitigate threats related to climate change, degradation of natural capital, which is the basis of sustainable growth.

"The Category of Gender Seem from Significative Samples of Pictorial Art"

Mauricio PRADA-ARÉVALO[1] Elizabeth MORENO-GÓMEZ*[2], y Henry W., LEÓN-CALDERÓN[3]

[1, 2, 3] Corporación Universitaria Minuto de Dios, Bogotá, Colombia
*mauricio.prada@uniminuto.edu.co

Abstract

The main objectives of this work are the investigation and description of some characteristics of the category "gender" seen from the pictorial art. Some notions associated with this category find their expression in specific samples of universal painting and it is interesting to see how pictorial art has portrayed women throughout history and how in this reproduction has left visible samples of their conceptions of feminine nature. The gender category is not strange to this cultural process of the evolution of art and therefore, from some examples, the concept of women can be discussed with all the richness that this entails.

Keywords: gender, pictorial art, woman, history.

Introduction

The research project has allowed in its different advances to expand the spectrum of theoretical considerations. That is why, from the bibliographic inquiry and reflection on the concepts of gender and pictorial art, it has been possible to establish a significant relationship between the conceptions of women and the painting that has frequently portrayed in history. The idea resulting from this conviction is that pictorial art can say something about the gender category that can also be found in the cultural spaces of many peoples and nations. The question that could serve as the initial problem of the paper could be, according to the above, what relationship can exist between the gender category and some representative samples of pictorial art? And to resolve that question there are two specific goals: Identify some aspects of the gender category present in representative samples of universal pictorial art, and Describe some special elements of the genre category based on the analysis of some samples of universal pictorial art.

Methodology

The project development process assumes that some articles and papers can be created that constitute examples of themes that can be expanded to better support the synthesis of the thematic search and, in that order of ideas, approaches to the gender category can be generated. Expand your understanding. From the point of view of the methodology, it can be said that the process of construction of the paper started from the search matrix for articles on gender problems and sexual representations. Once this stage was completed, an analysis was made that favored the categorization of the phenomenon. After that, we proceeded with the investigation of the works of painting that dealt with the conception of women throughout history, in particular, the last century. With the testimonies on the subject, an interpretation work was carried out that yielded a vision on gender that can also be found in spaces such as culture and school. This product served in turn to initiate another bibliographic search that reinforced the theme of art and gender and from there the reflexive exercise that gave rise to the presentation was derived.

Results

The results of the project had to do with two great themes: the first of them is that the notions and perceptions of sex and gender are historical. Each era in culture and art posed an ideal and a reality

about women and about their sexual condition, as well as in men, and second: that the art of painting reflects these changes in an aesthetic and personal way.

Conclusions

1. There are samples of Western pictorial art that provide an image and a perception of sex and gender that may well be relevant and valuable in the process of understanding them in many cultural, social and academic contexts.

2. Regarding the conception, perception and evaluation of women and women, pictorial art is rich in examples and points of view that have their parallel account in many aspects of theories associated with gender.

3. From the samples of the pictorial art the interpretations of the artists in relation to the theorizations about gender and sexual diversity are noticed.

The Evaluation of Teaching Factory Learning in Vocational High School in Bekasi

Dewi NURMALASARI

Universitas Negeri Jakarta, Jl. Rawamangun Muka, Jakarta, Indonesia, dewi_nurmalasari@unj.ac.id special.dewi@gmail.com

Susan FEBRIANTINA

Universitas Negeri Jakarta, Jl. Rawamangun Muka, Jakarta, Indonesia, susanfebriantina@unj.ac.id

Abstract

Learning Teaching Factory is a learning model of production/service-oriented Vocational High School that applies to principles and procedures that exist in the industry and are carried out in an environment like what happens in the industry. The introduction of Teaching Factory requires the total participation of the industry as a third party determining the standard of educational results in vocational high school. The research was conducted in 11 public vocational schools in Bekasi, held in May to July, with the number of respondents in this study being 23 people who were entrepreneurship subject teachers. A purposeful sampling method is the sampling technique. Interviews and questionnaires are used to collect data. Based on the analysis, TEFA was appropriately given to vocational high schools and this program is appropriate with an age requirement of 87 %. It was found that the most appropriate infrastructure facilities given to the school by the government are 80 %. And as for the teacher's competence is 62 %, and the TEFA program was able to permeate the market achieved 100 % strongly agree, but as for the school readiness aspects to incorporate the TEFA program is 64%.

Keywords: Teaching Factory, Enterpreneurship, and School Management

Introduction

The importance of providing skilled human resources realized by the government through the policy enhanced vocational education that gives attention to vocational high school. Vocational high school development is now moving from local labor market orientation to the ASEAN labor market welcoming the ASEAN Economic Community (AEC) and preparing the graduates with a decentering of entrepreneurial character. The application of the teaching factory in the vocational school is Directorate of Vocational School Development's effort to strengthen school cooperation or synergy between school and industry.

Learning with teaching factory aims to foster character and work ethic (discipline, responsibility, honesty, cooperation, leadership, etc.) needed by the business world/industrial world and improve the quality of learning outcomes from competency-based training to production-based training.

The cooperative relationship between vocational school and industries in teaching factory learning patterns will have a positive impact to build a systematic and planned partnership mechanism based on a win-win solution position. The application of the teaching factory affiliating vocational education world with the industrial world so the checks and balances on the educational process at the vocational school maintained and to maintain harmony (link and match) with the needs of the job

market. The government programs stated above also following 21st-century learning patterns that promote innovation and the realization of the creation of new ideas.

As stated in the previous posting, 21st-century learning has some characteristics known as 4Cs:

1. Communication
   In this character, students are required to understand, manage, and create effective communication in various forms and contents verbally, in writing, and with multimedia helps. Students are allowed to use their abilities to express their ideas, both when discussing with friends and when solving problems from the teacher.
2. Collaboration
   In this character, the students demonstrate their skills in group teamwork and leadership, adapting to different roles and responsibilities, working productively with others, putting empathy in place, honoring different perspectives. Students also accomplish their responsibility and personal flexibility, at the workplace and in community relations, setting and achieving high standards and goals for themselves and others, understanding confusion.
3. Critical thinking and problem-solving
   In this character, students strive to provide logical reasoning in understanding and making complex choices, understanding the interconnection between systems. Students also use their abilities to try to solve the problems they face independently and also can compile and express, analyze, and solve problems.
4. Creativity and innovation
   In this character, students can develop, implement, and convey new ideas to others, being open and responsive to new and different perspectives.

21st-century skills are skills needed to deal with life in a global society. Several organizations have defined and identified 21st-century skills. Although the classification of 21st-century skills is different from several different organizations, the essence is the same.

Literature Review

Education

Stated in Indonesian National Education System Law (*Undang-Undang No. 20/2003*), Education is a conscious and planned effort to create an atmosphere of learning and learning process so that students actively develop their potential to have spiritual strength, self-control, personality, intelligence, noble character, and the skills needed by themselves, society, nation, and the country.

Constitution of the Republic of Indonesia (Amendment version), Article 31, clause 3 also states, "The government organizes and implements a national education system, to be regulated by law, that aims at enhancing religious and pious feelings as well as moral excellence to upgrade national life." And article 31, clause 5 states, "The government advances science and technology along with holding religious values and national unity in high esteem to promote civilization as well as the well-being of humanity."

Learning Skills

The National Research Council (in Lai & Viering, 2012) has initiated the topics of learning and assessment of 21st-century skills. Types of 21st-Century Learning Skills (Student Competencies) required by students to have readiness in a career and attend education in college and career readiness are:

1) Cognitive skills which include critical thinking, non-routine problem solving, and systems thinking,
2) Interpersonal skills which include complex communication, social skills, teamwork, cultural sensitivity, and accepting differences,

3) Intrapersonal skills which include self-management, time management, self-development, self-regulation, adaptability, and executive functions.

The North Central Regional Education Laboratory (2003) identified 21st Century Learning Skills (Student Competencies) broader achievement of learning in the 21st century through digital literacy, inventive thinking, effective communication, and high productivity.

Program Evaluation

According to Suharsimi Arikunto (2012), "Program evaluation is a unit or unit of activity aimed at gathering information about the realization or implementation of a policy, taking place in a continuous process, and occurring in an organization involving a group of people for decision making". it means program evaluation is a series of activities carried out deliberately and carefully to determine the level of implementation or success of a program by knowing the effectiveness of each component, both for the current program and 7 that have passed.

There are many program evaluation models used by experts. One of them is the CIPP models (Context - input - process - product). This model was developed by Stufflebeam. (1971). The CIPP model looks at four dimensions: Context dimension, Input dimension, Process dimension, and Product dimension.

Teaching Factory

Learning Teaching Factory is a learning model in production/service based Vocational High School that refers to standards and procedures that apply in the industry and are carried out in an atmosphere like what happens in the industry. The implementation of Teaching Factory requires the absolute involvement of the industry as a relevant party assessing the quality of educational outcomes in Vocational High School. Implementation of Teaching Factory (TEFA) also must involve governments, local authorities, and other stakeholders in the regulatory, planning, implementation, and evaluation.

Teaching Factory implementation according to the Directorate of Vocational High School Development is divided into 4 models and can be used as a mapping tool for vocational high schools that have implemented TEFA. The model is as follows:

1) **The first model**, Dual Systems in the form of fieldwork practices is a pattern of vocational learning in the workplace known as experience-based training or enterprise-based training.
2) **The second model**, Competency-Based Training (CBT) is a learning approach that emphasizes the development and improvement of students' skills and knowledge by work needs. In this model, student assessment is designed to ensure that each student has achieved the skills and knowledge needed in each competency unit pursued.
3) **The third model**, Production Based Education, and Training (PBET) is a production-based learning approach. The competencies that students have possessed need to be strengthened and their skills ensured by providing knowledge of making real products needed by the world of work (industry and society).
4) **The fourth model**, Teaching Factory is an industry-based learning concept (products and services) through the synergy of schools and industries to produce graduates who are competent with market needs.

The harmonious goals of learning the teaching factory according to Alptekin et al. (2001) are as follows:

a) Prepare more professional graduates through the provision of modern manufacturing concepts so that they can effectively be competitive in the industry;
b) Improving the implementation of Vocational High School curriculum that focuses on the concept of modern manufacturing;
c) Showing feasible solutions to the technological dynamics of integrated business;

d) Receive the transfer of technology and information from the pair industry, especially on the activities of students and teachers while learning.

The learning stage teaching factory can use PBET / PBT syntax or can also use the syntax applied at Cal Poly - San Luis Obispo USA with steps adapted to competency expertise mentioned by Alptekin et al. (2001):

1) Designing products
   At this stage, students develop new products/recipe inventions or consumer goods products/ design contemporary shows by drawing/making script/designing on the computer or manual with data specifications.
2) Making prototypes
   Making new products /creations/testers as prototypes according to data specifications.
3) Validating and verifying prototypes
   Students validate and verify the dimensions of the specification data from the prototype/ new creation/tester that is made to get approval to be produced/staged.
4) Making mass products
   Students develop a schedule and number of products/performances by the specified time.

Based on the results of research conducted by Dadang Hidayat (2011), the learning steps of the Teaching Factory were developed as follows:

a) Receiving orders
   In this learning step students act as recipients of the order and communicate with the order giver relating to the order/service desired. Effective and polite communication takes place and records the wishes/complaints of the order giver for example: at the repair shop Smart Phone or hotel room reservation.
b) Analyzing orders
   Students act as technicians to analyze orders giving orders both related to product/service objects in connection with detailed drawings, specifications, materials, work time, and prices under the supervision of teachers who act as supervisors.
c) Stating Readiness Orders
   Students express their readiness to do work based on the results of the analysis and their competencies to foster motivation and responsibility.
d) Ordering
   Carry out work according to the demands of work specifications that have been generated from the order analysis process. Students as workers must obey prescribed work procedures. He must comply with work safety and work steps seriously to produce workpieces that conform to the specifications specified by the customer.
e) Evaluate the product
   Conduct an assessment of the workpiece/service by comparing the parameters of the workpiece/service produced with the data parameters on the order specifications or specifications in the service manual.
f) Submitting orders
   Students submit orders both workpieces/services after making sure all the requirements for order specifications have been fulfilled so that productive communication occurs with the customer. (extracted from the 2013 Vocational School Refreshing Material in 2017)

Public Policy And Education Policy

Policies made by the government of a country are public policies because they will have an impact on the lives of citizens in the country. Therefore a policy made by a government should not be detrimental to its citizens, meaning that every policy determined should be in favor of the citizens. But it cannot be denied that every policy made by the government is a result of a response to something that is influenced by various things such as pressure from a group of people who influence the government, can or indeed want from the ruling group in a government itself.

Research Method

Data Source

The study was conducted in 11 public vocational schools throughout Bekasi, held in May to July. Participant of this research is entrepreneurship subject teachers chosen with convenience sampling technique.

Data Collection Technique

Data collection will use the following techniques:

1. Interview: data collection will be done through in-depth interviews intended to obtain qualitative data as well as information from informants.
2. Questionnaire: to obtain valid or accurate data beyond observation, data collection will be done through questionnaires to understand opinions and gather information. The questionnaire was made based on the CIPP concept, The questionnaire explores in-depth information about the content, input, process, and product of implementation of the teaching factory.

Result And Discussion

The results of this research take precedence by describing the answers to the questionnaire as outlined in the form of pie charts for each item in question. Items asked include routine questions covering 4 important aspects in evaluating a program starting from Context - Input - Process - Product. The data we can describe empirical data obtained from the sample are entrepreneurship subject teachers in vocational highschool in Bekasi City totaling 11 schools. The data is following the TEFA 6 M (teaching factory) program evaluation indicators. We also conducted interviews with resource persons namely: headmaster, MGMP (*Musyawarah Guru Mata Pelajaran*) or entrepreneurship teacher working group chairman and several teachers who teach entrepreneurship subject about how teachers implement TEFA 6 M (teaching factory) at school, obstacles encountered, school readiness, supporting facilities provided by the government and solutions in implementing TEFA 6 M to develop the concept of entrepreneurship learning based on output or products, where it is hoped that in the future vocational graduates will not flock to find work but be able to open businesses and create their jobs. The result of the questionnaire analysis are explained below:

Table 1: Questionnaire Analysis Result

No.	Statement	Scale (in percent)				
		Strongly Agree	**Agree**	**Neutral**	**Disagree**	**Strongly disagree**
The extent of the development of TEFA 6 M in its implementation						
1.	The government precisely deliver TEFA 6 M to Vocational High School	39	48	4	9	0
2.	The government has made the program TEFA 6 M with clear objectives appropriate age development	14	73	0	9	4
Facilities and infrastructure that support the implementation of TEFA 6M						
3.	The government has prepared competencies of teachers to be able to implement TEFA 6 M is well in school.	34	14	29	14	5
4.	The government has provided the budget needed to realize the TEFA 6 M program in schools	5	25	60	5	5

5.	The government has prepared all procedures well for the success of TEFA 6 M	5	55	25	10	5
6.	The government has provided a clear market for absorbing products from the TEFA 6 M	5	35	45	10	5
7.	The government has prepared schools to realize TEFA 6 M	9	41	36	5	9
Products that support the TEFA 6M program						
8.	Aspects within schools supporting the implementation of TEFA 6 M	9	55	27	4	5
9.	TEFA 6 M can be a good program to establish student entrepreneurial spirit	62	33	5	0	0
10.	TEFA 6 M program can be a solution for absorbing many unemployed graduates of vocational high school	55	45	0	0	0
11.	Students can carry out the TEFA 6 M program well	23	45	27	0	0
12.	The TEFA 6 M program is beneficial for Vocational high school students	64	36	0	0	0

From the data above it can be concluded that regarding the extent of the development of TEFA 6 M in its implementation, 48 percent of the teachers agree with the TEFA 6 M program provided by the government in vocational high schools, 39 percent strongly agree with this program because it helps vocational schools develop creativity and immediately feel entrepreneurial activities to the end so that it is felt the program is right to do in vocational high schools, 4 percent doubt, 9 percent 9 disagree.

14 percent of teachers strongly agreed that the government had made supporting facilities for the implementation of the 6 M TEFA in schools, 33 percent agreed, 38 percent were doubtful because there were still some schools that did not get supporting facilities by 10 percent disagreed and 5 percent strongly disagreed.

14 percent of teachers strongly agreed with the government to make infrastructure that supports TEFA 6M in schools, 29 percent agreed, 43 percent were doubtful because not all schools received supporting infrastructure, 9 percent disagreed and 5 percent strongly disagreed. From this, it follows that the supporting infrastructure provided by the government to support the implementation of TEFA 6 M has not been evenly distributed throughout the school.

From the data above, it was concluded that 9 percent of teachers strongly agreed that the government had made facilities that were in line with the needs for the implementation of the 6 M TEFA in schools, 27 percent agreed, 46 percent were hesitant because schools had not yet fully obtained the facilities following the 6 M TEFA implementation needs, 9 percent did not agree, and 9 percent strongly disagree. From the above statement, we conclude that indeed the infrastructure supporting the implementation of the 6FA TEFA program has not been fully provided by the government following the needs of the school.

5 percent of teachers strongly agree, 30 percent agree, 50 percent doubt because not every school has the infrastructure that meets the needs for the implementation of TEFA 6 M, 5 percent disagrees, and 10 percent strongly disagrees. Based on the results of the respondents' answers, we know that most of the facilities and infrastructure made by the government are not following the needs of schools to implement the program.

Also, regarding Facilities and infrastructure that support the implementation of TEFA 6M, it can be concluded that 38 percent of teachers strongly agree that the government has prepared teacher competencies to be able to implement TE 6 M well in schools, 14 percent agree, 29 percent doubt, 14 percent disagree and 5 percent strongly disagree. If we make a mapping based on the answers of the

respondents then we can conclude that the government has made preparations for the competence of teachers in vocational high schools related to the implementation of TEFA 6 M by 52 percent.

5 percent of teachers strongly agreed, 25 percent agreed, 60 percent of teachers were doubtful because they did not know about the government providing a budget for the need to realize the 6 M TEFA program, 5 percent disagreed, and 5 percent strongly disagreed. Regarding the budget, very few agreed and strongly agreed that the government had provided a special budget.

5 percent of teachers strongly agreed, 55 percent agreed with the government to prepare all procedures well for the success of TEFA 6 M, but cooperation with emotion had to be increased, 25 percent doubt, 10 percent disagree and 5 percent strongly disagree.

5 percent of teachers strongly agreed, 35 percent of teachers agreed that the market was available to absorb products from the TEFA 6M program, 45 percent of teachers were very doubtful because there were no facilities to accommodate products to the target market, 10 percent disagreed, and 5 percent strongly disagree. The conclusion from the evaluation above we can know that there are greater doubt and disagreement that the market can absorb the TEFA program made by the government.

9 percent of teachers strongly agreed, 41 percent of teachers agreed that the government had prepared schools to realize 6M TEFA, 36 percent of teachers were doubtful because only a part of the existing schools had been prepared to realize 6M tefas, 5 percent did not agree, 9 percent strongly disagree. There seems to be a balanced number of people who agree with and strongly agree that the government has made good preparations for schools to realize the TEFA program and half of them have doubts and disagreements.

Lastly, regarding products that support the TEFA 6M program, 9 percent of teachers strongly agree, 55 percent of teachers agree that all aspects of the school support the implementation of the 6FA TEFA, 27 percent of teachers hesitate because there are many aspects such as leadership, whooping, TU staff get the same understanding, 4 percent disagree, and 5 percent strongly disagree. From this, we can know that more people agree and agree strongly compared to those who are hesitant and disagreeing about schools that have prepared all aspects for the readiness to implement the TEFA program.

62 percent of teachers strongly agree with the existence of the 6FA TEFA program which can be a good program to shape the entrepreneurial spirit of students, 33 percent agree, and the remaining 5 percent of teachers doubt. If we refer to the answers above, we will find that the school, in this case, the teacher very significantly agrees that the TEFA (Teaching Factory) program is a program that can form a good entrepreneurial spirit in students in the school.

55 percent of teachers strongly agree that the TEFA 6M program can be a solution for absorbing many unemployed SMK graduates and the remaining 45 percent agree. All teachers stated strongly agree and agree if the TEFA (Teaching Factory) program can help be one way to alleviate unemployment.

23 percent of teachers strongly agreed, 45 percent of teachers agreed with this program students were able to carry out the TEFA 6M program well, 27 percent of teachers were doubtful because they needed to work hard to realize it, and the remaining 5 percent strongly disagreed. From the results of this questionnaire, we can know that the teacher's opinion is very significant about the ability of students to carry out the TEFA (teaching factory) program.

64 percent of teachers strongly agree that the TEFA 6M program is beneficial for vocational students and the remaining 36 percent agree. 100 percent of teachers agree that this TEFA (Teaching Factory) program is useful for students.

From the results of interviews that have been done before, we find that 95 percent of entrepreneurship teachers answer that there are many advantages gained from the TEFA 6 M program because they

can hone vocational students' abilities and are better prepared to go straight into the world of work, 5 percent say no because they do not know this.

95 percent of teachers answered that if the TEFA 6M program was realized well it would overcome unemployment for Vocational High School graduates because Vocational High School students would be better prepared with the provisions obtained at school through this program, 5 percent of teachers answered no because not all Vocational High School graduates had an entrepreneurial spirit.

Entrepreneurship teachers also answered that they had to involve more relevant agencies to improve the implementation of the 6FA TEFA program, there was socialization to all aspects of the school not only entrepreneurship teachers, then the school also had to support the facilities and infrastructure for the implementation of the 6FA TEFA program, the existence of financial assistance to implement the program.

The government prepares more budget for Entrepreneurship Subjects, more prepares things needed to support the needs of vocational students to be ready to work and entrepreneurship such as facilities and infrastructure, the existence of socialization to students to have an entrepreneurial spirit and deal with competitors.

Conclusion and Recommendation

If we refer to the context as the first rule that we value from the evaluation of the TEFA (teaching factory) program, we get significant results answered by respondents in the statement that TEFA (teaching Factory) has been appropriately given to vocational high schools and this program is appropriate with an age requirement of 87%.

In the second item, we examine the inputs there, we can find out that respondents thought the highest opinion regarding the most suitable infrastructure facilities given by the government to schools was 80%.

After we find out about the next input we look for data about the process, in the product questionnaire we find that the procedure given by the government regarding the implementation of TEFA (teaching Factory) is given the highest value which is 80% while for the lowest items given answers by respondents is about competence the teacher is only 62%.

The product was the last thing we evaluated in the TEFA (teaching factory) program where we got the highest answer for the statement that the TEFA (teaching factory) program was able to permeate the market which was declared 100% strongly agree and agreed by the teachers and the lowest was about aspects of school readiness to realize this TEFA program that is equal to 64%.

Acknowledgment

The authors would like to thank the Dean of Faculty of Economics, for supporting this research, and to Faculty of Economics of Universitas Negeri Jakarta who provide funding for this research. The author is grateful for suggestions from all those who kindly provide consulting advice throughout this research.

Abstract

Managing a company nowadays is a very complicated process. In order to have a complete picture of what is happening in the company, especially in production processes, monitoring systems such as SCADA are used. A system of this kind is an integral part of a complex IT system, which makes it possible to obtain valuable information about the production process. An optimizing of production process course has a fundamental meaning for proper enterprise functioning. The most practical and the most effective way of production process course controlling is a visualization of an actual process state. A visualization of production process gives a possibility for quick insight to a real state of production machines and allows controlling and steering of manufacturing process. Current article presents an optimizing of a production process course controlling in a chosen enterprise by implementation of a SCADA type system, moreover it points essential benefits caused by the SCADA system employment.

Keywords: Management, Optimization, Production Process, Company, Visualization, SCADA System

Introduction

This section should follow keywords. This section should provide background of the study and highlight research motivation A huge competition and dynamically changing market requirements, impose to enterprises application of more and more modern, safe and dependable systems of production process realization. Progressively wider application in automating of industrial processes, currently gain scattered steering and visualization processes which are labelled SCADA systems (Supervisory Control And Data Acquisition). It finds application on many fields of industry and infrastructure, ensuring a technological and production processes safety.

One of the most important feature of modern SCADA systems is theirs scalability, what means a possibility of theirs development. SCADA systems may process hundreds or even thousands of inputed variables, depending on complexity and on particular technology scope, together with development needs of a particular enterprise. The systems allow for cooperation with PLC drivers (Programmable Logic Controller) and another devices e.g. microprocessor regulators. Due to a scalability, SCADA systems can be used by small as well as by huge enterprises.

Today modern visualization and steering systems, allow for managing and controlling of all processes which take place in an enterprise, in real time. They allow also for steering of machines and devices work, for supervising of production processes and for managing of various technological

installations work. Currently SCADA systems are a basis of a modern industry and they pose a crucial solution for present enterprises.

The aim of this article is to present an optimizing of production process course controlling, in a chosen enterprise, through the implement of a SCADA system, with consideration of significant benefits resulted from SCADA system application.

Production Process Optimizing

Adjustment of enterprises to the variable market conditions is a supremely difficult and laborious task. Contemporary production processes, which employ modern technologies, becoming more and more complex. The main aim of production process optimizing is to achieve an efficiency increase, make a time of production shorter and to decrease its costs. The optimizing of production process is nowadays a necessity, because technological processes which take place at enterprises, need an effective managing. Complexity of production route steering systems, entails a necessity to assure a quick and simultaneously assured informations exchange, between machines and an operator, in real time, with possibly simple and understandable way for him.

The production process optimizing wield an essential influence for whole enterprise functioning and it determines achievement of a number of profits. Due to an optimizing of production processes, enterprises can increase their capability and decrease a cost effectiveness, which have crucial meaning on a competitive market.

SCADA System

SCADA systems are the automation systems that are used to monitoring of the course of technological process. SCADA system gathers information from individual machines and devices in real time, and then visualizes these informations. SCADA provides discreet control and supervision of production processes at a high level [Wu J., Cheng Y., Schulz N.N., 2006]. SCADA is widely used in large and medium-sized systems, so there are many types of SCADA software systems [Morsi I., El Deeb M., El Zawawi A., 2009]. Modern SCADA type software allows for full visualization of processes stage [Kaliczyńska M., 2016].

The most important elements, without which the SCADA system can't exist, are data sources and a technology of data acquisition. This operation can be done in several ways, beginning with the most popular, the fastest and the most confident data read-out from PLC drivers (Programmable Logic Controller) or directly from intelligent sensors (direct communication) and finishing with supplying to the SCADA system data, which were previously gathered e.g. in databases or even in individual files. The most often a direct read-out is used, with use of various types of media and data transfer protocols.

A number of SCADA systems offer a pool of communicative drivers which include the most popular protocols e.g. Modbus RTU, Modbus TCP, Profibus DP, MPI, Data Highway, SNP. It makes an opportunity to use the SCADA system practically to any automated technological process [http://systemy-sterowania.pl/informatyka-przemyslowa/].

The analysed enterprise and its functional problems

The analysed manufacturing and service company began in 1991, actually it employs 158 people. The company specializes in tools production, products, half-products and elements made of metal and it provide service of metal working. Production process in the analysing enterprise is running in a mechanized and automatized way. Modern machines and devices, as an integrated production lines, are a strong supply base of the company. Employees tasks are limited to the efficient service of machines and devices and to controlling of its working. Products offered by the company are

characterized as high quality and lasting products. The company continuously actualizes and extend its offer to face up to growing market requirements and it customizes to clients demands artfully. Due to a modern machines park the company readily cooperates also in range of details made of metal production. Confirmation of a high quality of fabricate articles is the ISO 9001:2015 quality certificate achieved.

In spite of long-standing presence on a market, the enterprise was facing with some problems in area of production process steering system in real time, which used PLC drivers. Next problem was a correct, upright and fast flow of the key informations from technological lines of production department, which was conducting directly by machines and devices. Next problem was assuming some difficulties with determining of a production process parameters and an efficiency of machines and devices exploitation, stoppages and failures history.

By analysing of an exemplary workplace, a big problem was a diagnostics of an arose failure, during automated welding process, which was supervising by a PLC driver. In the process, beginning of welding was following only after correct set up of required details and after locking of right actuators. Otherwise, a welding robot was not starting the welding. Because of specific conditions of a welding process, very often the presence sensors (so-called limiting switches) which are used for components presence detecting, were suffering damages. Due to this fact, a welding robot was not receiving an agreement for welding process beginning. Diagnostics of this kind of failures was only possible with use of a special computer (SIMATIC Field PG). The diagnostics could only led an automation specialist. Moreover, the company was employing only one automation specialist, thereby a process of failure removal or restoring of technical output of machines and devices was very time-absorbing. Exemplary picture of a welding table is shown on figure 1.

Fig 1. A welding table during an automatised welding process.

After an accomplishment of functional problem analysis of the company, an improvement of production process route controlling via implementation of a SCADA type system with accommodated diagnostic functions, has been proposed. The company has analysed this proposal and decided to introduce suggested system of SCADA class, adequate for company requirements.

Implementation of a SCADA system

The main challenge for the company was efficient and effective implementation of SCADA class system. After thorough analysis of potential suppliers of SCADA class software, the company

decided to implement the mySACADA system. The choice was imposed by the fact that mySCADA system distinguishes from competitive systems with wide scope of application possibilities.

Operation of the mySCADA system is very intuitive and close to WinCC operating. Furthermore the mySCADA system is much less expensive than WinCC, it has lesser hardware requirements and it is available for many operational systems as Linux, Windows, Android, Mac OS. The mySCADA system with connection through a WWW browser, represent a JAVA application, that is to say any calculations are performing form a client side – it makes a fundamental supremacy (in the mySCADA – with much weaker hardware server configuration much greater efficiency can be achieved. The mySCADA software allows to data exchange statistics preview in real mode, a graphical presentation of change of a variable value in time, visualization of current data and archival data (so-called trends), furthermore the system allows to identify critical values of monitored variables [Rut J., Bartoszuk M., 2016].

Implementation beginning of the mySCADA system to the analysing company took place in November 2015. The mySCADA system has been implemented to four workplaces, responsible for technological process supervising. A server of the mySCADA system has been realised on a computer of PC class, which was working under control of the Linux Debian operating system. This decision was made due to the fact that Linux operating system has a good stability and technical support. Moreover the system work in console mode to reach better server efficiency.

The mySCADA system is accessible through a WWW browser (from any PC class computer, tablet, smartphone or even TV of SMART TV type) after log in to the departmental WIFI network. Additionally there were client workstations applied which allows for interaction of user with the system, visualization of the process, process steering, incidents review, replies for alerts or tracing of reports. For realisation of this task, industrial console computers has been used, which were installed at each machine in production line. Client workstations display actual production data and allow for standpoint diagnostics.

Implementation of the mySCADA system encompassed inter alia:

- precise analysis performance of process data and determination of data displayed on screens,
- PLC drivers verification – compatibility with the mySCADA system,
- formation of a uniform LAN network – PLC drivers, which were not connected so far to the LAN network and which were using the Profibus bus, has been connected with use of Profibus adapters to Ethernet,
- verification of communication from PLC to computer and from computer to PLC,
- determination of variables which will be accessible to edition from mySCADA system level and determination of variables which should be archived,
- archiving of a process data and of steering commands which are transmitting to machines and devices,
- creation of graphical panel for diagnostics of particular standpoints,
- creation of graphical panel for particular standpoint work parameters monitoring,
- adjustment of the system (system actualization) – implementation of new functions and their integration with the actually existing,
- tests of system working – initial monitoring and production line work controlling and automatic informations generating,
- training of authorised employees in scope of appropriate (correct) using of system (machines operators, maintenance department employees, electricians, process engineers, managers).

It is necessary to make an appoint that in initial stage of mySCADA system implementation in the company, tests of particular unit modules had been made.

Process of the mySCADA system implemetation in the company lasted 5 months and it finished successfully in March 2016. Implementation of the mySCADA system transpired as a very complex

and complicated process, because obligatorily the system had to guarantee great reliability. Implementation of the mySCADA system dissolved appearing functional problems in the company, what made way for immediate information flow from technological lines, it enabled operational technical state controlling of machines and devices and it allowed for graphical visualization of production process steering in real time. Furthermore the mySCADA system largely contributed to increasing of production process realization degree through correct setting of production process parameters and its analysis and also through a complex gathering, archiving, processing and using of production data. Exemplary screenshots, showing graphical interface (HMI) of the implemented mySCADA system in the company are shown on figure 2 and figure 3.

Fig. 2: System mySCADA – produkcji dzienna, w trybie zmianowym dziennym (daily production in daily shift mode (I Zmiana – I Shift, II Zmiana – II Shift, Plan, OK, NOK – Not OK, AVG – The average production time of one piece).

Fig. 3: The mySCADA system – sensor diagnostics in production process.

Due to the implemented mySCADA system, in the production enterprise, an efficiency of machines and devices exploitation had grown, through an elimination of loses connected with their working.

The mySCADA system has improved also a diagnostics through an easier failures and defects detecting and quick alerting and incidents registration.

Essential benefits emerging from SCADA system implementation in the analysed enterprise

By the analysis of acquired and rational benefits, emerging from the mySCADA system implementation to the analysed enterprise within 8 months (from April 2016 to November 2016), it has been noticed that in spite of an initial scepticism, the engineers very willingly use the mySCADA system as a tool for collecting of production process informations and for monitoring of status of particular production stages in real time and also as a tool for archival data obtaining. Furthermore, increase of an efficiency and production flexibility, increase of a devices and machines technical state controlling and increase of an efficacy of machines park use, had been noticed.

Implementation of the mySCADA system allowed for a running data and historical data (trends) presentation, allowed for reporting (daily and periodic), for generating of announcements (informational, warning and alerting), allowed for data exchanging with another applications (e.g. spreadsheets and data basis) and for reliable data archiving. Subsequent benefits are cyclical processing of process variables, possibility to quick decision making which are simultaneously more accurate in the context of arose incidents during production and an optimizing of production costs.

Applying of an expanded diagnostics functions and its visualization, caused significant easier a faster failures diagnostics, which can be now done by an electrician or even a brigadier (after previous training carried by a maintenance department). Due to this fact a time of standstills (waste time) had been decreased and an effectiveness of production line use had grown (OEE rate growth).

Summarize, application of the mySCADA system to the analysed enterprise introduced a lot of benefits, improving significantly working of all the company. Obtained in this way possibility of visualization of production process course, allowed for insight and controlling over a production process and gave an actual knowledge of its efficiency.

Conclusions

The aim of this report was to represent of optimizing of production process course controlling in a chosen enterprise through the implement of a SCADA type system, with consideration of significant benefits resulted from SCADA system application. Implementation of the SCADA system in the analysed enterprise, dissolved many of appearing functional problems and it allowed to obtain clear visualization of production process and of machines and devices state.

The implemented mySCADA system allowed for running controlling and for analysing of production process and it contributed to optimal using of production line capability through increasing of its efficiency. Furthermore the mySCADA system implementation largely contributed to improvement of a quality of generating documentation of production process course and to presentation of data from wide scope of steering devices (PLC, regulators, intelligent scanners). The mySCADA system transpired to be very helpful for tracing and recording of incidents (failures) and allowed for quick alerting of important process incidents in production line.

To sum up, after the analysis carried out of the implemented mySCADA system used in the analysed enterprise (during 8 months), it should be objectively stated that the mySCADA system transpired to be very relevant solution. Implementation of the mySCADA system contributed to obtain many significant benefits and to work out improvements in production operations area. Due to the system implementation the enterprise achieved an improvement with integration and exchanging of a data with another applications/devices and it achieved a possibility to analysing production process parameters comprehensively.

Abstract

Declining academic performance among students has remained a recurring irritant in Nigeria's educational system, in spite of all efforts of government and major stakeholders to change the narrative in the education sector. Since all teaching and learning activities take place within an environment, it is expected that the outcome of the education process correlates significantly with the teaching-learning environment. Following the method of survey design, this research identifies environmental factors that influence learning outcomes based on a sample of 622 respondents from public secondary schools in Anambra State. Multi-stage sampling technique is used in the sample selection, first to choose two senior secondary schools from each of three senatorial zones of the state. A second sample made up of 520 students and 102 academic instructors was drawn on proportionate basis from the previously selected sample of six senior secondary schools. The method of analysis is largely descriptive. The study presents robust evidence that students' family background, proximity of home to school, level of training/professionalism attained by teachers, as well as school structure greatly determine how students perform in these institutions and thereby concludes that environmental factors play significant roles in the promotion of high educational achievement among students at the senior secondary level.

Keywords: Environmental factors, Academic performance, Public school system, Senior secondary education

Introduction

Education is the process through which a society perpetuates itself. Education offers a platform for society to transmit its stock of knowledge, values and skills to future generations. It is a basic tool for development and empowerment. Basically, education aims at promoting understanding and judgement, and enabling action. It equips the individual for decisions that improve the quality of life (George, Okoye, Efobi and Modebe, 2017); it also promotes literacy and awareness, and confers responsibility to make decisions that guarantee better life for individuals in particular and the economy in general (Okoye, Omankhanlen, Okoye, Urhie, Okoh and Ezeji, 2019)

At the early days of education, the primary goal was to educate the child, no matter the environment (Wagner, 2017). This goal derives from the philosophy that something was better than nothing, which implies that any learning environment was better than no learning environment. As learning cannot take place in vacuum, any available environment was acceptable. However, with the growth in literacy rates across the globe over the years, there has been a paradigm shift by educational administrators to improvement in the quality of education, with great attention attached to the environment of education.

The environment is critical to the development of individuals in the society. In the school system, for instance, environment determines whether a child will be happy and ready to learn or become a deviant. The physical, social and psychological or emotional environments must be such that every aspect of human behaviour is warmly accommodated. Education is an important industry for social, political and economic development and it is affected by the environment within which it is conducted (Adediran, Ojomo & Adeyanju, 2015). The physical environment can determine the comfort of students and thereby their learning ability (Falsario, Muyong and Neuvaespana, 2014). When students are uncomfortable, they are easily distracted and are not likely to learn faster than their peers whose environments are quite comfortable.

Wagner (2017) posits that students' behaviour towards academic performance can be influenced through provision of an environment that balances and controls stimulants to the five human sensory organs: sight (what learners see), hearing (do they hear their teacher or noise from outside?), touch (is the temperature too hot or too cold?), smell (does the scent from deodorant or cleaning liquid support or disrupt learning?), and taste (there should be provision for food and drinks because hunger can disrupt learning). Wagner further alludes to substantial evidence that educational objectives like reading comprehension, multiplication and reading speed can be influenced by the study environment.

According to Olufemi, Adediran and Oyediran (2018), students' academic performance is affected by several factors which include students' learning skills, school environment, parental background, peer influence, teachers' quality, learning resources and infrastructure, among others. The school environment, for instance, supports the acquisition of academic knowledge. School environment refers to the quality and characteristics of school life, both social and physical aspects of the school, which can positively promote behaviour, school achievement, and the social and emotional development of students. Proximity, accessibility and the serene nature of the school environment of a school can encourage learning. Kenzo (2014) asserts that some researchers have studied the mechanisms by which school accessibility could affect test scores and found a positive correlation. UNESCO (2001) posits that the Nigerian child is a product of several environments, all of which contribute to his development and learning process. A child comes from a home, attends a school, lives in a community and belongs to a larger society (town, state, or a country).

Academic performance refers to the rate at which educational objectives are being achieved by those within the school system (Owan, 2012). This implies that students' academic performance measures the extent to which students' are achieving desired educational goals and objectives. According to Erum and Zahoor (2011), students' academic performance and graduation rates have been an area of concern, and investigation of factors relating to academic performance of secondary students has been a topic of much interest to scholars. This scenario may arise because since schools were established for the students, their performance can be used to judge the effectiveness of school system.

Statement of Problem

Poor academic performance has remained a recurring irritant in Nigeria's educational system, in spite of conscious efforts of governments at all levels to change the narrative in the education sector (Egunsola, 2014). There are many factors which may affect the educational performance of the learners. These can be categorized into teacher-related, school-related and home-related factors (Fajar, Hussain, Sarwar, Afzal and Gilani, 2019). There are also society-induced causations.

Poor sanitation and hygiene conditions can also be injurious to infants and children, particularly of school age, and thereby hamper performance. Bouya et al., (2010), for example, explain that illness caused by poor hygiene practices of students, such as failure to wash hands before eating, not washing oneself properly after using the toilet and not washing one's undies regularly may negatively affect students' cognition and performance at school.

Abdulmalik (2013) contends that inadequate attention to children's academic work by parents and guardians as well as having the dual activity of teaching and learning in poor school environments contribute to poor academic performance of students. Different scholars have investigated the sources of poor academic performance among students across different jurisdictions, but not many of the studies have been conducted in sub-Saharan African countries. It therefore remains unclear how the findings of these studies apply to sub-Saharan Africa. Based on a survey of selected public secondary schools in Anambra State, this study investigates how the academic performance of students at the senior secondary level is determined by environmental factors.

Research Statements

The study seeks to ascertain the validity of the following research statements:

i. Educational accomplishment of students in government-owned senior secondary schools is affected by the social and economic status of their parents (family background).
ii. Proximity of students of government-owned senior secondary schools to their school determines how they perform in their academics.
iii. Deployment of professionally qualified teachers to government-owned senior secondary schools promotes students' educational achievement.
iv. Academic performance of senior secondary students in government schools is strongly linked to quality and adequacy of school structure

Theoretical Foundation of the Study: Triarchic Theory of Intellectual Abilities

The triarchic theory of intellectual ability provides the necessary framework for this research. The theory which was postulated by Robert Sternberg in the 1980s (Sternberg, 1985) explains human intelligence in terms of distinct components: Analytical or Componential, Creative or Experiential and Practical or Contextual intelligence. Sternberg explains intelligence in the context of one's ability to succeed in life based on his personal standards. He contends that success is achieved when one is able to maximize his strength, while compensating for his weakness. Within the context of the theory, individuals achieve success when they are able to balance their analytical, creative and practical abilities in order to adapt to, shape, and select environments.

Review of Related Literature

Conceptual Review

Academic Achievement

Okoro and Ibebuike (2013) define academic achievement as the learning outcomes of the child. It refers to an outcome with common specifications, with students achieving results corresponding to previously determined success criteria, such as teaching aims. It is often discussed in relation to teaching aims (Kapsalis & Haniotakis, 2011). Academic performance measures the extent to which

educational goals is realized (Obeta, 2014). Common measures of academic performance include examinations or continuous assessment (Bossaert, Doumen, Bogse and Verschuereme, 2011). In Nigeria, such examinations include standardized (external) examinations like the West African Examinations Council (WAEC), National Examinations Council (NECO) and the Joint Admissions and Matriculation Board (JAMB) examinations. Academic performance can be affected by teacher-related, student-related, and/or school-related factors. It could also be influenced by instructional processes and socio-economic factors.

School Environment

The school offers an environment for formal education whereby learners learns and instructional materials and facilities to get socialized and equipped to confront societal challenges. It encompasses all conditions and controls in the school which determine educational achievement of students, like buildings, laboratory and library facilities, academic instructors, furniture, administrative staff, healthy teacher-pupil rapport and school location, among others (Ajayi, 2007). School policies are also important considerations. Ajayi and Ashaolu (2005) opined that improvements in physical facilities greatly affect students' academic achievement. The physical environment of a school creates an image which enables the public decide whether or not to associate with it (Mgbodile, 2004).

Family background/status

The family is the primary social unit of the society. It is the basic social environment of a child, and can define the character or personality of the child. Clifford (1998) asserts that family environment has immense potential to influence the intellectual capacity of the child. Anene (2005) describes home or family environment as the foundation from which children grow to become full and successful members of the society. The family offers love, security, encouragement, simulation and opportunities that prepare and enable children to realize their potentials in full. Learner-friendly home environment provides children with relevant social interaction, attention, and activities that enhance development of positive attributes and enables the acquisition of physical, emotional, social, intellectual, and language skills (Nanalee, 1977). As the immediate condition and the immediate socio-psychological surrounding in which an individual develops, the home environment also influences academic performance of the students (Enoh, Bamaja, and Onwuka, 2007).

Amadi and Segun (2018) situate family social standing as a major variable influencing the educational accomplishment of students in schools. Also, Hill (2004) posits that the socio-economic status of parents significantly contributes children's academic performance. Educational attainment of parents, motivation and income level are common measures of family social status.

Parents play considerable roles in shaping the lifestyle and behaviours of the younger generations by virtue of their privileged position at homes and from their vast experience in social issues, (Machebe and Ifelunmi, 2014). As the primary educators of children, parents provide them with physical, emotional and mental framework for learning (Ryan and Adams, 2000). By their actions, parents mold and shape moral character of their children and influence the career path of their children pursue in life (Li, Lerner and Lerner, 2010). They tend to modify the behavior, taste and preferences of their children.

Teacher's professionalism/quality

Evans (2006) defines teachers' professionalism as net growth in intellectual aptitude and skills as measured by the students' academic performance. Professionally qualified teachers manifest intellectual, social and emotional stability, display love for students, demonstrate ability to inspire students and show positive attitude towards the teaching profession. Poor academic performance among students often derives from a number of variables such as high teacher-student ratio, dearth of qualified and experienced teachers, low standard of leadership in educational institutions, unstable political environment, political influence on educational programmes, non-conducive teaching and learning environment and inadequate educational facilities (Evans, 2006; Ewetan, 2010).

Trained teachers engage a variety of instructional methods, experiences, assignments and materials to facilitate attainment of learning objectives. Qualified teachers are required to produce high quality

and productive students who can live fulfilled lives and contribute to societal development. These are teachers who have obtained relevant minimum level of training in education (Olaniyonu, 2008).

Empirical Review

Imeokparia (2018) examined how environmental factors correlate with academic performance in Edo State using a sample of 2,374 junior secondary (JS) Business Studies students and 65 teachers of the subject. The study did not show that location and school-type correlate strongly with academic performance. However, there is evidence of substantial connection between educational facilities and the performance of students. Gilavand (2016) investigated how the learning environment influences learning outcomes of students by analyzing data gathered from literature survey on the subject. Based on critical analysis of thirty-nine (39) published articles, selected on the advice of medical education experts, the result indicates that noise retards academic achievement while appropriate painting, lighting of educational environment, and open spaces in schools enhance learning outcomes.

Obeta (2014) examined how selected home environmental factors affect the educational performance of secondary school students in Abia Sate, Nigeria by conducting a survey of 200 respondents selected from a random sample of students at the junior and senior secondary levels, and their parents. The study reveals that lack of adequate educational materials at home and poor attitude of parents to the educational activities of their children, in addition to social and economic status of parents substantially affect the academic performance of students. The work of Joseph, Yeboah-Appiagyei and Fentim (2014) focused on identifying environmental factors that affect the performance of senior high financial accounting students in the Tamale metropolis of Northern Ghana. Based on data obtained from 260 students and 29 teachers drawn from 7 senior high schools, the authors observe that instructional materials and provision of residential facilities lead to improvement in students' academic performance.

Nwobodo and Agusiobo (2017) investigated the connection between academic adjustment of secondary school students in Enugu State and the environment of the school. Data obtained from the survey were analyzed using the method of means, standard deviation and Pearson Product Moment Correlation. The result shows strong association between the environment of the school and students' educational adjustment. It further indicates that location of the school is closely related to students' academic adjustment. However, it did not show significant relationship between gender and academic adjustment.

Kalagbor (2016) examined factors that enhance students' academic performance in public and private secondary schools in Rivers State-Nigeria. The data was analyzed using simple descriptive analytical methods: frequency counts, percentage and mean. The result indicates that academic performance in private secondary schools is better enhanced by most of the items analyzed in the study than in public secondary schools. These items include home background, teacher-student relationship, teacher's supervision, effective use of teaching time, and teacher-student ratio. However, academic performance in public secondary schools is better enhanced by the quality of teachers than in the private secondary schools.

Fajar, Hussain, Sarwar, Afzal and Gilani (2019) conducted a cross-sectional study of undergraduate nursing students to determine factors that determine their academic performance using convenient sampling technique. The authors observe negative correlation between gender of participants and academic performance. They also discover that teacher, school, home and student-related factors also affect students' academic performance.

Igbinoba, and Aigbedion (2015) analyzed the impact of classroom management techniques on students' academic performance in selected junior secondary schools in Abuja Municipal Area Council. Mean and percentages were used to analyze data obtained from a sample of 247 respondents. The finding shows significant positive correlation between classroom management techniques and academic performance in junior secondary schools in the Municipal Area Council.

Using a sample of 350 students selected through multi-stage sampling technique, Igbo and Ihejiene (2014) examined how parenting styles relate to students' abnormal behaviour and educational achievement based on a sample of students from selected secondary schools in Garoua, Northern

Cameroun. The outcome of the analysis of variance (ANOVA) test indicates that styles adopted by parents in the upbringing of children determine their behaviour and academic performance.

Farooq, Chaudhry, Shafiq and Berhanu (2011) investigated factors that affect academic performance using a sample of secondary school students from a metropolitan city of Pakistan. Standard t-test and ANOVA were used to analyze data obtained from the survey. The result indicates that the social and economic standing of parents and their educational attainment have significant effect on students' general educational achievement in addition to their performance in subjects like Mathematics and English. This implies that students from high and average socio-economic families perform better than those from lower class. They also observe that girls perform better than the male students.

Using descriptive and inferential statistics, Olufemi, Adediran and Oyediran (2018) examined the factors affecting students' academic performance in Colleges of Education in southwest, Nigeria. The result indicates that student-related factors, parental background, school factors, and teachers' factors greatly affect academic performance of students.

Umar and Samuel (2019) examined how school facilities and school-type impact students' academic performance using a sample of science students from senior secondary schools in Nasarawa State, Nigeria and discovered that school facilities significantly impact science students' academic performance in urban and rural schools from both the private and public school sector.

Ogoro, Nkwocha and Ogoro (2018) examined the correlation between proximity of students' homes to school and academic performance using a sample of students from selected schools in Obio/Akpor LGA of Rivers State. The finding indicates that pupils' distance to school does not correlate with their academic performance. However, they observe that lateness to school, family background, and family size could substantially determine their academic performance.

Ewetan and Ewetan (2015) investigated the effect of teachers' experience on students' academic performance in Mathematics and English Language based on a sample of public secondary school students in Ado-Odo/Ota and Ifo Local Government Areas of Ogun State. They observe that teachers' teaching experience significantly determine students' performance in Mathematics and English Language. The study specifically shows that schools with more teachers having above 10 years of experience in teaching achieved better results than schools with more teachers having 10 years and less of teaching experience. The authors used respondents' perception of students' performance in the Senior Secondary School Certificate examinations as proxy for academic performance.

Usaini, Abubakar and Bichi (2015) investigated how school environment influence the academic performance of secondary school students in Kuala Terengganu, Malaysia. Based on regression test of observations generated from respondents, the authors show that students with adequate facilities, good teachers and favourable environment perform better than their counterparts with inadequate learning facilities, untrained teachers and unfavourable learning environments.

Using proportionate random sampling method, Barkindo, Shehu and Aliyu (2018) conducted a study on how socio-economic background of parents and their involvement in their children's education correlate with children's performance at school based on a sample of 216 final year students of business education in Adamawa State, Nigeria. The research reveals that while social and economic standing of parents correlates strongly with students' educational achievement, parental involvement in children's educational activities did not substantially correlate with the academic performance of their children.

The above review shows strong correlation between environmental constituents and the educational achievement of students in secondary schools across different jurisdictions, including Nigeria. However, there is no evidence of such study in Anambra State in general and the selected local government areas in particular. In addition, available studies have not considered the nexus between closeness of students to school and their performance in school. This research takes account of the identified gaps.

Methodology

The survey design was used in this research because it offers researchers considerable latitude to administer research instrument (questionnaire) to a sample or to the entire population of people, and based on data generated describe the attitudes, opinions, behaviors, or characteristics of the population. The study covers six senior secondary schools across the three local government areas in Anambra State. Academic performance is proxied as the performance of students in the Senior Secondary School Certificate Examinations (SSCE) organizes by the West African Examination Council (WAEC). Multi-stage sampling technique was used in the sample selection, first to choose two senior secondary schools from each of the local governments. A second sample made up of 520 students and 102 academic instructors was further drawn on proportionate basis from the previously selected sample of six senior secondary schools. The Likert-type questionnaire was used to elicit responses from respondents because it takes account of degrees of opinion respondents hold on particular issues raised. The method of analysis is largely descriptive and evaluation of the research items was based on the method of means. By comparing the mean of data generated from the respondents with the likert mean of 3.00, research items that return of 3.00 and above qualify for acceptance, otherwise they are rejected.

Data Presentation and Analysis

The opinions of respondents harvested from the field survey were collated and presented in frequency tables while statistical analytical tools (mean and standard deviation) were used to analyze the observations and evaluate the research statements.

Table 1: Distribution and Return Rate of the Research Instrument

Questionnaire	Number	Percentage
Distributed	624	100.0%
Returned	578	92.6%
Not Returned	46	7.4%

***Source**: Field Survey (2019)*

From the result in table 1 above, out of 624 copies of questionnaire administered on the selected audience, 578 were correctly filled and returned for analysis. Forty-six (46) copies were either not correctly completed or not returned and were therefore excluded from the study. The return rate of 578, representing 89.1% of the total questionnaire was considered adequate for statistical analysis and generalized conclusion.

Table 2: Educational accomplishment of students in government-owned senior secondary schools is affected by the social and economic status of their parents (family background)

Question Items	SA (%)	A (%)	U (%)	D (%)	SD (%)	Statistics	
						Mean	Std.
Parents on high income are able to provide learner-friendly homes and also send their children to better schools	478 (82.7%)	76 (13.2%)	16 (2.8%)	6 (1.0%)	2 (0.3%)	4.77	0.791
Students from rich families perform better in their academics than their counterparts from poor homes	109 (18.9%)	141 (24.4%)	97 (16.8%)	119 (20.6%)	112 (19.4%)	3.03	0.042

Children of rich parents have higher career aspirations than those from parents with low economic standing	468 (81.0%)	82 (14.2%)	5 (0.9%)	1 (0.2%)	2 (0.3%)	4.65	0.738
Children of parents with high educational standing perform better academically than those from low educational status	346 (59.9%)	138 (23.9%)	76 (13.2%)	10 (1.8%)	8 (1.4%)	4.39	0.621
Children of parents with high social standing perform better in school than those from low social class	104 (18.0%)	128 (22.1%)	103 (17.8%)	117 (20.2%)	126 (21.8%)	2.94	0.027
Cluster Mean	**52.1%**	**19.6%**	**10.3%**	**8.8%**	**6.8%**	**3.95**	**0.444**

Source: Field Survey, 2019

The result presented in table 1 indicates that over 70 per cent of the respondents subscribe to the opinion that family background is an important influence on students' academic performance while 15.6 per cent hold a contrary opinion. On the other hand, 10.3 per cent are undecided on the subject.

From a statistical point of view, the table shows that four family-oriented research items present mean values of 3.00 and above while one presents a lower value. It is important to mention from the observation that social standing of parents may not affect children's academic performance. Overall statistical analysis of the feedback from respondents produced a cluster mean of 3.95 which is greater than the likert mean of 3.00. This result suggests that family background significantly affects the academic performance of students in public secondary schools in the selected areas.

Table 3: Proximity of students of government-owned senior secondary schools to their school determines how they perform in their academics

Question items	SA (%)	A (%)	U (%)	D (%)	SD (%)	Statistics	
						Mean	Std.
Students who live close to school perform better than those who live far from school	218 (37.7%)	126 (21.8%)	28 (4.8%)	101 (17.5 %)	105 (18.2%)	3.43	0.639
Students who live close to school know their teachers better and therefore are favoured during exams	307 (53.1%)	169 (29.2%)	27 (4.7%)	52 (9.0%)	33 (4.8%)	4.20	0.537
Students who live close to school come to school earlier than those living far from the school	452 (78.2%)	93 (16.1%)	18 (3.1%)	9 (1.6%)	6 (1.0%)	4.67	0.747
Students proximity to school amounts to less stress which in turn lead to better academic performance	382 (66.1%)	126 (21.8%)	28 (4.8%)	29 (5.0%)	13 (2.2%)	4.45	0.649

Students who live close to school are given more functions by the school authority which favours them in their academic performance	285 (49.3%)	158 (27.3%)	49 (8.5%)	41 (7.1%)	45 (7.8%)	4.03	0.460
Cluster Mean	**56.9%**	**23.2%**	**5.2%**	**8.0%**	**6.8%**	**4.16**	**0.606**

Source: Field Survey, 2019

Table 3 captures the feedback from respondents in relation to whether students who live close to their school perform better than those that live far away from school. The responses suggest a near total agreement that proximity to school determines academic performance. About 80 per cent of the respondents agree that closeness to the school affect students' performance. While 8 per cent do not have definite position on the issue, about 15 per cent did not agree that proximity to school affects academic performance.

In terms of statistics, the table shows that the mean response of the target audience to all the research statements is well above the likert mean value (3.00), an indication that all the items in the cluster agree to a relationship between proximity to school and academic performance. The cluster mean of 4.16 further validates the relationship.

Table 4: Deployment of professionally qualified teachers to government-owned senior secondary schools promotes students' educational achievement

Question items	SA	A	U	D	SD	Statistics	
						Mean	Std.
Teachers who teach what they studied can teach the subjects in ways that students understand better.	486 (84.1%)	74 (12.8%)	8 (1.4%)	4 (0.7%)	6 (1.0%)	4.78	0.796
Teachers are happy when they teach subjects from the area of their specialization, and this promotes positive interaction with their students.	478 (82.7%)	86 (14.9%)	6 (1.0%)	3 (0.5%)	5 (0.9%)	4.78	0.796
Professionally-experienced teachers use both theory and practical teaching methods, and students learn better under them	354 (61.2%)	172 (29.8%)	24 (4.2%)	12 (2.1%)	16 (2.8%)	4.45	0.649
Teachers' professionalism has significant positive impact on the educational achievement of students at the secondary level.	372 (64.4%)	168 (29.1%)	18 (3.1%)	11 (1.9%)	9 (1.6%)	4.51	0.675
Professionally trained teachers teach with high level of integrity and understanding.	428 (74.0%)	122 (21.1%)	14 (2.4%)	6 (1.0%)	8 (1.4%)	4.68	0.751

Source: Field Survey, 2019

Table 4 presents overwhelming support that professionally qualified teachers contribute significantly to enhanced academic achievement of students in public secondary schools. This is attested to by over 94 per cent of respondents covered by the survey. Only about 5 per cent of the respondents either could not form an opinion or out-rightly disagreed with the statement. Quality of teachers in schools can derive from their professional status.

The mean value of all the items in the cluster of questions relating professional qualification to students' academic qualification exceed the Likert mean (3.00), which implies that, individually, they support that employment of professionally-qualified teachers can lead to improvement in the educational achievement of students. With a cluster mean of 4.64, the statement that students' educational achievement in senior government-owed schools can be enhanced through engagement of professionally qualified or good quality teachers is strongly validated.

Table 5: Academic performance of senior secondary students in government schools is strongly linked to quality and adequacy of school structure

Question items	SA	A	U	D	SD	Statistics	
						Mean	Std.
Procurement of educational facilities and degree of deployment has productive influence on students' educational accomplishment.	375 (64.9%)	108 (18.7%)	52 (9.0%)	20 (3.5%)	23 (4.0%)	4.37	0.612
Maintenance of healthy school atmosphere can promote academic performance.	397 (68.7%)	132 (22.8%)	27 (4.7%)	13 (2.3%)	9 (1.6%)	4.55	0.694
Prompt compliance to school teachers' welfare needs, including payment of salaries can enhance students' academic performance.	348 (60.2%)	164 (28.4%)	21 (3.6%)	19 (3.3%)	26 (4.5%)	4.37	0.612
Maintenance of approved teacher-student ratio leads to improvement in academic performance of students.	362 (62.6%)	177 (30.6%)	12 (2.1%)	21 (3.6%)	6 (1.0%)	4.50	0.671
Provision of recreational facilities in schools can influence students' academic performance.	398 (68.9%)	132 (22.8%)	24 (4.7%)	11 (2.9%)	13 (2.3%)	4.54	0.688

Source: Field Survey, 2019

Table 5 shows the opinion of respondents in respect of the relationship between educational facilities and the educational achievement of government-owned senior secondary schools in Anambra State. The collated data shows over 89 per cent of the respondents agree that provision of school facilities can enhance the performance of students in these schools. On the other hand, while about 5 percent are undecided, the rest did not agree that school structure can influence academic performance.

The responses to the individual items in the cluster stands above the likert mean which indicates that they are in agreement that academic performance of students in public secondary schools is strongly linked to quality and adequacy of school structures. The cluster mean of 4.47 provides further validation to the above statement.

Discussion of Results

This research examines how environmental factors affect the academic performance of students in public senior secondary schools in Anambra State using six secondary schools across the three senatorial areas of the state. From the analysis of data generated from the respondents, it was observed that family background, in terms of social and economic standing of parents, determines the educational achievement of students. This result suggests that children of high profile parents perform better in school than their counterparts from poor background. This outcome aligns with the findings in Obeta (2014), Farooq, et al (2011), Ogoro, et al (2018), Igbo and Ihejiene, (2014), Barkindo, et al (2018), Olufemi, et al (2018) and Fajar, et al (2019).

The study also validates the statement that proximity of students to school contributes to their academic achievement. This implies that students living close to the school premises are likely to perform better in school than those that travel far distances to school. Though not many studies have been conducted in this area, the work of Ogoro, et al (2018) did not establish a connection between closeness to school and academic performance. However, the work of Joseph et al (2014), which reports that provision of residential facilities in schools leads to improvement in students' academic performance, suggests proximity to school can influence the performance of students in school.

Further evidence from the study indicates that employment of professionally-qualified teachers impacts the performance of students in public secondary schools in Anambra State. Experienced and well-trained teachers have the advantage of breadth and depth on the subjects they teach as well as the appropriate methods to use so as to achieve learning objectives. This result aligns with the works of Olufemi, et al (2018), Ewetan and Ewetan (2018), Usaini, et al (2015),and Fajar, et al (2019).

Finally, from our analysis, we observe that provision of the required quantity and quality of school facilities influences academic performance. This implies that students from schools that have adequate, functional and good quality structures often out-perform their counterparts from schools where these facilities are in short supply. This observation corroborates the research findings of Joseph, et al (2014), Imeokparia, (2018), Usaini, et al (2015), Olufemi, et al (2018), Umar and Samuel (2019) and Fajar, et al (2019).

Summary of Findings, Conclusion and Recommendations

Analysis of data obtained from respondents in respect of their opinions on how environmental factors affect academic performance in selected public senior secondary schools in Anambra State, Nigeria reveals that family socio-economic status, closeness of students to school, employment of professionally-qualified teachers, and provision of adequate and good quality school facilities contribute to students' academic performance.

Following from the results outlined above, this study concludes that academic performance of students in public senior secondary schools is affected by environmental factors like family social and economic status, distance students have to travel to and from school, professional status of teachers, and adequacy of facilities available to the students.

We therefore recommend that education managers, particularly in the public education sector, through the inspectorate unit of the Ministry of Education should ensure that learning-supportive school environments are in place. For instance, schools should be located in low noise areas and there should be adequate open spaces for students to operate, classroom temperature should not disrupt learning, paintings should be moderate, and scent from deodorants and or cleaning liquids should not be offence.

More schools should be established, particularly in the rural areas, to bring them closer to the people, and provision of residential facilities in schools should be encouraged to allow students more time to

concentrate on their studies. Students that reside in the school, for instance, have more time to plan their academic programme and stand a better chance of academic success. Also, teacher education should be emphasized. Teachers should be trained and re-trained to enhance the capacity of teachers to impart knowledge on their students. The on-going effort to professionalize and re-certify those qualified to teach in Nigeria is commendable.

Finally, there should be adequate infrastructural support to promote learning in public schools. Though ambience is relevant to academic accomplishment, teachers and students need facilities to achieve learning objectives. It is established that students easily remember what they see, so visual and practice should complement theory. To achieve this, instructional materials, adequacy of classrooms, information and communication and technology should be provided in the public school system.

Zdeněk ULRYCH
University of West Bohemia, Pilsen, Czech Republic, ulrychz@kpv.zcu.cz

Abstract

This paper presents the possibilities of introducing and visualizing the Industry 4.0 trend concept to students of industrial engineering, or workers in technical fields using the STEM concept. The first part of the paper deals with an overview of technical aids with which it is possible to introduce the concept of Industry 4.0. The second part of the paper is devoted to a description of the Fischertechnik Training Factory Industry 4.0, how to operate it, the programming possibilities and a presentation of the possibilities for using it in education at technical universities, with industrial executives and other areas mainly related to industrial engineering.

Keywords: Industry, Industry 4.0, Industrial engineering, Engineering, Mechanical engineering, Education, STEM, Fischertechnik

Introduction

The education of both students and workers in complex fields such as industrial engineering is a relatively difficult task during the 4th Industrial Revolution. The previous need for knowledge and understanding of e.g. layout, production machines (including their possibilities and limitations), technological and production processes is extended by at least one other essential dimension – a communication layer between machines and people, or people and people, or also machines and machines, where people can be understood as service / employees of the company, so today in many cases this means suppliers, internal customers, or external customers. This puts new demands on the imagination and orientation of students / educated workers in new technologies, which is relatively difficult to pass on in such a way as to give a real idea of what Industry 4.0 is, what benefits and opportunities it brings and an idea of what is needed to introduce, change or improve if the organization wants to work as an Industry 4.0 company or wants to take it to the next level within the Industry 4.0 concept. In this case, it is advisable to use appropriate teaching and presentation aids for familiarization with the Industry 4.0 concept. In this way it is possible to switch from theoretical education to practical education, when a much higher level of interest and understanding of the issue can be expected, mentioned by Xudong Pan et al. (2011).

Industry 4.0 education

For practical training in Industry 4.0, it is appropriate to use physical models that promote interest, imagination, creativity as well as a level of understanding mentioned by Zokowski et al. (2016) or Rehman, Narejo and Zaidi (2012). This can also increase the range of students' knowledge without negative consequences on understanding the problem and success in the exam. So, there are 4 options for education in Industry 4.0:

1. Do not use physical models (educational aids)
2. Use own models (own building, e.g. using 3D printing)
3. Use building kits
4. Use purchased assembled models

Because we did not want to follow the path of not using educational aids and we already use the kits in the classroom - these are programmable kits based on the STEM concept Fishertechnik education - STEM Engineering, we had to choose between buying an assembled model or building it ourselves.

The advantage of such models is the possibility of demonstrating process thinking and production management methods such as Lean, Six Sigma or TOC and others in production practice mentioned by Koblasa, Šírová and Kralikova (2019).

Approaches to presenting Industry 4.0 on our own model

Platforms such as Arduino, RaspberryPi, or BBC micro:bit are the most common custom models illustrating the Industry 4.0 concept.

According to Votrubec and Koblasa (2019), it is possible to build a relatively complex model illustrating the Industry 4.0 concept on the Arduino development platform with Wi-Fi network communication and a stand-alone automatic guided vehicle (AGV), where problems such as guidance accuracy and fluidity of AGV can be solved by using a combination of physical modification and optimization of the algorithm for evaluating line tracking (or designing a new one).

In the case of the BBC micro:bit, the most common approach is the creation of separate devices (robotic arm, warehouse, conveyor, elevator, etc.) mentioned by Sanfilippo and Austreng (2018). If we want to create communicating devices it is possible to use Bluetooth (programming in graphical environment Microsoft MakeCode) or a radio signal (Python or programming in graphical environment Microsoft MakeCode) mentioned by 'Micro:Bit Educational Foundation | Micro:Bit' (2020).

In the case of RaspberryPi, there are often already deployed controllers, such as Industry 4.0 Embedded Systems Network mentioned by Andramuño, Vega and Parra (2019) (where there is a combination of RaspberryPi as a server and Arduino), or e.g. control units for a robotic arm mentioned by Garcia et al. (2018).

Variants of model acquisition and creation of own model

The advantage of acquiring an assembled model is the speed of delivery and the possibility of introducing it almost immediately into education. On the other hand, a bought solution has some disadvantages like the relatively high purchase price, the necessity of adapting it to the chosen model and in some cases it is a closed solution and this may be disadvantageous. Moreover, in such a case we will not encounter mistakes and dead ends related to the creation of our own model, which often have a significant influence on the transfer of knowledge and understanding of the issue.

Creating one's own model is from an educational point of view, i.e. understanding the issue, acquiring knowledge and engaging in the issue, probably the best way. Another significant advantage is that when creating your own model, many possibilities open up for bachelor's, master's or doctoral theses, which in addition can permeate across disciplines such as electrical engineering, construction, machining, cybernetics, informatics, industrial engineering, etc. Such models can be built on almost any platform such as Arduino (mentioned by 'Arduino - Home' (2019)), BBC Micro: Bit (mentioned by 'Micro:Bit Educational Foundation' (2019)), RaspberryPi (mentioned by 'Teach, Learn, and Make with Raspberry Pi – Raspberry Pi' (2020)) and others, or their combination. The cost of such a model is considerably lower than the acquisition of a finished model, and it is possible to extend the model almost infinitely in terms of both hardware and software. On the other hand, the disadvantage of this variant is that it is time consuming, and the model is not available for teaching in the near future and the creation of the final model can take several years.

In view of the above, the combination of both variants seems to be the best way. That is, to acquire an assembled model that is available almost immediately and it is possible to include it in the classroom and at the same time work on our own model using student work.

Industry 4.0 models on the market

There is not much choice on the market of ready-made models based on the Industry 4.0 principle, or models that could, after slight modifications, present the Industry 4.0 principles.

FESTO CP Factory

CP Factory is a versatile modular development and education platform in the Industry 4.0 area. It uses standard PLC systems, so there should be no problem connecting another system, including communication between them. All modules have a standardized size and the dimensions of most modules are around 1200 x 800 x 900 mm, stated by Festo Didactic SE (2020a).

FESTO CP LAB

These are pre-assembled sets of models from CP Factory and separate modules suitable for production, such as modules for drilling, bending, stamping, etc. An example is CP Lab 404-1, which consists of four application modules mentioned by Festo Didactic SE (2020b) of approx. 1800 x 1800 x 1800 mm:

- Magazine application module, which allows e.g. work with RFID, Process start
- Analogue measuring application module, which allows work with e.g. QS, SPC, Analytics
- Drilling application module, which allows work with CPS, Production parameters, Variants
- Output application module, which enables work with Parameter processing, Flexible handling, Logistics

Fischertechnik Training Factory Industry 4.0 - 9V

The model uses a 9V power supply, the control of the model is via the Fischertechnik cloud, which can be customized. The model contains 6 control units, a Wi-Fi router providing an internal Wi-Fi network and communication with the cloud via WAN. The model consists of a robotic swivel arm with vacuum system for gripping / dropping material and an NFC reader, automated warehouse, machine tool, conveyor, sorting device working on the principle of colour detection and a station of environment sensors with a remote-control camera cloud. The dimensions of the model are approximately 9720 x 7720 x 4020 mm mentioned by Fischertechnik GmbH (2020a).

Fischertechnik Factory Simulation – 9V or 24V

The model is largely similar to the Fischertechnik Training Factory Industry 4.0 and is available in 9V mentioned by 'Factory Simulation 9V - Simulation - Fischertechnik' (2020) or 24V versions mentioned by Fischertechnik GmbH 2020b. The 9V model needs to be equipped with control units that can control power elements running on 9V, e.g. the Fischertechnik TXT Controller, which is also equipped with the Fischertechnik Training Factory Industry 4.0 model. The model using 24V does not contain control units and needs to be additionally equipped with a PLC system through which it can be controlled. Another significant difference from the version of Fischertechnik Training Factory Industry 4.0 is the lack of material reception and delivery with the NFC reader, the connection to the Fischertechnik Cloud and the missing sensor station including the camera. All these things can be done by our own solution and driven via PLC. The variant running on 24V has the advantage of simple extension of any components from PLC technology, deployment and operation of our own PLC systems and connection to other models or devices e.g. for collection or transfer of information mentioned by Fischertechnik GmbH (2020b).

Merkur Toys – Programmable minilink with MG

Mercury Toys are not a complete, comprehensive solution. It seems appropriate to use the models of the Education series, specifically the programmable model "Programmable minilink with MG" which includes a robotic arm with six degrees of freedom and a conveyor with sensors. Some models of the Education series or Robotics series could be used to extend it. The model can then be expanded with other models from the Merkur Toys range, but the user must deploy some of their own, appropriate solutions for their connection and communication mentioned by Merkur Toys s.r.o. (2020).

Choice of solution

In our case, the Fischertechnik Training Factory Industry 4.0 9V was chosen. The main reason is the use of the Fishertechnik education - STEM Engineering kit in teaching the basics of robotics and algorithmization and thus a relatively simple possibility of extending the model with its own parts, the connection to the Cloud and data collection to the Cloud, including the control of the model, and last but not least, knowledge of the system and programming options thanks to the experience with the kit.

Model Fischertechnik Training Factory Industry 4.0

The model is controlled by six Fischertechnik TXT Controllers, whose basic technical data are: ARM Cortex A8 500MHz+Cortex M3, 128MB DDR3 RAM, 64 MB Flash, Micro SD Slot, 2.4" colour touch screen (320x240 Px), BT 2.1 EDR+ 4.0, WLAN 802.11 b/g/n, infra port, USB 2.0 client, 10 pin connector, I2C interface, integrated loudspeaker, Linux, power supply 9V DC, 8 universal inputs which can be used as 4 counter inputs or 4 outputs for motors or 8 individual outputs. Communication between the controllers and the cloud model is via a small TP Link Wireless Nano router TL-WR802N, which connects to the WAN by cable and creates a local Wi-Fi network to connect the controllers to each other and the main controllers with the cloud application via MQTT (Message Queuing Telemetry Transport, open message protocol) mentioned in 'TXT Controller - Fischertechnik' (2020).

In addition to control units and building blocks, the model contains a relatively large number of power elements. The most important are the NFC reader, optical colour sensor, light gates, solenoid valves, compressors, electric motors, stepper motors, calibration modules, webcam, air quality sensor, humidity quality sensor, light control sensor, thermal sensor, LEDs and buttons.

The mechanical parts are mainly gear mechanisms of various types and designs and pneumatic cylinders.

The model consists of a total of five elements: Sorting Line with Colour Detection, Multi Working Station with Oven, Automated High Bay Warehouse, Vacuum Gripper Robot and Sensor station.

Fig. 1: Fischertechnik Training Factory Industry 4.0

Description of Model Processes

Because the model consists of several separate devices that are able to communicate with each other, it is important to get an idea of the basic processes that can be encountered when using the model.

Material Storage

A colour puck containing an NFC chip is inserted (there are blue, red and white pucks, which represent material at the beginning and later a product). Using the light gate, the Vacuum Gripper Robot is informed that it has material to store. If it has no other job, it takes the material, reads the NFC code using an NFC reader, the colour using an optical colour sensor, and passes the material to the Automated High Bay Warehouse input, which puts it into a free warehouse location. Information about the colour and NFC code of the stored material is written to the Cloud and it is possible to order the product with this colour via the e-shop.

Production

After ordering the product, the material is removed from the warehouse and the material is transferred using the Vacuum Gripper Robot to the Multi Working Station with Oven, where heating in a furnace is simulated (inserting the material into the furnace, LED simulating the heating and withdrawal of the material). The Multi Working Station with Oven has a small vacuum gripper that transfers the material to the milling machine, where the machining is simulated and transferred to the Sorting Line with Colour Detection when the machining is complete. The current status of the material and the use of individual parts of the model, including the reporting of possible errors, is constantly displayed in the cloud interface.

Transportation to pick-up place

As soon as the workpiece reaches the Sorting Line with Colour Detection, the conveyor is lowered, the product passes through the paint shop, and the product is sorted by colour at the end of the conveyor to the dispenser. The current status of the material and the use of individual parts of the model, including the reporting of possible errors, is constantly displayed in the cloud interface.

Product picking

When the product is delivered to the warehouse, the Vacuum Gripper Robot takes over again, checks the NFC code and colour of the product, and issues it to the customer. In the graphical interface of the cloud application there is information that the customer should take the material. The removal of the material by the customer is monitored by a light gate.

Watch / Check Factory

The entire factory can be viewed from the graphical interface of the cloud application using a webcam, which can be remotely recorded as needed. It is also possible to create photographs. A sensor station monitors the model environment, namely temperature, air quality, lighting and pressure. All this information is graphically depicted in the cloud application's graphical interface.

Fig 2. Fischertechnik Cloud – sensor information

Demo program of the model

The demo program of the Fischertechnik Training Factory Industry 4.0 is fully available on the Git hub mentioned by 'TxtSmartFactoryLib: Main Page' (2019), including the source code, which means it can be modified. Control programs can be written in C / C++ mentioned by 'TxtSmartFactoryLib: Main Page' (2019), Python mentioned by 'Fischertechnik TXT Community Firmware' (2019), RoboPro (graphical programming environment, where the program is created by composing graphical elements and setting their properties) and now also in Scratch mentioned by 'Fischertechnik/FT-TXT' (2020).

Cloud - Dashboard

The production model and simulation can be viewed from the cloud application's graphical interface from 3 different views:

- Customer View - The customer can see what products can be ordered (depending on the stored material) and place an order. When the product is finished, the customer is informed and can take it from the dispensing point.
- Supplier View - The supplier sees what material is stored in the factory and what material is missing. Accordingly, it can supply the missing material and the factory will store it.
- Manufacturing View - The manufacturer can see the stock status, current production, the status of all parts of the model (whether they are working / standing or reporting any error),

the statistics of the ordered products and the factory environment (temperature, humidity, pressure, lighting)).

Fig. 3: Dashboard of Training Factory Industry 4.0 from Fischertechnik Cloud system

Model Extension Options

The behaviour of the model can be changed by either modifying the demo version of the control program or creating one's own control program. The extension of the model can be done either by the added part communicating with the model elements via Wi-Fi, or by only reading data from e.g. light gates. Such an extension is easy, quick to implement and there is no danger of brick modelling. In this way it is also possible to solve separate elements of the AGV type, which would bring the material for storage or take away the finished products. In the case of reading only values from light gates, it seems easy to use other models built on a platform other than Fischertechnik, such as Arduino, BBC micro:bit, or RaspberryPi.

Industry 4.0 concept in the model

The principle of Industry 4.0 in this model is based on several points.

The first important point is the concept of collaboration between the individual elements of the Fischertechnik Training Factory Industry 4.0. The model is composed of five separate devices controlled by their own control units, namely Sorting Line with Colour Detection, Multi Workstation with Oven, Automated High Bay Warehouse, Vacuum Gripper Robot and Sensor Station. These independently controllable models communicate with each other by connecting to a common Wi-Fi network, and in some cases using shared features such as light gates. In addition, one of these controllers provides communication with the cloud application. If necessary, you can program or modify the demo program for selected devices only.

The second important point is online access to the model from anywhere and via any device (phone, tablet, PC, laptop, etc.). The only condition is internet access and a web browser. Using the cloud

application, the model is completely managed and the state of the warehouse, production, etc. and the state of the environment in the factory - temperature, humidity, lighting, or air quality are monitored.

The third important point is the ability to access the model as a material supplier, a customer ordering a product, or a manufacturer, with the ability to monitor the current state of the warehouse, product, manufacturing features and current production process or processes at any time.

Possibilities of using the Fischertechnik Industry 4.0 model

The Fischertechnik Industry 4.0 model seems to be a quick (or instant) opportunity to show students or engineering professionals the principles of the Industry 4.0 concept in such a way that they can understand it and can imagine at least approximately the impact of the concept on production, management, communication both within the company and with its surroundings. Last but not least, we can show the way of thinking of all who work or cooperate with an enterprise at least partly based on the Industry 4.0 principle.

In addition to the Industry 4.0 principle, this model (and similar models) can also be used to familiarize students with in-house and outsourced logistics (using other, proprietary models), fundamentals of algorithmization, programming, data collection and visualization simulation. Creation of digital twins should be understandable and if students are familiar with the model, then the validation and verification should be relatively simple. As reported, for example, mentioned by Vachálek et al. (2017), which used the digital twin model Festo.

Conclusion

The paper describes the basic idea of the approach to modelling the Industry 4.0 concept, including a brief overview of some models based on this principle and a closer look at the possibilities of the Fischertechnik Industry 4.0 model in teaching and its practical use for industrial engineers or workers in any technical sector. An approach where the problem is shown on a suitable model is a way to enable students to see the tangible results of their work on a physical model that behaves according to student-programmed rules, but mainly it teaches students to think in the necessary context, systemically and with regard to the surroundings of the designed and running system. The industrial engineer can then use these models not only for simulation, but also for the creation of initial system designs or problem solving designs of real systems in certain cases. It should be possible to use such models in practice as part / complement of large systems, e.g. for data collection, behaviour evaluation, planning or management of certain processes.

Abstract

The success and competency of an education system depend on the main driver of the system. They are the teachers. Teaching is not the only profession associated with a high-stress level job. Instead, almost all other professions are. High-stress level imposed an occupational threat to the mental and physical state of a person. Stress is a state of mental or emotional strain which results from adverse or demanding circumstances. It provides both physical and emotional effects leading to positive and negative feelings among teachers. Over the years, researchers examined issues about the stress level in the teaching profession. Researchers contended that teaching preparatory work mainly causes teachers to have a high-stress level. However, there is little evidence from the Malaysian literature concerning the stress level among school teachers. Hence, it is obligatory to explore the factors affecting stress level among teachers in Malaysia. This study may help the researchers to diminish the gap. This study attempts to examine the relationship between variables that affect stress among school teachers in Selangor. This study adopted the quantitative method. Researchers distributed the Questionnaires among 15 secondary schools in Selangor, particularly in Petaling Utama district which totals up to 2259 teachers. The findings reveal that the independent variables are highly significant and positively associated with the dependent variable. Hence, all the hypotheses were accepted. The findings further reveal the teachers' stress awareness. Steps to be taken to keep stress under control were proposed using various stress management techniques. The measures proposed in this study include widespread stress handling program development for teachers.

Keywords: Stress; depersonalizations; workload; interpersonal relationship; working environment

Introduction

According to Maphalala (2014), pressure is an organizational problem, which can disturb individuals in a somewhat public atmosphere, whether workplace, home or religious. Like everybody else in their group, teachers

are unprotected to tension due to their working profession (Maphalala, 2014). The causes of stress can be internal or external to the individual. (Maphalala, 2014). A study by the National Union of the Teaching Profession *Malaysia* (NUTP) found that 70 percent of 9,000 teachers across the country were depressed not only because of the burden of duties but also had to face headaches, clerks, parents and students (Nor Kasiman, 2009). Raja Ali (2011) in his written report stated time constraint factor was the highest mean score (2.66), followed by the task load factor (2.58), the reward factor (2.50) and the lowest mean score was the student's incapacity factor (2.10).

Stress-related issues are acceptable complaints in most workplaces, this is associated with some negative personal and professional effects (Karasek & Thorell, 1990; Roeser et al., 2013; Shirom, Oliver, & Stein, 2009). Teachers 'pressure not only affects teachers' health and negatively on job satisfaction, but also increases in teacher pressure across the country (McCarthy, Lambert, & Reiser, 2014).

In Malaysia, there are a few researchers who do research related stress among teachers but this is not done at all levels and areas in large scale (Rahman Budi, 2013). There is a need for some future researchers to continue studying about stress among teachers in Malaysia especially at Selangor and Kuala Lumpur (Zahid Munir, 2010). The highest levels of stress among teachers were caused by the introduction of the new curriculum (Maphalala, 2012). The largest direct effect on teacher stress in this category resulted from planning and assessment workload (Maphalala, 2012). Among the factors that cause teacher stress are depersonalisation, self-success, emotional depletion, overwork, interpersonal relationships and work environment. This depersonalisation refers to a teacher's emotional state such as how to treat a student and how a teacher overcame his student's problems. Self-success refers to the way a teacher achieves success in seeing his students achieve good results in the lesson. Emotional deprivation also refers to a strong sense of teacher in carrying out tasks without feeling angry, sad and sentimental. The working environment also affects teachers in their daily tasks including classroom environment conditions, teaching aids facilities and other tools to facilitate teacher and student relationships.

Besides good interpersonal relationships it is also necessary for teachers to share their problems with colleagues, co-workers are always cooperating and always getting encouragement from administrators or principals. Teachers are also charged with various administrative tasks that have become routine of their work, such as filling in forms, collecting fees, updating student arrivals, preparing performance reports, preparing test and exam questions, giving guidance and more to advance their students. Kyriacou (1987) also emphasizes that long-term stress can undermine mental and physical well-being as well as to significantly undermine the teacher's career and student performance as stress affects teaching quality and commitment of teachers. This study can help to inform the level of stress experienced by teachers in Selangor especially in Petaling Utama district. The effectiveness of an education depends on the main driver of the system, namely teachers. Teachers' performance and commitment are important for a teacher to help the nation in achieving success.

Stress Among Teachers

The issue of stress among teachers has gained considerable attention and began to be studied as early as the 1970s to this day (for example: Kyriacou & Sutcliffe, 1978; Chaplain, 1995; McCormick, 1997; Lau, 2002; Lemaire,2009; Abdullah Ismail, 2010;Ages, 2011). Among them are the study by Van Dick and Wagner (2001) who find that the load factor work is a major contributor to teacher stress. Their study also shows that the stress experienced by teachers will have a negative impact not only in terms of physiology such as high blood pressure, but also it also affects the behaviour of teachers. It also found by Tang and Yeung (1999) and Lau (2002) in Hong Kong's high school studies also found that the burden of duty has caused teachers to invite stress. This phenomenon is also supported in Kokkinos (2007) and Kumarakulasingam (2002).

Montgomery and Rupp (2005) conducted a meta-analysis on 65 studies related to teacher stress from 1998 to 2003 to identify the various causes that cause teachers to become stressed. The findings show that three external stress factors moderately influence stress among teachers. These factors are student behaviour, workload or job demands, and support from colleagues. Kyriacou and Chien (2004) are also in their study of primary school teachers in Taiwan found that 48 percent of respondents were at moderate stress levels. Similar findings were obtained from the study of Klassen and Chiu (2010) on primary and secondary school teachers in Canada. The factors of workload and poor attitude were also found to be the dominant factors affecting teachers' stress. Compared to the Chaplain study, Klassen and Chiu reported with detail that the level of stress of a female teacher

is much higher than that of a man but it is only for the factors of workload and the ability of the student alone. Based on the literature emphasized above, it is pure that there are numerous reasons that cause teachers to feel stressed. Among them are workload factors, student abilities and relationships with colleagues. As teachers are an important asset needed by the state, the teachers need to be addressed especially in the face of stress. With the stress among teachers, it will have an impact on teachers in making commitments in carrying out their duties and responsibilities at school.

The Relationship of Depersonalization and Stress Among Teachers

Concept of depersonalisation emphasises on the individual that remains comparatively fine after facing high quantities of traumatic lifecycle events. Individuals who contribute a high mark of stress without falling ill have a character structure differentiating them from individuals who become sick under stress (Kobasa, 1979). This character change is greatest characterized by the term "personalize". Personalized reflects the individual's response to life events both for myself and for money (Kobasa, 1979). Depersonalisation is a particular type of dissociation involving a disrupted integration of self-perceptions with the sense of self, so that individuals experiencing depersonalisation are in a subjective state of feeling estranged, detached or disconnected from their own being (Daphne Simeon, 2004). Some teachers may lead to avoid some work because they think it was not under the job scope of teacher as an example key in marks into an online system and it makes them feel unhappy (Kusyairi, 2010).Commitment imitates an assurance to oneself and to one's effort. Control is the degree to which a distinct stimuli lifecycle actions to warrant a precise conclusion. Challenge refers to lifetime actions and one's comeback to a person's events. Persons who are strong survive with several stressors, both for example life cycle, family and specialized for instance work-related roles and associations, are better than those people who are not hardy (Simoni and Paterson, 1997). Therefore, it can be hypothesized that,

H1: There is a positive relationship between depersonalisation and stress among teachers.

The Relationship of workload and Stress Among Teachers

Occupational Stress (OS) is the employee's response when facing work stresses and burdens not matched to their resources, needs, skills and information, and overwhelmed their capability to succeed (Desouky and Allam, 2017). Committed teachers' always want to finish the syllabus prior to the schedule organized by school and sometimes they do not have enough time (Norhayati, 2012). Teachers also tend to get headaches with several organizational responsibilities that have become repetitive of their work, such as filling in forms, collecting fees, bringing up-to-date student entrances, preparing performance reports, preparing quiz and exam questions, providing direction and more to advance their students (Kelly, 2011).

Kyriacou (1987) also emphasizes that long-term stress can undermine mental and physical well-being as well as to significantly undermine the teacher's career and student performance as stress affects teaching quality and commitment of teachers. The current research discloses that accountability for pupils to be successful in examinations and able to act like standard students were the chief workload that underwrote teachers' stress. This is shadowed by managerial work, presence training, managing stock and catalogue, and too much task in one time (Mohd Ghani, 2014). Therefore, it can be hypothesized that,

H2: There is a positive relationship between workload and stress level among teachers.

The Relationship of Interpersonal Relationship Between Colleagues and Stress Among Teachers

Investigation of this research exposes that the greatest important stress influence for interpersonal relationships is "getting blurred instruction and orders from the managerial", shadowed by observation by education officers and absence of colleagues' collaboration in accompanying an action specifically from a regular education instructor (Mohd Ghani, 2014). There are, however, insufficient studies have been presented on pressure interferences and their efficiency among teachers (Wiley and Sons, 2006). Work stress among colleagues is common but will be

problematic in the future and may occur episodes of depression in two groups on management and administration (Lewinsohn, Rohde, Klein, & Seeley, 2010; Pine, Cohen, Gurley, Brook, & Ma, 2010; Rao, Hammen, & Daley, 1999; Weissman et al., 2011). Among the causes of conflict is the misunderstanding, personal problems such as spousal relationships or problems that are happening at home and taken to the office and do not recognize colleagues despite long working groups in an organization (Cramer, 2011). Therefore, it can be hypothesized that,

H3: There is a negative relationship between interpersonal relationship between colleagues and stress level among teachers.

The Relationship of Working Environment and Stress Among Teachers

One of the sources of labour pressure is by the unhealthy and safe working conditions (Toscanor & Weber, 2009). This factor is due to incomplete work instructions and unspoken safety instructions, unregulated regulations, inherent hazards are not well controlled, lack of interaction between management and unprotected protection devices (Bulatao & VandenBos, 2011). Working in locked and unfriendly organizational environment takings about undesirable reactions and moods on the part of the teachers and students, these including disappointment, psychosomatic burden, shirking, insignificance, and finally job alienation leading to occupational stress which can be named the catastrophe of the contemporary era (Ahghar, 2008). Stress that is bright to decrease teacher's motivation can have harmful effects such as alienation from the school, absenteeism, and attrition. In fact, when superior education teachers are harshly harassed by the uncontrollability of their job, they are more likely to leave the special education classroom (Miller, Brownell, & Smith, 2013). Therefore, it can be hypothesized that,

H4 There is a negative relationship between workload and stress level among teachers.

Methodology

The research strategy of this research is adopted survey research where the instrument used for this research would be a questionnaire. By distributing the questionnaire, the data gained is less time consuming rather than using other methods. Other than that, this method would give the researcher accurate data from the respondent. The process of distributing the questionnaire is done within 10 days. First of all, the researcher will contact the administration for each of the chosen schools. The questionnaire will be given to administration at each school and they will give it to teachers in that particular school to answer the questionnaire. They are given 14 days to complete the questionnaire without any pressure from the researcher. If the total of questionnaires that the researcher received back from the representative of the class is not tallyed for the first time, the researchers will give another set of questionnaires and collect them back within 3 days. The researcher also uses a simple word to make it easy for the respondent to answer all the questions.The content of the questionnaire is also not subjective to a specific respondent as the topic and items of the questionnaire is understandable by all respondents. The researcher would use a personal administered questionnaire through drop and collect method. For this research, the variables proposed to measure are adopted from the past research that has been conducted by the past researchers. The independent variable that is being measured is depersonalization, workload, interpersonal relationship among colleagues and working environment adopted from (Azizi Yahaya and Mazeni Ismail, 2014).

Findings and Discussion

Based on the findings of this study, in terms of demographic profile, the respondents are mostly female (85.9%) equivalent to 305 of them. And the rest of the respondents are male (14.1%) equivalent to 50 of them. Most of the respondents have been working up to 3-4 years (45.4%) equivalent to 161 of them. The second highest are up to 1-2 years of work (45.4%) equivalent to 159 of them. Lastly followed by who are more than 4 years of work (9.9%) equivalent to 35 of them.The respondents' salary are less than or equal to RM 4000.00 (65.6%) equivalent to 233 of them. The second highest salary is less than or equal to RM 3000.00 (24.5%) equivalent to 87 of them. Lastly followed by whose salary are more than RM 4 000.00 (9.9%) equivalent to 35 of them. The majority of the respondents are teaching elective subjects (55.2%) equivalent to 196 of them. And the rest of the respondents are teaching core subjects (44.8%) equivalent to 159 of them.

Correlation

Table below showed that there is a significant positive high correlation between workloads and stress (r=0.755, p=0.00, p<0.05). Therefore, it illustrates that the higher the workloads the higher the stress. Table above that there is a significant positive high correlation between relationships between colleagues and stress (r=0.812, p=0.00, p<0.05). Therefore, it illustrates that the higher relationship between colleagues the higher the stress. Table above shows that there is a significant negative almost negligible correlation between the relationship between the working environment and stress (r=-0.195, p=0.00, p<0.05). Therefore, it illustrates that the higher working environment the lower the stress.

Table 1: Correlation and Cronbach Alpha Table

Variables Workload Depersonalization Relationship Work environment Stress

Depersonalization 0.362** (0.618)

Relationship 0.694** 0.646** (0.660)

Work Environment -0.175** -0.174 (0.035) (0.638)

Workload (0.669)

Stress 0.755** 0.786** 0.812** -0.195 (o.636)

Note: ** Correlation is significant at the 0.01 level (2-tailed); Entries in parenthesis indicate Conbrach Alpha values.

The alpha coefficient for the 15 items for depersonalisation independent variables have questionable correlation. It shows the value of Cronbach's Alpha is 0.618 (62%). It indicates that the items for depersonalisation's questionnaire can be used for the future research for different samples. The alpha coefficient for the 11 items for workloads independent variable have questionable correlation. It shows the value of Cronbach's Alpha is questionable 0.569 (57%). It indicates that

The items for workloads questionnaire can be used for future research for different samples. The alpha coefficient for the 9 items for interpersonal relationship between colleagues independent variables have questionable correlation. It shows the value of Cronbach's Alpha is questionable 0.660 (66%). It indicates that the items for interpersonal relationship between colleagues questionnaire can be used for the future research for different samples. The alpha coefficient for the 17 items for working environment independent variables have unacceptable correlation. It shows the value of Cronbach's Alpha is questionable 0.038 (4%). It indicates that the items for the working environment questionnaire can't be used for the future research.

All the four independent variables (Depersonalisation, Workloads, Relationship Between Colleagues and Working Environment) together explain 88% (R^2=0.883) of the variance Stress. It is highly significant, as indicated by F-value of 658.745 (f>1) as shown in the table.it indicates that the remaining 12% was influenced by other variables.

(Constant) -41.388 3.985 -10.386 .000 Total Workloads .637 .040 .437 16.002 .000 Total Depersonalisation 1.215 .062 .501 19.545 .000 Total Relationship Between Colleagues .588 .106 .187 5.544 .000 Total Working Environment -.159 .084 -.038 -1.894 .059

a. Dependent Variable: Total Stress

Based on the coefficients table, depersonalisation is proven to be the highest variable that influences stress (β=1.125, p=0.000, p<0.05) where 50% of depersonalisation influences stress. This indicates the higher the depersonalisation, the higher the stress. This is followed by workloads (β=0.637, p=0.000, p<0.05) where 44% of workloads influence stress. This indicates the higher the higher the workloads, the higher the intention to stress. Next followed by relationships between colleagues (β=0.588, p=0.000, p<0.05) where 19% of relationships between colleagues influence stress. However, the working environment was found not significant as the 4% (β=-0.159, p=0.059, p>0.05). This indicates the higher the working environment, the lower intention to stress.
Collin (2012) stated that there is a positive relationship between depersonalisation and stress which means the higher the depersonalisation the higher the stress. People who are facing depersonalisation need to be more energetic, try to be involved in sport and get more new friends (Billy, 2013). It tends to make them feel more relaxed and peaceful (Gabriel, 2003).Therefore hypothesis 1 is supported.
Hypothesis 2 : There is a positive relationship between workloads and stress . This is supported by Munir, (2010). The higher the workloads the higher the stress among Teachers. Teahers often are burdened with administration work such as to collect fee bills, registration student names and conduct orientation day for students (Kelly, 2013).
Hui Ling Ling (2011) stated that there is a positive relationship between interpersonal relationships between colleague and stress. The higher the interpersonal relationship between colleagues the higher the stress. Hypothesis 3 is supported.
For hypothesis 4, Rubbin (2007) stated that the higher the working environment the higher the stress. It happened, as an example for those who work in teaching profession including lecturer and nursery and kindergarten, even though the environment is clean and peaceful but they need to work on Saturday and sometime may lead to half day on weekend (Rubbin, 2007). However, according to Kelly (2009), the relationship sometimes can be positive and negative, it depends on who your respondents are.

Conclusion

Based on the objectives of the research which is to determine the relationship between depersonalisation, workloads, relationship between colleagues, working environment, four hypotheses were developed in order to determine the relationship between independent and dependent variables. To conclude the finding, all the hypotheses accepted.
Overall, the results of this study have achieved its objective of responding to the study questions based on the variables studied. The findings show that teachers from 15 secondary schools in Petaling Utama District experience stress even at moderate levels. The findings show that the factors that cause stress among secondary school teachers in Petaling Utama are depersonalisation, workloads, relationship between colleagues and working environment. The importance of paying attention to these factors is seen in terms of their impact on students, teachers, and schools. Improving the positive relationship between teachers and parents is not only beneficial for both parties, but also for the excellence of the school. It is also important for appreciation and support factors, especially from the administration that can be further enhanced to create a harmonious atmosphere in the school.

School administrators should play a key role in reducing the stress of teachers. School administrators should also play a key role in reducing the stress of teachers. Principals, professors or administrators need to first establish a healthy and harmonious school environment by ensuring a good relationship between the administration and the teachers without any conflicts. The management style of headmasters and school principals also greatly influences the relationship with their subordinates, especially teachers. Headmasters should not only use one management style, such as collaborative or collaborative management styles but can diversify them according to the appropriate situation. The other way to treat depersonalisation is that counsellor at school may conduct one day for teachers to do stress tests, teach them how to handle stress, how to measure stress and knowing in depth the causal effect of stress. Teachers who have a depersonalisation effect also can do some vacation or get outdoors activities such as jogging, joining music class and try to involve in corporate social responsibility events. They also need to talk, try to be an extroverted person, join any indoor or outdoor club and be a president for any society or do something that doesn’t make them feel lonely.

As for the future research, it is recommended that longitudinal study be used along with observations of the same subject over a period of time. Therefore, the objectives can be reached within the time. Although it would take more time and effort and cost more rather than doing cross-sectional studies, however, a well-planned longitudinal study will help researchers to identify causes and effect relationships for studies. As to measure the effect of the stress, researchers can detect developments or change in the characteristics of the target population at both the group and individual levels.

Health Security Survey of the Population of Warsaw Using the Logistic Regression Model

Małgorzata GRZELAK
Military University of Technology, Faculty of Security, Logistics and Management, Warsaw, Poland,
malgorzata.grzelak@wat.edu.pl

Abstract

Health is the priority value for all people and a prerequisite of their sense of safety. Fast economic and industrial growth has heightened the risk of threat to human health security. This is attributable to the constantly growing emissions of harmful substances into the environment, which causes air pollution, including smog. Consequently, it is essential to monitor and survey the types of emitted substances and their underlying factors through analysis. Such an analysis is discussed in this article. It employs the logistic regression model. Based on survey data collected in the years 2016-2018, a preliminary analysis of the conditions of smog formation was carried out. The estimated parameters of the model and calculated odds ratios allowed the assessment of impact of selected factors on the risk of exceeding the concentration limits of harmful substances in the air. Assessment of the model was carried out based on cross-validation, and its quality was validated against a significance analysis of parameters and by testing goodness of fit using the Receiver Operating Characteristic Curve (ROC) and the Area Under ROC curve (AUC). Obtained results can be useful in shaping the development of the comprehensive environmental strategy for the area of the capital city of Warsaw.

Keywords: Smog, Logistic Regression, Health Security

Introduction

Health security is defined as a process implemented by government, self-government, specialized and non-specialized bodies and units aimed to maintain or improve the health status of citizens as well as enhancing the operation of health care system (Kięczkowska, 2020; Aldis, 2008). The fast growth of industry and the transport sector, let alone globalization, has some negative effects on the environment, in particular generating air pollution. Such effects can pose a threat to the health security of society as well as directly contributing to the emergence of respiratory, cardiovascular, and cancer diseases in humans. Therefore, it is of key importance to monitor and study the types of emitted pollutants and factors that deepen the negative impact on the environment. It is also no less important to develop forecasting models that support the decision-making in environmental matters.

The population of Warsaw is growing steadily reaching 1.77 million in 2019. The number of registered motor vehicles is on the rise as well (up to 727 vehicles per 1,000 residents). This means traffic congestion and an increase in emissions affecting the environment. These facts have urged a research which aims to identify factors and areas in which corrective action can be taken to improve the worsening condition of the environment.

The research focuses on air pollution which leads to the formation of smog in the city of Warsaw. It employs the logistic regression model. Based on data spanning the years 2016-2018 and covering the concentration of specific harmful particles in the air (e.g. PM-2.5 or PM.10), a preliminary analysis of smog formation was conducted. Then, explanatory variables were identified that may be involved in the occurrence of the phenomenon. Quantitative variables were also selected related to weather conditions and traffic volume plus qualitative variables attached to the calendar date. Based on the above input, model parameters were estimated, and the existing relationships were assessed. Assessment of the model was carried out based on cross-validation, and its quality was validated against a significance analysis of parameters and by testing goodness of fit using the Receiver Operating Characteristic Curve (ROC) and the Area Under ROC curve (AUC).

Literature Analysis: Problem Status

The price for the dynamic economic and industrial development, coupled with the growing demand for carriage services, is more and more harmful compounds released into the atmosphere. The result is air pollution which takes the form of smog. Reduced air purity produces many negative effects, including on human health status, primarily seen in the growing number of respiratory, circulatory, and cancer diseases. It also worsens the mental state of people who are concerned with their health. The World Health Organization estimates that the stressors associated with the environment and its pollution account for 15 to 20% of all deaths in European countries. In addition, according to the Organization for Economic Co-operation and Development (OECD), by 2050 the level of air pollution in cities is forecast to become the main environmental cause of mortality in the world (Treder, 2017).

Air pollution is understood as the presence of a specific volume of liquid and gaseous substances in one of the strata of the atmosphere that causes a nuisance to humans and has a negative impact on their health. The main sources of pollution are natural and are attributed to environmental processes, i.e. forest fires or volcanic eruptions, but they can also be anthropogenic, i.e. related to human activity, e.g. emissions caused by the use of motor vehicles or the heating of homes. The visible effect of exceeded air pollution limits is referred to as smog (Gangwar, 2019).

Smog refers to a non-natural atmospheric phenomenon that is caused by two main factors: human activity and specific atmospheric conditions (Łabij-Redtuta et al., 2019). Based on the available literature on the subject, two main types of smog can be distinguished: the London-type and the Los Angeles-type smog. The London-type smog is mainly caused by air pollution due to the burning of coal and sulfur dioxide emissions. Its chemical structure is: nitrogen oxides, soot, and dust suspended in the air. Such contamination combined with fog causes the formation of sulfuric acid droplets in the air (Read, Parton, 2019; Wielgosiński, Czerwińska, 2020). On the other hand, the Los Angeles-type smog, also known as photochemical smog or tropospheric ozone, consists of carbon oxides, nitrogen oxides, and hydrocarbons. These compounds undergo photochemical reactions and lead to the formation of peroxyacetyl nitrate (PAN), aldehydes and ozone (Czerwińska et al., 2019; Hidy, 2018).

A closer look at the literature on the subject shows an extensive research interest in the phenomenon of smog. Among the available studies, some focus on the mechanisms of smog formation and its chemical composition together with its effects on society. Still, others attempt to design mathematical models that capture the most significant factors behind the occurrence of smog as well as producing forecasts for its development (Łabij-Redtuta et al., 2019). Among the smog forecast models available in the literature, there are statistical and deterministic models. The former cover research mainly based on the analysis of ARIMA (or ARMAX) time series (Ni, Huang, Du, 2017), neural network models (Ravi, 2019) or data mining models (Pusporani et al., 2019). The latter include a diffusion box model, Gaussian diffusion models or chemical transport diffusion models (Bang, 2019; Levi, 2019; Wang, 2020).

The review of the available literature revealed a comparatively small number of studies on the use of the logistic regression model to study the risk of exceeding the nominal limits of concentration of air pollutants leading to the formation of smog. However, in the author's view, it seems reasonable to determine a satisfactory level of air purity and take measures only when the established limits are violated. This approach can help identify significant relationships between the identified factors and high air pollution by pinpointing the source and causes of such a state of affairs and enabling corrective measures to be taken to alleviate negative effects on the environment.

Logistic Regression Model

The study of threats to health security in the capital city of Warsaw was performed using the logistic regression model. It permits a mathematical demonstration of the influence of several variables $X_1, X_2, \ldots, X_n$ on the dichotomous variable Y, which adopt value 1 in the case of high values of air pollution indicators (smog) and value 0 when high air quality and purity is reported. The binding function of the model is the logistic function which takes the form of (1):

$$f(x) = \frac{e^x}{1+e^x} = \frac{1}{1+e^{-x}} \tag{1}$$

where:
e - Euler's number,
x - value of explanatory variable *X*.
The logistic regression model is embodied in the equation:

$$P(Y=1|x_1, x_2, \dots, x_k) = \frac{e^{\beta_0 + \sum_{i=1}^{k} \beta_i \cdot x_i}}{1 + e^{\beta_0 + \sum_{i=1}^{k} \beta_i \cdot x_i}} \tag{2}$$

where:
β_i $i=0,\dots,k$ – regression coefficient,
$x_1, x_2, \dots, x_k$ – independent variables that can be measurable or qualitative.

The logistic regression model is based on the method of expressing probability through odds, i.e. a ratio of probability of occurrence of an event and probability of its non-occurrence. For event A, the above definition takes the form of:

$$(\text{Odds})\text{S(A)} = \frac{P(A)}{P(notA)} = \frac{P(A)}{1-P(A)} \tag{3}$$

The most commonly used measure of association is the odds ratio (OR). For the two compared groups A and B, it is defined as the ratio of likelihood of A v. likelihood of B. The odds ratio is recorded as:

$$\text{OR}_{AxB} = \frac{S(A)}{S(B)} = \frac{P(A)}{1-P(A)} : \frac{P(B)}{1-P(B)} \tag{4}$$

Regression coefficients β_i where $i = 0, \dots, k$ are estimated based on the maximum likelihood estimation (MLE) which maximizes the likelihood function or its squared value. The likelihood function takes the form of (Borucka, Grzelak, 2019):

$$\text{L}(x_1, x_2, \dots, x_n; \theta_1, \theta_2, \dots, \theta_k) = \prod_{i=1}^{n} p(x_1; \theta_1, \theta_2, \dots, \theta_k) \text{ for discrete variables} \tag{5}$$

$$\text{L}(x_1, x_2, \dots, x_n; \theta_1, \theta_2, \dots, \theta_k) = \prod_{i=1}^{n} f(x_1; \theta_1, \theta_2, \dots, \theta_k) \text{ for continuous variables} \tag{6}$$

where:
$\theta_1, \theta_2, \dots, \theta_k$ - unknown distribution parameters,
$x_1, x_2, \dots, x_n$ - observed in the random sample of the value of variable X,
p(x) - distribution determined by the likelihood function,
f(x) - distribution determined by the density function,
L - likelihood function.

Assuming that all observations are independent of each other, the likelihood of observing the entire data set (with established model parameters) is equal to the product of the likelihoods (likelihood function) of individual samples. The results of estimated parameters are values with the highest likelihood (the higher likelihood, the better model to data matching).

Model and prediction quality assessment is carried out by:

- taking advantage of the statistics used in the assessment of diagnostic tests, i.e. accuracy (ACC), sensitivity (SE) and specificity (SP),
- conducting a Hosmer-Lemeshow test,
- plotting the ROC and analysing the AUC.

The use of statistics employed in the assessment of diagnostic tests requires a value known as cut-off point. This is the value of the studied variable that optimally divides a group into two parts: one in which a phenomenon occurs and the other in which it does not. The cut-off point is therefore a fixed value π_0 from the range [0,1] for which:

$$\hat{P}(Y=1|x) > \pi_0 \tag{7}$$

To assess the quality of the classification, two values are most often used simultaneously: sensitivity and specificity (within the meaning of difference: 1 - SP). In order to perform assessment, the received

value pairs 1 - SP and SE are marked on a plane where the horizontal axis represents values 1 - SP and the vertical axis represents values SE. The connection of the two points creates the so-called Receiver Operating Characteristics Curve (ROC) that allows an overall assessment of the predictive quality of the model. It shows all possible cut-off points and related statistics. Moreover, it does not depend on the adopted scale and allows easy reading of sensitivity and specificity values.

If there is a continuous independent variable in the logistic regression model, many different cut-off points can be tested that help distinguish occurrences from non-occurrences, depending on predicted likelihood. It is important to find such a point that reveals high values of both sensitivity and specificity. This will be the optimal cut-off point determined using the Youden index (J). It adopts the following form:

$$J = sensitivity + specificity - 1 \quad (8)$$

The optimal cut-off point corresponds to a case in which value *J* reaches the maximum.

The study of health security threats in the capital city of Warsaw using the logistic regression model

The subject of the study is air quality in the capital city of Warsaw. The analysis covered the values of concentration of individual particles registered in the years 2016-2018, including PM 2.5 [μg/m^3], PM 10 [μg/m^3], ozone O_3 [μg/m^3], carbon monoxide CO [mg/m^3], benzene C_6H_6 [μg/m^3], sulphur dioxide SO_2 [μg/m^3] and nitrogen dioxide NO_2 [μg/m^3]. Regular monitoring is carried out by the Chief Inspectorate for Environmental Protection. It underlies the estimation of air quality index. Exceeding the nominal concentration limits for individual particles in the air causes the formation of smog. An air quality index with a binomial distribution was used as a dependent variable for which *1* means exceeded nominal concentration limits of the above particles, i.e. smog. For the purposes of the study, it was assumed that smog occurs when at least one of the nominal concentration limits for individual particles in the air is exceeded, these limits being: for PM 2.5 - 35.1 [μg/m^3], PM 10 - 50.1 [μg/m^3], ozone O_3 - 120.1 [μg/m^3], carbon monoxide CO - 7.1 [mg/m^3], benzene C_6H_6 - 11.1 [μg/m^3], sulphur dioxide SO_2 - 100.1 [μg/m^3] and nitrogen dioxide NO_2 - 100.1 [μg/m^3].

The building of the model begun with selecting factors that may affect the explanatory variable. Primary selection covered variables related to the calendar date, weather conditions (air temperature, wind speed, air humidity, cloudiness, total precipitation, air pressure and insolation), as well as traffic volume.

In the first step, the impact of the above variables on the dependent variable was analysed. As regards the group of qualitative variables, the analysis was carried out based on contingency tables and testing the relationship strength using independence test χ^2 (Table 1).

Table 1: Independence test results χ2 (Pearson's test)

Variable	Test statistics value	df	p-value
day of week	45.30	6	0.00
month	57.40	11	0.00

The analysis revealed that both the day of the week and the month have a significantly influence on air quality and smog formation. It was confirmed by the results of independence test α^2. These results show that the null hypothesis should be rejected in favour of the alternative one saying that the value of concentration of individual particles in the air depends on qualitative variables linked to the calendar date.
The analysis of the impact of quantitative variables on air quality in the capital city of Warsaw was based on non-parametric Levene's homogeneity of variance test. (Table 2).

Table 2: Results of Levene's homogeneity of variance test

Variable	Test statistics value	p-value
air temperature	3.85	0.00
wind speed	38.71	0.00
total precipitation	9.26	0.00
air humidity	4.85	0.00
cloudiness	4.21	0.00
atmospheric pressure	4.98	0.00
insolation	45.30	0.00
traffic volume	4.15	0.00

The results of the test indicate the need to reject the null hypothesis in favour of the alternative one saying that the variances in individual groups are not homogeneous, which means that the above variables have an appreciable effect on the modelled phenomenon. In addition, a single-factor analysis was performed of quantitative variables along with the corresponding result of the LR (Likelihood Ratio) test, looking at whether the single-factor model containing a given variable is significantly better than the model with only an absolute term (Table 3) (Kozlowski, et. al. 2020).

Table 3: LR test results

Variable	Test statistics value	p-value
air temperature	9.72	0.00
wind speed	79.71	0.00
total precipitation	29.01	0.00
air humidity	13.78	0.00
cloudiness	12.74	0.00
atmospheric pressure	18.35	0.00
insolation	13.32	0.00
traffic volume	11.03	0.00

To ensure the effectiveness of using the logistic regression model requires that the assumption of linearity of independent and quantitative variables be met. Uncritical adoption of the assumption of predictor linearity has an adverse effect on the process of inference about the impact of the variables and may ensue in encumbered values of estimators of regression parameters. Therefore, a graphical assessment of its scatter plots was carried out along with the odds logarithm corresponding to its value. In addition, a linearity test was performed to check whether the quality of the model is statistically significantly affected by the addition of the square of the predictor value (Table 4) (Borucka, Grzelak, 2019).

Table 4: Results of linearity of quantitative variables test

Variable	p-value
air temperature	0.15
wind speed	0.20
total precipitation	0.00
air humidity	0.55
cloudiness	0.68
atmospheric pressure	0.89

Variable	p-value
insolation	0.00
traffic volume	0.89

Calculated *p* value indicates that for the variables *air temperature, wind speed, air humidity, cloudiness, air pressure* and *traffic volume*, there are no grounds for rejecting the null hypothesis indicating the linear impact of the tested variable on the analysed phenomenon.

In the next stage, a multifactor model was built using the backward stepwise method in which statistically significant variables will not be rejected and will not be included in the model's design. The variables used were those whose impact on mortality due to traffic accidents was significant and linear. For qualitative variables, parametrization was carried out with the adopted benchmark (January was used for the variable *month* and Saturday for the variable *day of the week*). Cross-validation was selected as a method of model assessment. Estimated values of logistic regression parameters are shown in Table 5.

Table 5: Estimated parameters of the logistic regression model

Effect	Modelled likelihood: poor air quality Distribution: binomial, binding function: LOGIT				
	Effect level	Parameter	Standard estimation error	Wald test statistics	p-value
month (m)	February	-0.38	0.46	0.69	0.01
month (m)	March	-1.13	0.48	5.60	0.02
month (m)	April	-2.87	0.56	26.20	0.00
month (m)	May	-5.82	0.69	70.88	0.00
month (m)	June	-5.16	0.70	54.84	0.00
month (m)	July	-5.39	0.72	56.02	0.00
month (m)	August	-5.27	0.71	54.36	0.00
month (m)	September	-4.26	0.63	45.46	0.00
month (m)	October	-2.63	0.51	26.28	0.00
month (m)	November	-1.58	0.45	12.19	0.00
month (m)	December	-1.17	0.43	7.46	0.01
day (d)	Sunday	-0.98	0.33	8.71	0.00
day (d)	Monday	-2.05	0.35	34.50	0.00
day (d)	Tuesday	-1.14	0.33	11.87	0.00
day (d)	Wednesday	-0.19	0.34	0.32	0.01
day (d)	Thursday	-0.74	0.34	4.79	0.03
day (d)	Friday	-1.02	0.33	9.53	0.00
air temperature		0.10	0.02	18.72	0.00
air humidity		-0.04	0.01	22.10	0.00
wind speed		-0.90	0.10	85.84	0.00
cloudiness		-0.15	0.05	10.41	0.00
pressure		0.01	0.00	101.93	0.00

All estimated model parameters proved to be statistically significant. For all variables, the Wald test statistical value and the corresponding *p* value are below the adopted significance level α=0.05. On this

basis, it can be concluded that the factors named above have a significant impact on the risk of exceeding the nominal values of concentration limits of harmful particles in the air. The logistic regression model equations is (9):

$$P(dead = 1|X) = \frac{e^a}{1 + e^a} \tag{9}$$

where: $a = -0.38 \cdot February - 1.13 \cdot March - 2.87 \cdot April - 5.82 \cdot May - 5.16 \cdot June - 5.39 \cdot July - 5.27 \cdot August - 4.26 \cdot September - 2.63 \cdot October - 1.58 \cdot November - 1.17 \cdot December - 0.98\, Sunday - 2.05 \cdot Monday - 1.14 \cdot Tuesday - 0.19 \cdot Wednesday - 0.74 \cdot Thursday - 1.02 \cdot Friday + 0.10 \cdot air\ temperature - 0.04 \cdot air\ humidity - 0.90 \cdot wind\ speed - 0.15 \cdot cloudiness + 0.01 \cdot atm.pressure$ (10)

The equation given above can take the equivalent form of odds (11):

$$P\frac{P(dead = 1|X)}{1 - P(dead = 1|X)} = e^a \tag{11}$$

where: $a = -0.38 \cdot February - 1.13 \cdot March - 2.87 \cdot April - 5.82 \cdot May - 5.16 \cdot June - 5.39 \cdot July - 5.27 \cdot August - 4.26 \cdot September - 2.63 \cdot October - 1.58 \cdot November - 1.17 \cdot December - 0.98\, Sunday - 2.05 \cdot Monday - 1.14 \cdot Tuesday - 0.19 \cdot Wednesday - 0.74 \cdot Thursday - 1.02 \cdot Friday + 0.10 \cdot air\ temperature - 0.04 \cdot air\ humidity - 0.90 \cdot wind\ speed - 0.15 \cdot cloudiness + 0.01 \cdot atm.pressure$ (12)

Then, the model's goodness of fit was examined based on a comparison of predicted and observed values. For this purpose, the Hosmer-Lemeshow (HS) test was used. It compares the frequency of occurrence of the modelled class with its actual materialization. The null hypothesis for the above test assumes that the observed and expected frequencies do not differ from each other. The calculated p-value of the HS test is 0.45. It does not give grounds for rejecting the null hypothesis showing that the model matches the data well.

The next step was to calculate the odds ratio of exceeding the nominal values of concentration limits of harmful particles in the air, provided that some of the individual factors occurred. The sign next to the calculated parameter values indicates whether the analysed factor is a stimulant or destimulant of the odds of occurrence of the studied phenomenon (Table 6).

Table 6: Estimated odds ratios

Effect	Modelled likelihood: death as a result of a road accident Distribution: binomial, binding function: LOGIT				
	Effect level	**Odds ratio**	**95.00% Cl**	**-95.00% Cl**	**p-value**
month (m)	February	0.68	0.28	1.68	0.01
month (m)	March	0.32	0.13	0.82	0.02
month (m)	April	0.06	0.02	0.17	0.00
month (m)	May	0.01	0.00	0.01	0.00
month (m)	June	0.01	0.00	0.02	0.00
month (m)	July	0.01	0.00	0.02	0.00
month (m)	August	0.01	0.00	0.02	0.00

month (m)	September	0.01	0.00	0.05	0.00
month (m)	October	0.07	0.03	0.20	0.00
month (m)	November	0.21	0.08	0.50	0.00
month (m)	December	0.31	0.13	0.72	0.01
day (d)	Sunday	0.38	0.20	0.72	0.00
day (d)	Monday	0.13	0.07	0.26	0.00
day (d)	Tuesday	0.32	0.17	0.61	0.00
day (d)	Wednesday	0.82	0.42	1.61	0.01
day (d)	Thursday	0.48	0.25	0.93	0.03
day (d)	Friday	0.36	0.19	0.69	0.00
air temperature		1.11	1.06	1.16	0.00
air humidity		0.96	0.94	0.98	0.00
wind speed		0.41	0.34	0.49	0.00
cloudiness		0.86	0.78	0.94	0.00
pressure		1.01	1.01	1.01	0.00

The calculated odds ratio values (Table 6) indicate that each of the model parameters has a significant effect on the risk of exceeding the nominal values of concentration limits of harmful particles in the air. Speaking of air temperature, the odds ratio indicates that an increase by one degree raises the risk of air pollution by 11%. In the case of air humidity, an increase in the parameter by 1% reduces the risk of worse air quality by 4%. An increase in cloudiness by one octane reduces the risk by 14%, while an increase in atmospheric pressure by 1 hPa increases the risk by 1%. The analysis of the odds ratio for the month variable indicates that in January the risk of exceeding the concentration limits of harmful particles in the air is lower in the other months: 0.01 times in May, June, July, August and September, 0.68 times in February, 0.32 times in March, 0.06 times in April, 0.07 times in October, 0.21 times in November and 0.31 times in December, respectively. Considering the day of the week, it should be noted that for Saturday the risk of exceeding the air purity limits is lower: 0.38 times on Sunday, 0.13 times on Monday, 0.32 times on Tuesday, 0.82 times on Wednesday, 0.48 times on Thursday and 0.36 times on Friday, respectively.

The above model can also be used to predict the risk of exceeding the nominal values of concentration limits of harmful particles in the air, so the next step was to assess the quality of prediction. The ROC was plotted. Its key assessment parameter is AUC, i.e. the area under the ROC. It adopts values from 0 to 1. The larger the area under the curve (AUC), the greater model discrimination. For its assessment, Kleinbaum and Klein proposed the following classification (Table 7) (Borucka, Grzelak, 2019):

Table 7: AUC classification

AUC value	Grading
0.9<AUC<1.0	Excellent discrimination
0.8<AUC<0.9	Good discrimination
0.7<AUC<0.8	Fair discrimination
0.6<AUC<0.7	Poor discrimination
0.5<AUC<0.6	Failed discrimination

The model was assessed using cross-validation: the sample was divided into 10 subgroups containing the training and test sets. The study was then conducted in accordance with the LOO (leave one out) strategy. It provides that all observations are used to estimate the model except one that will be used to calculate prediction error. The overall prediction assessment is an average of errors from individual

sets (Borucka, Grzelak, 2019). Due to the use of cross-validation for model assessment, ROCs were plotted separately for the training and test sets; next, the AUC fields were calculated (Figs 1 and 2). Determined were also the cut-off point and the matrix of classification of actual observations and those indicated by the model (Tables 8 and 9).

Fig. 1: ROC curve for training set

Fig. 2: ROC curve for test set

Table 8: Classification matrix: actual state and model indication

	Predicted: 1	Predicted: 0	Percentage of correct
Observed: 1	480	117	80.40
Observed: 0	157	342	68.54

Table 9: Cut-off point for tested model

Observation no.	Cut-off point	True positive	True negative	False positive	False negative	SE	1-SP
624	0.51	476	351	148	121	0.79	0.29

The calculated AUC values for individual sets are 0.8225 for the training set and 0.7803 for the test set, respectively, which (according to the classification by Kleinbaum and Klein) permits a conclusion that they exhibit sufficient discrimination. This testifies to good data fit and to the sufficient quality of the model in the event of emergence of new data. In addition, the calculated AUC values are similar (the difference between them is not greater than 0.05), which means that the model can be considered correct.

For the proposed cut-off point, sensitivity is at 0.79, while 1 - specificity at 0.29. There are 827 correctly classified cases (476 positive positive and 351 positive negative) and 269 badly classified ones (148 false positive and 121 false negative). For this adopted cut-off point, the value of accuracy indicator, which determines prediction effectiveness, is 75.45%, which allows the model to be considered satisfactory and proves its good predictive properties.

Summary

Air quality in the capital city of Warsaw has a direct impact on the residents' health security. A high level of air pollution affects the mental state of the residents and can also be an underlying cause a number of diseases, including respiratory, circulatory, and oncological conditions. The economic and industrial development and the accompanying population growth in Warsaw provided a stimulus for an analysis aimed to identify factors that significantly contribute to air pollution.

The study discussed in the article was conducted on data on the concentration of harmful particles in the air registered between 2016 and 2018 in the capital city of Warsaw. The objective was to develop a model for estimating the risk of exceeding permissible air pollution limits, which manifests itself in the form of smog. Based on the developed model, it was demonstrated that air temperature has a significant role in smog formation, and a temperature growth one degree increases the risk of smog by 11%. In the case of air humidity, an increase in the parameter by 1% reduces the risk of worse air quality by 4%. An increase in cloudiness by one octane reduces the risk by 14%, while an increase in atmospheric pressure by 1 hPa increases the risk by 1%.

The assessment of quality of the developed model demonstrates its good predictive characteristics. The model can be used as a tool supporting decision-making processes in environmental protection management in the city of Warsaw.

Abstract

Organization social effectiveness assessment has been studied for many decades by leading experts in the field of economics and management. However, at present, unified approaches to the problem of quantitative and qualitative measurement of social efficiency have not yet been determined. What makes it even more difficult is that this category is directly related to the working activity of personnel, and human behavior is subject to special laws and has a direct impact on the economic and social results of the organization. The study of scientific approaches and concepts allows us to identify three methodological approaches to assessing the social effectiveness of an organization. Proponents of the first approach believe that the main criteria for social effectiveness are the final results of work for a certain period of time. Proponents of the second scientific trend are of the opinion that indicators reflecting social efficiency should take into account labor productivity, as well as its quality and complexity. The third approach puts social efficiency directly dependent on the forms and methods of working with staff. This study showed that it is impossible to assess the social effectiveness of an organization using just one indicator. To do this, a system of indicators should be used, which collectively will indicate social efficiency. This point contributed to the development of methods for assessing the social effectiveness of an organization based on labor indicators.

Keywords: Social Efficiency, Personnel Management, Performance Indicators

Introduction

Long-term success of the organization is impossible without effective personnel management, since it is investment in a person that contributes to the development and socio-economic growth of the organization and the economy as a whole. However, the problem is exacerbated by a conflict of interest between staff and employers. In an effort to maximize economic benefits, the employer often pushes into the background the needs and interests of workers. A high level of economic efficiency can be achieved only when social efficiency is achieved. Therefore, the problems of assessing social effectiveness are important for scientific research.

Certain aspects of the study of social efficiency from the standpoint of economics and management were considered in the works of well-known domestic and foreign scientists, such as G.V. Atamanchuk (2002), L.P. Vladimirova (2006), B.M. Genkin (2019), I.N. Gerchikova (2017), R.L. Daft) (2015), P.F. Drucker (1998), A.P. Egorshin (2015), A.A. Litvinyuk (2015), I.I. Mazur (2003), M.H. Mescon (1988), M.G. Mankew (2014), Yu.G. Odegov (2011), K.A. Raitsky (2003), S.D. Reznik (2018), S.P. Robbins (2018), H.A. Simon (1995), E.A. Utkin (2000), V.M. Shepel (1999), I.O. Shkaratan (1982), K. Eklund (1991) among others.

General approaches to social efficiency were studied, however, the assessment of social efficiency based on labor indicators is not found in the works of domestic and foreign researchers.

Materials and Methods

The scientific problem was investigated on the basis of the Department of Economics and Management of the Cheboksary Cooperative Institute (branch) of the Russian University of Cooperation using information resources that are available, including electronic library systems, official websites of existing Russian organizations. The object of the study is organization of Russian business entities, their structural units (training and development of personnel, personnel administration, staff recruitment groups, remuneration management departments), as well as mechanisms for participation in ensuring the organization's social effectiveness.

In the course of work, general scientific methods of dialectics, system analysis, expert assessments, opinion polls, and the theory of social efficiency were used.

Research Results and Discussion

The success of the economy of the organization is determined by the ability to increase the volume of activity, and of the social component - by the growth of the real level of remuneration, increase of the social security of staff, improvement of the quality of working standards, as well as the comprehensive development of a person.

In our opinion, social efficiency comes to the foreground as the economy becomes more socially oriented. We propose to consider this category as workers' satisfaction with the level oftheir salary, labor intensity, social security, and career and professional growth prospects. Based on the works of well-known Russian scientists G.V. Atamanchuk, B.M. Genkin, A.P. Egorshin, E.A. Utkin, it was proposed to group the factors and criteria of the organization's social effectiveness based on labor indicators (Fig. 1).

The studied category is very specific, which leads to difficulties in choosing the criteria for its evaluation. The following are the leading quantitative and qualitative factors of social efficiency: social (qualitative) structure of personnel, salary, degree of satisfaction of the staff with their work. Indicators of labor are the criteria for social effectiveness of the organization.

Fig. 1 : Factors and criteria that are taken into account when assessing the organization's social performance based on labor indicators

All researchers who studied the problem of social efficiency assessing agree that it is much more difficult to measure social efficiency than economic performance. A number of researchers argue that social effectiveness of an organization is largely determined by the system of motivation and stimulation of labor, organizing work with personnel and an established organizational culture. A more typical methodology for assessing social effectiveness is proposed by Russian scientists and economists Yu.G. Odegov and T.V. Nikandrova They believe that attention should primarily be focused on the prevention of negative aspects (damage to the physical and psychological health of the employee) and implementation of benefits (ensuring a decent standard of living, social contact, recognition of merit, individual development).

After a thorough and detailed analysis of the scientific and methodological literature, we propose a grouping of parameters for assessing the organization's social effectiveness based on labor indicators and their generalization according to the object and content of the analytical work (Fig. 2).

Fig. 2 : Scheme of grouping parameters for assessing the social effectiveness of the organization

Based on the proposed criteria parameters, we propose the following groups of indicators reflecting the social effectiveness of the organization (table 1).

Table 1: groups of indicators showing the social effectiveness of the organization

Indicator groups	Essential Content
Salary level	Guaranteed permanent part of renumeration (salary), remuneration for certain achievements in work, annual and quarterly bonuses, surcharges
State social guarantees (according to Labor Code of the Russian Federation)	Annual paid leave, payment of state-guaranteed benefits, payment of sick leave
Social guarantees provided by the organization	Payment of material assistance, gifts for significant dates within the framework of corporate policy, compensation payments

	(corporate communications, food, travel, additional medical insurance)
Environment in the workplace	Socio-psychological climate, management styles in the organization, stress prevention, positive motivation
Relations with senior management in the organization	Respect for employee rights, relations with the organization's management, degree of respect and trust towards managerial staff, competent personnel policy in the context of digitalization of the economy
Career management	Staff turnover, regular internships and staff development, promotion solely on merit and performance, lack of apathy and stagnation
Organization of workspace and time	Security of the workplace with everything necessary, presence of a parking lot for personal vehicles, provision of company's vehicles, application of time management tools, sense of personal safety

Thus, regardless of what changes are observed in the economic and social development of the country, the main trends in ensuring the proper level of social efficiency of the organization are:

1) wage system as a key motivational incentive;

2) state guarantees in the field of labor relations, ensuring the implementation of basic rights and interests of workers;

3) social guarantees to employees by the organization in the form of non-state benefits;

4) belonging to a certain social group within the framework of labor relations, which will serve as a source of social satisfaction or vice versa;

5) relations developing along between the administration and the employee;

6) possibility of changing status as a result of career growth, leading to the development of self-motivation and self-expression of the staff, and, therefore, has an impact on the social effectiveness of the organization.

A study of approaches to assessing social effectiveness shows to the specificity of this category and causes problems in the selection of criteria for its assessmnent. Nevertheless, it is undeniable that social efficiency is directly related to the organization's personnel and its labor activity, which means that our proposed methodology for assessing social efficiency based on labor indicators is justified.

Table 2 presents the indicators recommended for assessing the social effectiveness of the organization.

Table 2: parameters for assessing the social effectiveness of the organization based on labor indicators

Indicators	Calculation Method	Note
Average salary per employee, rubles/person.	The ratio of labor costs to the average number of employees	the indicator reflects the level of salary and trends to its change
Share of labor costs in revenue, %	The ratio of labor costs to revenue, multiplied by 100%	allows to show economic feasibility of labor costs in the cost structure
Staff turnover rate	The ratio of the number of those who left the organization to the average number of employees	characterizes the level of staff stability

Socio-psychological climate, points	Determined on the basis of studies involving independent experts in this field	allows you to identify leaders, motivation, efficiency of organizational and corporate culture
Qualitative level of staff work, points or %	I) The ratio of the proportion of complaints to the average number of employees II) Expert assessment of quality according to a scale	allows you to evaluate the quality of staff with an external quality assessment by consumers and customers
Quality of organization management, points	Determined by an independent panel of experts according to a selected scale	increases the brand capital of the organization (image)
Ratio of key and supporting personnel, person	The ratio of key personnel to supporting personnel	allows you to judge the ratio of the two main categories of personnel
Average qualification level of staff	The sum of the products of the number of employees of a particular category and the category as a whole	reflects the skill level of the organization's personnel
Educational level of the organization's staff, %	The ratio of the number of employees with higher and secondary vocational education to the average number of employees	allows you to judge the level of education of staff
Ratio of the average salary in the organization and the average salary in the constituent entity	The ratio of the average salary in the organization to the average salary in the constituent entity	reflects the correspondence of the size of the average salary in the organization with the average value in the region
Actual salary, rubles	Ratio of nominal wages and price index	reflects the amount of material benefits that an employee can receive in the amount of nominal earnings
The level of differentiation of wages	The ratio of the maximum and minimum wages	reflects differences in the level of remuneration between employees of the organization
The degree of satisfaction of staff: - relations in the team - remuneration - social security - career growth - organization of the workspace	It is determined on the basis of sociological and psychological studies (primarily questionnaires) with the involvement of independent experts and specialists of consulting firms	allows you to understand how satisfied the employees of the organization with their work, the atmosphere in the team, working conditions
The degree of staff cohesion	Determined based on specialized tests (e.g. Seashore)	serves as an indicator of the organizational culture of the organization

The proposed methodology for assessing social efficiency based on labor indicators is quite universal and can be used to conduct a comprehensive analysis of social efficiency both at the organization level and in the macroeconomic aspect.

Conclusion

Based on the study, the authors come to the following conclusions. Efficiency should be considered both from the economic and social points of view, with priority being given to social efficiency. Considering that social efficiency is achieved, first of all, through the realization of the interests of personnel, it is proposed to evaluate it on the basis of labor indicators, which can be integrated into the following groups:

1) social (quality) staff structure;

2) remuneration;

3) employee satisfaction with work.

Summarizing, it should be noted that the use of labor indicators for assessing social efficiency was not chosen accidentally, since the success of any business mainly depends on effective, self-developing, loyal to the organization personnel.

Abstract

In Public Relations, the Publics of an organisation are essential; therefore, implementation of a planned programme of action must serve the interest of both the organisation and its publics. Public relations is a management function, and its activities and tool are indispensable to every organisation for building and sustaining their image in public, especially to their audience. This study seeks to find out the awareness of public relations actions carried out by the ministry and agency and the impact of their activities on the citizens. The study focused on the Lagos state ministry of environment and one of its agencies, Lagos State Parks and Gardens, which were selected purposively. The population was selected purposively due to accessibility and availability of respondents also; every citizen has an equal chance of being selected both male and female. The sample size for the study was 250 questionnaires, but 200 questionnaires were retrieved successfully from the field. The study discovered an information gap and the need for more awareness of organised public relations activations. However, the study recommends that the government's public relations actions should help the citizens to imbibe the appropriate cultures and lifestyles that would grow organisations. Also, other researchers are to find out the awareness and the impact of this initiative, LASPARK on the populace in Lagos covering other local governments and zones.

Keyword*:* Awareness, Publics, Public Relations, Healthy Living, Environment, Impact

Introduction

The British Institute of Public Relations defined Public Relations as a deliberate, planned and sustained effort to establish and maintain mutual understanding between the organisation and its public. According to the Mexican Statement (1978), public relations is the art and social science of trend analysis, management counselling and implementation of planned programmes.

The sustainability and development of the environment become a focus to tackle. Hence, the Lagos State Ministry of the Environment came to existence and saddled with the responsibility of ensuring a clean, healthy and sustainable environment for the wellness of the citizens. The wellness and totality of the citizens are imperative to the government in order to achieve a sustained environment. The Lagos State Parks and Gardens Agency was established with its mandate to make Lagos greener and healthier through the creation and maintenance of operational parks and gardens and planting and maintenance of trees.

Statement of The Problem

The Lagos State Ministry of the Environment focuses on the clean, healthy and sustainable environment for the wellness of the public. Lagos State Parks and Garden Agency is one of the agencies with a mandate to make Lagos greener and healthier through maintenance of trees in conjunction with the Sustainable Development Goals 15- emphasis on Life on Land. Despite the existence of LASPARK, there are issues surrounding tree felling, planting of trees, parks

development, and gardens tending. Trees maintenance has become necessary for combating the adverse effects of climate change and the safety of lives on land. Therefore, this study seeks to find out the awareness of public relations actions carried out by the ministry and agency and the impact of their activities on the citizens.

Research Objectives

The objectives of this study are to find out the Public Relations activities carried out by the Ministry and Agency, how informed are the citizens about it and its impact on them.

1. To find out the extent of awareness of the ministry and agency PR activities on the public.
2. To find out the impact of the PR tools on the public.

Research Questions

1. What is the extent of awareness of the ministry and agency PR activities on the public?
2. What is the impact of the PR tools on the public?

Theoretical Framework

Excellence theory supports the objectives of this study. It is a public relations theory that stipulates that the effectiveness of an organisation depends on the engagement of public relations practice. Public relations determine an organisation's structure, relationship management and public worth (J. E. Grunig 1992; Dozier et al. 1995; L. A. Grunig et al. 2002).

The theory's emphases on the relevance of public relations in an organisation and society, following the social role of the top management, their decisions impact on the public. The theory indicates that proffering effective solution to stakeholders' problems must be a primary goal of an organisation. If not achieved, the stakeholders might force the organisation to be flexible or oppose it in ways that add cost and risk to corporate progress.

Research Design and Methodology

In this study, the researcher adopted the survey research design. Survey research design has an unbiased representation of the population of interest and by gathering of the same information from each participant (Owens, 2002). The use of a questionnaire instrument was engaged to get answers to the research questions from respondents. The questionnaires were administered on the field to the selected respondents with the aid of research assistants. The research adopted the purposive and simple random sampling technique. The researchers administered the questionnaire based on random selection as every individual had an equal opportunity to participate. The sample size for the study was 250 questionnaires, but 200 questionnaires were retrieved successfully from the field.

Literature Review

Public Relations, as viewed by Grunig and Hunt (1984, p.6) is 'the management of communication that exist amid an organisation and its publics'. Besides, PR is the management function that deals with creating and maintaining understanding relationships that are valuable to both an organisation and its publics to boost its success (Cutlip et al., 2000 p.6).

Victoria Ajala (2001) source the definition of public relations as created by Harlow as the unique function that helps the management to build and maintain mutual lines of communication, approval, for cooperation between the companies and their publics. It further involves managing organisational problems and helping to inform management on issues that are of the public's interest (Salau et al., 2020). Furthermore, these help shape the decisions that would be taken by the management, which will not only benefit its publics but help actualise their goal. (Aiyende, *et al.*, 2020b; Fayemi, *et al.,* 2020a; Fayemi, *et al.,* 2020b; Fayemi, *et al.,* 2020c; Fayemi, *et al.,* 2020d; Olabanjo, *et al.,* 2020b;

Omokiti, *et al.,* 2020a).

Organisations employ these tactics to establish, maintain and to sustain a favourable image and to obtain adequate publicity. These plans are documented, signed and tied to an organisation's goal, which conveys a clear message that focuses on the values and interests of the public. The plans aim to achieve the specified objectives (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a).

Public relations practitioners engage different platforms to reach their publics online and offline; through the media, town hall meetings, public announcements, to mention a few. These are tools used to disseminate their information and intentions to the people (Nwosu *et al.*, 2020a; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

The practice of PR has become a need for an organisation to its publics. Hence, the need for PR expert in an organisation to predict consequences, counsel top leader and implement a planned program of action according to the Mexican statement of 1978. PR has become an integral part of an organisation's function. The functionality of an organisation is dependent on its level of exposure to PR activities and what it entails (Udomisor, 2013).

Furthermore, PR upholds corporate credibility which rubs off on products, services and even employees (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020; Olabanjo *et al.,* 2019). Relationship management is the essence of public relations tied to organisational performance and overall success (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).

Environmental Sustainability

Environmental sustainability implies that sustaining the environment involves a system that must be kept in check while maintaining the natural resources as used by humans at when due to replenish themselves. Though climate change is a global phenomenon, other environmental problems such as erosion, deforestation, and scarcity of drinkable add up to harm the poor, especially the developing countries. It is the collective role of both the public and private sectors to tackle these issues because environmental degradation has a considerable imprint on national economic growth. The issues as identified are insufficient government commitment, weak institutional capacity to deal with them and insufficient attention to sustainable development goals (World Bank, 2008).

The World Economic and Social Survey (2015) discussed that the international community must harmonise the climate change imbalance between the developed and developing countries. Cooperation is necessary to reduce carbon dioxide emission globally. Also, the effort to safeguard forest with sustainable production and consumption pattern, deforestation is seen to be caused by factors beyond the forest sector's control. The role of forests as viewed in the life and maintenance of the indigenous people should receive much attention. Likewise, availability of potable drinking water and sanitation depends on public ingenuity, supported by public relations efforts of government and business organisations (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020; Olabanjo *et al.,* 2019).

Sustainable Development Goals 15 - Life on Land - focuses on restoring, protecting and promoting and ensure the effective use of terrestrial ecosystems. It includes managing the forests, combating desertification, encouraging biodiversity and reversing land abuse. Human activities had caused severe damage to the ecosystem through deforestation, loss of natural habitats and land degradation. The target is that by 2030 according to the SDGs 15, deforestation would end. Forest restoration and conservation of land ecosystem would take place.

Ugochukwu (2008) opined that to ensure environmental sustainability in Nigeria, the government should increase the budgetary allocations to the environmental sector. More expenditures should go to capacity building and reorientation of the ministries and agencies. Also, the government should come up with strategies to ensure that environmental laws are adhered to by the citizens and

companies. The Nigerian environment is still under assault from various challenges; the different efforts from the government to curb such challenges are yet to stem the tide adequately. Existing policies and laws are mostly ineffective (Leke & Leke, 2019).

According to Oyefara 2013, he discovered that the Lagos state leaders need to possess essential characteristics of good governance which is also relevant to the future needs of the society. He found that the state government dedicates to improving the environment and its serenity.

Data Analysis

After the collection of data, it was analysed through frequencies and percentages by the use of SPSS (Statistical Package of the Social Science) software. The tables interpret the findings.

Table 1: Gender

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	female	127	63.5	63.5	63.5
	male	73	36.5	36.5	100.0
	Total	200	100.0	100.0	

Table 1 indicates that 73 of the population (36.5%) are males, while 127 (63.5%) are females. These show that the mainstream of the respondents are females.

Table 2: Age Bracket

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Under 18-25	53	26.5	26.5	26.5
	26-35	91	45.5	45.5	72.0
	36-45	41	20.5	20.5	92.5
	46 and above	15	7.5	7.5	100.0
	Total	200	100.0	100.0	

This table shows the age bracket of the respondents stating that 45.5% are between the ages of 26-35, 26.5% are between the ages of 18-25, ages 36-45 has a percentage of 20.5% while the lowest which is 7.5% consist of ages 46 and above. Therefore, the highest age bracket which engaged in this exercise are ages 26-35 (45.5%).

Table 3: Marital Status

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Single	90	45.0	49.2	49.2
	Married	93	46.5	50.8	100.0
	Total	183	91.5	100.0	
Missing	System	17	8.5		
Total		200	100.0		

Table 3 indicates that the married has the highest percentage with 93(46.5%) while the single has 90 (45.0%).

Table 4: Educational Qualification

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	SSCE	37	18.5	19.5	19.5
	OND/NCE	57	28.5	30.0	49.5
	HND/BSC	90	45.0	47.4	96.8
	Specify	6	3.0	3.2	100.0
	Total	190	95.0	100.0	
Missing	System	10	5.0		
Total		200	100.0		

The table states that 90(45.0%) are HND/BSC Holders, 57(28.5%) are OND/NCE holders while 37(18.5%) are SSCE holders and 10(5.0%) were unanswered. The lowest 6(3.0%) specified that they were either postgraduate students or PhD holders.

Table 5: Length of residence in Lagos

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	1-5 years	50	25.0	25.0	25.0
	6-10 years	7	3.5	3.5	28.5
	11-15 years	67	33.5	33.5	62.0
	others	76	38.0	38.0	100.0
	Total	200	100.0	100.0	

Table 5 shows that 76 (38.0%) have lived in Lagos above 15 years. 67 (33.5%) have resided in Lagos for 11-15 years, 50 (25.0%) have resided for 1-5 years while 7 (3.5%) resided in 6-10 years.

Table 6: View about Lagos and its Environ?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Very good	12	6.0	6.0	6.0
	Good	132	66.0	66.0	72.0
	Not good	56	28.0	28.0	100.0
	Total	200	100.0	100.0	

This table indicates that 132 (66.0%) viewed Lagos and its environs to be Good, 56 (28.0%) viewed it to be Not Good while 12(6.0%) viewed Lagos and its environs to be Very Good.

Table 7: Is there any Difference from the Lagos of 2010 and the Lagos of 2019?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	132	66.0	66.0	66.0
	No	68	34.0	34.0	100.0
	Total	200	100.0	100.0	

This table states that there is a massive difference from the Lagos of 2010 and the Lagos of 2019 with a highest agreed percentage of 132(66.0%) while 68(34.0%) states No.

Table 8: Awareness of LASPARK

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	79	39.5	39.5	39.5
	No	121	60.5	60.5	100.0
	Total	200	100.0	100.0	

According to the table, 121 respondents (60.5%) are not aware of LASPARK while 79(39.5%) are aware of the agency, LASPARK.

Table 9: existence and function worth it?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	72	36.0	36.0	36.0
	No	128	64.0	64.0	100.0
	Total	200	100.0	100.0	

Table 9 shows that 128 (64.0%) find the existence of LASPARK not worth it while 72(36.0%) agrees that its existence and function are worth it.

Table 10: Awareness of LASPARK's Public relations activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	94	47.0	47.0	47.0
	No	106	53.0	53.0	100.0
	Total	200	100.0	100.0	

As viewed from table 10, it indicates that 130(65.0%) are not aware of the public relations activities carried out by LASPARK. In comparison, 70(35.0%) are aware of the activities, which shows a gap in information.

Table 11: Kindly mention them

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Mentioned	101	50.5	100.0	100.0
Missing	System	99	49.5		
Total		200	100.0		

According to table 11, 101 respondents with 50.5% mentioned the activities they aware of being carried out by LASPARK. In contrast, 99 persons with 49.5% failed to mention the public relations activities they are exposed to or aware of carried out by the agency, LASPARK.

Table 12: Is the Environment conducive enough for Healthy Living?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	76	38.0	45.0	45.0
	No	93	46.5	55.0	100.0
	Total	169	84.5	100.0	
Missing	System	31	15.5		
Total		200	100.0		

As shown above, 93 respondents, with 46.5% disagree that the environment is not conducive enough for healthy living; 76 respondents with 38.0% agree that the environment is conducive for healthy living. In comparison, 31 respondents with 15.5% failed to respond to the question. This result shows that the environment is not conducive enough for healthy living.

Table 13: Impact of the PR activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Mentioned	98	49.0	100.0	100.0
Missing	System	102	51.0		
Total		200	100.0		

Table 13 indicates that 102 (51.0%) did not respond to the impact of Public relations activities on them. In comparison, 98 (49.0%) mentioned its impact on them.

Table 14: Usefulness of the beautification of street, gardens, parks and lawns useful?

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	94	47.0	47.0	47.0
	No	106	53.0	53.0	100.0
	Total	200	100.0	100.0	

According to table 14, it shows that 106 respondents with 53.0% do not find the beautification of street, gardens, parks and lawns useful. In contrast, 94 with 47.0% find such an initiative to be useful.

Discussion of Findings Based on Research Questions

1. What is the extent of awareness of the ministry and agency PR activities on the public?

As seen in table 10, it indicates that 130 respondents are not aware of the public relations activities carried out by LASPARK. In comparison, 70 respondents are aware of the activities which show a gap in information. To some extents, the Public Relations activities carried out by the ministry and agency in view, LASPARK is known as the public but not to a large extent. This finding shows that much effort is necessary to create awareness for the activities. The functionality of an organisation is reliant on its level of exposure to PR activities and what it entails (Udomisor, 2013).

2. What is the impact of the PR tools on the public?

From findings, the PR tools have a slight influence on the habit patterns. Many of the respondents are still oblivious about the PR tools engaged by the ministry and the agency to disseminate their

information. The assumption is that there is an influence on the public, but findings show the discrepancy.

Some respondents claimed that the PR tools have added to their knowledge base, helped them to engage in public sanitation, and enabled their environmental consciousness. Some say the public relations actions have enlightened them on waste disposal and volunteer opportunities.

Public Relations, as viewed by Grunig and Hunt (1984, p.6) is 'the management of communication that exist amid an organisation and its publics'. Besides, PR is the management function that deals with creating and maintaining understanding relationships that are valuable to both an organisation and its publics to boost its success (Cutlip et al., 2000 p.6).

From findings, several respondents agreed that there is much difference between the Lagos of the early 20s and the Lagos of late 20s (see Table 7). Also, 79 respondents claimed to be aware of LASPARK. In comparison, 121 respondents seem to be unaware; thereby indicating many gaps in the awareness of the existence of the agency responsible for the beautification of lawn, garden, trees and ensuring sustainability in conjunction with the Lagos State Ministry of the Environment.

Some respondents are also aware of the executed public relations activities such as media relations, stakeholders' meeting, fliers distribution, news conference, and public enlightenment campaigns. There were other initiatives to deal with the dirty environment and tree felling.

According to Table 9, one hundred and twenty-eight (128) respondents did not find the existence of the agency worth it; thus, showing that despite the substantial PR activities being out by the agencies via several platforms, there remains an information deficiency.

A fair representation of the respondents agrees that Lagos is conducive for healthy living. In contrast, 93 respondents disagree with this statement. They asserted that Lagos is over-crowded, dirty and everybody wants to live in Lagos at the same time, which has contributed to the inability of Lagos to be conducive enough.

Beyond beautifying the lawns, gardens and trees, it is necessary to sensitise the public about the benefits and importance of ensuring a sustainable environment for every citizen to live in (see table 14).

One of the functions of Public relations is Feedback. Feedback helps the organisation to make proactive decisions and to ascertain that the public duly understands their messages and activities.

Conclusion

Findings show that the Public relations activities carried out by the ministry and its agency LASPARK are oblivious to the public. The PR activities as claimed to be recognised by the public are mere assumption. There is need for educating the citizens more often on the need of the gardens, parks, lawns and other activities and amenities put in place for their benefit in order to maintain a sustainable environment conducive for their total well-being in conjunction to the SDGs 15- Life on Land.

Recommendation

The study recommends the reengineering of the Lagos State Ministry of the Environment and LASPARK officials to be able to develop policies of global standards in alignment with the SDG 15. Public sensitization on climate change and advocacy on appropriate lifestyle living should increase forthwith.

Abstract

This paper is to investigate and find out the public perceptions on the activations of the Ministry of Housing using the Lagos State Development and Property Corporation (LSDPC) as a case study. Public relations plays important roles in organisations because of the level of competitions and trust from both existing and prospective patrons (Fayemi, 2019). Two hundred (200) copies of questionnaires were distributed to the members of the public to examine the level and impacts of these PR activations. The Excellence Theory by James Grunig formed the theoretical framework for this study. This study concluded that more still needs to be done when it comes to informing and creating awareness about the activities and practices of the corporation. Many respondents are not aware of the corporation's activations. Moreover, public perception of the image and activations of LSDPC is not encouraging. Based on these results, this study recommends an intentional creation of public awareness through impactful activations involving the public.

Keywords: Public, Perceptions, Activations, Ministry for Housing, Lagos state, Development, Property, Corporation.

Introduction

Public relations activities range from program planning which means analysing problems and opportunities, defining goals and planning activities. It measures results, for the progress of the organisation (Aiyende *et al.*, 2020b; Fayemi *et al.*, 2020b; Fayemi *et al.,* 2020c, Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). This way, Public relations activations plays a vital role in connecting publics all over the world and enabling them to discuss mutual concerns and solutions (Omokiti *et al.*, 2020a). However, James *et al.* (2020b) opine that the presence of PR in the government is not new; it carries the responsibility of disseminating information to the citizen of a country to make them fully aware of the governments' activities. Public relations activations and tools enhance housing development which can likely shape the common environment, reputation, developer's actions, and perceptions of the local population to be served (James *et al.,* 2020a; Ndubueze *et al.,* 2020b, James *et al.,* 2020b; James *et al.,* 2020c; Ndubueze *et al.,* 2020; Nejo *et al.*, 2020a; Olabanjo *et al.,* 2019)

Access to suitable, affordable housing and property is a fundamental human right, which is "essential to the well-being of individuals, families and communities" (ACOSS 2008 in Select Committee 2008, p29). The provision of modern housing schemes and the transformation of slums and ghettos in Lagos dates back to 1928 with the inauguration of the Lagos Executive Development Board (LEDB); among other things, the LEDB was chiefly charged with the task of getting rid of the filth and unhealthy living conditions that existed in Lagos at that time. The Board also intended to transform the slum areas and ghettos into a planned and habitable setting. Though the Board was the sole planning and development authority in central Lagos and its surroundings; the Lagos City Council was responsible for maintaining its highways, drains and open spaces. Also shared with the City Council was the approval of construction plans, an uncomfortable process that always resulted in the

delay in approving building plans. The attendant frustration of private developers often led to developers breaching planning regulations. However, subsequent urban expansion required the involvement of the Ikeja Area Planning Authority (IAPA) in controlling the development and supply of public housing outside the city.

On the one hand, the (IAPA) had full powers to monitor building plans and private development in its area of jurisdiction, but such plans had to be forwarded to the appropriate local health authorisation council. With the establishment of Lagos State in 1967, the need to curb the lack of proper coordination between the existing planning authorities involved and the unnecessary dissipation of energy without meaningful results necessitated the formation of a central body to be charged with the responsibilities of the various bodies. Consequently, the Lagos Executive Development Board (LEDB), the Ikeja Area Planning Authority (IAPA) and the Epe Town Planning Authority (ETPA) metamorphosed into what is now known as the Lagos State Development and Property Corporation (LSDPC). The LSDPC granted this metamorphosis legality. Edict No. 1 of 1972.

The way housing is perceived and consumed influences a range of factors. A major constraint on housing choices is the availability and supply of new homes, which, despite some recent efforts, lags significantly behind housing demand (NHPAU, 2009). There are also cultural influences that make the way people live or view their identity and belonging a home important (Savage et al., 2006). There are also strong demographic pressures on demand, as increased longevity and solitary living patterns mean household growth rates are higher than population growth rates (NHPAU, 2009). Residential property is now primarily seen as an investment rather than good use and is now contributing to financial planning for a household (Smith & Searle, 2006). Every investment is dependent on land, in some way or another. The land is the key component of the private sector, national and local investment, far-reaching land-related projects, tax collection, land re-adjustment, expropriation, and other similar socio-economic applications (Candas & Yomralioglu, 2016).

Though land value is one of the most important data required for all these investments and applications, the "true value" is typically difficult to predict. Assessing the value of land by assessing many factors related to real estate, e.g. location, climate, topography, and conditions of use are called valuation of real estate, which is a key factor in land management. Planning process land use can influence the supply and range of housing produced in both new development and redevelopment areas. With the rapid population growth that resulted in illegally building homes, buildings vulnerable to disasters, utilities and transportation, one needs to consider the local housing and property values (Prasetyo, & Putri, 2018)

Statement of the Problem

The rate at which housing and properties are being sold is of interest to this studies because an average individual wants to own a house or at least a property but the process of getting any of these things to dissatisfy the members of the public; when it comes to the matter of getting original documents of any property and the troubles such individual faces in a building is quite discouraging. According to SDG 9, which encompasses industry, innovation and infrastructure, Lagos State Development and Property Corporation must be able to provide their operations/duties following these goals. One of the major problems public relations faces as to do with assumptions, therefore; this research seeks to investigate Public Perceptions on the activations of the Ministry for Housing: A focus on Lagos state development and property Corporation

Objectives of the Study

The research aims to examine public expectations regarding the Lagos state construction and property corporation's activations. The following research questions will be answered based on those goals:

1. What are public relations practices in the Lagos state development and Property Corporation?
2. To what degree is the impact of these PR activations?

Literature Review

According to Grawe (2012), practitioners operating as service providers are commonly limited to advocating organisational viewpoints. This role prevents them from helping the company develop and sustain long-term partnerships that guarantee long-term organisational performance, requiring some adjustment to public expectations and needs. In establishing and maintaining organisational legitimacy, a company or organisation that has a sound public relations philosophy works unceasingly to build and maintain a good reputation on which present and future operations depend. Companies that have survived for decades, or even centuries, have built a good image-based mainly on their 'bonding' with their various publics which public relations is all about (Metzler 2001, p. 321) Public relations have achieved a secure place in the corporate structure. Significant expenditure for public relations programs is essential.

However, Ledingham (2018) noted that the relational viewpoint holds that "public relations combine the needs of organisations and the public through organisational-public relations management. The idea of managing relationships has several advantages. As Ledingham puts it, "It offers a mechanism to evaluate how public relations programs relate to organisational objectives." Such goals often go beyond profitability to encompass social and even political objectives. Ledingham claims, among others, convincingly that the relational viewpoint is a reasonable unit assessment of the influence of public relations in the organisation-public relationship. Ratio dimensions can define an organisation-public relationship which, in turn, can act as a predictor of public perception and choice behaviour and, most importantly, the result of effective relationship management is mutual understanding and benefit. The point here is that an organisation that manages its relationship with the public has a high chance of positive perception, which often leads to higher patronage of the company's product and ultimately, higher profitability.

As previously noted, Relationship management is the core of public relations in every modern sense, in particular, where organisational success is involved. Several researchers argue that "relationship should be constructed to ensure the corporate bottom line's effectiveness" (Jo, 2006, p. 227). Although many admit that public relations is useful within an organisational framework, they also observed that the contributions of public relations are difficult to measure. The seeming difficulty in measuring public relations contributions to organisational effectiveness and performance is often exaggerated because of obsession with quantification as life depends entirely on figures and statistics. In real-life situations, everything is not reduced to figures alone. In this case, the use of digital public's relations practices also helps in enhancing the existing relationship with the publics (Salau *et al.,* 2020)

Housing Affordability

Affordable housing is the supply of houses for less than market value for sale or rent. These include a housing with voucher assistance systems depending on the location and the tenant; housing built with low-income tax credits for rent; and affordable housing. 'Affordable housing' was used as an alternative to words like 'public' housing, 'private' housing or 'low cost' (Gabriel et al. 2005, p6). Practical interpretations of what constitutes affordable housing are typically unique to the context of the normal policies and services. However, they typically have common features such as a notion of what is affordable, and a reference to the target group(s) for which they are intended (Milligan et al. 2007, p26). Creating awareness and impacting personnel is a paramount function every ministry should embrace in other to bring diaspora partnerships (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.,* 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.,* 2020a).

The complexity surrounding affordability means that there is no single measure to assess the nature and degree of affordable housing issues. Therefore, the challenge is to identify the policy needs around the issues and to develop measures relevant to the policy requirements for identifying the scale and shape of the problem; assessing consumer patterns in housing, informing policy-making or

offering business feedback (Gabriel et al. 2005, p37). Quantitative tests may show that there is a problem with affordability but do not propose solutions (Gabriel et al. 2005, p37).

Additionally, the affordability of households can be experienced in a variety of ways; that is, through employment, transportation, health and other consumption by individuals, single parents and couples with children who adapt their circumstances to high housing costs and low incomes (Gabriel et al. 2005, p37). Hence Stone (2006, p459 in Paris 2007, p2) firmly argues in favour of an affordability approach to residual income because 'housing costs continue to be inflexible and make the first claim on after-tax income for most households.' The disadvantage of this approach, though, is that it relies on subjective household spending assumptions. Burke *et al.* (2004, p2 in Gabriel *et al*., 2005, p27) have commented that, while several studies that review low-income housing issues recognise the utility of residual housing costs measures (e.g. HNZC 2004; Bramley 1990; NHS 1991, pix), the preference for most researchers has been to deploy a ratio measure because of the perceived difficulties of defining measurement criteria. Ministers of Planning accept that the design and provision of affordable housing using planning frameworks is a major contributor to sustainable communities based on the three-pronged approach to sustainability through cultural, environmental and social improvements (HPLGM 2005, p5 in Gurran et al. 2007, p1)

How Affordable Housing Affect Surrounding Property Values

According to Furman 2008, the key to understanding this problem is to identify those particular housing, neighbourhood or regional economic conditions that may depress, or, in many cases, even stabilise and strengthen the values of neighbouring properties. A clearer delineation and comprehension of these requirements helps developers, builders and public representatives to make better-informed decisions which can lead to better outcomes. The factors identified most consistently through a series of rigorous research studies include:

Replacement: affordable housing projects that replace vacant, distressed areas, abandoned buildings or other blighted areas are likely to have more beneficial effects on surrounding property than those built inside vacant communities (Furman, 2008)

Degree of Concentration of Affordable Housing Units: Larger, affordable housing developments (whether new construction or rehabilitation) have, to some extent, resulted in positive prize impacts for nearby homes (Furman, 2008).

Host Neighborhood Context: affordable housing appears less likely to hurt property value when embedded in higher value, low poverty, stable neighbourhoods and when affordable housing is well managed (Furman, 2008).

Management: Good management makes a difference, and good management of assets correlates with those built by non-profit community development companies, less so with those created and operated by for-profit developers or public housing authorities (Furman, 2008).

Theoretical Framework

The Excellent Theory by James Grunig in 1985, explains the value of public relations when organisations apply the process in the system, thus contributing to good relations with strategic audiences, helping an organisation to develop and achieve desired goals, reduce negative advertising, and increase revenue by providing stakeholder-needed products and services. As defined in this theory, to a balance of expectations, property development organisations must optimise the value of public relations. Nonetheless, internal and external contact and partnership should be based on the principle of excellence.

Research Methodology

This aspect deals with the tools used to collect data from the area of study. The questionnaire is the instrument used to collect data; it consists of a series of questions. A survey research design with 200 respondents from selected publics in Alausa Ikeja, Lagos State, Nigeria, was drawn using stratified random sampling. The two hundred copies of an open and closed-ended questionnaire. It contains two sections, section A and section B. The first section is about the respondent's perceptions on the activations of the ministry for housing, while the second section consists of the demographic questions. The series of questions is aimed at eliciting information and getting answers to the research questions.

Data Analysis and Presentations

Table 1: Respondents' awareness of LSDPC

	Frequency	Per cent
Yes	131	65.5
No	69	34.5
Total	200	100.0

Table 1 illustrates that 131 (65.5%) respondents know about LSDPC, while 69 (34.5%) respondents do not know at all.

Table 2: Respondents awareness of any LSDPC's community relations activities

		Frequency	Per cent
	Yes	79	39.5
	No	67	33.5
	not sure	54	27.0
	Total	200	100.0

The above Table indicates that 79 (39.5%) respondents know about community relations activities being carried out by LSDPC**,** 67 (33.5%) respondents do not know while 54 (27.0%) respondents are not sure if community relations activities are being carried out by LSDPC

Table 3: Corporate updating of the public

		Frequency	Per cent
	Yes	84	42.0
	No	71	35.5
	Not sure	45	22.5
	Total	200	100.0

According to Table 3, 84 (42.0%) respondents said the corporation keeps up to date with new policies, activities and general information about their programmes, 71 (35.5%) respondents said they don't while 45 (22.5%) were not sure if they do.

Table 4: LSDPC activities that respondents are aware of

		Frequency	Per cent
	Press release	15	7.5
	Corporate promotions	18	9.0
	TV adverts	29	14.5
	Newspaper adverts	35	17.5
	Annual general meetings	8	4.0
	Specialised trade fairs	7	3.5
	Non	78	39.0
	Others	10	5.0
	Total	200	100.0

Table 4 shows the type of activities respondents are aware of, 15 (7.5%) respondents know Press release, 18 (9.0%) respondents knows corporate promotions, 29 (14.5%) respondents know TV adverts, 35 (17.5%) respondents knows Newspaper adverts, 8 (4.0%) respondents knows Annual general meetings, 7 (3.5%) respondents knows Specialised trade fairs, 78 (39.0%) respondents knows None of these activities, while 10 (5.0%) respondents stated "Others" as sources of awareness.

Table 5: Sources of respondents' awareness of these activities

		Frequency	Per cent
	Social media	29	14.5
	Radio	5	2.5
	Television	18	9.0
	newspaper	35	17.5
	Magazine	18	9.0
	Billboards	15	7.5
	Fliers	3	1.5
	Word of mouth	38	19.0
	Non	39	19.5
	Total	200	100.0

Talking about how respondents became aware of those activities, Table 4 shows 29 (14.5%) respondents said through Social media, 5 (2.5%) respondents said through Radio, 18 (9.0%) respondents said Television, 35 (17.5%) said Newspaper, 18 (9.0%) respondents said Magazine, 15 (7.5%) respondents said Billboards, 3 (1.5%) respondents said fliers, 38 (19.0%) said through Word of Mouth, and 39 (19.5%) respondents said non.

Table 6: Impact of these activities on respondents

	Frequency	Per cent
Increase your level of awareness	62	31.0
Encourages you to own a property/house	34	17.0
changed your perceptions about them	15	7.5
convinces you to refer a friend	4	2.0
Non	79	39.5
Total	200	100.0

Table 6 stated the impact of these activities on respondents. 62 (31.0%) respondents said it Increased their level of awareness, 34 (17.0%) respondents said it encourages them to own a property/house, 15 (7.5%) respondents said it changed their perceptions about the corporation, 4 (2.0%) said it convinced them to the point of referring a friend, while 79 (39.5%) respondent said non

Table 7: Respondents' satisfaction with these activities

	Frequency	Per cent
Yes	93	46.5
No	84	42.0
Indifferent	23	11.5
Total	200	100.0

Table 7 shows that 93 (46.5%) respondents are satisfied with these activities 84 (42.0%) respondents are not you satisfied meanwhile 23 (11.5%) respondents are just indifferent about the whole thing.

Table 8: Respondents' perceptions of respondents about the PR practices of LSDPC?

	Frequency	Per cent
Excellent	19	9.5
Above average	28	14.0
Average	57	28.5
Below average	38	19.0
Very poor	46	23.0
Don't know	12	6.0
Total	200	100.0

According to how respondents rated the frequency about the practices of LSDPC in Table 7, 19 (9.5%) said Excellent, 28 (14.0%) said Above average, 57 (28.5%) said Average, 38 (19.0%) said Below Average, 46 (23.0%) said Very poor while 12 (6.0%) don't know.

Table 9: Respondents' suggestions on LSDPC's public relations actions

	Frequency	Per cent
Create more awareness and publicity	82	41.0
Improve and do more	21	10.5
Engage more on social media platforms	17	8.5
Use modern technology for advert	34	17.0
Housing scheme	46	23.0
Total	200	100.0

The following are what the respondents think in Table 9, 82 (41.0%) said they should create more awareness and publicity, 21 (10.5%) said they should improve and do more, 17 (8.5%) said they should try and engage more on social media platforms, 34 (17.0%) respondents said they should use modern technology for the advert, while 46 (23.0%) respondents said housing scheme.

Table 10: Respondents' Gender Distribution

	Frequency	Per cent
Male	99	49.5
Female	101	50.5
Total	200	100.0

Table 10 shows that 99 (49.5%) Males and 101 (50.5%) Females responded. Meaning that more women were interested in the study than men.

Table 11: Age range

	Frequency	Per cent
18-25	55	27.5
26-31	64	32.0
32-35	47	23.5
36-41	26	13.0
42-and above	8	4.0
Total	200	100.0

Table 11 shows the ages respondent's falls into; 55 (27.5%) are between 18-25, 64 (32.0%) are between 26-31, 47 (23.5%) are between 32-45, 26 (13.0%) are between 36-41, and then 8 (13.0%) are between 42 and above.

Table 12: Marital status

	Frequency	Per cent
Married	87	43.5
Single	112	56.0
Divorced	1	.5
Total	200	100.0

According to Table 12, 87 (43.5%) respondents are married, 112 (56.0%) respondents are single, and 1 (.5%) respondent divorced.

Table 13: Occupation

	Frequency	Per cent
Students	52	26.0
Employee	96	48.0
Employer	15	7.5
Self-employed	31	15.5
Retired	6	3.0
Total	200	100.0

Table 13 shows that 52 (26.0%) respondents are Students, 96 (48.0%) respondents are employee, 15 (7.5%) respondents are employers, and 31 (15.5%) respondents are self-employed while 6 (3.0%) respondents are retired.

Discussion of Findings

According to the outcome of the analysis obtained, majority of the respondents in Table 1 knows about the corporation, but less to these percentages of respondents in Table 2 are not aware of the community relations activities being carried out by LSDPC**.** Meanwhile, in Table 3, a minority of the respondents said the corporation keeps up to date with new policies, activities and general information about their programs.

According to Table 4, the larger number of respondents which respondents know none of the corporation's activities, however, few could identify Newspaper adverts (which are the traditional media) to be the type of activities of their awareness. As a result of this, these activities have no impact on the majority of the respondents when the larger number/percentages of respondents said none of these activities has any form of impact on them

From Table 7, the number plus percentages of respondents are not satisfied while some of the respondents are just indifferent about the whole thing. More so, based on the perceptions of the public about the practices of LSDPC in Table 8, the respondents rated the performances of the corporation "Average."

Finally, in Table 9, respondents stated ways the corporation can improve its information dissemination and other public relations functions; higher number of the respondents in numbers/percentages said they should "create more awareness and publicity" while some others suggested they should "engage more on social media platforms".

Conclusion

Based on the results of this report, it is clear that it has been learned that more needs to be done when it comes to educating and increasing awareness of the company's activities and procedures because not everyone who cares about the organisation is aware of their activations that they participate in or introduce. Also, the public's view of the Lagos State Development and Property Corporation's image is not entirely positive, because the public thinks that everything they do is either bad or good, so that is why, Intentional steps must be taken by the corporation not only to let the public know what they are doing, but also to let them know how all their activities, as they may affect the public, are carried out and, at the same time, to carry the public through these different activities.

It is imperative to create a meaningful two ways relationship which comes with the mutual understanding that helps the public's get all of the information of interest to them and vice versa. It is important to note that the confiscation or modification of the property must be straightforward, fair and acceptable to all stakeholders involved in the projects (Pievatolo, 2016). Moreover, those demands have grown as changing media and increased access to information-on-demand puts greater pressure on organisations to be accessible, sensitive and transparent. (Odiboh, Olonode, Adesina, and Yartey, 2018)

Recommendations

The study recommends the improvement of the public relations office because the corporation already has an established public relations departments and experts in the field that works directly with the members of the public, but still, the corporations need to get their public relations tools right and properly engage their publics in communicating their activations because the public's of an organisation is it most important stakeholders with whom relationships need to be developed. Therefore, Lagos State Development and Property Corporation need to do more in building substantial relationships with the public by communicating their healthy activations, facilities and

expertise always. Public relations in any organisations are the messages communicated and the relationships established with the publics.

As LSDPC practice public relations, they will improve their company's brand, connect with the community, and boost their marketing efforts. Consistent, strategic messaging with the end goal of building and nurturing public relations is key to the success of any organisation. In other words, good public relations are the key to LSDPC 's success, and they need to do a better job in keeping their audiences aware of the things they do every day. Besides, public relations initiatives conducted by the ministry and agency should be stepped up with greater public knowledge before it becomes a lifestyle (Nwosu *et al.* 2020a; Nejo *et al.,* 2020b; Olabanjo et al., 2020a; Omokiti et al., 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b*).*

Abstract

This preliminary study focuses on farmers' business and their perception of digital public relations and agricultural information dissemination. As an experimental study, collaborations are invited to harvest an ultimate global inquiry on new media influences on providing food security in the world. Specifically, this study presents the viewpoints of 341 representatives of 3,406 farmers in Lagos, Nigeria. Selected farmers cut across the spectra of agricultural business. Results of this pilot study indicate that majority of farmers in Lagos have digital devices on which they spend up to three hours daily mainly for Facebook social networking. Interim conclusion is that perceived high cost and diversion of use render digital media unproductive for agricultural information dissemination among Lagos farmers. The study recommends that relevant government ministries and agencies should take advantage of farmers' ownership of digital media to refocus attention on productive agricultural information dissemination.

Keywords: Digital Media, Public Relations, Farmers, Agricultural Information.

Introduction

Subject area	Business Information Media
More specific subject areas	Agricultural Communication, Public Relations, Marketing Communication
Study execution	A survey using a questionnaire instrument.
Study format	Quantitative methodology
Experimental factors	As an experimental study, 341 farmers representing 3406 members of the Lagos branch of All Farmers' Association of Nigeria. Study objectives include examining farmers' knowledge of digital new media; accessibility of agricultural information; and investigating the frequency and prominence of agrarian information in creating awareness on poverty alleviation in Lagos, Nigeria. Charts and tables indicate the initial results.
Experimental features	Data on farmers' perception, ownership and usage of digital media for public relations, marketing and communication in the course agricultural activities appear in this maiden study.

Preliminary study location	Lagos, Nigeria
Data accessibility	Original data is available to compare with similar investigations anywhere in the world

Value of Study

1. This study supports the United Nations Sustainable Development Goals (SGD) one (no poverty and two (zero hunger). It provides the template for similar studies in different parts of the world, especially the developing countries.
2. Preliminary results of this study are potential background data for future researches on farmers use of digital media for their business communication.
3. The multidimensional focus of this study consists of the following:

    a. Agricultural and Digital Media Information. Sample in Adeyeye et al., (2018); Grunig, J. (2001); Kaplan and Haenlein (2010); Kaur (2015); Alzahrin and Alias. (2018); Bach and Kim (2012); Baer (2017); Baruah (2012); Bernama (2018); Chinnasamy (2018); Comscore Inc. (2017); Einwiller and Steilen (2015); Farzana *et al.,* (2015).
    b. Public Relations and Information Management. Sample in DiStaso, Mccorkindale, and Wright (2011, 2012); Coombs and Holladay (2012); Diga and Kelleher (2009); Eyrich, Padman and Sweetser (2008); Fitch (2009); Gabriel and Koh (2016); Garding and Bruns (2015; Grunig and Grunig (1992); Grunig and Hunt (1984); Hadina (2010); James (2007); Ji *et al.,* (2017); Kent and & Taylor (1998, 2014); MacNamara (2010); McLennan and Howell (2011; Moreno *et al*., (2015; Mukhtar and Syed (2017); *News Straits Times.* (2017); Robson and James (2013); Shahizan and Sobihantun, (2015); Statcounter Global Stats (2018); Stříteský and Stránská (2015); Tench and Jones (2015); Valentini (2015); Wright and Hinson (2008, 2009, 2015); Zheng, Liu and (2018).
    c. Public relations in marketing communication. Sample in Odiboh and Oladunjoye (2019), Odiboh, *et al.* (2020a), Odiboh and Ajayi (2019), Odiboh, Ezenagu, and Okuobeya (2019), Adelua, *et al.* (2020a), Adelua, *et al.* (2020b), Adelua, *et al.* (2020c), Adelua, *et al.* (2020d), Aiyende, *et al.* (2020a), Aiyende, *et al.* (2020b), Fayemi, *et al.* (2020a), Fayemi, *et al.* (2020b), Fayemi, *et al.* (2020c), Fayemi, *et al.* (2020d), James, *et al.* (2020a), James, *et al.* (2020b, James, *et al.* (2020c), James, *et al.* (2020d), Ndubueze, *et al.* (2020), Ndubueze, *et al* (2019), Nejo, *et al.* (2020a), Nejo, *et al.* (2020b), Nwosu, *et al.* (2020a), Nwosu, *et al.* (2019), Nwosu, *et al.* (2020b), Olabanjo, *et al.* (2020a), Olabanjo, *et al.* (2020b), Olabanjo, *et al.* (2019), Omokiti, *et al.* (2020a), Omokiti, *et al.* (2020b), Salau, *et al.* (2020a), Salau, *et al.* (2020b).

Experimental Design, Materials and Methods

This short survey method generated the data for all time use. Three hundred and forty-one farmers drawn from 3,406 members of the Lagos branch of All Nigeria Farmers Association. The farmers were selected through a random sampling technique. Tables below indicate part of the initial results of the research.

Preliminary Study Results

This study adopted descriptive statistics to indicate mean scores in the data presentation. Frequency distribution tables show the position of each item in the questionnaire. The study used Statistical Package for Social Sciences (SPSS/PASW) software, version 25.

Table 1: Descriptive on social networking sites among farmers

Social networking sites	Frequency	Per cent (%)
Facebook	78	30.9
Twitter	52	20.6
Instagram	36	14.3
You tube	24	9.5
Pinterest	20	7.9
WeChat	18	7.1
Telegram	14	5.6
Others	10	4.0
Total	252	100%

Lagos farmers' favourite social networking sites are Facebook (30.9 per cent), Twitter (20.6 per cent) and Instagram (14.3 per cent). Whereas, WeChat (7.1 per cent), Telegram (5.6 per cent), and others (4 per cent) were relatively low in usage.

Table 2: Descriptive on the main limitations of using/adopted digital media by selected farmers

Items	Options	Frequency	Percentage	Rank
What would you describe as the main limitation of using digital media for agricultural business information dissemination?	It is very slow	85	33.7	2
	The websites do not look good on my device	24	9.5	4
	It is expensive	86	34.1	1
	It is only suitable for limited use	57	22.6	3

Table 2 labeled farmers' main limitations of using digital media. Majority (34.1%) said that using digital media is expensive. Whereas, 33.7% said it is slow, 22.6% said it is only suitable for limited use. Only 9.5% acclaimed that agriculture business websites do not look good on their devices.

Conclusion

It is clear that the potential value of farmers' digital media consumption for agriculture business is limited. Farmers' vast ownership of digital tools and awareness of social media networking are two public relations factors for deepening SDG 1 and 2 of the United Nations, locally. These findings are also useful to agriculture Ministries and Agencies for coordinating farmers for productive yields and food security in the country.

Abstract

The role of the Internet has significantly changed the channel of health information. As a result, it becomes essential to understand the behavioural pattern of people seeking health-related information on the websites and highlight improvements. This study executed a cross-sectional examination using 221 patients of selected primary health care centres at Yaba, Lagos state. The data covered between December 2019 and January 2020 using an adapted structured questionnaire. The 25 research items were validated to answer the questions raised. The questionnaire items captured the adoption of social media for health awareness, perception of health information on social media, benefits of the use of social media for seeking health-related information, knowledge of health information on social media and usage of social media for health information. The study findings showed that the advent of social media platforms had transformed people's health information-seeking behaviour. Majority of the respondents (patients) claimed that they adopt digital media because it saves time, convenient to access, fosters immediate, up-to-date information and less cost of accessing compared to other sources. The findings of this study revealed that online health seeker had modified the way they take care of their health after having internet searches and their health-related decision making (Omokiti et al., 2020). Our findings suggest that most participants used social media platforms to find information about their health conditions, while around one-third received direct online medical consultations. There is a need for public awareness on the use of reputable sources for health information. The study findings will also become a significant contribution to health policymakers and health-related website content regulators.

Introduction

Social media has become a convenient source for obtaining educational materials and information. Social media refers to the applications of networking sites to create and exchange information through blogs and microblogs (i.e. twitter), content communities (YouTube), and social networking (i.e. Facebook and LinkedIn). Social media and online resources have affected most aspects of our lives, and many are now using it to guide their healthcare decisions. With the emergence of the Internet, the world, especially in the perspective of communication, has advanced. (Aiyende, et al., 2020) Over the past years, social media enabled and unrestricted sharing of information and knowledge distribution, including medical and healthcare information that can be quickly discovered by patients (Tan & Goonawardene, 2017).

The use of social media is unlimited; some people use the mentioned platforms to receive medical consultations, while others use it to find information related to their conditions. Several studies are stressing how technology has empowered individuals and changed the way they seek out health-related information on the Internet. (Salau, et al., 2020) Social media provides informal channels for disease reporting. It also plays a vital role in connecting patients all over the world with others that have the same health conditions, enabling them to discuss mutual concerns and solutions. Health professionals are generally individuals who work and are experts in a particular field (Adelua et al., 2020). Patients take into consideration the comments of strangers when making medical decisions.

Today, many patients are seeking online advice from physicians they have never met. The advantage of an online medical consultation is that there are no geographic boundaries, as the patient can gain access to reputed physicians that are not usually available. Another advantage is the cost; the consultations provided online are lower in price (Shepherd, Sanders, Doyle, Shaw, 2015; Albalawi & Sixsmith, 2014). However, this will not be suitable for many cases, where a physical examination is needed. While social media facilitates patient care and education, it could also create impending risks for patients and healthcare professionals alike. (James, et al., 2020)

The distribution of poor-quality information can cause harm to patients and damage the professional image. Even though many as an influential factor in improving health and reducing costs saw patient engagement in social media, there is a considerably high risk of patients encountering misleading information (Tyrawski & DeAndrea, 2015).

Extant literature has shown that health care practitioners have reduced the potential harm caused by untrustworthy information retrieved from social media by sharing accurate knowledge and educating patients to reputable sites. (Fayemi, et al., 2020) Another risk is the inappropriate exchange of online information or advice for in-person visits to a healthcare provider. Thus, the use of social media among patients is changing the traditional information-seeking behaviours. This study aims to assess the use of social media platforms for obtaining health information and describing their perceptions, attitudes, and practices. (Nejo, et al., 2020)

Statement of the Research Problem

Since the global target of Health for All as declared in 1978, primary health care (PHC) has been universally adopted and embraced as the path to achieving Millennium / sustainable development goals. The primary health care program is a grass-root approach designed to address critical community health challenges by offering preventive, restorative, and rehabilitative services (Gofin, 2005, Hao & Gao 2017). Primary-health care values underline the approach's great importance. These principles, which include essential health care, community involvement, equity, inter-sectoral collaboration and the use of appropriate technology, are the driving force behind the efficiency of primary health-care as the hope of achieving universal health coverage.

By implications, this means that primary health care aims to provide services to most people based on needs without geographical, social or financial barriers through their involvement in health program planning, implementation and evaluation. The World Health Organization (1991) agreed that health information should be made available to the public in the mass channels they already learn and use, which means that the mass media can make a useful contribution to the dissemination of health messages to the general public. This situation raises the salient question on the benefits and use of social media platforms by health-seeking patients. They should focus more on areas public benefits such as more empowerment programs, educational programs and better community relations (Adelua et al., 2020a; Adelua et al., 2020b; James et al., 2020d; Nwosu et al., 2019; Adelua et al., 2020c; Adelua et al., 2020d; Aiyende et al., 2020a; Aiyende et al., 2020b; Fayemi et al., 2020a; Fayemi et al., 2020b; Fayemi et al., 2020c; Fayemi et al., 2020d; Olabanjo et al., 2020b; Omokiti et al., 2020a).

Research Objectives

i. To examine the benefits of social media usage for seeking health-related information; and
ii. To evaluate social media awareness, adoption and usage on Health seeking information by primary health care patients

Research Questions

i. What are the significant benefits of social media usage for seeking health-related information?

ii. To evaluate social media awareness, the adoption and usage of Health seeking information by primary health care patients are critical.

Literature Review

Social Media

Social media is part of our society, which influences social norms and ideology (Abdulaziz, 2014; Antheunis, Tates & Nieboer, 2013). The sharing of information and content is now a common desire (Albalawi & Sixsmith, 2015). It has changed how many people interact, communicate and socialize. This scenario implies that the social media platform has become gradually more popular as the central platform for small businesses worldwide. Adelua et al., (2020a) proposed that the impact of social media platform as an electronic market place for business has become a critical issue in the industry and the literature of entrepreneurship (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).

According to Fernández-Luque and Teresa (2015), social media is used as an alternative business tool so that small and medium enterprises (SMEs) can gain advantages such as engaging in a marketplace which is situated far from their geographical area without necessitating physical presence. Nowadays, social media have been pervasive for businesses as a tool for interacting directly with consumers, even reaching potential customers (Hao & Gao, 2017; Househ, Borycki & Kushniruk, 2014; Greaves, Pape & King, 2012).

Health Information

Health information-seeking behaviour is now gradually gaining attention among the public worldwide including Nigeria (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). Health information-seeking behaviour also differs between each individual depending on the health issues ones face. Health information-seeking behaviour is "finding and receiving messages or information to minimize the health status-related confusion and build trust in the health context. Health information pursuing action is, according to (Fayemi et al., 2020b) a pursuit that involves obtaining information about medical treatments, alternative medicine, diet and physical activities.

A systematic review study revealed that studies investigating health information seeking in Nigeria are still low. The study of health information-seeking is relevant in the context of Nigerian society. Awareness of health information-seeking behaviour is not only imperative to public health (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b). But more importantly, it will have an impact on people's ability to self–manage their health. (James, et al., 2020a). A recent study found that the Internet has become necessary to those who are health conscious and prefer to be more empowered in managing personal health through seeking health information using the Internet (Nejo et al., 2020b).

Social Media and Health Information

The adoption of the Internet has significantly changed the way health information considered. It is essential to understand the behavioural pattern of seeking health-related information on the websites to identify their needs better. These highlight improvements are possible in the landscape of Internet health information quality and availability (Aiyende et al., 2020a).

Methodology

This study is a cross-sectional investigation conducted between December 2019 and January 2020 at Yaba, Lagos State, Nigeria. The ethical approval for this study was obtained from the Ethical Review

Board at Covenant University and conducted according to the underlying principles. The inclusion criteria consisted of patients in the waiting rooms of the outpatient clinics and their perceptions of health-seeking information via social media. The participants were literate (could read and write) and use the internet regularly (daily). Those who did not meet the inclusion criteria did not participate. A self-administered 4-section questionnaire was adopted from the literature to assess the use of social media by patients seeking health information.

Two hundred and sixty respondents filled a questionnaire based on the online sample size calculator Raosoft, and a 95 per cent confidence interval, which is an assumed 50 per cent prevalence of patients using social media for medical information. The self-administered questionnaire was developed in English and modified by the researcher(s) to fulfil this study's purpose and assure validity. 2 experts reviewed the items in the questionnaire: a social media expert and the supervisor. For the reliability of the instrument, Cronbach's alpha of the survey for sections B (perception) was 0.811, section C (awareness) was 0.792, and section D (usage) was 0.758.

The questionnaire consisted of 4 sections with a total of 20 questions measured by "yes", "no", and, "don't know" choices. Four questions were used in the third section to assess their awareness of health information through social media. Likert scales (4- and 5-point) were the perceptions and usage questions. Participants answered the question about seeking medical consultation via the Internet; response choices were yes or no.

The questionnaire consisted of two parts: 1. The first part was concerned with demographic data including age, gender and education. 2. The second part of the questionnaire included the following items: a. They were using internet/social media in general health-related reasons. b. Public sources to get oral health information. c. Use of social media to collect or share data about health. d. benefits of using social media to access health information as the primary source. e. Perception of using social media to obtain information on health. f. Most topics the respondents searched/viewed through social media those are related to oral health and how often they are doing it g. Awareness towards the importance of the references to the given information through social media. And social media effects in changing oral health behaviours. For the data analysis, frequency distribution shows the demographic characteristics of the participants.

Data Analysis and Presentation

Only 221 subjects completed the questionnaire. Out of the total sample, 29% were males, and 71% were females. Ages of respondents ranged from 18 to 50 years with a mean age of 30.5 (33.5) years filled in the questionnaires. Approximately 81 (37.6%) of the respondents were single, while 125 (56%) were married and only 15 (7%) were others such as a widow, divorced, separated, etc. Nearly 42% of the respondents had completed at least a university education (see Table 1). Regarding their profession/employment status, 114 (52%) respondents reported that they are employed; 82 (37%) were self-employed, and only 25 (11%) were employed. The demographic information summary of the participants is in **Table 1**.

Source: Field survey 2020

Out of the total 260 respondents for this study, only 221 (85%) participants reported that they have social media account(s). Among the 221 participants, 154 (70%) used at least one type of social media for health-seeking information. The primary reason for seeking consultations on social media may probably be as a result of time constraints to visit the physician's office. Facebook usage was predominant (28%), followed by Twitter (22%), Instagram (19%), and WhatsApp (14%). Approximately 28% (62/221) of respondents used Facebook; among all social media platforms, Snapshot was the least utilized, implying that the respondents got health-related updates on Facebook and Twitter more often than other social media platforms.

Considering the frequency of social media for health-seeking information, 45 (20%)respondents claimed that they search to get oral health information on social media platform(s) daily, followed by Weekly and BI-weekly 124 (56%), Monthly 22 (10%), Quarterly 19 (9%), and Yearly 11 (5%).

From a list of sources of medical web pages provided in our questionnaire (Ada, Webteb, Medscape, WebMD, WHO, Ministry of Health, Food and Drug Administration, Daily Medical Info, and Others), 216 respondents (98%) were familiar with at least one of them. Lastly, the table indicates the health-related topics that respondents have searched/viewed through social media.

The result shows that the predominant (23%) health-related issue is common flu (cold, catarrh, fever, headache, congested nose and respiratory tract infection). Others are tiredness/hypertension (18%), infertility (10%), infectious diseases such as missiles, chickenpox, Lassa fever, etc. (13%), implants (bleeding during pregnancy (15%), diabetes and obese (11%), surgeries (7%), and others constitute 3%.

Table 3: Perception of Health Information on Social Media (n = 221)

Total		221	100%	

Source: Field survey 2020

The participants' perception of health information via social media shows in **Table 3**. Out of 221 participants, 153 (69%) respondents like to seek medical information using search engines/social media platforms. 71% of the participants' believed that Information on social media had improved their health status. More so, 67% of the participants indicated that the use of social media has made them have a specific reference for doctors/hospitals. Approximately 67% reported that they have strong reliability on social media engines for health information. Lastly, 74% claimed that their beliefs about social media for health information had enhanced their awareness. By implications, participants often use social media for medical consultations and more importantly, the online information provided by physicians is useful.

Table 4: Benefits of the Use of Social Media for Seeking Health-Related Information

		Frequency	**Per cent**	**Cumulative frequency**
Quick accessibility of health information	Yes	164	74	74
	No	43	20	94
	Don't know	14	6	100
Total		221	100%	
Reach of a wide audience	Yes	142	64	64

	No	46	21	92
	Don't know	17	8	8
Total		221	100%	

Table 4 provides a clear illustration of the advantages of using social media as a leading source for getting health-related information. The majority of the respondents (74%) stated that quick accessibility and easiness of getting information is the crucial reason for the success of social media. Among 221 respondents, 64% expressed their interest in using social media to communicate and reach a wider audience. 66% of respondents also affirmed that social media is a cost-effective option

for patients. While 71% of respondents also believed that social media could allow health-related professionals to interact with people and share information effortlessly. In conclusion, the level of online fitness-related information was satisfactory.

Table 5: Awareness of Health Information on Social Media

		Frequency	Per cent	Cumulative frequency
Information on social media increases my desire to communicate with a physician	Yes	153	69	69

I prefer to share their medical conditions with the public through the social media platform(s)	Yes	142	64	64
	No	60	27	91
	Don't know	19	9	100
Total		221	100%	

The level of awareness and attitude of participants regarding social media usage shows in **Table 5**. Among 221 respondents, 69% expressed that information on social media increases their desire to communicate with a physician, and 38% of the participants indicated that health-related messages are receivable via any social media platforms (Facebook, WhatsApp, YouTube, and others. However, 65% of the respondents affirmed that there is a high risk of misinformation from social media platforms on health-related messages; while

64% prefer to share their medical conditions with the public through the internet.

Table 6: Usage of Social Media for Health Information

		Frequency	Per cent	Cumulative Frequency
Have you ever started medication/treatment on social media as advised/advertised, without asking your doctor?	Yes	152	69	69
	No	51	23	92
	Don't know	18	8	100

information received online before sharing it with other people?	No	67	30	87
	Don't know	28	13	100
Total		221	100%	

Table 6 The participants' usage of social media usage is presented in Table 6. 69% of the participants' expressed that they start medications/treatment as advised/advertised on social media without asking your doctor. This result bolsters the danger of seeking unverified information on health-related issues via social media. Approximately 54 per cent believe that they verify the credibility of health information on social media with a doctor or other health care professionals. In contrast, only 58 per cent claim that social media platform messages ever influence their decisions about them or the health care of their family. Ultimately, 57 per cent of respondents also indicated that before sharing it with other people, they would check the integrity of health information. The number of respondents who check the authenticity of health-related information obtained via social media is, by definition, slightly above average. This finding raises considerable concern.

Summary of Findings and Discussion

This study shows that health information obtained from social media influences the health status of the majority of the participants. Participants of this study believe that the health information available on social media has enhanced their awareness regarding their health conditions. This finding highlights a significant concern regarding the health misinformation and alarming for the urgent need for an official healthcare social media channels. The results revealed an important fact on the reliability of health information sought by social media users. The safety of information exceeded half of the total number of participants. This striking figure guarantees that healthcare practitioners and policymakers, in addition to the social media owners, can help reduce the potential harm of misleading or wrong information transmitted through social media by guiding patients to reputable sites.

It can be concluded based on the information above that social media holds considerable significant value because it allows new ways of accessing information and sharing it. In the current study, more than three-quarter of the participants stated that accessibility and easiness of getting information is the critical reason for the success of social media. This conclusion agrees with research conducted by Elof et al. (2014) which found that participants believed that online social network could allow health promotion campaigns to share information more easily. Moreover, about half of participants found communication with oral health professionals as one of the main advantages of using the social network for gaining oral health information. Many researchers, such as Bacigalupe (2011) and Chou et al. (2009) affirmed that social media encourages social support, cooperation and participation of the stakeholders concerned and increases the interaction of individuals and allow users to participate directly. Also, the majority of respondents in the current study found communication difficulty as the main barrier for using social media for getting oral health information followed by credibility and trustfulness which was the second most common barrier to the participants.

Health care professionals and policymakers raised concerns regarding the reliability of health-related information found on the internet and how to make it practical for the public. There is a high risk of misinformation; as healthcare providers are unable to control the content in circulation. However, our finding in term of searching related health information shows that patients are more willing than other users to get their news from social media and search engine. The study findings showed that respondents (patients) seek online health information because of time-saving, convenient to access, fosters immediate, up-to-date information and less cost of obtaining compared to other sources. It confirms that respondents seek online health information because of the high credibility of the information sources.

Moreover, health information seekers found health information on social media platforms because they would like to look for information and learning about a sensitive health topic that is difficult to talk about. In addition to that, there are several health-related information or medical issues that have

been sought by individuals. The searched health, or medical issues/topics were specific diseases or medical problems. Seeking health-related information from social media have some benefits, but at the same time result in challenges. Patients report both positive and negative effects. It is essential to identify these effects for health care authorities because the ratio of patients using social media for health-related purposes is evolving, so health professionals will have to follow on the advantages and disadvantages effects of this use.

Conclusion

In conclusion, this study shows that social media usage is widespread among patients in Lagos state. The majority used social media platforms to seek health information. The study participants are more likely to search for health information on behalf of family members while a minority received one-to-one medical consultations. Awareness campaigns on the practical use of social media are needed to enhance the knowledge of patients in evaluating the quality of health information, together with proper guidance and education for practitioners. Developing clear policies and guidelines in addition to addressing information accuracy and reliability, perhaps via new technologies by respective governments, might reduce the risk of misleading information.

The results also conclude that social media platform was useful in helping to make decisions relating to health, while only a few felt otherwise. Most findings from this study were also consistent with previous research work. The advent of social media platforms has transformed people's health information-seeking behaviour. It is the hope that this study's findings will help researchers in terms of understanding factors that might influence people's health-related decision making, particularly in Nigeria. The study findings will also become a significant contribution to health policymakers and health-related website content regulators. It is consistent with prior research, which discovered that online health information seekers had rated themselves as good or very good in terms of general personal health. However, the frequency of social media use for health-related purposes was every week. This study concluded that health issues/topics sought may vary according to an individual's preferences. The findings of the previous research revealed that online health seeker had modified the way they take care of their health after having Internet searches and their health-related decision-making.

Recommendation

The results of this study will help guide healthcare practitioners on how to use social media to provide consultations and will also help in developing clear policies and guidelines to reduce misleading information risk. This study shows the need for having active healthcare givers who have the right skills to interact and educate the public using social media.

Abstract

This study examines Community Relations activities in government agencies. The purpose is to investigate public awareness and perception about the community relations activities in ministry services. The research method employed for the aim of this paper is the survey design technique, using the questionnaires to gather the opinion of respondents. This paper reveals that the public generally are not aware of the activities being executed by the ministry and as such, have not impacted their lives since its existence. The paper adopts the theory of social relation. The paper concludes that the Ministry needs a stronger relationship with the public and the media to overcome the current negative perception and low awareness of its activities. They should as well focus more on areas that will benefit the public such as more empowerment programs, more educational programs and better community relations. Its recommends that the council should restructure its public relations team, set aside people who will mobilize people in each local government in Lagos. Let the community benefit from the government. Create a long-lasting relationship with Lagosians, and they will never forget the organisation.

Keywords: Community relations, Lagos state, Tourism, Culture, Ministry, Council

Introduction

In the world today, people go to places for leisure purpose, research and whatnot. Not to undermine culture and art, which is a way of life. Creating awareness and impacting personnel is a paramount function every ministry should embrace in other to bring diaspora partnerships (Fayemi, Odiboh, James and Olabanjo, 2020a).

Tourism is an aspect of the Nigerian economy that is not functioning soundly. It needs renewed attention. Tourism is now a crucial component of the economy as well as the fourth biggest industry across the world. It is bringing more gains to people, firms and government (Honey and Gilpin, 2009:1; UNWTO, 2008). Despite the numerous tourism potentialities and abundant cultural legacies within Nigeria, very few of these have been exploited and optimised into the global tourism industry. Tylor (1871) says that culture is about knowledge, beliefs, art, morals, law, custom and any other social capabilities and habits. For Oke (1984, p. 20), culture is "the distinctive way of life of a group of people, their complete design for living". Therefore, culture entails transferred perceptions, customs, principles and anticipations of a specific collection of individuals. It has diverse practical uses in people's lifestyles, informs social relationships, with material antiques constituting the foundation for developing the tourism industry. It is in languages; music, arts, governance, folklore, dance and literature in addition to the nature of the environment inhabited and passed on across generations. (Odiboh, Adelua and Fayemi, 2020a). As communities strive towards cultural conservations, previous customs in modern forms could readily be examined and utilised to redevelop the past. (James, Odiboh, Aiyende and Salau, 2020b).

Geographically, Lagos is physically an enormous State in Nigeria with 1,381 sq.km landmasses, 3,577km overall coastline with over 17,552,940 inhabitants as estimated by LASG in 2012. Lagos is one of the most culturally and socially endowed states in Nigeria with more than 250 ethnicities

existing in Lagos, inclusive of Fulani, Igbo and Hausa. This city is principally known for its transformational changes in the last two decades. Lagos was once considered fatal and hard for the government to coordinate. Today it is a new international destination with a bustling tourism industry that is attracting Nigerians in the diaspora.

Lagos is a fusion point of several ethnic customs. The state is characterised by exciting growing artistic landscapes which is just as apparent on the roadsides as it is in exclusive festivities of formalised contexts. The city's formal cultural infrastructure presently comprises 20 libraries, 51 art galleries, 14 theatres, 68 bookshops, 54 cinema screens and 12 museums.

Tourism entails operations which willingly and momentarily carries individuals out of their natural habitat to indulge their desires for thrills, enjoyment, recreation and adventure (Falade, 2000). These activities are advantageous in many ways to societies which engage in tourist endeavours. One, it brings prosperity to impoverished places. Two, it endows the local peoples' culture and ways of life to yield them revenue. Moreover, such tourism ventures are likely to boost the construction of infrastructural varieties which are gainful to the anchoring cities.

Tourism in Nigeria focuses mostly on events and celebrations. Owing to the nation's tremendous diversity of ethnic groups; nonetheless, it is inclusive of natural attractions such as waterfalls, savannah and rain forests amongst others. However, the industry's challenges include the country's deplorable conditions of quality water, roads and electricity (James, Odiboh, Adelua and Fayemi, 2020a; Ndubueze, Odiboh, Nwosu and Olabanjo, 2019; James, Odiboh, Aiyende and Salau, 2020b; James, Odiboh, Nwosu and Fayemi, 2020c; Ndubueze, Odiboh, Adelua and Fayemi, 2020; Nejo, Odiboh, James and Fayemi, 2020a; Olabanjo, Odiboh, Nwosu and Ndubueze, 2019).

Lagos is now a key venue for 'black' and 'African' indigenous identity. Numerous events take place in Lagos; where payment for these occasions differ yearly and could occur intermittently every month. Some of these festivals include annual Festac Food Fair, Lagos Jazz Series, Eko International Film Festival, Eyo Festival, Lagos Seafood Festival, Lagos Photo Festival, Lagos Carnival and Lagos Black Heritage Carnival. Each provides a distinct franchise for live music that covers all genres.

Despite being a prominent place for African and black cultural identity, the Lagos state tourism, art and culture still faces several problems among which include low awareness, misappropriation, mismanagement, and misguidance (Onyeocha, 2016). This paper focuses on and analyses the public awareness and impact of the community relations activities of the Lagos State Council for Art and Culture.

Statement of the Problem

The issue of low awareness to bring about a partnership that seeks to achieve the goal of the Ministry and Council for Art and Culture is paramount. According to the United Nations' Sustainable Development Goal 17, which revolves around creating partnerships for goals, awareness and community relations is very important. The key question in this regard is: who would bring partnerships to a seemingly lowly art and culture? (Adelua, Odiboh, Aiyende and Omokiti, 2020a; Adelua, Odiboh, Nejo and Fayemi, 2020b; James, Odiboh, Olabanjo and Adelua, 2020d; Nwosu, Ndubueze and Olabanjo, 2019; Adelua, Odiboh, Olabanjo and Ndubueze, 2020c; Aiyende, Odiboh, James and Salau, 2020a).

Significant shortcomings of the tourism sector in Lagos state include insufficient amenities at certified tourist locations, the low magnitude of international recognition of tourist activities within Nigeria, poorly built tourist infrastructures, inadequate security, low investment levels; and disparaging demeanour of Nigerians to relaxation and holiday breaks (IMF, 2005:73).

The information and level of awareness regarding diverse communities appear in news reports that are accessible to the general public, and these affect the viewpoint of people towards the narrative

and individuals concerned in such stories. Therefore, the mass media subtly paints a mental picture of persons and situations, which eventually determines the mannerism of interrelation with real-life scenarios that envelop the events (Asakitikpi, 2009). However, low awareness of the community relations activities of the council creates problems.

Research Objectives

This research aims at determining the public relations tools used by the Lagos State Ministry for Tourism and Council for Art and Culture to create public awareness of their activities. It also sets to investigate the public awareness and impact of these activities. Given these objectives, the research questions outlined for answers are below:

Research Questions

1. What are the PR tools the ministry/council adopts?
2. What are the awareness level and the PR activities of the ministry/council?
3. What is the view of the public about community relations activities in the ministry/council and the areas of improvement?

Literature Review

An overview of the Lagos State Ministry of Tourism Art and Culture

The Ministry's vision includes making Lagos State the favourite destination for recreation, business and tourism in Africa. Its mission involves attaining sustainable tourism development via a facilitating ambience which is satisfactory for both foreign and indigenous tourists.

The Ministry's several responsibilities include: initiating, formulating, executing, monitoring and evaluating policies relating to Tourism, Arts and Culture. Another is promoting investment in hotels and development of tourism projects, tourism advancement and information dissemination, supervision of the council for Arts and Culture, management of tourism assets, such as beaches, Supervision of Lagos State Film and Video Censors Board, Organization of all State tourism activities in conjunction with other relevant Agencies, Establishment of a mini-exhibition centre to project the image of the State, Promotion of entertainment & arts-related matters, Establishment and Management of project THESE – (Tourism, Hospitality, Entertainment, Arts and Sports for Excellence), Promotion of social arts and community cohesiveness.

Tourism in Lagos State was first fashioned in 1995 by the Military Administration of Captain Mike Akhigbe as a department under the Ministry of Home Affairs. In 1991, the government of Chief Michael Otedola removed the Tourism Department from the Ministry of Home Affairs. It merged it with the Ministry of Information and Culture. Thus creating the Bureau of Information, Culture & Tourism headed by a Permanent Secretary.

In 1994, the Tourism Department was again detached from Bureau of Information, Culture and Tourism and merged with the Ministry of Commerce, Industry and Tourism (MCIT), headed by a Commissioner. During that period, the Lagos State Tourism Board was created out of the Tourism Department. The functions of the Board were strictly tourism promotion and marketing.; while on the other hand, the Tourism Department was in charge of policy matters (Odiboh, Amodu and Ekanem, 2020a; Odiboh, Fasanya, Adegoke, Afolabi and Ofor, 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). In 1998, the Tourism Department and the Lagos State Tourism Board emerged a full Corporation named as 'Lagos State Waterfront and Tourism Development Corporation (LSWTDC)'presided by a Managing Director. In 2007, LSWTDC was segmented into 2 (two) separate arms: Ministry of Tourism and Intergovernmental Relations and Ministry of Waterfront Infrastructure Development.

Lagos State Council for Art and Culture

The Lagos State Council for Arts and Culture is a Social Service Parastatals established by Edict No. 12 of 1963 and amended in 1974. The Council has the responsibility of advising Government on the technical aspects of the National Cultural Policy and initiating principles for the Development of Institutional Infrastructure for meeting the Institutional needs. It implements International and Governmental Cultural agreements through adequate measures of coherence on all cultural activities. It is a channel between the Arts Agencies of the Culture Sector and the Ministry of Tourism, Arts and Culture on Professional matters relating to Culture and the enactment of the National Cultural Policy.

It is the overall policy organ of the Lagos State Government in the administration of Arts and Culture. The Council serves as advisers to Government on Arts and Cultural matters. It renders consultancy services to private and public Cultural Institutions. The Council also functions as Commissioned Agency for Artistes and similar performers.

The Lagos state council for art and culture is an arm under the Lagos state ministry of tourism, art and culture. Its vision includes making Lagos State Council for Arts and Culture the Heart Beat of Nigerian traditions by positively articulating and implementing the overall Nigerian Cultural Policy. Its mission includes providing gainfully related services in terms of propagating, encouraging, demonstrating and preserving the abundant cultural norms of persons within Lagos State and entire Nigeria.

Community Relations Activities of Lagos State Council for Art and Culture

The Lagos State Council for Art and Culture community relations activities include planning and showcasing the abundant culture and tradition of Lagos. Other activities are cultural education training programmes, recreating cultural facilities, providing assistance to art practitioners, and disseminating cultural Information on Lagos. The Council also implements bilateral cultural agreements between Nigeria and friendly countries, collaborates with international, governmental and non-governmental partners. It provides cultural entertainment and educative Programmes for the moral upliftment of the youths. Lastly, it preserves and maintains historical sites and monuments.

Others include propagating the state's culture and art policy and programmes. It functions as an adviser to the State Government on culture, as well as consults for private and publicly-owned Cultural Organisations. It serves as the Commission’s Agency for Artistes and other similar entertainers, and plays supporting duty on aesthetics aesthetic arts of general Nigeria and specifically in the city, Design Arts Division.

Sustainable Development Goal 17

In relations to SDG goal 17, which is to revitalize the global partnership for sustainable development, the Sustainable Development Goals (SDGs) of Lagos council for art and culture is achievable with a vivid dedication to worldwide cooperation and partnerships. (Omokiti, Odiboh, Aiyende and James, 2020b).

The globe currently has greater interlinkages than past times. Enhancing accessibility to knowledge and technology are crucial avenues to disburse ideologies and spur innovative actions. Harmonising policies to aid developing economies to handle their debt correctly, and fostering investment for less developed nations is necessary to accomplish sustained progress. Getting partnerships with bodies can also help the council impact successfully on its audience.

Theoretical Framework

The social relationship theory is the anchor of this study. This theory presumes that the grouping of persons depends on their common interests and predilections. It insists that individuals who belong to the same group would choose similar information materials and respond to it in an equitable approach (Bowen 1972). The theory additionally posits that demographic variable such as residential location, education, age, sex. Occupation, income and race can aggregately bring out communication saliency for collective people. So, a city that has various elements involving communal leaderships, student group, cultural associations, industrialists, domestic traders and women group, which are very important in informing the disposition, judgement and ideological belief towards the company (Aiyende, Odiboh, Adelua and Omokiti, 2020b; Fayemi, Odiboh, James and Olabanjo, 2020a; Fayemi, Odiboh, James and Aiyende, 2020b; Fayemi, Odiboh, Nejo and Salau, 2020c; Fayemi, Odiboh, Oyesomi, Nwosu and Olabanjo, 2020d; Olabanjo, Odiboh, Nwosu and James, 2020b; Omokiti, Odiboh, Salau and Nejo, 2020a).

Thus, a cultural organisation must be knowledgeable about the divergent socio-cultural groups in anchoring cities. The organisation must comprehend cultural components, goals and existential targets in order to work towards establishing reciprocal relations. This theory is relevant to the study as it explains the component that determines people's perception and opinion towards an organisation. The Lagos State Ministry of Art and Culture through its community relations activities, determines how the public sees and perceive cultural and tourist activities of the establishment.

Research Design and Methodology

Given the research objectives, the study adopted the survey research technique for collecting data. The survey entails obtaining information from a sample of people using their answers to questions (Check and Schutt, 2012, p. 160).

This type of research allows different approaches to reenlist respondents, gather data and adopt diverse information styles. E.g. survey research can make use of quantitative (via questionnaires with numerically ranked elements), qualitative (through open-ended questions) research strategies or using both strategies.

The data collection method implemented under the survey method is a questionnaire, which was self-administered to the respondents by the researchers.
The questionnaire obtained public responses on the enlightenment level of the Council's community actions. Notably, the survey instrument used close, and open-ended questions on applied community relations tools that utilised in creating conscious recognition by the Ministry. Questionnaire copies were self-distributed to the respondents based in Lagos State.

The sample size for this work is 200. The participants were selected from communities domiciling tourist attractions in Lagos state. Thus the purposive sampling method produced respondents from coastal Badagry where many beaches and historical centres attract tourists.

Purposive sampling used encompasses a collection of diverse non-probability sampling methods. This technique is similarly referred to as subjective, selective or judgmental sampling as it depends on the researcher’s perceptions in terms of choosing the units of investigation (Shobowale, 1981; Wimmer and Dominick, 2011; Odiboh and Ajayi, 2019).

Results

Through percentages and frequencies, aggregated data was analysed and shown in a tabular form via Statistical Package of the Social Science (SPSS) software. These tables reflect the participant's consciousness of community relations activities of the ministry and council, the corresponding

magnitude of contentment (with those activities) and suggested ideas for better actions. Out of 220 copies of the distributed questionnaire, 209 returned filled without any flaw. The low mortality of 11 copies of the questionnaire implies that the research scored an excellent and acceptable response rate. Respondents' knowledge of the ministry and council was the first poser of the questionnaire. The following tables depict the outcomes using questionnaires.

Table 1: Knowledge about the Lagos state ministry of tourism, art and culture's existence

	Frequency	Per cent	Valid per cent	Cumulative per cent
Yes	155	74.2	74.2	74.2
No	54	25.8	25.8	100.0
Total	209	100.0	100.0	

Out of 209 respondents, 155 respondents which represent 74.2% said to know the ministry exists while 54, which represents 25.8% said they do not. Table 1 shows that a lot of the respondents know the ministry exists.

Table 2: Respondent's awareness about the Ministry/Council's community relations

	Frequency	Percentage	Valid percentage	Cumulative percentage
Yes	44	21.1	21.1	100.0
No	165	78.9	78.9	78.9

Table 2 shows that 165 respondents which represent 78.9% are not aware of any community relations activity of the Ministry/Council. In comparison, 44 respondents which represent 21.1% are aware of the Council's community programs. This result shows that many participants are not aware of related community relations projects of the Council.

Table 3: Council activities that are known to the respondents

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	None	23	11.0	41.8	41.8
	social event	15	7.2	27.3	69.1
	Scholarship programs	6	2.9	10.9	80.0
	Sponsorship	8	3.8	14.5	94.5

	Education support and empowerment programs	3	1.4	5.5	100.0
	Festivals	37			
	Total	92	26.3	100.0	
Missing	System	117	73.7		
Total		209	100.0		

Table 3 reveals the community relations activities the respondents are aware of. A majority (37%) of the respondents said they are aware of the Council's festival activities. Fifteen (7.2%) of the respondents chose social events as the only community relations activity in their awareness. Six respondents (2.9%) are aware of scholarship programs, and eight respondents (3.8%) said they are aware of sponsorships. Meanwhile, three respondents (1.4%) noted that they are aware of the educational support and empowerment programmes. This result reveals that although people do not know some of these activities, the dominant community relations activity is the festival. However, 56.0% of the respondents ignored this question.

Table 4: The impact of the activities on respondents

		Frequency	**Per cent**	**Valid Percent**	**Cumulative Percent**
Valid	no impact	66	31.6	32.4	32.4
	Knowing about the culture	65	31.1	31.9	64.2
	Positive	53	25.4	26.0	90.2
	Negative	20	9.6	9.8	100.0
	Total	204	97.6	100.0	
Missing	System	5	2.4		
Total		209	100.0		

Table 4 shows that 66 respondents which represent 31.6% have not gained any impact from the ministry/council. In comparison, 65 respondents which represent 31.1% has learnt more their culture from the ministry while 53 respondents which represent 25.4% said the impact is positive. In contrast, 20 respondents (9.6%) said the impact has been negative. This result indicates a thin line between those impacted and others un-impacted by the community relations activities of the Ministry/Council. Noticeably, 2.4% of the respondents ignored this question.

Table 5: Tools used by the ministry that respondents are aware of

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Social Media	44	21.1	21.1	21.1
	Radio	40	19.1	19.1	40.2
	Television	39	18.7	18.7	58.9
	Newspaper	34	16.3	16.3	75.1
	Magazine	11	5.3	5.3	80.4
	Billboards	17	8.1	8.1	88.5
	Fliers	8	3.8	3.8	92.3
	None	16	7.7	7.7	100.0
	Total	209	100.0	100.0	

Table 5 reveals that 44 respondents (21.1%) are aware of social media as the community relations tool adopted by the Ministry/Council. Forty respondents (19.1%) on the other hand, says radio is the tool known to them. Thirty-nine respondents (18.7%) said that the newspaper is the tool they know. In comparison, 12 respondents (5.3%) said magazines are the primary tools Ministry and Council adopted for community relations. Seventeen respondents (8.1%) said that billboards are Ministry/Council tools they know. Meanwhile, eight (3.8%) said fliers are the tool they know, and 16 respondents (7.7%) said none of the listed options. This finding shows that a large per cent of the respondent is aware of social media as the primary PR tool the ministry/council uses.

Table 6: Perception of the respondents about the ministry/council

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Good	55	26.3	26.3	26.3
	Fair	29	13.9	13.9	40.2
	Poor	52	24.9	24.9	65.1
	Unsatisfactory	73	34.9	34.9	100.0
	Total	209	100.0	100.0	

Table 6 reveals the perception of the respondent about the practice of Lagos state ministry of tourism council for art and culture. Fifty-five respondents (26.3%) said the practice is good. Twenty-nine (13.9%) said the practice is fair, 52 respondents which represent 24.9% said the practice of the ministry is poor. In contrast, 73 respondents which represent 34.9% said the practice of the council is unsatisfactory. This response shows that the majority are unsatisfied with the practice of the ministry/council.

Table 7: Respondents' satisfaction with their practices and activities

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	57	27.3	27.3	27.3
	No	152	72.7	72.7	100.0
	Total	209	100.0	100.0	

Table 7 shows that 152 respondents which represent 72.7% are not satisfied with the practice and activities of the ministry/council. In contrast, 57 respondents which represent 27.3% said they are satisfied, and this shows that a more substantial part of the respondents is not satisfied with the ministry's activities.

Table 8: Areas the respondents want them to improve on

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	Yes	139	66.5	66.5	66.5
	No	70	33.5	33.5	100.0
	Total	209	100.0	100.0	

Table 8 reveals that despite not being satisfied with the council's practice and activities, a more substantial part of the respondent want them to improve on their activities. 66.5% of the respondent said some areas need improvement while 70 respondents which represent 33.5% said there is no need for improvement.

Table 9: Areas to improve on

		Frequency	Per cent	Valid Percent	Cumulative Percent
Valid	No need	18	8.6	12.2	12.2
	Publicity	22	10.5	15.0	27.2
	Everything	24	11.5	16.3	43.5
	Awareness	29	13.9	19.7	63.3
	International Partnerships	39	18.7	26.5	89.8
	More Information	15	7.2	10.2	100.0
	Total	147	70.3	100.0	
Missing	System	62	29.7		
Total		209	100.0		

Table 9 reveals different areas the respondents want the Ministry and Council to improve on. Results show that 18 (8.6%) of the respondents said there is no need for improvement, 22 (10.5%) said the publicity of their activities should be improved upon, 29 (13.9%) said there is need to improve on how they create awareness; 15(7.2%) said there should be more information. Sixty-two (29.7%) of the respondents ignored this question. While the majority of the respondents see areas needing improvement, others request that there should be an overall improvement on all services.

Discussion of Findings

The tables above show the findings from the respondents. This section discusses the responses to the research questions guiding this study. All the questions are treated to ascertain the respondent's opinions on essential ramifications of the community relations activities the Lagos State Ministry of Tourism and the Council for Art and Culture.

Research Question 1: What are the PR tools the ministry/council adopts?

This research question was structured to unearth the media tools adopted by the Ministry/Council in their Community Relations efforts. Findings to this respect are in Table 5. The data on Table 5 reveal that the most popular channel of community relations is social media. This tool is ahead of radio, television, newspapers, magazines and others. Physical activities rather than social media conversation would typically have more communicative impact on community relations relative to tourism. Social media would have played a supplemental or secondary role. The prominence of social media in this result suggests that the Ministry and Council are physically inactive as much as they are online.

Research Question 2: What are the awareness level and the community relations activities of the Ministry/Council?

This research question helps to determine the public awareness of community relations activities executed by the organisations. Data generated from the questionnaires indicate that the level of the public's awareness varies.

Findings in this respect can be found from tables 2 and 3, respectively. This result reveals that a large proportion of participants are not aware of the community relations activities of the Ministry/Council. This result indirectly reflects the earlier observation that social media, instead of physical activities, are the primary source of awareness of the Ministry/Council as community-related organisations.

However, out of all the purported activities of the Ministry/Council cultural festivals are the primary

community relations activities executed by the Ministry/Council. The gap between cultural activities and other actions is indicative of the disproportion of the organisations' community relations actions. The emphasis on cultural activities may indicate such events attract tourists and therefore generate income for the government. However, overemphasis on cultural activities at the expense of other income-earning activations shows that the tourism potential of the State is still untapped.

Research Question 3: What is the view of the public about community relations activities in the ministry/council and the areas to improve on?

This research question seeks to show the public's perception about the community relations activities in the ministry and council as well as areas the public will want the ministry to improve on. It was observed based on the findings on table 6 that majority of the respondents hold that the Ministry/Council are not doing enough. It means that the public is generally unsatisfied with their activities.

The overriding perception is that the Ministry/Council are weak organisations; although a handful says that they are doing well. The point is made more explicit in Table 7, where the respondents declared dissatisfaction pointedly. Table 8 goes further to show clearly that the Ministry and Council need to do better. There is room for improvement, especially in the area of service delivery and involvement of international partners, according to Table. Respondents mention of international partnership alludes to the need for foreign direct investment in tourism in the case the organisations lack the needed funds to expand tourism-expanding community relations activities,

Conclusion

From the findings above, this study

1. Concludes that the Lagos State Ministry of Tourism and the Council of Arts and Culture have not created appreciable public awareness for their activities.
2. In other words, low public awareness about what they stand for is a sign of public relations failure.
3. The Badagry community surrounding tourist attraction affirmed their dissatisfaction with the community relations activities of the Ministry/Council. According to the people, the Ministry and Council are not doing enough to relate to the community. Again, this is a sign of community relations failure of the two related organisations.
4. The concentration of efforts on cultural festivals is both positive and negative. Positive because the people could see that the Ministry and Council are active. The peoples' acknowledgement of the cultural festivals is an existential attestation for both the Ministry and Council However, and it is negative in the sense of a limitation. Where there are many tourism activities, pursuing only one indicates that the two organisations' activities are one-sided. There is a lack of strategic thinking for multiple tactical actions.
5. Lack of public relations initiative and poor community relations by the Ministry and Council indicates that the two organisations have lost touch with their key stakeholders (Nwosu, Odiboh, Olabanjo and Fayemi, 2020a; Nejo, Odiboh, Omokiti and Adelua, 2020b; Olabanjo, Odiboh, Adelua and Fayemi, 2020a; Omokiti, Odiboh, Aiyende and James, 2020b; Salau, Odiboh, Adelua and Fayemi, 2020a; Salau, Odiboh, Omokiti and Nejo 2020b; Nwosu, Odiboh, Oyedepo, James and Adelua, 2020b).

This study concludes that the ministry needs to focus more on community relations at the local level and create a high-level awareness among the people. Moreover, ensure that they build a relationship between the public and the organisation to overcome the issue of negative perception. They should as well focus more on areas that will benefit the public, such as more empowerment programs. More educational programs, better community relations activities

Recommendations

It is not enough for staffs of Lagos state ministry of tourism art and culture to sit down in one spot. The public does not know what the Ministry and Council stand for. They should try as much as possible to have a good working relationship with the media which would help to further project their activities at the community level. Additionally, the two organisations should restructure their public relations apparatuses, engage and train tourism mobilizers in each local government in Lagos. Let the community benefit from the tourism plan of the government through a long-lasting relationship that would stand the test of time.

Abstract

This study investigates the awareness and understanding of the usage and challenges of the digital public relation to the farmers in Lagos state. In-depth interview was adopted to elicit information from a cross-section of four PR practitioners. They were purposively selected to provide necessary information on the adoption of Digital Public Relations in farming. The Two-Symmetrical public relations model by James Grunig was adopted to explain the issues raised. The findings of the study call for the use of other channels of communication such as the new (digital) media, also known as digital public relations, to increase the dissemination and sharing of agricultural information to farmers. Findings suggest that the use of Facebook, email and text messages are valuable assets to the communication strategy.

Keywords: Digital Public Relations, Awareness, Poverty Alleviation, Farmers.

Introduction

Agriculture is an essential sector of Nigeria economy. The backbone of the economy. It provides jobs for over 70% of the citizen. Providing food for consumption, marketing purposes and exporting purposes which generate income and revenue for the government enhancing the growth and development of the country (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). However, agricultural productivity in Nigeria has many limiting factors. Such factors include poor fertiliser input, over-dependence on rainfall, and reduced physical infrastructures. Others include poor roads network and outdated harvesting methods, lack of technological advancements, weak market prices, and ineffective agricultural policies (Adeyeye et al., 2019; Adellua et al., 2020). Studies (Sharma, 2011; Sife, 2014) have shown that farmers are prone to inadequate accessibility to agricultural information.

Mtega and Benard (2013) noted that Nigeria's rural information availability and access are restricted by poor and unreliable communication, among others. Eradicating poverty, in its entirety, continues to be one of humanity's significant challenges (Aiyende et al., 2020). Worldwide, more than 800 million people are poor. The SDGs are an audacious commitment to ending poverty in all respects by 2030. To achieve the SDGs, a program is necessary to aid people living in vulnerable situations. Expansion of access to essential resources, services and information are necessary (Coombs & Holladay, 2012; Alzahrin, 2018).

Information and knowledge are significant components of poverty alleviation strategies. Digital public relations offer easy and fast access to large quantities of information that are useful for farmers. Financial challenges limit agricultural access to poverty reduction information for farmers, insufficient facilities and insufficient information (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019). The traditional approach to the distribution of farm knowledge by extension programs has also been lacking in many developing countries.

Thus, the use of other communication channels, such as digital new media, also known as digital public relations, to promote agricultural information dissemination and sharing to farmers (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a). Digital Public Relations are communication channels that can disseminate information in a short time to a broad audience. As such, the new media is a place for farmers to raise awareness of specific issues, particularly the poverty alleviation scheme so that they can be informed quickly. The new digital public relations is better than the scope of the standard extension services, according to Oladele and Boago (2011).

Statement of the Research Problem

ICT has brought many revolutionary changes to various sectors, including agriculture. The system has changed from traditional media to computerised systems, which is a more convenient and efficient method to save financial resources and time. Scientists widely analyse this phenomenon (Disney et al., 2018; Ghazizadeh et al., 2012; Martens et al., 2017; Roy et al., 2018; Skackauskiene et al., 2016; Yang et al., 2015), but attention to the developing countries and their acceptance of Digital Public Relations is missing.

As a result of these concerns of both positive and negative influences of digital public relations, numerous studies were executed by scholars, organisations, practitioners and stakeholders. Nevertheless, none of the studies captured the influence of digital public relations practice on farming in developing countries (James et al. 2020). This knowledge gap calls for new studies to understand the influence of digital public relations on the awareness of poverty alleviation programs for farmers in Lagos State, Nigeria.

Objectives of the Study

This study established the relationship between digital public relations adoption and awareness of poverty alleviation programmes for farmers in Lagos state.

However, the specific objectives were to:

i. Identify the significant digital PR channels adopted by PR practitioners in Lagos State Agricultural Development Authority (LSADA)
ii. examine the influence of social media (*Facebook*, *Twitters*, *Instagram*, *WhatsApp*) in promoting awareness of poverty alleviation programmes for farmers in Lagos state;

Research Question

i. What are the digital PR media adopted by public relations practitioners in Lagos State Agricultural Development Authority (LSADA)?
ii. What are the influence of social media (*Facebook*, *Twitters*, *Instagram*, *WhatsApp*) in promoting awareness of poverty alleviation programmes?

Literature Review

Yekini et al. (2012:13) defined poverty as being the opposite of wellbeing. Poverty goes beyond income shortages in this section of the literature review. It includes poor access to land, credit, and essential services. Poverty is not limited to material deprivation. There are other intangible aspects, such as poor

access to quality schooling, health care and social support (Yekini et al., 2012:13). Poverty in the broader sense means the lack of necessities, including food; shelter and general consideration of medical care and safety (Bradshaw, 2016). Poverty has low income and expense, high mortality, and morbidity, poor nutritional status, poor educational achievement, vulnerability to external shocks (such as drought, plagues, disease and flood), and exclusion from economic, social and political processes (Moyegun 2006).

Omoyibo (2013) described poverty in two terms–subsistence often referred to as extreme/absolute poverty and relative poverty. Absolute poverty describes a situation where people barely survive, where the next meal is unsure. This situation defines an inadequacy of fundamental human needs such as food, clothes, accommodation, clean water and health services. He, on the other hand, describes relative poverty as a process of deprivation, which allows people to slip away almost imperceptibly from the social life-system, with no stereotype pauper. Similarly, Adawo (2017:14) says that absolute poverty is misery linked to insufficient resources, income shortages, smaller margins, high risk of failure, hunger, and disease. In contrast, relative poverty is about deviant results and irrelevant comparisons between the material position itself and others, mainly from expectations.

Poverty alleviation is a set of reasonable measures to lift people out of poverty permanently. It is a public-spirited action for economic growth and social happiness (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Poverty alleviation in public relations uses institutions to empower the poor with knowledge and skills-based activities. It creates opportunities to develop and boost public livelihood in terms of income, spending, increase in revenue, provision of food and health services.

Digital Public Relations

The Internet has created the most prominent international village. The world is completely changing the delivery of information to the earth, enabling people to access data at all times and keeping them updated minutes at a time (Hiebert, 2004). Even as distribution outlets previously dominated by newspapers and television, the Internet gives equal access today to all those who contribute to information dissemination. The Web promotes real democracy with equal access and a free flow of information as opposed to any other platform.

Robert (2005) claimed that cell phones and the Internet were used by people around the world to mobilise rallies and protests. It is particularly useful for public relations professionals due to the global presence of online media. "Internet is a great tool that should be used effectively and rationally by PR professionals for effective public relations (Broom. 2009). (James, et am 2020) added that this changes the way professionals perform their work as public relations practitioners accept the power of the Internet. The emergence of the Web and electronic communications has changed public relations and the way it is practised (Nwosu, *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

Social Media

Social media is an essential means of communication from social networking websites and forums and microblogs (Aiyende et al., 2020). Demand for more creativity, efficiency, speed and public impact in public relations turns the attention of practitioners to the application of social media as a tool of activations. Data on social media are plentiful. Publics use social media to gather, connect, and disseminate information to friends, families, colleagues and their global networks. In this regard, public relations practitioners can use social media to achieve and engage their target audience (Nejo para al 2020).

Social Networking Web sites

Another innovative digital tool is social networking websites. Websites like Twitter, Myspace and LinkedIn are a popular way of keeping people linked. One-third of the top 15 sites in 2007 are websites for social networking (Johnson, 2008). Websites were, like Dwyer, Hiltz and Passerini observed, "the

core inspiration in interaction and relationship-keeping" (2007, p. 1). As the task of maintaining partnerships is public relations, social networking networks are an ideal way to manage multiple relationships at once. Dwyer, Hiltz and Passerini (2007).

Perceptions of Public Relations and Social Media

From the history of Public relations till date, people have a biased conception about the image, practice and Its function within organisations, as well as the role in society, is often discussed by professionals and academics alike. Rampton, Stauber (1995), Miller and Dinan (2008) directed attention to the detrimental public relations practice. They accused PR associations and big corporations of information manipulation and other unethical practices. These, from a theoretical perspective, are further revisited, in Grunig and Grunigs's (2008) excellence theory, Kent and Taylor's (2002) dialogical critique of public relations or Zerfass' (2008) and Odiboh's (2020) integrated communication.

Lagos Stage Ministry of Agriculture

Lagos State Ministry of Agriculture exists for the sole purpose of achieving agricultural development. Its vision is to be a significant contributor to sustainable economic growth and the social well-being of the general public. Its mission is to promote sustainable healthy, effective and efficient food production in a healthy environment.

Lagos State Agricultural Development Authority (LSADA)

The Lagos State Agricultural Development Authority (LSADA), in earlier times known as the Lagos State Agricultural Development Project (LSADP), was well-known in 1987 and became a state government parastatal schedule with effect from 1 April 1995. The Authority is a service-oriented agency providing farmers/fisher folks in the state with technical agricultural services. The Ministry is responsible for the coordination and monitoring of the Authority's activities. Public relations and LSADA are responsible for disseminating validated technologies on improved management practices in agriculture-related to crops, livestock, fisheries, agro-processing, farm mechanisation and women. The sub-component has 64 extension agents who visit farmers with new tested technology on a fortnightly basis, as well as providing solutions to farm and field problems. The agent-to-farmer extension ratio is 1:6204, and is valued at 600,000 farms.

Theoretical Framework

This study adopts the two ways public relations model. Grunig & hunt (2000) propounded this theory. It focused on the free flow of information, visual understanding between an organisation & its publics (Grunig 2000). The opinions and attitudes of the public have always been important in public relations practice as it shapes the interaction that can take place between the organisation & its publics. Hence, the adoption of digital public relations will facilitate reporting to the public in the ministry & agency activities, actions as a way of contributing to an informed public, disseminating. Agricultural information to create awareness, on rustic scheme and programmes as a prelude to farmers' participation in Ministry &its agency decision making and listening to public opinion through their feedback

Research Methodology

This study obtained data from 4 public relations practitioners in Lagos state. Specifically, data came from public relations practitioners working with Lagos State Ministry of Agriculture and Lagos State Agricultural Development Authority (LSADA) through a purposive sampling technique. This sample size was adequate for exploring and answering the objectives of this study. The data was collected using a semi-structured interview guide which contained items adapted from previous studies. Each piece had statements about which respondents were asked to express their opinion freely. These

statements were mainly on the adoption of digital public relations in creating awareness of poverty alleviation programmes for farmers. Specific responses across various questions were clustered and analysed.

Qualitative Findings

These are the findings from the in-depth interview conducted among four public relations practitioners from both the Ministry of agriculture and Lagos State Agricultural Development Authority. Findings reveal that farmers seek information concerning market prices, input supply, credit facilities, especially information about their lively hood "poverty alleviation programs. According to the practitioners, such data are readily available to the farmers through the digital public relations.

Two interviewees claimed that in addition to information being readily available to farmers, there is a feedback mechanism by the Ministry and its agency. The interviewees said that the Ministry and the Authority believe in two-way communication between them and the farmers.
As a professional in the field of communication all the interviewee affirmed that information dissemination and awareness creation is essential, hence the adoption of the digital platform of communication to disseminate quick reliable and credible agricultural information to the farmers

The interviewee claimed that Facebook, mail and text message are most prominent and vital digital communication platform that is valuable to the day to day practice of their profession. When asked for the benefit of digital public relation, a practitioner said

> *"To the best of my knowledge, digital means of communication is a good public relations strategy in the sense that, farmers can obtain credible, timely and up to date information on infrastructure, inputs, financial institution and government policies, programs and actions".*

In many developing countries, too, the traditional approach of disseminating agricultural information through extension services has many shortcomings. This situation necessitates the use of other channels of communication. These are the new (digital) media, also known as digital public relations, to increase the dissemination and sharing of agricultural information to farmers (Salau et al., 2020).

In determining the challenges faced by the PR practitioners in the selected Ministry and agency, one of the interviewees acclaimed:

> *I believe that the lack of credible data to ascertain some information is a significant hindrance to farmers on getting accurate information about poverty alleviation programme.*

While another PR professional has this to say:

> *The challenges they face is non-availability and accessibility of digital devices and some that do have, do not often make use of it.*

Another ascertain that:

> *Digital public relations involved the use of the English language to disseminate information. We discovered that some of these farmers are semi-illiterate. Consequently, lack local language, and relevant local information is significant obstacles to the usage of digital public relations.*

The study also revealed that public relations practitioners in the Ministry and agency agreed that Facebook, email and text messages are the most prominent and valuable assets to their daily practices. Facebook enables practitioners to communicate with specific communities of farmers on a micro-target basis and opens a one-on-one communication line with other members. Interviewee acknowledged that new digital media provides a new medium for target audiences (farmers) to connect.

In response to this, a Public Relations officer revealed that:

> *Facebook allows explicitly the ability to react and encourage updates." A PR practitioner confirmed that "Facebook should be part of any communication campaign which aims to interact with the farmer in a specific, unique, and genuine way; somehow in support of Sharma (2011) and Sife (2014).*

The interviewee adduced that farmers might be exposed to inadequate accessibility to agricultural information due to a whole number of factors. According to Mtega and Benard (2013), access to agricultural information in the rural areas of Nigeria faces inadequate and unreliable communication infrastructure, high levels of poverty, lack of electricity and high digital device costs.

Conclusion

In conclusion. The presence of digital media in our everyday life establish ways in which we come to communicate, express our identity representations, routine undertaking and experiences. Digital media has made it possible to reach a whole lot of people that were simply difficult to meet before. The findings of this study indicate that the adoption of digital social networking platforms allow public relations practitioners to target farmers and get the necessary governmental agricultural information to them. Respondents acknowledged that social media and websites offer a new method of micro-targeting that is not provided by other existing tools. The interviewees agree that text messages via Facebook are not the only social media device that allows public relations professionals to access their farmers. However, through social media, one-on-one interaction is achievable. The ability to communicate with farmers immediately and often get a quick response offers a new way of communicating to farmers on various poverty alleviation programs of the public relations units.

Recommendations

Based on this study's findings, the following its recommendations

i. First, the Ministry and its agencies have to discover that the farmers need enlightenment on the importance and benefits of new media of communication. The farmers need information and training on how to use digital handheld phones in accessing the information on the programmes, policies and schemes of the Ministry and its agency.
ii. Second, government agencies can lease out mobile phones to farmers to facilitate quick access to information. It would also lead to effective communication with empowered farmers, thereby making them information literate.
iii. Third, the government-owned computer network should be deployed for agricultural public relations. It would make the government and its agency easily accessible to farmers who will serve as an avenue to get immediate information on government schemes and programs about farmers.

Abstract

Public relations is a management function, and its activities and tools are indispensable to every organization for building and sustaining image. Lagos state is one of the most populous states in West Africa yet small in size. The Lagos state ministry of the environment with one of its agencies Lagos State Parks and Gardens is committed to building a cleaner, greener and sustained Lagos despite the challenge of overcrowding. This study seeks to discover public relations actions and its approaches to the Ministry and its Agency. It would identify the tools used in carrying out their public relations actions, and examine the effect of climate change while ensuring life on land. The study focused on the Lagos state ministry of environment and one of its agencies, Lagos State Parks and Gardens, which were selected purposively. The population was selected purposively due to accessibility of the ministry and agency. The study found that public relations actions are ongoing in the Ministry and its Agency. Proactive measures are in place to combat climate change and ensure secured life on land. Moreover, the right tools are engaged to execute and disseminate their public relations actions and messages which have a massive impact on the environment and the public. However, the study recommends that the public relations actions executed by the ministry and agency should be more intensified with massive awareness to the public until it becomes a lifestyle.

Keywords: Public Relations, Environment, Public Relations Activities, Sustainability

Introduction

The Mexican statement (1978) defines Public Relations as an art and social science of analyzing trends, predicting its consequences and counselling top organizational management on how to relate to the public. Another definition of PR is that it is deliberate, planned and sustained effort towards institution-public cooperation. That is why it is a general assertion that Public Relations interfaces between an organization and its publics.

The environment, on the other hand, can be defined as everything around us, the activities that take place within and around a business setting. The sustainability and development of the environment become a focus to tackle with. Hence, the Lagos State Ministry of the Environment came to existence with the responsibility of ensuring a clean, healthy and sustainable environment for the wellness of the citizens. The wellness and totality of the citizens are imperative to the government in order to achieve a sustained environment. For this purpose, the Lagos State Parks and Gardens Agency was established with its mandate to make Lagos greener and healthier through the creation and maintenance of operational parks and gardens and planting and maintenance of the tree.

Therefore, this study seeks to find out how the Ministry and its Agency engage the Public Relations actions to drive home their awareness of tree planting, beautification, maintenance of public lawns, gardens and parks in accordance to the Sustainable Development Goal 15 - Life on Land. A vital aspect of this goal is the need to plant a tree in order to protect the environment.

Statement of The Problem

The Lagos State Ministry of the Environment focuses on the clean, healthy and sustainable environment for the wellness of the public. Lagos State Parks and Garden Agency (LASPARK) is one of the agencies with a mandate to make Lagos greener and healthier through maintenance of trees. Despite the existence of LASPARK, there are issues surrounding tree-felling, tree-planting, and respect for trees. Other issues are management of parks, railings, lawns and gardens. The presence of trees and its maintenance has become necessary for combating the adverse effects of climate change and the safety of lives on land. Therefore, this study seeks to find out the awareness of the public relations actions executed by the ministry and agency, the approach used in disseminating PR actions to the public. The activities executed to ensure life on land.

Research Objectives

The objectives of this study are to find out the Public Relations activities executed by the Ministry and Agency, how informed are the citizens about it and its impact on them.

1. To discover and compare the PR actions of the ministry and agency and its approaches.
2. To identify the tools employed by the ministry and agency in carrying out PR activities.
3. To discover the effects of climate change while ensuring life on land.

Research Questions

1. What are the PR actions and approaches used to project your works?
2. Which public relations tools do you use?
3. What are the effects of climate change while ensuring life on land?

Limitation of Study

The constraint encountered during the interview with the agency LASPARK was that reshuffling took place not too long across the ministries and agencies. As a result, the Head of Enforcement was the only available person to grant the interview; hence, caused a limitation to the study.

Theoretical Framework

The two-way symmetrical model of public relations developed by James Grunig and Todd Hunt in their 1984 book 'Managing Public Relations' was adopted in this study. The theory focused on ensuring that resolutions made by the organization are mutually beneficial between itself and its publics. It provides an organization with the tools and path needed to create a strong company reputation built upon stable, long-lasting relationship and also maintains both the organization's and its audiences' best interests as the forefront in the fair and balanced way. Through these, the organization and its publics can collaborate to grow and strengthen the organization leading to greater success (Excellence theory 2013).

Therefore, the Lagos State Ministry of the Environment and its focus study agency, LASPARK should implement decisions, policies and projects that are in the interest of the public wellbeing. Their actions would ensure the environmental sustainability of the State, as indicated in their official mandate.

Literature Review

Broom (2009) defines Public relations as the management function that establishes and maintains mutually beneficial relationships between an organization and the publics on whom its success or failure depends. Public relations is the practice of knowing how to manage all information emanating from your organization and being able to positively influence such opinions from time to time from your base (Odiboh & Oladunjoye, 2019). It is the promotion of good rapport and goodwill between an organization and other persons (Abodunrin 2015). Likewise, PR assists top management leaders of

organizations to uphold the credibility of corporate image, products and services (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020; Olabanjo *et al.,* 2019).

Newsom et al. (2010:2) wrote that public relations involve responsibility and responsiveness in policy and information to the best interests of the organization and its publics. It entails anticipating the analysis of new and emerging issues that may affect an organization. PR is also the occupation responsible for the running and success of organizational relationships and reputation (Nwosu et al., 2020a; Olabanjo et al., 2020a; Omokiti et al., 2020b; Salau et al., 2020a; Salau et al., 2020b; Nwosu et al., 2020b).

It involves the communication and exchange of ideas either in response to or facilitates change. Intrinsically, it connects to policy initiatives, their promotion and responses to the organizational actors and their representative. Public relations exist in all sectors of different levels (L'Etang, 2009).

Public Relations Activities: Aid for Ensuring Sustainability

Public relations is a crucial tool for informing, building a mutually beneficial relationship with a focus on the public. These activations are employed to create and maintain the identity and what the organization stands for (James et al., 2020). Therefore, as human life develops and improves, daily, there is a need for smooth communication which expands the level of the people's knowledge base. Public relations helps organizations' management teams in achieving institutional or corporate goals. It brings into the affairs of companies' transparency, accountability, respect for citizens' rights, and programmes evaluation (Gilaninia & Taleghani 2013). They further posited that public relations help to promote mutual understanding, confidence and strong reasoning meanwhile safeguarding the interest of the organization and its public. (Gilaninia & Taleghani 2013).

Organisations, firms, industries, ministries, agencies to mention a few engage public relations actions and tools to develop and represent themselves to the public in good light hence, the office of the public relations practitioner. Public relations experts have the responsibility of the planning, building and maintaining institutional image and upholding the professional excellence at the same time (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a).

The public relations activities range from programme planning-which means analyzing problems and opportunities, defining goals and planning activities in order to measure results, which involves the management and clients (Fayemi et al., 2020). Writing and editing involve preparing news releases, annual reports, article and features, booklets, shareholders' reports to mention a few (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a). Media relations which is one of the crucial PR actions is about maintaining excellent working contact with the media operators and professionals. These media include radio, television, cinema newsreel, social media platforms and the press. The public relations professional works with the media to place stories about the products, companies and company spokespeople (Onabajo, 2013). Here, the organization supplies information and provides facilities to the media. At the same time, the media publishes these to the public as concerned. Additionally, the success of a kind media relation is subject to the public relations professional having an understanding of the functions of the media in society. The relationship is central to the practice of public relations (Onabajo, 2003).

Furthermore, products such as brochures, report ad multi-media programmes are essential to communication (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Special events organization helps to gain the attention of specific groups such as news conferences, exhibitions, award programmes and facility celebrations. Research and evaluation is one crucial activity of a public relations practitioner. It entails the gathering of fact, analysis, and evaluating the continuing process and success or failure in order to decide future strategy (Chartered Institute of Public Relations n.d.).

Environmental Sustainability

As discussed by the Office of Sustainability, University of Alberta (2013), Sustainability can be viewed as meeting the needs of the present without compromising the ability of future generations to meet their own needs. Sustainability is all-encompassing with a holistic approach that put ecological, social and economic dimensions into consideration in order to find lasting prosperity. It is also about working within limited available resources that allow the living system to thrive.

Environmental sustainability implies that all earth's environmental system is in balance. At the same time, natural resources are used by humans at when due to replenish themselves. Though climate change is everywhere, other environmental problems are more severe. They are erosion, deforestation, land degradation and potable water scarcity, which harms the poor, especially the developing countries. It is the collective role of both the public and private sectors to tackle these issues because environmental degradation has a considerable imprint on national economic growth. The issues as identified are insufficient government commitment, weak institutional capacity to deal with them and insufficient attention to sustainable development goals (World Bank, 2008).

The World Economic and Social Survey (2015) reports that the international community must ensure that the United Nations Framework Convention on climate change. Furthermore, it should produce cooperation between the developed and developing countries in order to meet carbon-dioxide emission reduction targets. Also, an effort to protect the forest with sustainable production and consumption pattern, deforestation is seen to be caused by factors beyond the forest sector's control. The role of forests in the life and livelihood of the indigenous people deserves much more attention. Adequate drinking water and sanitation infrastructure can be best built through public initiatives across all levels and access to clean water should be expanded (Nejo et al., 2020).

Sustainable Development Goals 15 (Life on Land) focuses on restoring, protecting and promoting sustainable use of terrestrial ecosystems. It also includes the need to manage forests, combat desertification, halt biodiversity and reverse land degradation in a more densely populated and resource-taxed world. There is no doubt that human activities had caused severe damage to the ecosystem through deforestation, loss of natural habitats and land degradation (Salau et al., 2020). The target is that by 2020 according to the SDG 15, an end comes to deforestation and restoration of degraded forests. Also, conservation and restoration of terrestrial and freshwater ecosystems must ensure the conservation of mountain ecosystems, restoration of degraded land, protection of natural habitats and biodiversity. There must also be access to genetic resources and integrate ecosystem and biodiversity in governmental planning.

Ugochukwu (2008), in his findings, discussed the need to ensure environmental sustainability in Nigeria. According to him, the government should increase the budgetary allocations to environmental matters. Ministries and Agencies of the environment should, in turn, invest in capacity building, training and acquisition of laboratories. Also, the government should ensure strict compliance with the environmental laws by citizens and companies operating in the country. Another discovery is that the Nigerian environment is lacking the coordinated management approach it deserves. It is still under assault from various challenges; the different efforts from the government to curb such challenges are not in the direction of stemming the tide. The policies and laws are mostly ineffective (Leke & Leke, 2019).

According to Oyefara 2013, he discovered that the Lagos State leaders needed essential characteristics of good governance responsive to the present and future needs of society. He found that the current administration is committed to good governance, which is visible in the areas of environmental sustainability are yielding positive.

Research Design and Methodology

The researcher adopted a qualitative method of gathering data through the use of an interview guide. An in-depth interview was adopted to get the opinions of the people in charge of public relations

affairs at the ministry and agency. After transcribing the interviews, a discourse analysis followed based on the research questions of the interview guide.

Results

From the results of the interview conducted, all the ministries have detailed approaches used to protect their works. The participants affirmed that the public relations actions used are door-to-door sensitization, public enlightenment, press releases, stakeholders meetings, and packaged mini-documentaries. Others are media relations, media appearances and interviews, location tours, press conference, media advocacy, sponsorship and community relations. Others still are partnerships, special reports and feature article and enforcement of government policies while ensuring compliance through monitoring of the activities. One of the participants elaborated further on how they go about stakeholders meetings. He said, "we do a lot of stakeholders meeting. We visit the traditional rulers in local government areas to discuss issues such as refuse dumping, biodiversity, wetland preservation, drainage blocking, street trading and others. During the stakeholders meeting, we get those people we think can reach out to the people at the grassroots level, then we educate them. We package mini-documentaries in diverse languages such as English, Yoruba, Igbo, Pidgin, etc. So that the people can understand the messages we are disseminating in order to stimulate them to act positively".

The LASPARK interviewees also agreed with the above-stated findings. However, they added that they carryout public announcements on obedience and enforcement of environmental laws. They harp on those trampling on the open spaces; those involved in soil degradation. Some officers are responsible for issuing notices and warning the public on tree felling.

These actions get to public knowledge via media vehicles such as radio jingles, television announcements, fliers, web pages, newspapers, and public address systems. Other outlets are stakeholders' meetings, individuals who walk into the office for clarifications and questions about the workings of the department of public affairs as one of the participants stated.

However, all the participants agreed on the need to tackle the challenge of climate change adequately. Since Lagos is an overcrowded city and also one of the most populous states in Nigeria, advocacy worked well. On tree planting to protect the environment, one of the participants said "my son had an assignment which talked about everyone who should plant a tree. After much research, I found out that as we drive, your exhaust from the car affects the climate. Therefore, we are to plant a tree." This statement is intriguing as much as it shows the interviewee's understanding of the relationship between climate change and environmental tree planting. Furthermore, limit burning to avoid the ozone layer being depleted and do not dispose of your waste indiscriminately to avoid flood when the rain comes.

All the participants ascertained that it is an offence which is punishable when caught to default the policies identified. Two of the participants opined that "We have a stiff penalty to unauthorized tree felling. If you want to cut a tree in Lagos, you must seek permission from the agency otherwise; a heavy penalty will be slammed on you". The reason given by the interviewees is that the Lagos State Government has executed several steps to combat climate change issues in order to protect lives on the land according to SDGs 15. The government continues to sign treaties with international bodies.

Conclusion

From the results of the qualitative in-depth interview research, it is clear that there are efforts in ensuring that Lagos State is habitable despite the rapidly increasing population. Government's emphasis is on greening, advocacy on a clean environment, sensitization and public enlightenment to ensure no defaulters. They were proactive in tackling climate issues this year, compared to previous years through Zero tolerance for refuse dumping and distillations of drainages to minimize the flow of flood and its impact on lives.

As the ozone layer depletes, the tree planting initiative and beautification of medians helps to protect the environment and makes it safe and conducive for living. Therefore, individuals on land have an

immense role to play in ensuring a sustained environment. Climate change is a part of life, and a natural cause that comes and its effect has found are flood, destruction of homes, properties and loss of lives.

Nigeria and Lagos state by extension is a signatory to treaties like Conference of parties which gear towards one goal that is, reducing the effect of climate change.

Recommendation

The researcher recommends that the public relations actions executed by the ministry and agency should be more intensified with massive awareness to the public until it becomes a lifestyle. Finally, aside from the stakeholders' meetings, more training is necessary for the officials assigned to areas on the Sustainable Development Goal 15. They need updates on how to inform the public about what the SDG entails.

Abstract

This study focused on e-Public Relations as a tool for effective healthcare management, using the Lagos State Ministry of Health. The Lagos State Primary Health Care Board, Nigeria, as a study, to discover if the outpatients are aware of the use of social media as an ex-public relations tool. The advent of the Internet has significantly changed the way health information considered (Omokiti *et al.,* 2020). Relevant to this study is the Sustainable Development Goal (SDG) 3., which is good health and well-being. Also, the theoretical foundation of the study is the Excellence Theory, which involves creating value and functional relationship between an organisation (hospital) and it is public (outpatients). Thus, In-depth interviews were conducted in the public relations departments of both the Ministry of Health and Lagos State University Teaching Hospital (LASUTH), its sister agency. An interview guide applied to elicit answers to each of the research questions., which recommended that the public relation department at hospitals try to execute the functions of maintaining a mutual relationship or an understanding between the hospital, and its outpatients. The study recommends the introduction of online communication consultants that will help guide healthcare practitioners on how to use social media to create a smoother patient-hospital relationship.

Keywords: Public Relations, Outpatients, and e-Public relations tool

Introduction

The usage of social media should be an essential factor for an outpatient's health. Arguably, information dissemination about health care, such as immunisation and medication. This social media, which is a site and an application, which empowers customers to make and share the content of what, they see. Social media such as the Facebook, Twitter, Instagram and so on acts as e-Public relations tool in health communication (Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a; Adelua *et al.,* 2020a; Adelua *et al.,* 2020b; James *et al.*, 2020d; Nwosu, *et al.,* 2019; Adelua *et al.,* 2020c; Adelua *et al.,* 2020d; Aiyende *et al.*, 2020a).

Public relations experts at the Ministry of Health and hospitals or Health centres should engage the outpatients (publics) more on the information on healthcare and about the healthcare institutions., especially with social media, because it is a standard tool that is being used or is operated by most people in our society today. The public relations department can disseminate health activities and information with different e-public relations tools, like social media and still the traditional media such as television and radio. Increasing access to social media by individual preferences is noticeable worldwide. Some prefer Facebook to Instagram and vice versa. Others prefer LinkedIn to Twitter or the other way round. Individual social media preferences can be a challenge for the public relations experts in any organisation (Aiyende *et al.*, 2020b; Fayemi *et al.,* 2020a; Fayemi *et al.,* 2020b; Fayemi *et al.,* 2020c; Fayemi *et al.,* 2020d; Olabanjo *et al.,* 2020b; Omokiti *et al.,* 2020a).

Statement of the Problem

Social media are popular outlets for all sorts of promotions (Odiboh *et al.*, 2020a; Odiboh *et al.,* 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019). Organisational promotions are moving with technological advancement leading to electronic visibility of public relations actions. Using social media platforms to communicate these actions is a trend that many countries have adopted. Specifically, Facebook, Instagram, Twitter, and others are online tools for fast-tracking public relations communications with various publics (James *et al.,* 2020a; Ndubueze *et al.,* 2019; James *et al.,* 2020b; James *et al.*, 2020c; Ndubueze *et al.,* 2020; Nejo *et al.,* 2020a; Olabanjo *et al.,* 2019).

Fast-tracking public understanding Sustainable Development Goal (3) and aligning organisations with their publics are two things that e-PR would do. However, public awareness and corporate usage of this tool are not clear. In this haze, public expectation of good health and well-being. It is against this background that this research seeks to investigate the use of social media as electronic public relations tools in the Ministry of Health and Lagos State Primary Healthcare Board. The aim is to ascertain how practical its uses are and the level of awareness, to the well-being of identified publics (Nwosu *et al.*, 2020a; Nejo *et al.,* 2020b; Olabanjo *et al.,* 2020a; Omokiti *et al.,* 2020b; Salau *et al.,* 2020a; Salau *et al.,* 2020b; Nwosu *et al.,* 2020b).

The objectives of the study

The general objective of this study is to examine the usage of social media and the awareness as e-public relations tool for achieving effective healthcare management of the public is towards their satisfaction in the hospital. However, the specific objectives of the study are:

I. To ascertain outpatients' level of awareness of social media usage by Lagos State Primary Health Care Board and the Ministry of Health
II. To find out what social media tools the hospital and Ministry of health deploy communicating their public relations activities
III. To find out outpatients' usage of social media to access information about e-P. R activities of the Ministry and LAGPHCB.
IV. Another objective is to investigate the challenges of useful application of social media between MoH, LAGPHCB and the outpatients.

Research Questions

I. What is the outpatient's level of awareness of the usage of social media by the officials of Lagos State Primary Health Care Board and the Ministry of Health?
II. What are the social media tools the hospital and MoH deploy in communicating their public relations activities?
III. How does the outpatient use social media to access information about P.R. activities of the MoH and LAGPHCB?
IV. What are the challenges of the practical application of the outpatients' using social media to access information about P.R. activities in the MoH AND LAGPHCB?

Literature Review

Social Media

Social media is one of the essential tools to be employed by any organisation. It is a website where people connect, make friends and also get information, e.g. Instagram and Face book. Kaplan and Haenlein (2010) define social media as internet-based applications built on the ideological and technological foundations of Websites.

The social media can be accessed with our digital devices such as mobile phones, laptops and other electronic gadgets. With the era we are in social media is the fastest way for information to be shared. Today, social media is part of public and private life to the extent that individuals only pay attention to the apps in building and sustaining relationships. Everybody is via web-based networking media from the youth, old, rich and poor. Indeed, even organisations presently are extremely dynamic Internet, posting refreshes and noting inquiries. (Adelua, et al., 2020)

The development of new media (web or advanced advances) changes how individuals speak with one another (Balaban-Sali, 2012), access and offer data. Not at all like in the days where individuals depended on conventional media or relational correspondence. Currently, individuals have the chance to look for, read, view. They offer the data they like, anyplace, whenever, and on any theme (Papoola, 2014).

With social media, health organisations can improve in carrying out their information to the outpatients (public), so they can be aware of the activities of the organisations. Also, social media is viewable anywhere, which gives easy access to fast pace information. (Salau, et al., 2020)

Public Relations and E-Public Relations Tool

Public relations have many definitions, which range from simple to complex (Salau et al., 2020) As indicated by L'Etang. In essence, public relations "are the occupation liable for the administration of hierarchical connections and occupation. It includes issues the executives, open undertakings, corporate correspondences, partner relations, risk communication and corporate social duty. Public relations work in the interest of various kinds of association both at the administrative and corporate level, to a private company and intentional areas (James *et al*., 2020). Public relations emerge at purposes of cultural change and opposition" (2009, p.13). Objectives of public relations are to advance common comprehension with the crowds (publics), which might be inside and outside (Aiyende et al., 2020)

The Mexican creed of public relations surmises that the profession is about trend analysis, prediction of consequences and programme implementation on behalf of an institution (Nejo *et al.,* 2020). Public relations also involve an organisation having a mutual understanding with the public (outpatients) for both their interest. The public relations tools include; media relations, press release, employee relations, social media usage and corporate social responsibility.

E-public Relations

The Internet has today changed the world, including acts of correspondence. The Internet is an essential instrument for communication, and the exploration shows that the Internet is exceptionally crucial to everybody. The public relations professional ought to be engaged with online public relations because the Internet is imperative to individuals. Public relations expert that does not discuss viably with the online open cannot effectively or productively keep up the favoured clear picture.

Everybody is associated carefully in this day and age, and P.R. encourages associations to make a vigorous online nearness that is very obvious to their intended interest group. Public relations online provide organisational backing and direction on the web, while being on standby in case of a fiasco occurrence (Fayemi et al., 2020).

E- Public Relations with Health Care

Since health care services and administration include all the people, hospitals have a unique significance among open administration organisations. Hospitals attempt massive missions in verifying physical and mental prosperity of the general public, in short ensuring the well-being of the public, which are the outpatients (Aiyende et al., 2020). Public relations is a series of continuing activities evaluating the attitudes of a target community, and creating relationships dependent on

collective participation and acknowledgement. It exchanges regards, love and compassion with hospital outpatients while giving them a positive picture of recovery back to life (Fayemi et al., 2020)

Public Relations Institute of South Africa (PRISA) looks at the administration of actions of the profession through correspondence. Accordingly, public relations is about discernments and connections between a going-concern and its inner and outer partners (Nejo et al., 2020). Accordingly, it is significant for associations and even people to pay attention impression they make of themselves (James et al., 2020).

Lagos State Ministry of Health

The Lagos State Ministry of Health is the state government supported organisation, accused of the obligation to plan, devise and complete the state courses of action on prosperity. Lagos State showed up through a Federal Decree on May 27, 1967, and Health was one of the Ministries with which it took off. The Ministry was once in the past blamed for commitment concerning both prosperity and social welfare. The political and official organisation of the Ministry resides in the Honorable Commissioner for Health and the Special Adviser to the Governor on Primary Health Care. Through them, healthcare matters affecting the citizens in the State go to the State Executive Council and the Governor. The Lagos State Ministry of Health has distinctive parastatals in the State. (https://health.lagosstate.gov.ng).

Lagos State Primary Health Care Board

Lagos State Primary Healthcare Board was formed to meet the desires of the citizens' health and well-being. One of the methods for accomplishing this objective is the bridging medicinal services and human needs through the 200 and eighty-eight Primary Health Care Centers in the State. The focal point of the Primary Health care is in this manner on preventive human services, and the Board is initiating its acknowledgement all through the niches and corners of the State. https://lagphcb.lg.gov.ng/company-overview/

Sustainable Development Goal (3)

Good health and well-being are one of the most critical tools in our lives. Guaranteeing healthy lives and advancing the prosperity at all ages is fundamental to available advancement. Efforts are needed to thoroughly remove a wide range of diseases/ sicknesses and address many different emerging health issues.

Theoretical Framework

The two-way symmetrical model of public relations is the theoretical foundation of this study. Grunig propounded it and the theory centres principally around the enthusiasm of an organisation (Lagos State Ministry of Health and Lagos State Primary Health Care Board) towards its publics. An organisation decides, which will profit both the organisation its crowds (Grunig, 2001). This theory grasps arrangement between the organisation (well-being division) and its publics, and one that likewise cultivates shared understanding (Severin, 1997). Along these lines, organisations are relied upon to settle on choices that will intrigue the public and not just themselves. At the point what the organisations need is intrigue-free public fulfilment.

Research Design and Methodology

The researcher adopted a qualitative method of gathering data through the use of an interview guide. Here, the interviewee answered the questions posed by the interviewer. The institutions under the study are the Lagos State Ministry of Health and Lagos State Primary Healthcare Board. In each of the purposively organisations, two public relations practitioners were selected and interviewed. The sample size was selected purposively; a senior P.R. practitioner and a junior or assistant P.R.

practitioner were interviewed for each sample size. The results of the interviews were examined and used to answer the research questions.

Results

In this section is the presentation of the interviewees' responses to the in-depth interview questions. All four participants agreed that the public is aware of social media usage by the public relations department. They affirmed that they follow the track of the United Nations' Sustainable Development Goal (SDG) 3. The goal is good health and well-being. The public relations officers said that they regularly disseminate information about diseases like polio, immunisation, meningitis and others to the public to create awareness for the outpatients or the public.

The four participants indicated that they work directly with the government in other for the public relations department to disseminates information to the public (outpatients) concerning the organisation. The participants stated that they all use social media for official purpose. All the staff of their public affairs units encourage and enlighten the members of staff to use the social media platforms effectively, and it helps to coordinate them. The participants also indicated that they all have different social media accounts in other to reach out to the public (outpatients) and also get feedback from the public. The participants also indicated that there are social media handles, that all staff are members. Some of the staff in the public relations departments manage the social media pages daily.

The social media platforms used by the participants in disseminating information to the public are Facebook, Twitter, Instagram, Telegram and WhatsApp. They are emailing telegram and the websites, which contain the phone numbers of their agencies and ministries. Two of the participants implied that Instagram and Twitter are mostly used in distributing information. Two of the interviewees indicated that weekly activations social media platforms. The other two interviewees said that their social media activities are daily.

However, the four participants also agreed that there are challenges for the outpatients or publics in accessing social media. However, one participant stated that "it depends on outpatients' desire for healthcare updates. I do not think it is challenging to access our public relations activities, especially LAGPHCB (Lagos State Primary Health Care Board). The challenges are subjective and individual.

The two interviewees from LAGPHCB stated that their e-PR challenges are the lack of uninterrupted Internet connectivity. Another challenge is that some outpatients are stuck with some unknown social media app. At the same time, some do not have digital media devices for using social media. Another challenge could be that some of the information is sometimes false, and various media articulates negative thing about the governments.

Furthermore, the four participants agreed that there are impacts of public relations activities on the public, which are numerous. If there were no Public Relations department, there is no way the public would know what the government is doing. So, the Public relations department is the tool in which the government disseminates information to the public. The public relations also react to public issues based on available information. They get feedback from the public.

This study, therefore, shows that the outpatients are aware of the social media usage and the four participants employ the right tools in disseminating the information. According to the interviewees, healthcare outpatients also access social media to get more information about the public relations activities of both the Ministry of Health and the Lagos State Primary Health Care Board. Though the access extent may vary; the impact of the healthcare institutions' public relations activities are numerous, and there are many challenges.

Conclusion

This study consists of in-depth interviews with two Public Relations Officers, each of the Ministry of Health and the Lagos State Primary Health Care Board. The study revealed that more information on the awareness and usage of social media as an e-Public relations tool is required. Based on the responses from the four Public Relations Officers, different factors and services affect the outpatients 'and that of the public's choices. To improve the system on hospitals in line with the Sustainable Development Goal (3), public relations officers need to be more proactive in the usage of social media platforms. Coordinated content sharing with both inpatients and outpatients should be institutionalised. Moreover, they inform the outpatients about their P.R. activities by sharing their social media contents and web updates.

Recommendation

This study endorses remodeling of the healthcare superstructure to create public relations units in all the healthcare agencies. That way, there should be a P.R. department, or they should hire the services of a P.R. agency, in other to disseminate information to the public or outpatients.

The study recommends the creation of clear public relations policies and guidelines inclusive of active healthcare givers with the skillset to interact with and educate the public using social media apps.

Abstract

This study examines community relations practices by professionals in the Ministry of tourism, council for art and culture. It also examines areas the public want the Ministry and council to improve on. The research method employed for this study is the In-depth interview method; the interview was also conducted with the public relations professionals in the Ministry and agency to get their insights. Professionals generally do not execute enough community activities to ensure the public see ministries in a positive light. It is not possible to do a successful activity without Public Relations. This paper reveals that despite the professional's claim in ensuring there is a mutually beneficial relationship between the community and the Ministry, a lot still need to be done. The paper concludes that the Ministry and council need to focus more on public relations with those at the local level and overcome the issue of negative perception. They should as well focus more on areas that will benefit the public, such as more empowerment programs. More educational programs, better community relations activities also need more attention. Its recommends that the Ministry of Tourism, council for art and culture must get involved with international partnerships as that is a significant area they are lacking. Also, they must endeavour to create keen awareness about their activities; they should exploit more activities across the different local governments in the State.

Keywords: Ministry, Public Relations, Professionals, Lagos state Ministry of Tourism, Lagos Council for Arts and culture, community relations.

Introduction

Professionals are like people who work as experts in specific fields. The problematic nature of the business world at large coupled with social and environmental inequalities have raised the issues of community relations and corporate image. In recent times, organisations generally have tried in one way or the other to be identified by the domiciling community they are operating. Thus, the need for identity and communication led to the development of public relations which community relations is part and parcel of (Nwosu, Odiboh, Olabanjo and Fayemi, 2020a; Nejo, Odiboh, Omokiti and Adelua, 2020b; Olabanjo, Odiboh, Adelua and Fayemi, 2020a; Omokiti, Odiboh, Aiyende and James, 2020b; Salau, Odiboh, Adelua and Fayemi, 2020a; Salau, Odiboh, Omokiti and Nejo 2020b; Nwosu, Odiboh, Oyedepo, James and Adelua, 2020b).

Community relations, as explained, constitute an essential tool in building good relations between an organisation and its various publics.

The primary goal of practising public relations in regards to community relations is to create two-way communication and sustain mutual relationship and understanding between the organisation and the host community (Adelua, Odiboh, Aiyende and Omokiti, 2020a; Adelua, Odiboh, Nejo and Fayemi, 2020b; James, Odiboh, Olabanjo and Adelua, 2020d; Nwosu, Ndubueze and Olabanjo, 2019; Adelua, Odiboh, Olabanjo and Ndubueze, 2020c; Aiyende, Odiboh, James and Salau, 2020a). Communities are the central part of a business plan that helps in promoting the sustainable development of business activities of corporate organisations through profitable future partnerships.

The Lagos State Council for Art and Culture has had several activities over the years. However, to what end has these activities impacted its surrounding community? Not to undermine the importance of partnership as recorded in the Sustainable Development Goal 17 of the United Nations Organisation (UNO).

This paper seeks to get professionals' perspectives of community relations. It would examine what they have done so far; and how they execute their activities and most especially, how they get partnerships.

Statement of the Problem

There is a general misconception that individual professionals in ministries have become figureheads who would rather sit all day than do an actual job. There is the issue of non-challant attitudes of professionals in ministries to work. The image of an organisation lies solely on the attitude of its workers. The misconceptions about the ministries were avoidable if things were straight from the outset (Fayemi, Odiboh, James and Olabanjo, 2020a). This paper, therefore, looks at the activities being executed by the professionals, tools used, how they create awareness of their programmes, and how they get partnerships.

Research Objectives

This research examines the community relations activities of the Ministry and Council and the P.R. tools applied.

Research Questions

Based on these objectives, the following research questions suffice:

1. What are the media outlets used by the Ministry of Tourism and Lagos State Council for Art and Culture to create awareness of their activities?
2. What are the community relations activities being executed by Lagos state council for art and culture?
3. How does the ministry/council get partnerships?

Literature Review

Concept of Community Relations

The idea of community relations is to establish a cordial and mutual relationship between an organisation and the host community (James, Odiboh, Adelua and Fayemi, 2020a; Ndubueze, Odiboh, Nwosu, and Olabanjo, 2019; James, Odiboh, Aiyende and Salau, 2020b; James, Odiboh, Nwosu and Fayemi, 2020c; Ndubueze, Odiboh, Adelua and Fayemi, 2020; Nejo, Odiboh, James and Fayemi, 2020a; Olabanjo, Odiboh, Nwosu and Ndubueze, 2019). Such a mutual relationship and rapport helps to entrench peace which in turn enables the organisation to operate effectively without hostile interference from the host community. In order to understand community relations very well, it is imperative to know the meaning and what constitutes a community of an organisation.

Community is a place of interactive institutions. It may be social, political, economic, and religious. All of them produce interdependence; co-operation, collaboration, and unification (Nnaemeka, 1993; Odiboh, Amodu and Ekanem, 2020a; Odiboh, Fasanya, Adegoke, Afolabi and Ofor, 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).). A community is a combination of social units and system which perform the primary functions having locality relevance (Waren, 1963). By locality relevance, Akpan (1987) holds that it concerns the condition in which human beings find themselves integrated into a web of meaningful relationship with fellowmen in their style. Such interacting social structure of the community believed to have been possible through what Cutlip and Centre call "... attitude and practice of interdependence, co-

operation, collaboration and unification" (1982, p. 311). A community is also one of the underlying subsystems of human existence that opens the way to man's realisation of their need.

According to Nwokedi, (1988, p.3), community relations is the social responsibility which organisations owe to the people in that area of operation. Canfield (1968) sees community relations by what it does and the reason for doing so – much co-existence between the company and the community in which it operates. He sees good community relations as making an organisation a corporate citizen of the community. Their organisation must do everything to enable society to be well-governed and provide socio-economic activities to support the community.

Nweke (2001) sees community relations as the deliberate effort and planned programme embarked upon by an organisation to maintain a smooth relationship with the host community. The success of this mutual relationship thus depends on proper understanding and adequate knowledge of each other, easily facilitated by functional communication services, knowledge of the community, its pressing needs, social status structure, channels of communication, social agent, opinion leader, among other issues (Nweke 2001).

The essential ingredients of community relations translate practically into social responsibility on the part of the organisation. Meaning that by operating within the community, the organisation should not only identify within the community but should discharge some fundamental social responsibilities to the community. Benson-Eluwa (1999) holds that many organisations in Nigeria do not have plans for issues and crisis management. They operate as if they have everything at their disposal. What they do in times of crisis is to take ad hoc measures. Instead of giving support to public relations expert to manage the issues, they do the wrong things until it is too late to avert crises.

Explicitly, Kogan (1977, p. 8) holds that community relations are "the management functions that evaluate community concerning an organisation within the community, the peoples' interests and executes a programme of action to earn community understanding and acceptance". In Kogan's viewpoints, community relations is no less a severe part of public relations practice. In respect to that, communication becomes the primary useful tool required in maintaining and sustaining a mutual relationship, understanding, goodwill and acceptance in the community where the organisation exists.

Therefore, to achieve a mutual relationship with the members of the community, the organisation should adopt the principles of community relations. These include: (i) the fundamental principles of operation; (ii) the need to define community relations objective; (iii) the importance of community relations, public complaints and expectations.

Community Relations Development

Community relations is way beyond being helpful to people around, and it involves commercial participation in research, vision, evaluation and dissemination (Salau, Odiboh, Adelua and Fayemi, 2020a). With this, it is essential to examine the community relations activities executed accordingly. However, evaluating community relations programmes can be challenging to measure in terms of quantifiable data—performance indicators such as publicity, employee feedback, money value, innovations. Compatibility, perceptions from public opinions, appreciation messages, internal and external communication audit results could measure the community programmes achievements.

There are also vital factors to consider knowing the success of community involvement programmes. Among which is the acceptance of the strategies done by Board of directors and senior management, their endorsement is necessary to avoid unnecessary scrutiny later on. (Nejo, Odiboh, Omokiti and Adelua, 2020).

Key Factors to the Success of Community Involvement Programmes

Several crucial factors determine the success of a programme, the key one of which is the acceptance of the strategy by board directors and senior management. Without their endorsement, the programme and individual initiatives will differ from unnecessary scrutiny beyond the necessary status

measurement criteria. Certain things that may influence these programmes may include partnerships with community organisations, monitoring and evaluations, top management support, successful internal and external communication.

Theoretical Framework

This study adopts the Two-way Symmetrical Model. In this model, both the communicator (the organisation) and the receiver (the public) are mutually communicating. The messages take into account the needs, demands and interests of the public. This model is dependent on research in not only designing or packaging a message but also in helping an organisation to adjust concerning the needs of the public. According to the two-way symmetrical model the public relations practitioner should serve as a liaison between the organisation and critical publics, rather than as a persuader (Odiboh and Ajayi, 2019). Here, practitioners negotiate using communication to ensure that all involved parties benefit from the situation. The term "symmetrical" denotes used attempts to create a mutually-beneficial situation. The two-way symmetrical model is the most ethical, one that professionals should aspire to use in their everyday tactics and strategies (Simpson, 2014).

This theory is relevant to this study because it clearly states how messages relayed by the professionals are considered. Here the professionals are made to serve as an intermediary between the company and critical audience, which in turn sharpens how the public views them. For this research, the qualitative method of research was adopted, using the in-depth interview method of data collection.

Results

Findings from the in-depth interviews conducted among three interviewees revealed that they create awareness about their activities. Moreover, they make people know the customs and traditions of different divisions in Lagos. "When we say that we are propagating and presenting the rich culture of Lagos State, it means that we have a relationship with the people at the grass-roots and communities, for instance, we attend festivals like the Zagbeto Festival in Badagry, Coconut Festival in Badagry, and through the attendance of such festivals, we create awareness."

Two of the interviewees agreed that they use more social media as their primary tool to pass information and create awareness. At the same time, one noted that the Ministry uses the State-owned radio and television stations more. Also, two of the interviewees said they get more of sponsorships and consultants rather than partnerships. In contrast, the other said they get partnerships. "We partner with different newspapers, and they come to cover the event. We send out stories to them, and then they make use of our stories and pictures as well" One also noted they create an enabling environment for the creative arts.

However, one of the interviewees said they use festivals to drive tourism devoid of tradition to avoid Juju and harms on the people. "We normally devoid the tradition from the festival so that at the end of the day, the Juju or whatever they want to do will not be part of the show. It is not as if they do not do the traditional aspect of that festival. However, we try to let them emphasise on the entertainment aspect of that festival so that we can drive tourism". The Ministry and Council have the same structures, the interviewees said. Concerning measures to build relationships between themselves and the community, an interviewee stated that they do so by creating awareness. Another interviewee highlighted that they build a relationship by organising events on creative arts, and more celebrated Lagos festivities. However, the other said they educate the public on traditions and culture, and by that, they build an everlasting relationship.

From the interviews conducted with the Ministry and Council officials, it is clear that the significant activity consistently highlighted is Zangbeto festivities in Badagry. The other two are Egbe and Greater Lagos festivals which happens in few areas of the State. There is little effort to activate its more activities. They stated some of the ways they activate their activities include creating

awareness, strategic meetings, sharing of banners. They agreed that there is usually room for improvement in the way they pass messages to their publics.

Notably, they get sponsorships from reputable brands like GAC, Pepsi, Guinness amongst others. They also have an in-house magazine where pictures of several activities are displayed. To this end, it will be essential for the Ministry and agency to focus more on managing the public misperception and the issue of not creating awareness, activities, and partnerships by improving on their tools and manner of activating their community relations activities.

Conclusion

Community relations, as outlined, ensures confidence-building. It preaches the key messages and organisation's aims at passing across to its publics; in other words, the Ministry's messages must from time to time be consistent and luring enough. (Odiboh O, Olonode A, Adesina E and Yartey D, 2018).

As often said, there is a better method of pitching visibility as a brand, building a customer base and enlightening the public than through community relations activities. It often allows the organisation to execute its crafted messages to target publics professionally and credibly. A primary essential objective in any community relations activities is the ability to differentiate the client's brand from the competition.

However worthy of note that community relations help to make or mar an organisation. A good relationship with the community in which an organisation operates will help build a good reputation. It is essential to embrace as many activities as possible and create necessary awareness as much as possible.

To this end, this study concludes that the Ministry of tourism must embrace more tools in reaching out to its publics not just rely on the traditional media. At the same time, the council for arts and culture must endeavour to get international partnerships to display the cultural heritage of Lagos to the world at large, not just local consultants.

Recommendations

Ministry of tourism must get involved with international partnerships as that is a significant area they are lacking. Also, they must endeavour to create keen awareness about their activities. Furthermore, they should exploit more activities across the different local governments in the State, not just in some areas. Everyone should be able to benefit from the Ministry.

Council for arts and culture must also get involved with partnerships to showcase the rich culture of Lagos worldwide and internationally. It will benefit the State. Above all, Organisations generally should contribute to the development of society and better the lives of its community by providing excellent and maximum service.

Abstract

The use of electronic public relations constitutes and forms a standardized way of promoting an organization's products, services, and therefore making an impact on its general public. The purpose of this research is to examine the usage of electronic media by the public affairs Practitioners in the transport sector of Lagos state. The use of an electronic medium in public relations has excellent potential as a communication tool because the profession generally is and always will be about human relationships. The use of ecology theory and its assumptions form the basis of this study, and it focuses on how the media and communication processes influence human perception, understanding, feelings and values. The researcher adopts a qualitative method of gathering data through the use of an in-depth interview. The study population include the Ministry of transport and its agency LASTMA. The result shows that the transport sector adopts electronic media communication and have effectively used it in ensuring a relationship between the agency and the public. Thereby creating an impact which is positive on the economic growth on the State. Thus, this study recommends that LASTMA needs to intensify effort in the use of the media to instill the habit of obeying traffic rules and regulations on vehicle drivers. Celebrities and social icons should be engaged to influence road users, regardless of whatever challenges they may encounter in their day to day discharge of duty.

Keywords: Public Relations, Traffic Management, Electronic Public Relations

Introduction

Traffic management involves the diverse practice of coordinating, controlling, arranging, and directing existing traffic system. Traffic management provides an environment that is conducive enough for motorists plying the roads. Over the years, the situation of vehicular traffic in Lagos is increasingly critical. A chaotic situation and neglect by the government were significant characteristics. Therefore, leading to a loss of lives and properties. This situation now led to the establishment of an agency under the control of the Ministry of transportation, called LASTMA (Lagos State Traffic Management Authority). The agency was established in the year 2000, under the authority of the State Governor to control and manage the traffic situation in Lagos, which will to a great extent help in saving productive time from been wasted on the highway thereby ensuring sustainable economic growth in the State.

Traffic infrastructure is one of the most relevant elements of development today. Transport infrastructure facilitated the growth of connections between regions within a geographical environment. It also supports the formation of mutual economic, social, cultural relations.

Electronic public relations play a significant role in facilitating two-way communication. Today, this medium has allowed practitioners to implement more effective communication through electronic channels with the public.

Statement of The Problem

Lagos roads before the establishment of LASTMA was full of high traffic congestion, high rate of road accidents, the poor driving culture of commuters and motorists on the roads, high rate of a log jam. There was little or no observation of road rules and regulations, no usage of pedestrian bridges, no complaints to traffic lights and control amongst many others. All of these problems led to a high result in several accidents and significant loss of lives and properties on the roads—theft on the road and precious human hours in traffic. Also, there is severe damage to vehicles plying the roads. These problems, therefore, had an effect on the business costs and efficiency, which also injured and slowed down the social, economic development of the State and county at large.

All of this form the brain behind the establishment of an agency which can help curb all these problems. In 1999, LASTMA came to existence to ensure and create an avenue for the free flow of vehicular traffic, and to help prevent the waste of productive time on the road and to improve the quality of living in the metropolis. The Ministry of Transportation at large is responsible for implementing the State's policies on the transport system. Part of these policies creates an avenue for transportation infrastructural development according to the Sustainable Development Goal (SDG 9). This Goal evolves around enhancing and building resilient infrastructure and the administration of new city models aimed at achieving the safety of lives and properties. And also, the sufficient flow of traffic in Lagos State. This study examines LASTMA activities concerning the motoring public. The study also aims to review the application of procedures in traffic management in the State. It considers the public relations channels adopted to develop and innovate the transport system in the State.

Research Objectives

The objective of this study is finding out the usage of electronic public relations on the activities executed by the Ministry of transportation.

1. To find out how public relations activities contribute to the vision of LASTMA through electronic mediums.
2. To examine the usage of an electronic medium to create awareness in ensuring a free flow of traffic.

Research Questions

1. How do the activities of public relations contribute to the vision of LASTMA through electronic media?
2. How does the usage of the electronic medium create awareness in ensuring the free flow of traffic?

Literature Review

Public Relations

Human life continues to advance relative to global changes. Therefore, there has been an increased need for information and communication; everyone craves for accurate and up to date information to be knowledgeable about happenings in the world. (Fayemi et al., 2020) notes that when practitioners respond to an organizational problem strategically instead of tactically, it helps the reputation of the organization to be positively projected. Public relations is the promotion of goodwill relationship between an organization and it publics. Information brings about success and aids development. Public relations is the practice of knowing how to manage all information emanating from an organization and being able to positively influence such opinions from time to time from its base (Odiboh &Oladunjoye, 2019).

The role of public relations in any organization in terms of work quality is to achieve organizational goals. The objective of public relations is to promote mutual understanding with the audiences(public) which may be internal and external. Public relations practice is the way, and manner top management uphold the credibility of their brand, services, products, staff members to gain acknowledgement (James et al., 2020a; Ndubueze et al., 2019; James et al., 2020b; James et al., 2020c; Ndubueze et al., 2020; Nejo et al., 2020a; Olabanjo et al., 2019). Public relations experts adopt the use of different media platforms in reaching out to both their online and offline audiences. Some of these tools include one on one meetings, public announcement, to mention a few (Odiboh et al., 2020a; Odiboh et al., 2020b; Odiboh and Oladunjoye, 2019; Odiboh and Ajayi, 2019; Odiboh, Ezenagu and Okuobeya, 2019).

Public relations is a profession that is responsible for the success and growth of organizational relationships and reputation. The effect of creating a mutual relationship is to have a mutual understanding with the public, which is an essential responsibility of a public relations practitioner, to ensure a positive perception of the organization (Fayemi et al., 2020). The practitioners' primary duty is establishing and maintaining convivial relationships for their organizations. Part of that duty is safeguarding the interests of the organization. Public relations practitioners are involved planning, creating, building and maintaining a positive image and integrity of an organization (Adelua et al.,2020a; Adelua et al., 2020b; James et al., 2020d; Nwosu et al., 2019; Adelua et al., 2020c; Adelua et al., 2020d; Aiyende et al., 2020a). The survival and growth of an organization depend on having a reciprocal relationship between the internal and external publics. Therefore, the need to provide up to date useful information is essential to keep the public informed of happenings within the organization. Public relations involve the manner at which the top management of organizations employ the use of strategic ways to uphold the credibility of their brand, services to gain acknowledgement (James et al., 2020).

The British Institute of Public Relations explains that the activities of public relations as a profession are deliberate, planned and sustained. It is an effort to establish and maintain excellent and mutual understanding between an organization and all its publics. Three variables are central to this definition of public relations. First, it is a planned activity. Second, the activity must be sustained. Third, the principal aim of the activity is to ensure mutual understanding. Thus, an excellent public relations department must operate with clearly stated goals and objectives. Concerning establishing mutual relations, the public relations practitioner must be both a good listener as well as a good speaker. Public relations practitioners are individuals responsible for the running and success of an organization's reputation (Nwosu, et al., 2020a; Nejo et al., 2020b; Olabanjo et al., 2020a; Omokiti et al., 2020b; Salau et al., 2020a; Salau et al., 2020b; Nwosu et al., 2020b).

Another definition by the International PublicRelations Association describes public Relations as a management function with which an organization or institutions works for the support and understanding of those who make up the public opinion about them. Public relations is the art and social science that analyses situations around the organization. Having a good relationship with media practitioners is a critical action that a public relations expert must be able to do. They are keeping good working contact with the media such as radio presenters, journalists, and bloggers (Nejo et al., 2020).

Electronic Public Relations

Public relations is an occupation responsible for managing an organization's reputation and relationships between the management, stakeholders, customers, government, employees, and all other publics associated with the growth and development of the organization. Public relations practitioners are charged with the responsibility of the planning, building and maintaining the image and upholding the professional excellence and integrity of the organization. As a whole, the body of public relations involves two sub-sectors, one half is responsible for building a good relationship with the internal public of the organization. In contrast, the other half is responsible for creating an excellent mutual relationship with the external public. These sub-sectors work hand in hand to the progress of the organization as a whole. In carrying out these responsibilities, practitioners must adopt the use of a mass medium for proper communication. Some of the media mediums include both traditional

mediums and the new mediums. Salau et al., 2020) noted that sincere information seekers will always go to an organization's website to get relevant, trending information about the policies and activities of the organization. With this, they refer this platform to others who may need any information about the happenings within an organization.

With the emergence of the Internet, the world, especially in the aspect of communication, has advanced. The Internet is now of utmost importance as it affects quick and effective communication both far and near. Public relations activities range from program planning-which means analyzing problems and opportunities, defining goals and planning activities in order to measure results, for the progress of the organization. Due to this, public relations practitioners now involves the use of not only the traditional medium of communication but also the Internet, especially social media platforms. Online activities include photo sharing, video sharing and communication, audio sharing, messages and content sharing amongst many others. It is now very essential for practitioners to adopt these new mediums in order to be able to effectively shape and maintain the desired public image of their organization. (Salau et al., 2020) describes public relations use of digital as an innovative concept that is computer-mediated. It involves practicing public relations in the cyberspace.

The observation regarding the application and use of the online with the electronic public relations is that practitioners tend to apply the online tools in a similar way to traditional media tools such as the print and broadcast (newspaper, radio, T.V., magazines (Aiyende, et al., 2020b; Fayemi et al., 2020a; Fayemi et al.,2020b; Fayemi et al., 2020c; Fayemi et al., 2020d; Olabanjo et al., 2020b; Omokiti et al., 2020a). While there are several advantages to the use of the Internet, it also has some challenges. For example, cases of crisis control, the traditional media rather than the Internet perform better. Therefore, practitioners much are conversant with the effectiveness of these mediums to the benefit of the organization.

Public relations practitioners all over the world, including Nigeria, must master the principles, rules, tricks and applications of digital public relations in order to be relevant to organizations of the future. Noticeably, human activities had caused a severe change to the communication system through the enormous growth in the adoption of internet features. The first step is to be vast in the use of the Internet and digital equipment because being digital involves the use of computers. Also, practitioners in this profession must understand the difference between analogue and digital because they both have their implications for executions. Digital can transmit information quickly without considering proximity as a factor. However, it is always difficult to keep records while the analogue is like an archive for data and information. Today, electronic public relations have become an essential and necessary style for communication because it is open to more extensive opportunities. The public can now interact with one another about an organization in a public way through the Internet.

Road Traffic Management

Managing road traffic involves applying control measures for road users to improve road safety and ease road congestion. These measures could also be the process of controlling and determining the timely movement of vehicles on the road. Traffic management is a technique that ensures a sufficient flow of traffic through the adoption of strategic methods. These are achievable by combining many years of experience with fresh techno approaches to provide a free traffic controlled environment. Managing traffic helps to control large vehicles, tricycles, road users (including pedestrians) to prevent jam and congestions on the road, with a minimum level of convenience.

Road traffic management and control involve the activities of directing vehicles and pedestrian traffic within and around an environment, construction area, accident zone and other kinds of disruption, therefore ensuring the safety of lives and properties of the general public. This activity may include the use of some technologically advanced equipment like the CCTV and monitoring tools. Also, advice can be given by local roadside authorities to commuters and motorists all to ensure a road free of traffic congestion. Besides, traffic management ensures the achievement of dynamic balance between the needs of individuals plying the road and network capacity. It also includes having in mind that users of the different means of transportation share limited infrastructural space. The requirement for traffic

management involves the monitoring of traffic. This activity is not one-sided, support like sharing of information to users, emergency management, and support for commercial means of transportation amongst many others.

Urban community traffic management is a telematics system of road traffic control because this kind of advanced community can quickly reveal the cause of a problem. Through the web of traffic, information solutions are more accessible to come about. The use of advanced tools such as television circuits, information transmitter and road detectors, traffic management
is now part of social governance.

Generally, traffic involves the movement of people and goods from one point of location to another. This movement occurs along a particular pathway which may also be a guideway. The cause of traffic congestion is a condition in which the number of road users increases with little available space to accommodate them adequately. The slow speed characterizes this situation in the movement, longer time spent on the road, and increased long queues. Congestions like this create frustrated drivers engaging in road rage and violation of traffic rules and regulations, which frequently result in accidents, loss of lives, loss of properties and damage of the roads.

Research Design and Methodology

The researcher adopted a qualitative method of gathering data through the use of an interview guide. Here, the respondents give their opinions and comments directly to the researcher. An in-depth interview was adopted, and the population were selected purposively. The study population include the Ministry of Transportation and its agency LASTMA.

Theoretical Framework

Media Ecology Theory assumptions are best suitable to emphasis the idea of the study. This theory aims to understand the social impact of technology and communication (McLuhan, 1964). The theory claims that the media act directly to shape and organize culture within a society. Media ecology is the study of how media and communication processes influence human perception, feelings, values, understanding.

McLuhan notes the influence of technologies including radios, clocks, television, movies and games on its viewers. He focused on defining the relationship between technology and members of a specific culture. He also noted that electronic media had revolutionized the society, and the society is quickly becoming reliant on these communication technologies. No society is unaffected by the impact of the various electronic media used by communication.

Results

The result from the interview conducted at the Lagos ministry of transportation and it agency LASTMA reveals that the public relations department adopt the use of an electronic medium of communication to create and maintain a mutual relationship with their public. The Participants explains that the public affairs unit mediates between the Ministry and it publics, and every aspect of transportation is a susceptible sector as it affects every single person. The department's responsibility is disseminating information through different media channels to reach people and share information on the activities of the Ministry. The participants mentioned that in addition to the traditional media, they use new media. The reason is that because the world has transformed to digital where the Internet plays a vital role, especially the social media platforms, handled by the social media unit. YouTube, Twitter, Facebook, Instagram, email and other platforms.

Each participant explains extensively on the use and effectiveness of the Traffic radio 96.1FM, created for communicating the control and navigation of vehicular movements within Lagos. Road traffic officials on the road help transmit what is happening on the road from time to time, into the

department's WhatsApp group chat. This information, in turn, is transmitted to the control room who then transmits it to Traffic Radio an arm of the Lagos state government ministry of information and strategy. Traffic Radio disseminates information to the motoring public concerning road situations, so they can plan their journey accordingly and help them spend less time on the road.

This platform allows the public to call into traffic radio to find out the situation of a particular road and the traffic situation on that particular road. Traffic radio also gets across especially to the zonal commanders and zonal heads who are in charge of the zones. Besides, participants also added that there are many challenges with maintaining traffic-free roads in Lagos State. One of these challenges is the peoples' poor maintenance culture. People do not maintain their vehicles. So, along the line, this may lead to a breakdown. Once this happens on the road, it results in massive traffic congestion. Motorists are so impatient to get to their various destinations, and therefore, leading to violation of traffic rules and regulations which even compounds the traffic congestion. Another challenge is the ability to instill a safe driving culture in the State. It is not that the people are not aware of the traffic rules and regulations, but they just chose not to adhere. Motorists violate traffic rules, and when apprehended, unfortunately, the members of the public then turn against the traffic officers to insult them while carrying out their duties. One of the participants mentioned that the Ministry is coming up with some strategies to help instill professionalism in the LATMA officers through retraining and the use of technology to execute most of the duty.

Lagos is an overcrowded city and also one of the most populated State. Also, there has been more damage to roads due to the constant and continuous rain pour. Therefore, advocacy for more infrastructures is highly needed. The government's massive construction and reconstruction of roads in Lagos state have added to traffic gridlocks because some parts of the roads need to be blocked. In situations like this, motorists are to be patient to follow the instructions of the traffic officers. The Officers are on the road because of the road users to ensure safety and to help navigate easily within the minimum possible time.

Discussion of Findings

Based on the results from the interview, all the three public relations officers expatiate that the use of the electronic medium of communication has been beneficial. Based on the interviews conducted, it is clear that the public relations department use the radio, television, and the Internet is relating to the public. The study shows that the state government has a specific radio station that was established purposely for monitoring the traffic situation in the State. The Lagos Traffic Radio 96.1FM works hand in hand with the Lagos State Traffic Management Authority (LASTMA) to alert people and inform the people of on-ground traffic situations.

Conclusion

This study is an in-depth interview with three public relations practitioners from both the Ministry of Transportation and its agency LASTMA. They explained their policies and strategies through the adoption and use of electronic media in reaching out to their public. Most notably, the use of Lagos Traffic radio and the internet platforms have been beneficial to the State's progress. It is ensuring the free flow of traffic on the road to enable economic development.

Recommendation

Electronic public relations goes beyond using the State-owned radio station to disseminate traffic-related information. The absence of digital media and social media applications in the traffic management mix in the State suggests that the Ministry of Transportation and LASMA still need to do a lot. Thus, an internet application that would attract public participation in transportation relations is recommended going forward. LASTMA needs to intensify effort in persuasive public relations actions to instill the habit of obeying traffic rules and regulations on road users. This action is regardless of whatever challenges they may encounter in their day to day discharge of duty.

Common Goods Theory: Identification and Review of Research Areas

Agnieszka CIECHELSKA

Wroclaw University of Economics and Business, Wroclaw, Poland,
agnieszka.ciechelska@ue.wroc.pl

Abstract

Although the concept of common goods, or commons, has been used by scholars since the Middle Ages, its meaning keeps evolving and it has not been consistently defined so far. The increasingly complex reality and the challenges of today have been inspiring researchers to look for new applications of the common good theory. Traditionally, two research areas have been distinguished: the analysis of common goods, understood as natural resources, and the analysis of their users and the institutions they create. These areas have been quite thoroughly researched and the ensuing knowledge is relatively well structured, although many gaps still exist. However, new types of goods and services emerge in the literature, alongside new institutions, relationships and social processes that can be analyzed using the common good theory. In these areas, few theoretical works have been written and knowledge is poorly structured. Therefore, this paper aims at identifying and reviewing those research areas where the common good theory is or could be applied.

This paper is directly inspired by the issue of effective municipal waste management in the context of circular economy. While the theory of public goods seemed more appropriate at first, it turned out that many elements of this system could be seen as common goods. Waste itself could be perceived as both a common good and a demerit good. Although some works have been written on this, they are merely case studies or do not derive from the common good theory.

The paper sets out to identify and possibly expand the areas researched by the common good theory by determining the attributes of common goods and their environment that can be analyzed. The historical development of the common good theory will serve as a starting point.

Keywords: common goods, common pool resources, new common goods

Introduction

The notion of common goods is already present in the works of Aristotle and Cicero, who understood them as goods produced collectively, but shared individually (Dupre L., 1993). Also Thomas Aquinas and Machiavelli in the Renaissance looked at those issues. Both of them analyzed the relationships between the common interests (the state) and the individual interests of citizens (Mrozek M., 2013; Słup P., 2017; Izdebski H., 2017). The concept of the common good is also present in Catholic social teaching, introduced there by John XXIII. Also political sciences and law have contributed greatly (Łaczkowski W., 2003). In economics, the issue was first addressed together with the voluntary exchange theory and the analysis of public expenditure policies. Among other things, public and common goods were studied in this context, including their financing, or their presence in the public sector. These issues were researched by such authors as Musgrave R.A.(1959). Somewhat later, common goods were analyzed by Samuelson, who in 1954 concluded that such goods did not meet the optimization condition (the marginal social cost of producing a good must be equal to the aggregated marginal rates of substitution of all consumers of that good). Therefore, in Samuelson's opinion, such goods should be produced by public entities as public goods. He used the term "collective consumption goods" to describe the subject matter of his research (Samuelson P. A., 1954).

The interest in common goods flourished after publication of G. Hardin's "Tragedy of the commons" (Hardin G.,1968). Hardin formulated a social dilemma, still known as the "tragedy of the commons", claiming that the discrepancy between the self-interest of an individual and the common good of all users of renewable resources, eventually leading to its depletion. The individual self-interest aims at maximizing the benefits by increasingly intensive use of the resource. In contrast, reduced use is in the common interest, to ensure sustainable use. If individuals fail to take into account the replacement rate of the resource, irreversible destruction occurs. The underlying reason is that individual benefits are instant and therefore desirable. In their turn, collective benefits are postponed and hence much less obvious for individuals (Prandecki K., 2016).

Despite the growing popularity of the common good theory, despite even the Nobel Prize for E.Ostrom, no consistent definition of the concept of commons has become generally accepted. To quote Schumpeter (1995; as quoted in: Grabowska, Szawiel 2003: 75) *there is no such thing* as a uniquely determined *common* good, that all people could agree on or be made to agree on by the force of *rational arguments*. Piechowiak (2012: 433) understands common good as the sum of the *social life conditions that enable and facilitate comprehensive development of all members of a political union and the communities it forms.* Broadly speaking, common good are those of material or non-material value for a certain community (Prandecki K., 2016:56). Based on these statements, it can be assumed that common goods combine an economic category, related to goods and their value, and a social category that determines that value. Many definitions of commons emphasize that their use is reserved for members of a particular group, thus excluding others (Barnes P., 2006). L. Balcerowicz (2013) finds that common goods are somewhere between easily excludable and non-excludable goods and may be rivalrous or non-rivalrous.

These properties have become a basis for searching for definitions of common goods by differentiating them from private and public goods, introducing increasingly elaborate sets of distribution criteria (Weimer D. L. Vining A. R., 1999; Cooper T., Hart K., Baldock D., 2009). The initial works on common goods aimed at seeking their physical characteristics. Researchers focused on the unique features of commons (usually natural resources) used by a particular community. Apart from comparisons to public and private goods, the distinguishing criteria included (Choe J., 1992, as quoted in: Hess C., 2000):

- origin: natural and anthropogenic,

- intended use: for profit or for consumption,

- renewal rate: renewable and non-renewable.

Importantly, these divisions may evolve over time or denote different categories for different users.

Another research area was proposed by E. Ostrom, who defined commons by reference to their users and the institutions they created. Today, the term common pool resources (CPR) is used to describe common goods perceived in this way (Ostrom E., 1990). These two research areas are still being explored today, both in the traditional sense and in attempts to use the existing knowledge for new applications. Therefore, many terms denoting common goods have appeared in the literature. They do not always mean the same thing and the differences are not clearly defined. New possibilities of applying or modifying the common good theory regularly emerge, mostly owing to technological and information progress, which generates completely new goods and services. Also contemporary environmental problems, including those of a global nature, together with the related externalities, are increasingly being studied in the context of common goods. However, in these new research areas, there are few works that propose a systematic framework for the existing knowledge. Hence, significant research gaps exist in this area.

Common Goods as Common Resources

This area of research on common goods is based on Harding's works. Initially, attempts were made to identify physical characteristics of common goods that would distinguish them from clearly defined

private and public goods. Analyses focused on renewable natural resources, which were particularly vulnerable to the 'tragedy' if exploited beyond the sustainability rate by private users seeking to maximize their profits.

To mitigate these negative effects, it has been proposed to award property rights, whether to private or public entities (Ostrom e., 1990). Introduction of fees or tradable permissions is another way to limit access (Tietenberg T.,2002). These proposals have sparked an array of research papers on market failures, such as the free rider effect, the prisoner's dilemma, or the agency theory. As research progressed, it was found that Harding's solution was only seemingly more efficient. The essence of the problem was that a particular type of goods were analyzed (i.e. goods commonly used but not managed in any way). Today, such goods are referred to as open access goods. Everyone can freely use such goods, and at the same time everyone suffers the consequences of the free use by other users, without being entitled to make any claims. Thus, an indeterminate set of users without specific rights enjoy a given resource. A few economists have tried to distinguish between common goods and open access goods (Bromley, 1982; Runge 1981).

Some researchers considered top-down regulations (for instance introducing property rights or fees) as a way to avoid the 'tragedy'(Goldman M.,2013, Dasgupta P.S., Heal G.M.,1980). An analysis of their works shows a number of features of common goods, today referred to as common pool resources (CPR). These are as follows:

- common pool resources are renewable,
- users have similar resources and skills and do not consult their decisions with other users
- the analyzed situation is predictable and stable over time.

In these models, as long as the price that buyers are willing to pay exceeds the cost of private production, the number of resource users will grow, over-capitalization (i.e. excessive investment in technical solutions used to exploit the resources more intensively) will continue, and – as a consequence – the economic rent will be increasingly fragmented. Traditionally, such an approach has been applied to describe commonly used renewable natural resources such as forests, pastures or fisheries. However, it can also be applied to certain man-made (anthropogenic) resources, such as the Sahel famine in the 1970s (Picardi and Seiferet, 1977, as quoted in: Hess C., 2000).

Institutions established by resource users

As research progressed, it became evident that ownership supervision proposed by Harding did not mitigate the 'tragedy'. Whether the owner is private or public, there is no certainty that the benefits owed to ownership will be clearly greater than the cost of supervision. This conclusion inspired a search for rules ensuring effective use of commons in the long term. It was recognized that the essence of such goods was not so much in their physical characteristics as in their users and the institutions they create. The leading researcher in this area is Elinor Ostrom, who, together with her team, was the first author who approached commons in this way. In her opinion, what distinguishes common goods from other goods, is above all the manner of social supervision, which determines the long-term viability of these goods (Ostrom E., 1990). In her works, she analyzed a number of detailed issues related to the goods themselves and the communities who use them. She created a methodology for studying common goods (The Institutional Analysis and Development – IAD) in the classical meaning of the term (natural renewable resources) (e.g. Ostrom E., Hess C., 2007). In her research she proved that depletion of common resources largely depends on the behavior of the community that uses them – the division of roles and property rights, the community's characteristics, the type of institutions created, the exchange of information, the co-organization of activities or the adjustment of rules and principles of using the common resources. The stability and functioning of the institutions are crucial in ensuring sustainable use of the resources (Ostrom E., 1990).

Communities that successfully manage their natural commons often operate under changing natural conditions and are characterized by longevity (similar experiences, continued cohabitation, shared plans and values) and by assigning importance to the individual's reputation as a prerequisite for achieving a certain social status. Examples include communities and the institutions they set up to use

common forests, contemporary farming communities (Marelli B.,2020), and institutions managing natural resources in Africa (Bollig M., Lesorogol, C., 2016). Ostrom identified the following characteristics of such communities that are essential for long-term success in the management of common goods:

- individuals or households that use the resources are clearly defined, as are the boundaries of these resources,
- the rules governing the use of the resources are adapted to local needs and conditions and are flexible,
- most participants subject to the rules are entitled to modify them, and decisions are made collectively,
- the right of community members to set their own rules and apply them in practice is respected by higher-level authorities,
- community members organize a system for monitoring members' behavior,
- a system of graduated sanctions is used to penalize those who violate the rules,
- community members have access to affordable dispute resolution mechanisms (Ostrom E., Hess C., 2007a:7)

Ostrom, introduced the concept of group ownership. With reference to the use of commons, she did not define the concept, but proposed it as an alternative to public and private ownership. As in the case of private ownership, group ownership confers ownership rights on individuals who are also users of the common goods in question. Thus, the goods are used individually, but the benefits are common for all users. Balcerowicz (2013) is of the opinion that this type of ownership is becoming similar to private capitalist ownership. Many of the group ownership cases described by Ostrom have been built bottom-up, sometimes even centuries ago, and still exist today. This shows the strength of bottom-up institutions. Bottom-up group ownership formation processes may also be promoted or managed by state institutions, such as courts, which can intervene in case of disputes among commons users (Ostrom E., 1990).

Objects: new common pool resources

The development of the goods and services market, technologies and information has led to the emergence of completely new common pool resources and has changed the characteristics of the existing ones. For example, easier and more affordable copying makes consumption less likely to be rivalrous, while the introduction of usage fees facilitates exclusion from consumption. Although new common pool resources share certain features of traditional common pool resources, they are different in many ways. New common pool resources are most often man-made and based on technology, hence the term 'object' (although it is reasonable to include here the use of the environment to meet new, artificially created needs) (Hess C., 2000). While a great body of literature has been devoted to these issues, they are not deeply rooted in the common good theory, even though the authors highlight problems that are analogous to those of common pool resources: the free rider effect, congestion, or exclusion from consumption. The new common pool resources include:

- road infrastructure and transportation systems (e.g. highways) (Waller P.F.1986),
- landscape and cultural heritage (Gerber J.D., Hess G.,2017; González A.P.,2015).
- municipal and urban infrastructure – e.g. sewerage systems (Svderberg, 1997)), urban infrastructure (Little R.G., 2005) community centers (Foster S.R., Iaione C.,2016; Frischmann B.,2012)
- shared goods (e.g. city bikes, social gardens, community fridges or cars (Nettle C.,2016).
- services of the environment (e.g. waves for surfers and other environmental functions used for sports, e.g. mountains for skiers (Rider R., 1998; Nazer D.,2004),
- public radio (Steemers J.,2004).

A community using common pool resources benefits from a certain system of objects (Oakerson R.J., 1986) (a function, good or service provided by that system) which are large enough to make the exclusion of potential users and beneficiaries costly (albeit not impossible). A system of objects generates object units, such as the annual number of bridge crossings. For an object to exist in the long term and maintain its productivity, its normal wear and tear cannot outpace the investments in maintenance, repair and improvement. Objects are accessible to all, whether or not they have

contributed to these investments. Access reserved only for contributors (i.e. exclusion of all others) involves a high cost of use and may be unfeasible. Consequently, this leads to overuse.

Global Commons

In the age of globalization and global problems, global commons have been identified as a subtype of common pool resources. These include both natural and anthropogenic goods and services, including in particular:

- goods and services related to information technology (e.g. the internet and information resources) (Bailey R., Tierney B.,2002; De Filippi P., Tréguer F.,2015),
- climate and rainforests (Sirén A.H.,2006; Carattini S., Tavoni A., 2019)
- world cultural heritage, gene pool, radio space and outer space (Hess, 2000).

They are analyzed in the same way as common pool resources or objects. Some research problems are the same, and a few new ones exist, such as those related to intellectual property or the assessment of environmental policy effectiveness.

Colletive action as commoning

The factors determining the transformation of a good into a common good are another research area in the common good theory. Such factors may be exogenous and endogenous. Studies on endogenous factors and how they contribute to 'commoning' of public goods can be found in literature. One of those factors is the possibility (actual rather than potential) to exclude users from consumption, caused by physical conditions and the socio-cultural environment. Therefore, 'commoning' depends on the specific circumstances, actions and decisions of the community of users of a given good (Helfrich 2012: 65), which can vary over time. Hence, the same good may and may not be common in various periods.

According to Euler (2015), it is collective actions that make common goods common, and the individual who uses them becomes an element of the system, not just an external controller. Some authors (Bennhold-Thomsen, 2012) indicate that common goods should be treated as social relationships. Thus, they will depend on the relationships and type of interactions among individuals and between individuals and goods. Euler (2015) notes that commoning depends on the universality of collective actions. Endogenous and exogenous changes may lead to changes in the existing rules, which may cause commoning (or uncommoning) of goods. Among the social behaviors that may cause commoning, Euler mentions: (re)production, satisfaction of needs through volunteering, self-organization of community members, as well as inclusion and mediation. Co-production means that the user of the common good is both the producer and the user, which results in commoning.

Common actions are meant to satisfy everyday needs. They are often performed free of charge, especially those of a social nature, such as care and nursing work. This means that such work has a high added value derived from the pleasure of doing it or from a sense of purpose. It may also be a way of maintaining relations or building a sense of importance. Thus, volunteering may cause commoning, in a process that is separate from commoning through market transactions. The third cause for commoning is self-organization of the community. The basis of self-organized free cooperation is the recognition of all members of the community as equal and committed partners establishing common, individual, loose relationships of individuals cooperating with one another regardless of market cues or managers' orders (Benkler, 2006). Thus, the rules of common action can only be established in peer-to-peer relationships, rather than in superior-subordinate relationships.

Inclusion serves the purpose of better meeting the needs of the community, and consists of inviting users with different skills and competences, but also with different needs. Members join the community voluntarily and offer their skills to better serve the community's needs. In some situations, inclusion-related changes in existing relationships in the community are profound enough to cause

uncommoning. Inclusion of a governmental partner may be an example of such a destructive factor. In its turn, mediation always leads to communing (Euler J., 2015).

Exogenous factors leading to commoning or uncommoning include primarily those related to the activity of an external regulator, such as the state, and to a permanent change in governance conditions. The role of the state as a promoter or inhibitor of commoning may result from legislative changes which:

- affect the value of a given resource (e.g. waste treated as a resource in circular economy becomes a social value),
- govern the functioning of community members (e.g. resettlement or eviction orders)
- allow state institutions to join the community.

Another example of commoning factors are environmental changes in governance conditions. For example, as a result of climate change, the resource used so far by a particular community may no longer satisfy its needs, whether due to its changing quantity or quality, or to the availability of alternative ways of satisfying those needs. It seems that the importance of these factors will grow in line with the increasing severity of environmental problems, especially those of a global nature.

Demerit goods as a common

The common good theory may be extended to include demerit goods, also referred to as economics bads. These are goods which are socially undesirable and sometimes generated and/or consumed as a side effect of the consumption of traditional goods. Being a considerable social nuisance, economic bads are the opposite of economic goods and represent a negative value for the consumer or a negative market price. This means that goods and payments flow in the same direction. The adverse effects of the consumption of demerit goods are often unknown or underestimated by the consumer, mainly because they affect the society as a whole. This ignorance may be due to a lack of information or incorrect decision making. In contrast, private benefits are often overestimated. This leads to over-consumption or over-production of economic bads, as long as production and/or consumption decisions are made on the free market. Therefore, the government intervenes in certain ways to reduce or eliminate demerit goods, e.g. through taxation, takeover or administrative orders and prohibitions. As no-one can usually be excluded from government intervention, the free rider effect typically occurs, thus limiting the effect of the introduced intervention (Mendoza, 2011). The consumption or presence of this kind of demerit goods reduces consumers' wealth. Alternatively, consumption or presence of certain kinds of demerit goods reduces consumers' usefulness. Examples of demerit goods include modern-day slavery, disease, environmental emissions, waste, various forms of discrimination in the labor market, internet viruses, or high rates of global income and wealth inequality.

Demerit goods can be analyzed as common goods on a local, regional or global scale and in several dimensions. Continuing with the example of waste, let us assume that demerit goods are a common renewable resource. We can then proceed to analyze waste in exactly the same way we analyze common pool resources, but the relationships will take the opposite direction. It seems however, that environmental emissions, such as air pollution, are not in the same category of demerit goods as waste. Environmental pollution can be analyzed as an increase in the supply of demerit goods, or as a decrease in the supply of goods in the form of reduced assimilation capacity of a given environmental component. In the case of waste there is no such possibility – waste (especially with long decomposition time) can only be analyzed as a demerit good. The second dimension of the analysis will be related to commoning resulting from collective actions. If waste is a common demerit good, are there internal or external factors that will make it a common good? In the case of municipal waste, the circular economy policy, which turned waste into a raw material, has become such a factor. The mere fact that there exist factors that 'turn' demerit goods into goods (or vice versa) is not tantamount to commoning. Finally, the third dimension of the analysis is related to institutions built by the users' community. Examples of such institutions include addiction treatment centers or waste processing plants. In the literature dealing common goods the notion of demerit goods has not yet been addressed.

Concluding Remarks

The most intensively developing literature on new common resources deals with the internet and information resources, urban collectives, communication and transportation. However, research on new common goods may also concern completely new areas, such as dynamic development of new institutions created as a result of endogenous and exogenous changes, as well as constant technological development. New research areas dealing with new common goods also highlight new problems, such as the analysis of the effectiveness of applied instruments from the perspective of the common good theory, issues observed in adaptation systems, in intellectual property or in environmental protection. The problem of demerit goods as common resources has not been addressed in the literature so far.

Abstract

The zeal to constantly advance the educational practise of students has been rising progressively around the world and entrepreneurship education in Nigeria cannot be left out. Entrepreneurship education in Nigeria has been proceeding on two distinctive directions – general entrepreneurship education at tertiary institutions and skill acquisition programme by government and non-governmental agencies. However, these programmes have fallen short of expectations in terms of curbing unemployment in Nigeria. One reason often adduced is the weakness of the current structure of imparting entrepreneurship knowledge. As a result, the pedagogical approach to entrepreneurship education is often seen as a way out. Hence the paper examines the current challenges of entrepreneurship education and the need to adopt pedagogical approach to entrepreneurship education in Nigeria. Various literature on entrepreneurship education and pedagogical approaches were reviewed, theories that support this study reviewed and theoretical framework developed. The importance of pedagogical approach to entrepreneurship education discussed. Based on the necessities, appropriate pedagogical approach is recommended in entrepreneurship education in Nigeria.

Keywords*:* entrepreneurship, entrepreneurship education, Nigeria, pedagogical approach.

Introduction

In Nigeria, entrepreneurship education has been going on in two main directions which are, entrepreneurship education in higher institutions and skill acquisition programme by government and non-governmental organisations. To reduce the high rate of unemployment and poverty condition, government and non-governmental agencies introduced several Poverty Reduction Policies (PRPs) (Taiwo & Agwu , 2016). Due to the failure of PRPs to address the purpose and as a result of flaws in the nation's development policies, the Nigerian government made entrepreneurship education compulsory in all educational system starting from the 2007/2008 academic period (Gabadeen & Raimi, 2012). Before the take-off, in 2006 Yahya emphasized the main objective for setting up entrepreneurship education as to nurture entrepreneurship value and culture among students and faculty. Likewise, maintaining sustainable businesses and not restricted to their research finding.

Furthermore, the team estimated that after three years (2010), 10,000 graduates out of about 50,000 graduate students will be self-employed and reliant (Rufa'i, 2011).

Globally, United Nations Sustainable Development Goals (UNSDG), under education and economic growth included the advancement of entrepreneurship in the education system due to its significance (Greence, Brush, Eisenman, Neck, & Perkins, 2015). In the opinion of Aja-Okorie & Adali (2013), the main objective of entrepreneurial education is to impart on students the correct appraoaches, acquaintance, talent, abilities and expertise to perform in business thereby making it possible for them to succeed in the highly uncertain economic environment. In addition, it is also essential to developing an entrepreneurial culture. Although entrepreneurshiop education has been included in educational system, graduates still find it very challenging and unrealistic to establish their feet on ground as professional business owners even when they have undergone skill training (Adebayo & Kolawale, 2013).

Hence, these programmes have fallen short of expectations in terms of curbing unemployment, poverty alleviation and rapid economic development in Nigeria. Bruton, Ahlstrom, and Oblog (2008) opined that scholars in entrepreneurship have more concerned with who, why and how of entrepreneurship instead of the impart of entrepreneurship on development and on developing countries. Audretsch and Thurik (2007) as cited in Naudé (2013) described it as intellectual disconnect. Some of the challenges that weakened the current structure of imparting entrepreneurship knowledge are inappropriate and inconclusive skill training at the universities and other training centres among others. Similarly, Olokundun, Moses, Iyiola, Ibidunni, Ogbari, Peter and Borishade (2018) attributed one of sure challenges to traditional teaching approaches of entrepreneurship in the universities that involves theoretical methods and are less operative to motivate entrepreneurship career. The methods make students to cultivate a dormant outlook instead of participating actively. As a result, the pedagogical approach to entrepreneurship education is often seen as a way out.

Pedagogy by definition is having skill and science of teaching. It involves the abilities to transfer understanding and assistances in ways that students can relate with, comprehend, recollect and put into practices. Its abilities can be classified into classroom management skills and content-related skills. Having good pedagogical expertise is essential use for classroom and behaviour management. Operational pedagogy incorporates a collection of instruction approaches that back academic commitment, linkage to the extensive domain, supportive classroom environments, and acknowledgement of variance. The application is necessary in all major education and aspects of the course. It forms the action of the teacher by recognising learning theories, upbringing and training of the students, their needs and interest.

As noted in the Nigerian educational policy, education is the greatest essential mechanism for driving transformation, because no vital development will take place in any economy unless the minds are influenced through educational revolt (Federal Government of Nigeria, 1998). Generally, the advantage of entrepreneurship in developing economic growth is implicit. Over time, some countries have achieved substantial poverty reduction, stimulating employment through entrepreneurship (Naudé, 2013; Akhuemonkhan, Raimi, & Sofoluwe, 2013). Individual can view problem from different perspectives with the help of creativity. Therefore, Olokundun et al (2018) suggested that experiential entrepreneurship teaching methods in universities with practical activities and active involvement can be considered significant to students' advancement of entrepreneurial interest in business start-up possibilities. Hence the paper examines the essential of pedagogical approach to entrepreneurship education in Nigeria.

Literature Review

Entrepreneurship Concept

Entrepreneurship has been in existence for quite a long time. France-based Irish economist Richard Cantillon 1732 first used entrepreneurship to mean any practice of quick buy and sell with the purpose of making gain that consists of risk connected with a fresh business. Overtime, the interpretation of

entrepreneurship phenomenon is in accordance with the social scientist disciplines and views. Entrepreneurship has been defined by numerous theorists, but there is yet no widely acceptable definition. Previous definitions tended to be based on the areas of specialisation of the author. Economist defines entrepreneurship from economics view point, same with sociology and psychology. Similarly others look at it from the viewpoint of management or social outlook. Hence Bula (2012) referred to entrepreneurship as a multidimensional concept. For example, an entrepreneur from the point of view of an economist could be regarded as a bearer of uncertainty (making difference between risk which calculated or not), a resource allocator or an innovator. According to Schumpeter an economist, the abilities of transforming, bring together new equipment, increasing competence and output, or creating new products or services, are specific potentials of entrepreneurs (Friis, Paulsson, & Karlsson, 2002).

Anayadike, Emeh and Ukah (2012) defined entrepreneurship as a process through which people recognise prospects, assign means and make value. The value is created through recognition of opportunities for transformation of needs. An entrepreneur transforms innovations into economic values, as challeges are seen as opportunities that needs transformation to make the environment better. One important aspect of entrepreneurship is the acquisition of the skills and knowledge necessary to understand entrepreneurship.

Entrepreneurship Education

Entrepreneurship education is a learning (formal or informal) that instils in students the capability toward observation, recognition and take hold of accessible prospects in the surroundings with acquired skill (Akhuemonkhan, Raimi, & Sofoluwe, 2013). Also, entrepreneurship education can be described as a developmental teaching that inculcates in the students' qualities with abilities of squad player, headship, self-tracking, challenge resolving, cooperation expertise, and self-controlling, different from the traditional education that places little consideration to talents and useful requirements of the domain of work (Soskice, 1993; Sofoluwe, 2007; Gabadeen and Raimi, 2012). Entrepreneurship education as a facet of education, prepares and build an individual's mind-set to carry out the risk of going into something new through the application of acquired knowledge and skills from school (Atakpa, 2011). The general objective of entrepreneurship education is to improve skills as individual and to have varieties of abilities establishing and obtaining entrepreneurial mind-sets, expertise and traits. Since these attributes can be adept, improved and learned; it is essential that all students should be exposed to entrepreneurship education (Ojeifo, 2012).

In the opinion of Brush (2014) entrepreneurship education entails a set of activities that encompass curriculum- formal and informal, co-curricular activities and investigation efforts. The aim is to add values to opportunities discovered. In addition emphasis is on the necessity to inculcate in young people the entrepreneurial behaviours with improved expertise in an innovative way. As entrepreneurship education has transformed, so also has our understanding of what is required to learn and practice entrepreneurship. It is worth to note that entrepreneurship education varies with the different audiences and countries. For example entrepreneurship programme (education) for primary and secondary school will be different from tertiary institutions which will focus on developing competencies among others thing. In the same way the entrepreneurship education for community/local areas will centre on how to start-up a small business and self-employed.

Despite the increase in research concerning the effectiveness of entrepreneurship education, there are inquiries about the general effect on the real number of increase of business undertakings. The emerging findings from Rauch and Hulsink, (2015); Singer, Amoros and Moska (2015) indicate an optimistic link between entrepreneurship education and entrepreneurial mind-sets. However, Olokundun, et al (2018) submitted that for students to develop entrepreneurial competences in school, universities recognition of the essence of experiential teaching approaches, its influence on students' entrepreneurial curiosity and starting ups a business is desired, which are far reaching implications for all the stakeholders.

According Greene, Brush, Eisenman, Neck, & Perkins (2015), the United States has an extensive history in entrepreneurship education and China denotes an evolving centre of education and commerce. Finland has been recognised for long time in its advancement in all stages of education. Also Qatar symbolises a region controlled by the oil industry but considering diversification in its economic activities through entrepreneurship. However, these countries are at various diverse levels of their entrepreneurial initiatives. Across the countries, their emphases are different, subject to the background, circumstances and industrial policy. Meaning that entrepreneurship education depends on the purposes and targets of the country. United States entrepreneurship education is directed toward the improvement of fast growth and technology-based businesses. While Europe entrepreneurship education is more associated with the small and medium enterprise (SME) community, as the emphasis of China is mostly on start-ups. Greene et al (2015) stated that the decision of entrepreneurship education comprises of learning objectives, topics covered, materials choice (cases, training and ideas); pedagogy and delivery mechanism. These decisions comes from intention of the entrepreneurship, the role of concept and magnitude of assimilation across classes, programmes (Neck, Greene, & Brush, 2014). Neck, Brush and Greene (2014) opined that entrepreneurship education is the known of generating, discovery and working on avenue to add value that can be used in the same way in other domains. Ebele (2008) opined that any teaching of knowledge and expertise that aids students to plan, establish and manage their own businesses is called entrepreneurship education.

Entrepreneurship Education in Nigeria

Entrepreneurship education would be formal or informal, the informal structural learning has been an age long programme in Nigeria. This informal learning modified with their natural skills to develop traditional businesses and crafts have sustained the country for more than fifty years (Osalor, 2010). In addition, several programmes and policies have been adopted by government and non-government agencies to enables youths acquire skills to put a stop to the rising unemployment and prevalence poverty that will make them self-employed and economically empowered (Ojeifo, 2012, Taiwo & Agwu, 2016). Due to flaws in the nation's development policies and programmes, the Nigerian government through Federal Ministry of Education introduced entrepreneurship education into higher education syllabus that started from the 2007/2008 school period (Gabadeen & Raimi, 2012). Yahya (2006) gave reasons for making entrepreneurship education compulsory in the educational system. To improve the repositioning of more new business start-up by graduated students. Unemployment To reduce unemployment and put the country on the track to join other countries that have alleviated poverty by means of consolidating on setting up of small businesses.

That notwithstanding, the traditional entrepreneurship training method still exist alongside with the formal entrepreneurship training. The traditional entrepreneurship education is an age long training that existed before the inclusion of formal entrepreneurship education into Nigerian tertiary institutions. The traditional entrepreneurship education are in two forms – Igbaboi and the Omoshe. The concept of Igba boi which means trade apprenticeship is a culture practiced by the Igbos in the eastern part of Nigeria and is also being referred to as mentorship. Though it is an age long practice, their terms of engagement are archaic and should be reformed. This method of training involves an agreement between the parent of the student and the trainer (oga) whereby the student will live with and serve the Oga for a number of years, get trained and the Oga will establish business for him at the end of the training. Another traditional method of entrepreneurship education is called Omoshe mostly practiced in the western part of Nigeria. This type of training, the student go for training from his/her parent's house and at the end of training, his/her parents establish for him/her. With this method, certain amount is paid to the trainer for the training. In both methods, the number of years of training depends on the agreement and the nature of the business. Before now, the two form were referred to as apprenticeship but today, it is called mentorship, where the trainer is referred to as the Mentor and the student (apprentice) as the Mentee.

However, a number of issues have been identified as responsible for the rather slow adoption of entrepreneurship education. The issues as identified by Moses, Ezema, Ezema and Omolade (2017) with entrepreneurial education in Nigeria include curriculum content, availability of qualified and adequate staff, funding, facilities, faulty foundation and weak university-industry linkage. Also

students are restricted to available skill acquisition rather than being able to select something close to their area of disciplines. When Entrepreneurship education is successfully and proficiently taught there is the possibility that it will lead to self-employment among students and increasing viable growth and improvement. With entrepreneurial educational facilities for improving human capital against traditional method of teaching that is predominant in developing world Nigeria inclusive, will lead to better results.

Problems with Current Entrepreneurship Education in Nigeria

Different tertiary institutions ascribed different meaning and method to entrepreneurship education in Nigeria. Most of entrepreneurship education programmes are done in form of vocational and technical education instead of evolving the spirit of entrepreneurship and performance in various disciplines. Some major problems of entrepreneurship education are inappropriate learning environment, lack of updated teacher's schedule, lack of understanding of student's interest, lack of access to modern equipment for vocational and skills. Ojeifo (2013) however stated the following as the challenges of entrepreneurship education in Nigeria:

a. Lack of data to run entrepreneurship education resulting to inadequate curriculum scheme for entrepreneurship education.

b. Inadequate administration and trade hurdle that restrain capacity building and hinder access to technical support.

c. Absence of a pro-active regulatory measures, an environment that encourages innovative enterprise development at the grassroots level.

d. Most vocational skill centres are not accessible to everybody – development training for rural and urban youths involved in the informal economy not easy to get to.

e. Inadequate funds for teaching the practical terms for entrepreneurship education, starting up and expanding venture.

Pedagogy/pedagogical approaches

Pedagogy updates teacher's schedules, judgements and approaches considering theories of learning, understanding and knowing what students need, also the situations and interests of individual students. As an encompassing term is apprehensive of the things teacher does to encourage learning in others. According to Collins English Dictionary, Pedagogy is a field that deals with the theory and practice of teaching and the influences it has on student training. It includes the interaction of teacher and students, the social and intellectual environment the teacher strives to create.

Pedagogical approaches*:* Pedagogical approach is defined as how the teachers educate their students. Every teacher advances his/her own technique of teaching, he or she uses a peculiar pedagogy. No single learning approach is enough, hence a combination of different approaches is required for effective results. Effective teachers use a group of teaching approaches as there is no particular, general method that fits all conditions. Different schemes with different amalgamations with different gatherings of students to develop their learning results. Moses, Olokundun, Akinbode and Agboola (2016) submitted that teachers' creative abilities in teaching motivate creativity in learners, because entrepreneurship teaching is creative work as well as an expression of creativity.

Bhowmik, Banerjee and Banerjee (2013) observed that pedagogical analysis irrespective of the subject, the purpose of the content will aim at analysing the course material either in part or sub-part, subject matter or as a whole, the concept of the subject being taught involves gradually implementing the succeeding four tasks in a handy collaborative style.

i. ***Content analysis***: It has to do with the teacher's topic and concept as he teach the subject.

ii. ***The objective formulation*:** Teaching background and instructional purposes of the content material of the topic on ground by documenting them in detailed behavioural expressions.

ii. ***Selection of the teaching technique and material***: Proposing procedures, skills, teaching learning actions, supports and tools supportive for the teaching learning of the topic on ground is reasonably in harmony with the understanding of the agreed instructional objectives.

iv. ***Selection of the evaluation devices*:** Advising suitable assessment strategies in an oral form, documented or pro-active undertakings and test inquiries for appraising the results of the teaching learning method used with respect to the teaching of the topic on ground. The four components mentioned above are in relationship and interdependent of the pedagogical analysis and the operations are accurately explained through Figure 1 diagram.

Fig 1 Effective Processes of Pedagogical Approach to Entrepreneurship Education
Source: *Adapted from Greence, Brush, Eisenman, Neck, & Perkins, (2015)* https://www.wise-qatar.org/2015-wise-research-entrepreneurship-education/

From the diagram fig. 1 above, a teacher will need to accomplish pedagogical investigation of the substances of the topic he is going to teach in the class, by completing the series of the above four stated mechanisms.

Theoretical Framework

Before now, there is a general believe that starting point of a business is the idea, opportunity or business plan, but that has shifted to developing a mind-set of acting, doing and creating, hence pedagogical approach to entrepreneurship education. There are various methods/techniques to teaching especially if you have taught for a long time. This can also mean that there are no specific ways to teach

a student. You can also have a specific preferences methods and different ways to reach students or you have used to reach students. As your teaching style continue to be and it becomes part of you to form changes in your style of teach. The right way to know how to change your teaching depend on how student learn. There is no particular learning theory that can capture the requirements of every teaching event. Amalgamation of viewpoints is the most likely and effective approach. However, you can build on the various pedagogical theories and approaches that underpin this paper which are the Socio-Cultural theories of learning and teaching, Need for Achievement Theory (NAT) and the three principles of ARM approach. Below are the theoretical frameworks and their corresponding teaching approaches.

Socio-cultural theory

was created by Lev Vygotsky (1896-1934) a Russian psychologist but his work was unfamiliar not until the publication by West in 1962. Vygotsky's theory is one of the foundations for constructivism as an answer to behaviourism. The theory states that the interaction of people with one another and their culture shape their mental abilities, meaning that social interaction plays an essential role in the cognisance improvement. Hence this study is built on critical socio-cultural theories of learning and teaching. Modern-day socio-cultural theories of learning, and outgrowths such as cultural historical activity theory, advance that social and cultural perspectives of learning atmosphere, composite and changing nature of human activity structures at a point in time shape the teaching and learning. Before thinking about how to teach, there is need to consider how people learn. Moses, et al (2016) stated that school culture of creative methods teaching entrepreneurship is dependent on the values, norms, beliefs and perceptions of teachers and stakeholders. Since different schools have their own understanding of culture of entrepreneurship education, school culture of entrepreneurship teachings are usually established unintentionally, but centred on the values of the managers, founders and stakeholders of different institutions.

Need for Achievement Theory (NAT)

NAT is a psychological theory of David McClelland (1965), this theory indicates a positive connection among the need for achievement (n-Achievement), economic development and entrepreneurial undertakings. The theory advocate McClelland (1956) clarifies that when the average level of need to achieve is comparatively great, there would be a relatively larger aggregate of entrepreneurial undertakings in the society. The theory brings to bear that when students are adequately inspired to acquire high need for achievement in life through entrepreneurship education, there is larger inclination for them to establish their own businesses after graduation. NAT -Fast-tracking entrepreneurship education.

The principles of Action-Reflection-Model (ARM) approach

This model has been developing since 1980s with Handel (1983) and Lauvas (1990) as the originators. The model talks about the importance of active participation and active learning on the part of the student; the significance of reflective learning and reflection for both student teachers and learners; and modelling by staff to student teachers and by student teachers to learners in school. In the book, 'the Reflective Practitioner' by Donald Schon (1983) made known about the ideas of reflection-on-action and reflection-in-action. Reflective practice is the ability to reflect on one's actions so as to take part in a practice of constant learning. Reflection is also a vital way to combine theory and practice, through reflection one is able to see and tag systems of thought and theory around the work frame. The focus on the teacher's capacity to reflect over actions is yet another inspiration for the model. One of the authors that also inspired Handel and Lauvas was Ole B. Thomsen. Thomsen argues that student teachers should be joint participants in developing the criteria for good teaching. Therefore, the teachers should reflect on their teaching methods and the impact on the students, in the same way students should reflect on what they have been taught. Teachers think analytically about their practice and learn from their experience (through reflection practicing).

The Importance of Pedagogical Approach to Entrepreneurship Education

The conducts and techniques a teacher adducts in passing his/her instruction is an essential part of teaching, predominantly the way he/she decides to interact with learners, structure the classroom and deliver the content. The different strategies used in different combinations with different groups of students to improve their learning outcomes are very significant. Thus, importance of pedagogical approach to entrepreneurship education cannot be over emphasized and they are:

i. The pedagogical entrepreneurship education is to fulfil specific expected student learning outcomes.

ii. With pedagogical approach to entrepreneurship education, it brings out a better solution proposed to teachers that helps to modify their approaches of teaching in harmony with their students learning styles. Some teachers emphasise strongly the importance of differentiating lesson plans to meet the needs of all types of minds. They write comprehensively about concrete ways to continue to be relevant in the classroom by teaching to students with diverse abilities and cultural backgrounds.

iii. Pedagogical approach boost confidence of the students and teachers and also adds to their reason of presence at school. Teachers take the recognisance of the student that is they give attention to the intellectual, sentimental, collective, and physical dimension when drafting an instructional programme.

iv. The interest of the teachers, students and school community is motivated through pedagogical practice.

v. Through pedagogical syllabus, learning is built upon reflection on experience. This process enhance previous knowledge with cultural and social experiences valued.

vi. Active engagement and interaction facilitate student learning.

vii. Students have their areas of interests with strength which can be used to improve student learning. Good teachers will create an instructional situation that can attract on the strengths.

viii. Students learn best in an optimistic and developed environment recognised by teachers who believe in the abilities of their students to learn.

Recommendations

The following recommendations are made for entrepreneurship education policies maker especially in Nigeria.

i. Detailed syllabus that clearly outlines all expectations and course logistics

ii. Factors affecting the growth come from the entrepreneurial decision to insightful educational entrepreneurship. Entrepreneurship education should be designed to boost student interest and self-efficacy.

iii. A well-organized course website and make the components known.

iv. The advancement of entrepreneurship education has made known of what is needed to learn and practice entrepreneurship. Responsiveness should be on educating the students' entrepreneurial mind-sets and deeds.

v. The policies and programmes of countries should be consistent and proactive in restructuring the capacity of education system to provide entrepreneurial competences and expertise for their citizenries.

vi. There should be increase in fund for entrepreneurship education and advancement and support innovative machineries to leverage partnerships with companies, Non-Government Organisations, international institutions and foundations, as well as with personalities.

vii. From time to time outcomes should be measured to know the current state and the effectiveness of the impact. This will also help to know when some of the policies should be modify if not meeting the target and to increase the growth drive.

viii. Face-lift instructional values and classroom models to stimulate team-based, action-oriented education in areas targeted to improve teamwork and imagination that embrace actual world collaborations with entrepreneurship experts and with purpose markets for new products and services.

ix. For a suceessful achievement, institutions must strengthen the incorporation of pedagogical approaches to entrepreneurship education in Nigeria system.

Conclusion

Interest in entrepreneurship is not inborn as it can grow and develop in accordance with the factors that influence it. A pedagogical approach to entrepreneurship education is able to build confidence and capabilities in learners thereby making it an essential capital in starting a business. The built capabilities is the self-efficacy that reflects on an individual's understanding of his abilities based on previous practice and attribute of the performance and attention to work. It is worthy to note that entrepreneurial thinking patterns are basically changing and the approach to entrepreneurship education should change. Aside from idea, opportunity or business plan, attention should shift to developing mind-sets for acting, doing and creating. This is to achieve an optimistic connection between entrepreneurship education and new business formation. The pedagogical approach will help to achieve the objectives of entrepreneurship education.

Abstract

The aim of this paper is to identify the scale and type of changes in the global passenger air transport sector that occurred as a result of catastrophes. According to the definition by Marcinkowski (2019) catastrophes can be divided into two main categories – natural disasters and technological catastrophes. These include plane crashes, volcanic activity and epidemics. All of these catastrophes have an influence on entities in the airline sector. In their research, the authors reviewed the literature, carried out desk research and conducted an analysis of public-access documents of selected companies from the passenger air transport sector. The review of the literature shows a variety of relationship life-cycle models with many similarities and differences among them. Studied models seems to be insufficient to examine relationship development in project-based organizations, and the revised model with two loops and six phases was developed and presented. The paper develops a framework for strategic analysis and the operational implications of natural disasters and technological catastrophes. It indicates those implications that have already been and one-sided to give impetus to the prognosis of such catastrophe implications. Research is an introduction to the broader research implications in the management in global passenger air transport sector that occurred as a result of catastrophes. The findings might constitute a basis for further research on the SARS-Cov-2 outbreak and its impact on the passenger air transport sector.

Keywords: Management of Change, Catastrophes, Strategic Management

Introduction

Changes in the management of organizations are caused by various factors. Much research has been conducted, and many monographs written, concerning this management issue. The authors agree that even though changes may result from a single factor, they are usually influenced by a combination of simultaneous factors which may be of different nature, process, and may determine efficiency in various ways.

Special factors influencing change include natural disasters directly or indirectly connected with an existing sector. This paper analyses changes which occur in enterprises functioning in the passenger air transport sector as a result of selected natural disasters. The choice of this particular sector resulted predominantly from the authors' own interest, but also its specific character.

After World War II, it was observed that the development of civil aviation could contribute to the spread of democratic values and peace, as reflected in the preamble to the 1944 Chicago Convention by ICAO. As Van Vleck (2013) writes, the process of building a policy of open skies in line with Adolf Berle's vision, which began then, aspired to create a world in which national and imperial boundaries no longer constrained the free movement of people, planes, and products [Van Vleck, 2013].

Later on, thanks to a process of sector deregulation launched in the 1970s, aircraft have become widely available means of transport, both for long-distance, continental and domestic journeys, often in direct

competition with railways. As Bailey (2010) notes, the reform issue was framed as both providing the consumer of air travel with lower fares and freeing business from the "dead hand of regulation." One of the main examples that the deregulation has become successful has been Southwest Airlines – a carrier that has provided impetus for lower consumer prices, and even now is considered a model of a low-cost carrier.

In this sector, the diffusion of management changes resulting from a natural disaster occurs exceptionally fast. It is connected with its global nature, unique information flow, especially relating to flight safety, special economies of scale, particular intensity of supplier power and competition, as well as exceptional role of the carrier's prestige and reputation as instruments of creating competitive advantage. Another characteristic feature of this sector is the presence of network relationships in the form of strategic and operational alliances. All those characteristics make the sector an exemplary subject for an analysis of effects of external influences on strategic and operational management.

Marcinkowski [2019] defines a catastrophe as a sudden event disrupting the functioning of a given community, contributing to the occurrence of suffering and social, material, economic and institutional damage. It determines the need for external assistance as a result of overstretching the capacity to cope with its effects. Catastrophes can be divided into two main categories: natural disasters and technological catastrophes. The former category, natural disasters, includes among others volcanic activity and epidemics. The latter, technological catastrophes, include among others catastrophes in air transport, for instance plane crashes. A similar approach is followed by Zeckhauser (1996), who points out that catastrophes are "by definition extreme events". Additionally, he observes that most of them are caused jointly by nature and humans. An example he gives is an epidemic, in which nature creates a virus, but it is transmitted mainly by human behavior. The widespread availability of air transport

Table 1: Classification of natural disasters and technological catastrophes

Category	Subcategory	Main type of disaster / catastrophe
Natural disasters	Geophysical	Volcanic activity
	Meteorological	Fog
	Hydrological	Flood
	Climatological	Drought
	Biological	Epidemic
	Extraterrestrial	Meteorite impact
Technological catastrophes	Industrial catastrophes	Fire
		Building collapse
		Fuel leak
	Catastrophe in transport	Air transport
		Road transport
		Rail transport
		Water transport
	Other	Other typse

SOURCE: Marcinkowski, J. M. (2019), Humanitarny łańcuch dostaw w sytuacji wystąpienia katastrof naturalnych na przykładzie ugrupowania regionalnego ASEAN. Wyd. Uniwersytet Ekonomiczny we Wrocławiu

undoubtedly contributes to an increase in the geographical coverage of infectious diseases, especially those transmissible by droplets.

Natural disasters and technological catastrophes are important factors that induce changes in the passenger air transport sector. According to the International Air Transport Association (IATA), the airline segment consists of more than 290 air carriers in the world, representing 82% of the world's air traffic, which means more than 4.3 billion passengers carried in 2018. Taking that into consideration, the passenger air transport sector is one of the most globalized branches of the world's economy. It is exposed to diverse factors which may potentially cause serious disruption, or force managerial changes

in organizations, including the international route network, global sales systems, supply chain, air traffic control and dependence on foreign aircraft producers.

In the past 20 years, several natural disasters and technological catastrophes have affected the world, with a serious impact on the operations of air carriers. The aim of this article is to identify the scale and type of changes in the global passenger air transport sector which have occurred in the past 20 years as a result of natural disasters and technological catastrophes. The paper is based on desk research, literature and market data analysis.

Changes in the management field of the passenger air transport sector may refer to strategic, but also operational processes. In terms of strategy, those may be decisions referring to the scale and range of airlines' membership in a network of alliances, scale and range of services offered (the choice of markets), acceptable level of infrastructure safety, scale and type of purchase decisions (aircraft, fuel, other cost factors). On a tactical and operational scale, they especially include events influencing the RASM (Revenue per Available Seat Mile) and CASM (Cost per Available Seat Mile), i.e. those indirectly or directly connected with the processes of passenger or transport service.

Clearly, catastrophes have a direct impact on changes in managing passenger air transport, but they also influence it indirectly, resulting in new regulations in air carriage. The authors claim that natural disasters and technological catastrophes have been responsible for strategic and operational changes in the sector over the last two decades, and that catastrophes have increased the degree of state regulation in this field, thus indirectly influencing changes in management.

Selected Natural Disasters and Technological Catastrophes That Impacted the Passenger Air Transport Sector Between 2000 And 2019

The 11 September 2001 attacks

On 11 September 2001, a terrorist group later identified as al-Qaeda, hijacked four airplanes. Two Boeing 767 airplanes (American Airlines Flight 11 and United Airlines Flight 175) crashed into both towers of the World Trade Center in Manhattan, New York City. The third airplane, Boeing 757 (American Airlines Flight 77) hit the Pentagon building in Washington, DC. The fourth airplane (Boeing 757, United Airlines Flight 93) crashed into a field 15 minutes of flight from Washington, DC. 2,973 passengers were killed in the four crashes, excluding 19 hijackers and 26 persons reported missing.

The direct consequence of that terrorist attack was the grounding of commercial air fleet for three consecutive days in the USA. Clark, McGibany and Myers (2009) wrote that it "resulted in a 31.6% reduction in travel volume in September of 2001 compared to that same month in 2000 and generated massive industry losses". The use of aircraft as a weapon in the hands of terrorists increased the fear of flying and also led to increased insurance costs for aircraft and carriers. As a consequence of the 9/11 terrorist attacks, security requirements were tightened among US carriers and airports, and subsequently extended to the entire world. It increased the costs of air travel financially, but also in terms of time.

Ten years later, in one of its analyses, IATA indicated that the 9/11 events probably cost the airline industry three years of growth. Between 2001 and 2002, airlines lost USD22bn globally. The global air traffic and its revenues returned to the 2000 level three years later – in 2004, and the profitability of the branch (1.1% margin) – in 2006. It was also identified that the shock after the attacks led some financially fragile airlines, such as Swissair and the Belgian national carrier Sabena, to bankruptcy.

Scheraga (2004) states that the financial crisis followings the events of 11 September 2001 precipitated the "low-cost revolution" in the airline sector, of which the flagship example is the aforementioned Southwest Airlines. National carriers looked to "no-frills" low-cost airlines for operational solutions that could be emulated into their business models. Scheraga concludes that this caused large carriers to reassess the appropriate nature of customer service.

SARS outbreak 2002-2003

Severe Acute Respiratory Syndrome (SARS) is a viral respiratory disease caused by coronavirus SARS-CoV-1. Its outbreak in the years 2002-2003 started in Guangdong Province in China. The first cases were reported in November 2002. The epidemic reached the public spotlight in February 2003, after SARS symptoms had appeared in a patient travelling from China to Singapore. The plane was forced to make an emergency landing in Hanoi, Vietnam, where the patient subsequently died and the medical workers who were taking care of him also developed the same disease. The World Health Organization (2020) announced the end of the global outbreak in July 2003. Overall, the SARS epidemic affected 26 countries (with China, Hong Kong and USA affected most) and resulted in more than 8,000 cases in 2003 and 775 deaths world-wide.

IATA estimated that the SARS outbreak had caused a loss of 51.8bn in international passenger traffic (measured in revenue passenger kilometers, RPKs) and USD7bn in revenues in Asia-

FIG. 1: Impact of past outbreaks on civil aviation

SOURCE: IATA . [DOWNLOADED 2020-04-22], www.iata.org/en/iata-repository/publications/economic-reports/what-can-we-learn-from-past-pandemic-episodes/

Pacific and North American carriers [IATA. Economic Briefing. Avian Flu]. For the Asia-Pacific airlines, it meant 8% of annual traffic loss caused by SARS.

Eyjafjallajökull volcanic eruption 2010

On 14 April 2010, Eyjafjallajökull, an active volcano in Iceland erupted. The eruption followed a series of unusual seismic activities recorded since the end of February 2010 including, among others, three thousand earthquakes detected near the volcano, and its first eruption on 20 March. The major explosive eruption was followed by 800 people being evacuated, but no fatalities were reported. It threw volcanic ashes several kilometers up in the atmosphere, which led to air travel disruption in northwest Europe between 15 and 21 April 2010. What is important, the major air corridors connecting Europe and North America run through the airspace of Iceland.

IATA assessed that over the three-day period between 17 and 19 April, when the disruptions in air travel were the most severe, lost revenues reached USD400m per day. Throughout the six-day period, revenues lost by airlines reached over USD1.7bn, the crisis impacted 29% of global aviation and affected 1.2m passengers per day [IATA. Volcano Crisis Cost Airlines…]. According to IATA, the scale of the crisis exceeded 9/11. The Eyjafjallajökull crisis impacted mostly European carriers (70% of available seat kilometers affected), Asia-Pacific airlines (11% ASKs) and North American carriers (10% ASKs) [9. IATA. Economic Briefing. The Impact of Eyjafjallajökul…].

Boeing 737 MAX 8 crashes

Boeing 737 MAX was introduced into service in 2017 as the fourth generation of the single-aisle passenger jet. On 29 October 2018, the Boeing 737 MAX 8 Flight 610, operated by Lion Air crashed into the Java Sea 13 minutes after takeoff, killing all 189 people onboard. Less than half a year later, on 10 March 2019, the Boeing 737 MAX 8 Flight 302 operated by Ethiopian Airlines crashed 6 minutes after takeoff, killing all 157 people onboard. As a result of these two crashes, global safety concern was raised, resulting in the grounding of this type of aircraft by national aviation authorities. It caused a sudden shortage of more than 300 aircraft around the world, delays in production and deliveries, and a decreasing number of new orders. While presenting the financial results of Q4 2019, the Boeing Company announced that costs associated with grounding the B737 MAX would likely surpass USD18bn, including at least 8.3bn in compensations for the affected airlines [Gelles, 2020]. The grounding has remained in effect for over a year now, and the date of returning the Boeing 737 MAX to service remains unknown.

Impact of natural disasters and technological catastrophes in the passenger air transport sector

In this part, the subject of analysis includes changes connected with the scale and range of membership of an airline in a network of alliances, scale and range of services offered (choice of markets), scale and type of purchase decisions (aircraft, fuel, other cost factors) and acceptable level of safety infrastructure. On a tactical and operational scale, they include changes influencing the RASM (Revenue per Available Seat Mile) and CASM (Cost per Available Seat Mile), i.e. those indirectly or directly connected with the processes of passenger or transport service.

Clearly, catastrophes have a direct impact on changes in the management of passenger air transport, but they also influence it indirectly, resulting in new regulations in air transport. The authors claim that natural disasters and technological catastrophes have been responsible for strategic and operational changes in the sector over the last two decades, and that catastrophes have increased the degree of state regulation in this field, thus indirectly influencing changes in management.

Natural disasters and technological catastrophes influence the passenger air transport sector in different ways. By having a look at the graph below, it can be inferred that between 2000 and 2011, when the three events described above took place, terrorist attacks hit the sector in the most visible way – the decrease in passenger air traffic was -2.7%. Apart from the disruptions caused by the SARS outbreak of 2002-2003 and the volcanic eruption of 2010, there was no significant impact on its general level. The 2020 COVID pandemic will most likely cause a significant decrease in passenger numbers as well.

In terms of strategic decisions, it may be concluded that carriers which are members of alliances are coping considerably better. Currently, three strategic alliances dominate: Star Alliance (27 airlines), oneworld (14 airlines) and Sky Team (20 airlines). Membership in such alliances allows airlines to react to changes in a flexible way. However, it may also lead to disruption if vertical relationships exist among the members. In such cases, one network's disruption may influence the operation of other airlines, e.g. when airlines are concentrated on international routes and airlines servicing domestic hubs connected with them.

Modern air carriers are globalized entities, operating in multiple foreign markets, with extensive route networks and dense flight schedules to maximize their profits generated by aircraft. Natural disasters and technological catastrophes require sudden and immediate reactions in various ways on the part of the affected entities in the passenger air transport sector.

Aircraft purchase is among the strategic decisions. Leasing planes is the current operating model, a change obviously influenced by the Boeing 737 MAX crashes. The terminated contracts, altered financing models and damage to Boeing's reputation have already brought about purchasing changes. A drastic reduction in the number of orders is at the same time accompanied by growing demand for lease and charter of planes.

An event such as an air crash first of all means the loss of a valuable asset, in this case an aircraft. For example, the list price of a narrow-bodied Boeing 737 MAX 8 is more than USD120m. It is not a common practice for airlines to maintain a sufficient reserve fleet of aircraft in case of an emergency need to replace an out-of-service airplane, regardless of the reason. Taking into consideration that the aircraft may be taken out of service anywhere in the world, and that airlines have a limited number of their bases, smooth replacement of an immobile machine with another one is operationally difficult.

There is a number of leasing or chartering companies offering aircraft that are often older but still operational and safe, even in emergency cases. The worldwide grounding of the Boeing 737 MAX 8 has shown that, in a serious crisis, demand exceeds supply in the so-called second-hand aircrafts market. The 2020 pandemic will probably force more changes in purchasing patterns, but it will also influence changes in aircraft manufacturing. It is bound to cause an increase in prices on the market.

Passenger safety is another important issue. Each of the above-mentioned catastrophes changed external regulations concerning the scale of the carrier's responsibility for the aftermath of such incidents.

Disruptions in flight schedules cause an obligation on the part of the carrier to compensate passengers affected by cancelled or significantly delayed flights. In the European Union, it is sanctioned by Regulation (EC) No 261/2004 of the European Parliament [13. Regulation (EC) No 261/2004…] and

of the Council, which states, among others, that "passengers whose flights are cancelled should be able either to obtain reimbursement of their tickets or to obtain re-routing under satisfactory conditions, and should be adequately cared for while awaiting a later flight". Operating carriers may avoid their obligation to pay additional compensation if the delay or cancellation is caused by extraordinary circumstances, which include, in particular "political instability, meteorological conditions incompatible with the operation of the flight concerned, security risks, unexpected flight safety shortcomings and strikes" [13. Regulation (EC) No 261/2004…].

The carrier is responsible for damages in case of death or bodily injury if the accident that caused it occurred in-flight or during embarking/disembarking, according to The Montreal Convention 1999 (MC99) 3. [Convention for the unification of certain rules…]. Up to the compensation amounting to 113,100 SDRs (Special Drawing Rights, 1 SDR = approx. 1.25 EUR on 22 April 2020), the carrier may exclude its liability for death or loss of health only if the damage was caused by the passenger himself or herself. Above the limit of 113,100 SDRs, the carrier may exclude its liability by proving that the death or injury did not result from negligence or a wrongful act of the carrier or (similar to Regulation EU261/2004), it was a result of negligence or a wrongful act of a third party.

The 11 September terrorist attacks affected the airline sector also by increasing the costs of security (including the requirement of reinforcing doors to the flight deck on airplanes) and insurance. The total aviation insurance market amounted to around USD2,830m in 2000, and was expected to reach 6,950 m in 2002 [Harding, Maddocks, Moss, Pyrde, 2004]. After 11 September, aviation insurance was perceived as more risky, which in turn led to increased insurance costs for carriers and aircraft operators (e.g. lessors).

It means that carriers incur significant costs to minimize and mitigate the risk of impact of a catastrophe on its operational and financial situation when facing the payment of compensation for losses in the event of their occurrence. If they are excessive, it may lead the airline to a liquidity crisis, which may result in suspension of the operations and filing for bankruptcy. For example, the Lockerbie disaster, caused by a bomb, is listed among the main causes of PanAm's (Pan American World Airways) bankruptcy in 1991. Clearly, the increase in spending caused by the necessity to improve security, as well as growth in insurance-related expenditure, directly affect both the RASM and CASM.

Factors which directly influenced a decrease in revenue included e.g. the volcanic eruption in Iceland and the current suspension of air traffic due to the pandemic. If the situation continues, bankruptcies will be inevitable. The suspension may also lead to strategic changes, including a shift to cargo transport or limiting services to domestic flights.

Natural catastrophes, such as volcanic eruptions or even heavy fog at the hub airport, may paralyze traffic in the airspace. As previously mentioned, in April 2010 the Eyjafjallajökull crisis impacted 1.2m passengers per day during its most severe, three-day phase. Such a situation leads to other consequences connected with delayed or cancelled flights, like the costs of taking care of affected passengers, even if the carrier manages to bypass liability and avoid paying additional compensation. According to Eurocontrol, in 2018 the total costs of delayed and cancelled flights rose by 28%, to EUR17.6b [Walków, 2019c]. Only for one carrier, Ryanair, these costs amounted to EUR699.7m, as compared to EasyJet paying EUR455.3m, and Lufthansa 391.9m.

Outbreaks of diseases have an impact not only on direct traffic and financial condition of airlines, but require additional public health safety measures. Droplet-transmitted infections, like SARS, pushed the Asian-Pacific air carrier sector to establish or comply with new regulations. "During SARS everything had to be invented. It was the first time we were dealing with such a disease, such an international threat", as Isabelle Nuttal, WHO Director for the Global Capacities Alert and Response Department, said in an interview for CNN ten years after the outbreak [Inocencio, 2013]. Several airlines, especially in the Asia-Pacific region, introduced procedures for aircraft disinfection and dealing with passengers displaying certain symptoms. Airports in that region started to measure the body temperature of in-bound and out-bound passengers (manually or by using thermal imaging cameras). Another

consequence was the higher level of attention resulting from advanced onboard air-purification systems installed in Boeing 787 Dreamliners, newer Boeing 777s, Airbus A350s and Airbus A320neos.

Catastrophes can lead to financial instability, but also loss of reputation and passengers' fear of flying. Two months after the second crash of the Boeing 737 MAX 8, only 3% of respondents surveyed by Ipsos stated that the brand and model of the plane was important for them when choosing an air ticket [2019a]. In July 2019, the media revealed pictures of yet undelivered Boeing 737 MAX airplanes in Ryanair's livery, in which the model's name had been changed from 737 MAX to 737-8200. Ryanair is expecting the delivery of 135 aircraft of this type. Also, the British airline group IAG, when announcing an order of 200 aircraft of this type, described them as Boeing 737-8, and its bigger version – as Boeing 737-10. Even US president Donald Trump recommended in April 2010 that the name Boeing 737 MAX should be changed. Also, new market research by Barclays, carried out among 1.8 thousand European and North American passengers revealed that only 19% of them would feel comfortable when boarding a Boeing 737 MAX airplane after they return to service, whereas a similar percentage claims the opposite [2019b].

Such catastrophes also influence changes in the field of operational management in passenger air transport. The most common ones include:

- changes in check-in and boarding passenger service (increased airport fees due to additional health checks, supply of disinfectants, more restrictive control of checked-in baggage and carry-on luggage),
- increased risk of delays (legal requirement to unload the luggage of a passenger who did not show up at the gate for boarding)
- changes in onboard passenger service (safety infrastructure costs, other costs, e.g. installing bullet-proof cockpit doors resistant to potential forced entry)
- increased fleet service costs because of additional safety requirements, technical inspections and recommended remedying of defects found during accident investigations
- accelerated changes as a result of the "low-cost revolution" by adapting the offer of traditional air carriers (limited catering, additional paid services) in order to improve the financial condition of airlines.

FIG. 2. CHANGE IN NUMBER OF PASSENGERS (MILLIONS) AND AIR TRAFFIC GROWTH (%) IN 2000-2011. OCCURENCE OF CATASTROPHES MARKED. SOURCE: OWN WORK BASED ON IATA STATISTICS, 2011

Discussion and Conclusions

Natural disasters and technological catastrophes are a serious challenge for the passenger air transport sector on many levels. They can impact directly the financial situation of an entity, causing the risk of a liquidity crisis, potentially resulting in bankruptcy. Especially in the case of technological catastrophes – including air crashes – they may also undermine trust in the company, which can lead to similar consequences. The article has identified the influence of catastrophes, especially in terms of strategic decisions, on:

- decisions concerning the scale and range of an airline's membership in alliances, scale and range of services provided (selection of serviced markets)
- decisions concerning the acceptable level of infrastructure safety
- decisions concerning the scale and type of purchasing decisions (aircraft, fuel, other cost factors); tactically and operationally, such decisions influence the RASM (Revenue per Available Seat Mile) and CASM (Cost per Available Seat Mile), and are usually connected with the processes of passenger or transport service.

The examples of catastrophes listed in the paper are important in that at least some of them were not within a planning scenario in the passenger air transport sector. Their incidence changed the conditions of the competitive and co-operative environment. They require higher costs to be incurred, without any knowledge of expected usability. Globalization is playing an interesting role here. On the one hand, it is a buffer of the negative impact of single events. On the other, it acts as an accelerator increasing the overall negative influence of a single event on other subjects of the global market.

Abstract

Entrepreneurial activity varies in time and space. The nature of entrepreneurial activity is influenced by many external factors. All of them transform into one form or another, depending on the character and psychological type of the entrepreneur. Researchers have long tried to define the concept of the entrepreneur and identify its main characteristics. However, they faced significant difficulties. Recently, scientists are increasingly turning their attention to the study of the types of entrepreneurs and entrepreneurial activities. However, the theory of entrepreneurship does not offer any comprehensive approach to this study. Therefore, the article proposes a novel method of the identification of the type of entrepreneur using five key properties, which, measured in the aggregate, comprise the entrepreneur code.

Keywords: Psychological Type, Entrepreneurship, Properties, Entrepreneur, Code, Trader, Engineer, Raider, Inventor, Schemer

Introduction

Entrepreneurship appeared with the start of the first commodity exchange between settlements, cities and countries. It was the first entrepreneurs who carried out this exchange of goods. This was a new type of business, carried out at their own risk. At that time one of the most fundamental characteristics of any entrepreneurial activity was the ability to protect one's life, the life of subordinates as well as the property from external threats. The ancient entrepreneur was, in the first place, a warrior, and his other fundamental properties and characteristics were not so obvious to ordinary people.

Entrepreneurial activity in other forms, not related to trade, was poorly developed since the entrepreneur did not have easy access to capital and free or cheap labour. At the same time, the attitude towards entrepreneurs engaged in trade was condescending. For example, the great thinker and philosopher of Antiquity, Plato wrote about entrepreneurs in his famous "Dialogues":

"Suppose now that a husbandman, or possibly an artisan, brings some production to market, and he comes at a time when there is no one to exchange with him, - is he to leave his work and sit idle in the market-place?

Not at all; he will find people there who, seeing this want, take upon themselves the duty of sale. In well-ordered states they are commonly those who are the weakest in bodily strength, and therefore unable to do anything else; for all they have to do is to be in the market, and take money of those who desire to buy goods, and in exchange for goods or give money to those who desire to sell" (*Dialogues, Plato, 2010, p. 194*).

According to Plato, it means that only residents who were no longer capable of anything else were engaged in trade.

Over time, the attitude towards entrepreneurs changed. Several centuries after Plato, the prominent figure of ancient Rome Cicero, Marcus Tullius, said that trade should be considered a dirty business, but only if the volume of it is insignificant. However, when trade is extensive and profitable, when many goods are brought from other countries and many people are supplied with them without deception, then it deserves respect (*Cicero, 2018*).

Entrepreneurial activity, commerce and trade facilitated the formation of economics as a separate discipline already in the Middle Ages. It is not accidental that the first economic research paradigm is associated with the phenomenon of mercantilism. According to supporters of this doctrine, the main function of trade is to enrich peoples. In this context, the entrepreneur played a key role, and it was within the framework that the notion of "entrepreneur" came to replace the notion of "trader".

The study of entrepreneurship began with the publication of Cantillon Richard, a London merchant and a banker. In his "Essays on the Nature of Commerce in General", published in 1755, for the first time, an attempt was made to determine the key characteristics (properties) of the entrepreneur (*Cantillon, 2009*).

Since then, economists have made significant efforts to identify the properties, which can distinguish the entrepreneur from other participants of economic activity. This was done mainly by listing the properties of the entrepreneur, which was definitely not the best way to define the entrepreneur.

Literature Review

Sombart, W., who claimed that the entrepreneur possesses a special entrepreneurial spirit, made the most prominent contribution to the solution of the problem. Under the entrepreneurial spirit, he understood a certain set of spiritual qualities that are necessary for the successful implementation of an entrepreneurial project (*Sombart, 2018*). The economist reoriented research from the external manifestations of entrepreneurship, such as the propensity to take risks, the desire for independent work, etc., to the study of the internal characteristics of entrepreneurs. Sombart, W. wrote that if the entrepreneur wants to achieve success, he should be a conqueror, an organizer or a merchant. This idea of Sombart about a special entrepreneurial spirit has inspired many scientists to conduct research in this field and brought about many recent research works.

Today, the phenomenon of the entrepreneur and the peculiarities of entrepreneurial activity are studied not only by economists, but also by psychologists and sociologists, who have made a significant contribution to the theory of entrepreneurship.

Troeltsch, Ernst wrote that capitalism was born in the depth of the organizational forms of church (*Nix, 2010*). These forms determine the moral and ethical principles of the social and economic life of society, and therefore, shape an attitude towards business and entrepreneurship. Becoming aware of the involvement in the life of society and the responsibility for what is happening, the individual finds the strength and develops the necessary properties to be engaged in entrepreneurial activities.

Freud, Sigmund, who laid the foundations for psychoanalysis, explored the behaviour of people through their sexuality and childhood experiences. He argued that only those people who can and want to control themselves and their surroundings become entrepreneurs (*Freud, 2012*). In his critical evaluation of the teachings of Freud, Fromm, Erich wrote that the basic human needs remain the same over time, but it is the social system that determines the way to satisfy them. The social type of the individual's character is formed as a result of the interaction between the biological self of the individual and the norms and values of society. Then this social type is continuously reproduced. Naturally, any social transformation meets resistance and cannot occur quickly. Only after a certain period of time, when a new social type of personality is formed, changes in society begin to accelerate. The personality of the entrepreneur reflects the social character of their era and the society they live in. Entrepreneurs possess a set of characteristics (properties), which varies depending on time and locality (*Fromm, 2013*).

Vries, Manfred agrees with Freud that the main features of the entrepreneur's psyche are formed in their childhood (*Vries, 2010*). Future entrepreneurs tend to be under stricter control from their parents, which is often coupled with a certain degree of rejection, especially from their father. These two factors determine the psychological type of the entrepreneur. The entrepreneur seeks to control the surrounding environment by organising it in the form of an enterprise. In addition, entrepreneurs reject authority and strive for establishing norms for society. This is a compensation for stringent control and rejection in their childhood.

One of the recent examples of the influence of Sombart's idea of the existence of a certain *entrepreneurial spirit* and the impact of this idea on the economic thought is the work of Adizes, Ichak, in which the *entrepreneurial spirit* is considered to be an integral part of the manager's psychological type.

It should be noted that in the modern theory of management there are three styles of leadership: authoritarian, liberal and democratic. Adizes shows how each of these styles can be formed by combining the four main managerial functions (according to the style of work organization) (*Adizes, 2004*):

1) producer (P),
2) administrator (A),
3) entrepreneur I,
4) integrator (I).

He believes that each manager has his own type of the PAEI code. For someone, (P) focuses on the result whereas another person is more concentrated on administration (A). However, Adizes's analysis of management styles can only indirectly help us solve the problem in question. He interprets the function of the entrepreneur as follows: the entrepreneur is by nature capable of pre-emptive actions in the environment of constant change ... the entrepreneur is creative and ready to take risks. It is clear, however, that this is not enough to define what the entrepreneur is and what properties he possesses. "Being enterprising" and "being entrepreneurial" are two completely different things.

Adizes did not study the entrepreneur as such. The object of his research was management and the manager. He did a thorough analysis of management styles and their peculiarities. However, he developed a very important tool, which we will use in our research as demonstrated below.

Methodology

ADIZES does not consider different types of managers as a set of rigid personality traits, but rather as a set of properties, each of which can be expressed in varying degrees. Some of these properties are strongly pronounced in a particular manager whereas in others they are barely noticeable. Various combinations of the four main properties - focusing on the result, focusing on administration, enterprise and the desire to integrate - lead to the formation of characteristic traits of the manager.

The entrepreneur also has a very different set of characteristics. Any successful entrepreneur has to complete the arduous journey from an emerging businessperson to a capitalist who does not engage in entrepreneurship anymore.

In the course of this evolution, significant changes occur in the worldviews of entrepreneurs and their styles of conducting business. Nor do attitudes to competitors and employees stay the same (Ponomarev, 2018). But the main properties of the entrepreneur remain unchanged in time.

Over many years, different researchers of entrepreneurship have identified the following properties inherent in the entrepreneur:

1) the focus on profit and being able to put everything at stake to get it;

2) the ability to conduct business in the conditions of risks and uncertainty; entrepreneurial profit is a genuine risk;
3) the ability to introduce innovations to get profit;
4) a creative approach to business;
5) specific knowledge of the market, people, market conditions, allowing the entrepreneur to conduct entrepreneurial activity;
6) the desire for continuous accumulation of capital;
7) money is the most important value for the entrepreneur, which makes it possible to compare the capital available with the capital of others as well as to objectify the world as a whole, make it more rational, predictable and subjected to assessment;
8) successful entrepreneurs are the individuals who are not burdened with social and cultural ties and relationships. It allows them to initiate super-profitable and sometimes unethical and immoral business projects;
9) the behaviour of entrepreneurs is often not rational; they do not even strive for being rational since the cognitive abilities of a person (perception, memory, decision making, etc.) are limited;
10) the behaviour of entrepreneurs is not rational due to the irrational nature of the surrounding world (*Odiorne*, 1990);

There are other properties, which can be derived from the list above. It can be noted that some of the ten basic properties of the entrepreneur can be combined into certain groups. We hold that there are several types of the entrepreneur:

1) T - Trader (businessman, merchant, dealer);
2) E - Engineer (engineer, financier);
3) R - Raider (conqueror, security guard, warrior);
4) I - Inventor (inventor, innovator);
5) S - Schemer (combinational player, communicator, organizer, lobbyist).
The properties of each type are inherent in every entrepreneur. However, in each individual, they are expressed to various degrees. Consequently, entrepreneurial styles also differ.

Let us analyse in more detail each of the five groups of entrepreneurs.

Historically, *Trader* is the first type of the entrepreneur. This is a merchant, a shopkeeper and a money lender. Before the era of industrialization, merchants and barterers represented this type. The famous Venetian and Hanseatic leagues were the main economic driving force of Western Europe in the first half of the second millennium. These people built up modern civilization, ensuring the exchange of goods and technology. They created the path “From the Varangians to the Greeks”, which served as the foundation for the development of Russian statehood in Europe. In general terms, the trader is a person having a special intuition, a special sense of trade. It is important to note that such people derive great joy from the very act of concluding a deal. This entrepreneurial quality is usually innate and manifests itself quite early in life. The main quality of the entrepreneur is the ability to make a DEAL. Each entrepreneur has this talent but, again, in varying degrees.

Engineer is a technically minded person, a builder, a farmer, a financier or a capitalist. These are business creators who built up the modern economy - from the first factories to modern industrial giants. These are modern Atlantes: Rand, Ford, Rockefeller, Dupont, the people who developed the industrial potential of the United States. These are the great Russian industrialists: the Demidovs, the Morozovs, the Ryabushinskys, the Stroganovs and the Nobels. These are the great Germans, Japanese, Koreans, Chinese, who created the most famous world brands. Without Benz, Daimler, Porsche, Mitsubishi, Toyota, the world would have been different. They are in construction, transport, banking, agriculture and food industry because at the core of their business is CRAFT. Craft is always a business. An entrepreneur having pronounced engineering skills is capable of organizing a perfect process of running a business.

Raider is a warrior, a security guard or a power entrepreneur. Even at the dawn of civilization, merchants organized long-distance armed raids to get spices or sable fur. As a result of these armed

expeditions, Europe conquered the American continent, and Russia expanded as far as Siberia and the Far East. The recent world economic crisis was a reminder that capitalism can both create and destroy. There are numerous entrepreneurs seeking to establish control over different types of assets at any cost. For them, the most important thing is 'nutritional value' - liquidity value of the asset being acquired. In the economic history of modern Russia, there have been as least two types of such power entrepreneurs – those of the 1990s (former criminals and athletes) and the entrepreneurs of the 2000s (former law enforcement officers). Naturally, the main thing for them is POWER. Any entrepreneur belonging to this type must have this quality otherwise, his business is short-lived.

Another type, *Inventor*, is a creator and an innovator. In this context, I cannot but quote Steve Jobs, who famously said, "Praise to the madmen, to the rioters and troublemakers. To those who are always inopportune and out of place. To those who see the world differently. They do not follow the rules. They do not respect the status quo. You can quote them, argue with them, glorify or curse them. But it is impossible to ignore them. Because they bring change. They push humanity forward. And let someone see them as madmen, we see geniuses. Because only madmen believe that they can change the world. And so they change it". This type of entrepreneur lives by DISCOVERY. In the modern theory of entrepreneurship, the postulate that the entrepreneur is an innovator is axiomatic. Yet, in each entrepreneur, the ability to innovate is expressed in various degrees. In addition, the desire to become a "troublemaker" decreases with time and acquires a more civilized and 'quiet' form.

Schemer is an organizer, a lobbyist and a rentier. All Russian businessmen were brought up with the image of the great schemer, Ostap Bender, a character from the famous book "Twelve chairs". This fictional character created by the Soviet writers Ilf and Petrov in the 1920s, the time of the New Economic Policy, is the epitome of an irrepressible organizer, a specialist in communications and a creator of different schemes. Beyond fiction, we cannot fail to notice that the economic situation, formed in the 1990s as a result of the privatization of the largest Russian enterprises, was formed partly by talented entrepreneurs, who used their connections, lobbying capabilities as well as contacts abroad. This type of the entrepreneur is a good manager of entrepreneurial assets (time, people, technology, finance). The main ability of these entrepreneurs is to connect the non-connected, i.e. the ability of networking. It is this type of entrepreneurs that is notoriously known as organizers of different pyramids. As entrepreneurs of this type mature and withdraw from active business and the management of capital, they tend to create legal and secure business schemes and often become rentiers. They manage PEOPLE.

Since each entrepreneur combines all five components of the *entrepreneurial substance*, every entrepreneurial type is characterized by the corresponding code consisting of a combination of all five types. Pronounced properties of the entrepreneur will be written in capital letters, for instance, TERIS. If some properties are poorly expressed, they will be written in lower case letters: teris. Since we are exploring the code of the entrepreneur, it will be logical to refer to the identified qualities as genes.

Results

In practice, pure types of entrepreneurs that possess a single code with only one dominant gene are a rare occurrence. Entrepreneurs belonging to one type only, i.e. having one dominant gene, are vulnerable and limited in their decisions. The lack of business-generating genes T, E, the organizational S, or I inevitably leads to the inability to effectively use the acquired asset.

If there is the T gene, the raider is able to effectively monetize the asset. If he possesses the I gene, the entrepreneur is a visionary and can foresee future developments of his business. The S gene ensures a deeper understanding of one's own weaknesses and turns them into strengths either by using the third-party business substance, by forming partnerships or by the development of internal entrepreneurship in the company.

The internal code of the entrepreneur is manifested externally. Having identified the five main qualities that are inherent in each entrepreneur and are present in varying degrees, we can now resort to the Adizes methodology to research different styles of entrepreneurship.

Proceeding from the objective of this research, it was important to show the functioning of the TERIS-code in practice. To this end, the author conducted a written survey of more than 450 Russian businessmen. This survey showed that there are at least 10 possible variations of the TERIS code. Our research showed the most frequent variations of the TERIS code are the following: IS (15%), RS (13%), TS (12%) and ES (12%).

It is necessary to note that these variations of the code were identified by Russian entrepreneurs during their self-evaluation. This fact allows us to put forward a hypothesis about the prevailing type of the entrepreneur in Russia – the Schemer. Further research into the entrepreneur code is the TERIS analysis and digitization of entrepreneurial groups and trends in the historical perspective. It is also necessary to further analyse the combinations of two dominant genes.

The newest economic history began with the legalization of entrepreneurship in the USSR in 1985. After the demise of the USSR, there were two groups of cooperatives that proved to be particularly efficient - trade and marketing cooperatives owned by entrepreneurs with the IT code and production cooperatives of the ET code entrepreneurs.

The emergence of cooperative banks and state-owned enterprises required a new type of entrepreneurs capable of transforming state capital into private capital - the TS code entrepreneurs.
The severe crisis of the early nineties led to the emergence of criminality in business - the RR code entrepreneurs, who later evolutionised into the SR type. Privatization means connections and schemes: how to redeem an asset at his own expense is the task the ST entrepreneur can easily solve.
Acquisition of an industrial enterprise means turning it into a profitable and developing asset, and here the skills of an entrepreneur with the TE code are required.

The consumer revolution of the 2000s made it possible for the TI code merchants to realize their potential. The time required the ability able to recognize the needs of the consumer and offer him products having definite competitive advantages.

Entrepreneurs of the construction boom of the early 2000s have the ET code: they are good civil engineers and salesmen.

The era of digitalization has opened the doors to innovators. Today, it is impossible to succeed in the digital economy without a deep knowledge of information technologies and the IE code entrepreneurs are good at their application.

The identified dominant combinations of the two genes of each type of entrepreneurs, working in modern Russia and beyond are complemented by the remaining three genes manifested in varying degrees.

Conclusion

The proposed approach to the identification of the types of entrepreneurs requires further development. It can be used to describe the most typical types of entrepreneurial activity and also to identify and assess the personal code of an entrepreneur. The personal code of the entrepreneur can be graphically expressed in many ways, for example, TeRis or teRIS depending on the type of the entrepreneur. The assessment of each component of the code of the entrepreneur is essentially binary: it can be more or less pronounced.

For simpler research, such a binary estimation is quite sufficient. However, a more complex and comprehensive research into the entrepreneur typology requires a wider assessment scale. For instance, the intensity of each property can be assessed on a scale from 0 to 10, where 0 is the

complete absence of the property, and 10 is the maximum possible score. In this case, a more accurate identification of the entrepreneurial code will be done.

The one of authors of this article, being an entrepreneur, evaluates his own TERIS code as T (10) E (5) R (5) I (8) S (6). Since the engineering component of this entrepreneurial code is not as pronounced it should, the author decided to develop his engineering competence through research activities.

Summing up, it should be noted that the scope of application of the TERIS code of the entrepreneur is much wider than just a simple analysis of entrepreneurial techniques, psychotypes or groups of entrepreneurs. It is obvious that the TERIS code of the entrepreneur is the most important part of the intellectual capital of his company.

Abstract

The self-assessment of civil servants is one of the elements of the open form of assessing public organisation's employees. This is a process of formulating assessments toward oneself with regard to the skills, knowledge and experience. The management decides on the criteria of this assessment that will be used for further decisions taken in the scope of managing human resources of a given organisation. The awareness of the potential of a civil servant on a given position is very important. The analysis of weaknesses should encourage civil servants to reflect on whether they want to improve them and if yes, what effort do they want to make and how much time do they want to spend on improving them, what influence does it have on themselves and on the environment in the professional work. The aim of the article is to discuss the role and significance of the value of civil servants in public organisations, indicate organisational areas that might be helpful in self-improvement of staff and to present research results related to the self-assessment of civil servants of selected public organisations.

Keywords: civil servants, self-assessment, public organisations, management, the management.

Introduction

The management's skills in the strategic, personal and interpersonal areas are of key significance. The maximum use of all possible resources, including the human capital, allows development and implementation of planned intentions and aims of public organisations. The role of local government institutions is to satisfy the needs and expectations of a broadly understood environment, i.e. public services' beneficiaries. In order to increase the civil servants' satisfaction, various measures are taken in the scope of human resources management in the area of motivating, developing attitudes based on full trust and engagement, which favours relations within the organisation's structure. The management of public organisations should create conditions favourable also to the staff. The aim of the article is to discuss the role and significance of the value of civil servants in public organisations, indicate organisational areas that might be helpful in self-improvement of the staff and to present research results related to the self-assessment of civil servants of selected public organisations.

The role and significance of the value of civil servants in public organisations

The organisation's resources comprise all that is available at the organisation and may be helpful in achieving aims, mission, vision and tasks adopted by that organisation. The organisation's resources usually include: financial resources, capital assets, human resources, equipment, raw materials, machines and devices (Dictionary, 2007). Civil servants making the human resources in organisations have their own places therein (job positions), perform specific roles and tasks, are held liable, are included and engaged in the achievement of the organisation's aims. They also have rights and obligations regulated by the Labour Code (Padzik, 2020).

Human resources in public organisations are at a disposal of specific value (they can be measured), they are renewable and continuously increased (certain measures of an investment character can be undertaken in the area thereof), they are also a source of future income (an organisation can expect a

return on investment) (Łukaszewicz, 2009). Work components of civil servants in organisations include (Juchnowicz, 20014):

- competences, that is, knowledge, skills, talents, styles of operation, personality, values, features, which, used and developed at professional work, lead to the results compliant with the assumptions of the whole organisation;
- interpersonal contacts (interpersonal relations, organisational communication and information system);
- organisational culture (models of thinking and behaviour);
- organisational climate (atmosphere at the organisation).

"The strength of the organisation's human capital is proven not only the obtained general and professional knowledge, as well as skills developed during the hitherto work, but also the possibilities of proving oneself in the professions, abilities not yet disclosed, aspirations, own deep motivation to work and learn, creativity, readiness to take risk and personal sense of responsibility for success of the organisation. Thus, human capital comprises people who are able to cooperate with each other - people permanently related to the organisation and its mission", as stressed by M. Rybak (Rybak, 2003). The concept of human capital is related to the superior concept of the intellectual capital, which is created by the organisational knowledge. The intellectual capital as non-material resource and material resources (funds and fixed assets) constitute the market or total value of the organisation (Armstron, 2011). The role of the management also comprises behaving in a manner recognising employees' values, their expectations, needs, way of thinking and acting. With their behaviour, the management should give good example in the scope of introducing changes, executing cultural transformations or norms. Proper leadership, motivational system and communication processes also play a significant role. Without effective motivation, employees will not strive for sharing knowledge or effective performance of tasks. The potential of the staff's knowledge and competences is the most important (Walczak, 2009). Human resources meet both, their own needs and expectations and the needs and expectations of the aim and task-oriented organisation. Whereas, the organisation creates conditions favouring human resources, applying to this end planning, organising, coordinating activities and controlling. Furthermore, the organisation's task is to recognise employees' attitudes and behaviours. The human capital is defined as "the knowledge, competences, abilities, skills, know - how, culture, values, relations, motivation, attitudes, mental agility, leadership" (Szopik-Depczyńska, Korzeniewicz, 2011), therefore, human resources must be treated as social capital which can be developed and their participation in decision-taking has its value. Moreover, H. Król believes that the concept "human resources" (Król, 2006):

- appears as a synonym to the following terms: workforce, staff, workers, employees; it is related to the new approach to employees treated subjectively and not objectively, it is connected with the word "management";
- has evaluative character, i.e. defines basic significance among other resources in the organisation, such as: material, financial, information, decides on using them by the human factor;
- is related to the most important values, i.e. abilities, knowledge, skills, attitudes, which should be properly used in the management process;
- can have a negative effect due to the comparison thereof with raw materials and machines, devices, all depends on the manner of treating employees - a person as a living being, who cannot be compared with other resources;
- other terms should not be adopted as synonyms of the subject matter.

Civil servants are the driving force of each public organisation focused on development due to the motivational possibilities of the staff (Dziędziora, 2006).

Organisational areas helpful in the self-development of civil servants

Human resources development comprises obtaining skills necessary for the performance of duties on particular job positions. In the literature there are various terms referring to the employees' development, among others: education, training, apprenticeship, supplementary education, professional improvement, learning, professional development (Trochimiuk, 2013). Therefore, the

conception of performing personal function focused on employees' development at the organisation can be adopted, which is enabled by the following assumptions (Morawski, Mikuła, 2011):

- focus on competition in the scope of knowledge and proper quality thereof;
- the most important competences of the organisation are developed by the best employees;
- professionalism and creativity of employees as the basis of each organisation;
- focus on migration of staff between labour markets, applying new human resources programmes due to the changing needs and expectations thereof;
- high costs of soliciting employees;
- maintaining proper relations with customers taking into consideration effective, efficient and reliable services also provided to new groups of customers and markets.

In the civil servants' supplementary education processes self-education or supplementary education is extremely important, which influences the properly performed work, which is directly related to the following learning attributes (Boydell, Leary, 2001):
- applying rules, i.e. learning proper performance of the easiest activities by strictly following the rules of performance thereof and adopted procedures; such method of work is necessary, especially with regard to safety and health;
- adaptation occurs when there is a need for adjusting rules and procedures in order to enable performance of more efficient work than in the case when an employee follows strict rules;
- discovering interrelations consists in realising why a specific form of performing work is effective and compliant with the procedures.

The need for training is an area of employee's competences, which must be subject to evolution in order to enable effective performance of duties. They can have the following character: ongoing (occur at the moment of a sudden issue requiring employees' training), adaptation (occur when a training enables employees to perform additional tasks) and development (conducted with a view of future consequences of employees in terms of human resources) (Jasiński, 2005). Employee trainings aimed at improvement of their knowledge and skills have a diverse dimension and the selection thereof is determined by the needs of both, the employed and the management and has the following forms (Andrzejczak, 2005):

- traditional, i.e. trainings focused on the needs of job positions, selection of the topic and preferred traditional methods of education;
- development, i.e. trainings have a long-term character targeted at innovativeness of activities and changes in the environment with a preservation of traditional methods of education;
- non-formal, i.e. conducting trainings in the form of apprenticeship by adjusting employees' competences to the requirements of particular job positions;
- innovative, i.e. conducting trainings so that they contribute to creative activities of employees targeted at creating new values.

In the improvement process employees identify their own educational-professional aims with the development policy of the organisation. Despite high expectations from employers, employees very often follow changes and wish not only to meet expectations, but also to be competitive on the market thanks to their attitude. The sense of physical and psychological wellbeing in the work environment and high self-control of employees in the aspect of self-development generates expected results (Różański, 2014). The management have to take decisions concerning selection of proper tools in the development process of employees taking into account the organisational culture based on mutual understanding and trust and supporting decisions taken by employees in this area (Michna, 2016).

Research results in the context of self-assessment of civil servants of selected public organisations

The research covered 10 randomly selected institutions of the Silesian Voivodeship local government, in Poland, and 50 civil servants of those institutions. In order to conduct the research, the survey questionnaire was selected from among many other measurement instruments from the

classification of direct survey methods of collecting data from primary sources to direct survey method. While formulating questions for analysed studies, factors determining human resources management in local government units were taken into account, with a consideration of, among others (on the grounds of in-depth, extensive analyses of literature, factors determining human resources management in local government organisations in Poland have been enumerated[)]:

- predispositions, abilities and skills, talents of civil servants;
- innovative, creative, entrepreneurship approaches, social responsibility of civil servants;
- motivation systems of public organisations toward the civil servants;
- improving human resources in local government units;
- improving human resources, delegating tasks, controlling and assessing civil servants;
- strategy, mission and vision of local government units;
- culture of public organisations;
- diversity of tasks performed by the administrative staff;
- IT shared on job positions of civil servants;
- effectiveness and efficiency of work of civil servants.

In question 1 (histogram 1) concerning the aspects that generate the most difficulties on the position of a civil servant, respondents could choose more than one answer. It turned out that civil servants encounter the most difficulties with knowledge of administrative provisions which are constantly changing. Employees complain that due to the large number of tasks they do not have the time to continuously analyse often small, yet, significant amendments to the administrative law. According to the respondents, knowledge on the functioning of the whole local government administration is another factor causing difficulties in performance of duties. It may result from the multiple aspects in particular organisational units of public administration. Another difficulty in performing duties on job positions comprises the manner of approaching performed tasks and effects thereof. It results from the lack of unambiguity in methods of implementing resolutions and acts introduced by the government, as well as interpretation thereof. Knowledge of foreign languages and provisions concerning the performance of entrusted tasks are the least difficult for civil servants.

(Knowledge of foreign languages, Knowledge of administrative provisions, Knowledge of provisions concerning performance of entrusted tasks, Knowledge in the scope of functioning of the whole local government administration, Manner of approaching performed tasks and effects)

Histogram 1: Distribution of answers to the question: What aspects of the job position generate the most difficulties for you? You can choose more than one answer

Source: own study on the grounds of survey research

In question 2 (histogram 2) respondents from Poland while answering took into consideration the significance of factors influencing job satisfaction. It turned out that they considered the most important the following factors: sense of employment security, possibility to improve qualifications, good atmosphere in the team, good interpersonal relations and appreciative superiors. The result shows that non-financial motivators are more significant for administrative employees in Poland. Awards for team members can have various forms: non-cash awards, promotion, praise in the presence of the whole team, appreciation or additional days off. The possibility of improving qualifications provides the employees with a number of opportunities, such as: changing the job position, promotion, specialist knowledge, new skills, combining theory with practice, broadening horizons and self-development. Good interpersonal relations in the team allow achieving satisfaction at work, trigger drive and initiative, favour proper atmosphere of work and have a positive impact. An integrated team, where responsible and loyal persons willing to cooperate work, is harmonious and strong and thus, it generates very good results, often exceeding the planned targets. Appreciative superiors notice the potential of the team and are able to use it effectively for the organisation's purposes. The team's potential can manifest itself in various employee skills, i.e. adjusting to working conditions, the ability to analyse various situations occurring in the organisation, organisational and decision-taking skills. Well-selected team members that are driven by mutual values, function better in the organisation and achieve set objectives faster.

(Prestige of the office, Sense of employment security, Ability to improve qualifications, Work at a place of residence, Character of the performed work, Good atmosphere in the team, Facility and equipment conditions, Good interpersonal relations, Appreciative superiors)

Histogram 2: Distribution of answers to the question: Factors influencing your job satisfaction at the organisation (please select not more than 3 answers)

Source: own study on the grounds of survey research

Answers to the question "Which skills do you use on your job position?" (histogram 3) imply that, according to the respondents, the most frequently used skills include: communicating, learning and developing, organising activities and formulating clear objectives. Communication plays a significant role both, in the private and professional life of every person. Work of a civil servant to a large extent

consists in communication with other people. This process is especially visible in administration, where the flow of information constitutes a basic element of the official activity. Functioning thereof consists in managing information in the communication process aimed at exchanging thoughts, sharing knowledge, information and ideas. A significant issue proves to be formulating clear objectives, as well as adjusting the manner of communication to situations and persons with whom civil servants interact. In the respondents' opinion, organising activities is a skill frequently used, since it is related to dividing tasks with the use of the potential of human resources both, in team and individual work. Local government officials' work becomes more and more interdisciplinary and requires continuous learning, obtaining information and practical use thereof. Learning and development of employees is related to the modification of previously adopted manners of behaviour, analysis and improvement of existing procedures, readiness to properly react in exceptional and unpredictable situations. Due to the development of their own skills, employees influence continuous improvement of local government institutions' functioning. Creating new visions, solutions, setting mutual objectives, using mental abilities of all members have a very favourable impact on the public organisations' functioning.

(Creative thinking, Formulating clear objectives, Organising activities, Full engagement, Learning and development, Planning, Motivating oneself and others, Taking decisions, Communicating, Introducing changes, Moving from thinking to acting quickly, Analysing failures and drawing)

Histogram 3: Distribution of answers to the question: Which skills do you use on your job position?

Source: own study on the grounds of survey research

Due to the specialist skills of civil servants, public organisations strive to gain customers' trust and are highly assessed by the external environment.

Conclusion

Public organisations, wishing to remain on the highly competitive market, ensure versatile development of civil servants. It has a positive impact on their external image and constitutes a

promotional element. Improvement of competences of both, the management and employees, updating knowledge, developing new and necessary skills, focus on innovativeness, entrepreneurship, aiming at implementation of newly developing trends, conceptions, assumptions - those are some of the factors determining strategies of contemporary organisations. Only effective human resources management in these areas provides the possibility of development of the whole organisation. Also the environment to a large extent forces new attitudes of employees in organisations and causes continuous necessity of their self-development necessary not only to achieve a high position in the professional work, but also full cooperation with superiors.

Abstract

Motivating staff to implement the organisation's strategy, including the staff in the decision-making processes targeted at activities related to creativity, innovation and entrepreneurship aims at developing a fully engaged public organisation with shaped organisational culture. The management of public organisations should create conditions favourable also to the staff. In order to increase the civil servants' satisfaction, various measures are taken in the scope of human resources management in the area of motivating, developing attitudes based on full trust and engagement, which favours relations within the organisation's structure. The aim of the article is to present the role and significance of the staff in the context of developing effective management of public organisations and to discuss the research results related to the assessment of functioning of public organisations by civil servants employed therein.

Keywords: management, civil servants, effective management, public organisation, resources

Introduction

The organisation's resources comprise all that is available at the organisation and may be helpful in achieving aims, mission, vision and tasks adopted by that organisation. The organisation's resources usually include: financial resources, capital assets, human resources, equipment, raw materials, machines and devices (Dictionary, 2007). Employees making the human resources in organisations have their own places therein (job positions), perform specific roles and tasks, are held liable, are included and engaged in the achievement of the organisation's aims. They also have rights and obligations regulated by the Labour Code (Padzik, 2020). Conducting an effective human resources policy in organisations has many positive aspects. The management supervises and supports the processes of tasks performed by employees, which, due to the implemented organisational culture, enables effective functioning thereof in the organisation. The aims, mission and vision of a public organisation are effectively achieved. Appreciated employees strive to fully use their knowledge, skills and experience and employers meet their requirements and needs. Such positive relations contribute to the organisation's successes and becoming more competitive for the environment.

The aim of the article is to present the role and significance of the staff in the context of developing effective management of public organisations and to discuss the research results related to the assessment of functioning of public organisations by civil servants employed therein.

Civil servants in Public Organisations' Functioning Processes

Civil servants are also indicators of competitiveness on the market where an idea, charisma and courage in taking action are valued (Szydzińska, 2000). Civil servants' capabilities must be subjected to ongoing improvement, which is also reflected in the organisation's integrated development model. Success in improving human resources depends on the purposefulness, planning, the manner of implementation and methods of measuring development opportunities of employees (Morawski,

Mikuła, 2009).
Processes of managing civil servants of public organisations are distinguished with, among others:

- organisation of the workplace in order to benefit from useful knowledge, innovativeness and creativity, stipulation of duties and tasks for particular employees;
- teamwork and interpersonal relations;
- assimilation of knowledge, skills and experience of team members;
- shaping development of particular team members;
- employee motivation generating expected results;
- full engagement of civil servants in the process of developing knowledge and sharing it with other members;
- assessment of work results, settlement of entrusted tasks and duties;
- laying out a path for professional promotion or demotion in the case of a lack of effective performance of employee tasks.

According to U. Sanak and B. Buchelt, the human resources policy constitutes one of the most important factors influencing employees' decisions on staying or leaving the organisation (Snanak, Buchelt, 2008).

While applying the human resources policy at the organisation, one should take into consideration the fact that employees create the value of a given organisational unit and constitute the element of its strategy and the basis of competitiveness. In the context of value, the human resources virtues include, among others: mobility and availability, identification with the organisation, engagement, productivity, diligence, willingness to work in a team, positive attitude to the organisation's value hierarchy (Sajkiewicz, 2007). Implementation of the human resources policy by managing human resources covers complex measures in shaping, development, results-orientation and motivation of employee groups. In this context, the human resources policy is understood as an instrument in striving for implementation of necessary assumptions and key strategies of the organisation. An important element of this process constitutes, among others: "(…) participation of employees in management, the sense of impact on the enterprise's results, the extended scope of autonomy, equal and just treatment of employees, the possibility of promotions and transfers according to interests and capabilities." (Listwan, 2008)

The management, whose role also includes self-development and liability for performed tasks, participates in the process of improving public organisations. Moreover, the management tasks include self-organisation consisting in effective delegation of tasks, self-evolution (searching for new forms of providing services) and self-recognition (any activities that do not generate expected values for petitioners within the provided public service). Civil servants must be aware of the necessity of professional self-improvement manifested in, among others, continuity of self-improvement, increase in activity, focus on learning and self-education. Process orientation in public organisations should be aimed at the development of managerial skills of the management and developing relations, as well as monitoring the activity of servants in the scope of the performance of tasks. In this area, the following might be helpful, e.g.: measurement of servants' competences or broad use of the newest achievements of science and technology. The management must be aware of the essence of human resources and their development necessary in building the organisational strategy. Costs or resources should be analysed in-depth, profitability of investment in the human resources should be identified and knowledge management systems should be introduce (Sitko-Lutek, 2006). Human resources management in public organisations is developed by many factors, so-called human resources management conditions. They include: external and internal conditions (micro and macro environment factors). Micro environment factors include: local community, competition, petitioners, organisations of employees and employers. Whereas, macro environment factors include the following conditions: demographic, market, political, economic, cultural, social, legal, technological progress and international conditions. Internal conditions of public organisations may include: organisational strategy, organisational culture, organisational structure, employment rate, competences of civil servants, the object of activity, the level of technology, activity of trade unions (Pawlak, 2003). In compliance with the adopted assumption, the human resources management in public organisations is one of the management conceptions focused on performed personal functions

in the organisation, where staff constitute the basic component of the organisation's assets and the source of competitiveness. This conception also includes: employment, development, remuneration, cooperation, shaping proper attitudes in scope of the superior – subordinate relations, but also among employees (Armstrong, 2011). The roles of the management in the scope of human resources' development in public organisations include (Bergenhenegouwen, Mooijman, 2012):

- initiating and carrying out discussions regarding human resources management systems aimed at competences' management;
- developing tools and techniques aimed at identification and description of key organisational and individual competences;
- coordination and establishment of relations between aims, business strategy, structure, procedures related to key competences of the organisation and particular employees;
- cooperation with the staff in the areas of developing and drawing up personal development plans;
- managing processes related to organisational changes;
- developing and implementing methods of recruitment and selection, assessment, training and building career development paths, the basic component of which constitutes competences.

Therefore, the following seem to be very important (Małysz, 2003): skilful use of the potential of servants, planning and control of employment, motivation and assessment of productivity, providing feedback to employees on the results of their work, managing the remuneration system and the motivation system, developing organisational culture, ensuring good interpersonal relations, implementation of the idea of social responsibility of business, improvement in the system of communication with the environment, measuring results of managers' work, connecting economic effectiveness with aims and values of public organisations, establishing proper relations between the legal – organisational and social sphere and the public management sphere, developing and implementing the principles of public management in the context of its social conditions.

Selected aspects of public organisations' functioning in the opinion of civil servants

The research covered 10 randomly selected institutions of the Silesian Voivodeship local government, in Poland, and 50 civil servants of those institutions. In order to conduct the research, the survey questionnaire was selected from among many other measurement instruments from the classification of direct survey methods of collecting data from primary sources to direct survey method. It is worth noticing that survey research in management sciences are aimed at recognising opinions, judgements and assessment of the reality, facts by respondents with regard to socio-economic phenomena occurring in state and private organisations.

In the question regarding the significance of work components in a public organisation (histogram 1), while choosing answers, civil servants took into consideration the significance of work elements by indicating the most important ones: taking initiative at work, permanence of employment, satisfactory remuneration, promotion and appreciation by the boss. Other answers had lower shares. In the civil servants' opinion, taking initiative at work is related to resourcefulness, creativity, specialist knowledge, which generates measurable benefits to the public organisation in the scope of performing tasks. The permanence of employment is a strongly motivating factor ensuring life stability and the sense of security, which have a positive impact on the mental sphere of employees. Satisfactory remuneration is one of the strongest motivational factors, which decides on the level of employees' engagement. Promotions and appreciation by superiors constitute a consummation of servants' efforts. In awarding it is important to recognise employees' motivation and adjust awarded prizes so that they satisfy their needs to the greatest extent. At the same time, it should be remembered that better results are obtained with the use of a positive motivation method. However, a negative motivation method, which can be defined as disciplining employees who continuously repeat the same mistakes, cannot be completely eliminated. Leaving such behaviour without reaction can result in the intensification of negative motivation methods.

(Taking initiative at work, Working on good quality equipment, Participation in trainings , Good interpersonal relations, Effective flow of information, Permanence of employment, Satisfactory remuneration, Promotion ,
Appreciation by the boss)

Histogram 1: Distribution of answers to the question: Which of the work components are the most important for you at your organisation? (please choose not more than 3 answers)
Source: own study on the grounds of survey research

(Work structuring, Planning succession, Developing individual plans of professional development, Trainings , Promotions, Horizontal transfer of servants)

Histogram 2: Distribution of answers to the question: Which of the tools of development of a civil servant at the public organisation do you identify with? (question 2)

Source: Self-Created Source based on Pilot Research

While analysing answers given by respondents to question 2, it is stated that the most important for the staff in the area of their development are: promotions, trainings and work structuring.

Work structuring is related to shaping the contents and conditions of work at the level of a given job position of a civil servant. Servant's activities vary depending on the type of office and held position. However, in general, they are multi-functional and require relatively broad general knowledge and specialist background. The basic tasks of a public administration official include practical implementation of assumptions and postulates of the state's policy in spheres directly related to the society's life in the system of territorial division units and single towns/cities. Furthermore, these tasks include: conducting activities related to meeting local communities' needs, taking care of following the law, initiating socio-economic ventures and influencing the awareness of particular groups and individuals in the scope of developing local ties and regional identity.

Employee trainings are one of the tools of developing the organisational culture. They have an actual impact when the obtained knowledge has practical application during performance of everyday duties. Employees should improve their qualifications and develop professional competences, in particular, in the scope of the issues regarding professional work.

Promotions constitute a significant instrument of civil servants' development due to the fact that they act as motivating factors and contribute to further progress in improvement.

I often have an impression that at my organisation..
At my organisation, employees believe that..
Civil servants do not have any impact on changing the conditions..
My organisation ruthlessly gets rid of..
My organisation does not research the needs and expectations..
Continuous improvement of employees is not a matter..
Rules of the management's treatment of employees..
I do not trust my co-workers..
I negatively assess the level of culture and behaviour..
At my organisation civil servants are not able to balance..
Communication manners between employees, methods..
Employees often do not keep up with duties, it is..
My organisation does not treat individually..

Histogram 3: Distribution of answers to the question: Which of the negative situations influencing the quality of work do you notice at your organisation? (question 3) Poland

Source: own study on the grounds of survey research.

In the respondents' opinion, the most important, negative situations influencing the quality of work in local government institutions include: a lack of individual approach to every servant, overload with duties, a lack of continuous development of employees. Individual approach to every employee at the

organisation consists in, above all, indication of an individual path of their development. An appreciated and noticed employee is more loyal and performs entrusted tasks with more engagement. Still noticeable bureaucracy in local government institutions is related to the significant overload with duties of civil servants, who clearly indicate this fact in the research. The employers' role is to delegate tasks so as not to discourage servants from work. The insufficient time of performing often monotonous and complex tasks, as well as related timelines result in the unnecessary frustration of the staff. While analysing civil servants' answers, it can be stated that they show willingness to attract the interest of the management regarding systematic improvement of employees. According to respondents, measures aimed at the improvement of the staff are undertaken decidedly too rarely and irregularly. The aim of the education and development of the staff is to achieve desirable changes in the scope of personal competences, skills and virtues of public administration employees, which is demonstrated in the social and professional role of civil servants.

Histogram 3 implies that the majority of servants are satisfied with their professional work and cooperation with superiors.

Histogram 3 implies that 25 persons out of 50 respondents stated that the professional work gives them satisfaction, 10 persons did not have an opinion in this matter, whereas, 15 persons stated that the professional work at local government organisations is not gratifying.

Conclusion

A civil servant's task is not only to professionally and reliably provide services to petitioners so that their work is assessed at the highest level, but also assessed as very good in terms of quality. Furthermore, a civil servant has to understand and support the aims of the public organisation, feel proud from the fact of belonging to the organisation and undertake additional tasks, if required by the management. Predispositions to perform this profession are extremely important. A position of a civil servant can be held by a person with high professional qualifications, with relevant skills, with reliable, professional expertise at a relevant level. Furthermore, it has to be a well-mannered, emphatic, communicative person ready to take challenges, changes, and development-oriented. Flexibility, morality, amicability, creativity and entrepreneurship are other features of a model civil servant. Petitioners like civil servants who solve their problems, are able to provide advice and the management appreciates those who perform duties entrusted to them. In public administration, the management underlines competences of their employees. They are expected to continuously improve their qualifications, undergo trainings, be knowledge-oriented. In present times, an employee of any industry, not only a civil servant, has to follow the changes; a different attitude annihilates the opportunities for further development and weakens the organisation's position. Furthermore, public administration does not like stagnation. Advancing technological changes, economic conditions and competition in a way force the staff to progress in their professional activity.

Abstract

Changes in education, including the assessment process, are a sign of contemporary times and are reflected on websites of university libraries. As a response to diverse information needs of users, the same information is being ever more frequently presented within various offer ranges and at diverse locations on library websites. The objective of the article is an attempt at description of the form of information by libraries of selected technical universities concerning sources related to assessment after the introduction of the Polish Act on Higher Education and Science of 2018. Taken into account were sources published by the Polish Ministry of Science and Higher Education following the period from introduction of the Polish Act on Higher Education and Science of 2018 until September 1st, 2019, available in their full text directly on the library websites, without necessity of searching through computer catalogues, databases or portals. Due to the breadth of the issue, the study is limited to selected aspects. The article contains an introductory chapter dealing with issues of information on library websites.

Keywords: acts of law, assessment of education, information, websites, university libraries

Introduction

Issues related to changes in Polish education in the second decade of the 21st century have entered an advanced phase and encompass various aspects of creative activity (Feret, 2018). All these have become the object of many new acts of law aimed at the improvement of competitive capacity of education and of universities on the global scale. The introduced Polish Act on Higher Education and Science of 2018, also referred to in Polish as the Constitution for Education, the *Ustawa* 2.0 (English: the Act 2.0) (referred to in the text as the New Education Act) was the first to fuse aspects of science and higher education into one concise system. Changes in education pursuant to the act govern, among others, issues concerning future assessment of the quality of scientific activity (referred to in the text as Assessment).

The new assessment procedures assumed in the act and in the subsequent regulations and communications of the Polish Ministry of Science and Higher Education (referred to as the MNiSW) differ significantly from those in force earlier – they take into account new scientific disciplines, new titles of ranked journals, new rules of ranking of scientific work and employee assessment, etc. The regulations provide support to Polish journals to strengthen their position in science and in the assessment process.

For this reason, scientists and publishing communities face the need to follow current information. Acts of the ministry, regulations, messages and other information resources related to the New Education Act published as generally available on the website of the MNiSW, the Polish Constitution for

Education website, the Polish Journal of laws, are being increasingly frequently recommended on library websites. The librarian community is making efforts for information on future assessment to contain full texts of ministerial sources offered broadly across library websites.

The objective of the article is an attempt at the presentation of the information on sources related to Assessment according to the New Education Act on library websites of selected technical universities. Browsing library websites was chosen as the research method. In the period between June 1st and September 17th, 2019, websites were browsed of the following technical universities: from Białystok, Częstochowa, Gdański, Koszalin, Kraków, Lublin, Łódź, Opole, Poznań, Rzeszów, Gliwice (Silesian University of Technology), Kielce, Warsaw, Wrocław and Kraków (the AGH University of Technology), further the University of Bielsko-Biała (ATH), the University of Technology and Humanities of Radom (UTH), the Bydgoszcz University of Science and Technology (UTP), the University of Zielona Góra (UZ), the West Pomeranian University of Technology in Szczecin (ZUT). The basic criterion of selection of libraries to study was the continuation of availability of sources related to registration of work on their websites (Knop, 2014; Knop, Cichoń, 2018). The article begins with a chapter introducing issues of information on library websites.

Information on library websites

Musings about information on library websites should best begin with a precise definition of the concept of information itself, as these abound depending on the scientific field and context in which this concept emerges. With respect to the carrier that is a library website it may mean notification about or communication of something (Szymczak (ed.), 1978, p. 788) as well as „… the volume of a certain factor reducing entropy[1]" (Materska, 2007, p. 23).

The proper transmission of information via a website entails such transmission of information so that it ensures the achievement of the expected result by the sender, i. e. the library. In other words, the user, to whom the information is sent, should notice the information on the website, be able to easily reach and be able to read it at any time they would choose. What turns out to be important is the „significance of information as a measurable value; [this] stems from the need of a quantitative analysis of the properties of necessary information for the purpose of assessment of the communication process. After all, situations and contexts may emerge, in which the conveyed information contains too little or too much information" (Materska, 2007, p. 25), in which the information requires more detail, a reference to a source, comment or simplification. Too little information may lead to destructive actions by the recipient as a result of incomplete knowledge, while too much information may discourage them from reading the message. In the pragmatic view, information is considered as useful information for the recipient – the information user.

To communicate anything via a library website „[also] identifies with the entirety of activity related to the creation and transfer to the market of the ideas about a company and its offer, and opening up people to these ideas: potential, present customers, interested parties and the broad general public" (Szymoniuk, 2006, p. 12). Research about websites of libraries, understood as the "Library 2.0", which is „user-focused, offers a multimedia experience, creates social capital and is socially innovative" (Wałek, 2014, p. 114) have shown that references to on-line resources are, after e-mail and tags, the tools the users expect the most (Wontorowska, 2009, p. 130-131).

Information on Assessment on library websites

The subject of the study of the present article shall be an attempt at a response to the question about information on websites of libraries of technical universities: of Białystok, Częstochowa, Gdańsk, Koszalin, Kraków, Lublin, Łódź, Opole, Poznań, Rzeszów, Gliwice, Kielce, Warsaw, Wrocław, and

---

[1] Entropy is the volume of information in a single message from a source. In other words, it is the weighted average of the volume of information carried by a single message, in which the weights are the probabilities of transmission of indivirual information (Entropy. Polish Wikipedia…, 2019).

the universities AGH, ATH, UTH, UTP, UZ, ZUT, on Assessment, in line with the New Education Act. Considered are sources published by the MNiSW between the entry into force of the New Education Act and September 1st, 2019, available as full text (linked) directly on library websites so that users need not search for them in computer catalogues, databases, portals. The results of the analysis of these websites also found linked general individual sources as recommended by the analysed libraries (table 1). These are acts of law, guides, projects, rank points of scientific journals published on the Polish Constitution for Education website, and presentations. Information about individual linked ministry sources are provided on the websites of 90% of the studied libraries.

Table 1: Individual ministerial linked sources of Assessment following the New Education Act available on websites of libraries of selected technical universities

Source name
Acts of law, regulations, messages
Polish act of July 20th, 2018, on Higher Education and Science (Polish Journal of laws, item no. 1668)
Polish act of July 3rd, 2018, auxiliary provisions to the act – Polish act on Higher Education and Science (Polish Journal of laws, item no. 1669)
Regulation of the MNiSW of September 20th, 2018, on fields of science, scientific disciplines and art disciplines (Polish Journal of laws, item no. 1818)
Regulation of the MNiSW of September 20th, 2018, on de minimis aid as part of the programme of support for scientific journals (Polish Journal of laws, item no. 1832)
Regulation of the MNiSW of November 7th, 2018, on the development of lists of publishers of scientific monographs and journals and peer-reviewed international conference materials (Polish Journal of laws, item no. 2152)
Regulation of the MNiSW of November 20th, 2018, amending the regulation de minimis aid as part of the programme of support for scientific journals (Polish Journal of laws, item no. 2198)
Message on the mode of determination of the list of scientific publishers and the main assumptions concerning its development, of 11.12.2018
List of publishers of peer-reviewed scientific monographs (attachment to message of the MNiSW of January 18th, 2019)
Draft regulation of the MNiSW on drawing up of lists of publishers of scientific monographs and scientific journals and peer-reviewed materials from international conferences
Ordinance of the MNiSW of January 25th, 2019, on the establishment of advisory committees concerning lists of scientific journals and peer-reviewed international conference materials (Polish Journal of laws, item no. 12)
Regulation of the MNiSW of February 22nd, 2019, on the assessment of quality of scientific activity (Polish Journal of laws, item no. 392)
Regulation of the MNiSW of March 6th, 2019, on data processed in the POL-on Polish Integrated System of Information on Science and Higher Education (Polish Journal of laws, item no. 496)
Message of the MNiSW of July 31st [2019], on the list of ranked journals and peer-reviewed international conference materials along with the assigned point rank

Books - guides
Polish Constitution for Education – guide to the education system and science. Part 1
Assessment of quality of scientific activity – guide
Others

List of journals from the Scopus and Web of Science databases along with their assigned scientific disciplines (suggestion of the MNiSW – October 2018)
List of projects qualified for financing as part of the programme of support for scientific journals
Point ranks of scientific publications
Presentations – training materials
Assessments
Assessment – slots – additional slides
Statements
Support for journals
Lists of journals
Issues concerning education and doctoral issues
Operation of IT systems of the MNiSW (including POL-on)
Organisation of a higher education facility, its financing and oversight

As can be seen, libraries provide many diverse sources concerning the process of assessment in relation to the publication the New Education Act. However, information about sources listed in table no. 1 on the websites of the studied libraries is varied. This variability stems primarily from the number of sources made available. The most libraries felt the need to publish information as links to source materials, in the following order: list of publications of peer-reviewed scientific monographs - 85% of libraries; list of scientific journals and peer-reviewed international conference materials along with assigned point ranks (in the text as: list of ranked journals) – 85% of libraries; list of ranked journals by discipline (in the text as: list of journals by discipline) – 75% of libraries; message of the MNiSW of July 31st list of scientific journals and peer-reviewed international conference materials along with assigned point ranks (in the text as: message on the list of journals) – 70% of libraries; content of the message of the MNiSW of July 31st, 2019 – 70% of libraries; message of the MNiSW of August 1st, 2019, amending the message on the list of ranked journals and peer-reviewed international conference materials along with the assigned point rank (in the text as: amending message) – 70% of libraries; regulation of the MNiSW of February 22nd, 2019, on the quality assessment of scientific work (in the text as: Regulation of the MNiSW of February 22nd, 2019, on assessment) - 60% of libraries; „Quality assessment in scientific work – a guide" - 55% of libraries; the Polish act of July 20th, 2018, act on higher education and science - 45% of libraries; the Polish act of July 3rd, 2018, auxiliary provisions to the act – Act on higher education and science - 40% of libraries; Regulation of the MNiSW of September 20th, 2018, on fields of science, scientific disciplines and art disciplines - 40% of libraries; list of projects qualified for financing part of the programme of support for scientific journals - 35% of libraries; Regulation of the MNiSW of September 20th, 2018, on de minimis aid part of the programme of support for scientific journals - 30% of libraries; Regulation of the MNiSW of November 7th, 2018, on on the development of lists of publishers of scientific monographs and journals and peer-reviewed international conference materials - 30% of libraries; „Polish Constitution for Education – guide to the education system and science" - 25% of libraries; regulation of the MNiSW of January 25th, 2019, on the establishment of advisory committees concerning lists of scientific journals and peer-reviewed international conference materials - 20% of libraries; list of journals from the Scopus and Web of Science databases along with their assigned scientific disciplines - 20% of libraries; Regulation of the MNiSW of March 6th, 2019, on data processed in the POL-on Polish Integrated System of Information on Science and Higher Education - 20% of libraries; Draft regulation of the MNiSW on drawing up of lists of publishers of scientific monographs and scientific journals and peer-reviewed materials from international conferences – 10 % of libraries; point ranking of scientific journals - 10% of libraries; Regulation of the MNiSW of November 20th, 2018, amending the regulation de minimis aid as part of the programme of support for scientific journals - 5% of libraries; message on the mode of determination of the list of scientific publishers and the main assumptions concerning its development, of 11.12.2018 – 5% of libraries; presentations on the following topics: assessment - 25% of libraries, assessment – slots, or how to calculate participation in scientific publications - 20% of libraries. The remaining presentations listed in table 1 may be viewed in the offer of 15% of libraries. It is noted that in the offer of websites, the presentations constitute an auxiliary, abridged form of provision of detailed information on changes stemming from the new acts of law and regulations of the MNiSW, whereby guides facilitate the understanding of changes requiring the knowledge of, among others, several acts

of law (see MNiSW, 2019a; MNiSW, 2019b). It must be stressed that in the initial period of analysis of library websites, grade information for scientific publications offered by the Polish Constitution for Education website was provided by 40% of the analysed libraries, however after the list of ranked journals was published, the link to this source was maintained by websites of only 20% of libraries; two libraries removed the information and drew up an information on ranking rules of publications using links to acts of law in the text – as will be discussed in the further part of the work.

None of the analysed libraries limits the information solely to presentations, guides as well as sources published in different forms than acts of law, as opposed to acts of law, regulations, messages that are the subject of news and information elsewhere on the library websites.

All the linked sources are recommended in different offers, depending on the relevant library, in locations foreseen for affairs concerning science, employees, local references concerning publications of employees/ the knowledge base, assessment, on special pages created and marked with links referring to the new act ow law, e. g. „Assessment in the New Education Act", among links at the library of the Wrocław University of Science and Technology; in the tab „University 2.0" at the library of the Poznań University of Technology and „Interesting links" under „Polish Constitution for Education" at the library of the Kielce University of Technology. Selected sources may also be viewed at the publishing house of the Łódź University of Technology that constitutes a part of the library of this university.

The specific location of information about new acts of law is the home page visible for everyone visiting the library virtually. Graphical design components particularly emphasized on a home page are indicated as typical for a modern website (see Kołodziejczyk, 2012), in particular within the context of the dynamic pace of information volume growth. Suitable visual representation aids in distinguishing specific information among all that is available at a specific location on a website. Visual representation is defined as a graphical method of development and transmission of information in a simple manner, yet with the use of artistic tools, often requiring creativity of those designing the information (Visual representation. Polish Wikipedia…, 2019); it facilitates emphasizing a topic and attracting the user's attention to selected information via specific senses. The possibility of using graphics to attract an individual's attention to sources concerning issues of Assessment was noticed by the studied libraries, which used:

- the MNiSW logo and a text link to the list of ranked journals[2] - latest news on the home page of the library of the Silesian University of Technology;
- the MNiSW logo as a link and a text link to a subpage with extensive information on the content of the list of ranked journals, with links leading to the list content, the list and to other components of the message – in current news – at the library of the Gdańsk University of Technology;
- moving graphical and text link to the specific topical sections „Quality assessment in scientific activity" with links: „ABC of Assessment", „List of journals and publishers of the MNiSW", „Polish Constitution for Education", „Useful links", „DONA scientific work database in assessment" - home page of the Library of the Wrocław University of Science and Technology.

The initial stage of the analysis already shows that access to one source is available from more than one location on the library website. This thesis is confirmed by the offer of the library of the Rzeszow University of Technology being different than others, in which the list of ranked journals and list of journals by discipline found on the page „Lists of ranked journals and publications" can also be found via the link „Lists of the MNISW" in the "Assessment" tab.

The information provided as a link to the full text of the act of law, regulation or list may contain information provided exclusively as the link and textual information with in-line links, also referred to as context links. The placement of a link in the text is considered to be more encouraging to view the

[2] In the discussed design, the library of the Silesian University of Technology included one more link to resources from the Internet that are not the subject of this paper's analysis, hence it was not listed here.

full text, as „[this] encourages close to 70% of readers to follow that link – thanks to which a site's usefulness also improves" (Gontarek, 2015).

The text information with in-line links analysed in this paper refer to the following sources:

a) list of ranked journals – at articles published in 2019-2020, according to which these articles will be ranked, differing from publications from 2017-2018 – in the message on the rules of scoring of scientific publications depending on publication year – in libraries of the Silesian University of Technology and the Wrocław University of Science and Technology; and in that same message by scientific articles published in reviewed materials from international scientific conferences included in the list of publications and conference materials – at the library of the Silesian University of Technology; in the information on the publication of a new list of ranked journals, containing detailed data on the rank number of scientific journals, conference materials included in this list – in the latest news at the library of the Gdańsk University of Technology; in the information on the addition of scores at the local publication database of employees to articles published in the years 2019-2020 at „DONA scientific work database in assessment" at the home page of the Library of the Wrocław University of Science and Technology;
b) list of publications of peer-reviewed scientific monographs – at the monograph, chapter and review, published in the years 2017-2020 in the information on the rules of scoring at „ABC of Assessment" – at the home page of the Library of the Wrocław University of Science and Technology; - in the information on the publication of the link with content of the list – in the latest news at the library of the Kielce University of Technology; in the information about the amendment of data to include the publisher's rank in descriptions in the local literature references of employee publications at „DONA scientific work database in assessment" at the home page of the Library of the Wrocław University of Science and Technology;
c) Regulation of the MNiSW of February 22nd, 2019, on assessment – in the information about a publication from outside the list receiving five points at the local database of employee publications, in latest news and at „DONA scientific work database in assessment" at the home page of the Library of the Wrocław University of Science and Technology.

The practice of attachment of the full text in the message is related to the repetition of the link leading to a single source in many different pieces of information on a single library website. The most frequently repeated source is the list of ranked journals offered e. g. seven times by the library of the Kielce University of Technology and six times by the home page of the Library of the Wrocław University of Science and Technology. The repetition of the source in a single information stems, as noted above, also from the presence of two links referring to different points in the source text. Further analysis shows that the former of these phenomena may be the result of the system of presentation of links in an information about one source used by the library as a PDF icon and relevant link given in the full name of the act of law, as is the case of the library of the Kraków University of Technology. The PDF file opens to show the content of the message with the list of journals publishing peer-reviewed scientific monographs within the library resources, with the second link leading to the PDF file in the public information bulletin of the MNiSW. The bulletin website allows the user access to more detailed information on the construction and content of the list. The most common information on assessment is the full name of the source included in the link, without additional data on this source, e. g. at the libraries of the Koszalin University of Technology, Lublin University of Technology, Poznań University of Technology, or the full name of the source with the link underneath, e. g.: prawo.sejm.gov.pl – at the library of the Wrocław University of Science and Technology, presented in particular as a list of various sources.

Summary

The musings in the present article certainly do not exhaust the topic at hand. The development of presentation of information and providing links to sources on Assessment is stressed in various ways

on library websites. The user's attention to selected sources is attracted by graphical components as well as various links to the same source. This means that the same information is provided in various ways from various locations. Information is provided in a shorter and more simple form or in an extended form, enriched with links to full texts. The libraries implement new tools of information design at various paces.

The information provided on library websites covers the two most important acts of law and legal acts significant in future of assessment. The most libraries provide the list of publications of peer-reviewed scientific monographs - 85%, the list of ranked journals - 85%, the list of journals by discipline - 75%. Linking of acts of law varies. Some open e. g. within library resources, some on an external body's website. Free sources related to the registration of work at local websites, placed directly on library websites, provide on the one hand access to information without the necessity of having to search for it in computer catalogues, databases or portals, yet on the other hand leading to reliable sources of the MNiSW, including e. g. new book publications (conf. Hudzik, 2018, p. 152). Users may also browse two guides and presentations.

The information offer evolves towards provision of resources that are generally available on-line, useful in education. Texts are published exclusively on-line, aiding the communication of something exclusively via the web page. The acquisition and usage of the opportunity offered by the Internet allows one to look differently upon the development of information on websites of university libraries and recruit users (conf. Sidorczuk, Gogiel-Kuźmicka, 2012). It is known that the Internet has become the medium of daily use in social communication, and good management of information on a library website may bring in more site traffic and retain the user for longer.

System Analysis of Risk of Human Errors in Enterprise Management From The Resilience Engineering Perspective

Izabela ZIEBACZ

Jan Dlugosz University, Czestochowa, Poland
Email: i.ziebacz@ujd.edu.pl

Abstract

Employees are a source of innovation, but employee is at the same time a critical "element" of the organization and the medium of greatest risk. Many experts judge current methods of HRA (Human Reliability Analysis) as not detailed enough and too simplistic in relation to the concept of human error. Conducting HRA, despite simulation modeling, is obviously difficult (Piesik et al., 2014). Nevertheless, such analyzes should be performed in the operational environment of the company, with a particular emphasis on the dynamic nature of the phenomenon. As a result, it is about creating forecasts and algorithms for possible behavior / events involving employees. The purpose of this work is to present a proposal for system analysis of human error risk as a management tool.
Design/methodology: The model presented in this paper was tested in a polish critical infrastructure enterprise for a period of 18 months. Research data were collected automatically from tablets, which monitored the tasks carried out by employees using a special application.
Findings: In this study the system based on automatic measurement of human error risk is presented. Human participation in processes related to the analysis and management of human error risk has been kept to a minimum. The tested system received implementation recommendations.
Originality/value – This article presents a new approach to developing a model that can be used as a tool for predicting potential human errors and managing personnel risk. Presented solution may support the management in measuring and analyzing human errors and managing the enterprise's activity.

Keywords: human risk, Human Reliability Analysis (HRA), work safety, resilience engineering.

In the literature on the subject there is almost unanimous agreement that the critical (weak) links of organizational systems are associated with the human factor, i.e. their users (Fragopoulos et al. ,2013). This is due to the fact that users are people with individual characteristics that cannot be completely classified. Sources of limitations of human nature are: senses (vision, hearing, touch, smell, taste), cognitive skills (perception, concentration, information processing), memory, motivation, situational awareness (the ability to understand what we see, draw conclusions and predict the consequences of action)(Cloninger et al., 1993). The psychophysical condition of a person, ones individual permanent characteristics (temperament, personality, routine) and states (fatigue, stress, attitude, monotony, stress) are also important (Kim and Hamann, 2007). Human and environmental factors also influence human behavior. As a consequence, forecasting causes of human errors is very difficult and complex, as it covers many dimensions and perspectives (psychological, technical, sociological, organizational and cultural) (Riuz-Moreno and Trujillo, 2012). Probably for this reason, there is no clear, universal definition of error. Fröderberg(2014) described human error as any unintentional human action which exceeds the limits of acceptability. Human error is also defined as the most critical factor in information security management (Werlinger et al., 2009; Asai and Hakizabera, 2010; Frangopoulos et al., 2014, Hadlington et al.,2019, Evans et al., 2019).

According to many practitioners, employee behavior is the primary risk carrier and not procedures, machines or systems (Navare, 2003). The literature on the subject uses an analogy - human errors as adequate to machine / device failures. In many control systems, including machine-human interactions, human errors prove to be one of the main causes of failure in areas such as industry, transport, technical

diagnostics, medicine, and the military, as demonstrated in a number of statistics (Chiodo et al., 2004). Human errors are inevitable (Kuchta, 2017)and constitute 30-90% to all economic failures(Asai and Hakizabera, 2010, Komatsu et al., 2013; Pintelon et al., 2016;, Alavi et al., 2016; Stewart and Jürjens, 2017; Evans et al., 2019).

When transferring risk categories to the personal area, they are defined as "involvement in conditions of uncertainty in personell activities that may fail" (Lipka, 2012). Personal risk is most often related to individual components of the personal function, e.g. the risk of planning personal needs, division of roles and tasks, motivational, etc.), or is considered from the perspective of the organization's human capital (risk of competence gaps, information security risk, risk of "human error, etc.) (Kierner, 2008). Occupational risk and behavioral risk are also closely related to personal risk. Behavioral risk (related to employee behavior) is seen as important, but managing it is much more difficult.

The more so that the employee's behavior in critical moments is the result of not only what he has learned so far, but also of professed values, fears, etc., which results in a set or sets of behaviors (Navare, 2003). A classic approach to the risk associated with the human factor in the enterprise (personal risk, occupational risk), when applied and analysed fragmentary, does not provide the opportunity to grasp the specificity of this risk, its variability and complexity. In turn, the risk of human errors is apprached in the literature mainly from the perspective of managing work safety, which means that it is very often narrowed down to the issues of safe work and ergonomics of the workplace. Is this representation of the problem sufficient?

The fact is that personal risk (including the risk of human errors) belongs to the least recognized in both theory and practice of management. Methodological proposals regarding the practical application of theoretical concepts are not following the development of the theory fast enough. As a consequence, there is a lack of tools for diagnosing and improving the state of the organization. The issue of the human factor, due to its complexity, is neglected even in the analyzes regarding the resilience of organizational systems to emergency events (Choi et al., 2018, Eveans et al., 2019). Many existing techniques developed for the quantitative assessment of human reliability share the same weakness, which is the use of expert assessments as a basis (Kirwan, 1992).

With the rapid development of information technology, future research should focus on the automatic identification and registration of research factors and combining them with models to develop an automated system of dynamic risk assessment (Zhangming et al., 2019). Therefore, it becomes expedient to analyze the causes and conditions of human error, as well as to develop principles and tools for their elimination

Man in control systems - review of selected concepts and risk testing models

The issues of occupational safety management are considered in most publications from two perspectives: American and European. In Europe, safe work is usually understood as a job that does not pose a threat to workers or anyone in the workplace. In the US, safe work means not only the safety of employees and other people in the workplace, but also the protection of the company’s property and of the company itself, it is a safe production or safe provision of services, it is a safe product. This difference influences, to a great extent, the effectiveness of the management and the profitability of a company. For this approach, an established view is that the more comprehensive the risk analysis and assessment are, the greater the chance of building an effective management system.

Potential human errors increase the level of risk associated with operating systems. In order to assess the risk resulting from potential human errors, a set of methods called Human Reliability Analysis (HRA) is used (Merkisz at al., 2014; Olpiński, 2016; Pniewski and Kornaszewski, 2017). With the help of HRA, the impact of people on the functioning of individual technical systems is analyzed, which in turn leads to both the minimization of technical damage as well as the reduction of the number of accidents. The purpose of conducting human error analysis is to design a technical system resistant to human errors. HRA (Human Reliability Analysis) is based on a systematic analysis of factors affecting human behavior in an ergonomic system (Obora, 2014).

Selected specific concepts and risk testing models that are best known and used in practice were selected and shown below:

1) **A Technique for Human Error Analysis (ATHEANA)** - HRA method developed by the American Commission for Nuclear Energy in 2000. The purpose of the method is to identify probable situations related to human errors and potential contexts forcing these errors - EFC (Error-Forcing Context) and to estimate the probability of HEP (Human Error Probabilities) in risk assessments. The ATHEANA methodology consists of the following stages (Thompson, 1997).
2) Cognitive Reliability and Error Analysis Method (CREAM). The CREAM method was developed by Erik Hollnagel in 1998. This method can be used to analyze human errors, as well as to estimate the probability of making a mistake (Bedford, 2013). It consists of nine phenotypes (e.g. time, duration, strength, distance, speed, direction, wrong object, sequence, quality / level) and three categories of genotypes (human factors, technical / environmental factors, organizational factors). The is based on the selection of subsequent phenotypes characteristic of incorrect human activity, and then the selection of the genotype that best suits the given phenotype. This method specifies four control modes appropriate for the level of control performed by the operator (Marseguerra and Librizzi, 2006).
4) MORT (Management Oversight Risk Tree) - the first comprehensive risk management system based on risk assessment (1980). This was the first time the concepts of: formal risk acceptance by company's management, level of acceptable risk, which determined the cause of accident as a consequence of the assumed risk level, were adopted. The system, initially introduced in the US power industry, contributed greatly to the importance of a risk management approach based on risk assessment. For the first time, OHS (occupational health and safety) specialists have begun to differentiate hazard from risk (Johnson, 1980).
5) LMRA (Last Minute Risk Analysis) - the LMRA rules come down to employees checking the workplace, to ensure that all hazards are identified and adequate protection measures are taken. This approach is based on the assumption that hazardous work can only be commenced if all necessary protection measures have been applied (Karczewski, 2012).
6) TRA (Task Risk Analysis) – is based on dividing the task into successive steps, taking into consideration the occurrence of threats at selected stages. This is justified, since the managers are required to discuss the hazard of each commencing step with employees and not rely only on previous training presentations, inclusion of the hazards in the occupational risk assessment, or discussions from few days ago. In TRA perspective, every step of the hazard is analyzed and it is known, at every step exactly, what are the risks and what protection measures need to be applied. Such information cannot be conveyed through the risk assessment card (Karczewski and Karczewska, 2013).
7) The concept of RE (resilience engineering) in critical infrastructure management is a security management paradigm. A distinctive feature of RE is the emphasis on understanding how to create safety and predictability in a work environment that abounds in hazards / risks(Hollnagel and Woods, 2006). The basic premise of RE is that human error is inevitable, so the workflow system must be flexible, assuming that the management of variability is as important as reducing diversity (Rasmussen et al., 1994). Wreathall (2006), in turn, connects RE with the ability of the organization to maintain a stable status or its fast recovery, which is a condition of the efficient execution of all processes and operations during major system interruptions as well as after their occurrence. In this context, the ability of an organization to function smoothly, under conditions of permanent instability in the environment is also important.

Management processes absolutely play a key role in ensuring safe and ergonomic working conditions (Tabor, 2013). However, the risk of human factor in operational terms, reduced to the assessment of occupational risk or task risk does not meet the needs of enterprises, despite the fact that its assessment and analysis is carried out using various models and management systems. Even the TRA concept captures the problem of human factor risk fragmentarily, focusing only on elements related to human work. The problem of human risk should be seen much more broadly. It is also a fact that any employee behavior may be correct, but only in a specific situation. The problem is also that some of the side effects that arise can only adversely affect certain parts of the system (Borkowski et al., 2013). It is clear, however, that human availability is an uncertain state and therefore the risk is to be expected.

Systemic approach to risk

Current risk management methods are based on static identification and risk assessment. So many organizations do not see financial benefits of human risk management, although they put a lot of effort into its analysis and selection of protection measures, considering these activities mainly as a formal requirement. The fact is that applied risk management methods are of little use to a large number of executives, who, in order to manage efficiently, want to have readable, quantitative indicators. It is also worth mentioning here that the traditional approach to risk is categorized according to the probability of occurrence and the reduction of risk is limited to reaching the acceptable level. In this concept, risk types with little or no probability of occurrence are omitted, although (as demonstrated by practical examples) often cause large losses. The effectiveness and efficiency of risk management depends on the extent to which all existing threats related to the organization can be identified. The step of identifying the risk is crucial, so if it is carried out incorrectly or incompletely, subsequent steps are burdened with increasing systemic errors. Practice proves that the hazards identification is very often carried out in a superficial and formal way - to please the superiors. Also, the practice of artificial stretching the number of included hazards (just in case) in the risk assessment cards, does not lead to an effective risk assessment. Taking into account all the possible sources of danger causes a monstrous expansion of the workplace's risk assessment card, which makes it completely impractical. Inclusion of everything into the documentation, just in case, causes records to grow and to become of little use and difficult to understand for the employee. There is no doubt that the division of risk into categories facilitates its description in a cause-effect relationship, and coded risk effects (by constant and repetitive elements) allow them to concentrate on finding the causes for the analyzed risk. But is this practice sufficient for management purposes?

Figure 1: Risk map

In the diagram above the individual points are the following categories: strategic risk, business risk, human error risk and others.

As real-life scenarios suggest, knowing the whole structure / tree of cause-effect relationships (scheme 1.) is required. On this basis the choice of one critical link can be made. So it seems that the aim is not to identify or find as many risk types as possible. The goal is to uncover so far unknown types and correlations between them.

In analyzing this problem, cybernetics seems to come to fruition as a science of system control. Cybernetics assumes that numbers are a sufficient medium to distinguish the interdependence between different phenomena and also to describe the actions of individuals. It provides a new knowledge about how to anticipate, control and influence employee behavior at work, which can be useful for the effective risk management of human error. In cybernetics, behaviors of employees are described by elastic properties that can be influenced to a great extent and rigid properties that are not a subject to

any influence. A set of rigid properties determines the nature of the indyvidual. Therefore the compliance of the flexible characteristics of any worker and his professional situation may be achieved in two ways: by adjusting the emloyee to the situation or by adjusting the situation to the employee. On the other hand, there is only one possibility in relation to the rigid qualities of man: the adaptation of the situation to man. In managing the risk of human error, it is useful to identify the nature of employees, in order to improve the management of staff (more accurate prediction of the undesirable behavior of employees, without trying to "tamper" with their character, since such attempts fail). Thus, from the cybernetic point of view, there are six basic character traits (three informative and three energetic).
The information (intellectual) properties are:

• information capacity (intelligence);
• recordability (determining capacity);
• preference (specifying talent).
In turn, the energy properties consist of:
• dynamism (defining attitudes);
• tolerance (defining free acceptance of stimuli);
• susceptibility (defining stimulus acceptance).
There are six cases of non-compliance with the character level when:
• an intelligent employee is prevented from processing a lot of information,
• a non-intelligent employee is forced to process a lot of information,
• a worker with high capacity is prevented from processing information quickly,
• an employee with low capacity is forced to process information quickly,
• a talented employee is prevented from processing information about his talent,
• a non-talented employee is forced to process information in a particular area (Mazur, 1999).
Another question that needs to be addressed is the extent to which workers' behavior can be influenced by the environment, and in particular by the impact of others. Given that stimuli may be attractive or aversive (it is assumed that the person is seeking to maintain the independence of his or her behavior) for an employee, and that his or her reactions may be attractive or aversive to his or her contractor (a person striving to influence that behavior), the following situations are possible:

Conflict-free situations

- mutual encouragement - attractive stimuli cause reactions that are attractive to both the employee and the contractor,
- mutual avoidance - aversive stimuli cause responses that are aversive to both parties.

Conflict situations

- stimuli attractive to the employee trigger aversive reaction of the contractor (the employee seeks attractive stimuli but the contractor hinders his/her efforts),
- stimuli aversive to the employee cause reactions which trigger attractive stimuli to the contractor (the employee avoids such situations, but the contractor tries to force them).

Other type of situations characterized by the presence of inert stimuli are these where conflict does not occur. Such situations base on links, where the reactivity of one system or both is equal to 1(Mazur, 1999).

The behavior of the employee determines information, which lead to the decision. In this context, the employee's initial influences are composed of his reactions. The type of these reactions is determined by the influence of the correlation power K. The intensity is determined by the disposition power P_d. Among mentioned factors are the following compounds:

$$\boldsymbol{K = [V_r + V_h]G}$$
$$\boldsymbol{P = P_0 + P_d}$$
$$\boldsymbol{P_d = P_r + P_s}$$

Explanation:

information factors, constituting correlating components of power "K"

Vr - current stimuli (expressed as receptor potentials),
Vh - self-interest (expressed by the homeostatic potential),
G - state of memory (expressed by the distribution of correlational conductivity)
energy factors, constituting the components of physiological power "P":
P_0 - needs of the body (expressed by sterility power)
Pr - situation in the environment (expressed by working power)
Ps - influence on the environment (expressed by free power)(Mazur,1999).

In situations where the influence of a contractor on an employee is limited to information factors, only current stimuli (Vr) may be influenced. By providing additional stimuli, attractions over the aversions (encouragement) or the aversions over the attractions (discouraging) may be achieved, leading to the replacement of the approval with disapproval or vice versa. This is the case of stopping a conflict as a result of persuasion.. Nevertheless, it is mportant to note that an employee may want different things, but in different situations. In a specific situation, employee's desires are a result of his current structure (Mazur, 1999).

Intelligent System Resistant To Human Errors

When analyzing the literature on the subject, unfortunately it should be stated unequivocally that there is a lack of systemic risk solutions in dynamic terms and in connection with the risk assessment of processes operated and implemented by employees, as well as taking into account the correlation between individual types of risk. This is due to different reasons. One of them is the fact that systems omit correlation analyzes of various types of risks with various probabilities of occurrence. Only the assessment which captures this context can provide the basis for more adequate projections in the area of enterprise risk management.

The integration area of the worker with the operational process

Figure 3: Model of employee integration with the operational process

The model presented above was used to design the risk prediction system at the critical infrastructure enterprise in Częstochowa. The test measurement was carried out over a period of 18 months. The essence of the system was the ongoing and automatic collection of data from all participants of operational processes. The system monitored activities and even employee behavior at each shift and generated forecasts with confidence intervals for operational risk. This information was systematically conveyed to the management and the maintenance department. Technological service employees were equipped with tablets on which, after logging in to a specific object / machine, a checklist was displayed. The checklist contained all parameters of technological devices and machines on the critical path of this enterprise and appeared on a tablet after each login.

Every day, in accordance with the adopted procedure for assessing the condition of machinery and equipment, the information was processed automatically to assess the risk of human errors (including quality errors and omission errors, according to Reason's classification). This information was forwarded in the form of a report to the dispatcher. The dispatcher, based on the received data which contained confidence intervals for operational risk, provided relevant information to the maintenance department and the technology department in order to ensure work continuity and maintain proper technical and operational parameters. The first stage of testing the system allowed us to positively verify the architecture of the model and demonstrated its usefulness for the purposes of assessing and managing the risk of human error.

Figure 5: Fragment of the system report

Conclusion

Today, no one should have illusions that the ongoing automation of processes in organizations, will cause a decrease of the direct involvement of workers (for diagnostic work). This implies significant risks to operational efficiency. Employees who are at risk of losing their jobs can intentionally introduce errors to the systems, hoping that the employer will mistake it for an equipment filure, so they can keep their jobs. However, technological change is inevitable. This risk closely implies another: the risk of inadequate configuration (selection) of employees (crucial factor in case of personell, manning sites with critical infrastructure, where in the event of a failure, teams must demonstrate maximum efficiency, which may have a direct impact on the effectiveness of remedial actions). Systemic identification of potential critical areas, related to the participation of employees in operational processes (as an integrated part of the organizational environment) in the context of risk identification and management, is an area of great research potential.

In order to attain a dynamic adaptation to the environment and achieve goals of the system, it is not enough to monitor only the quality of processes. Their dynamic and flexible adaptability is also important. It is imperative that the security of the entire operating system, not just work safety, is strictly managed to ensure high performance of such organizations. Models of systemic identification of human

errors can be an important support for managers in managing organizational processes in a cost-optimal way.

Dynamic Business Model-Electronic Payments Market. Practical Perspective

Pawel NOWODZINSKI

Czestochowa University of Technology, Czestochowa, Poland
pawel.nowodzinski@wz.pcz.pl

Abstract

The authors presented the concept of the business model as a review of other studies related to the institution of the payment card processor, i.e. the company which provides services in the area of electronic payment. The concept of the business model seems to be cognitively interesting on account of the fact that it combines a few unique structures. Polish market of electronic payments is steadily increasing. It is determined by the development of electronic and mobile banking. The approach of clients is changing. Although cash payments still constitute a high percentage of all payments, the number of transactions conducted with the help of payment cards or through websites and mobile applications is constantly increasing.

Keywords: Business Model, Electronic Payments Market, Business Model

Introduction. The perspective of the business model

Technology has become increasingly important to the evolution of payment ecosystems and the development of new electronic products. The ability to deliver new advanced technology products reliably has become a central theme in the strategies of a growing number of ecosystems members. Most institutions see introducing new products and services as a necessary step for retaining highly valued customers, and for positioning themselves strategically for the future. As this trend continues, the nature and magnitude of risks posed by technology will continue to change. The purpose of this paper is to review the extant literature on empirical research related to payment card processor institution. It provides a comprehensive assessment of research methodology of empirical research describing the functioning of the market of electronic payment in Poland 1998-2019. The final part of the paper describes the conceptual model of delivering value in the contemporary business model of the cashless payment operator (payment card processor). The perspective of the business model of the company emphasizes and concentrates the attention on the role of a client and the concept of value which is provided to them. The characteristics of the business model describe the general concept of creating value in the company [Ueda, Takenaka et al, 2008; Haile, Altmann 2016]. It should also specify the dependencies and interactions between different groups of stakeholders. In this context, the importance is appointed to the relationship with clients in creating the appropriate business model of the company. Changes in product portfolio, strategic alliances, takeovers, coopetition, diversification, company takeover strategies along the entire value chain – all of these activities lead to the creation of a specific ecosystem, i.e. the developed business model in which the client may easily use a wide range of values offered by the company, inside which they do not deal with the offers of the competitors.

Ever since the Internet boom [Centner, 2008], firms have been experimenting with new ways of doing business and achieving their goals, which has led to increase in popularity and number of editions of the scholarly literature on business models [Massa et al., 2017].

The concept of business models is useful also in the analysis of the relationships with clients in small and medium companies. Considering the varied role of clients, the companies become complex and dynamic systems, including the components entering friendly and antagonistic interactions with other systems [Doligalski, 2013; Girella et al., 2019].

The issue of creating value is the subject of interest of both theoreticians and practitioners of management. On account of its interdisciplinary nature, this issue combines the theory and practice of management and finance. The appropriate configuration of the fundamental elements of the business model (both in the financial and non-financial categories), allows for creating competitive advantage which is favorable for creating value by the enterprise [Kindström, 2010; Anwar, 2018; Bashir, Verma, 2017]. The business environment of enterprises has very significant impact on the opportunities which appear due to the understanding and implementation of the appropriate business model. The increasing globalization and fast technological progress are changing them radically. The relationships between the producer (the offer supplier) and the client (the offer recipient) are changing. Consumers are assessing offers available on the market much faster and more accurately. The information asymmetry is decreasing. Companies must be increasingly client-oriented, regularly verifying value propositions provided to them. The value appropriation approach is changing - the essence of creating competitive advantage is building such a business model which will provide the creation of value and its maintenance, but also the adoption of value created by other entities – by the possibility of possessing or controlling resources and the capabilities corresponding to generating value. It is common across the industries [Malara, 2003; Kollmann, Hensellek, 2016; Hall, Roelich, 2016; di Trana et al, 2019; Yang, 2017; Valdez-Juárez et al, 2019; Nitsenko, 2016].

These factors bring about the necessity to verify and redefine if needed the business models applied by the companies so far. The competences of this type should be included, in the current economic reality, in the key competences favorable for building the enterprise value. In turn, the system of cause and effect links and ties between individual components of the business model should allow for the implementation of the assumed goals of the enterprise [Rudny, 2013; Niemimaa, et al., 2019].

The main purpose of the paper is to design and characterize the concept of the business model for the institution of the payment card processor, i.e. the company which provides services in the area of electronic payment in retail and service outlets. In order to achieve the goal of the paper – there should be the cashless payments across the market explained and the Polish market of cashless payments, as well.

The functioning of the market of electronic payment

Cashless payments, particularly using payment cards, are developing very fast. Both the number of cards and the amount of transactions conducted with them is globally increasing. In 2012 the number of the issued payment cards in the world went up by 12% and reached 10 billion. There were generated 182 billion cashless transactions using payment cards. The forecasts indicate that by 2018, the number of transactions will have been growing faster than the number of the issued cards – respectively 8% and 5% per year. In 2018 there will be nearly 14 billion cards. An increase in the number of transactions will be caused by the popularization of proximity cards, mobile payments and e-commerce.

In Poland, there are two types of payment card systems: three- and four-party payment card systems. However, the key role is played by four-party systems (e.g. represented by Visa and MasterCard payment organizations). During implementation of retail payment in a retail outlet – the charge is imposed on a sales or service outlet (MSC - merchant service charge). The charge is collected by the payment card processor (the company which provides services in the field of card payment in a specific retail outlet). The listed charge consists of the margin of the payment card processor, charges for the benefit of the

payment organization and the charge for the bank (interchange fee), which issued the card for the client [Heikkinen, Tómasson, 2016; Fung et al, 2018; De Groen, 2020].

The suppliers of payment services are responsible for providing payment system, access to appropriate suppliers of financial services (e.g. acquirers and banks) and they establish the payment transaction process between consumers and merchants in the point of sale. Their role is reduced to supplying the appropriate software and hardware to the parties of the transaction. The supplier of payment services can be an operator, or an organization appointed jointly by the banks and also the independent entity. In turn, network providers supply telecommunications infrastructure which allows to conduct transactions with the help of payment terminals, mobile phones, starting with initiating the payment and ending with verifying the users. Also, the sellers and providers of services and consumers always take part in transactions. The parties having direct impact on the process of mobile payments are legislators and market regulators, establishing legal frameworks and technical requirements [Hsiao, 2019; Tan et al, 2019].

In the system of retail payment, the participation of the central institution is not required, therefore, the role of non-banking institutions intermediating in the processing of electronic payment is increasing. It is also the result of the development of technologies and electronic forms of payment. Modern payment systems are treated as platforms joining payers and payees [Iwańczuk-Kaliska, 2013]. Therefore, the activity of the organization performing the function of the payment card processor may be based on the concept of two-way market (platform/network).

This type of two-way platforms creates "two groups of users with related interests. Two-way markets are characterized by direct network effects, therefore, the demand for the service provided depends jointly on both groups. An example of such a market is the card payment systems, in which the demand for the payment service is reported by the card merchants and holders (consumers). Merchants accept card payments whereas consumers buy merchants' goods with the help of them. Multiplying network effect occurs when the acceptance network is growing in the form of points equipped in payment terminals and, at the same time, their number and the card payment value is increasing [Górka, 2013; Krivosheya, Korolev, 2018; Bounie et al, 2017].

In this sense, a new participant of the system (this can be both a client and seller), who joins the "network", understood in this way, provides an increase in the system value for all its participants. This brings about that the greater the subjective "value" of the payment card for the holder the larger the network of entities accepting it. On the other hand, the bigger the number of clients using these cards is the greater benefits are brought about by entering the system by merchants [Maciejewski, 2012; Ramya et al, 2017; Tee, Ong, 2016].

Polish market of cashless payment

The Polish e-commerce market is showing remarkable growth, which is unsurprising considering the overall performance of the economy. Gross domestic product growth was 5.1% in 2018. The main driver has been private consumption and strong consumer confidence, driven by high wage growth. Due to such conditions, it is no surprise that due to forecast Poland is able to have double-digit growth for e-commerce up to 2021, making it one of the most dynamic European markets. Polish market of electronic payment, compared to other European countries, is exceptional and there can be observed some dualism. On the one hand, in Poland, proximity payments are developing the most rapidly and there are carried out a lot of projects connected with mobile payments. On the other, a significant part of the society prefers cash payments and there is recorded one of the lowest rates of a number of cards per one citizen (about 0.86).

A decade ago, at the beginning of the 2010, Poland has one of the lowest degrees of banking across the whole population in the European Union, amounting to 77% of Polish adults, every third Pole does not have a payment card. About 1/3 of cash transactions were performed by people possessing payment cards but in places not accepting such a form of settlement. This, among others, results from the fact that, according to estimates, only about 16% of Polish entrepreneurs offer their clients cashless settlement. Then, there occur significant technological and legislative changes, which influence an increase in the dynamics of development of the popularity of electronic payment. In 2013 there were taken the decisions on the introduction of the statutory reduction of interchange to the level of 0.5%. At the end of 2014, there were 35.5 million of payment cards on the Polish market [NBP, 2014]. (Fig. 1).

At present, bank transfers are Poland's most-used payment method, taking a 50 percent share of all e-commerce transactions and €5 billion in yearly sales. Major banks tend to offer their own, branded e-commerce bank transfer solutions or e-commerce bank transfer platform. This method is expected to grow at a compound annual growth rate of eight percent to 2021, but the rapid rise of cards as a payment option will dent the overall share of transactions carried out by bank transfers. Indeed, cards are forecasted to grow at a compound annual growth rate of 25 percent up until 2021 and will take almost 30%of the payment market. Card usage is growing quickly in the country as people turn away from cash payments, and Mastercard and Visa are already well established. Digital wallets are also growing in popularity. At the moment, they account for only 15% of online sales, but this is set to expand at a compound annual growth rate of 33% out to 2021, when they are predicted to take a 23% market share. The rise of digital wallet facilities is being supported by Poland's high uptake of mobile banking and an overall willingness to adopt new payment technologies. Poland was one of the first European countries to embrace contactless technology, for example: the rapid success of BLIK highlights the readiness of the Polish consumer to migrate to digital-only payment options [Morgan, 2019].

Fig. 1: Number of payment cards in Poland in subsequent quarters [millions] since 1998.

Source: Narodowy Bank Polski, Informacja o kartach płatniczych III kwartał 2019, Departament Systemu Płatniczego, Warszawa 2019.

With the arrival of new payment tools (proximity cards, mobile applications and payment technologies), the awareness of consumers and entrepreneurs concerning the advantages of cashless settlement is growing. The introduction of new technologies and simplifying payment procedures brings about that more and more people consider electronic payment practical and safe. In turn, new legal regulations may be an incentive for entrepreneurs to offer their clients electronic settlement. The domestic market of electronic payments is comparable to other markets with reference to the available payment solutions, however, it is lagging behind with respect to the popularity of cashless transactions and the number of

payment terminals (per 1 million of citizens, Poland occupies the second-to-last position in the European Union. In 2012, the EU average amounted to 17 500, whereas the average in Poland – 7000). This state indicates some significant opportunities for development. Greater availability of payment terminals on the market will affect an increase in the number and popularity of cashless transactions carried out on the Polish market. According to the data by the banks, in the fourth quarter of 2014, there were conducted 690 million of transactions using payment cards and, compared to the previous quarter, there was recorded an increase in the number of transactions by 46.8 million, which amounts to an increase by 7.3%. Over the last year, there was recorded an increase in the number of transactions by 19%, and over the last two years –36% [NBP, 2014] (Fig. 2).

As many as 65% of them are in centers below 100,000 residents, thanks to which people living in villages and smaller towns gain greater freedom in choosing the means of payment. the Cashless Poland Program is developing so rapidly and is also reaching those regions of Poland that need the most civilizational change brought by cashless payments. This has a positive effect on the development of local enterprises and retail and service outlets, which, especially in smaller towns, play the role of a center of local activity. Regions with the highest percentage of terminals installed include the following voivodships:

Mazowieckie (15.19%), Śląskie (11.55%), Greater Poland (9.49%) and Lesser Poland (9.32%) , while those with the lowest number include the Świętokrzyskie (2.86%), Podlasie (2.84%), Opolskie (2.76%) and Lubuskie (2.48%) voivodships. So far, terminals installed as part of the Cashless Poland Program have completed over 187.5 million transactions, for a total of nearly PLN 10 billion. According to the latest statistics presented by the National Bank of Poland at the end of December 2019, the number of POS terminals in Poland in the third quarter of last year was already over 867 thousand and is constantly growing. In addition, since March 2019, virtually all installed terminals allow contactless payments.

The research [PBS, 2013] indicates that Poles, the most frequently, use cashless payment in stores and at gas stations (56%). However, 66.9% of the respondents stated that such a form of settlement guarantees security. Only 6.9% of the respondents indicated that they consider card payment dangerous. More than 33% of the respondents admitted that they do not have a payment card, either debit or credit card, whereas 9.7% of the respondents claimed that admittedly, they do have a card, but they usually pay cash. In turn, with reference to the availability of payment terminals in Poland, the respondents confirmed a general tendency to an increase in the number of points accepting this form of payment. More than 70% of the participants of the research believe that the availability of terminals in Poland is considerable.

The research results indicate that Poles are increasingly into electronic payment tools and they are more willing to settle payments with cards, expecting such a possibility even in small shops or service points. The basic conclusions from the research are the following:

— card payments are becoming increasingly popular,
— card payments are safe (Polish awareness and, consequently, trust in the security of this type of transactions is growing),
— consumers indicate the rapidity and comfort of transactions conducted with cards.

A positive attitude towards payment cards and recognizing the advantages of such a form of payment – comfort, security and rapidity, is a good signal for new projects connected with the popularization of electronic payments in Poland. However, there is still the need to increase access to entrepreneurs who run commercial and service premises in smaller cities and towns to show them the value of the payment terminal installation for their business. In conversations with representatives of various industries who have decided on such a step, there is clearly satisfaction that thanks to their openness to cashless payments, their clients can choose whether they prefer to pay by card or cash.

The concept of business model of the cashless payment operator (payment card processor)

According to A. Osterwalder and Y. Pigneur, the business model consists of nine basic elements which determine four areas of business activity (clients, offer, infrastructure, financial position). According to the cited authors – in a sense, the business model is an outline of the strategy which is to be implemented in the framework of structures, processes and systems of an organization [Osterwalder, Pigneur, 2012] (Fig. 4).

The payment card processor (whose business model has been presented in Fig. 3) – provides services of completing and conducting payment transactions using payment cards or similar payment tools. A payment card is an instrument authorizing the payment of cash or allowing the submission of the payment order, in this case, via the payment card processor, accepted by the merchant in order to receive due funds. The listed service is dedicated to payment card processors. It consists in allowing the execution of payment transactions, initiated by or via the merchant, with the payer's payment instrument, particularly, by authorization service, sending a payment card to the issuer or payment systems of payment orders of the payer or merchant, aiming at the transfer of funds owed to the merchant, excluding the activities consisting in its clearance and settlement in the framework of the payment system.

Fig. 5: Business model of the payment card processor

Source: Authors' own study

The presented model uses the functioning of the multilateral platform. Multilateral platforms associate two individuals but mutually related groups of clients. Such a platform has a value for one group if there is a possibility of establishing the relationship with the other group. The platform generates the value, creating the conditions for interaction for the representatives of different groups. An increase in the platform value consists in attracting new users (network effect). In case of the payment card processor, the larger the number of merchants the transaction platform possesses the larger value generated for the consumers using payment cards. On the other hand, the larger the number of consumers (payment card users) conducting transactions the greater the value of the transaction platform. The activity of this type has become popular with the occurrence of information technology. Such a model generates value as a result of acting as an intermediary. To generate value, the platform must attract and provide services to the representatives of all interested groups at the same time. The value of the platform for a specific user considerably depends on the number of users on the other side. An essential challenge to this outline is attracting a segment of clients (and their sufficient number), therefore, the operators of the multilateral platform often apply the donation (formulating not expensive or free value proposition) to a particular segment of clients. Such activities are to arouse interest in the offer by the other party. The key resource essential for the functioning of this business model is the platform – key activities consist in management of the platform, providing services and promotion of the platform. The value proposition in this model includes attracting a specific number of users, associating segments, reducing costs by using the platform for transactional purposes.

The next step to achieve better performance on the market is strategy related to payment gateway solutions. A payment gateway is a merchant service provided by an e-commerce application service provider that authorizes credit card or direct payments processing for e-businesses, online retailers, and so on. The payment gateway may be provided by a bank to its customers but can be provided by a specialized financial service provider as a separate service, such as a payment service provider. A payment gateway facilitates a payment transaction by the transfer of information between a payment portal (such as a website, mobile phone or interactive voice response service) and the front-end processor or acquiring bank. Payment Gateway could work as an innovative platform, created to facilitate activities for entities involved in the process of adopting to non-cash payments, such as: financial institutions, acquirers, Added Value Service providers, and banks. The unique quality of this system is the possibility of integration between paying devices of different class, and systems of the billing agent. For the Payment Gateway, support is foreseen for devices from Ingenico, Verifone and Bluebird and more. Payment Gateway is a flexible solution, providing differentiated services developed with the increase in activities such as: transaction authorization between multiple acquirers, loyalty programs, recurring payments, and electronic top-ups.

Conclusions

Polish market of electronic payments is steadily increasing. It is determined by the development of electronic and mobile banking. The approach of clients is changing. Although cash payments still constitute a high percentage of all payments, the number of transactions conducted with the help of payment cards or through websites and mobile applications is constantly increasing. Banks are into the development of technologies and the direction of changes is often subjected to the demand from the market. With the development of technologies, mobile banking will become the central element of each purchase made both traditionally and online [Campos, 2014]. With the development of e-commerce there is forecasted the early arrival of the age of domination of electronic payments, including the ones implemented with the use of mobile devices [Burak, 2013]. The presented business model of the payment card processor institution partially uses the ideas of multilateral markets to make mangers focus on managing the transactional platform and management of the relationships of business partners with consumers.

The holistic business model framework can serve both as a cognitive instrument and a planning tool to get the most out of value chain design, which is an inherent part of the design system.

Transformation of The Funding Sources in Banking Activity in Poland In 2016-2019

Agnieszka WOJCIK-MAZUR

Abstract

The study aimed to assess the degree of the development of the Polish banking system and to analyze its funding sources as related to the lending activity. The analyses revealed that the Polish banking system still retains the classical model of financial intermediation, i.e. lending activity is financed entirely by non-financial sector deposits. Sources of financing are mainly composed of deposits from the non-financial sector. At the same time, such a structure causes a deep term mismatch between the lending activity and funding sources (long-term foreign sources account for 5% of total liabilities). The new supervisory requirements introduced mainly in terms of liquidity standards (NSFR) and resolution (MREL) may, therefore, pose a significant challenge to the Polish banking sector.

Keywords: bank, founding sources, deposit

Introduction

The experience of the financial crisis has led to the introduction of new supervisory requirements to reduce the materialization of systemic risk on the one hand and the public cost of a massive bailout oriented to the banking sector on the other. These regulations focus on capital requirements and supervisory standards for bank liquidity. The need to regulate the banking system results in particular from its functions in terms of the transformation of measures, terms, and risk. A deep mismatch in the maturity structure of assets and liabilities remains the main source of risk in such banking systems as in Poland.

Transformation of funding sources in the light of supervisory banking standards

The activity of banks has a significant effect on the functioning of the economy as a whole. Banks transform small savings into much larger investments, thanks to which they implement significant investment projects with key importance to the economy. Banks act as financial intermediaries and undertake a specific estimated level of risk with the expectation of generating sufficiently high profits. Banks use their accumulated capital to grant not only loans in the broadest sense of the word, but also to make investments in the capital markets. These are transactions with a reasonably long time horizon (Prokopowicz 2008, Krawczyk-Sokołowska 2011, Wielgórka 2018).

Commercial banks operate in a high-risk environment. The classic functions of financial intermediation make banks vulnerable to mismatch of maturity, resources, and risks. The specific financial structure based on almost 90% foreign capital results in banks being exposed to a strong materialization of risk which, due to the links and dependencies between entities, may even lead to systemic risk. The negative effects of the financial crisis forced supervisors to introduce new legal regulations aimed at strengthening the existing regulations for the banking sector and creating a safer and transparent financial system (Łukomska-Szarek and Wójcik-Mazur 2010, Łukomska-Szarek 2010).

The essential prerequisites for the legal regulation of banking activities are to ensure the stability and security of the financial system and to protect depositors. The regulations concerning the sector security guarantees are an essential element in limiting the systemic risk of a crisis because problems of one bank can lead to a serious crisis of the entire banking sector, and consequently to disturbances in economic stability. Undoubtedly, the failure of one bank can increase the risk of contagion and it would be highly questionable to recognize that the bankruptcy of one institution can produce benefits to competitors13. This results from the specific characteristics of the bank, which include Szczepańska et al. (2015):

1. the structure of the balance sheet, which consists in that banks' funding sources are scattered, short-term and can be payable on demand (e.g. deposits), whereas assets are generally long-term and are not always eligible for quick sale (e.g. loans) or fire-sale
2. low equity to assets ratio (high leverage), which allows for a rapid erosion of capital in the event of increased deposit withdrawals and sale of assets at an undervalued price.

These features make the stability of banks largely dependent on the trust of their creditors. The loss of this confidence exposes banks to the phenomenon of bank run, i.e. mass withdrawals of deposits and other forms of financing caused by negative information. This is due to the belief that those who postpone the withdrawal of funds may face bank insolvency and consequently incur losses.

Therefore, the essential prerequisites for the legal regulation of banking activities are to ensure the stability and security of the financial system and to protect depositors. The regulations concerning the sector security guarantees are an essential element in limiting the systemic risk of a crisis because problems of one bank can lead to a serious crisis of the entire banking sector, and consequently to disturbances in economic stability. Furthermore, another element enforcing the need to introduce banking regulations is the protection of consumers in the banking market (i.e. depositors and consumers).

The current legal framework, concerning specifically existing prudential standards at both macro and micro levels, is the CRD IV/CRRR package (Brzozowski 2014, Olszak 2016). The macro-prudential tools in the CRD IV directive include instruments that have the nature of capital buffers, i.e. systemic risk buffer, countercyclical buffer, risk of a global institution with systemic relevance, the risk of another institution with systemic relevance.

Furthermore, for macro-prudential policy purposes (relating to systemic risk), they were defined in the CRR Regulation (Fedorowicz 2014, Mikita 2013). These instruments include:

- the level of own funds,
- requirements for making information available to the public,
- liquidity requirements,
- large exposure requirements,
- exposures within the financial sector,
- the level of security buffer,
- risk weights related to economic bubbles in the real estate market.

To improve banks' short-term resilience to international market shocks, the Basel Committee on Banking Supervision (BCBS) introduced reforms under Basel III.

The CRR Regulation indicates the need for banks to maintain at an appropriate level the liquid coverage ratio (LCR), known as the short-term liquidity ratio, and the net stable funding ratio (NSFR),

a structural (long-term) liquidity standard, to effectively match the terms of bank assets and liabilities (Meskova et al. 2019).

The CRR Regulation concerning the LCR levels indicates that credit institutions were required to maintain this indicator at the level of 70% by 1 January 2016, 80% by 01 January 2017 and 100% by 1 January 2018.

LCR aims to provide banks with sufficient reserves of high-quality liquid assets to enable them to withstand a period of significant liquidity risk of 30 calendar days.

Part IV of the CRR Regulation on liquidity risk sets out the requirements that banks must meet to ensure:

- liquidity coverage: maintaining an adequate level of liquid assets, the total value of which is covered by the decreasing liquidity less its flow in extreme circumstances in order to ensure that the bank maintains an adequate level of collateral over a 30-day period.
- stable funding - ensuring the coverage of long-term liabilities through the use of a variety of instruments to provide stable funding in normal and extreme conditions.[84]

Liquid coverage ratio is expressed by the formula:

$$LCR = \frac{HQLA}{NCO}$$

where HQLA is high-quality liquid assets

and NCO denotes net cash outflows over a 30-day time period.

Based on HQLA calculations, individual asset types are assigned weights and they are larger for more liquid asset categories while the NCO means the weight of a stable liability position (Niedziółka 2015).

A bank characterized by a satisfactory level of LCR possesses unencumbered liquid assets with low credit risk of a value adequate to cover the forecasted (net) outflow of funds within 30-days period of market stress. The main purpose of such construction of the measure is to encourage banks to reconstruct the balance sheet in a way that in period of market stress allows limiting excessive burden for the central bank related to the necessity to compensate liquidity shortages (Niedziólka 2015, Meshkova 2019).

The structural liquidity standard is determined by the formula:

$$NSFR = \frac{AASF}{RASF}$$

where AASF is the amount available for stable sources of funding,

while RASF is the total of the items that need to be covered by stable sources of funding.

The objective behind the introduction of the NSFR standard was to change the structure of financing of banking activities based mainly on short-term and renewable deposits based on medium and long-term sources. The NSRF is an important measure of liquidity risk at a time when markets are reporting the need to finance the purchase of securities and decreasing liquidity of the sector (Meshkova 2019).

One of the legal acts which may have a very significant impact on the transformation of the banking sector, including the sector in Poland in particular, is the BRR Directive. As a result of post-crisis modifications of the rules governing banks' activities, they were subject to new requirements for own funds and eligible liabilities. It was introduced to provide sources of financing of the bank's losses in the event of bankruptcy (Kozińska 2018).

The RDI directive and SRMR regulation set the following objectives for restructuring and orderly liquidation of banks:

- ensuring the continuity of critical functions, defined as 'activities, services or operations that are necessary for the real economy or for financial stability duet to the size, market share, external and internal relationships, complexity or cross-border activity of the institution or group ,
- avoiding serious implications for financial stability,
- protecting public finances by minimizing public support,
- protecting depositors covered by the Deposit Guarantee Schemes Directive (DGSD) and investors covered by the Investor Compensation Schemes Directive (ICSD);
- protection of clients' funds and assets.

The BRR directive introduced a new requirement for banks in the European Union referred to as the Minimum Requirement for Own Funds and Eligible Liabilities MREL). Its purpose is to ensure reliable sources of funding for banks, whereas its design (making its level dependent on the level of risk-weighted assets and balance sheet total) is similar to capital adequacy requirements. However, the need to meet the MREL requirements will result in changes to the business model (e.g. restructuring of operations to reduce the balance sheet total or the value of risk-weighted assets) or issuing new securities which will affect the banks operating costs (Kozińska 2018).

Analysis of the degree of development of the banking sector in Poland against the background of selected countries.

When assessing the level of development of the banking sector, the degree of financial intermediation should also be assessed. Its level determines the stability of the banking sector and allows for the identification of the banking system model. The banking system, together with insurance institutions, investment funds, pension funds, and leasing, factoring, loan and brokerage companies, form a financial system. Its development is evidenced by a basic indicator measuring the total assets of the financial system in relation to GDP. Table 1 shows the level of this ratio in the countries of Central and Eastern Europe against the background of the eurozone. These data indicate that Eastern European countries are characterized by a much lower level of development than in the eurozone. However, significant differences can also be observed among the countries of Eastern Europe. Undoubtedly, the most developed financial system is observed in the Czech Republic, whereas in other countries of the region, the differences are not that significant. On the positive side, the assets of the financial system are increasing steadily in all countries, but compared to developed countries, this level remains low. The analysis of the development of the banking system indicates similar relationships. Furthermore, it should be stressed that an excessive ratio of financial assets to GDP may result in an increase in systemic risk and materialization in times of economic downturn. However, the development of financial systems, especially in Hungary and the Czech Republic, is still low.

Table 1 : Assets of the financial system in relation to GDP in selected countries and eurozone.

	2015	2016	2017	2018
Poland	128.6	133	132.1	128.7
Czech Republic	153.7	161.7	168	171.8
Slovakia	120.3	124.3	126.8	125.8
Hungary	131.4	130.9	128.4	132.2
Eurozone	482.7	487.2	478.2	466

Source: Authors own elaboration based on: Raport o sytuacji banków, Urząd Komisji Nadzoru Finansowego Warszawa, 2019

The eurozone has a much higher level of development than the banking systems of Central and Eastern European countries. In 2016-2018, the level of assets of the banking system in relation to GDP in the eurozone ranged from 290% to 260% (table 2). Against this background, the banking systems of Poland, the Czech Republic and Hungary are much less developed. It should be stressed that the assets of the Czech banking system reached the level of almost 138% in 2018 whereas in the Polish system, this value was ca. 90%. Therefore, the Czech banking system (and the financial system) is relatively better developed than in countries such as Poland or Hungary. Substantial differences are observed in the lending activity of the Czech and Hungarian banking systems. In the Czech Republic, the ratio of total loans and GDP is about 63% in 2016-2018 whereas in Hungary this was only 32%. In Poland, on the other hand, the level of this ratio was ca. 50%. Similarly, the level of deposits to GDP ratio was the highest (outside the eurozone) in the Czech Republic and lowest in Hungary. Furthermore, it can be noted that in Poland, the Czech Republic and Hungary, the level of deposits acquired exceeds the lending activity observed in these countries. Therefore, all these countries are characterized by classic financial intermediation focused on deposit and lending activities. In the eurozone, the level of deposits acquired significantly exceeds the lending activity, which means that banks are forced to provide wholesale financing.

Table 2: Total assets of banking system, loans and deposits to GDP in selected countries.

	Total assets to GDP			Loans to GDP			Deposits to GDP		
	2016	2017	2018	2016	2017	2018	2016	2017	2018
Poland	91.7	89.4	89.2	51.2	49.4	49.6	54.9	53.4	53.6
Czech Republic	124.9	138.7	137	63.4	62.9	63.8	76.4	79.4	80.2
Hungary	97.3	95.3	100	33.2	32.1	32.4	39.4	40.1	43.1
Eurozone	288.3	271.9	266.5	90.4	88.8	87.6	84.6	84.8	85.1

Analysis of funding sources in the Polish banking system

An analysis of the funding sources of the banking system should take into account the relations between the level of lending activity and the funding sources. One of the basic indicators reflecting the stability of funding sources is the relation between the level of loans granted to the non-financial sector and the level of deposits acquired also from this sector. From the point of view of the security of the banking system, it is more advantageous for the lending activity to be fully financed by non-financial sector deposits. However, deposits from the non-financial sector are acquired for short terms, which requires their continuous rollover and does not increase the stability of the banking

system. Such a situation, especially in times of crisis, can be significant and may undermine the stability of the banking system. The option preferred especially by supervisors is a higher proportion of long-term funding sources, which include debt securities issues. However, issuing debt securities involves a much higher financing cost than deposits from the non-financial sector. Therefore, deposits from the non-financial sector remain a natural funding source for banks. Figure 1 presents the relations between the value of loans granted by the Polish banking system and the funding sources: deposits of the non-financial sector.

Fig. 1: Relation between the amount of loans to the non-financial sector and deposits in polish banking sector.

Source: Authors own elaboration based on: Raport o sytuacji banków, Urząd Komisji Nadzoru Finansowego Warszawa, 2018

Between 2016 and 2019, the level of this index remained well below 1. This seems to be an advantageous tendency since the banking sector, on the one hand, is not forced to raise more expensive capital from the wholesale market but, on the other hand, such a situation increases the risk of the term mismatch. Furthermore, this means that the Polish banking sector still has significant potential to increase lending activity. Against the background of aggregated data for the banking sector, the level of this indicator for the 3 largest banks in Poland was also analyzed. These data are presented in Figure 2. The analysis of the figure reveals that in the case of the largest Polish commercial banks, the scope of the gap is already much smaller, but it remains below 100%. Therefore, even the biggest banks in Poland such as PKO BP SA, PKO SA and Santander Bank Polska SA do not use their credit potential.

Fig. 2: Relation between the amount of loans to the non-financial sector and deposits in PKO BP SA, PKO SA and Santander Bank Polska SA.

Source: Authors own elaboration based on: Consolidated financial statements of the PKO Bank Polski SA Group, Bank Pekao S.A. Group and Annual report of Santander Bank Polska for 2019

One of the key determinants of the high degree of risk in banking activity is a strong mismatch between the structure of loans and the corresponding sources of financing. As mentioned above, lending activity is mainly financed by non-financial sector deposits and their stability is determined by maturity. The analysis of the structure of the mismatch between lending activities and their sources of financing shows the level of risk and potential directions for policy change. Table 3 shows the term structure of assets and liabilities of the Polish banking sector. Data contained in the table indicate that almost 58% of the value of assets is financed by liabilities with a term not exceeding 1 month and 75% finance liabilities up to 1 year. On the other hand, loan maturities over 1 year represent as much as 64% of total assets, which means that they require long-term funding sources. As shown in Table 3, long-term liabilities account for approximately 15% of the value of liabilities (of which 10% are equities). For this reason, even long-term loans are financed by deposits with much shorter terms. This phenomenon seems to be safe because, according to the deposit settlement rule, savings accounts (which are not assigned a maturity date) can be treated as a long-term source of financing but only until the macroeconomic situation is stable. In a crisis, a massive withdrawal of deposits may destabilize the banking sector.

Table 3: The term structure of assets and liabilities Polish banking sector (30 June 2019)

	No stated maturity	Own capital	=< 1 month	> 1 month =< 3 months	> 3 months =< 1 year	> 1 year =< 5 years	> 5 years
liabilities	37.1%	10.9%	20.1%	7.9%	10.1%	8.2%	5.8%
assets	13.4%		2.7%	10.3%	31.9%	28.3%	35.1%

Source: Authors own elaboration based on: Raport o stabilności systemu finansowego, Departament Stabilności Finansowej NBP, Warszawa, grudzień 2019

The type and the term structure of the bank's liabilities is important for the stability of both the individual institution and the banking sector as a whole. The source of risk is not only the term mismatch but also the lack of long-term sources of financing for the bank (which is compensated by savings and settlement accounts). These elements can affect primarily the level of liquidity of the bank, the contagion risk, the systemic risk, and, consequently, the failure of the banking system or its essential part. The experience of the recent crisis has demonstrated that the problem of securing banks' liquidity requires institutional solutions that focus on the requirements of the LCR and NSFR indices. It is the NSFR measure that requires changes in the structure of liabilities since it forces banks to match the risk of assets with the stability of their funding sources. Furthermore, the budgets of countries, mainly those highly developed after the financial crisis, have experienced the necessity of a bailout for the banking sector on an almost massive scale. For this reason, the bank supervisors introduced a remedy to cover possible losses due to bankruptcy by the banks themselves. This mainly concerns the MREL requirements, which aim to issue debt considered in this case as long-term funding sources. Nevertheless, the cost of introducing these capital requirements remains a major problem, which may result in an excessive burden on the banking system. The low level of development of the financial system in Poland, including the debt securities market, may significantly hinder the issue of qualified liabilities whereas the potential directing of issues to global markets will increase the cost of financing. The issue of debt securities that may be annulled will also require higher costs to encourage potential investors.

Conclusions

The experience of the crisis has shown that the materialization of systemic risk is a real threat. To prevent it, regulations that focus on the appropriate relationship between the sources of finance (including capital requirements) and the lending activity are introduced. In countries such as Poland, where the banking system performs traditional financial intermediation functions, lending activity is fully financed by non-financial sector deposits and the financial system is not highly developed, the burden of changes in the structure of funding sources may be excessive. However, maintaining a

structure of liabilities with long-term sources that account for ca. 5% requires changes in the financial policies of banks.

Abstract

The development of information and telecommunications technologies is extremely fast. Public institutions are adapting to the growing level of computerization of society and management in order to increase the efficiency of operations and improve the quality of services rendered. Electronic administration is part of the information society. Enabling access to public administration services contributes to its development as a whole. The purpose of the article is to present the implementation of the state computerization plan in the years 2016–2020, which is a response to the significant increase in social computerization and expectations of public administration. Presented results of research carried out by the Central Statistical Office on social informatization, transport and administration. The applications discussed are the implemented innovations in public e-services and human resource management.

Keywords: e-governance, ICT, innovations in public administration.

Computerization of society, economy and the State

The rapid development of information and telecommunications technologies is accompanied by an equally rapid increase in the IT competences of the society and the widespread use of ICT (from Information and Communication Technologies, a concept covering a wide range of all technologies enabling manipulation and sending information).

The definition of ICT is contained in the glossary of transport development strategies by the Ministry of Transport, Construction and Maritime Economy until 2020, and reads as follows: "ICT Technology An abbreviation of Information and Communication Technologies. The concept of ICT covers a wide range of all technologies that enable information to be manipulated and transmitted. The conceptual scope of ICT includes all communication media (Internet, wireless networks, bluetooth networks, landline, cellular and satellite telephones, sound and image communication technologies, radio, television, etc.) and media enabling the recording of information (portable memory, hard drives, CD / DVD discs, tapes, etc.) as well as equipment enabling information processing (personal computers, servers, clusters, computer networks, etc.).

Poland is getting closer to the results of other European Union countries when it comes to access and use of the Internet, although it still ranks in the last five. The survey conducted by the Central Statistical Office shows that in 2019, at least one computer at home was owned by 83.1% of households with at least one person aged 16-74. This ratio is steadily increasing year by year, but at a slower pace; compared to the previous year, it increased by 0.4 pp (in 2015 it was 77.9%).

In recent years, the share of households with an internet connection has also been growing. In 2015, 75% of households had access to the Internet at home, and in 2019 86.7% of households (2.5 percentage points more than in 2018), including as much as 83% having a broadband connection.

The concept of using e-government services includes, among others use of websites regarding civic obligations (e.g. tax returns, change of residence), rights (e.g. social assistance), official documents (e.g. ID cards, birth certificates), public educational services (e.g. public libraries, information and recruitment to public schools or universities), public health services (e.g. public services, hospitals); excluding handwritten emails. In 2019, people using public administration services over the internet in the last 12 months constituted over 40% of the population of people aged 16-74. Every year in recent years, the group of people who use the option to download forms and return completed ones has been growing. In 2019, the percentage of people downloading forms is 24.6% and increased by 2.5 pp annually, and those sending 31.4%, an increase of 6.8 pp (GUS). The percentage of people seeking information on public administration websites is 24.9%.

The Ministry of Digitization has commissioned a report on the opinions of people using the Internet about the quality of electronic services. 4,800 Internet users were surveyed, divided into 3 types, in terms of e-government services and services. Extracted users using - using these services provided and confidently (25%), as well as unconvinced users who have already gained experience in this topic, but are not always available, must be included in the required effect (29%), they are supported 54 %. A large proportion of the respondents, to the inexperienced handled - prefer personal contact, are not subject to e-government experience, but opportunities for using these services in the future are often rejected (46%).

The knowledge of services provided by e-administration is growing from year to year, 60% of respondents know ePUAP platform, 48% trusted profile, and citizen.gov.pl 47%. The biznes.gov.pl and danepubliczne.gov.pl websites are known for fewer international transactions - 40% and 25%, respectively. The ZUS electronic services platform is known by 66% of respondents, and the Electronic Land and Mortgage Register - 45%.

The most frequently visited websites of offices is obtaining address and contact data as well as information about additional devices of the institution. In recent years, the percentage of people meeting data and reports has increased. Among the public services of public administration, the analysis of main interests enjoys searching information on public administration websites.

The most important matters that respondents use to settle over the internet are issued / exchanged documents, and also include health-related issues. In recent years, the entire steady increase in the number of documents that have an impact on the operation of the e-Declarations service.

The use of information and communication technologies in enterprises necessarily associated with equipping enterprises with computers. Their widespread use means that the indicator showing the use of computers in companies has been used at a similar and consistent high level for several years. In 2019, the percentage of enterprises using computers was 96.8% (in 2015 it was 94%). Already in the years 2011–2015 100% of large companies employing 250 and more people used computers. The dynamic increase in the use of the Internet in business includes its important feature, such as: no bureaucratic restrictions, cooperation opportunities for specialists, global reach and widespread use. Thanks to this, the internet has become a business tool. Increasing interested service companies enjoy cloud computing. Cloud computing is understood to mean that you use scalable ICT services via the Internet. Services may include access to software, use of computing power, and data storage. The following services: - are provided with the services of suppliers' servers; - they can be scalable up or down (you can scale, for example, users, or the amount of data stored); - they can be changed or adapted for On-demand self-service, i.e. without the intervention of service providers; - they may be subject to payment methods, such as a subscription or a flexible payment adapted to the quantity and options of services purchased (Ministry of Digitization, 2016). The biggest benefits of using clouds are:

• saving financial resources,
• smaller needs for office space
• limiting the number of people involved in IT support in the company.

In 2019, 17.5% of enterprises used paid cloud services, i.e. by 6.0 pp. more than in 2018. Among the services offered in the cloud computing function, popularity of e-mail services (e-mail) - 12.9% of enterprises (by 5.2 percentage points. More than a year ago). Enterprises using paid cloud services by various services (in% of all enterprises).

The use of electronic sales is increasing. In 2018, 15.7% of enterprises received orders for products electronically, with 11.3% comparing sales via a website or mobile application, 6.4% - via an external online trading platform, 4.3% - via EDI messages. Enterprises also covered with open public data - data of institutions and offices made available to interested parties for use and application for any purpose. In 2018, 16.9% of companies used open public data, with data on the list of data on business and business activity most frequently searched for (15.1%). In order to protect the ICT infrastructure, the availability of available services is implemented with various measures and methods that eliminate various threats appearing on the network. In 2019, 87.2% of enterprises used ICT security measures. The most-used security services and software updates, and strong password authentication (80.8% and 76.4%, respectively). Among the problems that occurred in connection with the occurrence of ICT security safety incidents, the availability of indications available for impossible use with ICT resources, e.g. due to DoS attacks, ransomware, as well as destruction or damage of data, e.g. due to taking into account malicious activity.

There is also a growing use of robots in various operations. In 2019, 7.5% of enterprises used robots in their operations, including industrial robots - 5.7%, and service works - 2.9%. The highest percentage of enterprises using robots was recorded among the most-used - 28.4%. The interest of these companies focused mainly on industrial robots (25.3%) and less often on service works (8.1%).

Another symptom of advanced ICT in the economy is being used with social media as business tools. Over 20% of enterprises in Poland used in 2015 available on one of the social media. Include classic sizes, preferably large companies (49.4%), taken into account the type of business - companies from the information and communication section (61.3%). Social networking sites were the most popular tools, they are divided into size classes and operate their business.

Entrepreneurs are eager to use e-government services. The option of completing and sending documents online saves time, and information on public administration websites is available to track changes in regulations. The percentage of users using the Internet in relations with public administration successively used - 90% in 2012, 92% in 2015, 95% in 2020 (source CSO).

E - governance

Innovation is purposeful and benefits from changes in public services offered by the administration. It may concern a new service, modified services or new solutions used for the first time in a given institution. Innovation in the public announcement of Mikołajczyk, implementation of a new product, service, process, new strategy or changes in organization or relations with the environment (Mikołajczyk 2013, p. 96). The goal of innovation is to improve public administration and / or increase services related to activities for the benefit of applicants and activities (Krawczyk-Sokołowska I., 2013). E-services are key to the quality assessment, availability and functions of public services. Development of administration services in Poland at three levels: in the register of administrative offices, in the scope of cooperation of offices and enterprises, and between offices and citizens (Kobylińska 2015, p. 148).

E-governance for IT applications in public administration, in the scope of improving the quality of services rendered for administration and management. It is "a continuous process of improving the quality of governance and service services through integrated external and external relations with portable internet and communication devices. External relations to the office-citizen, office-business entity and office-service provider relationships include various relationships between outstanding office-office and office-staff. The purpose of creating e-administration is the effective operation of public administration in the field of services. E-administration is to simplify the handling of official matters and the available downloading of information about them. The adopted form allows for

gathering in one place extensive to various public administration units and making their procedures available on the Internet " (Wikipedia). E-governance is the application of information and communication technology (ICT) for delivering government services, exchange of information, communication transactions, integration of various stand-alone systems between government to citizen (G2C), government-to-business (G2B), government-to-government (G2G), government-to-employees (G2E) as well as back-office processes and interactions within the entire government framework.(Saugata, B., Masud, R.R. 2007). Implementing E-Governance Using OECD Model(Modified) and Gartner Model (Modified) Upon Agriculture of Bangladesh. IEEE. 1-4244-1551-9/07. Through e-governance, government services are made available to citizens in a convenient, efficient, and transparent manner. The three main target groups that can be distinguished in governance concepts are government, citizens, and businesses/interest groups. In e-governance, there are no distinct boundaries (Garson, D.G. 2006).

In Europe, for the first time, e-government began to be talked about in 1994 after the publication of the Europe and public global information by the publication page. Recommendations to the Council of Europe, in which the directions of development of the information society in Europe were signaled. The beginning of e-administration in Poland is the year 2000, when the Scientific Research Committee published the Society of global information in the general conditions of Poland to the European Union. In the same year, the Sejm of the Republic of Poland adopted a resolution on the construction of a basic information forum, and in 2001 adopted bills that were friendly to partners in the implementation of this project: the act on access to public information and the act on electronic signature. In the same year, a document entitled: ePoland was prepared. Action plan for the development of the information society in Poland for 2001-2006, which outlines an action plan for the development of the information society in Poland. On its basis, he created the "Polish Gateway" project - a central IT system, available, available to citizens and business entities related to the formalities for using electronic devices. The project has not yet been fully implemented. In 2008, the government adopted the strategy for the development of the information society in Poland until 2013, which is associated with the strategic document creating the framework for the development of the information society in Poland, including e-administration. According to Eugeniusz Bojanowski, e-administration is "public administration using information and telecommunications technologies in the operation of public services, aimed at improving the quality of services provided by administration.

The use of information and communication technologies in public administration is still a challenge, despite the fact that the level of development of public e-administration in Poland is successively subject to. Research offered by the EU offer for the growing distance between the spread of broadband internet and users of administration services in Poland. Broadband units with global computer support is a mandatory condition for the existence of e-government. Widely available universal access to the network is connected to the Internet using mobile technologies. In Poland, in 2016-2017 the most commonly used Internet access connections among public administration units are available through connections with DSL technology (76.4% and 75.3% of the number of these units, respectively), and the least often - service via a mobile narrowband connection (11.3% and 11.9%) (GUS, 2018).

Despite the dynamic development of mobile technologies, the scale of disseminating Internet access in public administration is unattainable for its maximum capabilities. This is due to the function of inhibiting the development of this method of connecting with results. Half of the surveyed public administration units not reporting problems limiting or managing access to mobile Internet access (49.6% in 2016 and 50.9% in 2017).

Currently, many e-services are available for public administration connections, including citizenship, the labor market, health insurance, the judiciary, education and culture. The most important for society and management include:

- free Trusted Profile, available confirming the identity of customers in electronic contacts with the administration;
- access to the National Court Register (KRS) throughout the country;
- access to information from the Court and Economic Monitor;
- access to Land and Mortgage Registers;

- services for the unemployed - searching the central database of job offers in Poland and abroad (www.psz.praca.gov.pl, www.eures.praca.gov.pl); online registration of the unemployed;
- health care services; eWUŚ - electronic verification of the entitlements of beneficiaries; ZIP - Integrated Patient's Guide (access to information on healthcare services provided and the amount of expenditure spent on financing those covered);
- access to e-services for organizations through garden services and the ePUAP platform (eg, adding to the voter list, submitting an application for an ID card, etc.);
- e-Declarations - submitting tax declarations for income tax, tax on services and services, inheritance and donation tax and tax on civil law operations;
- customs service - including Possible access to transactions and settlements with electronic handling of transactions with foreign trade in goods, in transit and trade in excise goods;
- e-services for people running a business (CEIDG); handling identification reports (for issuing NIP) or update reports referred to in the Act on the principles of recording and identifying taxpayers and payers; servicing reports submitted to the official REGON register, including the assignment of a REGON number; handling reports submitted to heads of tax offices submitted in the scope of registration or changes to registration data in the use of CRP KEP.
- electronic checking of the status of implementation of a passport submitted by citizenship; access to spatial data - geoportal.gov.pl, access to administration (including rescue services), services and services for spatial data using e-services and mobile devices;
- shared results regarding statistical information - CSO Information Portal (PI GUS);
- handling calls to the emergency number 112 (including the location of the places to report);
- • access to databases on the socio-economic, demographic, social situation and the state of the environment for voivodships, poviats and communes;
- • access to cultural heritage resources (www.nina.gov.pl, http://www.nac.gov.pl).

For several years, special emphasis has been put on the operation of operations that will improve the efficiency of public administration due to the widespread implementation of the electronic device management service. This way is faster and cheaper than traditional, extending the clerk's work efficiency and the number of full-time jobs enables customer service. The increasingly widespread access to the network makes this tool very popular when using spread functions by business functions and activities. Banks which offer services of accessing our services via the network have been noticed as the first advantages of the Internet. The same thing awaits public administration, a sphere more resistant to changes. Increased costs, as well as reducing the efficiency of traditional administration, that you are looking for new, cheaper and more efficient tools for carrying out tasks. (Zalewska-Bochenko, 2017).

The greatest benefits resulting from the use of e-administration services indicated by the offices are shortening the time of providing services, increasing the number of services provided by electronic devices, eliminating the use of services by clients data that are already in official resources, as well as removing customer service procedures. The largest selection of benefits, which was an increase in customer satisfaction with service, a statement based on research carried out by the office or on its behalf (4.5%) (Rozkuta D., 2012).

Over 40% of the surveyed officials used the electronic document management system, almost three quarters of unfavorable plans planned in the next 12 months to implement such a system. Electronic documentation management systems do not replace a uniform paper size, often just publish it. In addition, 37% of government administration offices and only 4% of local government administration offices declare that electronic documentation management is supported for them. The main problem in effective communication with the office by electronic means is the lack of a common application identification system.
The ePUAP Trusted Profile performs this role only to a broader extent, but encourage it to use a successive application. It is also worth considering large important forms of authentication, available in the form of an electronic signature of tax returns (Kozioł G., 2014). The popularity and reliability of this solution are associated with the use of usage and security relationships. In order to meet the goals set at the service level, Poland defined the development plans in the field of administration. The basic goal of the strategy is developed by the state thanks to the skills and intensive use of information and

communication technologies for the development of the country. One of the strategic ones is the preparation of Digital Poland. Its goal in the 2020 perspective, detailed in the National Development Strategy 2020 (SRK2020), as an objective indicating social and institutional activities that require support for faster and sustainable development of the country and improvement of the life of the population.

The Ministry of Digitization based on analyzes of the performance of tasks under the financial perspectives 2007–2013 (7. Priority Axis Innovative Economy) in the field of e-administration, identified many problems regarding the impact on the design processes and effects of IT systems by the administration. The greatest beauty was poorly prepared by the administration to implement projects, to take over activities related to the substantive and organizational implementation of projects and the lack of a coherent concept of the application and maintenance of created systems. There was no comprehensive, strategic management of administration development, cooperation and construction of systems not cooperating with each other and duplication of activities undertaken under various projects.

Based on the identified problems developed, the integrated state information program, which aims to increase Polish policy by developing electronic service services and improving business conditions. The integrated state computerization program is an executive document for the development strategy, i.e. the Efficient State 2020 strategy. A document that takes into account the important role in planning activities co-financed by the European Union in the business perspective for 2014-2020. The program is included in the area prepared by the Ministry of Digitization, the strategic document Paper Policy on the development of Poland's development by 2020 and the Digital Poland Operational Program. The priorities of the Minister of Digitization should be rationalized from the point of view of finance and centralization of the ICT systems created by the administration, assuming that the citizen is covered by the use of various administrative activities (MoD 2016).

The basic criteria and development directions specified in the operational strategy are concentrated in five basic principles:

- the state is to be servant to the citizens - thanks to digital technology and combine distributed functions and transform complicated procedures into coherent and simple services;
- access to networks and public services must be secure for data and transactions involving the comparison of data types on the network;
- acceleration of the development of modern telecommunications infrastructure for the implementation of e-administration, social and activities;
- current, available access to data collected by public services;
- a list of compatible administration services, effective use of the benefits of digitization and competing in the global market.

The goal of the program is to increase the use of application and communication technologies in the economy, improve business operations and increase customer satisfaction and services in the field of quality and speed of operation with administration. The program of integrated creation of a coherent, logical and extensive state IT system, providing e-services at the level of coverage and services in an effective manner in terms of quality and cost. It is to take into account cooperation and new ICT systems of public administration and eliminate duplicate restrictions. The Ministry regularly monitors the percentage of citizens and users using public administration e-services and the level of user satisfaction. In the program covering four directions of intervention in which systematic actions are undertaken. Belong to them:

- open government; convey to civil society (development of information society and knowledge-based transport);
- effective and secure e-administration (designated recommendations, integration of active registers, uniform information system, consistent authentication system, electronic document management in administration);
- public e-services (citizenship, labor market, health care; justice, business and other);

- computerization of offices (management of IT services - operating standards, use of ICT, raising the competences of officials).

Successful achievement of the Program in designated directions requires the implementation of actions. They were specified in the Action Plan of the Minister of Digitization, constituting an attachment to the PZIP, which contains a schedule for the implementation of projects supporting the set goals and directions. The Ministry created the concept of the Chief National Computer Science - a set of general regulations for the computerization process. The role of the National Chief Information Technology is to centralize the ICT infrastructure and to integrate the state's ICT resources and systems. The goal is to reduce production costs and maintain IT systems. The solutions that the implementation of the integrated computerization program of the State brings with it are mutual. Expanding and facilitating access to public information, services and the quality of electronic services as well as their services for the needs of services, as well as accelerating the implementation of operations as part of proceedings involving saving time required for personal services in the office and financial finance. It should also be indicated what are available from the improvement of communication between offices, from the burdens associated with the transmission of this information, increased administrative transparency, and thus increased trust Electronic administration offering the possibility of using information, officials includes saving time, the clerk facilitates work - from charging in terms of information (Kapler M., Piersiala L., 2014).

Innovations in management of human resources in public administration

The public service is characterized by a large number of intangible assets and two-way, simultaneous involvement in factors, i.e. officials and petitioners. Account should also be taken of the significant external and human impact as well as the resulting heterogeneity in the process of providing services. One of the main activities of a public organization is the effective management of human resources in the context of covered activities. Development of tax officials offered by a pro-innovative human resource management system. Building conditions for assessing the quality of services requires the support of human resources through an incentive system targeted at those particularly involved and predisposed to professional activity in public services. Effective Leadership in public administration it consists in acquiring talented and talented employees, motivated to achieve the assumed aims and results, creative and willing to take on new challenges, engaged in self-education and updating knowledge, the needs and expectations of applicants and open to cooperation.

The potential of the managerial staff in innovation management processes is also extremely important (Skowron S, Skowron Ł., 2015). It is noted that the role of officials in innovation-oriented public organizations requires a solution to reflection in policy and practice of managing tchem (Bielski I., 2007). That is why it is so important (Małysz-Bujak E., 2009): the ability to use employee services, employment planning and control, motivating and assessing work efficiency, providing feedback to employees about the results of their work, managing the remuneration system and incentive system, creating an organizational culture, using concentrated services, implementing the idea of function general business, improving the communication system with the environment, measuring the results of managers' work, linking economic efficiency with the goals and values of a public organization, extended relations between the legal and organizational sphere and social and the sphere of public management, shaping and implementing public management principles in the context of its social conditions.

Manage in public organizations, wanting to apply innovative action to change your attitude with managing the present, to create an action plan for balancing the balance between different modes of management. Experience shows that emotionality and intuition are unfortunately too rarely recognized as an important element for decision in public. Creative thinking, creativity means the ability to formulate new ideas or combine them, at the core of which used existing solutions. To process, as part of what we are dealing with accumulation of facts, model creation and analysis, maturing ideas, creating solutions and critical ideas. (Stępień J., 2001)

Impacts affecting the level of processing in public administration include:

- environment - the number of competing organizations that can be a benchmark for the success of successes or failures, public service applicants;
- organization culture;
- organization climate;
- cosideration of organization;
- competitive strategies;
- measures to improve work efficiency;
- work planning;
- different options;
- Human Resources management;
- research and development.

It is noted that the above factors must interact with innovation in public administration it proceeded in a planned, organized way and without agreeing on complications.

Conclusion

The digitization of services related to the service is necessary in the context of the social computerization and activities that have been growing in recent years, and in view of the expectations of public administration. It is necessary to constantly improve and introduce changes in the computerization of the state to create a coherent and effective state information system, which is the basic basic efficiency of e-administration. Flexibility and constant access to resources to one of the basic solutions of the modern economy, also posed for public administration. Changes in mentality and competence preparation of officials are also necessary. The simplification of procedures and transformation includes an integrated system based on paper information processing into electronic will be a significant facilitation for companies and operators, responding to their expectations towards e-administration. The strategic goal is to increase Polish development thanks to the development of electronic services, to improve the conditions for business operations and to improve services. There is also an urgent need to address potential undesirable effects of data collection, including the need to ensure data protection and privacy for all individuals in the evolution of big data and new technologies.

Abstract

In times of crisis, the whole world changes at a large scale. Consumption behaviors are swapping as well and the most normal activities become lavishness. The key to break through is the ability to adapt in an ecosystem where social distancing is imposed and economy is collapsing. Technology plays an important role in the adapting strategy and persisting unpreceded times. But how effective are the digital solutions in an industry where human interaction and mobility is mandatory and emotions play an essential part in creating the demand? The current article aims to study the extent to which digitalization can be applied and where it can be applied. Therefore, this study cannot be complete without acknowledging technological limitations and means of improvement. In any case, the new pandemic has caught the world off guard and is putting technology through a very difficult test.

Keywords: Neuromarketing, Marketing Communication, Tourism Digitalization, Covid-19,

Introduction

On the 11th of March 2020, the World Health Organization "made the assessment that Covid-19 can be characterized as a pandemic. Pandemic is not a word to use lightly or carelessly. It is a word that, if misused, can cause unreasonable fear, or unjustified acceptance that the fight is over, leading to unnecessary suffering and death". (WHO, 2020)

Once this declaration was made, the whole world has changed. In his book entitled "Thinking Fast and Slow", Daniel Kahneman (a Nobel Prize-winning psychologist) stated that our brains rely on a dual-core system to process information and make choices. He describes the first system as automatic (emotional) and the second as controlled (cognitive). These two processes can be roughly distinguished by where they occur in the brain, and together they form the backbone of our decision-making. If we understand how each system works, we can use this knowledge to make better decisions and influence the people around us.

According to Kahneman, "System 1 (thinking fast) is intuitive, automatic and generally operates below the level of our conscious awareness. It is in this subconscious setting that we undergo different affective (emotional) states, many of which motivate impulse reactions and feelings such as hunger, fear, sexual desire and pain" (Nahai, 2017).

Therefore, as a first reaction, people from everywhere around the world, regardless of culture or social status, started to shift their attention from products and services considered in a normal economic course, such as shopping and specialty goods or services, to basic products, such as non-perishable food and sanitary products.

As a result, a significant number of industries sectors have faced a negative impact. The figure below (Figure 1) shows how manufacturing and travel and transportation industries are the most affected sectors on all four dimensions: personnel, operations, supply chain and revenue.

Fig. 1: Most affected industries by covid-19

How the pandemic affected tourism

Almost in real time, after WHO declared the pandemic, people's appetite for travel decreased dramatically. According to comscore.com (Figure 2), after the 11th of March 2020, weekly visits to travel categories registered -38% for airlines, -43% for hotels and home rentals and -53% for online travel agents.

Fig. 2: Weekly visits to travel categories

Source: comscore.com

No industry has been more affected by coronavirus than the industry of making memories: tourism. As they are usually the first to feel the impact of any global crisis, tourism companies around the world have made urgent requests for help from governments.

Once the Covid-19 disease generated by the coronavirus debuted and spread, almost the whole world had to impose quarantine. In turn, quarantine greatly affected the economy, as too few companies from even fewer domains of activity could respond in time and digitalize their activity or were able to reduce the personnel to only a handful of people. As stated in Chakraborty and Maity's (1 August 2020) article, the economy of many countries is now facing the threat of high inflation and unemployment as a result of the lack of productivity brought forth by Covid-19. According to data gathered by the OECD Interim Economic Assessment (2 March 2020, cited in Chakraborty, 1 August 2020), the annual GDP growth loss will be approximately 2% for each month spent in this situation, the tourism sector will be hit among the hardest, with an output decrease of 50% or even up to 70%.

"Based on travel restrictions and an expected global recession, IATA estimates that global air transport industry revenues could fall $252 billion, 44 percent below 2019's numbers".

Fig. 3: Percentage change in revenue from 2019 to 2020

Source: nationalgeografic.com

As a component part of the market, the demand represents the desire for a certain product, doubled by the possibility and the decision to buy it. Tourist consumption represents services with tourist motivation. Thus, the result of the interaction between supply and demand. Tourist consumption has a larger scope than demand, because in the field of tourism we can also talk about self-consumption when holidays are spent in second homes or with relatives or friends (Minciu, 2004).

Faced with the exceptional circumstances, the tourism industry has reached a point of interruption of normal activity never seen before, as more and more borders are closed and more and more travel restrictions are imposed. The way the activity will be carried out throughout the rest of the year is impossible to anticipate. What we can do is look at how tourists feel about the current crisis, what the long-term impact of Covid-19 will be on them, and what new tactics will have to be applied to refresh the market.

Even in the aftermath of the pandemic, people will be skeptical of other people, and the market segment will be segmented into two more categories, those that wish to take a vacation as soon as possible, and those that would rather wait a few months for things to settle down once again. This can also be noted in Barbhuiya and Chatterjee's article (1 January 2020), in which they state that exogenous shocks can lead to stagnation and decline of the touristic destination, depending on the targeted market resilience. The study itself has concepts regarding specific events that took place in specific countries, thus making that place more inclined to be visited by a niche segment and less so by those concerned by their safety. Since Covid-19 is affecting the whole world, we can assume that the majority of people will not want to travel due to this perceived risk to their health.

Marketing strategies to revive tourism

We can assume that the best type of strategy regarding this pandemic will be adaptation, since the market change could not have been forecasted due to the unknown that is part of the human behavior regarding a pandemic, otherwise some companies might have been able to use an active strategy. The product life cycle should also be analyzed since all the products that are not considered essential will most likely reach a decline stage, regardless of the previous stage they were on before the pandemic.

Regarding the tourism sector during and after the pandemic, we can assume that it is most likely in the decline stage. A product modification strategy with reduced prices could prove useful, offering a more for less value proposition. After the quarantine ends, most people will not have enough money as they could not work, thus, at least the very first months they will keep saving money and only afterwards they might be inclined to get a vacation. But they are likely to wish to spend less money, while still being able to enjoy themselves.

Going back to the two above-mentioned segments, the more health concerned segment will most likely want a later appointment towards their preferred destination, while the other segment, which comprises of people less concerned of their health, is more prone to visit certain destinations sooner rather than later. Those two segments can be offered totally different offers, but in the same mindset of more for less, the first segment can be offered an almost VIP experience for the standard price, while the second segment can be offered additional services to the standard package, like a hot meal under x monetary units at a specific restaurant or one free spa, those services can be personalized depending on the original segmentation, due to demographics and other aspects.

The reasoning behind these offers is that those booking a later appointment may be inclined to take those offers and they will have the money for it since it will not be on the immediate term, the second segment will get the standard package at a reduced price with extra services, but in order for the short-term customers to be incentivized to visit a certain destination now rather than later, it all depends on the extra services that need to be carefully selected to get their attention.

Decrease strategy – "**Customer churn** is calculated by the number of customers who leave your company during a given time period. In a more down-to-earth sense, churn rate shows how your business is doing with keeping customers by your side" (Plaksij, 2015). In order to prevent churn tourism, agencies should give their customers reasons to stay by showing them the benefit of using their services (Plaksij, 2015).

Adaptive strategy – in order not to lose their clients or the money they already paid, the tourism agencies should adapt to the new situation and use the following ideas:

- extend the validity of holiday vouchers
- offer the same services but at another time of the year
- send offers for the areas not affected by Covid-19

Digital solutions

Taking into consideration the restrictions imposed by the quarantine, many businesses have tried to adapt and shifted to the digital environment. Schools have moved the teaching to e-learning platforms, fitness studios started training via video calls and restaurants, which were not considering home delivery before, now partnered with delivery services suppliers and take orders online. In tourism, there are suppliers that play in different industries sub-sectors: travel, leisure, entertainment, arts and culture, and hospitality.

Therefore, the touristic sector cannot be fully digitalized, and even so it would take great investment in order to do so. Some investments can be made in Virtual Reality (VR) equipment, but this will also

require the management of an application through which the consumer will be able to "visit" a specific destination.

The application itself will have various destinations through which the consumer can choose and live the experience without actually being there. Now, in order for this to work, either the application would charge a specific amount per destination, or the equipment would be used at the tourism company's headquarters for a certain amount of time, or even loaned, on the condition that it is disinfected after each use.

The application could be charging a respective amount per destination visited or even as a subscription, this way consumers who do have a Virtual Reality (VR) equipment do not have to actually visit the headquarters or subsidiaries in order to use it.

The end result is similar to the "Virtual Reality in Tourism" videos, but of higher quality, in order to immerse the customer into the touristic experience.

Two examples of this kind are VR Cities application and Google Arts & Culture application.
VR Cities uses a very similar concept to Microsoft Encarta or Google Earth, the pioneers of VR travel. This application comes with a list of most wanted cities in the world to be visited; Berlin, Hong Kong, Chicago being just a few of them. The user taps on the city he would like to virtually visit and another list of the touristic landmarks or main attractions in the chosen city will appear. The user only has to "walk through" and let himself immersed in the beauty of the landscape (Figure 4).

However, the "walk" through the city is quite limited, since the location is brought in the applications by professional cameras, the user cannot get lost among the streets or enter any shop for souvenirs.

Fig. 4: List of virtual cities and places

Source: VR Cities application

The lack of access to museums, generated by pandemic, can be fulfilled by the fast response the most famous museums had. The partnership between Google and MoMa, Van Gogh Museum, Louvre, Sorolla Museum or Musee d'Orsay. Google Arts & Culture, fulfills effectively the desire for cultural

activities (Figure 5). The masterpieces are pictured in high quality and they can be visualized for free, while at a visit to a museum there is usually an entrance fee.

Definitely the art enthusiasts will argue that the experience of living the emotion of admiring a Van Gogh, a Vermeer or a Michelangelo in reality is not the same and the smallest details cannot be seen via the app.

Fig. 6: Virtual Museums Tours and Van Gogh Museum, Netherlands

Source: Google Arts& Culture application

"People, businesses, and agencies are continuing to move to using virtual reality worlds because they are tired of traveling, have less money to spend on travel, and are realizing the power associated in these worlds. My motto is, "Essentially everything that can be done in person can be done over the Web using various technologies" (Epstein et al., 2013)".

"Digital transformation of companies involves fundamental changes in business process, including digitalizing everything that can be digitalized (Basly and Hammouda, 2020)".

Longstanding business models are affected by the digital transformation, that is why new businesses face new opportunities. Digital transformation means the use of digital technologies, which will aid in changing the business model and creating new approaches and opportunities for the creation of new added value. Despite the growth of online distribution of tourism packages and tourism offers, there is

still a significant part of untapped potential for websites and resorts. For example, AirBnb became the biggest hotel in the world without ever having to place a single brick. That is a key example of the change in the environment (Zahariev, 2019).

A responsive state should proactively develop resilience of vulnerable subjects in order to better monitor potential exploiters and equip them with more tools to avoid or resist exploitation (Fineman et al., 2017).

Digital transformation implies intelligent management of human resources, creative and innovative models for good management, creative mobile applications, an Internet of everything connected to the travel industry, big data, open data, artificial intelligence, hotel software, booking software, developed following a new principle, a new type of digital travel marketing and management and new tendencies in the communications over powerful social media platforms (Zahariev, 2019).

Conclusions and limitations

Even though technology is aiming to help the most affected industries survive during the pandemic and the financial crisis, there are limitations that cannot be ignored. While digital transformation can support the tourism sector in improving safety and security or automating processes, when it comes to experience, VR can only provide a hint, a trial of what the place looks like.

We can talk about VR as an instrument of keeping tourism customers engaged with the "product" until the pandemic passes and maybe use it in the future as a "sample" before purchasing a vacation.
"Still, there is a big gap between using virtual reality to "try before you buy" and treating virtual reality like the destination itself" (National Geographic b., 2020).

"Limited sensations are another hurdle. The videos focus on sounds and sights but cannot do much with smell, touch, or taste, and VR experiences tend to only be a few minutes long—hardly the equivalent of a two-week vacation in Spain" (National Geographic b. 2020).

Despite the fast-evolving technology trend, the experiences, the emotions and the places where the memories are born, cannot be replaced by technology.

Abstract

In literature, there has not been a known comparative study published on Nigeria and Ghana stock markets. The study is considerably important to enable a fair comparison of the level of improvement on the Ghanaian and Nigerian Stock-Exchanges. We observed market responsiveness to information. We engaged Partial Autocorrelation in testing the independence of prices. We used One-sample Kolmogorov Smirnov to investigate recognizable trends in movement of prices. Price movements were found independent in these two markets. Results of the Partial Auto Correlation's test show independent movements of prices. However, Runs and Distribution patterns display prices movement, which is not completely random. Study shows that the two markets are similar in every respect as they both exhibit independence in stock movements, show non-randomness as well as the presence of observable trends within the period under study. We conclude that no one could really draw a line of difference between the two markets.

Keywords: efficient market; stock exchange; price movement; information-efficient

Introduction

Efficient market hypothesis holds that no investor is able to sustain reaping of abnormal profits when all investors are well informed of the existence of an accruable abnormal profit at a particular segment of the market. They would all rush into such investment to reap of the profit; thereby, they increase the demand for such an investment; and thereby force out the abnormal yield.

Even though the strong form efficient market holds to the believe that no investor can earn any excess returns, the hypothesis holds that efficiency can be at its strong, semi-strong, or its weak form. It is at its strong form when no one earns any excess profit no matter the form of analysis employed, but at its weak form when some fundamental analyses enable excess returns; even if on a very short term. This implies therefore that the hypothesis asserts that excess returns can be earned on the capital market when strategies based on historical share prices are used. It implies that the hypothesis does not subscribe to the fact that technical analysis techniques will be able to consistently produce excess returns. It avers that there are no patterns to assets' prices. That is, future price movements are random; they are determined by unexpected information.

Thus, it can be said that stock market efficiency basically concerns the nexus between prices of shares and information. In the words of Markowitz, as Akinsulire (2003) puts it, the efficiency of the market can be discussed or measured in categories. In the categories are the strong-form of efficiency, the semi-strong form, and the weak-form of efficiency as Fama (1970) defines it. At the weak form, prices are random. No historical price pattern could be studied and utilized to enable abnormal profits. Daily prices are independent of one another. Future earnings cannot be predicted accurately. There is no pre-assumption of potential price rallying. Hence, one could say that market efficiency is uncertain.

Study objectives

The central aim of the study is to find out degree of proficiency that exists in the Nigeria and Ghana stock markets. The specific objective is to investigate the extent to which the movement of stock prices in the two markets depends on previous stocks' prices movements; and compare the two. Equally, study set out to examine whether successive stocks' price movements in the two markets are random. That is, it set out to determine the extent to which there are observable patterns in the movements of prices in the two stock markets.

Research hypothesis

$H0_{1:}$ Movement of prices in the two markets are not independent.
$H0_{2:}$ Movement of in both markets are not random.

Empirical Evidence

Ignited by Fama (1965)'s study of the American stock market, series of researchers have examined the efficiency of different markets, but with diverse results. For instance, Vitali and Mollah (2010) studied the random walk hypothesis on Egypt, Morocco, Kenya, Mauritius, South Africa, Tunisia and Nigeria from 1999 to 2009. Results obtained rejected the hypothesis. Only South Africa bourse proved market efficient; even at weak-form. The results suggest that prices of stocks do not fully reflect all historical info. Aga and Kocaman (2008) examined the efficiency of Istanbul stock market, with index-20, for a period of 20 years: 1986 – 2005. The analysis confirmed the existence of weak-form efficieny. That is a departure from Vitali and Mollah (2010).

Bhattacharya and Murherjee (2002) investigated the causal link between stock prices and financial market aggregates in India, using Granger causality tests. They found no causal link between stock prices and money supply, national income, nor interest rates. Moreover, they found a two-way causation between share prices and inflation. The study perceived Indian market tended towards efficiency.
Dragota et al (2009) appraised Romanian capital market. They used daily and weekly returns of 18 quoted firms. In addition, Dragota et al (2009) equally assessed daily and weekly market returns, using multiple variables ratio, and found that most of the stock prices were information efficient.

Vosvorda et al (1998) and Nwosa and Oseni (2011) could not find stock prices reflect random walk on Prague and Nigeria stock markets rerspectively. These are in tandem with the finding of Macskai and

Molnar (1996). Macskai and Molnar (1996) utilised Ljung-Box Q Statistics to test the degree of efficiency on the Budapest stock exchange, and found traders making excessively high returns.
Afego (2012) studied the Nigerian stock market, testing for random walk, using monthly index returns over 25 years (1984 - 2009). He conducted non-parametric runs. He found the market inefficient; even in the weak-form. This is contrary to the report of Ajao and Osayuwu (2012). Ajao and Osayuwu (2012) analysed efficiency of the market using all securities being traded on the stock exchange, and the month-end All Share Index of ten years (2001 - 2010). Serial Correlation technique was utilized to observe independence of price movements, the distributive pattern, and runs test for randomness. The duo found Nigeria stock market efficient; though it was at weak-form.

Olowe (1999) too analysed monthly data obtained from 59 randomly selected securities from 1981 to 1992 on the Nigerian stock exchange. Olowe (1999) found the market conformed with the weak-form efficiency. Nevertheless, Olowe doubted if the market could pass more stringent statistical tests. Apart from Olowe (1999), some other studies on the efficiency of the Nigerian stock market, Ekechi (2002), Inegbedion (2009), Aguebor et al (2010) and Rapuluchukwu (2010), averred that the Nigerian stock market is efficient in the weak-form.
Ekechi (2002), Aguebor (2010), and Inegbedion (2009) show that the Nigerian bourse was not efficient even in the weak-form. A cursory look on the reports show that all studies reporting that the Nigerian stock market is efficient in the weak-form used All Share index, while those reporting inefficiency used just samples of selected securities (Ajao and Osayuwu, 2012)

Research design

The data analysed for study were mostly sourced from internet. The publications of the Nigerian stock market, newspapers, publications of the Central Bank of Nigeria, the monthly All Share Index used were sourced from the CBNs Statistical Bulletins. The Ghana stock exchange composite index was sourced from Ghanaian stock exchange. The population of this study comprised the Nigerian and Ghanaian markets. Samples include monthly published all shares' indexes and the Ghana composite index. The NSE All-Shares Index and the Ghanaian Stock Exchange Composite Index depict the behaviours of ordinary shares that are quoted on the Exchanges. These provide a complete representation of the market. The market index indicate direction of the markets and capitulates the scope of their movements.

The Nigerian Stock Exchange's All-Shares' Index and the Ghana Stock Exchange's Composite Index are used as performance indicators for study. Two are the aggregations of shares' price gains and losses on trading. They constitute appropriate measures of stock price changes; required to determine market efficiency.

Model specification

$$ri=\frac{n\sum xy-\sum x\sum y}{\sqrt{[n\sum xi^2-(\sum xi)^2][n\sum yi^2-(\sum yi)^2]}}$$

$$Q = n\sum ri^2$$

Where:

Q	=	Box-pierce statistic
ri	=	serial correlation coefficient (the ith lag)
n	=	sample size (financial security)

The Box-pierce statistics follow chi-square distribution with 'm' degree of freedom; 'm' is the number of lags.

Test for randomness of prices

$$Z=\frac{R+0.5+R;}{SR}$$

Where:

R = number of runs (stock price changes)
R = (2N1N2/N1+N2) **+ 1 = me**an number of price changes
SR = 2N1N1 (2N1N2 - N1 – N2) / (N1+N2) 2(N1+N2 - 1)

Where:

N1 = number of positive price changes
N2 = number of negative price changes
SR = standard deviation of the distribution (number of price changes)

Data analysis

We examined the unit root of data and obtained the following result. We used Augmented Dickey Fuller for the examination. We adjusted data for stationarity by integrating once, due to failure of Augmented Dickey Fuller stationarity test. It was after the adjustment that we conducted the analysis.

Table A. All Share Index (Nigeria). Month ends (2004-2014)

	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEPT	OCT	NOV	DEC
2004	22,712.9	24,797.40	22,896.40	25,793.00	27,730.80	28,887.40	27,061.10	23,774.30	22,739.70	23,354.80	23,270.50	23,844.50

Unit root test

Table B. Result of the unit root test

Augmented Dickey Fuller (ADF)					
Variables		Test Statistic	Probability	Status	Remark
ASI	1st Difference	-4.180128	0.0010	1(*1*)	Stationary
GSE-CI	1st Difference	-9.842816	0.0000	1(*1*)	Stationary

On the table above, the ADF test shows that both the ASI and GSE-CI are stationary at first difference. Thus, the 1st difference of the variables are used to perform the analysis to obtain normal results.

Test of hypotheses

We used Partial Autocorrelation to test for individuality of prices in the market. Equally, we used Ljung-Box and the Box-Pierce to test for the significance of autocorrelation coefficients. Based on the outcomes of the series of tests conducted we arrive at the following conclusions.

Hypothesis 1**:** The movement of prices in the market is not independent.

Test Statistics: (i) Partial Autocorrelation test (PACF)
(ii) Autocorrelation test (ACF).

Table C: Result of Partial Autocorrelations

Lag	Partial Autocorrelation	Std. error
1	.153	.087
2	.194	.087
3	.204	.087
4	-.173	.087
5	.086	.087
6	-.040	.087
7	.123	.087
8	-.136	.087
9	.132	.087
10	.051	.087
11	-.107	.087
12	-.029	.087

Fig. 1: Partial Autocorrelation 2 Standard Error Test

As seen in Fig.1, lags 2 and 3 of these 12 lags violate the two standard error limits; lag 4 is only just within. All the remaining 9 lags fall inside the range. Thus, a significant percentage of the 12 lags (above 75%) are within the two standard errors limit. Hence, we accept the null hypothesis. We conclude at 95% confidence level that movement of prices in the stock market is independent.

Table D. Autocorrelations

Lag	Autocorrelation	Std. error[a]	Box-Ljung Statistic			
			Value	Df	Sig.[b]	Remark
1	.153	.086	3.154	1	.0.76	Not significant
2	.213	.086	9.255	2	.0.10	Significant
3	.248	.086	17.623	3	.001	Significant
4	-.086	.085	18.254	4	.001	Significant
5	.136	.085	20.819	5	.001	Significant
6	-.004	.085	20.821	6	.002	Significant
7	.084	.084	21.821	7	.003	Significant
8	-.035	.084	21.999	8	.005	Significant
9	.079	.084	22.893	9	.006	Significant
10	112	.083	24.709	10	.006	Significant
11	-.108	.083	26.416	11	.006	Significant
12	.064	.083	27.018	12	.008	Significant

The Box-Ljung statistics as contained in the Autocorrelation test show that only the 1st lag is not significant. Results of the Box-Pierce Q statistics show that the overall significance of the test is poor; the tabulated value of the Box-pierce Q is higher than the calculated value. Hence, we accept null hypothesis. Therefore, it is reasonable to conclude that at 95% confidence level, the changes in prices of stocks traded on the floor of the Stock Exchange are independent. This result is consistent with that of the partial autocorrelation test.

$Q = n\sum r_i^2$ where n is the sample size

What informs the use of this statistics is that high sample autocorrelations lead to large values of Q. If the calculated value of Q exceeds the appropriate value in a χ^2 table, we reject the null hypothesis. This implies the acceptance of the alternative hypothesis; that at the minimum, one autocorrelation is not zero.

Table E: Box-pierce statistics

0.153^2	0.023409
0.213^2	0.045369
0.248^2	0.061504
-0.086^2	-0.007396
0.136^2	0.018496
-0.004^2	-0.000016
0.084^2	0.007056
-0.035^2	-0.001225
0.079^2	0.006241
0.112^2	0.012544
-0.108^2	-0.011664
0.064^2	0.004096
	$^{\Sigma}$=0.158414

Q = 0.158414 × 132
Q = 20.911
Box-pierce statistic$\sim\chi^2_{\propto,\,m}$
$\propto$ = 0.05
Bp$\sim\chi^2_{0.05}$, 12 = 21.026
Bp > $\chi^2_{\propto}$, m
Hence, we admit null hypothesis; since Q > Bp
This implies that changes in prices of stocks are dependent. Hence, investors can predict future price movement from past stock prices. Hence, the Nigerian stock market lacks efficiency; even at the weak-form.

Test for randomness

Hypothesis 2**:** The movement of prices not random.

Table F : Runs test

	VAR00001
Test value	31568.9164
Cases< Test value	80
Cases>= Test value	52
Total Cases	132

Number of runs	4
Z	-10.988
Asymp.Sig.(2-tailed)	.000

As shown in Table F the calculated value of the Z-statistic is -10.988 with an associated asymptotic significance (2-tailed probability of 0.000). Therefore, the null hypothesis is accepted at 1% level. Thus, at 99% confidence level, we conclude that the stock price movement in the stock market is not random.

Although the results from this study contradict few previous studies already done on the Nigerian Stock Exchange, which have employed the Runs test, they are consistent with many others like Appiah-Kusi and Menyah (2003), Smith (2008), Emenike (2008), and Mollah and Vitali (2011). Given that African Stock Markets, including the Nigerian stock exchange, are bothered by problems of thin trading, lack of market transparency and poor regulatory standards (Mlambo and Biekpe, 2005). Therefore, the results reported in this study are not inconsistent with expectations.

Distribution patterns

The normal curve in Fig. 2 shows that the distribution Patterns is asymmetrical, since the shape of the curve to the left of the line of symmetry is conspicuously different from the shape to the right of the line of symmetry. The implication is that the distribution pattern of the Stock price movement is not Random. This is consistent with the result of the Runs test earlier carried out.

Test for observable trend

Hypothesis 3: There is no observable trend in the movement of stock prices in the Nigerian stock market. This test was carried out using the one-sample Kolmogorov smirnov test.

.

Table G. Result of the One-Sample Kolmogorov Smirnov test

N		132
Normal Parameters[a],[b]	Mean	31568.9164
	Std. Deviation	11177.58123
Most Extreme Differences	Absolute	.217
	Positive	.217
	Negative	-.147
Kolmogorov-smirnov Z		2.497
Asymp.Sig.(2-tailed)		.000

One-sample Kolmogorov-Smirnov test

As shown in Table G, Kolmogorov-Smirnov calculated value of the Kolmogorov-Smirnov Z is 2.496 with an associated asymptotic significance (2-tailed probability of 0.000). as a result of this, the null

hypothesis is rejected. The implication is that we conclude at the 99% confidence level that there is an observable trend in the pattern of price movement in the market.

Discussion of findings relative to Nigerian Stock Exchange

The results of the autocorrelation and partial autocorrelation tests indicate that the movement of stock prices in the Nigerian stock market is independent. This implies it is impossible for investors to use previous stock price movements to predict potential prices or use today's stock price movement to predict future prices. Contrarily, the results of the runs test and distribution patterns of price changes show that price movement is not random; thus signalling that the Nigerian stock market is not efficient, even in the weak form. In other words, it is possible for investors to beat the market; that is, make gains on the basis of privileged information. Although this result is inconsistent with those of Olowe (1999) and Rapuluchukwu (2010); it is consistent with the findings of Ekechi (2002) and Inegbedion (2009).

Test of hypotheses for the Ghana stock market

The same tests that was carried out for the Nigerian bourse was also carried out for the Ghana Stock Market. The aim is to promote fair comparison of the two markets.

Table H. Data presentation [Ghanaian Composite Index (GSE-CI)] Months end (2004-2014)

11	-.051	.087
12	-.032	.087

Fig 3: Partial Autocorrelation 2 Standard Error Test

Result in Fig 3 shows that out of the 12lags, none of them violate the two standard error limits, but are all within the range. The implication of this is that the degree of independence of the stock price movement is maximal. Hence, we accept null hypothesis. We therefore conclude that at the 95% confidence level the movement of prices in the Ghana Stock Exchange is independent.

Table J. Result of the Auto correlation test

Lag	Autocorrelation	Std. Error[a]	Box-Ljung statistic			
			Value	Df	Sig.[b]	Remark

-0.077^2	-0.005929
-0.065^2	-0.004225
	$\sum$ =0.002092

Q=0.002092× 132
Q=0.2761
Box-pierce statistic~$\chi^2_{\propto,\,m}$
$\propto$= 0.05
Bp~$\chi^2_{0.05}$, 12=21.026
Bp> $\chi^2_{\propto}$, m

The Box-Ljung statistics from the Autocorrelation test shows that all the lags are not significant. Results of the Box-Pierce Q statistic shows that the overall significance of the Autocorrelation test is poor since the calculated value of the Box-pierce Q is less than the tabulated value. Hence, we reject the null hypothesis. In other words, it is reasonable to conclude that at 95% confidence level, the changes in prices of stocks traded in Ghanaian Stock market are independent.

Table L. Runs test

	VAR00001
Test value	4721.8402
Cases< Test value	51
Cases>= Test value	81
Total Cases	132
Number of runs	5
Z	-10.801
Asymp.Sig.(2-tailed)	.000

Table 4.12 shows the calculated value of the Z-statistic is -10.801 with an associated asymptotic significance (2-tailed probability of 0.000). Consequently, the null hypothesis that the stock price changes are random is rejected at the 1% level. Thus, at the 99% confidence level, the stock price movement in the Ghanaian market is not random. This result is consistent with Magnusson and Wydick (2002). They made use of Partial Autocorrelation and runs test for randomness for a number of African markets. They find evidence of significant correlations in stock returns for Ghana, Nigeria and Zimbabwe, thus suggesting that these markets are not efficient, even at weak form.

DISTRIBUION PATTERNS

Fig

4: Distribution pattern

The normal curve in the above shows the distribution pattern is asymmetrical. This implies that the distribution pattern of the stock price movement is not random. This is consistent with the result of the Runs test earlier conducted.

Table M. Result of the One-sample Kolmogorov Smirnov test

N		132
Normal Parameters[a],[b]	Mean	4721.8402
	Std. Deviation	2801.68066
Most Extreme Differences	Absolute	.158
	Positive	.158
	Negative	-.118
Kolmogorov-smirnov Z		1.814
Asymp.Sig.(2-tailed)		.003

One-sample Kolmogorov-Smirnov test

The table above shows the calculated value of the Kolmogorov-Smirnov Z is 1.814; with an associated asymptotic significant (2-tailed probability of 0.003). Therefore, we reject the null hypothesis that there exists no observable consistent trend in the pattern of price movement. This implies, at the 99% confidence level, that there is an observable consistent trend in the Ghanaian market.

Discussion of findings for the Ghana stock market

The Ghanaian market just like the Nigerian bourse shows that the movements of prices are not independent. This means that it is possible for investors to use previous stock price movements to predict subsequent day's stock prices or use today's stock price movements to predict future prices. Furthermore, the results of the runs test and distribution patterns of the stock price changes show that the price movements are not random. This suggests that the Ghana stock market is not efficient in the weak form. That is, new information is not always diffused promptly. Therefore, it is possible for investors to make gains on the basis of privileged information. This result is consistent with Magnusson and Wydick (2002), Frimpong et al (2008), Ayentimi et al (2013) and Osei (2002).

Lastly, the one sample Kolmogorov Smirnov test for availability of trend in the pattern of stock price changes in the Ghana stock market revealed that there is a trend in the pattern of stock price movements. This means that there are short durations of bullish runs and short durations of price movements. However, even within these periods, the investors were not in a vantage position to predict stock prices with absolute certainty since the changes in the stock prices are independent. The results obtained from both the Nigerian and the Ghanaian stock markets show that they are the same in every respect as they both exhibit independence in price movements, exhibited non-randomness as well as the presence of observable trends in the movement of prices within the period under study. This shows that one could not really draw a line of difference between the two markets.

Moreover, we acknowledge the finance approved for publishing this article, which Landmark University, Nigeria supplied. It is our hope that tertiary institutions in and around Nigeria will emulate and adopt the laudable gesture.

Acknowledgement

Glory be to God for his mercies that endures. We hereby acknowledge the financial supports of the management of Landmark University, Nigeria. May the God in his mercies continue to prosper you in all your endeavours. Thanks and God bless.

Abstract

This paper proposes the model of *Exit, Voice, Loyalty*, and *Neglect* (EVLN) as a manifestation of Employees' Organizational Commitment (EOC) in responding to organizational cultures within the Indonesian public university setting. Structural equation modelling is used to fit the data provided by 150 lecturers. The best predictions are proposed for loyalty and neglect. Loyalty is expected to be found in organizations that value the organizational culture dimensions of *teamwork, respect for people, stability, attention to details* and *outcome orientation*. The proposition is expected to have important implications for practitioners attempting to improve the level of EOC of their employees which in turns to enhance the level of loyalty contributing to improvements in productivity and growth in the Indonesian public university environment.

Keywords: loyalty, neglect, employee organizational commitment (EOC), organizational culture, public sector management

Introduction

Research on organizational commitment conducted in separate Asian national cultures has shown that the meaning of commitment and predictors of commitment differ. For example, in a study of Malaysian librarian, Karim & Noor (2017) noted that 'harmony, non-aggressiveness, and a strong preference for a relationship-based orientation' were key to Malaysian values and that these values predicted AC. Similarly, in a sample of Korean workers, a warm, supportive climate positively predicted (affective) commitment (Choi *et al*., 2018). Chaudhuri & Oba (2016) found that freedom positively correlated with a commitment for Americans, but not Japanese. For Japanese, seniority positively related to commitment. This indicates that idiocentric values, such as freedom and achievement might be significant predictors of commitment in individualistic societies, whereas allocentric values, such as respect, tradition, and seniority might be important predictors of commitment in communal societies *i.e.* emphasizing relationships with others. In another psychoanalytical study on organizational commitment among Japanese employees, entitled '*Spurious Loyalty of Japanese Workers'*, Naotaka Watanabe and Kohoku-ku Takahashi (2002) show that the Japanese style of management actively promotes the employees' continuance commitment, rather than an affective commitment. Under such a system, it is very costly for workers to quit the organization they have worked for since they have almost no alternative organization to employ them in better, or at least the same, conditions. So they must remain in the company even if they no longer have any emotional attachment to it.

Cross-cultural studies of organizational commitment have been conducted consistently in many countries such as Canada, Great Britain, Belgium, Australia, Russia, South Korea, Japan, Singapore, Indonesia (e.g., Ko, Price, & Mueller, 1997; Lee, Allen, Meyer, & Rhee, 2001; Vandenberghe, 2003; Sue et al., 2009; Rajiani, 2010). With increasing globalization and awareness of cultural issues that bear on social, cognitive, and attitudinal issues in the workplace (Hofstede et al., 2010), extending research on organizational commitment to the public sector is essential. Public organizations in Indonesia are structured and run differently from their U.S. counterparts, in terms of recruitment, promotion, work environment, and political expectations (Abbas et al., 2018). As such, public university lecturers in Indonesia may have different views and motivations toward their job. Besides, the cultural orientations of the two countries are entirely dissimilar. Given these differences, it is possible that the factors that influence the organizational commitment of employees would be different in Indonesia.

Since the crucial test of commitment should be the readiness to stay as long as possible and contribute as energetically as possible , the approach derived from *Hirschman* **-exit, voice, loyalty, and neglect (EVLN)-** is a useful conceptual framework for analyzing the relationships among responses to organizational commitment (Bar-Haim, 2007). Hirschman's model, which was developed to explain varieties of consumer (customer) behavior, has broad appeal to a variety of disciplines, including marketing and political science (Lee & Varon, 2020). The theory of exit, voice, and loyalty suggests at least three possible option as responses to dissatisfaction.

Given the importance of Employees' Organizational Commitment, the overall objective of this study is to provide practitioners with an insight on how they can enhance the level of EOC within their organization. The study aims at achieving this objective by extending the literature examining the contextual factors influencing EOC. This way, the study's overall objective is to examine the association between cultural factors and level of EOC among Indonesian employees working in Lambung Mangkurat Universities Banjarmasin reflected in *Loyalty* and *Neglect* behaviour. Specifically, the study will explore the association between EOC with the six dimensions of culture attributed to Chatman and O'Reilly's (2016) Organizational Culture Profile (OCP) measure: *team work; respect for people; outcome orientation; innovation; stability and attention to details*.

Employees Organizational Commitment (EOC)

There are many definitions of commitment, such as : *an attitude that reflects feelings such as attachment, identification or loyalty to the object of the commitment* (Viccovic & Morrow, 2019). Porter, Steers, Mowday (2013), clarify organizational commitment represents an employee's (a) *firm belief in and acceptance of the organization's goal and values*; (b) *a willingness to exert considerable effort on behalf of the organization;* and (c) *a strong desire to maintain membership.* Although more recent researchers have refined this definition (e.g., Al-Jabari & Ghazzawi, 2019), its basic concepts of the employee's identification with and attachment to the organization's values and practices have been accepted by most researchers.

Meyer et al., (1993) identified three dimensions of organizational commitment which allow researchers and practitioners to examine why employees form more significant commitment towards their organizations. These dimensions are "*affective commitment*" (i.e., commitment as an affective attachment to the organization), "*continuance commitment*" (i.e., commitment as a perceived cost associated with leaving the organization), and "*normative commitment*" (i.e., commitment as an obligation to remain in the organization). Since continuance and normative commitment is beyond the control of management (Su , et al. , 2009), this study assesses the level of affective commitment. Besides, Karim & Noor (2017) consider normative commitment as an extension of affective commitment as these two types of commitment statistically in high correlation and a lack of discriminating validity.

Exit, Voice, Loyalty, and Neglect (EVLN) Responses

Hirschman (1970) proposed the fundamental theory of exit, voice, and loyalty to outline how people respond to decline in firms, organizations, and nation-states. Since then, the theory has been used in

various disciplines including public management (John, 2017) and education (Carter et al., 2019). *Hirschman* initially described **exit** as 'some customers stop buying the firm's products or some members leave the organization: this is the exit option' (1970). A conceptual broadening of the exit option was suggested by Rusbult et al. (1988), who conceived of the exit option not only as actually quitting the job or leaving the organization voluntarily, but also as searching for a different job and thinking about quitting.

Hirschman defined voice as 'any attempt at all to change an objectionable state of affairs, not only by petitioning to management or higher authorities, but also through protests including the mobilization of the public opinion' (However, when the model is employed to describe the employment relationship, voice necessarily takes on a different meaning, defined by Rusbult *et al.* (1988) as 'actively and constructively trying to improve conditions', a form of voice also referred to as pro-social voice (Van Dyne *et al.,* 2003). In the present study, voice is operationalized as pro-social voice.

As Hirschman set out to develop a theory of loyalty, he first somewhat loosely referred to it as '. . . that special attachment to an organization known as loyalty'. In the organizational literature, loyalty was defined by Rusbult and colleagues as passively but optimistically waiting for conditions to improve, by giving public and private support to the organization, waiting and hoping for improvement, or practicing good citizenship (Rusbult et al., 1988).

As organizations and employees had already been conceived of as partners in exchange relationships long before the work of Rusbult, the assumption that neglect behavior would also occur in the work environment appeared to be a logical step. Here, neglect was described as lax and disregardful behavior, exemplified by lateness, absenteeism, error rates and using company time for personal business (Farrell, 1983; Rusbult et al., 1988). According to Rusbult et al. (1988), exit is active and destructive, whereas voice is active and constructive; neglect is passive and destructive, and loyalty is passive and constructive.

While Rusbult et al. (1988) demonstrated that different behavioral responses to the imbalance in the exchange relationship could be predicted based on exchange variables such as job satisfaction and quality of job alternatives, they did not consider the societal or cultural context in which the exchange was embedded (Thomas & Au, 2002). Exit is an active response and, as such, might also be favored by individualists. For individualists, the alternative active behavior of voice is a more acceptable option than it is for collectivists. Therefore, an exit script is not likely to be a more dominant active response option for collectivists. Within the Indonesian setting, organizations often interpret speaking up as unfavourable because it can threaten cohesiveness. This is because the social behavior of collectivists Indonesian is highly influenced by norms, perceived duties or obligations that they are less likely to exhibit non-conforming behaviour (Rajiani & Pyplacz, 2018). Loyalty has been conceptualized as both an attitude that deters exit and promotes voice and as a distinct behavioral response. As a passive and non-confrontational response, it is consistent with the vertical collectivist cultural orientation described above. Maintenance of harmony and conflict avoidance norms associated with this cultural orientation is indicative of a dominant loyalty script. Neglect, like loyalty is a passive response. Therefore, it seems inconsistent with the active pursuit of conflict resolution characteristic of horizontal individualists like Indonesian (Passakonjaras et al., 2019). Neglect and loyalty, are vague as to the target of behavior, and thus are more subtle means of responding to a dissatisfying situation that avoids confrontation with organization members. These subtle responses allow higher status members in the exchange relationship to maintain face while still satisfying the lower status individual's need to respond. Both loyalty and neglect will be more prevalent scripts for vertical collectivists than for horizontal individualists (Akhmad et al.,2020). Consequently , being vertical collectivist Indonesian employees will engage in passive exchange behavior; ***neglect*** and ***loyalty*** which is consistent with the conflict avoidance norm observed in Indonesian values ; *tepa-selira* (or tolerance), a characteristic of many Indonesian relationships practiced in part to minimize risk among individuals (Rajiani & Pyplacz, 2018).

Organizational Cultures

Organizational culture refers to 'a system of shared values and norms that define appropriate attitudes and behaviours for organizational members' (Chatman & O'Reilly, 2016) and it is one of the fundamental factors in developing and maintaining a high level of organizational commitment among employees. However, few studies have investigated the effect of organizational culture on the level of EOC (Su et al. , 2009).

Chatman & O'Reilly, (2016) Organizational Culture Profile (OCP) instrument is used as the measure of organizational culture in the present study. This measure consists of 26 items and has been used extensively (Ru et al., 2019) with similar findings regarding the dimensions of culture: teamwork; respect for people; outcome orientation; innovation; stability; and attention to detail.

Teamwork refers to the extent to which employees within a firm cooperate and work in unison towards overall organizational goals. The importance of teams has been emphasized in the modern economy as they can increase employees' flexibility and productivity which are both essential components for organizational success (Bishop, Scott and Burroughs 2000). Gil, Alcover and Peiro (2005) suggested that teams empower greater responsibility to team members, thereby increasing their involvement and commitment to work. Hayat et al. (2019) found a positive association between team work and the level of EOC and hence, the level of EOC is expected to be higher in organizations where teamwork is more prevalent.

Respect for people refers to the extent to which business units focus on fairness, respect for the rights of the individual, and tolerance (Wiedner & Mantere, 2019). Being respected by the organization can increase employees' commitment to their organization (Zappala et al., 2019). Specifically, employees who are treated with genuine respect and fairness are more likely to behave with loyalty and hard work. Du et al. (2019) found a positive association between respect for people and the level of EOC in a Taiwan organization. It is expected that a similar result will be found in Indonesia as the importance of value and respect is universal (Beauchamp, 2020).

Outcome orientation refers to the extent to which business units emphasize action and results, have high expectations for performance, and are competitive (Chatman & O'Reilly, 2016). Kumar (2019) argued that employees feel more committed in organizations that focus on pragmatic values where results are more important than processes. Hofstede et al., (2010) also suggested that employees in organizations with a process-oriented culture perceive themselves as risk-averse and only exert the minimum amount of effort on their work, while in outcome-oriented organizations; employees perceive that every day can bring new challenges and exert maximum effort into their work. McKinnon *et al.* (2003) treated the link between outcome orientation and the level of EOC as an empirical question with the results demonstrating a positive relationship. Similar findings are expected in the current study. Innovation represents a business unit's receptivity and adaptability to change, and its willingness to experiment. Further, innovative organizations are more likely to experiment with new practices and their employees are more likely to respond positively to new techniques (Rajiani & Norain, 2019).

Drucker (1998) argues that innovation requires focused and hard work every day rather than just genius, and therefore employees in innovative organizations will exhibit higher levels of EOC. A strong positive relationship between the culture dimension 'innovation' and the level of EOC was found in McKinnon et al. (2003). However, the organization in Indonesia is in paternalistic environment. The well-defined hierarchy, with its specific roles for each member inhibits creativity and innovation (Abbas et al., 2019). Further, face—a measure of social value—is an essential concept to the Indonesian. The potential loss of face from failure may discourage innovativeness. Therefore, in a culture where innovativeness is not encouraged, it becomes a differentiating cue that discriminates more from innovative and less innovative organizational culture. As such in this research , innovation is not expected to relate to EOC, making this variable is excluded from the research model.

Stability refers to the security of employment. It represents the extent to which an organization provides stable employment for employees and employees' perceptions that the employment will continue as long as they exert the appropriate effort in their job (Cairo & Cajner, 2018). In terms of Chitre's (2019) study, employees' attitudes toward job security are contingent on the behaviour of the labour market. Su et al., (2009) prove that in Australian manufacturing industry, two cultural factors (outcome orientation and stability) were found to be significantly associated with the level of EOC. Hence, given the study is conducted where economic conditions in Indonesia is growing making job security is not expected to be related to the level of EOC.

Attention to detail is defined as strict compliance with detailed rules and procedures in terms of precision and accuracy (Chatman & O'Reilly, 2016). McLarty et al. (2019) found that the extent of

specific information given by supervisors has no direct impact on employees' commitment to their organization. As a result, attention to detail is not expected to be associated with the level of EOC.

The above discussion leads to the development of the following theoretical model:

X1 = Team Work

X2 = Respect for people

X3 = Stability

X4 = Attention to Details

X5 = 0utcome Orientation

Y1 = Employee Organizational Commitment

Y2 = Loyalty

Y3 = Neglect

Given these mixed findings, the preposition concerning the relationship between organizational culture and the level of EOC is stated in the following propositions :

PROPOSITION 1: *Organizations that value the organizational culture dimensions of teamwork, respect for people, stability, and attention to details and outcome orientation to a greater extent are more likely to exhibit higher levels of EOC reflected in loyalty behaviour.*

PROPOSITION 2: *Organizations that less value the organizational culture dimensions of team work, respect for people, stability, attention to details and outcome orientation to a greater extent are more likely to exhibit lower levels of EOC reflected in neglect behaviour.*

Method

A survey questionnaire was administered to lecturers from a non-random sample of 150 Indonesian working in public universities. Using Structural Equation Model (SEM), the general rule outlined by Hair et al (2006) is that the minimum sample is to have at least five times as many observations. As there were 28 indicators to be tested, a sample of 150 falls within an acceptable sample range. This study applies Cook and Wall's (1980) nine-item scale to measure the level of EOC. It has been shown to be a reliable measure of EOC in prior studies conducted in Asian setting (Sufan et al., 2017; Lee, 2018; Choy et al., 2018; Koiv et al., 2019). The scale consists of three components (organizational identification, organizational involvement, and organizational loyalty) with respondents required to indicate the extent to which they agree with each of the statements using a five-point scale with anchors of 'strongly disagree' and 'strongly agree'. The level of EOC was measured as them combined score for the nine items (ranging from 9 to 45), with a higher (lower) scores representing a more significant (lower) level of EOC. Reverse scoring was applied for the three items that were negatively stated.

There are two main perspectives to the measurement of organizational culture, the quantitative and qualitative approaches. The quantitative approach maintains that 'culture can be objectively determined and measured' (Schmiedel et al., 2019). The qualitative approach assesses organizational culture through observation thereby facilitating a more detailed insight into the prevailing culture. Hence, given the objective of the study was to determine how differences in culture may affect the level of EOC, a quantitative approach was considered appropriate. Accordingly, organizational culture was measured using Chatman & O'Reilly's (2016) Organizational Culture Profile (OCP) instrument. This instrument was chosen as it has been widely used in many prior studies including in the education setting (Rosenthal et al., 2017).

The OCP measure required respondents to indicate the extent to which each item was valued within their organization on a seven-point Likert scale with anchors of 'not at all' and 'to a great extent'. Scores for each of these dimensions were calculated as the sum of the cultural value items which loaded on those dimensions with higher (lower) scores indicating that the cultural dimension was valued to a higher (lesser) extent.

Items used to measure neglect and loyalty use questionnaires developed by Naus and Iterson (2007). Items measuring neglect consists of reporting sick because do not feel like working, coming in late because do not feel like working, putting less effort into work than may be expected , not putting enough effort into work and missing out on meetings because do not feel like attending them.

Items measuring loyalty consists of trusting the decision-making process of the organization ,trusting the organization to solve the problem , remaining confident that the situation will be taken care, assuming that in the end everything will work out fine and optimistically waiting for better times.

A Descriptive Approach on Motivating Factors Influencing Labour Retention among Teachers

UDUME Mercy E, IMHONOPI David and IRUONAGBE Tunde C.

Covenant University (NIGERIA)

Corresponding author: mercy.adebayo@covenantuniversity.edu.ng

Abstract

Education is important as it aids the development of every society. Teachers play a crucial role in promoting this development and are responsible for training students to be informed and contributory members of the society. Dissatisfaction among teachers often leads to turnover. This research investigated the factors that motivates and influence retention among. It solely relied on the use of survey method. 100 copies of questionnaire were administered to teachers in Iganmode secondary school in Ota, Ogun state Nigeria using the simple random sampling technique. Only 80 copies of questionnaire were retrieved. Data retrieved was analyzed using the statistical package for social sciences representing the result in frequency tables and percentage. The study revealed that factors such as promotion, trainings and salary increment when due is crucial in motivating and retaining teachers. When motivating factors are not in place, it leads to extra cost of hiring and training new teachers. The study recommends that administrators in school should put appropriate measures in place such as incentives and benefits so as to make teachers satisfied and retained. There is a need to ensure also the good working condition in the school that is conductive for teaching and learning as this will motivate teachers and improve their performance.

Keywords: Retention, Satisfaction, School, Teachers, Turnover

Introduction

Education is vital in developing man power which is crucial for the social and economic development of a nation Rebore (2007). Retaining teachers have become a major issue faced by most schools globally (Msuya, 2016).. Herbert and Ramsay (2004) stated that in developing countries, teachers' turnover rate is high. These turnover rates of teachers often affect the schools and students negatively (Obineli, 2013). Also, turnover cost affects an organization in term of recruiting and training newly employed staff. It has also been noted overtime that teachers turnover have detrimental effect on the productivity of the school and academic curriculum (Frincke, 2006; Hammond and Luczak, 2005). According to Ingersoll (2011), 25% of teachers often leave the school in a span of five years in search of another school with better remunerations. Motivation is a tool that aid teachers productivity, loyalty and satisfaction Nadim, Chaudhry, Kalyar, and Riaz 2012). Schools are dependent on the commitment and intellectual abilities of teachers which make it important to ensure teachers are retained.

Literature Review

Retention is vital as it helps in ensuring continuity and reduction of turnover rates among teachers (Chiboiwa, Samuel and Chipunza 2010). Retention can be regarded as an employer voluntary move to ensure employees remain in the organization for a long period of time (Michael, 2008). Retention can be seen as steps taken by an organization to ensure employee's turnover is reduced. Retention is a process of ensuring that high performing employees remain committed in an organization (Michael, 2008). The aim of every organization is to ensure productivity and maximize profit so it is vital that employers ensure their employees are retained.

Teacher retention focuses on ensuring teachers do not move to different schools, or leave the profession before retirement (Musaazi, (2005). Teachers' retention is of utmost important to school managements because of the cost of recruiting new teachers. Amutuhaire (2010) stated that teachers can be retained by attractive remuneration. Kipkebut (2010) asserts that teachers will be retained if they are satisfied with the working conditons and welfare policies in the school.

Motivating factors that retains teachers in schools

Salary: a good salary package is crucial in the retention of teachers as they are able to meet their financial needs (Shoaib, Noor, Tirmizi and Bashir, 2009). Salary could be a factor that helps to encourages a teacher intention to leave or remain on the job or career path (Adebayo, Imhonopi and Iruonagbe, 2019). Barton (2002) suggested that financial reward such as salary can strongly influence the job satisfactions of teachers. Cowin's (2002) stated that salary helps to motivate teachers. The performance of teachers is often increased if the salary they get is commensurate with the job they do. Robbins (2001) stated in line with the Herzberg theory of motivation that salary as a hygiene factor helps to reduce job dissatisfaction among employees. According to the Expectancy theory, employees work and expect to be rewarded in turn. The form of rewards includes promotion, money etc. Employees expect that if they work well in their workplace then their performance will increase and automatically their pay will increase (Udume, Imhonopi, and Iruonagbe, 2019) Man sees money as economically important as it is used more to satisfy needs, in terms of purchasing food, shelter, and clothing. When employees are well paid, it reduced turnover intentions (Samuel and Chipunza, 2009). Employees are often in search of organizations with better pay, bonuses and higher wages (Kinicki and Kreitner, 2003). Employees who are well paid have reduced turnover intentions (Nelson and Quick, 2005). Therefore, for organization to achieve productivity, their employees must be adequately rewarded, and the rewards must be attractive and enticing (Burgess and Ratto, 2003)

Good working conditions: providing a good working condition is of great benefits to organizations, It reduces absenteeism and also improve performance and productivity among teachers. A difficult working condition can influence employees' performances negatively. A safety working environments is important as it reduces danger to life or health. It helps employees avoid accidents, injuries at work. Employees should be trained and oriented on how to the handle equipment's in the organization to reduce the rate of accidents. Good working condition leads to job satisfaction and commitment among employees (Adeniji, Osibanjo, Iruonagbe, Ibidunni, Olokundun, 2019).

Trainings: organizing training for teachers has a positive relation with retention (Ilunor 2010). Training increase chances for advancement. Training can also help to improve the current performance an employee in an organization (Miller, 2006). Training involves offering a new or improved learning experience (Paul and Anantharaman, (2003) Training helps increases job satisfaction among employees. Southwest Wisconsin Workforce Development Board (2008), states that job training is often provided by an employer in an organization to an employee. Buckley and Caple (2005) assert that training can lead to intrinsic or extrinsic job satisfaction among employees in an organization. Inadequate training in organizations could lead to absenteeism as teachers may not know what to do on the job and so loose in interest in coming to work (Adewunmi, 2011).

Promotion: promoting teachers when due have a positive impact on their job satisfaction (Demaki, 2012). Promotion is the upward mobility where an employee changes position from a lower one to another with greater responsibility. It sometimes comes with greater pay and other benefits (Ilunor, 2010). In most cases, promotion serves as feedback from an employer to an employee for a job well done. Promoting a teacher when due, enhances retention and productivity (Ikenyiri and Ihua-Maduenyi 2011). Teachers who have stayed long in a current position are often demotivated and this often triggers job dissatisfaction which can lead to turnover. Promoting teacher also helps to build their social status and boost their morale (Demaki, 2012).

Methodology

This study employed the use of survey research design. The study population consist of 126 teachers in the selected school. The sample size consists of 100 teachers. 100 copies of questionnaire were administered using the simple random sampling method to teachers in Iganmode Secondary school in Ota, Ogun State. Only 80 copies of questionnaire were adjudged usable for this research. Statistical package for social sciences was used to analyse the data. The results are presented using frequency tables and percentage.

Data analyses and results

Table 1: Socio demographic characteristics of respondents

Sex	Frequency	Percent
Male	36	45.0
Female	4	55.0
Total	80	100.0
Age		
25-34	25	31.3
35-44	34	42.5
45-44	21	26.3
Total	80	100
Marital status		
Single	20	25.0
Married	60	75.0
Total	80	100
Academic qualification		
M.Sc/Mba	13	16.3
B.Sc /Ba	62	77.5
Hnd	4	5.0
Ond	1	1.3
Total	80	100.0
Years of teaching		
1-5years	19	23.8
6-10	33	41.3
11-15	21	26.3
21-25	4	5.0
26-30	3	3.8
Total	80	100.0

Source, field work

From the table above, 45% of the respondents' are males while 55% are females. Majority of the respondent are between the ages of 35-44 with 42.5%. 25% of the respondents' are single and 75% are married. 16.3% have an MSc/MBa, majority has a BSc/Ba with 77%, 5% has an Hnd and only 1.3% has an Ond. 41.3% which constitute majority of the respondents has taught between 6-10 years while only a few 3.8% has taught between 26-30 years.

Table 2: Sources of motivation in retaining teachers

Variables	Frequency	Percent
Salary increment/welfare packages	12	15.0
Better working conditions/ better classrooms and laboratories	47	58.8
Trainings	13	16.3
More teachers needed	1	1.3
Promotion	1	1.3
Allocation of funds to the educational sector	6	7.5
Total	80	100.0

Source, field work

From the table above 15% of the respondents' state that salary increase helps to retain and motivate them, 16.3% stated that trainings serves as a form of motivation to them, 1.3% stated the need to recruit more teachers, 1.3% state that promotion is vital I retaining them, 7.5% stated that the allocation of more money to the educational sector motivates and retains them while 58.8% of the respondent which is the majority stated that the provision of better working conditions, better classrooms and laboratories helps in motivating and retaining them to remain in the school.

Conclusion and Recommendations

This study revealed that the variables such as promotion, salary, working condition and training is crucial in motivating and retaining teachers to remain on the job and in their current school of employment. The absence of these variables can have detrimental effects on the school as teachers may be dissatisfied. Job dissatisfaction among teachers can affect their teaching output. Hiring new teachers after turnover may result in incoherence in the teaching curriculum, high cost of hiring and training newly employed teachers. Thus, the study recommends that. School management should ensure teachers are promoted as at when due. Also prompt payment of teachers' salaries is important as it increases commitment among teachers. Training is vital as it aids career development and advancement among teachers. Furthermore, good working condition is necessary it motivate them

Towards Achieving Organizational Goals Through an Improved Administrative Communication

Solomon A. ADEDIRE

Landmark University, Department of Political Science and International Relations, Omu Aran, Nigeria, bayoadedire@yahoo.com

Abstract

Administrative communication is a very important tool towards attaining organizational objectives. The study adopts descriptive method and relies on secondary source of data collection. The data collected were analyzed descriptively. Administrative communication is an instrument for social interaction, a tool for understanding others, and a means of keeping in touch with people. The paper argues that effective administrative communication is a sine qua non for the attainment of organizational goals, while ineffective administrative communication often leads to industrial conflict and low morale. The paper further highlights the relevance of effective administrative communication towards achieving organizational goals, and the study found out that administrative communication is hindered by time constraints, hierarchy, culture, filtering, status differences among others. It therefore recommends clarity of communication, feedback mechanism, listening, consistency, completeness of the message as ways of improving administrative communication in organization.

Keywords*:* Organizational goals, administrative communication, attainment, feedback.

Introduction

Organizations are set up to achieve definite objectives (Oden 2011). These objectives need to be communicated to every employee at different levels. One of the problems that organization faces is the inability to deliver a clear message and makes the receiver have an understanding of the information (Keyton cited in Lunenburg 2010). However, effective administrative communication is one way of attaining organization objectives (Razak, Athmar, Durani, Salleh and Hamdan 2019). Effective administrative communication allows the sender to understand the emotion and intention of sending the information to the receiver (Razak et al 2019). According to Chiang, Jang, Canter and Prince (2008: 327-351), employers and employees must be consistent, clear, complete and accurate when communicating with each other. Good communication is therefore fundamental to the existence of human organization (Oden 2011). Lack of good communication in an organization tends to create conflicts between individuals and within an organization, and can cause a good plan to fail (Oden 2011; Osabiya 2015).

Karen (2004) defines administrative communication as a means by which administrative level of organization communicates with each other and also with lower employees. It involves writing business correspondence such as memos, notices, reports and letters, speaking in meetings and presentations and listening to all levels of employees, co-workers and superiors in order to be productive (Karen 2004)..

N'yel (2006) indicates that administrative communication is an instrument for social interaction, a tool for understanding others, and a means of keeping in touch with people. It also assists in establishing, extending and maintaining relationships, by giving orientation to staff and spelling out the goals of an organization. N'yel (2006) maintains that communication is the lubricant that keeps the machinery of an organization going, and the means through which roles are identified and assigned.

Since no organization can survive without effective communication, this paper therefore examines the relevance of administrative communication in the attainment of organizational objectives. It also

discusses factors that hinder effective administrative communication, and suggest ways of achieving organizational objectives through an improved administrative communication.

Conceptual Framework

The two basic concepts that are central to this study are administration and communication.

Administration

Administration is derived from two Latin words "Minor " and "Ministrare" meaning to "serve" and to "govern." It is a universal phenomenon and it is essential in every human endeavor for the accomplishment of set objectives. Administration is said to commence immediately two people agree to co-operate to undertake a task which cannot be completed by a single person (Simon, Smitburg and Thompson 1950). Thus, the bedrock of administration is co-operation. Fayol (1984) stressed that we are involved in administrative behaviour when we co-operate with other people to accomplish such objectives as erecting a community town hall, constructing and managing schools, churches, hospitals, vehicles, assembly plants etc. The modern systems of administration have emerged in one way or the other form the old practices and experiences of the ancient Egyptians, Chinese the Greeks and Romans, and much later from the Christian Church, and the German Cameralists of the middle ages (Onuoha 1999).

Communication

The word "communication" is derived from a Latin word "communis" which means common. There is no acceptable definition of communication. However, communication has been described along the dimensions of content, source, channel, destination, and purpose (Wikipedia 2007: 48). Communication refers to the process of passing information and understanding from one person to another. Communication is an act by which one person known as sender gives information to someone else known as receiver based on person's needs, desires, knowledge, opinions, and perceptions (Razak, Athmar, Durani, Salleh and Hamdan 2019). It involves an exchange of facts, ideas, opinions or emotions by two or more individuals (Rao and Rao 1996).

According to Allen (1958) communication is the sum of all the things one person does when he wants to create understanding in the mind of another. Terry and Franklin (2003) define communication as the art of developing and attaining understanding between people. It is the process of exchanging information and feelings between two or more people, and it is essential to effective management. Keyton's study (as cited in Lunenburg 2010) observe that the stimulation and motivation of employees could be achieved through administrative communication. Clamitt (1993) observes that the stimulation and motivation of employees could be achieved through administrative communication.

Administrative communication involves writing business correspondence such as memos, notices, reports and letters, speaking in meetings and presentations and listening to all levels of employees, co-workers and superiors to be productive and effective in your position (Karen, 2004). Communication which could be verbal or non-verbal could ensure the success of every organization. Non-verbal communication involves the expression of feelings and emotions at workplace (Burgoon, Guerrero and Manuson 2011). Non-verbal communication could be expressed through positive and facial expression (Burgoon, Guerrero and Manuson 2011).

The above analysis is an indication that communication has some characteristics. These are (a) It involves two or more people (b) It is a process ©It has a channel (d)It has a sender and receiver(e)There must be an understanding of the message (f) It occurs at different level, and (g) there must be feedback.

Process of Administrative Communication

Sharma, Sadana and Kaur (2011) observe that administrative communication starts with the sender who initiates the communication. The sender has an idea or information, a thought or need which he wants to transmit to some other person or persons in the group or organization. The encoding process that follows is when the sender translates his ideas into common language or symbols. The language or symbols must be specific to the purpose of the communicator's message.

The message which can be verbal or non-verbal is communicated by the sender depending on the purpose of communication. The message is communicated through a channel. Communication channel is the carrier of the message sent by the communicator, and is the link that connects the sender and the receiver. The channel can be formal like letter, memorandum, telephone, telex, computer, group meetings, policy statements, production schedules, etc. or informal like facial expression, tone of voice, body gestures (Sharma, Sadana and Kaur 2011)

Decoding process allows the receiver to translate the message into the terms that he understands. It is affected by the receiver's past experience, education, perception, expectations and common understanding with the sender. The rate at which the sender understands the message, the greater the possibility of success of the communication. The sender must take into account the socio-cultural background of the receiver, his decoding abilities, and his capacity to understand the message being transmitted (Sharma, Sadana and Kaur 2011).

The feedback loop provides a channel for the receiver response which enables the sender to determine whether the message received is exactly the same as the message sent. Feedback provides a kind of check to see how successfully the message is transferred and interpreted by the receiver (Sharma, Sadana and Kaur 2011).

Channels of Administrative Communication

Channel of communication is a path through which messages are transmitted from the sender to the receiver. Communication channels are the various means by which people at work transmit messages (Badau 2018). Channels of communication are used to accomplish various tasks in an organization (Badau 2018). Channels of organization can be categorized into formal and informal. Formal channel is established by the management and specified in the organization charts. In this channel, commands, instructions and orders travel downward, reports regarding performance, grievances and suggestions travel upward; and coordination travels horizontally. Formal channel of communication follows a formal chain of command and it includes circulars, unit meetings, board meetings which are held to ensure the enforcement of rules and regulations (Greenberg and Baron 2010). The formal communication is orderly, systematic and supports the authority of superiors. This channel of communication is very slow as it travels long distances in the organizational set up and distortions are likely to occur.

The formal channel of communication has four distinct directions: downward communication, upward communication, horizontal communication, and diagonal (Lunenburg 2008).

Downward communication travels from the superior to the subordinates and may take the form of instructions, face -to-face conversation, use of public address systems, company newspapers and bulletin boards. Badau (2018) observes that downward communication transmits information from higher to lower levels of organization. Canary (2011) identified five general purposes of downward communication: implementation of goals; strategies and objectives; job instructions and rationale; procedures and practices; performance feedback, and socialization. Distortions in communication are likely to occur if the number of levels through which the communication is to travel is large. To overcome this problem, managers must strive to forge the shortest link between themselves and the person who will carry out the order.

Upward communication travels from subordinate to superior**.** This consists of ideas**,** suggestions for improvement, requests for help or information, and expression of attitudes or feelings affecting performance on the job. It provides feedback to the management on how well things are going. It provides opportunity to the employees to contribute valuable ideas for improving efficiency and profitability of the organization. Rao and Rao (1996) suggested the following methods to improve upward communication: social gatherings, union publications, scheduled meetings, performance appraisal meetings, grievance procedures, formal suggestion system and open door policy.

Horizontal communication involves the lateral flow of information from colleague to colleague and department to department. Canary (2011) defined it as a kind of communication that takes place across the lines of the formal chain of command. It can be in form of intradepartmental problem-solving, interdepartmental coordination, staff advice to the departments, in brief horizontal communication (Canary 2011). It can also be with persons outside the organization like customers, suppliers, other organizations, etc. It is very useful when coordinated activity is necessary in order to achieve common organizational goals. Horizontal communication fosters social interaction and group cohesiveness. The methods used include memoranda, letters, and the personal face to face contacts, telephonic contacts etc.

Diagonal communication occurs when the source of a message cannot effectively reach the receiver through other existing channels. This can save time. For example, if a salesman writes directly to a client to know his requirements instead of routing the letter through his manager.

Informal channel of communication takes place outside the formal structure of an organization (Greenberg and Baron 2010). It is spontaneous and is not deliberately created by the management but it co-exists with formal communication system. Informal channels include facebook, videos, cartoons, and talks (Greenberg and Baron 2010). Employees resort to informal communication when there are barriers in the formal channels. Managers also use informal communication when they find it difficult to collect information from the workers. The best known type of informal communication is known as the "grapevine".

Grapevine or the rumour mill is the inevitable part of the organizational life. The term seems to have its origin in the American Civil War when the telegraph lines, to carry military intelligence, were garbled or interfered with, and so all unofficial messages came to be known as carried "by the grapevine" (Rao 1996)..

The communication chains formed by friendship cliques or casual associations, which carry daily gossip and news of work, are the more frequently used forms of the grapevine. It is the people at the lower levels of the organization who are likely to be important actors in the grapevine. They carry juicy pieces of information from place to place. The grapevine can carry incorrect messages as well as accurate ones. One important limitation of grapevine is that it tends to spread rumours and half-truths thereby rapidly tarnishing the image and reputation of people (Rao and Rao 1996).

Rumour is un-official information without evidence to confirm. It is based on speculation, wishes or imagination. It can be correct but most often it is not. Rumour also is the grapevine information, but it is without any authentic evidence. It is therefore, an untrue part of a grapevine.

Rumour tends to change as it passes from one person to another. Its general theme may remain the same, but details get changed sometimes beyond recognition.

Methods of Administrative Communication

There are two methods of Administrative communication. These are verbal and non-verbal. Verbal communication is used in daily activities with no record (Badau 2018). It can take place either face to face or through mechanical devices. The most natural way of transmitting messages is face to face conversation. Face to face talk eliminates the possibility of misunderstandings, because through it one can convey the message both by words and gestures.

Oral communication is used for instructing, lecturing, counseling, receiving suggestions of the workers etc. It promotes personal interaction and, therefore, is very useful in promoting relations between the management and the employees. It is used in communicating with the trade union leaders. It is useful for receiving grievances of employees and feedback from them.

Written communication is not difficult to understand if expressed in unambiguous terms. It is generally formal and verifiable. It can be in for of circulars, bulletins, manuals, handbooks, notes, orders, instructions, etc. Written communication serves as a permanent reference for future. It is found useful by the executives when the assignment is important and it is necessary to fix responsibility. Workers and trade unions communicate with the management through written communication and they prefer to receive response from the latter through this medium. But compared to oral communication, it is very slow. If the language of the letter is ambiguous or faulty, the written communication can lead to confusion, disputes or other such problems. Written communication may be blocked through bureaucratic procedures or red tapism. Poorly drafted written communication can give rise to queries for clarification and elaboration which may lead to further loss of time and money.

Non-verbal communication is a kind of communication through gestures or postures and it is used as a means to supplement verbal communication. Non-verbal communication gives an impression of people to others without saying or writing anything. It also reinforces what is being said or written. The main components of this communication are: appearance, manner, expression, eye contact, body movement, position, listening (Badau 2018).

Relevance of Administrative Communication in Organization

In any organization, communication is a very essential tool towards achieving the set objectives. The general public must be provided with adequate information to help them make better decisions and identify opportunities that could improve their quality of life. It is true that the decisions made by the administrators are greatly affected by the way they communicate. That is why it should be practiced properly when in office and even outside appointments (Karen, 2004).

Chabra and Suri (2000), highlight the importance of communication in organization to include:(i) It helps the management in making the employees understand the objectives, plans and policies of the organization. (ii)It develops understanding between the superiors and the subordinates. Therefore, it leads to better human relations in the organization. (iii) It helps in controlling the performances of different individuals and departments of the organization. (iv) It facilitates decision- making by providing necessary information in time. (v) It provides unity of direction to various activities of the organization. (vi) It is an effective device for achieving participation by the workers. (vii) It facilitates change on the part of employees by modifying their behaviour.

Factors that Hinder Effective Administrative Communication

Robbins (1980) believes that there are three types of barriers to communication. These are physical, individual and semantic. According to him, since organizations are formal structures, they cannot help but create barriers to effective communication. The existence of excessive hierarchy creates physical distance between people. The reliance upon the unity-of-command concept requires that formal communications follow prescribed channels through the organization

Also, instead of listening in a rational, or objective manner to what is being said, people occasionally become emotionally involved. People inject their value systems into what they hear or read. Robbins explains the semantic barrier by saying that things mean different things to different people. The meanings of words are not in the words but they are in us. Cushyway and Lodge 1999 cited in Osabiya 2015: 84 identified the barriers to effective communication like unwillingness of the sender to communicate the necessary message very clearly, or with the receiver who may be unable to understand the message being sent, or there may be environmental factors affecting the conditions under which the message is conveyed, such as noise.

Apart from the distortion in communication process, Huneryager and Heckman (1972) identify the following barriers to effective communication:

Many people in organizations cannot communicate effectively because they cannot use words and their personality effectively. They ask for one thing and mean another. It is this which creates misunderstanding in the mind of the receiver of the message.

Also, Managers and supervisors lack writing, oral, reading and listening skills which prevent them to express themselves clearly.

Another barrier to effective communication is the perception of different people about the information received. People give different interpretation to messages depending on their perceptions. This depends on the past experience of a person, his educational background, emotions, values, beliefs, etc.

Filtering constitutes a barrier to effective communication. This is an attempt to alter and colour information to present a more favourable or unfavourable impression. Subordinates try to filter information as it progresses up the chain of command. They tell the boss what he wants to hear.

Differences in status created by the organizations through titles, offices and amount of support resources distributed serve as hinderance to communication. For example, the person who has a car parking space, personal fax and an office suite puts up barriers to communication with the more junior staff.

Similarly, time constitutes a barrier to effective communication in an organization. Cheney (2011) observes that time lags between communication and the action can inhibit communication. Managers work under time pressures. They must make decisions without delay and meet deadlines. To expedite matters, they often short-circuit formal channels, leaving some people in the dark; and when the messages that are transmitted are incomplete or ambiguous to the receiver, effective communication is hindered.

The hierarchical structure of an organization is a setback to communication. The more hierarchical an organization, the more the communication problems it creates. At each stage of communication process, messages may be either lost or added through transmission.

Furthermore, organizational culture which consists of practices, beliefs, values and feelings constitutes a barrier to effective communication. Some organizations spread the feeling that orders are not be questioned or show no interest in the feedback or do not encourage two-way communication. In this, case communication goes underground when the climate is threatening.

Finally, problem arises when the rules and regulations are written in language that is not simple and direct, and where standards vary between different managers, supervisors, departments, divisions and functions.

Ways of improving administrative communication in organization

Administrative communication can be enhanced through the feedback mechanism that allows the sender to have ideas whether the information sent has been received as originally intended. The use of feedback improves the communication process and reduces the chance of major disparities between the information received and the one intended. Similarly, repeating of messages using various media can improve communication. For example, Airport controllers use this technique so that information relayed between the tower and arriving and departing aircraft is as distortion-free as possible.

Administrative communication can be improved through good listening skills of an administrator. This important quality of an administrator helps him to give objective judgment to issues. In this case, the speaker expresses his points of view fully before you react. It requires separating objective from subjective data.

Also, the message being sent must be as clear as possible. There should be no ambiguity in the message. The language should be clear and simple so that the receiver is able to understand the message without any difficulty. In addition, the message being sent should be complete in itself and adequate so that there is no misunderstanding in the mind of the receiver. Inadequate information delays actions, spoils good relations and affects the efficiency of the parties to the communication.

There is the need to bridge communication gap in an organization. Communication gap occurs where the workers have not been properly informed about several things concerning them like what their jobs are, what is expected of them, how important their work is, how is their performance, when their promotions are expected and what would be required to get promotions.

Finally, timely passage of information to the stakeholders will improve administrative communication. The management should make it a practice of passing along the information promptly to everyone concerned so that action, where required, is not delayed.

Conclusion

Administrative communication is a sine qua non of a successful organization. Since administration is the sum total or the whole complex of activities that are undertaken to realize the objectives in view. It therefore requires the efforts of all the employees to learn how to communicate effectively. It demands that each employee must know his roles as an administrator. Administrative communicators should be able to translate their ideas into simple and understandable language. The communication channel chosen must be appropriate to the information they want to pass.

Also, administrative communicators should know that words can destroy therefore, they should take cognisance of their environment when communicating. In addition, they should not allow their subjective judgement affect their communication. Superiors at different levels should have listening abilities so as to allow their subordinates to express their opinion. An open door policy that allows interpersonal relationships between the superior and the subordinates should be encouraged.

Finally, administrative communicators should try to avoid grapevine information in form of rumour because it can destroy the image and reputation of people.

Acknowledgment

I acknowledge Landmark University for the provision of fund for the publication of the research work.

Abstract

The purpose of this study was to investigate the impact of information technology (IT) in service delivery: a case of Gaborone Technical College. The study investigated the impact of IT in improving service delivery. The study adopted a case study research strategy were both qualitative and quantitative data was collected using questionnaires. Subjects in this study comprised of students and lecturers of the Gaborone Technical College. Convenience sampling was used to select the respondents who were selected based on their availability, accessibility to the researcher and their willingness to take part. The findings of the study revealed that IT has a positive impact on service delivery at Gaborone Technical College.

Keywords: Information Technology, IT, Service Delivery, Gaborone, Strategic management

1. Introduction

It is evident from global industries that the use of information and communication technology seems to be the solution to information management problems in most organisations. Therefore learning institutions as organisations are no exception to the rule. Information technology is a wide and varied sector, and is represented in some form in almost all the industries. Information technology impacts on business operations, the achievement of organisational goals and service delivery (Swap and Srivastava, 2011). A review of literature indicates that the use of IT for improving customer service and customer satisfaction has attracted much recent attention (Cummings & Worley, 2008)). Swap and Srivastava, (2011) argued that IT is increasingly being adopted by community and hospital-based providers of health care services, because IT is now available not only to improve the communication of patients' clinical data but also to expedite communication of myriad other information across health care organisations.

Information technology have significant effects on the structure, management and functioning of most organisations. Cummings and Worley (2008) point out that "IT is redefining the traditional business model by changing how work is performed, how knowledge is used, and how the cost of doing business is calculated". Research studies have addressed information technology's impact from a variety of perspectives (Brynjolfsson & Hitt, 2000). Increasingly, the relevant question about information technology's impact relates to the nature of the impact and how it occurs. Impact through use is one area of investigation suggested (Torkazdeh & Doll, 1999). Although it is quite obvious that IT system use would lead to some impact, the unanswered question is how? Some authors proposed job-learning as one possible mechanism in this regard (Torkzadea et al, 2009).

As individuals interact with the system applications, they learn about their job, and as a result, become more productive. Information technology plays an important role in job-learning and individual productivity. Because of this, information technology plays a critical role in the expansion of knowledge and learning becomes a new form of labour. Learning is no longer a separate activity that occurs either before one enters the place or in a remote classroom setting. Learning is the heart of productive activity. For the individual, information technology holds promise in terms of job enhancement and the outcome of labour. Information technology impacts on how a job is performed and what the outcome might be. Thus, there is a need for better understanding of the nature and outcome of the interaction between people and technology in an organisational context (Torkzadea et al, 2009).

According to Sarmento (2005) computer systems play a prime role in the support and delivery of services. For many systems their main role is in enabling service encounters between customers and providers. ATMs, self-service airline ticket dispensers and Internet shopping sites represent services entirely delivered by the computer. Here the service encounter is purely between the computer and customer (Sarmento, 2005). Today, it is essential for all organisations to adapt to their rapidly changing environment. To remain competitive, organisations must continuously scan their environment and look for better ways of conducting business.

1.2. Background of the Study

Gaborone Technical College (GTC) falls under Vocational Education Training (VET) in Botswana. The idea of Training in Vocational Education Training (TVET) in Botswana was conceived around the country's independence in 1966. As noted by Van Rensburg (2002), it started with setting up the Botswana Training Centre (BTC). According to the same author Van Rensburg (2002), the establishment of BTC then led to the setting up of the Botswana Institute of Administration and Commerce (BIAC) and Botswana Polytechnic. Around the same time as observed by Ankoojee, Gower & McGrath (2002) the Brigades were also established. Finally, six technical colleges among them Gaborone Technical College, were set up in 1987.

Looking at the Southern African region, there are limited studies with regard to VET (Ankoojee, 2003). In fact as noted by McGrath (2002), there are only a few international journal articles, which is a call for concern because VET plays an important role in supporting a country's social and economic development goals. The importance of the role played by VET in an economy can therefore not be ignored. Vocational Education Centers (VET) if well utilised could play a significant role in a country's social and economic development. As noted by Ankoojee et al (2005:18), such institutions are established with an aim of empowering the citizens, especially the youth, with technical skills and competencies that promote the spirit of entrepreneurship and in the process, employment and sustainability. The focus now narrows to GTC. The Institution as mentioned earlier was established alongside six other such institutions in 1987 (Ankoojee et al, 2005).

The main objective of this study is to determine the impact of IT in the service delivery, with particular reference to the educational sectors. The main research question is: **What is the impact of Information technology on service delivery at Gaborone Technical College?** Technology remains one of the primary drivers of change in the ways that people work, seek information, communicate and entertain themselves (Marimuthu & Paraman, 2011). This paper is organised as follows: The next section presents a brief literature review. Section 3 presents the methodology used to conduct the study. Section 4 presents the results from the study. Finally, section 5 presents the discussion and conclusion of the study.

2. Brief Literature Review

There are numerous research efforts on IT investments on service delivery. However, understanding IT investments' contribution to business value and service delivery has been challenging and perhaps more challenging in developing countries due to generally less predictable changes in social, political, and

economics infrastructure (Roztocki and Weistroffer, 2004). Prasad (2008) conducted a study of the intangible benefits of IT investments in Fiji. The findings indicated that for businesses in developing countries, their IT investments provide intangible benefits, especially at the process level that contributes to business value. In a similar research effort, Roztocki and Weistroffer (2004) presented a framework for evaluating IT investments by integrating the value chain model with activity-based costing in emerging economies, where the primary motivation of the many investments is an improvement of cost structure.

Furthermore, in the work of Roztocki and Weistroffer (2004), a value chain analysis framework was presented for evaluating investments for services. They argued that in order to achieve reliable cost estimation, the framework employs a costing system, which integrates activity-based costing with an economic value-added performance measure. Oliver (2002) emphasised the impact of ICTs on educational practice in higher education, as a tool with the capacity to transform education from a teacher directed enterprise to more student-centred models. He also argued that the use of ICT in higher education settings could enhance knowledge creation through increased use of ICT among students. McGrath (2002) also discussed the use of ICT tools as a means of fostering interaction and knowledge creation among students through the use of online discussion forums.

2.2 The impact of Information Technology in Education Sector

The challenges faced by countries in increasing access to post-primary education, improving quality of education and addressing threats to education systems from pandemics, natural disasters and civil conflicts, need participation of all parties which include higher education institutions. It is true that institutions of higher education should not differ from other businesses in the manner in which they adapt to environmental changes; however, the environmental factors that affect them should not be compared to those of other businesses. Information technology is one of the leading environmental factors that affects all industries and have played a significant role in transforming the higher education industry.

Countries need to strengthen the management of education systems, provide better teaching materials and increase expenditure for training, hiring and management of teachers. For example, an estimated 4.5 million teachers needed in Africa to achieve the MDGs by 2015 (MDGs 2008) is a challenge to try to achieve within time left. The contribution of ICTs in achieving these goals and the participation of higher learning institutions in particular cannot be over emphasised as a number of ICT projects are carried out by these institutions. The significance of ICTs is realised in many aspects such as improved access to learning by all, creation of a conducive learning environment by gender, quality of knowledge delivery expanded secondary and post-secondary education, reduction of expenditure on training and many others (Kaino, 2005). This is to the advances in information technology (IT) that have changed ways of communication in education and delivery of knowledge to society. Some new delivery technologies using for example electronic learning (e-learning) in virtual programs, Internet courses' delivery strategies, audio and video communications have changed and challenged ways of knowledge delivery in the education sector.

In education, the delivery of knowledge using ICTs has influenced the design of various curricula programmes globally. The technology allows learners' interaction with the computer screen rather than the teacher. Through the computer network, learners are able to communicate with the instructor on the material and could discuss assignments involved. In this process, learners are able to attend lectures "online". Current technologies in e-learning such as AulaNet, tend to provide groupware for creation, participation and maintenance of Web-based courses emphasising group learning where individuals shared ideas online (McGrath, 2002). It has been argued that ICT is a way to move from elite to mass education through digital media where more learners could get access to education for both campus and distance-learning students (Kennedy, 2005). ICT is seen as a way to promote educational change, improve the skills of learners and prepare them for the global economy and information society (Kozma & Wagner, 2005). ICT is used to improve delivery of and access to education. ICT as focus of learning tends to improve the understanding of the learner, increase quality of education and thereby increase the impact of education on the economy.

While basically ICT based innovations can occur in classrooms, their linkage to national policies is essential to achieve intended social and economic outcomes.

2.3 ICT Policy Framework

While the benefits of these technologies have been acknowledged there have been some constraints of adoption especially in developing countries. The constraints are many and include access to computers (email and Internet), affordability of computers and connectivity, telephone and electricity infrastructure, computer literacy, expertise (Oliver, 2002). While such problems have been acknowledged, the main reasons behind the slow pace of adoption have been identified as lack of effective policies on ICTs (Kaino, 2005). Many countries have outlined the significance of these technologies and much of these policies have remained on paper without committing enough resources to policies. The issue of utilising a fraction of the capacity of existing ICT facilities in developing countries has been noted in past studies (Cawthera, 2010).

One of the main obstacles to adoption of ICTs in developing countries in particular, has been identified as ineffective policies in Government departments (Kaino, 2005). While many efforts have been made to stipulate ICT policies, not much have been done on the implementation side and especially on the structures and processes in place. To realise the full impact of ICTs, educational policies and programs need to be coordinated with those in other ministries, such as economic development, human resource development, telecommunications, agriculture and rural and urban development. Policy leadership is key to any successful development strategy, particularly if these efforts are to contribute to economic and social transformation. The contribution of ICTs policies to education, social and economic development are premised on ICT policy framework structure. ICTs should be used to address social and economic inequalities by extending the ICT infrastructure to rural areas and establish community technology centres.

2.4 Theoretical Framework

Cheung & Huang (2005) proposed a framework for assessing Internet usage in university education in Figure 1. The framework investigates the impact Internet has on learning and job prospects considering organisational and individual factors, perception, attitude and Internet usage. The research framework takes into account organisational factors and IT usage as a factor influencing IT investment on service delivery such as management support, institutional goal, power supply, improved funding and security. The first construct of the framework takes into account the organisational context. Previous research demonstrates that organisational support, IT support and IT skills are important factors that influence internet usage (Cheung & Huang, 2005). The second construct describes various aspects of Internet usage by the university personnel including the frequency and intensity of Internet use (Cheung & Huang, 2005). The third construct examines the impact of the use of IT on service delivery and interaction with students. In summary, the relationship between the factors specified in the framework was supported. The Internet usage for teaching, registration, examination processing and submission of assignments, had a positive impact on service delivery by the staff. Findings also revealed that there is efficient service delivery and availability of Internet in the Institution to foster online interaction among staff and students.

Fig 1. The Research Framework

A review of literature indicates that the use of IT for improving customer service and customer satisfaction has attracted much recent attention. Information technology plays an important role in job learning and individual productivity. Because of this information technology plays a critical role in the expansion of knowledge and learning becomes a new form of labour. To remain competitive, organisations must continuously scan their environment and investigate better ways of conducting business. The next section discusses the research methodology used to conduct the study.

3. Research Methodology

Research methodology is a collective term for the structured process of conducting research. This section describes the researcher's basic research plan. It explains how the research problem was investigated and why particular methods and techniques were used. It also gives a detailed account of the data collection processes employed to obtain data.

3.1 Research Design

Research design is the detailed outline of how an investigation will take place. The study used a case study research design which allows both qualitative and quantitative data in a single study. The questionnaire that was used contained both open and closed ended questions to allow some components of data to be measured numerically and elaborate on those through qualitative ones. Yin (2009) defines the case study research as "an empirical inquiry that investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident; and in which multiple sources of evidence are used". The case study design help provides an understanding of a complex issue or object and can extend experience or add strength to what is already known through previous research and detailed contextual analysis of a limited number of events or conditions and their relationships. Case studies are important in decision making and for policy makers.

3.2 Sampling Procedure

The target population for this study was 596 respondents - both the students and personnel of Gaborone Technical College in Gaborone. However, the researcher managed to interview only 296. Polit and Beck (2010) defined sampling as "the process of selecting elements which are the basic unit from which data and information will be collected to represent the entire population". The sample for this study was 296 comprising of 200 students and 96 lecturers. This study used convenience sampling which is a non-probability sampling method to select the respondents. The personnel of Gaborone Technical College who

were available and willing to participate during the period of data collection were given the questionnaires to complete. The questionnaire was administered to determine a variety of aspects from respondents which included beliefs, thoughts and knowledge about impacts of technology on service delivery at Gaborone Technical Collage.

3.3 Research Instruments

A questionnaire was used in the study which consisted of both closed and open ended questions, developed based on the constructs from literature in order answers the research question. The questionnaire was developed to solicit information from the respondents of Gaborone Technical College. A questionnaire was chosen because it allows participants to give their views anonymously reducing bias. Polit and Beck (2010) explained that the importance of administering a questionnaire as that it makes it easy to test validity and reliability, it is flexible and may be applied to many different populations within a short time and the same questions are repeated to get valid and reliable answers with minimal resources. Depending on the type of questions, data capturing may be quick if most of the questions are fully structured. However, even though questionnaires were used, the researcher was aware of its limitations. Questionnaires are sharply limited by the fact that respondents must be able to read the questions and respond to them. Thus for some demographic groups conducting a survey by a questionnaire may not be practical. A total of 280 questionnaires were prepared and distributed. For students, 200 questionnaires were administered and 80 for lecturers. Pilot testing was also done to estimate the time needed for the actual survey and refine some questions.

3.4 Reliability and validity

In this research, quantitative and qualitative designs were chosen to deduce impacts of information technology in the Institution. In this study, content validity was ensured by doing a thorough related literature search on which contents of questionnaire and interview guides are based. The pilot testing conduct helped to improve the quality of the questionnaire and validity. In this research, data analysis was done using both quantitative and qualitative analysis tools such as descriptive statistics and Statistical Package for Social Science version 19 and a statistician was engaged to help with analysis of data. This research external validity was influenced by the sampling method used, namely convenience sampling, therefore findings cannot be generalised to other settings.

3.5 Data Analysis

When the questionnaires arrived from the field, they were checked for completeness and only the questionnaires which were 75% answered were considered and captured into Microsoft Excel while qualitative data obtained from open ended questions were analysed using content analysis whereby only responses that are relevant to the questions were considered and the rest were discarded. The qualitative data was then reported qualitatively in the report while the quantitative data was exported to the Statistical Package for Social Sciences version 19 for analysis.

3.6 Ethical Considerations

All research designs should consider ethics of participants - that is how sensitive the issue might be to the respondents. In carrying out a research, it is the responsibility of the researcher to protect the respondents from harm and provide them with adequate information on the importance of research and enable them to withdraw whenever they want to. The main aim is to assess the impact of information technology on service delivery at Gaborone Technical College therefore written permission to conduct the study will be sought and obtained from the Principal. Copies of consent forms providing information on the nature, purpose and research process, assuring respondents confidentiality of data and information provided, was prepared and

issued to sampled respondents prior to commencing the study. Respondents were given an option to fill in the questionnaire or decline, and extra time was given so as not to rush the subjects. Interviewees were also given options to write down their answers and allocated more time as a way of encouraging them to express themselves freely.

In this research, all subjects were informed verbally and through consent forms about the benefits of the study. In this study, respondents were encouraged to participate so as to make contributions and suggestions to ensure effective use of technology in providing good service to the customers. The researcher indicated clearly and stressed verbally on first meeting to the respondents that they are not supposed to write their names in order to maintain anonymity and confidentiality of their information. The participants were told that participating in the study is voluntary, hence they could decide to quit at any stage. However, taking part in the study was emphasised. Participants were informed that at the end of the study, the results would be shared with them as a way of appreciation as well as giving them feedback about the results. This section discussed methodology employed in the data collection process on the research. The next section presents the results of the study.

4. Research Results

This section presents statistical results of the data obtained by a questionnaire from students and lecturers in Gaborone Technical College in Botswana.

4.1 Demographic Data

The distribution of the subjects who participated in the study was that, about 70.5% were lecturers while 29.5% were students amongst which 63.7% were females and 36.3% males.

Fig 2. Respondents' age

Figure 2 above shows that the majority (61.2%) of the respondents who participated in the study were of the age 20-29 years of which the most were the students while the other 38.8% may come from other mature students and lecturers. Looking at the age of the participants, those participants of the age 20-29 should consider the use of technology most useful in delivering services. One can expect them to use different

modes of technology such as the use of Internet for research, the use of intranet to communicate with their lecturers, the use of e-learning strategies, for example the mode for access of course materials.

Fig 3. Education level

With regard to educational attainment, most of respondents (77.3%) have obtained either a vocational/college certificate or a senior school certificate. About 3.2% have obtained either a junior or a primary certificate. These are probably those students who have not yet completed their studies. The other 19.4% came from those participants who have a University degree and would be the lecturers. Regarding the level of education of the respondents, this reveals why the use of technology may not be considered as the most effective method of communication within the Institution in delivering services, especially between the lecturers and the students. When asked about the length of time they have been in GTC, about 50.4% indicated that they have been in the Institution only for at most 6 months, 19.1% for 12 months while 30.6% have been in the Institution for more than 12 months.

4.2 Lecturer section

4.2.1 Level of proficiency in IT

This section seeks to determine the lecturers' level of proficiency in IT. Lecturers were asked to indicate the extent to which they are proficient in the hardware and software categories selected and the following responses were gathered.

Table 1: Level of proficiency in IT

Category	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Basic hardware	4.8	7.2	14.5	19.3	54.2
Microsoft Word	1.2	1.2	9.6	28.9	59.0
Microsoft Excel	1.2	1.2	9.6	28.9	59.0
Microsoft PowerPoint	7.2	7.2	7.2	18.1	60.2
Use of Internet	2.4	1.2	8.4	25.3	62.7

The results in Table 1 indicated that the majority (60%) of the respondents across all the categories agreed and strongly agreed that they were proficient in the use of software. This is Microsoft Word, Excel and PowerPoint. However, there are some who indicated that they are not proficient with these soft- and hardware as indicated by those who disagreed and strongly disagreed. It is indeed a concern to discover that at a college level, there are some lecturers who are not capable of using some of these soft- and hardware effectively. This may negatively affect service delivery to students in a convenient way. Due to this incompetency, this may lead to under-utilisation of information technology in service delivery within the Institution. At college level, students should be able to receive the notes, assignments, announcements and any other important messages through such modes of communication. This is supported by Oliver (2002) who emphasised the impact of ICTs on educational practice in higher education, as a tool with the capacity to transform education from a teacher directed enterprise to more of student-centred models. He also argued that the use of ICT in higher education settings could enhance knowledge creation through increased use of ICT among students.

4.2.2 Teaching aids

Table 2: Teaching aids

Questions	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Do you use a computer/laptop to conduct class?	12.0	9.6	18.1	14.5	45.8
Do you use PowerPoint to illustrate to learners?	12.0	9.6	15.7	14.5	48.2
Do you use a projector to conduct class?	9.6	13.3	14.5	16.9	45.8
Do you use a white board to illustrate to learners?	2.4	0	8.4	38.6	50.6
Do you use pointing devices to illustrate to learners?	12.0	15.7	19.3	14.5	38.6

Regarding the use of a computer or laptop to conduct classes, more than 50% across all the questions indicated that they use computers/laptops to conduct classes, PowerPoint to illustrate to learners, projectors, white board as well as pointing devices. Above all, white board markers seem to be the most common to the majority of the lecturers as indicated in Table 2 above. However, there are also some lecturers who indicated that they do not make use of the mentioned teaching aids. At tertiary level, most of the mentioned teaching aids need to be employed in order to allow various teaching strategies. If the instructors at tertiary level can encourage the use of technology to the students, this may also reduce their workload as most of the information could be uploaded onto the Web and students could access it at their own time. Cheung and Huang (2005) proposed a framework for assessing Internet usage in university education. The framework investigates the impact of Internet on learning and job prospect considering organisations as well as the individual factor - perception, attitude and Internet usage. Results showed that students preferred to do their school work and hear about any school activities through the Web/email. Students also indicated that they preferred to receive assignments that involve them in research, since this encourages independent learning.

4.2.3 The role of information technology on service delivery

Table 3: The role of information technology on service delivery

Statement	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Electronic tools help my students to learn the course.	0	3.6	8.4	43.4	44.6
In planning a course I consider electronic tools to help students achieve course educational goals.	1.2	2.4	7.2	45.8	43.4
If the college were to commit more resources to support information technology for teaching, it could improve the effectiveness of my teaching.	0	0	6.0	50.6	43.4
Computers help me to keep learner records.	0	2.4	2.4	55.4	39.8
I use a computer to prepare lesson plans.	1.2	0	2.4	56.6	39.8
I use a computer to prepare learner progress reports.	1.2	1.2	3.6	54.2	39.8
I use a computer to receive correspondence from other departments.	4.8	3.6	9.6	39.8	42.2
I use a computer to communicate with regional office.	8.4	10.8	12.0	30.1	38.6
I use a computer to keep teaching and work information.	0	2.4	9.6	42.2	45.8

When asked on the role or effect of IT on service delivery, most of the respondents across all the statements were of the view that indeed IT plays a major role in delivery of services. Results in Table 3 above also revealed that even though respondents believe that IT plays a major role in the delivery of services, it is unfortunate to them because of limited resources, as not all of them seem to be able to use computers for several activities including correspondence with other departments or with regional offices. Yang (2008) examined the impact of Information Communication Technology (ICT) on higher education among tertiary teachers and students. The study also explored the issues that emerged from the implementation of ICT in higher education information as an essential commodity in well-managed organisations. The report revealed that it is evident from global industries that the use of information and communication technology seems to be the solution to information management problems in most organisations and therefore learning Institutions as organisations are no exception to the rule. Comparing the information from other researchers and the results from this study, it can be concluded that IT indeed plays a major role in the delivery of services. It is now evident that at GTC this affect there is a gap that needs to be closed. There is a limited utilisation of IT within the Institution.

4.2.4 Level of satisfaction by the users on information technology

Table 4: Level of satisfaction by the users on information technology

Statement	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
I am happy with IT usage in the College	14.5	19.3	19.3	20.5	26.5
I am competent in using IT tools.	9.6	18.1	19.3	21.7	31.3
IT tools makes my teaching easy.	3.6	4.8	10.8	43.4	37.3
IT improves my service delivery	1.2	2.4	12.0	45.8	38.6

When asked about their level of satisfaction in information technology at Gaborone Technical College, some respondents indicated that they were satisfied while others were not. The respondents who indicated that they were satisfied could be those who find it not necessary to be innovative and they may be used to their communication level, hence not concerned about change, whereas those who are not satisfied are those respondents who believes that service delivery can be improved by improving and encouraging the use of technology at Gaborone Technical College. Generally looking at the results in Table 4, the level of satisfaction with information technology in the Institution is not satisfying hence a need to improve it so that both the lecturers and students can realise the importance of subscribing to technology in the Institution.

4.2.5 The successes of the information technology on service delivery

Table 5: The successes of the information technology on service delivery

Statement	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Use of IT simplifies my work	1.2	1.2	7.2	53.0	37.3
Use of IT professionalise my work (presentations, neatness, organised)	0	2.4	2.4	54.2	41.0
A computer assists me in drawing a timetable for classes and assessments.	2.4	2.4	2.4	2.4	2.4
A computer helps to simplify management of the college (Records and assets)	0	6.0	7.2	45.8	41.0
Computers improve my learners understanding.	0	1.2	4.8	44.6	49.4
I use a computer to prepare scheme of work.	0	3.6	3.6	49.4	43.4
I use a computer to receive work from students electronically.	9.6	10.8	7.2	32.5	39.8
I use a computer to communicate with other lecturers from other colleges.	6.0	3.6	9.6	38.6	42.2

From Table 5 we can deduce that most of the lecturers indicated that they use computers in most of their day to day activities and they agreed that it helps them a great deal. This clearly indicates that given enough resources, the level of satisfaction with IT services will improve since Gaborone Technical College community is willing to subscribe to technology and this may improve the situation at the college.

4.2.6 Problems associated with the use of information technology on service delivery

Table 6: Problems associated with the use of information technology on service delivery

Statement	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Non availability of electricity affects the use of IT in college.	2.4	4.8	8.4	57.8	26.5
Limited IT resources affect service delivery in the college.	4.8	6.0	3.6	60.2	25.3
Lack of IT skills affects service delivery.	4.8	1.2	3.6	65.1	25.3
Network failure interrupts service delivery.	6.0	1.2	1.2	67.5	24.1

The results of the sample revealed the problems faced by the lecturers at GTC regarding information technology and delivering services to the students. Across all the statements, most of the lecturers agreed with the statements revealing how limited IT resources, lack of IT skills and network failures contribute to the problem at the Institution. Some researchers indicated that the usage of information technology for the completion of tasks in any organisation, speeds up the processing and information mobility, and also improves the reliability and integrity of information (Swapnil & Srivastava, 2011). Lecturers were also asked to share their opinion on problems they experienced regarding information technology in the Institution and the following were the common suggestions: Provide lecturers with access to wireless connection, install backup system for use in times of blackout, IT systems should be kept up to date, offer training on IT to lecturers, the college should buy their personnel laptops to use during lessons.

4.3 Section C: Students

4.3.1 Availability and accessibility of IT to students at the college

Table 7: Availability and accessibility of IT to students at the college

Questions	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Do you have computer laboratories in your college?	1.5	1.0	3.1	28.1	66.3
Are computer laboratories in your college sufficient for use by all learners?	21.4	26.5	20.9	8.7	22.4
Are computer laboratories in your college equipped with computers?	5.6	12.8	13.3	21.4	46.9
Are most computers in your college in a working condition?	9.7	25.0	26.0	9.2	30.1
Is the number of computers enough for the whole class to use at once?	15.3	19.9	8.7	19.4	36.7
Are learners allowed to use computers when they need information on the Internet?	10.7	14.3	17.3	16.3	41.3

The result shows that there are computer laboratories at Gaborone Technical College but there are not sufficient for use by all learners. Furthermore respondents reported that laboratories are equipped with computers but they are not in a good working condition. Respondents were also asked if the numbers of computers were enough to be used by the whole class at once. These results indicate that the use of technology at the Institution is very limited as both students and lecturers have indicated on various aspects and this has affected delivery of services negatively for both the students and the lecturers as there is no

smooth communication thorough email or the Web. Therefore this does not only affect the students and lecturers but also the Institution at large in terms of delivery of services and effective communication within the Institution.

4.3.2 The benefits of IT to students at the college

Table 8: The benefits of IT to students at the college

Questions	Strongly Disagree	Disagree	Neutral	Strongly Agree	Agree
Do you usually need Internet to do your challenging school work?	2.1	1.0	1.0	62.1	33.8
Do you prefer Internet to text books for doing school work?	4.1	4.6	24.6	39.5	27.2
Does Internet help you improve your performance at school?	1.5	0	6.7	47.2	44.6
Do you use Internet to find other methods of solving a subject content problem?	1.0	1.0	11.8	40.0	46.2
Do you use a computer to receive notes and tasks from your lecturers?	20.0	30.8	15.4	9.7	24.1
Do you use computers to communicate with other students in the college?	36.4	28.2	16.4	4.6	14.4
Is your learning better facilitated using PowerPoint?	8.7	17.4	33.3	21.0	19.5
Does a computer make your learning easy?	1.5	.5	8.2	47.2	42.6

It is evident from the results in Table 8 that the respondents find it necessary to make use of information technology. Across all the questions asked, most of the respondents indicated that they really need to use IT services to communicate as it makes life easier. This indicates that there is indeed a problem with the use of IT within the Institution that is mostly associated with the insufficient number of computers and lack of Internet connectivity. This may leave both students and lecturers with no available resources to use hence compromise the quality of learning. Students and lecturers indicated that this problem affect effective communication amongst them and even with other Institutions. Students also indicated that their academic performance could be improved if resources were made available and wireless network provided, as this may result in enough computers. This section provided the results of the study. The results were analysed objectively in that questions from the same objective were put together. The next section presents the discussion and conclusion of the study.

5. Discussion and Conclusion

Results from the study revealed that IT forms indeed an integral part in delivering of services. The overall responses from the respondents indicated that IT is needed and is also useful in any organisation for better services to the clients. Therefore the situation at the GTC needs to be improved as indicated by the results, namely that most of the areas need to be improved especially those that affect student learning directly as the core primary role of the Institution is to produce competent products that will lift up the country in different areas. Provision of adequate resources may help both lecturers and student to better their performance and thus uplift the name of the Institution. Overall, respondents were not satisfied with the impact of IT in delivering services.

The results show that information technology has a positive impact on service delivery and that limited IT resources and lack of skills affect services delivery negatively at Gaborone Technical College. It is evident

from the results that there is a lot that need to be done in the Institution in terms of providing enough resources to execute various tasks. Results from the study revealed that there are limited resources in the Institution therefore this affects both the students and the lecturers negatively and hence affect learning. Provision of adequate resources may help both lecturers and students to better their performance. Overall, respondents were not satisfied with impact of IT in delivering services. A review of literature shows that more research on the impact of IT-based services on customer perceived service quality is needed. An opportunity to go beyond the current state of knowledge presents itself in developing and testing the conceptual framework which links the attributes of IT based services, the variables affecting customers' evaluation of such services and the dimension of service quality.

In conclusion, the proposition that limited use of information technology is the major contributing factor to the poor service delivery at Gaborone Technical College has been supported by the results of the study. The findings shows that information technology has a positive impact on service delivery and that limited IT resources and lack of skills affect service delivery negatively at Gaborone Technical College. The results also revealed that efficient service delivery and availability of Internet in the Institution fosters online interaction among personnel and students. Based on evidence emanated from this study, it can be concluded that the impact of IT investment in GTC is significant to the service delivery in the Institution. However, for further studies the opinion of administrative and academics could be analysed separately since the usage and access of IT might not be the same for the two groups. It is important to note that while many expect IT to make a positive contribution to improve service, it should be remembered that IT is a tool people use, not a strategy. People are emotional and select the logic they want to apply based on their feelings. However, technology alone does not guarantee success.

This study has its limitations, firstly the study only concentrated on one Technical College in Botswana, while future research could examine multiple Technical Colleges across Botswana. Secondly this study was limited to the views and opinions of lectures and students of Gaborone Technical College, excluding non-teaching and support staff. The study was limited to the impact of technology on service delivery at Gaborone Technical College. For future studies, it is therefore recommended that service quality and customer satisfaction be explored to determine the effectiveness of information technology on them. Despite these limitations, the study results can provide valuable lessons to other vocational colleges.

Sources of Financing for Innovative Activities of Enterprises in The Industry 4.0

Dariusz WIELGÓRKA

Faculty of Management, Częstochowa University of Technology, Częstochowa, Poland
e-mail: dariusz.wielgórka@wz.pcz.pl

Abstract

The aim of the study was to identify possible sources of financing for innovative activity of enterprises. The very concept of innovation is understood ambiguously. It is usually defined as a radical change, invention or novelty, especially in the context of a product, technology or business management methods. If enterprises will have the possibility to use a wide portfolio of sources of financing innovations, it will influence their development and active participation in the fourth industrial revolution - the concept of Industry 4.0. The study presents an attempt to systematize the definition of Industry 4.0, discusses the main elements of necessary changes in an enterprise. Optimal sources of financing for innovative activity of enterprises will allow for full implementation of the concept of Industry 4.0, which may allow to achieve an unprecedented level of operational efficiency and accelerate productivity growth, which should be taken as a great advantage. New types of advanced production and industrial processes, integration and cooperation of machinery and equipment for human work will allow full flexibility of the company's production systems.

Keywords: Innovation, Industry 4.0, Sources Of Financing Innovation

The concept of innovative activity of enterprises

In the literature, the concept of innovation is not unambiguous, there are many definitions of innovation (Weryński, Dolińska - Weryńska, Tokar 2014, pp. 13). The word innovation comes from the Latin language. Innovation, innovatis, innovatio, means renewal, introducing something new. Innovation is perceived as products and phenomena or processes of technical, organisational, social or psychological nature. Different approach to innovation results from short research time on innovation and also from different theoretical approaches. The genesis of this concept makes it possible to distinguish two main areas of perception of innovation. Innovation understood as less radical, i.e. renewing a certain area of reality, and more radical, meaning introducing new qualities. These are currently used explanations of the understanding of innovation. Innovations can be interpreted in two ways, narrow and broad. In the narrow sense, innovation in the strict sense is a change in a product or production method that is based on new, previously unused knowledge. In a broad sense - the largo sense - it should be understood as any change consisting in assimilating the knowledge obtained (Pichlak 2012, pp. 24). Thus, it will be every good change implemented for use, which is perceived as a novelty from the point of view of the entity introducing it. These changes will concern functional areas of the enterprise, which may result in product or organizational innovation (Kalinowski 2010, pp. 18). In a narrow sense, an innovation is only a change with a positive effect of implementation (Szamrowski 2010, pp. 20). It should be stressed that not every invention is immediately an innovation. It becomes only when it can be copied on an industrial scale, at an acceptable cost level. For a company to achieve market success, it must have the ability and speed of adapting to the current technical progress. The best known and classic definition of innovation was introduced by J. Schumpeter, who considered it an innovation (Schumpeter 2017, pp. 102):

- the introduction of new products or the improvement of existing products,
- introduction of new or improved manufacturing methods,
- creating a new market,
- the use of a new form of sale or purchase,
- use of new raw materials or semi-finished products,

- introducing new process organization.

Currently, the development of the business management concept has led to the creation and modification of new definitions of the term innovation. Many of them have their roots in Schumpeter's view, however, they have a different view on the degree of novelty, the area of change implementation or the effect on the company and the market. Most definitions of innovation can be grouped in some way, emphasizing some of their characteristics. The first group of innovations is based primarily on the use of an idea. An innovation is a process that includes all activities that are related to the creation of an idea, invention and implementation of a new or improved product, process or service (Pomykalski 2001, pp. 17). A. Farazmand also refers to innovation in terms of ideas, methods, approaches, structures or processes, behaviours, attitudes and cultures, as well as technology. The author also treats knowledge used to create a new product or service, to govern and administer communities and manage various types of organizations as an innovation (Farazmand 2004, pp. 8). Innovation is also defined by D.A. DeCenzo and S.P. Robbins as the process of transforming a creative idea into a useful product or service or way of acting (DeCenzo, Robbins 2002, pp. 345). One of the latest definitions of innovation was presented by M.C. Schippers, M.A. West, J.F. Dawson. According to these authors, an innovation is the deliberate presentation and application in a work, work team or organisation of ideas, processes, products or procedures which are new to that work, work team or organisation and which are designed, to benefit the work, the working team or the organisation. Innovation includes creativity and the application of its products. (Schippers, West, Dawson 2012, pp. 3). For J. Tidd and J. Bessant, on the other hand, innovation is the process by which the perceived opportunity begins to be a new idea, and this one is widely used in practice (Tidd, Bessant 2009, pp. 16). The second group are the definitions of innovation, in which the authors focused not only on an idea, but on the whole idea, i.e. a guiding thought that gives direction to scientific activity and creativity. Innovation is every idea, action or thing that is new because it is qualitatively different from the current state. These are products, services and activities that aim to bring them to their buyers and convince them of their utility. E. refers to ideas. M. Rogers, for whom innovation is an idea or object perceived as new by persons or other recipient entities (Rogers 2003, pp. 12), as well as J. Brilman , considering innovation to be an application of some creative idea (Brilman 2002, pp. 162), as well as P. Kotler and G. Armstrong, claiming that innovation is an idea, product or element of technology developed and offered to customers who consider it new or innovative (Kotler, Armstrong, Saunders, Wong 2002, pp. 662). D. Smith writes that innovation is a new idea, practice or object (Smith 2006, pp. 6). L. Soete describes innovation as creating value from ideas and ideas by bringing them to the market in the form of a new product or service, through better design, better production or better distribution of the product (Soete 2006, pp. 198). Innovation is any new idea or approach that is applied in a fundamentally different way to create value for an organization and for customers, suppliers, partner organizations, communities, governments and the general good of humanity. Innovation is directly related to value creation (Lee, Olson, Trimi 2012, pp. 818). From the entrepreneur's point of view, innovation is a process that allows to transform entrepreneurial opportunities into attractive ideas (Kuratko, Hodgetts 2001, pp. 120), or it can be treated as creativity, i.e. creation of new ideas, as well as implementation of these ideas, i.e. their application in practice (Von Stamm 2008, pp. 2). Every idea, action or thing is an innovation because it is qualitatively different from the current state of affairs. Another group of definitions of innovation is also connected with knowledge, as some authors rightly said. P. Hildreth and C. Kimble believe that innovation is the result of the exchange of knowledge from many areas and then it is integrated in a new and different way, from which a new material product or service or process is created (Hildreth, Kimble 2004, pp. 81). Innovation is the economically successful exploitation of new ideas, a continuum of technical and organisational change that includes simple modifications of an existing product or process or practice, up to fundamentally new products or processes, technological improvements or better methods, as well as the way a particular thing is done (Porter 1990, pp. 45). J. Fagerberg considers innovations to be new and better solutions than those used so far by people, which have an impact on socio-economic living conditions (Fagerberg 2005, pp. 155). The Organisation for Economic Cooperation and Development defines innovation as the implementation of a new or significantly improved product or process, a new marketing method or a new organisational method into company practice (Oslo Manual 2005, pp. 31). Nowadays, innovations are also identified with an idea or an innovative idea, as well as an effect, but also with a

cause-and-effect process, which aims at preparing and implementing innovative solutions. Innovation is treated as something new or significantly improved in some area (Yusuf 2009, pp. 1). Currently, innovation is also defined as the process of creative use and transformation of knowledge, belonging to the organization or obtained from outside, as a new product, service or process (Cavagnoli 2011, pp. 112). In characterising innovation, reference should also be made to the concept of innovation, as it is linked to each other. Innovation is the ability to continuously generate and implement innovations that are appreciated by consumers for their high level of modernity and competitiveness on a global scale. In companies, innovation becomes an interesting tool that can provide competitive advantage, enables development and gives independence, which can result in the expected success and financial benefits (Wielgórka, Trzepizur 2015, pp. 45).

Concept Industry 4.0 - Innovative challenges for enterprises

In today's environment, companies face the challenge of coping with large amounts of data, speed of making the right decisions or flexibility of production processes. The flexibility of production is an important element here, because nowadays, the nature of production is shaped by paradigm shifts from mass production to on-demand production, directed to the customer's needs (Schwab 2015, pp. 18-26). The development of the technological process results in an increase in the complexity of the company's business areas. This results in increased demand for innovations in new materials and technologies, innovative production processes as well as new business models. In order to introduce innovations, optimal sources of their financing are necessary. Taking into account these additional aspects: processing a large amount of data and decision making, the company faces a huge challenge and technological leap forward. The challenge is to provide innovative platforms and tools for the mutual cooperation of all areas of a company's activities. It turns out that many of the companies' production systems are not prepared to manage large amounts of data due to the lack of intelligent analytical tools.

In order to meet the expected complexity of modern production systems, a new concept based on knowledge, technology and tools, simulation, optimization and monitoring of existing production systems was created. The phenomenon of the next phase of socio-economic development, which is referred to in the literature as the "Fourth Industrial Revolution", is related to three phenomena:

- universal digitization and ensuring constant communication between people, between people and devices and between devices,
- increasingly often implemented disruptive innovations, which allow for a jumping increase in the efficiency and effectiveness of the social and economic system,
- achieving such a development of machines that they gain the ability to behave autonomously through the use of "artificial intelligence" in their control process.

The concept of "Industry 4.0" has an important place in the vision of a world that will reach a level of development defined as the "Fourth Industrial Revolution". The concept of Industry 4.0 appeared for the first time in 2011 in Germany (Lee 2013, pp. 9). It was then stated that in the area of Industry 4.0 (Alexa L., Alam 2019) the company's production system will consist of an information system and numerically controlled machines that will operate autonomously and display elements of artificial intelligence. The concept of Industry 4.0 should be considered on a case-by-case basis, depending on the needs of the company concerned. The nomenclature of the new concept is also changing, as evidenced by various scientific studies, in which we can find terminology related to Industry 4.0, such as Industrial Internet or Digital Factory (Lasi, Fettke, Kemper, Feld, Hoffmann 2013, pp. 240-242). The term Industry 4.0 means the fourth industrial revolution, which assumes that this is the vision of intelligent factories built with intelligent information systems. The implementation of this idea allows for the development of intelligent production systems which, in addition to this autonomy, have the properties of self-configuration, self-control or repair. The concept of Industry 4.0 covers areas with numerous technologies and related paradigms. The main elements that are closely linked to the idea of Industry 4.0 are therefore: cloud-based production, the industrial internet of things or intelligent factories (Hermann., Pentek, Otto 2015, pp. 4-8).

The concept of Cloud Computing (CC) or cloud computing was first used in 1997. The most commonly used definition of CC is which: "Cloud computing is defined as a model allowing access through the network to computing resources that can be delivered and based on the use of services provided by an internal or external service provider". (Grance, Mell 2019). Kevin Ashton first defined the term "Internet of things" in 1999 (Ashton 2009). The author proposed the use of data transmission over the Internet using RFID for supply chain control at Procter & Gamble. The area of Industrial Internet of Things also includes Industrial Control Systems (ICS). Industrial control systems already make use of advanced web-based communication technologies to some extent, so they can be quickly integrated into the company's information systems. Integration activities are currently being carried out in many industries, which provides an excellent basis for launching future intelligent production systems in the idea of Industry 4.0. The highest form of development is "Smart Factory" as the main component of the Industry 4.0 concept. It is defined as a factory that deliberately supports human resources and machines in performing their tasks based on elements of the cyber-physical system of the Internet of Things. This means that the factory 'will be aware and intelligent enough' to control the production process or keep machines and equipment in good condition. Innovation will be the source of the development of the "smart factory". The construction of an optimal portfolio of financing sources of the company's innovative activity will have an important role in building a competitive advantage.

Sources of financing for innovative activities of enterprises

Implementation of innovative undertakings in the era of Industry 4.0 requires adequate capital. Therefore, there is a need to obtain external sources of financing for innovative activity. Innovative projects are burdened with high risk and are characterized by a long period of return on invested money, as well as uncertainty about future profits. This makes it difficult to raise money for their implementation. Depending on the type of financing source for the company's activity, one can distinguish between own and external financing. The source of equity may be external and internal. The internal sources of equity include obtained net profit, depreciation, release of capital by accelerating the rotation of current assets. The external sources of equity capital include partner surcharges, venture capital funds, searching for new partners, and over-the-counter issues. Foreign capital includes bank loans (Wójcik-Mazur 2012, pp. 6-22), leasing, loans, grants, bonds, franchising, factoring and funds from European Union funds. Hybrid financing can also be distinguished, including other sources of capital creation which are not classified as already mentioned (Janasz 2010, pp. 136-145). Own financing is a form that is suitable for financing any investment regardless of its type. Equity can be used to finance new investments, and to modernise or expand existing ones. Equity capital can also be increased from proceeds from the sale of redundant assets or from making assets available to other entities for use against payment. Equity capital also includes depreciation charges. Depreciation is a cost without expenditure and does not result in a decrease in cash, so depreciation can also be used to finance innovation. The sale of redundant assets is also one of the solutions, as internal financing of innovative activities. The release of capital reserves is also possible by accelerating the rotation of current assets, i.e. the sale of warehouse stocks, an appropriate policy for the settlement of receivables, in order to minimize transport and storage costs. The company obtains profit which can be used to finance innovation. Such activities strengthen economic and credit independence. The company becomes more reliable and easier to obtain financial resources from external sources. Venture capital is another source of financing for innovative activity, commonly called venture capital. Venture capital is an important source of financing the development of small and medium-sized enterprises, including those that would not have a chance to obtain capital from other sources. Venture capital funds raise funds from large investors interested in high returns and willing to take on higher risks. The investors are mainly financial institutions, but also large companies. The funds can operate on their own, as well as be organised by specialised companies managing such funds. Such enterprises are responsible, among other things, for choosing the industry or market on which the acquired funds will be invested and take various decisions related to potential and current investments. Running an innovative activity requires large financial outlays and a long period of return on invested funds. Therefore, financing from own sources is often insufficient. This causes companies to look for other sources of financing innovation. The most common, foreign source of financing is bank loans. However, innovative undertakings usually

require a long implementation period. They are not always successful. Banks require a certain amount of credit security from enterprises, which makes small and medium-sized enterprises unable to take advantage of the bank loan offer because they do not have sufficient fixed assets to provide security. Moreover, innovation requires considerable financial resources, and the risk incurred is so great that the bank has to set a high interest rate on the loan, which is not conducive to innovation by companies. Banks are also reluctant to engage in capital freezing for a longer period of time in exchange for possible future profits. A loan, on the other hand, is similar to a bank loan, except that it may be granted by other economic entities or other (non-bank) financial institutions for innovative activities, and it does not have to involve the payment of interest. Another form of capital raising is leasing, a long-term source of financing for various undertakings. It consists in obtaining various types of investment goods on the basis of a long-term contract, in which the donor undertakes to place certain goods at the disposal of the recipient in exchange for fixed fees. In practice, the most important forms of leasing are: returnable, operational and financial. The first type consists in selling the manufactured capital goods to a leasing company, at the same time concluding a lease agreement to use the goods. An operating lease consists of putting a specific good into use for a specific period of time, usually shorter than the period of full depreciation of the value of the good. In financial leasing, an agreement of this type is of a long-term nature and its duration is similar to the period of full depreciation of the value of the leased asset. It concerns capital goods of higher value than in the case of an operating lease. Foreign capital may also include non-returnable funds, which include subsidies from the state budget, as well as funds from the European Union funds. Franchising is another way of financing innovation. It is a method of economic cooperation through the creation of a network of units, assuming independence in terms of ownership, but also permanent control of the network owner on the basis of a coordination agreement. Another way of financing is factoring, which is a short-term financing of activities without increasing the company's liabilities. It is therefore an effective instrument for improving liquidity and speeding up the rotation of cash by converting the frozen capital provided in the form of services or products of the recipient into cash. It is a transfer of receivables resulting from the conclusion of a contract with a contractor to a factor who collects receivables from the debtor, finances the creditor and takes over the risk, and for his service charges an appropriate remuneration. The company in the period of innovation development bears costs which it is not able to cover the income, so venture capital financing can be used here. One of the attractive possibilities of financing innovative activities are subsidies from the European Union. These are various types of funds granted within the framework of the competition. Structural funds are funds that come from the European Union budget. Their basic aim is to support restructuring and modernization of regions and sectors of the economy of the member states, which have problems with meeting the average economic level in the European Union. In the years 2007-2013, in financing innovation, these were: Innovative Economy Operational Programme and Regional Operational Programmes (ROP). Z European funds can also be used for the period 2014-2020, where the programmes also include funding for innovative activities for businesses. Innovation vouchers can also be used to purchase services. There are many sources of funding for innovation activities, but there is no single optimal choice. The choice of the appropriate method of financing is an individual matter, which results from the specific conditions of a particular enterprise. What is important here is a detailed analysis and assessment of availability and effectiveness of particular sources of financing. The choice also depends on the characteristics of the implemented innovative project, the current financial condition and previous experience, or management staff, etc. In innovative activity, various sources of financing innovation are used at various stages. It is often used to divide the sources of financing of innovative activity taking into account the stage of the process of innovative projects. In order to facilitate this procedure, it is necessary to adopt three phases of an innovative project, conducting research and development, implementing and marketing and sales. At each stage of the process it is possible to show the expenses and revenues connected with conducting innovative activity. Sources of financing can also be assigned to each phase. NewConnect (NC) is a stock exchange platform for young and dynamic companies that are interested in a stock exchange debut but do not meet the stringent criteria for entering the stock exchange's core market. Companies can raise capital from the issue of new shares and sell them in an issue intended for external investors. The shares are traded on the NC market. The type of source of financing can also be attributed to the development stage of the company. Loan funds are local institutions operating in a specific area. Their product and service offer is tailored to the needs of entities operating in a given

area, focuses primarily on micro, small and medium-sized enterprises and applies simplified rules and principles of creditworthiness assessment. These institutions operate in various legal forms, most often it is a foundation, association or company. Moreover, they deal with training, advisory and information activities, they also run business incubators and guarantee funds. Credit guarantee funds are non-profit parabank units that provide financial assistance in the form of guarantees, mainly for small enterprises that have problems with completing the required collateral within the credit procedure. The term business angels refers to individuals who provide equity capital directly to new, innovative enterprises with growth potential, with which they have only an economic interest. They are venture capitalists, using their personal financial resources for this purpose. Such investors include current entrepreneurs and those who have already been successful and thus have sufficient capital to invest in new companies. Technology parks provide comprehensive support and offer entrepreneurs also advisory services in the field of development, technology transfer and transformation of scientific research results and development works into technological innovations. The mission of technology parks is to support enterprises in the process of technology development and implementation. They are naturally pregnant with the scientific environment. Most of them, even if there is no "scientific" part in the name, "are involved in the implementation of the mission of science parks, which consists of organizing research work, in order to implement their results in the company, as well as supporting the process of creation and development of spin-off, spin-out' companies. Entrepreneurship incubators act as a tool to support entrepreneurs who start running their own business. The operation of the incubators is part of the policy of supporting entrepreneurship, at national, as well as regional and local level. They have a significant impact on the level of local communities. This allows for the development and use of proven business creation patterns. Within a properly prepared offer of business incubators, one can distinguish basic services that reduce the costs of running a business on a current basis, as well as a number of additional services that provide entrepreneurs with an advantage over companies that operate on the market without similar support.

Fig. 1: Outlays on innovative activity due to the source of financing in production companies (billion PLN).

Source: Own elaboration based on GUS 2019.

In Poland, another type of financing of innovative activity is state aid in the form of technological credit, as well as reliefs and tax exemptions. The technology credit is a source of financing aimed at providing financial resources for the implementation of modern technology. It is available for the SME sector. The amount of the technology credit may not exceed the equivalent of EUR 2 million, and the subject of financing by the credit may be solutions developed on their own or solutions that come from outside. The necessary condition is a high level of novelty of the acquired technology.

Various innovation and business centres can also be used to support companies or potential entrepreneurs in the form of financial or material equipment and various services such as information, advice or training. In recent years, such a form of raising capital for innovations as Crowdfunding has been gaining in popularity. It is a kind of collection and transfer of accumulated funds by the society through the Internet. The innovative potential should be increased, both in the sphere of financing and introducing new solutions. Financing the innovative activity of enterprises in the Industrial 4.0 era is one of the most serious management problems. Capital is the basis for the development of innovative enterprises. There are many different sources of financing innovation, from the company's own resources to bank credits, loans, as well as various types of funds such as: venture capital or funding from the European Union. An appropriate source of financing should be chosen according to the stage of the implemented undertaking. Research has been carried out which illustrates the expenditure on innovative activity of enterprises operating in Poland. Expenditures on innovative activity can also be considered due to the source of financing of these expenditures.

The data presented in Figure 1 shows that the main source of financing of outlays on innovative activity in the examined period 2011-2017 was the companies' own funds. In 2015, they constituted as much as 63% of all outlays and increased by 13.03% in relation to the previous year. The lowest expenditures were recorded from the state budget. Throughout the entire period under examination, they remained at a similar level of about 0.5%. In 2015, however, bank loans as funds obtained for innovative activities increased by 80.46% compared to 2010. The increase in bank loans as a source of financing for innovative activities results, among other things, from the fact that the interest rate in Poland has decreased, loans have become cheaper. The reduction of interest rates was from 3.5% in 2011 to 1.5% in 2015, which partially resulted in an increase in bank loans. Also noteworthy is the low share of resources from the structural funds on average 1.42%.

Conclusions

In today's economy, innovation is a key factor in social and economic development. Only those enterprises that implement innovative projects, introduce innovative products and services, solutions, technologies will be able to match the competition and meet the requirements of the dynamically changing market in the era of the Industry 4.0 concept. More and more entrepreneurs are aware of the necessity of implementing innovative projects and benefits resulting from them. Increase of profits, increase of market shares, increase of competitive advantage, use of new market opportunities are only some of the advantages of implementing innovations in an enterprise. Not without significance is also the implementation of customer needs, personalization and variety of products, processes, services or increase in customer loyalty. All this makes entrepreneurs want to implement and implement innovations to ensure the company's survival and development. The available sources of financing include debt financing, interest-free foreign capital, as well as own capital, which is used to start up and develop innovative activities. Therefore, financing is available at every stage of the company's development. The funds come from both public and private sources. Available sources of financing for innovative projects in Poland include:

- EU funds (operational and framework programmes),
- Funds from the National Centre for Research and Development,
- Innovation Support Loan Fund (PARP),
- Venture Capital and Business Angeles funds,
- Crowdfunding.

Research has shown that equity is the most popular in financing innovation. Polish companies have great potential to create and develop innovative solutions known all over the world and actively implement solutions of the Industry 4.0 concept. The criteria for applying for structural funds may be relaxed. There are many sources of financing innovative activity at each stage of the enterprise's development. A tax relief for research and development may also be an incentive to undertake innovative activity.

Abstract

There has been an increasing build-up of studies that focus on suspected relationship between developments in Finance and economic development variables. While some studies sought to establish the causation between the two variables, some others focus on the aspect or extent of development in Finance, or exact variables in Finance that could ignite growth in the economic sector. Yet some others examine those macro-economic variables, which financial growth could ignite their performance. Undoubtedly, the quest to proffer logical answer to the fundamental economic development question on why countries grow at different rates has undoubtedly digressed researchers to further investigate the causal factors of influence among growth variables in finance and the real economy. Moreover, dearth of studies on correlation that exists amidst real and financial growth variables in Nigeria necessitated this study. The paper aims at investigating the impact and trend of developments in the finance and real sectors of the Nigerian economy. The study examines the long-run effects and two potential causal variables of influence on economic development; using Vector Error Correction Model. It finds that growth effect of finance is bias to choice of macro-economic variables regressed. The results suggest that the influence of growth in finance on macro-economic variables depends on measures used to proxy for financial growth.

Keywords: Economic Development Variables, Financial Growth, National Income, Market Capitalisation, Gross Domestic Products

Introduction

It is considerably wise for resource managers to have at least a good analyses conducted on their individual business units; even if they lack the requisite expertise of business portfolio matrix. In like manner, it is equally wise of public functionaries to periodically identify and conduct periodic assessments tailored at improving the various variables that aid the performance of the economy that they govern. In other words, it is pertinent to identify and further develop such variables that could play pivotal roles in aid of performance of cogent macro-economic variables.

This study chose the Gross Domestic Product and the National Income to proxy macro-economic development on one side; and loans to the private sector and capitalization of stock mart as proxy to developments in finance. Macro-economic variables are economic aggregates via which economic development and performances are measured. These are aggregates like total output of an economy, general price level in an economy, inflation rate, rates of interest, national income and exchange rate. National outputs are measured by the GDP, which represents the value of all final products in the mart produced at a particular time. That is, national income connotes earnings of producers and suppliers of productive resources. It is the net national income at factor cost, which excludes transfer earnings (Ajayi & Ojo, 1980).

Meanwhile, according to Falaye (2014), the following indicators enunciated by Khan and Senhadji (2000) are good measures of developments in finance. The sum of loans and advances to private sector as a percentage of Gross Domestic Products; the sum of domestic credits lent to the private sector as a percentage of the GDP plus the stock mart capitalization as a share of the GDP; the sum of domestic credits lent to the private sector as a share of GDP plus the stock mart capitalization as a share of GDP, and non-public and public bond marts capitalization as a share of GDP; and the stock mart capitalization. Out of the four, the most exhaustive is the sum of domestic loans lent to non-public segment of the economy relative to domestic products plus the stock mart capitalization as a percentage of GDP, and the bonds mart's capitalization as a percentage of gross domestic products. Where the capital mart is still emerging however, the ratio of private credits to the GDP could be used to measure financial depth. In sum, financial growth is easily noticeable via increased change in financial structures over periods of time. Hence, the rate at which financial structure increases can be deduced by comparisons at different points in time. Some other measures of financial growth that may prove useful in less developed economies include liquid liabilities of banks and non-bank institutions as a percentage of GDP, the ratio of banks' credit to the sum of banks and central bank's credit, the ratio of private credits to domestic credits, the measure of financial assets in the economy, and commercial banks deposits as a ratio of GDP.

Related works

Moreover, it is not out of place to further probe Schumpeter's view on the constructive effect of financial growth on economic development. This is in consonance with the articulate models of King and Levine (1993a), (1993b), Shaw (1973) and McKinnon (1973). In sum, the correlation between pecuniary development and economic growth variables must be established to enable fair comparison among countries in investigating the reasons nations grow at diverse degrees.

Shaw (1973) and McKinnon (1973) built on the work of Schumpeter (1883-1950) and propounded the financial liberation thesis of 1973 that higher degree of financial growth that results from financial liberalization would accelerate growth in outputs. They further maintained that financial sector could raise not only the volume of savings, but also the quality and quantity of investments. In support of their view, growth and endogenous financial growth models emerged in 1990s. These models clearly indicate that financial growth occasions long run growth; and that financial distribution lessens economic development rate.

In the words of Goodhart (2004), progress causation between real and financial growth variables runs in either of the two directions. This is equally the report of Demetriades and Hussein (1996). Goodhart however submits that a more domineering research finding is that financial growth promotes economic development. According to him, the most functional financial marts are found mostly in very successful economies. More importantly, his submission implies the existence of a linear relationship between the two.

As Das (2005) puts it, 'a well-developed financial sector plays an important role in the overall economic development.' In his words, literature has exposed some ways via which the financial sector supports macro-economic development. Das submits that the financial sector does not only mobilise and channel funds into investments, but also optimizes resources allocation. Yet, a well-functioning finance sector lowers costs of financial intermediation and reduces the risks inherent in financial transactions. His submission is in tandem with King and Levine (1993) that a well-functioning finance system quickens economic development via successful brilliant innovations. Some other studies that report financial growths positive impact on economic development include Claessens and Feijen (2006), Uddin et al (2013), Durusu-Ciftci et al (2017), Assefa et al (2015), Bayar (2014), Ben-Jedidia et al (2014), Bijlsma et al. (2018) and Yang (2019) among many others.

Nevertheless, some researchers hold the opinion that even though there exists a fundamental connexion between growth in finance and economic development, the rapport is negatively linear. They maintain that financial growth impacts negatively on economic development. Studies in support of the report that financial growth has negative impact on economic development include D -Gregorio and Guidotti (1995), Ductor and Grechyna (2015) and Samargandi et al (2014). Conclusively, while some other studies like Hassan et al (2011), Ang and McKibbin (2007) and Ibrahim (2007) report that it is even economic development that influences financial growths; some like Adu et al (2013) even report that variations in those reports base on variables used to proxy financial growth.

Goldsmith (1969) presents data from 35 nations for a period of 103 years (1860 to 1963), applying the OLS and graphical exploration. The study establishes distinct association between finance growth and developments in the economy. King and Levine (1993a) use a sample of 77 countries for 29 years (1960 to 1989). They conclude that finance is crucial for economic development. In the same vein, Atje and Jovanovic (1993) investigate the impact of stock marts and banks on economic development, based on 94 countries for a period of 25 years (1960 to 1985). They find that stock markets have non-negative and growth impact on economic activities. Equally, Levine and Zervous (1996) obtain data for a period of 29 years (1960 to 1989), apply OLS estimation technique to a sample of 49 countries. The study finds stock mart liquidity positively and significantly correlated with economic development.

Objectives of study

1. To investigate if there is an underlying relationship between the finance growth and developments in Nigeria's economy.
2. To find the trend of the fundamental association between the two variables; if there exists any in Nigeria.

Methods

Model specification

$$GDP, Y = f(M_C, C_P, i + ecm)$$

Where:

GDP	=	Gross Domestic Product
NI	=	National Income
MC	=	Market Capitalization
CP	=	Credit to the private Sector
i	=	Prime interest rate
ecm	=	error correction term

Hypotheses of study

H0$_1$: There exists no significant connection between finance growth and developments in Nigeria's economy.

H0$_2$: The relationship between National Income and Financial Performance is not significant.

Scope of study

The study based its data usage on the Nigerian economy only. It's a collection of a period of 35 years; starting from 1984 to 2018. We decided to analyse two independent and two dependent variables for study.

Table 1: Unit Root Augmented Dickey-Fuller test

Variables	ADF@ levels	ADF@1st diff and Intercept	Order of Integration
National Income(NI)	-0.429414* ** ***		I(0)
Market Capitalization(MC)	-1.841954* ** ***		I(0)
Credit to private Sector (CP)	-1.549822 * ** ***		I(0)
Gross Domestic Product (GDP)	-2.834029* **		I(0)

Evidence from our unit root test shows that all the data variables in our study are stationery at first difference. This implies that the data variables are efficient for further analysis; hence, we proceed to regression analysis**.**

Test of hypotheses

H0$_1$: There is no substantial connexion between financial performance and economic advancement in Nigeria.

Table 2: Regression results showing the effect of financial performance on economic growth in Nigeria.

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	1.497706	0.049865	30.03546	0.0000
MC	0.196856	0.060995	3.227432	0.0029
CP	0.631695	0.068543	9.215990	0.0000
R-squared	0.991550	Mean dependent var		3.883827
Adjusted R-squared	0.991005	S.D. dependent var		0.919947
S.E. of regression	0.087252	Akaike info criterion		-1.955945
Sum squared resid	0.235998	Schwarz criterion		-1.821266
Log likelihood	36.25106	Hannan-Quinn criter.		-1.910015
F-statistic	1818.770			
Prob(F-statistic)	0.000000			

From Table 2, mart capitalization (MC) indicates a coefficient of regression value of 0.196856. This means that MC is confident and substantial determinant of economic advance in Nigeria as measured by Gross Domestic Product (GDP). It also means that a unit variation in MC will bring about equal change in economic growth in Nigeria. As seen in the table, credit to private sector (CP) has a coefficient of regression value of 0.631695. This indicates that CP is positive and significant; hence, a function of GDP in Nigeria.

$H0_2$: The relationship between National Income and Financial Performance is not significant.

Table 3: Regressions results showing relationship between National income and Economic growth in Nigeria

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.519932	0.113386	4.585513	0.0001
MC	-0.048661	0.138694	-0.350852	0.7281
CP	0.513235	0.155859	3.292943	0.0025
R-squared	0.943146	Mean dependent var		139.7684
Adjusted R-squared	0.939225	S.D. dependent var		170.3217
S.E. of regression	41.98880	Akaike info criterion		10.40174
Sum squared resid	51128.72	Schwarz criterion		10.53916
Log likelihood	-163.4279	Hannan-Quinn criter.		10.44729
F-statistic	240.5380			
Prob(F-statistic)	0.000000			

Evidence from Table 3 indicates that market capitalization has a regression value of -0.048661. This value is seen to be negative and insignificant at a 0.5% level, implying that national income is not a function of mart capitalization in Nigeria. Again, the Table 3 also shows that credit to private sector (CP) has a coefficient of regression value 0.513235. Permit to say that this value is positive and significant at a 5% level. It indicates that CP is a determinant of economic growth as measured by national income in Nigeria.

$H0_1$: There is no significant influence between financial performance and economic growth in Nigeria.

Table 4: ***Regression result showing the influence of financial performance on economic growth in Nigeria***

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-933.2059	410.9096	-2.271074	0.0305
EG	0.392053	0.010108	38.78518	0.0000
R-squared	0.980447	Mean dependent var		8991.254
Adjusted R-squared	0.979795	S.D. dependent var		12795.19
S.E. of regression	1818.753	Akaike info criterion		17.91015
Sum squared resid	99235880	Schwarz criterion		18.00176
Log likelihood	-284.5624	Hannan-Quinn criter.		17.94052
F-statistic	1504.290			
Prob(F-statistic)	0.000000			

Statistical evidence from Table 4 shows that economic growth in Nigeria is a function of financial performance. This assertion is validated by a coefficient of regression value of 0.392053, which is momentous at a 5% level. It means that pecuniary performance effects economic growth in Nigeria.

Results

As seen in Table 2, mart capitalization is indicated to have a coefficient of regression value of 1.369411. This means that mart capitalization is positive and significant determinant of economic development in Nigeria as proxied by GDP. Thus, a unit change in mart capitalization will bring about equal change in economic development in Nigeria. Equally, the Table 2 shows that credit to private sector has a coefficient of regression value of 3.590826. This is an indication that credit to private sector is confident and substantial; hence, a determinant of economic development in Nigeria.

In Table 3, it is evident that mart capitalization has a regression value of 0.011911. This value is seen to be positive and significant at a 0.5% level; implying that national income is a function of mart capitalization in Nigeria. Equally shown in the Table 3 is the fact that credit to private sector has a coefficient of regression value fo0.013927. Permit to say that this value is confident and substantial at a 5% level. It indicates that credit to private sector is a determinant of economic development as proxied by national income in Nigeria.

Summarily, the statistical evidence from Table 4 shows that economic development in Nigeria is a function of financial performance. This assertion is validated by a coefficient of regression worth of 0.392053 that is significant at a 5% level. This means financial growth stimulates economic development in Nigeria. Hence, there exists substantial correlation of influence amid financial performance and economic development in Nigeria. Hence, we equally discard the third null proposition.

Discussion and conclusion
